12X	16X	20X	✓	24X	28X	32X

The copy filmed here has been reproduced thanks to the generosity of:

Library,  
National Museums of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol → (meaning "CONTINUED"), or the symbol ▽ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Bibliothèque  
Musées Nationaux du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole → signifie "A SUIVRE", le symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

## PREFACE TO THE SECOND VOLUME.

(BY THE EDITOR.)

THE present volume contains, as announced in the Preface to the first, the Systematic Memoirs and Miscellaneous Descriptions of Plants; and to these have been added a number of short contributions to different publications, together with notices of the assistance acknowledged to have been afforded by the Author to various writers, wherever the nature of the assistance is distinctly pointed out.

In Pritzel's 'Thesaurus Literaturæ Botanicæ,' p. 35, at the end of the enumeration of Mr. Brown's works, it is stated, "Robertus Brown dedit præterea descriptiones ultimi (an etiam tertii?) Fasciculi Plantarum Cryptogamicarum Dicksonianarum, neenon eas tertii voluminis Plant. Coromand. Roxburghii, et curavit Editionem alteram Horti Kewensis a classe XII ad XXIV." To all the works here mentioned there is no doubt that Mr. Brown contributed valuable assistance, but of different kinds and in different degrees. The fourth fasciculus of Dickson's 'Plantæ Cryptogamicæ,' but not, I believe, the third, was largely indebted to him; but it would be difficult, if not impossible, to determine what portions of the text were actually furnished by him. To the publication of the third volume of Roxburgh's 'Coromandel Plants' he gave a general superin-

tendance, but in dealing with the text confined himself to slight verbal corrections. One generic name, that of *Gynocardia*, was substituted by him for the barbarous name, *Chaulmoogra*, adopted by Roxburgh, and this alteration has met with general acquiescence. On the portion of the second edition of the 'Hortus Kewensis' printed after the death of Dryander, in 1810, he bestowed the same attention which had been devoted by Dryander to the earlier portion, and by Solander to the first edition, adding largely to the elucidation of certain Families and Genera. These contributions will be found extracted in the present volume.

In the list of Mr. Brown's works given by Pritzel there occur two: "No. 1365†, Of three species of the natural order Orchideæ, Lond. 1817, 4, 8 pp. 2 tab. col.;" and No. 1366†, Select Orchideæ, ib. 4, 2 pp." both extracted from 'The Journal of Science and the Arts,' which do not properly belong to Mr. Brown, but formed part of a series of papers on Cape *Orchideæ*, by Mr. Bellenden Ker. These, of course, have not been admitted into the present edition.

I have only, in addition, to return my best thanks to my friends, Mr. Carruthers, and the Rev. W. W. Newbould, for much valuable assistance in reading and comparing the proof-sheets; and to Mr. Carruthers, in particular, for the preparation of the elaborate Index of Names of Plants appended to the present volume.

JOHN J. BENNETT.

ON THE  
NATURAL ORDER OF PLANTS

CALLED  
PROTEACEÆ.

BY  
ROBERT BROWN, LIB. L.S.

(READ JAN. 17TH, 1809.)

[Extracted from the 'Transactions' of the Linnean Society of London,  
Vol. X, pp. 15—226.]

LONDON.

1810.

)

ON THE  
PROTEACEÆ OF JUSSIEU.

---

THE Linnean system of botany, though confessedly <sup>[15]</sup> artificial, has not only contributed more than all others to facilitate the knowledge of species, but, by constantly directing the attention to those essential parts of the flower on which it is founded, has made us acquainted with more of their important modifications than we probably should have known, had it not been generally adopted, and has thus laid a more solid foundation for the establishment of a natural arrangement, the superior importance of which no one has been more fully impressed with than Linnæus himself.

There are still, however, certain circumstances respecting the stamens and pistilla, which appear to me to have been much less attended to than they deserve, both by Linnæus and succeeding botanists. What I chiefly allude to is the state of these organs before the expansion of the flower. The utility of ascertaining the internal condition of the ovarium before fecundation will hardly be called in question, now that the immortal works of Gaertner and Jussieu have demonstrated the necessity of minutely studying the fruits of plants in attempting to arrange them according to the sum of their affinities, as in many cases the true nature of the ripe fruit, especially with respect to the placentation of the seeds, can only be determined by this means. Its importance is indeed expressly inculcated by many botanists, who, however, have frequently neglected it in practice : <sup>[16]</sup> nor do I find any one who has steadily kept it in view, except Aubert Du Petit-Thouars in his excellent work on

the plants of Madagascar and the Isles of France and Bourbon.

The bursting of the antheræ has, it is true, been generally observed, and many of its most unusual modes have been introduced into the characters of genera ; but the examination of these organs, at a still earlier period, has been universally neglected ; and hence the very imperfect knowledge which, even now, is possessed of their real nature in two of the most remarkable families of plants, the Orchideæ and Asclepiadæ.

Examples of the great advantage of observing the antheræ in this early stage will hereafter be given in my general remarks on the order which is the proper subject of this essay. But I trust I shall be pardoned for here introducing some account of their structure in Asclepiadæ, as it will enable me not only to bring forward the most striking proof of the importance of this consideration with which I am acquainted, but also, as I apprehend, to decide a question which has long occupied, and continues to divide, the most celebrated botanists.

The point in dispute is whether this order, comprehending Asclepias, Cynanchum, Pergularia, Stapelia, and several genera, at present confounded with these, ought to be referred to Pentandria or Gynandria, and, if to the latter, whether the antheræ are to be considered as five or ten ; all of which opinions have had advocates of the greatest name in the science.

According to Linnaeus, Jussieu, and Richard, they belong to Pentandria.

Linnæus has assigned no reason for his opinion, which, however, it appears he retained after he became acquainted with the observations of Jacquin and Rottboell ; but it is <sup>more</sup> probable he was induced to adopt it more from the consideration of the close analogy these plants have with the manifestly pentandrous Apocineæ, than from regarding them as strictly referable to this class ; for, in his natural generic characters of Asclepias and Pergularia, he very clearly describes both these genera as gynandrous.

Jussieu has entered more fully into the subject, but seems

also to have been chiefly guided by this analogy and the observations of others; as he concludes by expressing his doubts, respecting both the origin and use of the parts.

Richard, whose description of these organs I find in Persoon's Synopsis, has indeed come nearer to the solution of the question; his account, however, of the origin of the lateral processes hereafter mentioned, proves that this description was not altogether formed on actual observation.

Jacquin, the first botanist that submitted these plants to minute examination, and whose figures well illustrate most points of their structure, has adopted a very different opinion, referring them to Gynandria, in which he is followed by Koelreuter, Rottboell, and Cavanilles, all of whom likewise agree with him in considering them as decandrous; while Dr. Smith, in his late valuable Introduction to Botany, who conceives that "no plants can be more truly gynandrous," regards them as having only five antheræ. And lastly Desfontaines supposes the five glands of the stigma to be the true antheræ, considering the attached masses of pollen as mere appendages to these.

All the authors who thus refer them to Gynandria seem quite confident in the justness of their views; and yet the inspection of a single flower bud overturns, as it appears to me, with irresistible evidence, the conclusion they had formed from premises apparently so satisfactory.

My attention, while in New Holland, having been much engaged by the plants of this family, the species in that continent being both numerous and with difficulty reducible to established genera: I there observed the following facts concerning them, all of which I have, since my return to England, confirmed by the examination of different species of the same tribe.

The observations of Jacquin on this subject being generally known, it must be unnecessary to enter into a minute description of those organs which are well exhibited by his figures in every respect, except as to the origin of the supposed antheræ.

If a flower bud of any plant of this family, while scarcely

half the size it attains immediately before expansion, be carefully examined, it will be found that the polleniferous sacs, as they are termed by Jacquin and his followers, in which they suppose the antheræ to be merely immersed, are really the organs by which the fecundating matter is secreted : for at this period they are perfectly closed, and consequently all communication cut off between the stigma and their contents now consisting of a turbid fluid or pulpy mass.\* If the stigma be at the same time observed, the gland-like bodies which originate in its grooved angles are already visible ; but, instead of having the cartilaginous or horny texture which they at length acquire, are as yet semi-fluid, and of hardly a determinate form. Near the base of each side of these grooves a more superficial depression is observable, which, though in some cases extremely short, is in others of considerable length, and generally forms a right angle with the corresponding groove. In these depressions, the processes by which, at a more advanced stage, the contents of the antheræ are connected with the stigma, are immersed, and at this period they are found to be semi-fluid. By degrees the glands, as well as their lateral processes, acquire a firmer consistence, and the inferior or outer extremity of each of the processes, being extended beyond <sup>10</sup> its depression or furrow, on the bursting of the opposite cell of the corresponding anthera, firmly attaches itself to its contents, now become a regular mass of a waxy consistence.

If the accuracy of this statement be admitted, it will probably be allowed that the *Asclepiadæ* cannot be regarded as gynandrous, especially in the sense in which they are so considered by botanists ; but lest it should not be thought completely satisfactory, it may be added, that in a still earlier stage of the flower bud I have found the fecundating matter already secreted in the cells of the antheræ, while the glands of the stigma, as well as their processes, were absolutely invisible.

As to the question of their being pentandrous or decandrous, every analogy must lead us to refer them to the former class ; nor, indeed, have they, when not considered

xy con-

An economy, in many respects similar to that now described, obtains also in *Orchidææ*; in which, however, the processes connecting the antheræ with the stigma, where they exist, are in many cases derived from the masses of pollen themselves; but in others they as certainly originate from the stigma, or its glandular appendage.

The result of my examination of these two interesting orders of plants I hope hereafter to submit to the Society; and I now proceed to the proper subject of the present paper.

The natural order of *PROTEÆ*, or, as it is less exceptionably called, *PROTEACEÆ*, was first established in the *Genera Plantarum* of the celebrated Jussieu; and the description there prefixed to it will, with a few alterations, still apply to the order, now that it has received so many additions, not only in species, but in very distinct genera, several of which were first published by Dr. Smith, in <sup>120</sup> the 4th vol. of the Society's *Transactions*, and others are in the present paper submitted to the consideration of botanists.

The general description and definition of the order will be most advantageously placed at the head of its systematic arrangement; before entering upon which, I shall offer some remarks on its geographical distribution, and likewise on such modifications of structure in the different organs as appear to be of the greatest importance in indicating or characterising genera.

The geography of plants being as yet in its infancy, the smallest addition to our knowledge of a subject which promises to become of considerable importance, will probably be received with indulgence; and in this persuasion I venture to make the following observations on the order before us. In the first place, it is remarkable that the *PROTEACEÆ* are almost entirely confined to the southern hemisphere. This observation originated with Mr. Dryander, and the few exceptions hitherto known to it, occur considerably within the tropic. The fact is the more

it will  
be re-  
which  
uld not  
ed, that  
nd the  
of the  
as their

decan-  
to the  
sidered

deserving of notice, as their diffusion is very extensive in the southern hemisphere, not merely in latitude and longitude, but also in elevation; for they are not only found to exist in all the great southern continents, but seem to be generally, though very unequally, spread over their different regions: they have been observed also in the larger islands of New Zealand and New Caledonia; but hitherto neither in any of the lesser ones, nor in Madagascar. As in America, they have been found in Terra del Fuego, in Chili, Peru, and even Guiana, it is reasonable to conclude that the intermediate regions are not entirely destitute of them. But with respect to this continent, it may be observed, that the number of species seems to be comparatively small, their organization but little varied; and further, that they have a much greater affinity with those  
<sup>21</sup> of New Holland than of Africa.

Of the botany of South Africa, scarce anything is known, except that of the Cape of Good Hope, where this family occurs in the greatest abundance and variety; but even from the single fact of a genuine species of *Protea* having been found in Abyssinia by Bruce, it may be presumed, that in some degree they are also spread over this continent.

With the shores, at least, of New Holland, under which I include Van Diemen's Island, we are now somewhat better acquainted, and in every known part of these, Proteaceæ have been met with.

But it appears that, both in Africa and New Holland, the great mass of the order exists about the latitude of the Cape of Good Hope; in which parallel it forms a striking feature in the vegetation of both continents.

What I am about to advance respecting the probable distribution of this family in New Holland, must be very cautiously received; as it is in fact chiefly deduced from the remarks I have myself made in Captain Flinders's Voyage, and subsequently during my short stay in the settlements of New South Wales and Van Diemen's Island, aided by what was long ago ascertained by Sir Joseph Banks, and by a very transitory inspection of an herbarium collected on the west coast, chiefly in the neighbourhood

of Shark's Bay, by the botanists attached to the expedition of Captain Baudin.

From knowledge so acquired I am inclined to hazard the following observations.

The mass of the order, though extending through the whole of the parallel already mentioned, is by no means equal in every part of it; but on the south-west coast forms a more decided feature in the vegetation of the country, and contains a far greater number of species than on the east:—and in that part of the south coast, which was first examined by Captain Flinders, it seems to be more scanty than at either of the extremes.

On the west coast also, the species upon the whole are more similar to those of Africa than on the east, where they bear a somewhat greater resemblance to the American portion of the order.

From the parallel of the mass, the order diminishes in both directions; but the diminution towards the north is probably more rapid on the east than on the west coast.

Within the tropic, on the east coast, no genera have hitherto been observed, which are not also found beyond it; unless that section of *Grevillea*, which I have called *Cyclopterae*, be considered as a genus. Whereas at the southern limit of the order several genera make their appearance, which do not occur in its chief parallel.

The most numerous genera are also the most widely diffused. Thus *Grevillea*, *Hakea*, *Banksia*, and *Persoonia*, extensive in species in the order in which they are here mentioned, are spread nearly in the same proportion; and they are likewise the only genera that have as yet been observed within the tropic.

Of such of the remaining genera, as consist of several species, some, as *Isopogon*, *Petrophila*, *Conospermum*, and *Lambertia*, are found in every part of the principal parallel, but hardly exist beyond it. Others, as *Josephia*<sup>1</sup> and *Synaphea*, equally limited to this parallel, have been observed only towards its western extremity; while *Embothrium*

<sup>1</sup> Subsequently in this paper altered to *Dryandra*. Confer *Prod. Fl. Nov. Holl.* 1, p. 396.—EDIT.

(comprehending for the present under this name all the many-seeded plants of the order),<sup>1</sup> which is chiefly found on the east coast, and makes very little progress towards the west, advances to the utmost limit of south latitude, and there ascends to the summits of the highest mountains.

[23] Genera consisting of one or very few species, and which exhibit generally the most remarkable deviations from the usual structure of the order, are the most local, and are found either in the principal parallel, or in the highest latitude.

The range of species in the whole of the order seems to be very limited ; and the few cases which may be considered as exceptions to this, occur in the most extensive genera, and in such of their species as are most strictly natives of the shores. Thus *Banksia integrifolia*, which grows more within the influence of the sea than any plant of the order, is probably also the most widely extended, at least in one direction, being found within the tropic, and in as high a latitude as 40°. It is remarkable, however, that with so considerable a range in latitude, its extension in longitude is comparatively small : and it is still more worthy of notice, that no species of this family has been found common to the eastern and western shores of New Holland.

The celebrated traveller Humboldt is the first who has expressly pointed out a remarkable difference in the distribution of the species of plants.

He observes that, while the greater number grow irregularly scattered and mixed with each other, there are some which form considerable masses, or even extensive tracts, to the nearly absolute exclusion of other species. Of plants growing thus in society, the greater number occur in the temperate zones ; and of these, the most decided instances will readily present themselves to every botanist. I venture to add, that such as exist within the tropic, are found, either at considerable heights or on the sea-shores.

To this class very few of the Proteaceæ can be said to

<sup>1</sup> In the systematic part of the present Memoir, the Australian species of *Embothrium* are separated under the generic names of *Knightia*, *Lomatia*, and *Stenocarpus*.—EDIT.

species of  
*omatia*, and

belong. *Protea argentea* of Linnaeus is the most striking example among the African species; and my friend Mr. <sup>24</sup> Ferdinand Bauer has observed a similar tendency in *Protea mellifera*.

Among the New Holland species, *Banksia speciosa* is the sole instance, and even that only in certain circumstances, of this manner of growth.

The favourite station of Proteaceæ is in dry stony exposed places, especially near the shores, where they occur also, though more rarely, in loose sand. Scarcely any of them require shelter, and none a good soil. A few are found in wet bogs, or even in shallow pools of fresh water; and one, the *Embothrium ferrugineum* of Cavanilles, grows, according to him, in salt marshes.

Respecting the height to which plants of this order ascend, a few facts are already known. The authors of the Flora Peruviana mention, in general terms, several species as being alpine; and Humboldt, in his valuable Chart of Aequinoctial Botany, has given the mean height of *Embothrium emarginatum* about 9300 feet, assigning it a range of only 300 feet. On the summits of the mountains of Van Diemen's Island, in about 43° south latitude, at the computed height of about 4000 feet, I have found species of *Embothrium*, as well as other genera hitherto observed in no other situation. *Embothrium*, however, as it is the most southern genus of any extent, so it is also, as might have been presumed, the most alpine of the family.

Two genera only of this order are found in more than one continent: *Rhopala*, the most northern genus, which, though chiefly occurring in America, is to be met with also in Cochin-China and in the Malay Archipelago; and *Embothrium*, the most southern genus of any extent, is common to New Holland and America.

From this account of the geographical distribution of <sup>25</sup> the Proteaceæ, I proceed to make some general remarks on the structure and modifications of their different parts. The order, which consists of shrubs of the most rigid nature, or of trees of moderate size, contains also one herbaceous plant, my *Synphionema paludosum*, which, how-

ever, except in this respect and in the union of the tops of its filaments, does not remarkably differ from the usual structure of the family.

The pubescence, which is very general in the order, consists either of a short and in many cases nearly impalpable tomentum, or of soft hairs which are either spreading, close pressed, or somewhat crisped, generally simple, but in some genera fixed by the middle, and in a very few cases glandular.

The existence or absence of pubescence in the adult leaves cannot always be depended upon in distinguishing species; but the short tomentum, especially of their under surface, is of greater consequence than the spreading hairs. In the bractæ more reliance may be placed on it, and in the different parts of the flower I have never hesitated to employ it in my specific characters. In the calyx I have even derived the greatest advantage in some difficult genera, especially *Serruria*, from attending to its differences in direction.

Mr. Salisbury has introduced the pubescence of fruit into several of his generic characters, and in some I think with evident advantage, but in such only as where from its abundance and length it performs a function of manifest importance in assisting dissemination: hence I conceive it may be safely admitted into the characters of *Protea* and *Isopogon*; but I can perceive no advantage whatever in employing it in those of *Serruria* and *Spatalla*. For this reason too it ought not to be used in the capsular or drupaceous genera, in which indeed experience proves it to be of no further moment than in distinguishing species.

Dr. Smith has given it as his opinion, that from the disposition of leaves in New Holland plants no conclusion can safely be drawn as to their genera. This remark however appears to me only applicable to certain families, or rather genera; for in many tribes the plants of that country are altogether as constant in their leaves as in any other part of the world. In proof of this, it may be sufficient to mention the order Rubiaceæ; and there are many others in which I find nothing at all remarkable in this respect.

As to Proteaceæ, it must be acknowledged that in *Banksia* both verticillated and scattered leaves occur; but the leaves constantly in threes in *Lambertia* seems to me a circumstance of even greater importance than the number of flowers in the involucrum; and the opposite leaves of *Xylomelum* distinguish it at once both from *Rhopala* and *Hakea*.

Although the form and divisions of leaves in the order are variable in no common degree, yet there are certain genera, both among those of Africa and New Holland, which the leaves even in these respects assist in indicating. Thus, in that genus to which I have applied the name of *Protea* (the Erodendrum of Mr. Salisbury), and I believe also in my *Leucadendron*, there is no instance of a divided or toothed leaf; thus also the leaves of *Spatalla* are filiform and undivided, and those of *Serruria* filiform and almost always pinnatifid. Their dichotomous divisions in *Simsia* and *Franklandia* are still more characteristic; and their division and remarkable reticulation readily distinguish *Synaphea* from *Conospermum*.

The inflorescence in Proteaceæ, whatever use botanists may think proper to make of it in their generic characters, is of undoubtedly importance in determining genera, and even in the primary division of the order it appears to be of nearly equal consequence with the fruit itself; for, in dividing the order into two sections from the structure of the ovary, it will be found that while all the single-seeded genera have each flower subtended by a proper bractea, or more rarely are without one, those with two or more seeds have, with very few exceptions, the flowers of their spikes or clusters disposed in pairs, each pair being furnished with only one bractea common to both flowers: it may also be observed that all the American and two thirds of the New Holland species have this mode of inflorescence, while only one instance of it occurs in Africa.

The single envelope of the stamens and pistillum in Proteaceæ I have, with Jussieu, denominated CALYX, chiefly because the stamens, of equal number with its laciniae, are constantly opposite to them, and from the close analogy

subsisting between this family and that of Thymeleæ, in which I believe the greater number of botanists will allow that this envelope is really calyx: and as this latter argument may be considered as the stronger, I shall endeavour to establish the identity of this organ in these two families. In several of the Thymeleæ, especially in *Pimelea*, the lower part of the tube of the calyx is, as it were, jointed with the upper; after the falling off of which, it remains surrounding the fruit: this is also the case in several genera of Proteaceæ, as in *Adenanthes* of Labillardière, in *Isopogon*, in *Grevillea Chrysodendron*, and still more remarkably in *Franklandia*, in which the persistent tube becomes indurated and even nearly woody, a change surely not likely to take place in a genuine corolla. But though I have thus adopted the language of Jussieu, I am decidedly of opinion that, in all families having a single <sup>28]</sup> envelope, it will be still better to call it perianthium or perigonium, which latter term was proposed by Ehrhart, and is adopted by Decandolle.

A circumstance meriting the attention of the theoretical botanist, respecting the calyx in this order, is its invariable division into four leaves or segments; for the single exception noted by Linnæus in his description of the male flowers of *Brabejum*, he himself seems afterwards to have distrusted, from the manner in which he has introduced it into the amended generic character given in the Mantissa; and I may add, that in nearly 400 species of the order, which I have examined, I have not met with a single exception to this rule.

With this uncommon constancy in point of number, it is remarkable that there is, in the whole order, a strong tendency to irregularity in form, the various kinds of which are of great importance in characterising genera.

Before the expansion of the calyx the margins of its segments are applied to each other; and from the unequal degrees of cohesion in many cases subsisting among them after expansion, several kinds of irregularity arise. I am not sure that any term has been contrived for this manner of aestivation, except it be the *aestivatio valvata* of Linnæus;

Thymelææ, tanists will this latter shall endea- these two in *Pimelea*, as it were, of which, it he case in of Labillar- , and still persistent y, a change rolla. But ssieu, I am g a single erianthium by Ehrhart,

theoretical s invariable ngle except- the male rds to have produced it Mantissa ; the order, in a single mber, it is strong ten- of which of its seg- e unequal ong them- se. I am is manner Linnaeus ;

but as he has not defined it, and as his commentator Reuss has given the very different aestivation of grasses as an example, I have, in introducing this circumstance into the general description of the order, specified it at length.

From the colour of the calyx, many genera of Proteaceæ are indicated with tolerable certainty. Thus *Synaphea* is distinguished from *Conospermum* by its yellow flowers; and no instance of yellow flowers has been met with in the numerous genera *Serruria* and *Spatalla*, nor any of purple in *Leucadendron*. In some genera, however, as in *Banksia*,<sup>129</sup> and *Isopogon*, it is evidently of very little importance.

The fleshy or scale-like bodies, which surround the ovarium in the greater number of plants of this family, are in many cases so manifestly secreting organs, that it is surprising Mr. Salisbury should hesitate in considering them as nectaria, and denominate them calli; a term which excludes the idea of secretion. But whatever their functions may be, great assistance may certainly be derived from their various modifications, in distinguishing genera. Their importance however in this respect, like that of all other parts, not only in this, but, as I apprehend, in every natural family, is very unequal, and in some cases seems to be entirely lost. Thus, in the genus *Leucadendron* as it is here constituted, they are wanting in several species, and in some I am inclined to think exist only in the males.

In most of the regular-flowered genera they are four in number, and alternate with the leaves or laciniae of the calyx. In these genera they are also generally in the form of succulent scales, distinct, or more rarely cohering at their base, and in a very few instances adhering to the calyx; but in *Persoonia* they are nearly round and fleshy, and in *Bellendena*, *Sympionema*, *Simsia*, *Agastachya*, *Petrophila*, and *Isopogon*, they are entirely wanting.

In the irregular-flowered genera with two or many seeds their number is less than four, in most cases only one exists, in a few others three, and in some none.

Varieties in the structure or apparent origin of the STAMINA, afford, as might be expected, important generic characters. Their usual insertion in the order is in the

concave tops of the laciniæ of the calyx; all considerable deviations from which may safely be employed in characterising genera. In this way *Rhopala*, *Xylomelum*, and *Lambertia* are readily distinguished from *Embothrium*, *Grevillea*, and *Hakea*; and thus also *Persoonia* and *Brahejum* remarkably differ from *Grevillea*; while *Bellendena* differs from all others in having its stamens distinct from the calyx, affording however an indication of the real origin of these organs in the whole family.

The deviations from the usual structure of ANTHERÆ in this order are not many; but some of them are of so singular a nature as to constitute the essential characters of the genera in which they take place. These genera are *Simsia*, *Conospermum*, and *Synaphea*, all of which are most truly syngenesious; for not only do their antheræ firmly cohere together, but the corresponding lobes of these being, when considered separately, entirely open, are so applied to each other as to form but one cell, without a trace of any intermediate membrane. In *Simsia* the four antheræ are perfect, each consisting, as in the rest of the order, of two lobes, and therefore the whole before bursting constitute four cells. Whereas in *Conospermum* and *Synaphea* one filament is entirely barren, the two lateral ones have each a single-lobed anthera, and the fourth alone is perfect: hence before bursting the whole form only two cells.

This remarkable structure, which can only be ascertained before the opening of the calyx, necessarily escaped Dr. Smith in describing his *Conospermum*, for I conclude he had only the expanded flower before him, and the appearance of the antheræ in this state after their separation justifies him in referring the genus to Tetrandria: but according to the view now given of its structure, it can have no other pretension to a place in this class than its belonging to Proteaceæ; and the order Syngnesia Monogamia being abolished, it must be referred to Triandria.

The only remaining anomaly in these parts occurs in *Franklandia*, and consists in the anthera, or rather that portion of the filament on which it is fixed, adhering to the calyx through its whole length.

The figure of the POLLEN has been attended to by a few theoretical, but by hardly any practical botanists; yet I am inclined to think, not only from its consideration in this family, but in many others, that it may be consulted with advantage in fixing our notions of the limits of genera: and though its minuteness may perhaps always exclude it from a place in generic characters, yet it well deserves, to use the words of Linnæus when speaking of habit, to be "occulte consulendum."

Its usual figure in the order is triangular with secreting angles, a beautiful contrivance for insuring impregnation in a tribe, in which, from the very scanty, or in many cases apparent want of secretion by the stigma, it must otherwise have been very uncertain; for by this form and secretion, as well as by the singular œconomy of the calyx, it remains so long in contact with the stigma, as probably to compensate for the somewhat defective structure of that organ.

From this figure the principal deviation is in the extensive genera *Banksia* and *Josephia*, in all of which it is elliptical or oblong, and either straight or bent into a semi-lunar form; and in *Franklandia* and *Aulax*, where it is spherical. The only remaining exception with which I am acquainted is the original *Embothrium* of Forster, his *E. coccineum*, in which, as in *Banksia*, it is oblong; a circumstance that, together with the more important character of a regular club-shaped stigma, and some other differences, has determined me to separate it from all the other species of *Embothrium*, except *E. lanceolatum* of Flora Peruviana, whose pollen however remains to be examined.

The external modifications of the OVARIUM must be very cautiously used in the generic characters of this family; <sup>as</sup> even its being sessile or pedicellated is not always of sufficient importance, though I think Mr. Salisbury has done well in introducing it into his characters of *Serruria* and *Spatalla*, in both which genera I had overlooked it before the publication of his Essay.

Its internal structure, which ought always to be ascertained, will be found of the greatest importance in most

cases, but fails in *Persoonia*, the species of which differ in having one or two seeds : it would seem however, in this case, that an irregularity in a point of such importance could not take place unaccompanied with other anomalies in the same organ, and accordingly such are found to exist in this genus, and will be mentioned when treating of the fruit.

Besides number, the insertion of the ovula is also to be attended to ; for though this may generally be presumed from the situation of the radicula in the ripe seed, yet to this criterion there are several exceptions, even in the present order : thus, while the radicula constantly points downward in the whole of the order, the insertion of the ovulum is in many cases at the top or side of the cell of the ovarium. My observations on this subject are as yet incomplete ; but, from those that I have made, I am inclined to think such differences will be connected with genera, or rather perhaps with particular kinds of fruit. Thus I conjecture, in *Leucospermum*, *Mimetes*, *Nivenia*, and *Spatalla*, the insertion to be uniformly lateral.

The STYLE, though not subject to much variety in this family, will be found in a few cases to furnish generic characters. Thus in *Protea*, strictly so called, the persistent subulate style forms an important part of its character : and the persistency of the whole of the style in the greater number of species of *Grevillea* will probably be used by future botanists in distinguishing them from that remarkable section of the genus, which I have at present united with them and called *Cyclopterae*. Its length also, when compared with that of the calyx, seems in some cases to be of importance, as in distinguishing *Adenantheros* from *Spatalla* ; but in general this circumstance can hardly be had recourse to except in specific characters.

The form of the STIGMA is in many cases of considerable importance in characterising genera, a fact which could not escape the penetration of Dr. Smith when establishing his new genera of this order : thus its conical papilla in his *Conchium* (the *Hakea* of Schrader) will in many, though certainly not in all cases, distinguish it from *Grevillea* : but

its form in both these genera will readily serve to separate them from *Xylomelum* and *Rhopala*; and thus also *Spatalla* remarkably differs from *Adenanthes*. Upon the whole, however, it seems that its obliquity is of greater importance than its form; for this, when existing in any great degree, is generally accompanied with a corresponding irregularity in the calyx: but as this irregularity is produced for the purpose of bringing all the antheræ into contact with the stigma, so its obliquity in the dioiceous genera *Leucadendron* and *Aulax* is not attended with so great a degree of irregularity, which would here serve no end, impregnation depending on the pollen of different individuals, to insure which the surface of the stigma in these genera is rough with papulae; a circumstance that, together with its form, readily distinguishes them from all others of the order.

In *Synaphea*, the stigma or summit of the style inosculates with the divisions of the barren filament, which in some species appear beyond it in horn-like processes, but in others are entirely lost in its substance. I am acquainted with nothing like this in the whole vegetable kingdom; and such a singularity alone, when occurring in several <sup>34</sup> species, would have determined me to separate these plants from *Conospermum*: but being also accompanied by other remarkable differences, both of structure and appearance, no genus, I apprehend, can be better founded than this.

That the opinion of Christian Knaut and Vaillant respecting the non-existence of naked seeds is correct when anatomically considered, there can be no doubt; but the practical utility of deviating in this subject from the common language of botanists may still be questioned: and accordingly Gaertner, who was fully aware of the truth of their position, has nevertheless continued to describe the seeds of many plants as naked. I confess however I am inclined to adopt the opposite decision of the French botanists, at the head of whom is Richard, who has also proposed terms for distinguishing the various species hitherto confounded under the name of naked seeds. The fruit of the mono-spermous genera of Proteaceæ might probably be with

advantage referred to that which he has termed *Akenium*; but as I am unwilling in the present paper to adopt any term not more generally sanctioned and understood than this, I shall content myself with calling those *nuces*, which are either not at all or but slightly compressed and not bordered; and apply the term *samara* to such as are either very much compressed, or with a less remarkable compression are surrounded or terminated by a membranaceous border: that I regard these distinctions however as in some cases of very little importance, may be inferred from this, that my genus *Leucadendron* includes both these kinds of fruit.

The first observation I have to offer on the fruits of Proteaceæ is, that there is no really bivalvular capsule in the order; a truth which was not perceived by Gærtner in <sup>35</sup> describing his *Banksia dactyloides* (the Conchium dactyloides of Dr. Smith), and which has equally escaped Cavanilles and Labillardière in their characters of *Hakea*. Dr. Smith has more cautiously omitted this consideration in his character of that genus, and Professor Schrader has accurately described the suture as only existing on one side: such fruits then are as truly folliculi as those of *Grevillea*, *Rhopala*, or *Embothrium*; and that the existence of a distinct placenta is by no means necessary to constitute this kind of fruit, is proved even by some genera of Apocineæ, to which family this term was first applied.

A circumstance occurs in some species of *Persoonia* to which I have met with nothing similar in any other plant: the ovary in this genus, whether it contain one or two ovula, has never more than one cell; but in several of the two-seeded species a cellular substance is after fecundation interposed between the ovula; and this gradually indurating acquires in the ripe fruit the same consistence as the putamen itself, from whose substance it cannot be distinguished; and thus a fruit originally of one cell becomes bilocular: the cells however are not parallel, as in all those cases where they exist in the unimpregnated ovary, but diverge more or less upwards.

In all the seeds of this order there is a very manifest

Akenium; at any term than this, I which are d not bor- are either stable com- paranaceous ever as in terred from these kinds

y manifest

CHALAZA, which, whatever may be the point of insertion of the seed, is always situated at its upper extremity ; and I have not been able to observe any fasciculus of vessels connecting it with the umbilicus in cases where this latter is placed in a different part of the seed.

I am not aware of any function being ascribed to the CHALAZA of seeds, except the nutrition of their proper membrane : but it appears to me too remarkable a part to be destined for this purpose only ; and some observations I have made induce me to suppose that it is the organ <sup>136</sup> secreting the liquor amnios. This opinion I was first led to form by observing in some species of *Persoonia*, in which the inspissated remains of this fluid are visible in the ripe fruit, that it evidently originated in the *chalaza* and continued to adhere to it : nothing has hitherto occurred to invalidate this opinion, which is here however hazarded merely as a conjecture, requiring for its confirmation more numerous and decisive facts than I can at present adduce.

That the ALBUMEN of seeds is merely that condensed portion of the liquor amnios which remains unabsorbed by the embryo, seems to me very satisfactorily established ; and as this fluid is in the early stage never wanting, all seeds may in one sense be said to have albumen : but while in some tribes this unabsorbed part in the ripe seed many times exceeds the size of the embryo, so there are others in which not a vestige of it remains ; and such has hitherto been supposed to be the case with Proteaceæ : nor are the few exceptions with which I am at present acquainted of so decisive a nature as to invalidate this character of the order ; for they occur only in some species of *Persoonia*, where the semi-fluid remains of this substance are observable between the cotyledons ; and in *Bellendena*, in which it continues to form a thin fleshy coat on the inner surface of the proper membrane of the seed. From such instances, however, we may expect to find plants with a more copious albumen, which nevertheless it may be necessary from the whole of their organisation to refer to this family.

The RADICULA pointing towards the base of the fruit in

all Proteaceæ is a circumstance of the greatest importance in distinguishing the order from the most nearly related tribes ; and its constancy is more remarkable, as it is not accompanied by the usual position or even uniformity in the situation of the external umbilicus.

<sup>37]</sup> If Gaertner had not described the PLUMULA of *Protea argentea*, I should not have hesitated to assert that it was inconspicuous in the whole order.

The number of COTYLEDONS when more than two is a circumstance of little importance. In *Persoonia*, the only genus of the order in which a plurality of cotyledons has been observed, I am not even certain that their number is constant in those species in which this anomaly occurs.

In the following part of this essay it may be observed, that the genera into which I have subdivided the great African family *Protea*, are in most cases similar to those already proposed by Mr. Salisbury in the *Paradisus Londinensis*: from that essay however they are certainly not derived, but before its publication were formed and submitted to the judgment of Mr. Dryander, at whose suggestion they are now offered to the Society. That the results of an examination conducted by two observers wholly independent of each other, are so similar, will probably be considered as some proof of their correctness.

As Mr. Salisbury's generic names have the unquestionable right of priority of publication, I have in most cases adopted them, though I wish some of them had been differently constructed. But as I cannot accede to his application of the Linnean names *Protea* an' *Leucadendron*, I shall here, that I may not disturb the following arrangement, assign my reasons for differing from him in this respect ; and as in so doing I am obliged to trace the progress of Linnæus's knowledge of the family, I persuade myself that this will in some degree compensate for the otherwise unwarrantable length of the discussion.

The name PROTEA, which originated with Linnæus, first occurs in the folio edition of his *Systema Naturæ* published in 1735 ; no generic characters are there given,

but from the references to Boerhaave's figures it is evident that the genus is to be understood in the same extensive sense which he at length gave it in the second Mantissa. In 1737 appeared the *Genera Plantarum*, and in it for the first time the natural generic character of *Protea*: as in this work he only cites *Lepidocarpodendron* and *Hypophyllocarpodendron* of Boerhaave, it follows that here the genus is more limited, though its character is not peculiarly applicable to either of Boerhaave's genera referred to; and the description of antheræ and germani is not reconcilable to any plant whatever of the family. In the same year *Hortus Cliffortianus* was published, in which he resumes his first opinion of *Protea*, reducing to it all Boerhaave's genera, but referring to the character given in his own *Genera Plantarum*. It does not appear on what ground this change of opinion was formed; for in Clifford's garden, according to *Viridarium Cliffortianum*, there had only been two species, *Protea argentea* and *saligna*, neither of which had flowered, and the former was already lost; while in his Herbarium, now in the collection of Sir Joseph Banks, the specimens of all the three species given in the body of the work are without fructification, and of *Protea racemosa* added in the appendix there is no specimen whatever.

If Linnæus is to be considered in a great degree the author of the *Prodromus Floræ Leydensis*, published by A. Van Royen in 1740, as has been asserted by some of his pupils, and may be inferred from a passage in his Diary published by Dr. Maton, it must be noticed as his next work in the order of time; for from the same Diary it appears that he could only have been employed in its composition in 1738. In this work the genus *Protea* is given in the same extensive sense as in *Hortus Cliffortianus*, and no fewer than twenty-one species are characterised, of which however only two were in the Leyden <sup>139</sup> garden, the rest being described from specimens in Van Royen's Herbarium.

In 1738 he also published his *Classes Plantarum*, in which, notwithstanding he appears to have composed it

while engaged in the arrangement of Van Royen's collection, another fluctuation of opinion occurs, *Protea* being limited as in the first edition of the *Genera Plantarum*, and to *Leucadendros*, which here for the first time occurs, he refers the *Conocarpodendron* of Boerhaave.

In 1740 he published the second edition of *Systema Naturæ*, where the names *Protea* and *Leucadendron* are both given; but the references to Boerhaave are reversed, *Protea* being confined to his *Conocarpodendron*, and *Leucadendron* comprehending his other two genera. In this sense they also appear in the second edition of the *Genera Plantarum* published in 1742, in which the character of *Leucadendron* is first given, some of whose species he must, from the annexed asterisk, have seen recent: his description of corolla and pistillum is only applicable to *Lepidocarpodendron*.

In 1745 Linnæus received the Herbarium of Hermann, from which he composed his *Flora Zeylanica*: the fourth volume of this collection containing a mixture of Ceylon and African plants, the latter are not noticed in this work; but from an inspection of the Herbarium itself, now in the Banksian collection, it appears that he had added generic names to most of them: of *Proteæ* only three species exist in the volume, of which *Protea conarpa* is one: of this there are on the same page two specimens, whose heads of flowers are separately pasted; under one of these specimens he has written *Leucadendron*, and under the second *Protea*; to a specimen of *Protea Serraria* on a different <sup>401</sup> page he has given the name of *Santolina*. These facts are mentioned to prove, that at this period his knowledge of the family must have been chiefly derived from Boerhaave's figures, and perhaps from specimens which he had casually seen:

In 1748 the sixth edition of *Systema Naturæ* appeared, where the essential characters of *Protea* and *Leucadendron* first occur, both of them evidently derived from the natural characters previously given.

In 1753 the *Species Plantarum*, the most accurate of all his works, was given to the world; both genera are found

in it, their species characterised, and trivial names for the first time applied to them : of *Protea* there are only two species, *P. argentea* and *fusca*; to the former however he referred as varieties *P. saligna*, *conifera*, and three others; to the whole adding the following observation, which may be supposed to contain his chief reason for applying his name *Protea* to this genus rather than to that for which in his Classes Plantarum he had first intended it. "Planta naturalis in patria argentea excellit fronde inter arbores nitidissima omnium; at culta et captiva extra patriam exuit decus; variat dein etiam domi mille modis verè *Protea*."

At this time he had in his Herbarium a specimen without fructification of *Protea argentea* properly so called; but of its supposed varieties or of *P. fusca* none whatever. Of his genus *Leucadendron* he had only one species, *L. proteoides*, afterwards called *Protea purpurea*, a plant differing in many respects from the tribe to which he had, though not without hesitation, referred it.

In 1754 the fifth edition of Genera Plantarum appeared, in which the characters of both genera remain exactly as in the second.

In 1759 was published the tenth edition of Systema Naturæ, where the essential generic characters are nearly the same as in the sixth, and the specific characters are copied from the Species Plantarum.

Of this latter work the second edition appeared in 1762: it contains two additional species of *Leucadendron* described from Burmann's Collection and Plantæ Africanæ; *Protea argentea* of the first edition is here divided into two species; the first *Protea argentea* now so called, the second comprehending *P. saligna*, *conifera*, and three other nearly related species: to this latter the greater part of the observation added to *P. argentea* of the first edition is annexed, though evidently less applicable to the species thus divided.

In the sixth edition of Genera Plantarum printed in 1764 no alterations are made in the characters of these two genera.

In Mantissa prima published in 1767, two new species of *Leucadendron* are described: neither of these, how-

ever, he had in his Herbarium : the first, *Leucadendron speciosum*, he had probably accidentally seen, the antheræ of which are described as filaments, and their callous apices alone as true antheræ : the description of the second, *L. pinifolium*, is by Van Royen.

In the twelfth edition of *Systema Naturæ* published in the same year, the species of *Leucadendron* are arranged in a different, and, as the author intended, a more natural order ; from which it may be concluded that at this time considerable additions had been made to his Herbarium : but *L. glomeratum* is unaccountably omitted. *Protea* here receives again *P. Levisanus*, the *P. fusca* of the first edition of the *Species Plantarum*, which in the second had been referred to *Brunia*.

In *Mantissa altera* published in 1771, the two genera are united under the name of *Protea* ; new characters are given to the species, and most of them are described from specimens then in his Herbarium ; five species are added which had already been published by the accurate Bergius ; and three, *P. totta*, *strobilina* and *parviflora*, are here first met with : in his description of the last he seems to suspect it to be a male plant, which we now certainly know to be the case. *P. glomerata* is here again taken up ; but *Protea acaulis*, *cancellata* and *conocarpa* are omitted ; and *Protea conifera* of the second edition of the *Species Plantarum* is subdivided into three species, *P. conifera*, *pallens* and *saligna*.

In the thirteenth edition of the *Systema Vegetabilium* published in 1774, the essential character of the genus is adapted to its present state, and no alteration occurs among the species, except that *P. speciosa* is considered as a variety of *P. Lepidocarpodendron*.

From this statement it appears, that Linnæus in his earlier works had not sufficient materials for obtaining an accurate notion of this family ; and hence that perpetual fluctuation of opinion concerning it, which has been now pointed out, and may in few words be recapitulated.

1st, He gave the genus *Protea* the same extent which he at length assigned to it in the *Mantissa*.

2dly, He limited it, leaving unnoticed that part to which at a latter period he exclusively applied the name.

3rdly, He resumed his first opinion.

4thly, He subdivided it into two genera, giving them the same names which are adopted in the present paper.

5thly, He continued the subdivision but reversed the names, and for a reason, as it would seem, which is now known to be founded in error.

And lastly, Having acquired more perfect materials <sup>as</sup> and perceiving the insufficiency of his characters, he united them together, thus ending exactly where he commenced.

But, as in this he has been universally followed for nearly forty years, *Protea* can no longer be considered as more strongly associated with any one species of the genus than another ; and therefore this name so familiar to botanists, if the necessity of again subdividing the genus be allowed, ought certainly to be given to that part which is best known, and which contains the greatest number of published species, especially if the name be at least as applicable to this as to any other subdivision : now this part unquestionably is the *Lepidocarpodendron* of Boerhaave, the *Protea* of the first edition of the *Genera Plantarum* and *Classes Plantarum*, and of the present Essay.

The question respecting the application of the name *Leucadendron* is reducible to a smaller compass. Mr. Salisbury is aware that the Linnean character of the genus is only applicable to *Lepidocarpodendron* of Boerhaave ; and therefore, consistently with the reasons which determined him in his application of the name *Protea*, *Leucadendron* ought to have been retained for that which he has called *Erodendrum* in *Paradisus Londinensis* ; and this it seems he would have done, had it not been differently used by Plukenet, whom he professes to follow in this respect. But as rejecting Linnean names when accompanied by characters, for those of Plukenet who never published a single character, is somewhat unusual, it must be supposed to have arisen from the latter author's more appropriate use of this significant name, while it may also be presumed that Linnæus's application of it is wholly unsuitable ;

and it is at least to be expected that in his own application he is consistent with Plukenet, whom he means to follow.

43 To determine how far this is the case, I have examined the figures published by Plukenet under the name of *Leucadendros*, and also his Herbarium, which forms part of the Sloanean collection in the British Museum. Of his three species so named the first is *Protea argentea*, his "*Leucadendros africana arbor tota argentea sericea foliis integris, Atlas Tree, D. Herman,*" of which the figure represents a branch without fructification, and a separate fruit possibly of the same plant, but rather, as I suspect, belonging to a different species of the same genus.

On the same plate is figured a single leaf, in all probability belonging to *P. conocarpa*, with the following name, "*Leucadendro similis africana arbor argentea folio symmo crenaturis florida, an Leucadendros africana foliis serratis D. Herman?*" The separate fruit accompanying this, probably does not belong to it, but to some species of that division of *Leucadendron* which Mr. Salisbury has called *Eurypermum*.

The third species, his "*Leucadendros africana, seu Scolymocephalus angustiori folio apicibus tridentatis,*" is a good figure of a flowering branch of *Protea cucullata*.

It could not certainly from his publications alone be understood why the name *Leucadendros* is applied to these three plants so little alike, while different names are given to species much more nearly related to some of them than they are to each other: of this however the solution is to be found in his Herbarium; on consulting which I find, that after the publication of *Protea argentea*, with whose flowers he was unacquainted, he had acquired flowering specimens of *Protea hirta*, and had supposed these two species to be the same, pasting between two leaves of *argentea* four loose heads of *hirta*, and under the whole copying in his own hand the name *Leucadendros*, &c. at full length from his *Phytographia*. This satisfactorily 43 explains why he referred *P. cucullata* to *Leucadendros*, its flowers being very similar to those of *Protea hirta*. As

to his application of this name to *P. conocarpa*, it could only proceed from his total ignorance of its fructification; for, as he has figured a nearly related species, *P. hypophylla*, under the very different name of *Thymelea*, &c., it is reasonable to conclude, that had he seen the flower of *P. conocarpa* he would have given it the same generic name. This *P. conocarpa* however, of which it may truly be said he knew nothing, and concerning which at least no information is to be derived from his works, is the only species of the three which belongs to Mr. Salisbury's genus Leucadendron.

But the original *Leucadendros* of Hermann, of Plukenet, and of Linnæus himself, is *Protea argentea*, the only plant of the family to which the name can properly be applied; to this therefore I have assigned it in the following arrangement.

Before proceeding to this arrangement, I am happy in having an opportunity of acknowledging that assistance which has so liberally been afforded me.

To the invaluable Herbarium and Library of Sir Joseph Banks I have on this, as on all other occasions, enjoyed the freest access; an advantage which has been greatly enhanced by the opportunity it has given me of consulting my friend Mr. Dryander, both as to the formation of genera and respecting synonyms, on which points his sound judgment and unrivalled erudition so well enable him to decide.

To Dr. Smith I am indebted for the permission of inspecting the Linnean Collection, and for the most friendly and satisfactory answers to the queries on this subject which he allowed me to put to him.

Mr. Lambert, whose Herbarium in this tribe is only surpassed by that of Sir Joseph Banks, has, with his accustomed liberality, submitted it without reserve to my examination.

Mr. Hibbert, who for many years possessed the most extensive collection of living Proteas that has ever been formed, and who also received from his intelligent collector Mr. Niven a valuable Herbarium of native specimens, most

obligingly permitted me to examine these, and even to dissect such as were new. For the like privilege I am indebted to the friendship of Mr. Aiton of Kew, who sent me his whole collection, peculiarly valuable as containing many of the original specimens of Mr. Masson: and lastly, I have to acknowledge the great assistance I have derived from the extensive collection presented to this Society by my friend Dr. Roxburgh, who during his short residence at the Cape appears to have paid particular attention to this tribe of plants, and who, besides the many new species discovered by him, has given a greater value to his Herbarium by numerous observations on the sexes, the size, and places of growth, which I have everywhere inserted on his authority.

*Gen. Pl. ed. 2, 5, 6. Conocarpos. Adans. Famill. Protea,*  
*Euryspermum, Chasme. Salisb. Parad. Lond.*

CHAR. GEN. *Flores dioici, organis imperfectis; capitati.*

Fem. *Stigma obliquum, clavatum, emarginatum, hispidulum.* *Nux v. Samara monosperma, squamis (quandoque cohærentibus) strobili inclusa.*

HABITUS. *Frutices, raro Arbores, saepe sericeo-tomentosi.*  
*Folia integerrima. Capitula terminalia, solitaria; bracteis*  
*imbricatis foliis verticillatis et subcoloratis plerumque*  
*cincta.*

OBS. The separation of sexes in the genus *Protea* of authors, obscurely suspected by Linnaeus himself in his *Protea parviflora*, and afterwards more expressly by La-

mark in *P. pinifolia*, was first ascertained in *Aulax* and the present genus (as Mr. Dryander informs me) by our countryman Masson, during his last residence at the Cape of Good Hope, and is beautifully illustrated by that eminent botanical painter Mr. Francis Bauer, in his unpublished drawings preserved in the Banksian collection. Numerous observations on the same subject have also more recently been made by Dr. Roxburgh and Mr. Niven, who have bestowed much pains in ascertaining its limits, of which, as far as regards the African part of the family, Mr. Salisbury has given an accurate account in his Essay already quoted. The Dissertation of Thunberg, who was wholly unacquainted with this separation of sexes in these plants, is necessarily imperfect, and he has, in several cases, described the different sexes as distinct species; and thus also Bergius has founded his genus *Aulax* on the male of a species, whose female he had previously published as a *Leucadendron*. On the other hand, Jussieu, deceived by the resemblance in inflorescence, between *Brabejum* and the spiked species of *Protea*, has erroneously suspected these to be monoicous, while he has totally overlooked the truly dioicous nature of the present genus.

† *Nux ventricosa*, stylo toto calyceque persistentibus.

HAB. In Africâ Australi, prope Promont. B. Spei, in  
montosis. (v. s. in Herb. Soc. Linn.)

26. *L. uliginosum*, foliis lanceolato-linearibus utrinque <sup>63</sup>  
argenteis tomento arctè adpresso: callo apicis acuto,  
ramis tomentosis, calycis feminci tubo hirsuto, squamis  
strobili sericeis dilatatis subundulatis obsoletè retusis,  
samaris apteris.

Frutex aethiopicus conifer foliis cneori salici æmulis.  
*Breyn. Cent.* 21, t. 9, excepto strobilo ad basin tabulæ,  
qui ad *L. adscendens* pertinet.

*Protea saligna*. *Thunb. Diss.* n. 47,\* secund. descrip.

HAB. In Africæ Australis uliginosis, prope Prom. B.  
Spei. (v. s.)

27. *L. floridum*, foliis lanceolato-linearibus sericis  
suprà villosis: callo apicis acuto; floralibus subtùs  
ramisque hirsutis, calycibus masculis longitudinaliter  
pilosis, strobili squamis tomentosis apice dilatatis integris,  
samaris apteris.

*Thymelæa capensis* sericeis longioribus et acutis foliis  
caule geniculato piloso. *Pluk. Phyt.* 181, t. 229, f. 4,  
fide specim. in ejus Herb.

*Protea saligna* mas et fem. *And. Rep.* 572?

HAB. In Africâ Australi, prope Promont. B. Spei, in  
paludososis ad radicem Montis Wynberg. *Gul. Roxburgh M. D.* (v. s. in Herb. Banks. et Mus. Brit.)

††† *Squamæ strobili connatae*. Samara foliaceo-compressa, glabra. Folia  
aliqua vel omnia filiformia.

\*28. *L. platyspermum*, foliis superiòribus linearis-spathula-  
tis: callo obtuso, strobili squamis duplicatis longitudinaliter  
accretis: rimis semicircularibus, samaris duplo latioribus  
quàm longis.

HAB. In Africâ Australi, prope Promont. B. Spei.  
Hout Hoek. *And. Auge.* (v. s. in Herb. Banks.)

DESC. *Frutex* glaber. *Folia* inferiora filiformia, canaliculata, sesquiuncialia; superiora plana, vix longiora.

<sup>64</sup> MASC. *Amentum* ovatum, bracteis lanceolatis, sericeis subtensum. *Laminæ calycis* glabræ. *Stigma* clavatum.

FEM. *Amentum* oblongum: *Squamis* glabris connatis. *Ungues calycis* villosæ. *Laminæ* glabræ. *Stigma* dilatatum, obliquum, papulosum. *Strobilus* oblongus, quandoque ovatus, rimis transversis semicirculum sub-æquantiibus. *Samara* cinerea, lœvis.

29. L. *comosum*, foliis superioribus spathulato-lanceolatis obtusis mucronatis rugoso-striatis, strobilis oblongis: squamis basi connatis suprà distinctis marginibus inflexis sub-barbatis, samaris subrotundis nigris.

*Protea comosa*. Thunb. *Diss.* n. 25,\* secund. descript. folior. *Prod.* 26. Willd. *Sp. Pl.* 1, p. 517. *Lam. Illust.* *Gen.* 1, p. 238, n. 1254. Poiret, *Encyc. Botan.* 5, p. 655.

HAB. In Africâ Australi, pone Montes Swellendam. D. Masson. (v. s. in Herb. Banks. et D. Aiton.)

\*30. L. *aemulum*, foliis superioribus lanceolato-spathulatis acutis rugoso-striatis, strobilis ovatis: squamis basi cohærentibus suprà distinctis marginibus recurvis imberibus, samaris subrotundis nigris.

*Protea incurva*. And. *Repos.* 429, fortè Mas hujus speciei, quamvis folia superiora vix duplo latiora.

HAB. In Africâ Australi. *Gul. Roxburgh M. D.* (v. s. in Herb. Soc. Linn.)

31. L. *abietinum*, foliis omnibus filiformibus canaliculatis obtusiusculis lœvibus patulis arcuato-incurvis, strobili squamis marginibus axibusque infrà connatis suprà distinctis bilobis.

<sup>65</sup> *Protea teretifolia*. And. *Repos.* 461, femina et ramulus ad 4. mas.

HAB. In Africâ Australi, prope Prom. B. Spei, frequens. (v. s. in Herb. Banks. et Soc. Linn.)

\*32. *L. scabrum*, foliis omnibus filiformibus canaliculatis acutis imbricatis rectiusculis margine scabris pilosissime, strobili squamis marginibus axibusque infra connatis apicibus distinctis bilobis.

HAB. In Africâ Australi. (v. s. in Herb. Hibbert.)

++++ *Dubia tribus. Feminis adhucdum incognitis.*

33. *L. sericeum*, foliis lanceolatis sericeis semiunguicularibus, caule erecto, capitulis sessilibus solitariis aggregatis turbinatis, calycibus masculis longitudinaliter pubescentibus: tubo gracili inferne stylo cohaerente.

*Protea sericea*. Linn. *Suppl.* 118,\* fide specim. in ejus Herb.

*Protea sericea*. Thunb. *Diss.* n. 46,\* sed caulis erectus videtur.

HAB. In Africâ Australi, prope Promont. B. Spei. (v. s. in Herb. Banks.)

34. *L. Globularia*, foliis linearispatulatis glabris aeniis: callo obtusissimo; basi attenuatâ tortâ, capitulis sessilibus depresso-globosis: bracteis tomentosis, calycibus masculis pubescentibus, stigmate clavato.

*Protea globularia*. Lam. *Illust. Gen.* 1, p. 236, n. 1232, t. 53, f. 2. Poiret, *Encyc. Botan.* 5, p. 647? exclus. syn. Thunbergii.

DESC. *Fruticulus* erectus ramosissimus, ramis strictis, ultinis sericeis. *Folia* sparsa, 8—9 lineas longa, inferiora ramorum breviora, capitulum subtendentia confertiora. *Bracteæ* involucrantes capitulo dimidio breviores, ovatae, <sup>166</sup> artè imbricatae. *Calyx* tubo gracili unguibusque villosis, lamina glabris. *Ovarium* nullum. *Syllus* villosus. *Squamulae* quatuor, lineares, longæ, basi styli infra adnatae.

\*35. *L. pubescens*, foliis spathulato-linearibus obtusis obliquis: adultis pubescentibus; junioribus sericeis, ramis villosis, involucris capitulo globoso sessili brevioribus tomentosis, calycibus stylisque pubescentibus.

HAB. In Africâ Australi. *Gul. Roxburgh M. D.* (v. s. in Herb. Soc. Linn.)

OBS. Quam maximè affine præcedenti.

\*36 *L. ericifolium*, foliis acerosis glabris semiunguiculatis, capitulis corymbosis paucifloris, calycibus tomentosis.

HAB. In Africâ Australi. *Dom. J. Roxburgh.* (v. s. in Herb. Lambert. et Soc. Linn.)

DESC. *Frutex* erectus, ramosissimus, ramis rubicundis, ramulis tenuissimè tomentosis. *Folia* frequentia, erecta, imbricata, mutica, concaviuscula. *Capitula* breviter pedunculata, *Involucro* breviore sericeo subtensa. *Calyx* tubo gracili. *Ovarium* nullum. *Stylus* glaber. *Stigma* clavatum. *Squamulae* nullæ intra calycem.

\*37. *L. crassifolium*, foliis cuneato-ovatis obtusissimis glaberrimis crassis aeniis (3-uncialibus) basi attenuatis, capitulis globosis, bracteis propriis lanatis, calycibus glabris.

HAB. In Africâ Australi. *D. Masson.* (v. s. in Herb. Banks.)

DESC. *Rami* glaberrimi, glauci, crassitie digitii minimi. *Folia* frequentia, glauca, rigida, sesquiunciam lata, callo <sup>et</sup> subrotundo, acutiusculo, marginibus subsimplicibus per lentem minutè crenulatis, novellis ciliatis. *Capitulum* magnitudine cerasi maximi. *Calycis Tubus* cylindraceus. *Laminæ* lineares, planiusculæ, unguesque recurvæ. *Stylus* glaber. *Stigma* oblongo-clavatum.

An hujus generis?

\*38. *L. cartilagineum*, foliis ovali-spathulatis obtusissimis: callo subtruncato: aeniis cartilagineis glaberrimis; basi attenuatâ linearî, capitulis globosis subpedunculatis, bracteis calycibusque tomentosis.

HAB. In Africâ Australi. (v. s. in Herb. Soc. Linn. et D. Hibbert.)

ETYM. Πετρος et φιλεω. Hi frutices enim semper in saxosis apricis proveniunt.

OBS. Mr. Salisbury has united such of the New Holland Proteæ as he had seen, into one genus, which he calls *Atylos*; a name meant to express the want of those bodies that usually surround the ovary, in this order, and which he chooses to term *calli*: but as I conceive they are certainly secreting organs, the name on this ground would be exceptionable: my chief reason however for not adopting it, either for the present or the following genus, is, that the whole of his essential character does not apply to either of them. In his secondary character he has also considered them as monoicous, a mistake into which he has probably been led, not only from the striking similarity between the strobili of *Petrophila* and *Leucadendron*, but also from the style of the former remaining for some time unwithered after the calyx has fallen off. In one species he has even described the relative situation of the sexes; regarding the terminating amentum of *P. pulchella* as female, and the lesser ones, which frequently though not always surround

it, as male; but that this is not the case is proved by Cavanilles' figure of the species, in which all the amenta are in fruit, and a specimen in the same state may be seen in Sir Joseph Banks's Herbarium.

† *Stigma articulatum, articulo inferiore angulato, glutro, superiore tomentoso. Nux lenticulari-compressa, intus marginibusque comosa. Folia filiformia indivisa.*

\*1. *P. teretifolia*, foliis teretibus exsulcatis, squamis strobili nervibus, stigmatis articulo superiore stuposo triplo longiore.  
HAB. In Novæ Hollandæ orâ australi, Lewin's Land.  
(ubi v. v.)

\*2 *P. filifolia*, foliis teretibus exsulcatis, squamis strobili nervosis orbiculatis, stigmatis articulo superiore barbato vix duplo longiore.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land; in collibus saxosis. (ubi v. v.)

\*3. *P. acicularis*, foliis filiformibus suprà obsoletè sulcatis, squamis strobili nervosis ovatis.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land; in campus collibusque sterilibus. (ubi v. v.)

†† *Stigma inarticulatum, hispidiusculum. Nux lenticulari-compressa, intus marginibusque comosa. Strobilus squamis distinctis. Folia filiformia bipinnatifida.*

\*4. *P. rigida*, foliis triternatis: laciniis divaricatis, calycibus barbatis: laminarum apiculis glabris.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land; in collibus saxosis. (ubi v. v.)

5. *P. pulchella*, foliis trifido-bipinnatis: laciniis erectis, calycibus sericeis: laminarum apicibus tomentosis.

*Protea pulchella.* Schrad. Sert. Hanov. ii. p. 15.\* t. 7.  
Willd. Sp. Pl. 1, p. 507. Cavan. Anal. 1, p. 237.\* Ic. 6,

*Protea fucifolia.* Salisb. Prod. 48.

*Protea dichotoma*. *Cavan. Anal.* 1, p. 239.\* *Ic.* 6, p. 34,\* t. 551.

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson ; in arenosis inter saxa. (ubi. v. v.)

\*6. *P. fastigiata*, foliis trifido-bipinnatis : laciniis erectis <sup>(70)</sup> fastigiatis teretiusculis muticis, calycibus glabris, strobilis terminalibus sessilibus : squamis lanatis.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in ericctis aridis elevationibus. (ubi. v. v.)

\*7. *P. pedunculata*, foliis tripinnatifidis : laciniis canaliculatis divaricato-patulis, calycibus glabriusculis, strobilis pedunculatis : squamis glabris.

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson ; in montibus saxosis. (ubi v. v.)

+++ Strobilus *squamis connatis*. Samara *foliacea*, *dilatata*. Stigma *inarticulatum*, *hispidiusculum*. Folia *plana*, *bipinnatifida*.

\*8. *P. diversifolia*, foliis bi-tripinnatifidis planis : laciniis mucronatis, calycibus barbatis, strobilis axillaribus pedunculatis : squamis lanatis cohærentibus.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in collibus saxiosis. (ubi v. v.)

++++ Strobilus *squamis distinctis*. Samara *planiuscula*. Folia *plana*, *ternalim divisa*.

\*9. *P. squamata*, foliis trifidis : lobis linear-lanceolatis ; lateralibus sæpiùs bi-trifidis, strobilis axillaribus sessilibus : squamis apice scariosis glabris.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in ericetis collibus aridis. (ubi v. v.)

\*10. *P. trifida*, foliis trifidis : lobis spathulato-lanceolatis sæpiissimè indivisis, strobilis axillaribus sessilibus : squamis apice sericeis.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in collibus apricis sterilibus. (ubi v. v.)

## 4. ISOPOGON.

ATYLI species. *Salisb. Parad.*

GEN CHAR. *Calyx* quadrifidus, tubo gracili, diutiùs persistente. *Stylus* totus deciduus. *Stigma* fusiforme, v. cylindraceum. *Squamæ* nullæ hypogynæ. *Nux* sessilis, ventricosa, undique comosa.

HABITUS. Frutices rigidi. Folia *glabra*, *plana* v. *filiformia*, *divisa* v. *integerrima*. Capitula *terminalia*, raro *axillaria*. Floribus modò *densissimè imbricatis* strobilo *globoso*; modò *fastigiatis* receptaculo communi *planiusculo subinvolucrato*, paleis *deciduis congestis*. Genus distinctum, praecedenti proximum, posthac forsitan in duo dividendum, ratione inflorescentiae secundum quam species *infrà* distributæ sunt, in duas phalanges habitu parùm diversas.

ETYM. Ισος et πογον, ob nuces undique æqualiter barbatas; quâ notâ a *Petrophila* facile distingendus.

† *Strobilus globosus*; *squamis densissimè imbricatis*, *tardius deciduus*.

\*1. I. *teretifolius*, foliis bi- v. triternatis filiformibus exsulcis, ramulis tomentosis, calycis tubo sericeo: laminis longitudinaliter barbatis.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land; in ericetis collibusque saxosis. (ubi v. v.)

2. I. *anethifolius*, foliis pinnatifidis bipinnatifidisque filiformibus supra sulcatis: laciniis erectiusculis, ramis glabris, calycis tubo pubescente: laminis *infrà* glabris apice barbato.

<sup>72</sup> Protea anethifolia. *Salisb. Prod.* 48.

Protea acufera. *Cavan. Anal.* 1, p. 236.\* *Ic.* 6, p. 33, t. 549.

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson; in ericetis. (ubi v. v.)

\*3. I. *formosus*, foliis bipinnatifidis suotriternatis fili-

formibus suprà canaliculatis : laciniis divaricatis, ramulis tomentosis, calycibus glabris : laminis apice pilosiusculis.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in collibus saxiosis. (ubi v. v.)

4. I. *anemonifolius*, foliis trifido-pinnatifidis bipinnatifi-disve : laciniis linearibus planis patenti-erectis subtùs laci-nibus, strobili squamis stuposis.

*Protea anemonifolia*. *Salisb. Prod.* 48. *Sims, Bot. Mag.* 697. *And. Repos.* 332.

*Protea tridactylites*. *Cavar. Anal.* 1, p. 235.\* *Ic.* 6, p. 33,\* t. 548.

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson ; in ericetis saxosis. (ubi v. v.)

\*5. I. *ceratophyllum*, foliis trifido-bipinnatifidis : laciniis linearibus planis divaricato-patulis utrinque striatis mucronatis ; floralibus basi dilatatis, strobili squamis glabratiss.

HAB. In Novæ Hollandiæ orâ australi, prope Port Phillip ; in campis et collibus. (ubi v. v.)

\*6. I. *trilobus*, foliis cuneatis planis trilobis : basi attenuatis petiolatis ; lobis integerrimis, ramulis tomentosis.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in ericetis siccis. (ubi v. v.)

\*7. I. *longifolius*, foliis lineari-lingulatis : superioribus integerrimis ; inferioribus passim trifidis, calycibus sericcis, stigmate glabro.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in collibus saxosis. (ubi v. v.)

†† *Receptaculum commune planum v. convexiusculum, paleis deciduis.*

\*8. I. *cuneatus*, foliis oblongo-cuneatis obtusissimis, involueri bracteis tomentosis, calycibus glabris, stigmate fusiformi.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land. *D. A. Menzies.* (v. s. in *Herb. Banks.*)

\*9. I. *attenuatus*, foliis elongato-oblongis mucronulatis basi attenuatis, ramis bracteisque involucrantibus glabris, capitulis solitariis, calycis laminis apice barbatis, stigmate cylindraceo.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land; in collibus saxosis. (ubi v. v.)

\*10. I. *polycephalus*, foliis linear-i-oblongis mucronulatis, ramulis tomentosis, capitulis subaggregatis: bracteis omnibus lanatis, stigmate cylindraceo.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land; in collibus saxosis. (ubi v. v.)

\*11. I. *buxifolius*, foliis ovatis sessilibus acutis: apicibus recurvis, caulinis proliferis, capitulis solitariis foliis obvallatis; bracteis subulatis, stigmate fusiformi.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land; in ericetis elevationibus subhumidis. (ubi v. v.)

\*12. I. *axillaris*, foliis cuneato-lingulatis mucronulatis, capitulis axillaribus paucifoliis; bracteis involucrantibus ovatis imbricatis, calycis laminis longitudinaliter barbatis, stigmate fusiformi.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land; in collibus saxosis. (ubi v. v.)

## 9. NIVENIA.

*Paranomus. Salisb. Parad.*

CHAR. GEN. *Calyx quadrifidus, æqualis, totus deciduus. Stigma clavatum, verticale. Nux ventricosa, nitens, sessilis, basi integrâ. Involucrum simplici serie tetraphyllum, quadriflorum, fructiferum induratum; Receptaculo plano epaleato.*

HABITUS. Fructices. Folia *sparsa, inferiora bipinnatifida filiformia; superiora, in quibusdam, indivisa, plana. Involucra in spicam rariusve capitulum terminale digesta, sessilia, bracteâ unicâ subtensa. Flores purpurascentes.*

This genus is published by Mr. Salisbury: his primary generic character does not indeed at all differ from that which he has given to *Mimetes*; in his account of Inflorescence, however, it is evident he understood the genus nearly as I have here proposed it: I should therefore have adopted his name had it appeared to me tenable; but I am disposed to believe that he will, on reconsidering the subject, see the propriety of relinquishing it; for the irregularity or unusual structure, which (if I understand him) he says exists "tot partibus diversis," only takes place in the leaves of a small number of species; on the other hand, the flowers of all are perfectly regular, and that too in opposition to some of the most nearly related genera, while the great uniformity and regularity of inflorescence forms an essential part of its character. I have therefore named it in honour of Mr. James Niven, an intelligent observer and indefatigable collector, to whom botanists are indebted for the discovery of many new species, especially in the two extensive South-African families of *Erica* and *Proteaceæ*.

DESC. *Frutex* erectus. *Rami* elongati, stricti. *Folia* imbricata, subtùs convexiuscula venoso-striata, suprà convexuscula lœvia, unguicularia, mucrone incurvo. *Capitulum* terminale, sessile, subovatum, solitarium, v. e. 2—3 aggregatis compositum. *Involucrum commune* polyphllum, imbricatum, capitulo brevius; foliolis lanceolatis, membranaceis, coloratis, scabriusculis. *Involucra partialia* sæpiùs quadriflora, tetraphylla; foliolis lanceolatis, hirsutis. *Calyx* tubo gracili, laminis barbatis. *Ovarium* barbatum. *Stylus* strictus. *Stigma* elliptico-clavatum, hinc gibbosiusculum. *Nux* glaberrima, nitens, fusca, oblonga, basi angustatâ concolori emarginatâ.

\*8. *S. diversifolius*, foliis spathulato-lanceolatis subtùs

lævibus : infimis bipinnatifidis, unguibus laminisque calycis barbatis, stigmate cylindraceo.

HAB. In Africæ Australis montibus saxosis, prope Goud Rivier. D. Niven. (v. s. in Herb. Banks., Lambert., et Hibbert.)

DESC. *Frutex* erectus, glaber, bipedalis usque orgyalis, indivisus, v. bifidus, strictus, crassitie pennæ olorinæ, supra pubescens. *Folia infima* trifido-bipinnatifida, canaliculata, biuncialia ; *reliqua* imbricata, obtusiuscula, parùm concava, vix semuncialia. *Capitulum* terminale, solitarium, sessile, ovatum, obtusum, magnitudine pruni minoris.

## 11. SPATALLA.

*Salisb. Parad.*

CHAR. GEN. *Calyx* quadrifidus, laciniâ interiore (in plerisque) majore, totus deciduus. *Stigma* obliquum, dilatum. *Nux* ventricosa, brevissimè pedicellata. *Involucrum* simplici serie 2—4-phylum, uniflorum v. definite pauciflorum. *Receptaculum* epaleatum.

HABITUS. Frutices. *Folia sparsa, filiformia, indivisa.* Involucra terminalia, spicata v. racemosa, unibracteata, fructifera haud mutata. Flores purpurascentes. Anthera laciniæ majoris calycis proportionatim major, et in quibusdam unica fertilis.

† *Involucra uniflora.* *Stigma concavum, cochleariforme.* *Calyx inæqualis.*

\*1. S. *mollis*, involucro diphylo : foliolis integerrimis, foliis strictis ramulisque villosis.

HAB. In Africæ Australis montibus. D. Joh. Roxburgh. (v. s. in Herb. Lambert.)

DESC. *Frutex* erectus, ramosissimus. *Rami* rubicundi, ramuli graciles, erecti. *Folia* erecto-patentia, 7—8 lineas longa, callo acutissimo, villis modicè patentibus sericea. *Spica* sessilis, erecta, solitaria, oblongo-cylindracea, densa, racemosa, vix uncialis. *Bracteæ* foliaceæ, pedicellis duplo

longiores. *Involucrum* foliolis ovatis, villosis, exteriore latiore. *Calyx* densè barbatus, laminâ laciniæ majoris villis marginalibus inflexis. *Squamulae hypogynæ* quatuor, lineares, persistentes.

\*2. S. *pedunculata*, involucro diphyllo: foliolo latiore tridentato, spicâ imbricatâ, pedunculo foliis longiore triquetris incurvis basi attenuatis, bracteis sericeis involucro brevioribus.

HAB. In Africæ Australis montibus. Kleine-Hoot-Hoek. *Gul. Roxburgh, M.D.* (v. s. in *Herb. Soc. Linn.*)

DESC. *Frutex* erectus, ramosissimus, foliis ramisque adultis glabris, junioribus sericeis. *Folia* frequentia, ferè uncialia, basi attenuatâ, erectâ, suprà patentia, falcato-incurva,  
145] callo apicis obtusiusculo. *Pedunculi* sesquiunciales, solitarii, sericei; bracteis alternis, subulatis. *Spica* cylindracea, pedunculo vix longior; pedicellis, involucris, calycibusque sericeis.

\*3. S. *nivea*, involucro diphyllo: foliolo latiore tridentato, spicâ imbricatâ, pedunculo foliis rectiusculis acutissimis breviore, bracteis foliaceis villosiusculis involucra æquantibus.

HAB. In Africæ Australis montibus. *D. Niven.* (v. s. in *Herb. D. Hibbert.*)

DESC. *Frutex* erectus, ramosissimus, ramis foliisque adultis glabris, novellis sericeis. *Folia* uncialia, leviter incurva, v. rectiuscula, basi parùm attenuata. *Pedunculi* solitarii, subsericei, bracteis alternis subulatis. *Spica* sesquiuncialis, pedunculo duplò longior. *Involucrum* foliolum exterius profundè tridentatum, dente intermedio angustiore. *Calycis* laminæ villis brevibus, patulis, niveis barbatæ.

\*4. S. *ramulosa*, involucro diphyllo: foliolo latiore trifido, spicâ subsessili imbricatâ, bracteis superioribus longitudine pedicellorum, foliis acutè mucronatis.

*Protea* foliis setaceis, floribus racemosis. *Hort. Cliff.* 496?

*bracteati. Calyx flavus, deciduus, quadripartibilis. Bractea cucullata, persistens.*

ETYM. συναρψη connectio, ob peculiarem cohærentiam stigmatis v. apicis styli cum filamento sterili.

\*1. *S. favosa*, foliis oblongo-cuneiformibus indivisis trilobisque : lobis integris, petiolis spicisque glabris, stigmate bicorni.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v.)

2. *S. dilatata*, foliis apice dilatatis trilobis : lobis incisodentatis, petiolis spicisque villosis, stigmate bicorni.

*Conospermum reticulatum. Smith in Rees, Cyclop.*

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v.)

\*3. *S. petiolaris*, foliis rameis petiolos subæquantibus tripartitis : lobis divisis planis ; infimis trilobis integrisque, spicis elongatis ramosis, stigmate acuto.

*Polypodium spinulosum. Burm. Ind. p. 233, t. 67, f. 1,* vel ad hanc v. ad plantam congenerem pertinere videtur.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v.)

\*4. *S. polymorpha*, foliis rameis brevissimè petiolatis tripartitis canaliculatis : lobis subdivisis ; infimis indivisis trilobisque, spicis simplicibus pedunculo longioribus, stigmate acuto.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v.)

CHAR. GEN. *Calyx* hypocrateriformis, limbo quadripartito, plano, deciduo, tubo persistenti. *Antheræ* inclusæ, calyci adnatæ ! *Squamæ* hypogynæ, in vaginam connatæ. *Nux* fusiformis, pedicellata, apice dilatato papposo.

HABITUS. *Frutex glaber*. Folia alterna, filiformia, dichotoma. Spicæ axillares, indivisæ, floribus alternis, unibracteatis, sordidè flavis. Pollen sphæricum. Cotyledones brevissimæ!

This genus is named in honour of Sir Thomas Frankland, Baronet, to whom English botany is much indebted, and whose valuable observations and excellent figures of submarine plants it is hoped he may be induced to communicate to the public.

\**FRANKLANDIA fucifolia*.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in ericetis humidis. (ubi v. v.)

## 17. SYMPHIONEMA.

CHAR. GEN. *Calyx regularis, tetraphyllus, basi cohærens, medio staminifer. Filamenta apice cohærentia! Antheræ distinctæ. Glandulæ nullæ hypogynæ. Ovarium dispermum. Stigma subtruncatum. Nux monosperma, cylindracea.*

HABITUS. Suffrutices v. Herbæ glabrae, pilisve raris glandulosis. Folia tripartita, lobis divisis; inferiora opposita! Spicæ terminales et e summis alis, simplices. Flores alterni, sessiles, unibracteati. Calyx flavus, deciduus. Bractæ cucullatae, persistentes.

\*1. *S. paludosum*, laciniis foliorum subulatis semi-<sup>168</sup> teretibus, rachibus bracteisque glaberrimis.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in ericetis paludosis. (ubi v. v.)

\*2. *S. montanum*, laciniis foliorum planis linearibus uninervibus, rachibus bracteisque pubescentibus pilis glandulosis brevissimis.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in rupibus humidis. (ubi v. v.)

## 18. AGASTACHYS.

**CHAR. GEN.** *Calyx* regularis, tetraphyllus, basi cohærens, medio staminifer. *Filamenta* distincta. *Glandulæ* nullæ hypogynæ. *Ovarium* sessile, monospermum, trigonum. *Stigma* unilaterale.

**HABITUS.** Frutex *glaberrimus*. Folia *sparsa, integerrima, plana*. Spicæ  *numerosæ, terminales et e summis alis, simplices*. Flores *alterni, sessiles, unibracteati*. Calyx *flavescens, decidens*. Pistillum *staminibus brevins*. Bractæ *cucullatæ, persistentes*.

**ETYM.** αγασταχυς spicis abundans.

\*AGASTACHYS *odorata*.

**HAB.** In Insulæ Diemen plagiis australioribus; prope Adventure Bay: ubi primùm a *D. Nelson* detecta, nuperius lecta a *D. G. Caley*. (v. s. in Herb. Banks.)

19. CENARRHENES. *Labill. Nov. Holl.* 1, p. 36, t. 50.

**CHAR. GEN.** *Calyx* tetraphyllus, regularis, foliolis suprà angustatis, deciduus. *Stamina* basi calycis inserta. *Glandulæ* <sup>1691</sup> quatuor hypogynæ, staminiformes. *Ovarium* sessile, monospermum. *Stigma* simplex. *Drupa* baccata.

**HABITUS.** Arbor *glabra*. Folia *alterna; plana, dentato-serrata, nitida*. Spicæ *axillares, simplices*. Flores *alterni, sessiles, unibracteati*.

**OBS.** Labillardière considers this genus as most nearly related to Lauri. Jussieu, however, has (in *Annales du Muséum*, v. 5, p. 224) stated sufficient reasons for excluding it from that order, but has not attempted to determine its affinity. I have ventured to place it in Proteaceæ, from the structure of its fruit, stamina and calyx, and the only circumstance in which it differs from them, consists in its having (according to Labillardière) four barren

stamina; but even these occupy the place of the glands or scales usually found in the order, and the resemblance they bear to stamens in this genus, may assist in explaining their nature in all: nor does their being in most cases secreting organs render this view of their origin improbable; for the function of secretion, which, as it is far from universal, must be considered as only of secondary importance in assisting impregnation, is more frequently accomplished by the modification of some of the usual parts of the flower than by the production of an additional organ.

CENARRHENES *nitida*. *Labill. Nov. Holl.* 1, p. 36,\* t. 50.

HAB. In Insulæ Diemen plagis australioribus. *Labbillardière*. (v. s. eum fructu sed floribus delapsis in Herb. D. Lambert.)

## 25. GREVILLEA.

CHAR. GEN. *Calyx* irregularis foliolis laciniiisve secundis, apicibus cavis staminiferis. *Antheræ* immersæ. *Glandula* unica hypogyna, dimidiata. *Ovarium* dispermum. *Stigma* obliquum, depresso (rarò subverticale, conicum). *Folliculus* unilocularis, dispermus, loculo centrali. *Semina* marginata v. apice brevissimè alata.

HABITUS. Frutices rarò Arbores, *pube dum adsit medio affixa*. Folia alterna, *indivisa* v. *pinnatifida*. Spicæ modò elongatæ racemosæ, modò abbreviatæ corymbosæ v. *fasciculatæ*<sup>168]</sup> formæ, involucro nullo, pedicellis geminatis, rarò pluribus fasciculisve unibracteatis. Calyces *sæpissimè rubicundi*, nunc *flavi* ; in quibusdam obliquè inserti. Folliculi vel coriacei, ovali, stylo toto coronati ; seminibus ovalibus angustis.

*tissimè marginatis et apice brevissimè alatis: vel lignei,  
subrotundi, pseudo-bivalves basi tantum styli mucronati;  
seminibus undique alatis.*

This extensive genus, of which a few of the least remarkable species have been already published as *Embothriums* by Dr. Smith, Cavanilles, and others, I have dedicated to the Right Honourable CHARLES FRANCIS GREVILLE, one of the Vice-Presidents of the Royal Society; a gentleman eminently distinguished for his acquirements in natural history, and to whom the botanists of this country are indebted for the introduction and successful cultivation of many rare and interesting plants.

Grevillea is probably the most extensive genus of Proteaceæ in New Holland, and admits of division into several very natural sections, most of which are readily distinguishable by more than one character, existing either in the parts of fructification or in habit; notwithstanding which, I have not ventured to separate them into distinct genera, as I probably should have done, had I been acquainted with fewer species; but have given to each section a proper name, a practice that may perhaps be advantageously adopted in all large genera where they are thus capable of natural subdivision. It must be unnecessary to add that proper names can in this manner be given only where the sections are perfectly natural, and not in those cases where genera have been subdivided from single characters, and those too of but little importance, as in Thunberg's division of *Protea*, from the form and division of the leaves; to which may be opposed the masterly <sup>169</sup> subdivision of the same genus previously given by Linnæus in the *Mantissa*, whose sections, though apparently depending on single characters, are evidently formed from a contemplation of the whole structure, as far as it was then understood; and it is remarkable that, with the exception of the first species, with whose real structure he was necessarily unacquainted, the rest are arranged, and even divided into sections, in most cases corresponding with the genera proposed in the present essay.

† Folliculi *coriacei*, stylo toto stigmataque depresso coronati. Semina ovalia, angustissimè marginata, apiceque brevissimè alata.

#### A. LYSSOSTYLLIS.

Folia omnia integerrima (in plerisque marginibus refractis v. replicatis pseudo-3-nerviis). Flores fusciculati v. in racemo abbreviato. Stylus glaber. Folliculus ecostatus.

1. *G. punicea*, foliis elliptico-oblongis basi subattenuatis marginibus refractis, ramulis floriferis racemoque abbreviato recurvis, pistillis uncialibus, barbâ interiore calycis oblongâ dimidium inferiore unguium æquante.

HAB. In Novæ Hollandiæ orâ australi; Flinders' Land: in depressis apricis prope littorâ. (n<sup>o</sup> 172 ubi v. v.)

\*12. *G. aspera*, foliis linear-i-oblongis obtusis mucronulatis suprà punctato-asperis subtùs argenteis, racemis abbreviatis recurvis, stylis brevissimis, stigmate cochleariformi.

HAB. In Novæ Hollandiæ orâ australi; Flinders' Land: in ericetis aridis. (v. v. flor. delaps. fruct. matur.)

\*13. *G. concinna*, foliis linearibus margine revolutis lævibus erectis, racemis recurvis secundis multifloris, ovariis lanatis, stylis glaberrimis calyce subsericeo duplò longioribus.

OBS. A reliquis sectionis facie differt.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in sterilibus prope littora marina. (ubi v. v.)

#### † B. PTYCHOCARPA.

*Folia omnia integerrima. Flores fasciculati v. in racemo abbreviato, floribus superioribus præcocioribus! Stylus hirsutus v. tomentosus. Ovarium subsessile. Folliculus costatus!*

\*14. *G. arenaria*, foliis oblongis obtusis mucronulatis, racemis recurvis paucifloris, pistillis tomentosis.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: ad ripas arenosas fluviorum. (ubi v. v.)

\*15. *G. montana*, foliis lanceolatis acutis suprà læviusculis subtùs sericeis, floribus geminatis, pedunculis glabris

calyces nudiusculos subæquantibus, pistillis hirsutis, tomento ramulorum arctè adpresso.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in montosis. (v. s.)

\*16. *G. acuminata*, foliis lanceolatis subacuminatis mu-<sup>173</sup> cronatis suprà punctato-scabris subtùs cinereo-tomentosis, racemis paucifloris porrectis recurvisve, pistillis hirsutis, calycibus demùm glabriusculis, ramulis pubescentibus.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in montosis. (v. s.)

17. *G. cinerea*, foliis ellipticis obovatisve mucronatis suprà scabriusculis subtùs cinereo-tomentosis, racemis paucifloris recurvis, pistillis hirsutis, calycibus pedunculisque lanatis.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in montosis ad ripas saxosas fluviorum. (ubi v. v.)

\*18. *G. mucronulata*, foliis obovatis obtusis mucronulatis suprà scabris nitentibus subtùs parùm sericeis, racemis abbreviatis, pistillis hirsutis, calycibus pilosiusculis pube adpressâ.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in ericetis. (ubi v. v.)

\*19. *G. Baueri*, foliis oblongis obtusis mucronulatis utrinque glabris lœvibus, racemis abbreviatis, pistillis hirsutis, calycibus pedunculisque glaberrimis.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in depressis a littore remotis. (ubi v. v.)

#### † C. ERIOSTYLLS.

*Folia omnia integerrima. Flores fasciculati, subumbellati. Pistillum lanatum, pedicellatum. Folliculus ecosystatus.*

\*20. *G. occidentalis*, foliis lanceolatis suprà punctatis scabris subtùs sericeis, fasciculis axillaribus terminalibusque, calycibus utrinque stylisque lanâ patulâ cinereis, stig-<sup>174</sup> mate mutico.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in sylvis solo sterili. (ubi v. v.)

\*21. *G. sphacelata*, foliis oblongis lanceolatisve suprà punctis minutis scabriusculis subtùs sericcis, fasciculis terminalibus, calycibus extùs ferrugineo-tomentosis intùs stylisque cinereo lanatis, stigmate mutico.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in saxosis. (ubi v. v.)

\*22. *G. phylicoides*, foliis linear-lanceolatis: suprà punctato-scabris superioribus villosis; subtus pubescentibus cinereis, stigmatibus ovalibus appendice duplo longioribus.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in montibus saxosis. (ubi v. v.)

23. *G. buxifolia*, foliis ellipticis suprà punctatis scabris subtùs tomento adpresso cinereis, stigmatibus orbiculatis appendicem curvam vix æquantibus.

Emboth. buxifolium. *Smith, New Holl.* 29, t. 10.  
*Willd. Sp. Pl.* 1, p. 538. *And. Repos.* 218.

*Embothrium genianthum. Cav. Ic.* 4, p. 60, t. 387.

HAB. In Novæ Hollandiæ orâ australi; prope Port Jackson: in ericetis saxosis. (ubi v. v.)

#### † D. PLAGIOPODA.

Folia integerrima v. divisa. Racemus thyrsiformis. Pedicellus ovarii accretus apici obliquo pedunculi, cui utrinque foliola duo calycis unum supra alterum inserta!

\*24. *G. Goodii*, foliis integerrimis oblongis undulatis venosis utrinque glabris, racemis elongatis pedunculatis, caulis prostratis.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpenteria, et Arnhem's Land: in depressis arenosis, prope littora. (ubi v. v.)

\*25. *G. venusta*, foliis pinnatifidis v. trifidis passimque

indivisis subtùs sericeis, racemis erectis, calycibus glaberimis, stylis hirsutissimis.

HAB. In Novæ Hollandiæ orâ orientali; prope Cape Townsend: in umbrosis, ad radices montium. (ubi v. v.)

† E. CALOTHYRSUS. (GREVILLIA strictè sic dicta.)

Racemus thyrsiformis. Folia pinnatifida (rarò passim indivisa).

\*26. G. *pungens*, foliis pinnatifidis suprà glabris subtùs argenteis: laciniis subulato-linearibus mucronatis pungen-tibus, racemis refractis, calycibus pistillisque glaberimis.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpen-taria: prope littora. (ubi v. v.)

\*27. G. *Dryandri*, foliis pinnatis subtùs sericeis: foliolis elongato-linearibus, racemis pedunculatis porrectis longis-simis, calycibus insertione subobliquis pistillisque glaber-imis, caule patulo.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpen-taria, Arnhem's Land: prope littora. (ubi v. v.)

\*28. G. *aspleniiifolia*, foliis elongatis linearibus pinnati-fido-incisis integerrimisque subtùs tomentosis, racemis folio-ter brevioribus, calycibus pubescentibus, stylis glabris.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: rariùs. (v. s. in Herb. Banks.)

\*29. G. *Banksii*, foliis pinnatifidis subtùs sericeis: laci-niis elongato-lanceolatis, racemis erectis æqualibus, caly-cibus tomentosis, stylis glabris, ovariis sessilibus.

HAB. In Novæ Hollandiæ orâ orientali; Keppel Bay, Pine Port, &c.: in collibus saxosis. (ubi v. v.)

\*30. G. *Chrysodendrum*, foliis pinnatifidis bipinnatifi-disque: laciniis angusto-linearibus elongatis, racemis cylindraceis: floribus semiverticillatis, calycibus tomentosis basi persistenti! ovariis subsessilibus, stylis glabris.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v.)

†† CYCLOPTERA.

Folliculi lignei, subrotundi, basi styli mucronati. Semina undique alata.

\*31. *G. heliosperma*, foliis pinnatis subbipinnatisque glabris: pinnis oblongo-linearibus v. oblongis: inferioribus petiolatis, racemis divisis erectis, calycibus pistillisque glaberrimis.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v.)

\*32. *G. refracta*, ioliis pinnatis passim indivisis: foliolis elongato-linearibus subtûs argenteis, racemis refractis divisus, calycibus sericeis, pistillis glaberrimis.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v.)

177 \*33. *G. ceratophylla*, foliis 2-3-fidis indivisisque subtûs nervosis sericeis: laciiniis elongato-linearibus, folliculis glaberrimis ovalibus.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v. sine flor.)

\*34. *G. mimosoides*, foliis integerrimis ensiformibus planis nervosis ramisque glabris, folliculis obovatis viscidis.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v. sine flor.)

\*35. *G. polystachya*, foliis linear-ensiformibus integerimis laxis subtûs nervosis sericeis, racemis terminalibus alternis, pistillis semunciam longioribus, stigmate obliquo concavo papillâ centrali.

HAB. In Novæ Hollandiæ orâ orientali, intra tropicum. (ubi v. v.)

\*36. *G. striata*, foliis linear-ensiformibus integerrimis strictis subtûs multinervibus sericeis, racemis terminalibus

alternis, pistillis semunciat brevioribus, stigmate verticali depresso-conico.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v. sinc fruct.)

\*37. *G. lorea*, foliis teretibus! pendulis longissimis, stigmate truncato-pyramidalis.

HAB. In Novæ Hollandiæ orâ orientali, prope littora; Shoalwater Bay. (ubi v. v. sine fruct.)

\*38. *G. gibbosa*, foliis elongato-lanceolatis integerrimis pubescentulis uninervibus venosis, racemis elongatis, <sup>178</sup> stigmate conico, folliculis gibboso-incrassatis.

HAB. In Novæ Hollandiæ orâ orientali, intra tropicum; prope Endeavour River. *J. Banks, Bart.* (v. s.)

## 26. HAKEA.

*Schrud. Sert. Hanov. Cavan. Ic. 6. Labill. Nov. Holl. 1, p. 30. Pers. Syn. 117. Conchium. Smith, Linn. Trans. iv, p. 215. Vent. Malmais. 110. Gært. Carp. 3, p. 216.*

CHAR. GEN. *Calyx* tetraphyllus, irregularis, foliolis secundis. *Stamina* apicibus concavis calycis immersa. *Glandula* hypogyna unica, dimidiata (raro biloba). *Ovarium* pedicellatum, dispermum. *Stigma* subobliquum, e basi dilatata conico-mucronatum. *Folliculus* unilocularis, ligneus, loculo excentrico, pseudobivalvis. *Semina* alâ apicis nucleo longiore.

HABITUS. Frutices rigidi, quandoque Arbores mediocres; pube dum adsit medio affixa. Folia sparsa, in variis varia, nunc in eodem frutice diversiformia. Fasciculi v. Racemuli, saepius axillares, in plerisque involucrati, squamis imbricatis, scariosis, caducis, rudimenta ramulorum quandoque simul inincidentibus, ideoque potius pro gemmâ habendis, sed genus, unicâ exceptâ specie, a confinibus, optimè distinguentibus, aliis notis in quibusdam vacillantibus. Pedicelli colorati, in

*racemosis geminati, paribus unibracteatis. Flores parvi, albi v. ochroleuci. Pistillum glaberrimum, stylo subdeciduo. Capsula parietibus incrassatis. Semina nigra, raro cinerea.*

† *Folia omnia filiformia.*

A. *Capsulae juxta apicem ecalcaratae.*

1. *H. pugioniformis*, foliis filiformibus indivisis glabris, calycibus sericeis hirsutis, capsulis lanceolatis acuminatis rectis utrinque infra medium transversim cristatis.

<sup>1791</sup> a. Calyces sericci.

### 31. KNIGHTIA.

CHAR. GEN. *Calyx* tetraphyllus, regularis, foliolis revolutis. *Stamina calyci* extra medium inserta. *Glandulæ hypogynæ* quatuor. *Ovarium* tetraspermum, sessile. *Stigma* verticale subclavatum. *Folliculus* coriaceus, stylerus, unilocularis. *Semina* apice alata.

HABITUS. Arbor excelsa. Folia sparsa, serrata. Racemi axillares, floribus geminatis, paribus unibracteatis. Folliculi oblongi, tomentosi.

Genus proximum Rhopalæ, distinctum, Seminibus quaternis, apice solùm alatis.

This genus, which was discovered by Sir Joseph Banks, is, with his approbation, named in honour of his friend Thomas Andrew Knight, Esq., the author of many valuable essays on Vegetable Physiology, published in the Philosophical Transactions.

For the figure here given I am also indebted to the liberality of the illustrious President of the Royal Society, who has enabled me to complete the account of this remarkable plant, by permitting me to copy Dr. Solander's description, which I was the more desirous to give, as it exhibits a specimen of the accuracy with which subjects of natural history were investigated in that celebrated voyage; of whose important results it is to be lamented so little is known to foreign naturalists, though in this country they have ever been open to the public, and in the most advantageous manner.

*KNIGHTIA excelsa.* Tab. 36 (II).

HAB. In Novâ Zelandiâ; prope Tolaga et Opuragi.  
*Josephus Banks*, Baronetus. (v. s. folliculis vacuis sed impressionibus seminum insignitis.)

