Technical and Bibliographic Notes / Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

12X	16X	20X	24X	28X	32X

The copy filmed here has been reproduced thanks
to the generosity of:

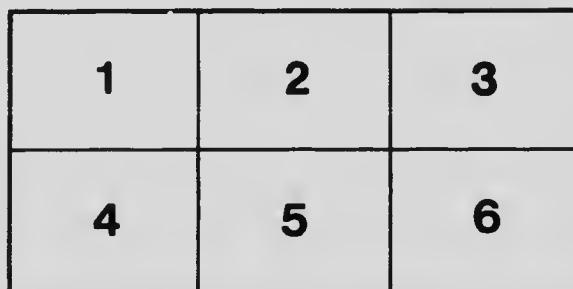

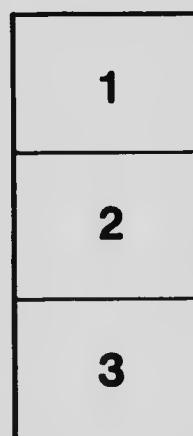

National Library of Canada

The images appearing here are the best quality
possible considering the condition and fragility
of the original copy and in keeping with the
filming contract specifications.

Original copies in printed paper covers are filmed
beginning with the front cover and ending on
the last page with a printed or illustrated impression,
or the back cover when appropriate. All other original copies are filmed beginning on the
first page with a printed or illustrated impression,
and ending on the last page with a printed
or illustrated impression.

The last recorded frame on each microfiche
shall contain the symbol → (meaning "CONTINUED"), or the symbol ▽ (meaning "END"),
whichever applies.

Maps, plates, charts, etc., may be filmed at
different reduction ratios. Those too large to be
entirely included in one exposure are filmed
beginning in the upper left hand corner, left to
right and top to bottom, as many frames as
required. The following diagrams illustrate the
method:

L'exemplaire filmé fut reproduit grâce à la
générosité de:

Bibliothèque nationale du Canada

Les images suivantes ont été reproduites avec le
plus grand soin, compte tenu de la condition et
de la netteté de l'exemplaire filmé, et en
conformité avec les conditions du contrat de
filmage.

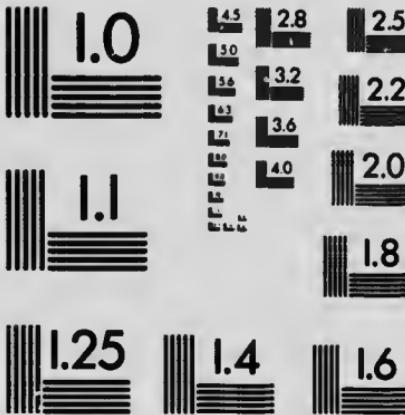

Les exemplaires originaux dont la couverture en
papier est imprimée sont filmés en commençant
par le premier plan et en terminant soit par la
dernière page qui comporte une empreinte
d'impression ou d'illustration, soit par la seconde
plan, selon le cas. Tous les autres exemplaires
originaux sont filmés en commençant par le
premier plan qui comporte une empreinte
d'impression ou d'illustration et en terminant par
la dernière page qui comporte une telle
empreinte.

Un des symboles suivants apparaîtra sur la
dernière image de chaque microfiche, selon le
cas: le symbole → signifie "À SUIVRE", le
symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être
filmés à des taux de réduction différents.
Lorsque le document est trop grand pour être
reproduit en un seul cliché, il est filmé à partir
de l'angle supérieur gauche, de gauche à droite,
et de haut en bas, en prenant la nombre
d'images nécessaire. Les diagrammes suivants
illustrent la méthode.

**ENGINEERING INSTITUTE OF CANADA
STANDARD SPECIFICATIONS**

FOR

**Cast Iron Water Pipe and Special
Castings**

**With Tables of Dimensions
Thicknesses and Weights**

MANUFACTURED BY THE

Canada Iron Foundries Limited

ENGINEERING INSTITUTE OF CANADA
STANDARD SPECIFICATIONS FOR CAST IRON PIPE
AND SPECIAL CASTINGS

DESCRIPTION OF PIPES

Section 1. The pipes shall be made with hub and spigot joints, and shall accurately conform to the dimensions given in Tables Nos. 1 and 2. They shall be straight and shall be true circles in section, with their inner and outer surfaces concentric, and shall be of the specified dimensions in outside diameter. They shall be at least 12 feet in length, exclusive of socket.

Pipes with thickness and weight intermediate between the classes in Table No. 2 shall be made of the same outside diameter as the next heavier class. Pipes with thickness and weight less than shown by Table No. 2 shall be made of the same outside diameter as the Class A pipe; and pipes with thickness and weight more than shown by Table No. 2 shall be made of the same outside diameter as the Class D pipe.

