The copy filmed here has been reproduced thanks to the generosity of:

National Library of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol  $\rightarrow$  (meaning "CONTINUED"), or the symbol  $\nabla$  (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Bibliothèque nationale du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon la cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole  $\rightarrow$  signifie "A SUIVRE", le symbole  $\nabla$  signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

# THE MAPLE CITY CREAMERY

**C. E. LISTER  
PROPRIETOR**

**CHATHAM, ONTARIO**

As it is now over ten years since I established the creamery business in Chatham, I wish to thank most heartily my many patrons for the assistance they have given me in building up a business and a reputation for good creamery butter, that is well established all over Ontario, and in the British markets, where there is a demand for more Maple City creamery butter than can be produced from all the cows that can be cared for in Kent county. While this reputation I established trade is for Maple City Creamery butter, it belongs as much to the patrons as it does to the proprietor, and is worth to them from one to two cents for every pound of butter they have made at the Maple City Creamery, as the cost of hauling the cream and making the butter is the same whether the selling price is high or low.

## **A Good Reputation.**

This good reputation is of great value to the future patrons of the Maple City Creamery, and in order to retain this well established trade, it is very important that every

patron should take the best possible care of their cream, as the quality of the butter depends largely on the condition of the cream, and the price will be according to the quality of the butter, so that the better quality of cream we receive, the more money we will have to divide up between our patrons.

### Our System.

Is to gather the cream twice a week in separate cans for each patron's cream, which should be kept in crocks or creamer cans, as cool and as nearly sweet as possible, and should be well stirred up every time more cream is added; the new cream must be cooled before it is mixed with the older cream.

### Weighing the Cream.

When the cream arrives at the Creamery it is poured into the weigh cans, which are balanced on the scales, so that the weight shown on the beam is the net weight of the cream, so there can be no mistake in deducting the weight of the can.

### Testing the Cream.

A small sample is then taken for testing to find out the exact percentage of butter fat in each patron's cream, to which is added what is known as the over run, which is the difference between the butter fat, as shown by the Babcock Milk and Cream Tester, and the finished butter. Our statements all show the number of pounds of butter made from each patron's cream. We do not use the fat percentage, because it is very misleading, not being generally understood by creamery patrons, and we prefer to have our system thoroughly understood by all our patrons.

## Two Pay Days a Month.

Our statements for the first half of January will be for all cream received from the first to the fifteenth inclusive, and we will be ready to pay with a complete statement on or after the first of February. The last half of January will be for cream received from the sixteenth to the thirty-first inclusive, and payments will be ready on or after the sixteenth of February, so that all regular patrons should receive their money between the 1st and 5th, and the 16th and 20th of each month. Patrons delivering their own cream will be paid at the office. Those sending by any of our wagons will receive their money from the drivers and will please sign their book as a receipt to them, as all pay envelopes are charged to the drivers, and we hold them responsible until you sign their book. Patrons shipping by express will be paid by post office or express money orders, and if not received by the 5th or 20th of each month, please notify us by post and at once.

## How We Figure It Out.

The total weight of cream furnished by each patron during the first or last half of each month is multiplied by the percentage of butter; this gives the total number of pounds of butter made from each patron's cream. The pounds of butter is then multiplied by the average wholesale price for each half month, which gives the total value of the cream. From this amount we take three cents a pound of butter for making, and thirty-three and one-third cents per hundred pounds of cream for hauling, and if shipped by express or electric car the charges will be about the same, or the total cost of taking the cream from your house and giving you the money for it is about four cents on a pound of butter but this four

cents a pound does not come out of the patrons after all, as the buyers of Maple City Creamery Butter are always willing to pay from four to five cents a pound more for it than for good dairy butter, so that the consumer pays all the expense and makes it possible for us to pay our patrons as much, or a little more, than they could get for their butter at the grocers and we do all the work.