DESC. *Arbor* sylvestris, magna, sæpè 80 pedalis. *Caudex* strictissimus. *Rami* erecti, teretes, glabri. *Ramuli* ultimi parùm compressi, villosiusculi. *Coma* pyramidalis. *Folia* numerosa, densè sparsa, erecta, petiolata, lanceolato-oblonga (v. oblonga), acutiuscula, profundè serrata, serratis remotis obtusis, plana, coriacea, rigida: supernè glabra, nitida, laevia, subtùs venosa venulisque numerosissimis subreticulata, villis copiosissimis brevissimis densissimis cinerascentia: 4-5 uncias longa. *Petioli* foliis sexies breviores. *Racemi* sessiles, axillares, simplices, multiflori, ovato-oblongi, foliis duplò breviores, sæpè in ramis nudis collocati, ubi ante decessum foliorum axillares fuerunt, unde primo intuitu videntur quasi lateribus ramorum erumpentes. *Rachis* ruberrima. *Pedicelli* holosericei, <sup>105]</sup> ruberrimi, crassiusculi, patentissimi, semunciales, bipartiti, unde biflori. *Calyx* tetraphyllus, foliola ante expansionem arctè in tubum connata, linearia, acutiuscula, sesquiuncialia, coriacea, extùs villosa holosericea, ruberrima, usque ad basin revoluta, æqualia, in medio paulò angustiora. *Glandulae* quatuor, receptaculo inter basin foliolorum insertæ, e latâ basi acutæ, virescentes, apice rubicundæ, semilineam longæ. *Filamenta* quatuor, unguibus petalorum adiata, suprà medium per spatium lineare libera, filiformia, plana, erecta, rubicunda. *Antheræ* lineares, longitudine foliolorum, supernè parùm incurvæ, flavæ, ipso apice casso lanceolato. *Ovarium* conicum, subangulatum, villosiusculum, rubrum. *Stylus* filiformis, crassiusculus, strictus, persistens, longitudine filamentorum, rubicundus. *Stigma* cylindraceo-angulatum, incrassatum, apice attenuatum, longitudine antherarum, virescens. *Folliculus* oblongolanceolatus, stylo persistenti coronatus, coriaceus, crassus, durus, unilocularis, sesquiuncialis v. paulò longior, extùs sericeus. *Hactenus* SOLANDER.

OBS. Pollen triangulare, angulis per lentem pellucitoribus, flavum. *Ovarium* tetraspermum, ovulis apicallatis.

### 32. EMBOTHRIUM.

*Embothrii species. Forst. Gen. 15, t. 8, litt. g. et seq.*

CHAR. GEN. *Calyx* irregularis, hinc longitudinaliter fissus, inde quadrifidus. *Stamina* apicibus concavis calycis immersa. *Glandula hypogyna unica*, semiannularis. *Ovarium* pedicellatum, polyspermum. *Style* persistens. *Stigma* verticale, clavatum. *Folliculus* oblongus. *Semina* apice alata.

HABITUS. Frutices v. *Arbusculæ glabrae*. Ramuli squamis persistentibus gemmarum quandoque obsiti. Folia sparsa, integerrima. Racemi terminales, corymbosi, paribus pedicellorum unibracteatis: Involucro communi nullo. Flores coccinei, glaberrimi.

1. *E. coccineum*, foliis ovali-oblongis obtusis mucronulatis: paginis discoloribus, ramulis squamatis.

*Embothrium coccineum. Forst. Gen. p. 16, t. 8, litt. g. —m. Linn. Suppl. 128. Forst. Com. Soc. Reg. Goett. 9, p. 24. Lam. Encyc. Botan. 2, p. 351.\* Illust. Gen. 1, p. 244, n. 1284, t. 55, f. 2. Willd. Sp. Pl. 1, p. 537.*

HAB. In Americâ Australi ad littora freti Magellanici, et in Terra del Fuego. (v. s. in Herb. Banks.)

OBS. Pollen ellipticum, levissimè arcuatum, extremitate utrâque pelluentiore; fovilla majusculâ globosâ.

2. *E. lanceolatum*, foliis lanceolato-linearibus, ramis esquamatis.†

*Embothrium lanceolatum. Flor. Peruv. et Chil. 1, p. 62, t. 96.*

HAB. In Chili collibus et montibus altis, inter Concepcionis urbem et Arauci arcem. *Flor. Peruv. l. c.*

### 33. OREOCALLIS.

*Embothrii species. Flor. Peruv. et Chil.*

CHAR. GEN. *Calyx* irregularis, hinc longitudinaliter

fissus, inde quadridentatus. *Stamina* apicibus concavis calycis immersa. *Glandula* nulla hypogyna. *Ovarium* pedicellatum, polyspermum. *Stigma* obliquum, orbiculato-dilatatum, concaviusculum. *Folliculus* cylindraceus. *Semina* apice alata. *Involucrum* (racemi) nullum.

**HABITUS.** Frutex *speciosus*. Folia *sparsa*, *integra*, *paginis discoloribus*. Racemus *thyrsoides*, *terminalis*, *paribus pedicellorum unibracteatis*. Flores *coccinei*, *gla-berrimi*.

**ETYM.** Ορος mons, et καλος formosus.

[<sup>197]</sup> **OREOCALLIS grandiflora.**†

*Embothrium grandiflorum*. *Lam. Encyc. Botan.* 2, p. 354.\* *Illust. Gen.* 1, p. 244, n. 1283. *Willd. Sp. Pl.* 1, p. 538.

*Embothrium emarginatum*. *Flor. Peruv. et Chil.* p. 62, t. 95.

**HAB.** In Peruviae montibus; in collibus frigidis Provinciae Tarmæ. *Flor. Peruv.* l. c.

### 34. TELOPEA.

*Embothrii* species. *Smith, Salisb.*

**CHAR. GEN.** *Calyx* irregularis, hinc longitudinaliter fissus, inde quadriditus. *Stamina* apicibus concavis calycis immersa. *Glandula* hypogyna unica, subannularis. *Ovarium* polyspermum, pedicellatum. *Stylus* persistens. *Stigma* obliquum, clavatum, convexum. *Folliculus* unicellularis, cylindraceus. *Semina* apice alata, alâ hinc immarginatâ inde vasculosâ nervo obliquè recurrenti. *Involucrum* (racemi v. corymbi) imbricatum, deciduum.

**HABITUS.** Frutices *ramis determinatis*. Folia *sparsa*, *dentata* v. *integra*. Racemi *terminales*, *corymbosi*, *paribus pedicellorum unibracteatis*. Flores *coccinei*.

**ETYM.** τηλωπος qui e longinquo cernitur, quod de his fruticibus, floribus coccineis speciosis, valet.

In this genus, as well as in Lomatia, and perhaps in all those with an indefinite number of seeds, an extremely

thin black-brown crust is interposed between the ripe seeds, exactly corresponding with them in size and form, and which is probably the remains of a fluid matter that had separated them in the unripe state.

The most important characters distinguishing this genus from Lomatia, seem to be the single semiannular or nearly circular gland, the cohering calyx, and the vascular wing of the seed; for the Involucrum, which at first seems to ~~not~~ afford so excellent a distinction, considerably loses its importance in *Telopea truncata*, in which it almost always includes the rudiments of branches, as in Hakea. In natural affinity Telopea approaches much more nearly to Oreocallis, which differs principally in having no gland at the base of the footstalk of its ovary, and in the want of an Involucrum: the wing of the seed seems (from the figure in the Flora Peruviana) to be in like manner vascular. Embothrium itself, which is also very near akin to Telopea, is distinguishable by its vertical stigma, oval pollen, and naked corymbi.

1. *T. speciosissima*, foliis cuneato-oblongis inciso-dentatis venosis cum ramulis involucrisque glaberrimis.

Embothrium speciosissimum. *Smith, New Holl.* 19, t. 7. *Sims, Bot. Mag.* 1128.

\*2. *B. sphærocarpa*, foliis acerosis integerrimis mucronulatis (uncialibus), calycis unguibus laminisque hirsutis, stigmate subulato, strobilis globosis, folliculis ventricosis apice compressiusculis.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in ericetis depressis. (ubi v. v.)

\*3. *B. nutans*, foliis acerosis integerrimis mucronulatis, amentis nutantibus, calycibus sericeis, folliculis apice dilatatis depressis.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in ericetis aridis prope littora. (ubi v. v.)

4. *B. ericifolia*, foliis acerosis emarginato-bidentatis (unguicularibus): marginibus integerrimis, amentis elongatis, calycibus sericeis, stigmate capitato.

*Banksia ericæfolia*. *Linn. Suppl.* 127. *Lam. Encyc. Botan.* 1, p. 369. *Illust. Gen.* 1, p. 242, n. 1276. *Willd. Sp. Pl.* 1, p. 536. *And. Repos.* 156. *Cavan. Anal. de Hist. Nat.* 1, p. 221.\* *Ic.* 6, p. 27, t. 538. *Pers. Synop.* 1, p. 117.

*Banksia*. *White's Voy. tab.* ad p. 225, fig. 1, strobilus.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in ericetis saxosis. (ubi v. v.)

5. *B. spinulosa*, foliis (adultis) acerosis (1—3-uncialibus) apice tridentatis dente intermedio longiore: marginibus spinuloso-dentatis integerrimisve, calycibus basi intùs imberbibus, stigmate subulato.

*Banksia spinulosa*. *Smith, New Holl.* 1, p. 13,\* t. 4.  
<sup>204</sup> *Willd. Sp. Pl.* 1, p. 536. *Cavan. Anal. de Hist. Nat.* 1, p. 219.\* *Ic.* 6, p. 26,\* t. 537. *Pers. Synop.* 1, p. 17.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in ericetis aridis. (ubi v. v.)

Obs. Frutex est et saepius humilis, nec Arbor decempetalis, &c. ut habet Cavanilles. l. c.

\*6. *B. collina*, foliis linearibus spinuloso-dentatis denticulo terminali breviore subtùs venosis, bracteis amenti obtusis apice tomentosis, calycibus basi intùs imberbibus, caule fruticoso.

HAB. In Novæ Hollandiæ orâ orientali; in collibus apricis prope littora. Hunter's River. (ubi v. v.)

\*7. *B. occidentalis*, foliis lineäribus extra medium spinuloso-dentatis subtùs aeniis, bracteis amenti apice glabris,

calycibus marcescentibus : unguibus basi intùs barbatis, folliculis ventricosis tomentosis : apice compressiusculo nudo, caule fruticoso, ramulis glabris.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in ericetis. (ubi v. v.)

\*8. *B. littoralis*, foliis elongato-linearibus spinulosodentatis basi attenuatis subtùs aveniis, calycibus deciduis, folliculis compressis bracteisque strobili apice tomentosis, caule arboreo, ramulis tomentosis.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : ad littora arenosa sinuum. (ubi v. v. flor. delaps.)

9. *B. marginata*, foliis linearibus truncatis mucronulatis integrerrimis v. dentatis : venulis subtùs inconspicuis, ramis ultinis hirsutis, bracteis omnibus amenti apice glabris : majoribus acutis, caule fruticoso.

*a.* Frutex erectus, orgyalis. Amentum foliis plerumque integris longius.

*Banksia marginata*. *Cavan. Anal. de Hist. Nat.* 1, p. 227. *Ic.* 6, p. 29,\* t. 544.

*β.* Frutex erectus, orgyalis. Folia spinuloso-dentata, planiuscula, amento quandoque longiora.

*Banksia microstachya*. *Cavan. Anal. de Hist. Nat.* 1, p. 224. *Ic.* 6, p. 28,\* t. 541, exclud. syn. Linnei.

*γ.* Frutex humilis, diffusus. Folia spinuloso-dentata, planiuscula, cuneata, amento longiora.

HAB. In Novæ Hollandiæ orâ orientali ; prope Port Jackson : in ericetis. (ubi v. v.)

\*10. *B. depressa*, foliis elongato-cuneatis truncatis mucronulatis spinuloso-dentatis : subtùs obsoletè costatis venulis inconspicuis, bracteis omnibus amenti (folia vix æquantis) tomentosis obtusis, caule prostrato, ramulis ultimis hirsutis.

HAB. In Insulæ Diemen plagis australioribus ; in saxosis ad radices montium. (ubi v. v.)

\*11. *B. patula*, foliis cuncato-linearibus truncatis mucro-

nulatis integris v. paucidentatis (uncialibus) subtùs reticulato-venosis, bracteis amenti apice tomentosis obtusis, calycis laminis carinâ glabrâ, caule diffuso, ramulis ultimis tomentosis.

HAB. In Novæ Hollandiæ orâ australi; Flinders' Land: inter frutices, in sterilibus elevationibus. (ubi v. v.)

\*12. *B. australis*, foliis linearibus truncatis mucronulatis margine recurvis integris subtùs reticulato-venosis, raimulis <sup>206</sup> ultimis tomentosis, bracteis amenti obtusis subæqualibus apice tomentosis, calycis laminis carinâ obsoletissimâ sericeâ, caule arboreo.

HAB. In Insulâ Diemen, ubique in campis et prope littora, neenon in orâ australi Novæ Hollandiæ prope Port Phillip. (ubi v. v.)

\*13. *B. insularis*, foliis lineari- v. cuneato-oblongis subrotundatis cum mucronulo sparsis verticillatisve subtùs reticulato-venosis, bracteis amenti obtusis extrorsum tomentosis, folliculis compressis apice glabris.

HAB. In Insulis Freti Bass, et in Insulâ Diemen, prope littora. (ubi v. v.)

14. *B. integrifolia*, foliis verticillatis oblongo-lanceolatis integris mucronulatis: subtùs venulis reticulantibus conspicuis, folliculis tomentosis, caule arboreo.

a. Arbor parva v. mediocris. Folia oblanceolata, saepius acuta, basi attenuata. Bracteæ geminateæ obtusæ, solitariis acutis dimidio minores.

*Banksia integrifolia*. Linn. *Suppl.* 127. *Lam. Encyc. Botan.* 1, p. 369. *Illust. Gen.* 1, p. 242, n. 1275. Willd. *Sp. Pl.* 1, p. 535. *Cavan. Anal. de Hist. Nat.* 1, p. 229. *Ic.* 6, p. 30, *tab.* 546.

*Banksia spicata*. *Gärt. Sem.* 1, p. 221, *t.* 48.

*Banksia oleæfolia*. *Cavan. Anal. de Hist. Nat.* 1, p. 228. *Ic.* 6, p. 30, *t.* 545.

*Banksia glauca*. *Cavan. Anal. de Hist. Nat.* 1, p. 230. *Ic.* 6, p. 31.\*

β. Arbor magna. Folia lanceolato-oblonga, saepius ob-

tusiuscula, basi acuta. Bractæ geminatæ obtusæ, solitariis acutiusculis haud dimidio minores.

HAB. In Novæ Hollandiae orâ orientali; prope Port Jackson: juxta littora marina.  $\beta$ . In orâ australi, prope Port Phillip. (v. v.)

Obs. Species polymorpha, cui nimis affines sunt *B. insularis* et *compar*.

\*15. *B. compar*, foliis sparsis lingulato-oblongis emarginatis muticis dentatis integris: subtus reticulato-venosis niveis, ramulis bracteisque tomentosis, calycibus sericeis, caule arboreo.

HAB. In Novæ Hollandiae orâ orientali; prope Keppel Bay: juxta littora. (ubi v. v. absque fructu.)

Obs. Præcedenti proxima; an distincta species?

\*16. *B. verticillata*, foliis verticillatis lingulato-oblongis obtusis muticis: subtus aeniis niveis, bracteis amenti tomentosis obtusis; involucratis hirsutis, caule arboreo.

HAB. In Novæ Hollandiae orâ australi; Lewins Land: prope littora. (ubi v. v.)

\*17. *B. coccinea*, foliis alternis cuncato-obovatjs oblongis: dentatis truncatis costatis reticulato-venosis basi transversis, bracteis subulatis calycibusque lanatis, stigmate pyramidali.

HAB. In Novæ Hollandiae orâ australi; Lewins Land: in campis prope littora. (ubi v. v.)

\*18. *B. paludosa*, foliis subverticillatis cuneato-oblongis subtruncatis basi attenuatis extra medium dentato-serratis margine subrecurvis: subtus costatis reticulato-venosis, petiolis ramulisque glabris, calycibus sericeis, caule fruticoso.

HAB. In Novæ Hollandiae orâ orientali; prope Port Jackson: in paludosis. (ubi v. v.)

19. *B. oblongifolia*, foliis sparsis angusto-oblongis <sup>1208</sup> truncatis dentato-serratis basi acutiusculis: subtus costatis

reticulato-venosis, petiolis ramulisque tomentosis, bracteis majoribus amenti acuminatis, calycibus sericeis, caule fruticoso.

Banksia oblongifolia. *Cavan. Anal. de Hist. Nat.* 1, p. 225.\* *Ic.* 6, p. 28,\* t. 542.

Banksia asplenifolia. *Salisb. Prod.* 51?

Banksia salicifolia. *Cavan. Anal. de Hist. Nat.* 1, p. 231. *Ic.* 6, p. 31,\*? folia enim in hac specie quandoque integra.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in ericetis. (ubi v. v.)

20. B. *latifolia*, foliis obovato-oblongis spinuloso-serratis basi acutis: subtûs costatis reticulatis cinereo-tomentosis, calycis unguibus sericeis: laminis glabris, caule fruticoso.

Banksia robur. *Cavan. Anal. de Hist. Nat.* 1, p. 226.\* *Ic.* 6, p. 29,\* t. 543.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in paludosis. (ubi v. v.)

OBS. Hujus speciei nomen Cavanillesii mutare coactus sum, quoniam nunquam arborescit sed frutex humilis est.

21. B. *marcescens*, foliis cuneiformibus planis sparsis truncatis extra medium dentato-serratis: basi acutiusculâ, ramis tomentosis, calycibus persistentibus folliculisque glabris.

Banksia præmorsa. *And. Repos.* 258.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: prope littora. (ubi v. v.)

OBS. Cùm folia minimè præmorsa falsum nomen mutare non hesitavi.

<sup>2001</sup>\*22. B. *attenuata*, foliis elongato-linearibus truncatis basi attenuatis extra medium serratis: subtûs costatis reticulatis areolis tomentosis, bracteis apice hirsutis, calycibus glabris, folliculis tomentosis.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: prope littora. (ubi v. v.)

\*23. *B. elatior*, foliis elongato-linearibus subtruncatis serratis subtus reticulatis: adultis glabriusculis, bracteis imberibus calycibusque tomentosis, stylo glaberrimo, stigmate ovali-clavato, caule arboreo.

HAB. In Novæ Hollandiæ orâ orientali; prope Sandy Cape: prope littora. (ubi v. v.)

24. *B. serrata*, foliis lato-linearibus elongatis truncatis serratis: subtus reticulatis glabriusculis: basi attenuatâ, stylo imo pulvereo-pubescenti, stigmate cylindraceo sulcato: basi obliquè incrassatâ, caule arboreo.

*Banksia serrata*. *Linn. Suppl.* 126.\* *Lam. Encyc. Botan.* 1, p. 369. *Illust. Gen.* 1, p. 242, t. 54, f. 1. *White's Voy.* 222, cum tab. 2 prioribus. *Willd. Sp. Pl.* 1, p. 535. *And. Repos.* 82.

\*31. *B. ilicifolia*, foliis cuneatis inciso-serratis subtus glabriusculis, amentis brevissimis, calycis unguibus diu cohærentibus stylum æquantibus: laminis citius dehiscentibus!

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in campis collibusque prope littora. (ubi v. v.)

OBS. Species tam singularis ut ferè proprii generis, transitorum ad Dryandras facilem reddit.

## 38. DRYANDRA.

**CHAR. GEN.** *Calyx* quadripartitus v. quadrifidus. *Stamina* apicibus concavis laciniarum immersa. *Squamulæ* hypogynæ quatuor. *Ovarium* bilocularis, loculis monospermis. *Folliculus* bilocularis, ligneus: *Dissepimento* libero, bifido. *Receptaculum commune* planum, floribus indeterminatim confertis, paleis angustis, rarò nullis. *Involucrum commune* imbricatum.

**HABITUS.** Frutices plerumque humiles. Rami dum adsint sparsi vel umbellati. Folia sparsa, pinnatifida v. incisa, plantæ juvenilis conformia. Involucra solitaria, terminalia, rarò lateralia sessilia, foliis confertis interioribus quandoque nanis obvallata, hemisphærica, bracteis adpressis, in quibusdam apice appendiculatis.

**OBS.** Dryandra of Thunberg, first published in Flora <sup>1819</sup> Japonica, being not generically different from Aleurites, which was previously established by Forster, I have peculiar satisfaction in giving the name of my respected friend, Mr. DRYANDER, to a genus so nearly related to Banksia, from which indeed it differs chiefly in Inflorescence, but in that respect so widely as to be at once distinguishable: there is also something in the habit, especially in the leaves of the greater number of species, by which, independent of the parts of fructification, the genus is pretty certainly indicated; and it is worthy of notice, that, while Banksia is generally spread over all the coasts of New Holland and of Van Diemen's Island, Dryandra has hitherto been observed only on that part of the south coast called Lewins Land, where, however, its species are nearly as numerous and abundant as those of Banksia itself.

\*1. *D. floribunda*, foliis cuneiformibus inciso-serratis, involuci bracteis exterioribus glabriusculis, calycis laminis glabris, stigmate subclavato obtuso.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land : in collibus saxosis. (v. v.)

Variat receptaculo epaleato.

\*2. *D. cuneata*, foliis cuneiformibus sinuato-dentatis spinozis petiolatis, involucri bracteis omnibus sericeis, calycis laminis barbatis, stigmate subulato-filiformi acuto.

*a.* Folia vix sesquiunciam longa, dentibus terminalibus sub equalibus.

*b.* Folia biuncialia, apicis dilatati denticulo medio breviore sinubus latioribus. Forsan species distincta.

<sup>213]</sup> HAB. In Novæ Hollandiæ orâ australi; Lewins Land : in collibus saxosis. (ubi v. v.)

\*3. *D. armata*, foliis pinnatifidis : lobis triangularibus planis divaricatis rectis spinoso-mucronatis : terminali proximis longiore ; subtùs reticulatis venulis nudis, ramis calycisque laminis glabris, stylo basi pubescenti, stigmate subulato sulcato.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land : in collibus saxosis. (ubi v. v.)

\*4. *D. falcata*, foliis pinnatifidis : lobis subulato-triangularibus divaricatis falcato-recurvis spinoso-mucronatis : terminali proximis breviore ; subtùs reticulatis venulis nudis, ramis pubescentibus, laminis calycis styloque longitudinaliter glabris, stigmata clavato exsulco.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land : in collibus saxosis. (ubi v. v.)

\*5. *D. formosa*, foliis elongato-linearibus pinnatifidis : lobis scaleno-triangularibus muticis planis subtùs niveis, involucris tomentosis : foliolis interioribus linear-oblongis, receptaculo paleaceo. *Tab. 37 (III).*

HAB. In Novæ Hollandiæ orâ australi; Lewins Land : in sterilibus prope littora. (ubi v. v.)

\*6. *D. mucronulata*, foliis elongato-linearibus pinnatifidis : lobis isoscelo-triangularibus mucronulatis planis subtùs

niveis, involucris tomentosis : foliolis interioribus linearibus mucronatis, receptaculo paleaceo, caule subsimplici.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land : <sup>[214]</sup> in depressis saxosis. (ubi v. v.)

\*7. D. *plumosa*, foliis elongato-linearibus pinnatifidis : lobis isoscelo-triangularibus mucronulatis margine subrecurvis subtûs niveis, involuci foliolis interioribus plumosaristatis, receptaculo epaleato.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in lateribus saxosis collium. (ubi v. v.)

\*8. D. *obtusa*, foliis linearibus pinnatifidis caule decumbenti tomentoso longioribus : lobis triangularibus obtusis subtûs niveis margine incrassato-recurvis, involuci bracteis exterioribus ovatis : interioribus linear-i-oblongis.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in apricis prope littora. (ubi v. v.)

9. D. *nivea*, foliis linearibus pinnatifidis caulem glabrum subæquantibus : lobis scaleno-triangularibus acutis mucronulatis subtûs niveis margine recurvis, involuci bracteis linear-i-lanceolatis glabris ciliatis, calyce quadrifido, unguibus laminisque hirsutis.

*a.* Folia lobis adscendentibus, mucronatis, subtûs venosis. Stigma stylo parùm crassius.

Banksia nivea. *Labil. Voy.* 1, p. 413, t. 24. *Nov. Holl.* 2, p. 118.

*b.* Folia lobis divaricatis, uninervibus, subaveniis. Stigma stylo vix crassius.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in saxosis prope littora. (ubi v. v.)

\*10. D. *longifolia*, foliis linearibus pinnatifidis longissimis acutis subtûs cinereo-tomentosis : basi attenuatâ integrimâ ; lobis triangularibus adscendentibus decurrentibus margine recurvis, involuci bracteis elongato-linearibus margine barbatis extûs glabris, calycis unguibus basi lanatis supra pubescentibus : laminis pilosiusculis, caule tomentoso.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land : in collibus saxosis. (ubi v. v.)

\*11. *D. tenuifolia*, foliis elongato-linearibus pinnatifidis subtruncatis subtûs niveis : basi attenuatâ integerrimâ petioliformi ; lobis triangulâribus decurrentibus divaricatis margine recurvis, involucri bracteis tomentosis: exterioribus ovato-lanceolatis, calycis unguibus basi lanatis suprà caule glabris.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land : in ericetis. (ubi v. v.)

\*12. *D. pteridifolia*, foliis pinnatifidis caule tomentoso longioribus : lobis linearibus acutis mucronatis margine revolutis basi dilatatis, involucri bracteis tomentosis ovatis.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land : ad latera saxosæ collium. (ubi v. v.)

\*13. *D. blechnifolia*, foliis pinnatifidis caule tomentoso longioribus : lobis linearibus obtusis mucronulatis trinervi- bus margine recurvis basi simplici.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land : prope King George's Sound. *D. Archibald Menzies.* (v. s. absque fructificatione.)

OBS. Ad hoc genus retuli, ob summam affinitatem cum *Dryandrâ pteridifoliâ*, cuius vix varietas.

<sup>216</sup> To RENDER this essay as complete as I am able, I proceed to notice such plants, as either belong or have been referred to Proteaceæ, but from my imperfect acquaintance with which, or from the unsatisfactory accounts hitherto given of them, could not with certainty be referred to any of the genera described, or, if referable to any of them, I could not with confidence propose as distinct species; and shall conclude with the addition of a few synonyms to the species described, from Ray's Historia Plantarum, which

had escaped me when the paper was first read to the Society.

**LEUCADENDRON linifolium**, foliis linearis-spathulatis aversis basi attenuatis ramisque glabris, capitulo masculo sessili foliis circumvallantibus longiore, calycis tubo barbato: laminis stylisque imberbis.

*Protea linifolia.* *Jacq. Hort. Schœnb.* 1, p. 11, t. 26.

Obs. There can be no doubt of the genus of this plant, or of the individual figured by Jacquin being a male. From the same figure, by which alone I am acquainted with it, it seems to be very nearly related to *Leucadendron tortum*, from which it differs in having the male heads sessile, and in the laminæ of the calyx being quite smooth.

**LEUCADENDRON fusciflorum**, foliis linearis-lanceolatis glabris junioribus rectis basi attenuatis, capitulo femineo foliis circumvallantibus breviore, calycis laminis plumoso-barbatis: tubo pilosiusculo.

*Protea fusciflora.* *Jacq. Hort. Schœnb.* 1, p. 11, t. 27.

This also is known to me only from Jacquin's figure, [217] from which it is unquestionably a Leucadendron, and a female plant; it can hardly however be supposed the female of the preceding species; and though I have constructed a specific character for it, I think it is not improbably a variety of *Leucadendron angustatum*.

#### LEUCADENDRON.

*Protea linearis.* *Houtt. Nat. Hist. par.* 2, vol. 4, p. 116, t. 19, f. 2, ed. *Germ.* vol. 3, p. 84, t. 19.

This is undoubtedly a Leucadendron, and probably a female plant; but from the figure alone its species cannot be determined.

#### LEUCADENDRON.

*Protea stellaris.* *Sims, Bot. Mag.* 881.

Seems to be a male plant, and apparently different from anything I have seen. From the form of the leaves and the length of those surrounding the capitulum, I am

inclined to consider it as the male of Jacquin's *Protea fusciflora* already noticed.

#### LEUCADENDRON.

*Conocarpodendron*; folio tenuissimo, angustissimo, saligno; cono calyculato. *Boerh. Lugd. Bat.* 2, p. 203, c. tab.

This is probably a male plant, notwithstanding the figure of a ripe cone is given at the bottom of the plate; the separate fruits of some of Boerhaave's figures belonging decidedly to very different species. It may be the male of *Leucadendron adscendens*.

#### LEUCADENDRON ?

*Protea odorata*. *Thunb. Prod. Append.* 187.

<sup>218</sup> There is no means of determining the genus of this plant, but it is rather more probably a Leucadendron than belonging to any other.

#### LEUCADENDRON ??

*Conocarpodendron*; acaulon; folio rigido, nervoso, oblongo, latiori; cono fusco; semine oblongo, in medio quasi excavato. *Boerh. Lugd. Bat.* 2, p. 201, c. tab.

I know not what to make of this. If the strobilus and nuces at the bottom of the plate really belong to it, it must be referred to Leucadendron, and will stand near *L. retusum* or *L. plumosum*; but there are some circumstances both in the figure and description which render this very doubtful. Thunberg refers it to his *Protea strobilina*, but the descriptions by no means agree.

#### LEUCADENDRON ?

*Scolymocephalus Oleæ folio*. *Sherard, in Raj. Hist.* 3, *Dendr.* p. 10.

This, according to Boerhaave, is his *Conocarpodendron*, &c. 2, p. 197, c. tab. which I have considered as the female of *Leucadendron squarrosum*.

#### LEUCADENDRON ??

*Protea glabra*. *Thunb. Diss.* n. 52.

From the very short and unsatisfactory description of Thunberg, the genus of this plant cannot be determined, or even with much probability guessed at.

#### ISOPOGON.

*Protea divaricata. And. Repos. 465.*

Can this be a variety of *Isopogon anemonifolius*? The yellow flowers satisfy me that it is not a species of <sup>[21]</sup> *Serruria*, and prevent me at the same time from referring it to *Isopogon anethifolius*, whose leaves are not unlike, but whose flowers are of a very different colour.

#### PROTEA.

*Protea venosa. Lam. Illust. Gen. 1, p. 234, n. 1212.  
Poiret, Encyc. Botan. 5, p. 640.*

Said by Poiret to resemble in most respects *Protea longiflora*; it must therefore be a genuine Protea.

#### PROTEA.

*Scolymodendros Africanus ex Monte Tabulari. Pluk. Mant. 168, t. 442, f. 4.*

This is manifestly a Protea, which it appears Plukenet had seen only in the possession of Woodward. The head, especially in the form of the bractæ, bears a great resemblance to that of *Protea cynaroides*; but the leaves are so very different, that, unless we suppose they were drawn from memory and disproportionately reduced, it cannot be referred to this species. It is probably however one of the more common kinds, and I know not what else to suppose it may be, except *Protea grandiflora*. The figure itself has never, so far as I know, been noticed by any author.

#### LEUCOSPERMUM.

*Scolymocephalus Africanus, foliis in summitate profundiùs crenatis, intercreniis majoribus, florum staminulis longis recurvis. Raj. Hist. 3, Dendr. p. 10.*

This is probably a Leucospermum, and perhaps *L. ellipticum*.

## 220] MIMETES?

*Protea dichotoma.* *Lam. Illust. Gen.* 1, p. 235, n. 1219.  
*Poiret, Encyc. Botan.* 5, p. 643.

Probably a spurious Mimetes.

**SERRURIA Bergii**, capitulis simplicibus solitariis subpendiculatis, bracteis cuneiformibus truncatis cum acumine villosis: inferioribus glabris, calycibus curvatis sericeis, stigmate turbinato-capitato, ramulis foliisque glabris.

*Leucadendron sphærocephalum.* *Berg. Cap.* 26.\*

This I have no hesitation in referring to Serruria; and from the description of the accurate Bergius I am disposed to think it distinct from any that I am acquainted with. It seems most nearly related to *Serruria acrocarpa*, differing chiefly in the smoothness of its branches, and in having terminal heads.

**SERRURIA.**

*Protea sphærocephala.* *Houtt. Nat. Hist. par.* 2, vol. 4, p. 99, t. 19, f. 1, ed. *Germ.* vol. 3, p. 72, t. 19.

Unquestionably a Serruria, and probably referable either to *S. hirsuta* or *pedunculata*.

**SERRURIA.**

*Protea villosa.* *Thunb. Prod. Append.* 186.

A Serruria whose characters cannot be made out from the specific difference given by Thunberg.

**SERRURIA.**

*Protea triternata.* *And. Repos.* 337.

This may be intended for *S. congesta*, but I cannot with confidence refer to it as such.

**SERRURIÆ.**

221] *Protea abrotanifolia minor.* *And. Repos.* 536.

*Protea abrotanifolia hirta.* *And. Repos.* 522.

*Protea abrotanifolia odorata.* *And. Repos.* 545.

These are manifestly Serruriæ, but I do not venture to refer them to any of the species I have described; nor are

there sufficient materials from which they may be characterized as distinct species.

#### NIVENIA.

*Protea concava.* *Lam. Illust. Gen.* 1, p. 234, n. 1217.  
*Poiret, Encyc. Botan.* 5, p. 642.

A species of Nivenia, and perhaps one of those described.

#### NIVENIA?

*Protea candicans.* *Thunb. Prod. Append.* 186.  
Probably a Nivenia, and perhaps not different from *N. mollissima*: it may however be a species of *Serruria*, in which case it is probably *S. candicans*.

#### PROTEA prostrata. *Thunb. Prod.* 27.

I know not to what genus this may belong; but from the species near which Thunberg has placed it, it may be supposed to be either a *Protea* or a *Leucadendron*: if the latter, it is probably not very different from *L. retusum*.

#### HAKEA.

*Conchium drupaceum.* *Gært. Carp.* 23, p. 217, t. 219.  
I cannot refer this fruit to any of the species I have described.

#### EMBOTHRIUM chaparro. *Humb. Aequin. Bot.*

Of this I know nothing but the name, which occurs in Humboldt's Chart of Aequinoctial Botany, and is placed there at the height of about 1600 feet.

#### EMBOTHRIUM strobilinum. *Labill. Nov. Holl.* 2, <sup>1822</sup> p. 116, t. 265.

The seeds of this remarkable plant, which I am acquainted with only from Labillardiere's figure and description, being unknown, and the internal structure of its ovary not having been examined, its genus cannot be determined. Its regular and deeply divided calyx, the four glands at the base of the ovary, and its vertical equilateral stigma, point out its near affinity to *Knightia*, from which it differs

in the style being deciduous, and perhaps also in the number and form of its seeds. If these are but two in number, it would be still more nearly related to Orites; but something in its whole appearance, and especially its uncommonly large bractæ, indicates its being a distinct genus.

According to Labillardiere, it is a native both of New Caledonia and the south-west coast of New Holland: but as I am acquainted with no plant of the order, which has so wide a range as this, and as it may be presumed the specimens from New Holland were very imperfect, otherwise so remarkable a plant would surely have found a place in the body of his work, I may be permitted to question the accuracy of the statement. I confess however that I know no plant of Lewins Land with which this could be confounded.

*ROUPALA pinnata.* *Lam. Illust. Gen.* 1, *p. 243, n. 1282.*  
*Poiret, Encyc. Botan.* 6, *p. 317.* *Rudge, Pl. Guian.* 25,  
*t. 38.*

There can be little doubt of this plant constituting a distinct genus; but its fruit being entirely unknown, it is better to place it among those which require a further examination. It was referred to Rhopala at a time when that genus was not at all understood. In its compound leaves, its irregular calyx, and even in some degree in the glands subtending the ovary, it seems to approach more nearly to Gevuina; and I am therefore inclined to think its fruit will be found to be a drupa, and not a folliculus as that of Rhopala. The whole plant however is so remarkable, that I here add a description taken from an excellent specimen, in Mr. Lambert's Herbarium, collected by the unfortunate Martin in Guiana, where it seems to have been first found by Richard.

*Frutex?* v. Arbor. *Ramuli teretes, tomento minuto cinerascentes.* *Folia alterna, abruptè pinnata, 3-4-juga.* *Foliola opposita, petiolata, latè ovata, obtusa quandoque acutiuscula, integerrima, glaberrima, super nitida, subter ferè opaca, venulis anastomozantibus parùm emersis reticulata:* dum  $3\frac{1}{2}$  uncias longa 2 uncias lata. *Petiolæ partiales*

semunciales, semiteretes, cum rachi teretiusculâ articulati. *Spica terminalis*, pedunculata, erecta, folio brevior, pedunculo longior, racemosa : *Pedunculo* rachique teretibus, pube brevissimâ cinereo-ferrugineis (in sicco). *Pedicelli* geminati, teretes, calyce breviore. *Calyx* tetraphyllus. *Foliola* ante expansionem in tubum curvatum cylindraceum clausum utrinque ampliatum cohærentia, mox ad basin distincta, decidua, linearia, extùs pube tenuissimâ arctè appressâ (in sicco) cinereo-ferrugineâ; intùs glabra: *Unguis* linearibus, basi dilatatis: *Laminis* ovatis, acutis, concavis. *Stamina* 4. *Filamenta* brevissima, basi laminarum imposita. *Antherarum* lobi (connectivo) adnati, distincti, basi parùm divergentes, longitudinaliter dehiscentes. *Pollen* flavum. *Ovarium* brevè pedicellatum, parvum, uniloculare, dispermum, ovalis collateralibus: *Pedicello* basi cincto *Squamâ latâ*, glabrâ, adnatâ, (in sicco) corrugatâ, posticè subdeficiente, intersticiâ angustissimâ. *Style* cylindraceus, crassiusculus, glaber, longitudine unguium calycis. *Stigma* obliquum, convexum, stylo crassius, papillâ centrali.

OBS. Singularis, Foliis verè compositis, petiolellis cum <sup>22</sup> rachi articulatis; et *Squamâ hypogynâ* pedicello ovarii adnatâ, nec ipso receptaculo connexâ.

*ORITINA acicularis. Append. Flor. Nov. Holl. ined.*

This is a perfectly smooth erect shrub; with alternate cylindrical leaves, furrowed on the upper surface and terminated by a pungent mucro. I observed it only on the summit of the Table Mountain, at the southern extremity of Van Dienen's Island. The perfect flowers I have not seen, but have examined the ovary so soon after fecundation, that I have no doubt of its containing originally only two ovula; and as its base is surrounded by four glands, the calyx is probably regular. Hence its near affinity to Orites, with which it also agrees in inflorescence and apparently in stigma. The fruit is a smooth compressed coriaceous follicle, containing two seeds, which are winged at both ends; on which account I have not absolutely referred it to Orites, but, until its flowers are discovered, have given it a temporary name, indicating its affinity to that genus.

*BANKSIA musculiformis.* *Gært. Sem.* 1, *p.* 221. *Lam.*  
*Illust. Gen.* 1, *p.* 242, *n.* 1280.

*Fructus musculiformis.* *Rumph. Amb.* 2, *p.* 184, *t.* 60.

Gærtner has taken up this plant entirely from Rumpf's figure, and referred it to Banksia on account of its fruit containing according to that author two winged seeds. But from Rumpf's description, it appears that the whole plant is lactescent; hence it probably does not belong to this family, but rather to Apocineæ, as Burmannus has already conjectured.

*CYLINDRIA.* *Lour. Cochin. ed. Willd.* 1, *p.* 86.

<sup>225]</sup> Both Willdenow and Ventenat have considered this genus as belonging to Proteaceæ, with whose structure indeed the description of Loureiro in most respects well agrees. Mr. Konig, however, (*Ann. of Bot.* 1, *p.* 392,) assures us, on the authority of original specimens, that it is scarcely different from Olea, though Loureiro has characterized it as having four bilocular antheræ, included in the concave apices of the segments of the corolla; two circumstances altogether incompatible with Oleinæ, and which render it not improbable that the specimen sent to Sir Joseph Banks by the author was very different from that which he described.

*LEUCOSPERMUM Conocarpum.*

*Scolymocephalus Africanus,* latifolius, lanuginosus, foliis in summitate crenatis, comâ sericeâ. *Raj. Hist.* 3, *Dend.* *p.* 9.

*MIMETES Hartogii.*

*Scolymocephalus Africanus lanuginosus humilis*, foliis in summo tridentatis, flore dilutè purpureo, carinulâ albulâ *Oldenlandii*. *Raj. Hist.* 3, *Dend.* *p.* 10, fide characteris et descriptionis.

*MIMETES cucullatus.* (*Raj. Hist.* 3, *Dend.* *p.* 10, *n.* 10.)

MIMETES *hirtus*.

Scolymocephalos *Africanus*, foliis brevioribus acuminatis, floribus rubentibus, summis surculis foliis intermisstis. *Raj. Hist. 3, Dend. p. 10.*

Besides the Proteaceæ described or noticed in this <sup>(226)</sup> paper, I am acquainted with several very beautiful species, chiefly of Grevillea and Persoonia, discovered in New Holland by Mr. George Caley, a most assiduous and accurate botanist, who, under the patronage of Sir JOSEPH BANKS, has for upwards of eight years been engaged in examining the plants of New South Wales, and whose numerous discoveries will, it is hoped, be soon given to the public, either by himself, or in such a manner as to obtain for him that reputation among botanists to which he is well entitled.

ON THE

# ASCLEPIADEÆ,

A NATURAL ORDER OF PLANTS SEPARATED  
FROM THE APOCINEÆ OF JUSSIEU.

BY

ROBERT BROWN, LIB. LINN. SOC.

(READ 4TH NOV., 1809.)

[Extracted from the 'Memoirs of the Wernerian Natural History Society,' Vol. I, pp. 12—78.]

EDINBURGH.

—  
1811.

## ASCLEPIADEÆ.

THE vast additions to the number of species which botany is constantly receiving, while they make a natural arrangement absolutely necessary to the general botanist, render it at the same time proportionally difficult. For though there are still many tribes of plants easily distinguishable even by a superficial observer, yet there are others, that hitherto have been thought abundantly distinct, which can no longer be circumscribed by means of characters taken from their organs of reproduction. This is perhaps now the case with the RUBIACEÆ and APOCINEÆ of Jussieu. It is true, that to an experienced observer, it may still be practicable to refer the greater part, perhaps the whole, of these plants to their proper places in a natural series; <sup>as</sup> but it is, I apprehend, no longer so, to distinguish the two orders by definitions derived from the usual source. Such at least is the opinion I have been led to form from all that I have seen published respecting them, as well as from what I have lately had an opportunity of observing in New Holland.

As, however, both these families are already too extensive, it becomes expedient rather to attempt their subdivision into smaller groups, which may possibly admit of more accurate limitation, than to unite them into one vast order, the distinguishing characters of which, could they be obtained, must probably be extremely vague, and clogged with numerous exceptions. Such a subdivision, it seems to me, may be easily made of the Apocineæ, by employing

a character at once obvious and important, and which while it preserves the natural series unbroken, has the additional advantage of dividing the order into two nearly equal parts. To one of these which includes the genus *Apocynum*, the name of *Apocineæ* will of course remain.

The consideration of the other, which from one of its most remarkable genera I propose naming *ASCLEPIADEÆ*, forms the chief subject of the following essay; but the more completely to illustrate it, I have subjoined new, and I trust amended characters of the genera of the most nearly related section of the *Apocineæ* strictly so called. The singular structure of the stamina in the *Asclepiadeæ* has attracted the attention of botanists since the days of Tournefort: it is therefore not a little remarkable, that two opposite opinions should still be held even respecting the origin of these parts, and that between these opinions botanists should be almost equally divided.

In a paper which was some time ago read to the Linnean Society of London,<sup>1</sup> I had occasion, in inculcating the necessity of examining the parts of the flower before expansion, to advert to this tribe of plants; and I there entered at some length, both into the opinions generally received respecting their male organs, and also into that which I had deduced from an examination of these parts before the opening of the corolla: and being unwilling to repeat now, what I then stated, I shall content myself with referring to the figures and descriptions published by Jacquin in the first volume of his " *Miscellanea Austriaca*," which give a correct idea of the state of the organs after expansion; and only add the observations I have made on one species of the family, the *Asclepias Syriaca*, in the earlier stages of the flower.

The flower-bud of this plant I first examined, while the unexpanded corolla was yet green and considerably shorter than the calyx. At this period, the gland-like bodies which afterwards occupy the angles of the stigma were absolutely invisible; the furrows of its angles were ex-

<sup>1</sup> [Ante, pp. 6—8.]

tremely slight, and, like the body of the stigma, green; the antheræ, however, were distinctly formed, easily separable <sup>15</sup> from the stigma, and their cells, which were absolutely shut, were filled with a turbid fluid, the parts of which did not so cohere as to separate in a mass; of the cuculli, which in the expanded flower are so remarkable, and constitute the essential character of the genus, there was no appearance.

In the next stage submitted to examination, where the corolla nearly equalled the calyx in length, the gland-like bodies of the stigma were become visible, and consisted of two nearly filiform, light brown, parallel, contiguous and membranaceous substances, secreted by the sides of the furrow, which was now somewhat deeper: instead of the filiform processes, a gelatinous matter occupied an obliquely descending depression proceeding from towards the base of each side of the angular furrow.

In a somewhat more advanced stage, the membranes which afterwards become the glands of the stigma were found to be linear, closely approximated, and to adhere at their upper extremity. At the same time the gelatinous substance in the oblique depression had acquired a nearly membranaceous texture and a light brown colour, and on separating the gland from its furrow, which was then practicable, this membrane followed it. At this period, too, the contents of each cell of the anthera had acquired a certain degree of solidity, a determinate form, and were separable from the cell in one mass; the cuculli were <sup>16</sup> also observable, but still very small and green, nearly scutelliform, having a central papilla, the rudiment of the future horn-like process. Immediately previous to the bursting of the cells of the antheræ, which takes place a little before the expansion of the corolla, the cuculli are completely formed, and between each, a pair of minute light green fleshy teeth are observable, the single teeth of each pair being divided from each other by the descending alæ of the antheræ. The glands of the stigma have acquired a form between elliptical and rhomboidal, a cartilaginous texture, and a brownish-black colour; they are easily separable from the secreting furrow, and on their

under surface there is no appearance of a suture, or any indication of their having originally consisted of two distinct parts : along with them separate also the descending processes, which are compressed, membranous, and light brown ; their extremity, which is still unconnected, being more gelatinous but not perceptibly thickened. The pollen has acquired the yellow colour and the degree of consistence which it afterwards retains. On the bursting of the cells, the gelatinous extremity of each descending process becomes firmly united with the upper attenuated end of the corresponding mass of pollen. The parts are then in that condition in which they have been commonly examined, and are exhibited in the figures of Jacquin, who having seen <sup>17</sup> them only in this state, naturally considered these plants as truly gynandrous, regarding the masses of pollen as the antheræ, originating in the glands of the stigma, and merely immersed in the open cells of the genuine antheræ, which he calls antheriferous sacs ; an opinion in which he has been followed by Rottboell, Koellreuter, Cavanilles, Smith, and Desfontaines. The conclusion to be drawn from the observations now detailed is sufficiently obvious ; but it is necessary to remark, that these observations do not entirely apply to all the plants which I have referred to the Asclepiadæ, some of them, especially Periploca, having a granular pollen, applied in a very different manner to the glands of the stigma : they all, however, agree in having pollen coalescing into masses, which are fixed or applied to processes of the stigma, in a determinate manner ; and this is, in fact, the essential character of the order. Dr. Smith, in the second edition of his valuable "Introduction to Botany," has noticed my opinion on this subject ; but, probably from an indistinctness in the communication, which took place in conversation, has stated it in a manner somewhat different from what I intended to convey to him : for, according to his statement, the pollen is *projected* on the stigma. The term projection, however, seems to imply some degree of impetus, and at the same time presents the idea of something indeterminate respecting the part to which the body <sup>18</sup> so projected may be applied. But nothing can be more

constant than the manner in which the pollen is attached to the processes of the stigma in each species; and as considerable differences in this respect take place in various species, I have with advantage employed these in the new generic divisions of the order which I have attempted to establish, and to which I now proceed.

As I have everywhere mentioned the sources from which my knowledge both of genera and species is derived, it becomes unnecessary particularly to notice here the extent of my obligations to the unrivalled Herbarium of Sir JOSEPH BANKS, who, with his accustomed liberality, has permitted me to examine, and, where necessary, to dissect such specimens as seemed to have any peculiarity of structure, and has thus enabled me to found my genera on a more satisfactory induction than I could have done in any other part of the world.

## ASCLEPIADEÆ.

## I. POLLINIS MASSÆ (10-20) CEREA CE, LEVES, nec in granulis separande.

A CORPUSCULA STIGMATIS (5) SULCO LONGITUDINALI BIPARTIBILIA, juxta basin, v. latere utrinque exserentia processum, Massam Pollinis uneam, affigentem.

a. Pollinis MASSÆ ERECTÆ V. convinentes, stigmati incumbentes : basi, v. infra medium lateris, affixa.

+ Anthere apice simplices, nec membranâ terminata.

\* Columna fructificationis tubo corollæ inclusa. Tubus staminis extus appendiculatus.

1. Corolla tubus e basi ventricosa cylindraceus : limbi 5partiti laciniae ligulares, conniventæ. OROPEGIA.
2. Corolla campanulata, limbo 10fido, inferioris foliola lobis exterioris opposita ..... HUERNIA.
3. Corolla campanulata, 5fida. Corona staminea 2plex ; foliolis lacinii exterioris oppositis ..... PIARANTHUS.

\*\* Columna fructificationis exserta v. semi-exserta.

1. Corona staminea duplex : (utrinusque figura varia) ; interior (cujus foliola antheris opposita) quandoque obsoleta. Massæ pollinis altero margine cartilagineo-pellucido ..... SIAPELIA.
2. Corona staminea simplex, 10phylla ; foliolis 5, antheris oppositis, indivisis, obtusis, 5 reliquis bipartitus, acutis. Massæ pollinis utroque margine opaco ..... CARALLUMA.
3. Corona staminea simplex, 5loba, lobis antheris alternantibus ! denticulis namis quandoque interjectis. Massæ pollinis medio affixe stigmatis incumbentes ..... MICROSTEMMA.
4. Corona staminea nulla : Corolla subrotata fax squamis 5 coronata. Massæ pollinis basi affixa, apice coarctato pellucido ..... LEPTADENIA.

4. Corona staminea nulla : Corolla subrotata faux squamis 5 coronata. Massæ pollinis busi affixæ, apice coarctato pellucido ..... LEPTADENIA.

†† Antheræ membranæ terminatæ.

- # Tubus stamineus extus appendiculatus.
  - \* Corona staminea (simplex, 5phylla), foliis *depressis*, carnosia. Corolla rotata. HOYA.
  - 1. Coronæ foliola angulo interiori producto in dentem antheræ incumbentem ..... TYLOPHORA.
  - 2. Coronæ foliola angulo interiori simplici edentulæ ..... MARSDENIA.
- \*\* Corona staminea (5phylla), foliis *compressis*.
  - 1. Coronæ foliola apice indivisa, intus edentula ..... PERGULARIA.
  - 2. Coronæ foliola apice indivisa, intus laciniulæ ancta ..... DISCHIDIA.
  - 3. Coronæ foliola bifida, laciniis apice recurvis ..... GOMPHOCARPUS.
- ## Tubus stamineus extus inappendiculatus.
  - 1. Semina comosa. Folliculi graciles, laxes. Corolla ureolata, fauce coronata, nunc edentula ..... SARCOCOLPOUS.
  - 2. Semina calva, marginata. Folliculi ventricosi, carnosæ. Corolla subrotata, fauce edentula stigmata occultata. Corona staminea 1phylla, lobata.
- b. POLLINIS MASSÆ TRANSVERSE, extremitate exteriore (respectu loculi transversim deliseantis) affixæ;
  - 1. Semina comosa. Folliculi sæpius costati v. muricati. (Caulis volubilis) ..... GOMPHOBUS.
  - 2. Semina calva, crenata. (Caulis erectus) ..... MATZLEA.
- c. POLLINIS MASSÆ PENDULÆ, apice v. supra medium lateris affixæ. Antheræ membranæ terminate.
  - † Tubus stamineus appendiculatus.
    - # Corona staminea simplex, 5phylla, foliis antheris oppositis, laciniulis 5 manis in eadem serie quandoque interiectis.
      - \* Corolla 5-partita reflexa. Coronæ foliola subeucellata, apice tubi filamentorum imposita.
        - 1. Coronæ foliola cucullata, e fundo exserta laciniulam corniformem. Folliculi graciles, laxes ..... ASCLEPIAS.
        - 2. Coronæ foliola subeucellata, utrinque unidentata, absque laciniulâ interiori. Folliculi inflati, ramentacei ..... GOMPHOCARPUS.

## I. POLLINIS MASSÆ (10-20) CEREACEÆ, LÆVES, &amp;c.—(contn.).

## A. CORPUSCULA STIGMATICI (5) SULCO LONGITUDINALI BIPARTIBILI, &amp;c.—(contn.).

\*\* Corolla rotata, non reflexa. Corona folia acuta v. acuminate, intus edentula .....

\*\*\* Corollaæ subcampanulatæ tubus ventricosus.

a. Columna fructificationis exserta. Massæ pollinis compressæ.

1. Corona folia carnosæ, obtusa, simplicia, dentellus 5 alternantibus nanis. Folium ventricosum, ramentacei .....
2. Corona folia longitudinaliter adnata, aversa, basi recurva. Folliculi ventricosi, leaves .....
3. Corona folia carnosæ, obtusa, soluta. Massæ pollinis curvaturæ processuum den ascendentium affixa. Corolla laciniæ ligulares .....

β. Columna fructificationis inclusa. Massæ pollinis ventricosæ.

1. Corolla campanulata. Corona folia e basi dilatata subulata, intus simplicia. Massæ pollinis apice affixa. Stigma multicicum .....
2. Corolla urceolata. Corona folia laciniæ interiori parallelæ aucta. Massæ pollinis infra apicem affixa. Stigma rostratum .....

†† Corona staminea simplex, monophylla, tubo intus quandoque laciniae carnisæ aucto. Corolla subrotata.

1. Corona annularis integerima. Massæ pollinis compressæ .....
2. Corona ore 5-20fido, dum 5fida lobis anteris oppositus .....
3. Corona bipartita, lobis anteris alternis .....

††† Corona staminea composita, seriebus 2 v. 3 insertione distinctis.

- \* Corona duplex, exterior 1 v. 5phylla, interior 5phylla. Faux corolla esquamata.
  1. Corona exterior bipartita, lacinia acuminatis : *inferior* brevir, extenori opposita..... DITASSA.
  2. Corona exterior bipartita, cum v. absce laciniis alternantibus, nanis : *inferior* longior, extenori alternans, folioli basi solutis. Folliculi ramentacei .....
  3. Corona exterior cyathiformis v. annularis, crenulatus : *inferior* longior : *strage* carnosa. Folliculi graciles, levæ .....

1. Filamenta basi connata, supra distincta. Antheræ cohaerentes, imberbes. Massæ pollinis 4, corpus-  
culo singulo affixa. Corolla rotata ..... HEMIDESMUS.  
2. Filamenta longitudinaliter distincta. Antheræ cohaerentes, barbatae. Massa pollinis 1, corpusculo  
singulo affixa. Corolla rotata, squamis fauvis aristatis ..... PERIPLOCA.  
3. Filamenta longitudinaliter distincta. Antheræ imberbes. Massæ pollinis 4, corpusculo singulo  
affixa. Corolla hypocotateriformis ..... GIMNANTHERA.

19]

## ASCLEPIADEÆ.

Confortarum genera, *Linn.* Apocinearum genera, *Juss.* Apocynarum genera, *Adans.*

CALYX quinquedivisus, persistens.

COROLLA monopetala, hypogyna, quinqueloba, regularis, aestivatione imbricata, rarissime valvata, decidua.

STAMINA 5, epipetala, laciniis limbi alternantia. *Filamenta* saepius connata. *Antheræ* biloculares, septisve semi-completis nunc subquadriloculares. *Pollen* ad dehiscentiam antherarum coalescens in massas numero loculorum, rariusve per paria confluentes, et geminatim, v. quaternatim, v. solitariae processibus quinque stigmatis affixas.

OVARIA 2. *Styli* 2, arctè approximati, saepè brevissimi. *Stigma* ambobus commune, dilatum, pentagonum, angulis corporisculiferis.

FOLLICULI 2; altero nunc abortiente. *Placenta* suturæ intus applicata, demum libera.

SEMINA numerosa, imbricata, pendula, ad umbilicum 201 saepissime comosa. *Albumen* tenuis. *Embryo* dicotyledoneus, rectus. *Cotyledones* foliaceæ. *Radicula* supera. *Plumula* inconspicua.

*Frutices*, rariusve *Herbæ*, ut plurimum lactescentes et volubiles. *Folia* integra, opposita, quandoque alterna v. verticillata, ciliis interpetiolaribus loco stipularum saepius instructa. *Flores* subumbellati, fasciculati, v. racemosi, interpetiolares.

## I. ASCLEPIADEÆ VERÆ.

[21]

*Massæ Pollinis* 10, læves, per paria, (diversis antheris pertinentia), affixæ stigmatis corpusculis, sulco longitudinali, bipartilibus. *Filamenta connata*, extus sæpius appendiculata.

## CEROPEGIA.

[Ceropegiæ pleræque, Linn.]

CHAR. *Corolla* tubo e basi ventricosâ cylindraceo; limbi laciniis ligularibus.

*Columna fructificationis* inclusa.

*Corona staminea* duplx, *exterior* abbreviata, 5loba: *interior* 5phylla, foliolis ligularibus, indivisis, lobis exterioris oppositis.

*Antheræ* apice simplices.

*Massæ pollinis* erectæ, basi affixæ, marginibus simplicibus.

*Stigma* muticum.

*Folliculi* cylindracei, læves. *Semina* comosa.

HABITUS. *Herbæ* glabrae, volubiles. *Radice* tuberosa. *Umbellæ* interpetiolaræ, nunc paucifloræ.

PATRIA. India Orientalis.

OBS. To this genus belong *C. Candelabrum*, Linn.; *C. biflora*, Linn.; *C. tuberosa*, *bulbosa*, *juncea*, *acuminata*, of Roxburgh, and two undescribed species.

## HUERNIA. [Stapeliæ species, Linn. Juss. Masson.]

CHAR. *Corolla* campanulata, limbo decemfido, laciniis accessoriis nanis, dentiformibus.

*Columna fructificationis* inclusa.

*Corona staminea* duplex; *exterior* quinquefida, laciniis bifidis: *interior* 5phylla, foliolis e basi gibbosâ subulatis, indivisis, laciniis exterioris alternantibus.

*Antheræ* apice simplices.

*Massæ pollinis* erectæ, basi affixæ, altero margine cartilagineo-pellucido.

*Stigma muticum.*

*Folliculi subcylindracei, laeves. Semina comosa.*

**HABITUS** *Stapeliæ.*

**PATRIA.** Africa Australis.

OBS. The whole of the third section of *Stapelia* in Willdenow's edition of the "Species Plantarum," probably belongs to this genus; but I have only had an opportunity of examining *S. campanulata*, *venusta*, and *guttata*, from which the character is formed. I have named the genus in memory of Justus Huernius, one of the earliest collectors of Cape plants, and from whose drawings the first account of *Stapelia* was taken.

23] PIARANTHUS.

[*Stapeliæ* sp. *Masson.*

**CHAR.** *Corolla campanulata, 5fida, carnosa.*

*Columna fructificationis inclusa.*

*Corona staminea simplex, 5phylla, foliolis dorso dentatis.*

*Antheræ apice simplices.*

*Massæ pollinis erectæ, basi affixæ, altero margine cartilagineo-pellucido.*

*Stigma muticum.*

*Folliculi. . . . .*

**HABITUS** *Stapeliæ.*

**PATRIA.** Africa Australis.

OBS. The want of the external corona renders it necessary to separate from *Stapelia* and *Huernia*, this genus; of which the only two certain species are *Stapelia punctata* and *pulla* of Masson; of both these I have examined specimens collected by Masson, and preserved in spirits, in the collection of Sir Joseph Banks.

STAPELIA.

[*Stapeliæ plures, Linn. et Mass.*

**CHAR.** *Corolla rotata, 5fida, carnosa.*

*Columna fructificationis exserta.*

*Corona staminea duplex, utraque in variis varia; interior quandoque obsoleta.*

*Antheræ apice simplices.*

*Massæ pollinis* basi affixæ, altero margine cartilagineo-pellucido.

*Stigma* muticum.

*Folliculi* subcylindracei, læves. *Semina* comosa.

**HABITUS.** *Plantæ* carnosæ, aphyllæ, angulatæ, sæpe <sup>[24]</sup> tuberculatæ. *Flores*, utplurimum speciosi, odore nauseoso, stercorario.

**PATRIA.** Africa Australis, præsertim in planitiis desertis, argillaceis, *Karoo* nuncupatis.

**OBS.** The essential character of this extensive and singular genus, consists, according to Linnæus and all subsequent botanists, in the double corona. But I have already shewn, that certain plants that have been referred to it, and which entirely accord in habit, have a corona of a single series; and it will hereafter appear, that other, and very different genera, agree with *Stapelia* in this part of its structure. The genus, even as it is here limited, is capable of further subdivision; and I have little doubt, that when the species become better known, such a subdivision will be found expedient, and probably from characters like the following, by which, in the mean time, it may be disposed into very natural sections.

### I. *Corona exterior 5phylla, foliolis indivisis.*

*Stapelia hirsuta*, *Linn.* *sororia*, *Mass.* *vetula*, *Mass.* *ambigua*, *Mass.* *asterias*, *Mass.* *glandulifera*, *Mass.* *stellaris*, *Jacq. ined.*

### II. *Corona exterior 5partita, laciniis bifidis.*

*Stapelia revoluta*, *Mass.* *pedunculata*, *Mass.* *verru-* <sup>[25]</sup> *cosa*, *Mass.* *mixta*, *Mass.* *variegata*, *Linn.* *levida*, *Jacq. ined.*

### III. *Corona exterior 1phylla, indivisa vel ciliato-multifida.*

*Stapelia articulata*, *Hort. Kew. et Mass.* *geminata*, *Mass.*, aliæque ineditæ, in Museo Banksiano, spir. vin. asservatæ.

## CARALLUMA.

CHAR. *Corolla* rotata, profundè 5fida.  
*Columna fructificationis* exserta.  
*Corona staminea* simplici serie 10phylla; foliolis quinque  
 antheris oppositis indivisis; reliquis bipartitis, subulatis.

*Antheræ* apice simplices.  
*Massæ pollinis* erectæ, basi affixæ, marginibus simpli-  
 cibus.

*Stigma* muticum.  
*Folliculi* graciles, læves. *Semina* comosa.  
 HABITUS ferè Stapeliæ.  
 PATRIA. India Orientalis.

OBS. This genus is the *Stapelia adscendens* of Roxburgh,  
 the *Car-allum* of the Telingas.

## MICROSTEMMA.

CHAR. *Corolla* rotata, 5fida.  
*Columna fructificationis* exserta.  
*Corona staminea* monophylla, carnosa, 5loba, lobis cum  
 antheris alternantibus.  
<sup>20</sup> *Antheræ* apice simplices.  
*Massæ pollinis* medio lateri insertæ, stigmati incum-  
 bentes.  
*Stigma* muticum.  
*Folliculi* graciles, læves. *Semina* comosa.  
 HABITUS. *Herba* glabra, erecta. *Radix* tuberosa.  
*Caulis* infrà simplex, foliis minutis; suprà ramosus, foliis  
 oppositis linearibus. *Umbellæ* laterales et terminales, sub-  
 sessiles. *Corollæ* nigro-purpureæ intùs barbatæ.  
 PATRIA. Nova Hollandia tropica.

## HOYA.

CHAR. *Corolla* rotata, 5fida.  
*Corona staminea* 5phylla, foliolis depressis, carnosis,  
 angulo interiore producto in dentem antheræ incumbentem.

*Antheræ membranâ terminatæ.*

*Massæ pollinis basi affixæ, conniventes, compressæ.*

*Stigma depresso, papillâ obtusâ.*

*Foliculi læves. Semina comosa.*

**HABITUS.** *Caulis suffruticosus, volubilis, v. decumbens.*

*Folia opposita, carnosa, v. membranacea. Umbellæ interpetiolares, multifloræ.*

**PATRIA.** India Orientalis, China, et Nova Hollandia tropica.

OBS. I have named this genus in honour of Mr. THOMAS HOY, whose merits as an intelligent and successful <sup>27</sup> cultivator have been long known to the botanists of this country. I have added specific characters of the only two species with which I am acquainted; but *Hoya carnosa* probably includes several species, which can only be determined from living specimens: it is also to be considered as the type of the genus, *Hoya viridiflora* differing in some degree in the structure of its corona, and considerably in habit.

1. *H. carnosa*, foliis ovali-oblongis carnosis, corollis barbatis, coronæ foliolis subtus sulcatis!

*Asclepias carnosa*, *Linn. suppl.* 170. *Murr. syst. veg. ed.* 14, p. 260. *Willd. sp. pl.* 1, p. 1264. *Pers. syn.* 1, p. 275. *Sims in bot. magaz.* t. 788. *Smith, exot. bot.* 2, p. 21, t. 70.

*Stapelia Chinensis*, *Lour. Cochinchin.* 1, p. 205, fide specim. ab auctore missi in Herb. Banks.

**HAB.** In Asiae tropicæ variis regionibus, etiam in Nova Hollandia (ubi et in hort. Angl. v. v.)

2. *H. viridiflora*, foliis ovatis acuminatis membranaceis corollisque glabris, coronæ foliolis exsulcis.

*Asclepias volubilis*, *Linn. suppl.* 170\*. *Willd. sp. pl.* 1, p. 1269. *Pers. syn.* 1, p. 276.

*Watta-haka-codi*, *Rheed. Malab.* 9, p. 25, t. 15.

**HAB.** Inter frutices in nemorosis Zeylonæ, *J. G. Koenig*, in Herb. Banks. (ubi v. s.)

## 28] TYLOPHORA.

*CHAR. Corolla rotata, 5partita.*

*Corona staminea 5phylla, foliolis depressis, carnosis, angulo interiori simplici edentulo.*

*Antheræ membranâ terminatæ.*

*Massæ pollinis erectæ, basi affixæ, marginibus simplicibus. Stigma muticum.*

*Folliculi læves. Semina comosa.*

*HABITUS. Herbæ v. suffrutices volubiles. Folia opposita, membranacea, plana. Umbellæ interpetiolares. Flores plurimum parvi.*

*PATRIA. Nova Hollandia, præsertim intra tropicum, sed usque ad grad. 33. lat. aust. India Orientalis, et Africa æquinoctialis. Octo species nobis cognitæ, quarum nullæ adhucdum editæ sunt.*

## MARSDENIA.

*CHAR. Corolla urceolata, 5fida, nunc subrotata.*

*Corona staminea 5phylla, foliolis compressis, indivisis, intus edentulis.*

*Antheræ membranâ terminatæ.*

*Massæ pollinis erectæ, basi affixæ.*

*Folliculi læves. Semina comosa.*

*HABITUS. Suffrutices sæpiùs volubiles. Folia opposita, latiuscula, plana. Cymæ, nunc Thyrsi, interpetiolares.*

*Stigma sæpiùs muticum, quandoque rostratum, rostro indiviso vel bifido.*

<sup>29]</sup> *PATRIA. India Orientalis et Nova Hollandia; rarius in America Meridionali, et Syria.*

OBS. This genus differs from *Pergularia*, chiefly in the want of the inner laciniae of the corona: it is therefore an arbitrary separation, and made principally to obtain clearer characters for both. The two species, with an elongated stigma, are perhaps not truly of this genus, but if separated from it, must form each a distinct genus.

It is named in honour of WILLIAM MARDEN, Esq.,

F.R.S., late Secretary to the Admiralty, and author of a very judicious and learned "History of Sumatra," in which, though it is evident that he has not made botany his particular study, he has had the merit of turning the attention of botanists to several valuable plants, among others, to the Camphor-Tree of Sumatra, and to a species of this genus, *Marsdenia tinctoria*, said to afford the best indigo in that island.

† *Stigma muticum*. *Marsdenia veræ*.

1. *M. velutina*, caule volubili, foliis cordatis latè ovatis acuminatis tomentosis mollibus, cymis umbelliformibus, fauce nudâ.

HAB. In Nova Hollandia, intra tropicum, (ubi v. v.)

2. *M. tinctoria*, caule volubili, foliis cordatis ovato-<sup>[30]</sup> oblongis acuminatis glabriusculis basi anticè glandulosis, thyrsis lateralibus, fauce barbatâ.

Taram akkar. *Mars. Sumat.* 78.

HAB. In insula Sumatra. (v. s. in Herb. Banks.)

3. *M. viridiflora*, caule volubili, foliis oblongo-lanceolatis glabriusculis basi obtusa, tubo intus villosiusculo.

HAB. In Nova Hollandia, intra tropicum, (ubi v. v.)

4. *M. clausa*, caule volubili, foliis lanceolatis utrinque acutis glabris: supra parum rugosis, fauce densè barbatâ.

HAB. In Jamaica. *Swartz.* (in Herb. Banks. ubi v. s.)

5. *M. suaveolens*, caule suberecto, foliis ovali-lanceolatis glabris aveniis, tubo ventricoso, fauce barbatâ.

HAB. In Nova Hollandia, extra tropicum, (ubi v. v.)

6. *M. cinerascens*, caule erecto, foliis ovatis obtusiusculis venosis pube rarâ conspersis, petiolis semuncialibus, corollis subrotatis.

HAB. In Nova Hollandia, intra tropicum, (ubi v. v.)

31]

†† *Stigma rostratum*.

7. *M. erecta*, caule erecto, foliis cordatis ovatis acutis, cymis umbelliformibus, limbi laciniiis imberbibus tubo 4-5ies longioribus.

*Cynanchum erectum*, *Linn.*

8. *M. rostrata*, caule volubili, foliis ovatis subcordatis acuminatis glabris, umbellis multifloris, limbo barbato.

HAB. In Nova Hollandia extra tropicum, (ubi v. v.)

### PERGULARIA.

[*Pergulariæ species*, *Linn.*]

CHAR. *Corolla* hypocrateiformis, tubo urceolato.

*Corona* staminea 5phylla, foliolis compressis apice indisis, intus lacinulâ euctis.

*Antheræ* membranâ terminatæ.

*Massæ pollinis* erectæ, basi affixæ.

*Stigma* muticum.

*Folliculi* ventricosi, læves. *Semina* comosa.

HABITUS. *Plantæ* volubiles. *Folia* latiuscula, membranacea. *Cymæ* interpetiolares. *Flores* flavescentes, odoratissimi.

PATRIA ignota: in China et India Orientali ob flores suaveolentes culta.

OBS. Of this genus the only certain species are *Pergularia odoratissima*, *Roxb. et Smith*, and *P. minor*, *And. Repos.* 160. *Pergularia purpurea*, *Vahl.* and *Japonica*, *Thunb.* may belong to it. *P. edulis* of *Thunberg*, prod. cap. is probably very different. When *Linnæus* established this genus in his *Mantissa*, he certainly meant his character to apply to *Pergularia glabra*, of which he had a specimen in his herbarium, and which is the *Flos Pergulanus* of *Rumphius*; but unfortunately this plant does not belong to the order of *Asclepiadeæ*, but to that section of *Apo-cineæ* of which I shall hereafter treat. The character of *Linnæus* was no doubt chiefly taken from a plant of

P. odoratissima, that had flowered in the Upsal Garden, and which he confounded with the *Asclepias cordata* of Forskael, an error long since pointed out by Dr. Smith in his very accurate and satisfactory account of *Pergularia odoratissima*.

### DISCHIDIA.

CHAR. *Corolla urceolata, 5fida.*

*Corona staminea 5phylla, foliolis bifidis, laciniis subulatis, patentibus, apice recurvis.*

*Antheræ membranâ terminatæ.*

*Massæ pollinis erectæ, basi affixæ.*

*Stigma muticum.*

*Folliculi læves. Semina comosa.*

HABITUS. *Herba* in arboribus parasitica, dependens, perennis, lactescens, farinâ albâ tota conspersa. *Caulis* ad genicula radicans. *Folia* opposita, subrotunda, crassa, carnosæ. *Flores* parvi, subumbellati.

PATRIA. India Orientalis, præsertim Insulæ Moluc-<sup>33</sup> canæ, neenon Nova Hollandia, ubi prope Endeavour River detexit *Illust. Banks.*

### GYMNEMA.

CHAR. *Corolla suburceolata 5fida. Fauce sæpe coronatâ, squamulis denticulis 5, sinibus insertis.*

*Corona staminea nulla.*

*Antheræ membranâ terminatæ.*

*Massæ pollinis erectæ, basi affixæ.*

*Folliculi graciles, læves. Semina comosa.*

HABITUS. *Suffrutices* sæpius volubiles. *Folia* opposita, membranacea, plana. *Umbellæ* interpetiolares, cymosæ.

PATRIA. India Orientalis, Nova Hollandia tropica, et Africa æquinoctialis.

OBS. Of this genus I have examined four species. Two of these are unpublished plants; the third is *Asclepias lactifera Linn.*, of which there is no specimen in the

Linnean Herbarium : it therefore rests entirely upon Hermann's specimens, which, though collected 140 years ago, were by maceration in water so far recovered, as to enable me with certainty to determine its genus. The fourth is *Periploca sylvestris*, *Willd. sp. pl. 1, p. 1252.*

### 34] LEPTADENIA.

**CHAR.** *Corolla* subrotata, *tubo* brevi, *fauce* coronata, squamis 5 sinubus impositis : *limbo* barbato, æstivatione valvata.

*Corona staminea* nulla.

*Antheræ* liberæ, apice simplices.

*Massæ pollinis* erectæ, basi affixæ, apice coarctato pellucido !

*Stigma* muticum.

*Folliculi* . . . . .

**HABITUS.** *Herbæ* ? perennes ? volubiles, tomento impalpabili, pulvereo, cinerascentes. *Folia* plana, opposita. *Umbellæ* interpetiolares, quandoque cymosæ. *Corpuscula* stigmatis minuta.

**PATRIA.** India Orientalis, Africa æquinoctialis et septentrionalis.

**OBS.** Of this genus I have examined three species in the Banksian Herbarium, none of which are as yet described, though one of them was collected by Forskael ; it is unnamed, however, and does not correspond with any of his descriptions.

### SARCOLOBUS.

**CHAR.** *Corolla* subrotata, 5fida. *Fauce* nudâ.

*Corona staminea* nulla.

*Antheræ* membranâ terminatæ.

35] *Massæ pollinis* erectæ, basi affixæ.

*Stigma* muticum.

*Folliculi* ventricosi, carnosæ. *Semina* marginata !

*HABITUS.* *Frutex* volubilis, glaber. *Folia opposita*, latiuscula. *Umbellæ interpetiolares*, multifloræ.

*PATRIA.* Java; in Prince's Island, prope Bataviam, detexit *Illust. Banks.*

**GONOLOBUS.** [Richard? in *Mich. Fl. Bor. Amer.*  
*Cynanchi species*, Linn. Jacq.

*CHAR.* *Corolla* subrotata, 5partita.

*Corona staminea* scutelliformis, lobata.

*Antheræ transversim dehiscentes*, membranâ terminatæ.

*Massæ pollinis* extremitati exteriori respectu loculi affixæ  
stigmata tectæ.

*Stigma* planiusculo-depressum.

*Folliculi* ventricosi, subcostati. *Semina* comosa.

*HABITUS.* *Suffrutices* volubiles. *Folia opposita*, latiuscula. *Umbellæ interpetiolares*.

*PATRIA.* America, præsertim intra tropicos.

Obs. *Cynanchum maritimum* Linn. *suberosum* Linn.  
*crispiflorum* Hort. Kew. belong to this genus; and I suppose also *C. planiflorum*, *grandiflorum*, *rostratum*, *nigrum*, *racemosum*, *Carolinense*, *obliquum*, *hirtum*, *prostratum*, and *undulatum* of Willdenow's *Spec. Plant.*: these, however, I have not determined, and the whole genus requires to be re-examined.

**MATELEA.** [Aubl. *Gujan. tab. 109*, Hostea.  
*Willd. sp. pl. 1*, p. 1274.

*CHAR.* *Corolla* rotata, 5partita.

*Corona staminea* scutelliformis, lobata.

*Antheræ transversim dehiscentes*, membranâ terminatæ.

*Massæ pollinis* extremitate exteriore respectu loculi  
affixæ, stigmata tectæ.

*Stigma* planiusculo-depressum.

*Folliculi* ventricosi, costati. *Semina* calva. (Aubl.)

HABITUS. *Frutex* erectus. *Folia* opposita, basi supra biglandulosa. *Flores* racemosi, laterales.

PATRIA. America meridionalis.

ASCLEPIAS.

[Asclepiadis sp. Linn.]

CHAR. *Corolla* 5partita, reflexa.

*Corona* summo tubo filamentorum imposita, 5phylla, foliolis cucullatis, e fundo exserentibus processum aversum corniformem.

*Antheræ* membranâ terminatæ.

*Massæ pollinis* compressæ, apice attenuato affixæ, pendulæ.

*Stigma* depresso, muticum.

*Folliculi* lœves. *Semina* comosa.

<sup>87]</sup> HABITUS. *Herbae* erectæ. *Folia* opposita, nunc alterna! vel verticillata. *Umbellæ* interpetiolares.

PATRIA. America Septentrionalis.

OBS. The species of this genus which I have examined, are *A. Syriaca*, (most improperly so called, as it is a native of North America only), *amœna*, *purpurascens*, *variegata*, *curassavica*, *nivea*, *elevata*, *parviflora*, *incarnata*, *decumbens*, *verticillata*, *tuberosa*, of Willdenow's Spec. Plant., and some unpublished species in the Banksian Herbarium; and there can be little doubt that *A. pulchra*, *citrifolia*, *Mexicana*, *linaria*, *rubra*, and all the species of Michaux, belong to it.

GOMPHOCARPUS.

[Asclepiadis sp. Linn.]

CHAR. *Corolla* 5partita, reflexa.

*Corona* summo tubo filamentorum imposita, 5phylla, foliolis cucullatis utrinque unidentatis, intus simplicibus.

*Antheræ* membranâ terminatæ.

*Massæ pollinis* compressæ, apice attenuato affixæ, pendulæ.

*Stigma* depresso, muticum.

*Folliculi* ventricosi, spinis innoxuis echinati.

*Semina* comosa.

*HABITUS. Frutices v. suffrutices erecti. Folia opposita,<sup>38</sup> sita, margine saepe revolutæ. Umbellæ interpetiolares.*

PATRIA. Africa Australis.

OBS. *Asclepias arborescens, fruticosa* and *setosa*, are the three certain species of this genus; but *A. crispa* has probably the same structure. The flowers I have examined, but have not seen the fruit. *A. pubescens* ought probably to be altogether omitted; for, according to the description and specimen in Linnæus's Herbarium, it is *A. arborescens*, while according to the reference to Plukenet, it is *A. crispa*. This observation I have copied from Mr. Dryander's notes.

### XYSMALOBIUM.

[*Asclepiadis* sp. *Linn.*]

CHAR. *Corolla* 5fida, patens.

*Corona staminea* summo tubo filamentorum imposita, simplici serie decempartita, laciinis 5 antheris oppositis carnosis, subrotundis, intus simplicibus; 5 reliquis nanis.

*Antheræ membranâ terminatæ.*

*Massæ pollinis* compressæ, apice affixæ, pendulæ, processibus connectentibus latiusculis.

*Stigma* muticum.

*Folliculi* ventricosi, ramentacei. *Semina* comosa.

HABITUS. *Frutices* erecti. *Folia* opposita. *Umbellæ* interpetiolares. *Flores* majusculi, limbo nunc barbato.

PATRIA. Africa Australis.

OBS. This genus at present consists of only two species, *Asclepias undulata* and *grandiflora*.

### CALOTROPIS.

[*Asclepiadis* sp. *Linn.*]

CHAR. *Corolla* sub-campanulata, tubo angulato, angulis intus saccatis, limbo 5partito.

*Corona staminea* 5phylla, foliolis carinæformibus, tubo filamentorum longitudinaliter adnatis, basi recurvâ.

*Antheræ membranâ terminatæ.*

*Massæ pollinis compressæ, apice attenuato affixæ, pendulæ.*

*Stigma muticum.*

*Folliculi ventricosi, lœves. Semina comosa.*

*HABITUS. Frutices erecti, glabri. Folia opposita, lata.*

*Umbellæ interpetiolares. Flores speciosi.*

*PATRIA. India Orientalis, et Persia.*

[<sup>1</sup> SPECIES. *Asclepias gigantea et procera.*]

## KANAHIA.

CHAR. *Corolla campanulata, limbo 5partito.*

*Columna semi-inclusa.*

*Corona staminea apice tubi filamentorum imposita, 5phylla, foliolis e basi incrassatâ subulatis, indivisis.*

*Antheræ membranâ terminatæ.*

<sup>40]</sup> *Massæ pollinis ventricosæ, apice affixæ, pendulæ.*

*Stigma muticum.*

*Folliculi graciles, striati. Semina comosa?*

*HABITUS. Frutex? erectus. Folia opposita, plana. Pedunculi interpetiolares, apice fasciculatim multiflori, pedicellis imbricatis, basi unibracteatis.*

*PATRIA. Arabia, [et Abyssinia.]*

OBS. *Asclepias laniflora*, *Forsk. Egypt. Arab.* p. 51, KANAHIA of the Arabs, is the only species of the genus. I have examined the flowers of an original specimen. The account of the fruit is taken from Forskael's description, and Vahl's figure.

## OXYSTELMA.

CHAR. *Corolla rotata, patens.*

*Columna exserta.*

*Corona staminea 5phylla, foliolis acutis, indivisis.*

*Antheræ membranâ terminatæ.*

<sup>1</sup> Added in MS. by the author.

*Massæ pollinis* compressæ, apice attenuato affixæ, pendulæ.

*Stigma* muticum.

*Folliculi* læves. *Semina* comosa.

**HABITUS.** *Suffrutices* volubiles, glabri. *Folia* opposita.

*Racemi v. umbellæ* interpetiolares.

**PATRIA.** India Orientalis et Nova Hollandia?

**OBS.** *Periploca esculenta*, *Linn. Suppl. Roxb. Corom.* [4] 1, p. 13, t. 11, is the type of the genus, and perhaps the only genuine species; for a New Holland plant which I have at present joined with it, differs considerably both in the form of its corolla and that of its corona.

### OXYPETALUM.

**CHAR.** *Corolla* tubo brevi ventricoso; limbo 5partito, laciniis supra ligulatis.

*Corona staminea* 5phylla, foliolis subrotundis simplicibus, carnosus.

*Antheræ* membranâ terminatæ.

*Massæ pollinis* lineares, pendulæ, affixæ curvaturæ processum, dein adscendentium.

*Stigma* acumine elongato bipartito.

*Folliculi* . . . . .

**HABITUS.** *Frutex* volubilis. *Folia* opposita, cordata. *Umbellæ* subcorymbosæ, interpetiolares. *Flores* suaveolentes.

**PATRIA.** America Meridionalis.

**OBS.** The genus consists of a single species, which was discovered in 1768, near Rio de Janeiro, by Sir Joseph Banks.

### DIPLOLEPIS.

**CHAR.** *Corolla* tubo brevi, urceolato, limbo 5partito.

*Corona staminea* 5phylla, foliolis obtusis squamulâ & interiori auctis.

*Antheræ membranâ terminatae.*

*Massæ pollinis ventricosæ, juxta apicem affixæ, pendulæ.  
Stigma rostro elongato indiviso.*

*Folliculi . . . .*

*HABITUS.* [<sup>1</sup> *Frutex* decumbens, glaber. *Folia* oblonga, mucronulata, coriacea. *Cymæ congestæ, extraalares et terminales.*]

*PATRIA.* America Australis.

*OBS.* Only one certain species is known, which was discovered by my friend *Mr. Archibald Menzies*, in Chili, near Valparaízo.

Asclepias vomitoria of Koenig's MSS., of which I have examined specimens in the Banksian Herbarium, agrees with this genus in many respects, especially in the form and insertion of its masses of pollen, but differs considerably in appearance, and in having a blunt stigma.

#### HOLOSTEMMA.

*CHAR.* *Corolla* subrotata, 5fida.

*Corona* imo tubo stamineo inserta, simplex, annularis, *integra.*

*Antheræ membranâ terminatae.*

*Massæ pollinis pendulæ, compressæ, apice attenuato affixæ.*

*Stigma* muticum.

*Folliculi* ventricosi, læves. *Semina* comosa.

*HABITUS.* *Frutex* volubilis, glaber. *Folia* opposita, lata. *Umbellæ* interpetiolares, subsessiles. *Flores* speciosi.

<sup>43</sup> *PATRIA.* India Orientalis.

*OBS.* This is Ada-Kodien, *Rheod. Mal.* 9, p. 9, t. 7, in which the leaves are represented alternate, an error that is corrected in the description, which is excellent, and well accords with a specimen in the Banksian Herbarium collected by Dr. Patrick Russell.

<sup>1</sup> Added in MS. by the author.

## CYNANCHUM.

[*Cynanchi* sp. *Linn.**CHAR. Corolla* subrotata, 5partita.*Corona staminea* monophylla, 5-20loba, diam 5fida lobis antheris oppositis.*Antheræ membranâ terminatæ.**Massæ pollinis ventricosæ, pendulæ.**Stigma apiculatum.**Folliculi* læves. *Semina* comosa.*HABITUS. Plantæ* perennes, vel *suffrutices*, ut plurimum volubiles. *Folia* opposita. *Umbellæ* interpetiolares.*PATRIA* varia, a gradu 59° lat. bor. ! usque ad 32° lat. aust.

Obs. Though I have here very much limited the Linnean genus *Cynanchum*, yet it appears still to contain the elements of several genera: I shall therefore add the characters of all the species I am acquainted with, divided into such sections as will probably hereafter be considered distinct genera.

*I. Corona staminea* tubulosa, columnam includens, ore 14-5-10fido. *Laciniæ* 5 interiores antheris exterioribusque oppositæ et parallelæ.

*Massæ pollinis* infra apicem insertæ.*Stigma* apiculo semibifido.*Folliculi* cylindracei, divaricati.*Caulis* volubilis. *Folia* cordata.

1. *C. acutum*, foliis oblongo-ovatis cordatis acutis, corollæ laciniis oblongis obtusis.

*Cynanchum acutum*, *Linn.*, cum synonymis.

2. *C. Monspeliacum*, foliis reniformibus: apice coaretato semi-lanceolato, laciniis corollæ lanceolatis obtusiusculis.

*Cynanchum Monspeliacum*, *Linn.*, cum synonymis.

Obs. Forsan haud distinctum a priori.

3. *C. Chinense*, foliis ovatis cordatis: acuminate brevi,

laciniis corollæ lanceolato-linearibus acutis, coronæ laciniis 5 exterioribus compresso-filiformibus integris.

HAB. In Chinæ provincia Pecheley, *Georgius Staunton, Baronettus.* (v. s. in Herb. Banks.)

<sup>45</sup> *II. Corona staminea* tubulosa, columnam includens, ore 5-10fido, carinis decem interioribus simplicibus v. in lacinulas supra productis.

*Massæ pollinis* infra apicem insertæ.

*Stigma* apiculo enarginato.

*Folliculi* ventricosi, angulati, patentes.

*Caulis* volubilis. *Folia* cordata.

4. *C. pedunculatum*, pedunculo communi foliis glabrusculis longiore, carinis interioribus coronæ in lacinulas productis.

HAB. In Nova Hollandia tropica (ubi v. v.)

5. *C. floribundum*, pedunculo communi foliis glaberrimis breviore, carinis interioribus coronæ in lacinulas productis.

HAB. In Nova Hollandia extra tropicum (ubi v. v.)

6. *C. erubescens*, carinis interioribus coronæ 10fidæ corolla brevioris simplicibus, pedunculo communi petiolum æquante, ramulis floribusque extus pubescentibus.

HAB. In Nova Hollandia tropica, ubi a *Josepho Banks, Baronetto*, detectum.

7. *C. pauciflorum*, carinis interioribus coronæ 5fidæ corollam æquantis simplicibus, pedunculo communi petiolo breviore, ramulis floribusque glabris.

<sup>46</sup> *Periploca tunicata*, *Retz. obs.* 2, p. 15. *Willd. phyt.* 1, p. 7, n. 23, t. 5, f. 3. *Willd. sp. pl.* 1, p. 1252.

HAB. In India Orientali. (v. s. in Herb. Banks.)

*III. Corona staminea* tubulosa, columnam includens, ore 5-10fido, laciniis carinisve interioribus nullis.

*Massæ pollinis* apice sæpius affixæ.

*Stigma* apiculo bifido.

*Caulis* volubilis. *Folia* subcordata.

8. *C. pilosum*, foliis ovatis acutiusculis calycibusque pilosis, corona 10fida longitudine corollæ.

*Periploca Africana*, *Linn.*, cum synonymis.

HAB. In Africa Australi prope Promont. B. Spei. (ubi v. v.)

9. *C. crassifolium*, foliis ovatis subcordatis obtusis cum mucronulo carnosis calycibusque glabris, corona 10fida longitudine corollæ.

*Cynanchum obtusifolium*, *Linn. suppl.* 169?

HAB. In Africa Australi. (v. s. in Herb. Banks.)

10. *C. Capense*, foliis ovatis cordatis obtusis cum mucronulo caulibusque glabris, calycibus pubescentibus, corona 5fida corollâ duplo breviore.

*Cynanchum Capense*, *Linn. suppl.* 168?

HAB. In Africa Australi. (v. s. in Herb. Banks.)

IV. *Corona staminea* tubulosa, columnam includens, <sup>[47]</sup> ore 10fido, intus laciniis carinisve nullis.

*Massæ pollinis* apice affixæ.

*Stigma* apiculo integro.

*Caulis* erectus.

11. *C. roseum*, foliis lanceolato-linearibus undulatis glabriusculis, pedicellis calycibusque pilosis.

Asclepias foliis ex linear-lanceolatis, floribus umbellatis, umbellis alternis erectis, caule erecto. *Gmel. Sib.* 4, p. 78, t. 42.

Asclepias Davurica, *Willd. sp. pl.* 1, p. 1272?

HAB. In Siberia. *P. S. Pallas*, in Herb. Banks.

V. *Corona scutelliformis*, carnosa, 5-10loba, intus simplex.

*Massæ pollinis* infra apicem affixæ.

*Stigma* apiculo brevissimo, integro.

*Folliculi* læves.

*Caules* erectiusculi.

12. C. *Vincetoxicum*, caule erecto, corollis imberbibus, pedicellis umbellæ simplicis pedunculo communi triplo longioribus, corona 5loba.

Asclepias *Vincetoxicum*, Linn.

HAB. In Europa: in Suecia, etiam ad 59° 40' Lat.

[48] 13. C. *medium*, caule supernè volubili, corollis imberbibus, pedicellis umbellæ sæpe divisæ pedunculo communi vix longioribus, corona 5loba.

HAB. . . . . Specimen e Hort. Reg. Paris. in Herb. Banks.

Sequenti proximum.

14. C. *nigrum*, caule supernè volubili, corollis barbatis, pedicellis umbellæ simplicis pedunculo communi vix longioribus, corona semidecemfida.

Asclepias *nigra*, Linn.

HAB. In Europa Australi.

VI. *Corona* profundè 5fida, laciniis simplicibus.

*Massæ pollinis* infra apicem affixæ.

*Stigma* papilla emarginata.

*Folliculi* ventricosi.

15. C. *Sibiricum*, foliis lanceolato-linearibus oppositis ternisque, caule decumbente.

Asclepias *Sibirica*, Linn.

HAB. In Siberia, etiam in China. (v. s. in Herb. Banks.)

OBS. Vix hujus generis.

## METAPLEXIS.

CHAR. *Corolla* subrotata.

*Corona* staminea 5phylla, foliolis nanis, cucullatis, cum antheris alternantibus.

*Antheræ membranâ terminatæ.*

*Massæ pollinis ventricosæ, pendulæ, latere fixæ.*

*Stigma rostro elongato indiviso.*

### DITASSA.

*CHAR. Corolla subrotata.*

*Corona staminea duplex; exterior 5partita, laciniis acuminati; interior 5phylla, brevior, exteriori antherisque opposita.*

*Antheræ membranâ terminatæ.*

*Massæ pollinis ventricosæ, infra apicem affixæ, pendulæ.*

*Stigma apiculo obtuso.*

*Folliculi . . . .*

*HABITUS. Suffrutex volubilis, glaber. Folia opposita, plana. Umbellæ interpetiolares.*

*PATRIA. America Meridionalis, Brasilia, ubi prope Rio de Janeiro detexit Josephus Banks, Baronettus.*

### DCEMIA.

*CHAR. Corolla subrotata, tubo brevi.*

*Corona staminea duplex, exterior brevis, 10partita, laciniis alternis nanis; interior 5phylla, foliolis basi solutis, supra subulatis.*

*Antheræ membranâ terminatæ.*

*Massæ pollinis compressæ, apice affixæ, pendulæ.*

*Stigma muticum.*

*Folliculi ramentacei. Semina comosa.*

*HABITUS. Caulis volubilis. Folia opposita, cordata. Flores umbellati.*

*PATRIA. India Orientalis, et Africa Aequinoctialis.*

OBS. *Asclepias cordata*, *Forsk. Arab.* p. 49, and *Cynanchum extensum*, *Jacq. ic. 1, t. 54*, are the only certain species of the genus: from the latter, *Asclepias scandens*, *Palis. Flor. D'Ware*, 1, p. 92, t. 56, is probably not distinct, and *Cynanchum bicolor*, *And. Repos.* 562, is very nearly related to it.

### SARCOSTEMMA.

CHAR. *Corolla rotata*.

*Corona staminea duplex; exterior cyathiformis v. annularis, crenata; interior 5phylla, exteriorem superans, foliolis carnosis.*

*Antheræ membranâ terminatæ.*

51) *Massæ pollinis apice affixæ, pendulæ.*

*Stigma submuticum.*

*Folliculi graciles, læves. Semina comosa.*

HABITUS. *Caulis volubilis v. decumbens, aphyllus, articulatus, v. foliis oppositis distantibus. Flores umbellati, laterales v. terminales.*

PATRIA. India Orientalis, Nova Hollandia, et Africa.

OBS. To this genus belong *Cynanchum viminale*, *Linn.*; a species nearly allied to it from New Holland and New Caledonia; and *Asclepias viminalis*, *Linn.*, all of which I have examined. The probable species are, *Asclepias aphylla*, *Thunb. prod.*; *Asclepias stipitacea*, *Forsk. Arab.* 50; *Cynanchum pyrotechnicum*, and perhaps also *Asclepias aphylla*, of the same author.

### EUSTEGIA.

CHAR. *Corolla rotata*.

*Corona triplex; singula 5phylla; extima fauce inserta laciniis limbi opposita; reliqua extimâ alternantia, antheris opposita, foliolis mediæ tripartitis, intimæ indivisis.*

*Antheræ membranâ terminatæ.*

*Massæ pollinis apice attenuato affixæ, pendulæ.*

*Stigma submuticum.*

*Folliculi . . . .*

HABITUS. *Herba decumbens, humilis. Folia oppo-*<sup>152</sup>  
*sita, hastata. Flores subumbellati.*

PATRIA. Africa Australis.

OBS. This remarkable character is taken from *Apo-*  
*cynum hastatum, Thunb. Prod. 47; A. minutum, Linn.*  
*Suppl. 169, and from a very nearly related species found*  
*at the Cape of Good Hope, by Mr. Ferdinand Bauer.*

### METASTELMA.

CHAR. *Corolla subcampanulata; Fauce coronatâ den-*  
*tibus 5 exsertis, sinubus oppositis, tubum decurrentibus.*

*Corona staminea nulla.*

*Antheræ membranâ terminatae.*

*Massæ pollinis compressæ, apice attenuato affixæ, pen-*  
*dulæ.*

*Stigma muticum.*

*Folliculi . . . .*

HABITUS. *Planta perennis, volubilis, glabra. Folia*  
*opposita, membranacea. Umbellæ interpetiolares, subses-*  
*siles. Flores parvi.*

PATRIA. America Meridionalis.