All pipes having the same outside diameter shall have the same inside diameter at both ends. The inside diameter of the lighter pipes of each standard outside diameter shall be gradually increased for a distance of about 6 inches from each end of the pipe so as to obtain the required standard thickness and weight for each size and class of pipe.

For pipes of each size from 4-inch to 24-inch inclusive, there shall be two standards of outside diameter, and for pipes from 30-inch to 60-inch inclusive, there shall be four standards of outside diameter, as shown by Table No. 1. The nominal diameters to be cast on pipes above 4-inch.

For pipes 4-inch to 12-inch inclusive, one class of special castings shall be furnished, made from Class D pattern. Those having spigot ends shall have outside diameters of spigot ends midway between the two standards of outside diameter as shown by Table No. 1, and shall be tapered back for a distance of 6 inches.

For pipes from 14 inches to 24 inches inclusive, two classes of special castings shall be furnished: Class B special castings with Classes A and B pipes, and Class D special castings with Classes C and D pipes; the former shall have cast on them the letters "AB" and the latter "CD." For pipes 30-inch to 60-inch inclusive, four classes of special castings shall be furnished, one for each class of pipe, and shall have cast on them the letter of the class to which they belong.

ALLOWABLE VARIATION IN DIAMETER OF PIPES AND SOCKETS

Section 2. Especial care shall be taken to have the sockets of the required size. The sockets and spigots will be tested by circular gauges, and no pipe will be received which is defective in joint room from any cause. The diameters of the sockets and the outside diameters of the spigot ends of the pipes shall not vary from the standard dimensions by more than .06 of an inch for pipes 16 inches or less in diameter; .08 of an inch for 18-inch, 20-inch and 24-inch pipes; .10 of an inch for 30-inch, 36-inch and 42-inch pipes; .12 of an inch for 48-inch, and .15 of an inch for 54-inch and 60-inch pipes.

ALLOWABLE VARIATION IN THICKNESS

Section 3. For pipes whose standard thickness is less than 1 inch, the thickness of metal in the body of the pipe shall not be more than .08 of an inch less than the standard thickness, and for pipes whose standard thickness is 1 inch or more, the variation shall not exceed .10 of an inch, except that for spaces not exceeding 8 inches in length in any direction, variations from the standard thickness of .02 of an inch in excess of the allowance above given shall be permitted

For special castings of standard patterns a variation of 50 per cent. greater than allowed for straight pipes shall be permitted.

DEFECTIVE SPIGOTS MAY BE CUT

Section 4. Defective Spigot ends on pipes 12 inches or more in diameter may be cut off in a lathe and a half-round wrought-iron band shrunk into a groove cut in the end of the pipe. Not more than 12 per cent. of the total number of accepted pipes of each size shall be cut and banded, and no pipe shall be banded which is less than 11 feet in length, exclusive of the socket.

In case the length of a pipe differs from 12 feet, the standard weight of the pipe given in Table No. 2 shall be modified in accordance therewith.

SPECIAL CASTINGS

Section 5. All special castings shall be made in accordance with the cuts and the dimensions given in the tables forming a part of these specifications.

The diameters of the sockets and the external diameters of the spigot ends of the special castings shall not vary from the standard dimensions by more than .12 of an inch for castings 16 inches or less in diameter; .15 of an inch for 18-inch, 20-inch and 24-inch; .20 of an inch for 30-inch, 36-inch and 42-inch, and .24 of an inch for 48-inch, 54-inch and 60-inch. These variations apply only to special castings made from standard patterns.

The flanges on all manhole castings and manhole covers shall be faced true and smooth, and drilled to receive bolts of the sizes given in the tables. The manufacturer shall furnish and deliver all bolts for bolting on the manhole covers, the bolts to be of the sizes shown on plans and made of the best quality of mild steel, with hexagonal heads and nuts and sound, well-fitting threads.

MARKING

Section 6. Every pipe and special casting shall have distinctly cast upon it the initials of the maker's name. When cast especially to order, each pipe larger than 4-inch may also have cast upon it figures showing the year in which it was cast and a number signifying the order in point of time in which it was cast, the figures denoting the year being above and the number below, thus:

1908
1

1908
2

1908
3

etc., also any initials, not exceeding four, which may be required by the purchaser. The letters and figures shall be cast on the outside and shall not be less than 2 inches in length and $\frac{1}{8}$ of an inch in relief for pipes 8 inches in

diameter and larger. For smaller sizes of pipes the letters may be 1 inch in length. The weight and the class letter shall be conspicuously painted in white on the inside of each pipe and special casting, after the coating has become hard.

ALLOWABLE PERCENTAGE OF VARIATION IN WEIGHT

Section 7. No pipe shall be accepted the weight of which shall be less than the standard weight by more than 5 per cent. for pipes 16 inches or less in diameter, and 4 per cent. for pipes more than 16 inches in diameter, and no excess above the standard weight of more than the given percentage for the several sizes shall be paid for. The total weight to be paid for shall not exceed for each size and class of pipe received the sum of the standard weights of the same number of pieces of the given size and class by more than 2 per cent.

