Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured covers/
Couverture de couleur
- Covers damaged/
Couvertures endommagées
- Covers restored and/or laminated/
Couverture restaurée et/ou pelliculée
- Cover title missing/
Le titre de couverture manque
- Coloured maps/
Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black)/
Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations/
Planches et/ou illustrations en couleur
- Bound with other material/
Relié avec d'autres documents
- Tight binding may cause shadows or distortion along interior margin/
La reliure serrée peut causer de l'ombre ou de la distortion le long de la marge intérieure
- Blank leaves added during restoration may appear within the text. Whenever possible, these have been omitted from filming/
Il se peut que certaines pages blanches ajoutées lors d'une restauration apparaissent dans le texte, mais, lorsque cela était possible, ces pages n'ont pas été filmées.
- Additional comments:
Commentaires supplémentaires:

- Coloured pages/
Pages de couleur
- Pages damaged/
Pages endommagées
- Pages restored and/or laminated/
Pages restaurées et/ou pelliculées
- Pages discoloured, stained or foxed/
Pages décolorées, tachetées ou piquées
- Pages detached/
Pages détachées
- Showthrough/
Transparence
- Quality of print varies/
Qualité inégale de l'impression
- Includes supplementary material/
Comprend du matériel supplémentaire
- Only edition available/
Seule édition disponible
- Pages wholly or partially obscured by errata slips, tissues, etc., have been refilmed to ensure the best possible image/
Les pages totalement ou partiellement obscurcies par un feuillet d'errata, une pelure, etc., ont été filmées à nouveau de façon à obtenir la meilleure image possible.

Irregular pagination: i - Lii, [1] - 6, [1] - 2, [1] - 8, [1] - 70, [1] - 84, 87 - 88, 91 - 92, 85 - 86, 89 - 90, 93 - 94, 95 - 740p. Pages 737, 738, 739, 740 are photoreproductions.

This item is filmed at the reduction ratio checked below/
Ce document est filmé au taux de réduction indiqué ci-dessous.

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
12X	16X	20X	24X	28X	32X

The copy filmed here has been reproduced thanks to the generosity of:

Library of the Public
Archives of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol \rightarrow (meaning "CONTINUED"), or the symbol ∇ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

La bibliothèque des Archives
publiques du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole \rightarrow signifie "A SUIVRE", le symbole ∇ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

PREFACE TO THE 18th EDITION.

THE editor is indebted to Professor A. D. Bache, Superintendent U. S. Coast Survey, for the article on the Tides of the Coast of the United States, besides many other favors; and to the officers of the U. S. Coast Survey, and U. S. Navy, he tenders his thanks for many obligations.

The subscriber is under obligation to Commander T. A. Jenkins, U. S. Navy, Secretary of the Light-house Board, for information of the changes which are to be made in the light-houses now erected, and of the new light-houses which are to be erected.

Since the publication of the 17th edition, the scientific community has sustained a great loss, by the death of Wm. C. Redfield, Esq., one of the most valuable contributors to this work: he has left a name identified with usefulness, science and goodness.

The information heretofore so freely furnished by the English Admiralty, through Sir Francis Beaufort, the late hydrographer, has been continued through its present hydrographer, Captain John Washington, R. N.

The Coast Pilot is now in the sixty-first year of its existence, and the subscriber hopes gives evidence of improvement commensurate with that advanced age.

GEO. W. BLUNT.

September 1, 1857.

NEW NAUTICAL PUBLICATIONS

OF

E. & G. W. BLUNT.

BOOKS.

- Nautical Almanac, containing the Moon's right ascension and declination for every 5 hours.
Bowditch's Navigator, 27th edition.
Blunt's Coast Pilot, 18th edition.
Expeditions Measurer, for measuring cargo.
Ward's Lunar Tables.
Sheet Anchor, 112 quarto plates, with additions by G. W. Blunt.
Commercial Digest, by Joseph Blunt, 9th edition.
TIDE TABLES for the Coast of the United States, by A. D. Bache, Superintendent U. S. Coast Survey.

CHARTS.

- Chart from Cape Cod to Labrador, including the Grand Bank and Gulf of Newfoundland, &c.
Eastern Coast of the United States, including Nova Scotia, from New York to Cape Canso.
Long Island Sound, on a large scale.
Chart from Montauk Point to Cape Antonio, including Bahama Bank, &c. on a diagonal scale.
Chart from New York to St. Augustine, in three sheets.
Bahama Banks, including the Admiralty Surveys up to the present date.
Bahama Bank, very large scale, (Pilotage Chart.)
Bahama Banks, Island of Cuba and Passages, on a large scale.
Florida Reef, on a large scale.
North Coast of the Gulf of Mexico, from St. Mark's to New Orleans.
Chart of the Coast of Texas.
West Indies to 15° North, including Gulf of Mexico, with Admiralty Surveys to present date.
West Indies to 9° North, including Gulf of Mexico, Spanish Main, Island of Trinidad, &c., two sheets.
Chart of Guyana, from recent surveys.
Coast of Brazil, three sheets.
River Plate.
Cape de Verde Islands.
NORTH ATLANTIC, new Chart, on a large scale, with a Memoir, PLANS of AZORES, MADEIRA, and TENERIFFE.
North Atlantic, with the curves of magnetic variation, and a Memoir.
South Atlantic.
Do. do. and South Pacific.
North Pacific, including China Seas and all the recent surveys.
Behring's Straits and Sea.
Indian and part of the Pacific Oceans.
Charts of the VINEYARD and NANTUCKET SOUNDS, on a very large scale, from actual surveys.
The subscribers have now published Charts of all the navigable world, from the best authorities, and hope that American Ship-masters will use American Charts.

CATALINA HARBOUR at Catalina Harbor, 86 feet above the sea, on CAPE FREELS, NEW BRUNSWICK, which may be seen from the light. On the north side of the entrance, 133 feet above the sea, on MISCOC ISLAND, page 641, a red light, 76 feet above the sea, is shown from the light. On the north side of the entrance, within a mile from the light, is BEDEQUE HARBOR, Prince Edward's Island. CHARLOTTETOWN, Prince Edward's Island, page 649. CARDIGAN BAY, Prince Edward's Island, which may be seen from the light. CASCUMPEQUE HARBOR, Prince Edward's Island, page 641. RICHMOND'S HARBOR, Prince Edward's Island, page 641. ISLE MADAME, page 641. LITTLE RIVER, page 641. PENNANT'S HARBOR, Prince Edward's Island, situated about 150 feet from the light. The light, which is exhibited for the first time, is on PORTLAND HARBOR, Prince Edward's Island. ALDEN'S ROCK.—An iron screw buoy formerly at that place. PRUDY'S REEF.—A light on each side, has been moored on SPRING POINT LEDGE, Prince Edward's Island, in white letters, on each side of the light. STANTFORD'S LEDGE, Prince Edward's Island, figures, has been placed, instead of the other marks in this harbor. WEBSTER'S ROCK, Cape Breton, page 641, placed about 20 feet N. of the light, and are compass bearings from the light.

Centre of Mark Island
BOONE ISLAND LEDGE, black, and numbered 1, has been placed at low-tide. The following are

APPENDIX.

CATALINA HARBOR, NEWFOUNDLAND, page 21.—There is a fixed light at Catalina Harbor, 86 feet above the sea.

CAPE FREELS, NEWFOUNDLAND, page 29.—There is a revolving light at Cape Freels, which may be seen at the distance of 22 miles.

POINT DE MONTS.—There is a fixed light at Point De Monts, North side of St. Lawrence River, which may be seen in clear weather about 15 miles.

CAPE ROZIER, page 88.—A lighthouse is being built at Cape Rozier; it will be 135 feet above the sea, and will exhibit a fixed light of the natural color.

MISCOE ISLAND, page 90.—On the N.E. point of this island, there is a fixed red light, 76 feet above the sea. A shoal extends about 3 miles in a N. by E. direction from the light. On other bearings the light may be approached from the Eastward to within a mile from the shore.

BEDEQUE HARBOR, page 106.—There is a fixed light at Bedeque Harbor, Prince Edward's Island.

CHARLOTTETOWN HARBOR, page 110.—There is a fixed light at Charlottetown Harbor, Prince Edward's Island.

CARDIGAN BAY, page 114.—There is also a fixed light at Cardigan Bay, Prince Edward's Island, which may be seen in clear weather about 15 miles.

CASCUMPEQUE HARBOR, page 117.—There is a fixed light at Casumpeque Harbor, Prince Edward's Island.

RICHMOND'S HARBOR, page 118.—A light-house, exhibiting a fixed light, has been erected at Richmond's Harbor, Prince Edward's Island.

ISLE MADAME, page 135.—There is a fixed light on the Southern part of Isle Madame, Chedabucto Bay.

LITTLE RIVER, page 215.—For "fixed light," read fixed, varied by flashes.

TENNANT'S HARBOR, page 225.—There is a light-house, 66 feet above the sea, situated about 150 feet from the shore, on the S. W. side of the entrance to the above harbor. The light, which is revolving, showing a red flash every 30 seconds, will be exhibited, for the first time, on the evening of the 1st of January, 1858.

PORTLAND HARBOR, page 235.—The following changes have been made, viz:

ALDEN'S ROCK.—An iron bell buoy, painted black, with "Alden's Rock," in white letters, on both sides of the frame, is placed to mark the rock, instead of the spar buoy formerly at that place.

TRUNDY'S REEF.—A nun buoy, painted black, with "T. R. 9," in white letters, on each side, has been moored in the place of the spar buoy formerly there.

SPRING POINT LEDGE.—An iron buoy, painted black, marked "S. P. L. 11," in white letters, on each side, has been moored in the place of the spar buoy formerly there.

STANFORD'S LEDGE.—A nun buoy, painted black, marked "13," in white figures, has been placed, instead of the spar buoy formerly in that place.

The other marks in this harbor remained unchanged.

WEBSTER'S ROCK, Casco Bay, page 235.—A spar buoy, painted black, has been placed about 20 feet N. $\frac{1}{2}$ E. of the above rock, in 3 fathoms water. The following are compass bearings from the buoy, viz.:

Centre of Half-way Rock.....S. $\frac{1}{2}$ W.
Mark Island Monument.....N. by E.

BOONE ISLAND LEDGE, page 239.—A spar barrel buoy, 50 feet long, painted black, and numbered 1, has been placed upon Boone Island Ledge, which is bare at low-tide. The following are compass bearings from the buoy:

Boone Island light-house, W. 2 $\frac{1}{2}$ miles.
Agamenticus hills, W. by N.

The buoy is moored in 13 fathoms, hard bottom, and is 100 yards from the shoalest part of the ledge.

EGG ROCK off Nahant, page 252.—The fixed white light at this station has been changed to a fixed red light, in order to remove all danger of vessels mistaking this light for Long Island Head light, when approaching Broad Sound from the North and East.

NANTUCKET HARBOR, page 268.—A stake light, 15 feet high, is placed in range with the Eastern beacon at the cliffs, Nantucket, for crossing the bar at the Eastern marks, in 5 feet water, at low-tide.

In coming in, bring Brant Point light to bear S., and run for it until the stake light is in range with the beacons; run in on this range until the beacon light at the head of the harbor is nearly in range, but open a little to the East of Brant Point light, then run in on this range, gradually opening the beacon more to the East, until it shuts in behind the farm-house, when run S. into the harbor.

HORTON'S POINT, page 293.—A light-house is in course of erection on this point.

LLOYD'S HARBOR, page 293.—A light-house is being erected on the S.E. point of this harbor.

NEW YORK HARBOR, pages 307 to 311.—Princess Bay light will be changed on the 15th of November, 1857, from a fixed white light to a fixed white light varied by a short eclipse and brilliant flash once in every two minutes.

This distinction will prevent the possibility of mistaking this light for any of the range lights in the lower bay. A N.W. $\frac{1}{2}$ W. course, made good, from the light-vessel, will lead to the mid-channel buoy, at the entrance to Gedney's Channel, on the line of Sandy Hook light and Mount Pleasant in range; and a W. by N. course, made good, from this buoy, (running for Princess Bay light,) will lead through the best water in Gedney's Channel, until Point Comfort lights are in range, when proceed as directed for the various channels.

A spar buoy, painted red and black horizontal stripes, has been placed to mark the wreck of the bark Byron, in the main ship-channel, Lower Bay, New York. It lies in 5 fathoms water, on the N.W. side of the wreck, about two-thirds of a mile below the West Bank buoy, No. 11, and 200 yards West of the red nun buoy, No. 10, on the Upper Middle. It may be passed on either side, but best to the Eastward. The Main Ship-channel range lights will lead clear of it.

CROSS LEDGE, Del. Bay, page 318.—An iron screw pile light-house is being erected at this station.

SHIP JOHN SHOAL, Del. Bay, page 322.—An iron screw pile light-house is now in course of erection upon this shoal.

WINTER QUARTER SHOAL, page 323.—An iron nun buoy, painted red, with "W. Q. S." in white letters, has been placed in 8 fathoms water, E. by S. one-fourth mile from the shoalest part of the above shoal, off Chincoteague Inlet.

Green Run bears from the buoy N.W. $\frac{1}{2}$ N., $5\frac{1}{2}$ miles.
Cape Chincoteague, W. by S. $\frac{1}{2}$ S.

REBECCA SHOAL, page 374.—Distance of Rebecca Shoal from Bush Key light for "174 miles" read 11 miles.

JUPITER INLET, page 376.—The light-house building at this place will exhibit a fixed light, varied by flashes.

LOGGERHEAD KEY, pages 382 and 384.—A light-house, to exhibit a fixed light, is in course of erection on this key.

MARSH ISLAND La., page 398.—The revolving light formerly at this island is discontinued.

BRAZOS ST. JAGO, Texas, page 401.—The fixed light at Point Isabel has been changed to a fixed light varied by flashes. It is 82 feet above the sea, and should be seen in clear weather about 16 miles.

LAGUNA DE TERMINOS, page 407.—A light-house will shortly be erected at this place.

APPENDIX—OCTOBER, 1858.

WEST QUODDY BAY, page 213.—There is a woolen beacon on the Lower Middle-ground, below the Narrows, painted red, surmounted by a cask on a spindle painted white.

West Quoddy Head bears S.W. 14 mile distant.
 Black Rock bears S.E. by E. $\frac{1}{2}$ E. 1 mile dist.
 Beacon on Western Bar bears N.N.W. $\frac{1}{2}$ W.

Give this beacon a berth of 50 yards.

A wooden beacon is also erected at Western Bar, painted black, surmounted by a cask on a spindle painted white. It should be passed 20 yards to the Eastward. The bottom is hard gravel.

Middle-channel (opposite Cranberry Point) bears N. by E. $\frac{1}{2}$ E., one mile distant. There are no U. S. buoys in these Narrows.

ST. CROIX RIVER, page 215.—There is a fixed light, 71 feet above the sea, on Big Island, opposite Robbinson, St. Croix River. The light is on the keeper's dwelling.

The following is a list of the buoys as they are passed in entering St. Croix River: Frost's Ledge, a black spar buoy, No. 1, in hard bottom, opposite Clam Cove head, Deer Island.

South end of Big Island, a red spar, No. 2, on Half-tide Ledge. May be approached within 30 yards.

North end of Big Island, a spar, No. 3. This buoy is on a point of ledge, and may be approached within 10 yards.

Middle-ground, spar, No. 4, soft muddy bottom. This buoy is about half-way between Chick's Landing and Raven's Head, and may be passed on either side.

Elliott's Flats, spar buoy, No. 5, marks the channel inside the ledge. Rise of tide 27 feet.

Knight's Point, spar buoy, No. 6, on the outer edge of the flats, marks the main channel.

MOOSE-A-BEE LIGHT-HOUSE, page 215.—The light revolves once in 30 seconds, instead of 1 minute, as stated.

The following is a list of buoys as they are passed entering Moose-a-Bee Reach:

A red spar buoy, No. 6, in 6 feet water, on the South end of Moose-a-Bee bar, about 50 feet North of a ledge, which dries at low water.

A black spar buoy, No. 5, in 15 feet water, about 100 feet South of Fessenden's Ledge, which is just bare at low water.

A black and red-triple spar buoy, in 11 feet water, about 50 feet West of Horse Ledge, which is just bare at low tide.

DEER ISLAND THOROUGHFARE, pages 215 and 218.—There is a fixed light on Mark Island, at the Western entrance of Deer Island Thoroughfare (Isle au Haut, Maine). The tower is of brick, painted white. The lantern is black, and the light is 65 feet above the level of the sea. From it

Saddle-back light-house bears S. $\frac{1}{2}$ W. $\frac{3}{4}$ W. 10 miles.

Wedge Island light-house N. by W. $\frac{1}{2}$ W. 8 miles.

Wallow's Isl., at Eastern end of Fox Isl. Thoroughfare, $\frac{1}{2}$ N. 6 miles.

Dillon Narrows and Gangway Rock buoy E.N.E. 14 mile

PETIT MANAN, page 216.—The light shows a brilliant flash once in 2 minutes.

There is a nun buoy on Jackson's Ledge, and a spar buoy on South-east Rock.

FOX ISLAND THOROUGHFARE, page 223.—A stone beacon is in course of erection on Fiddler's Ledge.

The following is a list of buoys in this passage, as they are passed going Eastward from Penobscot Bay:

On Drunkard's Ledge,	a black spar buoy, in 18 feet water.
" Dog-fish Ledge,	a red " " No. 2, in 26 feet water.
" Cross Island Ledge,	a black " " No. 1, in 17 " "
" Lobster Rocks,	" " " No. 3, in 18 " "
" Grindstone Rocks,	" " " No. 5, in 15 " "
" Iron Point Ledge,	a red " " No. 4, in 21 " "
" Waterman's Ledge,	a red and black spar buoy, in 9 " "
" Thomas' Ledge,	a black spar buoy, No. 7, in 14 " "
" Goose Rock,	" " " No. 9, in 15 " "

CASTINE, page 224.—There are three stone beacons at this harbor, as follow: Otter Rock beacon bears from Dice's Head light-house S. E. by E., one-third of a mile; from Long Island, N. E. $1\frac{1}{2}$ N., 10 miles; from Mark Island, N. E. by N., 7 miles. To be left on the port hand entering.

Hosmer's Ledge beacon bears from Otter Rock beacon E. $\frac{1}{2}$ S., three-quarters of a mile, from centre of the town, S. by W., half a mile; from Dice's Head light-house, E. S. E., one mile. To be left on starboard entering.

Middle-ground beacon bears from Hosmer's Ledge beacon N. E. by E., one mile, from centre of the town, E. $\frac{1}{2}$ S., half a mile.

CARVER'S HARBOR, page 224.—Bring the light to bear North-east and run for it. Deep water within a ship's length of the rocks. Half a mile from the light you will pass to the Eastward of Dead-man's Ledge, (the Eastern Hurricane Ledge) dry at low water. One-fourth of a mile South by West from the light lies Heron Neck Ledge, always above water. Pass between the light and the ledge, (a narrow but deep channel) and you will open Deep Cave on Green's Island—keep on in an Easterly direction, giving the different points of Green's Island a berth of a cable's length. When up with the S. E. point you will be near a dry ledge, one-eighth of a mile from the point—leave it on the starboard hand—Carver's Harbor will then be in sight, and may be known by the houses around the harbor, bearing N. E. by N., distant one mile. Give the East point of Green's Island, opposite the first house, a small berth, and run for the harbor, leaving some dry ledges on the starboard hand. Keep nearest the starboard shore at the entrance of the harbor, to avoid some sunken ledges on the opposite side—anchor in the middle of the harbor in 10 feet water, at low-tide—soft bottom—good holding-ground and good anchorage.

HURRICANE SOUND, page 224.—Bring Heron Neck light to bear N. E., and run for it; when half a mile from the light, you will pass Dead-man's Ledge, which you will leave on your port hand, and when midway between the ledge and the light you will be in the entrance to Hurricane Sound, which runs in a Northerly direction.

Keep midway between Green's Island on the East, and the islands and ledges on the West side; and when about a mile and a half above the entrance, you will be near a dry rock; pass to the Eastward of it, and anchor when you have room to give the rock a good berth.

There is anchorage all the way up the sound, but the water is deep until you get above the rock.

BILLINGSGATE ISLAND, Cape Cod, page 260. There is a fixed light on the East side of Billingsgate Island, North side of the entrance of Wellfleet Harbor. The tower is of brick, not painted. The lantern is black, and is 10 feet above the level of the sea. The stake light on the land is discontinued.

BISHOP AND CLARK'S SHOALS, page 267.—The light on this shoal will be lighted on the first of October next. It is a revolving light, showing a bright flash every 20 seconds, and should be seen in fair weather 14 nautical miles. The tower is of gray cut granite, on the North end of the shoal. The light is 50 feet above the level of the sea, and bears from Point Gammon S. by E. 24 miles.

BLOCK ISLAND LIGHT, page 285.—Only one of the lights at this station is now lighted.

DUTCH ISLAND, p. 287. There is a fixed light of the natural color on Dutch Island, R. I. It is 50 feet above the sea, and may be seen from the deck of a vessel 14 miles in clear weather.

LOYD'S HARBOR, p. 292.—A fixed light of the natural color has been placed on the S. E. point of Lloyd's Neck, in Huntington Bay, L. Island Sound. It is 40 feet above the level of the sound.

HORTON'S POINT, I. the sea.

LOGGERHEAD KEY, p. 50 feet high, of brick, and of level of the sea. Loggerhead

HORTON'S POINT, L. ISLAND, page 293.—Is a fixed light, 110 feet above the sea.

MONTAUK POINT, p. 305.—Montauk Point light is a first order fixed light, varied by a flash once in every two minutes.

SHINNECOCK BAY, p. 305.—Shinnecock Bay light is a first order fixed light. The light is 161 feet above the level of the sea.

FIRE ISLAND LIGHT, page 305.—After the 1st of November will be a first order revolving light, showing a brilliant flash once every minute. The tower is of brick, 150 feet high, and of a cream yellow color. The light is 166 feet above the level of the sea. From it Neversink lights bear W. by S. $\frac{1}{2}$ S., 38 $\frac{1}{2}$ miles.

BARNEGAT LIGHT, N. J., pages 306, 313.—On the first of January, 1859, this light will be changed from a fixed to a revolving light, showing a bright flash once in every ten seconds. The tower is brick, 148 feet high, the upper half being of the natural color of brick and the lower half white. The lantern is black, and the focal plane of the light is 165 feet above the sea.

CAPE MAY FIVE-FATHOM BANK, page 317.—A new light-vessel has been placed to mark the Five-fathom Bank, off Cape May light-house, in place of the old one withdrawn.

It is of the same character as the old one, and is moored to the E.N.E. of the former light-vessel, in 12 fathoms water.

SANDY POINT, CHESAPEAKE BAY, page 337.—A fixed light, varied by flashes once in every minute and a half (1/3 30%) will be exhibited after the 1st of October a Sandy Point, West side of Chesapeake Bay, between Greenbury Point light and the mouth of the Magotty River. The house is of brick, painted red. The light is 50 feet above the level of the sea, and should be visible 12 nautical miles.

CAPE HATTERAS, p. 312.—There is a beacon-light, 25 feet high, 500 yards from the point of the cape; the building is red.

ROANOKE MARSHES, North Carolina, page 313.—There is a fixed light about midway between Pamlico and Croatan Sounds. The building is white with red lantern. Light 31 feet above the water level.

CAPE ROMAIN, p. 319.—Cape Romain is a revolving light, showing a bright flash every minute. The tower is 150 feet high, and is of dark reddish gray brick. The old tower still stands.

CHARLESTON, S. C., page 350.—Charleston light is now a fixed light, 133 feet above the level of the sea.

There is a fixed light of the natural color on the East end of Charleston battery which, with the Fort Sumpter beacons, forms a range for entering North Channel. The light is 15 feet above low water, and may be seen 8 miles.

A new beacon has been lighted on Morris Island, 11 $\frac{1}{2}$ feet West of the old one which, in range with Charleston light-house, marks the deepest water in main ship channel. The old beacon has been torn down.

SAPALO INLET, p. 357.—A fixed beacon-light, 50 feet above the sea, has been placed in front of the main light, on the Southern extremity of Sapelo Island, Ga., in order as a range for crossing the Bar in the best water. To run in, bring the beacon in range with the main light, and keep on that range until the East beacon on Wolf Island bears S.W. by W. $\frac{1}{2}$ W., when steer N.W. by W. $\frac{1}{2}$ W., keeping in not less than 1 fathoms, to the anchorage, abreast of the main light-house.

AMELIA ISLAND LIGHTS, FLORIDA, page 360.—There are two beacon-lights on the North front of this island. The outer beacon is a fixed light, with its focal plane 50 feet above the level of the sea; beacon painted red. The inner beacon is on a dwelling house, painted red, with white roof. It is a fixed light, 35 feet above the sea. To enter Fernandina Harbor by these beacons, bring the main light to bear S. by W.S.W., in 7 fathoms water, and run for it until the beacons are in range; then run on the range which bears W. $\frac{1}{2}$ N., until up with the white buoy.

CARYSFORT REEF, pages 362 and 377.—The light on this reef is now a revolving light of the natural color, showing a bright flash once in 30 seconds. It is 66 feet above the sea, and should be seen in good weather about 18 miles from a ship's deck.

LOGGERHEAD KEY, p. 371.—There is a fixed light on this Key; the tower is 80 feet high, of brick, and of that color; the plane of the light is 152 feet above the level of the sea. Loggerhead Key is the Westernmost of the Tortugas Keys.

DRY BANK, p. 379.—The light-house on Sombrero Shoal, off Dry Bank, Florida Reef, is a fixed white light, illuminating the whole horizon, 114 feet above the sea, and should be seen in clear weather 19 miles from a ship's deck.

Mariners are particularly cautioned *not to mistake this light for the one on Caryfort Reef*, which is changed from a fixed to a revolving flashing light.

PENSACOLA LIGHT, page 390.—On the first of November, 1858, will be lighted a revolving Fresnel light, showing a bright flash every minute. The tower is 160 feet high, and the plane of the light 240 feet above the surface of the sea.

SAND ISLAND LIGHT, Mobile Bay, page 391, is a fixed Fresnel light. The tower is 150 feet high, and the plane of the light is 152 feet above the surface of the sea.

MOBILE POINT LIGHT, page 391, now a revolving light, will be changed to a fixed light.

DELTA OF THE MISSISSIPPI, page 395.—The light at the North-east Pass has been discontinued.

On the West side, and near the entrance of the South-west Pass, there is a fixed light, exhibited from a white tower, 70 feet above the level of the sea.

There is a revolving light of the natural color on the South-west side of Gordon's Island, near the entrance of the South Pass, showing a brilliant flash once in every minute and a half (1 30'). The light is 60 feet above the level of the sea.

On and after January 1, 1859, the light on the North side of the entrance of Pass Loure, on Middle-ground, which is now a fixed light varied by flashes, will be changed to a fixed light of the natural color. The light is 77 feet above the sea—tower black.

The light-house tower on Frank's Island, at the North-east Pass, 70 feet high, painted white, will be left standing.

BARRATARIA, p. 396.—A fixed light of the fourth order has been erected on the Isle Grand Terre, the East side of the entrance to Barratarin Bay. The tower is 55 feet high, whitewashed. The light is 60 feet above the level of the sea.

TIMBALLIER, p. 397.—A fixed light of the fourth order has been erected on the West side of the Grand Pass of Timballier. The tower is 55 feet high, whitewashed. The light is 60 feet above the level of the sea.

SWASH LIGHT, MATAGORDA BAY, page 400.—There is a fixed light at the Swash, opposite Alligator Head, Matagorda Bay, Texas. The structure is upon seven iron screw piles, hexagonal, painted white. The iron work is painted black. The light is 38 feet above the level of the sea, and marks the upper entrance to the Swash Channel.

LAGUNA, p. 407.—At the Indian village, on the West side of the entrance, there is a fixed light 75 feet high.

SAGUA DE LA GRANDE, page 412.—Between Cayo de la Cruz and Cayo Mariposa, in lat. 22° 59' 40" N., long. 79° 58' 27" W., is Poza de Marillanes, the last entrance into the harbor of Sagua de la Grande.

Run for the N. E. point of Cayo del Cristo, which may be known from its white beach and large pilot and fisherman's house on the point when it bears West, distant 1½ mile, and the S. E. end of Cayo de la Cruz S., by W. ¼ W. Steer S. E. until the S. E. point of Cayo del Cristo is in with the large white storerooms at the mouth of Sagua River, and bearing S. W. by S., when stand in. This range clears the shoal ground, called Cabezo de Marillanes, and crosses the bar in the best water, say from 10 to 21 feet.

When abreast of the pilot's house on the S. E. point of Cayo de la Cruz, steer S. W. by S. ¾ S., watching carefully the shoal ripples on either hand. When abreast of two small islands, called Cayo Palominos, half up from them to the Eastward, and anchor in from 17 to 18 feet water, good holding ground.

DANGERS.—Cabezo de Marillanes has but 7 feet upon it, and bears E. by S. ¾ S. from the huts in Cayo del Cristo, distance 2½ miles.

Cabezo de Chñete has but 4 feet water upon it, and bears S. E. by E. ¾ E. from the huts on Cayo del Cristo, and N. E. by N. from the pilot house on Cayo de la Cruz.

Slightly to the Eastward of the range between the S. E. point of Cayo de la Cruz and Cayo Palominos, are several shoal spots with 5 feet water only upon them.

S. ¼ W. from the pilot-house on Cayo de la Cruz, ¼ mile distant, is a spit that projects from Cayo Mariposa.

These shoals, at the mouth of the entrance, are very well defined by the tide ripples, and with care can be avoided.

* Cabezo is the Spanish for head or top of a shoal.

The rise and fall of tide is about 2 feet. A light will be erected in time on the N. E. spit of Cayo del Cristo.

CARDENAS BAY, CUBA, pages 112 and 115.—There is a fixed white light, varied by a red flash once in every half (3) minute, on Cayo Piedras, at the entrance of Cardenas Bay, 68 feet above the level of the sea.

CHENUEGOS, p. 155.—There have been four buoys placed in this harbor:

1st Buoy, white, in 18 fathoms water, stony bottom, the Point del Diablo bearing S. E. 5° E., Point la Vigia S. W., and the Fort N. W. 4° N. This buoy is one cable's length from the Eastern, and 1 cable's length from the Western coast, and marks the channel.

2d Buoy, white, in 23 fathoms water, stony bottom, Point del Diablo bearing S. E.; Point la Vigia, S. S. E.; and the Fort N. W. This buoy is about one cable's length from the shore on either side, and 5 cables' length from the first buoy.

3d Buoy, red, in 13 fathoms water, stony bottom, Point Paso Caballos bearing E. N. E.; Point la Milpa, N. E.; and the Fort N. N. E. This buoy is one cable's length from the shore, and 3 cables' length from the second buoy.

4th Buoy, red, in 25 fathoms water, muddy bottom, Cayo Carena bearing N.; Point la Milpa, N. N. E.; and Point Caleron de las Damas, E.; distant from the shore one mile, and 2 miles from the third buoy.

Vessels can tack between the buoys, as there is a sufficient depth of water, and not the least danger.

A pilot will be in attendance at all times near the first buoy.

LAGUAYRA, p. 576.—Bottom line, for 10° 57' read 10° 37'.

RIO DE LA HACHA, page 585.—There is a fixed light at the city of La Hacha, Nueva Granada, W. I., 69 feet above the level of the sea.

The small fixed light at the pier of Laguayra, the port of Caracas, Venezuela, is no longer exhibited.

RIVER SURINAM, page 623.—A light-vessel has been moored in three fathoms water at the entrance of the River Surinam, exhibiting a fixed light 30 feet above the level of the sea. The light-vessel carries a red ball at her mast-head by day, and has the word "Surinam" painted on her sides.

MACAYO, p. 617.—At Macayo there is an intermittent light of two minutes, viz: bright light 70 seconds, eclipse 16 seconds, brilliant 12 seconds, eclipse 22 seconds. It is 205 feet above the level of the sea.

MORRO SAN PAOLO, p. 653.—On the Morro San Paolo there is a revolving light; time of revolution one minute, duration light 15 seconds. It is 276 feet above the level of the sea. The tower is 80 feet high.

RIO JANEIRO, p. 651.—On Point Calhabouco, the harbor of Rio Janeiro, there is a red fixed light.

RIO DE LA PLATA, page 668.—A light-vessel has been moored in 7 fathoms water off North Spit of English Bank Shoal, Rio de la Plata, exhibiting a steady fixed light, visible ten miles.

This light should not be mistaken for the light on the Isle of Flores, which is a revolving light.

There is a fixed white and red light on Lobos Island, North side of entrance of Rio de la Plata, 81 feet above the level of the sea.

RIO DE LA PLATA, p. 671.—The following lights have recently been established in the Rio de la Plata:

A light-vessel off Point Indio, carrying a fixed white light, about 30 feet above the level of the sea, visible from the deck of a ship from 8 to 10 miles in clear weather.

The vessel lies in 31 fathoms water, N. E. 1° N. of Point Indio, at about 8 miles from the bank, near the edge of the bank or shelf that extends to that distance off shore, and about 9 miles S. S. W. of the tail or South-eastern extremity of the Ortiz Bank.

A light-vessel off the North end of the Chico Bank, showing a fixed white light, visible from 8 to 10 miles in clear weather. The vessel lies in 5 fathoms water, N. E. 1° N. 13 miles from Point Atalaya, and about 33 miles N. W. 4° W. from the before-named Point of Indio light-vessel.

A fixed white light is shown from the hulk or guard-ship, that lies in the Outer Bay at Buenos Ayres, in 24 fathoms water, at about 34 miles E. N. E. of the city, and 4 miles W. 4° N. from the above-named Chico light-vessel. It may be seen 7 miles in clear weather.

It is further proposed to place a refuge raft on the English Bank.

Varacion L. L. at Buenos Ayres, and 9° 50' at Montevideo, in January, 1857.

LAUYA—ST. AUGUSTINE, p. 361.—The bar at this place has changed. Bring the light to bear W. by N., and steer W. S. W. is the present course.

TABLE

For finding the distance of terrestrial objects at sea in nautical miles.

[Nautical mile, 6086.7 feet.]

HOW TO USE THE ABOVE TABLE.

This Table was made to determine the distance of an object whose height is known, when seen near the horizon: for instance—Sandy Hook light-house is seen from the deck of a vessel 20 feet above the surface of the water.

EXAMPLE.

Sandy Hook light, according to the Coast Pilot, is 90 feet above the water.

In the Table 90 feet gives 10m. 91

20 5m. 11

16m. 05 the distance the light-house top can be seen

in clear weather.

Feb. 1856.

The subscribers have now published Charts of all the navigable world, from the best authorities, and hope that American Ship-masters will use American Charts.

DIVIDING ENGINE.

They have just completed at their establishment, after a labor of over five years, a Dividing Engine, by which they are enabled to divide Astronomical and Nautical Instruments to a degree of precision which they will *guarantee* to be equal to the best of foreign make. The subscribers, therefore, ask that American ships may be navigated by American made instruments.

INSTRUMENTS.

Chronometers of the best makers, for sale and to hire.
Sextants, Quadrants, &c., of American manufacture.
Spy Glasses.
Night Glasses, new kind.
Aneroid Barometers.
Compasses, Dent's Improved, and others.
Binnacles.
Globes, Terrestrial and Celestial, 16 inch, by CHARLES COPLEY.
Massey's Patent Logs.
Ogden's, Eriessou's, and Massey's Patent Sounding Instruments.
Improved Compasses with elastic centres.
ABBOTT'S HOROMETER, a new and simple instrument for working the Longitude, either by Lunar Observations or the Chronometer.

ALL THE U. S. COAST SURVEYS AND ENGLISH ADMIRALTY SURVEYS.

NOTICE TO SHIP MASTERS.

Now publishing, a Chart of the West Indies, on a very large scale. Massachusetts Bay.

OFFICE OF THE BOARD OF UNDERWRITERS'
New-York, March 20th, 1858.

There is reason to believe that disasters to vessels have recently occurred on the Southern Coast of the United States, in consequence of the use of old and incorrect Charts. This board would earnestly impress upon Ship Masters the great importance of being provided with those that are of recent date and from a reliable source. BLUNT'S CHARTS of the Coast of the United States are corrected in conformity with the Government Surveys, and have accurately laid down the position of all the Lights now in use, or in process of construction on our coast, and these Charts should be familiar to every Ship Master in the trade.

WELLSWOOD WALTER,
Secretary Board of Underwriters.

Extract of a letter from Lieut. John Rodgers, commanding U. S. Ship "Hancock," attached to the Surveying Expedition to the China Seas, North Pacific.

New Bedford, January 14th 1852.

"I had a long discussion on charts of the extreme North Pacific, Behring's Straits, Sea of Okotsk. &c. All the Whalers say that you are right."

COMPASSES.—Attention is invited to the new Compasses constructed at the establishment of the subscribers. It is a fact now well understood, that most of the losses charged to Currents are due to the imperfect construction of Compasses, and to their deviation *not* being ascertained.

Compasses of a superior quality are manufactured by them, and are constantly on hand. Also, Dent's Patent and other approved Compasses.

E. & G. W. BLUNT.

Captain's Hill
Brant Point

APPENDIX—JANUARY, 1859.

RACCALIEU ISLAND, page 19.—On the North Point of this island there is a revolving light, showing a flash every twenty seconds: it is 380 feet above high water. When the southern end of the island bears S. S. W., you shut in the light when within eight miles of the island.

WADHAM ISLAND, page 30.—On Wadham Island there is a fixed light, 96 feet above the level of the sea.

DODDING HEAD, page 46.—On Great Burin Island there is a revolving light of one minute, with flashes every twenty seconds, 410 feet above the level of the sea.

SEAL AND WOODEN BALL ISLANDS, MAINE, pages 209–221.—Seal Island should read Wooden Ball Island, page 222. For second paragraph from top read Wooden Ball Island bears from Seal Island, W. S. W. $3\frac{1}{2}$ miles. Wooden Ball from Martinicus Rock Light, N. E. by N. 4 miles; from Martinicus Island, E. $\frac{1}{2}$ S., nearly 6 miles.

Almost half way (and nearly in range) between Wooden Ball and the southern end of the Fox Islands, is Bay Ledge, with 2 fathoms water on it. It is marked by a red can buoy.

About three miles W. by S. from the Southern Fox, is a ledge called the White Island Ledge, with 2 fathoms water on it.

TRIANGLES, page 241.—Lieut. Murray, U. S. C. Survey, has found $6\frac{1}{2}$ feet on the Triangles from the shoal water, bears N. N. E. $\frac{1}{2}$ E., 14 miles distant. Whale's Back Light, W. by S., four miles distant.

After doubling the bell buoy off Boon Island, vessels should keep the Whale's Back Light to the northward at least two points, until they pass the monument on Yock Ledge.

The rock has $6\frac{1}{2}$ feet water at mean low tide, and within a ship's length 7 and 11 fathoms.

IPSWICH, pages 244 and 245.—The eastern tower only is illuminated. There is no canal connecting Ipswich with Gloucester.

DAVIS' LEDGE, page 247, is off Cohasset, near Miots' Ledge, 20 miles south of Gloucester.

STELLWAGEN'S BANK, page 252.—The three buoys have been removed from this bank.

PROVINCETOWN HARBOR, page 257.—Fourth paragraph, for the course from Boston Lighthouse to Sandwich, &c., read, the course from Boston Lighthouse to Provincetown harbor, is first S. E. by E., 3 leagues, to Cohasset Rocks, thence to Provincetown S. S. E., 14 leagues.

BOSTON HARBOR—Omit lines 11 and 12 from bottom of page 257.

HIGH PINE LEDGE, page 259.—Insert after line 27 from top:
A black spar buoy, No. 1, has been placed off High Pine Ledge, in 15 feet water. The rock is dry at low water. The following magnetic bearings are given:

Gurnet's Lights	S. $\frac{1}{2}$ W.
Captain's Hill	W. $\frac{1}{2}$ S.
Brant Point	N. by W.

WELLFLEET, page 260.—There is a light on Mayor Beach, at the head of Wellfleet Bay, serving as a guide up the bay after passing Billingsgate Island light.

HANDKERCHIEF SHOAL, page 265.—A light vessel has been placed nearly a mile and a half from the south part of the shoal.

From it Monomoy Point Light bears.....N. E. $\frac{1}{2}$ N.
Shovelful Light Vessel bears.....N. E. $\frac{1}{2}$ N.
Great Point Light bears.....S. $\frac{1}{2}$ W.

HYANNIS, page 266.—There is a beacon on the east end of the breakwater in this harbor, and also a spindle on Great Rock. There is also an anchorage and breakwater of Bar's River, between Old Stage Harbor and Hyannis, and a Bug light 10 feet high west of Swan Pond River, which is E. by N. $\frac{1}{2}$ N., 5 miles from Point Gammon light. The breakwater off the mouth of Swan Pond River is $\frac{1}{2}$ mile from the light, in a S. W. $\frac{1}{2}$ S. direction.

NANTUCKET, page 266.—Nantucket beacons having been removed, the following directions should be observed for entering that harbor: When up with the Bell buoy the Cliff Beacon lights (white and red), the Bell buoy and outer Bar buoy (red No. 2) will be in range. Then steer for the Cliff Beacon lights, until the harbor beacon is in range with Brant Point light. When up with the inner black flat buoy, steer S. E. by S. for Brant Point buoy, until the harbor beacon light is shut in by a farm-house, then S. W. to the anchorage.

HOLMES HOLE, page 269.—The beacon lights at this place are extinguished, and the fixed light mentioned supplies their places.

GAY HEAD, page 271.—The passage between Gay Head and Noman's Land is now buoyed.

OLD COCK, page 276.—There is a spindle on Old Cock, one of the Hen and Chickens reef, a dangerous ledge on the west side of Buzzard's Bay, and extending out $\frac{1}{2}$ mile from Gooseberry Neck. Off the extreme point of reef there is a bell buoy. A light-house is now building on the west side of the entrance of Westport harbor, which is directly to the west of Gooseberry Neck.

WING'S NECK LIGHT, page 278.—This light is a red light situated on the Island, half a mile south of the Neck, and serves as a guide for the head of Buzzard's Bay, and for entering Pocassett, Redbrook and Sippiecar harbors.

CORMORANT ROCK, page 279.—There is a spindle on this rock, and the channel between Cutterhunk and Penike's islands has been buoyed out.

CHERRYSTONE INLET, page 325.—There is a fixed light on the bar, west side of the entrance of Cherrystone inlet, $\frac{1}{2}$ mile south of Sandy Point. It is a screw-pile structure, hexagonal in plan. The house is painted white, and the piles and lantern are painted red.

The light is 36 $\frac{1}{2}$ feet above the water, and should be visible 10 miles.

STINGRAY POINT, CHESAPEAKE BAY, page 330.—There is a fixed light at the south point of the mouth of the Rappahannock river, Va., in 6 feet water.

The structure is the same as Cherrystone.

The light should be seen 7 miles.

MOUNT PLEASANT, CHARLESTON HARBOR, pages 350, 355.—There is a fixed light at this place, 57 feet above the sea; should be visible about 10 miles. The lantern is on the keeper's dwelling, which, including the tower, is painted with a light brown color, with dark brown piazza, doors and trimmings.

ST. GEORGE'S SOUND, page 588.—A new channel has been discovered by Lt. Duer, U. S. N., leading from the sea to St. George's Sound, close in with the north shore of Dog Island, with 20 feet water.

By this channel vessels may be carried from sea to a good anchorage in 4 fathoms under a reef, and from there around the easternmost point and shoal of Dog Island.

On the bar of the East Pass there are at high tides usually 17 feet water. It would be unsafe to go beyond the 4 fathoms' anchorage under the reef without a pilot.

Directions.—Bring Dog Island light-house to bear west (by compass), and Southwest Cape N. E. $\frac{1}{2}$ N. On finding 5 $\frac{1}{2}$ or 6 fathoms water, the course hence is north, until the

westernmost end of Dog Island, east point of Alligator harbor, inside the reef, which is between Southwest Cape and Dog Island, not less than 31 feet, until water

easternmost end of Dog Island bears S. W. by W. $\frac{1}{2}$ W., or until the water shoals off the west point of Alligator harbor. From here haul up W. S. W., and keep this course until inside the reef, which can readily be discerned by colored water or breakers. Between Southwest cape and the reef, the channel now reported is very deep, having not less than 31 feet, until well in towards the land, where soundings give 4 fathoms.

ARROYA, PORTO RICO, page 510.—When off Crab Island, the S. E. point of Porto Rico, Cape Malapascua can be plainly seen, bearing about W. by N. The land rises abruptly, from the water's edge, to the height of several hundred feet, and forms a high semi-circular bluff of land. From this point to the harbor of Arroya, the course is nearly W. 9 miles distant. A reef extends nearly the whole distance, lying from 2 to 3 miles off shore, and on most parts of it the sea constantly breaks. When the S. E. point bears N. 5 or 6 miles distant, steer W. $\frac{1}{2}$ S. 9 miles, which will bring you up to the harbor of Arroya, and when the Custom-House, which is a large square building of a yellowish white color, bears N. by W., steer in for it, and anchor within $\frac{1}{2}$ of a mile from the shore, the Custom-House bearing N. This harbor is much exposed, and there is a constant roll of sea setting into it from the S. E.

Lying at anchor in this harbor, the following bearings were taken:

Eastern point of Breakers.....	S. E. 3 miles.
Western " ".....	S. W. $4\frac{1}{2}$ miles.
Eastern " Land.....	E. S. E. 2 miles.
Western " ".....	S. W. by W. $\frac{1}{2}$ W. 6 miles.
Custom-House.....	N. $\frac{1}{2}$ mile.

POINT PETRE, page 535.—Point Chateau, the easternmost land of Guadalupe, is composed of irregularly shaped rocks, some of which appear ready to tumble over into the water. From this point you run down the south side of the island, within 2 miles of the shore, until you pass an island called Le Grossier, and between which and the main island there is no passage, and only a small opening. From this island to near the harbor you may go along in the edge of the white water. When up with Isle le Grossier, you will see a building on a hill to the westward, near the water, which is the fort of St. Louis, although it has not much the appearance of one—before you get to this fort you can always get a pilot. About a mile from the fort is the entrance to the harbor of Point Petre. In running along you will, if not too far off shore, observe an island so low that the mangrove bushes appear to stand in the water, from which a reef extends off some distance to the westward. On this island there is a harbor-light, and opposite this island there is a telegraph. Vessels, after passing Point Chateau 10 miles, should hoist their signals for the telegraph. A little to the westward of this last is another island, larger and higher, with coconut trees and some houses on it, from which a large reef extends off in an easterly direction. Between these two reefs is the entrance to the harbor. A little inside the low island are several large square buoys near which you pass, leaving them all on the starboard hand. There are several islands to the westward of those already mentioned, among and around which the ground is foul, so that vessels lying off anchor should keep to windward.

There are 3 fathoms on a small piece of shoal ground, nearly S. by E. from the entrance to the harbor. Point Petre is one of the best harbors in the West Indies.

POINT DE MOULE, page 536.—A white flag, with a black ball in the centre, is a signal not to attempt to enter. A plain white flag is the signal to approach for a pilot. There is a harbor-light here.

Alterations to be made in the Light-Houses during the year 1859.

FENWICK'S ISLAND.—A new light-house is now building at Fenwick's Island, Delaware Bay, on the boundary between Delaware and Maryland. The light will be a fixed, varied by flashes once in every one minute and thirty seconds.

CAPE MAY.—A new tower, 150 feet high, will be erected, and the light will be a fixed, varied by flashes once every minute.

CAPE CHARLES.—This will be altered in exactly the same manner as Cape May.

CAPE LOOKOUT.—A new tower, 150 feet high, is now building. The light will be a fixed light.

JUPITER INLET, FLA.—This light will be built this winter. It will be a fixed light varied by flashes once in every two minutes.

SHIP ISLAND SHOAL.—The structure for this light, and now building, will be an iron screw-pile structure. The light will be a fixed, varied by flashes once every two minutes.

SOUTHWEST REEF.—This will be a fixed light. Structure, iron screw-pile. When this light is lighted, the Point au Fer light will be discontinued, and the Atehafalaya light-vessel will be removed.

SHELL KEYS LIGHT.—This will be a fixed light, on an iron screw-pile structure.

E. & G. W. BLUNT,

NO. 179 WATER-STREET.

We invite the attention of Shipmasters and Shipowners to our large assortment of Charts of our own and other publication—of all parts of the world—all from the latest authorities. We have facilities for procuring information from our own and foreign governments, and from private sources, not possessed by any other house in the United States. Shipmasters who deal with us, will therefore receive the earliest notice of changes in progress, or in prospect, in reference to lights, &c. Having recently completed a Dividing Engine, equal to any in the world, we are manufacturing Sextants, Octants, and Quadrants, which we guarantee to be equal to the best made in Europe.

Our spring-centre Compasses are universally acknowledged to be the best for all vessels, and especially for steamers, where there is considerable motion produced by the engine. We have also the usual kinds—Binnacle of various patterns, Azimuth, and Standard Compasses, such as are used in the English Navy by order of the Admiralty.

Marine Opera Glasses having gradually superseded the large and useless Night Glass, and being used for ordinary purposes in the day also, we would say that, our stock is composed of the finest quality, with substantial frames and cases. They are invaluable for reconnoitering purposes on land.

Also, constantly on hand, Aneroid and Mercurial Barometers, Thermometers, Spy-Glasses, Log-Glasses, Patent Logs and Leads, &c., &c., &c.

We are Agents for the following, viz:—

**DENT'S CHRONOMETERS AND COMPASSES,
ROGERS' CODE OF SIGNALS,
MARINE REGISTER, OR AMERICAN LLOYDS.**

16-INCH GLOBES.

We have made several additions to, and improvements in, them, including KANE'S ARCTIC EXPLORATIONS, BERRYMAN'S and other DEEP SEA SOUNDINGS, ISOTHERMAL LINES OF MEAN ANNUAL TEMPERATURE, &c., &c., &c., making them the most modern and

APPENDIX—August, 1859

CAPE COD, page 260.—The course from Cape Cod, the light bearing S. W. 2 leagues distant, is N. W. by W. $\frac{1}{2}$ W. to Boston Light.

FENWICK'S ISLAND, page 323.—On this Island, in latitude $38^{\circ} 27'$, there is a fixed light varied by a bright flash every two minutes. The light is 86 feet above the level of the sea.

CHARLESTON, page 351.—The Overall Beacons are not to be lit in future.

ST. HELENA SOUND, page 352.—There is a Light House on the North Point of Hunting Island. It contains a Revolving Light. Time of revolution, 30 seconds. The tower is reddish gray, the upper 25 feet painted *white*. It is 95 feet high. The light is 108 feet above the level of the sea.

There is also a Beacon 39 feet above the level of the sea. It contains a fixed light. The two range N. 77° E. and N. 77° N. This range will put you on the Star Bury of the Slough Channel. The Light Ship is to be removed on the 30th of June, when the Light and Beacon will be lit.

GREAT ISAACS, page 370.—Is a Revolving Light. Time of revolution, 30 seconds. It is 158 feet above the level of the sea. The tower is of iron, painted with alternate bands of *red* and *white*.

GUN CAY LIGHT, page 371.—The time of revolution is one and a half minutes.

CAPE ST. BLAS, page 389.—There is a Light House on Cape St. Blas. It is painted *white*. The light is 96 feet above the level of the sea. It contains a Revolving Light; time of revolution, one minute and 30 seconds.

APPENDIX—FEBRUARY, 1860.

CAPE LOOKOUT LIGHT, *page 344*.—The color of the light is red, and the focal plane is 155 feet above the level of the sea.

The keepers' dwelling, which is a part of the old tower, is painted in red and white horizontal stripes.

CAY LOBOS, *page 372*.—On this key there is a fixed light, 146 feet above high water mark.

FORT JUPITER, *page 376*.—A revolving light, 146 feet above the level of the sea, will be lit on the 1st of July next. Lat. $25^{\circ} 56' N.$ Lon. $80^{\circ} 05'$.

MALDONADO, *page 671*.—On East Point, the eastern side of Maldonado Bay, there is a fixed light, 152 feet above the level of the sea.

SHIP SHOAL, *page 397*.—The Light on this Shoal is 110 feet above the level of the sea, is a revolving light, and shows a *bright flash at an interval of 30 seconds*. Lat. $25^{\circ} 55', 06' N.$ Lon. $90^{\circ} 55' 56' W.$ The Light Ship has been *discontinued*.

BODY'S ISLAND LIGHT, *page 341*.—Is now a Revolving Light, showing a bright flash every $1\frac{1}{2}$ minutes, and is 90 feet above the level of the sea.

WINDS.

WIND is a sensible current or movement of the atmosphere over the earth's surface. The winds are divided into Perennial, Periodical, and Variable. They are also divided into General and Particular. Perennial, or Constant Winds, are those which always blow the same way: such is that Easterly wind, between the tropics, commonly called the Trade Wind. Periodical Winds are those which constantly return at certain times: such are land and sea breezes, blowing alternately from land to sea, and from sea to land. Variable, or Erratic Winds, are such as blow now this way, now that, and are now up, now hushed, without regularity, either as to time or place: such are the winds prevalent to the Northward of 30° N. latitude.

PERENNIAL, or TRADE WIND.—Over extensive tracts of ocean, in the lower latitudes, or towards the equator, Perennial or Trade Winds are found to prevail, which follow the course of the sun: thus, on the Atlantic Ocean, at about 100 leagues from the African shore, between the latitudes of 10 and 26 degrees, a constant breeze prevails from the North-eastward. Upon approaching the American side, this N.E. wind becomes more Easterly, or seldom blows more than one point of the compass from the East, either to the Northward or Southward.

The Perennial, or Trade Wind, on the American side of the Atlantic, extends, at most, to 30 degrees of latitude, which is about 4 degrees further to the Northward than on the African side. Likewise on the South of the equator, the Perennial Wind, which is here from the S.E., extends 3 or 4 degrees further towards the coast of Brazil on the opposite side of the ocean. The general cause of this wind is the motion of the earth, in its diurnal rotation, connected with its orbital movements.

HEAT increases evaporation, and renders the atmosphere capable of supporting a greater quantity of moisture than it would do in a cooler state: were the atmosphere forever continued warmth, and its motion uniform, there would be no rain; for it would contain more moisture in exhalation than it could support. Heat often produces restiness in winds and weather: for near the land, when the sun has great influence, it produces land and sea breezes near the shore; and, in particular situations, heavy squalls and squalls of wind.*

Small islands, lying at a great distance from the main-land, operate very little upon the Trade Wind. If elevated, these islands are more subject to rain than if low: this may be occasioned, principally, by the ascent given to the wind, or atmosphere, in passing over the tops of the hills, when, being cooled, it condenses into small drizzly rain. This is an effect peculiar to all mountains, even in the middle of continents, when the atmosphere is sufficiently charged with moisture. For the sun's rays, by passing through the atmosphere, according to its density, renders it much warmer at the bottom than at the top of hills. Upon a mountain sloping from the sea towards the top, about 700 yards in height, a pleasant breeze has been observed inshore, and fine weather; the air, in ascending, (being condensed by cold, at about half-way up) produced the appearance of fog, or thin light flying clouds; but at the top was a misting rain, and this may frequently be seen in any mountainous country.†

The clouds, in the higher regions of the air, are frequently seen to move in a direction contrary to the wind below. The N.E. Trade Wind has frequently a South-westerly wind above it; and a S.E. wind often prevails beneath one whose direction

* Winds of tornadoes, hurricanes, and squalls, have been thus assigned by Dr. Hare, of Cambridge. The air being a porous elastic fluid, its density is dependent on pressure, as in fluids; and it does not follow that air which may be heated in consequence of its proximity to the earth, will give place to colder air from above. The pressure of the atmosphere at the elevation of one stratum of air may be as much rarer by the dilatation of its constituent particles, as denser by the cold consequent to its removal from the sun; or it may be as much denser by the increase of pressure arising from its proximity to the earth, as rarer by being warmer. Hence, when unequal heat, differing strata of air, do not always disturb each other. Yet, at a certain time, the rarefaction in the lower stratum, by greater heat, may so far exceed that in the upper stratum, that a rent or rupture of pressure, that this stratum may preponderate, and begin to descend. When this motion commences, it must proceed with increasing velocity, for the pressure of the stratum, and, of course, its density and weight, increases as it falls; whilst, the density and weight of the lower must lessen, as it rises; and hence the motion will go on, so much accelerated, as to occasion the furious and suddenly varying currents, which attend tornadoes, hurricanes, and squalls.—*OLTMAN'S JOURNAL*, No. 12.