OBS. This is the *Cynanchum parviflorum* of *Swartz*,  
whose description, however, of the corona, in *Flor. Ind. oc.*  
*l, p. 537, does not agree with ours, which was taken from*  
excellent specimens in the Banksian Herbarium, col-  
lected in the islands of St. Croix and St. Christopher,<sup>153</sup>  
*Masson and Von Rohr.*

MICROLOMA. [Ceropégia sp. *Linn. Jacq. Ceropégia*  
*Lam. Illust. Gen. tab. 179.*

CHAR. *Corolla urceolata, tubo ventricoso, angulato,*  
*fauce nudâ, limbo breviore.*

*Squamæ* 5, inclusæ, medio tubo sub sinubus insertæ, totidem fasciculis villorum alternantes.

*Corona staminea* nulla.

*Antheræ membranæ terminatæ, sagittatæ.*

*Massæ pollinis compressæ, apice affixæ, pendulæ.*

*Stigma apiculatum.*

*Folliculi . . . .*

HABITUS. *Suffrutices* volubiles. *Folia opposita. Umbellæ interpetiolares.*

PATRIA. Africa Australis.

OBS. This genus is formed from the two Cape species of *Ceropegia*, viz. *sagittata* and *tenuiflora*, plants which are widely different from the original species of that genus.

1. M. *sagittatum*, foliis sagittatis pubescentibus, corollæ limbo acutiusculo.

*Ceropegia sagittata, Linn. mant.*

2. M. *lineare*, foliis linearibus glabris, corollæ limbo obtusissimo.

*Ceropegia tenuiflora, Linn.*

44 ASTEPHANUS. [Apocyni sp. *Lin. fil. et Thun.*

CHAR. *Corolla subcampanulata, fauce tuboque esquamatis.*

*Corona staminea* nulla.

*Antheræ membranæ terminatæ.*

*Massæ pollinis pendulæ.*

*Stigma caudatum, v. muticum.*

*Folliculi . . . .*

HABITUS. *Plantæ* perennes, sæpius volubiles. *Folia opposita.*

*Umbellæ interpetiolares. Flores parvi.*

PATRIA. Africa Australis.

OBS. This generic character is formed from *Apocynum triflorum* and *lineare*, *Linn. suppl.*, and from two new species

in the Banksian collection. *Apocynum cordatum* and *lan-*  
*ceolatum*, *Thunb. prod.*, probably likewise belong to the  
genus; and I have modified the character, to admit a very  
remarkable plant, found by Mr. Masson in South Africa,  
the stem of which is shrubby with spinescent branches, the  
leaves extremely minute, opposite, distant, and heartshaped;  
the corolla rather urceolate than bellshaped; the orifice of  
the tube furnished with deflected hairs; the masses of  
pollen are fixed by their attenuated apices; the stigma is  
blunt; the folliculi nearly cylindrical and smooth, with seeds  
of the usual structure. The whole genus is evidently<sup>[65]</sup>  
very near akin to *Microlooma*, and differs chiefly in the want  
of squamæ within the tube. They might, therefore, be  
united; but this would lead to the junction also of *Meta-*  
*stelma*, a native of the West India Islands, which I am  
unwilling to join with these South African plants.

## II.

*Massæ pollinis* 20, laeves, quaternatim (duabus antheris  
pertinentes), affixæ apici corpusculorum exsulcorum stig-  
matis.

*Filamenta connata, extus appendiculata.*

## SECAMONE.

[*Periplocæ* sp. *Linn.*]

CHAR. *Corolla rotata.*

*Corona staminea* ḥphylla.

*Massæ pollinis* erectæ quaternatim affixæ apici corpusculi  
subsimilis, exsulci stigmatis.

*Stigma* apice coarctato.

*Folliculi . . . . .*

HABITUS. *Frutices* erecti v. volubiles, glabri. *Folia*  
opposita. *Cymæ* dichotomæ, interpetiolares. *Flores* minimi.

PATRIA. Africa, India Orientalis, et Nova Hollandia  
tropica.

OBS. From the extreme minuteness of the parts, no genus

has been more difficult to determine than this: it is, however, perfectly natural and distinct, and is evidently the connecting link between the true Asclepiadeæ, and the Periploceæ, which follow. I have examined five species, of which two are published plants, viz. *Periploca secamone* Linn. and *emetica* of Retz. and Willdenow. The third is a climber, a native of India, discovered by Dr. Roxburgh; and two are erect shrubs, natives of the tropical part of New Holland.

### III. PERIPLOCEÆ.

*Massæ pollinis* 5-20, granulosæ, (granulis e sphærulis 4 compositis), solitariæ, usque quaternatim apici dilatato corpusculi singuli stigmatis affixæ.

*Filamenta* partim v. omnino libera.

#### HEMIDESMUS.

[*Periplocæ* s<sup>r</sup> Linn.]

CHAR. *Corolla* rotata, squamis 5, sub sinibus, obtusis.

*Filamenta* basi connata, supra distincta. *Antheræ* cohaerentes, a stigmati liberæ, imberbes, apice simplices.

*Massæ pollinis* 20.

*Stigma* muticum.

*Folliculi* cylindracei, divaricatissimi, læves. *Semina* comosa.

HABITUS. *Frutices* volubiles, glabri. *Folia* opposita, nitida. *Flores* interpetiolares, congesti, parvi.

PATRIA. India Orientalis.

OBS. This genus, whose name is derived from the partial connection of the stamina, is composed of *Periploca Indica*, and two very nearly related unpublished species. Its strict affinity to *Periploca* is unquestionable, but the differences in the structure of its flower appear to me sufficient to justify its separation from that genus.

## PERIPLOCA.

[*Periplocæ* sp. *Linn.*

**CHAR.** *Corolla rotata. Squamis* 5 *faucis laciniis alter-natibus, aristatis.*

*Filamenta distincta. Antheræ cohærentes, dorso barbatæ.*

*Massæ pollinis apici dilatato corpusculi stigmatis applic-itæ, solitariae, e quatuor confluentibus.*

*Stigma submuticum.*

*Folliculi cylindracei, divaricatissimi, læves. Semina comosa.*

**HABITUS.** *Frutices sæpius volubiles, glabri. Folia oppo-sita, nitida. Flores subcorymbosi interpetiolares.*

**PATRIA.** *Europa Australis. Syria. Africa Septen-trionalis et Æquinoctialis.*

Obs. *Periploca Græca*, and *lævigata*, are the two principal species of the genus. *P. angustifolia*, *Billard.* no doubt also belongs to it; and I have seen a fourth and very remarkable species brought from Sierra Leone by <sup>ss</sup> Professor Afzelius, on account of which I have been obliged slightly to modify the character.

## GYMNANTHERA.

**CHAR.** *Corolla hypocrateriformis. Corona faucis 5phylla.*

*Filamenta distincta, fauci inserta. Antheræ imberbes.*

*Massæ pollinis quaternatim applicitæ apici dilatato cor-pusculorum.*

*Stigma apiculo bifido.*

*Folliculi cylindracei, læves, divaricatissimi. Semina co-mosa.*

**HABITUS.** *Frutex volubilis, glaberrimus. Folia opposita, nitida. Pedunculi laterales sub-dichotomi. Flores albo-virescentes, imberbes.*

**PATRIA.** *Nova Hollandia, intra tropicum.*

(Table facing page 59.)

---

## SECT. I. SEMINA COMOSA.

A. *Coma ad extremitatem umbilicalem (superiorem) seminis.*

ECHITES. [Brown. Echitides pleræq. *Jacq.*  
Echitidis species, *Linn.*

CHAR. *Corolla* hypocrateriformis, fauce tuboque esquamatis. Laciniis limbi 5partiti inæquilateris.

*Stamina* inclusa. *Antheræ* sagittatæ, medio stigmati cohærentes, lobis posticis polline vacuis.

*Ovaria* 2. *Stylus* 1, filiformis.

*Squamæ* 5 hypogynæ.

*Folliculi* graciles.

HABITUS. *Frutices* volubiles. *Folia* opposita, ciliis interpetiolaribus glandulosis. *Pedunculi* interpetiolares, multiflori. *Flores* utplurimum speciosi, albi, lutei et purpurei.

PATRIA. America Meridionalis.

OBS. Of Echites I have only examined *E. umbellata*, the original species when the species was established by Brown (60) in his "History of Jamaica;" *biflora*, *circinalis*, and *Domingensis*: but, from the descriptions and figures of authors, especially of Jacquin, Swartz, and the authors of the "Flora Peruviana," I without hesitation refer to it the following species: *E. suberecta* *Jacq.* *repens* *Jacq.* *agglutinata* *Jacq.* *asperuginis* *Swartz*, *torulosa* *Jacq.* *acuminata* *Fl. Peruv.* *laxa* *Fl. Peruv.* *hirsuta* *Fl. Peruv.* *E. quinquangularis*, *Jacq.* and *annularis*, *Linn. Suppl.* are probably not genuine species, on account of the prominent

ring of the faux, and *E. glandulosa Fl. Peruv.* which according to the figure has a crown of 5 entire laciniæ and the segments of the corolla equal-sided, must be excluded from this genus. *E. siphilitica*, the specimen of which in the Linnean Herbarium I have seen but not sufficiently examined, is somewhat doubtful. *E. floribunda*, *corymbosa* and *spicata* are removed to another genus. The two remarkable species of South Africa, *E. bispinosa* and *succulenta*, require further examination; for their peculiar habit indicates their being a distinct genus from *Echites*, which it would be desirable to limit to the species of tropical America: hence it will be necessary to re-examine certain plants of India that in many respects agree with this genus, especially *Tsjeria-pupal-valli* of *Rheed, Mal. 7, p. 103, t. 55*, which appears to differ from *Echites* chiefly in having a calyx longer than the tube of the corolla, in the scales surrounding the ovarium being united, (which, however, is also the case in *E. Domingensis*,) and in the greater quantity and density of the albumen, which is between fleshy and cartilaginous.

The authors of the "Flora Peruiana" have reformed the character of *Echites*, but the scales which they describe between the calyx and corolla will certainly not materially assist in distinguishing this genus from those most nearly related to it; and I have observed a nearly similar structure in most of the genera of this family, as well as of *Asclepiadæ*: these scales, however, truly belong to the calyx, and are either five or ten in number, or more rarely consist of an uninterrupted series of ciliæ, not unlike those which so frequently occur within the footstalks of the leaves. My observations are not sufficiently numerous to enable me to determine whether their modifications might not generally assist in characterizing genera, and I have, therefore, very seldom had recourse to them.

### ICHNOCARPUS.

CHAR. *Corolla hypocrateriformis, limbi laciniis dimidiatis, fauce tubo quo esquamatis.*

LIBRARY  
NATIONAL MUSEUM  
OF CANADA

*Stamina inclusa. Antheræ sagittatæ, a stigmate liberæ.  
Ovaria 2. Stylus 1, filiformis. Stigma ovatum, acuminate.*

<sup>62</sup> *Filamenta 5, hypogyna, staminibus alternantia.  
Folliculi graciles.*

**HABITUS.** *Frutex oppositifolius. Panicula terminalis,  
brachiata. Flores parvi.*

**PATRIA.** India Orientalis et Zeylona.

**OBS.** This is the *Apocynum frutescens* Linn., of which I have examined the original specimen in Hermann's herbarium. The *Quirivelia Zeylanica* of Lamarck and Poiret, in *Encycl. method. botan. vol. 6, p. 42*, considered by them as Linnæus's plant, must, from the description, be widely different, and probably does not belong to the same natural family.

### HOLARRHENA.

**CHAR.** *Corolla hypocrateriformis, laciniis æquilateris,  
fauce tuboque esquamatis.*

*Stamina inclusa, imo tubo inserta. Antheræ a stigmate  
liberæ, lanceolatæ, integræ, longitudinaliter polliniferæ.*

*Ovaria 2. Stylus brevissimus. Stigma cylindraceum.*

*Squamæ nullæ hypogynæ.*

*Folliculi graciles.*

**HABITUS.** *Frutices erecti, glabri. Folia membranacea.  
Cymæ terminales et laterales.*

**PATRIA.** India Orientalis et Zeylona.

**OBS.** This genus consists of two species ; one of which is <sup>63</sup> *Carissa mitis*, Vahl, *symb. 3, p. 44* : a specimen of this, so named by Koenig, I have examined in the Banksian Collection.

### ISONEMA.

**CHAR.** *Corolla hypocrateriformis ; fauce tuboque esqua-  
matis ; limbo 5partito.*

*Stamina exserta. Filamenta fauci inserta, apice simplicia.  
Antheræ sagittatæ, medio stigmati cohærentes.*

*Ovaria 2. Stylus 1, filiformis. Stigma incrassatum,  
obtusum.*

*Squamæ nullæ hypogynæ.*

*Folliculi . . . .*

**HABITUS.** *Frutex* erectus? oppositifolius, pilosus. *Panicula* terminalis, brachiata, floribus corymbosis. *Calycis* foliola basi intus squamâ dupli. *Corollæ* (semuncialis) tubus cylindraceus, intus medio barbatus.

**PATRIA.** Africa Æquinoctialis. (*H. Smeathman*, in *Herb. Banks.*)

### VALLARIS. [Burm. Ind. 51. Pergulariæ sp. Linn.

**CHAR.** *Corolla* hypocrateriformis; fauce tuboque esquamatis, limbo 5fido obtuso.

*Stamina exserta. Filamenta fauci inserta, brevissima,  
apice extus gibbere carnosæ. Antheræ sagittatæ, medio  
stigmati cohærentes.*

*Ovarium biloculare. Stylus filiformis. Stigma conico-  
ovatum.*

*Squamæ 5, hypogynæ, basi connatæ, apicibus ciliatis.* <sup>164</sup>

*Folliculi . . . .*

**HABITUS.** *Frutex* volubilis, oppositifolius. *Pedunculi* interpetiolares, dichotomi. *Flores* corymbosi, suaveolentes.

**PATRIA.** India Orientalis.

**OBS.** This is the *Flos Pergulanus* of Rumphius, which Linnæus considered as the first species of his genus *Pergularia*: it does not, however, belong to the same order with the plant that afforded his generic character, and to which the name has been since generally applied.

### PARSONSIA. [Echitidis sp. Jacq. et Swartz.

**CHAR.** *Corolla* infundibuliformis, fauce tuboque esquamatis, limbo 5partito, recurvo, laciniis æquilateris.

*Stamina exserta.* *Filamenta* medio v. juxta basin tubi inserta, filiformia. *Antheræ sagittatæ*, medio stigmati cohærentes, lobis posticis polline destitutis.

*Ovaria* 2, v. 1, biloculare. *Stylus* 1. *Stigma* dilatum. *Squamæ* 5, hypogynæ, distinctæ, v. connatæ.

*Folliculi* 2, distincti, v. cohærentes.

**HABITUS.** *Frutices* volubiles. *Folia* opposita. *Flores* cymosi, v. racemosi, racemis sæpe compositis, terminales v. interpetiolares, parvi, colore in variis vario.

**PATRIA.** America Meridionalis et Australasia.

**OBS.** The American species of this genus, viz. *Echites corymbosa* *Jacq.* *floribunda* *Sw.* and *spicata* *Jacq.* differ considerably from the rest, which are natives of New Holland and New Zealand. Among these, the only published species is *Periploca capsularis*, *Forst. prod. n.* 126. When the fruit of all has been examined, they will probably be divided in the following manner :

† *Americanæ.* Ovariis duobus. Folliculis distinctis.

†† *Australasienses.* Ovario biloculari. Folliculis longitudinaliter cohærentibus.

The genus is named in memory of Dr. JAMES PARSONS, the author of a Dissertation on the Analogy between the Propagation of Animals and that of Vegetables, and of an unfinished work, entitled, "The Microscopical Theatre of Seeds." The Parsonsia of Brown, which Linnæus reduced to *Lythrum*, is a species of *Cuphea*.

### 66 LYONSIA.

**CHAR.** *Corolla* infundibuliformis, fauce tuboque esquamatis, limbo 5partito, recurvo, laciniis æquilateris: æstivatione valvata.

*Stamina exserta.* *Filamenta* medio tubo inserta, filiformia. *Antheræ sagittatæ*, medio stigmati cohærentes, lobis posticis polline vacuis.

*Ovarium* biloculare. *Stylus* 1, filiformis, apice dilatato. *Stigma* subconicum.

*Squamæ* 5, hypogynæ, connatæ.

*Capsula cylindracea*, bilocularis, valvis folliculiformibus, dissepimento parallelo libero utrinque seminifero.

HABITUS. *Frutex* volubilis. *Folia* opposita. *Cymæ* terminales, trichotomæ. *Flores* inter minores, limbo barbato.

PATRIA. Nova Hollandia.

OBS. This genus is perhaps too nearly related to the New Holland portion of Parsonsia, from which it differs chiefly in its fruit being capsular. It is named in memory of ISRAEL LYONS, author of "Fasciculus Plantarum circa Cantabrigiam nascentium," and from whom Sir Joseph Banks received his earliest instructions in botany.

### APOCYNUM.

[*Apocyni* sp. *Linn.* et *Juss.* <sup>[67]</sup>

CHAR. *Corolla* campanulata. *Tubus* denticulis 5, acutis, inclusis, laciniis limbi oppositis. *Faux* nuda.

*Stamina* inclusa. *Antheræ* sagittatæ, medio stigmati cohærentes, lobis posticis polline vacuis.

*Ovaria* 2. *Styli* subnulli. *Stigma* dilatatum, apice conico.

*Squamæ* 5, hypogynæ.

*Folliculi* graciles, distincti.

HABITUS. *Herbæ* perennes, erectæ. *Folia* opposita, membranacea. *Flores* cymosi.

PATRIA. America Borealis, et Europa Australis.

OBS. The Linnean genus Apocynum at present contains many plants widely different from the species of which it originally consisted. Most of the spurious species I have already referred to different genera, and I here add specific characters of all the genuine species with which I am acquainted.

1. *A. androsæmifolium*, foliis ovatis glabris, cymis terminalibus lateralibusque, tubo corollæ calycem vis superante.

Apocynum androsæmifolium, *Linn.*

68] 2. A. *cannabinum*, foliis lanceolatis utrinque acutis glabris, cymis paniculatis, calyce tubum corollæ æquante.  
Apocynum cannabinum, Linn.

3. A. *hypericifolium*, foliis oblongis glabris brevissimè petiolatis mucronatis: basi obtusa subcordata, cymis folio brevioribus, calyce tubum corollæ æquante.

Apocynum hypericifolium, Hort. Kew.

4. A. *pubescens*, foliis ovato-oblongis mucronatis; basi obtusis; utrinque cymæque breviore pubescentibus, calyce corollam subæquante.

HAB. In Virginia. Mitchell, in Herb. Banks. (ubi v. s.)

5. A. *Sibiricum*, foliis ovato-oblongis mucronatis glabris; basi obtusa, cymis terminalibus pedunculatis pulvereo-pubescentibus, tubo corollæ calycem superante.

HAB. In salsis desertorum Astrachanensium. P. S. Pallas, M.D., in Herb. Banks. (ubi v. s.)

6. A. *Venetum*, foliis oblongo-ellipticis glabris mucronatis; basi sinuata, cymis paniculatis lateralibus terminalibusque, calyce tubum corollæ æquante.

Apocynum venetum, Linn.

### 69] CRYPTOLEPIS.

CHAR. Corolla infundibuliformis. Tubus squamulis 5, obtusis, inclusis, laciniis limbi alternantibus. Faux nuda.

Stamina inclusa, imo tubo inserta. Antheræ sagittatæ.

Ovaria 2. Styli 0. Stigma dilatum, apiculo conico.

Squamulæ 5, hypogynæ.

Folliculi . . . .

HABITUS. Frutex volubilis. Folia opposita, paginis discoloribus, inferiore venosa. Corymbi interpetiolares sessiles brevissimi.

PATRIA. India Orientalis. (Franciscus Buchanan, M.D., in Herb. Banks.)

## PRESTONIA.

CHAR. *Corolla* hypocrateiformis. *Fauv* coronata *tubulo annulari* indiviso *squamisque* 5, *interioribus laciniis* limbi *alternantibus*.

*Antheræ* semi-exsertæ, sagittatæ, medio stigmati cohærentes, lobis posticis polline vacuis.

*Ovaria* 2. *Stylus* 1, filiformis, apice dilatato. *Stigma* turbinatum apicule angustiore.

*Urceolus* hypogynus, 1-phyllo.

*Folliculi* . . . . .

HABITUS. *Frutex* volubilis, tomentosus. *Folia* opposita, tomentosa. *Corymbi* congesti interpetiolares. *Calyx* [70] foliaceus, laciniis basi intus squamulâ instructis.

PATRIA. America Meridionalis.

P. tomentosa.

HAB. In sepibus prope Rio de Janeiro, in Brasilia, detexit Josephus Banks, Baronetus.

OBS. This genus is named in memory of Dr. CHARLES PRESTON, the correspondent of Ray, and styled by him, "eruditissimus vir, et curiosissimus stirpium observator." Many of his observations, chiefly on the more minute plants, occur in Ray's "Methodus emendata." Blair also mentions him as an ingenious and expert botanist.

## BALFOURIA.

CHAR. *Corolla* infundibuliformis. *Fauv* coronata *tubulo crenulato*. Limbi laciniæ rectæ, æquilateres.

*Stamina* semi-exserta, fauci inserta. *Antheræ* sagittatæ, medio stigmati cohærentes, mucronatæ.

*Ovarium* biloculare. *Stylus* 1, filiformis, apice dilatato.

*Stigma* angulatum.

*Squamulæ* 10, basi calycis extra corollam insertæ: hygynæ nullæ.

*Folliculi* . . . . .

HABITUS. *Arbor* inter minores. *Folia* opposita, lanceo-

<sup>71</sup> lato-linearia, falcata, denticulis interpetiolaribus. *Cynæ*  
trifidæ, laterales et terminales.

PATRIA. Nova Hollandia tropica.

OBS. I have named this genus in memory of Sir ANDREW BALFOUR; the founder of the Edinburgh Botanic Garden and Museum, of whose merits in natural history, especially in botany, an interesting account is given by his friend Sir Robert Sibbald, in a small volume, entitled, "Memoria Balfouriana."

### NERIUM.

[*Nerii* sp. *Linn.* et *Juss.*

CHAR. *Corolla* hypocrateriformis. *Faux* coronata foliolis lacero-multifidis. *Limbi* laciniis tortis, inæqualateris, ecaudatis.

*Stamina.* *Filamenta* medio tubo inserta. *Antheræ* sagittatæ aristatæ, medio stigmati cohaerentes.

*Ovaria* 2. *Stylus* 1, filiformis, apice dilatato. *Stigma* obtusum.

*Squamæ* nullæ hypogynæ . . . . denticuli in basi calycis, extra corollam.

*Folliculi* cylindracei.

HABITUS. *Frutices* erecti. *Folia* terna, elongata, coriacea, venis numerosis, parallelis.

PATRIA. India Orientalis.

<sup>72</sup> Obs. The only true species of *Nerium* are, *N. Oleander, odorum*, and probably *salicinum*, *Forsk.*

*Nerium Zeylanicum* and *antidysentericum*, form a very distinct genus, which I have named *Wrightia*. *N. coronarium* is probably a *Tabernæmontana*, and *N. divaricatum*, from an examination of the specimen in Hermann's Herbarium, on which this species entirely rests, I believe to be the same plant. *Nerium obesum*, *Forsk.*, seems to be *sui generis*: it cannot, at least, be a *Nerium*.

## STROPHANTHUS, Decandolle. [Echitidis sp. Linn.]

**CHAR.** *Corolla* infundibuliformis. *Fauæ coronata* squamulæ decem, indivisis. *Limbi laciniæ caudatæ.*

*Stamina* medio tubo inserta. *Antheræ sagittatæ, aristatæ, v. mucronatæ.*

*Ovaria* 2. *Stylus* 1, filiformis, apice dilatato. *Stigma* subcylindraceum.

*Squamæ* 5, hypogynæ.

*Folliculi* . . . . .

**HABITUS.** *Frutices* sarmentosi. *Folia* opposita.

**PATRIA.** Africa æquinoctialis, et India Orientalis.

B. *Coma ad extremitatem umbilico obversam (inferiorem) 173  
seminis.*

## WRIGHTIA. [Nerii sp. Linn.]

**CHAR.** *Corolla* hypocrateriformis. *Fauæ coronata* squamulæ decem, divisæ.

*Stamina* exserta. *Filamenta fauci* inserta. *Antheræ sagittatæ, medio stigmati cohærentes.*

*Ovaria* 2, cohærentia. *Stylus* 1, filiformis, apice dilatato. *Stigma angustius.*

*Squamæ* 5-10, basi calycis extra corollam insertæ.

*Folliculi* distincti, v. cohærentes, placentis adnatis.

**HABITUS.** *Frutices* erecti, arboresve minores. *Folia* opposita. *Corymbi* subterminales. *Flores* albi. *Albumen* 0. *Embryo* cotyledonibus longitudinaliter involutis, albus, aquâ calidâ immersus roseus evadit!

**PATRIA.** India Orientalis, Zeylona, Archipelago Malaica, et Nova Hollandia tropica.

**Obs.** Gærtner has given an excellent account of the fruit of this genus, in his description of *Nerium Zeylanicum*, and he no doubt supposed, that the fruit of *Nerium Oleander* was essentially the same. It is, however, very remarkably different. And no genus is more distinct in habit, or more beautifully characterized than this, which I

have dedicated to my much respected friend, WILLIAM  
<sup>74</sup> WRIGHT, M.D., F.R.S.L. & E., whose ardour in the pur-  
 suit of botanical knowledge, even while engaged in exten-  
 sive medical practice, in the island of Jamaica, has long  
 entitled him to this mark of distinction.

1. *W. antidysenterica*, foliis obovato-oblongis breviter  
 acuminatis glabris, corymbis subterminalibus, tubo corollæ  
 calyce 6ies longiore, folliculis distinctis.

*Nerium* foliis ovatis acuminatis petiolatis, *Linn. Flor.*  
*Zeyl.* 107, fide speciminis in herbario Hermanni.

*Nerium antidysentericum*, *Linn. sp. pl. ed. 2, p. 306.*

HAB. In Zeylona. *Hermann*, et *J. G. Koenig*, in *Herb.*  
*Banks.*

OBS. Codaga pala, *Rheed. mal.* 1, p. 85, t. 47, vix hujus  
 loci, præsertim ob diversam figuram foliorum, et coronæ  
 defectum ; ideoque forsitan Holarrhæne species.

2. *W. Zeylanica*, foliis oblongo-lanceolatis subacuminatis  
 glabris, corymbis terminalibus, tubo corollæ calyce 4-5ies  
 longiore, folliculis distinctis.

*Nerium Zeylonicum*, *Linn. Amæn. Acad.* 4, p. 309\*.

HAB. In Zeylona. Exemplar visum ex Herbario fuit  
 D. Van Royen, nunc in Museo Banksiano.

OBS. Præcedenti nimis affinis, diversa præsertim figura  
 foliorum, quæ etiam paulo minora sunt.

3. *W. tinctoria*, foliis elliptico-lanceolatis ovatisque acu-  
<sup>75</sup> minatis glabris, ramis corymbisque divaricatis, corollæ  
 tubo calyce duplo longiore, folliculis distinctis.

HAB. In India Orientali. *J. G. Koenig*, *M.D.*, et *Gul.*  
*Roxburgh*, *M.D.*, in *Herb. Banks.* (ubi v. s.)

4. *W. pubescens*, foliis elliptico-oblongis acuminatis calyci-  
 busque pubescentibus, corymbis erectis, tubo corollæ calyce  
 parum longiore, folliculis cohærentibus.

HAB. In Novæ Hollandiæ orâ septentrionali Arnhems  
 Land, et in insula Timor prope Coepang, (ubi v. v.)

C. *Semina peltata, ciliata, utriusque extremitatis ciliis  
elongatis comosa.*

## ALSTONIA.

[*Echitidis* sp. *Linn.*

CHAR. *Corolla hypocrateriformis, fauce tuboque esquamatis.*

*Stamina inclusa. Antheræ lanceolatæ, longitudinaliter polliniferæ, a stigmate liberæ.*

*Ovaria 2. Stylus 1, filiformis, apice dilatato. Stigma subconicum.*

*Squamulæ nullæ hypogynæ, nec calycinæ.*

*Folliculi teretes.*

HABITUS. *Arbores* sæpe proceræ, lactescentes.

*Folia verticillata vel opposita, costata, glabra.*

*Cymæ terminales, paniculatæ. Flores sæpius albi.*

*Folliculi plerumque longissimi.*

PATRIA. India Orientalis, Archipelago Malaica, et Insulae Societatis.

Obs. Had Linnæus examined the fruit of this genus, or even attended to the figure given of it in the "Hortus Malabaricus" (of which work, it is proper to observe, he had not a copy), it is probable he would have distinguished it from Echites, to which it has so little affinity. As it is, I am happy in having it in my power to commemorate the merits of Dr. ALSTON, the predecessor of Dr. Hope, by so distinct and splendid a genus. The Alstonia of the Younger Linnæus, is, according to L'Heritier, a species of Symplocos.

1. A. *scholaris*, foliis verticillatis 5-7 obovato-oblongis obtusis costatis venaque margini approximata cinctis, cymis breviter pedunculatis, limbo corollæ parum barbatis, folliculis longissimis.

Pala, *Rheed. mal.* 1, p. 81, t. 45, optima.

Lignum scholare, *Rumph. amb.* 2, *p.* 246, *t.* 82, quoad descriptionem, sed figura potius sequentis.

*Echites scholaris*, *Linn. mant.* 53.

HAB. In India Orientali et in Insulis Moluccanis. (v. s in Herb. Banks.)

2. *A. spectabilis*, foliis quaternis elliptico-oblongis sub-acuminatis costatis: margine simplicibus, cymis pedunculatis folio brevioribus, corolla limbo barbato, folliculis longissimis.

HAB. In Insula Timor prope Coepang, cum floribus fructibusque Aprili 1803 observavi.

OBS. Praecedenti quàm maximè affinis, sed reverà distincta, nec malè ab iconē cit. Rumphii repræsentata; descriptio autem *A. scholaris* melius convenit.

3. *A. venenata*, foliis quaternis oblongo-lanceolatis acuminatis basi attenuatis, cymis dichotomis, corollæ tubo sursum ampliato; limbo imberbi acuto, folliculis utrinque attenuatis folium vix æquantibus.

HAB. In India Orientali, *Gul. Roxburgh, M.D.* (v. s. in Herb. Banks.)

4. *A. costata*, foliis oppositis elliptico-oblongis acuminatis costatis, cymis effusis, limbi laciniis imberbis lanceolatis tubo longioribus, folliculis longissimis.

*Echites costata*, *Forst. prod.* n. 123.

HAB. In Insulis Otaheite et Ulaietea, inter juga montium (insularibus Attahé nuncupata). *Josephus Banks, Baronettus.* (v. s. in Herb. Banks.)

OBS. Kametti-valli, *Rheed. mal.* 9, *p.* 23, *t.* 14, which is given in Willdenow's *sp. pl.* 1, *p.* 1240, as a synonyme of this plant, differs in the shortness of the folliculi, and in having winged and naked seeds. Rheede also describes his plant as being a climber. The seeds of the Otaheite plant, which forms a moderate-sized tree, are distinctly

ciliated; but I am not certain that the ciliæ are so remarkably elongated at each extremity, as in the other species; and it may, therefore, be a connecting link between this section of Apocineæ, in which I have placed it, and the nearly related genera *Plumeria*, *Cameraria*, and *Vinca*.

ON

# WOODSIA,

A NEW GENUS OF FERNS.

BY

ROBERT BROWN, Esq., F.R.S., LIB. LINN. SOC.

(READ NOVEMBER 7TH, 1812.)

[Extracted from 'The Transactions of the Linnean Society of London,'  
Vol. XI, pp. 170—174.]

## ON WOODSIA,

[170]

### A NEW GENUS OF FERNS.

---

THERE is perhaps no tribe of cryptogamous plants which since the time of Linnæus has received greater additions to its number of species, or more considerable improvements in its systematic arrangement, than the *Filices*; and certainly no botanist has so essentially contributed to these improvements as the President of this Society; whose ingenious Essay on Dorsiferous Ferns may justly be considered as the groundwork of the more complete dissertations of Professors Swartz and Bernhardi, which have appeared since its publication.<sup>1</sup>

Linnæus, in his latest work, the 13th edition of the *Systēma Vegetabilium*, enumerates scarcely more than 200 Ferns, which he referred to twelve genera: while the *Species Plantarum* of the late Professor Willdenow contains upwards of a thousand plants of the same order, arranged under forty-three genera. It is however remarkable, that of this vast number of species nearly one half belong to four of the Linnean genera, namely, *Polypodium*, *Acrostichum*, *Asplenium*, and *Pteris*, all of which were first proposed by Ray in his *Methodus Plantarum Emendata*, published in 1703; without names, indeed, but with characters nearly similar to those of Linnæus.

It appears, therefore, that the arrangement of Ferns at present universally followed is not wholly new: and that it has not attained such a degree of perfection as to super-

<sup>1</sup> An. 1793, in *Mém. de l'Académie Royale des Sciences de Turin*, vol. v, p. 401.

sede all changes in nomenclature, may be inferred from the genus *Polypodium* alone, though reduced nearly one half by its present character, still including 157 species, or upwards of a seventh part of the whole order.

The expediency of subdividing *Polypodium*, as well as some of the other genera mentioned, especially *Acrostichum*, is indeed obvious, not merely on account of their great extent, but also from the striking differences in habit existing among the species referred to each.

I have, some time ago,<sup>1</sup> had an opportunity of remarking, that the plants referred to *Polypodium*, *P. ilvense* and *hyperboreum*, form a distinct genus, from the peculiar structure of their involucrum, even the existence of which had escaped preceding observers.

This genus I have named in honour of my friend Mr. Joseph Woods, whose merits as an accurate and skilful English botanist are well known to many of the members of this Society: and the object of the present communication is to illustrate it by some additional observations on its structure, and by a very perfect drawing, for which I am indebted to the friendship of Mr. Francis Bauer.

The character distinguishing *Woodsia* from all other genera of Ferns hitherto established, consists in its involucrum being inserted under the group of capsules, or, as it is technically called, the *sorus*, which it completely surrounds at the base; while it is in every stage open at the top, having its margin divided into a number of capillary segments, which from their length and incurvation entirely conceal the young capsules, and in a great measure the full-grown.

That so singular a structure should have been hitherto unnoticed, even though both species of the genus have been described and figured since the publication of Dr. Smith's memoir, is not perhaps to be wondered at: for the membranaceous base of the involucrum is completely concealed by the capsules, and the marginal hairs, which alone are visible, exactly resembling the pubescence of the frond, have been universally confounded with it.

<sup>1</sup> *Prod. Fl. Nov. Holl.* i, p. 158, Obs. IV.

The difficulty, too, of separating the membrane entire from the frond, to which, by the pressure of the capsules, it is closely applied, is so considerable, that, since the publication of my remark already quoted, its existence has been doubted by a botanist, whose opinion, especially in whatever regards this order of plants, is of peculiar weight, and in opposition to which I should not retain full confidence in my own observations, though frequently repeated, were they not so distinctly confirmed by Mr. Bauer's excellent drawing.

I first observed the involucrum six years ago in living plants of *Woodsia hyperborea*, and have since repeatedly ascertained its existence in dried specimens of the same species, and of *Woodsia ilvensis*. These two plants are indeed so nearly related, that I find myself unable to construct for them clear specific characters; and therefore, in proposing them here as distinct species, I am, from want of sufficient materials to determine the question, rather following the prevailing opinion than my own.

To the characters and synonyms which follow, I have not thought it necessary to add descriptions of the two supposed species, these having been given by several of the authors referred to, and in every respect correctly, except what regards the involucrum.

## WOODSIA.

[173]

*Sori dorsales, subrotundati.*

*Involucrum calyciforme apertum margine crinitum: includens Capsulas pedicellatas: receptaculo communi elevato nullo.*

*Filiculæ, frondibus cæspitosis, pinnatim divisæ; pilis simplicibus squamulisque angustis instructæ.*

1. *ilvensis*. W. frondibus bipinnatifidis, pinnis oblongis, pinnulis confluentibus multifloris: inferioribus subrepandis: infimis subæqualibus.

*p. 567.*

*Habitat* in Europæ alpibus (v. v.) 2.

## EXPLANATION OF TAB. 38 (XI).

[174]

## FIG.

1. A native specimen of *Woodsia hyperborea*, natural size.
2. The stipes and lower part of the frond of the same plant, magnified 3 times in diameter.
3. A pinna of the same plant, magnified 10 diam.
4. A pinna from another specimen, in which the clusters of capsules (sori) are more numerous and confluent, 10 diam.
5. A single cluster of capsules within their involucrum, the membranaceous base of which they entirely conceal, magnified 50 diam. (2500 times in superficies).
6. The involucrum spread open, with only one capsule left in it, magnified 50 diam.
7. An unripe capsule.
- 8, 9. Side and back views of a ripe capsule. } magnified
- 10, 11. Capsule opening and entirely burst, } 50 diam. shedding its seeds.
12. A seed magnified 200 diam.
13. A frond of a cultivated plant of the same species, natural size.

OBSERVATIONS  
ON  
THE NATURAL FAMILY OF PLANTS  
CALLED  
COMPOSITÆ.

BY  
ROBERT BROWN, F.R.S.,  
CORESPONDING MEMBER OF THE ROYAL INSTITUTE OF FRANCE, AND OF THE  
ROYAL ACADEMIES OF SCIENCES OF BERLIN AND MUNICH;  
MEMBER OF THE WERNERIAN SOCIETY OF  
EDINBURGH, LIBR. LINN. SOC.

OBSERVATIONS  
ON  
C O M P O S I T A E.

THE class *Syngenesia* of the Linnean artificial system, <sup>176</sup> as at present limited, constitutes a family strictly natural, and by far the most extensive in the vegetable kingdom. It is also, with the exception of Grasses only, the most generally diffused, and is almost equally remarkable with that order, for the great apparent uniformity in the structure of its essential parts of fructification.

This class of plants, for which I retain the established name COMPOSITÆ, in preference to any of those recently proposed, has lately become the subject of a minute and accurate examination by Mons. Henri Cassini; two of whose Memoirs on the Style and Stamina of the class, already published in the *Journal de Physique*,<sup>1</sup> are in my opinion models for botanical investigation.

A few years before the publication of M. Cassini's Memoirs on Compositæ I was induced to examine a considerable part of this extensive family, chiefly with a view to the more accurate determination of the New Holland plants belonging to it.

My principal object in the present paper is to communicate such general observations, the results of this investigation, as either have not yet been published by M. Cassini, or respecting which I consider myself to have anticipated that author in my General Remarks on the Botany of New

<sup>1</sup> Of 1813 and 1814.

in Holland, appended to Captain Flinders's Voyage to Terra Australis.

To these observations I shall add some remarks on certain genera of Compositæ, which occur repeatedly under different names in late systematic works, and whose structure and limits appear to be imperfectly understood.

My *first* observation relates to the peculiar disposition of the nerves or vessels of the corolla of this family of plants.

In the essay already mentioned, which appeared early in the summer of 1814, I have noticed this peculiarity in the following terms:<sup>1</sup>

"The whole of Compositæ agree in two remarkable points of structure of their corolla; which, taken together at least, materially assist in determining the limits of the class. The first of these is its valvular aestivation; this, however, it has in common with several other families. The second I believe to be peculiar to the class, and hitherto unnoticed. It consists in the disposition of its fasciculi of vessels or nerves; these, which at their origin are generally equal in number to the divisions of the corolla, instead of being placed opposite to these divisions, and passing through their axes, as in other plants, alternate with them; each of the vessels at the top of the tube dividing into two equal branches, running parallel to and near the margins of the corresponding laciniae, within whose apices they unite. These, as they exist in the whole class and are in great part of it the only vessels observable, may be called primary. In several genera, however, other vessels occur, alternating with the primary, and occupying the axes of the laciniae: in some cases these secondary vessels being most distinctly visible in the laciniae, and becoming gradually fainter as they descend the tube, might be regarded as recurrent; originating from the united apices of the primary  
<sup>78</sup> branches; but in other cases, where they are equally distinct at the base of the tube, this supposition can hardly be admitted. A monopetalous corolla, not splitting at the

[<sup>1</sup> Vol. i, p. 30.]

base, is necessarily connected with this structure, which seems also peculiarly well adapted to the dense inflorescence of Compositæ; the vessels of the corolla and stamina being united and so disposed as to be least liable to suffer by pressure."

At the date of this publication I certainly had no knowledge of any similar observations having been previously made: but I now see in M. Cuvier's account of the proceedings of the Institute of France for 1815, that M. Cassini is considered to have anticipated me on this subject, and as he says in "termes non équivoques." What these terms are, appears by a letter I have received from M. Cassini himself, in which he states his claim to rest on the following passage :

"Chaque fleur hermaphrodite ou male contient cinq étamines, correspondant aux cinq nervures de la Corolle et par conséquent alternes avec ses lobes."

This passage occurs in a Memoir on the Stamina of Compositæ, which was read to the Institute of France in July 1813, and first appeared with the substance of that Memoir in the *Journal de Physique*, said to be for April 1814; but the actual date of the publication of which I have reason to believe was somewhat later, and very nearly corresponding with that at which M. de Jussieu was in possession of a copy of my essay containing the observations already quoted. I conclude it is not supposed I could have been acquainted with the passage in the original memoir, unless the report usually made on memoirs read to the Institute should have been printed, and should have actually noticed this passage, or the discovery it is now said to contain.

But independently of the near equality of dates, I cannot consider my observations as either wholly or even in any considerable degree anticipated by the passage in question. My observations notice not only the disposition of the five vessels in the tube of the corolla, but their ramification in the laciniae, by no means a necessary consequence of that disposition; they notice also the existence, in several genera of Compositæ, of five vessels alternating

with those, and which I considered secondary in this order, though they occupy the place of the primary vessels in other families: and it is this inverted disposition, indicated in the greater part of the class by the primary being the only vessels existing, which I have considered as of material importance in determining the limits of Compositæ, though by no means as affording an essential practical character for the whole class.

In the passage quoted from M. Cassini (the only one I can find relative to the subject in the memoir in which it occurs), the existence of five nerves or vessels in the tube of the corolla, alternating with its laciniae, is stated, but their division and disposition in the laciniae are not noticed; it is at the same time to be inferred from the terms of the passage, that no other vessels exist in the tube of the corolla: and it is equally evident that, so far from announcing this disposition of vessels as a discovery, or peculiar to the order, the author rather considers it either as a fact already known, or as the usual structure. That M. Cassini was not then aware of the importance of the fact which he had imperfectly stated, appears likewise from his having, many months after his memoir was read, and at a time when he says he had finished his analysis of the corolla, proposed a name for the class, taken from a supposed peculiarity in the structure of the filament, a name which he is now inclined to abandon for one derived from the disposition of vessels in the corolla.

<sup>80]</sup> Since my attention has been again turned to the subject, I have endeavoured to collect all that has been observed on the nerves or vessels of the corolla of Compositæ, a brief account of which may be not altogether without interest.

The earliest notice I have been able to find is contained in a passage (in page 170) of Grew's Anatomy of Plants, where, in speaking of syngenesious flosculi, he says, "they are frequently ridged, or as it were hem'd like the edge of a band." And his figure of a magnified floret of the common Marigold, in tab. 61, gives a tolerable idea of the marginal vessels of its laciniae. Grew however takes no

notice of the trunks from which these branches arise, either in his text or plates.

Van Berkhey, in his Dissertation on Compositæ, published at Leyden in 1760, though he makes no mention of the nerves of the corolla in his text, yet in all the magnified figures he has given both of ligulate and tubular florets, correctly represents the trunks of the primary vessels, without, however, noticing their ramification in the laciniae. I am anticipated therefore by this author's figures exactly in the same degree as by the passage contained in M. Cassini's second memoir.

The accurate Schmidel, in the few Compositæ which occur in his Icones, has correctly represented the trunks of the primary vessels, but has equally omitted their ramifications.

In the Analysis Florum of Batsch, a work published in 1790, the object of which was to give an idea of the structure of the natural families of plants, by a minute description and magnified figures of one or more species selected from each, *Coreopsis tripteris* occurs; and although the vessels of its tubular floret are very indistinctly figured, yet both their trunks and branches are correctly described. The same author however, who in 1802 published an ingenious work on the natural families of <sup>the</sup> plants,<sup>1</sup> takes no notice of the vessels of the corolla in the character of Compositæ which he has there proposed.

In the figures of syngenesious plants given by Schkuhr,<sup>2</sup> wherever the ligulae of *Cichoraceæ* are magnified, the trunks of the nerves are correctly represented ending in the sinuses; unless in one plate containing *Lactuca virosa* and *Sonchus sibiricus*, in both of which the vessels are made to pass through the axes of the teeth; but in no case are the marginal branches noticed. It is singular that this generally accurate author, in the many magnified figures he has given of tubular florets, has only in two cases represented the trunks of their vessels, namely in *Echinops Ritro*, where they are correctly placed, and in *Silphium trifoliatum*.

<sup>1</sup> Tabulæ affinitatum regni vegetabilis.  
<sup>2</sup> In Botanisches Handbuch

where, though only five vessels are visible, they are erroneously made to pass through the axes of the laciniae.

The only remaining author that notices these vessels is M. Mirbel, who in the second part of his valuable *Elémens de Physiologie Végétale et de Botanique*, published in 1815, introduces into his character of *Compositæ* the fact of the laciniae of the corolla being furnished with marginal nerves. This observation, if not original, the author may have adopted either from my essay already quoted, of which he was in possession soon after its publication, or from M. Cassini's third memoir, which was read to the Institute of France six months after that essay appeared : but he could not have derived it from the passage in that author's second memoir, on which he rests his claim ; no notice being there taken of the disposition of vessels in the laciniae.

In M. Cassini's memoir expressly on the Corolla of *Compositæ*, which was read to the Institute of France in December 1814, and of which an abstract, by the author <sup>esq;</sup> himself, is given in a late number of the *Nouveau Bulletin des Sciences*, the disposition of vessels in the corolla is expressed in the following terms :

“ Chacun des cinq pétales dont se compose la corolle est muni de deux nervures très simples qui le bordent d'un bout à l'autre des deux côtés, et confluent par conséquent au sommet.”

On this statement I have several remarks to offer. And first, I object to its hypothetical language. Whatever opinion may be formed of the theory here adopted by the author, namely, that every monopetalous corolla is in reality composed of several confluent petals ; a theory first proposed by Linnaeus himself in his *Prolepsis Plantarum*, and ably supported on different grounds by Mons. Decandolle in his excellent *Théorie Elémentaire de la Botanique* ; I can see no advantage in adopting its language in stating a fact of this kind, especially if proposed as a practical character.

For my own part, I consider this opinion as correct in the sense in which it was held by Linnaeus, without how-

ever, connecting with it the ingenious hypothesis of M. Decandolle, namely, that petals are only modified stamens. It remains to be seen on what ground M. Cassini has adopted this theory, as proposed by M. Decandolle, for Compositæ, the only family which seems to present a very important objection to it, in having its principal, and in the greater part of the order its only, vessels occupying the lines of junction of the supposed united petals.

To adapt this disposition of vessels to the theory, M. Cassini is obliged to subdivide their apparently simple trunks; a division, however, which may be regarded as entirely hypothetical. From the observations I have made on the subject, I have no doubt that these trunks are equally simple with the secondary nerves when present, or with the primary in other families. I find them to consist of two kinds of vessels, the spiral and ligneous. Of the spiral vessels there are generally several in the cord: in *Helianthus multiflorus*, however, I have not been able <sup>as</sup> to find more than one, either in the trunk of the nerve above the insertion of stamens, or in the branches of the laciniae. It will be of some interest to verify this fact (which I by no means give with absolute confidence), both on account of the apparently formidable objection it presents to the theory in question, and also that, in following it up by an examination of the point of division, a clearer idea may be obtained of the ramifications of spiral vessels than has hitherto been given.

My second objection to M. Cassini's account is, that he describes the nerves as marginal through their whole length. I have formerly, in the passage already quoted, stated them to be parallel and approximated to the margins of the laciniae. Perhaps in no instance can the branches be considered as strictly marginal; in many cases they are manifestly distinct from the margins, and in the genus *Hymenopappus* are further removed from them than from the axis of the laciniae. In *H. scabiosæus* there is also an evident inequality of the two branches in each lacinia, the stronger extending nearly to the apex, while the weaker either entirely disappears before it reaches the stronger, or

unites with it considerably below its termination. In *H. tenuifolius* this irregularity is still greater; one branch being not unfrequently altogether wanting, and even the remaining branch considerably weakened: where this happens a secondary vessel is always produced, though very few flosculi are furnished with five complete middle nerves.

To the fact stated by M. Cassini that the lateral nerves are always simple, I have met<sup>1</sup> with only one apparent exception, in an unpublished species of *Madia*, where they are connected by a few branches with the secondary or middle nerve, which in this plant is more strongly marked than the primary, and from which indeed these connecting branches probably originate.

It must, I think, be admitted by M. Cassini, that in many genera of Compositæ five vessels passing through the axes of the segments exist, even ten others are occasionally found, as in *Helianthus*, though these can hardly be traced below the insertion of stamina. But as it has been already shown that the lateral or primary vessels are not strictly marginal through their whole length, and as one instance has been produced in which their branches, if not themselves subdivided, are at least connected by ramifications of the middle nerves,<sup>1</sup> it follows that a monopetalous corolla having in its tube fifteen nerves with distinct origins, three of which are continued through each of its segments, and unite together at the apex, would upon the whole better correspond with the definition M. Cassini has given of the Corolla of Compositæ, than the actual disposition of vessels in that order. Now such a structure exists in the whole of Goodenoviae,<sup>2</sup> a family of plants very

<sup>1</sup> M. Cassini himself (in a note to his third memoir published in the Journal de Physique for February 1816, p. 129) has given another instance of the ramification of nerves in *Iva frutescens*.

<sup>2</sup> I have formerly observed (in Prodr. Flor. Nov. Holl. p. 580, and in General Remarks on the Botany of Terra Australis [vol. i, p. 33]) that *Euthales* and *Velleia*, genera belonging to Goodenoviae, exhibit the remarkable and nearly peculiar character of a corolla having the lower part of the tube coherent with the ovary, while the calyx is entirely distinct. I have at the same time remarked that, even in those genera of the same natural family in which the calyx is coherent, the tube of the corolla may be supposed to be continued down to the base of the ovary; and that this becomes even evident in such species as have the

nearly related to Compositæ. It exists also in *Ernodea*,<sup>185</sup> in which the lateral nerves, though they give out externally a few branches, observe the same course, and terminate in the same manner in the laciniæ as those of Compositæ. A similar disposition is observable in certain genera of Solanaceæ, as *Datura* and *Cestrum*, though in these the lateral nerves are more ramified, and their trunks generally less distinct in the laciniæ. It appears therefore that, in adopting M. Cassini's theoretical expression for the vascular structure of the corolla of Compositæ, one peculiarity actually existing is lost.<sup>186</sup>

adhering part dilated into nectariferous processes; or in those where, the segments of the calyx not being closely approximated, the coloured corolla is visible in the interstices. In some species of *Goodenia*, particularly *G. decurrens* and *bellidifolia*, I find it practicable to separate not only the adhering calyx, but also the tube of the corolla from the ovary. In the tube thus separated it appears that the lateral nerves, which preserve their parallelism to the middle nerve nearly to the base of the segment, become more evidently divergent below the point of adhesion, and in such a degree that the corresponding branches of the neighbouring segments unite with each other considerably above the middle of the tube, forming a common trunk, which is continued to the base of the ovary; the five trunks thus formed uniting internally with those from which the filaments originate, and externally with the axes of the opposite segments of the calyx. The middle nerves of the segments of the corolla are in like manner continued below the point of cohesion to the real base of the tube.

The analogy of this disposition of vessels in the corolla of Goodenovia to that of Compositæ is obvious. To assimilate entirely the two structures, it is only necessary to suppose a deeper division of the five primary vessels of Compositæ, and a continuation of the tube of the corolla below its apparent base to that of the ovary. That this is its real origin, is rendered not improbable both from the analogous structure now described in the family of *Goodenovia*, and from the manifestly hypogynous corolla of *Brunonia*; a genus in many respects still more nearly related to Compositæ, though differing in the disposition of the vessels of its corolla.

The more direct proof of this origin, derived from an examination of the surface itself, can hardly, perhaps, be expected where the parts are generally so small, and where, as I conceive, the surface of the pericarpium in many cases depends less on that of the cohering envelopes, than on the proper figure of the ovary itself, as seems to be likewise the case in Umbellatæ.

There are however a few cases in which this opinion respecting the origin of corolla in Compositæ may derive some additional support from the appearance of the surface of the ovary, as in *Marshallia* and *Hymenopappus*, in both of which genera, but particularly in the former, it is marked with ten longitudinal striae, of which the five stronger are continued into the five nerves of the corolla, the remaining five ending abruptly at the apex of the ovary.

<sup>1</sup> A still stronger objection to M. Cassini's definition is, that while its application to Compositæ is only hypothetical, it very nearly corresponds with the

The principal peculiarity, however, consists in the corolla of a syngenesious plant, when reduced to its smallest number of nerves, having these nerves alternating with its segments in the tube. I am acquainted with no instance of this order of reduction in the nerves of any other monopetalous corolla, but I observe an apparent tendency to it in *Portlandia* and *Catesbea*. In the tube of the corolla of both these genera there are ten nerves, of which the five that alternate with the segments are manifestly stronger, and seem to furnish the greater part of the vascular system of the upper part of the tube and of the segments; the intermediate nerves being there somewhat like recurrent branches.

I shall conclude this subject by observing, that although the existence of nerves alternating with the segments of a monopetalous corolla, dividing below the sinus and uniting their branches at the apex of the segment, be rare, this disposition is comparatively frequent in a monophyllous calyx, especially where its aestivation is valvular. Labiatæ furnish the most striking examples of this structure. I am not however acquainted with any instance of a calyx having five nerves only, and those alternating with its segments.

The *aestivation* or condition of the corolla before expansion is the subject of my second remark on Compositæ. I <sup>87</sup> have, in the observations formerly quoted, stated this to be *valvular*, that is, having the margins of the segments applied to each other and dehiscing like the valves of a capsule. As I have remarked in the same place that this aestivation exists in several other families, it is rather surprising that M. Cassini, in the abstract of his third memoir given in the Nouveau Bulletin des Sciences for last October, should seem to consider this character as peculiar to

actual disposition of vessels in certain polypetalous genera. Thus in *Pittonsporum revolutum*, each of the petals has three nerves with distinct origins. Of these the two lateral, evidently within the margins, less so, however, than in *Hymenopappus*, are quite simple in the unguis, and ramify more or less in the lamina, near the top of which they unite with each other and with the middle nerve.

Compositæ.<sup>1</sup> It appears also that he is not aware of any exception to it in the class. I have however, in a different part of the same essay, noticed one exception existing in *Chuquiraga*, and I have since found another in *Corymbium*. In both these genera the aestivation is induplicate, that is, the margins of the segments are doubled in, so that in the unexpanded state none of them are visible. I have in the passage referred to observed that the valvular and induplicate modes of aestivation easily pass into each other, merely by an addition or abstraction of the elevated margins of the laciniae: instances of their abstraction, and of the consequent conversion of the induplicate into the valvular mode, occur in several Goodenoviæ, and in some Convolvulaceæ and Solanaceæ; while *Chuquiraga* and *Corymbium* are examples of their addition in an order where they are generally wanting.

My third remark is entirely borrowed from Schkuhr,<sup>2</sup> who states that in all *Uichoraceæ* or *Lignariae* the pollen is

<sup>1</sup> Since this paper was read, M. Cassini has published his memoir (in the *Journal de Physique* for February 1816), in which he states the same aestivation to exist in certain other families, namely, Campanulaceæ, Lobeliaceæ, and Rubiaceæ. This observation, if applied to the whole of these families, as is evidently the author's intention, is correct only with respect to *Campanulaceæ*, from which I have separated Stylineæ as a distinct order, partly, as I have stated, on account of its imbricate aestivation. In a considerable part of the Lobeliaceæ of Jussieu, which includes my Goodenovia, the aestivation is not valvular but induplicate: and though in Rubiaceæ the valvular mode is very general, there are many remarkable exceptions to it, as *Gardenia*, *Ixora*, *Pavetta*, *Coffea*, and several other genera, where it is unilaterally and obliquely imbricate, as in most of the Apocynaceæ, with which Linnaeus united them under the name of Contortæ, derived from this very circumstance. On this subject I may be allowed further to remark, that M. Cassini, who in the memoir now cited has repeatedly asserted his claim to the priority of the observation on the disposition of vessels in the corolla, has in treating of its aestivation omitted to notice what had been already published respecting it in my essay above quoted, where I conclude he must have seen my observation, as he refers to the sentence containing it. The aestivation of corolla in Compositæ is also noticed in the observations on *Brunonia*, contained in my *Prodromus Floræ Novæ Hollandiæ*, which I suppose he has not seen: I may therefore, for the general importance of aestivation of calyx and corolla in affording characters both for Orders and Genera, refer him to almost every page of the same work, and to its preface, for an observation on the degree of attention that had been previously paid to this point of structure, which will enable him to correct in some measure his own remark on the subject.

<sup>2</sup> *Botanisches Handbuch* 3, p. 8.

angular, and that in *Corymbiferae* and *Carduaceæ*, or in all tubular florets, it is spherical or oval.

All the figures which this author has given of pollen in Cichoraceæ represent it as a regular icosahedron, except that of *Geropogon glabrum*, which is a dodecahedron. I believe neither of these forms of pollen has been observed in any other family of plants.

A fourth remark on Compositæ I do not offer with absolute confidence, as it is opposed to the statement of M. Cassini, on whose general accuracy I have great reliance. It relates to the disposition of the branches of the style or stigmata, which according to M. Cassini are lateral, or right and left with relation to the axis of the common receptacle; whereas, I consider them as anterior and posterior, though in many cases by a slight degree of twisting in the style they acquire what M. Cassini regards as their original position.

This may seem a point of very little consequence to establish. Independent however of the necessity of minute accuracy in every case, it appears to me to have some connexion with my fifth remark, which relates to the internal structure of the Ovarium of Compositæ. I am not aware of anything having been yet said on this subject further than that it contains a single erect ovulum, inserted at the base of the cavity. In addition to this, I observe in the greater part of Compositæ, whose ovary I have examined, two very slender filiform cords, which, originating from opposite points of the base of the ovulum, or of its short foot-stalk, run up, and are more or less connected with, the lateral parietes of the ovary, until they unite at the top of its cavity, immediately under the style; between which and the ovulum a connexion is thus formed. In many cases, as in *Liatris spicata* and *Tussilago odorata*, these cords are easily separable from the ovary, and have such a degree of tenacity that they may be extracted from it entire, along with the ovulum. In other cases they more firmly cohere with the sides of the cavity: and in those plants in which I have been unable to see them distinctly,

I conclude they are not absolutely wanting, but that their connexion with the parietes is still more intimate.

These cords may be supposed to consist either solely of the vessels through which the ovulum is fecundated, or to contain also the remains or indications of a system of nourishing vessels, or chordæ pistillares, the position of which points out the true nature of the ovary in this class, or the relation it has to the apparently less simple ovary of other families. I am inclined to adopt the latter supposition. In order, however, to be understood on this subject, it is necessary to premise that I consider the pistillum or female organ of all phænogamous plants to be formed on the same plan, of which a polyspermous legumen or folliculus whose seeds are disposed in a double series may be taken as the type. A circular series of these pistilla, disposed round an imaginary axis, and whose number corresponds with that of the parts of the calyx or corolla, enters into my notion of a flower complete in all its parts.

But from this type and number of pistilla many deviations take place, arising either from the abstraction of part of the complete series of organs, from their confluence, or from both these causes united; with consequent abortions and obliterations of parts in almost every degree. According to this hypothesis, the ovary of a syngenesious plant is composed of two confluent ovaria; a structure which is in some degree indicated externally by the division of the style, and internally by the two cords which I consider as occupying the place of two parietal placentæ, each of these being made up of two confluent chordulæ, belonging to different parts of the compound organ. I am well aware how very paradoxical such an hypothesis must seem, especially when applied to a structure apparently so simple as that of the ovary of Compositæ; and I therefore regret that I am not yet fully prepared to bring forward in its support a series of facts already in my possession, consisting of deviations from the usual structure of organs, and particularly of instances of stamens changed into pistilla.

In the mean time it may give some plausibility to the hypothesis to remark, that there are families of plants strictly natural in which a series of degradations exist, if I may so speak, from the assumed perfect pistillum, to a structure as simple as that of Compositæ.

Thus in *Proteaceæ* we have the type of the perfect pistillum in the many-seeded folliculus of *Embothrium*; the first degree of imperfection in that of *Grevillea*, where only one ovulum of each series remains; a further reduction in the indehiscent monospermous fruit of *Leucospermum*, in which the insertion of the ovulum is lateral; and the simplest form in *Protea* itself, where the single ovulum is inserted at the base of the cavity. *Proteaceæ*, however, exhibit a series of obliterations in the parts of a single pistillum only. An illustration more in point, though somewhat less perfect as a series, may be taken from *Goodenoviae*, an order of plants very nearly related to the class of which we are treating. In the greater part of *Goodenoviae*, the ovarium is bilocular, each cell having an indefinite number of seeds; in the greater number of *Scævolæ*, each cell is reduced to a single ovulum; while in some species of the same genus, and in all the species of *Dampiera*, the ovarium, though retaining its external characters, is reduced to a single monospermous cell, with an erect ovulum, as in Compositæ. The natural order *Cruciferæ* exhibits also obliterations, more obviously analogous to those assumed as taking place in syngenesious plants; namely from a bilocular ovarium with two polyspermous parietal placentæ, which is the usual structure of the order, to that of *Isatis*, where a single ovulum is pendulous from the apex of the unilocular ovarium. And lastly in the genus *Bocconia*, in the original species of which (*B. frutescens*) the insertion of the single erect ovulum has the same relation to its parietal placentæ, as that of Compositæ has to its filiform cords, a second species (*B. cordata*) exists in which these placentæ are polyspermous.

My *sixth* observation on Compositæ regards the order in which the florets expand. To understand the relation this order has to that of other families, it may be necessary first

to make a few remarks on the more usual modes of inflorescence.

It is well known that in an absolutely simple spike the expansion of the flowers is ascendent; that is, begins at the base of the spike and proceeds regularly upwards. To this order very few real exceptions occur, several of the apparent deviations being connected with some degree of composition in the spike.

It is also known that in a compound spike, while the <sup>192</sup> expansion of each partial spike is ascendent, that of the spikes, with relation to each other, is descendent; the terminal spike expanding first, and the others in a regular succession downwards. This order, indeed, admits of a greater number of exceptions than that of the simple spike; several of them apparently depending on the density or imperfect composition of the spike; and the more usual deviation consisting in the expansion beginning below the apex, and proceeding in opposite directions from the point of commencement; the upper portion following the order of the simple, the lower that of the compound spike.<sup>1</sup>

The simple racemus and corymbus are obviously very slight modifications of the spike, and in their expansion obey the same law.

A syngenesious compound flower, or *capitulum* as it may be termed, is merely a spike with a shortened and generally depressed axis. In cases where this capitulum is unquestionably simple, the expansion of its flowers is uniformly from circumference to centre, or in the order of the simple spike. Where the capitula are disposed in a corymbus, which is their usual mode of combination, the order of the compound spike is observed; their expansion with relation to each other being from centre to circumference. In their denser aggregations, whether forming a

<sup>1</sup> The most remarkable exception to the order of the compound spike exists in the compound umbel of Umbelliferæ, of which the outer umbellule expand somewhat earlier than the central; and as this order of expansion seems to extend through the whole natural family, *Astrantia*, in which the terminating umbel expands much earlier than those of the lateral branches, cannot be considered as having a compound umbel.

compound spike or head, the same order of expansion obtains, and it continues though the florets in each common calyx or involucrum should be lessened in number, or even reduced to unity, as in *Echinops* and *Rolandra*.

[<sup>93]</sup> The absolute constancy in the order of expansion of the simple capitulum from circumference to centre, and the more or less complete inversion of this order in the compound capitulum, appear to afford tests of the real structure in certain cases where the degree of composition, and consequently the proper names of some of the parts, might otherwise be doubtful.

To illustrate this I select two genera, *Lagasca* and *Cæsulia*.

In *Lagasca* the capitulum, both from its form and the appearance of its involucrum, might at first sight be considered as simple: on examination, however, it is found to differ from all simple capitula, in each floret being furnished with a tubular envelope, exactly resembling a five-toothed perianthium, but which does not in any state cohere with the included ovary.

Cavanilles, by whom the genus was established, regarded this envelope as a genuine perianthium, and erroneously described its tube as cohering with the ovary; an error which is copied in Persoon's Synopsis Plantarum, where the genus is consequently placed in Polygamia æqualis. Jacquin, who has published *Lagasca* under the name of *Noceæa mollis*,<sup>1</sup> also describes the envelope of each flower as a proper perianthium, although aware of its tube being distinct from the ovary. Subsequent writers have, indeed, more correctly referred the genus to Polygamia segregata; but the ternis involucellum and calyculus, which they apply to the envelope in question, appear to me objectionable, for a reason that will presently be given.

Three suppositions may be formed respecting the nature of this envelope, namely, either that it is an involucrum reduced, as in *Echinops*, to a single flower; secondly, that it is a proper perianthium, which in appearance it very

<sup>1</sup> Fragm. Bot. p. 58, tab. 85.

much resembles; or thirdly, that it is more analogous to <sup>104</sup> the outer calyx of *Scabiosa*, which M. Cassini seems to consider different in its nature from both these parts.

But the order of expansion in *Lagasca*, which is, though with some degree of irregularity, from centre to circumference, or that of the compound capitulum, seems to decide the question respecting the envelope of each flower, and to establish its identity with involucrum: nor does this involucrum differ materially from that of *Echinops*, except in the reduced number and confluence of its component parts.

The real structure of *Cæsulia* is perhaps less obvious.

This genus, which was first published by Dr. Roxburgh,<sup>1</sup> is referred by him to *Polygamia segregata*; the tubular envelope or involucrum of each floret being described as distinct from the included ovary.

Koenig, on the other hand, by whom the genus was discovered, and whose account of it is given in the same work, describes the partial involucrum of Roxburgh as the surface of the ovary itself; its segments being, according to him, a pappus of two leaves. And lastly, Willdenow, regarding this involucrum as merely paleæ of the receptacle, refers the genus to *Polygamia æqualis*; in which order it is continued, both in Persoon's *Synopsis*, and in the second edition of Mr. Aiton's *Hortus Kewensis*.

This last view of the structure seems the most erroneous of any, and was probably adopted by Willdenow, in consequence of his having added to the genus a second species not really belonging to it, and which I shall have occasion to notice in another part of my subject.

An examination of the parts of fructification in different stages reconciles the opposite statements of Koenig and Roxburgh; for I find that at the time of flowering the envelope of each floret is, as Roxburgh has figured it, distinct from the ovary, with which, however, in a more advanced stage its tube becomes firmly united; a fact that sufficiently accounts for Koenig's description.

<sup>1</sup> In Corom. Plants, i, p. 64, t. 93.

There is here, therefore, a nearer approach to a true perianthium than in the involucrum of *Lagasca*; but the expansion of the flowers being, as in that genus, from centre to circumference of the capitulum, I consider the envelope of *Cæsulia* as unquestionably an involucrum, and the genus consequently belonging to Polygamia segregata.

I may here remark, that the name Polygamia segregata, invented by Linnæus for those genera of Compositæ with densely aggregate capitula, is calculated to give an erroneous idea of the nature of the structure; the opposite term Polygamia congregata being, according to the view now taken, obviously more proper for those genera, at least, whose involucra contain several flowers. It is not unlikely, indeed, that Linnæus himself was aware of the true nature of the inflorescence of these genera; but the term Polygamia congregata would not have suited the artificial arrangement which he adopted in his subdivisions of the class, nor his including in it the order *Monogamia*; for with this order the single-flowered genera of Polygamia segregata must then have been confounded.

It is a curious circumstance, that the order of expansion in Compositæ does not depend on the number of flowers actually existing, but on the effort, if I may so term it, made to produce them, manifested by the presence of an involucrum or common calyx, which is in some cases reduced to a single flower. The fact at the same time contributes to prove, that the whole natural class is formed on <sup>96]</sup> that plan of dense aggregation of flowers, for which I have already attempted to show that certain parts of the structure of a syngenesious floret are peculiarly well adapted.

The circumstance, however, is not confined to Compositæ, but exists in an equally remarkable degree in *Gramineæ*.

I have formerly<sup>1</sup> considered the gluma, or what Linnæus has termed calyx, in this family of plants, as an involucrum.

In those genera where this gluma or involucrum con-

<sup>1</sup> [Vol. i. p. 55.]

tains several flowers their expansion is generally ascendent, or in the order of the simple spike. In a spike formed by these many-flowered glumæ, as that of *Triticum* and *Lolium*, the expansion of the partial spikes, with relation to each other, is descended, or in the order of the compound spike; in most cases, however, with that deviation, which I have already noticed, of the expansion commencing below the apex and proceeding in opposite directions. But as the same descended expansion takes place in a spike formed of single-flowered glumæ, it may be inferred that the genuine type or most perfect form of a grass is to have several flowers in its gluma or involucrum: a view not only consistent with the fact of a great majority of the order having actually this disposition; but also with that peculiarity in the vascular structure of the inner valve of the perianthium; which, whether it be considered as indicating that this part is formed of two confluent valves, an opinion I have elsewhere<sup>1</sup> advanced, or merely as a transposition of vessels in a simple valve, analogous to that in the syngenesious floret, is evidently adapted to the many-flowered spicula, though equally existing in that with a single flower.

The resemblance between the outer calyx of *Dipsaceæ* and the single-flowered involucrum of *Compositæ* is so striking, that it cannot appear very paradoxical to consider them as both of the same nature.

In *Dipsaceæ*, however, there is no instance of the outer calyx containing more than one flower, and the evidence afforded by inflorescence on this subject is not altogether satisfactory.

In *Dipsacus* it has been long noticed that expansion begins about the middle of the spike, and proceeds in opposite directions from the point of commencement: this order is evidently more analogous to that of the compound than of the simple spike; there being several instances of spikes manifestly compound, where the same inversion of the upper part exists.

<sup>1</sup> In General Remarks on the Botany of New Holland [vol. i, p. 55].

But a fact, which I do not find any where observed, respecting the inflorescence of certain species of *Scabiosa*, particularly *succisa* and *atropurpurea*, is not so easily reconcilable with the compound spike: in these, and I have reason to think in many other species of the genus, the expansion begins simultaneously at the base and middle of the capitulum, proceeding regularly upwards from both points. Were this the case in all *Scabiosæ*, the compound nature of the spike in *Dipsaceæ*, although by no means proved, might be considered not improbable: there are, however, several species of the genus in which the order of expansion is altogether that of the simple spike.

Connected with the subject of inflorescence, I may remark that priority of development, whether among similar parts in the same flower or the different flowers of the same spike, is generally accompanied with greater perfection of these parts or flowers, and apparently with greater power of resisting the ordinary causes of abortion or obliteration.

I have formerly<sup>1</sup> observed respecting several natural families of plants, in which the stamens are in a determinate number, but a number subject to reduction, that this reduction, where the flower is of a regular form, takes place in the same order in each natural family. Thus in *Juncaceæ*, which are generally hexandrous, the triandrous species have their stamens constantly placed opposite to the three outer leaves of the perianthium, while in *Restiaceæ*, *Asphodelæ*, and I believe in a great part of the regular-flowered *Liliaceæ*, in certain species of which a similar reduction occurs, the stamens in the triandrous species are placed opposite to the inner leaves or segments of the perianthium. But in both cases the greater perfection of those stamens that exist in genera or species reduced to the smallest number, is indicated, where there is no reduction, by the earlier bursting of their antheræ; so that from this circumstance the order of reduction or abortion of stamens

<sup>1</sup> In Prodr. Flor. Nov. Holl. vol. i, and Appendix to Flinders's Voyage to Terra Australis [vol. i, p. 52].

in any natural family may with some confidence be predicted by an examination of those genera where the number is complete.

Wherever the separation of sexes takes place, it may be assumed that the female flower is the more perfect production. And if this be admitted, where both sexes exist in the same simple spike the female should be found at its base, or where expansion commences, which is almost uniformly the case. For the same reason, in the trifid or trichotomous inflorescence, the female should be placed in the centre, which is also generally the fact.<sup>1</sup>

This connexion between praecoccy and perfection of development is even more constant than the order of expansion in certain forms of inflorescence; as it is found to extend to several of the exceptions to this order.

Thus in the apparently simple spike of *Poterium*, where the order of expansion is descendent, the female flowers occupy the upper part of the spike; and this relation also exists in the more compound inflorescence of *Ricinus*, *Siphonia*, and *Celtis*, in which the order of expansion is equally inverted.

It may seem rather paradoxical to select *Euphorbia* as an example of the same relation; this genus being considered by Linnæus, and the greater part of the botanists who have adopted his system, as having a dodecandrous hermaphrodite flower. We have already, however, I believe, sufficient evidence that this supposed hermaphrodite flower is in reality formed of several monandrous male flowers surrounding a single female.<sup>2</sup>

<sup>1</sup> To this order the most remarkable exception occurs in *Begonia*, in which the male flowers are central, and expand long before the lateral female flowers.

<sup>2</sup> To the arguments I have adduced (in my Remarks on the Botany of New Holland [vol. i, p. 28]) in support of this opinion, I am now enabled to add the more direct proof derived from certain species of *Euphorbia* itself, in which the female flower is furnished with a manifest calyx. I have formerly observed, that in a few cases the footstalk of the ovary is dilated and obscurely lobed at top; but in the species now referred to it terminates in three distinct and equal lobes of considerable length, and which being regularly opposite to the cells of the capsule may be compared to the three outer folioles of the perianthium of *Phyllanthus*, between which and the cells of the capsule the same relation exists. This calyx is most remarkable in an undescribed species of *Euphorbia* from the coast of Patagonia, in the Herbarium of Sir Joseph Banks; but it is observable, though less distinct, in *E. punicea* and several other species.

In conformity with this view of its composition, and with the relation above attempted to be established, the development of the pistillum precedes that of the stamina in many species of the genus.

It is more difficult to determine whether this order of expansion and relative position of sexes in *Euphorbia* be in conformity with the general rule, or an exception to it. For its fasciculus of flowers may be considered as analogous either to the simple spike, and consequently having an inverted order of expansion, as in *Allium descendens*, and certain species of *Grevillea* and *Anadenia*: or it may be assimilated to the compound spike, as in several species of the genus the male flowers appear to be separated into <sup>1003</sup> fasciculi; and according to this view the order of expansion is direct, the central female flower being the representative of the terminal partial spike.

There is even a third species of inflorescence with which the fasciculus of *Euphorbia* may be compared, namely, that consisting of one or more verticilli with a single flower in the centre. In this, which may be considered a modification of the spike or umbel, the usual order of expansion seems to be from centre to circumference. Its simplest form occurs in an unpublished New Holland genus of the same natural family with *Euphorbia*, in which a single verticillus of male flowers surrounds the central female flower. *Lambertia* may be considered as another instance of the same mode, and as far as can be determined, in a case where the flowers are hermaphrodite and their expansion nearly synchronous, following the same order. In all the known species of this genus the leaves are verticillate, and uniformly in threes: in *L. formosa* and *inermis* the involucrum constantly contains seven flowers, while in *L. uniflora* it is reduced to one flower. The seven flowers of the two former species I consider as made up of two verticilli, in number of flowers corresponding with that of the leaves, and of a single central or terminal flower; to which terminal flower *L. uniflora* appears to be reduced. From this order of reduction it may be assumed as more probable that species of *Lambertia* should be found with

with

ten or four flowers in the involucrum than with nine, six, or three. But greater permanence being, as has been already remarked, generally connected with greater perfection, it becomes also probable that, if any species of this genus should be discovered with androgynous capitula, the female flower will occupy the centre as in the genus of Euphorbiaceæ above referred to.

It is worthy of remark, and may indeed appear in some degree at variance with the foregoing observations, that <sup>101</sup> although in an assemblage of flowers priority of expansion generally indicates a greater degree of perfection, and consequently a more ready convertibility of the hermaphrodite into the female flower; yet in a hermaphrodite flower the development of stamens usually precedes that of pistilla. The most remarkable exceptions to this order of development which I at present remember, occur in several species of *Plantago*, where the stigmata are fully developed, and often even withered, before the bursting of the antheræ.

---

I now proceed to make some remarks on certain genera of Compositæ which either occur under different names in late systematic works, or whose structure and limits seem to be imperfectly understood.

#### SOLIVA

was established in the *Prodromus Floræ Peruvianæ et Chilensis*, and is adopted by Persoon in his *Synopsis Plantarum*.

To this genus *Hippia minuta* of the Linnean Herbarium unquestionably belongs, and it is perhaps not specifically distinct from *Soliva pedicellata*. But on comparing the structure of this plant with the figures and descriptions, given by Mons. de Jussieu (in the fourth volume of the *Annales du Muséum*), of the different species of his *Gymnostyles*, it appears to me evident that the whole of

this genus is referable to *Soliva*, whose principal characters would consist in the want of corolla or perhaps its accretion with the persistent style in the female florets; in the pericarpia being more or less winged, and presenting their disk instead of their margins to the centre of the capitulum.

<sup>102]</sup> Sir James Smith has already pointed out the error M. de Jussieu has been led into in referring *Hippia minuta* Linn. to his *Gymnostyles nasturtiifolia*, a plant much more nearly related to *Hippia stolonifera* of Brotero; which, from repeated examination, I can with confidence refer to the same genus.

*Gymnostyles anthemifolia* is stated by M. de Jussieu to be a native of New South Wales: but as I have observed it only in cultivated ground in the neighbourhood of Sydney, and as it has certainly been found in South America, of which four other species of the genus are unquestionably natives, it has probably been imported into New South Wales, perhaps from Brazil; nor is it altogether improbable that *Hippia stolonifera* of Brotero may have been introduced into Portugal from the same quarter.

#### GRINDELIA,

described by Willdenow in the Transactions of the Natural History Society of Berlin for 1807, and subsequently in his *Enumeratio Plantarum Horti Berolinensis*, flowered in Kew Gardens for the first time in 1815, when I had an opportunity of examining it, and of determining its very near affinity with *Donia*, a genus proposed in the second edition of *Hortus Kewensis*, and adopted by Mr. Pursh in his *Flora of North America*: the principal distinction between these two genera consisting in a difference in the number of radii of the pappus, which in *Grindelia* is described by Willdenow as of two rays, and according to my observations has more frequently one only. But as even in *Donia* the number of rays, though indefinite, is variable, and the structure of the pappus is very nearly similar in both genera, which in all other respects agree, it

may be perhaps expedient to unite them under the name of *Grindelia*, which was first in order of publication.

## TRIDAX

[103]

was first established by Linnæus, in *Hortus Cliffortianus*, from a specimen found at Vera Cruz by Houston, and sent to Clifford by Miller. As Linnæus had no specimen in his own collection, that in Clifford's Herbarium, now in the possession of Sir Joseph Banks, is the only authority for the genus; and on examining this specimen I find the pappus to be not setaceous, as Linnæus has described it, but distinctly plumose. There is, therefore, no difference whatever between *Tridax* and *Balbisia* of Willdenow; and on comparing *Tridax procumbens* with *Balbisia elongata*, I cannot satisfy myself that they are even specifically distinct.

## ANGIANTHUS.

*Angianthus tomentosus* of Wendland's *Collectio Plantarum*, (vol. ii, p. 32, tab. 48,) published in 1809, is evidently the same plant as my *Cassinia aurea*, described in the fifth volume of the second edition of *Hortus Kewensis*, which did not appear till 1813. Wendland neither mentions the native country of his *Angianthus*, nor from whence he received it. He must, no doubt, however, have obtained it from Kew Garden, where it was introduced and flowered from seeds which I collected in 1802, in the island of St. Francis, on the South coast of New Holland.

## MEYERA.

This genus, described by Schreber in his edition of the *Genera Plantarum*, is not adopted by Willdenow. Swartz, however, in his *Flora Indiæ Occidentalis*, has referred to it, and I have no doubt correctly, *Eclipta sessilis* of his *Prodromus*. On comparing this species of *Meyera* with a plant in Sir Joseph Banks's Herbarium, collected in Peru

<sup>104</sup> by Dombey, and which exactly agrees with *Sobreya* of the Flora Peruviana, it appears evident that this genus is reducible to *Meyera*. *Enhydra* of Loureiro's Flora Cochinchinensis, though described somewhat differently, and referred to *Polygamia segregata*, I have little doubt, belongs to the same genus; as does unquestionably *Hingstha* of Roxburgh's unpublished Flora Indica, where it is also referred to *Polygamia segregata*. This plant, which I have examined, is scarcely distinct from a species of *Meyera* that grows in New South Wales.

*Cryphiospermum* of Mons. de Beauvois's interesting Flore d'Oware et Benin, although reduced by him to Cichoraceæ, I have but little hesitation in referring also to *Meyera*. And lastly, *Cæsilia radicans* of Willdenow, likewise a native of æquinoctial Africa, is perhaps not specifically different from *Cryphiospermum repens* of Mons. de Beauvois.

#### MELAMPODIUM

was established by Linnæus, in the first edition of Genera Plantarum and in Hortus Cliffortianus, from a specimen found by Houston near Vera Cruz, and communicated by Miller to Clifford, in whose Herbarium, now forming part of the collection of Sir Joseph Banks, it still exists. It does not appear that this plant has been found by any other botanist than Houston; and according to the character given by Linnæus of *Melampodium*, it must be considered the only species of the genus.

In the second edition of Species Plantarum he added to it, but with a doubt, *Melampodium australe*, a plant adopted from Löefling, according to whose description the pappus and surface of the seed are widely different from those of the original species. Swartz has referred to the genus a third species, *M. humile*, entirely distinct in these respects from both the former; and more recently a fourth species, *M. longifolium*, with seeds differently modified from all the others, has been annexed to it.

<sup>105</sup> But if these four plants, so extremely different from each other in pappus and form of the pericarpium, really

belong to the same genus, as their habit seems strongly to indicate, there can be no reason to separate from them *Alcina* of Cavanilles, erroneously considered by Willdenow as a species of *Wedelia*: and *Dysodium* of Richard, published in Persoon's Synopsis, though differing from all the others in the form of its pericarpium and in that of its receptacle, must also be reduced to this genus. If, however, the part described by Linnæus as pappus in *Melampodium americanum* be really such, and if the pericarpium itself vary so widely both in form and surface, it would be inconsistent with the principles of division generally adopted in Compositæ, to unite all these plants into one genus, notwithstanding their great resemblance in habit as well as in the other parts of fructification; and it would be at least in vain to look for any combining character in this part of their structure.

A careful examination of the female flowers, especially in an early stage, removes this difficulty, by proving that the supposed external coat of the ovary, with its various inequalities of surface, some of which have been described as pappus, is in reality an involute bractea or foliolum of the involucrum, like that of *Micropus*, completely inclosing the ovary, but from which in several species of the genus it is entirely, and in others in great part, distinct.

#### CRASPEDIA

first appears in Forster's *Prodromus Florulæ Insularum Australium*, where an essential generic character is given, but no description of the species. The genus is adopted and the character received without remark by Willdenow in his edition of *Species Plantarum*, and by Persoon in his Synopsis. Among George Forster's drawings of subjects of natural history made in Cook's second voyage, and now in the library of Sir Joseph Banks, there is a figure of this plant, from which it appears that he originally referred it to *Stachelina*; a proof that he had not at that time very carefully examined it. It is not improbable therefore that he afterwards proposed it as a distinct genus, belonging to

*Polygamia segregata*, from finding that this had been already done by Solander, whose name (*Cartodium*), however, he did not think it necessary to adopt, and with whose generic character he probably was not acquainted. In his own he very erroneously states that there is no partial involucrum, and hence perhaps M. Labillardière entirely overlooked *Craspedia* when he established his *Richea* from a nearly related species of the same genus. That such is the case I have long since briefly noticed,<sup>1</sup> and have ascertained by a comparison of the specimen of *Craspedia uniflora* in George Forster's Herbarium with *Richea glauca* of Labillardière, and other species of the same genus which I have observed in New Holland.

M. Labillardière's character of *Richea* is essentially correct. It is well to remark, however, that his general involucrum is formed of the bractæ subtending and in equal number with the outer partial capitula; and that the general receptacle has no other paleæ than the analogous bractæ of the inner capitula. It is the more necessary to take this view of the structure, as I have found in New Holland a nearly related genus (*Calocephalus*), which differs from *Craspedia* and *Richea* in the want of these bractæ, as well as in the partial receptacles being without paleæ, and in the rays of the pappus being plumose only in the upper part. I have also another genus of this tribe (*Leucophyta*) from the same country, differing from *Calocephalus* in having a general involucrum consisting of a few short bractæ, in the squamæ of its partial involucra being concave and bearded at top, and in the rays of its pappus being plumose through their whole length, as in *Craspedia*, from which it is distinguished by the want of paleæ on the partial receptacles, and very remarkably in habit.

I have selected the foregoing genera as having been either published under different names, or, as it appears to me, unnecessarily subdivided. In this extensive class it

<sup>1</sup> In Prodr. Flor. Nov. Holl. p. 555.

would not be difficult to point out a much greater number consisting of species improperly united. One very remarkable case of this kind is the genus

### CALEA,

to which, as I intend to enter fully into the history and affinities of its species, I shall confine myself.

This genus was established by Linnæus in the sixth edition of his *Genera Plantarum*, where the natural character is given: but the following essential character, which is still retained, appears for the first time in the twelfth edition of *Systema Naturæ*, in the third section of *Polygamia aequalis*:

"*Receptaculum paleaceum, Pappus pilosus, Calyx imbricatus.*"

The species originally referred to *Calea*, in the second edition of *Species Plantarum*, are *C. jamaicensis, oppositifolia*, and *Amellus*, described from specimens in Browne's Jamaica Herbarium, which he had received a few years before, and incorporated with his own.

These three plants Linnæus had originally referred to *Santolina*<sup>1</sup>, for which it seems to me rather less difficult to account than for his afterwards uniting them together to form his genus *Calea*; two of them, according to his descriptions,<sup>2</sup> though in reality one only, being without pappus, and in other respects corresponding with the generic character of *Santolina*; and the third, which Browne had doubtfully referred to the same genus, though furnished with pappus, agreeing with the others in having opposite leaves.

But the difference in habit between all these plants and the original species of *Santolina* is so great, that it probably afterwards determined Linnæus to remove them from that genus; and although he found a sufficient generic character in the pappus of *Calea jamaicensis* only, he united with it the two other species, for a reason perhaps similar

<sup>1</sup> In *Amœnit. Acad.* vol. v, p. 404.

<sup>2</sup> *Loc. cit.*

to what I have supposed led him to separate all the three from *Suntolina*. It is remarkable, however, that not one of these three original species of *Calea* corresponds with his character of the genus; and that they in reality belong to three very distinct genera, on principles which, I conceive, Linnæus himself would have admitted.

The first species, *Calea jamaicensis*, is the only one that even seems to agree with the generic character, in having pappus which at first sight (to the naked eye at least) might appear simply capillary, but which on a closer examination proves to be of a very different and nearly peculiar structure. Of this species I have seen only one authentic specimen, received from Browne by Ehret, and now in Sir Joseph Banks's Herbarium. The specimen in question, though incomplete, evidently belongs to the same species with "Conyzæ fruticosa cisti odore, floribus pallide purpureis, summitatibus ramulorum insidentibus," of Sloane,<sup>1</sup> of which I have examined the original very perfect specimens in his Herbarium, preserved in the British Museum,<sup>2</sup> and am satisfied that its pappus is of the same structure as that of *Calea cordifolia* of Swartz, who has well described it, but who has at the same time given a different account of that of *C. jamaicensis*.<sup>3</sup> These two plants are the only published species of this genus, for which the name of *Calea* should be retained, and which may be distinguished by the following characters:

#### CALEA.

*Caleæ* species *Linnæi*.

*Involucrum*<sup>4</sup> imbricatum. *Receptaculum* paleaceum. *Flosculi* tubulosi, uniformes, hermaphroditi. *Antheræ* basimuticæ. *Stigmata* acuta. *Pappus* paleaceus: radiis uninerviis, pinnatifido-striatis.

<sup>1</sup> Hist. Jam. i, p. 257, tab. 151, fig. 3.

<sup>2</sup> Herb. v.c.i. v, fol. 14 and 15.

<sup>3</sup> In Flor. Ind. Occid. vol. iii, p. 1328.

<sup>4</sup> Calyx communis *Linnæi*.

Frutices (*Americæ æquinoctialis*,) *pubescentes, scabri.*  
*Folia opposita, indivisa. Capitula<sup>1</sup> corymbosa, v. terminalia,*  
*v. axillaria. Involucri subovati foliola nervosa, obtusa.*  
*Paleæ receptaculi convexi distinctæ, figura et textura fere*  
*involucri. Corollæ luteo-purpureæ (Swartz), gla<sup>z</sup>, la-*  
*ciniis dinerviis. Achenium subcylindraceum v. obsolete*  
*angulatum, glabrum v. pubescens, callo baseos subobliquo.*  
*Pappus persistens albus, nitens; radiis simplici serie*  
*subulatis, indivisis, superne denticulatis.*

OBS. In Sir Joseph Banks's Herbarium there are two plants very nearly related to *Calea*, differing from it merely in having a radius of ligular female florets. If this difference be considered sufficient to constitute a genus, it may be named *Caleacte*. The first of these plants (*C. urticifolia*), with nearly ovate-acute crenated leaves, found by Houston near Vera Cruz, is *Solidago urticæfolia* of Miller, by whom it appears to have been cultivated. The second, with deeply lobed or pinnatifid leaves (*C. pinnatifida*), was lately sent from Brazil by Mr. Sellow.

The second Linnean species, *Calea oppositifolia*, has very little affinity to the first. In attending merely to the technical character of *Santolina*, it might be referred to that genus; but it differs so widely, both in other points of structure and in habit, that there can be no question of the propriety of separating it, which may be done by the following character, and under the name of

#### ISOCARPHA.

*Receptaculum conicum : paleis distinctis, conformibus :*  
*extimis involucrum constituentibus. Flosculi tubulosi,*  
*uniformes, hermaphroditi. Antheræ basi muticeæ. Stig-*  
*mata appendice elongato, hispidulo, acuto. Achenium*  
*prismaticum : pappo nullo.*

Herbæ (*Americæ æquinoctialis*). Folia opposita (vel

<sup>1</sup> *Corolla communis, Linn.*

*alterna) indivisa. Capitula ovata, terminalia, terna (vel solitaria). Paleæ lanceolatæ. Corollæ albidae. Antherae basi truncatæ.*

OBS. I have so constructed the generic character of *Isocarpha* as to include *Spilanthes atriplicifolius* of Linnæus, which, however, differs very remarkably from *Calea oppositifolia* in having alternate leaves and solitary capitula, as well as in the texture and form of its paleæ.

The pappus, consisting of three or four very minute aristæ, described by Swartz<sup>1</sup> in *Calea oppositifolia*, I have not been able to observe in any of the specimens that I have examined.

The third species, *Calea Amellus*, is probably the same plant as *Bidens scandens*, which Linnæus described in *Hortus Cliffortianus*, but, having no specimen in his own collection, appears to have forgotten. The original specimen in Clifford's Herbarium, now in the possession of Sir Joseph Banks, evidently belongs to the same species, and perhaps to the same individual, with a specimen in Miller's collection, which Mr. Dryander compared, and considered to agree with *Calea Amellus* of the Linnean Herbarium. The true synonym, therefore, of *Calea Amellus* is " *Bidens suffruticosus vimineus, foliis oblongo-ovatis oppositis, floribus comosis*" of Browne;<sup>2</sup> while Linnaeus has quoted and even derived his specific name from the same author's " *Amellus ramosus, foliis remotis terminalibus, fulcris longis divaricatis*";<sup>3</sup> which, instead of belonging to *Bidens scandens*, I believe, for the following reasons, to be *Bidens nivea*. 1st, The figure in Burmann's *Thesaurus Zeylanicus*,<sup>4</sup> quoted by Browne for his plant, though belonging to *Lavenia erecta*, is at the same time a good representation of *Bidens nivea*, and very unlike *Bidens scandens*. 2dly, Browne's description in most respects very well agrees with

<sup>1</sup> In Obs. Bot. p. 302.

<sup>2</sup> Browne, Jam. 317.

<sup>3</sup> l. c.

<sup>4</sup> *Eupatoriophafacrum scrophulariae aquatice foliis oppositis, Burm. Thesaur. Zeyl.* p. 95, t. 42.

the former species, but certainly not with *Bidens scandens*. And 3dly, I infer that *Bidens nivea* was actually in Browne's Herbarium, from finding it in the Flora Jamaicensis published in the 5th volume of Amœnitates Academicæ, and formed chiefly from that Herbarium; though a very erroneous reference for this species is there made to Browne's first *Santolina*, which, from the description, cannot possibly belong to *Bidens nivea*, but is probably *Verbesina gigantea*.

M. Decandolle has lately established a new genus, *Salmea*, consisting of *Bidens scandens*, *Bidens hirsuta*, and a third species which I have not examined. These plants are very properly separated from *Bidens* by this excellent botanist, and well distinguished both from that genus and from *Melanthera*. It is rather remarkable, however, that he has not thought it necessary to compare *Salmea* with *Spilanthes*, from which, according to his description, it differs only in its imbricate involuerum. But as in *Spilanthes* the foliola of the involucrum are not exactly equal, and are disposed at least in a double series, I have introduced some additional distinctions into the following character of

#### SALMEA.

*Decandolle in Cat. Hort. Monspel.* p. 140.

*Involucrum imbricatum. Receptaculum conicum, paleis persistentibus. Flosculi tubulosi, uniformes, hermaphroditi (5-fidi). Antheræ sagittatae. Achenium verticaliter compressum, bi-aristatum; aristis persistentibus (apteris v. alatis).*

Frutices (Americæ æquinoctialis) *sæpius decumbentes*. *Folia opposita, indivisa. Inflorescentia terminalis, subpaniculata, vel corymbosa. Corollæ albidae. Paleæ receptaculi post lapsum pericariorum persistentes.*

OBS. Of this genus I have examined specimens of three species in Sir Joseph Banks's Herbarium, differing from each other in several very remarkable characters.

1. *Salmea scandens*, (Decand. l. c.) in which the aristæ are equal and without any membranaceous border : stigmata remarkably dilated, tongue-shaped, obtuse, not hispid, obscurely papulose, and apparently without any terminal appendix : style dilated at the base into a hemispherical bulb which is truncated underneath.

2. *Salmea hirsuta*, (Decand. l. c.) whose aristæ are unequal ; the inner, which is the larger, being furnished with an evident ala ; the outer having a narrow margin only : stigmata sharp and spreading : style dilated into an ovate bulb which has an attenuated base.