No special casting shall be accepted the weight of which shall be less than the standard weight by more than 10 per cent. for pipes 12 inches or less in diameter, and 8 per cent. for larger sizes, except that curves, Y pieces and breeches pipe may be 12 per cent. below the standard weight, and no excess above the standard weight of more than the above percentages for the several sizes will be paid for. These variations apply only to castings made from the standard patterns.

QUALITY OF IRON

Section 8. All pipes and special castings shall be made of cast iron of good quality, and of such character as shall make the metal of the castings strong, tough, and of even grain, and soft enough to satisfactorily admit of drilling and cutting. The metal shall be made without any admixture of cinder iron or other inferior metal, and shall be remelted in a cupola or air furnace.

The contractor shall have the right to make and break three bars from each heat or run of metal, and the test shall be based upon the average results of the three bars. Should the dimensions of the three bars differ from those given below, a proper allowance therefor shall be made in the results of the tests.

TESTS OF MATERIAL

**Section 9.* Specimen bars of the metal used, each being twenty-six inches long by two inches wide and one inch thick, shall be made without charge as often as the engineer may direct, and in default of definite instructions, the contractor shall make and test at least one bar from each heat or run of metal. The bars when placed flatwise upon supports twenty-four inches apart, and loaded in the centre, shall support a load of 1,900 pounds, and show a deflection of not less than .30 of an inch before breaking; or if preferred, tensile bars shall be made which will show a breaking point of not less than 19,000 pounds per square inch.

CASTING OF PIPE

Section 10. The straight pipes shall be cast in dry sand moulds in a vertical position. Pipes 16 inches or less in diameter shall be cast with the hub end up or down, as specified in the proposals. Pipes 18 inches or more in diameter shall be cast with the hub end down.

* Pipe may be made under higher metal tests when desired.
Stock pipe may be made under metal tests as low as 1,800 pounds.

The pipes shall not be stripped or taken from the pit while showing colour of heat, but shall be left in the flasks for a sufficient length of time to prevent unequal contraction by subsequent exposure.

QUALITY OF CASTINGS

Section 11. The pipes and special castings shall be smooth, free from seals, lumps, blisters, sand holes, and defects of every nature which unfit them for the use for which they are intended. No plugging or filling will be allowed.

CLEANING AND INSPECTION

Section 12. All pipes and special castings shall be thoroughly cleaned and subjected to a careful hammer inspection. No casting shall be coated, unless entirely clean and free from rust, and approved in these respects, immediately before being dipped, by the engineer.

COATING

Section 13. Every pipe and special casting shall be coated inside and out with coal-tar pitch varnish. The varnish shall be made from coal tar. To this material sufficient oil shall be added to make a smooth coating, tough and tenacious when cold, and not brittle nor with any tendency to scale off.

Each casting shall be heated to a temperature of 300 degrees Fahrenheit immediately before it is dipped, and shall have not less than this temperature at the time it is put in the vat. The ovens in which the pipes are heated shall be so arranged that all portions of the pipe shall be heated to an even temperature. Each casting shall remain in the bath at least five minutes.

The varnish shall be heated to a temperature of 300 degrees Fahrenheit (or less if the engineer shall so order), and shall be maintained at this temperature during the time the casting is immersed.

Fresh pitch and oil shall be added when necessary to keep the mixture at the proper consistency, and the vat shall be emptied of its contents and refilled with fresh pitch when deemed necessary by the engineer. After being coated the pipe shall be carefully drained of the surplus varnish. Any pipe or special casting that is to be recoated shall first be thoroughly scraped and cleaned.

HYDROSTATIC TEST

Section 14. When the coating has become hard, the straight pipes shall be subjected to a proof by hydrostatic pressure, and, if required by the engineer, they shall also be subjected to a hammer test under this pressure.

The pressure to which the different sizes and classes of pipes shall be subjected are as follows:

	20-inch Diameter and larger Pounds per sq. inch	Less than 20-inch Diameter Pounds per sq. inch
Class A Pipe	150	390
Class B Pipe	200	300
Class C Pipe	250	300
Class D Pipe	300	300

WEIGHING

Section 15. The pipes and special castings shall be weighed for payment under the supervision of the engineer after the application of the coal-tar pitch varnish. If desired by the engineer, the pipes and special castings shall be weighed after their delivery, and the weights so ascertained shall be used in the final settlement, provided such weighing is done by a legalized weighmaster. Bids shall be submitted and a final settlement made upon the basis of a ton of 2,000 pounds.

CONTRACTOR TO FURNISH MEN AND MATERIAL

Section 16. The contractor shall provide all tools, testing machines, materials, and men necessary for the required testing, inspection, and weighing at the foundry of the pipe and special castings; and should the purchaser have no inspector at the works, the contractor shall, if required by the engineer, furnish a sworn statement that all of the tests have been made as specified, this statement to contain the results of the tests upon the test bars.