† Navigator, or East India Directory.

is N.W. It is found, that just without the limits of the Trade Wind, the wind generally blows from the opposite quarter. The counter-current of air, above, is often seen in a fresh Trade Wind.

There are several heights of clouds on the coast of North America; the highest and those which appear of the finest texture, (if I may be allowed the expression) float highest in the atmosphere. Clouds of this description always come from the Westward; just before the appearance of an Easterly storm, they gather in the S.W. and S.S.W., and if a gale (as the sailors call it) in the N.E. and N.N.E., their appearance in the sky indicates a N.E. storm of snow or rain. All great storms which meet with above the latitude of 30°, whether snow or rain, begin to the Westward, and advance gradually to the Eastward, along the coast of North America, in conformity with the general atmospheric current of the region. When a S.W. wind in the higher regions of the atmosphere, is attended with a N.E. or opposite wind below, the latter is commonly accompanied with low flying clouds, which drive before the wind, while the higher clouds go in a contrary direction.

Ship-masters and pilots, on leaving the coast, outward bound, may notice, that as long as these higher clouds do not gather and thicken in the W., or S.W., so long as heavy or long storm of snow or rain will not occur. Any rain or foul weather proceeds from winds which rise from the Eastward, and drives before the wind to the Westward, without a fall of the barometer, is not attended with violent wind.

The space from latitude 25° to 28° or 29°, between the Variable and Trade Winds, is remarkable for a continual change of winds, with sudden gusts and calms, thunder, and lightning. This space has been called the Horse Latitudes, because it has often been found necessary here to throw overboard the horses which were transported to the West Indies, &c. To the Northward of these latitudes, upon the American coast, and more than one-third over the Atlantic, Westerly winds prevail nearly 9 months in the year.

In the latitude above the Trade Winds, the wind from the W.S. Westward being replete with moisture, from the great exhalation between the tropics, as it approaches the cold and higher latitudes, becomes condensed into showers of hail, rain, or snow.

There is often an interval of calm between the Trade Winds and the opposite winds in high latitudes. This is not, however, always the case; for if the Trade Wind, at its borders be much to the Eastward, it frequently changes gradually round to an interval of calm. There is generally also a calm in a certain space between two prevailing winds blowing in opposite directions, as between the Trade Wind and the Westerly wind on the African coast. In the limits of the Trade Wind, a calm is generally the prelude to a storm, and it ought always to be considered as a prognostic thereof, though a storm often appears without this warning.

When the sun is at its greatest declination, North of the equator, the S.E. wind, particularly between Brazil and Africa, veering towards the course of the sun, changes a quarter or half a point more to the Southward, and the N.E. Trade Wind veers more to the Eastward. The contrary happens, when the sun is near the South tropic; for then the S.E. wind, South of the Line, gets more to the East, and the N. wind, on the Atlantic, veers more to the North.

On the African side of the S. Atlantic, the winds are nearest to the South, on the American side nearest the East. In those seas, Dr. Halley observed, that when the wind was Eastward, the weather was gloomy, dark, and rainy, with hard gales of wind; but when the wind veered to the Southward, the weather generally became serene, with gentle breezes next to a calm.

The Equatorial Limits of the N.E. or Perennial Trade Wind, between the parallels of 18 and 26 degrees West, have been found, upon the comparison of many journals, English and French, to vary considerably, even in the same months of the year. We have shown, by the annexed table, where the N.E. Trade, according to the probable mean, may be expected to cease in the different months; and it will be an answer to the purpose with sufficient precision.

In this table the columns of extremes show the uncertain termination of the Trade Winds, as experienced by Differ. 1. Ships. The annexed columns show the probable mean; and the last column shews the mean breadth of the interval between the N.E. and S.E. winds.

Thus the table shows that, in the month of June, the N.E. Trade has been found sometimes to terminate in the parallel of 10°, and sometimes in that of 3° N. The probable mean of its limit is about 5° N.; that the S.E. Trade, at the same time, has been found to cease sometimes at only half a degree North of the line, and sometimes at 4 degrees; so that the probable mean of its limit is, therefore, two degrees North of a quarter; and that the interval between the probable means of the N.E. and S.E. Trade Winds is equal to 1 1/2 degrees; and so on the rest.

the space of variable winds between the trades, exhibited in the last column, it has been found that Southerly winds prevail more than any other; more particularly when the sun has great Northern declination. Homeward-bound East India ships are therefore enabled, at this season, to cross the space more quickly than those outward-bound, which they do, in some degree, at all other times. Yet calms and variable winds are experienced in every month in the year within this space; but the former, and more generally in the vicinity of the North-east Trade, seldom continue long. The calms are frequently succeeded by sudden squalls, against which every precaution should be taken, as many ships have lost their topmasts, and have been otherwise damaged by them. Whirlwinds have sometimes accompanied these squalls.

On the Eastern coast of North America, and among its islands, the course of the North-east or Trade wind is uninterrupted, though subject to some modifications of direction and force. At a short distance from the land the sea-breeze calms at night, and is succeeded by the land-breeze. This variation happens every day, unless a strong wind prevails from the Northward or Southward: the first of these being experienced from October to May, and the second in July, August, and September.

On the Southward of Newfoundland shifts of wind are very common, and it frequently happens that, after blowing a gale upon one point of the compass, the wind suddenly shifts to the opposite point, and blows equally strong. It has been known while one vessel has been lying to, in a heavy gale of wind, another, not more than a league distant, has, at the very same time, been in another gale equally heavy, blowing to, with the wind in quite an opposite direction. This fact shows the whirlwind character of these gales, the opposite winds being on opposite sides of the circle of the gale.

In the year 1782, at the time the *Ville de Paris*, *Centaur*, *Ramillies*, and several other ships of war, either foundered or were rendered unserviceable, on or near the banks of Newfoundland, with a whole fleet of West Indian men, excepting five or six: they were all lying to, when a hurricane from E. S. E., the wind shifted in an instant to N. W., and blew with a heavy, and every ship lying to, under a square course, foundered.

The disaster was owing to their being hove to on the wrong tack. We insert the following as it has met the approval of some of our most experienced ship-masters.

HEAVING TO.—The recent disasters which have occurred to American ships, such as the *Dorchester*, *Medora*, *Ambassador*, and many others, have caused some inquiry, and it has been suggested by experienced men, borne out by the facts, that the disaster may be traced to the "heaving of ship to" on the wrong tack; that is, that the ships stand to the Westward from Europe, instead of "heaving to" with their port to the Southward, in a South-west gale, as is too often the case, should "heave to" on the port tack.

It is well known that our heavy Westerly gales, in the winter season, often begin at South or South-west, and as they increase in intensity, haul round gradually, but come suddenly, in a squall, to the North-west. Take, then, the case of a ship standing to the Westward, the wind commencing at the South or South-west, the ship on the port tack; the master, anxious to get to the Westward, carries his canvass as long as he can, and continues on that tack until he has his ship under a close-reefed main-tack, then staysail or trysail; in fact, "heave to" on the port tack, the sea making good to the South-west, the wind keeps hauling to the Westward, and the ship, with a mild sea, lies in the trough of the sea; the sea then having the command breaking; with its full force on the broadside, there is no canvass at this

time set that she can ware under with safety—the ship is then disabled, and some times founders—the fact is, over anxiety to get to the Westward has kept the ship too long upon this tack.

Now, what is the best course, as a general rule, to be adopted? We think that the rule should be laid down, that when it is blowing so hard as to make it necessary to furl the foresail, or head sails, previous to doing so, the ship should be wore round, and “hove to” on the starboard tack; and as the wind hauls, she comes up heading the sea more and more, until it is on the bow, and of course in the best position to avoid the shock.

Again, often the wind shifts so suddenly in a S.W. gale, that a ship is taken aboard by being on the port tack, which is fearful at any time, and particularly so at such a time. Those who have experienced it on a winter's passage from Europe, with a crew wore down with hard weather, and on a dark night, can only imagine what a scene it is.

This cannot occur on being “hove to” on the starboard tack.

The winds within the gulf are not so liable to sudden shifts as on the outside, or the Eastward of Breton Island. The weather to the Southward of Magdalen Island, between them and Prince Edward Island, is generally much clearer than on the North.

On the Winds, as influencing the tracks sailed by Bermuda vessels; and on the advantages which may be derived from sailing on Curved Courses when meeting with progressive Revolving Winds.

In high latitudes the prevailing atmospheric currents, when undisturbed, are Westerly, particularly in the winter season. As storms and gales revolve by a fixed line, and we are able by observation to distinguish revolving gales from steady-blowing winds, voyages may be shortened by taking advantage of them.

The indications of a Progressive Revolving Gale are, a descending barometer with regularly veering wind, or with the wind changing suddenly to the opposite point.

In the Northern hemisphere storms revolve from right to left.

In the Southern hemisphere storms revolve from left to right.

The indications of a steady-blowing wind, which will not revolve, but blow in straight line direction, is a high barometer remaining stationary. When the steady wind blows from either pole, according to the side of the equator, the atmosphere will be both dry and cool. An increase of warmth and atmospheric moisture are indications of the approach of a Progressive Revolving Wind.

Sailing from Bermuda to New York.—The first half of a revolving gale is a fair wind from Bermuda to New York, because in it the wind blows from the East; but the second half is a fair wind from New York to Bermuda. During the winter season, most of the gales which pass along the coast of North America are Revolving Gales. Vessels from Bermuda bound to New York, should put to sea when the North-west wind, which is the conclusion of a passing gale, is becoming moderate, and the barometer is rising to its usual level. The probability is, more particularly in the winter season, that, after a short calm, the next succeeding wind will be Easterly, the first part of a fresh Revolving Wind coming up from the South-west quarter.

A ship at Bermuda bound to New York or the Chesapeake, might sail whilst the wind is still West, and blowing hard, provided the barometer indicate that this West wind is owing to a revolving gale, which will veer to the Northward. But as the usual track which gales follow in this hemisphere is Northerly and North-easterly, a ship should be steered to the Southward. As the wind at West veers towards North-west and North, the vessel would come up, and at last make a course to the Westward, ready to take advantage of the East wind, at the setting in of the next revolving gale.

Sailing from New York to Bermuda.—A vessel at New York and bound to Bermuda, at the time when a revolving wind is passing along the North American coast, should not wait in port for the Westerly wind, but sail as soon as the first portion of the gale has passed by, and the North-east wind is veering towards North, provided it should not blow too hard. For the North wind will veer to the Westward, and become a fair hour fairer for the voyage to Bermuda.

Sailing between Halifax to Bermuda.—A great number of gales pass along the coast of North America, following nearly singular tracks, and in the winter season make the voyages between Bermuda and Halifax very boisterous. These gales, by revolving extended whirlwinds, give a Northerly wind along the shore of the American continent, and a Southerly wind on the whilwind's opposite side far out in the Atlantic. Sailing from Halifax to Bermuda, it is desirable for this reason to keep to the Westward, as affording a better chance of having a wind blowing at North, instead of on the South; as well as to use the current of the Gulf Stream sets vessels to the Westward.

From Barbadoes to Bermuda.—When vessels coming from Barbadoes or its neighboring West India Islands, sail to Bermuda on a direct course, they sometimes fall to the Eastward of it, and find it very difficult to make Bermuda when Westerly winds

prevail. They should therefore sail to the West longitude, before they begin to sail from England to Bermuda.

On the Trade Winds.—The Trade Winds, blowing from the East and West, to continue on the port tack, the wind should continue to veer North, a ship upon the starboard tack, the Westward of her direct course, the object of which would be to catch the wind and currents. There are two sets of the winter season originate from the Trade Winds, even further South than the above.

The winter season, is an important passage from England to Bermuda, composed of many European vessels, which must be determined by the changing advantage of the changes in the wind.

The high latitudes in both hemispheres, the Government House, Bermuda, the above, by Colonel Reid, the object of the winds in both hemispheres.

The general Easterly wind of the coasts of the Caribbean Sea, is a diurnal and annual breeze, and which strikes the coast according to the locality and originates from the interior, always blowing in the forenoon, and continuing as that luminary angle, as the sun's altitude decreases, the breeze is at the maximum of its force.

This breeze has perceptibly veer to the East, and continues until the rivings intervene between the latitude, which there is a perfect calm. The annual period of the Trade Winds, which occasion the dry seasons. The first gales with loud thunder are prevalent towards East, but interrupt and obscures the atmosphere.

When the sun is in the tropics, the Trade Wind, which is steady, and NW. winds are sometimes prevalent, they regularly alternate in the change of the seasons.

No change is experienced in the Trade Wind; but in August, September winds; and dreadful hurricanes are prevalent. From these periods of Colombia, (late Terra Florida) of Vera Cruz, to which the Trade Wind, which is steady, and regularly prevails; but in the Greater Antilles, the wind veers to the right. These had been much in getting to the left, would be almost impossible to reach Lucia, &c., there are no gales on the coasts of Guyana, the experienced between the Trade Wind from N. to N.E., and

* Hurricanes have so

They should therefore take advantage of the Trade Wind, to make the 68° of West longitude, before they leave the 25° of latitude.

Sailing from England to Bermuda.—On a ship leaving England for Bermuda, instead of steering a direct course for the destined port, or following the usual practice of seeking for the Trade Winds, it may be found a better course, on the setting in of the Easterly wind to steer West, and if the wind should veer by the South, towards the West, to continue on the port tack, until, by changing, the ship could lie its course. If the wind should continue to veer to North, as it sometimes does even to the Eastward North, a ship upon the starboard tack might be allowed to come up with her head to the Westward of her direct course. On both tacks she would have sailed on curved lines, the object of which would be to carry her to the Westward against the prevailing wind and currents. There is reason for believing that many of the revolving winds of the winter season originate within the tropics; and that ships seeking the steady Trade Winds, even further South than the tropic at that period of the year, will frequently be disappointed. How near to the equator the revolving winds originate, in the winter season, is an important point not yet sufficiently observed. The quickest passage from England to Bermuda, therefore, may, perhaps, be made by sailing on a course composed of many curved lines, which cannot be previously laid down, but which must be determined by the winds met with on the voyage. This principle of sailing advantage of the changes of revolving winds, by sailing on curved lines, is applicable to high latitudes in both hemispheres, when ships are sailing Westerly.

GOREAMENX HORSK, BERMDA, 21st March, 1816. W. R.

The above, by Colonel Reid, then Governor of Bermuda, exhibits the general character of the winds in both hemispheres, in high latitudes.

The general Easterly wind of the tropical regions is felt on the coast of Guyana, and the coasts of the Caribbean and Mexican Seas, but with variations which may be considered diurnal and annual. The diurnal period is that which the sea-breeze ceases, and which strikes the coast usually at an angle of two points, less or more, according to the locality and other circumstances; and then the land-wind, which, blowing from the interior, always blows off shore. The sea-breeze comes on at about 10 o'clock in the forenoon, and continues while the sun is above the horizon, increasing in force as that luminary augments its altitude, and diminishing, in a similar proportion, as the sun's altitude decreases. Thus, when the sun is on the meridian, the sea-breeze is at the maximum of its strength; and at the time the sun reaches the meridian, this breeze has perceptibly ceased. The land-breeze commences before midnight, and continues until the rising of the sun, sometimes longer. A space of some hours intervenes between the land-breezes ceasing and sea-breezes coming on, during which there is a perfect calm.

The annual period of the Trade Wind here is produced by the proximity or distance of the sun, which occasions the only two seasons known in the tropics—the rainy and the dry seasons. The first is when the sun is in the tropic of Cancer, and heavy rains, with loud thunder are prevalent. In this season the wind is generally to the Southward of East, but interrupted by frequent calms, yet it occasionally blows with force and obscures the atmosphere.

When the sun is in the tropic of Capricorn, the dry season commences, and then the Trade Wind, which is steady at N.E., is cool and agreeable. At this season, N. and N.W. winds are sometimes found blowing with much force, and, indeed, in some degree, they regularly alternate with the general wind, as they are more frequent in November and December than in February and March.

In the change of the seasons there is a remarkable difference: for in April and May no change is experienced in the atmosphere, and the weather is, in general, beautifully fine; but in August, September, and October, there are usually calms, or very light winds; and dreadful hurricanes in the 6 months sometimes render the navigation very perilous. From these perils, however, are exempted the Island of Trinidad, the coasts of Colombia, (late Terra Firma,) the Gulfs or Bays of Darien and Honduras, and the Gulf of Vera Cruz, to which the hurricanes do not reach. In the space of sea between the Great Antilles and the coast of Colombia, the general N.E. or Trade Wind regularly prevails; but near the shore the following peculiarities are found:

At the Greater Antilles, the sea breeze constantly prevails by day, and the land-breeze by night. These land breezes are the freshest which are known, and assist much in getting to the Eastward, or in counting to windward, which without them would be almost impossible. At the Lesser Antilles, as Dominica, Martinique, St. Lucia, &c., there are no land breezes.

On the coasts of Guyana there are no land breezes, nor more wind than is generally experienced between the tropics. In January, February, and March, the winds blow from N. to N.E., and the weather is clear. In April, May, and June, the

* Hurricanes have sometimes occurred in these regions.—W. C. R.

winds blow from E. to S.E. In July, August, and September, there are calms, with occasional tornadoes from S. to S.W.; and in October, November, and December, there are occasional rains, while the sky is, in general, obscured by clouds. In the dry season, which is from January to June, the heat is very great; and in the wet season rains and thunders are constant and violent.

On the coasts of Chiama and Caracas, to Cape la Vela, the breeze follows the regular course; but from that cape to Cape San Blas the general wind alters its direction: for it blows from N.E. to N.N.E., excepting in the months of March, April, May, and June, when it comes to E. N.E. and is then so uncommonly strong as to render it necessary for vessels to be to. These gales, which are well known to mariners, extend from about mid-channel to within 2 or 3 leagues of the coast, where they become weak, especially at night. On this coast, about the Gulf of Nicorangua, are West-erly winds, which the pilots of that country call *vendevales* (rainy winds), in the months from July to December; but these winds never pass the parallel of 13° N., nor do they blow constantly, but alternate with the sea-breeze.

Upon the Mosquito Shore, Honduras, and Eastern coast of Yucatan, the general winds or breezes prevail in February, March, April, and May; but during the first two of these months they are occasionally interrupted by Norths. In June, July, and August, the winds here are from the Eastward and Westward of South, with frequent calms; but in September, October, November, December, and January, they are from the Northward and Southward of West, with frequent gales from W.S.W., W.N.W., and North.

On the Northern and Western coasts of Yucatan, between Cape Catoche and Point Piedras, or Dezenfida, and thence to Campeche, there is no other than the N.E. or general wind, interrupted by hard Norths in the season of the rain; and about the end of April, tornadoes commence from N.E. to S.E. These tornadoes generally begin in the afternoon, continue about an hour, and by midnight the serenity of the atmosphere is re-established. The season of the tornadoes continues until September, and in all the time there are sea-breezes upon the coast, which blow from N.N.W. to N.E. It has been remarked that, as the sea-breeze is more fresh, the more fierce is the tornado, especially from June to September. The sea breezes come on at about 11 of the day; and at night the wind gets round to E., E.S.E., or S.E., so that it may be in some degree considered as a land breeze.

On the coast of the Mexican Sea, from Vera Cruz to Tampico, the breeze from E.S.E. and E. prevails in April, May, June, and July; and at night the land breeze comes on from S. to S.W.; but if the land breeze is from the N.W., with rain, the wind on the following day will be from N.N.E., or N.E., particularly in August and September: these winds are denominated in the country, *vientos de cañaza*, *ovenales*, *vales*, (head-winds, or rainy winds); they are not strong, nor do they raise the sea; with them, therefore, a vessel may take anchorage as well as with the general breeze; but they may be getting out, for which the land-breeze is required. The *vientos de cañaza*, or head-winds, reach to about 20 or 30 leagues from the coast, at which distance are found those at E. and E.S.E.

From the middle of September until the month of March, caution is necessary in making Vera Cruz for the Norths are then very heavy. The narrowness of this harbor, the obstruction formed by the shoals at its entrance, and the slender shelter afforded from the Norths render an attempt to make it during one of them extremely dangerous, for it will be impossible to take the anchorage. The following description of the coast here has been written by Don Bernardo de Orta, a Captain in the Spanish navy, who has been a great part of the port, and who surveyed it:

Although in the Gulf of Mexico we cannot see that there is any other constant wind than the general breeze of this region, notwithstanding that, from September to March, the North winds interrupt the general course, and, in some degree, divide the year into two seasons, wet and dry, or of the Breezes and Norths; the first, in which the Breezes are settled, is from March to September; and the second, in which the Norths blow, is from September to March. For greater clearness we shall explain each separately.

The first of the Norths is regularly felt in the month of September; but in this month and the following one, October, the Norths do not blow with much force. Sometimes it happens, that they do not appear, but, in that case, the breeze is interrupted by heavy rains and tornadoes. In November, the Norths are established, but with much weakness, and continue a length of time during December, January, and February. In these months, therefore, begin, they increase fast; and in four or five or a little more, attain their greatest strength, with which they continue blowing for 15 or 20 days after which, though they do not cease for some days, they are made up by these months the Norths are obscure and North westerly, and they come upon frequently, but there is, however, not more than 1 or 6 days between them. In March and April the y are neither so frequent nor last so long, and are clearer; but yet they are

fierce for the first 24 hours of November, in which, as we have said, and the general breeze is interrupted by night.

There are various signs by which the wind steady at South, and streets; seeing clouds from Villa-Rica, with the cloud increase of heat and dew toward; but the most certain sign of the Norths at Vera Cruz, is their eight-fingers; that is, lower than 20 inches, they do not begin to blow the Norths come on; at 11 of the day N.W. to N.E.; the sea with such warnings trust not to. This wind generally moderates the same strength which it has in the evening or at night, it opens that, after dark, or about the Northward and Westward or West, the North will come on at its regular hour; and at the turn of the day, the violence as on the day before.

The Norths, also, sometimes are more certain; for, if the wind covered the day, the Northward and Westward weather is very fresh and light, so that it will last to, in the N.E. to N.N.E. or North. Examples are not wanting, in which times they are most frequent, moderate are called *Chos*. In the wet season, or the season, at the end of March, the wind, are from time to time, the sky sometimes clear, and continue all night, excepting when the rains have begun. After the sun passes the equator, from the 21st of May to the 27th of August, with much mist or haze, from the N.W. to N.E. In the month of July, the tornadoes are fierce, and the heaviest winds are felt in the season of the breeze, at the descent of the sun to 21 inches, and does not fall below 16. Thus, it must be understood in one of the rooms in the months of August, and the Northern winds, they never arise, and for tornadoes. These, though they do not blow Southward and Eastward, from Tampico to Bay of San Blas, in the month of April, the coast is exposed to an hurricane, without intermission for more than 24 or 36 hours, than 10.

fiere for the first 24 hours, and have less North-westing. In the interval before November, in which, as we have said, the Norths are established, the weather is beautiful, and the general breeze blows with great regularity by day; the land breeze as regular by night.

There are various signs by which the coming on of a North may be foreseen: such as the wind steady at South; the moisture on the walls, and of the pavements of the houses and streets; seeing clearly the peak of Orizaba and the mountains of Perote and Villa-Rieja, with the cloud on those of St. Martin, having folds like a white sheet; the increase of heat and dew; and a thick fog or a low sand, flying with velocity to the southward; but the most certain of all is the barometer: for this instrument in the case of the Norths at Vera Cruz, does not vary more, between its highest and lowest, than eight tenths; that is to say, it does not rise higher than $30\frac{3}{8}$ inches, nor fall lower than $29\frac{1}{8}$ inches. The descent of the mercury predicts the Norths; but they do not begin to blow the moment it sinks, when it always does a short time before the Norths come on; at those times lightnings appear on the horizon, especially from N.W. to N.E.; the sea sparkles, cobwebs are seen on the rigging, if by day; and such warnings trust not to the weather, for a North will infallibly come on.

This wind generally moderates at the setting of the sun; that is, it does not retain the same strength which it had from 9 in the morning to 3 in the afternoon, unless it commences in the evening or at night, for then it may increase otherwise. Sometimes it commences that, after dark, or a little before midnight, it is found to be the land wind, blowing from the Northward and Westward; in which case, should it get round to the Southward or West, the North will be at an end, and the general breeze will, to a certainty, come on at its regular hour; but if it does not happen at the rising of the sun, or afterwards, and at the turn of the tide, it will return to blow from the North with the same violence as on the day before, and then it is called a Norte de Marea, or Tide-North.

The Norths, also, sometimes, conclude by taking to the Northward and Eastward, which is more certain; for, if the wind in the evening gets to North-east, although the land breeze covered the day following, but by night the land-breeze has been from the Northward and Westward, the regular breeze will surely cease in the evening, and the weather succeeding and continuing for 4 or 6 days; the latter period being the longest that it will last so, in the season of the Norths; but, if the wind retrograde from N.E. to N.N.E. or N., the weather will be still unsettled.

Examples are not wanting of Norths happening in May, June, July, and August, at which times they are most furious, and are called Norte del Mueso Colorado; the moderate are called Choculateros, but these are rather uncommon.

The wet season, or the season of the breezes, is from March to September; the breezes, at the end of March, and through the whole month of April, as already observed, are from time to time interrupted by Norths, and are from E.S.E. very fresh; the sky sometimes clear, at other times obscure. At times these touch from S., and continue all night, without giving place to the land-breeze, which prevails, in general, every night, excepting when the North wind is on. The land-breeze is freshest when the rains have begun.

After the sun passes the zenith of Vera Cruz, and until he returns to it, that is, from the 15th of May to the 27th of July, the breezes are of the lightest description; almost fresh, with much mist or haze, and slight trade-winds. After that time, the pleasant breezes from the N.W. to N.E. sometimes remain fixed.

From the 27th of July to the middle of October, when the Norths become established, the tornados are fierce, with heavy rains, thunder, and lightning; those which are the heaviest winds are from the N.W., but they are also of the shortest duration. In the season of the breezes, the total variation of the barometer is four-tenths; the greatest ascent of the mercury is to 30 inches nine-fifths one hundredth, and its greatest descent to 29 inches nine-eighths one hundredth. The thermometer in July rises to 87, and does not fall to 57; in December it rises to 80, but never falls below 65. This, it must be understood, was used in the shade, the instrument being in one of the coolest and best ventilated parts in the castle.

In the months of August and September, rarely a year passes without hurricanes from the North and the Northern Antilles; but to Vera Cruz, or any part of the coast, therefore, they never arise; and that is fit being the heavy sea which has arisen from the Antilles. These oceans begin blowing from the Northward and Eastward; although they do not always go round the same way, yet, in general, they next go round southward and Eastward, with thick squally weather and rain.

From Tampico to Bay of St. Thomas, the winds are generally from E. to S., and from the month of April to August; the contrary is experienced in the 2 months, the coast is exposed on account of the hardness of gales from E. and E.S.E., which are without intermission for two or three days before heading to the Northward.

From the 25th to N., there are land breezes at night, which blow from midnight to 4 A.M.

From Bay St. Bernard to the Mississippi there are land-breezes at daylight, and on the day's entering, the winds haul to S.E. and E.S.E., and in the afternoon it generally hauls S.W. In winter the Southerly winds are very tempestuous, and blow for the space of two or three days. The months most to be feared to navigate this sea are August, September, October, and November, in which there are hurricanes, and winds on shore, so heavy that no canvas can stand them; upon the Mississippi, and all its mouths, there are very thick fogs very frequently, especially in February, March, and April, and in June and July.

From the Mississippi to latitude 28° N., in the month of April to July, the reigning winds are generally from N. to E., and from E. to S. in the morning, and in the afternoon they haul S.W. These S.W. winds are tempestuous in August, September, and October, an epoch in which are also experienced heavy Southerly and hurricanes. From November to March the wind blows from the Northward, beginning first from S.E. and S., with heavy rain, when it hauls to S.W. and W., and blows very heavy, till it hauls to N.W. and N., when it clears the weather, and hauls to N.E., and is mild.

From latitude 28° N., to the Southernmost of the Florida Keys, the Trade Wind reigns in the morning, and at mid-day it hauls in from the sea. This happens in summer, and in winter, especially from November to March, the winds blow from S. to W., and raise a very heavy sea.

In the new channel of Bahama, the reigning wind is the Trade, interrupted in winter by Northerly, and in summer by calms. Although the Northern limit of this channel is in 28° 30' N., and consequently within the limits of the Trade, yet it is necessary to keep in mind that in winter, that is, from November to April, you will meet with the variables at or before you arrive to lat. 27°, which variables are from E. to S., and from S. to W., and in summer you have calms and light airs from S. to W., and from W. to N.

ON THE EASTERN COAST OF BRAZIL, between the months of September and March, the winds generally prevail from N. by E. to N.E. by E. Between March and September the prevailing winds are from E. by N. to E.S.E.

The former of these are generally termed the Northerly Monsoon, and the latter the Southerly one; although there appears, in fact, to be no direct and opposite change in them on or about the equinoxes, as is generally the case with the winds so called.

These winds are simply a continuation of the S.E. Trade, which changes its direction as above described, and is influenced by the land on its approach thereto. When the sun is to the Northward, no particular difference is observed in the S.E. Trade, but it may be carried within sight of the coast, with scarcely any deviation; nevertheless, about both equinoxes, but more especially when the sun is advancing to the Northward, calms and very light winds, with apparently no settled quarter, will prevail near the coast; and this may be said to be more particularly the case on that part of it between the Abrolhos and Cape Frio. As the sun advances to the Southward, the Trade Wind will generally come round to the North-eastward, and will have its retrograde movement with the return of the sun to the equinox. At this latter season, ships, on approaching the coast, will begin to observe this Northerly inclination of the South-east Trade, which within 4 or 5 degrees of it, and which they will find gradually to increase as they come to the Westward.

Within a few miles of the coast, and in the different roadsteads and harbors, the wind generally flows directly upon it; and in the deep harbors, and upon the shore, this is generally superseded by a land-breeze, which sometimes lasts a greater part of the night. About Rio Janeiro this land-breeze sometimes extends as far seaward as Round Island, while at Pernambuco it rarely reaches the roadstead.

The preceding remarks are those of Hewitt, Pimentel, and, after him, M. D'Apres, has said that the wind of the Northerly Monsoons, between September and March, are from N.E. and E.N.E., or less North-easterly than as above; and that those of the Southerly Monsoon are from E.S.E. to S.S.E., or more Southerly. It may, therefore, be admitted, that they do sometimes prevail more from the South, and that those near the North but seldom occur.

Mr. Lindley, in his narrative of a voyage to Brazil, having resided a considerable time on shore, at Bahia, &c., has described the inshore winds as follows: "From Cape St. Augustina, (i.e. southward) the wind blows, nine months in the year, chiefly North-easterly in the morning, and North-westerly during the evening and night. This continues gradually changing along the coast, till at Rio Janeiro and the Rio Plata, it becomes a regular land-breeze from evening to morning, and throughout the day the reverse. During the three stormy months, that is, from the latter end of February to that of May, the wind is generally Southerly, blowing very fresh and squally, at times, from the South-west.

Lieut. Hewitt has observed, that the winds off Cape Frio are seldom found to the Southward of East; and in the Northerly Monsoon they are generally to the Northward of North-east. Heavy and violent squalls are occasionally met with in rounding the cape, to obviate the effects of which every precaution is required.

The same officer adds, that at 10 o'clock in the morning, the wind from ten to one o'clock in the afternoon of seven and eleven. At 11 o'clock the N.W., named by the Portuguese, lasting from 4 to 6 hours. The late Captain John McBride's observations on the winds and weather at the Falkland Islands, 1767, which was published in 1768, contains the following general remarks: "From going over the following quarter, it will be found to prevail in the Westward, with a cool air. In the North-east quarter, generally hazy weather begins to rain; the wind then gets to the S.W. by S., and the S.W. wind continues for about the N.W. quarter; this continues in the manner above mentioned, these changes but seldom; the S.W. quarter, but rather inclines to rain and snow. There is not a squall in summer. In summer, as I have observed, a heavy squall will blow in such heavy squalls before a cutter can row to the shore of but one cable and half of very air. The most lasting gales are generally cold."

Observations on the W

"The Trade Winds, in the Westward, according to circumstances, which are to be observed in the Windward Islands, that is, from the Northward to the Southward, in the month of August. In the more Northern parts, &c., the wind, in the evening, is from North, or N.N.E., blows very fresh over which it travels, becomes very fresh in the English Harbor, in the above mentioned season of the year, the sickness and lassitude of the mornings, which is experienced by all the men who visited these islands, is owing to the change of 70 or 80 degrees, as well as in the energy, or force, of the winds, in the change of seasons (from wet to dry), and in May the atmosphere is very fresh. In August, September, and October, hurricanes blow in these months. In speaking of hurricanes, the late Captain Pimentel, in his narrative of his voyage to Trinidad, the main-land, and the islands of Vera Cruz, are almost entirely omitted; however, mention is made of the 1st August, 1810, in the greater Antilles, such a squall as the sea-breeze blows by day, such as at Martineo, Dominica, &c.; and certainly, in all the islands, the land-wind.

"From the coast of Cumana to the coast of E.S.E. to E.N.E., the land-breeze, in La Guayra Road, in the month of February, occasionally reached the sea. On the evening of the 20th of February, the wind from Cape la Vela, and blew for some days above facts, because in the Dominica coast.

"The coast between Cape la Vela and the coast of wind than any other

The same officer adds, that at Rio de Janeiro the sea-breeze varies in its commencement from ten to one o'clock in the forenoon, and ceases in the evening between the hours of seven and eleven. At the full and change of the moon, violent squalls from the N.W., named by the Portuguese "Tere Altos," immediately supersede the sea-breeze, lasting from 4 to 6 hours.

The late Captain John Melbride, of the Royal Navy, kept a regular journal of the winds and weather at the Falkland Islands, from the 1st of February, 1766, to 10th January, 1767, which was published in 1775, by Mr. Dalrymple. The journal concludes with the following general remarks:

"From going over the following journal of the winds, for the space of one year, they were found to prevail in the Western quarter, and generally blow a close-reefed top-gale, with a cool air. In November the winds begin to be more frequent in the N. quarter, generally hazy weather, and for the most part blow about 16 or 20 hours, when it begins to rain: the wind then regularly shifts into the Westward, and so on, it gets to the S.W. by S. and S.S.W., when it blows fresh, and clears up. This S.W. wind continues for about 16 hours, then dies away, when the wind shifts again to the N.W. quarter; this continues during December, January, and February, and changes in the manner above mentioned every 3 or 4 days. As March comes on, you see these changes but seldom; and as the winter advances, they are seldom in the W. quarter, but rather incline to the E.N.E., which is generally accompanied with frost and snow. There is not the least proportion in the gales between winter and summer. In summer, as I have before observed, as the winds are in the Westward, they blow in such heavy squalls off the tops of the mountains, that it is sometimes necessary before a cutter can row to the shore, although the water is smooth, and the distance of but one cable and half off. In the winter, the winds are pent up by a keen frosty air. The most lasting gales are those from S. by E. to S. by W., and are extremely cold."

Observations on the Winds, by Captain Frederick Chamier, R.N.

"The Trade Winds, in the West Indies, generally blow from N.E. to S.E., varying according to circumstances, which will be hereafter expressed. About Barbadoes and the Windward Islands, that is, from Tobago to Barbuda, the wind will be found to veer more to the Northward in the early part of the year, than in the months of June, July, and August. In the more Northern islands, such as Dominica, Montserrat, Antigua, &c., the wind, in the evenings of January, February, and March, veers round to the North, or N.N.E., blows very fresh in squalls; and from the extensive space of ocean over which it travels, becomes cool and very refreshing. The thermometer, even in English Harbor, in the above months, at 8 o'clock, p. m., I never saw above 76°. In the latter season of the year, the sickness of the hot months is no longer experienced; the general lassitude of the mornings and noons of July and August seems forgotten; and a man who visited these islands during the first three months of the year, would be surprised that the change of 70 or 80 days could make such an amazing difference in the health, as well as in the energy, of the inhabitants of the Windward Islands. In the latter part of seasons (from wet to dry) a great difference is experienced in the winds. In June and May the atmosphere is, in general, clear, and fine weather prevails; but in August, September, and October, calms, or very high winds, are not uncommon. Strong hurricanes blow in these months.

"In speaking of hurricanes, they are well known to have been very rarely experienced in Trinidad. The main-land of Colombia, the Gulfs of Darien and Honduras, and the coast of Vera Cruz, are almost exempt from this scourge. In the Derrotero de las Indias, however, mention is made of a hurricane having been experienced on the coast of the 1st August, 1810.

"In the greater Antilles, such as Jamaica, Cuba, St. Domingo, (or Hayti,) and Porto Rico, the sea-breeze blows by day, and the land-wind by night; but in the lesser Antilles, such as Martinico, Dominica, St. Lucia, Antigua, &c., land-winds are very uncommon; and certainly, in all my cruising in these seas, about these islands, I never experienced the land-wind.

"From the coast of Cumana to Punta Aguja, the common Trade Wind constantly blows at E.S.E. to E.N.E., the land-wind being uncommon, but still not unknown. At Puerto Rico, in La Guayra Road, in February, 1827, a very light cool land-wind from the N.W. occasionally reached the ship, but I doubt its ever extending more than 5 miles from the shore. On the evening of the 20th October, 1816, a heavy squall came from the S.S.W. to Cape la Vela, and blew for some time with violence. I have merely mentioned the above facts, because in the Derrotero it is asserted that land-winds are rarely known on this coast.

"The coast between Cape la Vela and Santa Martha seems more accustomed to changes of wind than any other part of the West Indies. Although the remarks of

some celebrated Spanish navigators would lead us to believe that the winds blow fiercely from the E.N.E. that ships are obliged to lie to; yet I have in the month of August, by keeping close inshore between Punta Agujá and Cape la Yeta, had the wind at West for two or three days together; and until we had passed Rio de la Hacha, we opened Cape la Vela, we neither had Easterly winds nor Westerly currents.

"In that part of the coast of Yucatan, between Cape Catoche and Punta Piedras, Deconocida, and that coast which trends to the Southward to Canpeche, the Trade Winds have generally been at E.N.E. In the evening towards September, the wind occasionally veers to the E.S.E., and this has been called a 'land-wind' by many authors.

"At all seasons of the year I have experienced land-winds on the coast of Cuba that is, from Cape Corrientes to St. Jago de Cuba. If the sea-breeze, which in Cuba as well as Jamaica and St. Domingo, (or Hayti,) generally begins about 9 o'clock in the morning, and freshens until noon, should in the evening about sunset dwindle to nearly a calm, you may be certain of a light air off the land; a mark to judge by, and which I never knew to fail, was the clouds hanging heavily over the Blue Mountains of Jamaica, or Copper Hills of Cuba.

"The winds operate very little upon the thermometer. From May to October, in Jamaica, at day-dawn, 82° will be the average; it will be 88° at noon, and again, in the evening. To find the thermometer at 78° during the night, even in a place where the wind circulates freely, cooled also by the dew, is a luxury so rarely likely to occur, that in looking over my private journal for two years, I cannot discover one instance of it in the above months; yet, still, the land-wind, to those who have been long resident in the country, is a luxury most eagerly expected, and most welcomingly received. It is so different a kind from the sea-breeze, that respiration becomes easy; whereas, with the thermometer at 90° at Port Royal, and the sea-breeze blowing nearly gale, I have found inhaling the hot wind very oppressive and relaxing.

"Between Jamaica and Marañybo, and in the space between the latter and St. Domingo, I have always observed, that should the Trade Wind at daylight be at E.N.E. at noon it will generally be about E. by S., if the day is clear. The knowledge of this gives a great advantage in a windward beat; and by this means, watching the variation of the wind, you will be able to head the current for some hours—an advantage which every one must perceive."

U. S. S. MISSISSIPPI, at Sea, Dec. 31, 1816.

SIR—In compliance with your request, I have the honor to make the following remarks (the results of observations) on the manner in which the barometer is affected by the changes of weather in the Gulf of Mexico, and the indications it gives of such changes. I have kept a memorandum of the barometer since this ship left Boston, August, 1815. I noted the height of the barometer at 8 A.M., 12 M., 4 P.M., and 8 P.M., and was also observant of the changes of weather that took place.

The general range of the barometer, for fair and pleasant weather, is from 30 $\frac{1}{10}$ to 30 $\frac{3}{10}$ inches; although I have often seen extremely unpleasant weather (mist, or what may be termed a double-reefed topsail breeze) when the barometer was at this range, particularly when on the coast of Yucatan; and I have, at such times, observed that the wind would be from the North and Northward and Eastward, whilst on the Western coast, and at Vera Cruz, the wind was from the Northward and Westward, but previous to this, the barometer had fallen to 30, or even below 30 inches.

It is said that these are unfailing indications of the approach of what is called a "Norther"—those severe gales that prevail in the Gulf from the month of September to April. These indications are, the clearness of the atmosphere, known by the high lands being visible, particularly Mount Orizaba; heavy dews, and the falling of the barometer; but I have often noted the appearance of these indications when the Norther did not succeed. I have also known Northers to take place when not preceded by the indications, particularly when Mount Orizaba has not been visible for many days; but I have never known a Norther to happen without being preceded by a fall of the barometer—and its intensity may be determined by the degree of the change, and its rapidity. If the fall of the barometer be from $\frac{1}{10}$ to $\frac{3}{10}$, in three or four hours, you may expect a change of weather; and if it be during the season for Northers, you may expect one in a few hours; if in the tornado months, you may expect one of them, or a sudden violent squall.

I have also noticed that a change is indicated rather by the *rapidity* than by the *extent* of the fall of the mercury in the barometer. The barometer falls before a Norther, and then rises as it comes on, and continues rising as the intensity of the gale increases. When the barometer again commences falling, it is an indication that the gale is at its greatest height, and that it is about abating.

I have also noticed that the barometer falls when the wind is Southerly, particularly when from the Southward and Eastward, and that it rises when the winds are from the Northward.

I have already noticed that the winds seldom blow from the Northward and Westward

the coast of Yucatan. During the month of Tampico, make for the Cape, and the N.E. wind prevails.

It would suggest the supposition that the winds, which prevent the Northward, under these Banks a safe retreat.

I am, Sir, with sentiments

Yours, M. C. PERRY, U. S. S. MISSISSIPPI.

CURSORY REMARKS ON TOPICS

BY A

The science of Meteorology is a natural phenomena of which it is the duty of every member of the human race to be conversant with, as it is exhibited in the various exhibitions, or of geographical and varied knowledge which is the subject of the preceding pages of the *Annals*. It is a science of observations on the wind, and on different portions of the atmosphere, and a cursory view of the general and cursory view of the phenomena which occur in

General

The transparent aerial fluid which forms the atmosphere, forms a comparatively small quantity of the earth is greatly extended and tenuous state is supported by means of the barometer. By means of this instrument it is within 34 miles of the surface of the earth. The lower surface of the atmosphere is a compression of the air at sea-level, would reduce its extent of comparison the height of the atmosphere in the proportion of only 1 to 34. These several facts are too important to be overlooked in the phenomena of the atmosphere. The height or thickness of the atmosphere, or the extent of its surface, this is only equal to one five-thousandth part of the radius of the earth. It may hence perceive the inappreciable movements which occur in the atmosphere, and its application in explanation of the various instruments of modern invention, as testing the condition of the atmosphere, every navigator. By the first of these instruments, the aneroid barometer, at any distance from the other, the temperature is obtained with equal precision. Among the most striking peculiarities of the atmosphere, the most striking peculiarities, the movements of progressive changes appear to prevail throughout the atmosphere, and the operation of some of these changes appear to have been satisfactorily explained.

the coast of Yucatan. During the Northers, vessels bound North, and those at an anchor off Tampico, make for the Campeche Banks, where the Northers are not felt, but a moderate N.E. wind prevails.

It would suggest the supposition, that these violent Northers are met by the N.E. winds, which prevent the Northers from blowing home on the Campeche Banks, and render these Banks a safe retreat for vessels in cases of violent Northers.

I am, Sir, with sentiments of respect,
your obedient servant,
M. H. BEECHER, *Prof. Math.*

Comd. M. C. PERRY, U. S. S. *Mississippi.*

CURSORY REMARKS AND SUGGESTIONS ON VARIOUS TOPICS IN METEOROLOGY.

BY AN AMATEUR OBSERVER.

The science of Meteorology is not only interesting to the philosophic observer, but a natural phenomena of which it takes cognizance are such as daily affect the interest and comfort of every member of the human family. But to no class of persons are these phenomena, as exhibited in various parts of the world, of so much practical importance as to the members of the nautical profession. A competent knowledge of these exhibitions, or of geographical meteorology, is therefore an important element of that varied knowledge which is acquired by the skillful navigator.

The preceding pages of the American Coast Pilot, will be found a valuable collection of observations on the winds which have been found to prevail in the Atlantic Ocean, and on different portions of the American coast. We now proceed to exhibit a general and cursory view of the atmosphere and winds, and of various atmospheric phenomena which occur in these regions.

General View of the Atmosphere.

The transparent aerial fluid which surrounds our globe, and which we denominate the *atmosphere*, forms a comparatively thin stratum or envelope, which in the immediacy of the earth is greatly compressed by its own weight, and which in its most extended and tenuous state is supposed to extend itself to the height of only 45 or 50 miles from the earth's surface. Its superincumbent pressure or weight, is ascertained by means of the barometer, and is equal to a column of mercury about 30 inches high. By means of this instrument we learn that one-half its weight or actual density is within 3½ miles of the surface of the ocean; and it is within this limit that all the visible or important phenomena of the atmosphere are apparently developed. The lower surface of the atmosphere is equal to about 200,000,000 square miles; and a compression of the whole mass to the common density which it exhibits at sea-level, would reduce its entire height to about 5 miles, it follows that by this standard of comparison the height or thickness of the atmosphere is to its superficial extent in the proportion of only 1 to 40,000,000.

These several facts are too important to be lost sight of in our general reasonings on the phenomena of the atmosphere; and the more so, as we are prone to give too great an altitude to our conceptions on these subjects. If we even consider the proper height or thickness of the atmosphere as equal to 50 miles, still, as compared with its surface, this is only equal to one five-hundredth of the proportion which the thickness of a common sheet of paper, of the foolscap size, bears to its surface dimensions, and if we view the atmosphere either as condensed to the mean of the surface pressure, or in relation to the actual limit of all its tangible phenomena, it will only be equal to one five-thousandth part of the proportional thickness above mentioned. We may hence perceive the inapplicability of analogical reasonings that are founded on the movements which occur in a chimney, or in an inclosed apartment, as attempted to be applied in explanation of the general movements of the atmosphere.

Two instruments of modern invention, the *barometer* and the *thermometer*, are truly invaluable as testing the condition of the atmosphere, and their use should be familiar to every navigator. By the first, as we have seen, the amount or weight of the superincumbent atmosphere, at any place, may always be accurately known, and by the motions of the other, the temperature of the air, as well as of the ocean, may be ascertained with equal precision.

Among the most striking peculiarities of the atmosphere, are its rapid and almost constant movements of progression or circulation, which, with some unimportant exceptions, appear to prevail throughout the globe. These movements, evidently the result of operation of some powerful impulse, which, to the writer at least, does not appear to have been satisfactorily explained. It is estimated from the average

rate of sailing of ships during long voyages, through different seas, and from other data, that the average velocity of the wind near the surface of the ocean is equal to 18 miles an hour throughout the year, and in the common region of the clouds the velocity must be much greater.

Temperature of Elevation.

Elevation above the level of the sea, or the general level of a country, causes a regular variation in temperature. The first 300 feet usually causes a difference of about one degree of Fahrenheit's thermometer. After ascending 300 feet, it is estimated that the thermometer falls a degree in 295 feet, then at 277, 252, 223, and 192 feet; but 300 feet to a degree is a common rule. On these principles the limit of perpetual frost has been calculated. It is made a little more than 15,000 feet at the equator, and from that to 13,000 between the tropics, and from 9,000 to 1,000 feet between latitudes 10° and 50°.

It has been found, however, that the above rule is subject to great variations, owing probably to the course, temperature, and superposition of the atmospheric currents which prevail in different regions at different altitudes. Colder currents are often found resting upon, or interposed between, those of a higher temperature, and *vice versa*. On the Himalaya mountains, in Asia, between the latitudes of 28° and 34° North, the region of vegetation has been found to extend several thousand feet above the supposed line of congelation in those latitudes. It is also remarkable, that the line of perpetual snow is found at a much greater altitude on the Northern side of these mountains than on the Southern side in a lower latitude. From this it may be inferred that the temperature in high regions, as well as in lower situations, is greatly affected by the geographical course and physical condition of the currents of atmosphere which prevail in these regions.

Stratification and Elevation of the Currents of the Atmosphere.

It is obvious, from the courses of the clouds and other light bodies which sometimes float in the atmosphere, that the movements of the latter are mainly horizontal, or parallel to the earth's surface. Notwithstanding this, the common theory of winds supposes a constant rising of the atmosphere in the equatorial regions, connected with a flow in the higher atmosphere towards the polar regions, and a counter flow at the surface towards the equator, to supply the ascending current. This ascending movement, however, has never yet been discovered, and it is easy to perceive that if it existed in the manner supposed, its magnitude and velocity must be altogether too great to have eluded observation.

It is apparent, however, that different currents often prevail at different altitudes, superimposed one upon another, and moving at the same time in different directions. These currents are often of different temperatures and hygrometrical conditions, and are found moving with different degrees of velocity. It is by the influence of these currents that volcanic ashes, and other light substances, which are elevated by means of whirlwinds to the higher regions of the atmosphere, are conveyed to great distances, and in directions which are often contrary to the prevailing wind at the surface. On the eruption in St. Vincent, in 1812, ashes were thus deposited at Barbadoes, which is 60 or 70 miles to the windward, and also on the decks of vessels still further Eastward, while the Trade Wind was blowing in its usual direction. On the great eruption of the volcano of Cosiguina, on the shores of the Pacific, in Guatemala, in January, 1835, the volcanic ashes fell upon the Island of Jamaica, at the distance of 800 miles in a direct line from the volcano. Facts like these ought to put at rest the common theory of the Trade Winds, according to which, these ashes would sooner have fallen upon the Northern shores of the Gulf of Mexico, or the peninsula of Florida. On the same occasion the volcanic ashes were also carried Westward in the direction contrary to the Trade Wind on that coast, and fell upon H. M. ship Conway in the Pacific, in lat. 7° N., long. 105° W., more than 1,200 miles distant from the volcano, in the direction which is nearly opposite from Jamaica. These phenomena were doubtless the effect of two different currents prevailing at different elevations; but we shall seek, in vain, in these developments, for proof of the commonly received but imaginary system of the Trade Winds.

The occasional interposition of a warmer current of atmosphere between the lower current and the higher regions has been proved by the observations of aeronauts. In countries similar to like the United States, where the surface is often occupied in winter, for long periods, by an intensely cold stratum of air from the interior elevation, the warmer currents from lower latitudes appear to find their way at a superior elevation, and their presence in this position is often demonstrated by the phenomena which they induce.

Clouds, Fogs, and Rain.

The atmosphere is always pervaded by water in the form of transparent or invisible vapor, and the process of evaporation is continually carried on, except in cases where the thermometer is below what is called the dew point, or when the vapor is being condensed in the form of clouds, fogs, or rain. "Clouds and fogs are the same thing, being an assemblage of small vesicles of water floating in the atmosphere. At a distance in the atmosphere we see the whole as a cloud; but when the vapor sinks to the earth, or does not rise, and we are immersed in it, we call it a fog. Dew fogs, which hang over the earth, are *stratus* clouds; and fogs which involve elevated objects, are *cumulous* clouds." It is to circumstances of distribution, light, shade, distance, and perspective that the great variety in the appearance of the clouds is owing; and on this variety of appearance the following classification has been founded, by which the clouds have been considered as pertaining to seven classes:

1. Like a lock of hair, or a feather, called *cirrus*.
 2. A cloud in conical or rounded heaps, called *cumulus*.
 3. A horizontal sheet, called *stratus*.
 4. A system of small, fleecy, or rounded clouds, called *cirro-cumulus*.
 5. The wavy, or undulating stratus, called *cirro-stratus*.
 6. The cumulus and cirro-stratus mixed, called *cumulo-stratus*.
 7. A cumulus spreading out in cirrus, and raining beneath, called *nimbus*.
- The *cirrus* is usually the most elevated—sometimes as a gauze veil, or parallel to the horizon. Its height is apparently from one to four miles. It is the condensation of aqueous vapor upon the surface of a condensing body or substance. Clouds and fogs are watery particles condensed from aqueous vapor while rising in the atmosphere, where they continue to float till precipitated, or again dissolved. If by the concentration of these particles, or by any additional condensation, their weight be increased beyond that which the extent of their surface can sustain, they then descend in the form of rain; and as the condensation ordinarily increases, the drops increase in magnitude, it is common to have more rain fall on the surface of the ground than on an equal space upon the top of a house or church. Clouds, fogs, and rain are, therefore, essentially the same, the latter being the continuation or extension of the same process which produced the former.
- On account of the evaporating qualities of the atmosphere in the higher regions, as well as the intensity of cold which there uniformly prevails, distinct clouds are seldom met with at a greater elevation than the summits of the highest mountains, which are not more than five miles. At an intermediate region, however, the clouds are often at a temperature above freezing, while the air at the surface is much below the freezing point, and the earth covered with snow. This condition of the clouds seems not frequently evident, by their appearance to the eye of an observer. Snowy or frozen clouds are usually dim and undefined in their aspect or appearance; and a fall of snow is not unaptly be termed the fall of a frozen cloud.

Of Hail.

Hail of a small size, as it falls in wintry storms, appears as frozen rain-drops. From the recurrence of this phenomenon in a freezing state of weather, we find evidence of a stratum of air in the region of clouds is at a temperature above the freezing point, or warmer than that which is found at the surface at the same time. A heavy fall of snow affords, perhaps, the same indication.

Summer hail of large size, which is deposited in a definite bath or vein, or in a local, or limited extent, is usually accompanied by heavy thunder and vivid or continued lightning, or a heavy rumbling sound or rapid concussions, high winds, &c., and is supposed to be the production of a vortex or whirlwind in the atmosphere, which is condensed at its upper extremity with an overlaying stratum of unusually cold air. A portion of this cold stratum probably descends on the exterior of the vortex, and reaching the earth's surface, is pressed into the vortex, and there entwined or laminated with a layer of warm and humid air of the surface, which is drawn in at the same time. This condensation, as is known, thus commences at the lower extremity of the vortex, and proceeds upward, and the condensed drops, alternately in a freezing and unfreezing layer of air, are carried upward by the powerful whirling and ascending action of the vortex, till, with the successive coatings of condensation received, they are finally pressed into the cold stratum at the upward extremity of the vortex, owing to the great temperature of which, they are prepared to receive a renewed accession during their fall to the earth; or, perhaps, by their accumulated weight, they are sometimes thrown through the sides of the vortex before reaching its higher extremity. By this gyratory and elevating action, some of the hailstones are thrown against each

other and broken; and each successive layer of congelation may be often seen in the fractured sections of the hail. In all vorticular condensations of this character, where the cold is not sufficiently intense to produce hail, drops of rain are produced of a much greater size than are ever found in a common and direct fall of rain.

Hail-storms of this character are less frequent in the tropical regions than in the temperate latitudes; for the reason, probably, that a stratum of sufficient cold to produce hail is seldom found so near the inferior stratum, that a vorticular communication can be established with the former, by means of an ordinary gust, spout, or whirlwind. Nor does this ordinarily happen in the temperate latitudes; but only when the lower warm stratum becomes overlaid, in close proximity, by a stratum from a colder region. An event which is not infrequent in most countries within the temperate latitudes, commonly happens therefore, that several hail storms, of greater or less magnitude and violence, occur on the same day, or about the same period.

Of Thunder-storms and Gusts.

When a cold stratum or current of the upper atmosphere moves or rests upon a warmer one which is next the earth, neither stratum, as such, can penetrate or displace the other. Nor can a sudden interchange or commingling take place between the masses or particles of which these strata are composed, except by the slow and tedious process of the successive action and convolution of single particles, or small groups of particles, upon or around each other; but if a communication or interchange between the two strata becomes established by means of the action of a gradually excited whirlwind or water-spout; or if, owing to any inequality of surface, or other accident, a depression is made upon the lower stratum, so as to enable the colder air to descend to this point, then an immediate gyration or convolution will take place in the two masses; at this point, the warm air rising as it becomes displaced, and copious condensations will immediately follow. It is movements of this character which produce the dense and convoluted appearance known as a thunder-cloud, and the thunder and lightning, and perhaps hail, follow as necessary results.