3. *Salmea ? curviflora* (nob.) differs from both the preceding in the tube of its corolla being remarkably bent outwards. In place of the inner arista there is a broad obtuse wing, of which the inner margin is straight and thickened, the outer continued down nearly to the base of the pericarpium : the outer arista is winged : and besides these, one or two minute processes are generally observable. Stigmata revolute.<sup>1</sup>

<sup>1</sup> In the remarkable character of its re-curved florets, as well as in some other respects, this species of *Salmea* agrees with *Spilanthes arboreus* of George Forster (in Commentat. Gotting. ix, p. 66), of which he originally formed his genus *Laxmannia* ; from a very erroneous view of its structure, however, having described the Nectarium or glandula epigyna as a "germen superum," the real, though imperfect, germen with its two aristæ as a "perianthium bidentatum," and consequently referring the genus to *Polygamia segregata*.

When he afterwards corrected these errors, and reduced *Laxmannia* to *Spilanthes*, he did not discover that he had only the imperfect hermaphrodite or male plant before him.

That *Spilanthes arboreus* is really dioecious, I have ascertained from the examination of numerous specimens collected by Sir Joseph Banks in the Island of St. Helena, where it forms a small tree called by the inhabitants White-wood. It is *Bidens arborea* and perhaps also *Spilanthes tetrandrus* of Dr. Roxburgh's List of Plants appended to General Beatson's Tracts on St. Helena ; the former being probably the female, the latter a starved variety of the male plant.

In re-establishing *Spilanthes arboreus* as a genus, sufficiently distinct from *Bidens*, *Spilanthes*, and *Salmea*, it will not, I conclude, be considered expedient to recur to Forster's name *Laxmannia*, which as far as relates to this plant is connected only with a series of blunders, was abandoned by the author himself, and has since been applied to another genus already generally adopted. It may be distinguished by the following character, and named

#### PETROBIUM.

*Involucrum polyphyllum subduplici serie : exteriore breviore, foliolis paucioribus. Receptaculum paleaceum, planiusculum. Flosculi dioici, tubulosi,*

In the 12th edition of *Systema Naturæ*, Linnæus added to his genus *Calea* a *fourth* species, namely *Calea scoparia*; for what reason it would be difficult to discover, as it does not resemble, either in its fructification or habit, any of the three genera of which, as has been shown, *Calea* was originally composed. This fourth species, which he had at first referred to *Chrysocoma*,<sup>1</sup> is now known to be dioecious;—Browne, by whom it was first described and figured, and one of whose specimens I have examined, Linnæus, and even Swartz when he published his *Observationes Botanicæ*, being acquainted with the male plant only; which, however, all of them considered hermaphrodite: nor is there any reason to doubt that Gærtner's genus *Sergilus* is also the male of this species; although he has ventured to describe the colour of the embryo, deceived, probably, by the size of the imperfect ovarium, and the colour of its inner surface.

Professor Swartz has since given a more satisfactory account of *Calea scoparia*, and has referred it to *Baccharis*,<sup>2</sup> to which genus as Richard<sup>3</sup> and Jussieu<sup>4</sup> have proposed to limit it, namely to the dioecious species of America, it unquestionably belongs. This limitation of *Baccharis* it may, upon the whole, be expedient to adopt; by doing so, however, a name of Dioscorides is applied to a genus of plants found only in the new continent; while, notwithstanding the contrary opinion is expressed by M. de Jussieu,<sup>5</sup> sufficient distinctions exist between those species

*4-fidi: Masculi: Antheris exsertis; Stigmatibus acutis hispidulis: Feminei: Staminibus sterilibus; Stigmatibus acutis recurvis. Achenium v. parallelo-compressum v. angulatum; angulis (2-3) aristatis: aristis persistentibus, autrorsum denticulatis.*

*Arbor (Insulae S<sup>te</sup> Helenæ). Folia opposita, indivisa. Panicula terminalis, brachiatæ. Involucrum oblongum. Paleæ receptaculi squamis involuci sub-similes. Corollula ochroleuce, tubo arcuato-recurvo (ut capitulum primo intuitu radiatum videatur). Mas. Antheris nigricantibus, basi emarginatis, appendice apicis brevissimo, acuto; loculis vestigio septi longitudinalis instructis. Fem. Staminibus sterilibus distinctis, antheris sagittatis cassis.*

<sup>1</sup> Annu. Acad. v, p. 404, et Syst. Nat. ed. 10, vol. ii, p. 1206.

<sup>2</sup> Flor. Ind. Occident. iii, p. 1339.

<sup>3</sup> Mich. Flor. Bor.-amer. ii, p. 125.

<sup>5</sup> l. c.

of *Baccharis* from which the Linnean character was taken, and *Conyza* when reduced to its original species, *C. squarrosa* and *bifrons*, and a few others since added to the genus: for these differ from *Inula* chiefly in the extreme shortness of their ligulæ.

As no satisfactory character has hitherto been given of *Baccharis*, that will serve to distinguish it, as now limited, from the dioecious *Gnaphalia*, I propose the following.

115]

## BACCHARIS.

(Richard) in *Michaux Amer.* ii, p. 125. *Jussiae* in *Annal. du Mus. d'Hist. Nat.* vii, p. 385. *Molina Ruiz et Pavon Prodr. Flor. Peruv.* 111. *Baccharidis* species *Linn.*

*Involucrum imbricatum. Receptaculum nudum. Flosculi tubulosi, dioici. Masculi: antheris exsertis, basi muticis; stigmatibus appendice acuto hispidulo; pappo sub-penicillato. Feminei filiformes; pappo capillari.*

Frutices (Americæ æquinoctialis et temperatae). Folia alterna, raro opposita, in quibusdam minuta vel nulla, ramis tunc foliaceo-alatis. Inflorescentia terminalis rariusve lateralis, corymbosa, nunc fasciculata. Involuci subovati v. oblongi squamæ semiscariosæ, margine simplici. Mas pappo cinereo. Fem. limbo minuto 2-3dentato, staminibus sterilibus nullis: pappo elongato.<sup>1</sup>

Willdenow, in his edition of *Species Plantarum*, has retained the four Linnean species of *Culea*, and added to

<sup>1</sup> I have observed another dioecious genus with naked receptacle, capillary pappus, and a habit nearly similar to that of *Baccharis*, of which *Baccharis nereifolia* Linn. is the only published species. It may be named

## BRACHYLENA.

*Involucrum imbricatum, squamis coriaceis. Receptaculum nudum. Flosculi dioici. Masculi: antheris exsertis, basi bisetis. Feminei angustiores, limbo 5-fido; filamentis sterilibus: stigmatibus linguiformibus imberibus. Pappus utriusque sexus pilosus scaber.*

Arbusculæ vel Frutices (Africæ australis) subtomentosi. Folia alterna integrerrima vel dentata. Inflorescentia terminalis, subracemosa. Involuci subovata, brevia: squamis ovatis, textura uniformi.

them an equal number, not one of which belongs to any of the genera formed by the original species, but to four others equally distinct.

The first of these additional species, taking them in the order in which Willdenow has arranged them, is *Calea aspera*, which he adopted from Jacquin; by whom it is well described and figured, though erroneously referred to *Calea*.

This, and not (as M. Richard has supposed) the <sup>one</sup> nearly related species of North America, is what Linnaeus originally intended by his *Bidens nivea*, as appears by the specimen in his Herbarium; by his original reference to Vaillant's "Ceratocephalus foliis cordatis s. triangularibus flore albo,"<sup>1</sup> described from a specimen in Surian's Herbarium; and by his afterwards adding as varieties of his species the two plants from Carolina figured in Hortus Elthamensis.

*Calea aspera* is abundantly distinct from *Bidens*, and has very little affinity with any of the original species of *Calea*, and least of all with *C. jamaicensis*, from which the character was taken. Since its appearance in Willdenow's work, however, it has been continued in this genus, in most of the recent catalogues of Gardens, as those of Desfontaines, Decandolle, and the second edition of Mr. Aiton's Hortus Kewensis; and Lamarek in his Illustrationes Generum has copied Jacquin's figure of it, apparently as the principal example of the genus *Calea*.

It is certainly now too late to rec. to the name of *Amellus*, under which Browne, as I have already attempted to prove, first proposed this plant as a distinct genus; Linnaeus having soon after given that generic name to two very different plants, to one of which it is still applied; and the real plant of Browne having till now been mistaken, owing in part to his having entirely overlooked the pappus which is deciduous.

*Bidens nivea*, however, as long ago as 1784 was described by Von Rohr, and published by him in 1792 in the second

<sup>1</sup> Act. Paris. 1720, p. 327.

volume of the Transactions of the Natural History Society of Copenhagen, as a distinct genus, under the name of *Melanthera*: and in 1803 by Richard, in Michaux's *Flora Boreali-Americana*, where it is called *Melanthera*, and in which where the two species included by Linnæus in his *Bidens nivea* are for the first time distinguished: and lastly this genus, as named and determined in the work of Michaux, is adopted by Persoon in his *Synopsis*.

But as both Von Rohr and Richard have given only the natural character of the genus, and the essential character proposed by Persoon is not altogether satisfactory, I have added the following, and adopted the more generally received name of

#### MELANANTHERA.

(Richard) in *Michaux Amer.* ii, p. 106. *Melanthera*  
*Von Rohr in Kiobenh. Naturhist. Selskab. bind.* ii, *hefte 1*,  
*p. 213.* *Amellus Browne Jam.* 317. *Bidentis species*  
*Linn.* *Caleæ species Jacquin.*

*Involucrum duplii serie polyphyllum, subæquale. Receptaculum paleaceum, convexum, paleis foliaceis. Flosculi tubulosi, uniformes, hermaphroditi. Achenium turbinatum angulatum vertice depresso. Pappus e setis (2—18) scabris, distinctis, deciduis.*

*Herbæ (Americæ æquinoctialis et temperatae) pubescentes, scabriæ. Folia opposita, indivisa v. sublobata. Capitula terminalia, pedunculis unifloris, elongatis, ternatis, geminisve. Involucrum foliaceum. Receptaculi hemisphærici paleæ foliolis involucri subsimiles. Corollæ albidæ. Antheræ nigricantes, appendicibus apicis albidis, basi muticæ; paulo post expansionem corollæ exsertæ, dein (contractione filamentorum) fauce inclusæ. Stigmata appendice acuto hispidulo, post retractionem tubi antherarum exserta; demum subinclusa.<sup>1</sup>*

<sup>1</sup> In the extensive collection of plants made by my lamented friend Dr. Smith, on the banks of the Congo, I have observed a Syngenesious genus, which, though belonging to *Polygamia superflua* and having yellow flowers, is in other respects so nearly related to *Melanthera*, that had it been found with

OBS. In Von Rohr's natural character of *Melanthera* the Nectarium, or glandular body sheathing the base of the style, is introduced, which is the earliest notice I <sup>118</sup> have yet found of this organ in Compositæ, except in Batsch's Analysis Florum, published in 1790, where it is both described and figured in *Coreopsis tripteris*. The merit, however, of establishing its nearly universal existence in the hermaphrodite florets of this extensive class belongs to M. Cassini.

Both Von Rohr and Richard in their characters of *Melanthera* have described the antheræ as shorter than the corolla, which is indeed the case in a particular state of the flower; immediately after its expansion, however, they project considerably, and again become inclosed in the more advanced stage. This fact has been noticed by Jacquin,<sup>1</sup> who considers the final inclosure of the antheræ to be owing to the elongation of the corolla. But the actual increase in length of the corolla is very slight, and by no means sufficient to account for the appearance; the real cause of which is a considerable, and I believe a gradual, contraction of the filaments. This economy is not unfrequent in Compositæ, especially in the tribe of *Ieliantheæ*, <sup>119</sup> to which *Melanthera* belongs.

In M. Cassini's Memoir on the Stamina of Compositæ the retraction of antheræ is not expressly noticed. This

ripe seeds only, it would certainly have been referred to it. The following characters, however, prove it to be sufficiently distinct. It may be named

#### LIPOTRICHE.

*Involucrum dupli serie imbricatum, subæquale. Receptaculum convexum, paleis foliaceis, distinctis. Capitulum radiatum. Ligulae (simplici serie) femineæ. Flosculi hermaphroditi, stigmatibus appendice acuto hispidulo. Achenia subuniforia, turbinata, Pappo setaceo, caduco.*

Herbæ (*Africa æquinoctialis*) Folia opposita, indivisa. Pedunculi terminales, terni. Involucra brevia, foliacea. Paleæ receptaculi carinatae, nervosæ, acutæ Corollulae flave. Ligulae elongatae, 3-dentatae. Antheræ nigricantes, sub-inclusæ, basi muticæ. Achenium obtuse tetragonum. Pappus, in disco verticis depresso, brevis, e setulis simplici serie, numerosis (8—10), distinctis, denticulatis, caducis vel deciduis.

*Melanthera proximè accedit: affinis quoque Ecliptæ Linn. Wedelia Jacq. et Diomedea Cassini (in Journ. de Phys. tome lxxxii, p. 145), sed ab his omnibus satis distincta videtur.*

<sup>1</sup> Collect. ii, p. 291, Ic. Rar. iii, t. 583.

appearance, however, can hardly have escaped so accurate an observer; and his opinion respecting its cause may perhaps be inferred from an observation he has made on the stamens of the tribe in which it is most remarkable, namely *Heliantheæ*; whose filaments below the joint, he says, wither very soon after fecundation.<sup>1</sup> To this withering, which he does not mention as occurring in any other tribe, the phænomenon in question may be supposed to be ascribed.

But it appears to me, that the contraction or collapse of the filaments, from their previous state of extension, is a vital action, and not the effect of withering or decay, which, however, speedily follows it. For the contraction may in great part be prevented by the separation of the floret, when the filaments are in the state of extension: and in many genera of Compositæ the antheræ are never retracted, but continue to project till they fall off with the corolla.

This contraction is also analogous to the more evident motion or irritability of the filaments long ago noticed by Borelli and Alexander Camerarius<sup>2</sup> in *Cinarocephalæ*; and more fully described in the same tribe by Dal Covolo,<sup>3</sup> whose observations are confirmed and extended to other subdivisions of Compositæ by Koelreuter.<sup>4</sup> A similar contraction and irritability of the style has been lately described by Mr. Ker in certain species of *Arctotis*.<sup>5</sup>

The second species added to the genus by Willdenow is *Calea lobata*, which Linnaeus, from the general appearance, I conclude, rather than from actual examination of the plant in Clifford's Herbarium, had referred to *Conyza*; and having no specimen in his own Herbarium, the twofold error of supposing it to belong to Polygamia superflua, and to have a naked receptacle, remained uncorrected in all his subsequent works.

<sup>1</sup> Journal de Physique, tome lxxviii, p. 278.

<sup>2</sup> Ephemerid. Acad. Nat. Curios. cent. ix et x, p. 194.

<sup>3</sup> Discorso della Irritabilita d' alcuni Fiori. Firenze, 1764.

<sup>4</sup> Von Einigen das Geschlecht der Planzen betreffenden versuchen. 3. fortsetz. p. 125.

<sup>5</sup> Botanical Register, i, 34.

Its real structure was first pointed out by Professor Swartz, who consequently referred it to *Calea*, with the character of which it exactly agrees. This alteration is adopted in the first edition of Hortus Kewensis, where the generic character of *Calea* is modified, to admit those species that are without pappus; and by Gærtner, who limits the genus to *C. lobata* and *C. jamaicensis*, as the only species that correspond with the Linnean character. But as *C. jamaicensis*, the original species of *Calea*, has been shown to have a pappus of a very different kind, it becomes necessary to give a new name to *Calea lobata*; and some additions being also wanting to its generic character, I propose the following, and the name of

## NEUROLÆNA.

*Calea* Gært.

*Involucrum imbricatum, foliaceum. Receptaculum paleaceum, planiusculum. Flosculi tubulosi, uniformes, hermaphroditici. Antheræ inclusæ, basi muticæ (emarginatæ). Stigmata acuta, recurva. Pappus capillaris, denticulatus, persistsens.*

Frutex (Americæ æquinoctialis) *erectus*. *Folia alterna, indivisa, et lobata. Corymbus terminalis, compositus. Involuci subovati foliola obtusa, nervosa. Paleæ receptaculi involucro subsimiles. Corollulæ flavæ.*<sup>121</sup>

<sup>1</sup> There are two other genera in many respects agreeing with the character here given of *Neurolæna*, which it is necessary to point out. The first is *Carphophorus* of M. Cassini (in Bulletin des Sciences, 1816, p. 198), sufficiently distinct in having the stigmata of *Eupatorium* or *Liatris* with the habit of the latter, from some species of which it differs only in its receptacle having paleæ. The second, not yet described, may be named

## PIPTOCARPHA.

*Involucrum imbricatum, turbinatum, scariosum. Receptaculum: paleis distinctis. Flosculi tubulosi, uniformes, limbo revoluto. Antheræ exsertæ, basi bisetæ. Stigmata filiformia, acuta, hispidula. Pappus pilosus.*

Frutex (Brasilensis) *ramosissimus, decumbens?* *Folia alterna, integerrima, subitus incana. Involucra axillario et terminalia, fusciculata, glabrata, squamis sessilibus obtusiusculis enerviis, textura uniformi. Paleæ receptaculi squamis*

The third species, *Calea pinifolia*, is adopted from Forster's *Florulæ Insularum Australium Prodromus*.

The specimen of this plant in George Forster's Herbarium (now forming part of the extensive collection of Mr. Lambert) is very imperfect; it evidently, however, belongs to the same species with a more complete specimen received, without a name, from Forster by Sir Joseph Banks, in whose Herbarium I have examined it, and ascertained that it has a naked receptacle. It therefore cannot be a species of *Calea*, which I have no doubt Forster considered it merely from a certain degree of resemblance to his *Calea leptophylla*. From the structure of its stigmata, antheræ, and involucrum, *Calea pinifolia* belongs, indeed, to a very different tribe, and might even be referred to *Gnaphalium* as it at present stands. But this extensive and ill-defined genus evidently requires reformation; and [122] if the necessity for its subdivision be admitted, it will also, I believe, be found most expedient to apply the name *Gnaphalium* to that section to which *G. luteo-album*, *sylvaticum*, and *uliginosum* belong, and which is characterised by its naked receptacle, its involucrum connivent at top and of equal height with the truncated capitulum, which consists of numerous filiform female florets in the circumference, with a smaller number of hermaphrodite florets in the disk, both of them ripening seeds and having a sessile capillary deciduous pappus.

To *Gnaphalium* so limited *Calea pinifolia*, a shrub with nearly acerose leaves, and in which all or most of the flosculi are hermaphrodite and the radii of the persistent pappus somewhat thickened upwards, cannot be referred.

It seems, however, to approach more nearly to *Antennaria*, a genus separated from *Gnaphalium* by Gærtner, but which, as he has proposed it, consists of three tribes of

*intimus involuci subimiles, et una cum iisdem deciduae. Corollæ glabre.*  
*antherarum integrerrima. Pappus albus, radis simplici serie.*

Obs. I have not seen perfect seeds; and as even in the unripe fall off along with the inner squamæ of the involucrum, and the antheræ ject in a remarkable degree, it is possible the plant here described may be only the male of a dioecious species: it certainly, however, belongs to a genus not before published.

plants sufficiently dissimilar in habit and structure to justify a further subdivision; and, what is remarkable, none of them entirely agreeing with his generic character.

The first tribe consists of herbaceous plants, natives of Europe and North America, having the male and female flosculi in distinct involucra and on different individuals. To this genus the name ANTENNARIA<sup>1</sup> may remain, though

<sup>1</sup> ANTENNARIA.

Antennariæ species. Gærtner. Gnaphalii species. Linn. Jussieu.

*Involucrum imbricatum, scariosum, coloratum. Receptaculum epaleatum, serbiculatum. Flosculi dioici. Masculi: antheris basi bisetis: stigmatibus truncatis: Pappo vel penicillato v. apice incrassato. Feminei filiformes, limbo parvo: staminum rudimentum nullis: Pappo capillari.*

Herba perennes, tomentosa, incana. Folia plana, adulta sœpe super glabriuscula; radicalia in plurisque latiora. Inflorescentia corymbosa raro solitaria. Involucri turbinati vel quandoque hemisphaerici squamæ e basi calycina superne coloratae (albae v. purpurascentes). Corollulae flaveæ. Antheræ semi-exsertæ. Pappus murium niveus, opacus.

Obs. *Gnaphalium margaritaceum*, which I have referred to this genus, was first described by Clusius; from whose account it appears to have been introduced into the English gardens from America towards the end of the sixteenth century.

It has ever since been very generally cultivated, as an ornamental plant, both in this country and on the continent of Europe; and has a place in several of the European Floras, as well as in those of North America. It is surprising, therefore, that hitherto the male plant only should have been obsryved, uniformly, however, considered as hermaphrodite, except by M. Cassini, who in his first memoir on *Synanthere* (in Journal de Physique, tome lxxvi, p. 200) suspects it to be male, from the imperfect appearance of the ovarium.

That this species of *Gnaphalium* is really dioecious, I learned several years ago from an inspection of a specimen of the female plant in the Herbarium of Sir Joseph Banks, who found it on the banks of the Rymney in Glamorganshire, where the plant was first observed by Lhwyd. I have since received several specimens of both sexes from Mr. Bicheno, to whom I had mentioned this fact, and who obligingly undertook to observe the different states of the plant in the same place, where it seems to be really indigenous. I have never been able to discover any female florets in the circumference of the capitulum of the male plant; but in the centre of the female capitulum I have always found two or three imperfect male florets, whose antheræ, although cohering and of the usual form, appear to be destitute of pollen.

The separation of sexes in a still more common plant of this class, namely, *Serratula tinctoria*, has been equally overlooked.

All the authors who have noticed this species, which is included in almost every European Flora, as well as in more than one recent Monograph of the genus, have considered it as hermaphrodite, while it really belongs to *Polygamia diacea*, or has its perfect sexual organs on different plants. The hermaphrodite plant, apparently perfect, but which I believe very seldom ripens seed, is well figured by Schkuhr (in Botanisches Handbuch, tab. 234); and the female, whose stigmata are remarkably developed and undulated, while the

<sup>123]</sup> descriptive of the pappus of the male flower only. Its species are *Gnaphalium dioicum* Linn., *alpinum* L., *carpathicum* Wahlenberg, *plantagineum* L., and *margaritaceum* L.

The second tribe, consisting of *Gnaphalium Leontopodium* <sup>124]</sup> and *Leontopodioides*, which may be called LEONTOPODIUM, is in affinity intermediate between *Antennaria* and *Gnaphalium* as here limited, but has sufficient characters to distinguish it from both.

The third tribe has been found only in South Africa, and consists of shrubs with small rigid heath-like leaves, of which the margins are incurved, the upper surface tomentose, and the under convex and nearly smooth; but by a remarkable twisting they are in most of the species resupinate; a character which seems to have been overlooked in all the described species; namely, *Gnaphalium muricatum*, *mucronatum*, and *seriphoides*. In this tribe, or genus, which may be named METALASIA, the involucrum is generally cylindrical, and in most of the species has a short radius formed by the spreading coloured laminæ of the inner scales; the flosculi are few in number, and all hermaphrodite; and the radii of the pappus, which fall off separately, are either thickened or more strongly toothed at top.

*Calea pinifolia* does not even belong to this genus, though it has a nearly similar habit; but the margins of its leaves are revolute, and their tomentum chiefly on the under surface. In these respects, as well as in the principal characters of fructification, it agrees with several shrubs, chiefly of New Holland and Van Diemen's Island; among which are *Eupatorium ferrugineum*, *Eupatorium rosmarinifolium*, and *Chrysocoma cinerea* of M. Labillardière. Part of these have the inner squamæ of the involucrum simple, as seems to be the case in *Calea pinifolia*;

antheræ are evidently imperfect, and which generally produces ripe seeds, is represented in English Botany (tab. 38), in Flora Danica (281), and probably also in Svensk Botanik (170). For my knowledge of this fact respecting *Serratula tinctoria* I am indebted to the Rev. Robert Bree of Camberwell, who pointed out to me both its states, which he was then disposed to consider as distinct species.

while in others, as the two species referred to *Eupatorium* by M. Labillardière, they form a short radius. These I am inclined to consider merely sections of one and the same genus, which may be distinguished by the following character, and named

## OZOTHAMNUS.

[125]

*Involucrum imbricatum*, scariosum, coloratum. *Receptaculum epaleatum*, glabrum. *Flosculi* (pauciores quam 20) tubulosi, vel omnes hermaphroditici, vel paucissimi feminei angustiores in ambitu. *Antheræ* (inclusæ), basi bisetæ. *Stigmata* apice obtuso subtruncato hispidulo. *Pappus sessilis*, pilosus, nunc penicillatus, persistens.

*Frutices* (Novæ Hollandiæ et Novæ Zelandiæ, vix Africæ australis,) graveolentes, tomentosi. *Folia sparsa*, integerrima, marginibus saepius recurvis. *Inflorescentia terminalis*, corymbosa v. congesta. *Involucra alba* v. *cinerea*: *squamis intimis* nunc conformibus et conniventibus; nunc laminis patulis niveis radium brevem obtusum efformantibus. *Corollæ luteæ*. *Pappus albus*.

The fourth species added to *Calea* by Willdenow is *Calea leptophylla* of Forster, whose specimens I have examined in Mr. Lambert's Herbarium. Amongst Forster's drawings, formerly referred to, there is a coloured figure of this plant, by which it appears that he originally considered it to belong to *Gnaphalium*. From this genus he afterwards removed it, probably on finding it referred to *Calea* in the collection of Sir Joseph Banks, by whom it was discovered in New Zealand in a more perfect, at least in a more luxuriant state.

This plant, though agreeing with *Calea* in every part of the Linnean essential character, differs remarkably from it in other points of nearly equal importance, as well as in habit; and along with *Calea aculeata* of M. Labillardière, and several other species also natives of New Holland and Van Diemen's Island, constitutes a genus very nearly

related to *Ozothamnus*, from which it is to be distinguished chiefly by the paleæ of its receptacle.

<sup>[26]</sup> I propose to name this genus in honour of *M. Henri Cassini*, whose well-conducted investigation of Compositæ has already thrown much light on the structure and economy of the more important parts of fructification of this difficult class: and especially of those organs from which the distinguishing characters of *Cassinia* are here derived.

I shall add the characters of the species of this genus, which, like *Ozothamnus*, admits of subdivision into two sections; and I have appended to it *Calea spectabilis* of Labillardière, a plant corresponding with it in character, but differing very much in habit from all the other species.

#### CASSINIA.

Caleæ sp. *Labillardière*.

*Involucrum imbricatum, scariosum, pauciflorum. Receptaculum: paleis distinctis, squamis intimis involucri subsimilibus. Flosculi tubulosi, vel omnes hermaphroditi vel paucissimi feminei angustiores in ambitu. Antheræ (inclusæ) basi bisetæ. Stigmata apice obtuso subtruncato hispidulo. Pappus pilosus v. penicillatus, persistens.*

Frutices. Folia *sparsa*, *sæpius angustata*, *marginibus recurvis*. Inflorescentia *terminalis*, *corymbosa rariusve paniculata*. Involucra *alba nunc cinerea raro aurea*; *squamis intimis sæpius apice conniventibus, nunc patulis et radium brevem obtusum efformantibus*.

† *Involucrum radiatum (squamis intimis apice patulis)*.

[29] Since the publication of Willdenow's Species Plantarum very few alterations have been made in the genus *Calea*.

In Persoon's Synopsis two of the species are excluded; namely, *Calea scoparia*, which, following Swartz, he has referred to *Baccharis*; and *Calea aspera*, adopted from Richard as a species of *Melanthera*. The additional species in the work referred to are *C. cordifolia* of Swartz, already noticed as a genuine *Calea*; *C. aculeata* and *spectabilis* of Labillardière, which belong to *Cassinia*; and *C. cordata*, adopted from Loureiro, of whose plant nothing is known except from the short description in *Flora Cochinchinensis*.

chinensis, which is only sufficient to render it probable that it neither belongs to *Calea* as I have proposed to limit it, nor to any of the genera hitherto confounded with it.

M. Poiret, in the Supplement to the Botanical Dictionary of the Encyclopédie Méthodique, has under the article *Calea* retained all the species of this genus given by Persoon; and also *Calea aspera*; which, however, he has in a subsequent article correctly referred to *Melanthera*.

Connected with the proper subject of this paper, I shall describe and add some observations on a plant lately sent from Brazil by Mr. Sellow; which, though not strictly referable to Compositæ, probably belongs to a genus at present included in this family; and conclude with a few remarks on the structure and affinities of *Brunonia*.

I have named the Brazil plant

#### ACICARPHA SPATHULATA.

*Herba annua?* glaberrima, ramosa, diffusa. *Rami* adscendentēs, angulati. *Folia* sparsa, petiolata, exstipulata, spathulata mucronulo brevissimo, sesquiuncialia, crassuscula? glauca? sæpius integerrima; inferiora quandoque extra medium dentata. *Petiolī* lineares basi parum dilatata<sup>130</sup> semiamplexicauli; inferiores elongati; superiores plerumque folio aliquoties breviores. *Capitula* solitaria, nunc oppositifolia pedunculata, nunc terminalia subsessilia, basiflora, ovata, flava. *Involucrum* simplici serie pentaphyllum, capitulum floridum superans, foliaceum; foliolis inæqualibus spathulatis sessilibus integerrimis ipsa basi connatis. *Receptaculum* subulato-conicum, paleaceum. *Paleæ* lanccatæ mucronulatæ, inter flosculos hermaphrodito-masculos magis manifestæ, inter hermaphroditos passim abortientes. *Flosculi* tubulosi, uniformes, glabri.

*Flosculi* ambitū, dupli triplicive serie, hermaphroditi, utroque organo perfecto. *Corollæ* *Tubus* gracilis cylindraceus, cum ovario continuus, basique stylo accretus, per lentem 10-striatus. *Limbus* infundibuliformis, 5-fidus, aestivatione

valvata; laciniis semilanceolatis, planis, trinerviis; nervis lateralibus margini parallelo-approximatis, indivisis, apice confluentibus, e nervis alternis tubi infra sinus furcatis ortum ducentibus.

*Stamina* 5 epipetala, limbi laciniis alternantia.

*Filamenta* inferne cum tubo arete connata, superne libera sauci quasi inserta, invicem cohærentia in tubulum 5-dentatum ipsis apicibus, subita mutatione texturæ, articulatis; basi intus incrassatum areis 5 oblongis cum filamentorum axibus alternantibus.

*Antheræ* continuae, lineares, dimidio inferiore arce cohærentes, superiore liberae; biloculares, loculis longitudinaliter dehiscentibus, valvula interiore angustiore, receptaculo pollinis utriusque loculi longitudinali septiformi: basi emarginatæ, lobulis posticis acutinsculis brevibus polliniferis; apice simplices connectivo ultra loculos hand producto. *Pollen* subglobosum, per lentem pluries augeantem obsolete angulatum.

*Ovaria* connata, singula coronata *calyce* 5-fido dentibus spinescentibus cum laciniis limbi corollæ alternantibus; 131 monosperma, ovulo ovato pendulo, paulo infra apicem affixo funiculo crassiusculo ex ipso apice angustato cavitatis orto; chorda vasculari a puncto insertionis ad extremitatem inferiorem ejusdem lateris attingenti. *Style* filiformis glaber, inferne cum basi tubi corollæ connatus. *Stigma* simplex obtusum hispidulum.

*Flosculi superiores* numerosi hermaphrodito-masculi, paulo minores hermaphroditis, calycis laciniis submembranaceis; ovariis (pariter connatis) imperfectis, sæpius absque ovulo.

*Pericarpia* (flosculorum ambitū): *Achenia* conferuminata, singula coronata calyce aucto 5-spinoso, spinis patulis conico-subulatis e substantia suberosa axi solidiori rigida.

*Semen* pendulum, ovatum extremitate superiore acuminato: *testa* membranacea: *membrana propria* nucleo adhærens. *Albumen* figura seminis, carnosum, copiosum, album. *Embryo* axilis, subcylindraceus, longitudine fere albuminis; albus, dicotyledoneus. *Cotyledones* lineares,

obtusæ, plano-convexæ, vix longitudine *Radiculæ cylindraceæ*, superæ.

Notwithstanding the great difference between my account of this plant and that given by M. de Jussieu of *Acicarpha tribuloides*, I have very little doubt that they both belong to the same genus; though from the above description it is evident that *Acicarpha spathulata* is not referable to Compositæ. To this plant *Calycera* of Cavanilles, in the seeds of which M. Correa has found albumen, seems to be very nearly related; and a third genus, probably referable to this group, is *Boopis*, described by M. de Jussieu in the same Memoir with *Acicarpha*. The important characters, however, of the pendulous ovulum and inverted embryo remain to be ascertained in all these; and the presence of albumen in *Acicarpha tribuloides* (in *Acicarpha lanata* of Lagasca in Pers. Syn. ii. p. 488, if it really belong to this genus), and in both species of *Boopis*. Another <sup>132</sup> question respecting the latter genus is, whether its capitulum be simple, as it certainly is in *Acicarpha spathulata*; or compound, as Jussieu's figure of *Boopis anthemoides* seems to indicate.

In the mean time, with the necessary knowledge of structure of *Acicarpha spathulata* only, I shall venture to propose this group as a distinct natural family to be placed between Compositæ and Dipsaceæ; though upon the whole somewhat more nearly approaching to Compositæ. This family, if my conjectures respecting *Calycera* and *Boopis* should be hereafter verified, may be called CALYCERÆ; *Acicarpha* even as a generic name being barely tenable, provided the original species agrees with that here described: for on this supposition M. de Jussieu has mistaken the laciniae of the perianthium for paleæ of the receptacle, deriving the name of the genus from their form; and has entirely overlooked the real paleæ, which, though they could not have suggested this name, may however sanction its being retained, if it be not still better to change it to *Acicarpa*.

It will be attended with similar advantage to form a separate family of

**BRUNONIA,**

as a link of equal importance, connecting *Compositæ* with *Goodenoviæ*, but from both of which it is in many respects very distinct. As I have formerly described this genus, and made several observations on its principal affinities,<sup>1</sup> I shall here only state the more important relations and distinctions between it and those families to which it appears to me most nearly to approach.

*Brunonia* agrees with *Goodenoviæ* in the remarkable indusium of the stigma; in the structure and connexion of the antheræ; in the seed being erect; and essentially in the aestivation of corolla. It differs from them in having both calyx and corolla distinct from the ovary; in the disposition of vessels in the corolla; in the filaments being jointed at top; in the seed being without albumen; and in its remarkable inflorescence, compatible, indeed, with the nature of the irregularity in the corolla of *Goodenoviæ*, but which can hardly coexist with that characterizing *Lobeliaceæ*.<sup>2</sup>

With *Compositæ* it agrees essentially in inflorescence; in the aestivation of corolla; in the remarkable joint or change of texture in the apex of its filaments; and in the structure of the ovary and seed. It differs from them in having *ovarium liberum* or *superum*; in the want of a glandular disk; in the immediately hypogynous insertion of the filaments; in the indusium of the stigma; and in the vascular structure of the corolla, whose tube has five nerves only, and these continued through the axes of the laciniae, either terminating simply (as is at least frequently the case in *Brunonia sericea*), or (as in *B. australis*) dividing at top into two recurrent branches forming lateral nerves, at first sight resembling those of *Compositæ*, but which hardly reach to the base of the laciniae.

It is a curious circumstance that *Brunonia* should so

<sup>1</sup> Prod. Flor. Nov. Holl. p. 589.

<sup>2</sup> See Flinders's Voyage to Terra Australis, ii. p. 559 [vol. i, p. 32].

completely differ from Compositæ in the disposition of vessels of the corolla, while both orders agree in the no less remarkable structure of the jointed filament; a character which had been observed in a very few Compositæ<sup>1</sup> only before the publication of M. Cassini's second Dissertation, where it is proved to be nearly universal in the order.

In the opposite parietes of the ovarium of *Brunonia* two nerves or vascular cords are observable, which are continued into the style, where they become approximated and parallel. This structure, so nearly resembling that of Compositæ,<sup>134</sup> seems to strengthen the analogical argument in favour of the hypothesis advanced in the present paper—of the compound nature of the pistillum in that order, and of its type in phænogamous plants generally;—*Brunonia* having an obvious and near affinity to *Goodenoviae*, in the greater part of whose genera the ovarium has actually two cells with one or an indefinite number of ovula in each; while in a few genera of the same order, as *Dampiera*, *Diaspasis*, and certain species of *Scævola*, it is equally reduced to one cell and a single ovulum.

Sir James Smith, in establishing *Brunonia* as a genus, is disposed to refer it to *Dipsaceæ*. To certain species of this order it, indeed, bears a striking resemblance in habit; it also very nearly agrees with them in its remarkable inflorescence; and one great objection to its union with them may be supposed to be removed in adopting M. Decandolle's account of their ovarium.

But as *Brunonia* differs from the whole order in the following characters, all of which are of primary importance;—namely, in the origin and aestivation of corolla; in the insertion and whole structure of stamina; in the indusium of the stigma; in the ovulum being inserted at the base of the cavity of the ovarium; in the erect embryo and want of albumen;—I continue to think that its proper place in the natural method is between *Goodenoviae* and *Compositæ*.

<sup>1</sup> Batsch Anal. Flor. p. 107; et Schkuhr Handb. tab. 236 et 244.

I shall conclude this subject, by proposing a few queries respecting the indusium of *Brunonia* and *Goodenoviae*.

Is this remarkable covering of stigma in these families merely a process of the apex of the style? or is it a part of distinct origin, though intimately cohering with the pistillum? On the latter supposition, may it not be considered as analogous to the glandular disk surrounding or ~~is~~<sup>is</sup> crowning the ovarium in many other families? And, in adopting the hypothesis I have formerly advanced<sup>1</sup> respecting the nature of this disk in certain families,—namely, that it is composed of a series of modified stamina,—has not the part in question a considerable resemblance in apparent origin and division to the stamina of the nearly-related family *Stylideæ*?

To render this supposition somewhat less paradoxical, let the comparison be made especially between the indusium of *Brunonia* and the imperfect antheree in the female flowers of *Forstera*. Lastly, connected with this view, it becomes of importance to ascertain whether the stamina in *Stylideæ* are opposite to the segments of calyx or of corolla. The latter disposition would be in favour of the hypothesis. This, however, is a point which will not be very easily determined, the stamina being lateral. In the mean time, the existence and division of the *corona faucis* in *Stylium* render it not altogether improbable that they are opposite to the segments of the corolla.

Since the preceding paper was submitted to the Society, M. Cassini has published<sup>2</sup> the substance of a Memoir, which he read to the Academy of Sciences of Paris in August last, on a new family of plants named by him *BOOPIDEÆ*, and consisting of *Calycera*, *Boopis*, and *Acicarpha*. I have also, through the liberality of Messrs. de Jussieu, Desfontaines, and Baron Delessert, had the opportunity of examining specimens of *Acicarpha tribuloides* in

<sup>1</sup> Linn. Soc. Transact. x. p. 159. [*Ante*, p. 133.]

flower and fruit, of both species of *Boopis* in flower, and detached flowers and pericarpia of *Calycera*. In all of these I have found the ovulum pendulous; and in *Aeicarpha* and *Calycera* an inverted embryo occupying the axis of a fleshy albumen. My conjectures, therefore, on their structure and relation to *Aeicarpha spathulata* of the preceding paper, are completely verified by this examination, as well as by the observations of M. Cassini, who with his usual acuteness has detected the principal characters distinguishing *Boopideæ* from *Compositæ* and *Dipsaceæ*, between which he has also placed them.

As M. Cassini's *Mémoire*, though read subsequently to mine, is already published, the name *Calycereæ*, which I have proposed for this family, is superseded by that which he has given it.

But as his account of the order is by no means complete, several characters of considerable, though not primary, importance being entirely omitted, I may be allowed to add to my paper some remarks on the more essential points of resemblance and difference between it and the two families to which it is most nearly related.

The principal characters distinguishing *Boopideæ* from the whole of *Compositæ* are the pendulous ovulum and the albumen inclosing the embryo, of which the radicle points to the apex of the pericarpium. It appears to me necessary to state all these characters, and nearly in the terms in which they are here given: for, 1st, A pendulous ovulum most frequently, indeed, is not, however, invariably connected with *radicula supra*, though that direction of radicle might here, as well as in *Compositæ*, with confidence have been inferred from the vascular structure of the ovulum.<sup>1</sup> 2dly, Where the insertion of the ovulum is, as in this family, evidently below the upper extremity, the radicle

<sup>1</sup> Some of the indications in many cases afforded by the structure of the unimpregnated ovulum, of the position and direction of the parts of the future embryo, have hitherto been overlooked: the subject, however, for its elucidation requires details incompatible with the limits of the present communication. I have in another place (*Flinders's Voyage to Terra Australis*, ii. p. 601 [vol. i, p. 77]) thrown out a similar hint, which has probably attracted no attention, and must reserve the explanation of both for a separate essay.

<sup>137]</sup> which points to this extremity cannot in strict propriety be described as directed towards the umbilicus. M. Cassini has not noticed the direction of the radicle; either from supposing it constantly connected with that of the ovulum, or, which is more probable, from not having ascertained it.

These distinctive characters may be considered as fully sufficient to authorise the separation of *Boopideæ* from *Compositæ*; yet the same differences exist between certain genera referred and really belonging to *Rubiaceæ* and the principal part of that order.

There are, however, three other characters unnoticed by M. Cassini, which distinguish the flowers of *Boopideæ* from the hermaphrodite flowers of the whole of *Compositæ*; namely, the accretion of the base of the style with the tube of the corolla; the absence of the epigynous disk or nectarium; and the longitudinal subdivision of each cell of the anthera by a "receptaculum pollinis," as in most other families, and of which, indeed, there seems to be the rudiment in the syngenesious genus *Petrobium*, described in the preceding paper.

In the partial cohesion of the antheræ, in which they resemble *Jasione*, they certainly differ from all known *Compositæ*: but as in certain *Compositæ* the antheræ are very slightly connected or entirely distinct;—this, though a remarkable circumstance, can hardly be employed as a distinguishing character.

The principal characters in which *Boopideæ* differ from the greater part, though not from the whole of *Compositæ*, are the corolla being continuous, or not jointed, with the ovary; the antheræ having no membranaceous appendix at top; and the undivided stigma.

*Boopideæ* differ from *Dipsaceæ* in the vascular structure and valvular aestivation of corolla; in the aestivation, insertion, and connexion of antheræ; in the absence of the partial involucrum; and in having alternate leaves.

In adopting M. Decandolle's description of *Dipsaceæ*,<sup>1</sup> they would differ also in the important character of "ova-

<sup>1</sup> Flor. Franc. 3<sup>me</sup> ed. vol. iv. p. 221.

rium inferum." This distinction, however, is neither universal, nor I believe absolute in any case.

M. Auguste Saint Hilaire in his excellent Memoir on *Primulaceæ*,<sup>1</sup> while he admits the correctness of M. Pecan-dolle's account with respect to great part of *Dipsaceæ*, has at the same time well observed, that in several species of *Scabiosa* the ovary is entirely united with the tube of the calyx. But neither of these authors has remarked the curious, and I believe peculiar, circumstance, of the base of the style cohering with the narrow apex of the tube of the calyx, even in those species of the order in which the dilated part of the tube is entirely distinct from the ovary.

This kind of partial cohesion between pistillum and calyx is directly opposite to what usually takes place, namely, the base of the ovary being coherent, whilst its upper part is distinct. It equally, however, determines the apparent origin or insertion of corolla and stamens, producing the unexpected combination of "flos superus" with "ovarium liberum."

In the vascular structure of the corolla *Boopideæ* may be considered as essentially agreeing with *Compositæ*, in many of whose genera the middle nerves of the tube and segments are equally manifest. In stating the character derived from this source in either of these orders, it is not sufficient to describe the nerves of the laciniæ only as M. Mirbel has done in his character of *Compositæ*,<sup>2</sup> and M. Cassini in that of *Boopideæ*: but it is also necessary to give their disposition in the tube or undivided part of the limb; there being instances in both families where the lateral nerves of the segments do not unite at top; and, as has been formerly remarked, several examples in other families of a nearly similar disposition in the segments, accompanied by a different disposition in the tube. To the examples of this kind formerly given, *Globularia cordifolia* may be added, in the segments of whose lower lip there are three simple nerves, of which the lateral do not unite at top, and con-

<sup>1</sup> Mem. du Mus. d'Hist. Natur. ii, p. 47.

<sup>2</sup> Elementa de Physiol. Veget. et de Botan. ii, p. 885.

tinue distinct nearly to the base of the tube, where they converge and appear to unite with the middle nerve.

In *Acicarpha* and *Boopis* the filaments appear to me jointed as in Compositæ; a character I have not been able to observe in the very few flowers which I have examined of *Calycera*.

In *Acicarpha* the florets of the circumference are hermaphrodite and apparently complete, the antheræ containing pollen and the ovaria producing seed; while those of the disk are male with an incomplete pistillum. Such an arrangement has not hitherto been observed in Compositæ, in which, wherever the central florets are male with an imperfect pistillum, those of the circumference are female with or without the rudiments of stamens.

The regularity in the order of expansion of flowers from the base to the top of the capitulum in *Acicarpha tribuloides* and *spathulata*, and the irregularity, approaching to the inverted order, which I have found to exist in both species of *Boopis*, seem to prove the capitulum to be simple in the former genus and compound in the latter, notwithstanding the great resemblance between their involucra. The exact nature of its composition, however, in *Boopis* can only be satisfactorily determined in recent specimens.

<sup>140]</sup> This irregular expansion in *Boopis*, which renders even the generic name improper, and at present the want of satisfactory characters to distinguish it from *Calycera*, are objections to the name M. Cassini has chosen for this family; while that of *Calycereæ*, which I have proposed, derived from the genus first described, and applicable to all the genera of the order, appears to me unexceptionable: especially as there seems no reason to doubt that the part which I have considered as calyx in *Boopideæ* is really such; its divisions being generally in equal number, and alternating with those of the corolla. It may be observed that a like alternation of the divisions of the pappus with the segments of the corolla obtains in those genera of Compositæ where both parts are in equal number. But in some cases, where the division of pappus is still further

reduced, the same alternation does not exist, especially in those genera having vertically compressed pericarpia and two aristæ, as *Spilanthes* and *Sulmea*.

The absence of "discus epigynus" in *Boopideæ* is a necessary consequence of the accretion of the base of the style with the tube of the corolla. It seems to me, however, that a modification of the same organ may be traced in the five thickened areolæ observable within and near the base of the tube formed by the filaments in *Acicarpha spatulata*; and much more distinctly in the same situation in *Boopis balsamitifolia*, where they have the appearance of five adnate fleshy bodies alternating with the filaments.

This apparent decomposition of the glandular disk in *Boopideæ*, compared with its state in Compositæ, as well as its transposition and the alternation of its parts with the stamina, seem to give some additional support to the conjecture I have formerly hazarded in the paper on *Proteaceæ*, published in the Society's Transactions (vol. x, p. 159<sup>1</sup>); namely, that in several families—for the hypothesis is not meant to be extended to all—this part, even in its simplest state, may be considered as formed of a series of modified stamina: Or, merely to state the facts from which the conjecture originates, that there are certain families in some of whose genera this organ exists in its simplest form, that of an undivided fleshy ring; while in other genera of the same families it consists of several distinct bodies alternating with the stamina, and in some cases putting on the appearance of barren filaments.

This hypothesis is chiefly applicable to families in which the number of stamina is equal to the divisions of one floral envelope only, the nectarium being supposed to be formed of the second series: but it receives its principal support from *Scitamineæ*,<sup>2</sup> where the glandular bodies belong actually to the same series with the perfect stamen.

I am aware at the same time of several objections to its generalisation. Thus, the nectarium or glandular disk exists in families where, though the stamina are definite,

<sup>1</sup> [*Ante*, p. 133.]

<sup>2</sup> See Flinders's *Voyage to Terra Australis*, ii. p. 574 [vol. i, p. 49].

they are equal in number to the divisions of calyx and corolla united ; and moreover, in such families where it consists of distinct parts, these parts are placed where an addition to the number of stamens is least likely to take place, as in *Crassulaceæ*. Here, however, as in many other cases, the divisions of the disk are opposite to the ovaria ; they may therefore be supposed more intimately connected with the pistilla than with the stamens ; an opinion which is I believe held, though not yet published, by the ingenious M. Decandolle with respect to *Ranunculaceæ*. In support of this opinion it may be noticed that in *Pæonia Moutan*, where the disk or urceolus is in the state of the greatest development, when a multiplication of the pistilla takes place, which in the double-flowered varieties of this <sup>142</sup> species it not unfrequently does by the addition of one or more inner series, the rudiments of an analogous disk are produced along with each of the additional series.

Yet, in opposition to this view, I have in a single instance found one of the divisions of the urceolus in *Pæonia Moutan* changed into an anthera ; and the divisions of the apparently analogous organ in *Aquilegia*, which in their usual state resemble barren filaments, have sometimes been observed with perfect antheræ.<sup>1</sup>

# LYELLIA,

A NEW GENUS OF MOSSES,

WITH

OBSERVATIONS ON THE SECTION OF THE ORDER TO  
WHICH IT BELONGS;

AND SOME REMARKS ON

LEPTOSTOMUM AND BUXTAUMIA.

BY

ROBERT BROWN, Esq., F.R.S., LIBR. L.S.

(READ APRIL 6TH, 1819.)

[Extracted from 'The Transactions of the Linnean Society of London,'  
Vol. XII, pp. 560—583.]

## CHARACTERS AND DESCRIPTION

[500]

OF

## L Y E L L I A, &c.

IN the tenth volume of the Society's Transactions, I have given a description of *Dawsonia*,<sup>1</sup> a genus of Mosses having entirely the habit of *Polytrichum*, but whose peristomium, instead of consisting of a single row of short teeth connected by a horizontal membrane, is composed of an indefinite number of capillary cilia. These cilia, originating both from the inner surface of the capsule, immediately within the orifice, and from the columella itself, form a loose pencil, of which the hairs are sufficiently distinct to allow of a gradual discharge of the seeds.

The correctness of this account of *Dawsonia*, especially as to the origin of the peristomium<sup>2</sup>, and the nature of the supposed columella<sup>3</sup>, has been questioned by some of those authors, who have since adopted the genus.

From a careful re-examination, however, I find no reason to alter in any respect the generic character formerly given; and to the description of the species I have only to add, that the upper surface of the leaves is furnished with parallel lamellæ, like those of *Polytrichum*; and that the inner membrane of the capsule is, in the early stage at least, [501] connected by numerous plicæ with those elevations of the

<sup>1</sup> [Vol. i, p. 348.]

<sup>2</sup> Bridel Meth. Nov. Muscor. p. 205.

<sup>3</sup> De la Pylaie in Journal de Botanique appliq. iii. p. 134.

surface of the columella, which are noticed in my description, and well expressed in Mr. Bauer's excellent figure.

My principal object, in the present paper, is to establish another genus of the same family, equally related to *Polytrichum* in habit, which resembles *Dawsonia* in the remarkable form of its capsule, but whose peristomium is of so peculiar a structure as to require its separation from both these, and readily to distinguish it from all other genera of Mosses.

This new genus I shall name *Lyellia*, in honour of Mr. Charles Lyell, an accurate English Botanist, who has particularly studied, and made several important discoveries in, the natural order to which it belongs.

Mr. Hooker has already intimated his intention of establishing a *Lyellia* in the same order, to consist of three species of *Leucodon* that have a mitriform calyptre;<sup>1</sup> but he has readily agreed to transfer the name of our friend from a genus, respecting which there is still some uncertainty, to one so unquestionable as that here proposed; and as I have not a drawing prepared to accompany the present communication, I trust he will give the necessary illustration of this interesting genus, in an early number of his excellent *Musci Exotici*.

### LYELLIA.

*Stoma edentulum, clausum epiphragmate (crasso depresso), cuius discus circularis a limbo (latori) persistenti secedens, cum columellâ remanenti inclusâ cohæret.*

*Capsula* hinc plana inde convexa.

*Calyptra* cucullata (apice pilosa).

<sup>562]</sup> *Muscus (Nepalensis) habitu Polytrichi; capsulae figurâ et structurâ interiori Dawsoniae similis; peristomio ab utroque genere diversissimus.*

<sup>1</sup> *Musci Exotici*, vol. i. 17.

## LYELLIA CRISPA.

**DESCRIPTIO.** *Muscus cæspitosus.*

*Caulis* erectus, simplicissimus, 3-4-uncialis, ipsa basi tomento radicali cinereo copioso tenuissimo tectus, dein, ad  $\frac{1}{3}$  circiter longitudinis, basibus emarginatis foliorum squamatus, supra dense foliatus.

*Folia* undique versa, e basibus dilatatis subcuneatis semivaginantibus membranaceis pallidis imbricatis, subulata, canaliculata, nigro-viridia, opaca; marginibus ab apice ad  $\frac{2}{3}$  longitudinis et ipso apice carinæ serratis; disco intus longitudinaliter lamellis numerosis, parallelo-approximatis, tenuissimis, e nervo ipsaque superficie ortis; limbo elamellato minutissime areolato; madore patula leviterque introrsum falcata, siccitate contorta.

*Masculi Flores* non visi.

*Fructificatio Feminea terminalis, solitaria.*

*Vaginula cylindracea*, villis implexis instructa, apice truncato simplici.

*Seta* sesquiuncialis—biuncialis, erecta, teres, lævis, castanea, demum cava.

*Calyptra* (nonnullæ delapsæ sotum a nobis visæ) cucullata, hinc altè fissa inde truncata, lævis, apice pilis brevibus simplicibus hispidula.

*Capsula* erectiuscula, circumscriptione rotata, fusca, vix manifeste areolata, hinc plana et ala perangusta cincta, inde convexiuscula, collo brevissimo cylindraceo. *Apophysis* nulla nisi *basis* castaneo-fusca et undique instructa punctis parvis sparsis numerosis, pustuliformibus, verticaliter ellipticis, margine paulo incrassatis, disco angusto, porum referente sed laminam tantum exteriorem perforante.

*Operculum* (unicum tantum visum quod calyprâ delapsâ inclusum) e basi depresso-conicâ desinens in rostrum longitudine circiter ipsius baseos, intus auctum processu cylindraceo, centro baseos inserto, et proculdubio disco circulari terminali columellæ applicito.

*Peristomium* horizontale, nec obliquum, clausum quasi operculo interiori seu *epiphragmate* crasso, opaco, edentulo,

planiusculo, persistente ; limbo latiusculo crassiore castaneo ; disco pallido leviter depresso ; ipso centro circulari piano, crassiunculo, fusco, a disco pallido mox separante, arcte cum columella cohaerenti, eaque demum abbreviata intia cavitatem retracto.

*Membrana interior* (s. *Theca vera*) approximata exteriori, quacum processibus numerosis vasculiformibus connexa, ore coarctato, spongioso-membranaceo, collum breve columellæ arcte amplexante, superficie interiore altè corrugata.

*Columella* incapsulamatura majuscula, subovalis, lacunosa, rugis elevatis applicitis et forsitan connexis plicis respondentibus membranæ interioris.

*Semina* minutissima, in cumulo viridia, separatim hyalina, lœvia.

*Lyellia crispa* was lately discovered in Nepaul (probably in the vicinity of Kathmandu,) by the botanical collectors sent from the Company's garden at Calcutta, by Dr. Nathaniel Wallich, the worthy successor of Dr. Roxburgh in that establishment.

The specimens here described were received from Dr. Wallich by Sir Joseph Banks ; and I have also seen others sent at the same time to Mr. Lambert, part of which he very liberally communicated.

<sup>664]</sup> The whole number of capsules examined does not exceed twenty-five ; but as all of these were ripe and of uniform appearance and structure, they will probably be considered sufficient for the establishment of the genus.

To complete the description of *Lyellia*, male flowers, which, however, probably resemble those of *Polytrichum* and *Dawsonia*, are still wanting ; and although there is no reason to doubt that the calyptra and operculum, both of which I have ventured to describe from fallen specimens, really belong to this species, yet it would be more satisfactory to find them while still attached to the capsule ; for in this state only the form of the operculum and its probable central connection with the orbicular disk of the peristomium can be absolutely determined. It will be necessary also to examine a greater number of specimens, and perhaps in

different states, to ascertain absolutely the economy of this moss in the dispersion of its seeds. It is evident, however, if the description already given be correct, that as far as dispersion takes place, by the mouth of the capsule, it can only be effected by a contraction or shortening of the columella, and a corresponding retraction within the cavity of the capsule, of the central portion of the peristomium which adheres to it; and in this state several of the specimens were actually found.

But it is also manifest, both from the great size of the columella, and its numerous points of connection with the inner membrane, that in this way the whole of the seeds cannot be discharged. It is possible therefore, that in certain circumstances at least, their dispersion may be assisted by the minute pores existing at the base of the capsule. These pores, in the specimens examined, were found to penetrate the outer membrane, or even its external layer only, and being situated below the origin of the seminal bag, their first effect will probably be to accelerate the decay of the internal spongy texture of the base of the <sup>555</sup> capsule. But by thus removing support from the columella and inner membrane, they may contribute to the greater shortening of the former, and consequently in increasing the dispersion by the mouth of the capsule; or, from the same cause, the inner membrane being at length ruptured, the seeds may be in part discharged by the pores themselves.

It seems then not improbable, from what we at present know of the structure of *Lyellia*, that for the dispersion of the seeds in this genus there are two distinct contrivances, both of which, however, in the only species yet known, are apparently imperfect. But hence it is perhaps allowable to conjecture, that either other species of *Lyellia*, or a nearly-related genus may exist, in which while the mouth of the capsule remains absolutely shut, the pores of the base may be sufficiently enlarged for the complete performance of this important function.

Pores exactly resembling those of *Lyellia crispa* have not hitherto been found in any other moss. I have observed,

however, in several specimens of *Polytrichum alpinum* still more minute pustules, not very different in appearance, and similarly situated on the base of the capsule.

In establishing this new genus of Mosses, it is of importance to determine its more intimate affinities in the family to which it belongs. Its place is unquestionably between *Polytrichum* and *Dawsonia*; and it will I believe be admitted, that these three genera, in the natural method, cannot be separated; though they will necessarily form or be referable to distinct sections of an artificial system founded chiefly on modifications of the peristomium.

In attempting to discover characters by which this group of POLYTRICHOIDÆ may be distinguished from other Mosses, it is in the first place necessary to determine the whole structure of *Polytrichum*; for this genus, though one ~~one~~ of the most common of the order, and, from the great size of the capsules in many of its species, most readily admitting of accurate observation, has never yet been thoroughly examined.

One of the most striking characters of *Polytrichum* is the dense texture and consequent opacity of the leaves; in which it agrees with the other two genera of the section. This character, however, is not altogether confined to *Polytrichoïdæ*, and is wanting in *Polytrichum undulatum* and *angustatum*. But the lamellæ of the upper surface of the leaves probably exist, though in very different degrees, in all the species of *Polytrichum*; are equally observable in *Lyellia* and *Dawsonia*; and I am not aware that they have been found in any other genera of the order.

These lamellæ, which are represented in several of the species figured in *English Botany*, by Wahlenberg in *P. lœvигatum*,<sup>1</sup> and since noticed by Messrs. Hooker and Taylor<sup>2</sup> as existing in nearly the whole of the genus, do not belong to the nerve only, as the authors of *Muscologia Britannica* seem to suppose, but in several species cover the greater part of the surface of the upper or spreading portion of the leaf; the sheathing base being either entirely

destitute of them, or having them much less developed and strictly confined to the nerve.

In the form and position of the male flowers there is probably an absolute uniformity in the whole of this group : but the only peculiarities consist in the perigonial leaf or bractea being formed chiefly of the sheathing part of the stem-leaf ; and in the new shoot proceeding from the centre of the star-like cluster. In *P. undulatum*, however, the former character is by no means obvious, and the latter is not perhaps constant ; and both are only presumed to exist in *Lyellia*.

The double calyptra of *Polytrichum*, long considered as the essential character of the genus, equally exists in <sup>1867</sup> *Dawsonia*. But this outer or spurious calyptra, formed of densely matted hairs originating from the vaginula and the apex of the inner cucullate calyptra, is wanting in several species of *Polytrichum*, in some of which, and in *Lyellia*, the true calyptra is furnished with a few hairs only, either scattered over the whole of its surface, or confined to its apex ; while in others, as in *Polytrichum undulatum*, it is nearly, and in *P. magellanicum* and *lævigatum*, entirely smooth.

Respecting the teeth of the peristomium of *Polytrichum*, I have very little to add, except that in *P. magellanicum* they appear to be eighty in number, which is a higher multiple of sixteen than has hitherto been noticed in this genus, and the greatest number that has yet been found in a single series in the order.

On the nature of the transverse membrane or tympanum of *Polytrichum*, I have formerly made some remarks in treating of *Dawsonia*, and have there considered it as the remains of the pulpy continuation of the columella, originally occupying the cavity of the operculum. But its uniform texture, as well as its exactly circular form and equal margin remain to be accounted for ; unless this regularity may be supposed to depend on the circular, and apparently corresponding, aperture of the inner membrane.

Most authors have described the tympanum of *Polytrichum* as minutely perforated. These pores I have never

been able to detect; but I observe in many cases an appearance which may perhaps account for the belief in their existence, namely a minute reticulation on the outer surface of the membrane, apparently owing to the corresponding areolæ of the inner surface of the operculum, with which it was originally in contact.

*Polytrichum* is remarkable for the various forms of its capsule. Those species, indeed, in which it is quadrangular have been considered as a distinct genus by Mons. de Beauvois. But unless this difference of external form should be found connected with others, either in the habit or in the internal structure, which I believe is not the case, it seems hardly sufficient to justify the subdivision of so natural a genus.

The symmetrical quadrangular capsule, admitting of a regular cylindrical inner membrane, is a character of inferior importance to the plano-convex or dimidiate capsule, which almost necessarily implies, and in *Dawsonia* and *Lyellia* at least is found to be connected with, a corresponding irregularity in the figure of the cavity; and hence I have introduced this remarkable form into the characters of both these genera.

On the structure of the inner membrane of the capsule in *Polytrichum* the only observation that I have met with occurs in *English Botany*, where, in the account of *Polytrichum subrotundum* (plate 1624), it is stated that Mr. James D. Sowerby has discovered, in this species as well as in *Polytrichum undulatum*, a real membranaceous peristomium within the teeth, which, according to Sir James Smith, "gives quite a new idea of the generic character."

This inner peristomium, if it may be so termed, which is well represented in the figure referred to, and consists of a horizontal projection of the inner membrane immediately below its apex, will, I believe, be found to exist in all the species of the genus, and in some cases reduces the aperture of the inner capsule to half the size of the outer at the origin of the teeth. It is always, however, quite entire, and, according to my observations, is formed of a doubling of the

inner membrane, with a loose cellular or rather spongy substance interposed between the lamellæ.

Besides this transverse annular projection there are in the inner membrane of all the species of *Polytrichum* that I have examined, *P. undulatum* alone excepted, four longitudinal equidistant processes, extending from the aperture to the base of the capsule; and in many species projecting so far into its cavity as to come in contact either with the salient angles or sides of the columella, and consequently to subdivide it into a determinate number of cells.

The analogy of these longitudinal processes with the more numerous and irregular plicae in *Dawsonia* and *Lyellia* is obvious; and I have not myself met with similar processes of the inner membrane in any other genus of mosses. They do not, however, afford an absolutely distinguishing character of this group, as they seem to be altogether wanting in *Polytrichum undulatum*; and Hedwig, it must be admitted, has represented an apparently analogous structure in *Gymnostomum pyriforme*.<sup>1</sup>

The quadrangular or four-winged columella of *Polytrichum commune* is well figured and described by the accurate Schmidel<sup>2</sup>; and I have found an equally regular form of this body in most of the species of *Polytrichum* that I have examined; though in many it is less evidently winged than in *P. commune* and the species nearly related to it.

Mons. de Beauvois seems to consider the alæ of the columella as themselves forming complete septa, and also that in this state they exist only in such species as have quadrangular capsules; for to these he limits his genus *Polytrichum*, distinguished by him from *Pogonatum* by its multilocular fruit. The cavity, however, is completely subdivided in several of the species with cylindrical capsules, as in *P. urnigerum*, and in a new species very nearly related to it (*P. microstomum*, nob.) lately received from Dr. Wallich: and the alæ of the columella, as far as I have observed, never form complete septa, at least in the ripe fruit; though

<sup>1</sup> Fundam. Hist. Nat. Muscor. Frond. pars ii. tab. 2, 3.

<sup>2</sup> Icones pl. p. 236, tab. 59, fig. 15.

in those species having quadrangular capsules they nearly reach the parietes opposite to the external angles, towards which they are directed.

As the columella of *Polytrichum* retains its regular form in the ripe capsule, its real structure may even then be in a great measure determined. In this stage I find its wings, or compressed sides, to consist of a double membrane with an intermediate spongy substance, in which there is no appearance of granules; and the internal denser substance of the axis is equally free from granular matter. But as there is no indication of lateral rupture, the sides in several species remaining perfectly smooth, nor of any central cavity, this structure affords a powerful argument in refutation of those hypotheses which assume the existence of two kinds of granules in the capsules of mosses; the one produced in the cavity formed by the internal membrane, the other in the substance or supposed cavity of the columella itself; the latter being considered as seeds in one of the hypotheses,<sup>1</sup> and in the other as pollen.<sup>2</sup>

This argument, however, is not here advanced to disprove the existence of two kinds of granules in the capsules of mosses, but merely against their production in the distinct cavities assigned to them in the hypotheses referred to.

In the greater number of *Polytricha* as well as in *Lyellia* and *Dawsonia* the seeds are extremely minute; a fact with which the increased surface for their production is probably connected: for in *P. undulatum*, where the seeds are larger than in most other species of the genus, this increased surface does not exist: and in *P. laevigatum*, where they are of still greater size, the plicæ of the inner membrane are probably also wanting.

<sup>571</sup> Although there is but little resemblance in the structure of the peristomium among the different genera of *Polytrichoideæ*, they may still be said essentially to agree in the function of this part: for in all of them the complete separation of the seeds is ensured by the smallness of the apertures for their discharge. It may be remarked, that the

<sup>1</sup> Palisot Beauvois, *Méthog.* p. 5.

<sup>2</sup> Keith, *Physiol. Bot.* ii. p. 346.

necessity for this complete dispersion in Mosses seems to be inversely as the size of the seeds. For in those genera of the order in which the capsule either bursts irregularly or has a naked mouth, the seeds are in general larger than in those with a single, and still more manifestly than in those with a double, peristomium. And in conformity with this also, in *Polytrichum undulatum* and *lævigatum* the tympanum is sooner ruptured or removed than in the other species of the genus.

The result of this comparison of *Polytrichum* with *Lycellia* and *Dawsonia*, although it confirms the propriety of their approximation, does not afford any clearly distinguishing mark for the very natural section of the order which these three genera form. In the mean time, however, it may be circumscribed, though not with absolute precision, by a combination of the more general characters which have been now enumerated.

#### LEPTOSTOMUM.

In defining this genus, which was first proposed in my former paper on Mosses<sup>1</sup>, I relied chiefly on the undivided annular projection of the inner membrane of the capsule. I was induced to employ this modification of the peristomium as a character, though certainly far from being obvious, in finding it to exist in several mosses of the southern hemisphere, having a similar and peculiar habit: and which, had it been neglected, I must have referred to *Gymnostomum*, with the greater number of whose species they have hardly anything in common.

Mr. Hooker, however, has since found, as he states, (572) the same structure in several other mosses, generally considered as having a naked peristomium, particularly in *Gymnostomum microstomum*, *Griffithianum*, and *fasciculare*; and as these species have but little resemblance to each other, and still less affinity to *Leptostomum*, he has reduced this genus also to *Gymnostomum*.

If the statement referred to be correct, *Leptostomum*,

<sup>1</sup> [Vol. i, p. 352.]

though it may be a natural genus, must be given up, until other marks shall be found by which it may be distinguished. I have not had specimens sufficiently perfect to enable me to judge of the structure of all the species of *Gymnostomum* mentioned by Mr. Hooker. In one of them, however, *Gymnostomum microstomum*, the peristomium is certainly very different from that of *Leptostomum*. In this species I find, on removing the operculum, that the mouth of the capsule is not only completely covered by a horizontal membrane, but that this covering is derived from the outer membrane of the capsule, and consequently differs in origin as well as in form from the peristomium which it has been said to resemble. Its central portion, however, being extremely thin is soon ruptured and deciduous, and in this state only it has been seen by the authors of the *Muscologia Britannica*.

*Gymnostomum microstomum* therefore may itself be considered as a distinct genus, to which the name of *Hymenostomum*<sup>1</sup> may be given; and it is worthy of remark, that in its technical character it approaches most nearly to *Lyelia*, though no two mosses differ more widely in almost every other respect.

[<sup>573]</sup> From the account given of *Gymnostomum Griffithianum* it appears that this species also has in the early stage a membrane completely covering the mouth of the capsule. But this membrane probably differs in origin, at least, from that of *Hymenostomum*, as it seems to do both in form and dehiscence from the peristomium of *Leptostomum*.

Of *Gymnostomum fasciculare* I have examined only imperfect specimens, I cannot therefore speak with confidence of its structure. The annular process, however, mentioned by Mr. Hooker is more likely to be the remains of a complete horizontal covering, and probably originating from the inner membrane, than to resemble the peristomium either of

<sup>1</sup> HYMENOSTOMUM.

*Fl. Fem. terminalis.*

*Stoma edentulum, clausum epiphragmate* (e membrana exteriore orto), *disco* tenuissimo (a columella libero) mox rupto et evanido; *limbo* persistenti horizontali indiviso.

*Calyptra dimidiata, levigata.*

*Fl. Mas. terminalis, gemmiformis.*

*Hymenostomum* or *Leptostomum*. A membrane of this kind is certainly present in some species of *Gymnostomum*, and perhaps may be found in all those that really belong to that genus. It exists also in *Weissia Templetoni*, which so closely resembles *Gymnostomum fasciculare* as to be with difficulty distinguished from it, unless by the inspection of the peristomium; and, in addition to the erect annular peristomium from which the character of the genus is taken, I have observed a similar membrane in *Leptostomum* itself. It seems even to be not an uncommon process or termination of the inner membrane, though it has been remarked only in some of its more obvious and persistent modifications. Thus the spongy membrane figured and described in the two published species of *Calympres*, seems to be an analogous structure,<sup>1</sup> as is also the circular disk terminating the columella in several species of *Splachnum*; and perhaps even the tympanum of *Polytrichum* may be of similar origin.

But these characters of *Leptostomum* and *Hymenostomum*, though they do not appear to have been yet observed in any other mosses, may still perhaps be considered too minute for generic distinctions: and it must be admitted that were nothing to be obtained but the subdivision of an extensive natural genus it could not be necessary to have recourse to them. The divisions in question, however, are certainly not of that kind.

The weakest part indeed of Hedwig's system is its bringing together all those mosses that have a naked peristomium, and even including the greater part of them in the genus *Gymnostomum*; while many of the species so associated are in real affinity much nearer to several other genera of the order having a simple or even a double peristomium.

<sup>1</sup> The circular spongy membrane covering the mouth of the capsule certainly does not form an essential part of the character of *Calympres*; for, in the only species that I have examined, it is either entirely wanting, or firmly adheres to the inner surface of the operculum, along with which, also, a considerable portion of the columella separates. Nor has Swartz, who established the genus (in *Spreng. Schrad. und Link. Jahrb. der Gewäch.* vol. i, p. 1) even noticed this membrane in his description.

Thus *Gymnostomum microstomum*, the *Hymenostomum* of the present paper, has less the habit of the genus in which it is placed than of *Weissia*, to some of whose species, especially *W. affinis* and *trichodes*, it seems to approach even in the structure of its peristomium.

Several species of that section of *Gymnostomum*, to which perhaps the genus should be limited, especially *G. fasciculare*, *Bonplandii*, and *Rottleri*, can hardly be distinguished from *Weissia Templetoni*.<sup>1</sup>

<sup>575]</sup> *Gymnostomum* or *Anictangium pulvinatum* agrees in every other part of its structure with *Grimmia*.

*Gymnostomum lapponicum*, notwithstanding the difference of calyptra, may be considered as related to *Grimmia Daviesii*, and consequently to *Orthotrichum*, which *G. Daviesii*<sup>2</sup> resembles in its teeth being approximated in pairs.

*Gymnostomum viridissimum* has exactly the habit and calyptra of *Zygodon*.

*Gymnostomum pennatum* (*Schistostega* of Mohr,) in one remarkable character may be compared with *Fissidens*.<sup>3</sup>

<sup>1</sup> *Weissia Templetoni*, along with a nearly related species found in New Holland, *Funaria minor* of Delile (*Flor. Ägypt.*), and perhaps also *Weissia radians*, may form a genus distinct from *Weissia*, and nearly related to *Funaria*, differing chiefly in the irregular bursting and evanescence of the inner peristomium, which in *Funaria* is regularly divided and generally persistent, though in some cases perhaps equally deciduous. In a variety of *Weissia Templetoni*, or a very nearly related species, collected in 1800 in the county of Donegal, I have observed the outer peristomium to be not unfrequently wanting, even before the separation of the operculum; a fact which, if hereafter confirmed, would establish its affinity to *Gymnostomum fasciculare*.

<sup>2</sup> *Griffithia Daviesii* nob.

<sup>3</sup> As Schkuhr (in *Krypt. Gewäch.* ii, p. 31, t. 12) has ascertained that the operculum of *Gymnostomum pennatum* separates entire, the genus *Schistostega* must be again reduced to *Gymnostomum*, until other distinguishing characters are discovered.

Its resemblance to *Fissidens* consists in the somewhat similar disposition of leaves.

In *Fissidens*, as limited by Bridel, (*Muscol. Nov.* p. 186) the leaves are universally described as presenting their margin instead of their disk to the stem, and as having a doubling of the lower half of their inner or upper margin, extending as far as the nerve.

On this view Bridel (in *t. cit.*) has formed a separate section of the order, consisting of *Fissidens* and *Octodiceras*; and hence also M. de la Pylaie has changed the name of *Fissidens* to *Shitophyllum*. (*Journal de Botan. Appliq.* iv, p. 133.) It seems to me a much simpler explanation of the apparent anomaly to consider the supposed doubling or division of the leaf as its true disk, and

*Anictangium aquaticum* is evidently related to *Cinclidotus* or *Trichostomum*.

*Gymnostomum julaceum* and *Hedwigia secunda* of Hooker resemble certain species of *Pterygynandrum*, *Neckera* and *Leskeia*.

An unpublished moss (*Glyphocarpa capensis*) with a naked peristomium, which I observed on the Table Mountain of the Cape of Good Hope has the spherical <sup>1576</sup> striated capsule as well as the inflorescence and ramification of *Bartramia*: and with this genus also *Anictangium Humboldtii* agrees in its capsule, though its habit is that of *Leskeia* or *Hypnum*.

*Drepanophyllum* of Richard (*Dicranum? falcifolium* of Hooker,) in form and disposition of leaves is related to *Fissidens* and *Neckera*.

*Calymperes* approaches to *Orthotrichum*, or rather, perhaps, to *Schlottheimia* or *Macromitrium*.

*Lyellia*, which belongs to the same division of the artificial system, is evidently allied to *Dawsonia* and *Polytrichum*.

And lastly, *Leptostomum*, the genus more particularly under consideration, appears to me most nearly related to *Bryum*; with which indeed its affinity would be completely established, were Hedwig's account of the peristomium of *Bryum macrocarpum* proved to be correct.

To the observations now made on the various affinities of mosses which agree in having a naked peristomium, it may be added, that the genera with a simple peristomium do not form a strictly natural series, several of them being much more nearly related to those in which the peristomium is double than to each other.

But if the correctness of these statements be admitted, it follows that, in many cases to obtain natural genera in this order either additional sources of distinction must be

the deviation from the usual structure as consequently consisting in the greater compression of the leaf, and in the addition of a dorsal and terminal wing. In support of this view it may be observed, that in the lower leaves of the stem both the additional wings are greatly reduced in size, and in some cases entirely wanting, as they universally are in the perigonal leaves, which have likewise the more ordinary form, being moderately concave and not even navicular.

sought for, or those at present in use more minutely investigated.

Of additional characters, which in some cases may be employed with advantage, I shall merely advert to the membranes of the capsule being distinct or contiguous, and to that more intimate union where there seems to be a single membrane only; to the modifications of internal structure of the inner membrane; the differences in form and duration of the columella, or even its being entirely wanting in the ripe capsule; the presence or absence of <sup>w7</sup> the annulus; and the insertion, form and relative position of the male flowers, which, though always considered of importance by Hedwig, many of the most distinguished muscologists of the present day entirely exclude from the characters of their genera.

With respect to the principal source of generic distinctions, the Peristomium, in addition to the circumstances generally attended to, namely, the origin, number, direction, form, and actual division of the teeth, it may be of some importance to ascertain their aestivation, which, though very generally, is not always valvular: and especially to mark the existence or want of the *longitudinal striae* or semi-pellucid lines; for these, if they do not prove the compound nature, at least clearly indicate a tendency to division in the teeth where they are found; division being always in the course of the striae, and in no instance taking place unless where they are present.

But in considering them, which I am inclined to do, as proving composition or confluence of the teeth, it would appear that there is a much greater uniformity in the structure of the simple or outer peristomium, at least, than is generally admitted; and that the prevailing number of teeth in this series is thirty-two; though by a coalescence, more or less complete, they are frequently reduced to sixteen, in some cases to eight, and in a few even to four.

According to this view, a single longitudinal line in the axis of a tooth indicates the confluence of two teeth; three equidistant lines, one being central, the coalescence of four; and seven lines similarly disposed that of eight.

Nearly the whole of these modifications exist in that natural subdivision of the order, which may be named *Splachneæ*, consisting of *Splachnum*, *Systylium*, *Tayloria* (*Hookeria* of Schwaegrichen), *Splachnum squarrosum* of Hooker, and *Weissia splachnoides*.

<sup>578</sup> The number of teeth in *SPLACHNEÆ* is thirty-two, which, however, are never entirely distinct and at the same time equidistant, but approximated or united in various degrees in the different genera and species of the section.

Thus in *Tayloria* and *Systylium* the thirty-two teeth are distinct and disposed in sixteen pairs.

In *Splachnum rubrum* and *luteum* there are apparently only eight pairs, each tooth, however, having a pellucid and obscurely-perforated axis. In almost all the other genuine species of *Splachnum* there is the same disposition as in *S. rubrum* and *luteum*; but the pellucid axis of each tooth is less distinct and imperforated.

In *Splachnum angustatum*, and I believe also in a second species nearly related to it, the arrangement is somewhat different; for the sixteen apparent teeth are approximated, and at the base even united in fours, the pellucid axis of each tooth being still less obvious. Hence these species in their peristomium very nearly approach to *Tetraphis*, to which they would be absolutely referable were the union complete.

In *Splachnum squarrosum* the apparent number of teeth is eight, without any actual subdivision. But as each tooth has three equidistant pellucid lines, of which the lateral are nearly as distinct as the central, there can be no doubt that the composition is the same here as in the rest of the section.<sup>1</sup>

<sup>1</sup> In a late number of *Musci Exotici*, (No. 17, tab. 136,) *Splachnum squarrosum* is transferred to *Octoblepharum*, and, on the authority of M. de Beauvois, is stated to be *Octoblepharum serratum* of Bridel. Mr. Hooker, however, continues to refer it to this genus, on the supposition of its agreeing with the original species in the form of its calyptra; observing that if this should prove not to be the case, it ought to be separated, under the generic name *Orthodon*, formerly given to it by its discoverer M. Bory de St. Vincent.

The calyptra of *O. albidum* is represented as distinctly cucullate, both by Swartz (in *Obs. Bot.* tab. xi, fig. 1) and M. de Beauvois (in *Flore d'Oware*, i, tab. 31). I have also observed it of the same form in specimens from Madagascar. There seems, therefore, no reason to doubt that these two

<sup>579]</sup> By these lines also *S. squarrosum* is readily distinguished from *Octoblepharum*, in which the apparent number of teeth is the same : for in *Octoblepharum* each tooth has only a single pellucid line ; and hence its affinity to certain species at present referable to *Weissia*, with a nearly similar habit and sixteen distinct teeth, whose axis is not perceptibly pellucid.

*Weissia splachnoides* differs from the other *Splachneæ* in having sixteen equidistant teeth ; but as these teeth, according to the indication of the pellucid axis, are double, the arrangement may be compared with that of *Tayloria* and *Systylium*, in which the separation into thirty-two is complete, and the sixteen pairs equidistant. It agrees, however, also in this respect with *Grimmia* and with several species of *Weissia* : but in other important characters, as well as in habit, it is evidently related to *Splachnum*, and offers perhaps one of the best examples of the importance of the male flowers in distinguishing natural genera.

Even *Tetraphis pellucida* may be cited in proof of the same prevailing number in the peristomium ; each of its four teeth, when highly magnified, appearing to have seven longitudinal striae, which, according to this test, would make the real number thirty-two ; a structure contributing to fix the place of *Tetraphis* in the natural series between *Splachnum* and *Orthotrichum*.

<sup>580]</sup> Better evidence on the same subject is afforded by *Trichostomum*, *Didymodon*, and *Leucodon*, in all of which the thirty-two teeth are distinct, though approximated in pairs ; by the sixteen bifid teeth of *Dicranum* and *Fissidens* ; and by the like number of teeth with a perforated axis in *Trematodon*, *Weissia nuda*, *Didymodon latifolium*, and several species of *Grimmia*.

mosses differ materially even in this part of their structure ; and as other differences, of at least equal importance, also exist, both in the peristomium and male flowers, *Octoblepharum serratum*, whose habit is nearly that of *Splachnum*, may be distinguished both from that genus and from *Octoblepharum* by the following characters.

#### ORTHODON.

*Fl. Fem. terminalis.*

*Peristomium simplex, octodentatum, dente singulo striis tribus longitudinalibus instructo (ideoque e quatuor coalitis composito).*

*Calyptra mitriformis (4-fida, pilosa).*

*Fl. Mas. terminalis, discoideus.*

In all the genera having a double peristomium I believe the pellucid axis more or less manifestly exists ; but in these genera there is a great uniformity in the apparent number of teeth in the outer peristomium ; there being no instance of actual division in this series beyond sixteen, or of a further approximation, unless in *Orthotrichum*, in several of whose species the approximation or even union of the double teeth by pairs takes place, while in a few others the sixteen teeth are slightly divided at the apex, and in the whole genus the pellucid axis is remarkably distinct.

The only exceptions to the actual division into thirty-two, or the structure indicating that number, in the simple peristomium of Mosses, occur on the one hand in certain species of *Weissia*, perhaps in *Encalypta* and in *Octoblepharum*, in all of which, I believe, there is a reduction to sixteen : and on the other in *Polytrichum*, where the number is frequently increased, varying in the different species, and chiefly by multiples of sixteen, from thirty-two to eighty. In this genus also, whatever the number may be, the teeth never have a semipellucid, but rather an opake or thickened axis, and no tendency to union or even approximation is observable. The constant equidistance of the teeth of *Polytrichum* seems to be connected with its peculiar mode of dissemination ; for as this takes place through the interstices of the teeth, and as complete separation of the seeds seems necessary on account of their extreme minuteness, a reduction in number and consequent increase of size of these apertures would probably, in some degree, prevent dispersion, while the unequal distances of the teeth might either produce a deviation from the regular figure, or an early rupture, of the tympanum, which forms an essential part in this economy.

#### BUXBAUMIA.

In my former paper<sup>1</sup> I have proposed to preserve the genus *Buxbaumia*, as established by Schmidel ; and in construct-

<sup>1</sup> [Vol. i, p. 351.]

ing a character to comprehend both species, I entirely rejected the outer peristomium of Hedwig; and having also adopted his opinion respecting the middle peristomium of *B. aphylla*, which he has termed corona, and considered as analogous to the annulus in many other mosses, it became unnecessary to advert to this part in defining the genus.

Mr. Hooker has since published an excellent analysis of both species, and has followed Ehrhart and Mohr in regarding them as forming distinct genera.

This determination I have now no hesitation in adopting; for, whatever the nature of Hedwig's corona may be, it affords at least an obvious character, and is connected with other differences of sufficient importance to justify the separation; though the two genera must always remain in the same natural section of the order.

The observations that follow belong, therefore, solely to *Buxbaumia aphylla*.

My first remark on this plant relates to its peristomium, on the nature of which, as compared with that of other mosses, at least two different opinions may be formed.

According to one of these, the outer peristomium of Hooker may with Hedwig be considered analogous to the fimbria or annulus existing in many other mosses; and the <sup>682]</sup> principal objection to this view would perhaps be obviated by rejecting the outer peristomium of Hedwig, as I have formerly proposed, and which Mr. Hooker has since done; as there would then be nothing either in the origin or texture of this part essentially at variance with the supposition; the principal remaining difference being its greater length; for the cilia of the peristomium of *Buxbaumia* may be compared with the striae or divisions existing in the annulus, which seem to be equally determinate in number, and in some cases also disposed in a double series.

On the second supposition, the peristomium of *Buxbaumia* originating entirely from the outer membrane, may, though consisting of several and even of dissimilar series, be regarded as analogous to that portion of the pencil of *Dawsonia* which arises from the same part of the capsule. This analogy is suggested by Mr. Hooker, and is confirmed

by a circumstance that he does not seem to have noticed, namely, that his outer peristomium, the corona of Hedwig, consists of a double series of cilia. The number of cilia in each series exceeds sixteen, but hardly amounts to thirty-two; it probably, however, corresponds with that of the plicæ in the membranaceous peristomium.

We have here then a passage from a number still perhaps definite, though disposed in a triple series, to the indefinite number peculiar to, and so striking in, *Dawsonia*.

My second observation relates to the inner membrane of the capsule, of which I find the mouth to be quite entire and open, though before the separation of the operculum it is closed by the terminating process of the columella. Hence *Buxbaumia* has some resemblance to *Polytrichum*, and a still greater to *Lyellia*, in this part of its structure.

*Buxbaumia aphylla* is the only moss considered as being entirely destitute of leaves; and though it has been oftener and more fully described than any other plant of the <sup>1683</sup> order, from the monographs of Linnaeus and Schmidel to the excellent illustration recently published by Mr. Hooker, there is no difference of opinion on this point. I have lately ascertained, however, that *Buxbaumia aphylla* is always furnished with perfect leaves, which more nearly resemble, both in texture and division, those of a *Jungermannia* than of any species of moss properly so called; and consequently are widely different from those of *Polytrichoidæ*, to which this genus is in several respects related.

The leaves in the barren plant, where I first observed them, are lanceolate and but slightly divided. Those at the base of the female perichaetium are even broader than the former, but more deeply cut, both laterally and at top, into several capillary segments; while the leaves which proceed from the surface of the perichaetium are still more deeply divided, and their segments so much elongated that the minute foliaceous base has been universally overlooked, and the perichaetium consequently described as covered with hairs.

REMARKS  
ON THE  
STRUCTURE AND AFFINITIES  
OF  
CEPHALOTUS.

BY  
ROBERT BROWN, Esq., F.R.S., &c.

[Extracted from the 'London and Edinburgh Philosophical Magazine,'  
Vol. I, pp. 314—317.]

LONDON.  
—  
1832.

## ON THE STRUCTURE AND AFFINITIES

[314]

OR

## CEPHALOTUS.

IN the Botanical appendix of Captain Flinders's Voyage to Terra Australis,<sup>1</sup> a figure and description of *Cephalotus follicularis* are given, in some respects more complete than those of M. Labillardière, by whom this remarkable plant, a native of the south-west coast of New Holland, was first published. Both accounts, however, are equally imperfect with regard to the fruit; and my principal object in the present communication is to supply that deficiency.

My earliest knowledge of the ripe fruit of *Cephalotus* was obtained from a single specimen, sent in 1815 by M.<sup>[315]</sup> Leschenault, who had found the plant in February 1803 near the shores of King George's Sound, where I had gathered it in a less advanced state in the beginning of January 1802.

I have, however, more recently, received numerous specimens with ripe seeds from Mr. William Baxter, who collected them also at King George's Sound in 1829.

*Cephalotus* was introduced in 1823 from the same place by Capt. King, into His Majesty's Botanic Garden at Kew, where it flowered repeatedly, and ripened seeds from which several plants have been raised. A figure of one of these with expanded flowers, but still without fruit, has lately been published by Dr. Hooker in the Botanical Magazine; and a plant brought also from King George's Sound in 1829 by Mr. William Baxter is now in flower in Mr. Knight's nursery.

The following account of the ripe fruit will serve as a

<sup>1</sup> [Vol. i, p. 76, t. 4.]

supplement to the description of the plant which I have given in the work referred to.

**AKENIA membranacea**, insecta parva alis conniventibus quodammodo referentia, perianthio parum aucto staminibusque persistentibus cincta, iisque sesquiloniora, ferè distincta, ipsâ basi, ubi receptaculo communi inserta, post separationem intus aperta ibique e membranâ simplici crassiusculâ imberbi nitente formata; suprà clausa et e dupli membranâ conflata; harum exterior dense barbata, pilis longis, strictis, acutis, deflexis, stylo persistenti brevi arcte reflexo rostrata: membrana seu lamella interior tenuis, intus quandoque dehisces.

**SEmen unicum** (rarissimè duo), basi cavitatis membranæ interioris insertum, oblongo-ovale, teres, funiculo umbilicali brevi juxta basin affixum. *Integumentum duplex*: *Testa membranacea* laxiuscula, *raphe* tenui laterali et apice *chalazâ* parvâ insignita: *Membrana interior* tenuis separabilis. *Albumen* semini conforme, album, carnosum, subfriabile, e materia oleosâ cum granulis minutâ constans.

**EMBRYO** parvus, in basi axeos albuminis, teretiusculus, albus, rectus, albumine 4—5ies brevior. *Cotyledones* breves, plano-convexæ. *Radicula* teres, basin seminis attingens.

**RECEPTACULUM COMMUNE** fructûs: tuberculum centrale, parvum, brevissimum, subcylindraceum, cuius lateribus bases apertæ akeniorum adnatæ sunt, apice convexiusculo barbato.

From this description, especially of the embryo, it is evident that *Cephalotus* must be removed from *Rosaceæ*, to which it had been referred by M. Labillardière; and also, though not with much confidence, in the account which I published in 1814. M. de Jussieu, indeed, in 1818,<sup>1819</sup> proposed to exclude it from *Rosaceæ* and append it to *Crassulaceæ*; and the structure of the seed, as well as of the folliculi or akenia, and even their insertion on the minute central receptacle or axis, may seem to confirm the correctness of this approximation.

*Cephalotus*, however, still appears to me sufficiently remote from every natural order at present established, to entitle it

(like *Philydrum*<sup>1</sup> and *Brunonia*<sup>2</sup>), now that its structure is completely known, to rank as a distinct family which may be called **CEPHALOTEÆ**, and which may be placed between Crassulaceæ and Francoaceæ; differing from both in being apetalous, in the valvate aestivation of the perianthium, and in many characters of inferior importance: from Crassulaceæ also in its minute embryo and more copious albumen: and from Francoaceæ in the absence of barren stamens and in the pistilla being monospermous and apparently distinct.

The most striking peculiarity of *Cephalotus* consists in the conversion of a portion of its radical leaves into Ascidia or pitchers. But as ascidia in all cases are manifestly formed from or belong to leaves, and as the various parts of the flower in *Phænogamous* plants are now generally regarded as modifications of the same organs, the question is naturally suggested, how far the form and arrangement of the parts of fructification agree in those plants whose leaves are capable of producing ascidia or pitchers. The four principal, and indeed the only genera in which pitchers occur, are *Nepenthes*, *Cephalotus*, *Sarracenia*, and *Dischidia*, and the few other somewhat analogous cases, consisting of the conversion of bractæ or floral leaves into open cuculli, are found in *Marcgravia* and two other genera of the same natural family.

The only thing common to all these plants is, that they are Dicotyledonous.

It may also be remarked, that in those genera in which the Ascidia have an operculum, namely *Nepenthes*, *Cephalotus*, and *Sarracenia*, they exist in every known species of each genus, and the structure of these genera is so peculiar that they form three distinct natural families; while in *Dischidia*, whose pitchers are formed without opercula, these organs are neither found in every species of the genus, nor in any other genus of the extensive natural order to which it belongs.

The striking resemblance in most points of the Ascidia of

<sup>1</sup> Flinders's Voyage, vol. ii, p. 578 [vol. i, p. 53].

<sup>2</sup> Transact. Linn. Soc. vol. xii, p. 132 [ante, p. 310].

Cephalotus to those of *Nepenthes*, leads to a comparison in the first place of these two genera. But although both are apetalous, and in the parts of the flower deviate from the quinary or prevailing number in Dicotyledones, yet they <sup>17)</sup> differ in so many other important characters that they cannot be considered as nearly related.

The place of *Nepenthes* in the natural series I have long since<sup>1</sup>, in my account of *Rafflesia*, suggested to be near *Aristolochiæ* or *Asarinæ*, without, however, intending to include it in that family.

This approximation was adopted by M. Ad. Brongniart, who, however, went further, having absolutely referred *Nepenthes* to *Cytineæ*.

The union of plants so utterly unlike in appearance and œconomy, and so different, it may be added, in many of their most important characters, seems to have been generally regarded as somewhat paradoxical; and accordingly Professor Link, in 1829, has established *Nepenthes* as a section or tribe of *Aristolochiæ*, and Dr. Bartling and Mr. Lindley, in 1830, have considered it as forming a distinct natural family.

To the numerous and obvious distinctions between *Cytineæ* and *Nepenthes* may be added the no less important differences in their internal structure. For while *Cytineæ*, like most, perhaps all, other plants parasitical on roots, are destitute of spiral vessels, *Nepenthes* exhibits these vessels in the greatest degree of development and abundance, and also produces them in parts in which they are hardly to be met with in any other dicotyledonous plant.

Thus, in addition to the dense circle or stratum of spiral vessels existing in the stem between the outer parenchyma and the wood, they are found also singly or scattered in the pith, in the loose parenchyma situated between the wood and the bark, if it may be so called, even in the fibres of the root, and everywhere in the substance of the leaves, the pitchers, calyx and capsules. And between these solitary or scattered spiral vessels, which are often of considerable

<sup>1</sup> *Transact. Linn. Soc. vol. xiii, p. 219 [vol. i, p. 386].*

length, and those forming the stratum or circle externally bounding the wood and existing in the veins of the leaves, no essential difference in structure will I believe be found. In these points there is little resemblance between *Nepenthes* and *Cephalotus*, in the internal structure of which last there is nothing unusual.

Between the parts of fructification of *Nepenthes* or *Cephalotus* and *Sarracenia*, there is still less analogy, and it is obviously unnecessary to compare in this respect any of these genera with *Dischidia*.

September 25th, 1832.

CHARACTERS AND DESCRIPTION

OF

LIMNANTHES,

A NEW GENUS OF PLANTS

ALLIED TO

FLOERKEA.

BY

ROBERT BROWN, Esq., V.P.L.S.

(READ AT THE LINNEAN SOCIETY, JUNE 18TH, 1833.)

LONDON.

---

1833.

## CHARACTERS AND DESCRIPTION

OF

## LIMNANTHES.

A PAPER WAS read, entitled "Characters and Description of *Limnanthes*, a new genus of plants allied to *Floerkea*," by Robert Brown, Esq., V.P.L.S.

For specimens of the plant described the writer is indebted to the Horticultural Society, and to Mr. David Douglas, F.L.S., by whom it was recently discovered in California.

Mr. Brown was led more particularly to examine *Limnanthes*, from its resemblance to *Floerkea* of Willdenow, a genus which he had many years since investigated without being able to determine its place in the natural system. Examination proved these two plants to be so nearly akin, that they might perhaps be included in the same genus. They are here, however, separated, and the two genera are considered as forming a family distinct from all those at present known.

The place of this new family (LIMNANTHEÆ) is not absolutely determined; but it is suggested that in two remarkable points of its structure, namely, the presence of glands subtending the alternate filaments, and the existence of a gynobase, it more nearly approaches to Hypogynous families than to Perigynous, with which it has hitherto been associated.

The following are the characters of the Natural Order, and of the two Genera forming it.