POWER OF ENGINEER TO INSPECT

Section 17. The engineer shall be at liberty at all times to inspect the material at the foundry, and the moulding, casting and coating of the pipes and special castings. The forms, sizes, uniformity and condition of all pipes and other castings herein referred to shall be subject to his inspection and approval, and he may reject, without proving, any pipe or other casting which, in his opinion, is not in conformity with the specifications or drawings.

INSPECTOR TO REPORT

Section 18. The inspector at the foundry shall report daily to the foundry office all pipes and special castings rejected, with the causes for rejection.

CASTINGS TO BE DELIVERED SOUND AND PERFECT

Section 19. All the pipes and other castings must be delivered in all respects sound and conformable to these specifications. The inspection shall not relieve the contractor of any of his obligations in this respect, and any defective pipes or other castings which may have passed the engineer at the works or elsewhere shall be at all times liable to rejection when discovered, until the final completion and adjustment of the contract; provided, however, that the contractor shall not be held liable for pipes or special castings found to be cracked after they have been accepted at the agreed point of delivery. Care shall be taken in handling the pipes not to injure the coating, and no pipes or other material of any kind shall be placed in the pipes during transportation or at any time after they have received the coating.

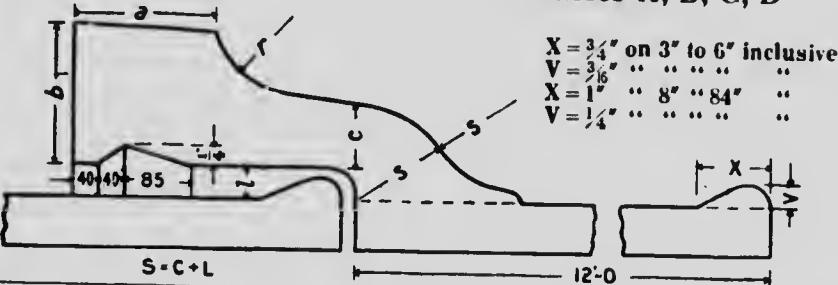

DEFINITION OF THE WORD "ENGINEER"

Section 20. Wherever the word "engineer" is used herein it shall be understood to refer to the engineer or inspector acting for the purchaser and to his properly authorized agents, limited by the particular duties intrusted to them.

18	6	56	48	8	114
20	6	56	54	8	134
24	6	56	60	8	137

Two pairs of lugs are placed on the vertical axis of each bell, the others at equal distances around circumference. H is equal depth of bell on all sizes.

G equals 2.50 inches, X equals 1.25 inches, Y equals 1.63 inches for 12 to 24 inches inclusive.

G equals 3.00 inches, X equals 1.50 inches, Y equals 2.00 inches for 30 to 60 inches inclusive.

72	128.00	140.50	153.00	302.50
84	147.00	161.50	175.60	348.00

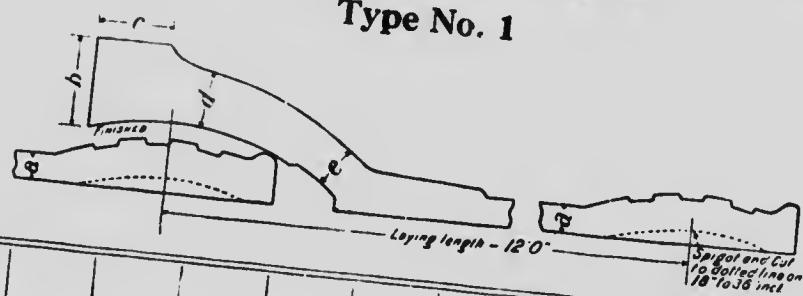

The above table gives the calculated weight of lead required for pipe joints, both with and without gasket. The weight of a cubic inch of lead is taken as 0.41 pound. An allowance has been made for lead to project beyond face of the bell for calking.

The specifications for pipes allow the lead space to vary from those given in tables, hence the weight of lead required for the joint may vary approximately 11 to 16 per cent. from weights given above.

Note.—Pipes made in 12 foot lengths and faced $\frac{1}{8}$ inch short for gaskets. All dimensions in inches. Above are neat finished weights. Allowance must be made for variation and finish. Flange and Spigot or Flange and Bell Pipes made to order. For drilling dimensions, etc., see Table No. 34.

FLANGES AND FLANGE FITTINGS

CANADIAN AND AMERICAN STANDARD

The use of flanges and flange fittings has been increasing quite rapidly of late years, in fact, a flange joint is the standard form of connection in many classes of piping. For most purposes the ordinary screw connection should not be used above 6" pipe size on account of the difficulty of making and breaking joints.