### **Keeps Up the Price of Butter.**

It is only by a large number of farmers sending their cream to us both summer and winter, and nearly all our make of Creamery Butter being shipped away from Chatham that keeps the price of butter up to a reasonable figure. If you are making your own butter just think over this question of the price you expect to get for it today and what you got for your butter ten years ago, and if you come to the conclusion that the creameries and cheese factories of Ontario have been the means of nearly doubling the cash returns from your cows, possibly you will give some of the credit to the Maple City Creamery, and if so do not forget the good old saying, that one good turn deserves another, and then carry out your convictions by sending your cream to the Maple City Creamery.

### **The Cream Separator.**

In order to get the best results from any separator it must be set perfectly level on a solid foundation, be well oiled and kept perfectly clean, both inside and out. To do this it must be thoroughly washed every time it is used and the sooner it is washed the easier it will be to make a good job of it.

In starting, turn the handle carefully up to full speed, see that the supply of milk

is right and set the cream screw to take about one quart of cream from eight quarts of new milk. The milk should always be separated while quite warm to get the best results. This should give a cream that will make about 35 pounds of butter to the 100 pounds of cream, and this quality of cream will give the best results in churning.

### **Cream Should Not Test Over 40 Per Cent.**

It is better not to have the cream to test over 40, as when it gets a little sour it will be so thick that it will not pour out of the can clean, which will interfere with the weighing, and is too thick to mix up readily, so that an even sample can be taken to make a fair test. And it is not as profitable to the patrons to send cream making less than 25 pounds of butter to the hundred of cream. Between 25 and 40 is all right, but we prefer a cream from 30 to 35 per cent., as this quality will churn out better and make a finer quality of butter.

Sweet skim milk is worth more on the farm than the buttermilk is worth at the creamery, and as we can pay as much money for 60 pounds of 33 per cent. cream as we can for 100 pounds of 20 per cent. cream, the patron sending the 20 per cent. cream is giving away the 40 pounds of skim milk with every 100 pounds of cream.

We need the most hearty and careful co-operation of every patron to still further improve the quality, increase the quantity, and to create a greater demand at higher prices for Maple City Creamery Butter.

### **Will Test Each Cow's Milk Free.**

To encourage our patrons to improve their dairy herds the Maple City Creamery will test each of your cow's milk free at any time. As we use the most reliable, the Babcock Steam Turbine 24 bottle Milk and

**Cream Tester, which is used and endorsed by the Ontario Agricultural College, Guelph, we can soon tell you which of your cows is giving you the best milk. In order to get a fair sample take about half a cup full of night's milk and the same of morning's milk, then put both into one bottle, being careful to mark the cow's name or number plainly on each bottle. While we will gladly make these tests free for our patrons, we will make tests for any person at 10 cents each.**

### **Our Relationship.**

It will always be our aim to maintain the cordial relationship that has continued to exist between us during the past ten years, and while mistakes may possibly occur some times, we are always ready and willing to make good any mistake on our part, and at any time when our statements are not thoroughly understood and perfectly satisfactory we will be pleased to have such patrons call in or write us as soon as convenient, as we would much rather have you come in with a complaint than to stay away and feel at all dissatisfied with your returns.

### **Winter Feeding.**

**To the Patrons.—Aim to have about half of the cows fresh for the winter creamery. Feed them liberally. Give the cows plenty of salt and water. Care for them regularly, treat them kindly, keep them clean and you will have your reward. We find that corn silage, mangels, clover hay, bran, peas, oats and some oil cake, if it can be got for twenty dollars per ton or less, give us good results in the milk flow. Swede turnips, rape, sugar beets or beet tops should not be fed to cows giving milk for butter or cheese-making.**

By separating your cream to test about 30 per cent. and cooling it quickly, it should grade number one.

# Baikie's Art Studio

## CHATHAM

When the soil is ready the Farmer loses no time in putting in the seed and when the grain is ripened wastes no time in harvesting his crops to avoid having it spoiled by rain or snow.

And so he should have each member of his family photographed before accident or death takes away perhaps father or mother and what would we not give for a good picture of loved ones who are gone.

So come and have your photographs made by Baikie, an artist unexcelled in Canada, who makes all the latest and best styles in photography.