## LIMNANTHÆ.

*Flos* completus, regularis. *Calyx* 3—5-partitus, æstivatione valvata, persistens. *Petala* 3—5, marcescentia. *Stamina* 6—10, insertione ambiguâ (hypo-perigyna), marcescentia. *Filamenta* distincta, 3—5 sepalis opposita basi extus glandulâ munita. *Ovaria* 2—5, sepalis opposita, cum *stylo* communi 2—5-fido mediante gynobasi connexa, monosperma; *ovulo* erecto, nucleo inverso. *Achenia* subcarnosa. *Semen* exalbuminosum. *Embryo* rectus; *radicula* infera.

Herbæ (Americæ septentrionalis, paludosæ) *glaberrimæ*, *alternifoliae*, *exstipulatae*, *foliis divisis*, *pedunculis unifloris*, *ebracteatis*, *apice dilatato basin turbinatam calycis simulante*.

## Limnanthes.

*Calyx* 5-partitus. *Petala* 5, calyce longiora, æstivatione contorta. *Stamina* 10. *Ovaria* 5.

Herba (Limnanthes Douglasii, Americæ occidentali-borealis) *foliis bipinnatifidis*, *pinnis suboppositis segmentis alternis*.

## Floerkea. Willd.

*Calyx* 3-partitus. *Petala* 3, calyce breviora. *Stamina* 6. *Ovaria* 2 (raro 3).

Herba (Americæ orientali-borealis) *foliis pinnatifidis, segmentis indivisis*.

[71]

### SILICULOSA.

CAKILE. *Gærtn. sem. 2*, p. 291.

*Silicula* biarticulata, articulis monospermis : superioris semine erecto sessili ; inferioris (quandoque abortientis) pendulo.

1. C. *maritima*, articulis ancipitibus : superiore sagittato, foliis pinnatifidis subdentatis carnosis.

Cakile maritima. *Willden. sp. pl. 3*, p. 416.

Bunias Cakile. *Eng. bot. 231*.

*Nat. of Britain.* ⊖.

2. C. *perennis*, articulo superiore ovali ancipiti stylo longiore, foliis laciniate-pinnatifidis dentatis acutis.

Myagrum perenne. *Willden. sp. pl. 3*, p. 406. *Jacqu. austr. 5*, p. 7, t. 414.

*Nat. of Germany.* 4.

3. C. *rugosa*, articulo superiore subgloboso rugoso stylo breviore, foliis obtusis dentatis ; radicalibus sublyratis.

Myagrum rugosum. *Willden. sp. pl. 3*, p. 406.

Rapistrum rugosum. *Allion. pedem. 1*, p. 257, t. 78.

*Nat. of the South of Europe.* ⊖.

CRAMBE. *Gen. pl. 1071.*

[72]

*Silicula* articulo superiore subgloboso, semine inverso

funiculo basi loculi inserto; articulo inferiore aborticente pedicelliformi.

1. *C. maritima*, filamentis longioribus bifurcatis, silicula mutica, foliis subrotundis sinuatis undulatis dentatis glaucis cauleque glabris.

Crambe maritima. *Willden. sp. pl.* 3, p. 418. *Engl. bot.* 924.

*Nat. of Britain.* 4.

2. *C. pinnatifida*, filamentis longioribus bifurcatis, silicula mutica, foliis pinnatifidis: lobis oblongis dentatis cauleque glabris.

Crambe orientalis. *Jacqu. ic.* 1, *t.* 128.

Crambe suecica. *Mill. dict.*

[82]

7. *T. montanum*, siliculis retusis : loculis 2-spermis ; stylo exerto, staminibus corolla brevioribus, petalis calycem ter superantibus, foliis caulinis cordato-sagittatis.

*Thlaspi montanum.* *Willden. sp. pl. 3, p. 445.* *Jacqu.*  
*austr. 3, p. 22, t. 237.*  
*Nat. of Austria.* ♂.

### HUTCHINSIA.

*Silicula elliptica integra:* valvis navicularibus apteris,  
 loculis dispermis. *Filamenta edentula.*

1. *H. rotundifolia*, foliis inferioribus orbiculato-ovatis  
 petiolatis; superioribus cordato-sagittatis integris.

*Iberis rotundifolia.* *Willden. sp. pl. 3, p. 454.*  
*Lepidium rotundifolium.* *Allion. pedem. 1, p. 252.*

t. 55, f. 2.

*Nat. of Switzerland and Piedmont.* ♀.

2. *H. alpina*, foliis pinnatis integerrimis glabris, petalis  
 calyce deciduo duplo longioribus, siliculis utrinque acutis;  
 stylo brevissimo exerto.

*Lepidium alpinum.* *Willden. sp. pl. 3, p. 433.* *Jacqu.*  
*austr. 2, p. 23, t. 137.*

*Nat. of the Alps of Germany, Switzerland, and Italy.* ♀.

3. *H. petræa*, foliis pinnatis integerrimis, petalis calyce vix  
<sup>ss</sup> longioribus, siliculis utrinque obtusis; stigmate sessili.

*Lepidium petréum.* *Willden. sp. pl. 3, p. 434.* *Engl.*  
*bot. 111.*

*Nat. of England.* ♂.

### TEESDALIA.

*Silicula emarginata,* valvis navicularibus, loculis dispermis. *Filamenta basi intus squamula aucta.*

1. *TEESDALIA nudicaulis.*

*Iberis nudicaulis.* *Willden. sp. pl. 3, p. 458.* *Curtis*  
*lond.* *Engl. bot. 327.*

*Nat. of Britain.* ⊖.

Jacqu.

## IBERIS. Gen. pl. 1080.

*Silicula* emarginata : valvis navicularibus alatis ; loculis monospermis. *Petala* inæqualia.

1. I. *semperflorens*, frutescens, foliis spathulatis glabris integerrimis obtusis. *Willden.* sp. pl. 3, p. 452.

*Thlaspidium* fruticosum *Leucoii* folio semperflorens. *Zanon. hist.* 214, t. 165.

*Nat. of Persia and Sicily.* ♂.

2. I. *sempervirens*, frutescens, foliis oblongo-linearibus integerrimis glabris, corymbis racemosis.

*Iberis sempervirens.* *Willden.* sp. pl. 3, p. 453.

*Thlaspidium.* *Rivin. tetrapet.* 110.

*Nat. of the Island of Candia.* ♂.

3. I. *gibraltarica*, frutescens, foliis cuneiformibus <sup>84</sup> obtusis apice dentatis glabris. *Willden.* sp. pl. 3, p. 453.

*Curtis magaz.* 124.

*Nat. of Spain.* ♂.

4. I. *saxatilis*, frutescens, foliis integerrimis acutis pubescentibus : inferioribus linearibus ; superioribus lanceolatis. *Willden.* sp. pl. 3, p. 453.

*Thlaspi saxatile*, vermiculato folio. *Garid. prov.* 460, t. 101.

*Nat. of France and Italy.* ♂.

5. I. *ciliata*, herbacea, foliis subcarnosis ciliatis : radicalibus spathulatis ; caulinis linearibus. *Willden.* sp. pl. 3, p. 455. *Botan. magaz.* 1030.

*Nat. of Mount Caucasus.* ♀.

6. I. *umbellata*, herbacea, foliis lanceolatis acuminatis ; inferioribus serratis ; superioribus integerrimis. *Willden.* sp. pl. 3, p. 456. *Curtis magaz.* 106.

*Nat. of the South of Europe.* ☽.

7. *I. amara*, herbacea, foliis lanceolatis acutiusculis sub-dentatis glabris, floribus racemosis,

<sup>85]</sup> *Iberis amara*. *Willden. sp. pl. 3, p. 456.* *Engl. bot. 52.*  
*Nat. of England.* ◎.

8. *I. violacea*, herbacea, foliis petiolatis spathulatis obtusis dentatis integerrimisque ciliatis, corymbo subumbellato.

*Nat.* ◎.

9. *I. linifolia*, herbacea, foliis linearibus integerrimis gla-bris, caule ramoso, corymbis hemisphaericis.

*Iberis linifolia*. *Willden. sp. pl. 3, p. 457.*

*Thlaspi lusitanicum umbellatum* gramineo folio flore pur-purascente. *Garid. prov. 459, t. 105.*

*Nat. of Spain and Portugal.* ♂.

10. *I. pinnata*, herbacea, foliis pinnatifidis, caule erecto paniculato, petalis calyce triplo longioribus.

*Iberis pinnata*. *Willden. sp. pl. 3, p. 458.*

*Thlaspi alterum minus umbellatum nasturtii hortensis* folio, narbonense. *Lobel. ic. 218.*

*Nat. of the South of Europe.* ◎.

#### LEPIDIUM. *Gen. pl. 1077.*

*Silicula* loculis monospermis; valvis navicularibus.  
*Petala* æqualia.

1. *L. latifolium*, foliis lanceolatis indivisis serratis integer-rimisve, siliculis ovalibus integris.

<sup>86]</sup> *Lepidium latifolium*. *Willden. sp. pl. 3, p. 436.* *Engl. bot. 182.*

*Nat. of Britain.* 4.

2. *L. lyratum*, foliis lyratis crispis, siliculis ovatis in-tegris.

*Lepidium lyratum*. *Willden. sp. pl. 3, p. 435.*

*Lepidium orientale*, nasturtii crispi folio. *Tournef. it. 2, p. 339, cum tab.*

*Nat. of the Levant.* ◎.

3. L. *Draba*, foliis amplexicaulibus indivisis lanceolatis oblongisve dentatis, siliculis cordatis apice integris stylo acuminatis.

Cochlearia Draba. *Willden. sp. pl.* 3, p. 451. *Jacqu. austr.* 4, p. 8, t. 315.

*Nat.* of Austria, France, and Italy. ♀.

4. L. *graminifolium*, foliis caulinis linearibus integris, siliculis ovatis acutis integerrimis, floribus hexandris, petalis calyce longioribus.

Lepidium *graminifolium*. *Linn. sp. pl.* 900.

Lepidium *Iberis*. *Linn. sp. pl.* 900, secundum synonyma omnia.

*Nat.* of Germany, France, and Italy. ♀.

5. L. *divaricatum*, foliis inferioribus pinnatifidis; rameis linearibus, caule ramosissimo, siliculis ovalibus obsolete emarginatis imbricatis.

Lepidium *divaricatum*. *Willden. sp. pl.* 3, p. 441. <sup>[87]</sup>

*Nat.* of the Cape of Good Hope. *Mr. Fr. Masson.* ♂.

6. L. *ruderale*, floribus diandris apetalis, foliis radicalibus pinnatifidis; rameis linearibus integerrimis, siliculis emarginatis patentibus.

Lepidium *ruderale*. *Willden. sp. pl.* 3, 440. *Engl. bot.* 1595.

*Nat.* of Britain. ♂.

7. L. *bonariense*, floribus diandris, petalis minutis, foliis caulinis pinnatifidis incisisve cauleque pilosiusculis, siliculis sub rotundis emarginatis.

Lepidium *bonariense*. *Willden. sp. pl.* 3, p. 441.

Thlaspi *bonariense* multiscissum, flore invisibili. *Dill. elth.* 381, t. 286, f. 370.

*Nat.* of South America. ♂.

8. L. *Cardamines*, foliis radicalibus pinnatis; caulinis lyratis, siliculis emarginatis.

Lepidium *Cardamines*. *Willden. sp. pl.* 3, p. 434. *Act. stockholm.* 1755, p. 273, t. 3, v.

*Nat.* of Spain. ♂.

9. *L. subulatum*, foliis subulatis integerrinis cauleque suffruticoso pubescentibus, siliculis emarginatis; stigmate semiexerto.

Lepidium subulatum. *Willden. sp. pl. 3, p. 438. D'Asso aray. 83, t. 6, f. 3.*  
<sup>ss]</sup> *Nat. of Spain.* ♂.

10. *L. piscidium*, foliis ovali-oblongis extrorsum dentatis integerrimisve, siliculis oblongo-ovatis emarginatis; stigmate exerto.

Lepidium piscidium. *Willden. sp. pl. 3, p. 437.*  
*Lepidium oleraceum. Edit. prior. 2, p. 374, excluso synonymo Forsteri.*

Lepidium bidentatum. *Montin in nov. act. acad. nat. curios. 6, p. 324, tab. 5, a.*

*Nat. of the Society Islands.* ⊖.

11. *L. perfoliatum*, foliis caulinis pinnatis bipinnatisque; rameis cordatis amplexicaulibus integris.

Lepidium perfoliatum. *Willden. sp. pl. 3, p. 431.*  
*Jacqu. austr. 4, p. 24, t. 346.*

*Nat. of Austria and the Levant.* ⊖.

12. *L. spinosum*, foliis pinnatis, siliculis cuneatis semi-bifidis.

Lepidium spinosum. *Willden. sp. pl. 3, p. 434.*  
*Nat. of the Levant.* ⊖.

13. *L. campestre*, siliculis ovatis emarginatis alatis, foliis caulinis sagittatis dentatis.

*Thlaspi campestre. Willden. sp. pl. 3, p. 444. Curt. lond. Engl. bot. 1385.*

*Nat. of Britain.* ⊖.

<sup>ss]</sup> 14. *L. sativum*, cotyledonibus tripartitis.

Lepidium sativum. *Willden. sp. pl. 3, p. 435. Zorn. ic. 16.*

a. *Nasturtium hortense vulgatum. Bauh. pin. 103.*

β. *Nasturtium hortense crispum*. *Bauh. pin.* 104.  
*prodr.* 44, *cum ic. in p.* 43 *et* 44.  
*Nat.* ◎.

15. *L. virginicum*, floribus 2-<sup>1</sup>/<sub>2</sub> andris tetrapetalis, foliis  
 caulinis linear-lanceolatis inciso-serratis, siliculis orbiculatis  
 emarginatis.

*Lepidium virginicum*. *Willden. sp. pl.* 3, *p.* 440.  
*Lepidium Iberis*. *Schkahr handb.* 2, *p.* 222, *t.* 180.  
*Nat. of North America and Jamaica.* ◎.

### COCHLEARIA. *Gen. pl.* 1079.

*Silicula* subovata polysperma : valvis ventricosis. *Semina*  
 immarginatae cotyledonibus accumbentibus. *Filamenta*  
 breviora edentula. *Calyx* patens.

1. *C. officinalis*, siliculis subrotundis, foliis radicalibus  
 reniformibus.  
*Cochlearia officinalis*. *Willden. sp. pl.* 3, *p.* 448. *Engl.*  
*bot.* 551. *Svensk bot.* 87.  
*Nat. of Britain.* ◎.

2. *C. anglica*, siliculis ellipticis, foliis radicalibus ovatis  
 integris.  
*Cochlearia anglica*. *Willden. sp. pl.* 3, *p.* 449. *Engl.*  
*bot.* 552.  
*Nat. of Britain.* ◎.

3. *C. danica*, siliculis ellipticis, foliis omnibus deltoideis.  
*Cochlearia danica*. *Willden. sp. pl.* 3, *p.* 449. *Engl.*  
*bot.* 696.  
*Nat. of Britain.* ◎.

4. *C. glastifolia*, siliculis sphæricis reticulato-venosis,  
 foliis caulinis amplexicaulibus sagittato-cordatis acutis.  
*Cochlearia glastifolia*. *Willden. sp. pl.* 3, *p.* 451.

*Lepidium glastifolium* perenne. *Moris. hist.* 2, p. 312,  
s. 3, t. 21, f. 3.

*Nat. of Germany.* ♂.

5. *C. saxatilis*, siliculis lenticiformibus lœvibus, foliis  
radicalibus oblongis dentatis pilosis.

*Myagrum saxatile.* *Willden. sp. pl.* 3, p. 409. *Jacqu.*  
*austr.* 2, p. 17, t. 128.

*Nat. of Austria and Switzerland.* ♀.

6. *C. Armoracia*, siliculis oblongis; stigmate dilatato  
subsessili, foliis radicalibus oblongis crenatis; caulinis elongato-lanceolatis dentatis incisisve.

*Cochlearia Armoracia.* *Willden. sp. pl.* p. 451. *Engl.*  
*bot.* 2223. *Schkuhr handb.* 2, p. 229, t. 181.

*Nat. of England.* ♀.

#### SUBULARIA. *Gen. pl.* 1075.

*Silicula ovalis* mutica polysperma: valvis ventricosis.  
*Cotyledones* incumbentes lineares bicrures.

1. *SUBULARIA aquatica*.

*Subularia aquatica.* *Willden. sp. pl.* 3, p. 423. *Engl.*  
*bot.* 732.

*Nat. of Britain.* ○.

#### DRABA. *Gen. pl.* 1076.

*Silicula integra ovalis*: valvis planis v. convexis; loculis polyspermis. *Semina immarginata*: cotyledonibus accumbentibus. *Filamenta edentula*.

1. *D. verna*, scapis nudis, petalis bipartitis, foliis lanceolatis subincisis hirtis. *Smith fl. brit.* 2, p. 677. *Engl. bot.* 586. *Curtis lond.* *Fl. dan.* 983.

*Nat. of Britain.* ○.

2. *D. rupestris*, scapis nudis monophyllis; petalis

312,  
foliis  
acqu.  
utato  
elon-  
Engl.  
osis.  
Engl.

indivisis, siliculis lanceolatis pubescentibus, foliis planis lanceolatis pilosis.

*Draba hirta.* *Smith fl. brit.* 2, p. 677 (excluso synynomio Linnaei et Floræ danicæ). *Engl. bot.* 1338.

*Nat. of Scotland.* ♀.

3. *D. incana*, foliis caulinis numerosis incanis subdentatis, siliculis oblongis glabris contortis.

*Draba incana.* *Willden. sp. pl.* 3, p. 430. *Engl. bot.* 388.

*Nat. of Britain.* ♂.

192

4. *D. muralis*, caule ramoso, foliis ovatis amplexicaulibus dentatis, siliculis patentibus glabris. *Willden. sp. pl.* 3, p. 429. *Engl. bot.* 912. *Scop. insubr. fasc.* 2, t. 15.

*Nat. of England.* ⊙.

5. *D. nemoralis*, caule ramoso, foliis ovatis amplexicaulibus dentatis, siliculis patentibus pubescentibus. *Willden. sp. pl.* 3, p. 429.

*Nat. of Europe.* ⊙.

6. *D. aizoides*, scapis nudis glabris, foliis lanceolato-linearibus rigidis carinatis ciliatis, staminibus petala æquantibus, stylo longitudine dimidii germinis.

*Draba aizoides.* *Willden. sp. pl.* 3, p. 424 (exclusis synonymis Milleri et Curtissii). *Engl. bot.* 1271.

*Nat. of Wales.* ♀.

7. *D. ciliaris*, scapis nudis glabris, foliis elongato-linearibus ciliatis, staminibus calycem vix æquantibus.

*Draba ciliaris.* *Willden. sp. pl.* 3, p. 425.

*Draba aizoides.* *Curtis magaz.* 170.

*Alyssum alpinum* hirsutum luteum. *Mill. ic.* 1, p. 14, t. 20, f. 2.

*Nat. of Switzerland.* ♀.

93]

## PETROCALLIS.

*Silicula* integra ovalis: valvis planiusculis; loculis dispermis. *Semina* immarginata: funiculis umbilicalibus dissepimento adnatis! *Filamenta* edentula.

1. PETROCALLIS *pyrenaica*.

*Draba pyrenaica.* Willden. sp. pl. 3, p. 428. Botan. magaz. 713.

*Nat. of Austria and the Pyrenees.* 4.

## CAMELINA. Crantz austr. 1, p. 18.

*Silicula* subovata polysperma: valvis ventricosis. *Cotyledones* incumbentes. *Filamenta* edentula.

1. C. *sativa*, siliculis obovatis marginatis, stigmate simplici, foliis lanceolatis sagittatis.

*Myagrum sativum.* Willden. sp. pl. 3, p. 408. Fl. dan. 1038.

*Alyssum sativum.* Engl. bot. 1254.

*Nat. of Britain.* ◎.

2. C. *austriaca*, siliculis subrotundis immarginatis, stigmate capitato, foliis oblongis sagittatis dentatis glabris.

*Alyssum austriacum.* Willden. sp. pl. 3, p. 408. Jacq. austr. 2, p. 7, t. 111.

*Nat. of Austria.* ◎.

## ALYSSUM. Lamarck illustr. tub. 559.

*Silicula* subrotunda: valvis omnino vel limbo planiusculis; loculis 1—4-spermis. *Semina* marginata. *Cotyledones* accumbentes.

\* *Herbacea.*

1. A. *calycinum*, siliculis emarginatis pubescentibus, calycibus persistentibus, filamentis edentulis: brevioribus stipatis pari setarum.

*Alyssum calycinum*. *Willden. sp. pl.* 3, p. 464.

*Alyssum campestre*. *Schkuhr handb.* 2, p. 234, t. 181.

*Nat. of Austria and France.* ◎.

2. A. *campestre*, siliculis emarginatis pubescentibus stylo 4-plo longioribus, calycibus deciduis, filamentis omnibus appendiculatis, foliis pedunculisque pube stellata sparsa.

*Alyssum campestre*. *Willden. sp. pl.* 3, p. 457.

*Nat. of France.* ◎.

3. A. *montanum*, siliculis emarginatis incanis stylo parum longioribus, calycibus deciduis, filamentis omnibus appendiculatis, foliis rannisque incanis.

*Alyssum montanum*. *Willden. sp. pl.* 3, p. 466. *Curtis magaz.* 419.

*Nat. of Germany and Switzerland.* ♀.

\*\* *Fruticosa.*

4. A. *saxatile*, siliculis emarginatis glabris, filamentis longioribus simplicibus, foliis oblongis lanceolatisve repandis tomentosis.

*Alyssum saxatile*. *Willden. sp. pl.* 3, p. 460. *Curtis magaz.* 159.

*Nat. of the Island of Candia.* ♂.

5. A. *alpestre*, siliculis integris, filamentis omnibus appendiculatis, foliis obovatis spatulatisque incanis, caulinis adscendentibus suffruticosis.

*Alyssum alpestre*. *Willden. sp. pl.* 3, p. 461. *Jacqu. collect.* 4, p. 227, t. 4, f. 1. *Alli. n. pedem.* 1, p. 241, t. 18, f. 2.

*Nat. of Italy.* ♂.

6. A. *spinosum*, siliculis integris glabris, filamentis edentulis, rami floriferis persistentibus spinescentibus, foliis spathulatis incanis; pube stellari minutissima.

*Alyssum spinosum*. Willden. sp. pl. 3, p. 459.

*Thlaspi spinosum hispanicum*. Barrel. ic. 808.

*Nat. of the South of Europe.* ♂.

7. A. *maritimum*, siliculis integris glabris: loculis monospermis, filamentis edentulis, foliis linear-lanceolatis acutis subincanis; pilis bipartitis adpressis.

*Alyssum maritimum*. Willden. sp. pl. 3, p. 459. Engl. bot. 1729.

*Alyssum halimifolium*. Linn. sp. pl. 907. Curtis magaz. 101.

*Alyssum minimum*. Linn. sp. pl. 908.

*Nat. of England.* ♂.

[96]

## FARSETIA.

*Silicula ovali-oblonga polysperma sessilis, valvis planis v. convexiusculis (non inflatis). Cotyledones accumbentes. Semina marginata vel Filamenta quædam denticulata.*

\* *Semina marginata. Valvæ planeæ.*

1. F. *Cheiranthoides*, caulis fruticosus erectis, foliis linearibus incanis, calycibus clausis.

*Cheiranthus Farsetia*. Willden. sp. pl. 3, p. 526. Desfont. atlant. 2, p. 89, t. 160.

*Nat. of the Levant.* ♂.

2. F. *lunarioides*, caulis suffruticosus adscendentibus, foliis spathulatis petiolatis siliculisque tomentosis incanis.

*Alyssum lunarioides*. Willden. sp. pl. 3, p. 461.

*Lunaria fruticosa perennis incana Leucoii foliis*. Tournef. it. 1, p. 242, cum tab.

*Nat. of the Archipelago.* 4.

3. F. *clypeata*, caulis herbaceis erectis, foliis oblongis repandis.

*Alyssum clypeatum.* *Willden. sp. pl.* 3, p. 468.

*Alyssum Dioscoridis.* *Dod. pent.* 89.

*Nat. of the South of Europe.* ♂.

\*\* *Valvæ convexiusculæ.* *Filamenta breviora denticulata.*

4. F. *mutabilis*, siliculis glabris compressis, seminibus marginatis.

*Alyssum mutabile.* *Venten. cels.* 85.

*Nat. of the Levant.* ♀.

[97]

5. F. *incana*, siliculis pubescentibus subventricosis, seminibus immarginatis.

*Alyssum incanum.* *Willden. sp. pl.* 3, p. 463.

*Thlaspi incanum machliniense.* *Clus. hist.* 2, p. 132.

*Nat. of the North of Europe.* ♂.

\* \* \* *Calyx basi bisaccatus.* *Valvæ convexiusculæ.*

6. F. *deltoidea*, caulis diffusis, foliis pilosis.

*Alyssum deltoideum.* *Willden. sp. pl.* 3, p. 470. *Curtis magaz.* 126.

*Nat. of the Levant.* ♀.

### VESICARJA. *Tamarch illustr. tab.* 559.

*Silicula inflata*, subglobosa, polysperma. *Cotyledones* accumbentes.

1. V. *utriculata*, calycibus bisaccatis, filamentis omnibus edentulis, foliis integerrimis glabriusculis.

*Alyssum utriculatum.* *Willden. sp. pl.* 3, p. 470. *Curtis magaz.* 130. *Waldst. et Kitaib. hung.* 2, p. 215, t. 196.

*Nat. of the Levant and Hungary.* ♀.

2. V. *sinuata*, foliis incanis subdentatis, siliculis membranaceis glabris stylo cuspidatis.

[98]

*Alyssum sinuatum.* *Willden. sp. pl. 3, p. 468.*

*Eruca peregrina.* *Clus. hist. 2, p. 134.*

*Nat. of Spain.*

### LUNARIA. *Gen. pl. 1085.*

*Silicula elliptica pedicellata polysperma : valvis planis.*  
*Semina marginata. Cotyledones accumbentes.*

1. *L. rediviva*, siliculis oblongis utrinque acutis, pedicello germinis stamina breviora superante, dentibus foliorum mucronatis.

*Lunaria rediviva.* *Willden. sp. pl. 3, p. 476.*

*Lunaria græca perennis.* *Besl. eyst. vern. 7, f. 2.*

*Nat. of Austria and Hungary.* 4.

2. *L. annua*, siliculis ovalibus utrinque obtusis, staminibus brevioribus pedicellum germinis superantibus, dentibus foliorum subinuticis.

*Lunaria annua.* *Willden. sp. pl. 3, p. 477.* *J. Miller illustr.*

*Nat. of Germany.* ◎.

### RICOTIA. *Gen. pl. 1086.*

*Silicula oblonga sessilis : valvis planis ; septo oblitterato unilocularis. Cotyledones accumbentes obcordatæ.*

1. *RICOTIA ægyptiaca.* *Willden. sp. pl. 3, p. 477.*

<sup>99)</sup> Lunaria foliis supradecompositis: foliolis trifidis, siliquis oblongis pendulis. *Mill. ic. 2, p. 113, t. 169.*

*Nat. of Egypt.* ◎.

*SILIQUOSA.*HELIOPHILA. *Gen. pl. 1092.*

*Siliqua* integra v. moniliformis. *Cotyledones* incumbentes curvatae (2-3-crures) linearis. *Filamenta breviora* basi extus dentata dum siliqua integra.

1. *H. incana*, pubescens, foliis spathulatis integerimis, siliquis teretiusculis pubescentibus erectis, caule fruticoso.

*Heliophila incana*. *Willden. sp. pl. 3*, p. 527, excluso synynomio Burmanni.

*Nat. of the Cape of Good Hope.* Mr. Fr. Masson. h.

2. *H. filiformis*, glabra, foliis angusto-linearibus elongatis integerimis, siliquis teretibus subulatis pendulis.

*Heliophila filiformis*. *Willden. sp. pl. 3*, p. 529.

*Nat. of the Cape of Good Hope.* ◎.

3. *H. platysiliqua*, glabra, foliis carnosis semiteretibus integerimis, siliquis plano-compressis pendulis, caule suffruticoso.

*Nat. of the Cape of Good Hope.* Mr. Fr. Masson. h.

4. *H. pilosa*, hirsuta: pilis patulis, foliis planis nunc linearibus integerimis nunc divisis subcuneiformibus, siliquis teretiusculis glabris integerimis.

*Heliophila pilosa*. *Lamarck encycl. 3*, p. 90.

*a integrifolia*. *Heliophila integrifolia*. *Willden. sp. pl. 3*, p. 527.

*Heliophila*. *Burmann, in nov. act. upsal*, 1, p. 94, t. 7.

*β incisa*. *Heliophila arabioides*. *Botan. magaz.* 496.

*Nat. of the Cape of Good Hope.* ◎.

5. *H. amplexicaulis*, glabra, foliis linear-lanceolatis amplexicaulibus integerimis suboppositis, siliquis moniliformibus.

*Heliophila amplexicaulis.* *Willden. sp. pl.* 3, p. 528.  
*Nat. of the Cape of Good Hope.* ◎.

6. *H. fæniculacea*, pilosiuscula, foliis pinnatis bipinnatis-  
 que filiformibus, siliquis linearibus, caule erecto angulato.  
*Nat. of the Cape of Good Hope.* *Mr. Fr. Masson.* ◎.

7. *H. pinnata*, glabra, foliis pinnatis filiformibus, siliquis  
 toroso-moniliformibus pendulis.

*Heliophila pinnata.* *Venten. malmais.* 113, exclusis  
 synonymis.

*Heliophila pendula.* *Willden. sp. pl.* 3, p. 529.  
*Nat. of the Cape of Good Hope.* ◎.

## CARDAMINE.

*Gen. pl.* 1088. *Dentaria. Gen. pl.* 1087.

*Siliqua linearis marginibus truncatis: valvis planis  
 enervibus (elastice saepius dissilientibus), dissepimento an-  
 gustioribus.*

1. *C. enneaphylla*, caule simplicissimo apice triphylo,  
 foliis ternatis: foliolis lanceolatis inciso-serratis, staminibus  
 corollam subæquantibus.

*Dentaria enneaphylla.* *Willden. sp. pl.* 3, p. 478.  
*Jacqu. austr.* 4, p. 9, t. 316.

*Nat. of Austria and Italy.* ♂.

2. *C. pentaphylla*, caule simplicissimo apice triphylo, foliis  
 quinato-digitatis: foliolis elliptico-lanceolatis inciso-serratis,  
 corolla staminibus duplo longiore.

*Dentaria pentaphylla.* *Willden. sp. pl.* 3, p. 480.

*Dentaria pentaphyllos* foliis mollibus. *Garid. prov.* 152,  
 t. 29.

*Nat. of Switzerland and the South of France.* ♀.

3. *C. pinnata*, caule simplicissimo apice triphylo, foliis  
 pinnatis: foliolis (5—7) elongato-lanceolatis inciso-serratis.

- Dentaria pinnata. *Willden. sp. pl. 3, p. 480.*  
 Dentaria heptaphyllos. *Garid. prov. 152, t. 28.*  
*Nat. of Switzerland and the South of France. ♀.*
4. C. *bulbifera*, caule simplicissimo, foliis inferioribus pinnatis; superioribus simplicibus.  
 Dentaria bulbifera. *Willden. sp. pl. 3, p. 479. Eng. [102] bot. 309. Select specim. 7.*  
*Nat. of England. ♀.*
5. C. *asarifolia*, foliis simplicibus reniformibus.  
 Cardamine asarifolia. *Willden. sp. pl. 3, 482.*  
 Nasturtium montanum asari folio. *Herm. parad. 203, cum tab.*  
*Nat. of Italy. ♀.*
6. C. *trifolia*, foliis ternatis: foliolis rhombeo-subrotundis denticulatis, caule subnudo simplici.  
 Cardamine trifolia. *Willd. sp. pl. 3, p. 483. Botan. magaz. 452.*  
*Nat. of Lapland, Austria and Switzerland. ♀.*
7. C. *africana*, foliis ternatis acuminatis, caule ramosissimo. *Willden. sp. pl. 3, p. 483.*  
 Nasturtium africanum, foliis ternis, facie Christophorianæ. *Herm. parad. 202, cum. tab.*  
*Nat. of the Cape of Good Hope. ♀.*
8. C. *chelidonia*, foliis pinnatis: foliolis quinis crenato-incisis: lateralibus ternatis auriculatisve, geruine piloso.  
 Cardamine chelidonia. *Willd. sp. pl. 3, p. 484. Waldst. et Kitaib. 2, p. 149, t. 140.*  
*Nat. of Italy. ♀.*
9. C. *græca*, foliis pinnatis: foliolis ovatis lobatis [103] obtusis.  
 Cardamine græca. *Willden. sp. pl. 3, p. 484.*  
 Sio minimo Prosperi Alpini affinis, siliquis latis. *Boccon. sic. 84, t. 44, f. 2.*  
*Nat. of the South of Europe. ♂.*

10. *C. amara*, foliis pinnatis: foliolis radicalibus subrotundis; caulinis dentato-angulatis, stylo obliquo, stigmate acutiusculo, caule basi radicante.

*Cardamine amara*. *Willden. sp. pl.* 3, p. 488. *Curtis lond. Engl. bot.* 1000.

*Nat. of Britain.* ♀.

11. *C. latifolia*, foliis pinnatis glabris: foliolis (5—7) radicalibus subrotundis; caulinis ovatis dentato-angulatis, stigmate capitato.

*Cardamine latifolia*. *Willden. sp. pl.* 3, p. 487.

*Nasturtium pyrenaicum aquaticum latifolium purpurascente flore*. *Herm. paradis.* 203, cum tab.

*Nat. of Spain.* ♂.

ntes.  
styo

1. C. *Cheiri*, foliis lanceolatis integerrimis : pube (dum adsit) bipartita appressa, siliquis linearibus ; stigmatis lobis recurvis.

Cheiranthus cheiri. Willden. sp. pl. 3, p. 516.

a. flore simplici.

β. flore pleno.

Nat. of the South of Europe. ♂. ♀.

2. C. *mutabilis*, foliis lanceolatis argute serratis canescens-tibus : pube stellari, siliquis linearibus, caule fruticoso.

Cheiranthus mutabilis. Willden. sp. pl. 3, p. 517. Curtis magaz. 195.

Cheiranthus longifolius. Venten. malmais. 83.

Nat. of Madeira. Mr. Francis Masson. h.

3. C. *tenuifolius*, foliis filiformi-linearibus integerrimis incanis : pube bipartita adpressa, caule frutieoso.

Cheiranthus tenuifolius. Willden. sp. pl. 3, p. 517.

Nat. of Madeira. Mr. Francis Masson. h.

## MATHIOLA.

[119]

*Siliqua* (teres vel compressa) coronata *Stigmate* communi-venti bilobo, lobis vel dorso incrassatis cotyledonibus tunc incumbentibus ; vel basi cuspidate stipatis. *Calyx* clausus. *Filamenta* longiora dilatata.

\* *Stigmatis lobis dorso incrassatis, subsimplicibusve.*

1. M. *incana*, foliis lanceolatis integerrimis, siliquis cylindricis glandulosis.

Cheiranthus incanus. Willden. sp. pl. 3, p. 520. Engl. bot. 1935.

a. Leucojum incanum majus. Bauh. pin. 200.

β. Cheiranthus *coccineus*, foliis lanceolatis undatis, caule erecto indiviso. Mill. dict.

γ. Cheiranthus *albus*, foliis lanceolatis integerrimis obtusis incanis, ramis floriferis axillaribus, caule suffruticoso. Mill. dict.

3. *Cheiranthus annuus*. *Willden. sp. pl.* 3, p. 520.

$\epsilon$ . *Cheiranthus glabrus*, foliis lanceolatis acutis petiolatis viridibus, caule suffruticoso. *Mill. dict.*

*Nat. of England.* 2.

2. *M. fenestralis*, foliis confertis obovatis tomentosis, caule indiviso.

*Cheiranthus fenestralis*. *Willden. sp. pl.* 3, p. 520. *Jacqu. hort. vindob.* 2, p. 84, t. 179.

*Nat.* ♂.

[120] 3. *M. sinuata*, foliis tomentosis: inferioribus sinuatis, siliquis compressis muricatis.

*Cheiranthus sinuatus*. *Willden. sp. pl.* 3, p. 524. *Engl. bot.* 462.

*Nat. of England.* ♂.

4. *M. odoratissima*, foliis tomentosis lyrato-sinuatis, siliquis compressis tomentosis lævibus.

*Cheiranthus odoratissimus*. *Willden. sp. pl.* 3, p. 524.

*Nat. of the North of Persia.* ♀.

5. *M. tristis*, foliis linearibus integerrimis subsinuatisve, floribus sessilibus.

*Cheiranthus tristis*. *Willden. sp. pl.* 3, p. 522. *Botan. magaz.* 729.

*Nat. of the South of Europe.* ♀.

\*\* *Siliquis tricuspidatis*.

6. *M. tricuspidata*, foliis sinuatis, siliquæ cuspidibus acutis subæqualibus.

*Cheiranthus tricuspidatus*. *Willden. sp. pl.* 3, p. 523. *Schkuhr handb.* 2, p. 250, t. 184.

*Nat. of Barbary.* ⊖.

[121] 7. *M. parviflora*, foliis lanceolatis repando-dentatis, siliquis sessilibus: cuspidibus lateralibus acutis medio obtuso longioribus.

## MALCOMIA.

*Siliqua teres, bivalvis. Stigma acutum. Cotyledones*  
*incumbentes planæ. Calyx clausus.*

1. *M. maritima*, foliis obovatis lanceolatis integerrimis  
 v. obsolete dentatis: pube adpressa 2—4-partita, siliquis  
 pedunculatis, calycibus deciduis.

*Cheiranthus maritimus.* *Willden. sp. pl. 3, p. 518.*  
*Curtis magaz. 166.*

*Nat. of the South of Europe.* ◎.

2. *M. africana*, foliis lanceolatis dentatis: pube stellari  
 laxa, siliquis sessilibus, calyce persistenti.

*Hesperis africana.* *Willden. sp. pl. 3, p. 532.*

*Leucojum gallicum*, folio halimi. *Bocc. sic. 77, t. 42,*  
*f.1.*

*Nat. of Africa.* ◎.

3. *M. littorea*, foliis lanceolatis integris vel dentatis sili-  
 quisque tomentosis incanis.

*Cheiranthus littoreus.* *Willden. sp. pl. 3, p. 521.*

*Leucojum maritimum minus.* *Clus. hist. I, p. 298.*

*Nat. of the South of Europe.* ◎.

HESPERIS. *Gen. pl. 1093.*

122

*Siliqua 4-gona v. anceps. Stigma subsessile, lobis con-  
 niventibus. Cotyledones* incumbentes, planæ. *Calyx*  
*clausus.*

1. *H. tristis*, petalorum laminis oblongis obliquis, siliquis  
 divaricatis ancipitibus margine incrassatis.

*Hesperis tristis.* *Willden. sp. pl. 3, p. 530.* *Botan.*  
*magaz. 730.*

*Nat. of Austria and Hungary.* ♂.

2. *H. matronalis*, petalorum laminis obovatis, siliquis erectis torosis margine simplicibus.

*Hesperis matronalis*. *Willden. sp. pl. 3*, p. 531.

*Hesperis imodora*. *Willden. sp. pl. 3*, p. 531. *Engl. bot. 731.*

a. flore simplici.

flore pleno albo.

β. flore pleno purpureo.

*Nat. of England.* ♀.

### ERUCARIA. *Gärtn. sem. 2*, p. 298.

*Siliqua* biarticulata: articulo inferiore bivalvi polyspermo; superiore evalvi oligospermo. *Cotyledones* planæ (rectæ v. curvatæ).

1. *ERUCARIA aleppica*.

*Erucaria aleppica*. *Venten. cels. 64.*

*Cordylocarpus laevigatus*. *Willden. sp. pl. 3*, p. 563.

<sup>123]</sup> *Bunias myagroides*. *Willden. sp. pl. 3*, p. 414.

*Nat. of the Levant.* ☽.

### BRASSICA. *Gen. pl. 1096.*

*Siliqua* bivalvis (rostro sterili v. monospermo). *Cotyledones* conduplicatæ. *Calyx* clausus.

1. B. *Napus*, radice caulescente fusiformi, foliis laevis: superioribus cordato-lanceolatis amplexicaulibus; inferioribus lyratis dentatis. *Willden. sp. pl. 3*, p. 547. *Engl. bot. 2146.*

*Nat. of Britain.* ♂.

2. B. *Rapa*, radice caulescente orbiculari depressa carnosa, foliis radicalibus lyratis scabris; caulinis integerrimis laevis. *Willden. sp. pl. 3*, p. 548. *Engl. bot. 2176.*

*Nat. of England.* ♂.

3. B. *oleracea*, radice caulescente tereti carnosa, foliis

## DAVIESIA.

*Smith in linn. soc. transact. 4, p. 222. Brown mss.*

*Cal. angulatus, ebracteatus. Cor. papilionacea, carina vexillo brevior. Germen pedicellatum, dispermum. Stylus strictus. Stigma simplex. Legumen compressum, angulatum, elastice dehiscens. Strophiola seminis postice integra.*

1. D. *ulicina*, ramis spinescentibus glabris patulis, foliis lanceolatis linearibusve margine laevibus : mucrone spinoso, pedunculis axillaribus unifloris : bracteis (8) imbricatis. *Brown mss.*

Daviesia ulicina. *Smith in linn. soc. transact. 9, p. 256.*

Daviesia ulicifolia. *Andrews's reposit. 304.*

*Nat. of New South Wales.*  $\frac{1}{2}$ .

2. D. *mimosoides*, ramis inermibus, foliis elongato-lanceolatis : mucrone brevissimo innocuo, corymbis axillaribus geminis solitariisve : bracteis adpressis, calycis labio superiore retuso. *Brown mss.*

Daviesia corymbosa. *Andrews's reposit. 526.* (excluso synomyno.)

*Nat. of New South Wales.* *Robert Brown.*  $\frac{1}{2}$ .

3. D. *latifolia*, ramis inermibus, foliis ellipticis ovalibusve venosis basi subattenuatis, racemis axillaribus multifloris. *Brown mss.*

*Nat. of Van Diemen's Island.* *Robert Brown.*  $\frac{1}{2}$ . [iii. 21]

## MIRBELIA.

*Smith in annals of bot. 1, p. 541. Brown mss.*

*Cal. 5-fidus, bilabiatus. Cor. papilionacea. Legumen biloculare, sutura utraque inflexa.*

1. M. *reticulata*, foliis lanceolato-linearibus venosis, germinibus dispermis. *Brown mss.*

337 100

### DIADELPHIA DECANDRIA.

iv. 266] PLATYLOBIUM. (*Smith in linn. soc. transact.* 9,  
p. 302.) *Brown mss.*

*Cal.* bracteatus, bilabiatus : labio superiore bifido rotun-  
dato maximo. *Stam.* omnia connexa. *Legumen* pedicel-  
latum, compresso-planum, dorso alatum, polyspermum.

1. *P. formosum*, foliis ovatis subcordatis, germine un-  
dique viloso, bracteis sericeis, pedicello leguminis calyce  
breviore. *Brown mss.*

*Platylobium formosum*. *Willden. sp. pl.* 3, p. 921.

*Smith new holl.* 17, *t. 6.* *Botan. magaz.* 469. *Venten. malmais.* 31.

*Nat. of New South Wales.*  $\text{h}.$

2. *P. parviflorum*, foliis lanceolato-ovatis, germine ciliato glabriuscule, bracteis glabris, pedicello leguminis calycem superante. *Brown mss.*

*Platylobium parviflorum.* *Willden. sp. pl.* 3, *p. 921.*

*Nat. of New South Wales.*  $\text{h}.$

3. *P. triangulare*, foliis deltoideis subhastatisve: angulis pinosis, pedunculis basi apiceque bracteatis medio nudis, legumine calycem aliquoties superante. *Brown mss.*

*Nat. of Van Diemen's Island.* *Robert Brown.*  $\text{h}.$

### BOSSIÆA. (*Venten. cels.* 7.) *Brown mss.*

*Cal.* bilabiatus: labio superiore majore semibifido obtuso. *Stam.* omnia connexa. *Legumen* *plano-* liv. 267 *compressum*, *pedicellatum*, *polyspermum*, *margine utroque incrassatum.* *Semina* *strophiolata.*

1. *B. Scolopendrium*, ramis complanatis linearibus aphyllis: denticulis floriferis, caule erecto, carina nuda, bracteis superioribus persistentibus imbricatis pedunculum æquantibus, calyce glaberrimo. *Brown mss.*

*Bossiae scolopendria.* *Smith in linn. soc. transact.* 9, *p. 303.*

*Platylobium scolopendrum.* *Andrews's reposit.* 191.

*Platylobium scolopendrium.* *Venten. malmais.* 55.

*Nat. of New South Wales.*  $\text{h}.$

2. *B. rufa*, ramis complanatis linearibus aphyllis: denticulis floriferis, carina fimbriata, bracteis superioribus caducis ab inferioribus remotis, calycibus glaberrimis. *Brown mss.*

*Nat. of the South-west coast of New Holland.* *Robert Brown.*  $\text{h}.$

3. *B. heterophylla*, ramis foliosis compressis, foliis obo-

vatis linearibusque planis, legumine multiloculari: septis spongiosis. *Brown mss.*

*Bossiae heterophylla.* *Smith in linn. soc. transact.* 9, p. 302. *Willden. sp. pl.* 3, p. 972. *Venten. cels.* 7.

*Bossiae lanceolata.* *Botan. magaz.* 1144.

*Platylobium lanceolatum.* *Andrews's reposit.* 205.

*Platylobium ovatum.* *Andrews's reposit.* 276.

*Nat. of New South Wales.* h.

[iv. 268] 4. *B. linophylla*, ramis foliosis compressis, foliis linearibus: marginibus recurvis, legumine uniloculari. *Brown mss.*

*Nat. of the south-west coast of New Holland.* *Robert Brown.* h.

5. *B. prostrata*, ramis foliosis filiformibus, caule procumbente, foliis ovalibus glabris, stipulis petiolo brevioribus, legumine uniloculari. *Brown mss.*

*Nat. of New South Wales.* *Robert Brown.* h.

6. *B. cinerea*, ramis foliosis teretibus, caule erecto ramosissimo, foliis ovato-lanceolatis: supra scabris; subtus pubescentibus; marginibus recurvis. *Brown mss.*

*Nat. of Van Diemen's Island.* *Robert Brown.* h.

7. *B. microphylla*, ramis foliosis spinescentibus teretibus, foliis obcordato-cuneiformibus. *Brown mss.*

*Bossiae microphylla.* *Smith in linn. soc. transact.* 9, p. 303.

*Platylobium microphyllum.* *Sims in botan. magaz.* 863.

*Nat. of New South Wales.* *Mr. George Caley.* h.

#### SCOTTIA. *Brown mss.*

*Cal.* bracteis imbricatus, 5-dentatus dentibus parum inaequalibus. *Vexillum complicatum* brevius Alis aequantibus Carinam. *Stam.* omnia connexa. *Legumen* pedicellatum, compressum; margine utroque incrassato. *Semina* (3-4) strophiolata.

1. *SCOTTIA dentata*. *Brown mss.*  
*Nat. of the south-west coast of New Holland. Robert Brown.* h.

### TEMPLETONIA. *Brown mss.*

*Cal. ebracteatus, 5-dentatus, dentibus parum inæqualibus. Carina oblonga. Stam. omnia connexa, antheris uniformibus. Legumen pedicellatum, plano-compressum, polyspermum. Semina strophiolata.*

1. *TEMPLETONIA retusa*. *Brown mss.*  
*Rafnia retusa. Venten. malmais. 53.*  
*Nat. of the south-west coast of New Holland. Robert Brown.* h.

### GOODIA. (*Salisb. paradis. 41.*) *Brown mss.*

*Cal. bilabiatus labiis longitudine subæqualibus; superiore semibifido acuto. Vexillum explanatum majus. Stam. omnia connexa. Legumen pedicellatum, compressum, subdispermum. Semina strophiolata.*

1. *G. lotifolia*, foliolis obovatis calycibusque glaberrimis, legumine varicoso. *Brown mss.*  
*Goodia lotifolia. Salisb. paradis. 41. Botan. magaz. 958.*  
*Nat. of Van Diemen's Island. Mr. David Nelson.* h.

2. *G. pubescens*, foliolis obovato-cuneatis calyci-<sup>[iv. 270]</sup> busque pubescentibus, legumine laevi. *Brown mss.*  
*Goodia pubescens. Sims. in botan. magaz. 1310.*  
*Nat. of Van Diemen's Island. Robert Brown.* h.

### HOVEA. *Brown mss.*

[iv. 275]

*Cal. bilabiatus: labio superiore semibifido retuso. Stam. omnia connexa. Carina obtusa. Legumen sessile subrotundum ventricosum dispermum. Semina strophiolata.*

1. *H. linearis*, foliis linearibus subtus pilosiusculis, leguminibus glabris. *Brown mss.*

*Poiretia linearis*. *Smith in linn. soc. transact.* 9, p. 304.  
*Nat. of New South Wales.* *h.*

2. *H. longifolia*, foliis elongato-linearibus : subtus venosis leguminibusque tomentosis. *Brown mss.*

*Nat. of New South Wales.* *Robert Brown.* *h.*

[iv. 299] KENNEDIA. *Venten. malmais.* 104.

*Vexillum recurvum* a carina non reflexum. *Legumen multiloculare*, polyspermum. *Semina strophiolata.*

1. *K. rubicunda*, foliis ternatis : foliolis ovatis, pedunculis subtrifloris, leguminibus hirsutissimis. *Venten. malmais.* 104.

*Glycine rubicunda*. *Willden. sp. pl.* 3, p. 1065. *Curtis magaz.* 268. *Schneevvoogt ic.* 28.

*Nat. of New South Wales.* The Right Hon. Sir Joseph Banks, Bart. K. B. *h.*

2. *K. coccinea*, foliis ternatis : foliolis obovatis, floribus capitatis, leguminibus glabriusculis. *Venten. malmais.* 105, excluso synonymo *Curtisii*.

*Nat. of the South-West Coast of New Holland.* *Robert Brown.* *h.*

3. *K. prostrata*, foliis ternatis : foliolis obovatis villosis, pedunculis 1-2-floris, carina alas oblongas superante, caule prostrato. *Brown mss.*

*Glycine coccinea*. *Willden. sp. pl.* 3, p. 1065. *Curtis magaz.* 270. *h.*

4. *K. monophylla*, foliis simplicibus glabris reticulatis : basi subcordata, floribus racemosis. *Brown mss.*

[iv. 300] *Kennedia monophylla*. *Venten. malmais.* 106.

*Glycine bimaculata*. *Willden. sp. pl.* 3, p. 1067. *Curtis magaz.* 263. *Schneevvoogt ic.* 29.

*Nat.* of the South Coast of New Holland. *Robert Brown.* h.

5. *M. diosmifolia*, foliis ovalibus oblongisve obsolete uninervibus petiolatis planis confertis ramulisque glaberrimis, spicis oblongis glabris, phalangibus 3—5-andris. *Brown mss.*

*Melaleuca diosmæfolia.* *Andrews's reposit.* 476.

*Nat.* of the South-west Coast of New Holland. *Archibald Menzies, Esq.* h.

6. *M. stypheleoides*, foliis ovatis acuminatis mucronato-pungentibus striato-multinervibus sessilibus glabris, spicis pubescentibus, calycis lacinia acutis nervosis. *Brown mss.*

*Melaleuca stypheleoides.* *Willden. sp. pl.* 3, p. 1430.

*Nat.* of New South Wales. *Mr. David Burton.* h.

7. *M. genistifolia*, foliis lineari-lanceolatis obsolete 1—3-<sup>42</sup> nervibus, spicis laxis foliatis glabris, phalangibus polyandris: unguibus petala subæquantibus. *Brown mss.*

*Melaleuca genistifolia.* *Willden. sp. pl.* 3, p. 1431. *Smith exot. bot.* 1, p. 107, t. 55.

*Nat.* of New South Wales. *Mr. David Burton.* h.

8. *M. striata*, foliis lanceolato-linearibus acutis punctatis obsolete striatis rigidis subsessilibus, spicis ovalibus oblongisve, calycis tubo lanato, phalangibus subdecandris: unguibus petala bis superantibus. *Brown mss.*

*Melaleuca striata.* *Labillard. nov. holl.* 2, p. 26, t. 165.

*Nat.* of the South Coast of New Holland. *Robert Brown.* h.

9. *M. thymoides*, foliis lanceolatis (passim oblongis) tri-

nervibus petiolatis ramulisque glaberrimis, capitulis globosis ovalibusve, calycis laciniis acutis trinervibus, phalangibus subdecandris: unguibus petalis brevioribus. *Brown mss.*

*Melaleuca thymoides.* *Labillard. nov. holl.* 2, p. 27, t. 167.

*Nat. of the South-west Coast of New Holland.* *Robert Brown.*  $\frac{1}{2}$ .

10. *M. squamea*, foliis ovatis lanceolatis acuminatis trinervibus: novellis ramulisque villosis, capitulis globosis pubescentibus, phalangibus 5—6-andris: unguibus brevisimis. *Brown mss.*

*Malaleuca squamea.* *Labillard. nov. holl.* 2, p. 28, t. 168.

*Nat. of Van Diemen's Island.*  $\frac{1}{2}$ .

453

11. *M. nodosa*, foliis subulato-linearibus mucronatis rigidis uninervibus planis, capitulis globosis, calycis laciniis membranaceis glabris, phalangibus 3—6-andris: unguibus petalis brevioribus. *Brown mss.*

*Malaleuca nodosa.* *Willden. sp. pl.* 3, p. 1431. *Smith exot. bot.* 1, p. 67, t. 35. *Venten. malmais.* 112.

*Nat. of New South Wales.* The Right Hon. Sir Joseph Banks, Bart. K.B.  $\frac{1}{2}$ .

12. *M. ericifolia*, foliis linearisubulatis enervibus muticis patentibus subcrenulatisque, spicis ovalibus glabris, phalangibus 8—10-andris: unguibus petala vix æquantibus. *Brown mss.*

*Malaleuca ericifolia.* *Willden. sp. pl.* 3, p. 1430. *Smith exot. bot.* 1, p. 65, t. 34.

*Nat. of New South Wales.* John White, M.D.  $\frac{1}{2}$ .

13. *M. armillaris*, foliis linearisubulatis mucronatis apice recurvis, spicis cylindricis glaberrimis, phalangibus polyandris: unguibus petala superantibus. *Brown mss.*

*Melaleuca armillaris.* *Willden. sp. pl.* 3, p. 1431.

*Melaleuca ericæfolia.* *Andrews's reposit.* 175. *Venten. malmais.* 76.

*Nat.* of New South Wales. The Right Hon. Sir Joseph Banks, Bart. K.B.  $\text{h}$ .

14. *M. uncinata*, foliis angulato filiformibus mucronatis <sup>414</sup> erectis : apice uncinato recurvo, ramulis virgatis, capitulis ovalibus : rachi lanata, phalangibus 5—6-andris : unguibus petala superantibus. *Brown mss.*

*Nat.* of the South Coast of New Holland. Robert Brown.  $\text{h}$ .

15. *M. scabra*, foliis teretiusculis mucronulatis scabris confertis, capitulis globosis, phalangibus 4—6-andris : unguibus petala subæquantibus. *Brown mss.*

*Nat.* of the South Coast of New Holland. Robert Brown.  $\text{h}$ .

16. *M. pulchella*, foliis sparsis suboppositisque ovalibus obtusis obsolete 3-nervibus floribusque subsolitariis glabris, phalangibus polyandris intus basin usque ramosis. *Brown mss.*

*Nat.* of the South Coast of New Holland. Robert Brown.  $\text{h}$ .

*Folia opposita v. verticillata.*

17. *M. thymifolia*, foliis oppositis lanceolatis enervibus, spicis paucifloris, phalangibus polyandris : unguibus intus medium usque ramosis. *Brown mss.*

Melaleuca thymifolia. Willden. sp. pl. 3, p. 1432. Smith exot. bot. 1, p. 69, t. 36.

Melaleuca gnidiæfolia. Venten. malmais. 7.

Melaleuca coronata. Andrews's reposit. 278.

<sup>415</sup> Nat. of New South Wales. The Right Hon. Sir Joseph Banks, Bart. K.B.  $\text{h}$ .

18. *M. decussata*, foliis oppositis decussatis ovali-lanceolatis trinervibus, spicis ovalibus glaberrimis, phalangibus polyandris : unguibus brevissimis. *Brown mss.*

*Nat.* of the South Coast of New Holland. *Robert Brown.*  
h.

19. *M. fulgens*, foliis oppositis lanceolato-linearibus acutis uninervibus, spicis ovalibus glaberrimis, phalangibus multifidis: unguibus longitudine petalorum. *Brown mss.*

*Nat.* of the South Coast of New Holland. *Robert Brown.* h.

20. *M. linariifolia*, foliis oppositis lanceolato-linearibus acutis trinervibus, spicis oblongis glabris, phalangibus polyandris longitudinaliter pinnatis. *Brown mss.*

*Melaleuca linariifolia.* *Willden. sp. pl. 3*, p. 1482. *Smith exot. bot.* 1, p. 109, t. 56.

*Nat.* of New South Wales. Colonel *William Paterson.*  
h.

21. *M. hypericifolia*, foliis oppositis elliptico-oblongis 3-nervibus: nervis lateralibus obsoletis margini recurvo approximatis, spicis glaberrimis, phalangibus polyandris: unguibus elongatis; filamentis radiantibus. <sup>1416</sup>

*Melaleuca hypericifolia.* *Willden. sp. pl. 3*, p. 1433.  
*Andrews's reposit.* 200, *Venten. cels.* 10.

*Nat.* of New South Wales. Admiral *Phillip.* h.

22. *M. squarrosa*, foliis oppositis ovatis acutis 5—7-nervibus petiolatis, spicis oblongis ovalibusque: bracteis foliacieis, calycis lacinia enervibus obtusis, phalangium unguibus brevissimis.

*Melaleuca squarrosa.* *Willden. sp. pl. p. 430.* *Labillard. nov. holl.* 2, p. 28, t. 169.

*Melaleuca myrtifolia.* *Venten. malmais.* 47.

*Nat.* of New South Wales and Van Diemen's Island.  
Mr. *David Nelson.* h.

23. *M. calycina*, foliis oppositis ovato-lanceolatis 3—5-nervibus subsessilibus, glomerulis paucifloris, calycis lacinia acutis enervibus, phalangibus polyandris: unguibus petalo brevioribus. *Brown mss.*

*Nat.* of the South-west Coast of New Holland. *Robert Brown.*  $\text{h}.$

24. *M. densa*, foliis ternis obovatis trinervibus glabris, spicis oblongis ovalibusve. *Brown mss.*

*Nat.* of the South-west Coast of New Holland. *Robert Brown.*  $\text{h}.$

[417] TRISTANIA. *Brown mss.*

*Staminum phalanges* 5, petalis oppositæ iisdemque vix longiores. *Antheræ* incumbentes. *Caps.* 3-loc. polysperma (semieserta v. inclusa et) connata calycis tubo turbinato pedicellato (in pedunculo communis).

1. *T. nereifolia*, foliis oppositis lanceolatis, phalangibus 3—5-andris. *Brown mss.*

*Melaleuca nereifolia.* *Sims in botan. magaz.* 1058.

*Melaleuca salicifolia.* *Andrews's reposit.* 485.

*Nat.* of New South Wales. *Robert Brown.*  $\text{h}.$

2. *T. laurina*, foliis alternis cuneato-lanceolatis, ramulis calycibusque pubescentibus, capsulis semisuperis. *Brown mss.*

*Melaleuca laurina.* *Willden. sp. pl.* 3, p. 1429.

*Nat.* of New South Wales. *Admiral Phillip.*  $\text{h}.$

3. *T. conferta*, foliis lanceolato-ellipticis acutis alternis : terminalibus confertis, calycis laciniiis acutis foliaceis. *Brown mss.*

*Nat.* of New South Wales. *Robert Brown.*  $\text{h}.$

CALOTHAMNUS. (*Labillard. nov. holl.* 2, p. 24.)  
*Brown mss.*

*Staminum phalanges* (4-5) petalis oppositæ (aliquæ nunc connatæ v. steriles). *Antheræ* basi insertæ, integerrimæ. *Caps.* 3-loc. polysperma, connata et inclusa calycis tubo incrassato basi adnato (ramo).

1. *C. quadrifida*, floribus 4-fidis, phalangibus distinctis <sup>614</sup> æqualibus 12—15-andris, foliis adultis fructibusque glabris. *Brown mss.*

*Nat. of the South-west Coast of New Holland. Robert Brown.* h.

2. *C. villosa*, floribus 5-fidis, phalangibus distinctis æqualibus polyandris, foliis adultis fructibusque villosis. *Brown mss.*

*Nat. of the South-west Coast of New Holland. Robert Brown.* h.

3. *C. gracilis*, floribus 5-fidis, phalangibus distinctis æqualibus 3-andris, foliis longissimis fructibusque exsertis glabris, caule ramoso. *Brown mss.*

*Nat. of the South-west Coast of New Holland. Robert Brown.* h.

#### BEAUFORTIA. *Brown mss.*

*Staminum phalanges 5, petalis oppositæ. Antheræ basi insertæ: apice bifidæ lobis deciduis! Caps. 3-loc. monosperma, connata et inclusa calycis tubo incrassato basi adnato (ramo).*

1. *B. decussata*, foliis oppositis decussatis ovatis ovalibusque multinervibus, phalangium unguibus longissimis; filamentis radiantibus. *Brown mss.*

*Nat. of the South-west Coast of New Holland. Robert Brown.* h.

2. *B. sparsa*, foliis sparsis ovalibus multinervibus. <sup>619</sup> *Brown mss.*

*Nat. of the South-west Coast of New Holland. Robert Brown.* h.

## COMPOSITÆ.

---

### IXODIA. *Brown mss.*

[iv. 617]

*Recept.* paleaceum. *Pappus* nullus. *Cul.* imbricatus, squamis interioribus radiantibus coloratis.

1. *IXODIA Achillæoides.* *Brown mss.*  
*Nat.* of the South Coast of New Holland. *Robert Brown.*  $\frac{1}{2}$ .

### DONIA. *Brown mss.*

[v. 82]

*Recept.* nudum. *Pappus* setaceus, caducus. *Calyx* imbricatus, hemisphaericus.

1. *D. glutinosa*, foliis ovato-oblongis serratis calycibusque viscidis. *Brown mss.*  
*Oronicum glutinosum.* *Willden. sp. pl. 3, p. 2115.*  
*Aster glutinosus.* *Cavanill. ic. 2, p. 52, t. 168.*  
*Nat.* of Mexico.  $\frac{1}{2}$ .

### PODOLEPIS. (*Labill. nov. holl. 2, p. 56.*) *Brown mss.*

*Recept.* nudum. *Pappus* pilosus. *Calyx* imbricatus scariosus hemisphaericus : squamis unguiculatis.

1. *P. rugata*, squamis calycis rugosis obtusis, caule simplici. *Brown mss.*  
*Podolepis rugata.* *Labill. nov. holl. 2, p. 57, t. 208.*  
*Nat.* of the South-west Coast of New Holland.  $\frac{1}{2}$ .

2. *P. acuminata*, squamis calycis æquatis ovatis acuminatis, caule subsimplici. *Brown mss.*

*Scalia Jaceoides.* *Sims in Botan. magaz.* 956.

*Nat. of New South Wales.* *Robert Brown.* 4.

v. 187]

### CULLUMIA. *Brown mss.*

*Recept. favosum. Semina glabra. Pappus nullus. Cal. monophylus: foliolis imbricatis tectus.*

1. *C. ciliaris*, foliis ovatis glabris imbricatis bifariam ciliato-spinosis: spina terminali reflexa. *Brown mss.*

*Berckheya ciliaris.* *Willden. sp. pl.* 3, p. 2273.

*Carlina* foliis imbricatis oblongis reticulatis et in aculeum aduncum desinentibus. *Burm. afr.* 151, t. 54, f. 1.

*Nat. of the Cape of Good Hope.* h.

2. *C. setosa*, foliis ovato-lanceolatis glabris recurvatis ciliato-spinosis. *Brown mss.*

*Berckheya setosa.* *Willden. sp. pl.* 3, p. 2273. (exclus. syn. Commelin.)

*Nat. of the Cape of Good Hope.* h

v. 188] 3. *C. squarrosa*, foliis subulatis recurvatis patulisve spinuloso-ciliatis subtus sulcatis: adultis ramisque glabriusculis. *Brown mss.*

*Berckheya squarrosa.* *Willden. sp. pl.* 3, p. 2272.

*Rohria squarrosa.* *Thunb. in act. soc. nat. scrut. hafn.* 3, part. 1, pag. 100, t. 5.

*Nat. of the Cape of Good Hope.* h.

### BERCKHEYA. (*Gen. pl.* 1329.) *Brown mss.*

*Recept. favosum. Semina villosa. Pappus paleaceus (nunc setoso-paleaceus ciliatus). Cal. monophyllus: foliolis imbricatis tectus.*

1. *B. cynaroïdes*, foliis caulinis alternis amplexicaulibus spinuloso-ciliatis; radicalibus elongatis integris inermibus

Berckheya cynaroides. *Willden. sp. pl. 3, p. 2275.*  
*Nat. of the Cape of Good Hope. ♀.*

2. *B. obovata*, foliis alternis cuneato-lanceolatis spinoso-dentatis utrinque glabris, foliolis calycis dentato-spinosis. *Brown mss.*

Berckheya obovata. *Willden. sp. pl. 3, p. 2269.*  
*Basteria aculeata. Hoult. nat. hist. 6, p. 158, t. 34, f. 2.*  
*Nat. of the Cape of Good Hope. ♂.*

3. *B. incana*, foliis alternis ovatis spinoso-dentatis subtus caulinibusque incanis, calycis foliolis dentato-spinosis <sup>tr. 189</sup> subtus tomentosis. *Brown mss.*

Berckheya incana. *Willden. sp. pl. 3, p. 2269.*  
*Gorteria asterooides. Jacq. ic. 3, t. 591.*  
*Nat. of the Cape of Good Hope. ♂.*

4. *B. cernua*, foliis alternis lanceolatis amplexicaulibus spinoso-dentatis ciliatis utrinque glabris, floribus cernuis, pappo setoso-ciliato. *Brown mss.*

Gorteria cernua. *Willden. sp. pl. 3, p. 2268.*  
*Gorteria araneosa. Meerb. ic. 1, t. 40.*  
*Nat. of the Cape of Good Hope. ♂.*

### DIDELTA. (*Gen. pl. 1351.*) *Brown mss.*

*Recept. favosum includens semina. Pappus multipartitus setoso-paleaceus dentatus. Cal. monophyllus : tectus foliolis : exterioribus maximis.*

1. *D. carnosum*, foliis alternis.

Didelta carnosa. *Willden. sp. pl. 3, p. 2262.*

Didelta tetragoniaefolia. *L'Herit. stirp. nov. 55, t. 28.*  
*Nat. of the Cape of Good Hope. Mr. Fr. Masson. ♂.*

2. *D. spinosum*, foliis oppositis.

*Didelta spinosa.* Willden. sp. pl. 3, p. 2262. Wendl.  
obs. 33, t. 4, f. 32.

*Nat.* of the Cape of Good Hope. Mr. Fr. Masson. ♂.

v. 140] GORTERIA. (*Gen. pl. 1328.*) Brown mss.

*Recept.* scrobiculatum. *Pappus*: margo ciliatus. *Cal.* monophyllus: foliolis imbricatis tectus; fructus induratus connivens deciduus.

1. GORTERIA *personata*.

*Gorteria personata.* Willden. sp. pl. 3, p. 2265. Jacqu. collect. 4, p. 224, t. 21, f. 1.

*Nat.* of the Cape of Good Hope. ◎.

GAZANIA. (*Gærtn. sem. 2*, p. 451.) Brown mss.

*Recept.* epaleatum (nudum; v. alveolatum germinibus exsertis.) *Semina* villosissima. *Pappus* piloso-paleaceus. *Cal.* monophyllus: tubo foliolis imbricatis tecto v. nudo.

1. G. *rigens*, foliis spathulato-lanceolatis indivisis passim pinnatifidis subtus tomentosis, scapo unifloro calcycibusque glabris, caule decumbente. Brown mss.

*Gorteria rigens.* Willden. sp. pl. 3, p. 2267. Curtis magaz. 90.

*Nat.* of the Cape of Good Hope. ♂.

2. G. *Pavonia*, foliis pinnatifidis supra pilosis subtus tomentosis: lacinias ovali-lanceolatis, scapo unifloro, caule decumbente. Brown mss.

*Gazania Pavonia.* Andrews's reposit. 523.

*Nat.* of the Cape of Good Hope. Mr. James Niven. ♂.

3. G. *subulata*, caule folioso decumbente unifloro, foliis subulato-linearibus margine revolutis subtus tomentosis. [v. 141] Brown mss.

## CRYPTOSTEMMA. Brown mss.

*Recept. favosum. Pappus paleaceus lana implexa seminis tectus. Cal. imbricatus.*

1. C. *calendulaceum*, ligulis indivisis, foliis pinnatifidis dentatis subtus tomentosis. *Brown mss.*

*Arctotis calendulacea. Willden. sp. pl. 3, p. 2347. Jacqu. hort. schænbr. 2, p. 16, t. 157.*

*Nat. of the Cape of Good Hope. ◎.*

2. C. *hypochondriacum*, ligulis (3-5-) partitis, foliis lyratis tomentosis. *Brown mss.*

*Arctotis hypochondriaca. Willden. sp. pl. 3, p. 2348.*

*Nat. of the Cape of Good Hope. ◎.*

3. C. *runcinatum*, ligulis (3-5-) partitis, foliis runcinatis dentatis subtus tomentosis. *Brown mss.*

*Nat. of the Cape of Good Hope. Mr. Fr. Masson. ◎.*

ARCTOTHECA. (*Wendl. hort. herrenhus. 8.*) *Brown mss.*

*Recept. favosum. Pappus nullus. Cal. imbricatus.*

1. ARCTOTHECA *repens*. *Willden. sp. pl. 3, p. 2365. [v. 142]*

*Arctotis repens. Jacqu. hort. schænbr. 3, p. 31, t. 306.*

*Nat. of the Cape of Good Hope. 4.*

SPHENOGYNE. *Brown mss.*

*Recept. paleis distinctis. Pappus paleaceus, simplex.*

*Stigma apice dilatato subtruncato. Cal. imbricatus : squamis intimis (omnibusve) apice dilatato scarioso.*

1. S. *anthemoides*, herbacea glabra, foliis bipinnatifidis pinnatifidisve lineariformibus, pappi foliolis albis : axi

subulato discolori. *Willden. sp. pl.* 3, p. 2361. *Botan. magaz.* 544.

*Arctotis paradoxa.* [*Hort. Kew.*] *Edit. prior.* 3, p. 273.  
*Nat. of the Cape of Good Hope.* ♂.

2. *S. crithmifolia*, fruticosa glabra, foliis pinnatifidis lineariformibus, foliolis exterioribus calycis subulatis. *Brown mss.*

*Arctotis paleacea.* *Willden. sp. pl.* 3, p. 2359.

*Arctotis crithmoides.* *Berg. cap.* 326.

*Nat. of the Cape of Good Hope.* ♀.

3. *S. scariosa*, fruticosa, foliis bipinnatifidis pinnatifidis lineariformibus glabris, calycis squamis omnibus scariosis obtusis nitidis: extimus sessilibus. *Brown mss.*

*Arctotis scariosa.* *Willden. sp. pl.* 3, p. 2360.

v. 148] *Nat. of the Cape of Good Hope.* Mr. Fr. Masson. ♀.

4. *S. abrotanifolia*, fruticosa, foliis 2-3-pinnatifidis calycibusque tomentosis. *Brown mss.*

*Nat. of the Cape of Good Hope.* Mr. Fr. Masson. ♀.

5. *S. dentata*, fruticosa, foliis pinnatifidis glabriusculis: lacinias 2-3-dentatis: dentibus piliferis, calycis foliolis exterioribus lanceolatis. *Brown mss.*

*Arctotis dentata.* *Willden. sp. pl.* 3, p. 2359.

*Chrysanthemum foliorum* pinnis brevissimis dentatis. *Burm. afr.* 175, t. 64.

*Nat. of the Cape of Good Hope.* ♀.

6. *S. odorata*, fruticosa, foliis planis glabris apice inciso-pinnatifidis, calycis foliolis exterioribus apice scariosis, seminibus glabris: pappo obsoleto. *Brown mss.*

*Anthemis odorata.* *Willden. sp. pl.* 3, p. 2186.

*Nat. of the Cape of Good Hope.* Mr. Fr. Masson. ♀.

Botan.

273.

ARCTOTIS. (*Gen. pl.* 1340.) *Brown mss.* [v. 169]

*Recept.* setoso-alveolatum. *Semina* dorso semi-biloculari v. bisulco. *Pappus* paleaceus. *Cal.* imbricatus: squamis apice scariosis.

1. *A. acaulis*, caule brevissimo decumbente, foliis utrinque incanis ternato-lyratis dentatis, calycinis squamis exterioribus adpressis. *Willden.* sp. pl. 3, p. 2348.

*Arctotis acaulis.* *Trew, ehret.* 53, t. 93.

*Nat. of the Cape of Good Hope.* ♀.

2. *A. tricolor*, foliis subtus tomentosis ovatis integerrimis lyratisve dentatis, scapo sulcato unifloro, squamis calycinis exterioribus reflexis. *Willden.* sp. pl. 3, p. 2349.

*Arctotis tricolor.* *Jacqu. hort. schænbr.* 2, p. 27, t. 159.

*Nat. of the Cape of Good Hope.* Mr. Fr. Masson. ♀.

3. *A. undulata*, foliis subtus tomentosis undulato-den-[v. 170] tatis ovatis lyratisve, scapis unifloris striatis, calyciis squamis exterioribus reflexis. *Willden.* sp. pl. 3, p. 2349.

*Arctotis undulata.* *Jacqu. hort. schænbr.* 2, p. 17, t. 160.

*Nat. of the Cape of Good Hope.* Mr. Fr. Masson. ♀.

4. *A. grandiflora*, foliis pinnatifidis denticulatis arachnoideis triplinerviis.

*Nat. of the Cape of Good Hope.* Mr. Fr. Masson. ♂.

OBS. Caulescens. *Radius* maximus. *Petala* straminea, subtus rubore tineta, supra prope basin lutescentia, ore nigro-purpureo.

5. *A. glaucophylla*, foliis canescentibus pinnatifidis repando-subdentatis, caule basi ramoso, calycinis squamis exterioribus reflexis. *Willden.* sp. pl. 3, p. 2350.

*Arctotis glaucophylla.* *Jacqu. hort. schænbr.* 2, p. 22, t. 170.

*Nat. of the Cape of Good Hope.* Mr. Fr. Masson. ♀.

6. A. *plantaginea*, foliis lanceolato-ovatis nervosis denticulatis amplexicaulibus. *Willden. sp. pl. 3*, p. 2350.

*Nat. of the Cape of Good Hope.* ♀.

v. 171] 7. A. *argentea*, foliis lanceolato-linearibus integerrimis tomentosis. *Willden. sp. pl. 3*, p. 2351.

*Nat. of the Cape of Good Hope. Mr. Fr. Masson.* ♂.

8. A. *rosea*, caule procumbente, foliis spathulato-lanceolatis repando-dentatis incanus, pappo duplici. *Willden. sp. pl. 3*, p. 2351.

*Arctotis rosea. Jacqu. hort. schænbr. 2*, p. 18, t. 162.

*Nat. of the Cape of Good Hope. Mr. Fr. Masson.* ♀.

9. A. *decumbens*, caule procumbente, foliis oblongo-lanceolatis inæqualiter dentatis canescens: subtus tomentosis trinerviis, calycinis squamis exterioribus adpressis. *Willden. sp. pl. 3*, p. 2351.

*Arctotis decumbens. Jacqu. hort. schænbr. 3*, p. 68, t. 381.

*Nat. of the Cape of Good Hope. Mr. Fr. Masson.* ♀.

### *MONANDRIA.*

I. *Anthera* adnata subterminalis persistens. *Pollinis massæ* e lobulis angulatis elastice coherentibus; basi affixæ.

#### ORCHIS. *Brown prodr.* 312.

*Cor. ringens. Labellum* basi subtus calcaratum. *Glandulæ* (1—2) pedicellorum pollinis inclusæ cucullo unico.

1. O. *Morio*, labello trilobo: lobis crenatis obtusis: medio emarginato, petalis adscendentibus obtusis, cornu conico adscendentente germine breviore. *Willden. sp. pl.* 4, p. 18. *Curtis lond. Engl. bot.* 2059.

*Nat. of Britain.* ♀.

2. O. *mascula*, labello trilobo crenulato obtuso: lobo medio bifido, petalis acutis: exterioribus reflexis, cornu conico adscendentente germinis longitudine. *Willden. sp. pl.* 4, p. 18. *Engl. bot.* 631.

*Nat. of Britain.* ♀.

3. O. *ustulata*, labello tripartito: laciniis linearibus <sup>189</sup> punctato-scabris: media bipartita, petalis erectis acutis, cornu uncinato germe triplo breviore, bracteis germen subæquantibus. *Willden. sp. pl.* 4, p. 20. *Engl. bot.* 18.

*Nat. of England.* ♀.

4. *O. fusca*, labello tripartito punctato-scabro : laciniis lateralibus oblongis ; intermedia ampla biloba crenata cum mucrone interjecto, petalis acutis conniventibus, cornu rectiusculo germine triplo breviore, bracteis germine quadruplo brevioribus. *Willden. sp. pl. 4, p. 23.* *Curtis lond.*

*Orchis militaris. Engl. bot. 16.*

*Nat. of England. ♀.*

5. *O. militaris*, labello tripartito punctato-scabro : laciniis lateralibus linearibus ; intermedia biloba obtusa cum mucrone interjecto, petalis acutis conniventibus, cornu recto germine duplo breviore, bracteis obsoletis. *Willden. sp. pl. 4, p. 22.* *Engl. bot. 1873.*

*Nat. of England. ♀.*

6. *O. globosa*, labello tripartito : lacinia media emarginata, petalis apice mucronatis, cornu germine duplo breviore, spica dense ovata, foliis lanceolatis. *Willden. sp. pl. 4, p. 14.* *Jaqu. austr. 3, p. 36, t. 265.*

*Nat. of Austria and Switzerland. ♀.*

7. *O. pyramidalis*, labello tripartito : superne basi bicorni ; laciniis æqualibus integerrimis, cornu germen subæquante, spica densa oblonga. *Willden. sp. pl. 4, p. 14.* *Engl. bot. 110.*

*Nat. of Britain. ♂.*

8. *O. hircina*, labello tripartito : laciniis lateralibus linearis-subulatis ; media elongata germine triplo longiore linearis bifida, petalis conniventibus, cornu brevissimo conico didymo. *Willden. sp. pl. 4, p. 28.*

*Satyrium hircinum. Eng. bot. 34.*

*Nat. of England. ♂.*

9. *O. latifolia*, labello leviter trilobo lateribus reflexo, petalis superioribus conniventibus ; binis lateralibus reflexis, cornu conico germe breviore, bracteis flore longioribus. *Willden. sp. pl. 4, p. 28.* *Curtis lond. Engl. bot. 2308.*

*Nat. of Britain. ♀.*

10. *O. maculata*, labello plano trilobo crenato, petalis superioribus conniventibus; lateralibus patentibus, cornu cylindraceo germine breviore, bracteis longitudine germinis. *Willden. sp. pl. 4, p. 31.* *Engl. bot. 632.*

*Nat. of Britain.* ♀.

11. *O. spectabilis*, labello obovato indiviso crenato retuso, petalis rectis: lateralibus longioribus, cornu clavato germine breviore, bracteis flore longioribus, caule aphyillo. *Willden. sp. pl. 4, p. 36.*

*Nat. of North America.* ♀.

12. *O. papilionacea*, labello obovato indiviso dentato <sup>191</sup> emarginato, petalis nervosis conniventibus, cornu subulato germine breviore, bracteis membranaceis coloratis germine longioribus. *Willden. sp. pl. 4, p. 24.*

*Nat. of Spain and Naples.* ♀.

#### GYMNADENIA. *Brown mss.*

*Cor. ringens. Labellum basi subtus calcaratum. Glandulæ pedicellorum pollinis nudæ approximatæ.*

1. *GYMNADENIA conopsea*. *Brown mss.*

*Orchis conopsea. Willden. sp. pl. 4, p. 32.* *Engl. bot.*

10.

*Nat. of Britain.* ♀.

#### ACERAS. *Brown mss.*

*Cor. ringens. Labellum ecalcaratum. Glandulæ pedicellorum pollinis cucullo communi inclusæ.*

1. A [*anthropophora*] labello germine longiore. *Brown mss.*

*Ophrys anthropophora. Willden. sp. pl. 4, p. 63.*

*Curtis lond.* *Engl. bot. 29.*

*Nat. of England.* ♀.

HERMINIUM. *Brown mss.*

*Cor. subpatens. Labellum ecalcaratum. Glandulae massarum pollinis nudæ distinctæ.*

1. *H. Monorchis*, foliis radicalibus lanceolatis binis.  
*Brown mss.*

*Ophrys Monorchis. Willden. sp. pl. 4, p. 61. Engl. bot. 71.*

[192] *Nat. of England.* 4

HABENARIA. *Brown prodr. 312.*

*Cor. ringens. Labellum basi subtus calcaratum. Glandulae pollinis nudæ distinctæ (loculis pedicellarum adnatis v. solutis distinctis).*

1. *H. nigra*, cornu abbreviato didymo, labello ovato acuminato, spica densa ovata, foliis linearibus. *Brown mss.*

*Orchis nigra. Willden. sp. pl. 4, p. 35.*

*Satyrium nigrum. Fl. dan. 998.*

*Nat. of the Alps of Switzerland, Austria, and Lapland.* 4.

2. *H. viridis*, cornu abbreviato didymo, labello linearis tridentato: lateralibus acutis; medio brevissimo, bracteis flore sesquilonioribus. *Brown mss.*

*Orchis viridis. Willden. sp. pl. 4, p. 33.*

*Satyrium viride. Engl. bot. 94.*

*Nat. of Britain.* 4.

3. *H. bracteata*, cornu abbreviato didymo, labello linearis retuso-tridentato: lateralibus obtusis; medio obsoleto, bracteis flore duplo longioribus. *Brown mss.*

*Orchis bracteata. Willden. sp. pl. 4, p. 34.*

*Orchis bractealis. Salisb. paradis. 110.*

*Nat. of North America.* 4.

4. *H. albida*, cornu obtuso germine triplo breviore, <sup>193</sup> labello tripartito : laciniis acutis : media majore. *Brown mss.*  
*Orchis albida*. *Willden. sp. pl. 4, p. 38.*  
*Satyrium albidum*. *Engl. bot. 505.*  
*Nat. of Britain.* 2.
5. *H. hyperborea*, cornu cylindrico germine breviore, labello integerrinio lineari-oblongo. *Brown mss.*  
*Orchis hyperborea*. *Willden. sp. pl. 4, p. 37.*  
*Nat. of Iceland and Labrador.* 2.
6. *H. bifolia*, cornu filiformi germine duplo longiore, labello lineari integerrinio, foliis radicalibus binis oblongis basi attenuatis. *Brown mss.*  
*Orchis bifolia*. *Willden. sp. pl. 4, p. 10.* *Curtis lond.*  
*Engl. bot. 22.*  
*Nat. of Britain.* 2.
7. *H. herbiola*, cornu filiformi germine breviore, labello oblongo obtuso basi utrinque dentato ; palato unidentato, bracteis flore longioribus. *Brown mss.*  
*Nat. of North America.* 2.
8. *H. fimbriata*, cornu filiformi germine longiore, labello tripartito laciniis cuneiformibus fimbriatis. *Brown mss.*  
*Orchis fimbriata*. *Willden. sp. pl. 4, p. 39.*  
*Nat. of Canada and Newfoundland.* 2.
9. *H. cristata*, cornu filiformi germine breviore, labello <sup>194</sup> lanceolato pinuatim-fimbriato, petalis interioribus dentato-incisis. *Brown mss.*  
*Orchis cristata*. *Willden. sp. pl. 4, p. 9.*  
*Nat. of North America.* 2.
10. *H. ciliaris*, cornu filiformi germine longiore, labello lanceolato pinnatum-fimbriato, petalis interioribus fimbriato-incisis. *Brown mss.*  
*Orchis ciliaris*. *Willden. sp. pl. 4, p. 8.* *Andrews's reposit. 42.*  
*Nat. of North America.* 2.

BARTHOLINA. *Brown mss.*

*Cor. ringens*: petalis interioribus inferne labello connatis. *Labellum* basi subtus calcaratum. *Pedicelli pollinis* elongati: loculis adnatis; glandulis distinctis lobulo exteriore semitectis.

1. BARTHOLINA *pectinata*. *Brown mss.*

*Orchis pectinata*. *Willden. sp. pl. 4*, p. 11.

*Orchis burmanniana*. *Swartz in Web. et Mohr archiv. 1*, p. 55, t. 3.

*Nat. of the Cape of Good Hope.* 4.

SERAPIAS. (*Swartz in act. stockholm. 1800*, p. 223.)  
*Brown mss.*

*Cor. ringens*. *Labellum* ecalcaratum. *Columna* cuspidata. *Pedicelli pollinis* inserti glandula unica exculo inclusa.

[195] 1. S. *Lingua*, labello tripartito: laciniis lateralibus obtusis erectis conniventibus; media oblonga lanceolata acutiuscula glabriuscula dependente. *Willden. sp. pl. 4*, p. 70.

*Orchis montana* *italica*, flore ferrugineo, lingua oblonga. *Moris. hist. 3*, p. 495, s. 12, t. 14, f. 21.

*Nat. of the South of Europe.* 4.

2. S. *cordigera*, labello tripartito: laciniis lateralibus obtusis erectis conniventibus; media ovata acuminata disco pilosa dependente. *Willden. sp. pl. 4*, p. 71. *Andrews's reposit. 475*.

*Nat. of Spain, Italy, and the Levant.* 4.

OPHRYS. *Brown prodr.* 313.

*Cor. subpatens. Labellum ecalcaratum. Glandulae pol-*  
*linis cucullis distinctis inclusæ.*

1. *O. apifera*, labello trifido : lobo medio majore semitri-  
 fido : lacinia media longiore subulata deflexa. *Brown mss.*

*Ophrys apifera.* *Willden. sp. pl. 4, p. 66.* *Curtis. lond.*  
*Engl. bot. 383.*

*Nat. of England.* 4.

2. *O. aranifera*, labello trilobo : lateralibus abbreviatis  
 obtusis ; medio retuso. *Brown mss.*

*Ophrys aranifera.* *Willden. sp. pl. 4, p. 66.* *Engl.*  
*bot. 65.*

*Nat. of England.* 4.

3. *O. muscifera*, labello trifido : lobo medio majore <sup>196</sup>  
 bilobo, anthera obtusa. *Brown mss.*

*Ophrys muscifera.* *Smith fl. brit. 3, p. 937.* *Engl.*  
*bot. 64.*

*Ophrys myodes.* *Willden. sp. pl. 4, p. 64.* *Andrews's*  
*reposit. 471.*

*Nat. of England.* 4.

SATYRIUM. (*Swartz in act. stockholm.* 1800, p. 214.)  
*Brown mss.*

*Cor. ringens :* petala 5 antica basi connata. *Labellum*  
*posticum, fornicatum, basi bicalcaratum v. bisaccatum.* *An-*  
*thera resupinata.* *Stigma bilabiatum.*

1. *S. cucullatum*, foliis radicalibus binis cordato-subro-  
 tundis concavis ; caulinis remotis cucullatis subretusis, floribus  
 cernuis. *Willden. sp. pl. 4, p. 54.*

*Orchis bicornis.* *Andrews's reposit. 315.*

*Nat. of the Cape of Good Hope.* 4.

2. *S. carneum*, foliis radicalibus binis cordato-subrotundis; caulinis vaginæformibus approximatis, spica compacta, petalis extus carinatis.

*Orchis carnea*. [*Hort. Kew.*] *Edit. prior.*

*Nat. of the Cape of Good Hope.* Mr. Fr. Masson. 4.

DISA. *Swartz in act. stockholm.* 1800, p. 208.

*Cor. ringens*: galea basi unicalcarata v. saccata petala interiora columnæ accreta. *Labellum* ecalcaratum.

<sup>1971</sup> 1. *D. cornuta*, galea obtusa; calcare conico deflexo, petalis interioribus bidentatis, labello obvato velutino plano, spica laxa. *Willden. sp. pl.* 4, p. 45.

*Nat. of the Cape of Good Hope.* 4.

2. *D. spathulata*, galea erecta acuta, labello petiolato apice dilatato trifido, caule paucifloro, foliis linearibus. *Willden. sp. pl.* 4, p. 52.

*Nat. of the Cape of Good Hope.* 4.

PTERYGODIUM. (*Swartz in act. stockholm.* 1800, p. 217.) *Brown mss.*

*Cor. subringens*: petala exteriora antica horizontalia concava. *Labellum* columnæ adnatum, bilabiatum. *Antheræ* loculis distantibus. *Stigma* adnatum.

1. *P. volucris*, caule triphyllum, labello triangulari sagittato. *Willden. sp. pl.* 4, p. 57.

*Nat. of the Cape of Good Hope.* 4.

II. *Anthera* stigmati parallela persistens. *Massæ pollinis* v. *farinaceæ* v. *e* *corpusculis* angulatis; apicibus stigmati affixæ.

GOODYERA. *Brown mss.*

4. *Cor. ringens*: petalis exterioribus anticis labello inferne gibboso superne indiviso suppositis. *Columna libera*. *Pollen angulatum*.

1. *G. repens*, foliis radicalibus ovatis, labello petalisque lanceolatis. *Brown mss.*<sup>108</sup>

*Neottia repens*. *Willden. sp. pl. 4*, p. 75.

*Satyrion repens*. *Engl. bot. 289*.

*Nat. of Scotland.* 4.

1. *G. pubescens*, foliis radicalibus ovatis, labello ovato acuminato, petalis ovatis. *Brown mss.*

*Neottia pubescens*. *Willden. sp. pl. 4*, p. 76.

*Nat. of North America.* 4.

NEOTTIA. (*Swartz in act. stockholm. 1800*, p. 224.)  
*Brown prodr. 319.*

*Cor. ringens*: petalis exterioribus anticis labello imberbi suppositis; interioribus conniventibus. *Columna aptera*. *Pollen farinaceum*.

1. *N. speciosa*, labello lanceolato indiviso, scapo bracteato, bracteis flore longioribus, foliis oblongis margine apicem versus undulatis. *Willden. sp. pl. 4*, p. 72. *Andrews's reposit. 3. Botan. mag. 1374*.

*Nat. of the West Indies.* 4.

2. *N. orchioides*, foliis radicalibus lato-lanceolatis, spica erecta labello basi cum petalis saccato; lamina acuminata. *Willden. sp. pl. 4*, p. 75. *Botan. mag. 1036*.

*Nat. of Jamaica.* 4.

3. *N. picta*, foliis radicalibus oblongo-lanceolatis, scapo<sup>109</sup>

bracteato, petalis anticis decurrentibus labello semiinfero ecalcarato suppositis.

*Neottia acaulis.* *Smith exot. bot.* 2, p. 91, t. 105. (varietas exscapa.)

*Nat. of Trinidad.* Mr. Alexander Anderson. 4.

4. *N. elata*, labello obovato emarginato, scapo vaginato, bracteis flore brevioribus, foliis ovatis petiolatis margine planis. *Willden. sp. pl.* 4, p. 72. *Redouté liliac.* 164.

*Neottia minor.* *Andrews's reposit.* 376.

*Nat. of Guiana and the West Indies.* 4.

5. *N. cernua*, foliis lanceolatis trinerviis, caule vaginato, floribus recurvato-cernuis, labello oblongo integerrimo acuto. *Willden. sp. pl.* 4, p. 75.

*Nat. of North America.* 4.

6. *N. spiralis*, foliis radicalibus oblongis subpetiolatis, spica tortili floribus secundis, labio ovato. *Willden. sp. pl.* 4, p. 73.

*Oryzopsis spiralis.* *Curtis lond.* *Engl. bot.* 541.

*Nat. of Britain.* ?.

#### PONTHIEVA. *Brown mss.*

*Cor.* irregularis. *Labellum* posticum, cum petalis interioribus columnæ insertum. *Pollen* farinaceum.

200 1. *P. glandulosa*, labello unguiculato acuminato, petalis interioribus dimidiato-ovatis.

*Neottia glandulosa.* *Sims in botan. magaz.* 842.

*Nat. of the West Indies.* Mr. Alexander Anderson. 4.

DIURIS. (*Smith. in linn. soc. transact.* 4, p. 222.) *Brown prodr.* 315.

*Cor.* irregularis : petala 2 exteriora antica linearia *labello* trifido supposita ; interiora unguiculata patula. *Columna :* lobis lateralibus petaloideis. *Pollen* farinaceum.

1. *D. aurea*, labelli lacinia intermedia basi intus bicarinata lateralibus duplo longiore, petalis integerrimis : interioribus ellipticis acutis, foliis linearibus canaliculatis scapo brevioribus. *Brown prodr.* 315.  
*Diuris aurea.* *Smith exot. bot.* 1, p. 15, t. 9.  
*Nat. of New South Wales.* 4.

### THELYMITRA. *Brown prodr.* 314.

*Cor. regularis.* *Labellum* sessile petalis subconforme. *Columna* cucullata : lobis lateralibus penicillatis nudis. *Pollen* farinaceum.

1. *T. ixiooides*, corolla patenti, cuculli laciniis lateralibus penicillatis ; intermedia trifida : lobulis lateralibus apice erosis medio breviore bifido dorso cristato. *Brown prodr.* 314.

*Thelymitra ixiooides.* *Willden. sp. pl.* 4, p. 79. *Smith exot. bot.* 1, p. 55, t. 29. (absque maculis saturatiōribus corollæ.)

*Nat. of New South Wales.* 4.

### LISTERA. *Brown mss.*

*Cor. irregularis.* *Labellum* bilobum. *Columna* aptera. *Anthera* basi inserta. *Pollen* farinaceum.

1. *L. ovata*, caule bifolio, foliis ovatis oppositis, columna postice cucullo anthera incumbente aucta.

*Ophrys ovata.* *Curtis lonl.* *Engl. bot.* 1548.

*Epipactis ovata.* *Willden. sp. pl.* 4, p. 87.

*Nat. of Britain.* 4.

2. *L. cordata*, caule bifolio, foliis cordatis oppositis, labello inferne bidentato ; lobis apicis linearisubulatis. *Brown mss.*

*Ophrys cordata.* *Engl. bot.* 358.

*Epipactis cordata.* *Willden. sp. pl.* 4, p. 88.

*Nat. of Britain.* 4.

III. *Anthera terminalis*, inserta, persistens. *Massæ pollinis* v. *pulvereæ* v. e. *corpusculis angulatis*: basi v. infra apicem affixæ.

EPIPACTIS. *Brown mss.* Epipactidis species. *Swartz in act. stockholm.* 1800, p. 231.

*Labellum* inferne ventricosum; superne v. indivisum; v. 3-lobum lobo medio majore articulatim connexo. *Pollen* farinaceum.

1. E. *latifolia*, foliis ovatis amplexicaulibus; bracteis 202] inferioribus flore longioribus, floribus pendulis, labello integerrimo acuminato petalis breviore, germinibus pubescentibus. *Willden. sp. pl. 4*, p. 83.

*Serapias latifolia.* *Engl. bot.* 269. *Select specim.* 3.  
*Nat. of Britain.* ♀.