As the flange fitting business grew, each manufacturer made up patterns for whatever sizes were called for, to his own personal ideas or knowledge at that time.

These dimensions were later published in catalogues and a wide variation in dimensions was found.

The variation in the diameter and thickness of flanges as well as the bolt circle, size and number of bolts on standard weight material caused the users and manufacturers considerable confusion and expense.

This brought about the movement by the American Society of Mechanical Engineers and the Master Steam & Hot Water Fitters Association, assisted by the manufacturers of these lines, the result of which was the adoption of what is known as the A. S. M. E. Standard of 1894. This covered flange dimensions and bolting only.

A few years later the manufacturers began to realize that the extra heavy 250* flanges and bolting were in the same state of confusion. This resulted in the adoption of what has been known as the Manufacturers' Standard of 1901.

It became evident in the past few years that the centre to face and face to face dimensions of all flange fittings, including low pressure, standard pressure and extra heavy pressure, should be established. After considerable work on the part of the M. S. & H. W. F. A. and the A. S. M. E. a standard known as the 1912 U.S. Standard was adopted.

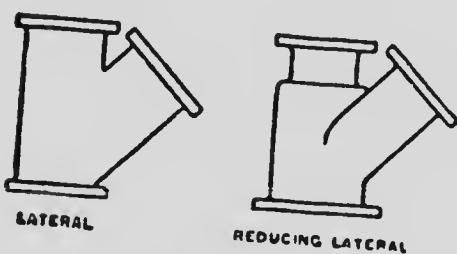

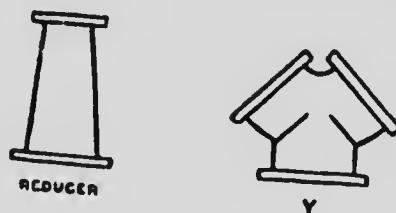

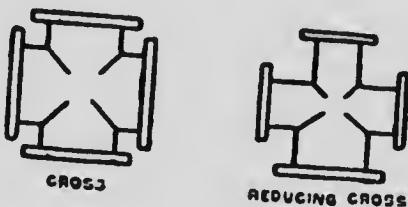

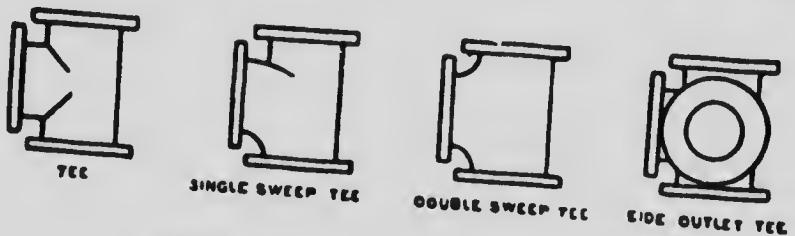

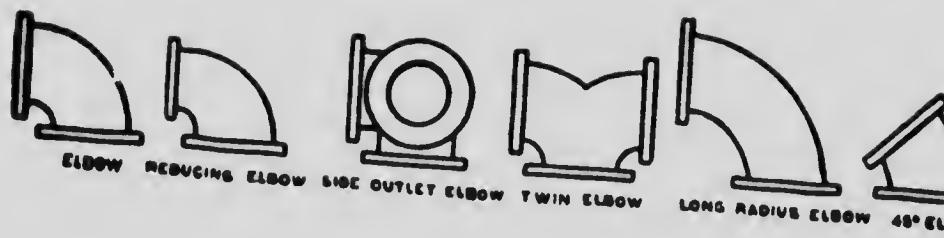

The adoption of this standard opened a discussion among those interested in the subject. It was found that the dimensions presented in the 1912 U.S. Standard differed from the dimensions which had been quite universally used by manufacturers and which covered a large majority of the fittings made.

At a meeting of manufacturers held in New York City, July, 1912, a standard known as the Manufacturers' Standard was adopted by them.

This left the Flange Fitting subject in the unfortunate position of there being two standards. When this condition came before the Committee of the A. S. M. E. an effort was made by this Committee with that of the Manufacturers' Committee to harmonize, if possible, the differences then existing between these two Standards.

After considering the various phases of the subject covering uniformity of design, strength of fitting, strength of bolting as well as the commercial features, a compromise was made.

In this compromise the bolting was increased where it was thought necessary. Additional size flanges were added and the centre to face and face to face dimensions were altered to conform to these requirements.