The precipitation of the colder stratum thus commenced, is regularly continued and enlarged till an equilibrium is produced, and the thunder storm thus engendered, assumes, of course, the direction of the upper current to which it is appended, and which in the temperate latitudes, is commonly from the Western quarter. The warm surface air, which is thus displaced at the commencement of the process, rises immediately in front of the colder intruding mass, and by the gyratory action thus commenced becomes convoluted in detached masses or layers with the colder surrounding air, and by the reduction of temperature thus produced, furnishes the large supply of aqueous vapour which is first condensed in the heavy thunder cloud, and then precipitated in a heavy fall of rain; and the electric phenomena which are induced by this sudden contact and intermingling of masses of air of different temperatures and hygrometric conditions, become so highly vivid, and too often destructive. The active gyration which is commonly produced within the body of the thunder storm or gust, is in the direction of the advance of the storm, and of the rising warm air which is forced upward, or in the direction of forward and upward at the lower front of the storm.

In consequence of this gyratory action, a storm which advances at the rate of fifty or twenty miles an hour, is often known to exhibit a velocity of wind during the period of its greatest violence, of sixty or eighty miles an hour. If the axis of this gyratory motion in a thunder storm assumes, from any cause, a vertical position, we then have a perpendicular whirlwind or tornado, which, if it be so situated as not to reach the earth by its direct action, will exhibit to us the phenomenon of a heavy thunder storm accompanied by rumbling sounds and concussion, and a fall of hail in or near some portion of its path. But if the regular action of the whirlwind should reach the earth, and continue for some time, great destruction may be expected to follow. The path of these destructive whirlwinds is generally narrow, and often but a few hundred yards in width.

From the nature of the causes which we have set forth as being favorable to the occurrence of a thunder storm, it follows that many of these storms will be likely to occur on the same day, at different parts of the same country, as has been already remarked in the case of hail storms, with which they are often identical; and the writer often found this to be true to a remarkable extent. The fatal accidents by lightning, which differ at parts of the country, have often happened on the same days; and we have reason to believe that scores of tornadoes, hail storms, and thunder storms, have sometimes occurred on the same afternoon. It usually happens that the precipitations of the atmosphere at these numerous points of disturbance, is sufficient to produce a moderate change in the temperature of the surface stratum within a period of 12 hours.

Atmospheric disturbances of this kind, which do not produce violent thunder storms, are usually denominated *squalls*; and it appears highly probable that the presence of a temperature considerably above the freezing point, is necessary to the production

of hail and lightning. In the temperate latitudes is neither warm nor yet very frequent, and tremulous. It is P. King, lightning and thunder storms. The heavy condensation produced implies that the cloud upon which the violent wind is sent forth is very dense. The cloud may indeed be very watery depositions for a heavy inert, like those of a common squall, which may be present in the same sense, result from its action.

Water

The character of these meteors of hail and thunder storms is explained by Franklin, and attributed to have been done from the equal distribution of particles that no movement of gravity means of a direct circuit of rotation will not be regularly directed by external propelling force, and towards which is the tendency of the latter in the case of the upper extremity of the whirlwind, and the column itself, put in the centrifugal effect of its rotation into which the dense air is drawn, but enters the common chimney, but enters the place of the preceding column, and is discharged at the top. The position is maintained, is found to be the mechanically produced, and will be nearly fifteen pounds per square inch, like a top, and account for all the violence of the storm, or whirlwind, or vortex, and its destructive power, but this movement and the particles near the extremity of the vortex, at a little more than a right angle, and upward towards the rotation as compared with the pressure becomes merged in a spiral circuit, and rapid in the whirling movement in a spiral circuit, and in all regular motion of a column, and the velocity, must be more than the common point to the centre of the whirlwind, which in this case is equal to the diameter of the circuit, and must here be as four hundred to one, however, is not the number of comparative revolutions, and electric effects which are not rarely noticed under the head of a storm, but intended to dwell here upon the first set in motion, but the cause as in thunder storms, the upward discharge and velocity, and in the temperate latitudes of the temperate latitudes; but it is to the same impulse of the atmosphere, and the whirlwind is chiefly to be

and lightning. In the Strait of Magellan in Patagonia, where the air of the sea is neither warm nor yet very cold, the squalls, called by the sailors williwaws, are very frequent, and tremendously severe; but, according to the observations of Captain P. King, lightning and thunder are seldom known.

Every condensation presented in a thunder cloud is often spoken of in a manner which implies that the cloud possesses some mechanical or other energy, by means of which the violent wind is sent forth; but nothing can be more unreal than such a supposition. The cloud may indeed be the means of electric development, and furnish the watery depositions for the hail or rain, but all the particles of the cloud are equally inert, like those of a common fog or mist, and the violent winds and disturbances which may be present, operate to produce the cloud, but do not, in any important sense, result from its action.

Water-spouts and Whirlwinds

The character of these meteors has already been described, in a measure, in our account of hail and thunder storms. The identity of whirlwinds and water-spouts was pointed out by Franklin, and although at a later period this has been called in question, it appears to have been done without sufficient reason.

From the equal distribution of the atmosphere as the oceanic envelope of our earth, it results that no movement of great violence can take place in any of its parts, except in the form of a direct circuit of rotation in the form of a vortex or active whirlwind.

A vortex will not be regularly formed, nor continue itself in action, without the aid of an external propelling force, and a constant spiral discharge from that extremity of the column towards which is the tendency of motion. Both these conditions, it is believed, are fulfilled to the letter in the case of a common whirlwind or water-spout. The air at the upper extremity of the whirling column, owing to its elevation, is rarer than at the base, and the column itself, particularly in its central portions, is mechanically rarefied by the centrifugal effect of its own whirling motion. We have thus a sort of rarefaction into which the denser air at the base of the column is continually forced by the pressure of the surrounding atmosphere; not to ascend in a separate current, as in a common chimney, but entering into the organization of the whirling vortex, to take the place of the preceding portions of air which are winding inwards and upwards to be again discharged at the upper extremity. The condition of force by which equilibrium is maintained, is found in the pressure of the surrounding atmosphere on the sides of the mechanically rarefied column, and if the expansive whirling motion is exactly active to produce nearly a vacuum at the centre, the external propelling force will be nearly fifteen pounds to the square inch; and as the whirling column turns on its own compass, like a top or any other rotative body, this force is quite sufficient to account for all the violence that is ever produced.

If there be no vorticular or whirling action already excited, and no discharge from the upper extremity of the vortex, the external pressure, it is true, could not produce it; but this movement and upward discharge having once commenced, from any cause, the particles near the exterior of the column, like those of water in a funnel, are a little more than a right angle, to the external pressure, in their spirally ascending course towards the rarefied centre. By the slowness of this centripetal application as compared with the whirling action, the intensity or magnitude of the external pressure becomes merged in the velocity of the rotative action. As the area of the direct circuit decreases rapidly as we approach the centre, it follows that the velocity of the whirling movement must be proportionably increased, as we perceive it to be in the funnel and in all regular formed vortices. Thus, if the rotative velocity near the exterior of a column be at the rate of but ten miles an hour, at one-third nearer the centre the velocity must be more than doubled, and at two-thirds of the distance from the exterior point to the centre, the absolute whirling velocity must be increased to thirty, which in this case is equal to ninety miles an hour; and in consequence of the increased diameter of the circuit of gyration, at the last point, the number of revolutions must be as four hundred, to one of the point first mentioned. The increased whirling velocity, however, is not here taken into account, which may perhaps reduce the number of comparative revolutions in the central portions of the column. The condensation and electric effects which often attend or follow these active whirlwinds, have not been so far noticed under the head of thunder storms.

It is not intended to dwell here upon the causes by which whirlwinds and spouts are first set in motion, but the local disturbance of the air is probably the chief cause as in thunder storms. The agency of electricity is also effective in causing the upward discharge and vorticular organization, in cases where there is great diversity in the temperatures of the air at the upper and lower extremities of the whirling column, but it is to the mechanical expansion of the air, the centrifugal action and the impulse of the atmospheric pressure, that the increase and powerful activity of the whirlwind is chiefly to be referred.

The term *water-spout* is undoubtedly a misnomer, as there is no effect produced which this term is probably descriptive, although the term *air-spout* would not be greatly inappropriate. The visible column of condensed vapor which often appears in the rarified centre of the vortex when the latter is not enveloped in cloud, has probably given name to this meteor. But the water of the sea is not taken up by the spout or whirlwind, except in a slight degree and in the form of fine spray, like other light meteor which is swept from the surface. This cloudy stem or column frequently appears and disappears, while the action of the whirlwind continues without any important change. Owing to this fact, observers sometimes believe that they witness the commencement of a water-spout, or tornado, when the same has previously been in action for one or more hours, and when the cloudy pipe or pillar happens to disappear. A spout is supposed to have "burst," while, often, it has undergone no important change except, perhaps, a slight decrease in its activity. The active and violent portion of the whirlwind surrounds the spout invisibly, and is probably of much greater diameter at a distance from the surface of the earth than at the base of the spout. Thus, when a spout or whirlwind has passed near a ship, the upper spars have been converted into a wreck while no violence of wind was felt on the deck.

Water-spouts follow the course either of the surface wind or of the higher currents with which they may communicate, or their course may be modified by both these influences without being absolutely determined by either. They abound most, however, in those calm regions which are found at the external limits of the Trade Winds, and in the regions near the equator.

It has been common to ascribe whirlwinds and water-spouts, as well as larger whirlwind storms, to an impulse produced by the meeting of contrary currents, but the laws of distribution and of motion in an oceanic body, are such as do not permit the movements of its different currents and gyrations to meet in conflict with each other; besides, any conflicting movement in the air would necessarily produce a rise in the barometer, whereas it is generally known to fall at the commencement of a storm, either of large or small extent. We may observe, also, that whirlwinds and spouts appear to come on gradually, and to require their full activity without the aid of foreign causes; besides, it is well known that they are most frequent in those calm regions where, apparently, there are no active currents to meet each other, and they are least frequent where currents are in full activity.

Of Trade Winds and the Circuitous Character of the Atmospheric Currents.

It is found that in almost every country, and in every sea, the wind is more or less predominant in a particular direction. In open sea, between the equator and the parallel of North and South latitudes, the wind, for the most part, blows from the Eastward; but near the Eastern borders of any ocean, below these latitudes, the wind blows in a direction more towards the equator than in its central or Western portions.

In the higher latitudes North of 30°, the Westerly winds are found greatly to predominate, although the eddying or rotative action which is required by large portions of the lower stratum of air in these latitudes, causes much diversity and frequent changing in the initial direction of the wind. But in the common region of clouds where the eddying movement is less frequent, the *trade atmospheric current*, at least in the United States, is fully as constant from the Westward as is the Trade Wind from the Eastward in any tropical region.

At New York, in four successive years, the Westerly winds have been found to be nearly two to one. Observations on the courses of the clouds the same period show the prevalence of an atmospheric current from the Westward, that elevation to be, as compared with those from the Eastward, nearly as fourteen to one; the prevailing wind being South-westerly. At Montreal, in Lower Canada, as appears by the observations of J. M' Cord, Esq., the Westerly surface winds also appear to exceed the Easterly, in the proportion of more than four to one. In consequence of the general prevalence of Westerly winds and currents in these latitudes, the passage of the fastest ships, from Europe to America, are found to occupy a much longer period than from America to Europe.

The first movement of the Trade Winds towards the equator and Westward, necessarily occasions an equal movement from the higher latitude to supply their place; as the Trade Winds in their progress Westward are opposed by the American and European continents, across which these winds do not pass, it follows that these winds are collected or thrown off towards the poles in order to support an equal distribution in the atmosphere; in the higher latitudes; but the air thus transferred to these colder regions with it the rotative impulse which it acquired in the tropical latitudes. By reason of the slower rotative motion which here prevails, is thrown to the Eastward in the form of Westerly winds.

entire circuit of atmosphere, the most equable and delicate Trade Winds; and this approximation in our atmosphere, as pursued by the winds in the latitudes of temperature and equator, are chiefly to be seen in the *rain*, which is peculiar to the Monsoons of the Indian Seas; the regular Trade Winds were deflected across the equator by the Westerly Monsoons; the Monsoons have, indeed, been but the North-westerly Monsoons over half the breadth of the foregoing generalization of the two parallels of latitude for the most part, revolves in the earth's crust, or is constant. The space previously occupied by the action of the earth's rotation. That portion of the atmosphere is drawn Westward by the earth's direct gravitation, constantly in equilibrium of distribution at the equator. That portion of the atmosphere, after having acquired the high velocity previously required in the equatorial winds, thus completing the development in each of the oceanic currents by the currents of these winds are found to be transported in the storms affords demonstration of this. The currents themselves from various causes, and because they exhibit, in their crossing, changes at the surface, which are courses which have been generally and superposition of the lowest portions are subject, over the rotative motion of the atmosphere the Trade Winds and the rotation is necessarily subject to calm in the excited in warm regions in the North Atlantic is known to be near New England and the Westward by these calms, were so great or a part of their deck, and across these latitudes in both possible effect at the surface, especially in the northerly winds depth, and in the Gulf of Mexico, the results are found in new directions of winds from each other, and the *calms*, and sometimes about the equator which is the Easterly from the equator, where the same velocity of rotation is either a Northerly or Southerly tendency breeze at the surface.

the shores of an island or coast of the day and night, blows from the Trade Wind which is p

The entire circuit of atmospheric currents is thus maintained on both sides of the equator, the most equable and determinate portion of which is to be found in the region of the Trade Winds; and this appears to be the general outline of the great system of circulation in our atmosphere, as well as in the ocean itself. It is to the geographical position pursued by the winds in different portions of these great circuits, that the peculiarities of temperature and climate pertaining to different countries lying in the same latitudes, are chiefly to be referred, as also the remarkable absence or predominance of rain, which is peculiar to certain regions.

The Monsoons of the Indian Seas are but a modification of the same system of circulation: the regular Trade Wind, instead of turning towards the higher latitudes, is here deflected across the equator, where it returns to the Eastward in the form of the Westerly Monsoons; the Easterly Monsoons being the regular Trade Wind. The Monsoons have, indeed, been ascribed to local refraction in Asia and New Holland, but the North-westerly Monsoon, regardless of this hypothesis, sometimes covers half the breadth of the great Pacific in its Eastwardly progress.

The foregoing generalization may also be expressed in the following form:

Between the two parallels of 30° N. and S. the atmosphere at the earth's surface, for the most part, revolves around the axis of the earth with a slower motion than the earth's crust, or is constantly being left behind in the movement of rotation. The space previously occupied by the atmosphere so left behind is, by the centrifugal action of the earth's rotation, constantly supplied from the higher latitudes. That portion of the atmosphere which is left behind in the tropical latitudes, and passes Westward by the earth's rotation, as above described, is, by the force of direct gravitation, constantly transferred to the higher latitudes: thus preserving the equilibrium of distribution, so far as the same is ever maintained in these latitudes.

That portion of the atmosphere which is so transferred to the higher latitudes, after having acquired the high rotative velocity of the equatorial regions, is, by the previously acquired impulse, thrown rapidly Eastward in the form of Westerly winds, thus completing the great circuit of perpetual gravitation, which is developed in each of the oceanic basins on both sides of the equator.

It is by the currents of these natural circuits of gravitation that hurricanes and storms are found to be transported from one region or locality to another; and the track these storms afford demonstrative evidence of the predominating course which these winds pursue. The currents themselves often become modified in their apparent direction from various causes, and being often stratified, or as it were *shingled* upon each other, they exhibit, in their crossings, initial movements in different directions, and frequent changes at the surface, while still performing with no little regularity the systematic courses which have been summarily pointed out. One obvious cause of the irregularity and superposition of these currents is found in the retardation to which the lower portions are subject, owing to the resistance of the earth's surface.

On the rotative motion of the atmosphere and the earth's surface in the latitudes between the Trade Winds and the returning Westerly winds being nearly equal, this region is necessarily subject to calms, and to those sudden gusts and squalls which are frequently experienced in warm regions in the absence of a prevailing wind. This region, in the North Atlantic is known to navigators as the *horse latitudes*, because the traders from New England and the West Indies, in consequence of the lack of sustenance afforded by these calms, were sometimes under the necessity of throwing overboard a part of their deck-loads of horses. The great circuits of winds intersect and cross these latitudes in both directions on almost every meridian, but with little or no effect at the surface, except towards the Eastern margin of the Atlantic, where northerly winds decidedly prevail; and towards the Western margin of the Gulf of Mexico the Southerly winds are usually prevalent.

Similar results are found in nearly all the regions which separate the great natural circuits of winds from each other, and these tracks of ocean are known by the designation of the *calms*, and sometimes are called the *rains* or the *variables*. Such is the case about the equator which separates the Northern from the Southern Trade Winds and the Easterly from the Westerly Monsoons. The Easterly Monsoons, in passing the equator, where they run into the Westerly Monsoons, necessarily receive the same velocity of rotation as the earth's crust, which of course produces calms; the northerly or southerly tendency of the Monsoons being here too small to produce a land breeze at the surface.

Land and Sea Breezes.

On the shores of an island or country it is often found that the wind, during different portions of the day and night, blows alternately to and from the land; or in the case of a regular Trade Wind which is parallel to the coast, its course becomes alternately

stages by means of the journals and reports of voyages, near two thousand five hundred miles. It was in this storm that the Russian corvette, Kensington, Captain [unclear], suffered so severely. The hurricane of August, 1831, which desolated the island of Barbadoes on the 10th of that month, the daily progress of which has also been ascertained, passed in nearly a direct course to the Northern shores of the Gulf of Mexico and New Orleans, where it arrived on the 16th of the same month, having travelled over a distance of twenty-three hundred statute miles in six days after leaving Barbadoes.* Many cases of like character might be adduced.

The duration of the storm, at any place within its track, depends upon its extent and the rate of its progressive velocity, as these circumstances are found to determine the time which is required for the storm to pass over any given locality falling within its course. Storms of smaller extent or dimensions are usually found to move from one point to another with greater rapidity than larger storms.

The course thus pursued by the storm, is found to be entirely independent of the direction of wind which it may exhibit at the different points over which it passes—wind in all such storms being found to blow after the manner of a whirlwind, around a common centre or vortex, during their entire progress, and in a determinate direction and sense of rotation, which is from *right to left* (or in the direction from West to South) horizontally. The direction of the wind, therefore, for the most part, does not coincide with the course of the storm.

In the lower latitudes, while drifting to the Westward, the direction of the wind at commencement, or under the most advanced portion of these storms, is from a Northern quarter, usually at some point from North-east to North-west, and during the latter part of the gale, it blows from a Southern quarter of the horizon, at all places where the whole effect of the gale is experienced.

After reaching the more Northern latitudes, and while pursuing their course to the Northward and Eastward, these storms commence with the wind from an Eastern or Southern quarter, and terminate with the wind from a Western quarter, as will appear more distinctly under the three following heads, the latter portion of the storm being usually attended with broken or clear weather.

On the outer portion of the track, North of the parallel of 30°, or within that portion of it which lies *furthest* from the American coast, these storms exhibit at their commencement a *Southerly* wind, which as the storm comes over, *veers gradually to the Northward*, in which quarter it is found to terminate.

In the same latitudes, but along the *central portion of the track*, the first force of wind is from a point near to *South-east*, but after blowing for a certain period it changes *suddenly*, and usually after a short intermission, to a point nearly or directly opposite to that from which it has previously been blowing, from which opposite quarter it blows with equal violence till the storm has passed over, or has abated. This change of a South-easterly wind to an opposite direction, *does not occur towards the margin of the storm's track*, but only on its more central portion, and takes effect in regular progression along this central part of the route, from the *South-west* towards the *North-east*, in an order of time which is exactly coincident with the progress of the storm in the same direction. It is under this portion of the storm that we notice the most fall of the barometer, and the mercury usually begins to rise a short time previous to the change of wind. In this part of the track the storm is known as a *South-sea*, and is usually attended with rain previous to the change of wind, and perhaps a short time after.

On that portion of the track which is *nearest* the American coast, or which is farthest inland if the storm reaches the continent, the wind commences from a more Eastern or North-eastern point of the horizon, and afterwards veers more or less gradually, North, to a North-western or Westerly quarter, where it finally terminates. Here the first part of the storm is usually, but not always, attended with rain, and its latter or Western portion with fair weather. The first or foul-weather portion of the storm, on this part of its track, recognized as a *North-easter*.

It should be noted, however, that near the latitude of 30°, and on the shores of Carolina where the storm enters obliquely upon the coast, while its track is rapidly changing from a Northwardly to an Eastwardly direction, the wind on the central track of the storm will commence from an Eastern or North-eastern point of the compass, and gradually become South-easterly as the storm approaches its height.

A full and just consideration of the facts which have been stated, will show conclusively that the portion of the atmosphere which composes for the time being the great body of the storm, whirls or blows as above stated, in a horizontal circuit, around a vertical, somewhat inclined axis of rotation which is carried onward with the storm; that the sense or direction of this circuit of rotation is from *right to left*; and that the storm exhibits nearly in the same manner as a tornado or whirlwind of smaller dimensions;

*The tracks of these and other hurricanes appear on the annexed chart.

the chief difference being in the more disk-like form of the whirling body and the magnitude of the scale of operation.* This view of the subject, when fully comprehended, affords a satisfactory solution of the otherwise inexplicable phenomena of storms, and will also be found to accord entirely with the fact which appears in the above statement, that in the phases or changes which pertain to a storm, the wind, on one margin of its track, veers *with the sun*, or from *left to right*; while under the opposite margin of the same storm it veers *against the sun*, or from *right to left*; for this peculiarity necessarily attends the progressive action of any whirlwind which operates horizontally.

12. Owing to the centrifugal action of these rotative storms, the barometer, whether in the higher or lower latitudes, always sinks while under the first portion or margin of the storm on every part of its track, excepting, perhaps, its extreme outward margin; and commonly affords us the earliest and surest indication of the approaching tempest. The mercury in the barometer always rises again during the passage of the last portion of the gale, and commonly attains the maximum of its elevations on the entire departure of the storm.

The great value of the barometer to navigators is becoming well understood, and its practical utility might be greatly increased by hourly entries of the precise height of the mercurial column, in a table prepared for the purpose. Its movements, when carefully recorded, often escape notice or recollection; which may easily happen on those times when a distinct knowledge of its latest variations might prove to be of the greatest importance.

In the foregoing statements our design has been to designate in a summary manner the principal movements which, in these regions at least, constitute a storm; and we do not attempt to notice the various irregularities, and subordinate or incidental movements and phenomena of the atmosphere with which a storm may chance to be connected, which may necessarily result from such violent movements in a fluid which is so tenacious and elastic in its character. It may be remarked in general, that the most violent or violent storms are usually the most regular and uniform in the development of their characteristic movements which we have already described. It is also probable that the vortex or rotative axis of a violent gale or hurricane, oscillates in its course with considerable rapidity, in a moving circuit of moderate extent, near the centre of the hurricane; and such an eccentric movement of the vortex may, for aught we know, be essential to the continued activity or force of the hurricane. Such a movement will fully account for the violent *blows* or *gusts* of wind, and the intervening *ulls* or *truces*, which are so often experienced towards the heart of a storm or hurricane, when in open sea; but of its existence we have no positive evidence.

In Purdy's Memoir of the Atlantic Ocean, it is stated, "that while one vessel has been lying to in a heavy gale of wind, another, not more than 30 leagues distant, at the very same time been in another gale equally heavy, and lying to with the wind in quite an opposite direction."

This statement is obviously to be understood as applicable to two vessels falling under the two opposite sides or portions of the same storm, where the wind in its regular circuit of rotation must, of course, blow from the opposite quarters of the horizon; and will suppose one of the vessels to be at A and the other at B, in the annexed diagram.

* It is to be understood that the diameter of the whirlwind which constitutes the storm is commensurate with the width of the track over which the storm passes. The main body of the storm is supposed to move in the form of an extensive disk, whirling around its own axis, and to advance in its regular track—with this difference, that the centre moves on a track which is in the interior portions of the whirling body, than towards its circumference.

progressive motion of the storm, which is equally obvious, will first take place; after it will blow, with no great force, brought under the point B. The wind will now commence rising, and the storm, being found in the direction of the track, may be stated at the point A. The vessel, if carried by vessels which fall under the track, may readily see, that the operations of the storm, as they progress, are more and more distinct and regular.

The phases of the wind in the storm, as they progress, may be ascertained by the course or change of the wind. For example: a ship on taking the track of a storm on the line A C, and under the point A, say at N.N.W., as in the diagram, will see the barometer, which reflects the force of the storm, would about this period be of the greatest rapidity.

A further reference to the figure will show, that during the passage of the gale, the wind will blow Northward and Westward; but, being equally unaffected by the violence of the storm, and the destructive fury at the distance of many such examples.

It has been suggested that the storm will then be found to draw towards the point A, and may draw either way, on either side of the storm, and the extent of the storm, and the extent of the storm, which encountered the gale, will be Northward at the very centre of the storm. By this means the direction of the wind, at the point A on the figure, and the direction of the wind, at the point B, will have been rendered more distinct. The direction of the wind, at the point A, will be Northward, and the direction of the wind, at the point B, will be Southward, and it is then desirable to observe the direction of the wind, at the point A, and the direction of the wind, at the point B, and it is then desirable to observe the direction of the wind, at the point A, and the direction of the wind, at the point B.

It frequently happens that a storm, when it takes effect upon the coast, will blow over a more elevated part of the coast. On land, the most violent storms will blow from the open sea, and under such circumstances, the coast of an island, or the greatest fury upon the coast, will be most from the early part of the storm, and some degree of shelter from the force of the wind, will be found on the open coast. On land, the most violent storms will blow from the open sea, and under such circumstances, the coast of an island, or the greatest fury upon the coast, will be most from the early part of the storm, and some degree of shelter from the force of the wind, will be found on the open coast.

progressive motion of the storm, we will set down at N.N.W. The other vessel, as is usually obvious, will first take the wind from the Southward, as shown at *e*, in which direction it will blow, with no great variation, till, by the advance of the storm, the ship is brought under the point *B*. The barometer, which had previously been falling, now commences rising, and the wind, veering more Westerly, will, at the departure from the storm, be found in the direction shown at *f*, which, after the allowance already made to, may be stated at W.N.W. Such, substantially, are the facts commonly observed by vessels which fall under the lateral portions of the Atlantic storms; and it is readily seen, that the opposite winds which are exhibited on the two different descensions of the storm, as above described, will very naturally be mistaken for two separate and distinct gales.

The phases of the wind in these gales are, however, in all cases modified more or less by the course or changing position of the vessel exposed to its action. For example: a ship on taking the gale, say at E.S.E., at the point *A* on the figure, and proceeding to with her head to the Northward, may by that means be brought to intersect the storm on the line *h i*, and at the point *i* would suddenly be taken aback, with the wind, say at N.N.W., as in the case of the Jamaica homeward bound fleet in 1782; and the barometer, which reaches its lowest depression under the central portion of the storm, would about this period be found to have commenced rising with some degree of rapidity.

A further reference to the figure will show that a ship, which may be at the point *A* during the passage of the gale, would be exposed to a heavy swell from the Southward and Westward; but, being beyond the organized limits of the storm, may remain nearly unafflicted by the violence of the wind, which at the same time may be raging in destructive fury at the distance of a few leagues. The writer has knowledge of many such examples.

It has been suggested that the "port tack is the proper one to lie on, as the vessel will then be found to draw aft;" but this will frequently prove erroneous, as the vessel may draw either way, on either tack, according to the position and course of the storm, and the extent and rate of progress of the latter. In the case of the fleet which encountered the gale of 1782, it was probably the best course to carry sail to the Northward at the very commencement of the gale, and as far and as long as possible. By this means the fleet might, perhaps, have been drawn as far Northward as the point *A* on the figure, and the change of wind to the Northward and Westward would have been rendered more gradual. The chief difficulty and danger is, when the direction of the wind, at the first setting in of the gale, is found to be nearly at right angles with the known course of the storms in the region where the gale is encountered, and it is then desirable to pursue such a course as to avoid, if possible, getting into the heart of the storm.

It frequently happens that a storm, during the first part of its progress over a given tract, fails to take effect upon the shores, while it exhibits its full activity at a greater distance. This commonly happens when this portion of the storm arrives from, or has already blown over a more elevated country, or is passing or blowing from the land to the sea. On land, the most violent effects are usually felt from those storms which first blow from the open ocean upon the shores of an island or continent. Upon the water, under such circumstances, the first part of the gale is usually the most violent, and that coast of an island upon which a storm first enters, or blows, also suffers most from the early part of the gale; but its later, or receding part, often acts with the greatest fury upon the opposite side of the island, which had previously derived some degree of shelter from the intermediate elevations and other obstacles exposed to the force of the wind, the benefit of which is now lost by its counter-direction from the open ocean. Owing to similar causes, the force of the storm is sometimes unequal at different places, situated in nearly the same part of its track, and its violence is as equally as we have before intimated, necessarily pertains to two places, one towards the centre and the other towards the margin of the route.

To illustrate the magnitude of facts by which these views might be illustrated, we will only mention that in the late hurricane at Barbadoes, (that of August, 1781,) the trees near the coast of that island lay from N.N.W. to S.S.E., having been prostrated by the westerly wind in the earlier part of the storm, while in the interior and some other parts of the island, they were found to lay from South to North, having fallen in the latter part of the gale. That after the same hurricane, divers that were received from the islands of St. Croix and Porto Rico, (which lay to the Northern margin of the track, stated that no hurricane had been experienced at these islands; but it afterwards appeared that some portions of these islands had suffered damage from this storm on the night of the 12th to 13th of August, two days after it passed over the coast of Barbadoes. That the sea-islands which border the coast of Georgia and the Bahamas, are known to suffer greatly from these tempests, while little or no injury is observed in the interior at a distance of a few miles from the coast. One of the most striking characteristics of these storms, is the *heavy swell* which in open sea is often

storm was widely extended on both sides the track indicated upon the chart, and the same fact pertains, in a greater or less degree, to the other storms herein mentioned. It appears to have passed from Martinico, and the other Windward Islands, to Boston, in Massachusetts, by the usual curvilinear route, in about 6 days; a distance of more than 2200 miles, at an average progress of about 15½ miles per hour.

Track No. V. represents the route of the hurricane which ravaged the Islands of Antigua, Nevis, and St. Kitt's, on the night and afternoon of August 12th, 1835; St. Thomas, St. Croix, and Porto Rico, on the 13th; Hayti and Turk's Island on the 14th; the vicinity of Matanzas and Havana on the 15th; was encountered off the Tortugas, the Gulf of Mexico, on the 16th; in lat. 27° 21', long. 91°, and other points, on the 17th and 18th; and also at Matamoros, on the coast of Mexico (lat. 26° 4') on the 18th, where it was most violent during the succeeding night.* This storm is remarkable as moving more directly, and further to the West, than is usual for storms which pass near the West India Islands, it having reached the shores of Mexico before commencing its sweep to the Northward. Its course, so far as known, is N. 73° W. Its progress more than 2200 miles in 6 days, which is nearly equal to 15½ miles per hour.

Track No. VI. is that of the memorable gale of August, 1830, which, passing close to the Windward Islands, visited St. Thomas on the 12th; was near Turk's Island on the 13th; at the Bahamas on the 14th; on the gulf and coast of Florida on the 15th; along the coast of Georgia and the Carolinas on the 16th; off Virginia, Maryland, New Jersey, and New York on the 17th; off Cape Sable on the 18th; and over the Porpoise and Newfoundland Banks on the 19th of the same month; having occupied about 7 days in its ascertained course from near the Windward Islands, a distance of more than 3000 miles—the rate of its progress being equal to 18 miles per hour.† If we suppose the actual velocity of the wind, in its rotary movement, to be five times greater than this rate of progress, which is not beyond the known velocity of such winds, it will be found equal, in this period, to a rectilinear course of 15,000 miles. The same remark applies, in substance, to all the storms which are passing under our review. What stronger evidence of the rotative action can be required than afforded by this single consideration?

Route No. VII. is that of an extensive gale, or hurricane, which swept over the eastern Atlantic in 1830, and which was encountered to the Northward of the West India Islands on the 29th of September. It passed on a more Eastern route than any which we have occasion to describe, to the vicinity of the Grand Bank of Newfoundland, where it was found on the 2d of October, having caused great damage and destruction along its widely extended track, to the many vessels which fell in its way. Its course is quite analogous to that which we have considered as having been probably pursued by the hurricane of October 3d, 1780. The ascertained route may be estimated at 1800 miles, and the average progress of the storm at 25 miles an hour.

Route No. VIII. is that of a much smaller, but extremely violent hurricane which was encountered off Turk's Island on the 1st of September, 1821; to the Northward of the Bahamas, and near the lat. of 30°, on the 2d; and on the coast of the Carolinas on the morning of the 3d; and from thence, in the course of that day, along the coast to New York and Long Island; and which, on the night following, continued its course across the States of Connecticut, Massachusetts, New Hampshire, and Maine. We are not in possession of accounts by which its further progress can be successfully ascertained. The diameter of this storm appears not to have greatly exceeded 100 miles; its ascertained route and progress is about 1800 miles in 60 hours—equal to 30 miles an hour. The last-mentioned route may also be considered to be nearly the same as that of a more, but less violent storm, which swept along the same portion of the coast of the United States on the 28th of April, 1835.

Track No. IX. represents the route of a violent and extensive hurricane, which was encountered to the Northward of Turk's Island on the 22d of August, 1830; Northward of the Bahamas on the 23d; and off the coast of the United States on the 24th, 25th, and 26th of the same month.

*Since the above was written, it is ascertained that this storm also passed over Galveston on the coast of Texas, where the hurricane blew with violence from the N. E., while at the mouth of the Mississippi, and along the Northern shores of the gulf, the gale was not felt. Such a fact appears quite sufficient to overthrow the hypothesis of Franklin relating to North-east winds, and are equally fatal to the more common theories. At Galveston, this storm, in passing toward by East to the South-east: the rationale of which may be made evident by drawing a line through the Northern side of the figure on the chart, parallel to the track of the storm. Further attention to the figure will also illustrate the general character of the Northerly winds, which are so common on the coast of Mexico during a considerable portion of the year.

†For a more extended notice of this storm, see American Journal of Science, vol. xx. pp. 34-38. The phenomena and progress of this storm have been more fully noticed in Silliman's Journal, vol. xx. pp. 24-27.

Much damage was done on the ocean by this storm; but it scarcely reached the American shores. Its duration off this coast was about 40 hours, and its progress appears to have been more tardy than that of some other storms.

No. X. represents the track of a violent hurricane and snow-storm, which swept along the American coast, from the latitude of 30° N., on the 5th and 6th December, 1830.

The last-mentioned track also corresponds to that of another storm, of like character, which swept along the sea-coast on the 13th, 14th, and 15th of January, 1831. These violent winter-storms exhibit nearly the same phases of wind and general characteristics as those which appear in the summer and autumn.

Track No. XI. represents a portion of the general route of the violent inland storm which swept over the Lakes Erie and Ontario, on the 13th of November, 1835. This storm was very extensive, spreading from the sea-coast of Virginia into the Canadas, to a limit at present unknown. The anterior portion of this gale was but moderately felt, and its access was noted, chiefly by the direction of the wind, and the great fall of the barometer; the violence of the storm being chiefly exhibited by the posterior and colder portion of the gale, as is common with extensive overland storms. The regular progression of this storm in an Easterly direction is clearly established by facts, collected by the writer, from the borders of Lake Michigan to the Gulf of St. Lawrence, and the sea-coasts of New England and Nova Scotia.

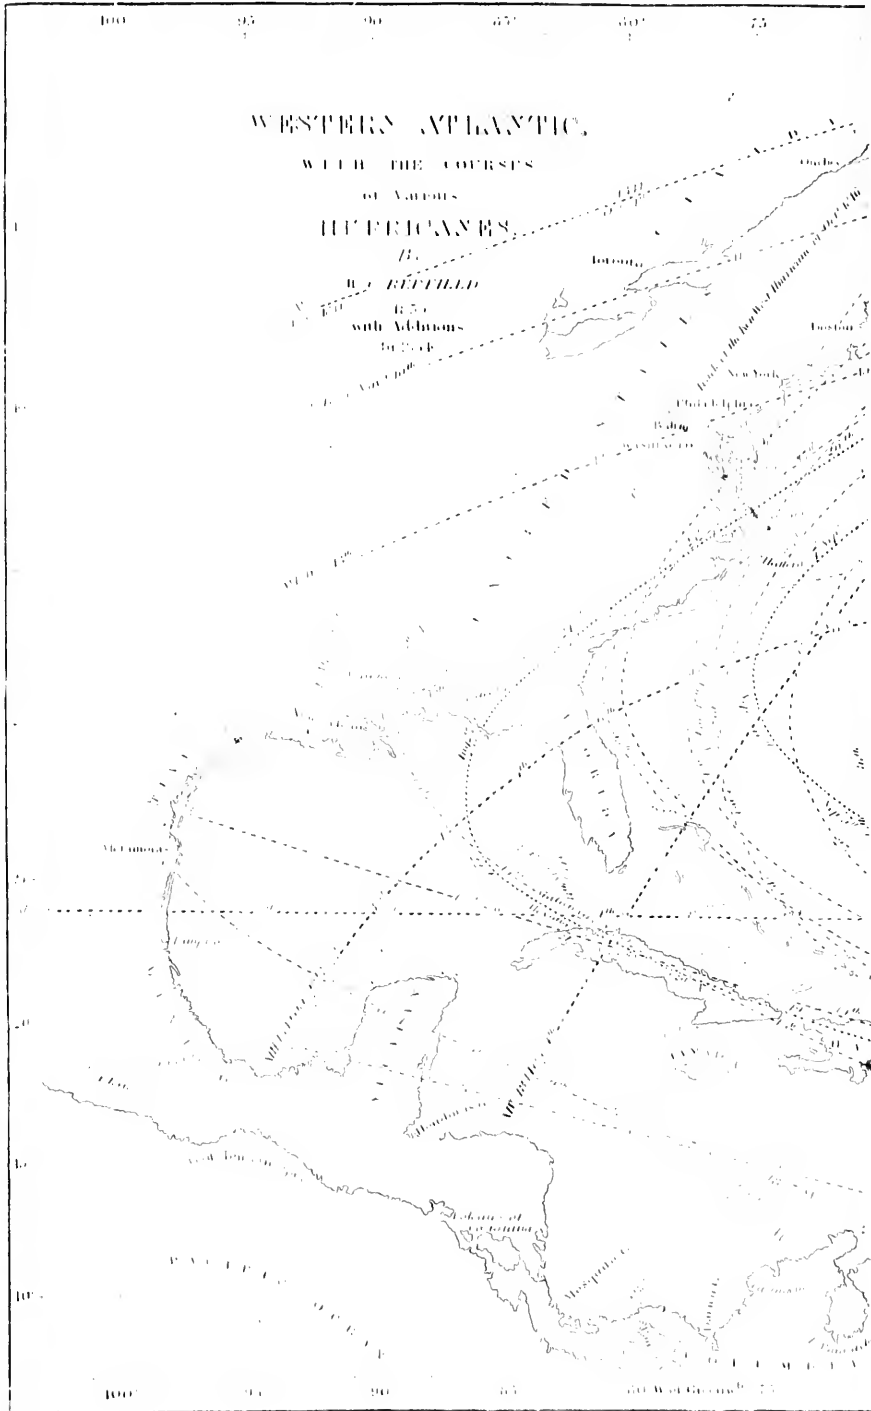

We have thus given a summary description of the route of 12 storms or hurricanes, which have visited the American coasts and seas at various periods, and at different seasons of the year. The lines on the chart, which represent the routes, are but approximations to the centre of the track, or course, of the several storms; and the gales are to be considered as extending their rotative circuit from 50 to 300 miles or more on each side of the delineations; the superficial extent of the storm being estimated both by actual information and by its duration at any point near the central portion of its route, as compared with its average rate of progress. The figure which appears upon the chart, on Tracks Nos. I., V., and VII., will serve, in some degree, to illustrate the course of the wind in the various portions of the superficies covered by the storm, and also to explain the changes in the direction of the wind which occur successively at various points, during the regular progress of the gale. The dimensions of the several storms appear also to have gradually expanded during their course.

Storms of this character do not often act with great violence on any considerable extent of interior country to which they may arrive. Even upon the coasts on which they enter, such violence is not often experienced under the posterior limb of the gale which sweeps back from its circuit over the land, the usual woodlands and elevations being a sufficient protection. Often, indeed, the interior elevations afford such a shelter as entirely to neutralize the effect of the wind at and near the surface, and the presence and passage of the hurricane is, in such cases, to be noted chiefly by the unusual depression which the great whirling movement of the incumbent stratum of air produces in the mercury of the barometer, which thus indicates the presence or passage of the hurricanes in positions where the force of the wind is not felt at all, or only with a moderate degree of violence. The action of these storms appears indeed, to be at first confined to the stratum or current of air moving next to the earth's surface, and they seldom, while in this position, appear to exceed a mile or so in altitude; and the course of the next highest or overlaying stratum does not, in these cases, seem to be all affected by the action of the storm below. During the progress, however, by the influence of high land and other causes, the storms often become transferred, in whole or in part, to the next higher stratum of current. Thus we sometimes see a stratum of clouds moving with the full velocity of a violent storm, while the stratum of surface wind is nearly at rest, or moves with its ordinary velocity; and thus, also, it happens that balloons, ascending under such circumstances, are carried forward with a velocity of from 60 to 100 miles an hour. The foregoing remarks are by no means hypothetical, but are the result of long-continued observation and inquiry.

It will hardly escape notice, that the track of most of the hurricanes, as presented on the chart, appears to form part of an elliptical or parabolic circuit, and this will be more obvious if we make correction, in each case, for the slight distortion of the apparent course in the higher latitudes, which is produced by the plane projection. We are also struck with the fact that the vertex of the curve is uniformly found on or near the 30^{th} degree of latitude. In connection with this fact it may also be noted, that the latitude of 30° marks the external limit of the Trade Winds, on both sides of the equator; and perhaps it may not prove irrelevant to notice, even further, that by the parallel of 30° the surface area, as well as the atmosphere, of each hemisphere, is equally divided; the area between this latitude and the equator being about equal to that of the entire surface between the same latitude and the pole. It is not intended, however, to make these facts the basis of any theoretical inductions on the present occasion.

A variety of deductions may be drawn from the general facts which we have stated, some of which, though deeply interesting to the philosopher and votary of science, might

of place in a nautical work of this description. For ourselves we disclaim any pretence to existing theories in meteorology; and shall on the present occasion only endeavour to notice a few of the more practical inferences which, to navigators and pilots, may, perhaps, be of no doubtful utility.

A vessel bound to the Eastward between the latitudes of 32° and 45° in the Westward of the Atlantic, on being overtaken by a gale which commences blowing from the Eastward of S. E. or E. S. E., may avoid some portion of its violence by steering her head to the Northward, and when the gale has veered sufficiently in the same direction, may safely resume her course. But by standing to the Southward, under like circumstances, she will probably fall into the heart of the storm.

In the same region, vessels, on taking a gale from S. E., or points near thereto, will probably soon find themselves in the heart of the storm, and after its first fury is over, may expect its recurrence from the opposite quarter. The most promising mode of mitigating its violence, and at the same time shortening its duration, is to stand to the Southward upon the wind, as long as may be necessary or possible; and when the movement succeeds, the wind will gradually head you off in the same direction. It becomes necessary to heave to, and the wind does not veer, be prepared for a gale from the North-west.

In the same latitudes a vessel scudding in a gale, with the wind at East or North-east, shortens its duration. On the contrary, a vessel scudding before a South-west or Westerly gale, will thereby increase its duration.

A vessel which is pursuing her course to the Westward or South-westward, in the Westward of the Atlantic, meets the storms in their course, and thereby shortens the periods of their occurrence; and will encounter more gales in an equal number of days than if stationary, or sailing in a different direction.

On the other hand, vessels while sailing to the Eastward or North-eastward, or in the course of the storms, will lengthen the periods between their occurrence, and consequently experience them less frequently than vessels sailing on a different course. The difference of exposure which results from these opposite courses, on the American coast, may in most cases be estimated as nearly two to one.

The hazard from casualties, and of consequence the value of insurance, is enlarged or diminished by the direction of the passage, as shown under the two last heads.

As the ordinary routine of the winds and weather in these latitudes often corresponds to the phases which are exhibited by the storms as before described, a comparison, founded upon this resemblance, can often be formed of the approaching changes of wind and weather, which may be highly useful to the observing navigator.

It will be perceived, from the foregoing facts, that the occurrence of a storm at a particular locality, has no immediate connection with astronomical periods, such as the changes of the moon, or the time of the equinoxes.

A due consideration of the facts which have been stated, particularly those under our twelfth head, will inspire additional confidence in the indications of the *barometer*, and these ought not to be neglected, even should the fall of the mercury be attended by any appearances of violence in the weather, as the other side of the coin will be pretty sure to take effect, and often in a manner so sudden and violent as more than compensate for its previous forbearance. Not the least reliance, however, should be placed upon the prognostics which are usually attached to the scale of the barometer, such as Set Fair, Fair, Change, Rain, &c. as in this region at least they serve no other purpose than to bring this valuable instrument into discredit. It is the regular rising and falling of the mercury which chiefly deserves attention, and not its conformity to a particular point in the scale of elevation.

These practical inferences apply, in general, chiefly to storms which have passed the Northward of the 30th degree of latitude on the American coast, but with the necessary modification as to the point of the compass, which results from the Westerly course pursued by the storm while in the lower latitudes, are, for the most part, equally applicable to the storms and hurricanes which occur in the West Indies, and South of the parallel of 30° . As the marked occurrence of tempestuous weather is here less frequent, it may be sufficient to notice, that the direction of the winds of the West India seas is from 8 to 11 points of the compass *more to the left* than on the coast of the United States in the latitude of New York.

Disturbances of wind and weather on this coast which do not conform to the foregoing specifications, are more frequent in April, May, and June, than in other months. This season it is not uncommon to find a regular current of Easterly wind prevailing many days, producing sometimes heavy rains, and always an elevated state of the barometer. Easterly or Southerly winds under which the barometer rises, or maintains an elevated state, are not of a gyratory or stormy character; but such winds frequently terminate in the falling of the barometer and the usual phenomena of an Easterly storm. The typhoons and storms of the China sea and Eastern coast of Asia, appear to be peculiarly similar in character to the hurricanes of the West Indies and the storms of this coast,

when prevailing in the same latitudes. There is reason to believe that the great circuits of wind, of which the Trade Winds form an integral part, are nearly uniform all the great oceanic basins; and that the *course* of these circuits and of the storm gyrations which they may contain, is in the Southern hemisphere, in a *counter-direction* to those North of the equator, producing a corresponding difference in the general phases of storms and winds in the two hemispheres.

From the foregoing results we infer the value and importance of correct marine reports relating to violent gales. Those reports should always comprise the *date, latitude and longitude*, and the *principal direction and changes of the wind*,

CURRENTS.

A CURRENT is at present to be understood as a stream on, or a particular set of the direction of, the surface of the sea, occasioned by winds and other impulses, exclusive of (but which may be influenced by) the causes of the tides. It is an observation of Dampier, that currents are scarcely ever felt but at sea, and tides but upon coasts; and it is certainly an established fact, that currents prevail mostly in the parts where the tides are weak, and scarcely perceptible, or where the sea, apparently little influenced by the cause of the tide, is disposed to a quiescent state. This will be obvious by an attentive consideration of the following descriptions. The necessity of attention to the silent, imperceptible, and therefore dangerous operation of currents will be equally apparent.

The currents of the Atlantic are often of a local and temporary nature; yet experience has shown where and how they predominate, and reason will inform the mariner where he is to expect and allow for their operation.

With the greatest velocity of the equinoctial current we cannot pretend to be accurately acquainted. Its central direction, when in full force, is W. N. W., and generally it is imagined, about one mile and a half in the hour, but increasing to the Westward so that off the coast of Guyana it commonly sets at the rate of 2 or 3 miles.

At any considerable distance from the coast of America, the Easterly current caused by the action of violent W. or N. W. winds, is seldom felt to the Southward of lat. 20°; consequently the sea about the Bermudas, and thence to Southward, is free from the influence of this current. The currents here, though slow, are produced in the direction of the wind, particularly when it is of long continuance. These currents are stronger near the islands and rocks of Bermudas than at a distance. In a brisk gale, the current here has been experienced from 12 to 18 miles in 24 hours, in the direction of the wind; at other times, when the wind was not settled, no current has been found.

To continued Westerly winds are to be attributed the common occurrence of a current from Halifax to the English Channel in 16 or 18 days, with such currents as that which carried the bowsprit of the Little Belt, sloop of war, lost near Halifax, in 1793, to the entrance of Basque Roads. The currents of the Atlantic have sent the products of the Hebrides, the products of Jamaica and Cuba, and of the Southern parts of North America.

The Easterly and South-easterly currents are blended in their Southern region with the Florida or Gulf Stream, hereafter described, and they do not seem to proceed to the S. W. of the Azores. On the contrary, to the W. S. W. and S. W. of these islands the currents appear to follow the course of the Trade Winds towards the Caribbean Sea; and to the Southward of the tropic they blend with the equatorial current, which sets from E. S. E. to W. N. W. and W. Towards the West, they occasionally extend to the Northward of the Bermudas, and even unite with the Southern edge or reflux of the Gulf Stream. The existence of these currents has long been known, but a further examination and more precise information are still desiderata. The recent examples of them which we have to adduce are not numerous, but they are satisfactory; they accord with natural facts, and are in unison with that theory which derives its current from the rotary movement of the earth, and the operation of the Trade Winds.

"The currents of the Caribbean Sea are probably varied by the influence of the moon, and combine, in some degree, with the tides, especially about Cuba, Jamaica, and Domingo."

The Erratero adds, "This idea is confirmed by what Don Torquato Pedrola, the captain of a frigate, has communicated to the Hydrographic Board. Although, generally speaking, the currents between the Spanish Main and the West India Islands set towards the fourth quadrant, (that is, North-westerly,) yet it sometimes happens, that they are found setting to the first quadrant, or N. E.; in proof of which he states that he perfectly remembers, though he cannot give the elements

of having lost his frigate from Santa Marta, but considering that by the force of the current he was able to make it before the end of the day, and did so, at noon he observed the frigate, and found that they were sweeping away W. by S., the force and velocity of the current were three days crossing the parallel of the frigate, the vessels went in search of the charts placed it, by 12 o'clock, expected to join the brig A, at her anchorage at the South, a vessel was seen ahead, which a vessel at anchor; and by the Pedro Key, towards which he was having to make several leagues beside the Alerta by morning, he observed that morning, he was bound to the Westward. In the next year, when the current nearly the same as the free with the Southern Hemisphere, which current has also been frequently remarked by the brig, on its Southern side, at Cartagena to Trinidad, some miles from it; but noticing the vessel and ran to the South until it was found; and the following morning, doubtless passed to leeward of the frigate more than thirty voyages ago, Rio, St. Domingo, and Cuba, he remarked that between the islands might be counted on for the Memoir, 3d edition, pp. 67 and 68, and continued vigor at certain places over a great extent of the sea, here called the Bay of Guatemal, the current is to be found." The frigate possessed by the Depository, have been found, which, by the examination of the coast of Porto, made in 1717, by Don I, strong currents setting to the Westward, leaving to it night, oil Coel, winds at the time were either proceeded to the Northward, N. and N. N. E., with which itself 10 leagues to the Westward, to the E. S. E., so that, when the point of Mignel de Borda, a whole time, from leaving Porto, the frigate, On the 11th March, it went through the Bocas with a single heading to the E. S. E." Again, "The captain of the frigate, was bound from the Rio Tinto to the North-westward, in such a manner that he made to sight Cape Antonio or West, Don Jouquin de Asunsola a frigate, of Cape Gracias a Dios, north squalls; and from the frigate took the same course; and the frigate and until he arrived at Blue

of having lost his journals, that in July, 1795, or 1796, when sailing with a breeze from Santa Martha to Jamaica, in a schooner, he steered for Morant Point; but considering that by keeping as close hauled as that course required, he must be able to make it before the day was spent, he preferred keeping away, to make the leeward of it, and did so at 8 A. M., thus augmenting the rate of the vessel's

At noon he observed the latitude, in conjunction with the pilot, Don Mignel, and found that they were some minutes to the Northward of Morant Point; keeping away W. by S., they saw it at 2 P. M. Although they calculated the direction and velocity of the current, he remembers only that it was to the N.E., and they were three days crossing from Santa Martha to Jamaica.

Leaving the parallel of the Bago del Comby ($15^{\circ} 30'$) the first time that the Spaniards sailing vessels went in search of it, and being to leeward of the meridian under the charts placed it, by 12 leagues, they made sail so that, at the rate of sailing, they expected to join the brig *Alerta* next evening, as they knew she was waiting for her anchorage at the Southernmost of the Pedro Keys. At 8 A. M., next day, a vessel was seen ahead, which at first they mistook for a rock, but soon made out that it was a vessel at anchor; and by 9 A. M. they saw not only the *Alerta* at anchor, but the Pedro Key, towards which the current carried them with much strength; and they were obliged to have to make several tacks, in order to fetch the proper channel, they were carried beside the *Alerta* by mid-day. The commander does not recollect the longitude observed that morning, but remembers that the current had carried them to the Westward. In the next year, when surveying the West end of the Pedro Shoals, they found the current nearly the same; and this ought to be a warning to navigators not to be too free with the Southern edge of the Pedro Shoals during the night.

A strong current has also been found near the Baxo Nuevo, lat. $15^{\circ} 50'$, and long. 78° was remarked by the brig *Alerta*, when near its Northern extremity. The same current was also observed on its Southern side: for in prior years, the schooner *St. Gregorio*, bound for Carthagena to Trinidad, saw the South end of the shoal at 4 P. M. At 5 she was 5 miles from it; but noticing that the current set strongly towards the shoal, they ran to the South until they considered the vessel nine miles from the South point; and the following morning tacked to sight it, which she did not effect, having doubtless passed to leeward of it.

More than thirty voyages made by Captain Pedrola, from the Spanish Main to the Rio, St. Domingo, and Cuba, sometimes with chronometers, and others without, he remarked that between the last two islands and the coast of the main, sixteen leagues might be counted on for a Westerly current, but not so much for the former." The Memoir, 3d edition, pp. 68-9, was this passage:—"The Trade Wind blows with force and continued vigor at certain seasons, particularly in the winter months, and rolls waves over a great extent of sea, into the great bay Westward of Carthagena, which is called the Bay of Guatimala. This may cause, at times, an outset, but no current is to be found." To this is added, in the *Derrotero*: "among the original observations, by different navigators, have been found, which may tend to throw some light upon the matter:

In the examination of the coast between Porto Vello (Porto Bello) and the Bocas del Toro, made in 1717, by Don Fabian Abances, he found on that coast, in the month of April, strong currents setting to the E.N.E., at the rate of two miles an hour; so that, when heaving to at night, off Coele Point, he found himself in the morning up at Chagre. The winds at the time were either calm or squally from the South-westward. Don Juan proceeded to the Northward, to the parallel of 10° , and then met with winds from the N. and N.N.E., with which he steered W. and W.N.W., until he considered himself 10 leagues to the West of the Bocas del Toro; but the current had carried him to the E.S.E., so that, when he expected to make the Bocas, he found himself at the point of Mignel de Borda, about 5 leagues to the Westward of Chagre. During the whole time, from leaving Porto Vello, he never gained an observation, the weather being adverse. On the 11th May he noticed that the waters of the Lagoon of Chiriqui ran out through the Bocas with violence, and formed, at a short distance from the coast, a single bending to the E.S.E."

The captain of the ship of the line *Don Pedro de Obregon*, in the month of August, was bound from the Rio Tinto (Black River) to the Havana, and he experienced strong currents to the North-westward, with winds from the N.E., E.N.E., squalls and calms, in such a manner that he made the Tortugas Bank of Florida without having been able to sight Cape Antonio or West end of Cuba."

Don Jouquin de Asunsola and La Azuela, in July, found strong currents to the West of Cape Gracias a Dios, after having strong winds from the E.N.E. and E.S. with squalls; and from the said cape to the Westward he found, also, that the current took the same course; and he concludes that, after he had made Providence Island and until he arrived at Black River, the currents were strong to the W. and S.W.

Chagre, at any time during the rainy season, (May till November,) and bound to Eastward, endeavor to get 4 or 5 leagues from the land so soon as you can; for the current, in general, very light, and the current very strong. The latter sets from the East directly on the rocks of Porto Bello, and thence along the land from E. by N., to E. by E., and according as the land lies; its general rate being from 1, to 2, leagues in an hour. Great care should be taken when near the land, if a heavy squall should appear to be coming on. During this you will have the wind from all points of the compass, and often so strong that all sail must be taken in.