2. E. *palustris*, foliis lanceolatis amplexicaulibus, bracteis flore brevioribus, floribus pendulis, labello crenato obtuso petalis æquali, germinibus pubescentibus. *Willden. sp. pl. 4*, p. 84.

*Serapias palustris.* *Engl. bot.* 270.  
*Nat. of Britain.* ♀.

3. E. *pallens*, foliis oblongo-lanceolatis sessilibus, bracteis flore longioribus, floribus erectis, labello obtuso petalis breviore, germinibus glabris. *Willden. sp. pl. 4*, p. 85.

*Serapias grandiflora.* *Engl. bot.* 271.  
*Nat. of Britain.* ♀.

4. E. *ensifolia*, foliis lanceolatis acuminatis subdistichis, bracteis minutissimis subulatis, floribus erectis, labello obtuso petalis duplo breviore, germinibus glabris. *Willden. sp. pl. 4*, p. 85.

*Serapias ensifolia.* *Engl. bot.* 494.  
*Nat. of Britain.* ♀.

5. *C. humile*, scapo aphylllo unifloro, foliis radicalibus geminis oblongis obtusis, lobo columnæ subrotundo-rhombeo acuminato deflexo, labello petalis lanceolatis longiore antice fisso. *Willden. sp. pl. 4, p. 144.*

*Cypripedium acaule.* *Curtis magaz.* 192.

*Nat. of North America.* 4.

6. *C. arietinum*, corollis pentapetalis, labello saccato- [222] calcarato, caule folioso.

*Nat. of North America.* 4.

GENERALIA ET SPECIES

PLANTARUM E VARIIS FAMILIIS,

QUAE

IN HORTO KEWENSI COLUNTUR.

[Extracted from '*Hortus Kewensis*,' 2nd Edition, Vol. III, IV, & V.]

LONDON.

—  
1811—1813.

## PLANTÆ VARIAE HORTI KEWENSIS.

### ANISOMELES. *Brown prodr.* 503.

[iii. 364]

*Cal.* 5-fidus. *Cor.* labium superius abbreviatum, integrum; inferius trifidum: lacinia media biloba. *Stam.* exserta, approximata: *Antheræ breviorum* bilocularis, lobis parallelis; *longiorum* dimidiatae v. dissimiles.

1. *A. ovata*, foliis ovatis subcordatis crenatis, verticillis multifloris, bracteis linearibus, calcycibus pilosis: glandulis inconspicuis.

*Nepeta indica.* *Linn.* sp. pl. 799 (exclusis synonymis). *Willden.* sp. pl. 3, p. 57.

*Ballota disticha.* [Hort. Kew.] Edit. prior. 2, p. 304. *Linn. mant.* 83?

*Marrubium odoratissimum betonicæ folio.* *Burm. zeyl.* 153, t. 71, f. 1.

*Nat. of the East Indies.* ◎.

### PYCNANTHEMUM. *Michaux amer.* 2, p. 7. [iii. 376]

*Brachystemum.* *Michaux amer.* 2, p. 5.

*Cal.* 5-fidus. *Cor.* labium inferius lacinia media longiore *Stam.* distantia: antherarum loculis parallelis. *Involucrum* capituli multibracteatum.

1. *P. incanum*, staminibus exsertis, foliis oblongo-ovatis acutis subserratis tomentosis, capitulis compositis: laterilibus pedunculatis.

*Pycnanthemum incanum.* *Michaux amer.* 2, p. 7.

*Clinopodium incanum.* *Willden.* sp. pl. 3, p. [132].

*Clinopodium menthae folio incanum et odoratum.* *Dill.*  
*elth.* 87, *t.* 74, *f.* 85.

*Nat.* of North America. ♀.

[iii. 377] 2. *P. aristatum*, staminibus exsertis, foliis lanceolatis, capitulis sessilibus, bracteis aristatis.

*Pycnanthemum aristatum.* *Michaux amer.* 2, *p.* 8, *t.* 33.

*Nepeta virginica.* *Willden. sp. pl.* 3, *p.* 56.

*Nat.* of North America. ♀.

3. *P. virginicum*, staminibus inclusis, foliis lanceolatis linearibusve integerrimis, capitulis subcorymbosis.

*Brachystemum virginicum.* *Michaux amer.* 2, *p.* 6.

*Thymus virginicus.* *Willden. sp. pl.* 3, *p.* 145.

*Satureja virginiana*, floribus in summitate. *Herm. parad.*

218, *cum tab.*

*Nat.* of North America. ♀.

#### CAPRARIA. *Gen. pl.* 1030.

[iv. 46] 1. *C. biflora*, glabra, foliis alternis lanceolatis serratis, floribus geminis, calycis laciniis subulatis, corollæ fauce imberbi.

*Capraria biflora.* *Willden. sp. pl.* 3, *p.* 323. *Jacqu.*  
*amer.* 182, *t.* 115.

*Nat.* of South America. ♂.

2. *C. cuneata*, pilosa, foliis alternis rhombo-cuneiformibus inciso-serratis, floribus geminis, calycis laciniis linearibus: pilis capitatis, corollæ fauce imberbi.

*Erinus frutescens.* *Mill. dict. ed.* 8.

*Nat.* of South America. ♂.

#### STEMODIA. *Gen. pl.* 1043.

*Cal.* 5-part. *Cor.* bilabiata. *Antheræ lobis distantibus.*  
*Caps.* bilocularis.

1. *S. parviflora*, procumbens ramosissima pubescens, foliis ternatis petiolatis ovatis crenatis.

*Erinus verticillatus.* *Mill. dict. ed. S.*  
*Nat. of South America.* h.

MAZUS. *Lour. cochinch.* 385. *Brown prodr.* 439. [iv. 53]

*Cal.* 5-fid. campanulatus. *Cor.* ringens : labio superiore semibilobo ; inferiore 3-fido, basi bigibboso. *Caps.* biloc. bivalvis : valvis integris, medio septiferis.

1. *M. rugosus*, racemo laxo caulem paucifolium superante, calycibus pubescentibus : fructiferis auctis.

*Mazus rugosus.* *Lour. cochinch.* 385.

*Lindernia japonica.* *Willden. sp. pl.* 3, p. 326.

*Nat. of China and Japan.* ⊙.

CROSSANDRA. *Salish. paradis.* 12. *Brown prodr.* [iv. 54] 475, in obs.

*Cal.* 5-part. inæqualis. *Cor.* unilabiata. *Stam.* inclusa : *Antheris* unilocularibus. *Caps.* biloc. bivalvis : dissepimento contrario. *Semina* retinaculis subtensa.

1. *CROSSANDRA undulæfolia.* *Salisb. paradis.* 12.

*Ruellia infundibuliformis.* *Andrews's reposit.* 542.

*Justicia infundibuliformis.* *Willden. sp. pl.* 1, p. 99.

*Nat. of the East Indies.* h.

APHELANDRA. *Brown prodr.* 475, in obs. [iv. 55]

*Cal.* 5-part. inæqualis. *Cor.* bilabiata. *Antheræ* uniloculares ! *Caps.* biloc. bivalvis : dissepimento contrario. *Semina* retinaculis subtensa.

1. *A. cristata*, foliis ellipticis oblongisve acuminatis, spicis tetragonis, bracteis ovatis integerrimis, corollis glabris.

*Justicia cristata.* *Jacqu. hort. schænbr.* 3, p. 38, t. 320.

*Justicia pulcherrima.* *Willden. sp. pl.* 1, p. 86.

*Justicia tetragona.* *Willden. sp. pl.* 1, p. 85.

*Justicia arborea.* *Mill. dict. ed. 8.*

*Ruellia cristata.* *Andrews's reposit. 506.*

*Nat. of the West Indies.* *h.*

BLECHUM. *Brown prodr. 478*, in obs. Blechi species.  
*Jussieu in annales du mus. 9*, p. 269.

*Cal.* 5-part. æqualis. *Cor.* infundibuliformis. *Caps.* subbilocularis, bivalvis: dissepimenti contrarii segmentis demum liberis. *Semina* plura, retinaculis subtensa.

1. B. *Brownei*, foliis ovato-ellipticis subdentatis, spicis tetragonis, bracteis ovatis pubescentibus.

Blechum *Brownei*. *Jussieu in annales du mus. 9*, p. 270.

*Ruellia Blechum.* *Willden. sp. pl. 3*, p. 362.

*Frunella elatior*, flore albo. *Sloan. jam. 1*, p. 173, t. 109, f. 1.

*Nat. of the West Indies.* *4.*

iv. 61]

BONTIA. *Brown prodr. 517*, in obs.

*Cal.* 5-part. *Cor.* ringens: labio superiore emarginato; inferiore trifido. *Stigma bilobum.* *Drupa* putamine biloculari: loculis bipartitis 4-spermis.

1. BONTIA *daphnoides*. *Willden. sp. pl. 3*, p. 394.

*Bontia laureolæ facie.* *Dill. elth. 57*, t. 49, f. 57.

*Nat. of the West Indies.* *h.*

iv. 62]

VOLKAMERIA. *Gen. pl. 1056.*

*Cal.* 5-fidus. *Cor.* tubo cylindrico; limbo 5-part. laciniiæ equalibus subsecundis. *Stam.* exserta adscendentia. *Bacca* dipyrena: ossiculis bilocularibus.

1. VOLKAMERIA *aculeata*.

*Volkameria aculeata.* *Willden. sp. pl. 3*, p. 383.

*Clerodendrum fruticosum spinosum*, foliis inferioribus confertis, superioribus oppositis; pedunculis tripartitis trifloris alaribus. *Brown jam.* 262, *t.* 20, *f.* 2.

*Nat. of the West Indies.* ♂.

*Obs.* Genus vix distinctum a Clerodendro.

### CLERODENDRUM. *Brown prodr.* 510.

*Cal.* 5-fid. (nunc 5-dent.) *Cor.* tubo cylindrico; limbo <sup>[iv. 68]</sup> 5-partito patentí lacinii subæqualibus. *Stam.* juxta faucem inserta, exserta, adscendentia: antherarum loculis parallelis. *Bacca* pyrenis 4 monospermis.

1. *C. fragrans*, tomentosum, foliis subcordatis dentatis basi glandulosis, corymbis terminalibus densis hemisphaericis. *Venten. malmais.* 70 (floribus simplicibus.)

*Volkmannia japonica.* *Jacqu. hort. schænbr.* 3, *p.* 48, *t.* 338 (floribus plenis).

*Nat. of Japan and China.* ♂.

2. *C. viscosum*, tomentosum, foliis cordatis dentatis, corymbo terminali paniculato, calycibus viscosis laxis dimidio tubi corollæ longioribus.

*Clerodendrum viscosum.* *Venten. malmais.* 25.

*Peragu.* *Rheed. mal.* 2, *p.* 41, *t.* 25.

*Nat. of the East Indies.* *William Roxburgh, M.D.* ♂.

3. *C. squatum*, foliis cordatis denticulatis subtus squamatibus, panicula terminali divaricata, pedunculis calycibusque coloratis glabris, staminibus corolla tota longioribus.

*Clerodendrum squatum.* *Willden. sp. pl.* 3, *p.* 385.

*Volkameria Kænopferi.* *Willden. sp. pl.* 3, *p.* 385.

*Volkameria Kæmpferiana.* *Jacqu. ic.* 3, *t.* 500.

*Nat. of China and Japan.* ♂.

4. *C. paniculatum*, foliis cordatis quinquelobis subdenticulatis glabris; summis saepius indivisis, panicula <sup>[iv. 64]</sup> brachiata, corollæ tubo calycem multoties superante.

*Clerodendrum paniculatum.* *Willden. sp. pl. 3, p. 388.*

*Clerodendrum pyramidale.* *Andrews's reposit. 628.*

*Nat. of Java and Pulo Pinang.* h.

5. *C. tomentosum*, foliis ellipticis acutis integris, calycibusque tomentosis: fructiferis auctis incrassatis coloratis, corymbis congestis. *Brown prodr. 510.* *Andrews's reposit. 607.*

*Volkameria tomentosa.* *Venten. malmais. 84?*

*Nat. of New South Wales.* h.

6. *C. ligustrinum*, foliis elliptico-lanceolatis integerrimis, petiolis pedunculis calycibusque (5-fidis) hirsutis, corymbis axillaribus, corollæ tubo limbum vix æquante.

*Volkameria ligustrina.* *Willden. sp. pl. 3, p. 383.* *Jacqu. collect. suppl. 117, t. 5, f. 1.*

*Nat. of the Island of Mauritius.* h.

7. *C. heterophyllum*, foliis lanceolatis linear-lanceolatisve integerrimis glaberrimis, corymbis axillaribus terminalibusque, calycibus 5-dentatis pedunculisque glabris, corollæ tubo limbum vix æquante.

*Volkameria heterophylla.* *Poiret in encycl. botan. 8, p. 687.*

*Volkameria angustifolia.* *Andrews's reposit. 554.*

*Nat. of the Island of Mauritius.* h.

iv. 65] 8. *C. inerme*, foliis ovatis ovalibusve integerrimis calycibusque (5-dentatis) glabris, corymbis axillaribus, corollæ tubo limbum aliquoties superante. *Brown prodr. 514.*

*Volkameria inermis.* *Willden. sp. pl. 3, p. 383.* *Jacqu. collect. suppl. 117, t. 4, f. 1.*

*Nat. of the East Indies.* h.

9. *C. Siphonanthus*, foliis verticillatis elongato-lanceolatis integris glabris, corymbis axillaribus paucifloris, corollis longissimis.

*Siphonanthus indica.* *Willden. sp. pl. 1, p. 606.*

388.

- Siphonanthus angustifolia.* Willden. sp. pl. 1, p. 606.  
*Ovidea mitis.* Willden. sp. pl. 3, p. 382. Burm. ind. 136,  
 t. 43, f. 1.  
*Nat. of the East Indies.* William Roxburgh, M.D. h.

MELHANIA. *Forsk. descr.* 64.

[iv. 146]

*Cal.* duplex: exterior 3-phyllo (nunc caducus). *Cor.*  
 5-petala. *Filamenta* 5 alterna sterilia. *Capsula* 5-local.  
*polysperma*: dissepimentis contrariis.

1. M. *Erythroxylon*; calyce exteriore caduco; interiore  
 intus sericeo petalis dimidio breviore, foliis cordatis crenato-  
 repandis: subtus reticulatis tomentosis.

Pentapetes *Erythroxylon*. [Hort. Kew.] Edit. prior 2,  
 p. 438.

*Dombeya Erythroxylon.* Willden. sp. pl. 3, p. 725.  
*Botan. Magaz.* 1000.

*Nat. of the Island of St. Helena.* h.

2. M. *Melanoxylon*, calyce exteriore caduco; interiore  
 intus glabro petalis parum breviore, foliis cordatis integer-  
 rimis utrinque tomentosis lævibus.

*Alcea arbor populinæ fronde tota argentea quinque-  
 capsularis, seu *Ebenus viridis*.* Pluk. mant. 6, t. 333, f. 5.

*Nat. of the Island of St. Helena.* h.

ABROMA. *Gen. pl.* 1217.

[iv. 409]

*Cal.* 5-part. *Petala* 5 unguibus dilatatis saccatis. *Sta-*  
*minum urceolus* 10-fidus: laciniis 3-antheriferis; 5 alternis  
 petaloideis. *Styli* 5. *Caps.* 3-loc. 5-alata, polysperma.

1. A. *augusta*, ramis tomentosis lævibus, foliis adultis  
 subtus pube simplicissima, capsulæ alis apice truncatis:  
 angulo exteriore acutiusculo.

*Abroma augusta.* Willden. sp. pl. 3, p. 1424.

*Abroma Wheleri.* Willden. sp. pl. 3, p. 1425.

# EXTRACTS FROM DR. RICHARDSON'S BOTANICAL APPENDIX

TO THE  
“NARRATIVE OF A JOURNEY TO THE  
SHORES OF THE POLAR SEA.

BY  
CAPTAIN FRANKLIN.”

AND  
ADDENDA

BY  
ROBERT BROWN, F.R.S.

[*Pp. 729—768.*]

LONDON.  
—  
1823.

PLANTS FROM THE  
APPENDIX

TO

CAPTAIN FRANKLIN'S NARRATIVE.

[“In drawing up the list, imperfect as it is, I have received much assistance from able botanists. To Mr. Brown I am under the greatest obligations, not only for the liberal use of the Herbarium and Library, which, so happily for science, have been placed in his possession; but also for the friendly manner in which he aided my researches, and condescended to solve the doubts so frequently presenting themselves to one little versant in these pursuits. In addition to this general assistance, he kindly superintended the botanical drawings, and has enriched my catalogue with the lists of the Cyperoideæ (including the Carices), the Gramineæ, Junci, and Filices, and, with the accounts of the genera Eutoca, Heuchera, and Cryptogramma.”—Dr. RICHARDSON.]

## ADDENDA TO CAPTAIN FRANKLIN'S NARRATIVE.

---

EUTOCA. *Brown.*

SYST. LINN. Pentandria Monogynia, post Hydrophyllum.

CHAR. GEN. *Calyx* 5-partitus, persistens. *Corolla* subcampanulata: membranulæ tubi decem, per paria filamentis alternantes. *Stamina* exserta. *Style* bifidus. *Capsula* polysperma, unilocularis, bivalvis, valvis indivisis medio placentiferis.

ORD. NAT. Hydrophyllæ, *Brown* in (Prodr. Fl. Nov. Holl. 492) *Bot. Regist.* 242, post Phaceliam.

CHAR. GEN. *Calyx* quinquepartitus, sinubus edentulis. *Capsula* polysperma.

Herbæ annue, pubescentes, eglandulosæ. Folia alterna, sæpius pinnatifida, nunc indivisa! Racemi terminales et quandoque e summis alis, secundi, ebracteati, novelli spiraliter revoluti.

*Obs.* Ad hoc genus, a coordinatis (Hydrophyllo, Nemophila, Ellisia, Phacelia,) diversum ovulis placentæ singulæ numerosis (unde nomen), pertinent E. *Menziesii*, (erecta, foliis linearibus integerrimis nonnullis quandoque incisis, ovulis placentæ singulæ viginti pluribus,) quæ forsitan Hydrophyllum lineare, *Pursh*, Am. 1, p. 134; et E. *parviflora* (diffusa, foliis pinnatifidis trifidisve; superioribus quandoque indivisis lanceolatis, ovulis placentæ singulæ 6—8,) quæ

*Phacelia parviflora*, *Pursh*, *Am.* i, p. 140. *Polemonium dubium*, *Linn.*

EUTOCA FRANKLINII, *Tab. 27.*<sup>1</sup>

*Eutoca* erecta, foliis pinnatifidis bipinnatifidisve, ovulis placentæ singulæ viginti pluribus.

*Hab.* Abundantly amongst trees that have been destroyed by fire, on the banks of the river Mississippi.

*Herba* annua, erecta, pubescens, 6-10-uncialis. *Radix* descendens subramosa. *Caulis* simplicissimus teres cavus, crassitiè pennæ columbinæ, fuscus, pilis acutis tenuibus patulis pubescens. *Folia* radicalia conferta, caulina alterna; omnia petiolata exstipulata pinnatifida (in plantis procerisibus bipinnatifida), circumscriptio lanceolata, lacinis lanceolatis integerrimis, inferioribus quandoque dentatis incisisve, plana utrinque viridia pilisque caulinis similibus pubescentia. *Petoli* foliis breviores super canaliculati basi parum dilatata semiamplexanti. *Spicæ* racemosæ breves secundæ, ebracteatae, novellæ arcuato-recurvæ, approximatæ, terminales et e summis alis.

*Calyx* monophyllus, æqualis, quinquepartitus sinibus edentilis, foliaceus, persistens: *lacinæ* lineares acutiusculæ planæ, trinerviæ nervis lateralibus margini approximatis medio venoso, hirsutæ pilis acutis strictis marginalibus crebrioribus longioribusque.

*Corolla* monopetala, hypogyna, regularis, subcampanulata, calyce sesquialongior, glabra limbo extus pube rara consperso, cærulea immaculata, siccatione saepius albescens, decidua. *Tubus* intus nervis 15, ternatim cum staminibus alternantibus, lateralibus ternationis singulæ infra medium auctis membranula linearis imberbi apice subtruncato medium fere tubi attingenti, basi ad ortum filamenti respondentis producta et cum eodem fere confluenti, versus nervum medium conniventi. *Fauax* nuda. *Limbus* tubo brevior, 5 partitus, æqualis, patens, lobis subrotundis integerrimis planis, venosis venis anastomosantibus, æsti-

<sup>1</sup> [See note at vol. i, p. 187.]

vatione imbricatis gemma obtusa. *Stamina* 5, epipetala, æqualia, limbum corollæ paulò superantia. *Filamenta* prope basin tubi inserta cum limbi laciñiis alternantia, filiformia, basi parum dilatata, pilosiuscula pilis longiusculis sparsis in ipsa dilatata basi crebrioribus, æstivatione induplicata. *Antheræ* ovali-oblongæ imberbes, incumbentes, basi semibifidæ lobis approximatis, loculis parallelo-contiguis medio longitudinaliter dehiscentibus. *Pollen* sphæricum simplex lœve, in cunulo albicans.

*Pistillum* altitudine staminum. *Ovarium* liberum, sessile ovatum pilosum, basi auctum disco annulari adnato, uniloculare, placentis duabus parietalibus semiseptiformibus cavitatem fere bipartientibus, polyspermis lateribus ovuliferis ventre plano nudiusculo: *ovulis* plurimis (30 pluribus) in singula placenta confertim nec utrinque seriatim affixis. *Stylus* 1, filiformis pilosiusculus, semibifidus, laciñiis filiformibus æqualibus modice patentibus glabris. *Stigma* obtusa papulosa ipsis apicibus laciniarum styli paulo crassiora.

*Capsula* calyce persistenti parum aucto cincta eoque paulò brevior, ovata modice ventricosa, pilosa, unilocularis, bivalvis, valvis indivisis medio placentiferis, placentis adnatis longitudine fere loculi, lateribus seminiferis ventre nudiusculo. *Semina* numerosa in singula placenta viginti plura maturescentia, parva, circumscriptione ovali, trigona angulis anguste alatis, areolata fusca, nucleo ovali.

#### TABULÆ 27 EXPLICATIO.

EUTOCA FRANKLINII, magnitudine naturali cum foliis duobus separatis, quorum alterum bipinnatifidum ad procerius, alterum ad nanum exemplar pertinet.

Sequentes omnes ad lentem auctæ.

- a. ejusdem. Calyx apertus cum Pistillo.
- b. —— Corolla aperta exhibens paria quinque membranularum tubi et Stamina cum iisdem alternantia.
- c. —— Anthera cum portione filamenti.
- d. —— Ovarii scctio transversalis, exhibens placentas duas parietales polyspermias.

e. Capsula haud penitus matura.

f. Capsulæ sectio transversalis.

g. —— Semen.

1. EUTOCAE MENZIESII, Capsula matura aperta. 2. Ejusdem Capsulæ valvula altera, exhibens placentam seminibus denudatam. 3. Ejusdem Semen. 4. Idem testa remota. 5. Sectio longitudinalis Albuminis Embryonem ostendens.

### HEUCHERA, Linn.

Pentandria Digynia. *Flores pentapetalii, superi, capsulares, cum Vahlia.*

CHAR. GEN. *Caps. unilocularis, placentis 2 parietalibus adnatis polyspermis. Calyx 5-fidus (nunc inæqualis), æstivatione imbricata.*

ORD. NAT. Saxifrageæ inter Tellimam et Vahliam.

CHAR. GEN. *Calyx 5-fidus, æstivatione imbricata. Petala indivisa. Stamina 5. Ovarium uniloculare, placentis duabus adnatis polyspermis. Styli 2. Capsula semi-infera, flore emarcido coronata, birostris, inter rostra dehiscens.*

Herbæ perennes, sæpi rufes. Folia radicalia conferta, elongato-petiolata, cordata, sublobata lobis serrato-incisis; stipulis lateralibus infra adnatis apicibus distinctis: caulinæ, dum adsunt, alterna, minora, brevius petiolata. Scapi paniculati, pedunculis trifidis basi unibracteatis, divisuris bibracteatis.

*Obs.* I. In ordine Saxifragearum locus Heucheræ est inter Mitellam gradifloram, *Pursh.* (*Tellimam nob.*) convenientem capsulæ unilocularis birostris dimidio supero flore persistente tecto, diversam staminibus decem, petalis laciniatis; et Vahliam, *Thunb.* (cujus certè species genuina est Oldenlandia pentandra, *Retz.* quæ Oldenlandia, *Smith in Rees, Cyclop.*) similem floribus pentandris, petalis indivisis, et capsulæ unilocularis dehiscentia, distinguendam placentis ab apice cavitatis pendulis solutis, æstivatione valvata calycis et habitu diversissimo.

*Obs.* II. A Saxifrageis transitus haud difficilis ad *Ribes* structura floris et ovarii admodum simile *Heucheræ*, diver-

sum stylo semibifido, fructu baccato, albumine densiore, et habitu. Attamen vel in eadem prorsus familia cum Ribe includenda, vel in proximo ordine (Escalloneæ) disponenda Escallonia *Mutis.* (*Stereoxylon Ruiz et Pavon*) et nonnulla genera inedita Novæ Hollandiæ, nec non Anopterus, *Labill.* (*et Prodr. Fl. Nov. Holl.* 457) cuius petala distincta, calyci inserta et ovarii capsulaeque basis adhærens. Sed Anopteri cum Saxifrageis affinitas mediante Heuchera in fructificatione saltem obvia, obstante quidem habitu omnino cuin Escalloneis et non Cunoniaceis nec Saxifrageis conveniente.

### HEUCHERA RICHARDSONII, *Tab. 29.<sup>1</sup>*

*Heuchera* calycis limbo inæquali obliquo.

*Hab.* On the rocky banks of rivers from lat. 54° to 64° north.

*DESC.* *Herba* acaulis, perennis. *Folia* radicalia conferta, elongato-petiolata, cordata, diametro sesqui-pollicari, semi-septemloba, lobo medio majore, omnibus inæqualiter serrato-incisis, super scabra subter lœvia, secundum nervos venasque primarias pubescentia pilis brevissimis acutis, eglandulosa. *Petiolus* folio longior, triuncialis, pilosiusculus, scaber, antice canaliculatus. *Stipulæ* laterales infra adnatae, apicibus lingulatis scariosis subciliatis. *Scapus* simplex, erectus, pedalis—sesquipedalis, gracilis, teres, striatus, pilosiusculus, dimidio inferiore pilis acutis divaricatis glandulisque intermixtis paucissimis, superiore pube brevisima glanduloso-capitata copiosa pilisque acutis rarioribus. *Panicula* laxe thyrsoidæ, angusta, ramis alternis bractea linearis apice bi-trifido subtensis, trifidis pericellis lateralibus 1-2-floris medio unifloro præcociore, divaricatis singulis bibracteatis, bracteolis linearis subulatis glanduloso-pubescentibus.

*Calyx* monophyllus, campanulatus, irregularis, persistens, extus glandulis subsessilibus parvis copiosis tectus: *limbus* obliquus 5-fidus, lacinias obtusis obovatis magnitudine

<sup>1</sup> [See note at vol. i, p. 187.]

subæqualibus sed ob faucis obliquitatem altitudine inæqualibus, duabus altioribus paribus impari demissiori, omnibus quinquenerviis nervis venosis, aestivatione imbricatis duabus altioribus reliquas equitantibus.

*Petala* 5, ipsis sinubus calycis inserta, unguiculata, indivisa, brevè ciliata, vix calycis lacinias superantia, persistentia, altiora lamina cuneato-ovata, demissiora sublanceolata, omnia trinervia nervis extus venosis, unguibus, angustis linearibus.

*Stamina* 5, summo tubo calycis inserta, ejusdem laciñis opposita, petala vix superantia, persistentia. *Filamenta* subulata, glabra, laciñis calycis altitudine proportionata. *Antheræ* incumbentes, brevè ovales, obtusæ, loculis parallelo-contiguis, longitudinaliter dehiscentibus. *Pollen* late-ritum.

*Pistillum*: *Ovarium* semi-inferum, uniloculare, placentis duabus parietalibus longitudinaliter adnatis prominulis, cum stylis alternantibus, polyspermis: *ovulis* indefinite numerosis confertis superficiem ventralem lateraque placentæ operientibus. *Styli* duo, subulati, glabri, altitudine staminum. *Stigmata* obtusa imberbia, apicibus stylorum vix crassiora.

*Capsula* semi-infra, dimidio supero breviore calyce aucto persistente cum petalis vix emarcidis et filamentis sæpe antheris orbatis tecto, stylis rostrato, apice bilobo lobis intus dehiscentibus, unilocularis, placentis proportionatim auctis.

*Semina* numerosa, sessilia, ovalia, punctis elevatis acutis longitudinaliter seriatis aspera, altera extremitate obtusiore. *Testa* crasso-membranacea, fusca, facile separabilis. *Mem-brana interna* albumini arete adhærens absque chalaza raphe manifesta. *Albumen* semini conforme, album, carnosum, molle, oleosum. *Embryo* minutus, subovatus albus ad albuminis extremitatem obtusiorem situs. *Coty-ledones* brevissimæ. *Radicula* processu capillari terminata, centrifuga.

## TABULÆ 29 EXPLICATIO.

**HEUCHERA RICHARDSONII**, magnitudine naturali. i. basis dilatata petioli cum stipulis infra adnatis.

Figuræ sequentes ad lentem plus minus auctæ.

a. Flos plurimum auctus. b. Idem hinc longitudinaliter apertus. c. Ovarium longitudinaliter sectum, placentas parietales adnatas accurate, sed perperam stylos infra connatos, exhibens. d. idem transversè sectum. e. Capsula matura flore stylisque coronata, paulo tantum aucta. f. Ejusdem sectio transversalis. g. Semen plurimum auctum. h. Idem testa orbatum.

CRYPTOGRAMMA. *Brown.*

ORD. NAT. Filices. *Gyratæ (Polypodiaceæ)* inter Onocleam et Lomariam.

CHAR. GEN. *Sori lineares* (v. subrotundi) venulis costæ (pinnulæ) obliquis insidentes. *Capsulæ* pedicellatæ, receptaculo communi elevato nullo. *Involucrum commune* (pinnulæ) marginale, continuum, disco venoso, margine scarioso libero saepius induplicato; *partiale* nullum.

*Filiculæ glabellæ*. Frondibus *cæspitosis bi-tripinnatifidis*: *centralibus mutato-contractis fertilibus, exterioribus sterilibus*. *Involucris dorsum totum pinnulæ tegentibus*. *Capsulis breve pedicellatis, annulo incompleto*. *Sporulis obtuse trigonis, lævibus*.

*Obs.* Typus generis est *Cryptogramma acrostichoides*, sed character constructus pro receptione *Pteridis crispæ auctor*. quæ dubia quidem species, ob soros abbreviatos potius subrotundos quam lineares, venulas terminantes sinum ferè involucri occupantes et cito confluentes, tunc æmulantes sorum linearem continuum costæ parallelum *Pteridis*, cum cuius speciebus pinnulis angustatis involucro omnino tectis, habitu benè satis convenit. *C. acrostichoides* habitu et sororum dispositione et forma *Grammitidibus nonnullis*

præsertim *G. leptophyllæ* analoga, diversa frondibus fertilibus distinctis et præsentia involucri dorsum totum pinnulæ tegentis: His notis autem *Cryptogramma* convenit cum Pteridi thalictroidi *Swartz* (à nobis tredecem adhinc annis in *Prodr. Fl. Nov. Holl.* i. p. 154, uti genus distinctissimum indicata). In hoc genere, (*Teleozoma nob.*) Capsulæ sessiles, annulo completo latissimo, distinctæ in serie simplici insident venis costæ parallelis, utrinque vel solitariis marginalibus, vel binis altera superficiaria. *Teleozoma* insuper insigne est sporis in ordine naturali forsan, in tribu quantum scio maximis obtuse trigonis pulchre striatis, puncto unico opaciore.

### CRYPTOGRAMMA ACROSTICHOIDES.

*Cryptogramma*, frondibus bipinnatifidis, sterilium pinnulis ovalibus crenatis; fertilium demum explanatis, soris linearibus discum totum occupantibus.

*Hab.* In shady rocky woods, between lat.  $56^{\circ}$  and  $60^{\circ}$  north. (First found by Mr. Menzies at Nootka Sound.)

*Desc.* *Filix* 4-8-uncialis, glabra, lætè virens, frondibus cæspitosis, stipitatis, crasso-membranaceis opacis venis vix adversus lucem conspicuis.

*Frondes* exteriores cæspitis *stipites*, circumscriptione lanceolatæ bipinnatifidæ apice pinnatæ pinnis distinctis alternis, brevissimè petiolatis; pinnulis confluentibus, ovalibus obtusis, crenatis, inferioribus passim dentatis, omnium venis e costa vix prominula acutangulis distinctis simplicibus bifidisve intra marginem crenaturæ desinentibus. *Stipites* pallidi, subtus semiteretes anticè bisulci, infra medium conspersi squamulis lineari-lanceolatis acuminatis disco fusco-atro limbo pallido, supra glabri. *Rachis* epaleata, angusta, compressa, colore et fere substantia frondis. *Frondes* centrales *fertiles* stipite sterilium longiore alioqui simili insidentes bipinnatæ: pinnæ petiolatæ; *pinnulæ* omnes fructiferæ distinctæ inferiores brevissimè petiolatæ; ante explicationem involucri lineares, limbo utrinque recurvo efformante *involucrum* fornicatum discum

totum operiens pallide viride venosum margine scurioso avenio sciepius induplicato: demum explanatae angusto-oblongae involucro quasi nullo: costa subtus particulis parvis flavis conspersa, venis costae obliquis, altè bifidis fere bipartitis, distinctis.

*Sori* ramulos omnes venarum a basi fere ad apicem occupantes, lineares, distincti sed ita approximati ut discus totus pinnulae explanatae capsulis maturis tectus est, et in hoc stadio filix species Grammitidis vel Acrostichi quasi evadit.

*Capsulae* brevè pedicellatae, turgide lenticulares annulo incompleto, altero lateri infra annuli terminationem transversim dehiscentes, *receptaculo* communi elevato nullo sed venæ parum incrassatae insidentes.

*Sporulae* triangulares, lèves, absque striis manifestis vel puneto opaciōri, in cumulo dilutè flavæ separatim hyalinæ.

## NOTES AND OBSERVATIONS

ON

# INDIAN PLANTS.

*ABELIA*. Brown apud Abel, in Itin. Chin. Append. <sup>16.14</sup>  
B. p. 376.

CALYX foliaceus 5- vel 2-partitus. COROLLA subinfundibuliformis, 5-loba. STAMINA 4, didyma vel subæqualia. OVARIUM 3-loculare; loculis 2 polyspermis, abortientibus tertio 1-spermo, fertili. PERICARPIUM 1-spermum, exsucsum, indehiscens, calycis limbo foliaceo aucto coronatum.  
*Brown MSS.*

Classis Linnæana, *Didynamia Angiosperma*. — *Brown loc. cit.*

Ordo naturalis, *Caprifoliaceæ veræ*, Brown; *Caprifolia-cearum sectio 1.* Juss. Gen. p. 211, *Linnææ prox.* — *Brown.*

Habitus: FRUTICES. FOLIA opposita, petiolata, dentato-crenata vel integerrima. INFLORESCENTIA varia.—*Brown.*

*ABELIA triflora*. (Brown MSS.) Tab. 15.

FLORIBUS corymbi congesti ternatis: lateralibus 3-bracteatis; calycibus 5-partitis; foliis ovato-lanceolatis, acuminate integerrimis.—*Brown.*

This new species of *Abelia* has in its inflorescence <sup>15</sup> nearly the same relation to *Abelia Chinensis*, that *Caprifolium* has to *Xylosteum*; the central flower present in *A. triflora* and in *Caprifolium* being abstracted in *Xylosteum* and in *A. Chinensis*. In a third species (*Abelia uniflora*) sent from China by Mr. John Reevcs, and for a

specimen of which I am indebted to the Horticultural Society, another modification of inflorescence occurs. The peduncles in this species have but one flower, which is considered as one of the lateral flowers, the ovary being subtended by three bracts, placed exactly as in those of the corresponding flower of *Abelia triflora*.

Of the Natural Order *Caprifoliaceæ*, the only certain genera appear to me to be,—*Caprifolium*, *Xylosteum*, *Symporicarpus*, *Linnæa*, *Abelia*, *Diervilla* (to which belongs *Weigelia* of Thunberg, who described the epigynous gland as the ovary which he overlooked) *Triosteum*, and *Leysesteria* of Dr. Wallich. I am not acquainted, however, with any other character distinguishing them from the genera, which have hitherto been associated with them, except the very minute one of the raphe, or adnate portion of the funiculus umbilicalis being on the outer instead of the inner side of the ovulum.—*Brown MSS.*

16]

MATONIA. (*Brown MSS.*)

SORI dorsales, rotundi, ex puncto confluentia venularum plurium orti. INDUSIUM orbiculatum, peltatum. Capsulae sessiles, in serie simplici circa receptaculum dispositæ.—*Brown*.

Ordo Naturalis, FILICES, tribus *Polypodiaceæ*.—*Brown*.

Habitus: *Filix pulcherrima*, laevis, fronde subbipinnatâ. Pinnæ plures hinc superiores, pauciores inde secundæ, omnes pinnatifidæ, lobis integerimis, singulis basi, nunc utroque latere, nunc inferiore tantum monosoris, raro bisoris.—*Brown l. c.*

MATONIA PECTINATA. *Brown MSS.*

INDUSIUM depresso-sphæroideum, capsulas omnino includens, hemisphærio superiore crassiusculo, inferiore tenuissimo, membranaceo, capsulis aretè applicito, et mox subevanido. RECEPTACULUM parvum, paulò elevatum. CAPSULE annulo obliquè verticali incompleto cinctæ. SEMINA angulata.—*Brown MSS.*

The beautiful ramification of the veins, and their union, from which the sorus originates in *Matonia*, is not altogether peculiar to it. Among the genera of *Polypodiaceæ* having an indusium, one remarkable example occurs in a genus as yet undescribed (*Hypoderris*), which with an indusium not materially different from that of *Woodsia*, has exactly the habit of *Aspidium trifoliatum*; while of those genera of *Polypodiaceæ* which are without an indusium, the same kind of vascularity is found in an extensive and very natural section of *Polypodium*, to which *Polypodium phymatodes* and the greater number of those species *soris saccatis* belong.—*Brown.*

COMETES. (Burm. Flor. Ind. p. 39).

[17]

CALYX 5-partitus. PETALA nulla. STAMINA uno calyci inserta, ferè hypogyna, antherifera 5, infrà cum totidem sterilibus membranaceis in ureolum connata. ANTERÆ 2-loculares. OVARIUM 1-spermum, ovulo adscendente funiculo e basi cavitatis orto. STYLUS 1. STIGMATA 3. PERICARPIUM: UTRICULUS calyce persistente inclusus, appendicibus setaceo-ramosis, post anthesin auctis et expansis involueratis. SEMEN adscendens, chalazâ lateralí. ALBUMEN unilaterale. EMBRYO periphericus rectus; RADICULA infera.—*Brown MSS.*

Ordo Naturalis: Cum *Pterantho* Forsk. parvulum tribum efformat, hinc *Illecebries* proximum, inde ad *Amaranthaceas veras* per *Desmochætam*, *Digeram*, et *Saltiam* Nob. hodiè (quæ *Achyranthus papposa* Forsk.) minùs arctè tamen accedens.—*Brown.*

Habitus: HERBÆ (annuæ?) ramosæ oppositifoliæ. FOLIA integerrima, stipulis scariosis, subsetaceis, vel lateralibus liberis, vel basi cum petiolo connatis. PEDUNCULI e superioribus alis alterni, apice 3-flori. BRACTEÆ ternationis singulæ 6, quarum 2 oppositæ communes; reliquæ 4 per paria floribus lateralibus, intra communes pedicello brevissimo insidentibus, pertinentes, subulatæ: singulæ appendice (ramo mutato) axillari, setaceo-diviso, ramulis sub anthesi fasciculatim approximatis, florescentiâ peractâ auctis

et patulis, subdivisionibus singulis bracteolâ subulatâ subtensis.—*Brown*.

COMETES SURATTENSIS. Burm. Tab. 17.

FOLIIS cuneato-obovatis, ellipticisve; ramulis lævibus; stipulis petiolaribus; fructus involueri ramulis fasciculatis, imis deflexis.—*Brown MSS.*

The genus *Cometes*, proposed by the younger Burmannus (in *Flora Indica*, p. 39), was adopted in *Mantissa prima* by Linnæus, whose generic character agrees in most respects with the short description of Burmannus, from which it was no doubt chiefly formed: as, however, it differs in some points, he probably had seen and slightly examined the original specimen, which Burmannus may have taken with him to Upsal, as it is known he carried there for Linnæus's determination many of his rarer unpublished plants. But Linnaeus, in describing the fruit <sup>183</sup> of *Cometes* to be a "*capsula tricocca*," must have presumed on the affinity which he erroneously supposed the genus to have to *Dalechampia*.

Burmannus's specimen of *Cometes surattensis* I have seen in his Herbarium, now in the possession of Baron Delessert. It corresponds tolerably with the figure in *Flora Indica*, which, notwithstanding some differences, was probably made from it.

When engaged in drawing up the catalogue of Mr. Salt's Abyssinian plants, it occurred to me that the genus which I have in that catalogue named *Saltia*, was at least nearly related to *Cometes*; but I had at that time no means of verifying my conjecture. I afterwards, however, requested M. Decandolle to examine the specimen in M. Delessert's Herbarium, and the result of that examination is given in a note attached to the specimen, written by M. Delessert in 1816, in which it is stated, on M. Decandolle's authority, to be a species of his genus *Desmochæta*, or *Pupalia* of Jussieu.

In September of the same year I examined the specimen, and left attached to it the following note, which refers to

M. Decandolle's opinion, as well as to the Abyssinian genus, which I had published :—" Non *Desmochætæ* sed *Saltiæ* species, vid. Catal. Pl. Abyssin. in Itin. D. Salt. *Cometes* nomen restituendum."—R. B.

M. Guillemin, in the *Dictionnaire Classique d'Histoire Naturelle*, tom. 4, p. 356, states that M. De Jussieu, who examined, or at least saw, the specimen in M. Delessert's Herbarium, recognised it to belong to *Amaranthaceæ*, and that M. Decandolle regarded it as a species of *Desmochæta*. M. Guillemin himself, in adopting M. Decandolle's opinion proposes to apply to that genus the older name *Cometes*; and he adds that in a manuscript note in Burmannus's specimen I have proposed to do the same thing. But from that note, which I have already given verbatim, it appears that my proposing to restore the name *Cometes* referred to *Saltia*, and not to *Desmochæta*, to which it was evident to me *Cometes* did not belong.

In the Linnean Herbarium the specimen named *Cometes*, I believe in the writing of the younger Linnæus, proves to be a plant belonging to *Convolvulaceæ*, and it is probably a species of *Convolvulus* or *Ipomæa*.

Burmannus (in *Flora Indica*) has given the specific name of *Surattensis* to his *Cometes*, and that name Linnæus has adopted in his first *Mantissa*. In the twelfth edition of the *Systema Naturæ* (vol. ii, p. 127), published in the same year, but subsequently to the *Mantissa*, he changed the specific name to *alterniflora*, no doubt derived from the account of the inflorescence given both by Burmannus and himself. It is, however, not a very apt name for a plant whose flowers are always in threes, though the common peduncles are generally alternate. I have therefore recurred to the original name.

Sir James Smith, in a (pencil) note on the specimen in the Linnean Herbarium, though aware that the specimen is not really *Cometes*, supposes the specific name last given by Linnæus to have been suggested by it. This might have been the fact had that name been *alternifolia*, which, when he wrote the note, I have no doubt he believed it to be; but the actual name *alterniflora* could not well be

suggested by this plant, which has its flowers in a capitulum.  
—*Brown's MSS.*

COMETES ABYSSINICA. (Brown MSS.) Tab. 18.

FOLIIS linear-lanceolatis, mucronatis, pungentibus; stipulis liberis; ramulis pulvereo-pubescentibus, scabris; fructus involuci ramulis pinnatis, patulis.—*Brown MSS.*

APOSTASIA. *Blume Bijdrag.* p. 423.

[7]

PERIANTHIIUM limbo sexpartito, regulari. STAMINA anterifera 2, quorum FILAMENTA foliolis lateralibus interiorum perianthii opposita, infrà connata cum basi STYLI supra cylindracei, et vel nudi, vel hinc FILAMENTO TERTIO castrato, altiñs adnato, foliolo antico exteriorum opposito, appendiculati. ANTHÈRE biloculares, longitudinaliter dehiscentes. POLLEN e granulis simplicibus, solutis. STIGMA obtusum, obsolete bi-trilobum. CAPSULA trilocularis, polysperma. SEMINA ovata, testâ nucleo conformi.—*Brown MSS.*

This very remarkable genus, founded on *Apostasia odorata*, was first published in 1825 by Dr. Blume in the work referred to; but in 1821 a nearly related species was discovered in the valley of Noakote in Nipal, by the plant collectors of Dr. Wallich, who, in his manuscripts, which I have had the advantage of consulting, named it *Mesodactylis deflexa*, and at the same time had the drawing made which is here given.

I have followed these two distinguished botanists in regarding *Apostasia* as belonging to, or at least as most nearly related to, *Orchidæa*. It exhibits, however, very few of those characters generally considered essential to that family of plants.

In its antheræ, pollen, style, and stigma (all which parts are so remarkably modified in *Orchidæa*), *Apostasia* does not materially differ, either in form, structure, or economy from the more regular-flowered families of *Monocotyledones*; and in its trilocular ovary it is distinguished from all other genera of the order to which it is here appended.

On the other hand, it agrees with *Orchidæa* in the structure, as far as I am able to ascertain, of its minute seeds, in the reduced number of stamens, and probably, with some genera of the family, in the order of their reduction;

in the filaments being at base connate with the lower part of the style, and in a great degree in habit. In endeavouring to estimate the importance of the several points of resemblance and difference here enumerated, with a view to decide on the degree of relationship *Apostasia* bears to *Orchideæ*, it is necessary to consider the relative position of the parts of the flower in that order, and also in *Scitamineæ*, the family most nearly allied to it.

The relation of stamina to the parts of the floral envelope in *Apostasia* is in the first place to be determined. The two antheriferous filaments, which I have more particularly examined in the unexpanded flowers of *Apostasia nuda*, appear to be opposite to the two lateral segments of the inner series of the perianthium; and the sterile filament in *Apostasia Wallichii*, and, no doubt, also in *A. odorata*, is opposite to the anterior segment of its outer series.

Several years since, I advanced the opinion, "That in a complete flower, whose parts are definite, the number of stamina, and also of pistilla, is equal to that of the calyx and corolla united in *Dycotyledones*, and of both series of the perianthium in *Monocotyledones*."<sup>1</sup>

It may be further observed that, in cases of reduction of pistilla, it is generally found that the remaining carpella, when more than one, but inferior in number to that of one series of the floral envelope, correspond in position with parts of both series, and, with very few exceptions, whether distinct or confluent, are all equally developed. Stamina, on the other hand, in cases of equal reduction, generally belong to one of the series only, or, if corresponding with parts of both series, are usually in different states of development, as they are here described to be in two species of *Apostasia*.

This appearance of part of the inner series of stamina has not hitherto been expressly remarked in *Orchideæ*. It is not improbable, however, that the same relation to perianthium exists in the lateral antheriferous stamina of

<sup>1</sup> In 1826, in Appendix to 'Denham and Clapperton's Travels,' p. 237 (vol. i, p. 293).

*Cypripedium*,<sup>1</sup> as well as in the sterile petaloid processes similarly situated in the other genera, as in *Diuris*. And the third stamen of the inner series, still more altered in form, may be considered as present in certain New Holland genera, especially *Glossodia*, where this supposed stamen is placed within the labellum, but entirely distinct from it; in *Epiblema*, *Pterostylis*, and *Chiloglottis*, in which an analogous appendage similarly situated coheres in various degrees with that division of the perianthium; and perhaps it may be considered as indicated in all cases where the labellum is furnished with a process, however minute, arising from its axis.

If the view here taken of the position of the lateral filaments in *Cypripedium* and *Diuris* be adopted, it may be remarked that indications or rudiments of the two stamens necessary to complete the order in *Orchideæ*, of those, namely, corresponding with the lateral segments of the outer series of the perianthium, have not yet been observed in the regular structure of any plant of the order. They have, however, been occasionally met with in monstrous flowers of *Habenaria bifolia*, in more than one spike of which I have found the greater number of flowers triandrous, the three antheræ being equidistant, and placed exactly opposite to the three divisions of the outer series of the perianthium, the inner series of which remains in its ordinary state.

M. Achille Richard<sup>2</sup> has given an account of an <sup>175</sup> analogous monstrosity in *Orchis latifolia*. In this case of a triandrous *Orchis*, M. Richard having adopted the opinion, which I believe I was the first to advance,<sup>3</sup> of the origin or nature of the auriculæ of the anthera of many genera of *Orchideæ*, considers the additional antheræ as formed by the perfect development of these auriculæ. This view, however, cannot be taken of the monstrosity of *Habenaria bifolia*, in which not only the auriculæ of the anterior or ordinary stamen are distinctly present, but two

<sup>1</sup> 'Prod. Fl. Nov. Holl.', i, p. 309.

<sup>2</sup> 'Mém. de la Soc. d'Hist. Nat. de Paris,' i, p. 202.

<sup>3</sup> 'Prod. Fl. Nov. Holl.', i, pp. 309 & 311.

other similar processes, one on the anterior side of each of the additional antheræ, also exist; a fact which throws considerable doubt on the correctness of the view here referred to of the nature of these processes in *Orchideæ*, unless the same hypothesis could likewise be extended to all cases of trifid filaments, as those of *Allium* and *Deutzia*, to which the auriculæ in *Orchideæ* may be said to be analogous.

In *Scitamineæ*, the family most nearly akin to *Orchideæ*, the complete number of stamens may be considered very generally present. Only one, however, is antheriferous; and this perfect stamen, instead of corresponding, as in *Orchideæ*, with the anterior segment of the outer series of the perianthium, is placed within the posterior segment of the inner series, the two remaining barren stamens of the same series being the epigynous glands or filaments existing in all the genera of this order except *Costus*,<sup>1</sup> while the outer series of stamens, very differently modified, form the innermost or supplementary series of the perianthium.

This view of the origin of that series was many years ago communicated to me in conversation by the celebrated Correa de Serra; but was first, I believe, published in 1826 by Professor Lestiboudois, in a memoir<sup>2</sup> in which the correctness of the opinion held, namely, that *Scitamineæ* and *Canneæ* possess rudiments or modifications of six stamens, is remarkably contrasted with the erroneous views taken, or rather adopted, of the greater part of the structures adduced in support of it.

A more accurate account of the relative position of parts was given in 1828 by my ingenious friend Professor Von Martius. In confirmation of the opinion, I may remark that the cells of the ovary, whose relation to the floral envelope appears to be very uniform in *Monocotyledones*,<sup>3</sup> are in *Scitamineæ* opposite to the supposed petaliform stamens, and to the divisions of the outermost series of perianthium. I have formerly pointed out the difference in

<sup>1</sup> 'Prod. Fl. Nov. Holl.,' i, p. 305.

<sup>2</sup> 'Mémoire sur la Canna indica et sur les familles des Balisiers et des Buaniers.'

<sup>3</sup> Appendix to 'Denham and Clapperton's Travels,' p. 243 (vol. i, p. 300).

position of the antheriferous stamen in *Scitamineæ* and that of *Canneæ* or *Maranteæ*, and have remarked that this difference is in some degree analogous to that existing between *Cypripedium* and the other genera of *Orchideæ*.<sup>1</sup>

*Apostasia* in its trilocular ovary differs from all the genera of *Orchideæ*; but an analogous difference occurs in *Scitamineæ*, in which *Globba* is distinguished from every other genus in having its ovary unilocular, with three parietal placentæ. And in both these families it may be proved that the constituent parts of the compound ovary, whether unilocular or trilocular, agree in position or in their relation to the divisions of the perianthium.

Lastly, *Apostasia*, in the economy of impregnation, or the state of the pollen, and the manner of its application to the stigma, probably differs essentially from all *Orchideæ*, except perhaps *Oxyrhopidium* and possibly *Vanilla*. But a similar difference, and in a degree still more striking, exists between *Apocynæ*, as I have formerly proposed to limit that order, and *Asclepiadæ*, which can only be regarded as a subdivision of the same natural class.—*Brown MSS.*

## HUMBOLDTIA.

CALYX bibracteatus, tubo turbinato, limbo quadripartito, lacinia postica (e duabus conflata) binervi. Petala 5 vel (suppressione inferiorum) 3. Stamina 5, omnia antherifera, distincta, fauci calycis inserta, ejusdemque laciniis opposita. Ovarium pluriovulatum, stipite tubo calycis hinc adnato. Stylus subulatus. Stigma capitatum. Legumen (oblongum, compressum, *Vahl*).—*Brown MSS.*

Frutices (vix arbores) inermes. Folia abruptè pinnata, subtùs glandulis nonnullis adpressis instructa. Stipulae foliaceæ, persistentes, peltatum adnatæ, infra insertionem productæ in lobum transversim dilatatum, subtùs foliorum instar glandulosum, (in siccо saltem) sæpiùs reduplicatum stipulamque accessoriam exteriorem æmulanteum. Racemi axillares, pedicellis bracteâ, præter duos calycinos, unicâ caducâ subtensis. Calycis limbus, aestivatione imbricatâ, deciduus, tubum persistente superans. Filamenta aestivatione induplicata. Antheræ versatiles.—*Brown.*

<sup>18)</sup> *H. laurifolia*, Vahl; pentapetala, foliis 3—5 jugis; sti-pularum lobo postico hinc productiore, acuto; ramulorum internodiis superioribus incrassato-fistulosis.—*Brown.*

ii 46;

## RATZEBURGIA PULCHERRIMA, Kunth.

*Ratzeburgia*, Kunth, Revis. Gramin., p. 487.—Spica articulata, rachi flexuosâ. Locustæ in singulo articulo 3. Duæ sessiles, per glumas superiores parallelo-contiguæ, bifloræ. Glumæ valvula inferior cartilaginea, dorso depresso nervoso scrobiculato, apice membranaceo bilobo; superior chartacea planiuscula lævis. Flosculi hyalini mutici; superior hermaphroditus univalvis enervis. Squamulæ hypogynæ 3, quarum duæ exteriores subcollaterales dilatato-cuneatæ retusæ bidentatæ; tertia interior triloba (pro palea superiore habita a Dom. Kunth). Stamina 3. Ovarium imberbe. Styli ad basin distincti, interjecto umbone. Stigmata coarctato-plumosa. Flosculus inferior neuter univalvis ob-

soletè binervis marginibus inflexis. Locusta tertia pedicello libero insidens, neutra, univalvis.—*Brown MSS.*

Gramen perpulchrum, humile, stoloniferum, glabriusculum. Culmi adscendentes, monostachyi. Folia brevia, rigidinscula, plana, nunc conduplicata, obtusa, marginata, vaginâ compressâ, ligulâ imberbi, indivisiâ.—*Brown.*

*Obs.* *Ratzeburgia* may be readily distinguished from all the other genera of *Paniceæ*, as I have defined that extensive tribe, in having at each joint of its rachis three locustæ, of which two are sessile, fertile, and without aristæ, while the third, which is merely rudimentary, consisting of a single valve, is supported on a pedicel entirely distinct from the rachis.

In most of these characters, indeed, it agrees with *Mnesitheæ* of Kunth (*Rottböllia perforata* of Roxburgh), which differs, however, in having the pedicel of its third still more imperfect locusta, connate at both extremities with the rachis, and thus contributing to form the perforated joints so remarkable in this genus. In *Mnesitheæ* M. Kunth considers the upper valve of the glume as belonging to a third univalvular neuter flosculus—an opinion which seems to be founded solely on its membranaceous texture, and which, if adopted, would exclude this genus from *Paniceæ*, as I have defined them, a definition which M. Kunth certainly does not adopt, as he has included in his tribe of *Rottbölliaceæ* several genera belonging to *Poaceæ*, namely, *Lepturus*, *Oropetium*, *Psilurus*, and *Nardus*.

According to the view here taken of the structure of the two genera, *Mnesitheæ* would have nearly the same relation to *Ratzeburgia* in its more important characters than *Rottböllia* has to *Ischænum Rottböllioides*, ‘Prodr. Flor. Nov. Holl.’ which I have in that work suggested might form a distinct genus. This genus has very recently been adopted by M. Brongniart, and named *Cælorachis*, with a character, however, which, as far as regards the structure of the pedicelled locusta, is so limited as to exclude both *Ischænum Rottböllioides*, whose pedicelled locusta contains an hermaphrodite and a neuter flower, and *Rottböllia Cælorachis* of Forster, in which that locusta contains two male flowers

This last degree of development of the pedicelled locusta extends to other species, and such species differ from *Manisuris* merely in the form of the outer valve of the gluma of the sessile locusta.

Two other views, different from that here adopted, of the structure of *Ratzeburgia*, have been taken; the first by M. Kunth, who considers, and perhaps more correctly, the third squamula as the upper valve of the hermaphrodite flower. According to the second view, which is obviously suggested by the figure, the locusta would be regarded as containing one flower only.—*Brown.*

## PLANTÆ JAVANICÆ RARIORES.

---

In the postscript to the 'Plantæ Javanicæ' Dr. Horsfield states—"On my arrival in England my zoological collections required my first attention, both with a view to their preservation and to their exhibition in the Honorable Company's Museum. It was therefore no less advantageous to myself than important to science, that Robert Brown, Esq., with a ready and disinterested zeal, undertook the examination and arrangement of my Herbarium. After much time and labour, every specimen of an extensive series of duplicates was examined, all the species of each genus were brought together, the entire Herbarium was distributed into families according to the natural method, and the basis of an accurate catalogue was formed. By this operation the number of species composing the Herbarium, which had previously been vaguely estimated, was determined to be 2196.

"While engaged in this arrangement Mr. Brown noted in each family those subjects which appeared to possess the greatest interest, either on account of their novelty, or of their peculiarity of structure; and from the subjects thus noted he finally made a selection, which it was proposed to publish under the title of '*Plantæ Javanicæ Rariores.*'

"It was at the same time determined that a series of figures for the illustration of all the subjects to be described in the work should be prepared. Although a considerable number of drawings had been made in Java by native

artists, these were found useful only in the representation of the general character and habit of the subjects. Mr. Brown therefore undertook the task of preparing such dissections as were necessary for the illustration of the generic characters, or other interesting points of structure, and of generally superintending the execution of the drawings; to this portion of the work Mr. Brown cheerfully devoted particular care and attention, and his experience in analysis of vegetable structure will be duly appreciated by Botanists.

"After the completion of the drawings and of the illustrative details, the subjects were put into the hands of the engraver, and Mr. Brown commenced the preparation of the text. In the prosecution of this task his public engagements, and other important scientific inquiries accumulating in a degree beyond what was expected when he commenced the work, it was agreed between Mr. Brown and myself that the original plan should be modified, and that the assistance of a coadjutor should be obtained.

"On this point I have the satisfaction to state that J. J. Bennett, Esq., Mr. Brown's assistant in the Botanical Department of the British Museum, was found willing to prepare for the press such articles as were left unfinished by Mr. Brown, and likewise to co-operate generally in the preparation of the work. Mr. Brown has, agreeably to his original intention, contributed his remarks on the affinity and structure of the subjects described; he has also afforded many valuable suggestions in the progress of the work, and the whole has received his examination and revisal.

"I embrace with pleasure and satisfaction the opportunity now afforded me of publicly expressing my great obligations to Mr. Brown. The examination and arrangement of my Herbarium, the laborious duties connected with the superintendence of the figures contained in this work, the preparation of the illustrative details, and the time devoted to the description of the subjects, are by no means the only marks of friendship which I have received

from that distinguished Botanist; who ever since his arrival in England has afforded to me his advice and assistance in my researches connected with Natural History, and on many other important occasions."

[The Extracts which follow are limited to Mr. Brown's direct contributions, but his invaluable suggestions enrich almost every page of the work.—EDIT.]

## POLYPODIUM (DIPTERIS) HORSFIELDII.

TAB. I.<sup>1</sup>

CHAR. SUBGEN. (DIPTERIS) *Sori* subrotundi, sparsi (v. transversim subseriati), inter (frondis palmatae) venas primarias dichotomas earumque divisiones, venulis divaricatissimis anastomosantibus incidentes. *Indusium* (verum) nullum.

*Caudex repens teres.* Frondes elongato-stipitatae binatae; partiales dimidiatae palmato-lobatæ. Venulæ secundariae tertiariae et ultimæ divaricatissimæ, crebre anastomosantes, penultimæ latere soriferæ, ultimæ apice vix dilatato libero. *Indusium* spurium vel (in D. Horsfieldii) *pili sorum cingentes et capsulis intermixti*; vel (in D. Wallichii) *materia pulposo-gummosa capsulas immaturas obtegens*.

POLYPODIUM (DIPTERIS) *Horsfieldii*, frondis binatae palmatae subtus glaucae lobis serratis, soris pilosis.

Dipteris conjugata. *Reinw. in Syllog. Pl. Nov. Soc. Bot. Ratisb.*, tom. ii, p. 3.

Polypodium Dipteris. *Blume Enum. Pl. Jav.*, p. 135.

DESCR. *Filix* 2—3-pedalis, vel elongatione stipitis usque orgyalis. *Caudex repens* crassitie pennæ olorinæ fibrillas copiosas nigricantes subramosas dimitens squamisque rigidis strigosis atris subulatis setaceo-acuminatis tectus, solidus, constans ligno quasi dupli, utroque e cellulis elongatis inipunctatis utrinque acutis composito, cum strato interposito tubum completum constitente, e vasis scalari-

<sup>1</sup> The Plates of "Plantæ Javanicæ Rariores," not being at present accessible, will not be given among the Illustrations. They are entirely systematic, and the reader is referred for them to the original work.—EDIT.

formibus in laminam transversim interrupte striatam vix definitæ latitudinis facile, ut in plerisque Filicibus Lycopodineisque, solubilibus. Stipites elongatae frondem ipsam saepius superantes crassitie pennæ anatinæ, adultæ glabræ lœves pallidè castaneæ teretiusculæ anticè canaliculatae; vasis scalariformibus tubum ferè completum anticè deficiente efformantibus. Frondes ad basin usque bipartite potiusve binatae; partiales dimidiatae palmato-lobatae, lobis incisis indivisisque acuminatis serratis; novellæ utrinque tectæ vellere ferrugineo-castaneo e pilis articulatis laxis constante; adultæ glabratæ pilis nonnullis secundum latera venarum primarium aliisque soros cingentibus relictis. Venæ primariæ dichotomæ validæ, subter prominentes teretes, super vix emersæ, divisionibus ultimis saepe infra apicem acuminatum lobi conniventibus et unitis. Venulae secundariae et tertiariae divaricatissimæ creberimè anastomosantes areolas subquadratas sed amorphas efformantes, ultimæ liberæ apice vix dilatato. Epidermidis areolæ minutæ parietibus paulo flexuosis. Stomata in pagina tantum inferiore. Sori parvi subrotundi passim e confluentia duorum amorphi, lateribus venularum tertiarium saepiusque ubi plures confluent insidentes, novelli pilis articulatis copiosis semitecti, adulti pilis brevioribus capsulis interstinctis. Capsulæ brevè pedicellatæ annulo verticali incompleto lateribus areolatis. Spora lœvia subovalia inaequilatera margine altero convexo altero rectiusculo.

Obs. I.—Dr. Horsfield, who discovered this remarkable species in 1814, has the following observations respecting it.

"I have four localities for this Fern. The most western is the mountain Karang, situated south of Bantam; next the mountain Gede, south of Batavia; proceeding westward, Ptarangan; and finally Mount Prahu; the latter lies south-west of Samarang. It is remarkable that I never noticed it in my numerous excursions through the eastern provinces; and I have concluded that it is not at all, or at least that it is very rarely, found eastward of the longitude of Samarang, which lies near the middle of the island, as far

as regards its extent from west to east. From its striking physiognomy it could not, I think, have escaped my notice.

"It grows in clusters with fronds of different height, the tallest often equalling five or six feet.

"Its range is above that at which rice can be cultivated in Java, which is about 5000 feet above the level of the ocean. It springs from the black vegetable mould, which very generally covers the mountains of Java."

OBS. II.—Before entering on the subject of the affinities of *Polypodium (Dipteris) Horsfieldii*, there are some parts of its structure deserving of notice.

In the first place, the existence of the complete circle of vasa scalariformia separating the ligneous or fibrous vessels of the caudex into an outer and inner portion, though not peculiar to *Dipteris*, seems to be of rare occurrence among Ferns. It exists, however, in the caudex of *Platyzoma* (though not in that of *Gleichenia*) ; and I have observed it also in some (probably it will be found in all) species of *Anemia*.

I have described *Polypodium (Dipteris) Horsfieldii* as having hairs surrounding the sori, and mixed with the capsules, while in the nearly related species *Polypod. (Dipteris) Wallichii*, the capsules, even when fully formed, are imbedded in a gum-like pulpy substance, the remains of which may always be found, even after the spora are discharged. In the dried specimens examined this pulpy substance had no appearance of organization ; in the living plant, however, it will probably be found to be minutely cellular, as I have observed in the nascent sori of several species of *Polypodium*, in which the production of this cellular pulp precedes the formation of the capsules, and is generally evanescent soon after they become visible. The peculiarity in *Polypod. (Dipteris) Wallichii* probably, therefore, consists merely in the longer duration of this substance, in which perhaps the capsules of the greater number of *Polypodia* are formed.

<sup>31</sup> OBS. III.—The Fern here described, and the nearly related species *Polypodium (Dipteris) Wallichii*, form a very

distinct section or subgenus of *Polypodium*, to which they must be referred, while the characters of that genus consist merely in its round sori, and absence of true indusium. But in adding two species, having so singular a habit, to a genus already too extensive, and including so many different forms, it must be evident that the present sources of generic distinction in this Natural Family are very insufficient for its satisfactory analysis.

The number of Ferns at present known, including unpublished species existing in collections, may be stated at upwards of 1800. The Family has been subdivided into five primary groups. These groups are strictly natural; they are not, however, of equal value as to the importance of their characters, and they are extremely unequal in extent; the great mass belonging to that called *Polypodiaceæ*, which has been divided into upwards of fifty genera, and contains about 1600 species. Of this number nearly one half, or 800, belong to five genera, namely, *Polypodium*, *Aspidium*, *Nephrodium*, *Asplenium*, and *Pteris*, as they are at present constituted, *Polypodium* alone consisting of about 300 species. The extent of *Polypodium*, therefore, renders its subdivision into natural sections or subgenera absolutely necessary.

For such subdivision, not in *Polypodium* only, but in other extensive genera of Ferns the most obvious, as well as the most advantageons source of character seems to be the modifications of vascular structure, or the various ramifications of the bundles of vessels, or veins of the frond, combined with the relation of the sori to their trunks or branches.

On this subject many important observations have been made, and subdivisions founded on them proposed by several writers, especially MM. Bory, Gaudichaud, Kaulfuss, Ad. Brongniart, and Blume. I may add, that I have at a still earlier period<sup>1</sup> introduced the ramification and relation of sori to veins into the definitions of several genera, in which these characters had not been before employed, and have more recently,<sup>2</sup> in treating of *Matonia*, pointed out a natural and extensive group in *Polypodium*,

<sup>1</sup> [‘Prod. Fl. Nov. Holl.’ i, p. 156-8.]

<sup>2</sup> [Antè, pp. 542-3.]

as being readily distinguishable by the sorus originating at the point of confluence of several veins.

With respect to *DIPTERIS*, the section to which our plant belongs, there is no difficulty in distinguishing it from all other groups of *Polypodium*, and particularly from that now alluded to, if the dichotomous ramification of the primary veins be admitted into its definition. And as that ramification may be said to be necessarily connected with the peculiar division of the frond, this section, so constituted appears to rest on characters at least as important as those of several groups at present generically distinguished from *Polypodium*, as *Cyclophorus*, *Pleopeltis*, *Adenophorus*, and even *Grammitis*, *Selligea*, and *Meniscium*.

If, however, the dichotomous primary veins are left out of consideration, no sufficient character remains to distinguish *Dipteris* from that section of *Polypodium*, including *P. quercifolium*, *diversifolium*, and several other species, and which M. Bory has established, chiefly from the presence of dissimilar sterile fronds, as a subgenus under the name of *Drynaria*. But the existence of these sterile fronds being neglected, *Drynaria* cannot be separated from that more extensive section comprehending *P. phymatodes*, *lycopodioides*, &c., and to which (including *Drynaria*) I have referred in my observations on *Matonia*, in Dr. Wallich's *Plantæ Asiaticæ Rariores*.<sup>1</sup>

These three subdivisions of *Polypodium* agree in having their sori placed on the point of confluence, or perhaps sometimes of divarication, of several branches of the anastomosing veins; and *Dipteris* being distinguished by its dichotomous primary veins, the remaining two sections may form one subgenus, for which the name proposed by M. Bory may be adopted.

In many species of *DRYNARIA* so constituted, the principal vein of the sorus is manifestly that in which the tendency to produce capsules is generally the greatest in the natural order; namely, the lowest branch of the upper or inner side of the primary vein, or that branch which in the appendix to Captain Flinders's *Voyage*<sup>2</sup> is considered as

<sup>1</sup> [*Antè*, p. 543.]

<sup>2</sup> [Vol. i, p. 60.]

having a relation to two different trunks; in other species, in those particularly where the sori are most numerous, and not confined to that branch, it is often difficult to determine the most important vein of the sorus; and in *Dipteris* it is hardly practicable.

From *Drynaria*, and from those species of it especially in which the principal vein of the sorus is distinctly marked, the transition is easy to *Polypodium aureum*, *decumanum*, and a few other species having anastomosing veins, and in which the sori are placed on the apices of two, or more rarely three, connivent ultimate ramuli, included in an area formed by the anastomosing secondary veins. But these species, from the identity of habit, may be included in, or appended to, a more extensive group, whose anastomosing veins form areæ or meshes, in each of which only one sorus exists, and that terminating a single included branch. This section, which may be named *PHLEBODIUM*, and whose species have either pinnate, deeply pinnatifid, or more rarely simple fronds, appears to me strictly natural, though it includes several species having the spurious indusium of *Pleopeltis*, and at least one with an oval or even oblong sorus.

Next to *Phlebodium* in affinity, as well as in the arrangement of the sori, may be placed a group, most of whose species have simple fronds, and all of which are natives of America. In this group, which may be distinguished by the subgeneric name *CYRTOPHLEBIUM*, the primary parallel veins are connected by transverse arched branches, from the convex upper side of which generally three (and never more than three) upright parallel simple veins arise, terminating within the area included between the proximate transverse arched branches: of these simple tertiary ramuli the two lateral are soriferous, generally below the apex, the middle branch being always sterile. In one species at least this branch reaches, and is united with, the arched secondary vein above it; and in a few others it is entirely wanting. This arrangement in *Cyrtophlebius* produces two series of sori between each primary vein, except in the lowest area, or that next the

midrib, in which there is one only, and that terminating the single vein exactly as in *Phlebodium*, into which this group passes by species having the habit of *Cyrtophlebium*, but with fronds so narrow, that they are reduced to the lowest areolæ, and consequently agree in character with *Phlebodium*.

An arrangement of veins and of sori analogous to *Cyrtophlebium* exists in the real species of *CYCLOPHORUS* or *Niphobolus*, none of which are natives of America: in all these the secondary veins are straight and parallel, instead of being arched; they are also given off at an angle more or less acute from the primary parallel veins, which they connect; and the tertiary or ultimate branches originating only on the upper side of each secondary vein are parallel with each other, more than three in number, and all of them bearing terminating sori.

An extensive and strictly natural group may be next noticed, though it cannot be considered nearly akin either to any of the preceding sections or to the principal part of that which follows.

This group or subgenus, the *LASTREA* of M. Bory, whose fronds are either bipinnatifid or simply pinnate, is chiefly intratropical. Its character consists in the secondary veins of the pinnate, and the only veins of the segments of the bipinnatifid fronds being perfectly simple and parallel, with one known exception reaching the margin of the segment, or in the pinnate species uniting with the corresponding vein, and each bearing a lateral sorus, generally about the middle, in some cases near the base, and in a few others proceeding from the base itself.

The closest affinity of *Lastrea* is not to any group of *Polypodium*, but to that section of *Gymnogramma*, the division of whose fronds, and the disposition of veins, are exactly similar, and in which the sori form very short lines of like origin. As the only distinction therefore consists in a difference, generally very slight, in the form of the sorus, it appears to me (and Dr. Blume has made a similar remark) that these two tribes cannot be generically separated, especially as species belonging to both agree in

having pilose capsules; and it is at least certain that the section of *Gymnogramma* referred to should be removed from that genus, and if still distinguished as a genus or subgenus, might receive the name of *PIEUROGRAMMA*.

This section is also manifestly related to *MENISCİUM*, which, though readily distinguished by its technical character, may be considered as a subgenus of *Polypodium*, nearly approaching in vascular structure to the pinnate species of *Lastrea*, but differing in the sori terminating the corresponding veins at their point of junction, and by their confluence forming a semilunar line. It is deserving of remark, that in some, and especially the original species of *Meniscium* in that part of the frond where the power of producing capsules is the weakest, the sorus is transferred from the point of union of veins to the upright branch arising from that point, and from semilunar becomes round or sublinear.

*Lastrea* may even be considered as approaching in affinity rather more nearly to that section of *Nephrodium*, which M. Gaudichaud has separated under the generic name of *Polystichum*, than to any subdivision of *Polypodium*; an approximation which appears to be confirmed by more than one fern, entirely agreeing in habit, in undivided veins and lateral fructification with this group of *Nephrodium*, but having a short linear sorus, with an Indusium of corresponding form, inserted by its longitudinal axis in the middle of the sorus. To this group the name of *MESOCHLÆNA* may be given; and though in general appearance it is abundantly different from *Didymochlæna*, it can only be distinguished from that genus, according to my view of the structure of its indusium, by its simple veins and lateral sori.

The most extensive but least natural section of *Polypodium* is that in which none of the veins anastomose, the sorus standing either on the apex, generally more or less dilated, of the branch, or distinctly below the apex, which is then scarcely or not at all dilated; the vein when simple, or its upper sciriferous division when branched, terminating within the margin of the frond or pinna.

*Polypodium vulgare* is one of the best examples of this section, which, however, comprehends species with undivided, pinnatifid, pinnate, bipinnate, and even decompound fronds, and these as various in texture as in division. Many species are found within the tropics; but the section includes all the European Polypodia and most of those found in the higher latitudes of the southern hemisphere.

As this section includes many of the earliest described species of *Polypodium*, it would require, if retained entire, no subgeneric name. But in a complete analysis of the genus it ought to be divided. The strictly natural subdivisions, however, can hardly be characterised from modifications of vascular structure alone; and I have not yet been able to detect sufficient differences, either in the capsules or seeds, by which they may be distinguished.

That subgeneric or sectional characters may in several instances be obtained or assisted from the seeds of this Natural Order is not improbable, and in one case, namely *CERATOPTERIS* (or *Teleozoma*), including *Parkeria* in that genus, even the generic character appears chiefly to reside in the seeds, which in their unusual size and peculiar marking or striation entirely agree in all the species of the genus, while in the original species the annulus is nearly complete; and in *Parkeria*, differing from the rest of the genus in no other point whatever, the ring is reduced to a few faint striae.

I. *Fig. 1.* A frond of *Polypodium (Dipteris) Horsfieldii*, of the natural size. *Fig. 2.* A portion of the under surface magnified, showing the arrangement of the veins and sori. *Fig. 3.* Another portion of the same, from which a sorus has been removed to show its insertion. *Fig. 4.* A sorus, more highly magnified. *Fig. 5.* A capsule before bursting. *Fig. 6.* A capsule after bursting. *Fig. 7.* Sporules.

## ATAXIA HORSFIELDII.

[8]

## TAB. III.

*ATAXIA, Br. in Chlor. Melv. p. 35. Kunth, Agrost.  
Synopt., p. 39.*

CHAR. GEN. *Gluma* locustam trifloram subæquans. *Flosculus inferior* masculus bivalvis; *intermedius* univalvis neuter: uterque dorso aristatus; *terminalis* hermaphroditus diandrus.

Gramen tam habitu quam structurâ inter *Anthoxanthum* et *Hierochloam* medium, pariterque odoratum. *Gluma* inæquivalvis. *Flosculi a basi brevissimâ persistenti racheos conjunctim solubiles*. Valvula superior hermaphroditi flosculi uninervis; staminibus axibus valvularum oppositis.

OBS. *Ataxia* along with *Hierochloe* and *Anthoxanthum* form a very natural and well characterised section, which belongs rather to the tribe *Avenaceæ* than to *Phalarideæ*; and these three genera are in reality so nearly related that they may perhaps be more properly considered as sections of one and the same genus; or at least *Hierochloe* and *Ataxia* might be united. It is deserving of notice that in all of them the upper valve of the hermaphrodite flosculus has a single nerve occupying its axis, and that one of the two stamens is placed opposite to this nerve. The co-existence of these two characters, both of which are remarkable deviations from the usual arrangement in *Gramineæ*, seems to invalidate the hypothesis respecting the composition of the inner valve of the flower in this family.<sup>1</sup> It might, however, be assumed that the median nerve in these genera is formed of two confluent cords, a view to a certain extent supported by the somewhat analogous structure in the corolla of *Compositæ*. It might also be assumed

<sup>1</sup> General Remarks, &c. in Flinders's Voyage, vol. ii, App. p. 580 [vol. i, p. 55].

that the stamen belongs to the inner or complementary series, which is rarely developed in triandrous genera. One remarkable apparent exception to the usual order of development of stamina occurs indeed in a genus of grasses found in Abyssinia by Dr. Rüppell, to whom I am indebted for the specimens I have examined. In this genus the locusta contains apparently a single flower, of which the gluma consists of two minute obtuse nerveless valves; the perianthium is formed of two valves nearly equal in size, form, texture, and nerves, which are three in number, the middle nerve of each valve ending in a seta; the stamina are three in number, but instead of being inserted as I have described those of triandrous grasses generally to be, they are placed within the upper or inner valve, the middle stamen being opposite to the median nerve; the embryo also is placed on the side of the inner valve: hypogynous squamulæ are entirely wanting. If the flower here described be really simple, it would present a still more formidable objection than *Ataxia* to the composition of the inner valve of the perianthium. But the arrangement of stamina, and direction of scutellum or embryo, suggest another hypothesis with respect to the Abyssinian genus; namely, that the flower is not simple, but made up of two flowers reduced to their outer valves. This latter view I am disposed to adopt, not only on considering the usual order of suppression of the parts of the floral envelope in grasses; but from the same degree of reduction actually existing in several *Paniceæ*, to which primary division of *Gramineæ* the Abyssinian genus would according to this view belong. It may be added that the genus referred to very remarkably agrees, both in habit and structure, with an unpublished genus discovered by Ehrenberg, likewise in Abyssinia (*Podopogon*, Ehrenb. MSS.), and which unquestionably belongs to this primary division of the order.

**DESCR.** Herba annua, erecta, glabriuscula, pube brevi articulata acuta rara conspersa. *Radix* fibrosa. *Caulis* teres, succulentus, crassitie pennæ anserinæ, 3—12-uncialis, modo simplicissimus saepius parum ramosus, ramis ad ortum cum ipsa basi petiolorum confluentibus saepe duobus <sup>103</sup> v. tribus seriatis, inferiore (cauli proximo) præcociore. *Folia* alterna, petiolata, exstipulata, integerrima, membranacea, lætè viridia, circumscriptione subovata cum acumine brevi, inæquilatera, basi hinc altè et ad nervum usque excisa inde rotundata, venis primariis vix eminentibus costata, venulis immersis, ultimis obsoletis, utrisque pube in adultis rarissima instructa, quandoque glaberrima,  $2\frac{1}{2}$  usque 4 pollices longa. *Petioli* antice canaliculati 1— $1\frac{1}{2}$  unciales. *Racemi* terminalis et axillares, simplicissimi, secundi, 2—4-unciales, rari, basiflori, pedicellis alternis recurvis unifloris unibracteatis. *Bracteolæ* vel subtendentes vel ipso pedicello insidentes, angustissimè lineares subfiliformes, erectæ, virides, pedicellis breviores. *Flores* deflexo-porrecti, cœrulei. *Calyx* liber, tubulosus, 5-gonus, viridis, subbilinearis, æqualis, persistens; *tubi* lateribus planis, angulis in aciem alamve angustissimam extantibus, minutè denticulatis, basi obtusa æquali; *limbi lacinii* semilanceolatis acutis saepius acutiusculis tantum, aestivatione valvata alabastro acuto. *Corolla* monopetala, lætè cœrulea, glaberrima, personata; *tubus* calyce longior subcylindraceus: *sau*x clausa arcu elevato transverso tenuissimè pubescenti ad basin utriusque labii, inferioris stria verticali brevi in areas duas pro receptione antherarum distincto: *limbus* bilabiatus: *labium superius* brevius, bifidum, respectu axeos racemi adscendens, lobis obtusis sinu rotundato; *labium inferius* lingulatum, cœruleum basi macula flava insignitum, apice semitrifido lobulis obtusis, lateralibus nanis. *Stamina antherifera* duo inclusa; *filamentis* sinubus lateralibus labii inferioris suboppositis, compressis, adscendentibus, glabris: *antheris* reniformibus, imberibus, conniventibus leviterque coherentibus, violaceis, bilocularibus, loculis basi divaricatis apice confluentibus, utriusque valvula interiore breviore et angustiore: *pollen* brevè ovale, obtuse trigonum. *Filamenta sterilia* tria, quorum *duo* sinubus

interlabialibus respondentia, apicibus simplicibus acutiusculis : tertium nanum axi labii superioris oppositum. *Ovarium* liberum, sessile, ovatum, compressum, glabrum, viride, utrinque sulco longitudinali axi placentæ lateralis respondentí insculptum, uniloculare, polyspermum : *placentis* duabus parietalibus, lateralibus, e lamina angusta ortis, bilobis, lobis planis, utrinque et per totam ferè superficiem ovuliferis. *Stylus* filiformis glaber pallidus, situ et longitudine staminum antheriferorum, diu persistens. *Stigma* depresso-capitatum indivisum papulosum stylo manifestè crassius. *Vaginula* hypogyna incompleta, venoso-striata, glaberrima, subtruncata sèpè lobata. *Capsula* deflexa, calyce persistenti arctè cincta ejusque longitudine, ovata, compressa, utrinque sulco longitudinali insculpta, unilocularis, bivalvis. *Placentæ* parietales duæ, axibus valvularum lamina angusta in lamellas duas fissilæ adnatæ, bilobæ, lobis expansis utrinque seminiferis. *Semina* undique versa, parva, numerosissima, elliptico-oblonga utrinque acuta, basi funiculo brevi crassi sculo pallido affixa ; *testa* crassiusculo-membranacea ; *membrana interna* obsoleta. *Embryo* ex-albuminosus, aqueo-pallidus, cavitatem testæ replens, rectus ; *cotyledones* breves ; *radicula* teretiuscula umbilicum attingens.

I observed the plant here described and figured in the Island of Timor near Coepang, chiefly in shady places, but sometimes in more exposed situations, in April, 1803. The same species was several years after collected in many parts of Java by Dr. Horsfield, who states that it grows "in shaded situations at no great elevation above the ocean, near rivulets and ponds, rarely in forests ; and that the native name is *Turu-pencheng*." If I am correct in referring *Rhinchoglossum obliquum* to our plant, it was observed also by Dr. Blume in mountainous situations of the same island, flowering in February.

By Dr. Wallich it was found in Nepal, Sylhet, and also in Martaban ; for although he has considered the plant from the last-mentioned region as a different species, named *L. intermedia* in his list, and for which Mr. Bentham has

proposed a specific difference, yet I find that the greater number of specimens collected in Nepal in 1819, and sent by Dr. Wallich to Sir Joseph Banks in the following year, have the deeply divided calyx with very acute and narrow segments characteristic of *L. intermedia*, while among the specimens from Martaban, in Dr. Wallich's Indian Herbarium, in the Museum of the Linnean Society, both states of calyx occur. But though I am not disposed to regard these differences in calyx as of specific importance, it is right to state that all the specimens which I have examined from Java and Timor, as well as those from Jurreepanee in the collection of Dr. Royle, agree in having the broader less acute and shorter segments of calyx, as represented in Mr. Bauer's figure, and also in that of Dr. Wallich.

With respect to the generic name *Loxotis* here adopted, it is that which I first gave in my manuscripts to the plant now described. This, however, I many years ago changed to *Antonia*, in compliance with the request of my lamented friend and fellow-traveller Mr. Ferdinand Bauer, to whom I was indebted for the figure here published. But as that name, by which it was introduced into a celebrated flower piece, painted in honour of the late Baron Jacquin at Vienna, and well known to the botanists of that capital, was never otherwise made public, and as *Antonia* of Pohl since published in his work on the "Plants of Brazil (vol. ii, p. 13, tab. 109)" is sufficiently established as a genus, I have been obliged to recur to my original name, under which indeed it has already appeared in Mr. Bentham's "Essay on Scrophularinæ Indicæ." The name *Loxotis*, however, may now be objected to from its too close resemblance in sound and identity of meaning, to *Loxoria*, another genus of the same family, more recently established by Dr. Jack; and the specific name *obliqua* is hardly less exceptionable, being merely a translation of that of the genus. This difficulty would be easily removed were it absolutely certain that *Rhinchuglossum* of Dr. Blume was identical with *Loxotis*; but from some of the characters ascribed to it I am not entirely satisfied that such is the case; and, indeed, as it is arranged by its author with *Rhinanthæa*, had I not re-

marked that it had been referred with a doubt to *Cyrtandraceæ* by Professor Lindley, in his enumeration of the genera belonging to that family, I should probably have overlooked it altogether, as I had previously done with respect to *Epithema* of Blume, which the author included in *Primulaceæ*, though unquestionably the same genus with my *Aikinia*, also belonging to *Cyrtandraceæ*.

With regard to the genus itself, it may be doubted whether *Loxotis* and *Glossanthus* ought to be generically distinguished merely or chiefly on account of the difference in the number of their antheriferous stamens, especially as they entirely agree in habit, in which there is something peculiar. It is not a little remarkable, that in some of the more minute and less important differences between them, the intermediate structure or connecting link should be found in a species sent by Dr. Schiede from Mexico (*Glossanthus Mexicana*, Br. ined.), and that this should be the only plant belonging to *Cyrtandraceæ* hitherto observed in any part of America.

LOXONIA, Jack in Linn. Trans., xiv, p. 40.

CHAR. GEN. *Calyx* 5-partitus æqualis, æstivatione valvata. *Corolla* bilabiata; *fauce* aperta; *labio superiore* semibifido; *inferiore* trifido. *Stamina antherifera* 4, didynamia, exserta; *antheris* reniformibus, per paria approximatis. *Stigma* bilobum, obtusum. *Capsula* ovata, calycem persistente longiore cincta, bivalvis; *placentis* utrinque seminiferis.

Herbæ v. Suffrutices. Folia opposita, inæqualia: majore inæquilatero, dentato; altero nano, integerrimo, stipuliformi. Racemi subcymosi, recurvi, sæpè bifidi, ex alis foliorum stipuliformium.

*Obs.* Genus Cyrtandracearum a b. Jack conditum et ad eandem sectionem cum *Loxotis* referendum, sed affinitate arctius junctum cum *Stauranthera* in quâ folia opposita nec alterna, pari modo inæqualia, altero nempe nano stipuliformi; altero inæquilatero.

*LOXONIA acuminata*, pubescens, foliis lanceolato-oblongis acuminatis denticulatis; nanis reniformibus, racemis subbifidis folio brevioribus.

DESCR. Suffrutex parcè tenuissimèque pubescens. Caulis erectus vel adscendens, ramis teretibus parum flexuosis, pube subappressa. Folia opposita, quorum alterum lanceolato-oblongum accuminatum inæquilaterum, denticulis brevissimis, subsessile, ni fallor aversum, basi hinc (lateris inferioris) obtusâ rotundatâ, superioris et angustioris excisâ, costatum, venis primariis alternis arcuatis intra marginem deliquescentibus anastomosantibus, secundariis tertiarisque divaricatis, ultimis reticulantibus immersis, 5—8

pollices longum  $2\frac{1}{2}$ —3 polliccs latum, membranaceum, viride, subtus pallidius, in cuius alâ rudimentum minutum gemmæ foliaceæ: alterum nanum stipuliforme sessile reniforme latius quam longum integerrimum, e cuius alâ pedunculus folio majore brevior, nano ipso multoties longior. *Racemus* subbifidns, ramis 3—5-floris, bracteis subulatis. *Calyx* 5-partitus: *lacinia* lanceolatae acuminate herbaceæ pilosæ pilis crebris articulatis acutis patulis, longitudine æquales, duæ laterales superiorum paulum angustiores, trinerviae, aestivatione valvatâ alabastro ovato acuminato, acuminatum apicibus distinctis. *Corolla* monopetala bilabiata, calyce parùm longior, glabra; *tubo* ventricoso calyce breviore; *fauce* apertâ infernè barbatâ; *labio superiore* semibifido plano, lobis obtusis; *inferiore* profundè trifido, lobis obtusiusculis integerrimis, medio paulò longiore. *Stamina antherifera* quatuor didynama exserta limbo tamen breviora. *Filamenta* subulata conniventia glabra, duo inferiora longiora. *Antheræ* conformatæ per paria approximatæ et leviter cohærentes, imberbas, reniformes, loculis divaricatis apice confluentibus medio anticè longitudinaliter dehiscentibus. *Pollen* subglobosum. Rudimentum staminis quinti brevissimum absque antheræ simulacro. *Ovarium* liberum sessile ovatum glaberrimum disco annulari angustissimo imberbi basi cinctum, uniloculare, placantis duabus parietalibus bifidis lobis divaricatissimis planis utrinque ovuliferis. *Stylus* cylindraceus glaber longitudine circiter staminum. *Stigma* obtusum papulosum obsoletè bilobum stylo parùm crassius. *Cap-sula* ovata cuspidata membranacea calyce persistenti brevior unilocularis bivalvis, cuspidé bipartibili; valvulae medio placentiferæ; placenta singula utrinque dilatata in laminam rectam marginibus utrinque seminiferis. *Semina* numerosissima minuta obovata sessilia, sœpè angulata mutuâ pressione, castanea: testa membranacea tenax: membrana interna tenuissima albumini parco v. parcissimo adhærens. *Embryo* rectus aqueo-pallidus subovatus, cotyledonibus brevissimis.

I have considered the plant here figured as distinct from

*Loxonia hirsuta* of Jack, which, however, it appears from his description to resemble in so many points that it may actually belong to the same species, differing only somewhat in the form of the leaves and in being less pubescent. Dr. Jack did not find his plant in fruit, neither did he ascertain the dehiscence of the capsule in *L. discolor*, from which the character of the genus was formed. In both species he describes the ovary as bilocular, and the lobes of the placentæ as revolute.

Dr. Horsfield found this plant in 1818, when he accompanied Sir Stamford Raffles on his journey from Padang—one of the principal stations on the west coast of Sumatra—to the Menangaboo country, growing on the ranges of hills which extend parallel to the coast from N.W. to S.E., in shaded forests between 500 and 1000 feet above the level of the ocean. He did not observe it in Java.

Capsule surrounded by the calyx. Fig. 6. Capsule after dehiscence, the calyx being removed. Fig. 7. One of the valves of the capsule. Fig. 8. Transverse section of the ripe capsule. Fig. 9. A seed. Fig. 10. The embryo.

---

CYRTANDRACEÆ, to which *Loxonia* and *Loxotis* belong, was established in 1822<sup>1</sup> by the late Dr. Jack as a natural order, according to him most nearly allied to *Bignoniaceæ*, but differing sufficiently from that family in the structure of its fruit, especially in the placentation of its minute seeds.

The existence or absence of albumen in the ripe seed is not expressly stated in his character of the order, nor is it noticed in the description of any of the species he has referred to it. It may, however, be presumed that he

<sup>1</sup> 'Linn. Soc. Trans.', vol. xiv. p. 23.

believed the whole family to agree in this respect with *Bignoniaceæ*, next to which he had placed it; and he had at least the proof of the absence of albumen in Roxburgh's figure of his *Incarvillea parasitica*, in which the structure of ovary as well as of seeds is correctly given.

The genera referred by Dr. Jack to this new family are *Cyrtandra* of Forster, *Didymocarpus* of Wallich, and <sup>nor</sup> two other genera for the first time proposed, namely, *Æschynanthus*, to which Roxburgh's *Incarvillea parasitica* belongs, and *Loxonia*.

Nearly about the same time Mr. Don published his *Didymocarpeæ*,<sup>1</sup> a family consisting of two of Dr. Jack's *Cyrtandraceæ*, namely, *Didymocarpus* and *Æschynanthus* (his *Trichosporum*), and a new genus *Lysionotus*. He in like manner depends chiefly on placentation, which is not very clearly described; and he also introduces into his character the absence of albumen, the pendulous position of seeds, and the undivided stigma. From this family he excludes *Cyrtandra*, which has, he states, erroneously however, a copious albumen; while *Chirita* of Dr. (Buchanan) Hamilton, of which Dr. Jack's *Didymocarpus* includes at least one species, is doubtfully referred to *Scrophularinæ*, chiefly on account of its bilamellar stigma.

In 1826 Dr. Blume<sup>1</sup> refers *Cyrtandraceæ* to the natural order *Bignoniaceæ*, distinguishing it as a tribe from true *Bignoniaceæ* by its pendulous seeds, and subdividing it into two sections; the first, *Trichosporeæ*, with capsular fruit, and seeds either winged or with some other form of appendage; the second, *Cyrtandreaæ*, having baccate fruit and seeds without appendage. To each of these sections he has added more than one new genus, but *Loxotis* and *Loxonia* are not included in either of them; though *Loxotis*, as I have already stated, is probably his *Rhinoglossum*, referred by him to *Rhinantheæ*; and *Loxonia*, notwithstanding his account of the fruit, may possibly be his *Loxophyllum*, which he has placed in *Scrophularinæ*;

<sup>1</sup> 'Edinburgh Philosophical Journal,' vii. p. 83, and 'Prodromus Flora Nepalensis,' p. 121.

<sup>2</sup> 'Bijdragen,' p. 759.

while his *Epithema*, my *Aikinia*, also belonging to *Cyrtandraceæ*, he refers to *Primulaceæ*.

It is somewhat remarkable that none of these writers should have adverted to the affinity of this new family to *Besleriaceæ* of Richard and De Jussieu, now generally named *Gesneriaceæ*. This affinity, however, did not escape Dr. Von Martius, who in his elaborate account of *Gesneriaceæ*, published in 1829,<sup>1</sup> considers *Cyrtandraceæ* as sufficiently distinct from that order in the absence of albumen and in having an inverted embryo: the latter character he states on the authority of Mr. Don, who, in employing the term "Embryo inversus," can only have intended to express its direction with respect to pericarpium; such at least is the real structure of those genera which he referred to his *Didymocarpeæ*, and it is certain that in the relation of embryo to hilum both families entirely agree.

Dr. Von Martius also notices the difference in the order of abortion of stamens between these two families, which is no doubt generally true, but admits in each of at least one exception; *Sarmienta* in *Gesneriaceæ*, agreeing with *Cyrtandraceæ* in having only its two anterior or lower stamens antheriferous: and in this latter family *Aikinia* or *Epithema*, which, as in the greater part of diandrous *Gesneriaceæ*, has its two posterior or upper stamens perfect.