**Bring your pictures to be neatly and appropriately framed.**

# ONTARIO DEPARTMENT OF AGRICULTURE, TORONTO.

## To the Producers of Cream.

This pamphlet has been prepared for the use of creamery instructors, sent out by the Provincial Department of Agriculture and the Dairymen's associations, with a view to assisting them in inducing the patrons of creameries to use greater care in the production, handling and delivery of cream. There is, undoubtedly, much room for improvement in equipment and methods in many of the creameries. It has been stated however, by well known men in the trade and in the columns of the agricultural press, that the greatest weakness in our dairy methods today is a lack of raw material of the highest quality. This is particularly true of the raw material which is delivered at many of our creameries. It would be to the interest of all concerned to have the cream richer, and delivered sweet, every day, if possible.

## The Objects of Instruction.

Instructors sent out by the department are not employed as detectives, but devote their energies to instructing the maker how best to improve the quality of the butter and the producers how best to supply raw material of the desired quality. Their duties are largely of an educational character. Besides advising and assisting the maker in the best methods to insure a high class product, they will, in many cases, visit the premises of the producer with a view to giving instruction in:

- (a) The care of the separator and adjusting of the same;

**We are Specialists**

**3 DOORS EAST OF MARKET**

- (b) Best methods of cooling and caring for the cream;
- (c) Necessity for maintaining a large supply of clean and cold water and value of ice supply;
- (d) Need of wholesome food for the cow, and liberal quantities of the same, etc.

The department recognizes the necessity for united effort on the part of the producers of cream and the manufacturers of butter, if the dairymen as a body hope to secure a strong hold in the British market; and towards this end it has been thought well to present in printed form to the patrons of factories some advice and suggestions as to the production and care of cream. The relationship which should exist between patron and maker, and their respective responsibilities, should be better understood by both. The manufacturers, as well as the farmers, are in the business for the purpose of making money, and the farmer cannot hope to get a high price unless he delivers his cream in the best condition; neither can the manufacturer hope to get the best results unless he provides up to date machinery and follows the approved methods of manufacturing.

The points presented in this pamphlet will be instruction to some, while to many others they will be only a reminder.

### Production of Cream.

In the profitable production of cream one of the essential factors is, that the cows kept shall give a liberal supply of milk, rich in butter fat. We have no hesitation in saying that any farmer would be well repaid for the time spent and expense incurred in making a thorough test of the individual cows in his herd, both for per cent. of fat in milk and total weight produced within the

'Phone 60

year. In the majority of herds, one or two of the best cows will be found to be returning a better profit than a half dozen of the poorer ones. Weed out the poor ones and encourage the money makers to still larger yields.

The scales and the Babcock test are just as essential to successful dairying as good food and proper management.

We wish chiefly to draw attention of producers of cream to the necessity for following the best methods of caring for and delivering the cream to the manufacturer. It will not be out of place, however, to here remind the producer of the necessity for providing a liberal supply of suitable food and pure water for his cows at all times; also an abundance of salt. The farmer is compelled to feed sufficient to maintain his stock; it is in the judicious feeding of additional food that the profit lies. When pasture growth falls off, it is well to supplement it with other feed, preferably green fodder. Avoid all musty food. Also see that the cows are not allowed access either to weedy fields, sloughs or filthy barnyards.

Have the patrons made an honest effort to produce a good quality of cream and have it delivered in a clean, sweet condition? If so, they should demand of the maker:

That he put up to date equipment in his creamery, that all utensils be kept scrupulously clean at all times, and that walls and ceilings of make-room be thoroughly cleaned and whitewashed.

That the churns be thoroughly washed with lime water occasionally.

That the cold storage be well aired and whitewashed, and that all decayed wood be removed.

Is your creamery kept in this way?

That proper care be taken of the horses

and wagons, and that the person and clothes of the driver be clean at all times.

The cream should be protected from the rays of the sun and kept as cool as possible in transit.