When crossing the Gulf of Darien, little or no current will be found; whenever there is a current, it sets about South, S. by W., or S. by E., up the Gulf.

Near Carthagena the current generally goes by the wind; but off the islands of Carthagena it sets to the N.W. and N.N.W., from one to two miles an hour.

Between Carthagena and the Magdalena, in the rainy season, you cannot put any dependence on the winds or currents; but from November to May the Trade Wind will be strong.

I should recommend, if turning to windward, with strong Trade Winds, to keep the ship close to; whereas, by going off from the land, you will not only have a heavy sea, but also a strong N.W. current. If you have light variable winds, approach no nearer the land than 4 or 5 leagues, as you may be certain of an easterly current."

Captain Livingston says, "During five weeks in which I remained at Carthagena, in April and July, 1817, the current inshore set constantly and strongly to the Northward, at the rate, I am convinced, of not less than 1½ mile an hour, or nearly as strong as the current at New Orleans. I have seen the Esk. sloop of war, current-ride against a fresh sea-breeze, when at anchor, nearly W. from the city, distant about 1 mile."

From the current between the Grand Cayman and Cape Antonio, Captain Monteath says, "In the months of May, 1811 and 1815, (two voyages in which I was chief mate of the ship Prince Regent, from Kingston;) in June, 1817, in the ship Fame; and in April and December, 1820, in the ship Mary, between Grand Cayman Island and Cape Antonio, I invariably found the current setting strong to the Eastward, or E.S.E.; and I have heard it generally remarked, that vessels shaping a course from the Cayman Islands for Cape Antonio, have found themselves off, or even to the Eastward of Cape Antonio; this has, in the above cases, invariably happened to myself."

Further on, "In my passage from Kingston, towards Campeche, in the ship Fame, in June, 1817, between Cape Antonio and Cape Catoche, I found the current to set due East, at the rate of 27 miles in a run of 18 hours."

We have already given, in the preceding page, the remarks of the Spanish navigators concerning the currents of the Mosquito Shore and Bay of Honduras. We now add those of Captain W. J. Capes, of London, and John Buraett, of Port Glasgow.

Captain Capes says, "Between Jamaica and Bonacca the current generally sets to the Eastward and Westward. Here, in May, 1816, I was set 60 miles to the Westward by the current, and found that it set rather Northerly, from one quarter to half a mile an hour."

Between Jamaica and Bonacca are the islands called the Swan Islands, in latitude 17° 22', longitude 83° 36'. I would not advise any one bound to the Bay to make the Swan Islands, for it cannot be of service, and the current is so very irregular about them, that the attempt serves only to bewilder the navigator; and by falling in with them in the night, a ship would be in danger of running on shore, as the land is very low.

About the Southern Four Keys the currents are very uncertain. I have known several ships to be lost on these Keys by lying to for the night, after they have made the land; for at all times the current sets strongly on them; and in two of the cases the ships were every two hours, with an intention to keep their station. In one voyage I was bound from Bonacca at four, p. m., with a strong breeze from the East, which continued till midnight it then died away, (no uncommon circumstance in this part) so that I did not lift the Southern Four Keys before four, p. m., the next day, from the fore-yard. I then made all snug, and plied to windward, under single-reefed sails, and top-gallant sails over them; tacked ship every three hours during night, to my surprise, in the morning, we were not more than one or two miles to windward of them; so, if I had hove the ship to, I have no doubt but she would have been run on shore by the current.

If a ship be lying to under Rattan, it will not be amiss to try the current. It is my opinion that the current about Bonacca takes two different directions; one part setting to the N.W. and the other part branching to the S.S.W. I have found it so on several occasions, which is the reason that I prefer taking a departure (for the Bay) from the middle of the East end of Rattan; for if a ship take her departure from the West end, her course will be N.N.W.; but it very frequently happens that ships get down on those reefs when they take their departure from the W. end. The reason is this: a ship steering to the N.W. from the West end has more of the current on her beam, which sweeps round the West end of Rattan very strong at times; consequently, ships that take their departure from the East or middle part, do not feel so much of the current.

the South side of Cuba, when the wind is Westerly, which it often is, you are almost certain of a reflowing current round Cape Antonio. This is easily accounted for: when the fresh Trade Wind ceases, and the Westerly winds set in, the barrier is, in a degree, removed, which confine the waters in the Gulf of Mexico, and they seek again their level as well by the Channel of Yucatan as by the Strait of Florida. The windward channel of Jamaica, the current generally sets with the wind to the Eastward, or S.W., yet both here and at Jamaica it is variable. Some have affirmed that a current runs to leeward, on the South side of Jamaica, there is frequently a current setting Eastward on the North side; and, at other times, no current is to be perceived; also, that when a lee current runs on the North shore, the same circumstances are perceived on the South shore as were before observed on the North.

Between the Mona Passage and the Caymans, South of the islands, the tendency of the currents towards shore is most commonly found to the North-westward. In the Bahama Passages the currents are devious: both weather and lee currents have been found. These also appear to be influenced by the tidal causes; for the tides are operative on the banks, and sometimes set strongly.

The following is an additional detail of the best information we have been able to collect, of the currents in the Caribbean and Mexican Seas, from the Derrotero de las Indias, &c.

In the channel between Trinidad and Grenada the current has been found to set West; on the South side half a point Southerly, and on the North side half a point Northerly. Its velocity from a mile to a mile and a half per hour.

Between Grenada and St. Vincent's, among the Grenadians, the currents are devious, the general inset appears to be W. by N.

Between St. Vincent's and St. Lucia, the current, from the Eastward, sets in more easterly; and within, on the West, it has been found setting to the N.W. Between the islands it seems to be as strong as in any other part of the range.

Between St. Lucia and Martinique it has been found nearly North. Very variable on the Western side of the latter.

The current sets nearly in the same manner between Martinique and Dominica; but on the North-westward of the latter, it has been found nearly S.W. three-quarters of an hour. Northward of Guadaloupe it sets W. $\frac{1}{2}$ S., and between Montserrat and Nevis N.W.

Between Redonda and Nevis it has been found W.S.W. half a mile hourly.

Without Barbuda and the Northern isles, it has set about W. by N., and to the Eastward of the Virgin Isles and Porto Rico about W.S.W.

At the distance of about one degree, within the range of the Caribbee Islands, and between the Virgin Islands, the current has been found setting, in general, to the W.N.W. at one mile to one mile and a half an hour.

In the Mona Passage, between Porto Rico and Hayti, the current has been marked frequently setting to the N.W., and we have instances of a set through to the S. but Captain Monteath, in February, 1816, when proceeding Southward towards Porto Rico, in from latitude 23° to 22° , and longitude 61° to 65° , found the current setting N.N.E. at the rate of 20 miles in the 24 hours; and he says that off the N. end of Porto Rico, it invariably set from the Caribbean Sea to the Northward N.N.

On the Western side of the passage it set North 2 miles an hour.

From Trinidad, Westward, and off the North side of the Spanish Leeward Isles, the current has been found setting West and S.W. to the Gulf of Maracaybo; thence S. also to Carthagena; but it varies, as has been already noticed.

From Carthagena towards the channel of Yucatan, it has been found N.N.W., N. W., N.W., and N.W. by N., from one to nearly two miles, and then decreasing to one mile per hour. It has also been found setting to the Eastward, as shown in the preceding pages.

At about 40 miles Northward of Cape Catoche, the current has been found N.W. W.; changing thence to S.S.W. off the N.W. point of Yucatan, nearly at the same distance from the coast. Rate something less than half a mile an hour. Between Vera Cruz the current ceases.

The action of the S.E. Trade Wind, in the equatorial regions, and the apparent dislocation of the waters in these regions to retire Westward, which has been attributed to the rotary motion of the earth, are considered as the causes of a current which is known to flow, during a great part of the year, from the Ethiopic ocean to the Caribbean Sea, and which has frequently carried ships considerably to the West and W.N. of their reckonings, when off the N.W. part of Brazil.

On the East coast of Brazil the currents generally partake of the direction of the seasons, as before explained, but vary in velocity according to the advance and decline of them, as well as the part of the coast.

Captain Hewett says, during the Southerly monsoon, the currents to the Southward of Cape St. Augustin are not so powerful as to the Northward, where they in-

crease in strength until the months of June and July, and then gradually decline. In the contrary, in the Northerly monsoon, they are generally very strong to the Southward of Cape St. Augustin, when they are weak to the Northward, as they have some difficulty in detaching themselves from the stream, which runs from the S.E. Trade around Cape St. Roque.

Mr. Lindley also notices that a strong current runs Southward from Cape St. Augustin, commencing about the middle of October, and continuing until January, after which there is no particular current till the middle of April, when a powerful one sets in Northerly till July, and then subsides in like manner.

The currents of the River Plata, and other local currents near the shores, have been before noticed, in the Descriptions and Sailing Directions.

The following facts establish the existence of a combined current; and they show in some degree, its force and direction towards the Brazilian coast:

1. In June and July, 1795, the Bombay Castle, East Indianman, between the Isle of Palms (of the Canaries) and the coast of Brazil, experienced a Westerly current amounting to $6\frac{1}{2}^{\circ}$.

2. On May 20, 1802, the Cutnels, East Indianman, lost the N.E. Trade in 84° North long. 22° ; gained the S.E. Trade, June 4, in 5° N., long. 21° . From the equator the current was found to set W. and W. by N., from 30 to 52 miles daily, till the coast of Brazil was in sight on the 14th in 8° S.

3. May 23, 1802, the Sir Edward Hughes lost the N.E. Trade in 6° N., long. 23° and the wind was from S.S.E. on the 25th, in 5° N., and 23° 30' W. The Trade set far at Southward, and the current set strongly to the West.

4. October 16, 1805, the European fleet lost the N.E. Trade in 11° N., long. 28° and gained the S.E. Trade on the 26th, in 4° N., long. 29° . On the 4th of November, the land of Brazil was seen in lat. 6° S.; the wind near the land was at E. by S. and S.E. By proceeding too far to the Westward, two ships of the fleet were wrecked the morning of the 1st of November, on the Roccos, or Low Keys, in lat. 3° 52' S. and $33\frac{1}{4}$ W., and several others had nearly shared the same fate. This catastrophe has probably been avoided by a due knowledge of, and attention to, the effects of the current, which was subsequently ascertained to set $2\frac{1}{2}$ miles per hour to the Westward near the Roccos.

5. On the 1st of June, 1793, the King George, East Indianman, crossed the line 30° W., and from the 2d to the 5th experienced a Westerly current of 1° 32'. On the 5th Cape St. Roque was in sight, and the ship was kept working until the 10th, endeavoring ineffectually to weather it. She then stood to the North-eastward, close hauled, to lat. 1° N., in order to regain the variable winds in North latitude, and she proceeded to cross the equator, which was at length effected.

6. In May and June, 1807, the transports laden with ordnance stores for the army of Montevideo, by crossing the equator too far to the Westward, were carried so far in this direction by the current, that they could not get to the Southward of Cape Augustin, (lat. 8° 23' S.) and were twice obliged to stand to the Northward, into variable winds, to regain Easting, after having attempted ineffectually to gain the regular South-east Trade Wind.

7. It is a well-known fact, that several ships have made the Isle of Fernando Noronha, on their outward-bound passage to India, by currents having set them to the Westward, after the failure of the N.E. Trade Wind. The current runs strongly about this island.

GULF STREAM AND STRAIT OF FLORIDA.

THAT immense current which continually sets from the Gulfs of Mexico and Florida to the Northward and North-eastward, should be well understood, as all who navigate the coast of North America experience more or less of its influence.

Three degrees to the N.N.E. of Vera Cruz, the current has been found setting to the N.E. one mile an hour. Then N.N.E. and N. by E., and again N.E., nearly the parallel of $32\frac{1}{2}^{\circ}$, long. $91\frac{1}{2}^{\circ}$. Here it changes more to the East, and becomes at lat. 26° E. by S., changing Southward to S.E. by S. In the direction of the River Mississippi, and lat. 25° 30' N., the current sets variously to the South-eastward. Its extent and exact direction are here unknown, but it is certain, that setting towards the N.W. part of Cuba, and striking on the banks of Isabella and Colorados, a small portion of it winds round Cape Antonio to the Eastward, while the great body of it sets Eastward, to the Northward of Cuba, winding to E.N.E., N.E., and N., through the Strait of Florida, into the Atlantic Ocean.

The Derrotero de las Antillas is included between the meridian of the Gulf of Mexico, like a river, course the flow first to the E.

shot Keys, by which key the current which it pursues on the North, including a little to the meridian of the Havana S.E. and S.E. from the Tortugas, the differences, caused by the current near the Colinas. The distinction is very

Should you involuntarily be in any care to examine when

The Derrotero de las Antillas says, "By the Strait of Florida, we understand the line included between the meridian of the Dry Tortugas and the parallel of Cape Antonio. The simple inspection of the chart will show this to be a bed or course, like a river, and the water to the Northward. This river, or general current, flows first to the E. far as the meridian of the Western part of the Donkey Keys, by which key the stream is diverted from E. N. E. to N. by E., the direction which it pursues on the parallel of Cape Florida: thence to Cape Canaveral it runs North, including a little to the East.

On the meridian of the Havana, stripes of current are at times found setting to the E. and S. E. from the Tortugas soundings. Care should be taken not to confuse these southern differences, caused by this branch of the current, with those caused by the eddy current near the Colorados—the one giving Eastern departure the other Western.

The distinction is very clear, and can admit of no doubt, because the eddy current is met only from the meridians of Canavals and Bay Honda to Cape Antonio, and runs further out from the coast than the parallel of 23 degrees.

As the velocity of the current varies, it is requisite for every navigator to ascertain its strength as frequently as possible, while within the stream. Every one who enters the channel, having marked well either the lands of Cuba or the Florida Reef, so as to be able to establish this point of departure, ought to determine, in his first day's run, the velocity of the current by the difference of latitude, by account and observation.

We say during the first day's work, because the generality of common navigators make use of meridian altitudes and the sun alone, to find the latitude: but it is very clear, that altitudes of the planets and stars ought not to be neglected; not only because by this you cannot be in doubt of your real latitude, but also because they may be observed at latitudes deduced from meridian altitudes of the sun, when that luminary is in the proximity of the zenith, and because these repeated observations during the day assume, as much as possible, the situation of the ship. Thus you may go on with confidence in the operation of the current, and the way that the ship is making.

Having ascertained the velocity of the current, use can be made of it to find the ship's departure, and this knowledge will be most important when you fail in obtaining observations for latitude; because, in such a case, wanting a knowledge of the difference of longitude given by the current, you will be in want of everything; but if you know the velocity of the current, and with it the course which it follows, you may find the difference of latitude and departure which the current gives, and which, though it will not give the position of the ship with that precision with which it might be obtained from a meridian altitude observed, will still approximate sufficiently to the truth to enable one to avoid danger, if prudence and seamanlike conduct are combined."

For those who have little experience in the art of navigation, we add—

1. That it is most convenient to direct your course in mid-channel, not only because it is the furthest from danger, but because you will there have the strongest current, which is desirable. (See Remarks of Mr. Romans on the Gulf Stream.)

2. That, as you cannot ascertain with all necessary certainty the position of the ship, notwithstanding the rules given to diminish the errors occasioned by the currents, you ought, with the utmost care, to shun the Eastern coast of Florida, as being very dangerous, the Trade Wind blowing upon it, while there is not the least risk in running along the Salt Key Bank and the edge of the Great Bank of Bahama. Upon the latter, you meet with good anchorages, very fit to lie in during the hard Northerly gales which are experienced between November and March, and which do not fail to cause much damage, and sometimes even force vessels to bear away, which is always dangerous, for the weather is generally thick with such winds, and the greatest danger will be to run, some of them, ashore upon the coast of Cuba, when hoping to have made Havana or Matanzas. Therefore, so soon as there is an appearance of a Northerly gale, the best way is, if near the Salt Key Bank, to anchor on it, and if near the Great Bank, to approach the edge of it, in order to be able to anchor when it may be necessary; for, though you may have a hard Norther, so long as you can lie to in it, you ought to pursue your voyage, as the current will certainly carry the ship through the strait.

3. It is very necessary to sight the keys on the bank, even though you have no fear of a Norther, and there may be occasions in which every exertion should be made to see them, especially if, from want of observations, the situation of the ship is not well known.

4. When, owing to calms or light winds, a vessel not bound to the Northward is in danger of being carried through the strait by the current, she ought immediately to approach the edge of the Salt Key Bank, or of the Great Bahama Bank, and return from thence by the Santaren Channel to the coast of Cuba, without trying to beat back the lost ground; for by doing this, she would only render the chance of being carried through more certain.

5. Should you involuntarily approach the coast of Florida, you should take extraordinary care to examine whether you have advanced out of the general current, and

into the eddy. That you may know this, observe the eddy forms a remarkable visible line between it and the general current, which line of division is, in many places, out of sight of land; that in general you have no soundings on it, and that it shows not only by the change in the color of the water, but that also in it, during the great calms, there is a kind of boiling or overfalling of the water. From this line of division the water gradually changes color, so that near the Florida Keys it is a beautiful green, and at last it becomes almost as white as milk.

6. When in the eddy, you have to make the correction of currents on courses entirely different from those in the stream. This is the more necessary to be attended because from ignorance of this circumstance, many have been shipwrecked.

7. When you enter the channel, or strait, from the Tortugas Bank, with the intention of passing through, take care to become certain of the land of Cuba, or some part of the Reef of Florida, in order to have a good departure, for although the latitude and soundings on the Tortugas Bank are more than sufficient to ascertain the position of the ship, yet the variable set of the current towards the Havana may produce a serious error, if not properly attended to. The meridian of the Havana is, in a word, the best point of departure for ships bound to the North-eastward.

At about $3\frac{1}{2}$ degrees North of Cape Antonio, the current has at times been found setting to the S.W., winding towards the Northern edge of the Yucatan Bank; but a degree thence Eastward, setting nearly S.E. Off the West end of Cuba, at 10 leagues N.W. from Cape St. Antonio, it has been found setting S.W. by W. one mile an hour. But these cannot be considered as its "general directions."

The stream in mid-channel, on the meridian of Havana, acquires the direction of N.E., and velocity of about $2\frac{1}{2}$ miles an hour. On the meridian of the Southernmost point of Florida, its velocity, at about one-third over from the Florida Reefs, is commonly $2\frac{1}{2}$ to $3\frac{1}{2}$ miles. Between the Benimi Isles and Cape Florida, its direction is about N. by E., and velocity the same.

On the Cuba side the stream is weak, and it sets to the Eastward. On the opposite side, along the Florida Reefs and Keys, there is a re-tlow or counter-current, setting to the S.W. and W. By the assistance of the latter, many small vessels have navigated through the strait from the Northward; but this navigation is too dangerous to be attempted by strangers. The tides set strong among these reefs, and are more particularly described in this work.

The winds are found to affect the position of the stream considerably. Between Cuba and Florida Northerly winds press it Southward towards the shore of the former. Southerly winds have a contrary effect. When turned to the North, Easterly winds press it to the Florida side, and Westerly winds nearer to the Bahamas. Southerly winds cause it to spread, and so may those from the North.

In the Strait of Florida, within the Bahamas, when a Northerly gale increases to storm, it opposes the stream in its course, and its adverse power causes it to fill all the channels and openings among the isles and reefs, and to overflow all the low coasts. Shipping have even been carried over the low keys, and left dry on shore.* The water is supposed at times to have risen to the height of 30 feet, and to have been running against the fury of the winds at the rate of 7 miles an hour. During these times the Strait of Florida exhibits a scene terrific beyond description.

Remarks on the Stream, &c., by Captain J. Steele Park.

"Sailed from Jamaica for London, on the 20th May, 1824. At noon, on the 27th was off the S.W. side of Cuba, in latitude $21^{\circ} 26'$, longitude by chronometers and lunars $81^{\circ} 47' W$. Here was discovered a current setting to the N.W. at the rate of 2 miles an hour. At 7h. 30m. Cape Antonio bore N.W., 5 or 6 miles. The current to the N.W.," says Capt. Park, "swept us into the Gulf of Mexico, and there we were beating about three or four days, making Northing and Westing in spite of our toil. All this time the wind was Easterly, and we might have cruised about there till Christmas, had the wind not got a little to the Southward of East, which enabled us to go over to the N.E. side, where we found the current running directly opposite to the former, being now in the Florida Stream.

"After rounding Cape Antonio the land of Cuba was not seen. At this time, (the latter days of May, 1824) the stream along the Florida side, and even in the strait was by no means so strong as it is generally found. In the narrowest part, where, of course, we had a right to expect the greatest velocity, it was running at the rate

* In the month of September, 1769, there happened an inundation, which covered the tops of the highest trees on the Cayo Largo, &c., and during which the Ludbury Snow, John Ford's master, was carried over the reef by the N.W. current of the stream, caused by a gale from N. The vessel bilged in shallow water, but an anchor was thrown out, and the next day the vessel was found to have grounded on Elliot's Key with his anchor among the trees.—(Dr. Braithwaite's Atlantic Pilot.)

24 miles in the hour. This was at noon, and an excellent chronometer. When we cleared the Gulf of Mexico, the influence of the stream, and the wind on to blow hard from the North. (Cape Battenas.)* This was the track, and we passed under this gale, for several days, and finally to the N.E.

On June 23d, at noon, lat. 37° , altitudes and chronometer were run, and the log gave a difference of latitude which had been running all the time. Allowing half a point for the current, on making Scilly, after the gale from the North, and S.W. The ship passed a fine North-easterly current, lat. $43^{\circ} 35'$ and long. 36°

Currents from the Bay of Honduras served by Captain Steele Park.

Day	Lat.	Long.	Direction
16	17°	55'	87°
17	18	24	87

From the S.W. corner of the Gulf of Mexico, or Port Cavanas, it takes the boisterous East, N.E., and continues to the Southern edge of the Gulf, about E. by S. 20 miles, and E. by N., 12 miles.

Remarks on the

Between lat. $25^{\circ} 40'$ and $28^{\circ} 30'$ and long. $78^{\circ} 30'$ to $71^{\circ} 30'$, Capt. M. Park, next day, July 7, to lat. $26^{\circ} 30'$. On the following day, July 8, to lat. $30^{\circ} 10'$, long. 66° continued each day by chronometer. The stream, from lat. 26° to 31° , it appears to run Northward; it thence suddenly turns to the East, or about the parallel of 71° long. the cape.

The stream in the neighborhood of the cape, at the rate of about 2 miles an hour.

A scientific navigator says, "It is better to get out of it as early as possible, for the change of the current will not be the same, which generally attend to

24 miles in the hour. This was correctly ascertained by meridian altitudes of sun and an excellent chronometer.

When we cleared the Gulf (Strait,) Capt. Park adds, "I was anxious to keep in the influence of the stream, and pass near the tail of the Bank of Newfoundland, but the wind on to blow hard from the Northward, in lat. $34^{\circ} 35'$, and long. $72^{\circ} 20'$ (E. by N. Cape Hatteras.)* This, of course, drove us away to the Eastward, out of the track, and we passed about 300 miles to the Northward of the Bermudas. In this gale, for several days a current was found to proceed from the Eastward to W.S.W., but in lat. 38° , and long. about 59° , the ship was in the Gulf Stream, and finally to the N.E.

On June 23d, at noon, lat. $37^{\circ} 51'$, long. $61^{\circ} 51'$; June 24th, lat. $39^{\circ} 56'$, long. 57° (by altitudes and chronometer.) Here the ship really made $4^{\circ} 28'$ of Easting in 24 hours' run, and the log gave only $3^{\circ} 16'$. In the same time Northing was made. The difference of latitude was 125 minutes, but the log gave about 80 only. The ship had been running all the time E. by N., by compass, and went through the water 125 miles. Allowing half a point of variation gives the true course N.E. by E. $\frac{1}{2}$ E. Consequently, on making Scilly, there was not an error in the watch of a single mile.

After the gale from the Northward subsided, the winds became variable between N.W. and S.W. The ship passed near the tail of the Great Bank, and continued to run a fine North-easterly current, at the rate of 30, 25, and 20 miles a day, until she reached lat. $43^{\circ} 35'$ and long. $36^{\circ} 50'$, where it ceased."

Currents from the Bay of Honduras, and thence through the Strait of Florida, as observed by Capt. W. J. Capes, in January, 1824.

Lat.	Long.	Current	Direction
16	$17^{\circ} 55'$	$87^{\circ} 30'$	16 miles Southerly in the 24 hours.

29	30 31	76 7	24 do. do.

From the S.W. corner of the Tortugas Bank, the current has, at times, been found to set S.S.W. directly over to the Colorados. But between the Tortugas and Bahía de San Juan, or Port Cavañas, it takes its regular set to the Eastward.

The boisterous East, N.E., and N. winds, which affect the Gulf Stream, generally begin in September, and continue until March.

On the Southern edge of the Tortugas Soundings, lat. $24^{\circ} 30'$, long. $83^{\circ} 30'$, the current sets about E. by S. 20 miles in the 24 hours; and in lat. 24° , long. $82^{\circ} 20'$, it sets out E. by N., 12 miles.

Remarks on the Stream, by Capt. W. J. Monteath.

Between lat. $25^{\circ} 40'$ and $28^{\circ} 20'$, Capt. Monteath found the current in the Strait had 24 miles in the 24 hours of June 27, 1820. On the Southern border of the stream, (northward of the parallel of Cape Hatteras.) 6th July, 1820, lat. $35^{\circ} 20'$ to $36^{\circ} 30'$, long. $72^{\circ} 30'$ to $71^{\circ} 3'$, Capt. M. found the current setting N.E. 75 miles in the 24 hours. Next day, July 7, to lat. $37^{\circ} 40'$, long. 69° , he found it N. 53° E. 86 miles in 24 hours. On the following day, July 8, to lat. 38° , long. 67° , it ran N. 58° E. 30 miles. On July 9, to lat. $39^{\circ} 10'$, long. $66^{\circ} 10'$, Westward, only 10 miles. The observations were continued each day by chronometer, which agreed within a few miles.

The stream, from lat. 26° to 28° , generally sets North, rather Easterly; from 29° to 31° , it appears to run North, inclining a little in the direction of the coast, rather Easterly; it thence suddenly turns to the N.E. by E., or a little more Easterly, to lat. 35° , or about the parallel of Cape Hatteras, where it runs within about 18 miles of the cape.

The stream in the neighborhood of the coast at Cape Hatteras, inclines more to the Eastward, at the rate of about $2\frac{1}{2}$ knots; then the shoals of Nantucket appear to front it,

A scientific navigator says, "When in the Gulf, Eastward of Hatteras, I generally endeavor to get out of it as early as possible, especially with a strong N.E. wind, for I think the change of the current will not compensate for the effects of the destructive sea and squally weather, which generally attend that part of the ocean."

and to throw it off to the E.N.E. and E. by N. Northerly. In about the parallel of 34° long. 63½°, it has been found to run at the rate of 2 knots between E. by N. and E.N.E.

Col. Williams, in his "Thermometrical Navigation," states that the whirlpools on the Northern edge of the stream, have been seen in lat. 41° 57', long. 65° 1'. He also observed great quantities of weed, supposed to be on the Northern edge of the stream in lat. 41° 53', long. 65° 33'. It has subsequently been ascertained by Lieut. Charles Hare, R. N., that on the meridian of 57° W., in the summer season, the Northern edge of the stream ranges up to 42½° N., and even in the winter months to above 42° N. This has been confirmed by 25 voyages across the Atlantic, assisted by chronometer, thermometer, &c., the last of which was made in the fall of the year 1824.

It is, however, to be considered, that a North, N.E., or East wind forces the stream towards the coast, contracts its breadth, and thus increases its rapidity. On the contrary, S.W., West, and N.W. winds, force the stream further into the ocean, and diminish its strength.* It is clear, then, that the stream fluctuates in its direction and force, according to circumstances, and no absolute rule can be given for ascertaining its more ordinary boundaries; it therefore follows, that a description of the indications by which it may be known, is of more importance. These are, the appearance and temperature of the water; the stream, in its lower latitudes, and usual course in fair weather, where it flows uninterruptedly, may be known by its smooth and clear surface, and blue color. The margin of the stream is marked by a ripple on its edge: the water in some places appears like boiling water, and in other places it foams like the waters of a cataract, even in dead calms, and in places which are fathomless, and during strong N.E. winds, that part from Cape Roman to the North and East breaks violently, so much so that it has been mistaken for shoals during the night.

On the outer edge of the stream, especially in fair weather, there are great ripplings, which are very perceptible; and it has been observed, by many navigators, that in the Gulf the water does not sparkle in the night, but with South-easterly winds it does as much as in other parts of the ocean. The appearance of the weed called Gulf-weed is also an indication of being in or near the stream, as it is never seen far North of it.

By the advantage of knowing how near to the coast a ship may venture, and how to distinguish the Gulf Stream from the water between it and the coast, we can be sure of a favorable current either way; and a small vessel might make a short voyage from Halifax to Georgia, which is thought by some a longer one than to Europe. Suppose you had the wind ahead all the way; take your departure and stand for the stream, so soon as you find the water to increase in heat about half as much as you know it would when in the stream, heave about and stand for the coast; you will infallibly discover the edge of soundings by the cooling of the water; then stand off again, and so on to the end of the voyage; when it is almost certain, that the distance would be run in a shorter time than if there were no stream, for you would have a favorable inside current. On the return passage, take your departure, and run off till you get into the warmest water, which will be the middle of the stream, and take the advantage of its currents.

The following fact may serve to illustrate the propriety of these directions. In June 1798, the mail-packet for Charleston had 25 days' passage in going, but returned in 7. The captain accounted for this by having calms, or very light airs and a Northerly current. This was the true cause. He was in the middle of the stream, where there generally are calms or light winds; the edges only, which come in contact with colder regions, being tempestuous. After being in the latitude of Cape Hatteras, he found himself in that of Cape Henry, (100 miles to the Northward.) The vessel, however, arrived at last; and on the return voyage, the captain steered the same course back again; and, with the same light airs, he performed the voyage in 7 days. Had the captain known the use of the thermometer, need he to have been much longer in going than in coming?

The thermometer is not only useful for ascertaining when in the Gulf Stream, but it is likewise advantageous in discovering the approach to soundings on the coast of North America, between Cape Canaveral and the Island of Newfoundland.

We believe the thermometer only indicates the difference of temperature caused by going into or leaving the Gulf Stream, on the principle that its temperature is influenced and governed entirely by the fact that it comes from the tropical regions, where the

* An experienced navigator, before quoted, says: "It is always found that the strongest current is in the warmest water. I have observed the greatest degree of heat of the Gulf between the meridian of Cape Hatteras and that of Nantucket, to vary at different times from 75 to 67 degrees of Fahrenheit, and the strongest current to differ from 3 to 14 miles per hour; that the breadth of the stream-current is much less than is generally supposed, and that the winds cause great effect on the Gulf; for instance, a wind that would produce a current of one knot, would retard one of 3 knots to 2 knots if opposed to it, and would accelerate the same to 4 knots, if in the same direction; and that a wind crossing a current obliquely, would deflect it as the sine of the angle at which it is opposed. The direction of a current calms, however, be materially changed, when forced against an opposing barrier."

mean temperature is 82°, and rises or changes its temperature. At the edge of the Great Bank, the water is colder than the deep ocean; it is even colder still, or 15 degrees cooler on the coast of New England. On the coast of New England, the water is 10 degrees warmer than in soundings; and in some places warmer still; so that, in coming out of the stream, the thermometer, after leaving the stream; and soundings.

On the coast from Cape Hatteras to Cape Fear, the water is 10 degrees warmer than in soundings; and in some places warmer still; so that, in coming out of the stream, the thermometer, after leaving the stream, and soundings. Mr. Williams recommends that the instrument be kept in one place, and the plate should be made of brass. If the instrument be fixed in one place, the water should be water-tight, and the instrument be kept in the water; the remainder of the instrument to be fixed in the water. Fix one instrument in the water, and another on the shore, at such out of the wind, and the after-stanchions, under the instrument. Let the second instrument be fixed in the dead-water of the stream. Put the other away safely in case of accident.

About the edges of the stream, the current, which is accelerated by the wind, is retarded, and the direction of the stream. In the winter, heavy and cold winds, which come from between the North and East, retard the Cape Hatteras until past Georgia. The force of the wind blowing along the coast of the Eastward as to render it in a change of wind.

During the prevalence of a strong wind, the current is forced close to the coast. Being thus pent in between the land and the coast, it is greatly diminished, and the force of the current, observed from Nantucket Shoal, thence to Cape Hatteras, and part of the coast of Georgia, is retarded the current to the edge of the bank, and in the latter place, that it is retarded.

With W. and N.W. winds, the current is retarded. These remarks are sufficient to show that the stream. The eddies on the coast, in fine weather, they are strong. By an ingenious work, entitled "Thermometrical Navigation," by Mr. Williams, and published at London, in 1798, it is shown that the stream has often ascertained the Cape Hatteras, and found it to be the same, an hour. The temperature of the water is sometimes the same; that is, the warmest, at the Cape Hatteras, and at the Cape Hatteras, says, "The bank, from Cape Cod, to Cape Fear, deepens gradually. In crossing the bank, the water is fine. On the outside it is fine. The bank, it is coarse sand, or shells, and deepens su-

mean temperature is 82° , and it requires a long time before so large a body of water loses or changes its temperature in a very great degree.

At the edge of the Great Bank of Newfoundland, the water has been found 5 degrees colder than the deep ocean to the Eastward. The highest part of the bank is 10 degrees colder still, or 15 degrees colder than the ocean Eastward.

On the coast of New England, near Cape Cod,* the water out of soundings is 8 or 10 degrees warmer than in soundings, in the winter; and in the stream it is about 8 degrees warmer still; so that, in coming from the Eastward, a fall of 8 degrees will indicate your leaving the stream; and a further fall of 8 degrees will indicate your being out of soundings.

On the coast from Cape Henlopen to Cape Henry, the water out of soundings is 5 degrees warmer than in soundings in the winter; and in the stream about 5 degrees warmer still; so that, in coming from the Eastward, a fall of 5 degrees will indicate your leaving the stream, and a further fall of 5 degrees will give notice of soundings.

Mr. Williams recommends to seamen to take three thermometers. "Let them," he says, "be kept in one place some days previous to sailing, in order to try their uniformity. The plate should be made of ivory or metal, for wood will swell at sea; and as the glass will not yield, it is from this reason very liable to break: bell metal is the best. Let the instrument be fixed in a square metal box, the bottom of which as high as the mark 30° , should be water-tight; so that, in examining the degree of heat, the ball may be kept in the water; the remainder of the length should be open in the front, with only two or three cross-bars to ward off any accidental blow, like the thermometer used by physicians. Fix one instrument in some part of the ship, in the shade, and in open air, but as much out of the wind, and in as dry a place, as possible. The after part of one of the after stanchions, under the quarter rail, may answer, if no better place can be found.

Let the second instrument be neatly slung, with a sufficiency of line to allow it to flow in the dead-water of the wake.

Put the other away safely, to be ready to supply the place of either of the others in case of accident."

About the edges of the stream there is generally a current running in a contrary direction, which is accelerated by the wind in proportion to its strength, blowing contrary to the stream, and retarded, or perhaps altogether obstructed, by the wind blowing in the direction of the stream. In the latter case, the limits of the stream will be extended.

In the winter, heavy and continued gales very frequently prevail, which commonly proceed from between the North and West, across the course of the Gulf Stream, from Cape Hatteras until past George's Bank, and bend its direction more to the Eastward: being aided, at the same time, by the discharge of the great bays and rivers, increased by the force of the wind blowing down upon them, and the constant supply of stream that passes along the coast of the Carolinas, the whole produces so strong a current to the Eastward as to render it impossible for a ship to approach the coast until there is a change of wind.

During the prevalence of a Southerly or South-easterly wind, it has been found that the current is forced close to the shore. This proves the Gulf is influenced by winds. Being thus pent in between the wind and the shoal grounds near the shore, the breadth is greatly diminished, and the velocity proportionally increased. This circumstance has been, in particular, observed from about the longitude of Block Island, along the edges of Nantucket Shoal, thence beyond George's Bank; it has the same effect along the coast of Georgia and part of South Carolina. In the first place, the Southerly winds forced the current to the edge of the soundings, where it then ran from 1 $\frac{1}{2}$ to 2 knots; and, in the latter place, that the Easterly wind forced the current upon soundings.

With W. and N.W. winds, the stream would be removed some leagues further off. These remarks are sufficient to show the uncertainty of the boundaries or edges of the stream. The eddies on the inner edge are inconsiderable; but on the outer one, in fine weather, they are strong, and of considerable extent.

By an ingenious work, entitled "Thermometrical Navigation," written by Mr. John Williams, and published at Philadelphia, in 1799, we are informed that Commodore Ingham has often ascertained the velocity of the Gulf Stream to the Northward of Cape Hatteras, and found it to be seldom less than one knot, and never more than two miles, an hour. The temperature of the air and water without the stream was generally the same; that is, the difference seldom exceeded 2 or 3 degrees; the air being sometimes the warmest, at other times the water.

Captain Livingston says, "It set me off Cape Hatteras one degree and eight miles,

* The bank, from Cape Cod, extends almost as far as Cape Sable, where it joins the banks of Nova Scotia, deepening gradually from 20 to 50 or 55 fathoms, which depth there is in latitude 43. In crossing the bank between lat. 40° 41' and lat. 43, the bottom is very remarkable. On the outside it is fine sand, shoaling gradually for several leagues. On the middle of the bank, it is coarse sand, or shingle, with pebble-stones. On the inside it is muddy, with pieces of shells, and deepens suddenly from 45 or 48 to 150 or 160 fathoms.

by sidereal and solar observations, to the Northward, in 16 hours, by dead reckoning and Capt. J. Collast, of Philadelphia, informed me that it set occasionally with great velocity."

Mr. Williams observes, "In the stream the water is much warmer than the air; indeed, I have known it 10 degrees warmer; but so soon as you get within the stream (that is, between it and the coast) the water becomes colder than the air; and the more you get on soundings and approach the shore.* If mariners, who have not the opportunity of determining their longitude by celestial observations, will only *carry with them a good thermometer*, and try the temperature of the water, and compare it with that of the air every two hours, they may always know when they come into or go out of the Gulf Stream. Indeed, I have always made a practice, when at sea, of comparing the temperature of the air and water daily; and often very frequently during the day throughout my voyage: whereby I immediately discovered anything of a current that way going, and afterwards found its strength and direction by observations of the latitude and longitude. It is of the utmost consequence, in making a passage from Europe, to be acquainted with this Gulf Stream; as by keeping it when bound Eastward, you shorten your voyage, and by avoiding it when returning to the Westward you facilitate it inconceivably: so much so, that I have frequently, when bound from Europe to America, spoken European ships, unacquainted with the strength and extent of it, off the Banks of Newfoundland, and been in port a very considerable time before them, by keeping out of the stream; whereas they lengthened their passage by keeping in it. The general course of the Gulf Stream is marked on the chart published by G. W. Blunt, in 1817; and I would advise those who make the Northern passage from Europe, never to come nearer the inner line of it, by choice, than 10 or 15 leagues, and then the probability will be, that their passage will be assisted by the help of a counter-current which often runs within it. In coming off a voyage from the Southward, be sure to steer N.W. when approaching the stream, if the wind will permit you, and continue that course till you are within it, which may be easily known by the temperature of the water, as before mentioned. I have always considered it of the utmost consequence, when bound in, to cross the stream as speedily as possible, lest you should be visited by calms or adverse winds, and by these means drove far out of your way, which would prolong the voyage considerably, especially in the winter season.

The course of ships bound from Europe to the ports of the United States is controlled, in a great degree, by the operation of the Florida Stream. Little, therefore, requires to be added to the subject here. Those bound to the Northern and middle ports, when passing the shoal grounds on George's Bank, should take care to pass between these shoals and the stream. Also, in passing the Nantucket Shoals, to be between them and the stream.

Ships crossing the stream, when bound to the Westward, must get over as quick as possible; or it is clear they will be carried far out of their course.

It has been remarked, that "ships from sea, approaching any part of the American coast between Long Island and Cape Hatteras, if in doubt about their reckoning, should take notice of what is commonly called the gulf-weed," which is in great plenty, and in larger clusters, to the Eastward of the Gulf Stream than in it, where sprigs are but small and few. Within the stream there is no weed, unless in rare instances, and there the color of the water changes to a still darker and muddy color.

The outer edge of the bank off this part of the coast appears to be very steep; for it has been frequently found, that, while the lead has been kept going, there have been from 45 fathoms, soon after 35, and a mile nearer the shore, only 25 or 20 fathoms from these depths the shoaling to the shore varies in different directions.

Sir Charles Blagden, M.D. & F. R. S., in the transactions of the Philosophical Society says, "During a voyage to America, in the spring of the year 1776, I used frequently to examine the heat of sea-water newly drawn, in order to compare it with that of the air. We made our passage far to the Southward. In this situation, the great

* By the journals of Capt. W. Billings, of Philadelphia, it appears that in June, 1791, the water on the coast of America was at the temperature of 61°, and in the Gulf Stream at 77°. By those of Mr. J. Williams, it appears that in November, 1789, the water on the coast was 52°, and in the Gulf Stream at 70°, viz.:

1791, June, Coast	61°	1789, Nov. Coast	52°	Difference between Coast and Stream
Stream	77	Stream	70	
Stream warmer	16	Stream warmer	23	

The difference of heat is therefore greater in winter than in summer.

Captain A. Livingston says: "On my voyage from Philadelphia to Kingston, Jamaica, in 1787, I particularly attended to the thermometer. Close off the month of the Delaware in about 16 fathoms, it stood at 60°; on the inner edge of the Gulf Stream it rose before noon to 66°, and in the course of an hour to 76°; next morning 78°, which heat continued till we were to the Southward of Bermuda, whence it gradually increased until between Cuba and St. Domingo, and at Jamaica it was 82°, which appears to me to be the mean temperature of the sea-water about Jamaica."

of the water, which I observed by the thermometer to 77°. This happened in lat. 10° N., and long., by reckoning, in lat. 22° 7', and long. 55°. I was, however, about the middle of August. The rendezvous appointed for the meeting of the American coast, by the French, was 74°, our latitude, and the sea was then in latitude 29° 12'. We were then in latitude 29° 12' N., and long. 55° 12' W. In proportion to the change of the day increased, it being the 26th of April, at half past 8 o'clock, the water, and was greatly surprised to observe it even within the Gulf Stream, the water was 74°. A quick diminution of the heat of the thermometer, at three o'clock, was only to 76°; by 9, the heat was to 71° nearly; all this time the color of the ocean, and to assist in the determination of soundings. According to the lead, at the depth of 100 fathoms, in the course of the following day, and nearer the land, the temperature of the air at the time was 78°. Unfortunately, bad weather prevented us from seeing the sun; but on the 27th, though we were from two altitudes, and found that which we had observed on the 25th, that we had been set many miles to the Southward. On the 25th, at noon, the longitudes of the spot where these observations were made, were 55° 12' Eastward. The ship's run on the 25th was about 10 leagues on a N. W. course, and finding bottom, we were at the depth of 100 fathoms. From these observations I think that the Gulf Stream runs in the month of April, at least to the Northward of the Gulf Stream. As the heat of the water on the 25th, and as the observations on the 27th, I first tried the heat in the morning, and during the night is nearly the same, as it blew a fresh breeze, there was a great deal of time between the two observations, may be estimated at 20 leagues. I think the bounds of the stream of it may be estimated at 20 leagues, including the rocks and the shallow water that extends to the coast, the correspondence of these observations with the known principles of hydrostatics, and the distance from the channel of the heat of the Gulf of Mexico, by comparing it with that of Kingston, in Jamaica, seems to me to be estimated at the same distance.

History of Jamaica, London, 1787, p. 100. I was included in that work, do not appear to me to be the most correct. M. de la Hire's experiments on the heat of the sea, in the month of August, to the 21st of Aug. to the 4th of Sept. indicated by 25° of M. de la Hire's thermometer, according to M. de Luc's calculation.

of the water, which I observed, was such as raised the quicksilver in Fahrenheit's thermometer to $77\frac{1}{2}^{\circ}$. This happened twice; the first time on the 10th of April, in $22^{\circ} 10'$ N., and long., by reckoning, 52° W., and the second time, three days afterwards, in lat. $22^{\circ} 7'$, and long. 55° ; but in general, the heat of the sea, near the tropic of Cancer, about the middle of April, was from 76° to 77° .

The rendezvous appointed for the fleet being off Cape Fear, our course, on approaching the American coast, became North-westward. On the 23d of April the heat of the sea was 74° , our latitude, at noon, $28^{\circ} 7'$ N. Next day the heat was only 71° ; we were then in latitude $29^{\circ} 12'$; the heat of the water, therefore, was now lessening in proportion to the change of latitude. The 25th, our latitude was $31^{\circ} 3'$; although we had thus gone almost 2° further to the Northward, the heat of the sea on this day increased, it being 72° in the morning, and $72\frac{1}{2}^{\circ}$ in the evening. Next day, the 26th of April, at half past 8 in the morning, I again plunged the thermometer into the water, and was greatly surprised to see the quicksilver rise to 78° , higher than I ever observed it even within the tropic. As the difference was too great to be attributed to any accidental variation, I immediately conceived that we must have come into the Gulf Stream, the water of which still retained great part of the heat that it acquired in the torrid zone. This idea was confirmed by the subsequent regular and quick diminution of the heat; the ship's run for a quarter of an hour had lessened the thermometer, at three-quarters after 8, being raised by sea-water, fresh from the sea, only to 76° ; by 9, the heat was reduced to 73° ; and in a quarter of an hour more to 71° nearly; all this time the wind blew fresh, and we were going 7 knots an hour on a North-western course. The water now began to lose the fine transparent color of the ocean, and to assume something of a greenish olive tinge, a well-known indication of soundings. Accordingly, between 4 and 5 in the afternoon, ground was struck with the lead, at the depth of 80 fathoms, the heat of the sea being then reduced to 68° . In the course of the following night and next day, as we came into shallower water, and nearer the land, the temperature of the sea gradually fell to 65° , which was not far that of the air at the time.

Unfortunately, bad weather on the 26th prevented us from taking an observation of the sun; but on the 27th, though it was then cloudy at noon, we calculated the latitude from two altitudes, and found it to be $33^{\circ} 26'$ N. The difference of this latitude from that which we had observed on the 25th, being $2^{\circ} 23'$, was so much greater than could be deduced from the ship's run, marked in the log-book, as to convince the seamen that we had been set many miles to the Northward by the current.

On the 25th, at noon, the longitude by our reckoning was 74° W., and I believe the probability to have been pretty just; but the soundings, together with the latitude, will determine the spot where these observations were made, better than any reckoning from Eastward. The ship's run on the 26th, from 9 in the forenoon to 4 in the afternoon, is about 10 leagues on a N.W. by N. course; soon afterwards we heve to in order to anchor, and finding bottom, we went very slowly all night till noon the next day.

From these observations I think it may be concluded that the Gulf Stream, about $33\frac{1}{2}$ degree of North latitude, and the 76th degree of longitude West of Greenwich, in the month of April, at least 6 degrees hotter than the water of the sea through which it runs. As the heat of the sea-water evidently began to increase in the evening of the 25th, and as the observations show that we were getting out of the current, I first tried the heat in the morning of the 26th; it is most probable that the ship's steering the night is nearly the breadth of the stream, measured obliquely across; as it blew a fresh breeze, could not be less than 25 leagues in 15 hours, the distance of time between the two observations of the heat, and hence the breadth of the stream may be estimated at 20 leagues. The breadth of the Gulf of Florida, which nearly bounds the stream of its origin, appears by the charts to be 2 or 3 miles less than this, excluding the rocks and sand-banks which surround the Bahama Islands, and the shallow water that extends to a considerable distance from the coast of Florida; the correspondence of these measures is very remarkable, since the stream, from the known principles of hydraulics, must gradually become wider as it gets to a greater distance from the channel by which it issues.

If the heat of the Gulf of Mexico were known, many curious calculations might be formed by comparing it with that of the current. The mean heat of Spanish Town in Kingston, in Jamaica, seems not to exceed 81° ;* that of St. Domingo, on the sea-coast, may be estimated at the same, from Mons. Godin's observations;† but as the coast

* *History of Jamaica*, London, 1754, vol. iii. pp. 652, 653. The different observations of the heat recorded in that work, do not agree together, but those adopted here are taken from that in which appeared to me most correct.

† M. de Luc's experiments upon the pendulum were made at the petit grove. They continued from the 21th of Aug. to the 4th of Sept., and the average heat during that time was such as indicated by 25° of M. de Reaumur's thermometer, (see *Mem. Acad. Science*, 1735, pp. 5, 7.) According to M. de Luc's calculation, (see *Modifications de l'Atmosphère*, vol. i. p. 378,) the 25th

of the continent, which bounds the gulf to the Westward and Southward, is probably warmer, perhaps a degree or two may be allowed for the mean temperature of the current over the whole bay; let it be stated at 82 or 83 degrees. Now there seems to be a great probability in the supposition that the sea, at a certain comparatively small distance below its surface, agrees in heat pretty nearly with the average temperature of the air, during the whole year, in that part; and hence it may be conjectured that the greatest heat of the water, as it issues out of the bay to form the stream, is about 82; the small variation of temperature on the surface not being sufficient to affect materially that of the general mass. At the tropic of Cancer, I found the heat to be 77; the stream, therefore, in its whole course from the Gulf of Florida, may be supposed to have been constantly running through water from 4 to 6 degrees colder than itself, and it had lost only 1° of heat, though the surrounding water, where I observed it, was 1° below the supposed original temperature of the water which forms the current. From this small diminution of the heat, in a distance of probably 300 miles, some idea may be acquired of the vast body of fluid which sets out from the Gulf of Mexico, and of the great velocity of its motion. Numerous observations of the temperature of this stream in every part of it, and at different seasons of the year, compared with the heat of the water in the surrounding seas, both within and without the tropic, would, I apprehend, be the best means of ascertaining its nature, and determining every material circumstance of its movement, especially if the effect of the current, in pushing ships to the Northward, is carefully attended to, at the same time with the observations upon its heat.

On the 25th September, 1777, as the ships which had transported Sir William Howe's army up Chesapeake Bay were returning towards the Delaware, with the sick and stores, they were overtaken, between Cape Charles and Cape Henlopen, by a violent gale of wind, which, after some variation, fixed ultimately at N.N.E., and continued five days without intermission. It blew so hard that they were constantly losing ground and driven to the Southward. We also purposely made some Easting, to keep clear of the dangerous shoals which lie off Cape Hatteras.

On the 28th, at noon, our latitude was 36° 40' N., and the heat of the sea, all day, about 65°. On the 29th our latitude was 36° 2'. We had, therefore, in the course of these 24 hours, been driven by the wind 38 nautical miles to the Southward. The temperature of the sea continued nearly at 65°. Next day, the 30th, our latitude at noon, was 35° 41', only 18 miles further to the Southward, though in the opinion of the seamen aboard, as well as my own, it had blown at least as hard on this as on any of the preceding days, and we had not been able to carry more sail; consequently may be concluded that some current had set the ship 20 miles to the Northward. To know whether this was the Gulf Stream, let us consult the thermometer. At half-past nine in the forenoon of this day, the heat of the water was 76°, no less than 11° above the temperature of the sea, before we came into the current.

Towards evening the wind fell, and we stood N.W. by N., close hauled. As the sea still ran very high, and the ship scarcely went above two knots an hour, we did not make less than three points of leeway on this tack. The course we made good, therefore, was W.N.W., which, on the distance run by noon next day, gave us about 16 miles of Northing; but that day, the first of October, our latitude was 36° 22', 38 miles further to the North than we had been the day before; the difference, 22 miles, must be attributed to the Gulf Stream. This, however, is only part of the effect which the current would have produced upon the ship, if we had continued in it the whole 24 hours; for though we were still in the stream at five in the afternoon of the 30th, as appeared by the heat of the water, being then above 75°, and at eight in the evening the heat being still 74°, yet by seven the next morning we had certainly got clear of it, the heat of the sea being then reduced to its former standard of 65°. On this occasion, therefore, we did not cross the stream, but having fallen in with it obliquely on the west side, we pushed out again on the same side, as soon as the gale abated.

These observations having been made 3° to the Northward of my former ones, it is curious to observe that the heat of the Gulf Stream was 2° less. The seasons of the year, indeed, were very different; but perhaps, under such circumstances, that their effects were nearly balanced. In the latter observations, the meridian altitude of the sun was less, but then a hot summer preceded them; whereas, in the former, though the

degree of Reaumur's TRUE thermometer answers to about the 75th of Fahrenheit's, but the average heat in Jamaica, during the months of Aug. and Sept., is also 75°; hence we may conclude that the mean heat for the whole year is nearly the same on the sea-coasts of both islands. The lowest calculation of the mean temperature of the gulf is preferred on this occasion, because of the constant influx of new water from the Atlantic Ocean, produced by the Trade Winds, which water, not having been near any land, must, I think, be sensibly colder than which has remained some time inclosed in the bay. On this subject, the observations made by Alexander Dalrymple, Esq., relative to the heat of the sea, near the coast of Guiana, ought to be consulted.—See Phil. Trans. vol. lxxviii., p. 394, &c.

was become very great, yet the winter has been passed but a short time. Calculating upon this proportion, we may be led to suspect that about the 27th degree of latitude, which is as soon as the stream has got clear of the Gulf of Florida, it begins to lose its heat from 82° , the supposed temperature of the Gulf of Mexico, and continues to lose it at the rate of about 2° of Fahrenheit's scale to every 3° of latitude, or some variation, probably, as the surrounding sea and the air are warmer or colder in different seasons of the year.

The preceding facts had made me very desirous of observing the heat of the Gulf Stream on my passage homeward, but a violent gale of wind, which came on two days before we had sailed from Sandy Hook, disabled every person on board, who knew how to handle a thermometer, from keeping the deck. The master of the ship, however, a very intelligent man, to whom I had communicated my views, assured me, that on the second day of the gale the water felt to him remarkably warm; we were then near the 45th degree of West longitude. This agrees very well with the common remark of the sailors, who allege that they are frequently sensible of the Gulf Stream off Nantuxet Shoals, a distance of more than 1000 miles from the Gulf of Florida. According to the calculation I have before adopted, of the loss of 2° of heat to every 3° of latitude, the temperature of the Gulf Stream here would be nearly 73° , the difference of which from 59° , the heat that I observed in the sea-water both before and after the gale, might easily be perceived by the master of the vessel. This was in the winter season, at the end of December.

The opinion prevails among seamen, that there is something peculiar in the weather in the Gulf Stream. As far as I could judge, the heat of the air was considerably raised by it, as might be expected, but whether to a degree or extent sufficient for producing any material changes in the atmosphere, must be determined by future observations.

Perhaps other currents may be found, which, issuing from places warmer or colder than the surrounding sea, differ from it in their temperature so much as to be discovered by the thermometer. Should there be many such, this instrument will come to be ranked amongst the most valuable at sea, as the difficulty of ascertaining currents is well known to be one of the greatest defects in the present art of navigation.

In the mean time, I hope the observations which have been here related are sufficient to prove that, in crossing the Gulf Stream, very essential advantages may be derived from the use of the thermometer: for if a master of a ship bound to any of the Southern coasts of North America, will be careful to try the heat of the sea frequently, he will discover very accurately his entrance into the Gulf Stream by the sudden increase of heat; and a continuance of the same experiments will show him with equal exactness how long he remains in it. Hence he will always be able to make a proper allowance for the number of miles a ship is set to the Northward, by multiplying the distance into the velocity of the current. Though this velocity is hitherto very imperfectly known, from want of some method of determining how long the current acted upon a ship, yet all uncertainty arising from thence must soon cease, as a few experiments on the heat of the stream, compared with the ship's run, checked by observations of latitude, will ascertain its motion with sufficient precision. From differences in the wind and perhaps other circumstances, it is probable that there may be some variations in the velocity of the current; and it will be curious to observe whether these variations may not frequently be pointed out by a difference in its temperature, as the quicker the current moves the less heat is likely to be lost, and consequently the hotter will the water be. In this observation, however, the season of the year must always be considered, partly because it may perhaps in some degree affect the original temperature of the water in the Gulf of Mexico, but principally because the actual heat of the stream must be greater or less in proportion as the track of the sea through which it flows was warmer or colder. In winter I shall suppose that the heat of the stream would be rather less than in summer, but that the difference between it and the surrounding sea would be much greater; and I conceive that in the middle of summer, when the stream had lost very little of its original heat, yet the sea might, in some places, acquire nearly the same temperature, so as to render it scarcely possible to distinguish the thermometer when a ship entered into the current.