There is indeed another, and that a very remarkable, distinction noticed in the position of the lobes of the stigma, which in *Gesneriaceæ*, according to Von Martius, are placed right and left in relation to the parts of the flower, and consequently opposite to the lateral parietal placentæ; while in *Cyrtandraceæ* the lips of the stigma—for so it is necessary to express the fact in this family—are anterior and posterior, and therefore alternate with the lateral placentæ; the latter being the ordinary relation in unilocular ovaria, where the placentæ and lobes, or rather lips, of stigma, correspond in number. This difference, however, even were it fully established, would hardly be available here as a technical distinction, several genera in each

<sup>1</sup> 'Nov. Gen. Pl. Bras.', iii. p. 72.

family having an undivided stigma; unless in such cases the position of the confluent parts could be determined by that of the two vascular cords generally observable in the style, and continued into the axes of the lobes of a regularly bifid stigma, when belonging to an ovary composed of two carpels. But even if this distinguishing character should be admitted to be general, it is certainly not without exception; and in the only cases that I have examined in *Gesneriaceæ*, where the lateral position of the lobes of stigma may be supposed to exist, the apparent position arises from the extreme breadth and manifest division of the lips, the two vascular cords of the style being still anterior and posterior.<sup>1</sup>

The only point of difference remaining, therefore, is [108] the existence of albumen in *Gesneriaceæ* and its absence in *Cyrtandraceæ*. This character, however, is not absolutely constant, there being cases in *Cyrtandraceæ* where the [109] remains of albumen are visible in the apparently ripe seed; and in several *Gesneriaceæ* it exists so sparingly as to become a character of very little value,<sup>2</sup> especially as it is not here connected with other more important differences.

<sup>1</sup> Here follows a note "On the relative position of the Divisions of Stigma and Parietal Placentæ in the Compound Ovary of Plants," which, having been originally distributed also in a separate form, has been already given in vol. i. pp. 553—563.—*EDIT.*

<sup>2</sup> The late Correa de Serra, in a very ingenious essay published in 1811,<sup>1</sup> endeavoured to establish a test for ascertaining the importance of albumen in relation to the affinities of plants, namely, that where the albumen is of a texture very different from that of the embryo, which does not absorb it in germination, its constancy may be depended on; while in those cases where its texture is nearly similar to that of the embryo, which derives from it its earliest nourishment, its presence or absence becomes of little value. His hypothetical expression of this difference is, that in the latter case the embryo before germination converts part of a uniform substance into its own body, and in germinating derives nourishment from the remainder; in the former it selects what is suited for its nourishment, leaving a residuum which it does not afterwards act upon, and whose presence is therefore constant. Among the examples given of families in which this selection and residuum exist are *Gramineæ*, *Palmeæ*, *Nyctagineæ*, *Caryophyllea*, and *Euphorbiacea*.

Soon after the publication of this essay a paper was read before the Linnean Society of London, in which I endeavoured to prove that the test attempted to be established by Correa was liable to many exceptions, and that his hypo-

---

<sup>1</sup> 'Annales du Muséum,' xviii. p. 206.

<sup>110</sup> In describing the genus *Aikinia* (*Epithema* of Dr. Blume) I regarded *Cyrtandraceæ*, or *Cyrtandreae*, for the reasons now assigned, as a tribe merely of *Gesneriaceæ*, <sup>111</sup> distinguishable from that portion of the order with hypogynous corolla, or *Beslerieæ*, by characters either of little importance or which required confirmation. For although, in addition to the characters referred to, *Cyrtandreae* differ very remarkably in geographical distribution from the rest of the family, yet this difference is not entirely without exception, as I have already noticed in my account of *Loxotis*.

But whether these groups be considered as distinct families, or as tribes only, it will probably be admitted that in a natural classification *Cyrtandreae* must stand next to *Beslerieæ*; while on the other hand they appear to be very nearly related to *Bignoniaceæ*, with which they are connected through *Incarvillea*, particularly with that section of it which in Dr. Royle's Illustrations I have described as a sub-genus, and named *Amphicome*. This sub-thetical expression of the facts was not applicable even to all the families he has cited in support of it. And I concluded that as a general rule the point most to be depended on in proving the importance of albumen in systematic botany was its relative quantity, especially when accompanied with a low degree of development of embryo; for where the albumen forms the great mass of the seed in any known portion of a natural family, it may in most cases, though not always, be safely inferred, not only to be present, but to exist in like proportion in the whole of that family. This rule, however, I regarded as merely empirical, founded on extensive experience, but not necessarily connected either with uniformity or even apparent importance of function; for while in some families in which its proportion to the whole body of the seed is the greatest, it constitutes the early nourishment of the embryo, in others, where it exists in equal quantity, it is either not at all or but slightly acted upon in germination. I stated also that there were cases in which this character was of reduced importance, existing only in certain tribes of one and the same great natural family, as in *Rubiaceæ*; nor are there wanting instances in which it is only of generic value.<sup>1</sup> And, lastly, I noticed that in several families, in which the constancy of the character was very general, exceptions occurred, dependent on the apparent necessity for an unusual development and increased energy in the embryo, connected either with the unfavorable circumstances in which it was destined to vegetate, as in plants growing in or exposed to the action of salt-water; or where great resistance, arising from the structure of the pericarpium, or even from the texture of the proper integuments of the seed itself, was to be overcome in germination.

---

<sup>1</sup> 'Linn. Soc. Trans.', vol. x. p. 86 [vol. i. p. 23], et 'Prodr. Flor. Nov. Holl.', vol. i. *passim*.

genus Professor Lindley has lately considered generically distinct from *Incarvillea*. But except those differences in the seeds and calyx, which I have regarded, and still consider, as only of sectional value, I find no other characters whatever in the flower or fruit to justify the separation; for in both species of *Amphicome*, as in the original *Incarvillea*, the ovary as well as the capsule is certainly bilocular, and not unilocular, as it is described in the species figured in the 'Botanical Register' (for 1838, t. 19), and the two subgenera entirely agree in the peculiar structure of the anthera, the spur of each of whose loculi originates not on the back, but front of the cell, in the line of dehiscence, which it limits.

The following characters of *Gesneriaceæ*, and of the three tribes of which, according to my view, it consists, may serve to distinguish the family from the nearly related orders, and the tribes readily from each other.

#### GESNERIACEÆ, Richard et de Jussieu.

*Calyx* 5-divisus, æqualis (raro parùm inæqualis). *Corolla* monopetala, irregularis, limbo 5-lobo, aestivatione imbricata. *Stamina* antherifera 2 v. 4, cum v. absque quinti postici rudimento. *Ovarium* (liberum v. adnatum) uniloculare (nunc approximatione placentarum quasi biloculare); basi disco lobato v. indiviso cinctum; *placentis* 2 parietalibus laterallibus (sæpius bilamellosis) polyspermis; *ovulis* anatropis. *Pericarpium* capsulare v. baccatum. *Semina* parva (raphe nulla), albuminosa v. exalbuminosa; albumine carnosæ, molli, copioso v. parco. *Embryo* rectus, axilis, orthotropus, dimidium albuminis dum adsit æquans v. superans.

*Herbæ* v. Suffrutes foliis simplicibus, indivisis, exstipulatis, oppositis, verticillatis alternisive, sæpius serratis crenatisive nunc integerrimis, in plerisque pube simplici, acuta v. capitata. Inflorescentia varia.

#### GESNERIEÆ.

*Calyx* cum ovario plus minus connatus. *Pericarpium* capsulare. *Semina* albumine copioso.

## BESLERIEÆ.

*Calyx* liber. *Pericarpium* baccatum v. capsulare. *Semina* albuminosa.

## CYRTANDREÆ.

*Calyx* liber. *Pericarpium* capsulare v. baccatum. *Semina* exalbuminosa v. albumine parco.

OBS. The following remarks relate to the modifications of the different parts of fructification in *Cyrtandreae* and their relative importance in characterising genera.

The CALYX admits of every degree of depth of division. Its segments are generally acute, always so when divided to the base; and wherever acute the aestivation appears to be valvular. In several cases where the calyx is tubular, particularly in the greater part of true *Didymocarpus*, and in one of the sections of *Eschynanthus*, the segments are rounded, and the aestivation necessarily overlapping. The tubular calyx, when accompanying an elongated capsule, is generally thrown off or separates transversely at the base, except in the few cases in which the capsule is pedicellated. The deeply divided calyx of the genera with elongated capsules is persistent; as it also is, whether deeply divided or tubular, in all those with short capsules and in the baccate genera. None of these modifications appear to be of generic value, though some of them form the principal characters of very natural sections of genera.

The tube of the COROLLA varies greatly in length, but its various proportions, either with respect to the limb or calyx, are seldom of generic importance; a difference of this kind, however, forms the only distinguishing character between *Bœa* and *Streptocarpus*. The limb varies considerably in form, direction, and proportion of lips; but the most important modification occurs in *Glossanthus* and *Loxotis*, in both of which the lateral lobes of the lower lip are obsolete; or, in the former genus, perhaps, altogether

wanting. This modification is necessarily accompanied by a different aestivation, which in all the other genera is quincuncial, the lateral lobes of the lower lip overlapping the upper, which covers the middle lobe of the lower. The spur of the tube is found only in one of the two species of *Stauranthera*.

The number of antheriferous STAMINA, or the difference between the diandrous and didynamous plants of the tribe, is not always of much value; for in *Didymocarpus* there are several didynamous species which certainly do not form a natural section. *Stamina inclusa* and *exserta* generally mark distinct genera, but yet not in all cases. The difference between parallelism and divarication of the lobes of antheræ is always, I believe, of generic importance. The various degrees of confluence of the divaricate lobes, and the apparently peculiar dehiscence in some of its modifications, seem not to be of equal value.

The STIGMA exhibits various remarkable differences, some of which are considerable, though not always of equal, value in the definition of genera. The most important of these, and which hitherto has been overlooked, is the abortion, or great reduction in size, of the upper lip, while the lower is proportionally dilated, and, in some cases, deeply divided. Thus in *Chirita*, in which the stigma is described as bilamellar, both lamellæ belong to the lower lip. And in many species of *Didymocarpus* the apparent obliquity of stigma arises from the abortion of the upper lip, and the lamellar expansion of the lower, which, however, is never divided as in *Chirita*. In several genera the lips are equal, and either lamellar or so short as to be hardly distinguishable; in other cases there is no trace of division. These different modifications, in most cases, mark the limits of genera.

As some of the most important characters of the tribe reside in the structure of OVARIUM and PERICARPIUM, so the principal natural divisions are founded on modifications of the same organ. The ovarium may be in all cases described as properly unilocular: though, from the approximation and slight cohesion of the parallel portions of the

inflected parts, or, as they are commonly called, placentæ, it not unfrequently appears to be bilocular. But this cohesion only occurs when the production of ovula is confined to the upper or inner surface of the carpel, which is the case in the greater part of the genera with elongated capsules; for where both surfaces are ovoidiferous, as in the baccate and most of the genera with included capsules, no such cohesion can take place. The general direction of the margins of the placenta of each component part of ovarium and pericarpium may at first appear a deviation from the ordinary structure, the general rule being that the margins only unite to form a complete cell, whereas the completion of the cell in that manner is incompatible with the direction of these margins, which in each carpel are turned from, not towards each other. This difference, however, is more apparent than real, and the structure in *Cyrtandreae* may be justly compared with that of such genera of other families as have the placenta of a multilocular, or that of the single distinct, carpel projecting considerably into the cavity.

The great elongation of pericarpium in many of the genera having capsular fruit, is the more remarkable in *Cyrtandreae*, as there is no instance of similar elongation, or any approach to it, in either of the two other tribes of *Gesneriaceæ*. In this elongation of capsule, however, they approach to *Bignoniaceæ*, where it is both more general and exists in a still greater degree.

In most of the *Cyrtandreae* with elongated capsules, the valves, though membranaceous, are perfectly straight, but in a few others they are spirally twisted, though nearly of the same texture. The spiral torsion of the valves certainly does not depend on the length of the capsule merely, the greatest length being found conjoined with straight valves, as in *Æschynanthus*; nor is it the consequence of drying, for the twisting in all cases commences long before the ripening of the fruit. The mechanism explaining these <sup>114</sup> differences is, however, in general obvious. In the twisted valve the endocarp consists of a stratum of vertically elongated fibres, with an extremely thin or hardly manifest

inner membrane, while in the valve of the straight capsule the vertically elongated stratum has a manifest inner covering, consisting of transversely elongated cells, which no doubt counteract the tendency to torsion of the longitudinal fibres. But the transversely elongated cells are found in the inflected or placentiferous portion of the elongated capsule, both in the twisted and straight-fruited genera; and their function here seems to be to determine the involution or revolution of the ovuliferous margin, which in these fruits is probably necessary for the protection of the seeds even after dehiscence.

The more remarkable differences in placentation are almost always important: thus, in many genera the ovula are produced on the inner surface of the margin only; in others both surfaces are equally productive: and in some, the production, instead of being confined to the marginal region, extends over the whole of the inflected and included portion of the carpel.

The SEEDS are generally pendulous, but in a few genera, as *Epithema* and *Loxocarpus*, erect; and in some others they vary in pericarpial direction, according to their different heights in the same placenta. They are always minute, generally oval, oblong, or nearly cylindrical, and inserted at or very near one extremity; in most cases sessile, or nearly so, but in a few furnished with a very long and extremely slender funiculus.

Although the ovulum is anatropous, there is no apparent raphe in the ripe seed. The capillary appendages existing in some cases at both extremities of the seed vary considerably in number and form in that genus where they are most remarkable, namely *Aschynanthus*, in which, as well as in *Agalmyla*, and probably in *Tromsdorffia*, they are mere appendages, performing no other function; but in *Lysionotus* the upper hair in the pendulous seed is in reality its funiculus or attenuated base.

The integument of the ripe seed is, in most cases, apparently simple; but in a few, especially *Aschynanthus*, the inner membrane is easily separable from the testa.

Before the complete ripening of the seed, the semifluid

remains of ALBUMEN are generally obvious ; and even in the ripe seed, in several cases, slight traces of it are visible : in *Rhabdothamnus* it is more abundant, and of firmer consistence.

---

## CYRTANDREARUM SYNOPSIS GENERUM.

### A. PERICARPIUM CAPSULARE.

† *Capsulæ elongatæ. Semina utrinque appendiculata.*

a. *Antheræ exsertæ, inappendiculatæ, loculis linearibus parallelis. Semina pendula, extremitate superiore nuclei (nec appendicis) affixa.*

*ÆSCHYNANTHUS.* *Stamina antherifera 4. Stigma indivisum, dilatatum.*

*TROMSDORFFIA.* *Stamina antherifera 4. Stigma bilamellatum.*

*AGALMYLA.* *Stamina antherifera 2. Stigma bilamellatum.*

β. *Antheræ (2) inclusæ, dorso appendiculatæ. Semina pendula extremitate setæ superioris affixa.*

*LYSIONOTUS.*

†† *Capsulæ elongatæ. Semina inappendiculata, sessilia. Antheræ inclusæ, loculis divergentibus.*

*CHIRITA.* *Stamina antherifera 2. Stigma labio superiore obsoleto ; inferiore bilamellato. Capsula valvis strictis (nec spiritaliter tortis).*

*DIDYMOCARPUS.* *Stamina antherifera 2—4. Stigma indivisum (sæpè ex abortione labii superioris obliquum). Capsula valvis strictis.*

*STREPTOCARPUS.* *Stamina antherifera 2. Capsula valvis spiritaliter tortis. Corollæ tubus calyce duplò multotiesve longior.*

BÆA. *Stamina antherifera 2. Capsula valvis spiraliter nus tortis. Corollæ tubus calycem vix æquans.*

5-partitus). *Corolla* tubulosa, bilabiata. *Stamina* anthe-

rifera 2 (raro 4) inclusa; antheris imberbibus, loculis divergentibus. *Stigma* indivisum (sæpè, ex abortione labii superioris, obliquum). *Capsula* valvis strictis. *Semina* inappendiculata, sessilia.

*Herbæ pubescentes, caulescentes vel acaules; foliis serratis crenatisve petiolatis, caulinis oppositis, verticillatis alternisve; inflorescentia subcymosa.*

## CLAVIS SPECIERUM.

### A. DIANDRÆ.

† *Calyx* infundibuliformis, coloratus, tubo lobos superante, in plerisque basi transversim secedens.

a. *Calycis* lobi rotundati. *Stigma* obliquum (unilabiatum). Bracteæ perfoliatæ, coloratæ.

1. Caulescentes.

*Didymocarpus aromatica*, *villosa*, *oblonga*, *acuminata*, *punduana*.

2. Acaules.

*Didymocarpus macrophylla*, *pedicellata*.

β. *Calycis* lobi acuti (glanduloso-pilosæ).

*Didymocarpus subalternans*, *obtusa*.

†† *Calyx* 5-partitus acutus persistens.

a. Placentæ latitudine valvularum, marginibus ovuliferis longitudinaliter revolutis.

1. Caulescentes.

*Didymocarpus crinita*, *serrata*, *racemosa*, *corniculata*, *cordata*, *corchorifolia*, *reptans*.

2. Acaules.

*Didymocarpus missionis*, *Zeylanica*.

<sup>118]</sup> β. Capsula hinc dehisrens, inde diù cohærens. Placentæ valvis angustiores.

*Didymocarpus Rottleriana*.

## B. DIDYNAMÆ.

a. Caulescentes.

*Didymocarpus frutescens, elongata.*

β. Acaulis.

*Didymocarpus lanuginosa.*

## SPECIERUM DIAGNOSES.

A. Diandræ. Calyce tubuloso infundibuliformi.

a. Calycis lobi rotundati.

1. *Didymocarpus aromatica*, foliis ovatis obovatisve inciso-crenatis, caule apice foliato petiolisque pube appressâ.

*Didymocarpus aromatica*, *Wall. Pl. Asiat. Rar.* 2, p. 34, t. 141, exclus. fig. 4—7, ad *Didymocarpum macrophyllum* pertinentibus.

*Didymocarpus primulifolia*, *Don, Nepal.*, p., 123.

*Loc. Nepal.*

2. *Didymocarpus villosa*, foliis obovatis inciso-crenatis adultis subsericeis, caule apice foliato petiolisque villis patulis hirsutissimo.

*Didymocarpus villosa*, *Don, Nepal.*, p. 123.

*Loc. Nepal.*

3. *Didymocarpus oblonga*, foliis oblango-lanceolatis inciso-serratis adultis cauleque apice foliato glabriusculis.

*Didymocarpus oblonga*, *Wall. in litt. 1819, et Plant. Asiat. Rar.* vol. 2, p. 34, tab. 140. *Don, Nepal.*, p. 123.

*Didymocarpus verticillata*, *Wall. List.* No. 783.

*Loc. Nepal.*

4. *Didymocarpus Punduana*, foliis ternis caulem glabriusculum terminantibus oblongis integris, pedunculis pedicellisque pube glandulosâ conspersis.

*Didymocarpus Punduana*, *Wall. List.* No. 777.

*Loc. Montes Sylhet.*

5. *Didymocarpus acuminata*, foliis caulem terminantibus approximatis latè ovatis acuminatis duplicato-crenatis, pedicello capsulae calycem persistentem superante.

*Loc.* Chura-Poongi. *Wallich.*

6. *Didymocarpus pedicellata*, acaulis, ovariis glandulosis, capsulae pedicello calycem persistentem superante, stylo brevissimo.

*Didymocarpus macrophylla*, *Royle*, *Illustr.* p. 294, t. 70, f. 1.

*Loc.* Kamoon. *Royle.*

7. *Didymocarpus macrophylla*, acaulis, ovariis glandulis sessilibus conspersis, capsulae pedicello brevissimo.

*Didymocarpus macrophylla*, *Wall. List*, No. 784. *Don*, *Nepal*. p. 122.

*Didymocarpus plicata*, *Don*, *Nepal*. p. 122.

*Loc.* Nepal. *Wallich.*

β. Calycis lobi acuti.

8. *Didymocarpus subalternans*, caulescens, foliis oppositis suboppositis obtusis elongato-petiolatis.

*Didymocarpus subalternans*, *Wall. List*, No. 782.

*Didymocarpus aromatica*, *Don*, *Nepal*. p. 123.

*Loc.* Nepal. *Wallich.*

9. *Didymocarpus obtusa*, scapis subradicalibus bifoliatis, foliis radicalibus elongato-petiolatis cordato-ovatis crenatis obtusis.

*Didymocarpus obtusa*, *Wall. List*, No. 786.

*Didymocarpus aromatica*, *Don*, *Nepal*. p. 122.

*Loc.* Nepal. *Wallich.*

B. Diandræ. Calyce 5-partito acuto. Capsula utrinque simul dehiscens.

10. *Didymocarpus crinita*, Jack, in *Linn. Trans.*, 14, p. 33, t. 2, f. 2.

*Loc.* Java, an. 1814. *Horsfield*. Penang. *Jack*, *Wallich.*

11. *Didymocarpus serrata*, foliis oppositis æqualibus elliptico-lanceolatis serrulatis acutissimis: basi acutâ æquali, cymis bifidis, corollæ tubo limbum quadruplò superante.

*Loc.* Sumatra? *Horsfield.*

12. *Didymocarpus racemosa*, Jack, l. c., p. 34.

13. *D. corniculata*, Jack, l. c., p. 36.

14. *D. cordata*, Jack, Wall. List, No. 781.

15. *D. corchorifolia*, Wall. List, No. 792.

16. *D. reptans*, Jack, l. c. p. 35.

17. *Didymocarpus missionis*, caule brevissimo, pedunculis axillaribus scapiformibus, foliis cordato-ovatis.

*Didymocarpus?* *missionis*, Wall. List, No. 639.

18. *Didymocarpus Zeylanica*, sub-acaulis, scapis paucifloris, foliis orbiculato-ovatis altè cordatis dentatis petiolo longioribus, calycis laciniis linearibus acutis.

*Loc.* Zeylona.

C. Diandra. Calyce 5-partito acuto. Capsula hinc dehiscens inde diù cohærens.

19. *Didymocarpus Rottleriana*, Wall. List, No. 778.

D. Didynamæ.

20. *Didymocarpus frutescens*, Jack, in Linn. Soc. Trans., vol. xiv, p. 39. Wall. List, No. 780.

*Loc.* Penang.

21. *Didymocarpus elongata*, Jack, in Linn. Soc. Trans., vol. xiv, p. 37.

*Loc.* Sumatra. *Jack, Horsfield.*

22. *Didymocarpus lanuginosa*, Wall. List, No. 791.

STREPTOCARPUS, *Lindl. Bot. Regist.* 1173.

CHAR. GEN. *Calyx* 5-partitus. *Corolla* bilabiata : tubo calycem duplò multoties superante. *Stamina* antherifera 2, inclusa : antherarum loculis divergentibus. *Stigma* bilobum : labiis æqualibus brevissimis.

*Capsula* elongata valvis (dextrorsùm) spiralibus. *Semina* inappendiculata.

Herbæ pubescentes vel caulescentes, foliis oppositis subæqualibus, inflorescentia cymosá ; vel caule brevissimo, folio altero nano, pedunculis seriatis.

† Caule abbreviato ; foliis oppositis, altero nano ; pedunculis seriatis axillaribus.

1. *Streptocarpus Rexii*, Lindl. in *Bot. Regist.*, t. 1173.  
*Didymocarpus Rexii*, *Hooker in Bot. Mag.*, t. 3005.

*Loc.* Africa australis.

†† Caulescentes, foliis oppositis subæqualibus petiolatis. Inflorescentia axillaris subcymosa.

2. *Streptocarpus Helsingbergii*, foliis ovatis crenatis petiolo quadruplo longioribus, cymis paucifloris, corollæ tubo calycem 4—5-ies superante.

*Loc.* Madagascar. *Helsingberg & Bojer.*

3. *Streptocarpus Bojeri*, foliis ovatis acutis grossè et sub-duplicato-crenatis petiolo quadruplo longioribus, corollæ tubo calyce duplò longiore.

*Loc.* Madagascar. *Helsingberg & Bojer.*

4. *Streptocarpus Thompsonii*, foliis subovatis ovalibusque crenato-serratis petiolo paulò longioribus, corollæ tubo calyce duplò longiore.

*Loc.* Madagascar. *D. I. V. Thompson.*

5. *Streptocarpus paniculata*, foliis ovatis acutis crenato-serratis brevè petiolatis, cymis elongato-pedunculatis paniculatis.

*Loc.* Madagascar.

*Bæa*, *Commerson*, in *Lam. Enc. Méth.* 1, p. 401, et in <sup>120</sup> *Juss. Gen. Plant.*, p. 121.

CHAR. GEN. *Calyx* 5-partitus. *Corolla* bilabiata tubo calycem vix æquante. *Stamina* antherifera 2, antherarum loculis divergentibus. *Stigma* obtusum (subbilobum). *Capsula* elongata, valvis (dextrorsùm) spiralibus. *Semina* inappendiculata.

Herbæ subacaules, foliis consertis; v. caulescentes, foliis oppositis.

1. *Bæa Commersonii*, caule abbreviato, foliis ovalibus ellipticisve obsoletè crenato-serratis petiolatis pube appressâ subsericeis, pedunculis scapiformibus uni-pauciflorisve: pedicellis calycibusque pube appressâ eglandulosâ.

*Bæa Magellanica*, *Lam. Enc. Méth.* i, p. 401.

*Loc.* "Isles Praslin," *Commerson*.

2. *Bæa hygrometrica*, acaulis, foliis ovatis obovatisve crenatis utrinque lanatis basi cuneatis subsessilibus, scapis folio longioribus apice divisis, pedicellis calycibusque pube glandulosâ patulâ.

*Dorcoceras hygrometrica*, *Bunge*, in *Mém. Acad. Imper. Sc. Petersb. Div. Sav.* tom. ii. p. 128.

*Loc.* China Borealis. *Bunge*.

3. *Bæa? Wallichii*, acaulis, foliis obovatis crenatis crassis, scapis apice 2—4-floris.

*Didymocarpus helicteroides*, *Wall. List.* No. 789.

*Loc.* Toong Dong. *Wallich*.

*Obs.* Flores nondum visi, ideoque dubii generis. Capsula *Streptocarpi* et *Bæa*.

4. *Bæa? multiflora*, caule suffruticoso, foliis oppositis petiolatis oblongis ovalibusve crenatis, paniculis axillaribus pedunculatis lanatis.

*Didymocarpus? multiflora*, *Wall. List.* No. 793.

*Loc.* Sylhet in montibus Punduah.

*Obs.* Flores inexpansi solum a nobis visi: tubo brevi

corollæ ni fallor cum Bæa convenit sed habitus diversissimus.

### LOXOCARPUS.

CHAR. GEN. *Calyx* 5-partitus. *Corolla* tubo brevi. *Stamina* antherifera duo, antherarum loculis divergentibus. *Stigma* indivisum. *Capsula* calyce (paulò) longior, hinc dehiscens, placentis angustissimis. *Semina* erecta, funiculis capillaribus elongatis.

*Herba annua, incana; foliis omnibus radicalibus petiolatis. Scapi apice subcorymbosi.*

*Loxocarpus incana.*

*Loxonoxia?* alata. *Wall. List, No. 809.*

*Loc.* Penang.

### EPITHEMA, Blume, *Bijdrag.* p. 737.

*Aikinia, Br. in Wall. I* *nat. Rar. 3, p. 65, t. 288.*

CHAR. GEN. *Calyx* tubulosus 5-fidus. *Corolla* bilabiata. *Stamina* duo superiora antherifera! *Stigma* indivisum. *Capsula* calyce cincta, circumscissa; placentis liberis, utrinque seminiferis, pedicellis parietalibus adnatis. *Semina* erecta, funiculis elongatis.

*Herbæ annæ, pilosiusculæ. Folia cordata, subdentata, inferiora, dum uno plura, alterna, terminalia subopposita. Spicæ unilaterales, circinales; hinc pedicellis subduplici serie confertis ebracteolatis, inde foliolo cucullato subrotundo involucratæ.*

### STAURANTHERA, Bentham in *Scrophul. Ind.*, p. 57.

CHAR. GEN. *Calyx* turbinato-campanulatus, 5-fidus, sinubus plicatis (quandoque in dentibus productis). *Corolla* subrotata, bilabiata, 5-loba; tubo nunc basi calcarato. *Stamina* antherifera 4; antheræ in coronulam conniventes, loculis divaricatis. *Stigma* . . . *Capsula* calyce per-

sistente cincta, circumscissa; placentis utrinque semi-niferis.

*Herba oppositifolia, folio altero nano stipuliformi.*

1. *Stauranthera grandifolia*, corollæ tubo basi cal-<sup>[12]</sup> carato, calycis sinubus in dentibus productis.

*Stauranthera grandifolia*, Benth. *Scrophul. Ind.*, p. 57.

*Glossanthus? grandiflora*, Benth. in *Wall. List*, No. 6395.  
Loc. Penang.

2. *Stauranthera ecalcarata*, corollæ tubo ecalcarato.

*Miquelia coerulea*, Blume in *Bullct. des Sc. Phys. et Nat. en Neerlande*, an. 1838, p. 94.

Loc. Java. Dr. Horsfield.

#### GLOSSANTHUS, Klein in *Wall. List*, No. 6394.

CHAR. GEN. *Calyx* 5-fidus, tubo 5-gono angulis marginatis, laciinis parùm inæqualibus; aestivatione valvata. *Corolla* personata; labium superius abbreviatum bilobum; inferius indivisum (lobis lateralibus abortientibus). *Stamina* antherifera 4 inclusa, antheris in coronulam cohærentibus. *Stigma* indivisum. *Ovarium* disco completo cinctum. *Capsula* calyce inclusa, bivalvis, placentis utrinque semi-niferis.

*Herbæ alternifoliæ, glabriusculæ; foliis integris basi altè excisis; racemis secundis.*

1. *Glossanthus malabarica*, Klein in *Wall. List*, No. 6394.  
Benth *Scrophul. Ind.*, p. 57.

2. *Glossanthus Notoniana*.

bilabiata. *Stamina* antherifera 4, 2, inclusa, antherarum

loculis parallelis. *Stigma* bilobum. *Bacca* placentis revolutis undique seminiferis.

WHITIA, *Blume, Bijdr.*, p. 774.

CHAR. GEN. *Calyx* 5-partitus. *Corolla* infundibuliformis, bilabiata. *Stamina* antherifera 2 semiexserta, antherarum loculis haud parallelis. *Stigma* infundibuliforme. *Bacca* siliquæformis.

Frutices (*Javanicæ*) radicantes; foliis oppositis integerim inæqualibus inæquilateris; inflorescentiâ axillari fasciculatâ.

*Obs.* Character a D. Blume.

## PTEROCYMBIUM JAVANICUM.

[219]

## TAB. XLV.

CHAR. GEN. *Flores* polygyno-monoici (ferè hermafroditi). *Calyx* 5-fidus, patens. *Antheræ* (10) simplici serie; loculis omnibus parallelis. *Ovaria* disperma. *Stigmata* filiformia, recurvata. *Pericarpia*: *Folliculi* foliacei, navicularis, longè ante maturitatem aperientes. *Semen* unicum, albuminosum. *Embryonis Radicula* hilo proxima.

*Arbor*, foliis *lobatis* *indivisisve*; paniculis *subterminalibus*.

Obs. Genus *Sterculiacearum* SCAPHIO proximum et forsan nimis affine. *Scaphium* verò differt: *Antheris* (15—20) congestis; *sty'lis* arctè cohærentibus; *stigmatibus* coalitis, unicum lobato-capitatum efformantibus.

DESCR.—*Arbor sylvestris*, 50—60-pedalis; trunco modicè crasso, cortice lœvi, rufesceni-fusco; comâ patenti (*D. Horsfield*). Folia alterna, 5—3-loba, passim indivisa, circumscriptione latè ovata, basi cordata 5-nervia, lobis ellipticis brevè acuminatis, sinubus obtusis; dum indivisa, paulò altius cordata, 3—5-nervia, brevissimè acuminata: omnium adulta supè glabra præter nervos venasque primarias tenuissimè pubescentes, pube simplici: subtè pube simili magis copiosâ, præsertim in nervis venisque ferè omnibus et insuper, rariore tamen et tenuiore, per totam paginam: novella utrinque pube stellari copiosâ tecta. Petioli teretiusculi, undique pubescentes, anticè sulco tenui exarati, basi apiceque pululùm incrassati, quandoque folia subæquantes, sepiùs dimidio et ultrà breviores. Stipulæ laterales, subulatæ, caducæ. Panicula subterminalis, e racemis alternis approximatis subcorymbosis. Pedicelli extra medium articulati, ipso articulo constricto, inter dilatationes duas manifestas. Bracteæ omnes deciduæ v. caducæ. Calyx monophyllus, ad medium quinquefidus, æqualis, turbinato-canpanulatus, coriaceus, glaber, laciñiis

tomento minutissimo cinereo marginatis, immersè nervosus venisque anastomosantibus, latè semilanceolatis; aestivatione valvatâ, alabastro 5-gono, turbinato; tubo intùs basi corpusculis scobiformibus minutis densissimè tecto. Corolla nulla. Flores hermaphroditi vel polygamo-monoici. Hermaphrodito-*Masculi*: Columna genitalium (gynostemium) e basi parùm dilatatâ cylindracea; dimidio inferiore breviore, pube tenuissimâ simplici patentî; superiore glabro, apice parùm dilatato (staminibus occultato) in urceolum decem- v. octo-dentatum antheriferum. Antheræ 10 v. 8 <sup>220]</sup> simplici serie dispositæ, incumbentes, supra medium affixæ; loculis appositis, contiguis, linearibus, longitudinaliter dehiscentibus. Pollen lève, subovale. Pistilla omnibus punctis ferè ut in Femineis. Hermaphrodito-*Feminei*: Columna quandoque brevissima. Antheræ ut in masculis numero et dispositione, polline forsitan effœto. Ovaria 5 (rarò 6) ipso apice columnæ incidentia, sessilia, arctè approximata, distincta tamen, dorsi apice gibboso, ita ut stylus quasi lateralis evadit, disperma; ovulis collateralibus erectis anatropis. Styli 5—6, arctè approximati, leviter cohærentes, breves. Stigmata filiformia, recurvata, intus longitudinaliter papulosa. Pericarpia 5—6, aliqua sèpè abortientia, follicularia, singula stipiti filiformi pubescenti incidentia; stipite communi 5-angulato, vix longitudine calycis diù persistentis haud mutati. Folliculi citò post fœcundationem et longè ante seminiis maturitatem aperientes, foliacei, reticulato-venosi, navicularis; dimidio inferiore duplò profundiore ibique carinâ in lobulum obtusum productâ, superiore planiusculo. Semen unicum maturescens, exsertum, basin folliculi occupans, erectum, basi insertum, sphæricum, lève, tenuissimè pubescens pube simplici. Integumentum triplex; *extimum* crustaceo-membranaceum, latere interiore, respectu axeos communis folliculorum, lineâ parùm elevatâ ab hilo ad apicem ductâ raphem indicante insiguitum, superficie interiore præter raphem venis per alterum latus recurrentibus ad basin tendentibus, ramo crassiore raphi opposito; inter hocce integumentum (v. epidermidem testæ) et medium substantia adest parca subfloccosa: *medium* (endospermium) nucamentaceum,

apice extus areolâ circulari (chalazâ) insignitum: *intimum* (integumentum interius) membranaceum. Albumen nucleo conforme, bipartibile, amygdalinum, album. Embryo erectus, ferè longitudine seminis, albus. Cotyledones latitudine albuminis idque bipartientes, foliaceæ: Radicula hilo proxima, brevis, subovata.

*Pterocymbium javanicum*, according to Dr. Horsfield, grows scattered among other trees in the luxuriant forests which, at a small elevation above the sea, cover many of the plains in the central and eastern districts of Java.

The native name is *Wining* or *Kemoonoong*.

TAB. XLV. *Fig. 1.* A branch bearing leaves. *Fig. 2.* A portion of the panicle, bearing ripe fruits. *Fig. 3.* An unexpanded flower. *Fig. 4.* The same, slightly magnified, opened longitudinally, the sexual organs being at that period sessile and the anthers closed. *Fig. 5.* An anther seen in front. *Fig. 6.* The same, seen from behind. *Fig. 7.* The column thickened at top, which in *Fig. 8* is seen divided into ten teeth. *Fig. 9.* One of the pistilla, cut longitudinally to show the two erect collateral ovula. *Fig. 10.* The half of an expanded flower, in which the column is elongated. *Fig. 11.* The base of a carpel, with its single seed. *Fig. 12.* The seed, deprived of its outer integument. *Fig. 13.* The same, after the removal of the inner integument. *Figs. 14 and 15.* The embryo, with its bipartite albumen.

STERCULIACEÆ, to which *Pterocymbium* evidently belongs, was first proposed as a distinct natural family by Ventenat in 1804;<sup>1</sup> his only character separating it from *Malvaceæ* being the presence of albumen surrounding the embryo, and from *Tiliaceæ* its monadelphous stamina.

In 1814,<sup>2</sup> in suggesting the formation of Natural Classes of plants and proposing *Malvaceæ* as one of these classes, I referred *Sterculiaceæ* to it, but regarded the order as

<sup>1</sup> 'Hort. Malmais,' fol. 91.

<sup>2</sup> 'Appendix to Capt. Flinders's Voyage to Terra Australis,' vol. ii. p. 540 [vol. i. p. 11].

more limited than Ventenat appears to have done; considering it as sufficiently distinct from *Bulleriaceæ*, to great part of which, however, Ventenat's two principal characters of *Sterculiaceæ* equally belong.

[221] In endeavouring to establish the characters and affinities of *Pterocymbium*, it became necessary to examine those of the established genera most nearly related to it, and as this examination has led me to adopt considerable alterations in arrangement, and enabled me to make some additions to the number of species, I shall here give the characters of the genera and species of that tribe to which the name of *Sterculiæ* has been applied by DeCandolle and Endlicher, prefacing that account with a history of the tribe, and especially of the genus *Sterculia*, from its formation to the present time.

In the botanical history of *Sterculia*, it is not necessary to go farther back than 1747, when Linnæus first published his character of the genus,<sup>1</sup> founded on the specimens and unpublished figures of Hermannus, whose Ceylon herbarium, of which the Museum Zeylanicum is a catalogue, had been sent from Copenhagen for his inspection. The result of a careful examination of this herbarium was the publication in 1748 of the 'Flora Zeylanica.'

Hermann's herbarium (purchased by Sir Joseph Banks and now in the British Museum) contained flowering specimens of *Sterculia foetida* and *Balanghas*, and the fruits of both species were figured by Hermann himself in the volume of drawings which accompanied the herbarium. From these materials, confirmed no doubt by the figures of the fruits in 'Hortus Malabaricus' and 'Herbarium Amboinense,' the Linnean genus was entirely established. The character given, however, is strictly applicable to *Sterculia foetida* only; and Linnæus was probably induced to refer *Balanghas* to the same genus, either from not having distinctly seen the remarkable form of the flower in that species, or, which is more likely, disregarding that difference, was determined by the exact resemblance in its

<sup>1</sup> 'Nova Genera Plantarum, respondente Dassow,' p. 13.

fruit to that of *S. fætida*, both being figured in the volume of drawings already referred to. These were the only materials he appears ever to have examined, and his own herbarium contained absolutely nothing except a single leaf of *S. fætida*: the generic character consequently remains unchanged in all his subsequent works.

In 'Flora Zeylanica,' Linnæus correctly includes *Sterculia* in his Class *Monacia*, notices the imperfect stamens in the female flower, and only overlooks the minute rudiments of ovaria in the male flower. He referred the genus to his Natural Order *Tricoccæ* (very nearly corresponding with the *Euphorbiaceæ* of Jussieu), as appears first in 'Philosophia Botanica,' published in 1751, and afterwards in the sixth edition of his 'Genera Plantarum' in 1764. In this determination of its affinity he was followed by Bernard de Jussieu in 1759, by Adanson in 1763; and in a manuscript list of the arrangement of plants adopted in 1779 in the Paris Garden, I find *Sterculia* still placed in the same family. The generic character of *Sterculia*, as given by Linnæus, who does not notice, and had no opportunity of ascertaining the structure of the seed, might with very slight alteration stand for that of the whole tribe, *Iheritiera* alone excepted.

In the order of time, the next work in which the same genus is described, though under a different name, is Aublet's 'History of the Plants of French Guiana,'<sup>1</sup> which appeared in 1775. He describes his genus *Ivira*, which all subsequent botanists have referred to *Sterculia*, as having hermaphrodite flowers, with ten stamens, and the capsules or follicles surrounded at the base with rigid filiform processes, formed as he states by the enlargement of the hairs which according to him exist in the flowering state. But from an examination of the specimens in his own herbarium (purchased by Sir Joseph Banks and now in the British Museum), as well as from others collected in the same country by the late celebrated Professor Richard, it appears that the flowers are unisexual; that the hairs of the

<sup>1</sup> p. 695, t. 279.

urceolus antherarum which Aublet describes, and which, as he states, by their enlargement form the mass of rigid processes surrounding the ripe fruit, have no existence; and that this singular appendage to the fruit is an accidental structure or monstrosity, probably of rare occurrence, of which I have found a single specimen among the loose fruits of his herbarium.

In 1775 also was published the 'Flora Ægyptiaco-Arabica' of Forskael, who describes a supposed new genus, *Culhamia*,<sup>1</sup> which is no doubt a species of *Sterculia*, certainly, however, not *platanifolia* as Vahl affirms, but perhaps either *S. tomentosa* of the 'Flora Senegambiae,' or the nearly related species *abyssinica*. *Culhamia* is described as having hermaphrodite flowers, and it is stated that the style, which is originally concealed by the stamens, only becomes visible after the expansion of the flower, so that here we have the same account of structure and gradual development of pistillum which was afterwards given by Cavanilles and adopted by de Jussieu.

In 1786, in the first volume of the 'Acta Acad. Patavin,'<sup>2</sup> Marsili proposed a new genus related to *Sterculia*, and formed of *St. platanifolia* of the 'Supplementum Plantarum' of the younger Linnaeus.

In 1788 Cavanilles published his fifth dissertation on Monadelphous plants, in which *Sterculia*<sup>3</sup> appears with its characters considerably modified, *Ivira* of Aublet being included in it, and some additional species described. He refers the genus to *Monadelphia*, states the flowers to be hermaphrodite, and accounts for their unisexual appearance by assuming the gradual and more tardy development of the female organ; he also describes the stigma as either bifid or with five rays, the supposed existence of the bifid stigma being founded on an error in the drawing of *S. platanifolia* by Mlle. Basseporte, from which his engraving is copied.

In 1789 the immortal work of A. L. de Jussieu appeared. *Sterculia* is there<sup>4</sup> for the first time correctly

<sup>1</sup> p. 96.

<sup>2</sup> p. 106.

<sup>3</sup> p. 284.

<sup>4</sup> p. 278.

referred to the Natural Order *Malvaceæ* as then understood: the generic characters, however, are stated to be taken from Aublet and Cavanilles. The erroneous assertion of the latter that the flowers are hermaphrodite, and his account of the gradual development of pistillum are adopted, and finally Jussieu expresses a doubt whether the embryo is corrugated, which he describes it to be in all the other genera of the same section of *Malvaceæ*, and which he considers as one of the principal characters of that Natural Order.

In Schreber's edition of the 'Genera Plantarum'<sup>1</sup> of Linnæus, published the same year, *Sterculia* is referred to *Dodecandra*, and the few changes made in the character are apparently taken from Cavanilles, and among these is the *stigma bifidum*.

In 1789 also Dryander, in the first edition of 'Hortus Kewensis,' established, partly from the manuscripts of J. G. Koenig, the genus *Heritiera*,<sup>2</sup> which he justly places next to *Sterculia*, and refers both to *Monæcia Monadelphia*.

Neither in Willdenow's edition of the 'Species Plantarum' of Linnæus, nor in Persoon's 'Synopsis' is any important alteration made in the character of the genus, which, following Schreber, is referred by Willdenow to *Dodecandra*, and by Persoon to *Monadelphia*.

In 1804 Ventenat, in his 'Jardin de la Malmaison,'<sup>3</sup> gives a considerably altered, and in most respects improved character of *Sterculia*, of which with some other genera of *Malvaceæ*, and the first section of Jussieu's *Tiliaceæ*, he proposes to form a new Natural Order, *Sterculiaceæ*, his principal distinguishing character of which has been already mentioned. He refers the genus to *Monadelphia Dodecandra* of the Linnean system for no very sufficient reason, namely the existence of the rudiments of the other sex in both the male and female flowers. He is the first to notice the *albumen bipartibile* and *radicula embryonis umbilico opposita or contraria*, both of which he introduces into

<sup>1</sup> p. 324.

<sup>2</sup> Vol. iii. p. 546.

<sup>3</sup> Vol. ii. fol. 91.

the character of the genus. Besides these improvements in the account of the genus, he has given the distinguishing characters of several new species.

In 1805 M. Palisot de Beauvois, in his 'Flore d'Oware et de Benin,'<sup>1</sup> in describing his *Sterculia acuminata*, introduces several alterations into his character of the genus, most of which belong only to the species he has there described, and some of which may be considered of generic importance, especially the remarkable structure of antheræ.

In 1806 Salisbury proposes a new genus, *Southwellia*, formed of all such species of *Sterculia* as have the segments of the calyx connivent with cohering apices; this being the only character distinguishing it from the rest of the genus.

In the same year Poiret, in the article *Sterculia* of the Botanical Dictionary of the 'Encyclopédie Méthodique,'<sup>2</sup> [223] considers the flowers as hermaphrodite, and adopts the explanation given by Forskael, Cavanilles and de Jussieu. In his generic character there is no improvement; but he suggests the probable expediency of afterwards dividing the genus, when the structure of the various plants referred to it is better known.

In 1819 Sir James (then Dr.) Smith, in Rees's 'Cyclopedia,' in his account of *Sterculia*, takes no notice of the structure of seed, and is inclined to agree with Schreber and Willdenow in referring it to *Dodecandra*. If the genus should be hereafter subdivided, he seems more disposed to trust to differences in the styles and stigmata than to those very remarkable modifications of fruit, with some of which he was acquainted, believing them not to be supported by other characters, and in proof of this instancing *St. platanifolia* and *colorata*, so similar in fruit, and so unlike each other in the form of the flower.

In 1824 DeCandolle, in the first volume of his 'Prodromus,' forms a tribe which he calls *Sterculieæ*, consisting of *Sterculia* and *Heritiera*, referring it to *Buttneriaceæ*. The

<sup>1</sup> Vol. i. p. 40.

<sup>2</sup> Vol. vii. p. 428.

most remarkable circumstance in his character of *Sterculiae*, is his describing the embryo as erect, which, if I rightly interpret his meaning, although applicable to a few species, is directly contrary to the more usual structure. *Sterculia* as a genus he distinguishes from *Heteriera* by the existence of albumen, which, however, is not universally present, and dehiscence of the follicles; the direction of embryo is not noticed in his characters of either of these two genera.

In 1827 M. Auguste de St. Hilaire, in the 'Plantes Usuelles des Brasiiliens,' gives, appended to his account of a supposed new species of *Sterculia*, an improved character of the genus, though in this character he describes the albumen as a coat of the seed; the "embryon antitrope" is considered as common to the whole genus. In the remarks that follow he supports Linnaeus's account of his classification of the genus, in opposition to the observations of Jussieu which he refers to, but which he does not seem to be aware were adopted from Cavanilles, and perhaps also from Forskael, with whom a similar account originated.

In the same year he published a Livraison of his 'Flora Brasiliæ Meridionalis,' in which work, as in the 'Plantes Usuelles,' owing to the state of his health, he was assisted by MM. Adrien de Jussieu and Cambessèdes. In the 'Flora Brasiliæ'<sup>1</sup> an enlarged, and in many respects improved character is given of *Sterculia*, of which the principal difference from that in the 'Plantes Usuelles' is, his admitting the existence of albumen divided into two equal segments, which, he correctly states, frequently cohere with the corresponding cotyledons, the first distinct notice I believe of that remarkable economy: he states also, that where the seeds are ascendent, the radicle of the embryo points to the hilum, and where they are transverse, in the diametrically opposite direction. His character, therefore, of the genus is so framed as to include every species of *Sterculia* of DeCandolle, as far as the author was acquainted with their structure. It will hereafter appear, however, that neither is the existence of albumen universal, nor is

the direction of the embryo dependent on that of the seed, even in the carpella of all the species then published.

In 1831, in the 'Flore de Sénégambie,' the joint work of MM. Guillemin, Perrottet and Richard, a new point is introduced into the character of *Sterculia*,<sup>1</sup> namely an incomplete arillus, which, however, if it really exists in any case, is probably to be found in one species only, namely, *Stereulia cordifolia*: in all the other species which I have examined, there is either only a minute *caruncula umbilicalis* or *strophiola*, as in *St. fœtida*, or more generally no trace whatever of this appendage.

In 1832, in the 'Meletemata Botanica' of Schott and Endlicher, the Natural Order *Sterculiaceæ* is divided into three principal tribes—*Bombaceæ*, *Helicteræ*, and *Sterculiæ*. This last tribe, as in DeCandolle's 'Prodromus,' is limited to the genera *Sterculia* and *Heritiera*. But *Sterculia* is divided into twelve genera, chiefly from modifications of the flower, or from the texture and period of dehiscence of the folliculi, and in one case from the seed being winged; no modification of internal structure of seed being introduced into any of the characters.

In the same year, the third volume of Dr. Roxburgh's 'Flora Indica' was printed at Calcutta. In this valuable work such a generic character of *Sterculia*<sup>2</sup> is given as to comprehend all the Indian species, and indeed so constructed as to include all that are now known, except *Courtenia*, a new genus of the present essay; and even that would be excluded only from its generally having double the usual number of ovaria. Several new species are well described in the work, and the direction of embryo noticed in most of them; the only species in which the radicle is described as pointing to the umbilicus being his *Sterculia alata*.

In 1840 Professor Endlicher, in the 13th part of his 'Genera Plantarum,' modifies the arrangement of the Linnean genus *Sterculia* given in the 'Meletemata,' all the genera there established, except his *Pterygota* (the *St. alata*

<sup>1</sup> Vol. i. p. 79.

<sup>2</sup> p. 144.

of Roxburgh), being considered as only subgenera of *Sterculia*, of which the principal characters distinguishing it from *Pterygota* are, as he states, orthotropous ovula and embryo either antitropous or parallel to the umbilicus. It would seem that these distinctions were adopted chiefly from the facts stated in the 'Flora Indica' of Dr. Roxburgh, and in part also perhaps from the generic character of *Sterculia* given in the 'Flora Brasiliæ.'

In 1841 the same arrangement and characters are given in his 'Enchiridion.'

---

Before proceeding to the description and characters of *Sterculiaceæ*, I have to make a few preliminary observations, chiefly on the relative importance of the different organs in the formation of genera.

In the general description of the tribe, I have enclosed in brackets such exceptions to the more usual structure as I believe to be in most cases of generic value.

The ordinary structure follows separately; no notice being taken of the exceptions, which are numerous, and such parts of the general description being excluded as are of least importance, and it may be remarked that this character is but little different from that of the genus *Sterculia*.

I then give the few characters to which hitherto no exception has been found.

The direction of *Embryo* with relation to the insertion or umbilicus of the seed appears to be by far the most important character, or that which is best supported by other modifications of structure; and it is worthy of remark, that in this point the ordinary direction of the embryo in the tribe, namely the radicle seated at the opposite extremity or apex of the seed, is itself a deviation from the more usual structure of Phænogamous plants, and an exception not only to the other tribes of *Sterculiaceæ*, but to the whole of the Natural Class *Malvaceæ*, to which that order belongs; and it becomes still more remarkable in

regard to the state of the unimpregnated ovulum, which I have some reason to believe is not orthotropous as might be expected, and as it has been described, but apparently anatropous, and that perhaps in the whole tribe. As, however, my observations on this subject are entirely made from the macerated ovaria of dried specimens, the statement here made must be received as requiring confirmation from the examination of living plants, and of a greater number of species.<sup>1</sup>

From this ordinary direction of embryo in the tribe, the deviations are of two kinds: the first, and no doubt the more important, is that in which the radicle is placed at a point close to the umbilicus, which is the most general structure in Phænogamous plants; but as it never points directly within the umbilicus, either in this or any other family, I have modified the expression generally employed in such cases. The second deviation is where the umbilicus is placed on or near the middle of the ripe seed with the radicle pointing to its lower extremity; in other words, where the embryo is parallel to the umbilicus. But this position of umbilicus of the ripe seed does not necessarily imply an exactly similar insertion in the unimpregnated ovulum; and in this tribe I am inclined to believe that in many cases the foramen of the ovulum is so close to the umbilicus as to appear anatropous, and that it ultimately becomes more distant from the unequal growth of the opposite extremities of the seed.

The exceptions to the ordinary structure in *Sterculiæ* which appear to be next in importance are the modifications in texture, and especially in the period of dehiscence of the seed-vessel or carpel, or even its nondehiscence, for in this respect the tribe admits of the two extremes. In the first, where the carpel opens long before the ripening of the seed, its texture is always foliaceous, and the embryo may

<sup>1</sup> The species of *Sterculia* with orthotropous embryo in which I have found this unexpected position of foramen in the unimpregnated ovulum, are *fœtida*, *guttata*, *carthaginensis*, *nobilis*, and *angustifolia*; and in the ripe seeds of *tragacantha*, *urens*, *villosa*, and *quadrifida*, an indication of a lateral foramen near the base is still visible, but which in *fœtida* I have not been able to detect.

be either transverse, that is, having its radicle distant from the umbilicus, or approximated to it.

The want of *Albumen* in this tribe is also a character of considerable value, but its absence is not quite so frequent as has been supposed, there being some room for doubt where its union with the cotyledons is most intimate.

The deviations from ordinary arrangement of the *Antheræ* may be considered as next in value to those already enumerated; of these modifications, that of the greatest importance is where the antheræ are disposed in a simple series and equidistant; this occurs I believe only when they are ten in number, or in the very rare case where they are reduced to five; the mere number, where they are not equidistant nor closely approximated, seems to be of much less importance.

The degrees of development of stamina in the female flower can never be employed in the formation of genera: in several, perhaps in many cases, the antheræ contain pollen, but, on comparing it with that of the male flower, I am disposed to believe it to be imperfect or effete. It would seem at first sight, that, in the numerous cases where the style is deflected, the stigmata are so closely approximated to the antheræ, that impregnation by their pollen is at least probable; but by this deflection of style the stigmata are equally exposed to the influence of the antheræ of the male flowers, which are generally lateral, while the female is terminal, the exposure being nearly equal, whether the inflorescence is pendulous or erect.

The modifications of calyx in *Sterculiæ*, especially in the depth of division and direction of its segments, have hardly more than specific or sectional value; and even those processes which occur in several species, either in the segments or tube, seem to be of no greater importance. The most remarkable anomaly of all is the induplicately aestivation found in a single species belonging to New Holland and in *Sterculia villosa* of Roxburgh. This mode of aestivation readily passes into the valvular in the corolla of several families, and is therefore of no great weight.

It is singular that so great a difference as that between

simple and compound leaves should in this tribe be unconnected with other characters, and the very few plants in which compound leaves occur differ widely from each other in the form of their flowers or direction of their segments.

### STERCULIEÆ.

**DESC. TRIBUS.**—*Flores* diclines, monoici, *Masculi* cum rudimento, sæpiùs minuto et antheris occultato, pistilli : raro stigmatibus ovulisque ferè ut in feminineis. *Feminei* antheris manifestis sæpè donatis polline sed semper effœto. *Calyx* monophyllus, 5-fidus, nunc 5-partitus, raro 4- v. 6-fidus, æqualis, coloratus ; æstivatione valvatâ rarissimè induplicatâ ; deciduus, quandoque marcescens. *Corolla* nulla. *Gynostemium*, columnâ genitalia sustinens, calyce breviùs v. longius raro abbreviatum ferè nullum, in cuius apice *Antheræ* subsessiles quindecim, nunc decem, quandoque viginti (raro quinque) urceolatum abbreviatum cyathiformem rarissimè tubulosum terminantes, in capitulum inordinatim congestæ, v. in fasciculos quinque cum ovariis alternantes polyadelphæ (nunc dum decem v. quinque, sæpiùs in serie simplici dispositæ) ; biloculares, loculis distinctis, parallelis (raro divaricatis). *Pollen* simplex, læve, sphæroideum. *Ovaria* 5, raro 4 v. 6 (rarissimè 10—12), leviter cohærentia, polysperma (nunc tetra- v. disperma, raro monosperma). *Ovula* angulo interno ovarii, dum inde-<sup>226]</sup> finita duplice raro quadruplici serie, inserta. *Styli* tot quot ovaria, coaliti v. arctè approximati, et tunc sæpè arctè deflexi (nunc ad basin ferè distincti, quandoque nulli). *Stigmata* in unicum subcapitatum quinquelobum cohaerentia, v. distincta subcylindracea indivisa. *Pericarpia*: *Folliculi* coriacei v. lignei (raro submembranacei) haud ante maturitatem seminum dehiscentes (in nonnullis in quibus ovula definita (2 v. 4) citò post fecundationem aperientes, foliacei) (raro clausi, nucamentacei). *Semina* aptera rarissime apice alata, umbilico sæpè omnino nudo, quandoque strophiolâ parvâ, rarissimè si unquam ? arillo carnosò incompleto ? aucto. *Integumentum* triplex (in exalbuminosis simplex :

ORDINARIUS TRIBUS.** Flores polygamo-monoici. *Calyx* 5-fidus, aestivatione valvatâ. *Corolla* nulla. *Genitalia* stipitem terminantia. *Antheræ* 15, congestæ v. polyadelphæ, biloculares; loculis parallelis. *Ovaria* 5, pluriovulata. *Styli* cohærentes. *Stigma* divisum v. lobatum. *Folliculi* ligneo-coriacæ, polyspermi. *Embryo* rectus, longitudine albuminis bipartibilis. *Cotyledones* albumini cohærentes. *Radicula* hilo contraria.

**CHARACTERES UNIVERSALES.** Flores unisexuales. *Calyx* coloratus, aequalis, aestivatione valvata raro ejusdem modificatione induplicata. *Corolla* 0. *Stamina* hypogyna. *Antheræ* biloculares. *Pericarpia* distincta.

## STERCULIA.

*Sterculiae pars auctorum ferè omnium.*

**CHAR. GEN.** *Calyx* 5-fidus (rarò 4-fidus). *Antheræ* v. inordinatim congestæ v. polyadelphæ. *Ovaria* pluriovulata. *Styli* cohærentes (in unicum sæpiùs arctè deflexum). *Stigmata* in unicum 5-lobum coalita quandoque distincta. *Folliculi* lignei v. coriacei. *Semina* albuminosa; albumine bipartibili cum cotyledonibus plus minùs arctè cohaerenti. *Embryonis* radicula hilo contraria.—Arbores intra tropicos Asiae (et insularum adjacentium) Africæ et Americæ provenientes. Folia indivisa, v. lobata, v. in paucis digitatim <sup>227</sup> composita. Inflorescentia v. paniculata v. racemosa, in plerisque nutans; floribus terminalibus sæpiùs præcocioribus et feminineis, et in his stylus arctè deflexus.

\* *Folia composita, digitata: foliolis cum petiolo articulatis et separatim solubilibus.*

a. *Calycis laciniae patulæ.*

**STERCULIA** (*fœtida*) foliolis 7—5 elliptico-lanceolatis acuminatis petiolatis vix quadruplo longioribus quam latis utrinque glabris.

*S. fœtida*, Linn., De Cand.

*Loc. Nat.* India orientalis, Insulæque Moluccanæ.

*Obs.* Varietatem in orâ septentrionali Novæ Hollandiæ, anno 1802, legi cuius venæ primariæ subflexuosæ et magis deliquescentes.

*S. (polyphylla)* foliolis 9—11 lincari-lanceolatis elongatis sessilibus sexies longioribus quam latis utrinque glabris.

*Loc. Nat.* E Sumatra, ad fretum Sunda, folium unicum reportavit D. G. Staunton (v. s.).

*Obs.* Figura Clompani majoris, *Rumph. Amb.* iii, t. 107, sat bene respondet, arboremque juvenilem biorgyalem, foliis

omnibus sumatrano similibus, in Hort. Reg. Paris. cultam anno 1843 vidi.

S. (*mexicana*) foliolis 7 cuneato-oblongis basi attenuatis petiolatis glaberrimis, floribus (masculis) paniculatis, calycibus intus barbatis.

*Loc. Nat.* Mexico ad Chiapas D. Linden v. s. in Herbb. Hort. Paris. et D. Delessert.

*Obs.* Feminei flores et pericarpia desiderantur ideoque genus incertum.

\* β. *Calycis laciniae conniventes, apicibus diù cohærentibus.*

S. (*versicolor*) foliolis oblongo-ellipticis acuminatis subtūs tomentosis.

S. *versicolor*, Wall., *Pl. asiat. rar.* i, p. 48, tab. 59.

*Loc. Nat.* Ind. or. ad ripas Irrawaddi D. Wallich.

*Obs.* Fructus ignotus.

\*\* *Folia simplicia, aliqua v. omnia lobata. Calycis laciniae patentes.*

S. (*urens*) foliis 3—5-lobis subtūs tomentosis velutinis, paniculis compositis erectis, calycis laciñiis basi lingulâ deflexâ, floribus decandris, urceolo antherarum cylindraceo, stylo erecto.

S. *urens*, Roxb. *Corom. pl.* i, p. 25, t. 24.

*Loc. Nat.* India orientalis, Roxburgh.

S. (*villosa*) foliis 5—7-lobis acuminatis subtūs tomentosis velutinis, paniculis compositis pendulis, calycis aestivatione induplicata! stylo deflexo.

S. *villosa*, Roxb. *Fl. ind.* iii, p. 153.

*Loc. Nat.* Ind. or., Roxburgh.

S. (*abyssinica*) foliis 3—5-lobis adultis supèr glabris subtèr pubescentibus, racemis (femineis) sub-simplicibus nutantibus, calycibus glabriusculis: laciñiis intùs extra

medium villosis, columna genitalium glaberrimo calyce breviore, stylo recurvo, folliculis polyspermis intus setosis.

*S. abyssinica*, *R. B. in Salt, Trav. app.*, p. lxiv.

*Loc. Nat. Abyssinia*, *D. Salt.*

[228] *S. (tomentosa)* foliis cordatis plerisque trilobis adultis utrinque tomentosis velutinis, floribus racemosis pendulis, calycibus extùs tomentosis, stipiti genitalium piloso.

*S. tomentosa*, *Guillem. Perrottet et Richard, Flor. sene-gamb.*, i, p. 81, tab. 16.

*Loc. Nat. Africa æquinoctialis.*

*Obs. S. abyssinicae* nimis affinis.

*S. (Triphaca)* foliis reniformibus acutis indivisis obsoletè trilobisve adultis supèr glaberrimis subtè glabriusculis, ovaris 2—3, stylo recurvo, stigmate lobato-capitato.

*Triphaca africana*, *Lour. Cochin.*, 577 (et *DeCand. Prodr.*) fid. fragm. ab ipso Loureiro in *Herb. Mus. Paris.*

*Loc. Nat. Africa orientali-australis contra Mozambique*, Loureiro.

*S. (carthaginensis)* foliis 3—5-lobis obtusis acutiusculisve cordatis adultis supèr glabratis subnitentibus subtè velutino-tomentosis cinereis venuis immersis, calycibus extùs fufuraceo-tomentosis intùs glabris, stylo recurvo.

*S. carthaginensis*, *Cav. Diss. vi*, p. 353.

ACTINOPHORA FRAGRANS, *Wallich.*

{239}

## TAB. XLVI.

ACTINOPHORA, *Wallich.*

**CHAR. GEN.** *Calyx* 5-partitus; fructus auctus, patens, foliaceus. *Petala* angusta, diu persistentia. *Stamina* inde finita, distincta. *Ovarium* 4-loculare; loculis biovulatis. *Stigmata* 4 (raro 3 v. 5), indivisa. *Pericarpium* evalve, ruptile, in monospermum. *Semen* erectum.

*Arbor parva* v. *Frutex subarboreus, multicaulis.* Folia alterna, stipulata. Inflorescentia axillaris.

ACTINOPHORA *fragrans*, Wallich, List, n. 1163.

**DESCR.** — *Arbor* v. *Frutex* multicaulis, 10—12-pedalis; caules partiales inordinatè ramosi, ramis ramulisque patulis parumque flexuosis, ultimis pube brevissimâ tomentosis. *Folia* simplicia, alterna, petiolata, stipulata, cuneato-oblonga, acutiuscula, 3—3½ uncias longa, 1½ unciam lata, coriacea, trinervia, nervis venisque primariis subtus elevatis, extra medium dentato-repanda, adulta super glabra subter pube stellari et tomento simplici flexuoso tecta: *petioli* breves. *Stipulae* laterales, subulatae, petiolo breviores. *Racemi* corymbosi, pauciflori, axillares, folio breviores. *Flores*, paulò ante expansionem visi, parvi. *Calyx* 5-partitus, æqualis, aestivatione valvatâ; laciiniis coriaceis, ovatis, acutiusculis, planis, pube stellatâ utrinque tectis extùs copiosiore, post anthesin plurimum auctis, trinerviis, reticulato-venosis, planis, subscarioso-membranaceis, pube rariore conspersis. *Petala* 5 foliolis calycis alternantia, mox ante expansionem calycis parva, lanceolata, basi parùm attenuata, post anthesin diu remanentia, elongata, subemarginata, linear-lanceolata, basi valde attenuata, filamenta emarginata superantia. *Stamina*

numerosa, simplici serio hypogyna, æquidistantia, distincta. *Filamenta* subulata, glabra, omnia antherifera. *Antheræ* oblongæ, obtusæ, paulò supra basin emarginatam insertæ; connectivo angusto; loculis parallelis longitudinaliter dehiscentibus. *Pollen* subglobosum, hispidulum. *Ovarium* ovatum, sessile, pube stellatâ copiosâ, 4-loculare; loculis dispermis; ovis erectis, collateralibus, cuneato-ovovatis. *Stigmata* 3—4 (quandoque 5), indivisa, semiteretia, papillosa. *Pericarpium* evale, pergamenteo-crustaceum, subglobosum, calyce aucto patulo, filamentis emarginatis, et diù petalis elongatis sed calyce brevioribus cinctum, ruptile, monospermum. *Semen* subsphæroideum, glabrum, irregulariter sulcis nonnullis longitudinalibus lobatum; umbilico nudo (nec strophiolato) prope basin lateris interioris.

Dr. Wallich, with whom the name *Actinophora fragrans* originates, and with whose specimens the plant here described and figured entirely agrees, has given no other account than that it was introduced into the Calcutta Botanic Garden in 1825, from the Isle of France. There is, however, no sufficient reason to believe that *Actinophora* is indigenous either in that island or in Bourbon or in Madagascar, whereas it is certainly a native of Java, Dr. Horsfield having found it in several districts, chiefly in the medial and eastern parts of the island, in teak forests in a rich soil, or in low ridges extending to the sea-shore. He adds that the wood, which is very hard and durable, is used for various domestic and mechanical purposes, and that it is so ponderous as to be occasionally employed for anchors of small native praoes and canoes. Its Javanese name is *Walli-kookoon*.

With respect to the affinities of *Actinophora*, it certainly does not belong to *Buttneriaceæ* as I originally defined it, but this may equally be said of several genera at present included in that order, and which like *Actinophora* are more obviously referable to *Tiliaceæ*; at the same time, as I observed in proposing the separation of *Buttneriaceæ*, these two families gradually pass into each other.

From all the genera of *Tiliaceæ* at present described,

*Actinophora* is readily distinguishable; its more remarkable characters being the enlarged subfoliaceous spreading calyx, accompanying the crustaceous evalvular monospermous pericarpium.

TAB. XLVI. *Fig. 1.* A branch of *Actinophora fragrans*, of the natural size. *Fig. 2.* A flower just before expansion, with the calyx removed. *Fig. 3.* A stamen, magnified. *Fig. 4.* The ovary, cut open longitudinally, crowned with the stigmata. *Fig. 5.* An ovule. *Fig. 6.* The fruit, with the enlarged persistent calyx, petals and stamens. *Fig. 7.* The enlarged calyx, seen from without. *Fig. 8.* The fruit, separated and slightly enlarged. *Fig. 9.* The same, cut open and with the seed removed. *Fig. 10.* The seed. *Fig. 11.* The convoluted cotyledons.

## SARCOSTIGMA HORSFIELDII.

## TAB. XLVII.

SARCOSTIGMA, *Wight and Arnott in Edin. New Philos. Journ. xiv, p. 299 (1833).*

CHAR. GEN. *Flores unisexuales (dioici). Perianthium duplex; utrumque calycinum 5-fidum (rarò 4-fidum); interius intra exterius sessile, aestivatione valvatâ. Masc. Stamina 5 (rarò 4), tubo brevissimo perianthii inserta, ejusdem laciniis alternantia, exserta. Antheræ versatiles. Fem. Ovarium uniloculare, biovulatum; ovulis ab apice cavitatis pendulis. Stigma sessile, depresso-capitatum, indivisum. Pericarpium drupaceum, perianthio utroque, interiore indurato, subtensum. Semen . . . .*

*Frutices volubiles, tenuè pubescentes, glabriusculi. Folia alterna, simplicia, integerrima, penninervia, reticulato-venosa, coriacea, petiolata, exstipulata. Spicæ e glomeris alternis paucifloris indivisæ.*

SARCOSTIGMA *Horsfieldii*, foliis obovato-oblongis, spicarum rachibus perianthioque interiore extùs pubescentibus.

*Loc. Nat. In provinciâ orientali Blambangan, ubi anno 1806 et in pago Pagetan anno 1809 detexit D. Horsfield. Javanis Kamaras.*

DESCR.—Frutex volubilis, ramosissimus; caule tereti (diametro sæpè bipollicari, *D. Horsfield*). Folia alterna, petiolata, exstipulata, integerrima, coriacea, glabra, impunctata, penninervia, reticulato-venosa, obovato-oblonga, extra medium paulò latiora, quandoque acutiuscula, nunc obtusissima et emarginata, 5—6 pollicaria, ultra duos pollines lata. Petioli teretes, semunciales, juxta basin

arcuatim recurvi. Spicæ longæ, sæpiùs 2—3 aggregatae quandoque solitariae, nunc rameæ absque cicatrice folii delapsi, nunc axillares, indivisæ sed e glomerulis alternis 3—4 floris formatae; rachi tereti pedicellisque flosculorum, perianthio brevioribus, extùs pubescentibus. Flores parvi. Perianthium exterius abbreviatum, 5-lobum lobis rotundatis; interius æstivatione valvatâ altè 5-fidum; laciniis planis, lanceato-linearibus, acutis, intùs glabris, supra medium recurvis. Stamina 5: filamenta laciniis perianthii <sup>[24]</sup> interioris alternantia, ejusdem tubo inserta, filiformia, lacinias limbi æquantia v. superantia. Antheræ versatiles, ovales; loculis parallelis, approximatis, longitudinaliter dehiscentibus. Rudimentum pistilli parvum, pubescens. Fem. perianthii, ut in Masc. interioris, laciniis apice recurvis. Ovarium ovatum, pubescens, uniloculare, biovulatum; ovlis collateralibus, ab apice cavitatis pendulis. Pericarpium drupaceum, oblongum, ipsâ basi perianthio interno indurato vix aucto subtensum; putamine crassopergameneo, rugoso (pulpâ succulentâ eduli, *D. Horsfield*). Semen . . . .

My remarks on the affinities of *Sarcostigma* are annexed to the account of the following genus, *Iodes*.

TAB. XLVII. *Fig. 1.* Flowering branch of a female plant of *Sarcostigma Horsfieldii*. *Fig. 2.* Part of a male spike; both of natural size. *Fig. 3.* A male flower, moderately magnified. *Fig. 4.* A male flower with quaternary division; probably a rare occurrence. *Fig. 5.* A stamen, to show the mode of dehiscence and insertion of filament. *Fig. 6.* The outer floral envelope or calyx. *Fig. 7.* A female flower, magnified in the same degree as the male; to show the expansion, recurvation, and external pubescence of the segments of the inner perianthium or corolla. *Fig. 8.* An ovary, slightly magnified and cut open to show the two pendulous ovula. *Fig. 9.* A drupe, nearly ripe, natural size.

## IODES OVALIS, Bl.

243]

## TAB. XLVIII.

IODES, Blume, Bijdr. p. 29.

CHAR. GEN. *Flores unisexuales* (dioici), 5-fidi. *Perianthium* duplex: utrumque calycinum; interius 5-partitum, majus, aestivatione valvatâ. Masc. *Stamina* 5, tubo abbreviato perianthii (corollæ?) inserta, ejusdem laciniis alternantia iisque breviora. *Antheræ* stantes. Fem. *Ovarium* uniloculare, biovulatum; ovulis ab apice cavitatis pendulis. *Stigma* sessile, depresso-capitatum, umbilicatum. *Drupa* exsucra, stigmate apiculata. *Semen* unicum: *Albumen* semini conforme; *Embryo* dimidio albumine longior; *Radicula* supera.

Frutex *volubilis*, *cirrhos axillaribus scandens*; foliis oppositis, integerrimis, petiolatis, exstipulatis; floribus parvis, paniculatis, axillaribus.

IODES *ovalis*, Blume, Bijdr. p. 30 (1825); Hasskl. Ilort. Bogor. p. 172, n. 798.

*Loc. Nat.* In plagiis orientalibus primùm 1806 et postea in variis locis detexit D. Horsfield. Javanis Jungetan et Jagal-Kedang.

DESCR. Frutex (quandoque subarborescens, *D. Horsfield*) pubescens, scandens, cirrhos axillaribus indivisis nunc oppositifloris. Folia opposita, petiolata, exstipulata, coriacea, penninervia, reticulato-venosa, ovata, acuta, basi obtusa, 4—5-uncialia, ultra 2 pollices lata; petioli semunciales, teretiusculi. Paniculæ axillares, compositæ, corymbosæ. Flores parvi, pubescentes (odorati *D. Horsfield*). Masc. Stamina 5, perianthio interiori (corollâ potius) aliquoties breviora, ejusdem laciniis alternantia; filamentis brevissimis; antheris basifixis, loculis approximatis parallelis longitudinaliter dehiscentibus. Rudimentum pistilli. Fem.

Floribus paulò post anthesin solùm visis, et tunc etiamque fructu maturo perianthio unico tantùm persistenti nec aucto nec indurato. Drupa exsueca, rugosa, magnitudine pisi majoris. Semen unicum maturescens; albumen carnosum, album, magnitudine seminis; Embryo respectu pericarpii inversus; Cotyledonibus subrotundis, planis, foliaceis; Radiculâ rectâ, brevissimâ, superâ.

OBS. I. Botanists are not agreed as to the light in which the two floral envelopes of *Sarcostigma* and *Iodes* are to be viewed. Both Klein, in describing the plant from which *Sarcostigma* was formed, and Blume, in his character of *Iodes*, have termed the outer envelope calyx and the inner corolla; while Drs. Wight and Arnott, by whom the genus *Sarcostigma* was established, have considered the outer envelope an involucrum and the inner calyx. In support of this opinion the persistence and even induration of the inner envelope in *Sarcostigma* would no doubt be adduced; but they were also, it may be supposed, determined by referring their genus to *Hernandiaceæ*, there being in *Hernandia* an undoubted involucrum, but that involucrum containing several flowers. On the other hand, the alternation of division of the two envelopes, and their close approximation in both these genera, are characters of at least equal importance; to which may be added the many analogous points of structure between these genera and *Cardiopteris*, in which it will hardly be disputed that both calyx and corolla are present.

OBS. II. As to the affinities of *Sarcostigma* and *Iodes*, the former genus was referred by Wight and Arnott to *Hernandiaceæ*, a family proposed by Blume in his 'Bijdragen,' p. 550, and adopted by Endlicher, consisting of *Hernandia* and *Inocarpus*, two genera which do not appear to me very nearly related to each other, and from both of which *Sarcostigma* is readily distinguished by many important characters. In the following year Professor Arnott, in describing *Nansiatum* of Dr. Buchanan Hamilton, proposed to place it next in affinity to *Phytocrene* of Wallich (*Gyno-*

*cephalum* of Blume), and to form of these two genera the new family of *Phytocreneæ*. It is remarkable that he did not also include in this family *Sarcostigma*, which so obviously belongs to it: this has been recently done by M. Planchon, who also justly proposes to add *Iodes*, appended by Blume to *Menispermeæ*, as well as *Miquelia* or *Jenkinsia*, which he regards as distinct genera, but which I think ought to be united. He also includes *Pyrenacantha*, properly united with *Adelanthus* of Endlicher; but this genus I exclude, admitting, however, its near relationship.

Of *PHYTOCRENEÆ* so constituted I subjoin the distinguishing characters of the family, as well as the differential characters of the genera belonging to it.

*PHYTOCRENEÆ*, Arnott, in *Edinb. New Phil. Journ.* xvi, p. 314 (1834).

*Flores* diclines (dioici), inconspicui. *Perianthium* duplex (*Calyx* et *Corolla*) utrumque 4—5-fidum, calycinum; interius majus, aestivatione valvatâ, intra exterius in quibusdam pedicellatum. *MASC.* *Stamina* 4—5, laciniis perianthii interioris alternantia; *filamenta* nunc hypogyna et ipsâ basi coalita, nunc tubo perianthii inserta; *Antheræ*: loculis longitudinaliter dehiscentibus. *Rudimentum pistilli*. *FEM.* *Ovarium* liberum, uniloculare, biovulatum; ovulis ab apice cavitatis suspensis. *Stigma* sessile, indivisum v. bifidum. *Drupa* monosperma. *Albumen* semini conforme; *Embryo* magnitudine fere albuminis, cotyledonibus foliaceis.

*Frutices* volubiles v. scandentes; foliis alternis raro oppositis, integerrimis v. lobatis, exstipulatis.

*PHYTOCRENE*, Wallich, *Pl. Asiat. rar.* vol. iii, p. 11, t. 216.

*Flores* utriusque sexûs 4-fidi, capitati. *Stamina* hypogyna. *Antheræ* versatiles. *Stigma* bilobum, obtusum.

*Folia* indivisa v. lobata.

SARCOSTIGMA, *Wight and Arnott, in Edinb. New Phil. Journ.* xiv, p. 299.

*Flores* spicati, 5-fidi (raro 4-fidi). *Stamina* tubo perianthii inserta, ejusdem lacinias longiora. *Antheræ* versatiles. *Stigma* depresso-capitatum. *Drupa* pulposa.

*Frutices volubiles; foliis alternis integerrimis.*

IODES, Blume.

[245]

*Flores* 5-fidi, paniculati. *Stamina* tubo perianthii longioris inserta, ejusdem lacinias breviora. *Antheræ* stantes. *Stigma* depresso-capitatum. *Drupa* exsucca.

*Frutex* *cirrhos* *axillaris* scandens; foliis oppositis, integerrimiis.

NANSIATUM, *Buchanan Hamilton, in Edinb. New Phil. Journ.* xvi, p. 314.

*Loc. Nat.* In plagiis orientalibus et medianis Javæ; in planitiis haud multum elevatis supra mare anno 1806

primum detexit D. Horsfield. Javanis orientalibus Parianom, medianis Kanjar Kawang vel Rindengan appellata.

**Descr.**—Planta annua? volubilis, glaberrima, præter raches spicarum tenuissimè pubescentes pube acutâ simplici. Rami ramulique flexiles, striati, inanes. Folia alterna, remota, elongato-petiolata, exstipulata, flaccidè membranacea, angulato-lobata, altè cordata; lobo medio acuminate cum mucronulo brevi; reliquis obtusis, muticis; diametro 2—3-pollicari; basi nervis 5—7 lobis respondentibus, immersè reticulato-venosis. Cymæ axillares, pedunculatæ, semel v. bis furcatae. Flores unilaterales, ebracteati, brevissimè pedicellati, parvi, caput aciculæ mediocris vix superantes. Calyx 5-partitus, aequalis, membranaceus, texturâ subcorollinâ, aestivatione imbricatâ; sepalis ovatis, obtusiusculis, marginibus tenuissimè ciliatis, subnerviis, axi parùm opaciore. Corolla monopetala, calycem vix superans, subrotata, virescenti-alba, glaberrima; tubo per-brevi, limbo 5-partito æquali; laciniis obovatis, obtusis, concaviusculis, obsoletè iminersè venosis, aestivatione imbricatis. Stamina 5, epipetala, æqualia, corollâ breviora, ejusdem sinibus inserta. Filamenta brevia, filiformia, glabra. Antheræ pro ratione flosculi majusculæ, didymæ, utrinque profundè emarginatæ; connectivo membranaceo angusto; loculis appositis, longitudinaliter dehiscentibus. Discus hypogynus nullus. Ovarium uniloculare, biovulatum; ovulis collateralibus, ab apice cavitatis pendulis, altero sæpè minore effœto. Stigmata duo: alterum (imperfectum) sub anthesi magis conspicuum, stylo manifesto insidens, capitatum, lœve nec papillosum; alterum (perfectum) sub anthesi vix obvium, postea sensim valdè auctum, demùm emarginatum, superficie interiore imperfectum spectante papillosum. Samara obcordata, nitida, vix uncialis, ipsâ basi angustatâ calyce persistenti vix aucto conniventi subtensa; alâ marginatâ utrinque ipso nucleo subcylindraceo ter quaterè latiore pergamenteâ; stigmate vero plurimùni aucto emarginato, tarde deciduo, stigmate effœto, capitato, pedicellato, persistenti, haud mutato, subemarcido, coronata.

Semen unicum, testâ? cum samaræ cavitate cohærens et omnino replens, striatum, subcylindraceum; integumentum prætereà unicum, membranaceum, albumini arctè adhærens. Albumen semini conforme, aqueo-pallidum, densè carnosum. Embryo in apice (respectu pericarpii) albuminis, minutissimus; radicula brevis, supera; cotyledon adhucendum indi-visus, subglobosus, obtusissimus.

OBS. There are some points both in the botanical history and in the structure of the genus *Cardiopteris* which deserve to be specially noticed. It is probable that a short time before the publication of the 10th edition of his 'Systema Naturæ,' in 1759, Linnæus had particularly examined the figures of the 'Herbarium Amboinense,' for in that edition almost the only figures quoted of the different species of *Dioscorea* are those of that work, and under *Dioscorea sativa* he refers to *Olus sanguinis*, vol. v, p. 482, tab. 180, which is an undoubted and a tolerably good representation of *Cardiopteris moluccana* of Blume; and in proof of Linnæus having no doubt as to the correctness of his reference, he has in his own copy of the work written *Dioscorea sativa* under the figure quoted. This synonym is adopted by Willdenow in his edition of 'Species Plantarum.' J. G. Koenig, in vol. iii, p. 81 of his manuscripts, formerly in Sir Joseph Banks's Library, now in the Banksian or Botanical Department of the British Museum, quotes the same figure of Rumphius (with a doubt, however, as to the correctness of Linnæus's reference to *Dioscorea*) for a plant which is no doubt *Cardiopteris lobata*, from his description in many respects very good, and with regard to stigma more nearly correct than some recent accounts. Koenig considers his plant to be monoicous, as does Hasskarl (*supr. cit.*): I also entertained the same opinion, having never found flowers with completely developed pistillum in which the corolla and consequently stamina were present. This, however, might depend on the advanced state of the flower whose corolla had fallen soon after expansion. Dr. Blume, therefore, is perhaps more correct in considering the flowers as hermaphrodite, and I am

inclined to adopt his view. His statements respecting the structure of the pistillum are more liable to objection: he describes the ovulum as orthotropous, having the micropyle at its lower extremity, and the embryo consequently existing at the same point of the seed; my own observations, which may indeed require to be verified, placing the embryo at the upper extremity, or close to the insertion of the seed, the ovulum being consequently anatropous. The external structure of the pistillum is very singular. In an early stage of the flower, immediately before or even at the time of expansion, there are apparently two stigmata: of these the more obvious is capitate, undivided, fleshy, but not papillose, and is supported on a distinct style; the second is quite sessile, much shorter in this stage than the capitate branch, and having its upper or inner surface distinctly stigmatic or papillose. In the next stage, the latter, which I regard as the efficient stigma, gradually enlarges, becoming longer than the capitate organ, which in my opinion is an imperfect stigma; and as in this stage the ovarium though enlarged has not perceptibly increased in diameter, this capitate stigma has the appearance of being lateral. The perfect stigma, which continues to lengthen, its upper surface becoming more evidently hispid or papillose, not unfrequently remains crowning the samara even when ripe; but frequently also it is then deciduous, while the imperfect capitate stigma, which has undergone no change either in size or surface, more generally remains after the real stigma has fallen.

In one of the flowers of a specimen preserved in spirits by Dr. Wallich, and in which the corolla was wanting, and a slight enlargement of ovarium had taken place, I found only one ovulum, the lower extremity of which seemed in some degree to support Dr. Blume's account of the position of micropyle. In a second flower of the same specimen only one apparently perfect ovulum existed, but the funiculus or remains of a second was visible; in the perfect ovulum a more transparent point, which might possibly be micropyle, was lateral; and in a third flower, long after fœcundation, the samara being distinctly formed though not of its full

size, I was able to observe only one ovulum, suspended from a funiculus which was continued on one side into a raphe ending at the lower and wider extremity of the ovulum. These appearances leave the question of the original position of micropyle undetermined.

Dr. Blume considers the capititate body as the true stigma, and I have some reason to believe that this is also the opinion of an excellent and more recent observer. I have little doubt, however, that the emarginate or bidentate branch is the organ performing the function. In connection with and in support of this opinion, I regard the ovarium or pericarpium of *Cardiopteris* as composed of two carpella, the line of junction being in the axis of the samara. This I infer from the relative position of the supposed perfect and imperfect stigmata, the former presenting its papillose surface to the latter, and both being in the plane of the wings of the samara; and these wings, as well as I can judge, being anterior and posterior with relation to the axis of the unilateral spike.

With respect to the affinities of *Cardiopteris*, Dr. Wallich, with whom the genus originated, and who first hazarded a conjecture on the subject, was disposed to refer it to *Sapindaceæ*; Hasskarl (*l. supra cit.*) has placed it among *Euphorbiaceæ*; and Blume, who considers it as forming a separate family (*Cardiopterideæ*), has placed this family in proximity with *Verbenaceæ* and *Boragineæ*. None of these approximations appear to me satisfactory, and although I am aware of several important objections to the view, I am inclined to consider *Cardiopteris* as an isolated genus or family to be placed at no great distance from *Phytocreneæ*, chiefly through *Iodes*, under which genus I have given some account of that family.

TAB. XLIX. *Fig. 1.* A branch of *Cardiopteris lobata*, in flower and fruit, natural size. *Fig. 2.* An expanded flower, slightly magnified, which shows the relative proportion of calyx, corolla, and stamina, and the external appearance of pistillum, of which the capitiate stigma has nearly attained its full size, while the true stigma is as yet

barely visible. *Fig. 3.* A corolla laid open, to show that it is monopetalous, that the stamens are inserted below the sinuses, and that its segments are slightly ciliated, somewhat more magnified than figure 2. *Fig. 4.* The corolla removed, to show more distinctly the external structure of pistillum. *Fig. 5.* A stamen. *Fig. 6.* The calyx surrounding the somewhat enlarged pistillum, on which, from the elongation of the true emarginate stigma, the capitate or spurious stigma has become apparently lateral. *Fig. 7.* A ripe seed-vessel, natural size, with its short pedicle covered by the withered calyx, and crowned by the two stigmata, of which the true or emarginate has greatly increased in size, especially length, while the capitate, not at all enlarged, is barely visible. *Fig. 8.* A seed slightly magnified. *Fig. 9.* The embryo separate, magnified more than fig. 8, and so placed as to indicate that it must have been situated at the upper extremity of the seed.

## BENNETTIA JAVANICA.

249

## TAB. L.

## BENNETTIA.

**CHAR. GEN.** *Flores unisexuales (dioici), regulares, 5-fidi (minimi). Calyx 5-partitus. Petala 5 concava, aestivatione marginibus inflexis mutuo applicitis valvata. Masc. Stamina 10, petalis saepius cucullatis inclusa. Antheræ loculis longitudinaliter dehiscentibus. Fem. Ovarium uniloculare, biovulatum, ovulis pendulis. Stigmata 3—4, filiformia, uno alterove quandoque bipartito. Drupa latior quam longa, monosperma. Semen figurâ drupæ. Albumen magnitudine seminis. Embryo transversus, rectus, longitudo fere albuminis; radicula alteri margini approximata, recta, cotyledonibus foliaceis.*

*Arbusculæ; foliis simplicibus, alternis, integerrimis, stipulis lateralibus, saepius caducis. Spicæ ramulos graciles terminantes, solitariae, longissimæ, pendulæ.*

**BENNETTIA javanica**, masculi floris petalis altè cucullatis glabris: alabastro ultra medium 5-fido depresso lobis retusis, antheris rudimentoque pistilli imbertibus, drupis paulo tantum latioribus quam longis, foliis utrinque ramulisque glabris.

**Loc. Nat.** In plagiis Javae orientalibus, ubi primum detexit anno 1806 *D. Horsfield*; et anno 1814 regionibus medianis Insulæ observavit. Javanis orientalibus *Klimo Koncher*; medianis *Jirikan* appellata.

**DESCR.** *Arbuscula* glabra, ramosissima, ramulis virgatis. *Folia* alterna, integerrima, stipulata, brevè petiolata, impunctata, oblonga, super glabra, subter secundum nervum et venas saltem primarias tenuissinè pubescentia. *Stipulæ* laterales, angusto-subulatæ, petiolo paulo breviores, caducæ. *Spica* terminalis, solitaria, longissima (usque pedalis), indivisa, nutans; *mascula* e fasciculis 4—5-floris approxi-

mato-alternis, sessilibus, pedicellis unifloris basi unibracteatis superne ebracteatis; *feminea* floribus solitariis. *Flores masculi* parvi, caput aciculi mediocris subæquantes. <sup>250]</sup> *Calyx* 5-partitus, æqualis, patens, laciniis planis acutiusculis pubescentibus, pube brevissimâ simplici acutâ. *Petala* 5, cum laciniis calycis alternantia, patentia, altè cucullata, obovata, glabra, apice cuculli retuso, calyce plus duplò longiora, brevissimè unguiculata, axi laminæ intùs incrasatâ prominulâ, aestivatione marginibus inflexis mutuò applicatis valvatâ, alabastro depresso 5-lobo. *Stamina* decem distincta. Filamenta brevissima, latiuscula, sepalis et petalis opposita. *Antheræ* biloculares, loculis connectivo lato distinctis longitudinaliter dehiscentibus; omnes cucullis petalorum semi-inclusæ, ita ut duæ petalo singulo oppositæ esse videantur (exterior interiorque), sed dum exterior ad filamentum petalo oppositum pertinet, interior e loculis respondentibus filamentorum duorum petalis alternantium formata est. *Pollen* simplex, sphæroideum. *Rudimentum pistilli* subovatum, apice depresso indiviso. *Feminei flores* paulo post fecundationem solum visi; petalis concavis haud cucullatis. *Ovarium* sphæroideum, 4—5-sulcum, pubescens, basi calyce parvo subtensum, stigmate triplici vel duplici singulo bifido v. laciniato coronatum, uniloculare, biovulatum, ovulis apici cavitatis affixis, collateralibus, latioribus quam longis, transversim oblongis, utroque angulo acutiusculo. *Drupa* paulò nec duplò longior quam lata, tenuissimè pubescens, pulpâ parcâ; putamine intùs venoso, basi excavato, depressione latâ longitudine totius baseos in cuius centro calyx persistens haud auctus. *Semen* unicum, apici cavitatis affixum, transversim ovale: integumento (testâ?) simplici. *Albumen* semini conforme, carnosum. *Embryo* transversus, longitudine ferè albuminis. *Cotyledones* foliaceæ, quoad apicem cavitatis accumbentes, ovales. *Radicula* recta cotyledonibus multoties brevior, margini alteri approximata.

OBS. *Bennettia* is dedicated to the principal author of the present work, John Joseph Bennett, Esq., my friend and colleague in the British Museum.

The generic characters of *Bennettia* are clear and important, but the affinities of the genus, or its place in a natural arrangement, though determinable, are not equally obvious. Many important points of agreement will readily present themselves between *Euphorbiaceæ* and *Bennettia*, but the general resemblance it bears to *Antidesmeæ* is still more striking. In their simple entire alternate leaves with lateral deciduous stipules and in their inconspicuous unisexual flowers they entirely agree, very nearly also in inflorescence, in the structure of ovarium, in their monospermous drupaceous pericarpium, and lastly, in the presence and texture of albumen, and in the degree of development of embryo. The principal distinctions would therefore be reduced to the existence of petals in *Bennettia*, to its stamens being equal in number to the divisions or parts of both floral envelopes, to a remarkable and obvious difference in the structure and aestivation of antheræ, and to the singular character of its transverse embryo. The presence of petals may even be regarded as of more than ordinary importance, their usual form in the male flower being necessarily connected with the aestivation of stamina. According to this view, therefore, *Bennettia* may be said to bear the same relation to *Antidesma* (for *Antidesmeæ* contains at present no other well-established genus) that the polypetalous bear to the apetalous genera of *Euphorbiaceæ*. But according to a principle which I proposed for adoption in 1810, *Bennettia* ought not only to determine the place, but also give the name (*Bennettiaceæ*) to the family. The principle referred to is stated in the 'Prodromus Floræ Novæ-Hollandiæ,' p. 351, in a note relative to *Combretaceæ* (an order then first proposed and characterised), in the following terms:—"Hunc ordinem inter polypetalos posvi, non solum propter petalorum in pluribus existentiam, sed quia vera natura partium affinitatesque ordinum, ex contemplatione generum in quibus structura magis evoluta quam ex iis in quibus aliqua pars suppressa, tutius erui queant." In 1814, in conformity with the same principle, I placed among polypetalæ *Euphorbiaceæ*, a family to which the same reasoning is still more

strikingly applicable. It is not my intention, however, to propose any change in this respect, for in both cases the names must be considered as established.

<sup>251]</sup> The affinity between *Euphorbiaceæ* and *Antidesmeæ* is rendered more obvious by the addition to the latter of *Bennettia*. But the structure of ovarium and the mono-spermous drupaceous pericarpium readily distinguish them.

*Iodes* and *Sarcostigma* also agree with *Bennettia* in several important points, particularly in their unisexual minute flowers, ovary with two pendulous ovula, mono-spermous drupa, and in most respects in the structure of seed. They differ in habit, being twining or scandent shrubs without stipules, in their monopetalous persistent inner perianthium or corolla, in aestivation and reduced number of stamens, in structure of antheræ, and in the embryo being inverted, not transverse.

OBS. II. Several species of *Bennettia* have been discovered in India. One of these, first observed by the late Dr. Jack, at Singapore, was referred by him, though doubtfully, to *Limonia*. Dr. Blume, who had observed a plant of the same genus in Java, for which he adopted the generic name here proposed, having liberally communicated specimens and drawings of this plant, it proves to be identical with *Bennettia javanica*; and lastly, Dr. Wallich has, in the concluding distribution of his great Indian Herbarium, noticed several plants of the same genus, to which he has also given the name *Bennettia*. These plants so closely resemble *Bennettia javanica* and each other, that they are chiefly distinguishable by minute, but, as I believe, constant differences in their male flowers, and in the form of their fruits. Of these supposed species the differential characters are here subjoined.

*Bennettia Wallichii*, masculi floris petalis concavis vix cucullatis glabris, antheris rudimentoque pistilli imberibus, drupis transversim oblongis duplò latioribus quam longis varicosis, ramulis foliisque utrinque glaberrimis.

*Doc. Nat. India Or. Tavoy. Wall. List, 8585 E.*

B. *phlebocarpa*, drupis latè cordatis sinu clauso reticulato-venosis paulo latioribus quam longis, foliis oblongis subacuminatis utrinque glabris.