### To the Producers.

In drawing the milk from the cow a suitable place should be provided for the work. If the cows are kept in the stable, the hair should be clipped from the hind quarters and tail. See that the stables are thoroughly cleaned and whitewashed once or twice a year, and that they are provided with good ventilation. If the milking is done in the open, see to it that the milk is not exposed to dust and bad odors. Do not compel the cows to go faster than a comfortable walk. The milking should be done quietly, quickly, thoroughly, regularly, and with clean, dry hands. A little vaseline rubbed on the hands will assist in making the operation easier.

A person suffering from any disease, or who has been exposed to a contagious disease, should remain away from cows and milk.

Do not use wooden or galvanized pails. Discard all rusty pails, cans, or stirring utensils.

Cream cans and pails should first be rinsed with warm water, then washed with hot water, in which a little of some good washing powder has been dissolved, and finally scalded with water as near boiling as possible, and placed on their sides in a place where they will be surrounded by pure air and have plenty of sunlight. Always use a good fibre brush for washing dairy utensils and never use a cloth for either washing or wiping—the heat of a utensil that is properly scalded will readily dry it. The foregoing directions ap-

ply equally to the washing of all dairy utensils, such as pails, cans, separator bowls and their parts, etc.

Do not use a cloth to wash or wipe utensils.

### Separating Cream.

The day is past for the use of the shallow pan system for creaming milk. If you have not a separator then use the deep setting system. This demands an abundance of cold water, and a liberal supply of ice should be provided.

The separator requires constant and careful attention. First, it must be placed on a firm foundation amid clean surroundings, well ventilated and well removed from stables and bad odors of all kinds. The milk should be run through it immediately after being drawn from the cow. Thorough-

ly clean the separator after each skimming, taking the bowl apart, washing, scalding, and leaving to dry before again putting together. Clean the separator as soon as possible after using, as it washes easier and it is less liable to contaminate the next batch of cream. In washing a separator bowl and its parts, follow the directions already given for the washing of dairy utensils. Do not heed the person who advises washing the separator only once a day or twice a week.

Put a quart of warm or hot water in bowl before starting to operate. This helps the process of separation, prevents cream from lodging, cleans out any impurities, and warms up the bowl. Speed the handle to the number of revolutions advised by the maker before turning on the milk; or three to five revolutions more to get a cleaner skimming and richer cream. Have the speed regular and uniform.

Skim each milking as soon as milked. There is additional loss in the skim milk, more work, and greater trouble when saving one milking over and skimming only once a day. The milk has to be cooled to keep sweet until skimmed, and then warmed again to get a thorough and clean separation. This additional heating and cooling tends to deterioration in quality of cream.

Cool the cream as it comes from the separator or immediately afterwards to a temperature below 60 degrees, and keep it there until called for, not mixing the different skimming until all is cooled. Remember never to mix cold and warm cream.

Provide a special box or tank for holding the cans of cream and keep cold water and ice always around them, having the water in the tank to come up as high as the cream in the can.

and make than cream testing a lower percentage of butter fat. It will keep sweet longer, there is less bulk to look after, a larger yield of butter is secured, more skim milk is kept on the farm and less weight to haul. Sweet, fresh cream of uniform quality, without bitter or other undesirable flavors, will be found most satisfactory to all concerned, and the patron will be repaid many times over for his extra trouble. Do not be misled by the belief that cream slightly sour will show a higher test and thus give you larger returns than sweet cream. Deliver your cream sweet, and see that the other producers do the same.

Variations in the test or richness of cream may be due to numerous conditions: Changes in temperature of milk when separating, changes in the speed of the separator bowl, variation in the amount of milk running through the separator in a given time, the amount of water or skim milk used in flushing out the bowl after separating, changes in the richness of the milk, seasons of the year, lactation period of the cows, etc.