Ships may with safety avoid the eddy of the gulf, or make allowance for it in their calculations; that is, if they cannot help falling into them, after they have taken all precautions by soundings in blue water, and when they had bottom, stood off, they may naturally subtract what longitude they make in the eddy from what they had in the stream, and begin a new departure, being at the same time very precise in their morning and meridian observations. Many ships bound through the Strait of Florida, unacquainted with the stream's eddy, and ignorant also of the soundings being in blue water, have been lost in fair weather. They were swept insensibly by the eddy to the Westward, and when they found by their calculations that they had

a sufficient offing East of Cape Florida, they stood North, and instead of entering the strait, ran directly upon a reef.

If, with adverse Northerly, Easterly, or N. E. winds, vessels happen to be in the mouth of the Gulf of Mexico, that is, between the Havana and Cape Florida, they had best endeavor to make the Bahama Islands, or at least the soundings of them, and proceed under the lee side; but when they are to the North of them it is best to keep in the Eastern extent of the stream, or else they will not be able to clear their way through the strait, nor along the coast of East Florida, and may get on shore upon the reef, either of Cape Florida or Cape Canaveral, if not upon the bench between the two capes, which is the least evil of the two; for thus the crew and cargo may be saved, and some vessels may also be brought off, provided the storm ceases before the vessel is made a wreck of. But if at any time of the South sun, or at any other time, the wind are Westwardly, then the Atlantic coast affords the most eligible lee for navigation, who do not choose to take the stream; but if the current in the gulf is Westwardly, it will greatly facilitate the progress, when bound to the Northward.

Speaking of the GULF STREAM, Mr. Romans,* whose surveys of the coast of Florida reflected great credit on him, says: "The All-gracious Ruler of the Universe has so disposed the several shores of this mazy labyrinth, as to cause this current to run in a direction N. E., and at the rate of 3 and $3\frac{1}{2}$ miles in an hour; by which means we are enabled better to avoid the imminent dangers of the reef, where it comes a lee shore; for the violence of the Easterly gales beats the gulf-water over the reefs, so as to destroy the effect of flood-tides, by causing a constant reverberating current from the shore over the reef, inasmuch that a vessel riding under the reef will with her stern to windward.

"I once came out from Matcumbe, and was scarcely clear of the reef before I was overtaken by a gale from the Eastward, which was very violent. It was 5 o'clock in the evening, and it being dark, to attempt a re-entrance of the reef, I was forced to heave the vessel to, which I did under the balanced mainsail; she was a heavy schooner of about 70 tons, and a dull sailer. The succeeding night I passed in the deepest distress of mind, seeing the breaking of the breakers in constant succession on the reef till past one o'clock; the storm continued till ten the next morning, when I made sail for the Northward, and at noon, to my utter astonishment, I had an observation of the sun's altitude, which proved me to be in $26^{\circ} 50'$ latitude, by which I had made a distance of latitude of 118 miles, in the short space of 19 hours, 17 of which I lay to.

"I am an utter enemy (continues Mr. Romans) to all theoretic and systematical positions, which has caused in me an indefatigable thirst for finding, in my experience, causes for all extraordinary appearances, be they what they may. And my experience has shown me that the position of the cause of the increase of the velocity of this current, during the gale, that blow contrary to its direction, is no other than the reverberating current occasioned by the swelling of the water within the reef, which in the memorable gale of October, 1769, when the *Ledbury* was lost, was no less than 30 feet above its ordinary level."

Besides the convenience of correcting a ship's course, by knowing how to make a proper allowance for the distance she is set to the Northward by the current, a method of determining with certainty when she enters into the Gulf Stream, is attended with the further inestimable advantage of showing her place upon the ocean in the most critical situation; for, as the current sets along the coast of America, at places on soundings the mariner, when he finds this sudden increase of heat in the sea, will be warned of his approach to the coast, and will thus have timely notice to take the necessary precautions for the safety of his vessel. As the course of the Gulf Stream comes to be more accurately known, from repeated observations of the heat and latitudes, this method of determining

* Mr. Romans observes, "If, by keeping to the Northward, the current of the Mexican Gulf has set you on soundings on Tortugas Shoal, these soundings, in foggy weather, may be your guide, being properly laid down in the chart. You do not change the color of your water, you get well in with the shoal, but there is generally an eddy-current so soon as you are on soundings; therefore, if you stand over to the Florida shore, so soon as you are up to the tide of $23^{\circ} 25'$, keep as much to the Eastward as N. N. E. or N. E. by N., till you get soundings. And, whatever terrible idea people may have of that shore, if the wind will allow you, be on board, especially in the autumn and winter seasons, when the N. and N. W. winds are frequent, and the current often runs to leeward. In these seasons, you may take an advantage of the tides on soundings, by carefully observing their times; and this conduct will tend to shorten your passage. When, however, you are got as far windward as the South of Matcumbe Reef, endeavor to get all the Easting you can possibly acquire, in order to get to the Bahama shore on board, which is the most eligible in going Northward. The proximity of the Reef of Florida will manifest itself clearly in daylight by the white color of the water, thus there may be no danger in approaching it—but this is far from being the case at night, when it ought to be carefully avoided, and the lead kept constantly going; because, from soundings to the distance of 2 miles without the steep part of it, they will show the proximity of danger."

the ship's place will be of great importance from the mouth of the Delaware, and beset with frequent storms, which has hitherto prevented these observations from being of their preservation up

from the superior elevation of the land, which has a declivity, or tendency to an off-set of the stream, frequently, to the Eastward of the Eastern range of the Bahama Islands. W. wind, we have no doubt of returning to Jamaica by the parallel of 30° N., which brought her on the meridian of the reef, but an Easterly current, which was the cause, Captain Manderson, says, "If it were once ascertained, might it not be favorable generally in the summer months. The ship's name, Captain J. Livingston, that he had been on the time of his departure, and the Passages; but this may have crossed too obliquely, and was bound from Northward in a run of thirteen days, and the current had set the ship to the Eastward. Captain Hall, in the brig *Ledbury*, thought that he had run through the Gulf Stream, as I am informed, passed the reef, and made the Mona."

Captain Romans, before quoted, says, "The color of the water gradually changing, as it approached the reef, was a deep blue to a beautiful green, under the blue-colored water, on the said narf, you meet with sometimes banks of white marl, with banks of red sandstone, and white sandstone, in the direction from that of the reef, and the soundings of the eddy, particularly in the Hawke Channel, run from the Northward of the reef, to 12 or 11 fathoms. The reef is

In addition to the above notices, it is to be observed, that, about thirty years ago, a vessel was bound to the Northward of the Bahamas; and, in the night, she was driven to the Northward of the reef, and was blown up my own plan, run out to the aid of this off-set. This is in the Southern parallels of the Gulf Stream; and I know that they

These notices tend to prove the utility of the Gulf Stream, and the advantage of the Northward of the Bahamas; and, in the night, she was blown up my own plan, run out to the aid of this off-set. This is in the Southern parallels of the Gulf Stream; and I know that they

These notices tend to prove the utility of the Gulf Stream, and the advantage of the Northward of the Bahamas; and, in the night, she was blown up my own plan, run out to the aid of this off-set. This is in the Southern parallels of the Gulf Stream; and I know that they

Captain Thomas Hamlin, in the year 1811, was bound to the Northward 101 miles in the 24 hours, and was in $23^{\circ} 50'$ W. To the North-

the ship's place will be proportionably more applicable to use. And it derives its importance from the peculiar circumstances of the American coast, which, from the mouth of the Delaware to the Southernmost point of Florida, is everywhere beset with frequent shoals, running out far into the sea. The Gulf Stream, therefore, which has hitherto served only to increase the perplexities of seamen, will, if these observations are found to be just in practice, become one of the chief means of their preservation upon this dangerous coast.

Off-set from the Gulf Stream.

From the superior elevation of the Gulf Stream, its water, about the Bahamas, appears to have a declivity, or tendency to the Eastward; and there is reason to believe an off-set of the stream, from without the Maternillo Bank, sets, if not generally, frequently, to the Eastward and S.E. With the usual set of the currents along the Eastern range of the Bahama Islands, we are not accurately acquainted; but, with a W. wind, we have no doubt that it is in a S.E. direction. The *Europa*, a ship of 1000 tons, returning to Jamaica by this passage, from a cruise off Havana, in 1787, steered on the parallel of 30° N., with a Westerly wind, until the run was supposed to have brought her on the meridian of Turks Islands, by which it was intended to pass to the Eastward, but an Easterly current had swept her along as high as that of the Mona Passage. Captain Manderson, of the Royal Navy, who first noticed this event, observed, "If it were once ascertained that a current was common in that part of the sea, might it not be favorable for vessels bound from Jamaica to the Caribbean Islands, especially in the summer months, during the prevalence of the sea-breezes?"

The ship *Fame*, Captain J. W. Montearth, a good lumbarian, assures me, "says Captain Livingston, "that he had been carried three degrees and upwards to the Eastward, soon after the time of his departure from the American coast and making the Windward Passage; but this may have been partly occasioned by the Gulf Stream, which may have crossed too obliquely in proceeding from Norfolk." The *Fame* above mentioned was bound from Norfolk, in Virginia, to Kingston, Jamaica, in May, 1816; and in a run of thirteen days, until in the latitude of 29°, and longitude 61°, it was found that the current had set the vessel 3° 10' E.

Captain Hall, in the brig *Lowland Lass*, passed to windward of Porto Rico, when he thought that he had run through the Mona Passage. Captain Patterson, of the *Clyde*, as I am informed, passed down the Anegada Passage, when he intended to make the Mona."

Captain Romans, before quoted, says, "Within the edge of the stream is a smooth surface, gradually changing, as it approaches Hawke Channel and its islands, from the sea's deep blue to a beautiful sea-green, and at last into a milk white. The soundings under the blue-colored water, are generally on a fine white marl; under the sea-green, on the said marl, you meet with sponge, white coral, sea-feathers, turtle-grass, and sometimes banks of rocks; and under the white-colored water the soundings are white marl, with banks of rocks, or white sand. The eddy takes its current in an opposite direction from that of the contiguous stream, viz., South-westerly."

The soundings of the eddy, provided no reef be in the way between the stream and the Hawke Channel, run from 20 fathoms to 2½; and when the reef divides the stream and the Hawke Channel, the soundings, in some places, are from bottomless at 12 or 11 fathoms. Hawke Channel is the channel between Florida Reef and the

In addition to the above notices, I have been assured, by an intelligent Spanish navigator, that, about thirty years since, vessels bound from Havana to Europe, used generally to cut off three degrees of longitude from their reckoning on account of this eddy, which, he said, was considered then as certainly existing. At that time the charts were about a degree wrong, which would reduce the Spaniard's allowance to two degrees, or thereabout.

These notices tend to prove that an Easterly off-set from the Gulf Stream sets to the Northward of the Bahamas; of this I am so firmly convinced, that if in charge of a ship from the Havana, or even New Orleans, bound to Jamaica, I should, if allowed to follow my own plan, run out the Strait of Florida, and attempt making my passage to the aid of this off-set. This is to be understood in case I should not have Westerly winds in the Southern parallels; for such winds are, I am told, more frequent than Easterly; and I know that they are by no means of rare occurrence on the S.W. of

Captain Thomas Hamlin, in the brig *Recovery*, then in the Gulf Stream, was set to the Eastward 101 miles in the 24 hours of the 20th of March, 1820. The ship's place at noon, was 28° 50' N., 79° 50' W. To the North-eastward, on the next day, without the stream, in lat. 29°

1st. Because, in open sea, it nowhere assumes the *form* of an eddy; but, when unobstructed by violent winds, pursues its course towards the South-west, parallel to the general direction of the coast.

2d. Because, on the edge of the Gulf Stream on this coast, there are no obstacles present which could divert the progress of a portion of the stream, or circumscribe the same in eddies.

3d. Because, if this current was derived from the Gulf Stream, it must necessarily partake of its temperature, as above suggested; but the sudden reduction of temperature on leaving the margin of the Gulf Stream is most remarkable, and is almost unparalleled, except in the immediate vicinity of ice.

We shall in vain attempt to explain this extraordinary change of temperature by the proximity of shallows or soundings, for this cannot avail if the water itself be derived from the Gulf current, to say nothing here of the general unsoundness of this explanation.

There have long since become satisfied that the current in question is neither more nor less than a direct continuation of the polar or Labrador current, which bears Southward the great stream of drift ice from Davis' Strait, and which, in its progress to the lower latitudes, is kept in constant proximity to the American coast by the same dynamical law of influence which, in the Northern hemispheres, causes all currents which pass in a southerly direction to incline to the Westward, in consequence of the increasing rotatory velocity of the earth's surface in the opposite direction, as in the case of the Trade Winds in the lower latitudes.

In collating the observations of various navigators, we find reason to conclude, that, in ordinary states of weather, this current may be traced from the coast of Newfoundland to Cape Hatteras, and perhaps to Florida, the reflux influence which sometimes follows a violent gale being of short duration.

According to this view of the case, the Gulf Stream, in its course from Florida to the bank of Newfoundland, is in part imbedded upon a colder current which is setting in the opposite direction, in its progress from the polar regions. The impulses by which these opposite currents are maintained, being as permanent and unchanging as the diurnal rotation of our planet, their opposite courses on this coast, while in contact with each other, are no more surprising or inexplicable than those of two opposite currents of atmosphere moving in the same manner, and the latter are often known to maintain opposite courses for a long period and at high velocities.

From the fact that these great currents have their origin, one in the tropical and the other in the polar seas, their presence can be determined, in most cases, by means of the thermometer; and with the aid of good chronometers, their position and extent may be ascertained with greater certainty than has yet been done, particularly in the latitudes between Nantucket and Florida. In this department of hydrology every navigator may contribute something of value to his profession and to science, for which other qualifications are required than frequent observations and proper attention to the ship's place. It is desirable, therefore, that every shipmaster who traverses this region should make and record his observations hourly upon these currents.

The drift ice from the polar basin is all found in the Western portion of the Arctic and North Atlantic oceans, notwithstanding the influence of violent Westerly winds. A writer in the London Nautical Magazine* supposes that a portion of the polar current, after bearing the ice along the Eastern edge of the Grand Bank into the Atlantic, there becomes exhausted, or joins the Florida Stream. By its action, the great stream of ice undoubtedly thus brought within the dissolving influence of the Gulf Stream, at the Grand Bank itself, perhaps, owes its origin to the deposits which have resulted from this process during a long course of ages. But this portion of the polar current probably "joins" the Gulf Stream in no other manner than by intruding upon and passing under the same, the order of super-position being determined by the diversity of temperature, or by the deeper position of the polar stream.† The icebergs being thus carried Southward by the deeper polar current, their rapid destruction is here effected by the water of the Gulf Stream, and we are thus relieved from these dangerous obstructions, which would otherwise be found in the lower latitudes of the Atlantic. These two streams of current, therefore, do not coalesce in any proper sense, as like other currents, both atmospheric and aqueous, pursue each its determinate course, the Gulf Stream being thrown Eastward by the greater rotative velocity which is required in latitudes nearer the equator, and the polar current being thrown West-

*Nautical Magazine for March, 1837, p. 139. He states that between 42° and 43° West is the furthest Easterly position in which floating masses of ice have been found; but we have seen that they sometimes extend to longitude 39°.

†For an account of the ice of the North Atlantic, see Blunt's Memoir of the Dangers of the North Atlantic.

NOTES ON THE GULF STREAM.

BY A. D. BACHE,

Superintendent of the U. S. Coast Survey.

(Revised to 1854, and communicated by authority of the Treasury Department.)

The developments made by the Coast Survey in the summer of 1853, in relation to the Gulf Stream, requiring a revision of the notes to bring them up to date, I have at the request of Mr. Blunt, and by authority of the Treasury Department, embodied the new observations with the former ones and communicated them for publication, that navigators may be benefited by the extensive circulation which they will receive in this form.

The Gulf Stream and the approaches to it have been explored in the progress of the survey of the Coast between the limits of a line perpendicularly across it from Cape Cod, whether from Cape Annoveral, the observations generally extending from about 42° N. latitude to about 28½°; and from about 65° W. Longitude to 80½°. The observations were made under detailed instructions from the Superintendent, by the following named officers of the Navy, Assistants in the Coast Survey:

1. By Lieut. Comdr. C. H. Davis, who examined in 1815 the Section from Cape Cod, and extended to the southward and westward of it, by Lieut. Comdr. Geo. M. Bache, who in 1816 explored the Sections perpendicular to the Stream from Sandy Hook, from Cape Cod, and from Cape Charles; by Lieut. Comdr. S. P. Lee, in 1817, who explored the Cape Cod Section; by Lieut. Comdr. Richard Bache, in 1818, who repeated the observations of the Cape Charles Section, and explored the Hatteras Section; by Lieut. Comdr. E. N. Mott, in 1823, who went over the Hatteras observations, and examined the Section from Cape Fear, and from Charleston; and by Lieut. Comdr. T. A. Craven, during the same year, who explored the Charleston, St. Simon's, St. Augustine, and Cape Annoveral Sections, and several other positions towards Cape Florida.

The different sections of the Stream were designed to be perpendicular to its axis from prominent points of the Coast, at such distances from each other as would insure a thorough knowledge of its whole course. It was foreseen that the surface observations would be comparatively little value, from the varied character of the circumstances to which the surface water is exposed, and the observations were accordingly carried to considerable depths. I propose to give the general distribution of the temperatures shown by several sections, and to connect with this, remarks on other points developed by the observations.

1st. The Ocean within the region of the Gulf Stream is divided into several bands of hot and lower temperature, of which the axis of the Gulf Stream is the hottest, the temperature falling rapidly in shore, and more slowly outside. This is not only the case on the surface, but with modifications, early understood, at considerable depths. It is presented in the annexed Diagram (No. 1), showing the distribution of temperature on the Sandy Hook Section at the depth of fifteen fathoms, from the observations of Lieut. Comdr. M. Bache. The scale of nautical miles on top shows how far the several points are from Sandy Hook. The scale at the side shows what the thermometer, with Fahrenheit's scale, would read if let down fifteen fathoms at the several positions marked at the top. The thermometer say at Position I, 100 miles from Sandy Hook, let down fifteen fathoms would mark 63°; at III, 150 miles would mark 67°; at 210 miles 63½°; and at 280 miles 61°.

When the curve rises, the thermometer would rise, and vice versa. Three points, marked a, b, and c, decidedly warmer than those on either side of them are seen; the warmest is on the axis of the main Gulf Stream. There are four points of low temperature, lower than those either inside or outside of them. The changes on the Cape May Section are more strongly marked, the curve of fifteen fathoms being dotted on the same diagram and including a fourth point of high temperature, d. The curve of one hundred fathoms on the Cape May Section is added, as showing how boldly these features present at considerable depths.

The curve of twenty fathoms on the Charleston Section in the Diagram (No. 2), shows the same thing. The curves deduced from the mean of observations at two hundred and three hundred fathoms give a similar result. These cases are mere illustrations of the general fact.

These bands are also shown in the sketch A, where the dark shades correspond to the warm bands, and the light spaces to the cold ones.

2d. Among the cold bands is one so much colder than the rest as to be very remarkable: it is that next inside of the axis of the main stream, and the change of temperature between it and the stream is so abrupt that Lieut. G. M. Bache called the space the "cold wall," the cold water appearing to confine the hot water as by a wall on the in-shore side. The Sandy Hook Diagram (No. 1), shows it between 230 and 280 miles from the shore, the Cape May between 132 and 178 miles from the shore; the rise in the first curve is from $62\frac{1}{2}^{\circ}$ to $80\frac{1}{2}^{\circ}$, eighteen degrees in fifty miles; in the second from 62° to $83\frac{1}{2}^{\circ}$, or $21\frac{1}{2}^{\circ}$ in forty-six miles. At Charleston the rise in the twenty fathom curve is from $67\frac{1}{2}^{\circ}$ to 79° in fifteen miles; at St. Simon's from 70° to 76° , in twelve miles. The rate is between four-tenths and eight-tenths of a degree to the mile.

Of the cold band inside of this I shall speak again. The two outside ones, though characterized by much smaller differences of temperature than between the axis and the cold wall band, are sufficiently marked, and should be known, because in crossing the stream after warm water is met with to find cold, then again warm, then cold, would baffle the navigator who was looking for no such alternations, and would greatly instruct him if he knew what to expect.

3d. The alternate cold and warm bands are represented on the chart A from a first discussion of the Coast Survey observations. Their position may be somewhat changed by a more complete discussion. The line which crosses the Sandy Hook Section at A is the axis of the Gulf Stream, taking the general directions of the bends of the coast, rather than those below than above water, and thrown quite eastward by the shoals off the Southern Coast of New-England. We have not yet traced it further than is shown in the diagram, but of course propose to do so. We know, however, that one branch reaches the shores of Ireland, parting with its heat as it goes, but remaining enough to reproduce there, as Prof. Harvey, of Dublin, has remarked, the algae of the Florida Coast. The shading upon the map is intended to represent the higher temperatures by the deeper shades.

The axis of the next warm band, which is well made out in the observations, crosses the Sandy Hook Section at C. It is not certain whether G. on the Charleston Section, connects with it or not: the more probable supposition is shown on the Chart, leaving future observations to settle the point; the bands M and L are perfectly well defined from St. Augustine to Charleston. There was another pair of cold and warm bands noted on the Cape Henry Section, and shown on the diagram, between the hot water of the Gulf Stream, and the band which, north of this, is the first cold band outside.

There is an axis of warm water distinctly shown on the Cape May and Hatteras Sections, beyond the last ones inserted on the Chart, but its position is not well determined. Warm water was found on the Cape Henry and Hatteras Sections, as far E. and S. as shown on the diagram.

Inside of the Gulf Stream, marked by E, a band of warmer water than the surrounding ocean, shows itself before striking soundings to the north, but afterwards on the southern coast. This is well marked by the observations on all the Sections, though its position not so well determined as the others.

The axis of the most marked cold band, the minimum of temperature which forms the "Cold Wall," follows the shore and shoals in its bendings, even more closely than the axis of the Gulf Stream. This is traced from our observations beyond the range of the other lines, with considerable probability, to longitude 66° .

The two axes of cold water outside are marked, where they cross the Sandy Hook Section by the letters D and F. Beyond the last of these many of the Sections show a line of minimum temperature, on striking soundings, but its position is not well determined.

North of Hatteras, the Sections show another line of minimum temperature, on striking soundings, of from one hundred and fifty to seventy-five fathoms.

4th. To understand this distribution of temperature, it must be remembered that the warm water of the Gulf Stream rests on a cold current from the north, flowing toward Cape Florida, the coldest water keeping near the Atlantic Coast, below the surface, if not at it. The following table will prove this, though it contains but a few of the very numerous observations.

TABLE,

SHOWING THE TEMPERATURE BELOW THE SURFACE AXIS OF THE GULF STREAM, AT FOUR HUNDRED FATHOMS, FROM SANDY HOOK TO CAPE FLORIDA. THE TEMPERATURE OF THE SURFACE CORRESPONDING TO THESE TEMPERATURES BELOW, EXCEEDED 80° .

At 1000 fathoms off

the warm water of the Gulf Stream, and in different parts of the cross-sections, the water is found to be warmer than the cold. The way in which the Sandy Hook Section, was made, is shown in the diagram. All the water above the surface, between the points f g h i k, is between the surface and the bottom, and is forced up by a bank or ridge of warm water, there is of course a counter-current which lies on the bottom, and the north prevails on the surface. At thirty fathoms, the temperature was 60° , bottom 74° at the surface, and in fifty fathoms the temperature in that order. One hundred and eighty fathoms of the axis of the Gulf Stream was 67° , at ten fathoms, 60° , and $52\frac{1}{2}^{\circ}$, diminishing in the direction of the cold counter-current which prevails north of Hatteras. We have no doubt, however, probable, from the observations, that the counter-current still prevails south of S. E. of Charleston Light, the temperature being 75° , and that at twice the distance from this point to the surface the water extends to the very bottom, and was found desirable, if not necessary, to solve one of our problems at a time, and to show a general tendency, besides the onward current, to the right and left of it. To the right and left of it, the cold wall, is inward and outward, and to the south of it, the current is in the axis of the Stream, and is found to be one mile per hour. The observations of this year, show that south of it, the bands of cold water are in the sea. The Diagram (No. 1) shows that Lieut. Matlit carried soundings to 600 fathoms for 32 miles, and then on to the limits of the Section on the Diagram, sloping to 100 fathoms, and falling off to 50 fathoms, was on an elevation of 100 fathoms, but rising three hundred fathoms, then another elevation, of 100 fathoms. This ridge was observed by Lieut. Matlit's observations on the next two Sections, and was aware of the previous character of the curve of temperature of 700 fathoms, and the shape of the bottom, and in it is entirely independent of the surface. At any depths at the same position, the temperature of 62° has but a single irregularity, and cause the cold streaks

At 1000 fathoms off Cape Hatteras, the temperature was but 40

The warm water of the Gulf Stream is of very different depths at different points of its course, and in different parts of any one of the Sections across it. From the deepest portions of the cross-sections, the warmer water flows off towards the shore and outwards, carrying the cold. The way in which it thins off is seen in the annexed Diagram (No. 3), on the Sandy Hook Section, where the curves of 80°, 75° and 70° of temperature are shown. All the water above the curve a b c d e, is above the temperature of 80°, so between the curve f g h i k, is between 75° and 80°. This thins out as it approaches the shore; the warmer water which lies on the bottom coming up in the northern Sections, but the warm water being to the very shore, and at considerable depths, in the southern. When the cold water is forced up by a bank or shoal, or when it comes to the surface from the thinning of the warm, there is of course a considerable change of temperature. This cold water of the north prevails on the inside of the cold axis at moderate depths, as far south as the Cape Fear Section.

At thirty fathoms, twenty nautical miles from Hatteras Light, in August, 1853, the temperature was 60°, bottom being found at thirty-three fathoms. At twelve miles from Hatteras, the temperature was 71° at the surface, and in five and ten fathoms, the bottom being at eighteen fathoms, the temperature in that Section, and at that time, in the axis of the Gulf Stream, was 82°. One hundred and eight miles from Sandy Hook, in August, 1846, the temperature in the axis of the Gulf Stream being 84°, the surface temperature was 71½°, at five fathoms, 67°, at ten fathoms, 66°, at fifteen fathoms, 63°, at twenty, 58°, and at thirty fathoms, 52½°, diminishing in the first fifteen fathoms 6½°, and in the second 12½°. This cold counter-current which gives character as well as motion to the water near the shore north of Hatteras. We have seen that the cold wall is not cut off at Hatteras, and is rather probable, from the observations of Lieut. Com'r Matlit's party this year, that the counter-current still prevails south of Hatteras. Acting-Master Jones found it about thirty miles S. E. of Charleston Light, running to the S. W., or along the shore, the surface temperature being 75°, and that at twenty fathoms, 68°, and in the axis of the Gulf Stream, 82°. The distance from this point to the axis was about twenty-three miles, so that moderately warm water extends to the very bottom.

It was found desirable, if not absolutely essential, to direct special attention to the question of one problem at a time, our results for currents are not numerous, but they are sufficient to show a general tendency near the surface from the axis of the Gulf Stream towards the shore, besides the onward current.

The direction of the axis of the Stream shows, therefore, the set of the current in that direction. To the right and left of it, the current is outward and onward, and to the left as well as the cold wall, is inward and onward. Inside of the cold wall, north of Hatteras, and to the south of it, the current is to the southward, or along the coast. The rate of the current in the axis of the Stream, on the Cape Canaveral Section, is about three nautical miles per hour, on the Cape Fear Section about two miles, and on the Sandy Hook Section about one mile per hour.

The observations of this year have fully proved that in the Charleston Section, and to the south of it, the bands of cold and warm water are produced by the shape of the bottom of the sea. The Diagram (No. 4) shows this shape on the Charleston Section. The soundings of Lieut. Matlit, carried soundings 68 miles from Charleston Light, and after losing 100 fathoms for 32 miles, sounded in three hundred fathoms, then in 550 fathoms, then in the limits of the Section, 210 miles. This gives a section of the bottom, as shown in the Diagram, sloping gradually to twenty fathoms, then more rapidly to one hundred fathoms, and falling off suddenly. The next sounding, thirty miles from the one hundred fathoms, was on an elevation sloping rapidly on the in-shore side, less steep on the out-shore side, but rising three hundred fathoms above the bottom eleven miles southward and inland, then another elevation, and then onward as if tracing some of the hills and valleys of the inland. This ridge was discovered independently by Lieut. Craven, within two miles of a half of Lieut. Matlit's first finding it on the Canaveral Section, struck again by Lieut. Craven in the next two Sections, and again, just north of this, on the Charleston Section, without being aware of the previous discovery.

The curve of temperature of 57°, traced on this Diagram (No. 4), follows with great regularity the shape of the bottom, which is the more remarkable that every observation made in it is entirely independent of every other, and that the results of many positions at many depths at the same position are concerned in the tracing of that curve. The curve of 62° has but a single irregularity. These elevations force up the cold water into the warm, and cause the cold streaks and the division into warm and cold bands. There is

ADDITIONAL REMARKS.

In addition to the foregoing, the following general facts may be stated:—

1. That in the summer, the temperature of the Gulf-water, South of Hatteras, is about the same as the water on soundings. In the months of July and August, 1845, the temperature of the water from the Mississippi to Cape Hatteras, both in and out of the stream, even to the very mouth of the Atlantic rivers, was 81° to 82°. This fact was ascertained by journals kept for the editor.

2. That the temperature of the Gulf South of Hatteras to Savannah, in the winter months, is from 72° to 75°; and that on soundings within the same limit, at the same time, 59° to 68°, and North of Hatteras, 48° to 61°; showing a difference of from 11 to 5 degrees higher to the South of the cape.

3. The general direction of the Gulf Stream, from Key Biscayne until it gets to lat. of 31° 40', is North, velocity 3 to 34 knots; from thence it turns to the N. N. E. and as it progresses to the North, it turns more to the N. E. On the Western edge of the Stream the Gulf-weed is mixed with the river sedge; on the Eastern edge it is clean as when first torn from the rocks. It appears from a notice in the Nautical Magazine, that some of the weed grows on the shores of the Andros Islands.

4. The Western edge, from Key Biscayne to lat. 31° 40' N., is generally on the meridian of 80°; the Eastern edge, after passing the Little Bahama Bank, is about 10 miles to the Eastward, when it is turned more to the Eastward. This, however, is in moderate weather. During heavy gales from the N. E. to the S. E., the stream is forced immediately on and over the shoals of the capes of North Carolina; and when N. W. and Westerly gales, the stream is driven from the shore, and no limit within miles can be fixed to it; and under such circumstances the warm water of the Gulf is displaced, so that at times there will be no current in the warm water, and current in the cold water.

5. The edges, in moderate weather, are shown by the rippings in the low latitudes and in the high latitudes, during the winter, with Northerly weather, by the evaporation from the surface.

6. The precise part where the stream begins to form is not known. It is shown, however, under the general article of "Currents," that the current sets to the W. N. W. or N. W., over the Campeche Bank; and that at a short distance West of the Tortugas the current sets to the S. S. E.; but where the proper head of the current is, is yet to be found.

7. On the Western side of the Gulf Stream, from Sandy Hook to Hatteras, the current sets South, a little Westerly, about 20 miles in 24 hours.

8. On the Eastern side of the Gulf Stream, nearly down to Matamilla Reef, the current sets to the South and West, almost opposite to the flow of the Gulf, at an average of 20 miles in 24 hours; the New Orleans steamers take advantage of it by crossing the Gulf stream near Hatteras, and from about 33° 30' N. lat., 74° 30' W. long., sailing directly for Matamilla Reef.

Of the Stream to the Eastward of the Coast Survey examination we want definite information. The following is the most accurate observation we have:

Ship Trade Wind, on the 26th of June, at 4h. 30m. p. m., came in contact with the ship Olympus, and both vessels went down in lat 41° 30', long. 57°. On the 1st of July, 2h. 30m. p. m., the ship Empire took a sailer from the foremast of the Trade Wind, in lat. 42°, long. 55° 30', showing that the mast had drifted 72 miles on a N. E. true course, in 104 hours, making $\frac{72}{100}$ of a knot, nearly, an hour.

TIDE TABLES,

for the use of Navigators; prepared from the Coast Survey Observations by A. D. Bache, Superintendent.

[By authority of the Treasury Department, to G. & C. W. Blunt, New York, and revised Jan., 1857.]

The following Tables will enable navigators to ascertain the time and height of high water in some of the principal ports of the United States. The results are approximate, the observations being still in progress, but they may safely be used for general purposes. The number of places of observation, and the time during which of them have been made, are steadily on the increase as the coast survey progresses.

The tides of the coast of the United States, on the Atlantic, Gulf of Mexico, and Pacific, are of three different classes. Those of the Atlantic are of the most ordinary kind, ebbing and flowing twice in twenty-four hours, and having but moderate difference in height between the two successive high waters, or low waters; one occurring before noon, and the other after noon. Those of the Pacific coast also ebb and flow twice during twenty-four hours; but the morning and afternoon tides differ very considerably in height—so much so, that at certain periods a rock which has three feet of water upon it at low tide, may be awash on the next succeeding low water. The intervals, too, between successive high and successive low waters may be very unequal. The tides of ports in the Gulf of Mexico west of Cape St. George, ebb and flow as a rule, but once in twenty-four hours, or are single-day tides. At particular parts of the month there are two small tides in the twenty-four hours. The rise and fall of all these ports is small. East of Cape St. George the rise and fall increases; there are two tides, as a rule, during the twenty-four hours, and the daily inequality, as well as in the Pacific tides, is large.

These peculiarities require a different way of treating the cases, and in some of them the following tables.

I propose to enable the navigator to find, from the Nautical Almanac and the following Tables, the time and height of high and low water at any date within the ordinary range of difference produced by winds and other variable circumstances. I will endeavor to divest the matter of unfamiliar technical expressions as far as practicable, and for shortness' sake, some such terms may be employed after defining them. My discussion of the Gulf tides has not been carried so far as to enable me to present the results in as definite a form as the others.

As well known, the interval between the time of the moon's crossing the meridian (transit) and the time of high water at a given place is nearly constant; that the interval varies between moderate limits, which can be assigned. The interval between the transit and change of the moon is known as the establishment of the port, and is ordinarily marked on the charts. As it is not generally the average of the intervals during a month's tide, it is a less convenient and less accurate quantity for the use of the navigator than the average interval which is used on the Coast Survey charts, and is termed called the "mean" or "corrected establishment."^{*}

The following Table gives the principal tidal quantities for the different ports named in the first column, where they are arranged under specific heads. The third column gives the mean interval, in hours and minutes, between the moon's transit and the time of high water next after the transit; the fourth, the difference between the greatest and least interval, occurring in different parts of the month, (lunar.) A close inspection of this column will show how important it is to determine these quantities in many of the ports where they amount to more than half an hour, or to more than fifteen minutes, for the average interval.

The fifth, sixth, and seventh columns refer to the height of the tide. The fifth column gives the average rise and fall, or average difference between high and low water.

The sixth gives the greatest difference, commonly known as the rise and fall of the tides; and the seventh the least difference, known as the rise and fall of the tides.

The average duration of the flood, or rising tide, is given in the eighth column; of the ebb, or falling tide, in the ninth; and of the period during which the tide neither rises nor falls, or the "stand," in the tenth. The duration of flood is measured from the middle of the stand at low water to the middle of the stand at high water, so that the duration from one high water to the next, or from one low water to the next, may be given by the sum of the numbers in the eighth and ninth columns.

^{*} This term was introduced by the Rev. Mr. Whewell, who has done so much for the investigation of the laws of the tides.

The mean interval in column 3 has been increased by 12 hours for some of the ports in Delaware Bay and Chesapeake Bay, so as to show the succession of times from the mouth. Therefore 12 hours ought to be subtracted from the establishments which are greater than 12 hours, before using them.

The foregoing Table I. gives the means of determining roughly the time and height of high water at the several ports named. The hour of transit of the moon precedes the time of high water is to be taken from the Almanac, and the mean establishing being added, the time of high water results. Thus:

Example 1.—It is required to find the time of high water at New York on the 5th November, 1854. The American Almanac gives $0^h 0^m$ as the time of transit of the moon on that day. The mean interval for New York, from Table I, column 3, is 13^m , which, as the transit was at 0^h , is roughly the time of high water.

The moon being full, the height is that of spring tides of column 6, namely, 4.5 feet. If the soundings on the chart are reduced to low water spring tides, 5.1 feet is to be added to them to give the depth at high water. If the soundings are reduced to mean low water, the rise and fall for mean tides being 1.1 foot less than for springs, the rise or increase of depth will be half of this, or 0.6 of a foot less than 5.1 feet, which is 4 feet, or nearly 4 feet 10 inches.

Example 11.—Required the time of high water at Boston on the 23d of January, 1854. From the American Almanac we find the time of the moon's southing, or transit, that day, $5^h 18^m$ a. m., and from Table I the mean interval at Boston dry dock is $11^m 27^s$.

We have then $5^h 18^m$ time of transit; to which add

11 27 mean interval from Table I.

16 45 time of high water, or $4^h 45^m$ p. m.

If the Greenwich Nautical Almanac is used, add 2^m to the time of transit of Greenwich for every hour of west longitude, and its proportional part, or less than an hour. It will suffice to take the half hour which may be over any number of hours, as a correction for less than this would be less than one minute, and need not be taken account. Thus Boston is $4^h 41^m$ W. of Greenwich. The correction to be applied to the time of transit of the moon at Greenwich is, for the four hours, eight minutes, for the 41^m one minute. The time of transit on the date assumed in the preceding example is $17^h 9^m$ of the 22d, or $5^h 9^m$ a. m. of the 23d; to which add nine minutes, correction just found gives $5^h 18^m$, as before ascertained from the American Almanac.

In using the United States Nautical Almanac, in the astronomical part of which the transits of the moon are given for the meridian of Washington, the corrections required may, in this first approximation for the Atlantic coast, be neglected.

To find the time of the next following low water, add from Table I the duration of ebb tide; this gives $4^h 45^m$ p. m., time of high water.

6 43 duration of ebb tide, from Table I.

10 58 p. m.

By subtracting the duration of flood tide, we obtain the time of the preceding water, $10^h 32^m$ a. m., recollecting that $4^h 45^m$ p. m. is the same as $16^h 45^m$ reckoned from midnight.

The height of this tide corresponding to the transit of 5^h will bring it nearly to neap tide, and the rise and fall, obtained from column 7, Table I, is 8.5 feet.

The next following high water may be had by adding to the time of low water the duration of flood, from Table I, thus: $10^h 58^m$ p. m., time of low water 23d of January; add 6 43 duration of flood from Table I.

Sum 17 11 or $5^h 11^m$ a. m. on the 24th of January.

Or, having found the time of high water, the time of the next following high water may be found by adding the duration of flood and of ebb together, and their sum to the time of high water found. Thus:

6 43 duration of ebb tide from Table I.

6 43 duration of flood.

12 26 duration of whole tide.

4 45 p. m., January 23, time of high water.

17 11 or $5^h 11^m$ a. m., 24th January, time of the next

preceding high water. Subtracting the same quantity, will give the time of the preceding high water. Thus:

4 45 p. m., or $5^h 45^m$ from midnight, is the time of high water

12 26 the duration of flood and ebb.

4 19 a. m. of the 23d for the preceding

The duration of the flood tide from the middle of the ebb found by subtracting half the duration of flood from Table I, from the time of high water may be obtained by

subtracting the time of moon's transit from the time of high water.

The duration of the flood and ebb being reckoned from the middle of one stand of water to the middle of the next, the time of beginning of stand of ebb or flood is found by subtracting half the duration of stand or slack water given by column 1, from the time of high or low water, and the time of the end of stand of flood by adding the same. A nearer approximation to the times and heights of water may be obtained by the use of Tables II and III.

In these, the variations in the interval between the moon's transit and high water are shown for some of the principal ports contained in Table I. These variations interval depend upon the age of the moon, and as they go through their values in a lunar month, are known as the half-monthly inequality of interval. The table extends from 0^h of transit, midnight of the calendar day, or full of the moon, to 11^h hours. The numbers for "change" of the moon correspond to those for 0 hours, and for 13^h (or 1 p. m. of the calendar day) to 1 hour, and so on, up to 23 hours. The ports which the numbers are given are designated by the heading of the columns.

The mean interval, it will be seen, does not occur at full and change, but nearly days afterwards, on the Atlantic coast. At Key West it occurs more nearly at and change, and at San Francisco still more nearly.

The same remark applies to the heights; spring tides occur about two days after full and change of the moon, and neaps two days after the first and last quarter.

The use of this table of nearer approximation is quite as simple as that of Table I. *Rule to find the time of high water.*—Look in the Almanac for the time of moon's transit (or southing) for the date required. In the table corresponding to that time will be found the number to be added to the time of transit.

Example III.—Required the time of high water at New York, October 1, 1856. In the United States Nautical Almanac, we find the time of moon's transit 1^h 21^m, astronomical reckoning, or 1^h 21^m p. m. calendar time. From Table II, we have under heading of New York, for 1^h 30^m, (the nearest number to 1^h 21^m in the table,) 8 10.

Thus to 1^h 24^m, time of moon's transit.
Add 8 10 interval found from Table II.

The sum, 9 34 p. m., is the time of high water on the 1st of October, 1856.

If the sum of these numbers had exceeded twelve, the tide would have belonged to October 2d, and we must have gone back to the transit of the day before, and computed with it, to obtain the tide for October 1st.

Rule to find the height of high water.—Enter Table III, column 1, with the time of moon's transit. In the column headed with the name of the place, and marked A, B, or C, be found the rise and fall corresponding to the time of transit: in column B, the number to be added to soundings on the chart, where the soundings are given for mean high water; in column C, the number to be added to charts of which the soundings are given for low water, spring tides.

In the foregoing example (III) the time of transit being between 1 and 2 hours, we find, from Table III, the rise and fall of the tide on the 1st October, 1856, between 1 and 2 hours, and 4.7; the number to be added to soundings given for mean low water (column B,) and for low water spring tides, (column C,) 4.9 feet.

Having found the time of high water, that of low water may be obtained nearly by adding the duration of the ebb from column 9, Table I. The time of the next following low water may be found by subtracting the duration of flood from column 5, Table I. The time of the next following high water may be found by adding the duration of both flood and ebb, and of the next preceding high water, by subtracting the same duration of the whole tide.

Example IV.—To find the duration of flood, column 9, is 6^h 25^m; the sum is 9 31^m p. m., October 1, 1856, 12 25 duration of flood.

Example V.—To find the duration of ebb, column 5, is 6^h 59, or 9^h 59, a. m. of October 1, 1856.

TIDES

On the Pacific coast there is, on the same day, the heights of two successive high waters of the same twenty-four hours, and the moon are very different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

When the moon's declination is greatest, either north or south, the heights of the same are the same as for high, though the intervals are different.

Example IV.—To find the next high water following that of Example III.
 The duration of flood, column 8, Table I, for New York, is 6^h 0^m; and of ebb from
 9^h 31^m p. m., October 1, the time of high water found,
 12 25 duration of flood and ebb.
 21 59, or 9^h 59, a. m. of October 2, the time of the next high water.

TIDES OF THE PACIFIC COAST.

On the Pacific coast there is, as a general rule, one large and one small tide during
 the day, the heights of two successive high waters occurring one a. m. and the other
 p. m. of the same twenty-four hours, and the intervals from the next preceding transit
 of the moon are very different. These inequalities depend upon the moon's declina-
 tion. When the moon's declination is nothing, they disappear, and when it is the
 greatest, either north or south, they are greatest. The inequalities for low water are
 the same as for high, though they disappear and have the greatest value at nearly
 the same times.

When the moon's declination is north, the highest of the two high tides of the twen-
 ty-four hours occurs at San Francisco about eleven and a half hours after the moon's
 transit. (transit:) and when the declination is south, the lowest of the two high
 waters occurs at about that interval.

The lowest of the two low waters of the day, is the one which follows next the high-
 est high water. The nature of these tides will probably appear more plainly from the
 following diagrams. In them the height of the tide is set off at the side on a scale of

feet, and the hours of the day are at the top.
 The moon, for example, the tide-gauge
 reads 4.7 feet. Joining all the heights
 together in the twenty-four hours, we have
 a curve like that marked in the figure. The
 high waters are *a* and *c*, and the two
 low waters *b* and *d*. If *a* is the high water,
c occurs about twelve hours after the
 transit of the moon, when the declination is
 nothing, the ebb *a b* is quite small, and the high
c is as much lower than the next high
e. If the moon's declination is *north*,
 the large high water *a* of the second dia-
 gram, which occurs next after the transit,
 occurs about twelve hours from it.

feet, and the hours of the day are at the top.
 The moon, for example, the tide-gauge
 reads 4.7 feet. Joining all the heights
 together in the twenty-four hours, we have
 a curve like that marked in the figure. The
 high waters are *a* and *c*, and the two
 low waters *b* and *d*. If *a* is the high water,
c occurs about twelve hours after the
 transit of the moon, when the declination is
 nothing, the ebb *a b* is quite small, and the high
c is as much lower than the next high
e. If the moon's declination is *north*,
 the large high water *a* of the second dia-
 gram, which occurs next after the transit,
 occurs about twelve hours from it.
 Tables IV and V give the number to be
 added to the time of moon's transit, to find
 the time of high water almost as readily as
 in the former case. It is one of double en-
 try, the time of transit being, as before,
 given in the first column. The number of
 minutes from the day at which the moon has
 the greatest declination, are arranged at
 the top of the table. Entering the first col-
 umn with the time of transit, until we come
 to the column containing the days from
 the greatest declination, we find the number
 to be added to the time of transit to give the
 time of high water. If the moon's declina-
 tion is *south*, Table IV is to be used; if *north*,
 Table V.

Number to be added to the time of moon's transit at San Francisco, to give the time of high water for different times of moon's transit, and declination of the moon.

Time of Moon's transit.		TABLE IV. South Declination—Days from greatest Declination.							TABLE V. North Declination—Days from greatest Declination.

Do not disregard the daily inequality of high water, as in the example of high water. With this inequality between six and seven days the diurnal inequality also disappears. Example V.—Required the time of transit for the moon on the 7th of February 1851. The time of the moon's transit at San Francisco is 11 53; the longitude of San Francisco is 122° 45'; the time of transit for San Francisco is 11 53. The moon's declination on the 7th of February is 11° 57', which the table gives as 12 03 days from the greatest declination. To 11° 57', time of transit is 11 53. Add 12 57' from column 5, sum is 21 51, or 0° 51', the time of transit which we took of Example VI. The moon's declination on the 7th of February is 11° 57', which the table gives as 12 03 days from the greatest declination. To 11° 57', time of transit is 11 53. Add 12 57' from column 5, sum is 21 51, or 0° 51', the time of transit which we took of Example VI. The moon's declination on the 7th of February is 11° 57', which the table gives as 12 03 days from the greatest declination. To 11° 57', time of transit is 11 53. Add 12 57' from column 5, sum is 21 51, or 0° 51', the time of transit which we took of Example VI.

TABLE VI.

3.9	4.0	4.0	4.1	4.2	4.3
4.1	4.2	4.2	4.3	4.4	4.5

NOTE.—To use these Tables with a difference from the numbers in the tables. Example VI.—In Example VI, the declination being south, we took the greatest declination, and find the difference of the lowest low water from mean low water, the tables VI and VII; thus, in the

We disregard the daily inequality, the column headed San Francisco, in Table II, will give us, as in the examples on the Atlantic coast, the means of determining the time of high water. With this, the column for seven days in the present table agrees, and the annual inequality also nothing.

Example V.—Required the time of high water at North Beach, San Francisco, California, on the 7th of February, 1853.

The time of the moon's transit at Greenwich, from the Nautical Almanac, is 12^h 57^m; the longitude of San Francisco 8^h 10^m; requiring a correction of 16^m to the time of transit for San Francisco, which is thus found to be 11^h 57^m.

The moon's declination is south, and at the time of transit about two days from the greatest. Entering Table IV, we find 12^h (or 0^h) of transit, the nearest number to 12^h 57^m, which the table gives; and following the line horizontally until we come to 11^h 57^m, time of transit of moon, February 7, San Francisco,

To 11^h 57^m, time of transit of moon, February 7, San Francisco,
Add 12 57 from column 0^h transit, and two days from greatest declination.

The sum is 21 54 or 0^h 54^m, February 8th, is the time of high water, corresponding to the transit which we took of February 7. If we desire the tide of February 7, we must go back to the moon's transit of the 6th. The example was purposely assumed to be in this case.

11^h 1^m time of transit February 6, 1853.
13 11 number for 11^h transit, and one day from greatest declination.

Sum 24 15 time of high water 0^h 15^m, a. m., February 7.
The height of high water.—The height of high water is obtained in a similar manner by the use of Tables VI and VII, entering these in the same way with the time of transit and days from the greatest declination. Table VI is for south declination, Table VII for north.

Tables showing the numbers to be added to the soundings on charts, referred to the mean lowest low waters of day, to give the depth at high water at San Francisco.

NOTE.—To use these Tables with a chart on which the soundings are referred to mean low water, subtract from the numbers in the tables.

Example VI.—In Example V, to obtain the height of the tide on February 7, the declination being south, we enter Table VI with 0^h of transit, and two days from greatest declination, and find that the tide will be 4.1 feet above the mean of lowest water, or that 4.1 feet are to be added to the soundings of a chart reduced to the mean of the lowest low waters of each day. If the soundings of the chart were ten feet for mean low water, then 1.0 foot ought to be subtracted from the numbers in Tables VI and VII; thus, in this example it would be 3.1 feet.

The approximate time of the successive low and high waters of the day will be found by adding the numbers in Table VIII to the time of the first high water already determined. The table gives the numbers for the different days from the greatest declination.

TABLE VIII.

Containing numbers to be added to the time of high water found from Table III, to obtain the successive low and high waters.

Days from greatest declination.	SOUTH DECLINATION.			NORTH DECLINATION.			Days from greatest declination.
	Low water. (Small)	High water. (Large.)	Low water. (Large.)	Low water. (Large.)	High water. (Small)	Low water. (Small)	
0	<i>h. m.</i>	<i>h. m.</i>	<i>h. m.</i>	<i>h. m.</i>	<i>h. m.</i>	<i>h. m.</i>	0
1	4 11	10 24	17 52	7 23	14 26	18 37	1
2	4 17	10 31	17 55	7 24	14 19	18 36	2
3	4 23	10 41	17 58	7 17	14 09	18 32	3
4	4 33	10 55	18 02	7 07	13 55	18 28	4
5	4 45	11 11	18 06	6 55	13 39	18 24	5
6	5 03	11 31	18 08	6 37	13 19	18 22	6
7	5 23	11 58	18 13	6 15	12 52	18 15	7
	5 49	12 25	18 14	5 49	12 25	18 14	

The days from greatest declination are written in the first and last columns of the table. The second, third, and fourth columns refer to south declination, and fifth, sixth, and seventh, to north. The second column gives the number which is to be added, according to the declination, to the time of high water obtained by means of Tables IV and V, to give the next low water, which is the small low water *b* of Diagram I. The third contains the numbers to be added to the same, to give a second or large high water *c* of Diagram I. The fourth, the numbers to be added to the same, to give the second or large low water *d* of Diagram I. The succeeding columns give the numbers to be used in the same way for north declinations, to obtain the low water *b* (large) of Diagram II, the high water *c*, (small,) and the low water (small) of the same diagram.

The rise and fall of the same successive tides may be obtained by inspection, from Table IX, in which the first column, at the side, contains the time of transit, and successive columns the numbers corresponding to that time, and to the number days from greatest declination. The arrangement of this table is like that already given.

The numbers for the small ebb tide *a b* of Diagram I, or *c d* of Diagram II, are first given; then those for small low and large high water *b c* of Diagram I, and *d e* of Diagram II; next, the large ebb tide *c d* of Diagram I, or *a b* of Diagram II; and lastly from the large low water to the small high water *d e* of Diagram I, or *b c* of Diagram II.

Example VII.—Thus in Example VI, the high water of February 7th was found to be 3.1 feet above mean low water. The declination being south, Diagram I applies, and this high water is the small one. To obtain the fall of the next low water, the small low water, we enter Table IX with 0° of moon's transit, and two days of the greatest declination in the first part of the table, and find 1.7 feet, which will be the difference in height of this high and low water. Entering with the same transit day in the second part, we find 3.5 feet, which is the rise of the large high water above the small low water; the difference between 1.7 foot and 3.5 feet, or 1.8 foot, is the difference of height of the two successive high waters.

It is easy to see how, in this way, the soundings of a chart can be reduced to what they would be approximately at all the successive high and low waters. A similar set of tables is in preparation for Key West, and some of the other ports on the Gulf of Mexico, where the tides are of the same character.

The tidal observations now in progress on the Pacific will give the means of extending the tables to all the principal ports there.

TIDES OF THE GULF OF MEXICO.

On the coast of Florida, from Cape Florida round the Peninsula to St. Marks, the tides are of the ordinary kind, but with a daily inequality, which, small at Cape Florida, goes increasing as we proceed westward to the Tortugas.

From the Tortugas to St. Marks, the daily inequality is large and sensibly the same, giving the tides a great resemblance to those of the Pacific coast, though the rise and fall is much smaller. Between St. Marks and St. George's Island, Apalachicola, the tides change to the single-day class, ebbing and flowing but once in twenty-four (lunar) hours. At St. George's Island there are two tides a day, for two or four days, about the time of the moon's declination being zero. At other times there is but one tide a day, with a long stand at high water of from 6 to 9 hours. From Cape St. Blas to, and including, the mouth of the Mississippi, the single-day tides are very regular; and the small and irregular double tides appear only for two or three days, (and frequently even not at all,) about the time of zero declination of the moon. The stand at high and low water is comparatively short, seldom exceeding an hour.

To the west of the mouth of the Mississippi the double tides reappear. At Isle Derniere they are distinct, though a little irregular, for three or four days, near the time of the moon's zero declination. At all other times the single-day type prevails, the double tides modifying it, however, in the shape of a long stand of from 6 to 10 hours at high water. This stand is shortest at the time of moon's greatest declination, sometimes being reduced to but one hour. At Calcasieu the tides are distinctly double, but the stand is a large daily inequality. The rise and fall being small, they would often present to an ordinary observer the same appearance as at Isle Derniere. At Galveston the double tides are plainly perceptible, though small for five or six days, at the time of moon's zero declination. At other times they present the single-day type, with the peculiarity that after standing at high water for a short time, the water falls a small distance, stands again at that height for several hours, then continues to fall to low water. Sometimes it falls very slowly for nine or ten hours following high water, and then again falls at a more rapid rate to low water. At Aransas Pass and Brazos Santiago the single-day tides prevail. Small, irregular double tides are only perceived for two or three days at moon's zero declination. At other times there is but one high water a day, with a long stand of from six to nine hours, during which there are often irregular fluctuations or a very slow fall.

In the following table the mean rise and fall of tides at the above stations is given. The highest high, and the lowest low, waters occur when the greatest declination of the moon happens at full or change; the least tide, when the moon's declination is nothing at the first or last quarter.

The rise and fall being so small, the times and heights are both much influenced by the winds, and are thus often rendered quite irregular.

DETERMINE THE RISE AND FALL OF TIDES

It is sometimes desirable to know the rise or fall in a given time from low or high water. This may be determined by referring to Table I, which shows the rise and fall in feet at different ports, nor in the same table. Table XI shows the relation between the rise and fall at New York and for Old Point Comfort. The numbers express the total rise or fall in half hours. For example, at New York the rise and fall in six-tenths (sixty hundredths) of a day to be 5.4 feet, (Table I) the rise and fall in three-tenths (thirty hundredths) of a day to be 3.24 feet, or three-tenths of a spring tide has passed about three-tenths of a day.

TABLE X.

Rise and fall of tides at several stations on the Gulf of Mexico.

DETERMINE THE RISE AND FALL OF THE TIDE FOR ANY GIVEN TIME FROM HIGH OR LOW WATER.