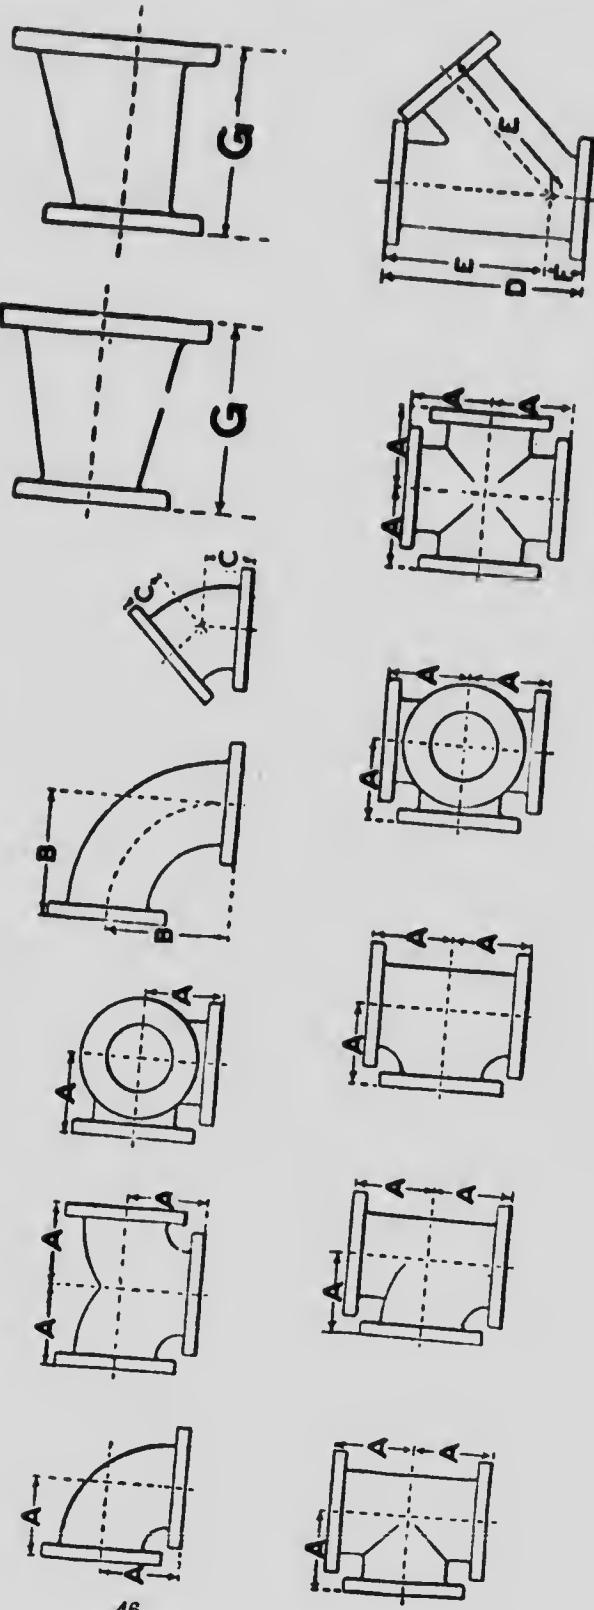

EXPLANATORY NOTES

- (1)—Standard and Extra Heavy Reducing Elbows carry same dimensions centre to face as regular Elbows of largest straight size.
- (2)—Standard and Extra Heavy Tees, Crosses and Laterals, reducing on run only, carry same dimensions face to face as largest straight size.
- (3)—If Flanged Fittings for lower working pressure than 125 pounds are made, they shall conform in all dimensions except thickness of shell to this standard and shall have the guaranteed working pressure cast on each fitting.
Flanges for these fittings must be standard dimensions.
- (4)—Where long radius fittings are specified, it has reference only to Elbows which are made in two centre to face dimensions and to be known as Elbows and Long Radius Elbows, the latter being used only when so specified.
- (5)—All standard weight fittings must be guaranteed for 125 pounds working pressure, and extra heavy fittings for 250 pounds working pressure, and each fitting must have some mark cast on it indicating the maker and guaranteed working steam pressure.
- (6)—All extra heavy fittings and flanges to have a raised surface of 1-16" high inside of bolt holes for gaskets.
Standard weight fittings and flanges to be plain faced.
Bolt holes to be $\frac{1}{8}$ " larger in diameter than bolts.
Bolt holes to straddle centre line.
- (7)—Size of all fittings scheduled indicates inside diameter of ports, except for extra heavy fittings 14" and larger when the port diameter is $\frac{3}{4}$ " smaller than nominal size.
- (8)—The face to face dimensions of Reducers, either straight or eccentric, for all pressures, shall be the same face to face as given in table of dimensions.
- (9)—Square head bolts with hexagonal nuts are recommended.
For bolts, $1\frac{1}{8}$ " diameter and larger, studs with a nut on each end are satisfactory.
Hexagonal nuts for pipe sizes 1" to 46" on 125 pounds standard, and 1" to 16" on 250 pounds standard can be conveniently pulled up with open wrenches of minimum design of heads. Hexagonal nuts for pipe sizes 48" to 100" on 125 pounds, and 18" to 48" on 250 pounds standards can be conveniently pulled up with box wrenches.
- (10)—Twin Elbows, whether straight or reducing, carry same dimensions centre to face and face to face as regular straight size ells and tees.
Side Outlet Elbows and Side Outlet Tees, whether straight or reducing sizes, carry same dimensions centre to face and face to face as regular tees having same reductions.
- (11)—Bull Head Tees or Tees increasing on outlet will have same centre to face and face to face dimensions as a straight fitting of the size of the outlet.
- (12)—Tees and Crosses 16" and down, reducing on the outlet, use the same dimensions as straight sizes of the larger port.
Sizes 18" and up, reducing on the outlet, are made in two lengths depending on the size of the outlet as given in the table of dimensions.
Laterals 16" and down, reducing on the branch, use the same dimensions as straight sizes of the larger port.
Sizes 18" and up, reducing on the branch, are made in two lengths depending on the size of the branch as given in the table of dimensions.
- (13)—The dimensions of reducing flanged fittings are always regulated by the reductions of the outlet or branch. Fittings reducing on the run only, the body pattern will always be used.
Y's are special and are made to suit conditions.
Double sweep tees are not made reducing on the run.
- (14)—STEEL FLANGES, FITTINGS AND VALVES ARE RECOMMENDED FOR SUPERHEATED STEAM.