A thin cream may be obtained by too slow a speed, too heavy feed of milk into the bowl, too low a temperature of the milk, too much water or milk used in flushing out the bowl, or the regulation of the cream or skim milk screw. A rich cream will be obtained by increasing the speed, reducing the flow of milk and raising the temperature

### Important.

Flush out all bearings of machine once per week with kerosene; do not allow too much oil to run in bearings, just enough to lubricate well. Do not leave spilled milk or cream around machines, but wash it up at once. It is business suicide to send good cream one day and poor the next. It means loss of trade and reputation. The flavor of

the butter will be the same as the cream from which it is made. Poor cream, poor butter, poor prices. Good cream, good butter, good prices. In Ontario the production of butter from gathered cream is growing rapidly, and from present indications the output from year to year will be greater and greater. We appeal to the producers and manufacturers to do all they can to improve the quality in order that the industry may be placed upon a more substantial basis.

Compliments of the Ontario Department of Agriculture and the Dairymen's Associations of Ontario.

### Cream Testing.

Cream varies in richness much more widely than does milk. The yield of butter per 100 pounds of cream sometimes goes as low as 12 or 15 pounds, and as high as 45 or 50 pounds.

When operating a hand separator the richness of cream produced may be caused to vary from day to day by a variation in one or more of the following conditions:

1. Speed of separator. A high speed produces a richer cream than a lower speed.
2. Temperature of the milk at time of separating.
3. The feed of milk to the separator. The faster the milk is allowed to enter the bowl of the separator, the lower will the cream test.
4. The amount of liquid used to flush the bowl. The same amount should be used each time.
5. The percentage of fat in the whole milk.

The most accurate method of determining the richness of cream is by means of the Babcock test, which is becoming quite generally adopted by many progressive creamery managers.

## The Cow.

By Miss Laura Rose—Agricultural College,  
Guelph.

Farmers are far too well satisfied with the cows they keep. Were they their hired help they would not give them shelter another night. They would let them go, for the simple reason that they did not earn their bread, let alone showing the smallest profit. We must, if we wish to make dairying pay, increase and improve the milk. A cow that is well fed and cared for should produce 6000 pounds of milk, containing 3.6 per cent. butter fat, or should make 250 pounds of butter per year. I would urge farmers to weigh the milk from each cow at least one day every month and test it for butter fat. This is the only accurate way of making comparisons and finding out what the herd is doing individually. The cow stable should be well lighted, well ventilated and kept clean. Give the cows plenty of wholesome food. It is the poorest economy to stint the cows either in the matter of food or water. Also see that salt is always accessible to the cattle.

### Milking.

There is no nicer place to milk cows than in a well kept stable. Milk quietly, quickly, cleanly and thoroughly. Cows do not like unnecessary noise or delay. Commence milking at the same hour night and morning, and milk the cows in the same order.

CHATHAM

"WE DELIVER THE GOODS"

Wipe the cow's flank and udder to prevent loose dirt and hairs falling into the milk. Do not wet the hands with milk. A practice to be recommended is rubbing a little vaseline on the hands. This keeps the teats in nice condition and overcomes the objections some have of milking with dry hands. Nothing tends more readily to drying up the milk flow than leaving a little milk in the udder.

### **Paying Patrons.**

Milk is valuable for butter-making in proportion to the fat which it contains, and the pounds of fat delivered in the milk or cream should form the basis of dividing proceeds among patrons of the creameries. —Ontario Agricultural College Bulletin 143.

### **Dairy Farmer.**

Many dairy farmers grow discouraged during the season of low prices and sell their cows. This is a great mistake. No branch of agriculture is so stable and so remunerative as dairying during a series of years. A year of low prices is usually followed by one of high prices. The cow is undoubtedly the best paying animal on the farm if she is fed and handled properly. However, in order to make a cow pay, it is necessary that her owner shall possess cer-

tain qualifications. The most important of all is that he shall have a real liking for the cows, not only because of the money which they earn, but he must like them simply because they are cows. A person who really likes cows will take pleasure in feeding and looking after them. To him it is not drudgery. This person will always treat cows kindly and considerately. There will always be a bond of sympathy between the owner and the cow. Each will strive to do the best possible for the other.