It is sometimes desirable to know how far the tide will rise in a given time from low water, or fall in a given time from high water, or to approximate to the time which has elapsed from low or high water, by knowing the rise or fall of the tide in the interval. At the proportion of the rise and fall in a given time were the same in the different ports, this would easily be shown in a single table, giving the proportional rise and fall, by referring to Table I, showing the rise and fall of the tide at the port, would be the rise and fall in feet and decimals. The proportion, however, is not the same in different ports, nor in the same ports for tides of different heights. The following table shows the relation between the heights above low water for each half hour, at New York and for Old Point Comfort, and for spring and neap tides at each place. The figures express the total rise of high water above low water, and the figures opposite to the half hour denote the proportional fall of the tide from high water onward to low water. For example, at New York, three hours after high water, a spring tide has fallen six-tenths (sixty hundredths) of the whole fall. Suppose the whole rise and fall that day to be 5.4 feet. (Table I.) then three hours after high water the tide will have fallen 3.24 feet, or three feet three inches nearly. Conversely, if we have observed that a spring tide has fallen three feet three inches, we may know that high water has passed about three hours.

TABLE XI.

Giving the height of the tide above low water for every half hour before or after high water, the total range being taken as equal to 1.

Time before or after high water.	NEW YORK.		OLD POINT COMFORT.

TIDES IN COASTING.

By observing the times of high and low water along the coast, we find the place at which they are the same. The map shows that it is high water nearly at the same hour all along our coast from Sandy Hook to Cape Canaveral; of course not in the bays and harbors and up the rivers, but on the outer coast. It is high water nearly at the same hour all along the line marked XII seen on the chart near Sandy Hook, and north and south of Hatteras, and, with small interruptions, at Cape Fear, out and Cape Fear, all the way to near Cape Canaveral. This same line extends outward to near Block Island and south of Nantucket, and then passes away from the coast. At full and change of the moon, along this line (approximately) it is high water at XII o'clock Greenwich time, the local time of high water depending upon the latitude of the place; or, to speak more correctly, in the average of a lunar month, it is high water so many hours after the time of the moon's passing the meridian of Greenwich.

By these lines, called cotidal lines, we can determine what tidal currents the navigator must expect to meet in coasting, and for this purpose we divide the ports of the coast into two sets, those south and those north of New York.

The sailing lines of coasters bound to southern ports this side of the Straits of Florida are marked upon the map, and also of those bound through the sounds to eastern ports and outside to Halifax and European ports.

Vessels to and from ports South of New York.

South of Sandy Hook, New York, the line of XII hours is nowhere more than 35 miles from the coast, that of XI $\frac{1}{2}$ nowhere more than 48 miles, and of XI nowhere more than 110 miles. The distances of these lines from the coast of New York to Cape Canaveral, for the lines of XII to XI hours (corresponding, within four minutes, to VII and VI of New York time) from different parts of the coast is shown in Table A, where the first column gives the name of the place, and the second, third, fourth, and fifth, respectively, the distances of the cotidal lines of XII, XI $\frac{1}{2}$, XI $\frac{1}{4}$, XI hours. The distances are measured from the ports on perpendiculars to the cotidal lines. They may be taken also from the parallel of latitude at all the points for the line of XII hours, and also between Sandy Hook and Cape Hatteras, for the lines of XI $\frac{1}{2}$ and XI $\frac{1}{4}$ hours.

The ebb tidal lines are in such directions that at 10, 20, and 30 miles from the coast, from Sandy Hook and the St. John's, there is but a variation of seven minutes, and at Cape Canaveral only of eight minutes. Keeping ten miles from the shore, the ebb would pass from XII hours at Sandy Hook to XI hours 45 minutes at Hatteras and increase again irregularly to XII hours 7 minutes at the St. Johns, as shown explicitly in the Table B. These three tracks of 10, 20, and 30 miles are inside the cold wall of the Gulf Stream, and generally in the cold current, except at Cape Canaveral.

It follows, then, as a general thing, from these two tables, that the coaster, in passing from Sandy Hook to the St. John's, would have the ebb and flood altered only fifteen minutes as if he remained at Sandy Hook. So that leaving, for example, at low water, he would, according to the elapsed time, have the ebb and flood altered only every six hours and a quarter nearly, as if he had remained near Sandy Hook. As the flood tide sets in generally to the northward and on shore, and the ebb tide to the southward and off shore, he would know by the time that elapsed from his departure and the period of the tide at which he started, what tidal currents he might expect to meet he passed along the coast. This of course is not peculiar to Sandy Hook as a point of departure, but would be true for any of the entrances given in the table, taking care not to mistake the times of tides within for that at the entrance.

By referring to George W. Blunt, Esq., I have obtained the tracks of sailing and steam vessels passing from New York to ports to the south of it, as shown by the lines on the chart accompanying this paper. Tracing these on the map of cotidal lines, I have determined how the navigator would find the tides as he passes from port to port. The results are shown in the annexed Table, (C) in which the port between which and Sandy Hook the mariner passes is at the head of the table, and at the side the place off which the cotidal hours will be found, as stated in the table.

(C)

Cape Canaveral								
Cape Florida								

Thus from Sandy Hook to Delaware Bay, starting with XII hours 5 minutes, off Barnegat there would be at the same instant XI hours 57 minutes, and off Cape May 12 hours 10 minutes; so the navigator would have the same succession of tides which he remained at Sandy Hook or passed onward to Delaware Bay, or whether he passed from Delaware Bay to Sandy Hook. So from Sandy Hook to Charleston he would find, at the same instant, XII hours 5 minutes at Sandy Hook, XI hours 57 minutes at Barnegat, XI hours 45 minutes off Cape May, and so onward upon the parallels of latitude for the several points. For all practical purposes, then, of coasting, the succession of the tides, and of course of the tidal currents of flood and ebb, will be the same as if the navigator remained stationary. Leaving at low water, he will meet the flood at 6 hours and 15 minutes, and then the ebb for another 6 hours and 15 minutes, and so on. It is the simplest of all rules that has thus come out of this investigation.

That remarkable change of temperature between the waters of the inshore current and of the warm waters of the Gulf Stream, (occurring in so short a distance that Lieut. Bache called it the "cold wall,") takes place at distances off the coast from 170 to 29 miles, (see Table D,) between Sandy Hook and Cape Canaveral.

from the several points measured along the coast, and the distance between Assateague and the parallel north of Assateague is 11 miles. The annexed table (D) shows the results.

The coasting line of thirty miles keeps inside of the cold wall all the way to Canaveral, and all the routes traced on the chart from Sandy Hook to southern ports are made of it. The Gulf Stream lines drawn on the chart show how the route to Bermuda and to the Bahamas cuts the alternate bands of warm and cold water of the Gulf Stream.

Vessels to and from ports East of New York.

The Plate shows the sailing lines of vessels bound from New York to eastern ports and to Halifax, outside. The annexed table (E) gives the Greenwich times of high water off the several points named in the first column on the routes to and from the ports named in the heading of the table. The distances are measured at right angles to the cotidal curves.

In passing from New York to an eastern port, the first great change in the tides and tidal currents is between the East River and Long Island Sound; the difference between Governor's Island and Negro Point, on Ward's Island, at the eastern entrance to Hell Gate, is 2 hours and 45 minutes. Between this point and Throg's Point the change is small. The mariner is now in the full tide of the Sound, and between Throg's Point and Fisher's Island there is a difference of time of but 2 hours and 20 minutes, the greatest part of which is at the head of the Sound and at its entrance, that is, near Throg's Point and Fisher's Island. From off New London to off Sands' Point, the difference is but 1 hour and 40 minutes. So that if the mariner, instead of remaining at Throg's Point, passed onward to Fisher's Island, he would lose but half a tide in the whole passage. In other words, he would have the same succession of rise and fall, according to the time elapsed, whether stationary or passing onward within two hours and a half, or less than half a tide. The tidal current lines show that even a less allowance is to be made for the change of current than for the change of tide, the difference in the change of current between Throg's Point and Fisher's Island along the middle of the Sound being of no practical significance. Passing out of Long Island Sound, the tidal hours grow earlier, until off Block Island that of Sandy Hook is again reached.

The cotidal line of Sandy Hook and Block Island being the same, it is the struggle of the same tide through New York Bay and the narrow East River and obstructed Hell Gate, and through Fisher's Island and Long Island Sounds and to Throg's Point. The tidal currents meet near Throg's Point.

The lower part of Narragansett Bay has the cotidal hour XII hours nearly. Buzzard's Bay has nearly the same cotidal hour, the tide-wave reaching the shore at nearly the same time all around the bay. It would be impossible to give, in a summary compass, a minute account of the tides of Martha's Vineyard and Nantucket Sounds. In general it may be said that as far as Holmes' Hole and Wood's Hole, they resemble those of Block Island Sound, and afterwards those of Monomoy, at the Eastern entrance; but this generalization is unsatisfactory without more details than there is space here to give. In these Sounds takes place the remarkable change of between three and four hours, the great change of our coast, dislocating, as it were, the times of high water at places south and west and east and north of Nantucket. The whole of this change takes place between the eastern entrance of Nantucket Sound and the western of Martha's Vineyard, giving rise to quite a complex condition of both tides and currents which it has occupied much time to unravel.

The dominant cotidal line of our coast, from Block Island to Cape Canaveral, is that of XII hours of Greenwich time; that of our eastern coast, from Nantucket to Passamaquoddy, is in general XV hours. Passing out of Nantucket Sound, coasters east, nearly the same cotidal hour to Cape Cod, and thence vary their time about half an hour in passing to Boston, to Portsmouth, to Portland, or to Passamaquoddy. It has long been known that the tidal almanac for Boston might practically be used for eastern ports. Vessels from New York to Halifax, (and New York to Europe,) which keep outside, and should keep well off the Nantucket Shoals, and off George's, as shown by the track on the chart, vary their cotidal hour but little, keeping between the hours of XII and of XI½ until quite well on their course and beyond Cape Sable. The same rule will apply to their case as has been given for vessels between New York and southern port.

COAST OF LABRADOR,

FROM YORK POINT TO SANDWICH HARBOR.

Variation allowed from York Point to Sandwich Harbor $2\frac{1}{2}$ and 3 Points.

YORK, or CHATEAUX BAY, lies about 16 miles N. W. $\frac{1}{2}$ N. from the South-western *York, or*
point of Belle Isle, and 8 leagues N. $\frac{1}{2}$ W. from the Harbor of Quirpon; it may easily *Chateaux*
be known by two very remarkable hills, situated on Castle and Henley Islands, which *Bay.*
stand at the entrance of the bay; these rocky hills appear flat at the tops, and the steep
sides around them have the appearance of castle walls; the islands form the Eastern side
of the entrance to the bay, while the Capes York and Temple are to the Westward;
the mariner may not be able to discover the above hills at a distance, because of
the high land behind, the better marks will be, to observe that all the land to the West-
ward is of a high and uniform figure, terminating at the West side of the bay with a
prominent knob or hillock; while the land to the Eastward of Chateaux Bay is hilly
and broken, having many islands near the shore, while to the Westward there are none.
To sail into Chateaux Bay, you must leave Castle and Henley Islands on your star-
board side, and endeavor to keep Point Grenville, which has a beacon upon it, on with
the Western point of Henley Island; this point is a smooth black rock, having a little
island just appearing above water off its point; keep this mark on until you get
to the point of Whale Island, then, to avoid the middle rock, over which are only 9 feet of
water, and which lies nearly midway between the East point of Whale Island and the
West point of Henley Island, haul over close to Henley Black Rock, or borrow towards,
that too near, to Whale Island, for here it runs off shallow and flat; and when you are
so advanced as to open the narrow channel into Temple Bay, with the view of sail-
ing into Pitt's Harbor, then haul to the Westward, until you bring the outer point of
Henley Island a little open of Whale Island; this mark will lead you up into Pitt's Har-
bor, which is spacious, clear from danger, and well sheltered from all winds; here you
may ride in 10 or 11 fathoms, with plenty of timber ready, for your use, and every con-
venience for carrying on your fishery. There is also a narrow passage into Pitt's Har-
bor to the Northward of Henley Island, through which you will have 3 fathoms water.
One mile to the Eastward of Henley Island, lies Seal Island, and $3\frac{1}{2}$ miles further is
Goose Island; between these is Goose and Bad Bay, full of rocks, both above and be-
low the water, and also open to Easterly winds. To the Eastward of Seal Island, dis-
tant 3 miles, are St. Peter's Islands, a cluster of barren rocks, within which is St.
Peter's Bay, a good place of anchorage, but too much exposed to the South and South-
westly winds to be much frequented.

CAPE CHARLES.—To the North-eastward of St. Peter's Islands is Cape Charles, *Cape*
which has a high hill, steep to seaward, and sloping down inland, so that when you *Charles.*
sail to the Westward of Chateaux Bay, it has the appearance of an island. Cape Charles
lies S. E. by E. $\frac{1}{2}$ E. distant about one and a half mile from Cape Charles; it is
of moderate height, and has several small rocks both to the Eastward and to the West-
ward of it. From St. Peter's Islands to Charles Island the course is E. N. E. $\frac{1}{2}$ E., dis-
tant 11 miles; between them lies Niger Sound, an inlet $2\frac{1}{2}$ leagues deep, and hav-
ing several small islands before it; to enter Niger Sound you may pass either to the
Southward or Northward of these islands, and obtain anchorage on the Northern side
of the sound, in 9 fathoms water; the course in will be nearly N. by W.

CAPE CHARLES HARBOR.—From the North point of Cape Charles Island into *Cape*
Charles Harbor, the course is N. W. $\frac{1}{2}$ N., distant 4 miles; this harbor is formed *Charles*
by the Great and Little Caribou Islands, on the Eastern side, and by the main on the *Harbor.*
Westward; there is a very good anchorage in from 17 to 22 fathoms water in it, on a mud-
bottom, and you may sail in on either side of the centre island; but the best pas-
sage is between it and Little Caribou.

From Cape Charles Island to the Battle Islands, the course is E. N. E. $\frac{1}{2}$ N., and the
distance 11 miles; this course will carry you clear to the Eastward of the rocks
which lie a large mile to the Eastward of Northernmost Battle Island, which will ap-
pear high and round at the top.

From the Northernmost Battle Island to the River islands, your course will be N. W.
distant 2 leagues; here, to the Westward of Poeklington, which is one of
the River Islands, you will find anchorage in 30 and 25 fathoms water, with the bottom
mud; and vessels may pass to the Southward of these islands up the river St. Lewis.

CUTTER HARBOR.—From the South point of Poeklington Island to Cutter Har- *Cutter*
bor, the course is W. $\frac{1}{2}$ S. distant one mile; in this harbor there is good anchorage *Harbor.*
for small vessels.

trends away, round a low point to the Eastward, and becomes a mile broad; it is thence
 about water, and fit only for small vessels.

Point Charlotte is the middle harbor, and fit for any ships; there is a low flat
 island on the starboard side of its entrance, from which runs a reef of rocks one-third
 of the channel over; to avoid this, keep the Southern side on board; you will then have
 9 fathoms close to the shore, until you get a quarter of a mile up within the harbor;
 you may then anchor in any part in from 12 to 17 fathoms, only giving the starboard
 side a berth to avoid a reef that lies on that side.

MacALENTHON HARBOR is the Northernmost of the three harbors, and turns in N.N.,
 W. $\frac{1}{2}$ N. and N.W. by N. about two miles; in the lower part of this harbor there are
 20 fathoms, but as you advance the water lessens, and in the upper part there are no
 more than 12 fathoms for ships to moor in. To sail up to the head of the bay, you must
 keep the port side nearest, in order to avoid the ledge of rocks that lies on the star-
 board, about 30 fathoms from the shore. These rocks lie within the narrowest part
 of the harbor, and above the low point on the starboard side; the best anchorage is at
 the head of the harbor.

ST. FRANCIS HARBOR.—From Point Spear to Cape St. Francis, the course and
 distance are nearly North 6 miles, and from the islands at the entrance of the three
 harbors to Cape St. Francis N.E. $\frac{1}{4}$ N. about 5 miles; between them and nearly half a
 mile to the Westward of the cape, is St. Francis Harbor. This is a snug and secure
 harbor, though small, and generally filled with vessels during the fishing season, consi-
 derable fisheries being carried on in its vicinity. To enter this harbor, there are two
 entrances, one being to the Northward, the other to the South-westward of Pigeon Isl-
 and, this island lying directly before its entrance; the South-eastern channel leads to a
 small but narrow inlet called Round Harbor; everywhere clean ground, with 10 fath-
 oms in the channel as you enter, and the depth gradually decreasing as you advance
 towards its head, where you have 5 and 3 fathoms. In entering to the South-westward
 of St. Francis Harbor, you should beware of and give a berth to the West side of
 Pigeon Island, for a rocky reef off it; give this a berth, proceed on N.N.E. $\frac{1}{2}$ N., and hav-
 ing got fairly between the two points of the harbor, you will perceive on your starboard
 side a small white rock; go no nearer to it than 7 fathoms, steer up North, and having
 passed mid-channel, or rather nearer the starboard shore, the rocks above water, which
 you will see on each side of you, turn West-erly, and anchor in 4 or 5 fathoms. Small
 vessels go to Birnell's Beach, or up to the cove at the Northern extremity of the harbor.

CAPE ST. FRANCIS is the Eastern point of an island, between which and Granby I. I.
 is a very narrow passage for boats, with 4 fathoms water in it. From this cape,
 in a N. N. West-erly direction, about $\frac{1}{4}$ of a mile, is Indian Point, between which and
 Jasper Island's South-eastern point, is an opening leading into Indian Bight and Shoal
 Tackle, two narrow coves, the latter being shallow, and with only 2 and $1\frac{1}{2}$ fathoms
 water in it. To the Northward of Indian Point are Hare and Fox Islands, by a
 narrow passage running Northward between them; on crossing from Indian Bight to
 the channel, you will have deep water, but when you enter the passage it will shallow
 to 5, 4, 3, and 2 fathoms; this flat will continue for a quarter of a mile, you then deep-
 en your water again to 5, 7, 10, and 12 fathoms; vessels frequently anchor in this place,
 on the Western side of Hare Island, or, rounding the Northern end of Fox Island, run
 through Pearce's Tackle into Sealing Bight.

SEALING BIGHT is a very commodious and convenient place for the fisheries; the
 best anchorage is on the Southern part of the bay, to the Westward of Jasper Island;
 here you may safely ride in 8, 10, or 11 fathoms, or further in with less water. There
 are several coves situated along shore, to the Northward of this anchorage, where
 small vessels may anchor; fresh water can easily be obtained, but wood is scarce; the
 Southern entrance to this place is between Indian Point and Jasper Island, on one
 side, and Hare and Fox Islands on the other; the water is deep, and there is no dan-
 ger, except a reef which stretches out to the South-westward from Gull Island, over
 which the sea breaks very high in stormy weather; it will therefore, to avoid the reef,
 be always prudent to borrow close towards Indian Point, in either sailing in or out of
 Sealing Bight. Merchantman Harbor is about 2 miles W. $\frac{1}{2}$ S. from St. Francis Isl-
 and; it is small, but has from 7 to 15 fathoms water.

FISHING SHIP HARBOR.—From St. Francis Island to the Northernmost Fishing
 Island, the course is N.N.E. $\frac{1}{4}$ N., distant 3 miles. The Fishing Islands are three in
 number; the two Northern ones are connected by a beach, which, with the main, forms
 Fishing Ship Harbor, where vessels may ride land-locked, and secure from all winds,
 in from 5 to 11 fathoms water, the entrance being to the Southward of the Southern
 Fishing Island; the best passage will be between the two Western islands, that en-
 trance bearing from Hare Island N. by W.; there is no danger in this channel, and
 vessels may sail right through it, in nearly a N. by W. direction, up to the very head of
 the harbor, and anchor in 12 fathoms, having good room for ships to moor; there are
 two other passages into this place, one to the Westward from the entrance of Gilbert's

Part
 Charlotte.

Cape St.
 Francis.

Sealing
 Bight.

Fishing
 Ship Harbor.

River, the other to the Northward of all the Fishing Islands; the latter has 7 fathoms throughout, but is so narrow that you will have some difficulty in discovering the opening.

Gilbert's River.

GILBERT'S RIVER.—Between Fishing Island and Granby Island is the Northern entrance to Gilbert's River; the Southern entrance is between Denbigh Island and the main, and this is much the wider of the two; there is also a channel between Denbigh and Granby Islands. The passage in has deep water every where; the course of the river is nearly N.W. by N. for about 6 miles; it then divides into two branches, one running N.W. by N. 7 or 8 miles, the other S.W. by W. about 6 miles; both these branches are full of rocks, small islands, and shoals; but in the middle the anchorage is good all the way up from 20 to 10 fathoms; this river has also a passage out to sea between Hare and the Fishing Islands.

Cape St. Michael.

CAPE ST. MICHAEL.—Six miles N.N.E. 4 N. from the Northernmost Fishing Island, and 16 miles N.N.E. 4 N. from Point Spear, is Cape St. Michael, high and steep, and easily known by a large bay to the Northward of it.

Occasional Harbor.

OCCASIONAL HARBOR.—About 2½ miles to the Southward of Cape St. Michael is Occasional Harbor, easily known by the twins, two large rocks lying two-thirds a mile outside of the entrance; they are very near each other, and vessels may pass on either side of them; the entrance to the harbor is between two high lands, and runs in W. by N. for 2 miles, then N.W. by N.; both sides are steep to, without any dangers, and having good anchorage in from 10 to 7 fathoms, about 2 miles from the entrance; the wind between the high lands always sets right into or out of the harbor.

St. Michael's Bay.

ST. MICHAEL'S BAY.—From Cape St. Michael to Cape Bluff, the course is nearly N.N.E. about 7½ miles, and these two capes form the points of entrance to the Bay of St. Michael, which contains a vast number of islands, inlets, and rivers; the largest island is named Square Island, lying at the mouth of the bay, and being 3½ miles long and very high; its N.E. point forms a lofty round hill, and makes, in coming from the Southward, like a separate island, being only joined by a narrow neck of land; the best anchorage for small vessels is on the Southern side of St. Michael's Bay; to get there you should keep Cape St. Michael's shore on board, then run along the Southern side of the first island you meet with, which is called Long Island, till you get near to its Western end, there you may anchor in from 12 to 20 fathoms, land-locked, and can work out to sea again on either side of the island. From Cape St. Michael to the entrance of Square Island Harbor, the course is N.N.W. 3¼ miles; at the entrance lies a small island of moderate height, to the Westward of which is the best passage into the harbor, there being only 2 fathoms in that to the Eastward of it. About a league from Square Island round hill is the entrance to Deadman's Harbor, which is formed by a number of little islands, and fit only for vessels of small dimensions. There is a passage between these islands and Cape Bluff, by which vessels may put out to sea.

Cape Bluff is very high land, rugged at top, and steep towards the sea; it may be seen 15 or 16 leagues. Cape Bluff Harbor is a small place, and unfit for large vessels to sail into it you should keep the cape on board until you reach a small island, where you should pass to the Eastward, and then anchor. The several bays and inlets in St. Michael's Bay are well stored with wood.

From Cape Bluff to Barren Island, the course is N. Eastward about one league, and from the South point of Barren Island to Snug Harbor, N.W. by W. 1½ miles. Snug is a small harbor, but in it is very good anchorage in 26 fathoms, and no danger to be apprehended either in sailing in or out of it. About one mile to the Northward of Barren is Stony Island, and within these islands, on the main, are Martin and Otter Bays; in the Northernmost is good anchorage, and no invisible danger in entering; wood and water are plentiful.

Duck Harbor.

DUCK HARBOR lies on the Western side of Stony Island, and is a very convenient place for small vessels; large ships may also anchor between the West point of Stony and Double Islands, in from 20 to 24 fathoms, sailing from thence to seaward on either side of Stony Island in great safety.

Hawke Bay.

HAWKE BAY.—About one mile to the Northward of Stony Island lies Hawke Bay, and within which is Hawke Bay, running in Westwardly 2 leagues; it then divides into two branches, one going W. by S. 6 miles, the other N.W. by W. 5 miles; the shores of these are well supplied with wood. After you get within Pigeon Island, the anchorage is good up to the very head of both branches.

Eagle Cove.

EAGLE COVE lies on the South side of Hawke Island; this place affords good anchorage for large ships in 30 or 40 fathoms of water, and also for smaller vessels in 8 fathoms at the upper end of the bay.

Captin Bay.

CAPTIN BAY.—On the main, within Hawke Island, and nearly 5 miles E. by N. from Hawke Bay, is Captin Bay, having good anchorage and plenty of wood.

Partridge Bay.

PARTRIDGE BAY lies 4½ miles to the Northward of Hawke Island; the anchorage is good, but the bay is difficult of access, unless to those who are well acquainted with the place, on account of the numerous small islands which enumber its entrance;

land hereabout may be very remarkable high table hill of St. Michael's Cape is high.

SEAL ISLANDS.—From the course is N.E. 4 N., distant 1½ miles; this latter island is easily recognized by a remarkable SHALLOW BAY.—From the course is N.N.E. 4 N., distant 4½ miles; a bay is fringed with numerous rocks, the course is N.N.E. 4 N., you must steer W. 4 S.

and no danger, excepting a whirl over the bay; this is a bay over it; there is little from White Rock to Pore island is high, barren, and some Bay, where the riding SANDY BAY lies on the S.

White Rock, from which it is 10 fathoms water, on a bay for fishing ships, but for the land are numerous islands and the coast extremely dangerous.

SPOTTED ISLAND is high on its Eastern side; it is a northern part lying in latitude 54° 30' Rocky Bay. To sail in Island, and go between either there is no good anchorage at Point and Eagle Island, clean, only taking care to

the Western side of Eagle Rocks and the Duck Rock, the length of a cable, or you and in Narrow Harbor, and from Spotted Island to Wolf is above water, and lies out, and several islands be

of the entrance to Rocky, especially at the Western end for small vessels, and it SAND HILL COVE.—This is the side of its entrance; and here the anchorage is

is about 8 miles within the North point a good harbor's length from the point.

TABLE BAY.—The Southern Sand Hill Cove, and may be bay, about 8 miles within the N.W. 4 N. 7½ leagues

the entrance, lies Ledge Island on the island up the bay for 12 or 14 fathoms, in which anchor in Table Bay.

North Harbor, having very should take care to keep the half way between the ledge the GANNETS are a cluster the outermost island bears from PURLEW HARBOR lies north distinguished by a green round is between this island and water close to the point; the bay will be about one mile long the small rock off the end will then ride in 14 or 15 mile N. by W. from G

land hereabout may be very easily known, for the Southern point of the bay is a remarkable high table hill of a very barren appearance, and all the land between it and St. Michael's Cape is high, while that to the Northward is low.

SEAL ISLANDS.—From Cape St. Michael to the Southernmost Seal Island, the course is N.E. $\frac{1}{2}$ N., distant nine leagues, and from thence to Round Hill Island N.E. $\frac{1}{2}$ E. 4 miles; this latter island is the Easternmost land on this part of the coast, and may be recognized by a remarkable high round hill on the Western part of it.

SHALLOW BAY.—From Round Hill Island to Spotted Island, the course is N.N. $\frac{1}{2}$ N., distant 44 miles; and from Spotted Island the land turns N. N. Westward, and is fronted with numerous islands. From the Southernmost Seal Island to White Rock, the course is N.N.E. $\frac{1}{2}$ E. about 5 miles; and from this rock, to enter Shallow Bay, you must steer W. $\frac{1}{2}$ S. nearly 4 miles; there is very fair anchorage within this bay, and no danger, excepting a small rock which lies off a cove on the port hand, about a mile and a half from the shore; this rock is visible at low water, and at other times the sea breaks over it; there is little wood visible on the shores of this bay.

From White Rock to Porcupine Island, the course is N.N.W. distant 2 leagues; this island is high, barren, and steep to; vessels may pass on either side of it to Porcupine Bay, where the riding is good, but little or no wood.

SANDY BAY lies on the Southern part of the Island of Ponds, and N. $\frac{1}{2}$ W. from White Rock, from which it is distant 5 miles. There is good anchorage in this bay, about 10 fathoms water, on a bottom of sand, and would be a very convenient resort for fishing ships, but for the total absence of wood. Between this bay and Spotted Island are numerous islands and rocks, both above and under water, rendering this part of the coast extremely dangerous.

SPOTTED ISLAND is high barren land, and may be recognized by several white hills on its Eastern side; it is about 3 miles long, and of nearly a similar breadth: the Southern part lying in latitude 53° 30' N. To the Westward, and within side this island is Rocky Bay. To sail into this bay, you should run in to the Northward of Spotted Island, and go between either of the islands that lie before the entrance of the bay; there is no good anchorage in it, the bottom being so rocky, until you get between Level Point and Eagle Island, where you may ride in 8 or 10 fathoms, the ground good and clean, only taking care to give Level Point a free berth; the best anchorage will be on the Western side of Eagle Island, in 8 or 9 fathoms, mud. In passing between the Duck Rocks and the Eagle Rocks, you may borrow on either side to within two-thirds the length of a cable, or you may run up and anchor on the Southern side of Narrow Harbor, and be handy for both wooding and watering.

From Spotted Island to Wolf Rock, the course is N.N.E. $\frac{1}{2}$ N. about 18 miles; this is above water, and lies 14 miles from the main; there are some sunken rocks about it, and several islands between it and the coast. About two miles to the Northward of the entrance to Rocky Bay, is Indian Island; this is remarkable high land, particularly at the Western end; between the island and the main is tolerably good anchorage for small vessels, and it appears to be a fit place for a seal fishery.

SAND HILL COVE.—This place is so called from several sand hills lying on the Southern side of its entrance; it is situated 4 good leagues to the Westward of Indian Island; here the anchorage is good about half a mile up from its entrance, in 4 or 3 fathoms water, sandy ground. When you are sailing into this cove, you should take care to anchor to the North point a good berth, because of a ledge of rocks which stretches off about the length of the point, and runs Westward along shore the length of two cables.

TABLE BAY.—The Southern head of this bay lies about two leagues N. by W. from Sand Hill Cove, and may be known by a remarkable table hill on the North side of the bay, about 8 miles within the entrance; this hill may be seen from the Wolf Rock, which lies N.W. $\frac{1}{2}$ N. 74 leagues from the entrance of the bay. In this bay, about 4 miles from its entrance, lies Ledge Island, so called from a ledge of rocks stretching Westward from the island up the bay for 2 miles. On the Southern side of this island is anchorage in 12 or 14 fathoms, in what is called South Harbor; or you can run further up, and anchor in Table Harbor. On the North side of the bay, just within Ledge Island, is North Harbor, having very good anchorage in it. In sailing up to Table Harbor, you should take care to keep the main land close on board, in order to avoid a rock that lies half way between the ledge that runs off Ledge Island and the main.

The GANNETS are a cluster of islands, lying from 7 to 11 miles off the main land; the Southernmost island bears from the Wolf Rock N.N.W. $\frac{1}{2}$ V. distant 10 leagues.

CURLEW HARBOR lies nearly S.W. of the Gannet Islands, on the main, and may be distinguished by a green round island lying before its entrance; the channel into the harbor is between this island and a low point to the Southward, having a small rock in the water close to the point; there is no danger in sailing into this place; the best anchorage will be about one mile within its entrance; here large ships may ride in safety, and the small rock off the entrance point on with the Northern point of Long Island; you will then ride in 14 or 15 fathoms water, good holding ground. Long Island lies about 14 mile N. by W. from Green Island. Small vessels run higher up the bay, and

generally anchor in from 10 to 7 fathoms. On the Southern side of the harbor is a shoal lying at a small distance from the shore; wood is scarce in this bay, but water plentiful.

Isthmus Bay. ISTHMUS BAY.—This bay lies round the Western point of Curlew Harbor, from whence you should endeavor to keep Great Island on board, in order that you go clear of a shoal that stretches off the point towards the island. There is also a passage into Isthmus Bay, between the Western point and a small bare rock of moderate height, that lies off the South point of the Great Island; this channel is narrow and has a depth of three fathoms within it. Both wood and water may be obtained here.

Hare Harbor HARE HARBOR.—One league to the Westward is Hare Harbor, fit only for small craft, the bottom being foul, except towards the head, where you may anchor in 10 fathoms water, the ground tolerably good. Hare Island, which lies before the entrance to the harbor, is high land. The Eastern point of Huntingdon Island lies about 2 miles to the Northward of Hare Island, and W.S.W. $\frac{1}{2}$ W about 13 miles from the main; it is moderately high, and in length, from East to West, 7 miles; off its Eastern point are some small islets, named Sadler's and Leveret's Islands, and a little Northward of the latter is a rocky flat; these lie $\frac{1}{2}$ mile off the extreme point of Huntingdon Island. There is a safe passage, above a mile wide, along the Southern side of Huntingdon Island; this leads into Huntingdon Harbor, opposite which you may ride safely in from 5 to 13 fathoms water; further in towards the island it shoals, but the best anchorage is behind Egg Island, in 6 fathoms, near that island; here you will be secure from all winds, and ride very convenient for both wooding and watering, there being abundance of both on the island.

Sandwich Bay. SANDWICH BAY, called by the natives Netsbuetoke.—On the South-western side of Huntingdon Island are Earl and Diver Islands, on either side of which is a passage into Sandwich Bay; but the channel between Diver Island and Earl Island, called the Tickle, is very narrow, and has in some places not more than 6 feet water; the channel between Diver and Huntingdon Islands is over a sandy flat, 9, 12, and 15 fathoms deep, and consequently not to be attempted by large vessels. To the Eastward of Cartwright's Harbor, leading to the Favorite's Tickle, and thence to Sandwich Bay, this has deeper water, and by keeping the Southern land well open of Earl's Island you will go through it until you reach the Narrows, when the two points forming the Narrows must be brought on with each other, and this will lead between the Eastern point of Earl's Island and the main, in 4, 7, and 9 fathoms; between the Narrows are the islands of Sandwich Bay, a very fine harbor, 6 or 8 miles broad, and 6 leagues deep, with plenty of wood and water, and four rivers running into it, abounding with fish. There is very good riding in a cove on the Eastern side of the bay, and also on the Northern side, under a mountain; from the shore at the foot of the mountain, about 2 miles to the Westward, the soundings stretch gradually off the shore, from 10 to 15 fathoms, muddy ground, and extend full three miles from the land. The passage into the bay, on the western side of Huntingdon and Earl Islands, is the widest and most convenient channel, for that to the Southward we have just shown to be narrow, shallow, and inconvenient; to enter to the Northward of Huntingdon Island you must beware of flats which lie a little to the Northward of Leveret's Island; there is deep water to the entrance, and you will see the Island of Plantation to the Northward, a little to the Westward of which is Henrietta's Island; between these two is Independent Harbor, a snug retreat running in North, and having every convenience for the fishery, directly before this harbor, and in the fairway of the channel to Sandwich Bay, are the Double Islands; in entering you will leave Wedge Island and Bellows Rock to the Eastward, and Gull Island to the Southward, and pass on either side of the Double Islands; your course then will be N.W. by W. $\frac{1}{2}$ W. 4 $\frac{1}{2}$ miles; and having got beyond the point of Huntingdon Island, you will perceive Entrance Island lying midway between the point and the opposite shore; the channel now bends to the South-westward, and is bounded to the Northward by the North River Flats, and to the South by Huntingdon Flats, the deep water passage being about a mile broad; you may sail in on either side of Entrance Island; proceed W. by S. towards Main Tickle Point; from that point a spit extends E.N.E. $\frac{1}{2}$ E. $\frac{1}{2}$ mile, contracting the channel, and making the passage very narrow for large ships to enter. On the starboard side are the Brenton Islands, situated in Table Hill Cove; when you get these open of each other, a line passing directly between them, or when the North Brenton opens its own way to the Eastward of the Southern one, you will clear the spit in 4 fathoms; these islands come on with each other, you will pass over the spit in 2 fathoms; the cross mark is Green and Leading Mark Islands in one; these lead on to the Eastward of the spit, and are two islands situated on Huntingdon Flats; the leading mark is a low hill, and the bearing to go through the Main Tickle Passage is Leading Mark Island on Old Man's Head; you will carry you clear of the shoals on both sides, in from 6 to 14 fathoms, right into Sandwich Bay; to sail out of the bay, bring the hollow part of Leading Mark Island on with the gap of Old Man's Head, until you are within three cables' length of the main, then give the island a berth of equal distance in passing, and steer direct for Entrance Island.

CHATEAUX BAY ENTRANCE OF

Variation allowed

York Point, the Southern
distance are W. by S. $5\frac{1}{2}$ leagues, or 10 miles; between these islands is Chateaux Bay, fit only for small craft, the bottom being foul, except towards the head, where you may anchor in 10 fathoms water, the ground tolerably good. Hare Island, which lies before the entrance to the harbor, is high land. The Eastern point of Huntingdon Island lies about 2 miles to the Northward of Hare Island, and W.S.W. $\frac{1}{2}$ W about 13 miles from the main; it is moderately high, and in length, from East to West, 7 miles; off its Eastern point are some small islets, named Sadler's and Leveret's Islands, and a little Northward of the latter is a rocky flat; these lie $\frac{1}{2}$ mile off the extreme point of Huntingdon Island. FROM CHATEAUX BAY TO THE ESQUIMAUX ISLANDS, AT THE
ENTRANCE OF THE RIVER ST. LAWRENCE.

Variation allowed 2 Points.—It now is (1850) 2½ Points.

York Point, the Southern entrance of Chateaux Bay, to Barge Point, the course
distance are W. by S. 5½ leagues; from Barge Point to Saddle Island is nearly
10 miles; between these is Green Bay, a place where small vessels may anchor
in fathoms water, but open to the S. Easterly winds.

RED BAY.—This is an excellent harbor, and may always be known by Saddle Isl-
land, which lies at its entrance; this island rises up at each end, and sinks down in the
middle somewhat similar to a saddle; there is also a remarkable round hill on the West-
ern side of the bay, and opposite to the West end of Saddle Island, which will tend to
mark the harbor: the land on the West side of the bay is high, the Eastern side
is low, and the head of the bay is high and woody: in sailing into this place there
is danger, the passage is to the Westward of Saddle Island, only taking care to
keep the berth to the rock, which at a quarter ebb is above water, and lies off the West-
ern point of the main land, and also not to come too near to the inner part of Saddle
Island, as a shoal stretches off it about the length of a cable. The Western bay lies
open Northward of the Western point, and has very good anchorage with Westerly
winds, but somewhat open to the Eastward; there is no passage, except for boats, to
the Eastward of Saddle Island; vessels coming from the Eastward must be careful to
pass a small rock, which lies about a mile from the two black rocky islets, which
lie off the East end of Saddle Island, and near a mile off the shore: the high round hill
on the West side of the bay on with the saddle of Saddle Island, will lead you directly
to the rock, and the sea commonly breaks over it.

BLACK BAY lies to the W.S. Westward, distant 10 miles from Saddle Island; the
anchorage here is tolerably good, but too much exposed to the S.E. winds. S.W. by
W. to Ship Head, which is the Western point of entrance to Black Bay, distant 1½
leagues; Modeste Island; it is small and low, but vessels frequently run into a place
between the island, called St. Modeste Bay, and anchor; but this, though occasionally
used, cannot be recommended.

WOLF'S COVE, OR L'ANSE DE LOUP.—S.W. by S. from St. Modeste Island,
distant 14 miles, begin some remarkable red cliffs, which continue full 2 miles, and
the Eastern point of Wolf's Cove; this is high table land, terminating with steep
slopes towards the sea. The entrance to Wolf's Cove is about 2 miles wide, the two
ends of the cove heading from each other S.W. and N.E.; there is good anchorage
at the head of this cove in 12 fathoms water, and also on the Western side, in Schoon-
er Bay, where small vessels may lie safely in 7 fathoms, on a bottom of sand.

FORTEAU BAY lies 5 or 6 miles to the Westward of Wolf's Cove; the shore be-
tween them is rather low: Forteau Bay is about 3 miles broad, and runs in nearly the
same distance; on the Western side, near the head of the bay, is good riding, in from 10
to 15 fathoms; but exposed to the Southward. Off the East point of the bay is a rock,
which appears like a shallop under sail; and on the Western side of the bay is a fall
of water, which, on coming from the Eastward, will easily be perceptible. West 7
miles from the Western point of Forteau Bay is Island au Bois, and 2 miles Westward
is Green Island; the former of these is of moderate height, and has a good pas-
sage through it; it lies in front of Bloue Sablon Bay, where a vessel may occasionally
anchor; but the ground is loose sand, and will not hold. The channel between
Island au Bois and Green Islands is good, and has 11 fathoms water in it; there is a cove on the
Western side of Green Island, where a fishery is sometimes carried on; there is also a
passage between Green Island and the main, which leads to Brador Bay and Harbor;
vessels should be careful to give Grand Point a good berth in passing, as some sunken
rocks lie directly off it.

BRADOR HARBOR.—From Green Island to Island of Ledges, the course is
N. by N. distant 5 miles; the Harbor of Brador may readily be known by the land
between it and Point Belle's Amour: the point itself is low and green, but about a
mile and it rises up to high table land; and further inland are three remarkable
islands called Our Lady's Hobbies; these are round, and may be seen all along the coast,
to the N. Eastward about 2 leagues distant from the Island of Ledges. This isl-
and is of moderate height, having a great many islets and rocks about it; on its East-
ern side is Bladder Cove, where small vessels may anchor in 2 and 2½ fathoms. There
are two passages into Brador Harbor, but that to the Northward of the Island of Ledges
is not so safe, on account of the number of rocks scattered about it. To enter
the Eastern passage, you must take care to avoid a small rock, which lies about S.W.
by W. a quarter of a mile from the low point on the main, where the houses stand;
on the rock the sea commonly breaks and shows itself at quarter ebb; on the Eastern

Red Bay.

Black Bay.

Loup.*

*Forteau
Bay.*

*Brador
Harbor.*

side, within this rock, is Shallop Cove; from the point above the cove a shoal stretches off about a cable's length from the shore, and continues nearly the same distance quite to the head of the harbor.

Esquimaux River and Bay.

ESQUIMAUX RIVER AND BAY.—From Point Belle's Amour to the outer Esquimaux Island, the course and distance are W. by S. 10 or 11 miles, N.N.E. about 12 miles from which there is good anchorage, between two high islands, for small vessels, and within these lies the River Esquimaux. From hence to Dog Island is a chain of cluster of small islands and rocks, the Easternmost of which are commonly called the Esquimaux Islands; the middle ones, the Old Fort Islands; and the Western ones the Dog Islands; within these, and on the main land, are various good bays and places of shelter; but the entrances to them are so intricate, narrow, and dangerous, that a person, unless well acquainted, should attempt to navigate a vessel through them. These islands extend from the outer Esquimaux Island nearly 4 leagues, and some of them are full 4 miles from the land.

Little Bay.

LITTLE BAY.—W.N.W. about 5 miles from the Dog Islands, is Little Bay, which small vessels may find very good anchorage; nearly a mile to the Westward of Little Bay, is the Bay D'Onar; this Bay runs up N.E. by N. nearly 3 miles, the land on both sides being very high, but the Western shore is the highest; its width is about two cables' length, but off the coves it is broader; outside of the Eastern point of the bay are two small islets a cable's length from the land. This bay has good anchorage, the best place being 2 miles within the entrance, opposite a woody cove on the Western side, where you will lie secure in 14 and 16 fathoms, with abundance of wood and water. On the West side, also, a mile within the entrance, is a remarkable green cove, but this becomes shoal a short distance from the shore. From the entrance of the Bay D'Onar to Bowl Island, the course and distance are W.S.W. $\frac{1}{2}$ S. 2 miles. This is a remarkable round island, of moderate height, and lies a mile from the main land, about it, and between Bowl Island and Shecatia, are a great number of islets and rocks, the coast being thereby rendered dangerous to navigate, unless you have a fresh wind, the rocks will then show themselves by the sea breaking over them.

From Bowl Island to Shecatia, the course is W. by N. about 2 leagues; and 3 miles N.E. from Shecatia Island is the Bay of Petit Pene, running in N.N.E. about 5 miles, but this place is scarcely fit for vessels to go into, because the water is too deep, the entrance too narrow, the ground bad, and the whole bay open to the Southerly wind.

Mistagogue Bay.

MISTAGOGUE BAY lies about 2 miles to the Westward of Petit Pene; there is a good channel between the Island Shecatia and the main, and many seals are frequently caught there. Before the entrance to the Bay of Mistagogue lies an island of the same name; here, between the island and the river, the anchorage is good, with from 15 to 20 fathoms water; the ground holds well, and there is room enough to moor. To go to this road, you should pass round the Western end of the island, which is bold to, or round its Eastern end, and between it and Shecatia; but this latter passage is fit only for small vessels. In the Bay of Mistagogue the anchorage is good up to the very head of the channel is both long and narrow; the island and the main land, at the entrance, have a barren appearance, and is high; but both wood and water may be obtained in the bay.

Shecatia Bay.

SHECATIA BAY runs close in to the Westward of Mistagogue Island, and extends many miles up the country, its course bending to the Northward, and having various branches and turnings, with numerous islands, capable of giving shelter to vessels of all descriptions; but these are little frequented, and consequently not well known, besides the passages are too narrow for strangers to attempt the navigation of.

Shag Island and Rocks.

SHAG ISLAND AND ROCKS.—Nearly S.W. by W. distant above 2 leagues from the Island of Mistagogue, is the Shag Island and Rocks; the island is small, high, and has a round peaked hill in the middle; to the Eastward of it are a number of rocks above water, the outermost lying E.S.E. $\frac{1}{2}$ E. one mile and one-third from the island.

Cumberland Harbor.

CUMBERLAND HARBOR lies N.N.E. $\frac{1}{2}$ N. about 3 miles from the outer Shag Rocks, and may readily be distinguished by a remarkable high hill on the main land, appearing like a castle at its summit, being a steep cliff looking like walls; this hill lies N. by W. nearly 3 $\frac{1}{2}$ leagues from the entrance to the harbor. The outer islands which form the harbor, are called the Duke and Cumberland Islands; these are moderately high, the Eastern one making in two round hills. To enter this harbor there is no danger but what appears above water, except one small rock, which lies South about half a mile from the Western head; the entrance to the harbor is a quarter of a mile wide, and the inlet half a mile long; from the Eastern head you must steer for the inner point on the Western side, and after you reach that point, haul over to the Eastern side and anchor in from 20 to 7 fathoms, excellent ground, and room enough for any ship; this is by far the most commodious and best harbor on the coast, and also the easiest of access; fresh water is plentiful, but for wood you must go to Shecatia Bay.

Sandy Island and Bay.

SANDY ISLAND BAY.—N.W. by N. about 2 $\frac{1}{2}$ miles from Shag Island, is the Bay and Harbor of Sandy Island; to sail into this you should pass to the Eastward of the Shag Rocks, keeping the starboard point of the bay on board; you will then perceive a small rock above water to the N.N. Westward; this lies off the entrance to the harbor;

pass on either side of this rock, and then steer in N.N.E. $\frac{1}{2}$ N. for the harbor; there is no other danger; here you will have room enough to moor in 5 and 6 fathoms with good ground and safe riding; there is no wood here, but water in plenty.

PORT AND RIVER ST. AUGUSTINE.—The entrance to the Port and River St. Augustine, is between Shag Island and St. Augustine Square; the West Island, which is moderately high, the Western part being the highest, and quite low in the middle, but not easily to be distinguished at a distance, on account of the islands within it being much higher; a third of a mile to the Eastward of this is the East Island, somewhat larger, not quite so high, but even at the summit; between these islands, after passing the Chain and Square Islands, is a safe passage for small vessels to enter this port; and they can anchor between the West and Round Islands, or run to the Northward, pass Round Island, and stop in 6 or 7 fathoms, with plenty of room to moor. S.W. $\frac{1}{2}$ W. about half a league from West part of St. Augustine's Islands, is a string of small islands, commonly called St. Augustine's Chain, the outermost of which is a remarkable smooth round rock, and to the Westward of this, one quarter of a mile, are several rocks under water, over which the sea is constantly breaking; some of these are visible at one-third ebb: half a mile W.S.W. from these is a high black rock above water, and between these two is the best passage for large vessels into the Port of St. Augustine. You should steer from this black rock, towards a remarkable low point, which will bear N.N.E. $\frac{1}{2}$ N. until you open the port; then haul in and anchor as before directed; or you may steer up the passage between this point and Round Island, and anchor.

THE RIVER ST. AUGUSTINE is $\frac{1}{2}$ leagues from the entrance of the port, and runs to the N.N.W., having several islands lying in the passage; but the river is shallow, and only fit for boats to enter; there is a sandy bar across, which dries at low water. Two miles up, it divides into two branches, both running to the N.N. Westward for 11 or 15 leagues; wood and water are plentiful.

From St. Augustine's Chain to the bluff head of Great Mecatina Island, the course is about 8 leagues; the distance are W.S.W. 8 leagues and 1 mile; the coast is lined with islands, within about which are many harbors; the main land, in sailing along this part from Sheltera to Ha Ha Bay, cannot be seen, and the adjacent islands are so high, so numerous, and so near each other, that although there are navigable passages between them, you cannot discover their entrances, nor perceive them to be islands, until you get grand and entangled among them.

EAGLE HARBOR.—This lies at the Western end of Long Island, to the Eastward of Ha Ha Bay, and is formed by a cluster of islands, being capable of holding a great number of vessels in security; in it are from 20 to 10 fathoms water, the ground being well. In order to find out this anchorage, it will be advisable to make for the Island of Mecatina, from whence you should shape your course for the Fox Islands, which lie S.S.E. $\frac{1}{2}$ S. one large mile from the Westernmost entrance of the harbor; it may also be known by a deep bay to the Eastward, without any islands, while to the Westward there are a great many. But if you intend sailing in to the Eastward, you should steer from the Fox Islands N.N.E. $\frac{1}{2}$ E. $\frac{1}{2}$ miles, into the bay, where you will observe to the N.N. Westward of you, a remarkable high island, round to the Northward, is a safe passage of 3 fathoms into the harbor, where you may ride with safety, well sheltered from all winds. To the Western passage to this harbor, there are 23 fathoms; this is, however, a narrow channel, fit only for small vessels, and running in between many small islands.

This part of the coast is very dangerous for any vessel to fall in with, in dark and foggy weather, on account of the infinite number of small low islets and rocks about it, many of which being under water, and to avoid which no practical mark can be given; it will, therefore, always be advisable and prudent to keep off the coast to a considerable distance.

HA HAY lies on the main, to the Westward of Eagle Harbor, and has several small islands at its entrance, forming separate entrances; the best of these is that which lies between Seal Point and Round Island, leaving all the islands on the starboard side; this is a wide and safe passage, having no danger but what is visible. Ha Ha Bay runs in to the Northward about 7 miles, and has many islands at its head, on the starboard side; within these islands, to the Eastward, are numerous anchorages, from 9 to 20 fathoms water; vessels may also occasionally anchor all along the starboard side of the bay in 12 and 11 fathoms, muddy bottom, but on the Western side the water is too deep. N.N.W. $\frac{1}{2}$ N. about 2 miles from the entrance on the West side is a high bluff head; round this head N.W. by W. half a mile, is a small, but safe harbor for small vessels, in which you will have 12 fathoms, good ground; this harbor is formed by an island, on either side of which there is a narrow but safe passage.

THE FISH HARBOR is to the Southward of Ha Ha Bay, and runs in Westwardly, and is small, and formed by an island covered with wood; you may sail in on either side of the island; but the Northern passage is considered to be the better of the two; in the Southward of the island, is a ledge of rocks, partly visible at all times. *Little Fish
Harbor.*

by E. from the Woody Island lies a rock, on which are only 2 fathoms at low water. You may anchor in the harbor at the back of this island in 7 or 8 fathoms, and have plenty of room to moor. Off the Northern point at the entrance to this harbor, called the Point, are two little islands, and a small sandy cove, where a seal fishery is carried on.

Between Fish Harbor and Ha Ha Bay there is a very remarkable round high making a peak, which may serve as a landmark to point out either of these places for anchorage.

Great Mecatina Island.

GREAT MECATINA ISLAND lies three miles off the main land; it is 2½ miles long, and about 3 miles broad, being the most remarkable land at this part of the coast. It rises up in the middle, which is much higher than either of the ends; its Eastern point makes like a bluff head, and around this head to the Northward, within a quarter of small islands, there is a cove running in about one mile and a half; in this cove vessels can safely anchor, in from 11 to 20 fathoms, good ground, and may obtain wood and water.

Mecatina Harbor.

MECATINA HARBOR.—This harbor is formed behind Mecatina Island on the main land; it is safe but small, yet will admit vessels of burden, there being not less than 3 fathoms at low water, in either passage to it; but they must moor head and stern there being no room to moor otherwise. To sail in through the Western passage there is no danger, but to sail in through the Eastern channel you must observe the following directions. From the Eastern point of Mecatina Island steer North toward the main land; keep that close on board until you get the Western point of the island on with the point of Dead Cove; this is a small cove on the main, which lies open to the Eastward; the land which forms it is very low, with some brushwood upon it; then sail on in that direction until you get above a stony point, which is to the North side of the said cove; or until you bring the North point of Gull Island, which is a small island lying E. by N., distant 1 mile from Mecatina Island, on with the Eastern point of Mecatina Island; you will then be within a spit of rocks which stretch across the island, and must haul over for Mecatina Island, in order to avoid a ledge which runs off from the point of Dead Cove; and when you bring the Western passage open you may anchor in 6 or 7 fathoms water. Vessels coming from the Eastward, bound for the Harbor of Mecatina, in passing to the Northward of Gull Island, should be careful either to keep Gull Island or the main land close on board, in order to avoid a sunken rock that lies near half way between Gull Island and the main, on one side of which there are not above 3 feet water. The highest part of the land between the Point and Ha Ha Bay is directly over the Harbor of Mecatina.

The Grand Point of Mecatina.

THE GRAND POINT of MECATINA is the extremity of a promontory, which runs out from the main land; it is low at the point, but rises inland, sloping gradually up until it becomes of considerable height; it may easily be recognized by the adjacent islands and rocks which are about it; the nearest is a small low rock, not far from the point; two of these islands are much larger, and rise much higher than the others; and the outermost are small low rocky islands, lying 2½ miles off the point S. E. by E. five miles and a half from the Grand Point are the Murr Islands and these are the most Southerly islands on all the coast. The Northernmost of these islands bears from the other North a little Westerly, distant one mile; they are remarkable objects, being two barren rocks of moderate height, and steep all round. About half a mile E. S. E. from the Southern Murr Island, are the two Murr Islands, both appearing above water, and E. ½ S. from the same island lies a ledge of rocks under water, on which the sea generally breaks.

Bay de Portage.

BAY DE PORTAGE.—N. W. by N. from the Murr Islands, distant 2 leagues, lies the Bay de Portage, the land over which makes in a valley, each side being high, its entrance lies an island of moderate height, which forms the harbor; you may enter on either side of this island, but the Eastern passage is fit only for small vessels, there being only 2 fathoms, in some parts of it, at low water. The Western passage is sufficiently large and safe for any vessel to turn, there being from 6 to 8 fathoms; but they must be careful to avoid two sunken rocks, on which are only 2½ fathoms at low water. The Northernmost of these lies from Mutton Island S. by W. distant one mile and a half; the Southernmost rocks bear from the Seal Rocks N. E. distant half a mile; they are both bold to, and vessels may borrow within a cable's length of Mutton Island or the Seal Rocks.

The land from the Grand Point of Mecatina runs about W. S. W. 15 leagues, to Cape White, and is skirted by many islands and rocks, some of which lie 7 miles off shore; therefore, in coasting along, the land must always have a wide berth given to it: vessels entering the Strait of Belle Isle, and being abreast of Chateaux Point, distant 7 or 8 miles, or having brought the Red Cliffs to bear West, distant 5 or 6 miles, may steer N. W. $\frac{1}{2}$ W. course, and they will go clear of all dangers; when having passed the Shipmaker's Ledge, which is the outermost reef, distant 7 miles from Cape White, and brought that cape to bear N. by W. or N., distant 8 or more miles, they may steer W. by N. past Wolf Island, until they see Mount Joli*, a sandy ridge, on the main land, bringing that to bear N. W. by N. and a N. W. $\frac{1}{2}$ W. course will take them to St. George's Island.

REMARKS.—All the islands along the coast of Labrador have a barren appearance, the outer ones being, for the most part, small low rocky islets, and the inner ones large islands, high, covered with a sort of green moss. There is no wood to be obtained, except in some places which we have mentioned.

TIDES.—The course and flowing of the tides along the whole coast are irregular and uncertain, depending much upon the prevailing winds; and when the weather has been calm, it was high water at Shecatia, full and change, about 11 o'clock, and at Mecatina at half after two, the rise of the tides being about 7 feet.

At Red Bay the tide flows, full and change, at half past nine o'clock; at Forteau at eleven; at Labrador at half after eleven; and at all these places, spring tides are 12 feet, neaps 4 feet.