*Loc. Nat.* Singapore. *Wall. List*, 8585 D.

B. *Finlaysoni*, masc. petalis modicè cucullatis glabris apice deflexo acuto: axi intùs elevatâ, antheris imberbibus, rudimento pistilli apice barbato, foliis oblongis acuminatis basi inæquilaterali subtùs nervo venis primariis ramulisque pubescentibus, spicis masc. foliis longioribus.

*Loc. Nat.* Pulo-Penang, b. Finlayson. *Wall. List*, 8585 B.

B. *affinis*, masc. petalis cucullatis glabris: axi intùs elevatâ, antheris imberbibus, rudimento pistilli apice barbato, stipulis ramulis venisque primariis subtùs pubescentibus, spicis folia lanceolato-oblonga acuminata subsessilia vix superantibus.

*Loc. Nat.* Pulo-Penang, b. Finlayson. *Wall. List*, 8585 B.

We are indebted to our friend, Robert Brown, Esq., for  
generic character and name, given to it in honour of Ber-  
nardinus Antonius Gomez, Physician to the Portuguese  
fleet, and author of *Botanico-Medical Observations* on the  
plants of Brazil, a very respectable work, written in the  
Latin and Portuguese languages.

Bot. Mag. 1748 (1815).

CYRTOPODIUM WOODFORDII.

*Petala* 5, distincta, secunda. *Labellum* trilobum, cum processu unguiformi baseos columnæ apteræ subarticulatum. *Massæ pollinis* 2, postice bilobæ. *Brown MSS.*

*Cyrtopodium Woodfordii*, labello ventricoso : lobis laminæ lateralibus intermedio verrucoso callis cristato brevioribus.

*Cyrtopodium Andersonii*, labello angusto unguiculato : lobis laminæ lateralibus divaricatis intermedio excavato longioribus.

*Bot. Mag.* 1814 (1816).

*Anisomeles malabarica*, tomentosa, subglandulosa, caule incano, foliis lanceolatis subtus rugosis, verticillis multifloris, calycibus lanatis dentibus subulatis tubum æquantibus. *Brown MSS.*

*Bot. Mag.* 2071 (1819).

*Pultenæa tenuifolia*, capitulis terminalibus subbifloris, fructibus lateralibus, foliis subulato-linearibus muticis supra concavis subtus convexis ramulisque pilosis. *Brown MSS.*

Native of the south coast of New Holland, and probably of Van Diemen's Island. It was observed on several parts of the former by Mr. Brown, to whom we are indebted for enabling us to settle the species, and to distinguish it from the *vestita* of the "Hortus Kewensis," under which name we received it.

*Bot. Mag.* 2086 (1819).

*Pultenæa biloba*, capitulis terminalibus paucifloris, foliis cuneiformibus apice dilatato-bilobis supra tuberculato-scabies subtus sericeis ; mucrone brevi marginibusque recurvis. *Brown MSS.*

We are indebted to our friend Mr. Robert Brown for

his assistance in determining the species, by whom it was first discovered in New South Wales.

*Bot. Mag.* 2091 (1819).

CHLORANTHUS MONOSTACHYS.

MONANDRIA MONOGYNIA.

\* *Flores Apetali.*

*Anthera lateri ovarii insidens* (indivisa, bilocularis; vel triloba, 4-locularis). *Ovarium monospernum*, ovulo pendulo. *Stigma capitatum*. *Drupa*.—*Brown*.

*Chloranthus monostachys*, antheris incurvis trilobis indivisisve, spicis solitariis, floribus alternis. *Br.*

By the advice of Mr. Brown we have placed *Chloranthus* in the first class of the Linnean system, although, he observes, that only one known species is really and at the same time constantly monandrous (*C. monander*, Br.); for in *inconspicuus* and *elatior* (Br.) the three-lobed, four-celled anther, hitherto regarded as an antheriferous petal, is according to him composed of three confluent anthers, of which the middle one only is perfect or two-celled, corresponding with the anther of *monander*, the lateral being dimidiate or one-celled; and in *monostachys* both simple and compound anthers are found on the same spike.

*Bot. Mag.* 2190 (1820).

RULINGIA PANNOSA.

PENTANDRIA PENTAGYNIA.

(Inter *Maherniam* et *Commersoniam*.)

*Petala* 5, e cucullata basi ligulata. *Stamina* sterilia 5,

*indivisa* (*Nectarium*, Linn.). *Ovarium* 5-loculare: loculis dispermis. *Capsula*: septis duplicatis dernum 5-partibilis. . . *Brown*.

*Rulingia pannosa*, capsulis echinatis exsertis, foliis dentato-serratis acutis planis supra scabris subtus tomentosis: inferioribus ovatis subcordatis passimque lobatis; superioribus oblongo-lanceolatis. *Br. prodr. fl. nov.-holl.* 2 inedit.

Our friend Mr. Brown, to whom we are indebted for the above generic and specific characters, places this genus in the Natural system in his order of *Buttneriaceæ*, which he has defined in the appendix to 'Flinders's Voyage,' vol. ii, p. 540.<sup>1</sup>

It is nearly related to *Commersonia*, from which it differs in the number of sterile filaments, or divisions of the nectarium, in the cells of the ovary being two-seeded, and in the capsule. Named in memory of John Philip Rüling, author of an essay on the 'Natural Orders,' in which he has published the ideas of Professor Büttner upon this subject. A greenhouse shrub, native of Port Jackson, in New Holland, where Mr. Brown discovered several other species of the same genus.

*Bot. Mag.* 2191 (1820).

#### SYMPHORIA RACEMOSA.

#### PENTANDRIA MONOGYNIA.

*Germen* 4-loculare: loculis 2 polyspermis, sterilibus; 2 monospermis, fertilibus. *Bacca* coronata. *Cor.* tubulosa, brevis, 5-fida, subæqualis. *Cal.* 5-dentatus. *Brown.* *Lonicerae* sp. *Linn.*

*Symphoria racemosa*, racemo interrupto subterminali, corolla intus barbata.

*Germen* ovate, with two or three small bracts applied close to the base. Mr. Brown has observed that it is four-

<sup>1</sup> [*Antè* vol. i, p. 11.]

celled, 2 of the cells bearing each several ovula, but which are always abortive; the other two having each a single seed, which alone come to maturity. An analogous circumstance takes place, he observes, in the fruit of *Linnaea*, and of *Abelia*, two nearly related genera belonging to the same family, the *Caprifoliaceæ*, in both which the germen is three-celled, two of the cells having several imperfect ovula, and the other a single ovulum, which alone comes to maturity. *Vide 'Characters and Descriptions of Three New Species of Plants, found in China by Clarke Abel, Esq. By Robert Brown, F.R.S.'* [Ante, p. 324.]

*Bot. Mag.* 2211 (1822).

*Dillwynia cinerascens*, corymbis terminalibus sessilibus, foliis filiformibus erectis; mucrone innocuo brevissimo sub-recurvo, ramulis calycibusque sericeis. *Brown MSS.*

Mr. Brown possesses many species of this genus, which he divides into two sections; in one of which (*Xeropetalum*, Br.) these parts are marcescent. It is to the latter section that the present plant belongs. The three species recorded in the 'Hortus Kewensis' all belong to the first; and from this division the above generic character seems to have been more especially framed.

*Bot. Mag.* 2247 (1822).

#### JACARANDA OVALIFOLIA.

*Cal. 5-dentatus. Cor. fauce campanulata: limbo bilabiato. Filamentum quintum sterile, longius, barbatum. Caps. ovata, bilocularis, bivalvis: dissepimento contrario, valvis pleniusculis adnato. Semina alata.*—Arbores. Folia opposita, abrupte rariusve impari-pinnata, pinnis impari-pinnatis. Flores paniculati, violacei. Calyx saepius cyathiformis nunc breve campanulatus vel subcylindricus dentibus obsoletis. Corollæ aestivatio imbricata, labio superiore bre-

*viore bilobo equitante inferius, cuius lobus medius major indivisus, lateralibus tectus. Stamina antherifera inclusa: Antheræ sœpius dimidiatae, cum rudimento nano lobi alterius; nunc completae, loculis æqualibus divaricatis apice solum connexis.* Brown MSS.

*Jacaranda ovalifolia*, antheris dimidiatis, corollis extus sericeis, foliolis pubescentibus; lateralibus ovalibus cum mucrone; terminali lanceolato. *Brown MSS.*

*Jacaranda ovalifolia* is very nearly related both to *J. acutifolia* and *J. obtusifolia* of Humboldt and Bonpland (*Plant. Äquinoct. tabs. 17 and 18*), between which it may be placed. *J. acutifolia* differs from it chiefly in all the leaflets being lanceolate, and in having a smaller number of pinnæ. *J. obtusifolia* is still more distinct in its leaflets entirely wanting the muero, which is both obvious and constant in our plant, and in having a smooth corolla. *J. Bahamensis*, Nob. (*J. caroliniana*, Persoon; *Bignonia cærulea*, Linn.), of which there is in the Banksian Herbarium a single imperfect specimen that may be supposed to be authentic, and *J. rhombifolia*, of Meyer (*Flor. Essequib.*, 213), which is probably not different from the plant found by the late Dr. Anderson, of St. Vincent, on the banks of the Essequebo, and cultivated in some of the gardens, under his name of *Bignonia filicifolia*, are easily distinguished from the three species already mentioned, by their rhomboidal leaflets, and from each other by differences in the surface of corolla, which is silky in *J. Bahamensis* and smooth in *J. rhombifolia*.

*J. procera*, Nob. (*Bignonia Copaiæ*, Aublet, *B. procera*, Willd.), is sufficiently different from all the others in the much greater size of its leaflets, which are frequently upwards of an inch in length; in the rachis of the pinnæ not being winged; and in the cylindrical calyx, of which the teeth are extremely minute.

In five of the above-mentioned species, I have ascertained that the antheræ are dimidiate, with a hardly visible rudiment of a second lobe; a structure which M. Meyer (l. c.) has expressed by "Antheræ simplices," and intro-

duced into his character of the genus.' But in an undescribed species lately found in Brazil (*J. tomentosa*, Nob.) they are perfect, consisting of two equal divariccate lobes, as in the greater part of the natural order. This species differs, indeed, from the rest of the genus in its leaves, having constantly a terminal pinna. It agrees with them, however, in all the other characters of the flower, and entirely in the structure of its fruit; it can therefore be regarded as forming only a section of a strictly natural and well defined genus, still depending on characters not materially different from those proposed for it by M. de Jussien; the only doubtful species being the *Jacaranda* 2, of Piso, from which the generic name was adopted.  
*Brown.*

*Bot. Mag.* 2327 (1822).

#### BRACHYSTELMA TUBEROSA.

Asclepiadea. *Corolla campanulata*; sinubus angulatis. *Columna inclusa*. *Corona* 1-phyllo, 5-fida: lobis antheris oppositis, dorso simplicibus. *Antheræ* absque membranâ apiculari. *Massæ pollinis* erectæ, basi insertæ. *Brown MSS.*

*Brachystelma tuberosa*. *Brown MSS.*

*Stapelia tuberosa*, Meerb. ic. t. 54, f. 1, Monente D. Aiton.

Mr. Brown, in his valuable treatise on the "Natural Orders of *Asclepiadæ* and *Apocinæ*," published in the first volume of the 'Transactions of the Wernerian Society,' has divided the genus *Stapelia*, but our present plant will not unite with any of the genera there established; we are therefore highly indebted to the friendship of this learned botanist, for enabling us to establish the genus of this very rare plant.

Meerburg's figure, above quoted, which was pointed out to Mr. Brown by Mr. Aiton, represents the flower much

larger than in our specimen, with the segments elongated to a very narrow point.

*Bot. Mag.* 2343 (1822).

*Arthropodium cirratum*, racemo diviso, bracteis foliaceis, pedicellis fasciculatis, petalis interioribus integerrinis, filamentorum dimidio barbato basi biappendiculato, foliis lanceolato-ensiformibus. *Brown MSS.*

*Anthericum cirratum*, foliis lanceolatis planiusculis, scapo paniculato, filamentis bicirratis. *Forster Prodr. Fl. Austr.*, p. 24. *Willd. sp. pl. 2*, p. 146. *Anthericum latifolium*, *Banks and Sol. MSS.*

Another species of *Arthropodium*, the *paniculatum*, will be found at No. 1421 of this work; from which our present plant differs in the much greater width of the leaves and revolute bracts; greater size of its white flowers; and both from that and every known species in the greater length of the spur-like processes at the base of the bearded part of the filaments, of which Mr. Brown could only trace mere rudiments in any of the other species; in the entire margins of the inner petals; and in the thicker root, approaching to tuberous.

*Bot. Mag.* 2350 (1822).

#### AMMOBIUM ALATUM.

#### SYNGENESIA POLYGAMIA ÆQUALIS.

##### Sect. DISCOIDEI.

*Receptaculum* paleis distinctis. *Pappus*, margo dentatus. *Antheræ* basi bisetæ. *Involucrum* imbricatum, coloratum, radians.—*Herba erecta, tomentosa*. *Folia integerrima*: radicalia lanceolata, basi attenuata, caulina minora, decurrentia. *Caulis alatus, ramis unifloris*. *Involuca hemisphærica, laminis albis, intimis patulis radium abbreviatum*

*efformantibus.* Corollulae uniformes, *flavæ.* Stigmata *truncato-dilatata.* Semina *ancipitia.* Receptaculum *convexum.* Brown.

*Ammobium alatum*, Brown MSS.

An undescribed genus belonging to the same tribe with *Gnaphalium*, discovered by Robert Brown, Esq., in 1804, growing plentifully, near the shores of Port Hunter (or the Coal River), in New South Wales, and named by him from its growing in sand.

*Bot. Mag.* 2459 (1824).

### ENTELÆA ARBORESCENS.

### POLYANDRIA MONOGYNIA.

*Cal. 4—5-phyllo. Petala 4. Stamina indefinita, uniformia, antheris subrotundis, incumbentibus. Stigma denticulatum. Capsula sphæroidea, echinata, sex locularis, semi-sexavalvis, polysperma.—Arbor (parva, ligno lœvissimo spongioso, SOLANDER) pube stellari (in pagina superiore folii adulti parciore et subsimplici) tomentosa. Folia cordata, angulata, duplicato-crenata, 5-nervia, stipulis persistentibus, parvis, foliaceis. Umbellæ simplices, terminales, pedunculatæ, involucro polyphyllo, brevi, pedicellis cibratæ.*

Flores albi, raro 5-fidi; calyce deciduo, foliolis aristatis, gemma (alabastro) quadricorni; petalis flaccidis, apice sublaceris, staminibus corolla brevioribus, subtorulosis, omnibus antheriferis; stylo angulato, stigmate umbilicato, margine denticulato. Capsularum setæ longæ, rigidæ, opacæ, pubescentes, spinula pellucida acuta recta terminatæ. Semina in singulo loculo biseriata, parva, obovata; albumine carnosæ, semini conformi; embryone recto, albo, longitudine fere albuminis; cotyledonibus planis, cordatis.

ORD. NAT. Inter Tiliaceas, proximum genus *Sparmanniæ*, quacum habitu, inflorescentia, antheris, stigmate, capsula-

rum figura, earumque setis spinula pellucida terminatis  
convenit; diversum filamentis omnibus antheriferis (unde  
nomen) vix manifeste torulosis, capsulis basi indivisis nec  
longitudinaliter dehiscentibus, loculis polyspermis, nec  
oligospermis (secundum Thunberg in *Sparmannia* dispermis,  
cujus tamen ovarii loculi certe polyspermi sunt) calycis  
foliolis aristatis nec muticis. *R. Brown MSS.*

*Entelaea arborescens*, *R. Brown MSS.*

*Bot. Mag.* 2480 (1824).

*Stylium adnatum*, foliis cuneato linearibus, spica sub-  
composita; partialibus paucifloris, labello inappendiculato,  
capsulis angusto-linearibus: loculo postico angustissimo  
vacuo adhaerente. *R. Brown MSS.*

*Stylium adnatum*, *Br. Prodr. Fl. Nov.-Holl.*, p. 572.

$\beta$  *spica pedunculata, caulis partialibus indivisis*, *Br.*

"It is possible that the plant here figured," Mr. Brown observes, "may belong to a species different from *S. adnatum*, whose spike is generally sessile, and more subdivided; I am inclined, however, to unite them, and to add, as a third variety, *S. propinquum*, which was taken up from imperfect materials. In the section of the genus to which *S. adnatum* belongs, the best specific differences are found in modifications of the structure of the capsule, and by these alone the species at present known may be readily determined. Thus, in *S. breviscapum* the cells and valves of the capsule are in form and contents perfectly equal, as in the other sections of the genus. In *fasciculatum* the cells are dissimilar in form, but of nearly equal size, and both fertile. In *falcatum* the posterior cell, still more different in form, is also considerably reduced in width and entirely without ovula; nor is it, as I have stated in the specific character, fertile. Lastly, in *adnatum*, of which I am now disposed to consider *propinquum* a variety, the posterior cell is not only entirely destitute of ovula, but is reduced to a capillary tube, which continues to adhere to the fertile cell. From this series of species, in which the upper or posterior cell is gradually obliterated, we are led

to the true explanation of the structure of *Lysipoma*. This genus, belonging to *Lobeliaceæ*, is described by M. Kunth as having a single parietal placenta; it may, however, be regarded as having a septum so closely pressed to the upper side of the capsule as to have no manifest cavity, and consequently produces ovula on the one side only." *Brown MSS.*

*Bot. Mag.* 2598 (1825).

*Bæckia camphorata*, *Brown MSS.*

*Bot. Mag.* 2694 (1826).

BOTANICAL REGISTER.

CRYPTARRHENA. Petala 5, distincta, patentia. *Labellum* ecalcaratum : *lamina* dilatata explanata. *Columna libera*, aptera. *Anthera* apice cucullato columnæ inclusa, porrecto-ascendens. *Massæ pollinis* quatuor. *Brown MSS.*

*Cryptarrhena lunata*, Brown MSS.

*Bot. Reg.* 153 (1816).

VESTIA.

On Mr. Brown's suggestion, we have placed the genus in the Order *Solanaceæ*. It comes very close to *Lycium*.

*Bot. Reg.* 299 (1818.)

*Callistemon rigidum*, foliis linearibus (lanceolato-lineari-busve) planis acutissimis mucronatis lœvibus, ovarii pubescentibus, capsulis distinctis. *Brown MSS.*

*Bot. Reg.* 393 (1819).

CALYTRIX. *Cal.* superus, tubo cylindraceo, limbo 5-partito, laciniis aristatis persistentibus. *Pet.* 5, decidua. *Stam.* omnia (sæpius infinita raro decem) antherifera, decidua. *Ovarium* uniloculare, dispermum. *Pericarpium* (*Achenopsis*) monospermum, indehiscens, exsuccum. *Frutices* (*Novæ Hollandiæ*) ericoidei. *Folia parva*, sæpius angulata, sparsa, imbricata, glanduloso-punctata, in plerisque petiolata et stipulis ! setaceis liberis minutis deciduis instructa. Flores

(*albi viri purpurei*) *axillares, solitarii, bibracteali, bracteis membranaceis, carinatis, persistentibus, basi connatis.* Brown MSS.

*C. glabra*, icosandra; foliis petiolatis stipulatis adultis bracteisque glabris. *Brown MSS.*

The generic character now offered is from the pen of Mr. Brown, and has been framed with the accustomed skill and foresight of that learned naturalist with a view to the cluster of confining genera from the same regions, which will be found near it in the concluding volume of his 'Prodromus of the Flora of New Holland.' Achenium implying an indehiscent originally one-seeded seed-vessel, while that of the present genus, though eventually one-seeded, having been found by Mr. Brown to originate in a germen with two ovula, one of which proves constantly abortive, he has thought it advisable to suggest *Achenopsis* as a more precise denomination for this sort of seed-vessel.

*Glabra* is the first of the genus that has presented itself in our European gardens, and is native within the colony of Port Jackson, where it was found by Mr. Brown, whose herbarium contains likewise four more of its congeners, of which that gentleman has favoured us with the following account:—Three, our plant being one, were observed by him in the colony above mentioned, as well as in Van Diemen's Island, and agree in having a petioled stipuled foliage and icosandrous flowers; a fourth he discovered on the south-west coast of New Holland, this had likewise a petioled stipuled foliage, but the flowers were decandrous; the fifth he observed on the north coast of the same continent (in the Bay of Carpentaria), in that the flowers were icosandrous as in the three first-mentioned species, but it differed from all the others in having a foliage without either petioles or stipules. Through these modifications the genus will be found to unite with its confining co-ordinates at different points. *Bot. Reg.* 393 (1819).

*Melaleuca incana*, foliis ternis linear-lanceolatis utrinque ramulisque incano-pubescentibus, spicis ovalibus oblongisve. *Brown MSS.* *Bot. Reg.* 410 (1819).

*ARTABOTRYS.* *Cal. tripartitus.* *Petala sex.* *Stamina hypogyna.* *Ovaria distincta, disperma.* *Baccæ dispermæ (abortione quandoque monospermæ).* *Semina collateralia erecta exarillata albumine rimoso.*—*Frutices decumbentes.* *Folia alterna, integrerrima, exstipulata.* *Pedunculi extra-ulares, suboppositifolii pauciflori, pedicellis (1—2) laterali-bus, apice uncinati.* Brown MSS.

Obs. *Characteribus suprà datis proximè accedit Kadsuræ, cuius baccæ dispermæ seminibus collateralibus pariter distinctæ receptaculo carnoso insidentes fide iconis et descriptionis Kämpferi* (Amœn. Exot. 476); *sed Kadsura vix Annonacea ob summam affinitatem cum Uvariâ heteroclita, Roxb. Flor. Ind. Ined. cui albumen indivisum nec processibus membranæ interioris rimosum auctoritate descriptionis operis citati.* Brown MSS.

*A. odoratissimus*, petalorum laminis planis lanceolatis, foliis oblongis acuminatis. Brown MSS.

*Uvaria odoratissima.* *Roxburgh, Flor. Ind. Ined.*

*Unona uncinata*, *Dunal Anonacées*, 105, t. 12 et 12a, *DeCand. Syst. Nat.* 1, 490.

*Unona hamata.* *Dunal Anonacées*, 107. *DeCand. Syst. Nat.* 1, 491.

*Uvaria esculenta.* *Rottler in Nov. Act. Soc. Nat. Cur. berol.* 4, 201.

*Uvaria uncata.* *Loureiro cochin.* 349.

*Anona uncinata.* *Lamarck encyc.* 2, 127.

*Anona hexapetala.* *Linn. Suppl.* 270. *Hort. Kew.* 2, 253. *Ed.* 2, 3, 335. *Willd. sp. pl.* 2, 1266.

The present plant, after various shifting from one inappropriate group to another, according to the wavering views of different botanists, is now placed in a new genus constituted for its reception by Mr. Brown, to whom the generic name has been suggested by the curious grapple or tendril belonging to the peduncle, by which the growing fruit is conveniently suspended on the nearest support, during its advance to maturity, and the slender flexible branch relieved from the disproportionate burden, which would be otherwise laid on the ground.

The synonymy is also a valuable contribution from

Mr. Brown, and presents a critical view of the scientific history of the species.

We understand that three species of *ARTABOTRYS*, besides the present, are already known, one of which with curiously small flowers has been recently discovered by Dr. Horsfield during his residence in Java, and is in the rich Herbarium that gentleman has brought to this country.

*Bot. Reg.* 423 (1820).

*MODECCA.* *Flores* diclines (dioici v. monoici). *Cal.* 5-fidus. *Petala* 5, calyci inserta. *Squamæ* (*Nectarium*, Linn.), numero definitæ (5—10) rarò nullæ. *MAS.* *Stamina* 5; *antheræ* stantes. *FEM.* *Caps.* (pedicellata) unilocularis 3-valvis polysperma. *Herbæ* (*Indiæ Orientalis*, *Novæ Hollandiæ*, et *Africæ Aequinoctialis*) scandentes *cirrhis* axillaribus simplicibus vel e divisuris pedunculorum. *Folia* lobata v. indivisa basi et subtùs sèpiùs glandulosa. *Pedunculi* axillares apice divisi dichotomis *cirrhiferis*. Brown MSS.

*Bot. Reg.* 433 (1820).

*CRYPTOSTEGIA.* *Cor.* infundibuliformis: *tubus* squamis 5, inclusis (bipartitis *subulatis*) laciniis limbi alternantibus. *Stamina* inclusa, imo tubo inserta; *filamentis* distinctis; *antheris* basi stigmate cohaerentibus. *Glandulæ* 5, spathulatae, angulorum stigmatis pollen granulosum (simplex) colligentes. *Ovaria* 2. *Styli* 2. *Stigma* (commune) pentagonum. *Folliculi* . . . . . *Semina* comosa.—*Frutex* volubilis, glaber. *Folia* opposita. *Pedunculi* terminales, 3-fidi. *Flores* speciosi. *Corolla* *æstivatione contorta*. *Folliculi* *ungulati*, *divaricatissimi*. Brown MSS.

*Cryptostegia grandiflora.* Brown MSS.

*CRYPTOSTEGIA* is founded upon a single species, native of the Peninsula of India, where it was first observed by Dr. Roxburgh, and strangely mismatched by him with the species of the genus *Nerium*, belonging to the *Apocynæ*; while our plant belongs to the third section of Mr. Brown's *Asclepiadæ*, distinguished from the other sections by granular solitary pollen-masses and filaments which are

distinct in whole or in part. *Cryptostegia* is, however, conceived by Mr. Brown to be the link by which the two orders connect through his genus *Cryptolepis*, also a native of India and a climber.

The name was suggested to Mr. Brown by the circumstance of the enclosure of the five-scaled crown within the tube of the corolla, and its not being exposed to view, as in other bordering genera.

*Bot. Reg.* 435 (1820).

BURCHELLIA. *Capitulum involucratum. Cor. clavato-infundibuliformis: limbo 5-fido abbreviato fauceque imberbi; aestivatione mutuo imbricatâ contortâ. Stamina supra medium tubi inserta; antheris subsessilibus inclusis. Stigma clavatum. Bacca calyce altè 5-fido coronata, bilocularis, polysperma.* Brown MSS.

*Frutex ramosissimus pubescens, ramulis compressis. Folia opposita. Stipulae interpetiolares, e dilatata basi subulatae, indivise, caducæ. Capitulum terminale, extra involucrum monophyllum pluridentatum abbreviatum, pari unico foliorum minorum stipulis proportionatim latoribus subtensum. Ovaria supra receptaculum convecum villosum bracteolisque non-nullis minutissimis conspersum sessilia, distincta. Calyx: limbo foliaceo æquali, tubum aliquoties superante. Corolla coccinea, extus pilis appressis, intus g'abra præter barbam annularem juxta basim tubi. Antheræ lineares. Discus epigynus carnosus, indivisus, imberbis. Stigma exsertum, utrinque sulco exaratum. Bacca turbinato-globosa, bilocularis septo completo. Placenta adnata. Semina angulata. Embryo axilis, dimidio albuminis cartilaginei longior.* Brown MSS.

*Burchellia capensis.* Brown MSS.

By its original observer the species had been ranked under the head of *Lonicera*, but was afterwards referred to its true station in *Rubiaceæ*; though that learned botanist, in adopting an erroneous description, representing the seeds of the berry as solitary, has placed the plant in a wrong section of the order. Mr. Brown having proved it not to be consistently reducible to any established genus, has

formed a new one from it, and with that liberality and vigilance which he extends to every interest of science, availed himself of the appropriate occasion of honouring the merits of Mr. Burchell, the zealous and enterprising investigator of the regions to which our plant belongs.

*Bot. Reg.* 466 (1820).

CALOTIS. *Recept. epaleaceum. Achenia coronata paleis duabus oppositis aristisque 1-3 glochidatis. Involucrum subaequale, simplici vel dupli serie polyphyllum.* Brown MSS.

Herbæ ramosæ, pilosiusculæ. Folia alterne. Involucra ramos terminantia, solitaria, planiuscula, foliacea. Ligulæ fæmineæ numerosæ, imbricatæ, cœruleæ, post anthesin spiraliter revolutæ, et diu persistentes. Flosculi masculi quinquefidi, flavi, antheris basi muticis. Achaenia (semina, Linn.) verticaliter compressa cuneata. Pappus persistens, e paleis lateralibus, dilatatis latioribus quam longis, auriculiformibus; et aristis longioribus sæpius duabus (anticâ et posticâ), extra medium vel apice solum aculeolis reversis. Receptaculum scrobiculatum vel subalveolatum convexum. Brown MSS.

*Calotis cuneifolia*, foliis cuneatis apice inciso-dentatis. Brown MSS.

The character of *Calotis* was formed, but not published about fifteen years ago, from *C. dentex*, a species first observed by Mr. Brown himself in New Holland, where it is not uncommon in the neighbourhood of Port Jackson. The present has been since found, during an expedition into the interior of the above country, growing on the banks of the River Lachlan in 1817, by Mr. Allan Cunningham, who is commended by Mr. Brown as "an indefatigable collector and acute observer."

*Bot. Reg.* 504 (1820).

VANDA. *Labellum calcaratum, cum basi simplici (brevi- usve productâ) columnæ apteræ continuum, trifidum, lobo medio carnos. Petala patentia distincta. Massæ pollinis 2, obliquè bilobæ.* Brown MSS.

OBS. *Aerides paniculatum* (*Bot. Reg. v. 3, f. 220*) *generis pristini species impar nimis huic* (*monente D. Brown*) *aplè satis associari potest. Parasiticæ ambæ.*

*Vanda Roxburghii*, ovaris contortis, petalis oblongo-ovatis undatis, foliis obliquè tridentatis. *Brown MSS.*

The generic character now given has been formed by Mr. Brown so as to include *AERIDES paniculatum*, published provisionally by that generic name in our third volume (fol. 220); but now it will be seen that the species is not a very close congener of the one before us. The *CYMBIDEUM tessellatum* of Roxburgh is not included in the present genus.

Mr. Brown had some scruple in not ranging the group under *ANGRÆCUM* of M. Du Petit-Thouars (of which a species is given in 'Voy. de Bory de St. Vincent,' 1859, tab. 19), not being able, from want of sufficient detail in the description of the structure of the parts of that genus, to decide satisfactorily whether he ought to do so or not; and has at last been determined principally by the *label* in *ANGRÆCUM* being undivided, and probably membranous, while in *VANDA* it is three-lobed and fleshy. He expects that several species of Swartz's genus *LIMODORUM* will be found to rank under the present.

*Bot. Reg. 506 (1820).*

#### GRIFFINIA parviflora.

Semina secundum observationes Dom. Brown, obovata, ventricosa, nitentia, ochroleuca; umbilicus basilaris; apex chalazâ fusçâ insignitus; raphe tenuis, immersa; integumentum duplex, exterius membranaceum, nitens, per lentem pulchrè areolatum, ventre longitudinaliter incrassatum, præsertim in regione umbilici; membrana propria tenuissima, albumini adhærens, separabilis tamen, evasculosa, basi chalazæ inserta cæterum libera; albumen semini conforme, dense carnosum; embryo avilis, longitudine dimidii albuminis, cylindraceus; radicula umbilico approximata, apice exerto. *Brown MSS.*

We are to thank Mr. Brown for the description of the seed of this genus, the nature of which had been misunderstood until the present subject was submitted to the test of his accurate and skillful investigation.

*Bot. Reg.* 511 (1821).

*Hedychium elatum*, foliis oblongo-lanceolatis glabris, spicis laxis; fasciculis ternis subtrifloris, laciinis interioribus limbi cuneato-linearibus, labelli laminâ bifidâ. *Brown MSS.*

Caulis 8—10-pedalis. Folia inferiora oblongo-lanceolata, omnia acumine subulato-filiformi citius marcescenti. Spica 6-uncialis, fasciculis distinctis sèpissimè ternis, patentibus, trifloris. Ovarium (germen) villosum. Perianthium exteriorius (calyx) spathaceum, scariosum, pubescens: interius (corolla) tubo cylindraceo ochroleuco, limbo exteriore tripartito laciniis angusto-linearibus acutis, interiore laciniis lateralibus cuneato-linearibus, apice parùm dilatato obliquo: labellum ungue brevi lato-lineari: laminâ circumscriptione ovatâ, lobis dimidiato-ovatis obtusiusculis. Filamentum labello longius. Antheræ linearis basi bifidâ lobis polliniferis. Stigma cyathiforme indivisum ciliatum. Nec-taria (stamina sterilia) 2, brevissima, teretiuscula, approximata. *Brown MSS.*

An unrecorded species, determined and described by Mr. Brown from native samples in the Banksian Museum, of which that gentleman is now, fortunately for science, in the well-earned possession. The samples formed part of the collection of Nepalese plants transmitted by Dr. Wallich, the able superintendent of the Calcutta Botanic Garden, by whom, as was plain from the inscribed notice, they had been taken for *speciosum*, accurately described by himself in the 'Flora Indica' of Roxburgh; but on examination by Mr. Brown, proved to be essentially distinct from that species.

*Bot. Reg.* 526 (1821).

*Anthemis apiifolia*, foliis glaberrimis pinnatifidis: lobis cuneatis trifidis incisisve, floribus solitariis, involuci foliolis linearibus apice scariosis. *Brown MSS.*

Involucrum (calyx) *hæmisphæricum*, foliolis subæquali-

*bus, appressis, linearibus, apice brevi scarioso vix dilatato. Pappus: margo membranaceus brevissimus indi-visus. Receptaculum convexiusculum, paleaceum, paleis linearibus acutis.* Brown MSS.

With our present imperfect knowledge of this plant, it is perhaps necessary to refer it to ANTHEMIS, though in real affinity it will probably be found to approach more nearly to CHRYSANTHEMUM *Indicum*, of which the supposed double-flowered varieties are in like manner generally furnished with *paleæ*. As that plant, however, in its single state has always a naked receptacle, and some of its double-flowered varieties are constantly, while others are occasionally without *paleæ*, in the second edition of the 'Hortus Kewensis,' it was continued in CHRYSANTHEMUM; an arrangement which it would not perhaps be necessary to alter, were it even proved that two species have been confounded under the name of CHRYSANTHEMUM *Indicum*, both of them belonging decidedly to the same natural genus, and to this genus I am inclined to think ANTHEMIS *apiifolia*, when completely known, may be referred. As to the narrow *margo* crowning the seed, on account of which our plant has been considered a PYRETHRUM, it does not appear to me to constitute a sufficient generic character, and it equally exists in CHRYSANTHEMUM *Indicum*, particularly in the single-flowered specimen of the Linnean Herbarium. *Brown MSS.*

For the above account we are indebted to the unwearied liberality of Mr. Brown, who has taken this opportunity to account for his retaining CHRYSANTHEMUM *Indicum* in that genus in the second edition of the 'Hortus Kewensis,' and for not following some of his predecessors in referring the species to ANTHEMIS.

*Bot. Reg. 527 (1821).*

**ASTELMA.** *Receptaculum nudum (nec paleatum nec favosum). Pappus plumosus, sessilis; radiis basi connatis. Involucrum (calyx) imbricatum, squamis scariosis: intimis conniventibus.* *Brown MSS.*

*Astelma eximium*, Brown MSS.

**ASTELMA** is now first detached from **GNAHALIUM** by the above able hand ; and founded upon the present species characterised as a genus by a naked *receptacle of the flower*. (neither chaffy nor honeycombed) ; a sessile feathered *seed-crown*, the radii of which are connected at the base ; an imbricated *calyx* composed of scariose *leaflets*, the innermost of which are convergent, and whose florets are all both stamen-bearing and pistil-bearing. It is the nearest genus to **ELICHRYSUM**, from the genuine species of which, according to Mr. Brown, it only differs by the rayless calyx.

*Bot. Reg.* 532 (1821).

*Dendrobium cucullatum*, caulis pendulis, foliis bifariis lanceolatis acuminatis, pedunculis oppositifoliis subbifloris, labello indiviso circumscriptione ovato basi cucullato.  
*Brown MSS.*

It is said to be in several collections, and to have been generally conceived to be **DENDROBİUM Pierardi** of the unedited part of Roxburgh's 'Flora Indica' ; and which, according to Mr. Brown, to whom, as in so many instances, we are indebted for all we have to say on the subject, it is possible it may really be ; but finding by both figure and description the flowering stems of that species represented as leafless, the lamina of the labellum of an obovate form, and leaves as emarginate, while in the present plant the flowering stems are in full leaf, its labellum of an ovate outline, and the leaves taper-pointed, he has deemed it safer to regard the present sample as belonging to a distinct species.

*Bot. Reg.* 548 (1821).

**LISSOCHILUS.** *Massæ pollinis 2, obliquè bilobæ. Labelum basi saccatum : laminâ sessili indivisiâ convexâ, posticè excisâ et cum basi columnæ apteræ edentulæ connatâ.*  
*Brown MSS.*

*L. speciosus*, petalis interioribus divaricatis duplò majoribus exterioribus reflexis, labello altè cordato. *Brown MSS.*

*Herba 4-pedalis et ultrà. Folia radicalia ensiformia*

*acutissima crassiuscula rigidula viridia nec glauca, marginibus carinatè lèvibus: basibus dilatatis incrassatis in bulbum emersum connatis, scapo aliquoties breviora. Scapus vaginatus teres viridis solidus, fasciculis vasorum sparsis. Vaginæ distantes strictæ foliaceæ, in foliola lanceolata, appressa, acuta longitudine vix ipsius vaginæ productæ. Spica racemosa simplicissima erecta laxa sesquipedalis. Bracteæ foliaceæ lanceolatæ, patulæ sèpiùsve divaricatæ, immersè nervosæ, marginibus lèvibus, infimæ in scapum paulò decurrentes ovarium cum pedicello suo superantes, reliquæ sessiles, superiores ovario breviores. Flores speciosi, e torsione pedicelli baseosque ovarii verè resupinati, labello antico. Perianthii foliola 3 exteriora utrinque viridia calycina, distincta arctè reflexa ovata acutiuscula immersè nervosa, postico plano, lateralia paulò latiora lavissimè concava; interiorum lateralia petaloidea, flava, immaculata, divaricatissima, oblongo-ovata, obtusiuscula, limbo parùm reflexo, disco hinc convexiusculo; nervosa nervis lateralibus alternatim simplicibus bifidisque, ipsa basi alba. Labellum lateralibus interiorum vix brevius, basi subtùs calcarato-saccatum cornu brevissimo compresso albo: lamina sessilis, circumscriptione ovato-oblonga, flava basi albicante venis purpureis, apice subretuso, basi altè cordata lobis posticis rotundatis dimidio inferiore liberis superiore cum basi columnæ cohærentibus suturis manifestis, lateribus subparallelè-reflexis plicatis plicis paulò tantum elevatis obtusis sulcis intersticialibus angustis: disco conveavo axi gibbosusculo. Columna PROPORTIONATA semiteres e basi albâ pallidè virens, aptera apice edentulo posticè rotundato. Anthera terminalis mobilis decidua, in expanso flore apicem anticè declivem columnæ operiens, didyma, dorso incrassato dilutè viridi apice retuso, bilocularis loculis approximatis septulo partiali incompleto contrario in latere exteriore instructis. Massæ pollinis in singulo loculo singulæ, in gemmâ florali juniori minutissimè granulosæ, in expanso flore cereaceæ ovatae, post imprægnationem in apice obliquo columnæ (clinandrio) inverse, posticè (respectu antheræ anticè) instructæ lobulo minore operiente majoris cavitatem illitam materia viscidâ elasticâ flavescenti processus cuius*

*massæ insertæ lingulæ communi brevi lato-lineari membranaceæ albæ e glandulâ subrotundâ apicis stigmatis ortæ. Stigma anticum cavum subrotundum viride secernens.* Brown MSS.

The plant here described is the only certain species of *Lissochilus*; *Cymbidium giganteum*, however, according to Thunberg's description, may also belong to the same genus. This genus, in affinity, comes nearest to those plants of South Africa at present referred to *Limodorum* and *Cymbidium*, namely, *Limodorum barbatum*, *triste*, *longicorne*, and perhaps also *hians* of Thunberg (not, however, *Satyrium hians*, Linn, which seems to be a *Disa*), *Cymbidium pedicellatum* and *aculeatum*. These, along with several Indian species, also referred by Swartz and Willdenow to *Limodorum*, especially *L. virens*, *carinatum* and perhaps *epidendroides*, form a genus (EULOPHUS) related on the one hand to *Dipodium* (vide *Prodr. Flor. Nov. Holl.*, p. 300), and essentially agreeing with *Lissochilus* in the structure of Anthera, but sufficiently different from it in its trilobed crested labellum, which is neither cordate nor connected at base with the column. In both these characters *Lissochilus* equally differs from *Angræcum* of M. Du Petit-Thouars, which has also an elongated spur, and a considerably different habit.

Among the plants at present referred to *Limodorum*, another very distinct genus may be noticed, consisting of *Limodorum veratrifolium*, and judging from Kämpfer's figure, *L. striatum* also. This genus (CALANTHE) agrees with *Bletia* in having eight pollen-masses, but differs from it in the claw of the labellum being connected with the column. It is not unlikely that this may be the *Cyanorchis* of M. Du Petit-Thouars, who will probably hereafter publish it under a different name. Brown MSS.

*Bot. Reg. 573 [578 by mistake in orig.] (1821).*

OPHIOPOGON *spicatus*.

*Liriope spicata*, *Loureiro cochin*, 200 (*monente D. Brown ab autopsia edocto exemplaris archetypi in Herb. Parisiano asservati*).

In *O. spicato* (*monente D. Brown*) semen (sæpè 2—3), nudum baccatum de ovulo mox post factum conceptum auctu præcociori cætera illidente exque germinis vertice crumpente excretum: basi cum exuto germine cohærens.

In *O. spicatus*, Mr. Brown has found the fruit to be of the same kind he has ascribed to *PELIOSANTHES Teta*, in the twelfth volume of the 'Linnean Transactions' [vol. 1, p. 362].

*Bot. Reg.* 593 (1822).

**MACRADENIA.** *Labellum sessile*, cucullato-concavum indivisum acuminatum. *Corollæ* petala distincta patula. *Columna libera*, lobis apicis conniventibus. *Massæ pollinis* 2, exsulcæ. *Brown MSS.*

*Macradenia lutescens*, *Brown MSS.* Cor. sordidè lutea, intùs purpureo-fusco marmorata. Labellum corollâ brevius, ecalcaratum, album, intùs purpureo interruptè lineatum, obovatum, appendice linearì acutâ reflexâ. Columna longitudine ferè labelli, semiteres, suprà sensim latior lobis lateralibus apicis in cucullum antheram amplexantem conniventibus. Anthera e basi paulò gibbosore intùsque bilocularē producta in acumen lato-lineare concavum ipsâ basi aliquoties longius processum subulatum stigmatis, glandulam, ejusque appendicem, involvens. Massæ pollinis cuneiformes, modicè compressæ, post migrationem apicibus suis acutis affixæ disco apicis dilatati appendicis elongatae proscollæ. *Brown MSS.*

An undescribed species, now first introduced by Mr. Griffin, who received the plant, represented in the annexed plate, from Trinidad. It flowered last December in the hothouse at South Lambeth, and was communicated to Mr. Brown, who has made it the foundation of the present

genus, to be placed next to *ONCIDIUM*, from which it differs by a convolutely concave undivided taper-pointed *label*, a *corolla* with the *petals* all distinct, a *column* with the two top-lobes converging convolutely (not extended), and by two furrowless or unindented *pollen-masses* (furrowed or indented in *ONCIDIUM*).

*Bot. Reg.* 612 (1822).

**CEROPEGIA.** Asclepiadea. *Cor.* *tubulosa* basi ventricosa, limbi laciniis ligularibus conniventibus : aestivatione valvata. *Columna fructificationis* inclusa. *Corona staminea* 10-fida ; laciniæ 5 antheris distinctis oppositæ longiores cum 5 reliquis (indivisis bifidis) alternantes. *Massæ pollinis* erectæ. *Herbæ glabrae, sæpius volubiles, radice tuberosa.* Umbellæ interpetiolares, nunc paucifloræ. Brown MSS.

*C. africana*, pedunculis 2—3-floris, foliis ovato-lanceolatis carnosis, limbo corollæ barbato, coronæ laciniis longioribus aversis falcato-recurvæ : brevioribus indivisis. Brown MSS.

Radix : tuber pro ratione herbæ 3—6-uncialis magnum. Caulis *simplex*, sæpius volubilis. Folia acuta, planiuscula, avenia, brevè petiolata, divaricata, apicibus subrecurvis, semuncialia. Spica rara e pedunculis alternis brevibus 2—3-floris, pedicellis brevibus minutè bracteolatis. Flores erecti, inferiore præcociore. Cal. 5-partitus, laciniis linearisubulatis modicè patentibus, basi ventricosâ tubi corollæ ferè ter brevioribus. Corolla : tubus e basi obovato-globosâ obsoletè pentagonâ viridi cylindraceus, fance infundibuliformi striatâ ; limbi laciniæ lineares intùs marginibusque pilis coloratis patulis acutis barbatæ, erectæ apicibus conniventibus lœviterque cohærentibus : limbus inexpansus prismatico-pentagonus fauce pentagonâ angulis extantibus cum laciniis limbi alternantibus. Columna fructificationis basi ventricosâ tubi inclusa. Corona apici tubi staminei brevis inserta monophylla decemloba : lobii quinque cum staminibus alternantes abbreviati indivisi obtusi basi saccati : quinque reliqui quasi interiores antheris oppositi aliquoties longiores margine interiori truncato-canaliculato exteriori in aciem

attenuato. Antheræ distinctæ ovatae loculis lateralibus longitudinaliter dehiscentibus appendice apicis carnosâ brevi acutâ stigmate incumbente. Massæ pollinis minutæ supra basin affixaæ subglobosæ. Stigma muticum. Brown MSS.

A very curious unrecorded species, now first introduced from the Cape of Good Hope. The masterly description is by Mr. Brown, who has so far modified the character of the genus with respect to that defined by himself in his illustration of the Natural Order, in the 'Memoirs of the Wernerian Natural History Society,'<sup>1</sup> as to fit it for the reception of the species before us; which he considers too naturally allied to the East Indian group he had originally allotted to CEROPEGIA to be separated.

*Bot. Reg. 626 (1822).*

SCHIZOPETALON. *Calyx clausus. Petala pinnatifida!*  
*Siliqua torosa, seminibus uniseriatis. Cotyledones quatuor!*  
*separatim contortuplicatae!* Herba annua *alternifolia, pube*  
*tenui-ramosa. Folia sinuato-pinnatifida. Racemus foliaceo-*  
*bracteatus.*

In ordine Cruciferarum genus nulli cognito affine, et

<sup>1</sup> [See ante, p. 205.]

equidem ob numerum, figuram et vernationem cotyledonum, petala pinnatifida, stigmatis structuram et stamina subæqualia tribus distinctæ initium efformare videtur.  
*Brown MSS.*

For the elaborate character which we have given above, we are entirely indebted to Mr. Brown, who alone, in this country, was capable of defining the limits, and of fully appreciating the peculiarities of this truly singular plant.

*Bot. Reg. 752 (1823).*

**CARMICHAELIA.** *Calyx* cyathiformis 5-dentatus. *Ovarium* polyspermum. *Legumen* oligospermum (1—3-sp.), *replum* post lapsum valvularum persistente!

*Frutex ramosissimus, sub statu florescentiæ sæpius aphyllus.* Caulis ramique primarii teretes, teneriores v. *plano-compressi*, v. *ancipites*, stipulis minutis alternatim dentati. Folia e dentibus ramorum fruticis junioris, ternata v. pinnata (*foliolis* 3—7 *obcordatis*). Racemi simplicissimi e denticulis ramorum: pedicelli basi bractea abbreviata, apice binis minutissimis. Flores parvi. Calycis dentes subæquales, brevissimi. Petala longitudine subæqualia. Vexillum lamina latiore quam longiore, basi absque callis auriculive. Carina obtusa. Filamenta 1—9-fid. Antheræ uniformes, subovales. Ovarium lineare, 5—6-spermum. Stylus subulatus, ascendens. Stigma obtusum, imberbe. Semina subreniformia, sinu clauso umbilico nudo. *Brown MSS.*

*C. australis, Brown MSS.*

*Lotus arboreus, Forst. Prodri., No. 2, 278.*

For the above character of this very remarkable genus we are indebted to the kindness of Mr. Brown, who, fortunately for science, is in possession of perfectly ripe fruit. The term *replum*, which is employed in Mr. Brown's generic character to designate the persistent circumscription of the legume, was used by Vitruvius for the frame of a door, and we believe has been already applied to the purposes of botanical description in the sense in which it is used here, which is certainly unexceptionable.

The garden plant has been compared by Mr. Brown with the specimens from Cook's 'Voyage,' in his own collec-

tion, and with an authentic specimen from George Forster's 'Herbarium,' as well as by ourselves, with others from some part of New Zealand; and no difference has been detected between them.

In explanation of the name applied to this plant, we make the following extract from Mr. Brown's communication upon the subject:

"I have named the genus in honour of my friend, Captain Dugald Carmichael, F.L.S., a very accurate botanist, whose interesting account of the Island of Tristan d'Acunha is published in the 12th volume of the 'Linnean Society's Transactions,' and to whom I am indebted for extensive collections, and many excellent descriptions of the plants of the Island of Mauritius and of the Cape of Good Hope."

*Bot. Reg.* 912 (1825).

*Chorizema Henchmanni*, foliis acicularibus pungentibus solitariis v. ternatim fasciculatis, calycibus villosis.

C. Henchmanni, *R. Brown, ined.*

This plant, which recedes very much in habit from the species of *Chorizema*, previously published, has been named by Mr. Brown in honour of Francis Henchman, Esq., a very successful importer of New Holland plants, for whom the present subject was collected by Mr. William Baxter.

*Bot. Reg.* 986 (1826).

## SHORT CONTRIBUTIONS

TO

### VARIOUS WORKS.

---

"IN the preparation of the following notices, I have derived most essential assistance in almost every article, from the information of Mr. Robert Brown; without that aid the account would have wanted those elucidations and explanations which his profound knowledge and research alone could supply, and which has given interest to some of the subjects far beyond what I anticipated or hoped for, before I obtained his promise of co-operation." J. SABINE,  
"Account of the Edible Fruits of Sierra Leone," in the  
'Transactions of the Horticultural Society,' vol. v, p. 441,  
London, 1824.

*ANISOPHYLLÆA*, *Brown MSS.*, *ibid.*, p. 446.

*Ficus Brassii*, *Brown MSS.*, *ibid.*, p. 448.

*CARPODINUS*, *Brown MSS.*, *ibid.*, p. 455.

"The specimens [of *Hoya*] which I have had the opportunity of examining, afford evidence of the existence of three hitherto undescribed species. The first is a native of the more northern part of New South Wales, with leaves varying from elliptic to obovate; this is in the Herbarium of Mr. Robert Brown, and is named by him *Hoya australis*, it having been referred by him in his 'Prodromus Floræ Novæ Hollandiæ,' vol. i, p. 460, with a doubt, to *H. carnosa*. The second is also in the same collection, and comes from the Nicobar Islands; it has beautiful globose

umbels of flowers, which are very numerous in each umbel, and ovate-lanceolate leaves: Mr. Brown has named this *Hoya nicobarica*." TRAILL, *Accounts and Descriptions of several plants belonging to the genus Hoya, &c.*, in the 'Transactions of the Horticultural Society,' vol. vii, London, 1830.

MAYNA, *Ruddi.*

"Ihre stellung im Natürlichen System betreffend, reiht sich unsere Pflanze unstreitig zunächst an die *Flacourtianæ* und *Bixinæ*. Wir haben sie vorläufig mit Fragezeichen zu ersterer Familie in die Nähe von *Hydnocarpus* gestellt, müssen aber dabei einer mündlichen Äusserung R. Brown's gedenken, gemäss welcher sie mit *Hydnocarpus* und *Gynocardia*, Roxb., eine eigene Familie bilden dürfte, deren Aufstellung unser unsterblicher meister hoffentlich später selbst übernehmen wird. ZUCCARINI in *Fasciculus Secundus Plantarum Minus Cognitarum, in Abhandlungen der Königlich Bayerischen Akademie*, band ii, p. 368 (1837).

Prof. Buckland acknowledges assistance from Mr. Brown, in determining the nature of the fossils, for which he states that, at Mr. Brown's suggestion, he had established a new family with the designation *Cycadoideæ*. *Transactions of Geological Society of London*, 2nd series, vol. ii, p. 395. (Read June 6th, 1828.)

In a note following the Preface to Dr. Buckland's 'Bridgewater Treatise,' 2 vols., 8vo, 1836, the author says—

"The scientific reader will feel that much additional value has been added to the present work—from the botanical part having been submitted to Mr. Robert Brown."

It is probable that most of the observations on the structure of *Cycadææ* and Cycadeous fossils, both in this work and in Prof. Buckland's Paper in the 'Geological Transactions,' were contributed by Mr. Brown; but the following are the only particulars for which he is specifically quoted:

CYCADITES.—M. Ad. Brongniart has referred these two fossil species to a new genus, by the name of *Mantellia nidi-formis* and *Mantellia cylindrica*. In my paper just quoted, I applied to them the provisional name of *Cycadoidea megalophylla* and *Cycadoidea microphylla*; but Mr. Brown is of opinion that until sufficient reasons are assigned for separating them from the genus *Cycas* or *Zamia*, the provisional name of *Cycadites* is more appropriate, as expressing the present state of our knowledge upon this subject. Buckland's *Bridgewater Treatise*, vol. i, p. 496, note (1836).

In the vascular bundles within the fossil petioles, Mr. Brown has recognised the presence of spiral, or scalariform vessels (*Vasa scalariformia*), such as are found in the petioles of recent *Cycadeæ*; he has also detected similar vessels in the laminated circle within the trunk of the fossil buds next to be described. The existence of vessels with discs peculiar to recent *Cycadeæ* and *Coniferæ*, such as have been described in speaking of fossil *Coniferæ*, has not yet been ascertained. *Ibid.*, p. 499, note.

#### PODOCARYA.

This fossil was found by the late Mr. Page, of Bishport, near Bristol, in the lower regions of the Inferior Oolite formation on the east of Charmouth, Dorset, and is now in the Oxford Museum. The size of this fruit is that of a large orange; its surface is occupied by a stellated covering or *Epicarpium* composed of hexagonal tubercles, forming the summit of cells, which occupy the entire circumference of the fruit.

Within each cell is contained a single seed, resembling a small grain of rice, more or less compressed, and usually hexagonal. Where the *Epicarpium* is removed, the points of the seeds are seen, thickly studded over the surface of the fruit. The bases of the cells are separated from the receptacle, by a congeries of footstalks formed of a dense mass of fibres, resembling the fibres beneath the base of

the seeds of the modern *Pandanus*. As this position of the seeds upon footstalks, composed of long rigid fibres, at a distance from the receptacle, is a character that exists in no other family than the *Pandaneæ*, we are hereby enabled to connect our fossil fruit with this remarkable tribe of plants, as a new genus, *Podocarya*. I owe the suggestion of this name, and much of my information on this subject, to the kindness of my friend, Mr. Robert Brown.

The large spherical fruit of *Pandanus*, hanging on its parent tree, is represented at pl. lxxxiv, fig. 1. Fig. 11 is the summit of one of the many drupes into which this fruit is usually divided. Each cell, when not barren, contains a single, oblong, slender seed; the cells in each drupe vary from two to fourteen in number, and many of them are abortive. The seeds within each drupe of *Pandanus* are enclosed in a hard nut. These nuts are wanting in *Podocarya*, whose seeds are smaller than those of *Pandaneæ*, and not collected into drupes, but dispersed uniformly in single cells over the entire circumference of the fruit. The collection of the seeds into drupes, surrounded by a hard nut, in the fruit of *Pandanus*, forms the essential difference between this genus and our new genus *Podocarya*.

In the fruit of *Pandanus* the summit of each cell is covered with a hard cup or tubercle, irregularly hexagonal; and crowned at its apex with the remains of a withered stigma. We have a similar covering of hexagonal tubercles over the cells of *Podocarya*. The remains of a stigma appear also in the centre of those hexagons above the apex of each seed. Buckland's *Bridgewater Treatise*, vol. i pp. 504, 505 (1836).

In the title-page to the edition of Dr. Buckland's 'Bridgewater Treatise,' published in 1858, after the death both of the author and of Mr. Brown, Mr. Brown's name is placed as having made additions to it. That Mr. Brown suggested to Dr. Buckland many of the remarks contained in the botanical portion of his Treatise, as well as of those contained in his previous papers on the *Cycadoideæ*, in the

'Geological Society's Transactions,' there can be no doubt ; but the only "additions" indicated in the notes to this, the third edition, appear to be the following :

Mr. Robert Brown has ascertained, by examination of a trunk of *Cycadites microphyllus*, from Portland, the existence of scalariform vessels without discs, in the mature trunk ; a point in which, he informs me, these fossils agree with the American portion of the order *Cycadeæ*, though, in other respects, they bear a greater resemblance to the African and Australian species. Mr. Brown observes further, that the order *Cycadeæ* presents but one genus in America, namely, the *Zamia*, on which this genus was originally founded, and to which it has been recently restricted ; and that the coincidence in the structure of the scalariform vessels in the trunk of this *Zamia* of the New World, with that of the fossil *Cycadites* of Europe, is very remarkable. Buckland's *Bridgewater Treatise*, new edition, 1858, vol. i, pp. 461, 462.

Mr. Robert Brown has noticed in the cellular tissue of a silicified trunk of *Cycadites*, portions of chalcedony bearing the form of extravasated gum within the trunks of recent *Cycadeæ*. He has also recognised spiral vessels in the laminated woody circle of a mature trunk of fossil *Cycadites*, and also in the laminated circle within a silicified bud of the same, near its origin. *Ibid.*, vol. ii, p. 102.

Mr. [now Sir] R. I. Murchison, in a paper on the "Fossils found at C寧ingen," says—

"Mr. R. Brown has discovered that among these plants, one is almost indistinguishable in the leaf from the *Acer villosum*, a species of maple brought from Nepaul by Dr. Wallich." *Geol. Trans.*, 2nd ser., vol. iii, p. 287 (1835).

Mr. Horner, in a note to his paper "On the Geology of the Environs of Bonn," says—

"I visited the lignite deposit at Friesdorf, in September, 1835, in company with Mr. Robert Brown, when he collected several specimens of the vegetable remains. He in-

forms me that all the wood he found is coniferous." *Geol. Trans.*, 2nd ser., vol. iv, p. 474 (1836).

Mr. Charles Stokes in his "Notice respecting a piece of Recent Wood partly petrified by Carbonate of Lime" (*Trans. Geol. Soc. of London*, 2nd series, vol. v, p. 207, 1840), acknowledges assistance obtained from Mr. Brown, and in a "Further Notice" appended to this paper (l. c., p. 213) he says—

"Since I communicated to the Geological Society the preceding notice on the partly petrified wood from the ancient Roman aqueduct of Eilsen, in the principality of Lippe Buckenberg, Mr. Robert Brown has shown to me a specimen from the same piece of wood, which was presented to him at Tharand, in the month of October last, by M. Cotta of that place, who discovered the wood in the aqueduct, and remarked its peculiar condition. Mr. Brown has pointed out to me, in the longitudinal section, that the petrified portions, in his specimen, are about two inches in length, and in the middle part, nearly a quarter of an inch in diameter, and terminate in a point at each end. The petrified portions are, in these instances, completely enclosed within and surrounded by the unchanged wood. See pl. xvi, fig. 3."

"Mr. Brown has observed another remarkable circumstance in the condition of these petrified portions. The change of the longitudinal fibres appears to be complete, but the medullary rays, of which the ends are seen in this section are still in their ligneous state, as shown in the magnified engraving, pl. xvi, fig. 4."

Dr. Fitton, in his paper "On the Strata below the Chalk," says—

"From the evidence afforded by thin transparent slices, both of the transverse and longitudinal sections which have been examined under the microscope by Mr. Brown, the fossil trunks of Portland are found to possess the characters uniformly belonging to coniferous wood; but it must be observed that these characters are not absolutely confined

to Coniferæ." *Geol. Trans.*, 2nd series, vol. iv, p. 222 (1836).

"A point which Mr. Brown considers as well deserving of remark is, that the only remains of vegetables hitherto found in these strata, under the circumstances above described, belong to two nearly related families, Coniferæ and Cycadæ, which have lately been regarded as forming a distinct class, characterised not only by greater simplicity of the parts of fructification, but also by some peculiarities of the internal structure, and thence have been considered as intermediate between Phænogamous and Cryptogamous or Acotyledonous plants." *Ibid.* p. 225.

"A cone has recently been found on the shore of the Isle of Portland, not improbably derived from one of the beds of clay, or 'Dirt,' subordinate to the lower part of the Portland strata, the structure of which, according to Mr. Brown, approaches in some respects to that of *Araucaria*. I am indebted to the kindness of the Rev. David Williams, of Cross, near Bleadon, in Somersetshire, to whom it belongs, for an opportunity of submitting this beautiful specimen to the examination of Mr. Brown, who will, I hope, describe its structure in the 'Transactions of the Linnean Society.'" *Ibid.* p. 349.

Mr. [now Prof.] Morris, in his appendix to Mr. Prestwich's memoir "On the Geology of Coalbrook Dale," under the description of pl. xxxviii, says—

"*Stigmaria ficoides*. In the 'Fossil Flora,' t. 31—36, are figures and descriptions of *Stigmaria ficoides*, and at t. 156 is shown the structure of the same; and although we cannot add much new information to that previously given by Prof. Lindley, it has been thought advisable to have another section represented, with a view of showing what has hitherto not been well illustrated in the published figures of its structure. The internal cylinder in the specimen (fig. 3) is eccentric, and consists of wedge-like portions of vascular tissue, the rounded origin of which, internally, is well defined; these wedges are generally of equal or nearly equal size, but they occasionally become confluent

by the joining of two or more of them together. The form of the space necessarily left, or interstices between the sections where these are distinct, varies a little; in some cases being of nearly equal breadth throughout, and in others becoming narrower outwards, and appearing to terminate or contract about the middle of the vascular tissue, beyond which they again frequently widen outwards: these spaces often contain portions of oblique and smaller vascular cords, apparently arising at different depths in the vascular cylinder; the origin and connection of which with the cylinder is shown in the oblique section, where a single series of vessels is seen passing from it, surrounded by tissue of smaller diameter. Pl. xxxviii, fig. 3 a."

"In no specimen yet examined has the course of the oblique cords been absolutely ascertained, but there can scarcely be any doubt, as suggested by Mr. Brown (to whom we are also indebted for the above observations), that those vessels after arising from the cylinder passed to the tubercles of the surface, through the thick cellular tissue which once probably occupied the larger space in the original plant. The discovery of these smaller oblique vessels is an interesting feature in the anatomy of *Stigmaria*; and they have also been pointed out by Mr. Brown as existing in *Anabathra*, and one of these is actually figured by Mr. Witham, in his work, ('On the Internal Structure of Fossil Vegetables,' 2nd edit., t. 8, f. 12), but considered by him (p. 41) as a section of a medullary ray. The analogous vessels existing in *Lepidodendron Harcourtii*, as figured by Mr. Witham ('Trans. of the Nat. Hist. Soc. of Newcastle, 1832'), appear to arise from the outer part of the vascular cylinder. A somewhat similar arrangement is also found in that division of *Lycopodiaceæ*, consisting of *Psilotum* and *Tmesipteris*: in those genera the vascular cylinder, from which the oblique cords proceed, includes a central pith (Brongniart, 'Hist. des Végét. Foss.', tom. ii, pp. 44, 45).

"Fig. 3 b. Shows that the vessels are much smaller at the internal rounded portions of the wedges.

"Fig. 3 c. Exhibits the oblique cords, consisting of

smaller vessels surrounding vessels of a larger diameter nearly equal to those forming the vertical tissue.

"Fig. 3 a. Is an oblique section, which exhibits the connection of these vascular cords with the vertical tissue."

*Trans. Geol. Soc.,* 2nd ser. vol. v (1840).

### PETROPHILOIDES.

"Upon showing the fossil cones to Dr. R. Brown, he very kindly pointed out to me the affinity existing between them and the genera *Petrophila* and *Leucadendron*, and particularly with one species of the former genus—*Petrophila diversifolia*—described in his 'Prodromus Floræ Novæ Hollandiæ,' page 365."

Dr. Bowerbank's '*History of the Fossil Fruits and Cones of the London Clay,*' page 43 (1840).

Mr. [now Sir] C. Lyell, in a paper 'On the Boulder Formation and Freshwater Deposits of Eastern Norfolk,' says—

"Among the vegetable fossils the most common and best preserved are the seed-vessels of an aquatic plant which Mr. R. Brown refers to *Ceratophyllum demersum*, English Botany, 947."—*London and Edin. Phil. Mag.*, vol. 15, p. 355 (1840).

Lieut. Newbould says that Mr. R. Brown determined the specimens of fossil wood brought by him from Egypt "to be dicotyledonous, and not coniferous."—*Geol. Proc.* iii, p. 787. (*Read Jan. 29, 1842.*)

Dr. Mantell, in a paper 'On Fruits from the Cretaceous Rocks,' says, under *Carpolithes Smithiae*—

"I am indebted to Dr. Robert Brown for the careful examination of this fossil, and he informed me that he knew of no fruit to which it bore any near affinity, but

suggested that the original was probably a succulent compound berry, the seeds appearing to have been imbedded in a pulpy substance, like the fruit of a mulberry, which is a spurious compound berry, formed by a partial union of the enlarged and fleshy calyces, each enclosing a dry membranous pericarp.—*Quart. Journ. Geol. Soc.*, vol. ii, p. 54 (1846).

The President exhibited portions of trunks of Winter's-bark trees from the Straits of Magellan, cut down in 1826 by Capt. P. P. King, R.N., offering inscriptions made through the bark by a midshipman who accompanied the Spanish expedition under Captain Cordoba in 1786, and by one of the companions of Captain Bougainville in 1767; the annual rings in the former case distinctly corresponding with the interval between 1786 and 1826. He also made some observations on the structure of the woody vessels of the genus.—*Proc. Linn. Soc.*, ii, p. 95 (June 18, 1850).

The President exhibited specimens of stems of *Kingia australis*, R. Br., and *Xanthorrhæa arborea*, R. Br., together with drawings of the former illustrative of its structure, especially of the siliceous covering of the vascular fasciculi of the persistent bases of the leaves; and in both genera, the means by which the stems are protected from the scorching fires of the natives.—*Proc. Linn. Soc.*, ii, p. 113—4 (Feb. 4, 1851).

The President exhibited specimens of the three known species of *Rafflesia* (*R. Arnoldi*, *R. Patma*, and *R. Cummingii*), particularly with the view of showing that they are all three dioecious.—*Proc. Linn. Soc.*, ii, p. 128 (April 15, 1851).

The President exhibited numerous specimens of recent and fossil *Cycadeæ*. Among these was a fine specimen of a new species (*Cycadites Saxbyanus*, R. Br.) found in the Isle of Wight by Mr. Saxby, of Bonchurch. The President remarked, that all the specimens of *Cycadites* hitherto found

in the Isle of Wight agreed in having an elliptical outline, unaccompanied with any inequality in the woody ellipsis, and also in having a bud in the axilla of each leaf; in these respects differing from the *Cycadites* of the Isle of Portland, and from all the recent species of *Cycadeæ* with which we are acquainted, which have a circular outline and only scattered buds.—*Proc. Linn. Soc.*, ii, p. 130 (May 6, 1851).

### INCARVILLEA.

Having, in examining the Himalayan species of *Incarvillea*, observed some appearances not mentioned in, or at variance with, the descriptions of that genus by Jussieu and Lamarek, I was induced to ask the opinion of the highest authority on the subject, and Mr. Brown has been good enough to favour me with his opinion that the Himalayan species are too closely allied to be separated into a genus distinct from the Chinese *Incarvillea*, but are yet sufficiently distinguished to constitute a sub-genus. He has been good enough to enrich my work with the character of this, and an amendment of the genus *Incarvillea*.

### INCARVILLEA. Juss. Gen. 138.

“ *Calyx* 5-dentatus, nunc 10-dentatus, [dentibus] alternis (accessoriis) membranaceis. *Corolla* fauce ventricosa; limbo 5-lobo inaequali. *Stamina* antherifera quatuor, didynama, inclusa. *Antheræ* lobis distinctis apice convergentibus, singulis infra apicem processu subulato munitis! *Stigma* bilamellosum. *Capsula* siliquæformis, bilocularis, bivalvis; septo contrario libero intra marginem seminifero. *Semina* suspensa (v. membranaceo-marginata v. comosa), radicula supera.

“ *Herbæ* alternifoliæ foliis pinnatis bipinnatifidis; racemi terminalis longi pedicellis tribracteatis. Rudimentum filamenti quinti (primum in *Amphicome* detectum a D. Royle). Genus *Biguoniaceis* adjiciendum, in sectione tamen propria ob habitum et semina pendula, radicula supera (v. *Prodr.*

Flor. Nov.-Holl. 1, p. 471) locandum et in duo subgenera dividendum. Horum alterum *INCARVILLEA* *Juss.* Chinense, distinguitur, foliis bipinnatifidis; calyce, praeter normales, dentibus 5 accessoriis sinuum loco membranaceis emarginatis; seminibus obovatis margine lato membranaceo indiviso cinctis.

"Alterum, *AMPHICOME* (*Cyrtandraceis* quodammodo accedens) ex Indiæ septentrionalis montibus: foliis pinnatis foliolis incisis; calyce 5-dentato sinubus simplicibus; seminibus fere subulatis utrinque acutis, basi et apice membrana capillaceo-lacera comosis."

*Illustrations of the Botany of the Himalayan Mountains*, by J. Forbes Royle, M.D. Pp. 295, 296. London, 1839.

#### HEDYCHIUM.

SECT. D. *Brachychilum*, Brown MSS. *Labellum* nanum, retusum, sessile. *Stigma* bilabiatum, labio inferiore triplo longiore.

*H. (Brachychilum) Horsfieldii*, Brown MSS.; glabrum, foliis lanceolatis acuminatis, spica laxiuscula, bracteis ovatis 2—3-floris, tubo gracili, limbi interioris lacinias lateralibus ovalibus obtusiusculis exteriore lanceolatas acutas latitudine triplo excedentibus.

*Patria*, Mons Prahn Javæ, *Horsfield in Herb Banks*.

I am indebted to my illustrious friend, Mr. Brown, for the following details of the inflorescence of this most singular plant, which I have copied from the original manuscript, lent to me on purpose, and which was written in 1815, when Dr. Horsfield sent the specimen from Java to the late Sir Joseph Banks.

"*Planta elegans, glabra, rhizomatosa, juxta specimen unicum in herbario citato circiter bipedalis. Folia punctis lineolisque longitudinalibus creberrimis notata. Calyx glenduloso-punctatus, tubo tertiam parte brevior, ore hinc fissio inde acervulo pubescentiae.*

"*Limbi exterioris laciniae angusti-lanceolatæ, concavius-*

culæ, acutæ, tubo breviores, post expansionem reflexæ; tertia acunine brevi subulato; *interioris lacinia laterales* ovales, obtusiusculæ, longitudine limbi exterioris, ejusdem laciniis duplo et ultra latiores, punctis minutis glandulosis creberrimis instructæ, impariwise venosæ. *Labellum* minutum, vix octavam partem longitudinis lateralium emetiens, latius quam longum, retusum, punctatum. *Filamentum* intra laciniam acuminatam limbi exterioris insertum, cum basi labelli oppositi quasi continuum, breve, lineare, concaviusculum. *Anthera* lato-linearis, apice nuda, basi semibifida. *Stigma* bilabiatum, hispidum, labiis ciliatis, inferiore triplo longiore subovato."

Wallich, "Attempt to define the Species of *Hedychium*," in 'Kew Journal of Botany,' vol. v, p. 376-7 (1853).

## INDEX OF SUBJECTS

TO

### VOL II.

- Abel, Clarke, characters and descriptions of three new species of plants found in China by, 319—328; notice of his collection, 326
- Acicarpha, observations on the genus, with description of a new species, 307—309; proposed as the type of a new family, 309; further observations on, 312—318
- Actinophora, affinities of the genus, 646
- Albumen, its origin, 23; occasional existence in Proteaceæ, *ibid.*; and in Cyrtandraceæ, 587; its importance, 587 *note*; in Sterculiaceæ, 623
- Allium descendens, exceptional order of expansion of the flowers of, 280
- Anadenia, exceptional order of expansion of the flowers of certain species of, 280
- Angianthus, synonymy of the genus, 283
- Anthereæ, their examination at an early period universally neglected, 6; great advantage of this examination, *ibid.*; their structure in Orchideæ and Asclepiadæ, *ibid.*; views of Linnaeus, Jussieu, and Richard on this subject in Asclepiadæ, *ibid.*; views of Jacquin, Koelreuter, Rottboell, Cavanilles, Smith, and Desfontaines, 7; views of the author, 7, 8; and in Orchideæ, 9; development of in Asclepiadæ, 197, 198; arrangement of in Sterculiaceæ, 623
- Antennaria, history and characters of the genus, 300—302
- Apocineæ, difficulty of circumscribing the order, 195; subdivision of it, *ibid.*; characters and descriptions of the genera, and species of the section of the order "seminibus comosis," 232—247
- Ascidia of Cephalotus and other pitcher-plants, observations on the, 357
- Asclepiadæ, views of various authors as to the structure of the Anthere in, 6—8; examination of, 8; memoir on the order, 193, &c.; characters and descriptions of the order, genera, and species, 200—231; observations on the flower in its earlier stages, 196—198
- Asphodelæ, order of reduction of stamina in, 278
- Baccharis, history and characters of the genus, 293—4
- Banks, Sir Joseph, his invaluable herbarium and library, 31, 199; important results of his voyage, 163
- Begonia, order of expansion of flowers, and position of female flowers in, 279 *note*
- Bennettia, observations on the structure and affinities of the genus, 663, 664; characters of the species of, 665
- Bentham's Flora Australiensis, names of plants quoted in, from Mr. Brown's herbarium, 708—711
- Bocconia, reductions of pistillum in, 272
- Boopidæ, proposed as a family, by M.

- Cassini, 312; observations on, 312—318; position of ovulum and radicle in, 313; other distinctive characters of the family, 314, &c.  
 'Botanical Magazine,' contributions to, 667, &c.  
 'Botanical Register,' contributions to, 681, &c.  
 Bowerbank, Dr., notice of a fossil cone referred to *Petrophila*, in his 'History of the Fossil Fruits of the London Clay,' 723  
*Brunonia*, its relations to *Goodenoviae* and *Compositae*, 267 *note*; observations on its affinities, 310, 311; nervures of its corolla, 310; structure of its ovarium, 311; structure of the indusium of its stigma, 312  
 Buckland, contributions to his papers on *Cycadites*, and to his 'Bridgewater Treatise,' 716—719  
*Buttneriacæ*, gradually pass into *Tiliaceæ*, 646  
*Buxbaumia*, observations on the genus, 349—351  
*Buxbaumia aphylla*, nature of its peristomium, 350, 351; inner membrane of its capsule, 351; furnished with perfect leaves, *ibid.*  
*Cæsulia*, nature of capitulum of, 275-6  
*Calca*, history, synonymy, and subdivision of the genus, 287—307  
*Calycereæ*, proposed as a new family, 309; further observations on, 312—318: the name superseded by that of *Boopideæ*, 313  
*Calytrix*, observations on the genus and on the species composing it, 684  
*Calyx* and adhering tube of corolla, separability of, in some species of *Goodenia*, 267 *note*  
*Campanulaceæ*, aestivation of corolla in, 269 *note*  
*Capitulum* of *compositæ*, order of expansion of florets in the, 273-7  
*Caprifoliaceæ*, limitation of the family, with observations on the genera composing it, 324; further observations on the genera, 673  
*Cardiopteris*, observations on the structure and affinitæ of the genus, 657—659  
*Cassinia*, characters of the genus, with a synopsis of the species, 304—306  
*Catesbæa*, arrangement of the nerves of the corolla in, 268  
*Celtis*, order of expansion of flowers, and position of female flowers in, 279  
*Cephalotæ*, establishment of the family, 357  
*Cephalotus*, remarks on the structure and affinities of, 353—359; account of the ripe fruit of, 356; entitled to rank as a distinct family, 357; nature of its ascidia, *ibid.*  
*Cestrum*, arrangement of nerves in the corolla of, 267  
*Chalaza*, manifest in the seeds of all *Proteaceæ*, 22, 23; its nature and function, 23  
*China*, characters and descriptions of three new species of plants found in, 319—328  
*Cleome*, species quæ in horto Kewensi coluntur, 413—415  
*Compositæ*, observations on the natural family of plants called, 267—318: object of the memoir, 259; arrangement of nerves in the corolla of, 260—268; claim of M. Cassini to priority in regard to the arrangement, 261; refuted, 261-2; observations of Grew, Van Berkhey, Schmidel, Batsch, Schkuhr, Mirbel, and Cassini, 262—264; remarks on M. Cassini's statement, 264—267; nerves in the corolla of *Goodenoviae*, 266; in *Ernobia*, *Datura* and *Cestrum*, 267; aestivation of the corolla, 268-9; exceptions to in *Chuquiraga* and *Corymbium*, 269; form of pollen, 269-70; disposition of the stigmata, 270; structure of ovarium, 270-72; inflorescence and order of expansion of the florets, 272—281; on what dependent, 276: genera et species quædam quæ in horto Kewensi coluntur, 459—470  
*Craspedia*, history and synonymy of the genus, 285  
*Cruciferæ*, type of pistillum, and of obliteratus in, 272; genera et species cruciferarum quæ in horto Kewensi coluntur, 367—413  
*Cycadites*, observations on the struc-

- ture of, 716—719; *Saxbyanus*, account of, 724
- Cyrtandraceæ*, observations on, and monograph of the order, 584—610; history of the order, 584—586; affinity of, 386—588; relation of stigmas and placentæ in, 386
- Cyrtandraeæ*, modifications of the different parts of fructification in, 590—594
- Datura*, arrangement of nerves in the corolla of, 267
- Dawsonia*, nature and origin of its peristomium and columella, 331-2
- Decandolle's 'Systema Vegetabilium,' names, &c., of plants contributed by Mr. Brown to, 703; 'Prodromus,' names, &c., of plants, contributed to, 705
- Dipsaceæ*, inflorescence of, and order of expansion of flowers in, 277-8; position of ovary in, 314-5
- Dryander*, advice and assistance derived from him, 31
- Dryandra*, observations on the genus, 179
- Echinops*, nature of capitulum, 274-5
- Embryo*, direction of, in the *Stereuliaceæ*, 621-2
- Ernodea*, arrangement of nerves in the corolla of, 267
- Euphorbia*, its inflorescence, 279 and note, 280; relative position of sexes in, 280
- Ferns, number of species known to Linnaeus, 251; to Willdenow, ibid.; known in, 1838, 565; *vasa scalariformia*, their arrangement in, 564; ramification of veins, and relation of veins to sori in, 565—570; seeds of, useful in distinguishing genera, 276
- Fitton, Dr., notice of fossil *Coniferæ* and *Cycadeæ* in his paper 'On the Strata below the Chalk,' 720-1
- Franklin, extracts from the botanical appendix to his 'Narrative of a Journey to the Shores of the Polar Sea,' and addenda, 511—527
- Fruit of *Proteaceæ*, its nature, 21, 22; its varieties in the order, 22
- Globularia cordifolia*, arrangement of the nerves of the corolla in 315-6
- Goodenia*, separability of calyx and of adhering tube of the corolla in some species of, 267
- Goodenovia*, arrangement of nerves in the corolla of, 266; its analogy to that of *Compositæ*, 267 note; vestigation of corolla in, 269 note; type of pistillum and reductions of, 272; structure of the indusium of its stigma, 312
- Gramineæ*, nature of inflorescence of, 276-7; order of expansion of flowers in, 277; composition of inner valve of the flower in, 571-2
- Grevillea*, exceptional order of expansion of the flowers in certain species of, 280
- Grindelia*, history, characters, and extent of the genus, 282-3
- Gymnostomum*, structure of various species referred to the genus, 342—5; great diversity in these species, ibid.
- Hedychium*, account of a new subgenus and species of, 725-6
- Herandiaceæ*, observations on the family, 651
- Horner, Mr. Leonard, note on epi-ferous wood in his paper on the 'Geology of Bonn,' 719
- Horsfield, extracts from his 'Plantæ Javanicas Rariores,' 557, &c.
- Hortus Kewensis, extracts from the second edition of, 367—510
- Humboldt, his observations on a remarkable difference in the distribution of the species of plants, 12
- Hymenostomum*, establishment of the genus, 342
- Incarvillea*, observations on the genus, 725
- Indian plants, names of and notes on, extracted from Dr. Wallich's 'List,' 529—538; notes and observations on, extracted from Dr. Wallich's 'Plantæ Asiaticæ Rariores,' 539—556
- Inflorescence, types of, and order of expansion of flowers, 272—281; in *Compositæ*, ibid.; in *Umbelliferae*, 273 note; in *Gramineæ*, 276-7;

- in Dipsacæ, 277-8; in B opideæ, 316  
**Iodes**, affinities of the genus, 651-2  
**Jacaranda**, observations on the genus and on its species, 670-1  
**Junceæ**, order of reduction of stamina in, 278  
**Kingia Australis**, notice of the structure of its stem, 724  
**Lagasca**, nature of capitulum of, 374-5  
**Lambertia**, inflorescence of, and order of reduction of the flowers of, 280-1  
**Leguminosæ**, genera et species quædam quæ in horto Kewensi coluntur, 417—447  
**Leiotropidium**, establishment of the genus, 302  
**Leptostomum**, observations on the genus, 341—349; reasons for retaining it, 342-3  
**Leucadendron**, reasons for differing from Salisbury on the application of the Linnean name, 29—31; history of the genus, *ibid.*; observations on the separation of sexes in, 40-1  
**Liliaceæ**, order of reduction of stamina in, 178  
**Limnanthus**, characters and description of, 361-364  
**Limnantheæ**, establishment of the family, 363; characters, 364  
**Linnean System of Botany**, advantages derived from the, 5  
**Lobeliaceæ**, aestivation of corolla in, 269 *note*  
**Lyellia**, characters and description of, a new genus of mosses, &c., 329—356; characters of the genus, 332—334; structure of its columella, and mode of dispersion of its seeds, 335; use of the pores at the base of its capsule, *ibid.*; its position in the family, 336  
**Mantell**, Dr., note on *Carpolithes Smithiae*, in his paper on 'Fruits from the Cretaceous Rocks,' 723  
**Melampodium**, history and synonymy of the genus, 284-5  
**Metalasia**, establishment of the genus, 302  
**Meyera**, history and synonymy of the genus, 283-4  
**Mirbel**, names of species of Coniferæ contributed to his 'Essai,' 706  
**Morris**, Prof., notice of *Stigmaria*, in his paper 'On the Geology of Coalbrook Dale,' 721—723  
**Mosses**, necessity of additional sources of distinction in the genera of, 345; nature of some of these sources, 346  
**Murchison**, Sir R. I., note on a fossil leaf, in his paper on Eningen fossils, 719  
**Myrtaceæ**, genera et species quædam quæ in horto Kewensi coluntur, 449—487  
**Nepenthes**, its place in the natural series, 358; distinctions between Cyttineæ and, *ibid.*; its spiral vessels, *ibid.*  
**Newbold**, Lieut., notice of fossil wood from Egypt, in his paper on the subject, 723  
**Nivenia**, reasons for changing Salisbury's generic name, 110  
**Orchideæ**, structure of anthera in, 6, 9; genera et species quæ in horto Kewensi coluntur, 471—499  
**Ovarium**, utility of ascertaining its internal condition before fecundation, 5; steadily kept in view by A. du Petit-Thouars, *ibid.*; its importance in Proteaceæ, 19, 20; its structure in Composite, 270  
**Ovula**, importance of their insertion as well as number, 20; insertion, direction, and relation to ovarium, 313  
**Ozothamnus**, characters of and observations on the genus, 303—304  
**Peristomium of mosses**, observations on the, 346—349; of *Buxbaumia*, 350-1  
**Petit-Thouars**, Aubert du, almost the only botanist who has steadily kept in view the internal condition of the ovary before fecundation, 5  
**Petrophila**, observations on the sexes in the genus, 55, 56  
**Phytocreneæ**, characters of the family

- and of the genera composing it, 652-3
- Pistillum of all Phænogamous plants considered as formed on the same plan, of which a polyspermous legumen or folliculus, whose seeds are disposed in a double series, may be taken as the type, 270; a circular series of these pistilla disposed round an imaginary axis, and whose number corresponds with that of the parts of the calyx or corolla, enters into the author's notion of a flower complete in its parts, *ibid.*; deviations from this type and number, how accounted for, *ibid.*; the type and its reduction in the family of Proteaceæ, 272; in Goodenoviae, *ibid.*; in Cruciferae, *ibid.*; order of development of stamina and pistilla, 281
- Pittosporum revolutum*, arrangement of nerves of the corolla in, 268 *note*
- Plantæ Javanicæ Rariores*, extracts from, 557, &c.
- Plantago, an exception to the ordinary rule of development of stamina and pistilla, 281
- Podocarya*, a fossil fruit referrible to Pandanaceæ, observations on, 717-8
- Pollen, importance of its figure in fixing our notions of the limits of genera, 19; form of, in Compositæ, 269-70
- Polypodium, expediency of subdividing the genus, 252; divisions proposed, 565-570
- Polytrichoidæ, distinguishing characters of the group, 336-341; structure of peristomium in, 340
- Polytrichum, characters of the genus, 336; structure of the lamellæ in, *ibid.*; form and position of male flowers in, 337; double calyptra of, *ibid.*; teeth of peristomium in, *ibid.*; transverse membrane of tympanum in, *ibid.*; various forms of capsule in, 338; inner membrane of capsule in, *ibid.*; inner peristomium of, 339; columella of, 339-40; seeds of, 340.
- Portlandia, arrangement of the nerves of the corolla in, 268
- Poterium*, order of expansion of flowers and position of female flowers in its spike, 270
- Protea, reasons for differing from Salisbury in the application of the Linnean name, 24-29; history of the genus, 25-29
- Proteaceæ, on the natural order of, 3; remarks on its geographical distribution, 9; almost entirely confined to the southern hemisphere, 9; occurs in the greatest abundance and variety in Southern Africa and New Holland, 10; its distribution in New Holland, 10-12; stations and elevations at which its species are found, 13; pubescence of, 14; disposition of, 14, 15; form and division of leaves, 15; inflorescence of, *ibid.*; calyx of, why so considered, 15, 16; identity of calyx with the organ so called in Thymeleæ, 16; better called perianthium, or perigonium, *ibid.*; invariably divided into four leaves or segments, *ibid.*; aestivation of, 16, 17; its colour useful in indicating genera, 17; scales surrounding the ovary, their use, importance, and number, *ibid.*; varieties in structure, or apparent origin of stamina, 17, 18; deviations from the usual structure of antheræ in, 18; figure of the pollen in, 19; its importance in fixing the limits of genera, *ibid.*; internal structure of the ovary of the greatest importance, 19, 20; number and insertion of ovula, 20; position of radicle, *ibid.*; form of style, *ibid.*; form and direction of stigma, 20, 21; nature of fruit, 21, 22; its varieties in the order, 22; chalaza always manifest, 22, 23; its nature and functions, 23; albumen, its origin, 23; occasional existence in Proteaceæ, *ibid.*; radicula always points towards the base of the fruit, 23, 24; plumula inconspicuous in the whole order, 24; cotyledons, when more than two of little importance, 24; genera formed before the publication of Salisbury's arrangement of the family, 24; reasons for differing from Salisbury in the application of the Linnean

- names *Protea* and *Leucadendron*, 24—31; characters and descriptions of the order, its genera and species, 32—192; type of the pistillum, and its reductions in, 272
- Radicula**, its direction in Proteaceæ uniformly pointing towards the base of the fruit, 20, 23, 24; relation of its direction to ovulum and to ovary, 313—4
- Rafflesia*, all the three known species shown to be diæcious, 724
- Restiaceæ**, order of reduction of stamens in, 278
- Richard, Achille, names of species of *Hydrocotyle*, contributed to his 'Monographie,' 706
- Richard, Louis Claude, names of species of Coniferæ, contributed to his 'Commentatio,' 707
- Richardson, Dr., extracts from his botanical appendix to the narrative of a journey to the shores of the Polar Sea, by Captain Franklin, and addenda, 511—527
- Royle, Dr., observations on *Incarvillea*, from his 'Botany of the Himalayan Mountains,' 725
- Rubiaceæ**, difficulty of circumscribing the order, 195; vestitation of corolla in, 269 *note*
- Sabine, Joseph, contributions to his 'Account of the Edible Fruits of Sierra Leone,' 715
- Sarcostigma**, affinities of the genus, 651—2
- Scabiosa*, inflorescence of certain species of, 278; order of expansion of flowers in, *ibid.*
- Seeds, non-existence of naked, 21; dispersion of, in Polytrichoidæ, how secured, 335, 340—1
- Sexes, in the separation of, in flowers, the female the more perfect, 279; and the earliest developed, *ibid.*; exceptions to, 279, 280
- Solander, Dr., his description of *Knightia* given as a specimen of the accuracy with which he described specimens of natural history, 163
- Soliya**, history, characters, and extent of the genus, 282
- Spike**, order of expansion of flowers in a simple and in a compound, 273
- Spiral vessels of Nepenthes**, 358—9
- Stamina** and **pistilla**, importance of attending to their state before the expansion of the flower, 5; order of reduction of stamens in various families, 278; order of development of stamens and pistilla, 281; origin of glandular disk in various families from imperfect stamens, 317—8; objections to this view, *ibid.*
- Stereuliaceæ**, history of the family, 613—621; observations on the relative importance of the different organs in the formation of genera in, 621—624; direction of embryo in, 621; monograph of, 611—644
- Stigma**, in Proteaceæ, its form and direction, 20, 21; in Asclepiadæ, its development, 196—198; disposition of stigmata in Composite, 270; nature of the indusium in *Brunonia* and *Goodenovia*, 312
- Stokes, Mr. Charles, notice on partly petrified wood, in his paper on the subject, 720
- Style**, its utility in the generic characters of Proteaceæ, 20; coherence of its base with the apex of the tube of the calyx in Boopideæ, 315
- Styliæ**, position of stamens in, 312
- Tiliaceæ**, gradually pass into Buttneriaceæ, 646
- Traill, contributions to his 'Account of the genus *Hoya*,' 715—6
- Tridax**, history of the genus, 283
- Umbelliferæ**, surface of the pericarpium in, 267 *note*; order of expansion of flowers in, 273 *note*
- Vestia** referred to Solanæ, 683
- Wallich, D., account of a new subgenus and species of *Hedycium*,

- from his monograph of the genus, 725-6  
Winter's bark, notice of trunks of, containing inscriptions, and of the structure of their woody vessels, 724  
Woodsia, a new genus of ferns, observations on, 249—255; singularity of structure of its involucrum, 252-3; characters of the genus and its species, 253-4  
*Xanthorrhœa arborea*, notice of the structure of its stem, 724  
Zuccarini, notice of the genus *Mayna* and its affinities, in his 'Plantæ minus Cognitæ,' 716

# INDEX OF NAMES OF PLANTS

TO

## BOTH VOLUMES.

- Abelia, i, 448; ii, 324, 541, 673  
  *Chinensis*, ii, 325, 541  
    *triflora*, ii, 531, 541  
    *uniflora*, ii, 542  
Abelmoschus, ii, 546  
Abroma, i, 11; ii, 509  
  *augusta*, ii, 509  
  *fastuosa*, ii, 509, 510  
  *Wheleri*, ii, 509  
Abrus precatorius, i, 111, 165, 168  
Acacia, i, 23, 62, 64, 110, 339; ii,  
  445  
  *acicularis*, ii, 445  
  *alata*, ii, 446  
  *armata*, ii, 446  
  *biflora*, ii, 446  
  *ciliata*, ii, 447  
  *decipiens*, ii, 446  
  *fasciculata*, i, 95  
  *laeta*, i, 95  
  *marginalata*, ii, 446  
  *melanoxyton*, ii, 445  
  *nigricans*, ii, 447  
  *nilotica*, i, 288  
  *pubescens*, ii, 447  
  *pulchella*, ii, 446  
  *Sophoræ*, ii, 445  
  *suleata*, ii, 445  
Acacia, i, 311  
Acanthaceæ, i, 134, 380  
Acanthus tetragonus, i, 94  
Acer villosum, ii, 719  
Aceras, ii, 475  
  *anthropophora*, ii, 475  
Achenopsis, ii, 684  
Achyranthus papposa, ii, 543  
Acicarpha, ii, 309, 312  
  *lanata*, ii, 309  
  *spathulata*, ii, 307  
  *tribuloides*, ii, 309, 312  
Acioa, i, 115  
Acorum maritimum, ii, 536  
Acrostichum, ii, 250  
  *alcicorne*, i, 147, 165  
  *alpinum*, ii, 254  
  *aureum*, i, 147, 165, 169  
  *calomelanos*, i, 473  
  *hyperboreum*, ii, 254  
  *ilvense*, ii, 254  
  *Stemaria*, i, 147, 165  
  *velatum*, i, 303  
Actinophora, ii, 645  
  *fragrans*, ii, 645  
Actinotus, i, 29  
Adansonia, i, 153  
  *digitata*, i, 288  
Adelanthus, ii, 652  
Adelioides decumbens, ii, 708  
Adenanthera, i, 22  
Adenanthes, ii, 16, 20, 21, 36, 125  
  *cuneata*, ii, 125  
  *obovata*, ii, 125  
  *sericea*, ii, 125  
  *terminalis*, ii, 125  
Adenophorus, ii, 566  
Adiantum, i, 146  
  *Africanum*, i, 148 *note*  
  *capillus-veneris*, i, 148 *note*  
  *tenerum*, i, 148 *note*  
  *truncatum*, i, 83; ii, 446  
Ægiceras, i, 150 *note*, 364, 380  
Ægopron, i, 127  
Ærides, ii, 492  
  *odoratum*, ii, 492  
  *paniculatum*, ii, 689  
Æschynanthus, ii, 585, 590, 594, 596  
  *acuminata*, ii, 597  
  *bracteata*, ii, 597  
  *fulgens*, ii, 596  
  *Griffithii*, ii, 596  
  *Horsfieldii*, ii, 597  
Æschynanthus longicaulis, ii, 597

- Æschynanthus parasiticus*, ii, 596  
*parvifolia*, ii, 596  
*radicans*, ii, 596, 597  
*ramosissima*, ii, 596  
*volubilis*, ii, 596  
*Wallichii*, ii, 597
- Æschynomene*, ii, 444  
*Americana*, ii, 444  
*aspera*, ii, 444  
*bispinosa*, ii, 444  
*hispida*, ii, 444  
*indica*, ii, 445  
*sensitiva*, ii, 444
- Ætheilema*, i, 134
- Æthionema*, i, 271 ; ii, 376  
*monospermum*, ii, 376  
*saxatile*, ii, 376
- Agalmiya*, ii, 593, 604, 597  
*staminea*, ii, 598
- Agaricus alneus*, i, 70  
*campestris*, i, 70  
*muscarius*, i, 70
- Agastachys*, ii, 17, 37, 132  
*odorata*, ii, 132
- Agathis*, i, 47, 458, 461
- Agatya*, ii, 443
- Ageratum conyzoides*, i, 165, 167
- Agoul*, i, 295
- Agrostis*, i, 221  
*algida*, i, 177  
*laxiflora*, ii, 514  
*paradoxa*, i, 177, 222  
*virginica*, i, 58, 164, 166
- Aikinia*, ii, 581, 606  
*Brunonis*, ii, 554  
*Horsfieldii*, ii, 556
- Aira*, i, 232  
*aquatica*, ii, 514