***LONG BODY PATTERNS** { Are used when outlets are larger than given in the above table, therefore have same dimensions as straight size fittings.

The dimensions of "Reducing Flanged Fittings" are always regulated by the reduction of the outlet. **FITTING REDUCING ON THE RUN ONLY**, the long body pattern will always be used except Double Sweep Tees, on which the reduced end is always longer than the regular fitting. Dimensions on request.

BULL HEADS OR TEES having outlets larger than the run, will be the same length centre to face of all openings as a tee with all openings of the size of the outlet, for example: a 12 x 12 x 18 inch tee will be governed by the dimensions of the 18 inch long body tee—namely, 16 1/2 inches centre to face of all openings and 33 inches face to face.

REDUCING ELBOWS carry same centre to face dimensions as regular elbows of largest straight size.

governed by the dimensions of the 18 inch long body tee—namely, 1 $\frac{1}{2}$ inches face to face.
REDUCING ELBOWS carry same centre to face dimensions as regular elbows of largest straight size.
 33 inches face to face.

STANDARD FLANGED FITTINGS GENERAL DIMENSION-REDUCING LATERALS (ALL DIMENSIONS ARE IN INCHES)

All reducing fittings 1" to 16" inclusive have the same centre to face dimensions as straight size fittings.

\\$

***LONG BODY PATTERNS** { Are used when outlets are larger than given in the above table, therefore they have same dimensions as straight size fittings.

The dimensions of "Reducing Flanged Fittings" are always regulated by the reduction of the outlet.

FITTINGS REDUCING ON THE RUN ONLY, the long body pattern will always be used, except Double Sweep Tees, on which the reduced end is always longer than the regular fitting.

BULL HEADS OR TEES having outlet larger than the run, will be the same length centre to face of all openings as a tee with all openings of the size of the outlet. For example: a 12 x 12 x 16 inch tee will be governed by the dimensions of the 16 inch long body tee—namely, 16 1/2 inches centre to face of all openings and 33 inches face to face.

REDUCING ELBOWS carry same centre to face dimension as regular elbow of largest straight size.

These Drilling Templates are in multiples of four, so that fittings may be made to face in any quarter, and bolt holes straddle the centre line.

Bolt holes are drilled $\frac{1}{8}$ inch larger than nominal diameter of bolts.

THE G. A. ROBERTSON CULLY
Manufactured Solely by
CANADA IRON FOUNDRIES LIMITED

The G. A. Robertson Catch Basin and Gully, manufactured solely by Canada Iron Foundries, Limited, has many points of superiority over any other now in use.

1. The lipped inlet prevents ice from accumulating on the inside.
2. The trap is set in a groove and is well below the outlet. The escape of sewer gas is therefore prevented.
3. The form is tapering and the flanges at the joints are inside. The surface is left plain and the frost has no effect upon it.
4. A handle attached to the plug in the top of the trap always remains in the gully and enables anyone to clear it of storm water in an instant, should it become blocked on the lower side with sand, etc., which often occurs during thunderstorms and heavy rains.

CAPACITY OF CAST IRON PIPE

Table No. 42

Table of contents in cubic feet and Imperial and United States gallons, and weight of water (at 62° pounds per cubic foot) contained in one foot lengths of different internal diameters of pipe, and square root of diameter in feet.

For larger diameters than those given, take one-half the size required from the table, and multiply by 4; so also with gallons and weights.

NOTES

- An Imperial Gallon = 277.274 cubic inches = 10 lbs. at 62° F.
- A United States Gallon = 231 cubic inches = 8.3356 lbs. at 62° F.
- 6.2321 Imperial Gallons = 1 cubic foot = 7.4805 U.S. Gallons.
- 1 Imperial Gallon = 1.20032 U.S. Gallons.