This is a sandy ridge, with spruce trees, near the S. W. extremity of Natashquan Point. From Mesquarro and Natashquan, parallel to the shore, from 5 to 11 miles distant, there are sand banks, with from 24 to 40 fathoms water, abounding with codfish.

GENERAL DESCRIPTION OF THE ISLAND AND BANKS OF NEWFOUNDLAND.*

The Island of Newfoundland.

THE ISLAND OF NEWFOUNDLAND is situated on the Eastern side, and directly in front of the Gulf and River St. Lawrence, its Northern part being separated from the coast of Labrador by the Straits of Belle Isle; and its South-western extremity from Breton Island and Nova Scotia, by the great entrance into the gulf. Its length, from Cape Race to Cape Norman, is nearly five degrees and a half; and its breadth, from Cape Spear to Cape Anguille, about 5 degrees 13 miles; being very narrow at the Northward, but becoming wide as you approach Southerly; its extremes between the latitudes of 46° 40' and 51° 40', and the longitudes of 52° 25' and 59° 25' West. The whole circuit of the island is indented with inlets and bays, many of which are extensive, commodious, and well sheltered, where vessels ride in perfect security. Into these bays and harbors numerous rivulets continually run, which, besides the purity of their water, afford abundance of trout and other fish. Most of their harbors have complete anchorages, with clear and good channels into them, so that they may be navigated at all times without the assistance of a pilot; they are frequently situated so near to one another, that, in many places, they form a succession of harbors, though they are not all inhabited. The towns and villages are in general to be found in the large branches only, where the situation and soil are most convenient; the inhabitants, therefore, are not numerous, and the settlements but small.

Great Bank of Newfoundland.

THE GREAT BANK OF NEWFOUNDLAND is to the Eastward of the island, and extends from about the latitude of 42° North to 50° or upwards, but recent observations seem to prove that its Southern extent does not exceed the parallel of 42° 50' North. Its form, like those of the other banks, is irregular, and not easily ascertained or defined, but about the latitude of 45°, its breadth, including the Jaquet and Whale Banks, nearly 4 degrees. To the Northward and Southward it narrows almost to a point, and seems insensibly to drop into fathomless water. The Jaquet and Whale Banks may be fairly considered parts of the Great Bank, being only divided from it by channels somewhat deeper water. The Jaquet lies to the Eastward, and has 55 fathoms upon its edge is very steep. Between it and the edge of the Great Bank are 112, 120, and 160 fathoms. The mariner, when entering upon the Great Bank, will change his soundings from 60 to 30, 37, 41, 45, and 60 fathoms; and as he advances towards the Whale Banks, he will have 55 and 60 fathoms. Between the Great Bank and the Whale Bank are 72, 75, and 80 fathoms, and upon the Whale Bank 50, 45, 55, and 60 fathoms; being over which, you again drop into 100 and 200 fathoms, no ground. On the Western side of the Great Bank, and to the Southward of the Island of Newfoundland and Nova Scotia, a chain of banks extends almost two degrees from the bank. These are called Green Bank, Banquereau, Sable Island Bank, &c. All these have soundings over them of various depths, from 20 to 70 fathoms, admirably situated, in dark weather, to warn the mariner of his approach towards the land.

Outer, or False Bank.

THE OUTER, or FALSE BANK, called also the *Flemish Cap*.—This is a patch of rising ground lying two degrees to the Eastward of the edge of the Great Bank, in latitude 46° 50' and longitude 45°. Its length is supposed to be about 90 miles, and breadth 50 miles. On it are from 100 to 158 fathoms. Between it and the Eastern edge of the Great Bank is much deeper water, the bottom being very fine sand and ooze, which will hardly stick to the lead. As you enter upon the Great Bank you will have a whitish sand, speckled black. These banks are frequently enveloped in most horrid fogs, which, from the middle of spring to December, have been known to last 8 and 10 days successively. At such times they are often so thick that you will not be able to see any object at 10 fathoms distance. A continual drizzling rain is dropping from your sails and rigging, a general calm prevails, and sometimes attended with a considerable swell of the sea, so that you are constantly in fear of running foul of some vessel, or being drifted by the currents upon some danger, which, from the total inability of discovering, you will have great difficulty to avoid. Added to this, the currents which surround the Island of Newfoundland are frequently so violent and so irregular, sometimes driven towards the shores, and sometimes towards the sea, that the greatest caution will always be found necessary, while the known current coming from the Northern regions, sweeps along the shores of Labrador, and in the spring detaches immense icebergs, which float to the Southward, and become exceedingly dangerous, especially in foggy weather. Some of these masses will frequently be grounded in 10 or 50 fathoms water, and others will be met with further out to seaward, at the distance

* E. & G. W. Blunt have published a CHART of the Bank and Coast of Newfoundland, Cape Race, and Gulf of St. Lawrence, from the Admiralty and French Surveys

of 125 or 130 leagues from the coast, and is generally discovered, even when the vessel is above them, and also before they may be apprehended by the eye. They continue and approach towards the bank, and will attend you, as rocks, more than 30 leagues off the coast, across the Atlantic, but in the following direction.

The following direction of the banks of Newfoundland by Cape Race, is as follows:—The quality of the bottom of the bank of Newfoundland the bottom of pebbles.

The Eastern approach of the banks which separate the bays, the bottom which is found to be sandy.

The currents on the Grand Bank are not the sole cause of the fog. We think that the fog is produced, that the direction of the current, which the fishermen have assured us will be the same, however, we can say with confidence, that the current will succeed during our navigation.

of Cape Race, the current is to the South of the Great Bank, and the direction varies little from the East. The velocity, which is from 24 to 30 miles.

We should inform navigators, principally on the Southern side, to be in such a manner that they may be able to steer their course with exactness.

The courses on the passing of the Great Bank of Newfoundland, when these are not known, you must keep on the Northward, to the opportunity of reaching land.

By sounding frequently, you may be able to find the depth at the islands of St. P. THE VIRGIN, or CAPE

an irregular chain or cluster of banks, with deep water between them, from 200 to 300 yards, and 6 fathoms, about 100 yards from the extremities of the banks, with deep water between them, with a confused cross swell, and the water deepens gradually towards the North, and N.E., one-third of the bank upon which the depth is 24 miles, and 24 miles, and 24 miles, until they are 20 to 30 fathoms, and the bottom is seen, and the sea breaks so violent.

N. Long. 50° 57' 30" W. A SHOAL of 21 feet is situated in lat. 46° 30'. It is 10 miles East of the Virgin R.

EAST COAST
FROM CAPE

CAPE RACE is the S.E. corner. Near it is a black rock

of 125 or 130 leagues from the land. Fortunately, these formidable objects may generally be discovered, even in dark weather, by a white and bright appearance on the sky above them, and also by the roar of the waters breaking against them; they also may be apprehended by the intense coldness they diffuse to a great distance around them. They continue and are met with sometimes every month in the year. Your approach towards the banks may be known by the numerous sea fowls which will attend you, as roches, malmanks, and divers. These latter are seldom found more than 30 leagues off the banks. Malmanks and others are occasionally seen all across the Atlantic, but in the vicinity of the banks they become numerous.

The following directions are translated from the report of a recent survey of the Banks of Newfoundland by the French:

"The quality of the bottom varies greatly; but we will remark, that on the Great Bank of Newfoundland the bottom is generally of sand, or sand mixed with gravel; seldom of pebbles.

"The Eastern approach is a fine white or whitish sand, often brilliant. In the deep places which separate the banks, and more particularly in the Whale's Hole, the muddy bottom which is found, has a fetid smell.

"The currents on the Great Bank of Newfoundland have a variable direction. The wind is not the sole cause of them. It is not rare for the current to be against the wind. We think that the tide has also some influence; for we have remarked, while at anchor, that the direction of the current varied as well as the velocity. Veracious fishermen have assured us, that the current daily made the round of the compass. However, we can say with a certainty which results from what we have seen and discovered during our navigation on these coasts, that most frequently beyond the meridian of Cape Race, the current runs to the Westward; that to the North as well as to the South of the Great Bank of Newfoundland, and on the Eastern approach, its direction varies little from E.S.E. to S.S.E., and most generally is between these points. The velocity, which is seldom below 8 or 10 miles in 24 hours, increases sometimes to 21 or 30 miles.

"We should inform navigators that on the outside approaches of all the banks, and principally on the Southern approach of the Great Bank, the currents boil and form eddies in such a manner that a vessel becalmed, or with a light wind, cannot estimate their course with exactness.

"The courses on the parallels between 46° and 48° of latitude are the best for passing the Great Bank of Newfoundland, and arriving at Green Bank and St. Peter's Bank. When these are reached, if you are bound to St. Peter's, in foggy weather, you must keep on the Northern side of St. Peter's Bank and wait a favorable opportunity of reaching land.

"By sounding frequently, the position of the vessel will be known well enough to give at the islands of St. Pierre and Miquelon."

THE VIRGIN, or CAPE RACE ROCKS are extremely dangerous. They extend an irregular chain or cluster S.W. by W. and N.E. by E. 800 yards, the breadth varying from 200 to 300 yards. The least water on a white rock is 4 fathoms, with from 6 to 6 fathoms, about 100 yards all around it. The bottom distinctly visible. Towards the extremities of the shoal, the soundings are from 7 to 9 fathoms, on detached rocks, with deep water between them, the current setting a mile an hour to the W.S.W., with a confused cross swell to the S.E. South, S.W., West, and W.N.W. of the shoal the water deepens gradually to 30 fathoms, half a mile distant; to the N.W., N.E., and N.E., one-third of a mile; and to the E.N.E., East, and E.S.E. a mile.

The bank upon which the shoal is situated extends E. by N. and W. by S. 4 miles to a quarter; and $2\frac{1}{2}$ miles across its broadest part, with regular soundings of from 30 to 30 fathoms, until they suddenly deepen on its outer edge to 39 and 43 fathoms. The bottom is seen, and large patches of sea-weed on the sand around them. Over the sea breaks so violently as to make it unsafe to pass in a gale. Lat. $46^{\circ} 26'$ N. Long. $50^{\circ} 57' 30''$ W.

A SHOAL of 21 feet is said to have been found by Capt. Ryder, of Provincetown, Mass., in lat. $46^{\circ} 30'$. It is a rock between one and two hundred feet surface, about 1 mile East of the Virgin Rocks.—See the Chart.

*The Virgin,
or Cape
Race Rocks.*

A Shoal.

EAST COAST OF NEWFOUNDLAND,

FROM CAPE RACE TO ST. JOHN'S HARBOR.

Variation, 24° West.

CAPE RACE is the S.E. point of Newfoundland. It is table land, moderately *Cape Race.*

Near it is a black rock, and several smaller ones around it.

CAPE BROYLE HARBOR runs in about 4 miles between Cape Broyle and Brigus Head, their distance from each other being $1\frac{1}{2}$ mile. Within the entrance, on the North side, is Admiral's Cove, where you may anchor in 12 fathoms water, good ground, but exposed to the S.E. The best anchorage will be found above the Narrows, in 7 fathoms. The only danger in the way is the Saturday's Ledge, which lies about $1\frac{1}{2}$ mile to the north outside of the Narrows, on the North shore. Bring the Saddle of Brigus Head open of the point of Admiral's Cove, and you will clear it; and after you get beyond the Narrows anchor in 7 fathoms, good ground, very convenient for both wood and water.

BREIGUS.—This is a small cove, or harbor, a little to the Northward of Brigus Head; it is only fit for boats.

Four and a half miles from Cape Broyle is Cape Neddick, a kind of table land moderately elevated, and steep to. From Cape Neddick to Baline Head is $1\frac{1}{2}$ mile. One quarter of a mile to the Northward of this is Baline Cove, fit only for boats. The outer part of Great Island is about $2\frac{1}{2}$ miles N.E. by E. $\frac{1}{2}$ E. from Cape Neddick; and from Baline Head to Spear Island, the course is N.N.E. $\frac{1}{2}$ E. distant one mile. Within this island is a fishery, but the anchorage is unsafe, and the bottom rocky. One mile to the Northward is Poad's Cove, fit only for boats; half a mile from which is Parker's Point, the Southern boundary of Momables Bay; this place is nearly one mile deep; it is open, and its Northern point forms the Southern part of Witless Bay; about three-quarters of a mile from which is Green Island; and the same distance to the Northward of Green Island is Gull Island, about a mile in length, and a quarter of a mile in breadth, the land appearing high.

WHITTLE BAY extends inwards full two miles from Gull Island, but lies open to the sea; the ground is tolerably good, and the depth of water moderate; but half way is a ledge of rocks off the Northern shore, part of which are seen at half tide.

BAY OF BULLS.—One mile and a quarter to the Northward of Gull Island is the Northern point of the Bay of Bulls, and from hence to the Northern point called Bull Head, the course is E. N.E. $\frac{1}{2}$ E. distant one mile and a quarter; between these points the bay runs up N.W. by W. nearly two miles, and then N.W. by N. one mile further to the river head. Within this bay the riding is good, in from 20 to 16 fathoms; and when you have passed Bread and Cheese Point there is a cove; off this latter point is a shallow rock, at the distance of about half a cable's length, having passed which, the bay is free from danger, and the shores bold; run up and anchor over against John's Hill, bringing it to bear N.E. by N., having 12, 13, and 14 fathoms; the merchant vessels run further in to 10 and 7 fathoms.

From Cape Broyle to the Bay of Bulls, the course is N.E. by N., distant $4\frac{1}{2}$ leagues. From Bull's Head to the South point of Little or Petty Harbor, from which a reef of rocks stretches out about a quarter of a mile, the course is N.E. distant $8\frac{1}{2}$ miles. The South point of Petty Harbor is distant from the North point $2\frac{1}{2}$ miles, between which lies the bay, running in two miles; at the bottom of this is a cove and fishery. About midway between the Bay of Bulls and Little Bay, is a cavern, having an opening at its summit, through which, whenever the sea runs high, the water spouts forth, forming a remarkable appearance, which may be seen far off; it is therefore significantly enough named the Spout.

From the North, or Lady Point of Little Harbor, Cape Spear bears N.E. distant $2\frac{1}{2}$ miles, it has a low and ragged appearance, and is the Easternmost part of Newfoundland, and lies in latitude $47^{\circ} 30' 53''$ N., and in longitude $52^{\circ} 39' 20''$ W. Vessels from the Eastward, upon getting into soundings, and bound for St. John's, generally steer for this point. Between the cape and the entrance of St. John's are three bays; the first is called Cape Bay, and lies between Cape Spear and Black Head; the second is called St. John's Bay, and lies between Black Head and Small Point; and the third is called Freshwater Bay, and lies between Small Point and Fort Amherst.

There is a light-house on Cape Spear, containing a revolving light, elevated 275 feet above the level of the sea. The time of revolution one minute.

ST. JOHN'S HARBOR is one of the principal places in Newfoundland, being the seat of government; and although its entrance is narrow, its harbor is excellent, and its situation readily known, both by the block-house built on Signal Hill, at the North end of Fort Amherst, on which there is a fixed light, on its South head or point of view. The channel, from point to point, is only 360 fathoms wide; but it gets narrower just within the points than between them, decreasing again as you approach the Pancake Rock, for from the latter to the Pancake Rock, the distance is only 95 fathoms; these are rocks, both being above water, and steep to; Chain is the Northern rock, and Pancake Rock lies on the South side of the channel.

When approaching the Harbor of St. John's with a large ship, care must be taken to avoid the Vestal Rock, which lies about 50 fathoms off the Southern, or Fort Amherst side; over this rock are 25 feet water; the marks for it are Fort William, or the Old Light, just open of the South head; and the outer Wash-ball Rock open to the

Cape Broyle Harbor.

Brigus

Whittle Bay.

Bay of Bulls.

Light.

St. John's Harbor.

Light.

Lanse Cove, lies a small low island called Little Belle Isle, W.S.W. of which, about 1½ mile, is Kelley's Island, of middling height, and about three-quarters of a mile in length.

Within Belle Isle, on the main, is Portugal Cove, the anchorage within which is not considered safe. To the Southward is Broad Cove, and at the bottom of the bay, is Holyrood Harbor, in depth about 3½ miles; in a cove on the West side of which is an anchorage, in 8, 9, 10, or 12 fathoms water, and room enough to moor.

Following the coast, about 1½ mile from Holyrood entrance, is Harbor Main, about a mile in depth, and half a mile wide; it is an open place, but near the upper part you may anchor in from 7 to 10 fathoms water.

SALMON COVE.—One mile further is Salmon Cove, the entrance to which is a *Salmon Cove*. It is wide; the course in is W.S.W. about 2½ miles; it then divides into two branches: one to the Westward about one mile, the other Southward one mile and a half; in either of these branches the anchorage is good, but the Southern river is considered the better one, there being no danger in entering. In the Western branch a rock lies at a small distance from the starboard shore, having on either side a passage, but the Western one is the wider of the two.

COLLIER'S BAY.—To the Northward, near one league, lies Collier's Bay, running *Collier's Bay*. It is about South-westerly full two leagues; one mile and a half from the entrance of the bay lies a sunken rock, nearly mid-channel, on both sides of which the channel is narrow; this rock is visible at three-quarters ebb. Two and a half miles up the bay is an anchorage in 10 fathoms water, on the Eastern side and opposite a small cove; in this cove vessels may go, and ride in 3 and 4 fathoms water. Higher up the bay is another cove, at the further distance of 1½ mile, but it is both foul and shallow.

At the head of the bay the anchorage is good in 8, 9, and 10 fathoms.

BRIGUS BAY is two miles to the Northward of Collier's Bay, and seldom frequented but by small vessels, it being open, and too far up Conception Bay; it runs in from the head of the bay, behind a small island on the South side, small craft may lie secure from all winds, with 3 and 4 fathoms water, and moor to the shores. The South side of Brigus Bay may be known by its peculiar ragged appearance. *Brigus Bay.*

PORTGRAVE, or PORT DE GRAVE BAY, lies to the Northward of Brigus, and within it Sheep's and Cupid's Coves; the latter is on the South side of the bay, and is a good place for two or three ships to ride in, with 4, 5, and 6 fathoms water, but the bay is land-locked, and having not above one point open. Its north side is bold, and you may lie alongside the rocks and take in your cargoes. The shore on the South side is remarkably high, and called Spectacle Head. Sheep's, or Ship Cove, accommodates small vessels in 4 and 5 fathoms water, mooring head and stern, and their S.W. anchor in 22 fathoms, about a cable and a quarter's length from the shore.

Portgrave is about three-quarters of a mile to the Westward of Ship Cove; the water within the islands is shallow, but without them the anchorage is 20 and 25 fathoms deep, where you will be quite exposed to South-easterly winds. Burnt Head is the point of Portgrave Bay; from whence 2½ miles N.E. ¼ N. lies Bay Roberts, at the Southern point of the entrance to the Roberts Bay, which is 1½ mile broad, and extends to the South-westward 5 miles. One mile above Bay Roberts Point is Blow-me-away Head, which is higher than any land near it; half a mile within this is a cove.

BAY ROBERTS has no invisible danger at its entrance; you may borrow on either side, and go close to the island, which lies further in on your starboard side; having a cove in which you may run on about a mile, and lie land-locked in 9 or 10 fathoms. Between the island and main vessels can anchor, but the ground is foul and bad; and there are two sunken rocks, one being near the inner part of the island, the other above the main and near the main. Two miles above the island is excellent anchorage, in the S.W. arm or branch of the bay, on muddy ground. Give the South point a good anchorage in sailing in, as some rocks under water lie near it, and the starboard shore is near half a cable's length. *Bay Roberts.*

SPANIARD'S BAY is divided from Bay Roberts by an isthmus, or neck of land. Spaniard's Bay is deep and extensive, but open to the S. Easterly winds. There is anchorage within it, nearly all over, especially at its head, in 7 and 8 fathoms water. *Spaniard's Bay.*

Two leagues N.E. from Spaniard's Bay are the islands of Harbor Grace; they are about 6 miles from Cape St. Francis about 6 leagues, bearing E. ¼ S. To the southward is Harbor Grace, a good place for fish, but not for shipping. There is a rock midway of the bay. You may sail in on either side of this rock, and find good anchorage in 5 fathoms water. The ground within the rock is clean.

HARBOR GRACE.—The entrance to the harbor is to the Northward of the islands, of which, a mile from the main land, there is a fixed light; to the Southward, between them and the shore, the channel is narrow and the ground is foul; the light will be nearly West. Almost mid-channel is the Salvage Rock; no danger

is outside of this rock. There is also another rock, called the Long Harry, lying near the North shore; both these rocks are above water, and always visible. When you are within the Salvage, go no nearer the West shore than just to open a passage to the West side of the Long Harry, the leading mark for sailing in being the high point of the main, called Mosquito Point, just open to the Eastward of Long Harry Rock; this will carry you in with not less than 22 fathoms, quite up to the harbor, clear of danger; but towards the Eastern shore, you may stand over until you bring the Western Landmark on with the Cupola of the Chapel; you will then be up to the North side of the bar, and must take care not to open these marks, especially if the mark at the Cove at Ship's Head is open with the mark on the point of Admiral's Beach; if you can bring the Western Landmark at the back of the Chapel on with the Cupola, before the mark at the Cove at Ship's Head comes on with the mark at the point of Admiral's Beach, then you will be in the narrows, and must not stand further over to the Eastward than to bring those marks in one, and continue turning with these marks to the East and West, until you bring the Eastern Landmark at the back of the Cupola on with the Cupola; then you will be within the bar, and should stand well over to the Eastward. About half way down this harbor a broad spit of sand runs off from the Southern shore, extending full two-thirds over towards the Chapel; this appears to what Mr. Lane has called the bar: it has 1, 2, 3, and 3, fathoms in some places on it; but there is a channel between it and the Northern shore, with 1 and 5 fathoms water; to sail through which bring Otterbury Head on with the point of the beach of Ship's Head; this will also lead to the Northward of the island of the Harbor Grace. A white rock on the beach at the West end of Father Ewer's House, near the Catholic Chapel, will clear the East end of the spit; the Western post of the said Father Ewer's Gate on with the opening between the spire and the West end of the Catholic Chapel, will clear the West end of the spit; and the outer edge of the Long Harry on with the extreme point of the Northern shore, will clear the shoal on its Northern side. This is a very good and convenient anchorage, with room enough for a vessel to turn in or out of the narrows; and the marks here given are very easily distinguished, and will clear all dangers. The Middle Mark at the back of the Chapel on with the Cupola, and the mark at Ship's Head on with that at Admiral's Beach, leads on to the shoalest part of the bar. To the Northward of Harbor Grace is Carbonierre Island and Harbor; before you reach which is Mosquito Cove, a place between Harbor Grace and Carbonierre, little frequented, although the anchorage is good, it not being convenient for the fisheries.

Carbonierre Island.

CARBONIERRE ISLAND lies about 18 miles from Cape St. Francis: its Southern end is low land, but upon it stands a small fort, built for the defence of the fishermen. The island is bold to, so are the shores of the harbor, but off the S.W. end of the island are several rocks under water; the passage, therefore, between the rocks and the main, should not be attempted. On the North side, opposite Carbonierre Bay, are two small coves, where the planters live, who keep fishing-boats; the Northern of these is called Clown's Cove, fit only for boats; the other is called Crocker's Cove, and is separated only from Carbonierre Bay by a small point of land, called Crocker's Point. Off these coves are several rocks, both above and under water; therefore, in sailing either in or out of the Bay of Carbonierre, these must have a bearing, and after you reach Otterbury Point you may stand in to either shore, both being bold to, until you near the head of the harbor; this is a good place for riding in. It is bold to, and with water of various depths for anchoring everywhere.

Two miles N.E. by N. from Carbonierre Island is Salmon Cove Head, high and steep; behind which is a cove, where abundance of salmon are caught; an island lies in the midway of the channel, but the cove is only fit for boats.

Green Bay.

GREEN BAY.—Four or five miles further North is Broad Cove Head, and 3 miles further is Green or Western Bay Point; off the shore, and about a mile to the Northward of Broad Cove, is anchorage in from 10 to 15 fathoms. At the entrance to Green Bay, is anchorage in 15 and 16 fathoms, but it would be dangerous to go far into the bay, which is quite open to the Eastward.

Five miles to the North-eastward of Green Bay is Devil's Point Cove, a place of little note, and further on is Flamborough Head, black and steep to. There is no place of shelter hereabout, nor from Carbonierre to the Island Bacalieu, except the wind off shore.

Bay Verde.

BAY VERDE is about half a mile to the Westward of the head, and up to the is three-quarters of a mile; the entrance is not above a cable's length across, and the shoals lie about half a cable's length from the head of the bay, in 5 fathoms water; a cable fastened to the shore, and an anchor out astern. Six or seven ships may lie in this manner, but S.W. winds blowing right in, would make that a dangerous anchorage: it is also a bad place for either wood or water, but the great quantities of fish which resort here, occasion it to be much frequented. It is a place easily known from Bacalieu and the projecting land, called Split Point. Bay Verde Head itself will

point out its position, for the Island, appearing promising Southward; and the entrance is high land, nearly 4 miles between is a good channel, and is a sunken rock, over which it is six fathoms deep. From Split Point about 4 miles open Trinity Bay.

FROM BACALIEU, OR

TRINITY BAY is, like the Eastward; like that also, it will be regularly described from which, distant about 10 miles of bay, where boats, with a depth of rocks above water, between this island and the other is a mile; the course is 2 miles. Off the latter is a Perlican; vessels cannot pass good and open, because run in to the Southward in 5 fathoms. This cannot be done with the wind at N. E. Perlican to Salvage Point

is a good berth, having a distance of 1 mile to the Eastward of which is Hants Head, and further is King's Head, which is S.W. & W. about 10 miles Eastward of the Sugar-loaf Perlican. From Salvage Point to the Perlican, the bearing is S. by E. small, but tolerably good anchorage. The shores are 10 miles wide, being bounded to the West; but as you advance you will scarcely be half a mile from HANTS CONTENT.—The harbor, fit for any ship, is in 12 fathoms water. 10 miles beyond that is the bay, and a league further is much exposed, and the bottom is small islands, which you take a mile from Witless Bay is 10 fathoms. Three miles further is a place of shoal water, called HARBOR.—Two anchorage is very good anchorage in 10 to 20 fathoms water, going to the mouth of which is a narrow channel, about two miles to the Northward in the same direction to Chapel Head, which runs inward, in a Southward, and though little frequented by BULLS.—To the Northward anchorage in various parts of the Western side in a cove, in 15 fathoms, sandy ground, and island. Both these lie very

point out its position, for these three heads, Bay Verde Head, Split Point, and Bacca-
 Island, appear prominent bluff land, very similar to one another, as you come from
 Southward; and there is no hidden danger in entering the bay. The Island Bacca-
 is high land, nearly 4 miles long and 1 $\frac{1}{2}$ broad; it is distant 1 $\frac{1}{2}$ mile from the main.
 between is a good channel. Nearly midway between its Southern point and Split
 is a sunken rock, over which, in blowing weather, the sea generally breaks, al-
 though it is six fathoms under water, and steep to all round.

From Split Point about 4 $\frac{1}{2}$ miles is the Point of Grates, having rounded which, you
 open Trinity Bay.

FROM BACALIEU, OR BACCALOU, ISLAND TO CAPE BONAVISTA.

TRINITY BAY is, like Conception Bay, wide, extensive, and forms itself South- *Trinity*
 ward; like that also, it contains many lesser bays and harbors within it; these *Bay.*
 will be regularly described in rotation. Point Grates is the S. Eastern point of the
 bay, from which, distant about 2 miles, is Break-heart Point, and between them is a
 neck of bay, where boats, with an off-shore wind, ride in safety. Within this bay is a
 ledge of rocks above water. To the Southward of Break-heart Point is Scurvy Island,
 between this island and Sherwick Point is a bay running in S.S.E. about three-
 quarters of a mile; the course from Break-heart Point to Sherwick Point is S.W. by
 13 miles. Off the latter is a rock above water; this forms the Northern point of
 the Perlican; vessels cannot go between the island and point, although the passage
 appears good and open, because the ground is altogether foul and rocky; always there-
 fore run in to the Southward of the island, and when you have passed it, anchor in 4
 fathoms. This cannot be considered a good harbor, as the ground is bad for hold-
 ing, and with the wind at N.W. you will then be obliged to buoy your cables. From
 the Perlican to Salvage Point the course is W. $\frac{1}{2}$ N., distant 5 miles. Salvage Point
 is a good berth, having a reef of rocks running out from it; the point itself is
 1 mile from Salvage Point to Hants Head the course is W. by S., distant 7 miles;
 one mile to the Eastward of the head is Hants Harbor, fit for small craft only;
 one mile off which is Hants Harbor Rock, over which the sea generally breaks; bring
 your Head open of the Sugar-loaf, and you will clear it to the Northward. Two
 miles farther is King's Head, and from King's Head to the Sugar-loaf the course and
 distance is S.W. $\frac{1}{2}$ W. about 3 miles.

Eastward of the Sugar-loaf is Sillee Cove, fit only for boats, and unsafe for vessels. *New Perli-*
 can.

NEW PERLICAN.—From the Sugar-loaf to the North point of the entrance of
 the Perlican, the bearing is S. W. $\frac{1}{2}$ W., distant 2 miles; and one mile further is the
 point, small, but tolerably good, within which you may ride land-locked in from 5 to
 10 fathoms. The shores are bold to, and free from danger. The entrance is nearly
 1 mile wide, being bounded by Snutty Nose Point on the East, and Gorlob Point
 on the West; but as you advance the harbor becomes narrower, so that at the anchor-
 age it will scarcely be half a mile broad.

HEART'S CONTENT.—Three miles from New Perlican is Heart's Content, a *Heart's*
 harbor, fit for any ship, with excellent anchorage towards the North shore, in *Content.*
 12 to 14 fathoms water. One league further is Heart's Desire, fit for boats only
 13 miles beyond that is Heart's Delight, another cove, adapted for small craft.

From Heart's Delight, about three miles, is Long Point, projecting considerably
 into the bay, and a league further is Witless Bay, by no means a place of safety, being
 much exposed, and the bottom rocky. Between Long Point and Witless Bay are
 several small islands, which you leave on your port hand.

One mile from Witless Bay is Green Harbor, where vessels may anchor in from 7 to
 10 fathoms. Three miles further is Hope-all-a-head; two miles beyond which is New
 Harbor, a place of shoal water, and only fit for boats.

DILDO HARBOR.—Two and a half miles from New Harbor is Dildo Harbor, with *Dildo*
 anchorage in various parts of this bay, in 12 and 10 fathoms water, particularly *Harbor.*

Three miles from thence is Chapel Bay, the mouth of which is a mile broad, and the bay about three miles deep. Here,
 is a small island, about two miles in, is good anchorage in from 8 to 12 fathoms.
 Five miles to the Northward is Collier's Bay, very similar, and running nearly in
 the same direction to Chapel Bay. Seven miles further is the Point of Tickle Harbor
 which runs inward, in a Southerly direction, full 8 miles; there is no danger in
 the bay, and though little frequented, the anchorage is safe.

POINT OF BULLS.—To the Northward is the Bay of Bulls, running in a N.N.West- *Bay of*
 direction to within 2 miles of Chance Rivet, in Placentia Bay. There is very *Bulls.*

anchorage in various parts of this bay, in 12 and 10 fathoms water, particularly
 on the Western side in a cove, about one mile and a half from the entrance, with from
 15 fathoms, sandy ground. To the N.E. is Bull Island, and 5 miles further Cop-
 land. Both these lie very near the shore. We now open Deer Harbor, a place

TRINITY HARBOR is considered one of the best and largest harbors in all New-*Trinity Harbor.*
 Zealand, having several arms and coves, where some hundred ships may ride land-locked. It is a place where you may safely turn in or out, being hold to on each side, having no danger but what is visible, except when going into the S.W. arm. There the Admiral's Stage usually is, there is a shoal, called the Muscule Bank, from which shoots off the point within the small island on the port side going in, and extends over N.N.W. about a third of the breadth of that arm. Being within that bank, you will discover itself by the color of the water, you may edge over close to the north shore, or keep your lead going to avoid the Muscule Bank, giving it a little distance: the mark for avoiding it is the house, standing over the steep perpendicular cliff, situated between Tavernor's Point and Ship Cove, open of the Neddick. Keep the mark on until you are half way over to the Neddick, then haul towards the S.W. anchoring, taking care to avoid the South shore till you shut in Tavernor's Point with the Neddick; you will then go within the Muscule Bank. You may anchor in from 14 to 20 fathoms, and approach near to the stage on shore, so as to make a stage with top-sets to your stage on shore, to load or unload your ship. This will be found a most excellent harbor; for, after you are in the S.W. arm, you will perceive another branch opening up to the N.W. which is continued by another to the S.W.; but there is a bar ledge at the entrance of the S.W. arm. The N.W. arm is also a large place, having good anchorage for 500 sail of ships. Besides the fore-mentioned arms, the main harbor turns up to the North.

Ships, being within the harbor's mouth, may safely ride in a large cove on the starboard or East side, land-locked, on good ground; here the planters live. Over against the cove, on the port or West side, are two other coves; the Southernmost of them is called the Vice Admiral's Cove, very convenient for curing fish; and above, or to the northward of that, is a large cove or arm, called God's Cove, where there is room enough for 300 or 400 sail of ships to ride, all on clear ground; there neither winds, nor tide, can hurt you; and in this place ships may lie undisturbed until the weather becomes clear and open.

There are several other anchoring places in this harbor, with good clean ground. The bottom everywhere is tough clay, with 4 and 5 fathoms water, within two boats' length of the shore; and 6, 7, 8, 9, 10, 12, and 14 fathoms, and in some places more, in the middle of the arms and channels. You may turn in or out readily, observing your lead, which rises about 3 feet, and sometimes more.

ROBINHOOD'S BAY.—Sherwick Head, which is the Eastern point of Trinity *Robin-*
 Harbor, forms also the South-western boundary of Robinhood's Bay, the entrance to *hood's Bay.*
 which is a mile wide, and the bay extends Northward nearly two miles. Here vessels frequently ride and fish, in from 7 to 17 fathoms water. At the further or upper end of this bay there are some spots of shallow water, but at its entrance, and between the rock and Fox Island Points there is no danger whatever.

SALMON COVE and ENGLISH HARBOR lie to the Eastward of Robinhood's *Salmon*
 Cove, being only divided from it by a narrow neck of land, called Fox's Island. The *Cove and*
 Cove of these arms is Northerly, and is considered a good fishing place; it is clear *English*
 English Harbor, and has a good depth of water, from 17 to 10 and 8 fathoms; the Eastern *Harbor.*
 Cove is hold to, and at the further end of the cove there is a small run of water, which extends about two miles to the Northward.

ENGLISH HARBOR is situated at the South-eastern entrance of Salmon Cove. *English*
 English Harbor, where you may ride in 4 and 5 fathoms water. From hence the coast *Harbor.*
 runs to the Eastward to the Horsechops, a distance of more than three miles; it is high land, steep to and without danger. To the North-eastward of Horsechops is a bay, open and entirely exposed to the Southward. At the Eastern part of this bay is a small sandy beach, with a rivulet of water. This place is little frequented, but is another convenient for ships to fish or ride in. When you have passed this bay, there is no sheltering cove or place until you reach Ragged and Catalina Harbors.

RAGGED HARBOR is so named from the rough and craggy appearance of the sur- *Ragged*
 rounding rocks, which render it unsafe for either boats or ships to enter; but for those *Harbor.*
 who intend going there, we shall observe, they must go to the Northward of the bay, and at its entrance, running on North, until the harbor becomes quite open, you may steer in between the Round Island near the main, and a large black rock, which is the outermost of the ragged ones before mentioned; sail on until you are to the Westward of them all, or until you get the South head of Catalina to appear between the Westernmost rock and the main, then anchor. A river of good water is at the end of the harbor.

CATALINA HARBOR is nearly two miles to the Northward of Ragged Harbor. *Catalina*
 Catalina Harbor, in the latitude of 48° 31' 15" N., bearing from the North point of Bacalieu Island *Harbor.*
 North, distant 24 miles. It is a good harbor for small vessels, and may be distinguished by a singular green island at the South point of its entrance. Near half a mile North of this island are the Brandy Rocks, a ledge over which the sea frequently

breaks. You may go on either side of these rocks, giving the little island a berth with a leading wind between the island and the main, though this passage is exceedingly narrow, in 4 and 5 fathoms. Just within the entrance of the harbor is Church Rock or Shoul, lying near mid channel, over which are only 8 feet water. You must avoid bringing the North point of Green Island on with Burnt Head, the South point of the harbor, for that will carry you right upon the rock; there is a passage between the island and rock, and also between the rock and the North shore, only steering near the main, about two thirds over.

Little Catalina Bay.

LITTLE CATALINA BAY lies inwards on the Northern side. From Catalina Harbor to Little Catalina, the course is about N.E. 1½ mile; and thence to the North head of the bay E.N.E., a little westerly, 1½ miles. When within the harbor, you may anchor close to the shore in 4 and 5 fathoms, land-locked; or to the Southward of the Little Green Island in 3 fathoms, or by running up two miles further obtain 12 fathoms water. In the S.W. arm or branch of the river, where there is no anchorage in 5 fathoms, the harbor runs westerly. Sometimes the water in this harbor will suddenly rise 3 or 4 feet, then fall again, and in certain seasons it will often do so 2 or 3 times in 3 or 4 hours. It abounds with salmon, and the herb Alexander grows luxuriantly on the Little Island. Near a small cove, at the N.W., is a sort of mineral of a tering nature, generally called Fire-stone; excellent willicks may be found on the rocks.

From the South to the North head of Catalina the course is N.E. ¾ E., distant 1½ miles, and between them are from 13 to 5 fathoms water. The whole way is a sort of broken ground, and in blowing weather the sea frequently breaks high over it.

From the North head of Catalina to Flower's Point, the course is N.N.E. ¼ E., distant 2½ miles; and one mile to the Eastward of the point lie some sunken rocks; may go between Flower's Point and these rocks in 6 fathoms water, but it is not advisable to pass on the outside of them; this you will readily do by bringing the Island open of Spiller's Point, or by keeping the South head of Catalina open of the North head.

From Flower's Point to Bird's Island is 2 miles. Within Bird's Island is a small bay where ships can occasionally ride, in one branch which runs up towards the Westward; and in the other, amidst some rocks, which are above water. Bird's Island may be taken as far as Cape L'Argent.

From Flower's Point to Cape L'Argent is 3½ miles. It is rather a low rocky point, having also a large rock above water lying off it.

From Cape L'Argent to Spiller's Point is 1½ mile. Between these points the sea falls into very deep water. Spiller's Point is steep and bold to, but not very high, a rock above water near it. Over the point, you may discern the high land of Bonavista, a great way off at sea.

From Spiller's Point to Cape Bonavista the course is North, distant almost 1½ miles. Between them is a deep bay, which might be mistaken for the Harbor of Bonavista from the head of which it is only divided by a neck of land. Two miles over from Red Head Bay, it is not above a musket-shot.

Hitherto the allowance made for the variation of the compass has been two points West; which, it is presumed, will be found sufficiently near to the truth for all purposes of navigation; but from hence to the Northward it appears to have gradually increased. At the Capes which form Bonavista Bay, the variation in 1823 was 30° 28' W.; at Barrow Harbor, 28° 30' W.; and at Happy Adventure, only 25°.

FROM CAPE BONAVISTA TO CAPE FREELS (NORTH)*

Cape Bonavista.

CAPE BONAVISTA is in latitude 48° 42' N., and longitude 53° 08' W. there is a revolving light of two minutes intervals, showing a red and white alternately. It is 150 feet above the level of the sea. Kept open with Spiller's Point keeps vessels clear of the rocks, called the Flowers.

The cape appears from a distance of a bluish color, and is a steep rocky point, lying 4 fathoms close to the shore. Somewhat less than three-quarters of a mile E. from the extremity of the cape, lies Gull Island, which, though small, may be recognized, by being of moderate height, and elevated in the middle, making a thing like a round hat with broad green brims, and visible 4 or 5 leagues off, when the weather is clear. N.N.E. ¼ E., distant 3½ miles from Gull Island, is the Old Rock, lying only 13 feet water over it. From this a reef or bank extends to the E. nearly three miles, having several dangerous spots upon it, of only 18 feet at 4 fathoms. The outer edge of this danger is called the Young Harry. At its northern extremity are 10 fathoms water, and a little further off 45 fathoms. Between

* So called to distinguish it from a cape of the same name, situated on the Southern coast of Newfoundland, near St. Mary's Bay.

Harry and the middle ground of 18 feet, are 12, 20, and 50 fathoms; to the Northward of the middle ground are 60 and 40 fathoms; to the Eastward are 19 and 20 fathoms; to the Southward, and between it and the Old Harry, 26 and 34 fathoms. At the North part of the Old Harry are 11 fathoms; to the Westward 30 fathoms; to the South 9 fathoms; and a little further S.W. 57 fathoms. Abundance of fish are caught from the boats which frequent this bank, but it is very dangerous for shipping. The sea commonly breaks over Old Harry, unless in fine weather, and the water be very smooth; but the other part of the shoals show themselves only in, or immediately after, heavy gales on the shore.

In order to avoid the Old Harry, you should bring Gull Island on with the Green Ledge which lies considerably inland; but you must beware, for this mark will carry you too close to the Young Harry. Vessels running along shore, to avoid these rocks, must be careful in keeping Cape Bonavista open with the Westernmost extremity of the high range of land to the Southward, called the Inner Ridge; these dangers, together with the long ledge, called the Flowers, already noticed, render it very imprudent for a stranger to attempt making land hereabout in thick or boisterous weather; indeed, at any time, the Island of Bacalieu is the best and safest landfall for the stranger that should to any part of Bonavista Bay.

BONAVISTA BAY.—This extensive bay is formed on the South by Cape Bonavista, and on the North by Cape Freels. These capes lie N. 3 E. and S. 3 W. from each other, and comprehend a distance of 40 miles; between which the coast is much indented with bays and inlets of the sea, most of which are navigable, but difficult, dangerous, and steep. The land, on the South, is generally high and mountainous, and the shores steep and ironbound; the North side is low and marshy, from which the waves run off shoal to a considerable distance. The whole bay abounds with small islands, and is on every side encompassed with dangers. The harbors, sounds, and inlets are deep, extensive, numerous, well sheltered, and safe; but they are generally so deeply embayed, the passages into them so intricate, and the surrounding land so similar in appearance, that few, except those to whom the navigation is familiar, ever attempt to enter them. Of those which seem to offer the best refuge to strangers, who are necessarily should be compelled to seek a place of shelter, the following appear best calculated to suit his circumstances: Barrow Harbor, or Great Chance Harbor, on the South; and New Harbor, or Cat Cove, on the North side of the bay; but the extreme narrowness of the entrance to New Harbor is a great impediment, and renders Cat Cove the most to be preferred.

PORT BONAVISTA, or Bonavista Harbor, lies within and about 33 miles to the North-eastward of Cape Bonavista; and vessels intending to rendezvous there, may either pass to it between Gull Island and the Cape, or between Gull Island and the Old Harry Rock, or to the Northward of the Young Harry altogether; if the former, between Gull Island and Bonavista. The passage is about three-quarters of a mile wide, and both the cape and island steep to, having 4 fathoms water close to each side, and 18 fathoms mid-channel; but it will be advisable not to go too near to the Gull Head, on account of a rock under water, which lies about 300 yards off the S.E. part of the island. Having passed through this channel, and finding yourself to the Westward of the cape, you will see Green Island, distant about half a mile from the cape. Vessels commonly leave this island on their port side, in their passage to Port Bonavista, going between Green and Stone Islands. The channel is full one mile and quarter wide, and with 12, 16, and 18 fathoms water in it, and no danger whatever, except a snaken rock of 3 fathoms water, which lies about 200 yards to the N.E. of Green Island; or they may go to the Westward of Stone Island, and run on Southerly till they open the points of the harbor, and having passed Moses Point, sail to the Northward of the Swerry's Rocks; these are always visible, and have no passage between them and the point. Here they may anchor in 10 or 8 fathoms.

The inner passage, between Cape Bonavista and Green Island, is frequently attended by small vessels. The channel is in some parts narrow, and the ground foul. About a mile to the South-eastward of Green Island is a ledge of red rocks; you may pass between these and the land into Red Cove. There are 6 fathoms water, and the cove 4, 1, and 3 fathoms; but the ground is all foul. There is a passage also to the Southward of these rocks, and between them and Western Head, in which are 6 fathoms. A little to the Eastward of Western Head there is a small rock under water. It lies about a cable's length from the shore, and the sea commonly breaks over the boats can go between it and the shore. To the Southward is Red Head, or Red Head, and further on is Moses Point. Between these is another opening, called Bay-Cove. You may, in case of extreme necessity, run in here and anchor, but the ground is foul and rocky throughout. There was on the North side of this cove a good place for fishing. Moses Point is the Northern point of Bonavista Bay. This place is a favorable situation for carrying on the fishery; but it is so open to the weather, with North-westerly gales, following a continuance of strong winds from seaward,

Bonavista Bay.

Port Bonavista.

the waves break right athwart of the harbor's mouth, and sometimes the whole of the fishing boats founder at their anchors, and not unfrequently many of their staves are destroyed. Vessels during the summer months commonly moor under Swerry Head in 8 or 10 fathoms; but even here, and in every other part of this harbor, the ground is so rocky and uneven that you will be obliged to buoy up your cable.

Black Head Bay.

BLACK HEAD BAY.—This is a wide and deep bay, comprehended between Black Head to the Eastward and Southern Head to the Westward. Black Head bears from Cape Bonavista W.S.W. $\frac{1}{2}$ S., distant 5 $\frac{1}{2}$ miles; Southern Head bears from Cape Bonavista W. $\frac{1}{4}$ N., distant 12 miles; and Black Head and Southern Head bear from each other E.S.E. $\frac{1}{4}$ S. and W.N.W. $\frac{1}{4}$ N., being nearly 8 miles apart. On the Western side of Black Head Bay is King's Cove, distant about 4 miles from Southern Head. This also is a fishing establishment, but still more objectionable, as a place of shelter, than Bonavista, for this is directly open to seaward, and the ground is all foul.

Keels.

KEELS.—This is another establishment for the fisheries, and situated in one of the coves about midway between Southern and Western Heads. Between these two heads are four other coves; but neither Keels nor any of these coves are fit or good places for anchorage, especially with ships of burden.

From Western Head the land bends W.S.W. $\frac{1}{2}$ S., and leads to numerous coves, bays, and arms of the sea, most of which have deep water, and places of anchorage. We shall here enumerate the principal of these, with their respective situations; but, many of them are too deeply embayed for general navigation, we shall not extend our directions to a minute or particular description of them all, but confine ourselves such only as are situated in prominent parts of the bay, and are mostly fitted for general use, and commonly frequented.

We have already stated, that from Western Head the land turns W.S. Westward and leads to Plate Cove, Indian Arm, and Southward Bay.

Plate Cove.

PLATE COVE is situated on the coast about 7 $\frac{1}{2}$ miles distant from Western Head. Its entrance, between Arrow Point and Plate Cove Head, is three-quarters of a mile wide, from whence it bends in more than a mile to the Southward. At its Eastern extremity is a run of fresh water, but the bottom is foul and rocky. It is, therefore, much frequented.

Indian Arm.

INDIAN ARM lies about S.W. by W. from Plate Cove Head, distant 3 miles. It is a narrow inlet running in nearly S.W. about two miles, and terminates in a run of fresh water.

Southward Bay.

SOUTHWARD BAY is separated from Indian Arm only by a narrow neck of land. This is an extensive branch of the sea. Its entrance, between Red Head and Kate Harbor Head, is a full mile wide, with 30, 50, 80, and 90 fathoms water, mid-channel. From hence it bends to the South-westward 7 $\frac{1}{2}$ miles, becoming narrower as you advance, but with deep water and no danger. On the Western side there is an opening called Hayes Cove. It lies about two miles from Kate Harbor Head.

Bacon-Bone Rock.

BACON BONE ROCK.—It will be proper here to remark, that vessels intending to seek either of these places, must beware of the Bacon Bone Rock, a danger of only five feet water over it; this lies W. $\frac{1}{2}$ N., distant one mile from Western Head, and directly in the fairway of the navigation. To avoid this danger, do not shut in Southern Head until Little Denier comes on with the outer Shag Island.

Kate Harbor.

KATE HARBOR lies to the Westward of Plate Cove. Its entrance is three-quarters of a mile wide, and the harbor runs in about one mile and a quarter. The depth of water is 36, 29, and 27 fathoms mid-channel, decreasing as you advance to the other end. There is a rock under water off its entrance, with 7, 8, and 9 fathoms over it; this lies nearer to Kate's Head, but there is a passage between them, and a still wider channel on the Western side of the rock.

Sweet Bay.

SWEET BAY.—This is another extensive inlet, lying to the Westward of Kate Harbor. Its entrance is between Cutler's Head and Chance Point, and leads also to Maidenhair Cove, and Little and Great Chance Harbors. Sweet Bay is the Eastern most inlet, which having entered and passed Cutler's Head, which is rocky and steep to, you will see Turpook Island; it is small and narrow. About half a mile to the W. of this is Woody Island, and between them a rock under water. There is a passage on either side of these, and when you get beyond Woody Island, the bay bends about three-quarters of a mile wide, with 60 fathoms water, mid-way. Advancing further, you will observe several islands in your passage. There is also a rock under water on your starboard side, three-quarters of a mile beyond Woody Island. In the breast of a little island which is mid-channel. Further on is Wolf Island, being a small island, which and the main there is no passage. Off this lies Gooseberry Island; between which and Wolf Island there are 30 fathoms water, but the channel is narrow, that on the Eastern side of Gooseberry Island is much wider. Sweet Bay here divides into two branches; that to the Eastward is called the South-west arm, and directly before its entrance Hunt's Island, the channel to the Eastward of which is 10, 12, and 14 fathoms water, and that to the Westward 7 and 9 fathoms. You

when you see on your starboard side a small and rocky. The N.W. by W. 2 miles, and at the further end, South-westerly 3 $\frac{1}{2}$ miles. The bottom is a sandy bench. **GREAT CHANCE HARBOR.**—The entrance to this harbor is between Bacon Bone Rock. Having passed the rock, the course will be W. $\frac{1}{2}$ N., and against a sunken rock, the water over it. To avoid this, the course must be W. by N. 1 $\frac{1}{2}$ miles, and the channel is 5 fathoms. The ground is sandy, and may procure water. Head are both steep to. The part of Long Islands, the heavy gales from the sea, fine weather it is not dangerous. The Chance Gull Rock, situated one mile and a quarter from the main to Chandler's Reach.

CHANDLER'S REACH.—The course through which is from the main to Connecting Point, and from the latter.

GOOSE BAY runs in Southward, you will meet with no danger. Lubber's Hole, the depth is a small island situated to the N. of this, you may anchor in 10 fathoms. In most of these is fresh water and wood are plenty.

CLODE SOUND is a fine bay, 20 miles. It has many small coves. Vessels may find shelter in, at Long Cove, or in the other coves; or, passing the shore, the mid-channel has a depth of 10 fathoms.

BOON'S DEN.—This is a narrow inlet, which you must sail in the narrow, which is about 1 $\frac{1}{2}$ miles. Having passed the entrance, the depth is 5, 6, and 7 fathoms; that to the N.W. is a narrow channel, which runs to the S.W. 1 $\frac{1}{2}$ miles from the sunken rock, and rocky.

THE LONG ISLANDS are a range of which are encumbered with rocks and shoals; the next is narrower. They form the Chander's Reach; and also the North-eastern passage to the land, and therefore called nearly W. by N., distant 10 miles.

RAWMAN'S SOUND.—This is at its entrance Swale Island, the widest part. This division is called the Swale Tie, or Rawman's Sound. To sail from the Westward, the course will be W.N.W. $\frac{1}{2}$ W. To sail from the Eastward, the course will be W. by N. 1 $\frac{1}{2}$ miles, and in the fair

then see on your starboard side a small island: you may pass it on either side; and having so done, will drop into 24, 22, and 20 fathoms water. The head of the arm is full and rocky. The N.W. arm is divided from the S.W. arm a little below Hunt's Island, and at the further end of Wolf's Island is nearly a mile wide; from whence it runs South-westerly $3\frac{1}{2}$ miles, with good depth of water, and clear of dangers. At the bottom is a sandy beach and a small rivulet.

GREAT CHANCE HARBOR.—This is an excellent and convenient place of anchorage, the entrance to which lies W. $\frac{1}{2}$ S., distant 10 $\frac{1}{2}$ miles from Western Head. Vessels sailing for this place should recollect the mark already given to avoid the Bone-Rock. Having passed this danger, you may sail on directly for the harbor; your course will be W. $\frac{1}{2}$ N. until you get abreast of Chance Point. You will now stand against a sunken rock at the Southern part of the entrance, which has only 16 feet water over it. To avoid and go clear of this danger, be careful not to shut in the Westward Mustard-bowl Island with the Eastern one; these are situated at the port side of the channel. Having passed the Eastern island, stand boldly in, approaching each side as nearly as you like, and anchor anywhere above the narrows in from 4 to 5 fathoms. The ground is good and holds well. You will lie sheltered from all weather, and may procure wood and water with great facility. Chance Point and Cutler's Head are both steep to. Off the former, and directly in a line between the Southern part of Long Islands, there is a spot of ground with only 7 fathoms of water; during heavy gales from the seaward this will show itself by the sea breaking over it, but in fine weather it is not dangerous. N.E. a little Northerly, distant almost one mile, is the Chance Gull Rock, steep to, and always visible. To the Westward is Deer Island, one mile and a quarter long, but narrow. There is a good channel between it and the main to Chandler's Reach.

CHANDLER'S REACH is the channel leading to Goose Bay and Clode Sound; your course through which is W. $\frac{1}{2}$ S., which, from the N.W. point of Deer Island, will lead you to Connecting Point; this is the point of the peninsula that divides the former from the latter.

GOOSE BAY runs in South-westerly about 74 miles, and by keeping in mid channel you will meet with no danger, but have 17, 40, and 36 fathoms water, until having passed Lubber's Hole, the depth decreases to 12, 13, 10, and 8 fathoms, when you will see a small island situated to the Westward of Goose Head; behind, and to the Westward of this, you may anchor in from 4 to 7 fathoms, or further to the Southward in 5 $\frac{1}{2}$ fathoms. In most of these inlets you will lie perfectly safe, and entirely land-locked. Fresh water and wood are plentiful, and easily obtained.

CLODE SOUND is a fine branch of the sea, running in from Chandler's Reach about 20 miles. It has many good places of very good anchorage, and without any danger. Vessels may find perfect safety on the Northern shore, at Brown's Cove, or further in, at Long Cove, or Platter Cove; or on the Southern shore, at Bunyan's and Pine Coves; or, passing the Platter Rocks, and steering Westward, at Freshwater Cove. The mid-channel has all the way deep water, and there are no rocks except on the shores.

LION'S DEN.—This is an opening lying at the N.W. end of Chandler's Reach; the passage which you must sail to the Northward of the Deer and Cluster Islands, and through the narrows, which is about one-third of a mile wide, and has 24 fathoms water in it. Having passed the entrance about one mile, there is a sunken rock, round which are 15, and 6 fathoms; you may then perceive the inlet to branch off into two divisions; that to the N.W. is very narrow, and has a rocky islet at its entrance; but that which runs to the S.W. is broader, and has 11, 14, and 10 fathoms water in it, and runs in from the sunken rock about $\frac{1}{2}$ mile, and at its further end becomes shoal, low, and rocky.

THE LONG ISLANDS are 4 in number, having narrow channels between them, some of which are encumbered with rocks, and dangerous. The Eastern island is the largest and broadest; the next to it is the longest; the two Western ones are smaller and narrower. They form the Northern boundary of the passage from Western Head to Chandler's Reach; and also the Southern boundary to Swale Tickle and Newman's Sound. Off the North-eastern point of the largest Long Island lies a sunken rock; it is close to the land, and therefore may easily be avoided; this point bears from Western Head nearly W. by N., distant 6 miles.

NEWMAN'S SOUND.—This is a large arm of the sea, running in W. by N. to the East at its entrance Swale Island, which is nearly 14 miles long, and not one broad part. This divides the entrance into two channels; the Southern passage is called the Swale Tickle, and the Northern one goes by the general name of Newman's Sound. To sail from abreast of the Western Head into Swale Tickle, you should steer W.N.W. $\frac{1}{2}$ W. To sail from abreast of the Bonavista Gull Island, steer W. $\frac{1}{2}$ W. 29 miles, and it will carry you a little to the Southward of Little Newman's Island, and in the fairway of the passage; but in advancing through this

channel there are several obstructions, and the passages from thence into Newman's Sound are so narrow, that it will always be advisable to go to the Northward of the Great Swale Island. To do this, having rounded the Gull Island, steer W. N. W. 27 or 28 miles; you will then have the Sound open, and can proceed accordingly. It is full 1 1/2 mile wide, and extends in nearly a N. by W. direction from the N. E. point of Swale Island 11 miles, having several places of good anchorage. Those on the Southern shore are South Broad Cove, Minchin's Cove, and Stanford Cove.