This owner of cows must study their habits, likes and dislikes. He must feed them liberally and make them as comfortable as possible. Unless he or she is prepared to be a student of cows, success is not probable. To the dairy farmer we should say, know your cows individually. This can be best done by weighing the milk from each cow daily, once a week, or on two consecutive days each month, or even once a month. Samples for testing should also be taken on the day or days for weighing in order to know the percentage of fat in the milk. This, together with a close observation of the feed consumed by a cow, will enable a dairy farmer to determine whether or not his cows are making a profit. It will also enable him to intelligently weed the poorer cows.—Prof. Dean.

### Dairy Stable.

The chief requirements in a dairy stable are that it shall be light, clean and healthful. The first is got by having plenty of clean windows, the second by having cement floors, with stalls of proper length and a gutter or drop behind the cows, and the last by having the stable well ventilated, and whitewashed at least once a year. Mangers are not necessary in a modern cow stable.—Prof. Dean.

## Applied Proverbs.

Praise the day at eventide, and the cow  
at the end of the year, if she deserves it.

• • •

Children are the riches of the poor; but if  
you get them interested in the dairy they  
will help lift the mortgage from the farm.

• • •

Cleanliness is next to godliness; this ap-  
plies as much to the cow stable as to the  
front parlor.

• • •

We'll take the good will for the deed. Did  
you ever hear the cows say that when you  
neglected to properly feed and water them?

• • •

'Tis good in every case, you know,  
To have two strings unto your bow;  
Some clucking hens and a brooding sow  
Increase the profits from the dairy cow.

## Notes.

If considerable care is not exercised there  
will be some unprofitable cows in every  
herd kept at the expense of the profitable  
ones. In order to find the profitable cow,  
each cow's milk should be weighed separ-  
ately at each milking time. This does not  
involve much labor, as the pail can be hung  
on a milk balance and the weight got and  
recorded on a milk record sheet kept in a  
convenient place near the scale. At the end  
of each month the total amount produced  
by the cow should be figured. Tests of a  
composite sample of the night and morn-  
ing's milk of each cow should be made at  
the beginning and end of the month. If you  
do not care to buy a tester the creamery  
will be glad to test the sample for you. The

average of the two tests, multiplied by the number of pounds of milk, will give the quantity of butter fat for the month. When the loss producers have been detected, they should be discarded from the herd. If this kind of selection is exercised, and the herd given proper care, the business cannot but be profitable.

I would say: Educate your patrons. The majority are using hand separators, and by a little work you ought to be able to educate your patrons so that they will send you good cream. A mistake that is frequently made is in skimming too thin. A good many farmers imagine that as they have sent a good bulk of cream they will get large results, and it should be the reverse. If they would skim the milk and just send the cream to the factory, the cream would keep sweeter and they would have more skim milk to feed the calves. The trouble with us is that we have a great many separator agents who go out in the country to the farmers and tell them they only need to clean the separator once a day.—Prof. McKay.

#### Nine Cream Routes.

All through the summer season we run nine different cream routes and receive cream by the electric cars and on any railroad by express and can get a reasonable express rate on cream to be shipped from any station within 50 miles, and will undertake to start cream routes in any district where 200 pounds of cream can be had twice a week, and will always be pleased to hear from parties near any station who would like to gather cream for us either with a one or two horse wagon, and we will go out and canvass the proposed route with you. As these routes are to be covered twice a week, one driver can have one, two or three routes all coming back to the same station.

## Eggs and Bread.

We have always found it quite a convenience to our patrons as well as some profit to ourselves to carry bread on all our cream routes and will appreciate your order for a regular supply of bread, whether you have cream or not. We will also be pleased to buy your eggs all the season through, for which our drivers will pay the highest cash price or give you bread in exchange for eggs. And as we will take all your eggs all the year through, and not like many of the egg-men, who only call on you a few weeks in the early part of the season when eggs are plenty and cheap, and then about mid-summer, when the weather is hot and you are very busy, they do not call on you. This should be a sufficient reason for buying your bread from and selling your eggs to the **MAPLE CITY CREAMERY.**

Any further information will be furnished, and a copy of this book mailed free for the asking by addressing