APPLICATION OF THESE TABLES

These tables may be used to ascertain, approximately, (1) the maximum discharging capacity of a pipe under a given discharge and head; (2) the loss of pressure through a pipe from the reduction of pressure. Velocity and entrance head are not included in the figures for frictional head and may be omitted for ordinary mains, but should be added for high velocity.

(1) For example, what is the maximum discharge from 7.500 feet of 8-inch straight cast iron pipe under 160 ft. head? The frictional head per 1,000 feet is found by dividing 160 by 7.5, which gives 21.33. In the column 8-inch pipe, the closest frictional head to 21.33 is 21.74, and the table shows that an 8-inch pipe under a 21.74 feet head will discharge 833 Imperial gallons, or 1,000 U.S. gallons, per minute.

(2) For example, what diameter of pipe will be required to deliver 1,583.333 Imperial gallons, or 1,900,000 U.S. gallons, in 24 hours through a line 25.000 feet long under 150 ft. head?

The frictional head per 1,000 feet, i.e., 150 divided by 25, is 6. The nearest discharge in the table is 1,630.000 Imperial gallons, or 2,016,000 U.S. gallons, in 24 hours, and the table shows that a 12-inch pipe under 5.74 frictional head will give this.

fractional head per 1,000 feet is found by dividing 160 by 7.5, which gives 21.33. In the column 8-inch pipe, the closest frictional head to 21.33 is 21.74, and the table shows that an 8-inch pipe under a 21.74 feet head will discharge 833 Imperial gallons, or 1,000 U.S. gallons, per minute.

(2) For example, what diameter of pipe will be required to deliver 1,583.333 Imperial gallons, or 1,900,000 U.S. gallons, in 24 hours through a line 25.000 feet long under 150 ft. head?

The frictional head per 1,000 feet, i.e., 150 divided by 25, is 6. The nearest discharge in the table is 1,630.000 Imperial gallons, or 2,016,000 U.S. gallons, in 24 hours, and the table shows that a 12-inch pipe under 5.74 frictional head will give this.

APPLICATION OF THESE TABLES—Continued

(3) For example, what loss of pressure due to friction will occur in the delivery of 750 Imperial gallons, or 900 U.S. gallons, per minute through a 10-inch pipe 4,000 feet long to a point 100 feet above the pump—or, rather, what extra head will it be necessary to calculate upon in consequence of this friction loss in order to deliver this quantity under these conditions? The table shows that the frictional head of 10-inch pipe delivering 750 Imperial gallons, or 900

U.S. gallons per minute, is 5.93 ft. per 1,000 ft. head or 23.72 ft. for 10 ft. of pipe. It will therefore be necessary to provide for a pressure due to a head of 123.72 ft.

(4) For example, if the frictional loss is 2½ lbs. pressure in 1,000 ft. of 10-inch pipe, the table shows a flow of 750 Imperial gallons, or 900 U.S. gallons, per minute. If the frictional loss amounted to 4½ lbs., there would be a flow of 1,000 Imperial gallons, or 1200 U.S. gallons, per minute.

FRICTION HEADS FOR ELBOWS

Heads required to overcome the resistance of ninety-degree circular bends.

Table No. 45

Velocity in Feet per Second	Radius of Bend in Diameters of Pipe							
	0.5	0.75	1.00	1.25	1.5	2.0	3.0	5.0
Head, in Feet

8	.994	.288	.114	.104	.086	.074	.069	.065
9	1.260	.365	182	.132	.108	.094	.086	.082
10	1.550	.450	.225	.163	.134	.116	.106	.101
12	2.340	.649	.324	.236	.192	.167	.153	.145

The above table has been calculated by the well known Weisbach formula, for pipe or bends of circular cross section, i. e., round water pipe specials.

Let R = radius of curve or bend in inches

r = radius of section of pipe in inches

K = coefficient of resistance

v = velocity of flow in feet per second

a° = angle embraced by curve or bend (a right angle bend = 90°)

h = friction head in feet or decimal of root

g = acceleration due to gravity = 32.2

Then
$$K = 0.131 + 1.847 \left\{ \frac{r}{R} \right\} \frac{7}{2}$$

And
$$h = K \frac{v^2}{2g} \times \frac{a^\circ}{180}$$

Suppose a 90° bend of circular cross section, 20 inches diameter ($r = 10$) and 25 inches radius of curvature ($= R$) what friction head is developed by a velocity of flow of 27,896 feet per second?

$$K = 0.131 + 1.847 \left\{ \frac{10}{25} \right\} \frac{7}{2} = 0.206$$

And
$$h = .206 \frac{27,896^2}{64.4} \times \frac{90}{180} = 0.01245 \text{ feet}$$