*South
Broad
Cove.*

*Minchin's
Cove.*

SOUTH BROAD COVE is situated two miles and a half beyond the Western point of Swale Island, and is a place of great safety. The passage in is to the Southward, and you will ride well sheltered in 10 fathoms, free from any danger. There is a small island at the entrance, which you will leave on your port side.

MINCHIN'S COVE is to the Westward; to go to this place, there is a long narrow point of land running out to the Northward, which you will round, and turn Southwardly, the cove will appear open: there you will lie in 5 fathoms, opposite a sandy beach. To the Westward is Mount Stanford, off the point of which lies a small island, reaching half way over the passage, making the channel in this part very narrow. The best course through is to the Eastward of this island, in 9 fathoms. Here an opening appears to the Eastward, called Buckley's Cove, fit for small vessels. The coast, now opening to the Westward forms a broad bay, with 20, 26, and 27 fathoms water, free from any danger, and shallowing on each side towards the shore. At the south-western part of this is Stanford Cove, having a sandy beach, the approach towards which shallows gradually.

The anchorages on the Northern shore are, North Broad Cove, Great and Little Happy Adventure Coves, and Barrow Harbor. Barrow Harbor is tolerably safe, and the most convenient harbor on the South side of Bonavista Bay: it is situated on the Southern side of the peninsula which divides Newman's Sound from Salvage Bay, and is formed by three large islands, Kent's, Goodwin's, and Richard's Islands. That part between Goodwin's Island and the main is the entrance, about 500 yards wide, and not difficult of access. The harbor is a full mile in length, the outer part is rocky and not well sheltered, but the inner part is completely land-locked, and has good holding ground. Vessels taking their departure from Gull Island, Bonavista, should steer N. W. by W. 3/4 W. about 22 miles. But if coming from the Northward, the course from the Eastern Gooseberry Rock, towards Barrow Harbor, will be S. W. 1/4 W. 18 miles. Gooseberry Rock appears just above water. In this course they will have to avoid the Malone Rock and Ledge, the latter being a shoal, lying S. 3/4 W. distant one mile from the rock, which is always above water; this shoal has never less than 4 fathoms over it, so that, in fine weather, no danger whatever is to be apprehended. In sailing on, and approaching Little Denier Island, which is almost opposite the harbor's mouth, you must be particularly careful of the outer rock, lying N. 3/4 W. distant three-quarters of a mile; this has only 4 and 6 feet upon it, but frequently the sea constantly breaks over it, thereby pointing out its situation, and obliging the mariner to guard against, and steer clear of the danger. Having rounded the Little Denier, it will be better to go on its Northern side, for between Little Denier and Richard's Island there lies a dangerous reef of rocks, called the Brandishes, these extend nearly in a line, but at various distances, almost half way over the channel. Upon these rocks are from 12 to 17 feet, with narrow channels of 7 and 8 fathoms between them; to navigate this passage, therefore, requires a pilot, to clear the Brandishes, you should keep Wedge Point a little open to the Southward. Snooky Ridge, which is a range of high lands at the top of the harbor, until you have Broom Head on with the Middle Shag Island; the passage then will be open, without obstruction, until you get near to Wedge Point; off which, only 70 yards lies a sunken rock, with 8 feet water; you may then sail up Pudner's Cove, until you are entirely shut in from the sea; then you can anchor in from 10 to 15 fathoms. Some vessels prefer anchoring in Garland's Creek, but without running well up, the ground is foul. The land about Barrow Harbor is higher than the neighboring shoals, and consequently, may be the more readily recognized by its projection.

*Sandy
Cove.*

SANDY COVE lies further up Newman's Sound, and has good anchorage; it readily be known, having the only sandy beach on the North side of the sound. There is no danger in entering, and it is perfectly safe, the depth of water being from 10 to 20 fathoms. In sailing to this place, and keeping along the Northern shore, but not Barrow Harbor and Sandy Cove, you will meet with a rocky islet, called the Way Rock; it is steep to, and has 4 fathoms close to it; there is also a deep channel between it and the main, but keep outside and pass to the Southward of it, and there will be no danger.

*Great and
Little Ad-
venture
Coves.*

GREAT AND LITTLE ADVENTURE COVES.—These are two snug little anchorages, lying about three-quarters of a mile above Sandy Cove, and on the same side of Newman's Sound; but from the narrowness of their entrances they are fit only for small vessels. Between these coves, and off a point of land which separates them,

Blacken rock, about 80 yards from the Great Adventure Cove, lies a small island, for between the Great Adventure Cove and the NORTH BROAD COVE, there are several passages from Harbor Head, and a small unaltered anchorage, and another; this is named Blacken rock, and is a sunken rock at its Eastern end, and on board until you are close to the Eastern shore, where this rock you may anchor. In advancing further up Newman's Sound, off the Northern shore, there are quarters of a mile beyond Barrow Harbor, these are under water, and are 4 and 5 fathoms close to the shore; therefore, in these places have a good berth.

SALVAGE BAY lies on the Northern side of Newman's Sound; it has a good shelter.

DAMNABLE HARBOR is a small island, and a narrow island, about three-quarters of a mile long, Bonavista, you should proceed thence to the Northward, towards the Starboard point, like a sugar-loaf; at the entrance of Damnable Harbor, small vessels, but its very narrow entrance, and a rock off the Southern part of the island, which lies in the entrance, in 4 and 5 fathoms, makes it a dangerous anchorage.

MORRIS'S COVE.—This is a safe anchorage, and is a dangerous reef of rocks, the way towards Ship Island, and proceed therefore to the Northward, distant; and when you are off Varket Island; this latter will be a good anchorage, in account of there being several rocks. Steer for Varket until you are off the Rock on the Northern side, then clear the two sunken rocks, and enter the cove, which you will find in any part thereof, in 25 to 30 fathoms.

BAY OF FAIR AND FAIR is so filled with small islands, that it is of any use to the mariner. It is full 20 miles, or so far as the eye can see, with deep water, and is a safe anchorage, in the Bay, and Morris's Island, and towards Westward, and is a narrow arm, and the North-east end, running in one direction, and is a good anchorage, most to Damnable Harbor—there is a good anchorage, and plenty of both wood and water, and is a good anchorage, to the Eastward, through the narrow channel, off the Gooseberry Island, and between the Cut's Reaches, and Content Reaches, and the Northern shore are Hare, Loe, and other shoals, abounding with good anchorage, in all descriptions, in cases of emergency, frequented only by the constant vessels, the usual places of resort,

“Tickle,” a

broken rock, about 80 yards from the shore, with only 4 feet over it. Off the entrance of Great Adventure Cove, lies Sidney Island; the passage in is to the Northward of this island, for between the island and Harbor Head there is no thoroughfare.

NORTH BROAD COVE.—The entrance to this place lies one mile and three-quarters from Harbor Head, and is on the Northern shore. It is a convenient and well-anchored anchorage, and may be easily known by a round island lying at its Western

side; this is named Black Duck Island. Sailing into the cove you should keep the round island on board until you make a tickle* between it and the Western shore, to avoid a broken rock at its Eastern side; after which, it is advisable to keep as close as possible to the Eastern shore, for there is a dangerous rock lying mid-channel; being near this rock you may anchor in from 10 to 25 fathoms, muddy ground.

In advancing further up Newman's Sound, there are some other dangerous rocks off the Northern shore; one of these is called the Shag Rock, and lies three-quarters of a mile beyond Black Duck Islet; and one mile further on is Hall's Rock; with these are under water, and distant about a cable's length from the land; they are 4 and 5 fathoms close to them, and a passage between them and the shore of 6 and 7 fathoms; therefore, in sailing up Newman's Sound, the Northern shore should always have a good berth. Keep nearly half a mile off, and you will avoid them all.

SALVAGE BAY lies on the Northern side of the promontory which divides it from Newman's Sound; it has several runs of fresh water within it, but no place of good shelter.

DAMNABLE HARBOR lies to the Northward of Salvage Bay; between them are several small islands and rocks; the largest of these is named the Baker's Island, a narrow island, about three-quarters of a mile long. To go to this place from Gull Island, Bonavista, you should steer W. N. W. $\frac{1}{2}$ N. about 7 leagues, and round the Shag Islands; proceed thence to the Northward of the Baker's Islet, or steer W. by W. from the Gull towards the Ship Island, which may readily be known by a remarkable point, like a sugar-loaf; then W. $\frac{1}{2}$ S. from Ship Island 5 $\frac{1}{2}$ miles, will bring you to the entrance of Damnable Harbor. This place is well adapted for the reception of small vessels, but its very narrow entrance disqualifies it for ships of burden. There is a rock off the Southern part of the entrance, and another off the Northern side of the island, which lies in the middle of the harbor; there is good anchorage all round the island in 4 and 5 fathoms, sandy bottom.

MORRIS'S COVE.—This lies on the North side of Morris's Island, and is considered to be a safe anchorage. In sailing for this place, keep Ship Island well on board, in account of a dangerous reef, which extends from Flat Island nearly two-thirds of the way towards Ship Island, on some parts of which there are not above 17 or 18 feet; proceed therefore to the Northward of Ship Island, passing at not more than half a mile distant; and when you are well inside, avoid shutting in Lackington Rock with Market Island; this latter will be known by its appearing like two singular hummocks, in account of there being several clusters of rocks between Ship and Horsechop Islands. Steer for Varket until you get abreast of Lackington Rock, then keep Lackington Rock on the Northern extremity of Ship Island, until the Varket bears North, in order to clear the two sunken rocks off the end of Morris's Island; you may then steer directly for the cove, which you can enter without fearing any obstructions, and anchor on any part thereof, in 25 to 5 fathoms; but the Western side of the cove is to be preferred.

BAY OF FAIR AND FALSE.—This place may contain several good anchorages, but it is so filled with small islands and rocks, that no description we could give would be of any use to the mariner. A cluster of large islands extends off the frontage of this bay, full 20 miles, or so far as Otter Gooseberry Island; between these are passages innumerable, with deep water; there is also a wide channel, running from Fair and False Bay, and Morris's Island, to the Northward. This leads to Bloody Bay, which then turns Westward, and is divided into various branches, forming the N. W. arm, the Middle arm, and the North-east arm—this latter being a peculiar and extensive channel, running in one direction, Southward, almost to Newman's Sound; and in another, almost to Damnable Harbor—all these are navigable, and afford places of good anchorage, and plenty of both wood and water. There is also an open strait from Bloody Bay to the Eastward, through Bloody and Cottle's Reaches, and out to the Northward to Otter Gooseberry Island. Other channels branch off to the Northward from Bloody Bay to Cottle's Reaches, and between the Lakeman's Islands, running into Pitt's Sound, to Cottle's and Content Reaches, and thence to Freshwater Bay; within these, and on the Northern shore are Hare, Locker's, Trinity, Indian, and many other lesser bays, coves, and inlets, abounding with good anchorages, and calculated to afford shelter for shipping in all descriptions, in cases of necessity; these are, at present, but little known, and are frequented only by the constant traders; we shall, therefore, proceed to those which are the usual places of resort, and are better situated for the purpose of fishing.

* "Tickle," a narrow passage between islands and rocks.

Vessels coming from the South-eastward, and bound to the Northward, for New Harbor, Greenspond Tickle, Cat Cove, the N.W. arm, or anchorages adjacent, frequently take their departure from Cape Bonavista; in which case, their course will be N. by W. to clear the Eastern Rock, which lies E.S.E. distant one mile and a quarter from Otter Gooseberry Island. From thence they should steer N. $\frac{1}{2}$ E. to Copper Island, and at the mouth of Greenspond Tickle; here pilots may frequently be obtained to conduct you to this, or any of the adjoining anchorages. There is good holding-ground between Greenspond Island and the main; but the water is generally so deep that a vessel is liable to be drifted on shore in the act of weighing; nor is there sufficient rope to veer out a lengthened cable in heavy gales from the S.W., to which quarter it is much exposed.

Ships coming from the Eastward, or round Cape Freels, must be careful to go clear of the Charge Rock, which lies S.E. $\frac{1}{2}$ S., two and a half miles from Gull Island and Cape Freels. This has only 6 feet water over it, and is circumscribed by a large space of rough fishing-ground, with from 8 to 30 fathoms upon it. From the Gull Island and Cape Freels you may run immediately for the Stinking Islands, taking care not to open Cape Freels to the Eastward of the former; this will carry you inside the danger. You should keep a good look-out for the mid-rocks, which appear just above water, and two miles N.E. by E. $\frac{1}{2}$ E. from the Stinking Islands; but vessels not bound up the bay are strictly recommended to keep outside of them all; for, should the weather become suddenly thick and foggy, a circumstance by no means unusual, more especially with an Easterly wind, you will run great hazard of getting bewildered among the innumerable rocks, which are scattered so profusely about this part of the coast; and from which neither compass nor chart can extricate you. In the winter months, when North-easterly gales are generally heavy and continuous, the sea breaks exceeding high over several spots of the Stinking Banks, which lie E. by N. $\frac{1}{2}$ N. from the main, and distant about $2\frac{1}{2}$ miles; in two places there are only 7 fathoms over these banks, and in such weather, although a ship would not strike, she would be in great danger of foundering in the tremendous sea which would then frequently break over her; but when the weather is settled, and the sea smooth, they are by no means dangerous.

Having rounded the Stinking Islands, and wishing to sail into New Harbor, or Cape Cove, you may, with propriety, steer S.W. by W. $\frac{1}{2}$ W. directly for the Otter Gooseberry Island, until you bring Pouch and Flower Islands to touch each other; you will then be two miles outside of the three rocks, which lie $1\frac{1}{2}$ mile to the Southward of Flower Island; the outer rock has 3 fathoms over it, the middle rock 14 feet, and the inner rock only 11 feet. You will now alter your course to W. $\frac{1}{2}$ S., keeping the white face of Chalky Hills a little on the starboard bow, which will take you clear of Copper Island dangers; then should the inclemency of the weather prevent you getting a good lot on board, you can continue this course until you bring Shoe Cove Point, which may be distinguished by its semblance to white marble, to bear N.W. $\frac{1}{2}$ W., then shape your course W.N.W. for Indian Bay.

New Harbor. NEW HARBOR is situated on the Eastern side of Indian Bay, about two miles from the Shoe Cove Point. This place, during the Easterly winds, will be quite inaccessible, on account of its narrow entrance; in this case you must proceed onward, about four miles, for Cat Cove.

Cat Cove. CAT COVE.—In order to reach this place, you will proceed between Silver Flax and Brown Fox Islands and the main; and as you approach the latter the channel narrows, and you will have a narrow island on your starboard side; this is Cat Island, behind which is Cat Cove. You will have no difficulty in distinguishing this island, being the only part that is covered with live woods, for the surrounding forests have all been destroyed by some general conflagration. Off the upper part of Cat Island lie two high green rocks; you must go round these, for the water is too shoal to go between them; having done so, you may run on until you get some distance inside the upper point of the island, when you may anchor in from 5 to 13 fathoms, with a hawse open to the N.W., the winds from that quarter being most heavy and squally. In working in, you may stand close to either shore, except off the point of the island, as there is a sunken rock within 100 yards of it, with not more than 10 feet water over it.

North-west Arm. NORTH-WEST ARM.—This is situated on the main, and is the place of safety nearest to Cape Freels; but its entrance is very difficult, on account of the number of islands that surround it, and these islands are almost undistinguishable one from the other, from their similarity of appearance. In coming from the Southward for the North-West arm, the greatest danger which you will have to encounter is the Northern Rock, which never has less than 22 feet over it; this lies N.E., distant one mile and three-quarters from the Copper Island; this island you will easily recognize by its having no wood upon it, and by its height. In fine weather, and smooth sea, vessels pass over it in perfect safety; but in hard gales, the waves beat over it incredibly high. To avoid it, be careful to open Fool's Island, which is somewhat higher and more prominent than the rest, and which is covered with trees, except about the summit, to the

ward of the Western Pond Rock, until you get Butterfly Island to touch the inner Flower Island, or until Puffin and Copper Islands touch each other; then, leaving the Pond Rocks on your starboard side, steer in for Fool's Island. It is advisable to have this island well on board, for there is a sunken rock, lying mid-channel, exactly between it and Partridge Island Rocks; this danger has only 18 feet water over it; no mark can be given to avoid this rock. The course then up the arm will be N. by W., and so soon as you get inside of Odd Island, you may anchor, on muddy bottom, in from 7 to 9 fathoms, Fool's Island Hill bearing S.E. to S.E. by S.

GREENSPOND TICKLE.—Greenspond is a square island, about a mile in breadth *Greenspond Tickle.*

A reef of rocky islets runs off its Southern part all the way to Puffin Island. Greenspond Tickle lies on the South-eastern part of the island, and is of very little importance, being incapable of receiving any vessels whose draught of water exceeds 14 fathoms. The dangers in going to this place are, the Northern Rock, the Cook-room, and other Rocks; but it will be almost impossible to get into this harbor with an adverse wind, or even with a fair one, without the assistance of a pilot.

The channel is narrow, the water is very deep, and it lies too open to the S.W. winds to be considered a place of safety. In order to sail into it you must get to the Westward of the Copper Islands; in so doing, be careful of the Midsummer Rock, which lies nearly N. by S., distant one mile from Copper Island, and has only 5 and 6 feet water over it. Observe when you shut in Silver Hare Island by Shoe Cove Point, you will be on the side of the danger; it is also necessary to give Newal's and Ship Island a wide berth, as the water shoals off them to a considerable distance.

CAPE FREELS TO THE STRAIT OF BELLE ISLE.

CAPE FREELS is formed of three points, the South Bill, the North Bill, and the Middle, or Cape Freels. There are many shoals and rocky dangers about them all, therefore a wide berth should be given them at all times. Over these points is some ground, commonly called the Cape Ridge, which is visible at a considerable distance.

FUNK ISLAND.—N. 51° E. from Cape Freels, distant 27 miles, lies the Funk Island. This is little more than a sterile rock, and cannot be seen further than at the distance of 10 or 12 miles; but it will always be distinguished by the great number of birds which continually hover over it. About 200 yards North of Funk Island is a large rock above water, and N.W. by W., 180 yards from this, are still larger rocks; they are all barren, and only the resort of sea-birds, that inhabit and breed there. Between these rocks are 18, 37, and 42 fathoms water, with a clear passage; but between the Eastern rock and Funk Island there is a dangerous sunken rock, of only 10 feet water, over which the sea generally breaks; near this sunken rock are 14 and 16 fathoms, and between it and Funk Island, 30, 25, 56, 38, 21, and 17 fathoms. Off the Western point of Funk Island are some rocks, and at its Eastern part a sort of creek with 5 fathoms in it. It is also reported that a ledge of rocks lies S.W. from Funk Island, distant about 7 miles.

DUREL'S LEDGE, or Snap Rock.—This is a dangerous reef, and said to lie about 3 leagues N.W. by N. from Funk Island. The sea breaks over it continually; and nearly N.W. by W., distant 3 leagues from Durel's Ledge, is another danger, named Cromwell's Ledge. It is supposed to bear E.S.E. $\frac{1}{2}$ E., distant 10 or 16 miles from Little Penguin Islands.

N.N.W. $\frac{1}{2}$ W. from Cape Freels, distant 6 $\frac{1}{2}$ miles, is the Outer Cat Island. It is connected to the main by a sandy reef, which is impassable for shipping, and forms the Southern point of Deadman's Bay. A little before you come to the Outer Cat, you will see a remarkable hill, called the Windmill Hill, and near it the Little Cat Island. In sailing to or from Cape Freels the shore should have a good berth, although there are soundings all the way, and they decrease gradually towards the shore. Deadman's Bay is formed by the Outer Cat Island to the Southward, and Deadman's Point to the Northward. The soundings within it are regular, and the bay without is deep, unless close to the shore; but it is totally unsheltered, and open to all Eastern winds.

Having passed Deadman's Point, you will approach the Penguin Islands. These are 2 in number, and bear from Cape Freels N.N.W. $\frac{1}{2}$ W., distant 14 and 15 miles. Between them the passage is clear, with from 5 $\frac{1}{2}$ to 7 fathoms water; but vessels should not go within them and the shore, for there are several rocky reefs, which render particularly dangerous.

RAGGED HARBOR lies to the North-westward of the Penguins, distant 6 $\frac{1}{2}$ miles. The main land hereabout is low and sandy, and the passage from the Eastward rocky and dangerous; it should, therefore, not be attempted by a stranger, or without a pilot. To the North-westward is Ladle Cove Island, and 7 miles beyond that is Rocky Island. At its entrance, which is wide, lie three islands; Noggin Island, Green Island, and further South is White Island. You may pass between each of these in 7 fathoms.

oms, between Rocky Point and Green Island in 7, 8, 13, or 10 fathoms, and between Green and White Islands in 13 and 14 fathoms. Between Nugget Island and the Western point of the bay there are 33, 7, 12, 9, and 4 fathoms. The bottom of the bays, for there are 3 openings, is rocky, and vessels cannot go far into them.

The Wadham Islands

THE WADHAM ISLANDS—These are a cluster of islands lying to the North-westward of Cape Freels. They consist of 8 or 10 scattered islands, separated from each other by channels more than 1 and 2 miles wide. The largest of these is called Peckford's Island, which is almost a mile long, lies in the direction of North-South, and bears from Cape Freels nearly N. by W., distant 20 miles. From its Southern part, towards the land about Ragged Harbor, there are a number of rocky islets and reefs, with channels between them, rendering the navigation of this part extremely hazardous. N. N. W. $\frac{1}{2}$ N. 14 miles from Peckford's Island, is White Island, but a passage between them should not be attempted, for there are several small rocks off the North and North-western part of Peckford's Island, some of which stretch almost as far as White Island. N. W. by W., from Peckford's Island, about 14 miles is Copper Island. Green Island lies W. N. W. $\frac{1}{2}$ N., 24 miles from Peckford's Island and about a similar distance S. S. E. $\frac{1}{2}$ E., from Copper Island. There are also several small rocks lying off the N. W. end of Green Island, which being visible, can always be avoided with ease.

S. W. Rock.

S. W. ROCK.—This is a small detached rock above water, bearing from Peckford Island S. S. E. $\frac{1}{2}$ E., distant 31 miles—near it are 13, 17, and 21 fathoms. About N. N. E., distant 2 miles from the S. W. Rock, is a small flat island, and a little more to the Eastward is Otter Island—this is the most Easterly of all the Wadham Islands. There is yet a rock to describe, which lies E. S. E. $\frac{1}{2}$ E., from Otter Island distant about one mile and a half—this is dangerous, and must have a berth in passing either North or South of it.

The Fogo Islands.

THE FOGO ISLANDS lie to the North-westward of the Wadham Islands. Great Fogo is a large island, 4 leagues long and 9 miles broad—Off its South-western point are the Indian Islands, and N. E. by N. 4 miles from the body of Great Fogo, are the Little Fogo Islands. Numerous other rocks and small islands are scattered about.

Shoal Bay.

SHOAL BAY—This harbor is very secure, with good anchorage in many parts; the Harbor Rock, it has two tickles, so called in Newfoundland, and intended to describe narrow passages between islands and rocks—these may be entered with wind except from the South to the S. W., which wind blows out of both—To enter the Eastern Tickle, you should borrow on Rag's Island, keeping the extreme of Peckford Island nearly open of Lane's Island, until Gappy's Island comes open of Simon's Island, you will then clear the shoals of Filly's Point. To avoid the Harbor light bring Shade & Cox's Flag staff on with the Eastern chimney of their dwelling house, it will be necessary to get this mark on before Bontswain's Island or Bullock's Point. In coming from the Westward, it is advisable to make free of Fogo Island, in order that you may distinguish the small islands that form the tickle, which, if passed with Westerly winds, can never be regained, owing to the current set there is to the Eastward. Having passed Little Motion, keep the extreme point of the head over the Narrows Point, until you get past Bullock's Point, with the above directions will clear all the harbor's dangers.

Little Fogo Islands.

LITTLE FOGO ISLANDS lie nearly N. E., distant 14 miles from Joe Batt's Point. There are numerous rocks about them, both above and under water, making this part of the coast exceedingly dangerous. A little to the Eastward of Little Fogo is a small rock just above water, called the North-eastern Rock; and somewhat in this region, distant 10 or 11 miles, is said to be Cronwell's Lodge, whose exact position is not well determined, although it is considered to be extremely dangerous. Northward of Little Fogo are the Tarr Rocks, and from hence in the direction of the Westward side of Great Fogo Island and the Storehouse Rocks, the Seal Nests, Gappy's Stone Islands, the Jigger and Black Rocks, and various other dangers, all having a water round them, and tending to increase the difficulty of the navigation.

Change Island and Tickle.

CHANGE ISLAND TICKLE.—This harbor is accessible when Fogo Harbor is not. It is very secure, and has good anchorage with 6 or 7 fathoms muddy bottom.

general the islands about the bay water is clearer. The Tobacco Islands, the clear all the dangers of the bay may bring the vessel to the bay through in great safety. **TOULQUIN HARBOR**—This harbor is situated to the North of the White Ground, and is very commodious. This is very commodious without you are the only emergency. The anchorage is 6 fathoms, off Colburn's side of the table land, and vessels may ride there with the Eastern Stage on the moderately high, and open by Gull Island or the **TOULQUIN HARBOR**—

It is good when the harbor is narrow and dangerous to battle, except those bluffs. **TOULQUIN HARBOR**, (Green the Great and Little Fogo) has a reef running to the islands are bold to and a high land of Great Den is to be preferred to the remaining into Inspector's across, in perfect security. The tides here, and also in some rising, the springs are by the winds.

TOWELL HARBOR, (the largest ship to land. The best anchorage is in the entrance of wood and water in the entrance is the Fool's though Indian Tickle, and the Rock, keep the extreme end, until Green Bay Gull anchor within the heads at half tide.

THE ISLAND OF TONQUIN is a spacious, fine harbor, in **CAPE ST. JOHN**—From N. distant 12 or 13 leagues, it is known by the strong Northern pitch of the cape the third of that name on the Should hereafter distinguish the Freels, as the Middle, as the Bonavista, or South Bay, in the Fogo Islands, the bays and inlets, but the doubt the Great Bay in the of good anchorage, in the after frequented, better **LA SCHE**.—About 5 miles of 4a Scie; to sail

general the islands about it are low and marshy, but there is abundance of firewood, and the water is serene. The passage in from the Eastward is between Ruth's Rock and the Tobacco Islands, the mark being Brunstone Head kept between both; this will clear all the dangers on the Northern shore, and also off Skinner's Harbor, or may bring the vessel to the Westward between the points of the land, and steer directly through in great safety.

TOULQUET HARBOR—This harbor is sheltered from all winds but those which blow from the North and North east, when in heavy gales it becomes dangerous. In entering, either by the East or Western channel, you must take the greatest care to avoid the White Ground, to clear which, you must bring Messrs. Shale's dwelling on the open of Sun's Island, and keep it so until French Head opens through the Eastern passage. This is very commonly called Burnt Island Tackle, and should not be attempted without you are thoroughly acquainted with the navigation, or in cases of great emergency. The anchorage is mostly foul, but the best and most secure is about 6 fathoms, off Colburn's Stores. Both water and wood are serene. If the main anchorage should be here either early or late in the year, Back Harbor, which lies off the Western side of the table land, will be found a preferable place for shelter, and a few small vessels may ride there with much safety. You may proceed in on either side of the table land, lying with the Western Head open of Batrix Island and the Bluff Head, or through the Eastern Stage on Batrix Island. The islands about the harbor of Toulquet are moderately high, and bounded by dark colored slate cliffs. It may readily be seen by Gull Island or the table land.

FOURNE HARBOR—This harbor lies between the Bay of Exploits and New Fortune. It is good when untrammelled, but the entrance, which is the Western Tackle, is exceedingly narrow and dangerous, on account of the high land around it, from which all gales, except those blowing directly in

TRITON HARBOR, (Great Triton Island). The entrance to this harbor is between the Great and Little Demer Islands. In entering you will see Francis Island, which has a reef running to the South westward. Give this a berth, but both the Demer Islands are bold to and free from danger. Little Demer Island lies S.W. three or four miles from Sculpin Rock, on approaching which, the harbor opens off the high land of Great Demer. Its shores are exceedingly bold, and therefore it is to be preferred to Cutwell Harbor. Its great depth of water will be avoided by running into Inspector's or Scrub Cove, where vessels may moor with lawless ease, in perfect security.

The tides here, and also upon all the Eastern coast of Newfoundland, have nearly the same rising, the springs being about 6 feet, neaps 4 feet, but these are much influenced by the winds.

CUTWELL HARBOR, (Hong Island). This harbor has a spacious entrance, sufficient for the largest ship to beat in to secure anchorage, in from 10 to 5 fathoms, sand and mud. The best anchorage is about W. by N. distant three miles from the Southern Head. The arms runs in full one mile and a half above the narrows, in which is abundance of wood and water, and well adapted for heaving down and relitting vessels. The entrance is the Fool's Cap Rock, the marks for which are Copper Island seen through Indian Tackle, and Mark Island on with the White Point. To clear the Fool's Cap Rock, keep the extremity of Southern Head touching the North end of Hardix Island, until Green Bay Gull Island opens to the Westward of the Hag Rock. The danger within the heads is the rocks on the Eastern shore, and most of these are visible at half tide.

THE ISLAND OF TOULQUET lies to the Westward of Fogo, and has several small islands about it. Here is situated what is called Toulquet Bay; and to the westward of Toulquet Island is the Harbor of Herring Neck. This is said to be a spacious, fine harbor, and fit for any vessels.

CAPE ST. JOHN.—From Toulquet Bay to Cape St. John, the course is N.W. distant 12 or 13 leagues. This is a high and rugged point of land, and may be known by the small high round island to the South eastward, distant from the Northern pitch of the cape about 2½ or 3 miles. This is called the Gull Island, and the third of that name on this side of Newfoundland. Perhaps, it would be better to call hereafter distinguish this as the Northern, or St. John's Gull; that near Cape Freels, as the Middle, or Cape Freels Gull; and the one lying off Cape Bonnaville as the Pomavista, or South Gull.

Between the Fogo Islands and Cape St. John the charts commonly represent various bays and inlets, but their particulars are very little known, although there can be no doubt the Great Bay and River Exploits, and the Bay of Notre Dame, afford many bays of good anchorage, and of easy access, which when fully explored may become greater frequented, better understood, and prove highly beneficial.

LA SCIE.—About 5 miles to the Westward of Cape St. John, is the Little Harbor of La Scie; to sail into which there is no danger whatever, and you may an-

Fortune Harbor

Triton Harbor

Cutwell Harbor

The Island of Toulquet

Cape St. John

La Scie

Goat and Sop Islands, Sop's Arm, Jackson's Arm, French Cove, Great and Little Coney Arms, and Great and Little Cat Arms.

LOBSTER HARBOR.—This is a small round harbor, with a shallow narrow entrance, having at low water, in some places, not above 7 or 9 feet water; but when you are once entered, you will have 12 and 13 fathoms all over the harbor. Small vessels, therefore, sail in commonly at the flood tides.

THE SOUTHWARD ARM lies about 8 miles from Lobster Harbor, and further to the bay. Here a ship may anchor with great safety, in 17 fathoms water, about 3 miles within the bends; but there is also good anchorage in any part below this, and where you have advanced so far up, in 20 and 25 fathoms. A little above the inner point, on the Northern side, is a muscle bank, which stretches quite across the arm, and nearly dries at low water; and when you have passed this, you will have 11 and 12 fathoms water, and the channel continues deep until you approach the River's Head. This is the first great inlet on this side of the gulf, and may therefore be readily recognized.

MIDDLE ARM.—This inlet lies about 1½ mile S.W. from the Southward Arm; its entrance is a rocky island, which is joined to the shore by a shoal, over which are 1, 2, and, in some places, 3 fathoms water. This inlet runs in to the Southward, about 3 or 4 miles. To enter it you will do well in keeping the port shore on-board; it is good only for small vessels. Two leagues W. by S. from Middle Arm, is Hawling Point; and between them lie the Pigeon Islands, about which the ground is good for anchorage.

WESTWARD ARM.—This lies E.S.E. ½ S. of Hawling Point, and runs up nearly 4 miles. Here large vessels may anchor in 18 fathoms water; there is a cove on each side of its entrance; that to the North-eastward is named Bear Cove, where smaller vessels may moor securely, and ride safe from all winds, in about 12 fathoms water. The other is called Wild Cove, a very indifferent anchorage, open to the North-westerly winds, and the bottom rocky and foul.

PURWICK COVE.—About five leagues down from the River's Head, and near the S.E. side of the bay, lies Gransby's or Mid Bay Island, without either cove or place of shelter; on the South-eastern part of this island is a shoal running off the length of two cables, with not more than 9 feet water over it, and nearly abreast of this island, on the S.E. side of White Bay, is Purwick Cove, where shipping may find a good anchorage, and lie with good conveniences for the fisheries.

Having passed to the Southward of Gransby's Island, the bay narrows and runs up about 5 leagues towards Gold Cove, where the river branches out into several streams, and is commonly called the River's Head.

On returning up the Western side of White Bay, you will perceive Sop's Island, about 3 miles in length, and 11 miles in circuit; near its Southern end is Goat's Island; these form a long passage, or arm, called Sop's Arm, at the North part of which a vessel may safely anchor, just inside the North side of Sop's Island; this will be the inside of the channel, or passage, or bay; but there is anchorage in deep water between Sop's Island and the main before you reach so far up as Goat's Island; there is also a small cove at the North end of the island called Sop's Cove, and two other coves opposite the main, called Henri's Coves, in which the fisheries are carried on, though ships generally anchor in the upper part of the arm, and within side of Goat's Island.

JACKSON'S ARM.—About 4 or 5 miles to the Northward of Sop's Island, is Jackson's Arm, to enter which, you will pass a rugged point, low and round; the water is deep, except in a small cove on the starboard side, where a vessel should anchor head and stern. This place affords the largest timber in White's Bay. Frenchman's, or French Cove, is about a league to the Northward of Jackson's Arm, and affords good and safe anchorage.

LITTLE AND GREAT CONEY ARMS.—Nearly 4 miles to the North-eastward of Frenchman's Cove, is Coney Arm Head, the most remarkable land on the Western side of White Bay, and bears W. N. W. ¼ W., distant 6 leagues from Cape Partridge; this land here projects out one mile and a half, forming a deep bight, called Great Coney Arm. In this place there is no good shelter for shipping; but in Little Coney Arm, which lies to the Westward of the head, is convenient anchorage for small vessels, though its entrance is too shallow for large ships. Here fishing craft frequently rendezvous.

GREAT AND LITTLE CAT ARMS.—To the North-eastward of Coney Arm Head, distant 3 miles, lies the Great Cat Arm, and 5 miles further is Little Cat Arm. This latter inlet runs up to the Westward full two miles. Off its Northern point are the rocks above water; to avoid which, keep near to the Southern shore. You will find the water deep, and no good shelter, unless you approach the head or further end of the arm, where you will lie secure and land-locked.

Little Harbor Deep.

LITTLE HARBOR DEEP.—You will now be to the Northward of White Bay and following the shore, will perceive the entrance to Little Harbor Deep, called by the French *La Vache*. This place is much exposed to South-easterly winds, and by no means a good harbor: off its Northern point are some rocks, which are always above water; they lie half a mile from the shore, and afford good fishing about the environs. The water is not very deep in any part of this inlet, and when you get half way from the entrance to the head, or further end, it becomes quite shoal.

Grandfather's Cove, or L'Anse Union.

GRANDFATHER'S COVE, or L'ANSE UNION, is an inlet about two miles deep, lying one mile and a half from Little Harbor Deep. This is also open to the Southern winds, and may be known, when near the shore, by the Northern point appearing like an island, and bearing N.N.W. & N. from Cape Partridge. It is but an indifferent place for shipping, and seldom frequented.

Orange Bay, or Great Harbor Deep.

ORANGE BAY, or GREAT HARBOR DEEP.—This may be known from another inlet, by the land at its entrance being much lower than any land on the North side of White's Bay, and by its bearing North, distant 5 leagues, from Cape Partridge. It forms a large harbor, and when you get about 3 miles within its entrance, it divides into three branches. In the northern arm the water is too deep for vessels to anchor, until they have run up near the head; but the middle arm has a good bottom and safe anchorage in 6 and 7 fathoms water. A little within the entrance of Orange Bay there is a cove on each side, frequented by the fishing vessels; but these are very dangerous for a ship to lie in, for, although they moor head and stern, yet should a gale come on from the Eastward, there is little safety to be depended upon.

Fouché.

FOUCHE E.—This place is little frequented, and there is no anchorage until you approach its further end, where you will find a cove on the Northern side. This is 2 or 3 miles above the entrance, and very small vessels may anchor there in 18 fathoms, mooring head and stern. The land on both sides is extremely high and steep to the shore. There is also another arm running in above two miles further than the cove; but it is so narrow, and has such a depth of water, that it is almost useless for shipping.

Hopping Harbor.

HOPPING HARBOR.—About eight miles to the North eastward of Fouché, and a little to the South-westward of Canada Head, lies the entrance to Hopping Harbor, or Sans Fond. This place has two arms or bays, one running up Northward, the other Westward. Like many of the adjacent inlets, there is deep water all the way, and you get near to the head of the Northern branch, there the bottom is a kind of black sand; open to the Southerly winds, and by no means a safe place to lie in; but in the Western arm a vessel may anchor in a moderate depth with safety.

Canada Head.

CANADA HEAD lies about three miles to the South-westward of Canada Point or Bide's Head. It is elevated land, and very easily to be distinguished, either in the Northward or Southward; but when you are directly to the Eastward of it, it comes hidden by the high land up the country, commonly called the Clouds.

Canada Bay.

CANADA BAY.—This is an inlet of considerable size and extent. At its Southern entrance is Canada Head; from whence it runs N.N. Easterly full 5 leagues. Here vessels caught in Easterly gales may seek shelter, and anchor in safety. In entering, when you get above the two rocky islet which lie near Bide's Head, and call the Cross Islands, you will see a low white point, and another low black one a little beyond it. Of this latter, distant two cables' length, lies a sunken rock; keep there towards the middle of the bay, and you will find good anchor, except a rock above water which lies about a mile below the point of the narrows; this you will endeavor keep on your port hand, keeping mid-channel, and you will have 18 fathoms through the narrowest part. Soon after you have passed the narrows, the bay widens, and above a mile across, and you may then anchor in from 18 to 20 fathoms, good holding ground, and secure from all winds. But this bay is not much frequented, and is occasionally resorted to in case of necessity.

Engle Harbor.

ENGLE E HARBOR is situated on the North side of Canada Bay. To sail to this place, you must pass a low point, appearing white, and forming the Northern point of entrance to Canada Bay; then keep near the shore until you get abreast the next point, which makes the harbor: haul round it to the S.E., taking care not to come too near the point, for it shoals a full cable's length off. Having so far advanced, you can anchor in from 15 to 7 fathoms, good holding ground; but this is up the cove, which is too small to lie in, unless you moor head and stern. In the Arm, which runs up N.N.E. from Engle almost 2 leagues, there is no good anchorage, the water being too deep; but within the South end of Engle Island is a harbor for shallops, although from thence to where the ships lie there is no clearance for boats, unless at high water, or beyond half tide.

Couch Harbor.

CONCH HARBOR bears nearly E.N.E. & E., distant 7 or 8 miles from the entrance of Canada Bay. It lies very open to the winds from the South, but has an anchorage well up to the head, in 11 fathoms water, good holding ground. 8 by

from Couch, distant 2 leagues. This is a bad place for shipping. **CAPE ROUGE HARBOR** is a bay between the Croque Islands, which contribute to the Southern part of its entrance. The best anchorage is in the head in or out, but the water is shallow to its entrance is shallow. Its Northern end is BELLE ISLE and GROUPE, the Southernmost and the largest harbor at its Southern end for shipping. Other harbors sometimes take the name of islet, and to the Southern part of the bay. There are some small islands; but these lie close to the shore. **GROUPE ISLAND** lies to the North and 21 miles broad; the N.W. part of it is high and bold all round; the other part is low and flat. There are also two small islands. They are both steep to the shore. **CREOQUE HARBOR.**—This is a bay, the mouth of which is difficult to discover. It is situated to the Southward of Croque Island, and is a very good harbor, and is frequented with this navigation among the Southern shores, which are always visible. The harbor is bold to the North, and is a very good harbor, being good holding ground, and the water is deep up about a mile, yet shallow to the head. There is a little anchorage in 13, 10, 8, and 5 fathoms, which is a little rivulet of fresh water. **GREAT AND LITTLE ISLANDS.**—These lie Negro and St. Julien, and also the St. Julien, and bear to the North. The S.W. end of the island cannot be distinguished at this end, no passage exists, you may keep close to the shore, and you will open to your view Great St. Julien is the largest island within the entrance; the water is deep; but when you have passed into Little St. Julien, you will see a sunken rock, and opposite the entrance is a shoal of 10 fathoms water. It will be seen that it is extremely convenient. **CREMALLIRE and COUCHE BAY.**—Cremallire is a bay, and is frequented with abundance of water, which a few French vessels frequent. It is situated to the Northward of Cremallire, and is a very good harbor. **COUCHE COVE** is situated on the North side of Couch Bay, and has most excellent anchorage. **ANTHONY'S HARBOR** is a bay, and is a very safe place for shipping. It is situated on the North side of St. Anthony. It cannot

from Conch, distant 2 leagues, is Hilliard's Harbor, called by the French, Botitot. This is a bad place for shipping, but very convenient for the fishing craft.

CAPE ROUGE HARBOR.—This harbor lies to the Westward of Groais and Belle Cape Rouge Harbor.

Islands, which contribute to shelter it from the heavy swells of the Atlantic. The Southern part of its entrance is shallow and rocky, and in the S.W. arm is the Harbor Shoal. The best anchorage is in the Northern arm, in any depth of water. Ships may be in or out, but the centre of the harbor is too deep for anchorage. Directly opposite to its entrance is a small island, which is named after the harbor, Rouge Island. Its Northern end requires a berth in passing.

BELLE ISLE and GROAIS ISLAND.—These are high islands, lying off the N. Belle Isle

coast of Newfoundland, from which they are separated 9 or 10 miles. Belle Isle is the Southernmost and the larger island, being 8 miles in length and 3 broad. There is a single harbor at its South part, where fishing craft occasionally resort, but not calculated for shipping. Other coves may be found about the shores of the island, where whallopers sometimes take shelter. Off its South-eastern side lies Green Island, a small rocky islet, and to the Southward a bank of soundings extends with 12, 20, 25, and 30 fathoms. There are some rocks, both above and under water, at the South point of Belle Isle; but these lie close in to the land.

GROAIS ISLAND lies to the North-eastward of Belle Isle, and is about 8 miles in length and 2 miles broad; its Northern point lying in latitude 51°. Off this end, and Westward of the N.W. part of the island, are several rocks above water; otherwise this island is held all round; and between it and the main are from 20 to 70 fathoms water. There are also two islets midway; the Southern one is commonly called Red Island. They are both steep to, and without any known danger.

CROQUE HARBOR.—The entrance to this harbor is half a mile wide, and somewhat difficult to discover. It bears N.W. from Groais, distant 3 leagues. When the

South point of Belle Isle is clear of the Southern point of Groais, you will be a little Southward of Croque; and this mark will not fail pointing out to those unacquainted with this navigation to its entrance, especially as the headland forming the Southern shore is bare of trees and has a round appearance, with some rocks, which are always visible, and lie about 10 yards to the S.E. of it. The shores of the harbor are bold to, and even a frigate may easily work into it. The anchorage is excellent, being good holding ground, of dark slate-colored mud. Having opened the harbor's mouth, steer in N.W. by N., proceed mid channel, and when you have advanced up about a mile, you will see the river divide into two branches. Anchor in the Southern one. There is a little cove at the Southern entrance, called Fish Bay, in which are 13, 16, 8, and 5 fathoms, and two rocks above water at the head of the bay, near which is a little rivulet of fresh water.

GREAT and LITTLE ST. JULIEN.—To the North-eastward of the harbor of Great and Little St. Julien.

lie Negro and St. Julien Islands, near which are the harbors of Great and Little St. Julien, and also that of Grandsway. These are all adjacent to the Island of Groais, and bear to the North-westward of the Northern part of the Island of Groais. The S.W. end of the Island of St. Julien is but little separated from the main, and cannot be distinguished to be an island until you arrive very near it. There is no passage except for boats; therefore, to sail into either of these harbors, you may keep close to the North-east end of the island, and in passing than the rocks will open to your view.

Great St. Julien is the Easternmost harbor, to which there is no danger, until you reach the entrance; then you will find the starboard shore to be shoal nearly everywhere; but when you have passed the first stages, you may anchor in from 8 to 10 fathoms water.

To sail into Little St. Julien's you will first steer for Great St. Julien's Harbor, in order to clear a sunken rock, which lies directly before the harbor's mouth; and having passed opposite the entrance of Grandsway, steer into the harbor, and anchor in 5 or 6 fathoms water. It will be requisite for all ships which go into either of these harbors to moor both head and stern; but Grandsway is not a harbor for shipping, although it is extremely convenient for fishing craft.

CREMALLIRE and GOOSE COVES.—These places lie on the Northern shores of Cremallire and Goose

Harbor. Cremallire has spacious and good anchorage in 7 or 8 fathoms, and is supplied with abundance of wood and water. Trois Montagnes is merely a small creek, which a few French vessels moor during the winter season. It is situated to the Southward of Cremallire, and has a rivulet which extends Eastward to Goose Cove.

Goose Cove is situated on the Western side of Goose Cape; it is small but very good, and has most excellent anchorage in 4 and 5 fathoms. Vessels can sail into it with a Westerly wind, or into Cremallire with an Easterly one.

ST. ANTHONY'S HARBOR.—This lies a little to the North-eastward of Cremallire, and is a very safe place, having good anchorage with 6 and 7 fathoms water, at the bottom of blue clay. Its entrance lies West, distant one mile and a half from

St. Anthony. It cannot be easily mistaken, from the remarkable high land on

the other land, until Raven Point comes over Noddy Point, then haul in for the harbor, going not nearer than the distance of half a cable's length from the point of Grave's Island; the anchorage within the island is everywhere good, with room and depth enough for any ship, and the ground holds well; but the best place to ride in will be towards the upper end of Grave's Island, abreast of Green Island, in 9 fathoms water; the passage to the Inner Harbor, on either side of Green Island, is very good for ships of moderate water, through which you will have 3 fathoms, and above Green Island you have excellent riding in 7 fathoms. There is also a passage to this harbor through Little Quirpon Harbor, but it is too narrow and intricate for any one to attempt, unless they are perfectly acquainted with the navigation.

NODDY HARBOR.—This place lies a little to the Westward of Quirpon Harbor, *Noddy Harbor* and runs in between Noddy Point and Cape Raven; there is no danger in entering, and you will pass to the starboard of the little island that lies about a mile within the entrance, and anchor above it in 5 fathoms water; or you may, with a small vessel, run farther up into the basin, and anchor in 2½ or 3 fathoms; here is a stage within the island, and on the Eastern side of the harbor, with convenient room for many vessels.

GULL ROCK and MARIA'S LEDGE.—The Gull Rock lies W. N. W. from Bauld Cape, in the Island of Quirpon, distant 2½ miles; and N. N. E. ½ E., nearly 3 miles from Cape Raven; it is always above water. Maria's Ledge lies nearly S. W. from the Gull Rock, distant 2 miles, and N. by E. ¼ mile from Cape Raven, being distant about a mile from Maria's Head. In standing in from the Northward for either QUIR-
PON or NODDY HARBORS, you need be under no apprehension of danger from the Gull or Maria's Rocks, for both are above water, the passage between them is half a league wide and very safe; but it will be prudent to pass nearer the Gull Rock, because of the S. W. Ledge, which never appears but in bad weather: this S. W. Ledge bears W. a little S., distant ¼ of a mile from the Gull Rock, and you should not attempt the passage between it and the main, on account of other rocks that are said to lie about it, and places of shallow water.

To the Westward are the Sacred Islands: Great Sacred Island lies about N. W. by W. ¼ W. from Bauld Cape, distant 5½ miles, and S. E. by E. ¼ E. from Cape Norman nearly 13 miles. Little Sacred Island is one mile to the Southward of the great island; the passage between them is safe, and you may sail round both, for they are high and bold; within them on the main and to the W. S. Westward is Sacred Bay, tolerably large, with numerous rocky islets within it: the shores of this place abound with wood, and therefore it is much resorted to for the use of the fisheries at Quirpon, Gravel, &c. Cape Guion forms the North point of Sacred Bay, being high and steep; near it is a remarkable rock called the Newstone, and much resembling that in Plymouth Sound. There is a little cove to the Southward of this rock, where a vessel may occasionally resort to with safety.

HA HA BAY.—From Cape Onion to Burnt Cape the course is W. ½ N. about 6 miles, it has a white appearance, and rises from the seaward to a considerable height. To the Eastern side of Burnt Cape is Ha Ha Bay, which runs in Southerly about 2 miles, it lies open to Northerly winds, but when you are within the cape you will find anchorage in 6 or 7 fathoms; or you can go farther up and ride well sheltered in 3 or 4 fathoms. This is a convenient place for the fisheries, and has plenty of wood.

PISTOLET BAY.—This bay lies between Burnt Cape and the Norman Ledges, which bear from each other N. W. by N. and S. E. by S., distant 8 miles; the bay is extensive, and reaches several miles each way, having good anchoring ground in most parts, particularly on the Western side, a little above the islands, in about 5 fathoms water; the shore is tolerably well furnished with wood, and contrives to supply those places which are destitute of that article.

COOK'S HARBOR lies in the N. W. part of Pistolet Bay, and within the islands, about two miles above Norman Ledge Point. These ledges are about one mile to the Westward of the North point: to clear these dangers as you enter, be sure to keep that Cape well open of the outer rocks, that lie off the islands at the Western entrance to Pistolet Harbor; and if going in, so soon as you consider yourself to be to the Southward of these ledges, steer in for the harbor, leaving the islands and rocks to your port side; keep the Southern shore on board, for fear of a ledge of rocks that runs out from a little rocky island on the other side; and so soon as you get within the harbor haul over for the Northern shore, and anchor in 4 or 5 fathoms water. This harbor is capable of being made very convenient, and several fishing rooms and proper stages for the boats to resort to, and cure their fish, might be erected in all the coves between it and Cape Norman.

CAPE NORMAN is the Northernmost point of Newfoundland, being of a moderate height, and very barren appearance, which continues far inland; it is about a league to the North-westward of the ledges; from Cape Norman the shores of Newfoundland turn South-westerly, and will be described hereafter.

just within it. Vessels making this part of the coast may know their approach towards the land, by suddenly lessening their water to the above depths.

The Virgin Rocks, which are dangerous, lie in the direct track to Cape Race, Newfoundland, the point which vessels bound to Quebec generally endeavor to make. (See p. 13.)

Near Cape Race is a small inlet named Cripple Cove; the land then turns Westerly towards Mistaken Point, a distance of 4 miles; the shores are bold, and off Mistaken Point is a rock above water. N.W. by W. about 2 miles, is the French Mistaken Point; this also has a rock off its extremity. From hence the shore winds N. by W. into Trepassey Bay, at the Northern part of which lies Biscay and Mutton Bays, and Trepassey Harbor. The two former of these are seldom frequented, and it is considered dangerous to get embayed there, for the sea commonly drives in, and there is hardly any current to help you out again. Mutton Bay is formed to the Eastward by Cape Mutton, and to the Westward by Cape Powles; this last is the extreme point of a narrow neck of land that divides Mutton Bay from Trepassey Harbor; it is a long, low, sandy, and stony beach, over which the ships lying in Trepassey Harbor can be distinctly seen. Mutton Bay is about 2 miles deep, and has from 12 to 3 fathoms water in it, but the bottom is foul and rocky.

TREPASSEY HARBOR.—The entrance to this harbor is to the Eastward of Cape Trepassey Harbor, and the direct course in will be N.E. 4 E. Cape Powles lies from French Mistaken Point N.W., about 8 miles; from Cape Mutton W.S.W. 4 W., one mile; and from Cape Pine N.E. by E., 5 miles. The entrance to Trepassey Harbor is three-quarters of a mile wide, and continues of that breadth full 2½ miles up; it then narrows to less than half a mile, and opens again to its former width, and there vessels commonly ride. To enter this harbor ships commonly steer over from Mistaken Point towards Cape Pine, until you fairly open the harbor; you may then safely run along the shore, for it is bold. In sailing into the harbor you will meet with a rock on the South-eastern shore, lying about a mile from Powles Head, and one-third a cable's length off the shore. There is, also, on the Northern side, a shoal which runs along up the harbor, so far as a low green point; to clear this shoal, bring Baker's Point on with a low rocky point at the entrance of the harbor; and when you get so far up as the low green point, you may steer more Westerly, and anchor either in the N.W. or N.E. arm, in 5 or 6 fathoms water. Both wood and water can be obtained with ease.

CAPE PINE.—On this cape there is a light house 302 feet above the level of the sea. The tower is 50 feet high, painted red and white alternately. The light is revolving; time of revolution 30 seconds. *Cape Pine Light.*

From Mistaken Point to Cape Pine the course and distance are W.N.W. 4 W., 4 leagues and a half; and from Cape Pine to Cape Freels, West, one mile. The land about Cape Pine is barren and moderately high; from Cape Freels, the shores extend W.N.W. one mile to Black Head, and thence N.W. 4 W. to the Eastern reef, and head of St. Shot's Bay.

ST SHOT'S BAY.—This is the fatal spot where so many vessels have been wrecked; the bay is about a mile deep, and from the Eastern to the Western head, the bearing is N. by W. 4 W., distant two miles; it lies entirely open and exposed to the sea. *St. Shot's Bay.*

ST MARY'S BAY.—This is an extensive bay, or gulf, commencing on the Eastern head of St. Shot's, and on the Western side at Point Lance; the course from the Eastern head of St. Shot's to Point Lance, being N.W. 4 W., about 20 miles; from thence the land runs up E.N.E. 9 leagues and a quarter; the land on each side being moderately high, and having several good harbors in it. In proceeding from St. Shot's along the Eastern shore you will pass two little coves, and reach Gull Island; this lies close to the land, and bears from the Western head of St. Shot's N. 4 E., distant 4 miles. From Gull Island to Cape English the bearing and distance are N. by E. 4 E., two leagues; Cape English is high table-land, terminating in a low rocky point, and forming a bay, about a mile deep, to the Southward of it; at the bottom of this bay is a dry beach, within which is Holyrood Pond, running E.N.E., nearly six leagues, and from half a mile to 3 miles in breadth; this occasions the cape to appear like an island when you are to the Southward of it. One mile and three-quarters N.E. 4 N. from Cape English is False Cape; six and a half miles E.N.E. from Cape English is Point la Haye; this is low, and has a ledge of rocks running from it about a quarter of a mile into the sea, and above a mile along the shore, on which the waves break furiously in bad weather; this is the only danger you will meet with in St. Mary's Harbor. *St. Mary's Bay.*

ST. MARY'S HARBOR.—From Point la Haye to Double Road Point, which is the Southern extreme of St. Mary's Harbor, the course and distance are E.N.E. one mile and a half; the land between is low and wears a barren appearance. Within Double Road Point is Ellis' Point, distant half a mile; these two form the starboard points of entrance to the harbor, which is here nearly a mile wide. You will now perceive the river to be divided into two branches, the one running E.N.E. into what is *St. Mary's Harbor.*

may proceed between them, and also between the Bull and Cow Rocks and the main, if necessary, for there is no hidden danger; but perhaps it will always be more prudent to go to the Southward of both.

PLACENTIA BAY.—The entrance to Placentia Bay is formed by Cape St. Mary *Placentia Bay.* to the East, and Cape Chapeau Rouge, or Mountain of the Red Hat, on the West;

the former lying in latitude $46^{\circ} 49' N.$, the latter in $46^{\circ} 53' N.$, bearing from each other W.N.W. and E.S.E., distant 17 leagues. Cape Chapeau Rouge is the most remarkable land on all the coast, appearing higher than the surrounding shore, and somewhat like the crown of a hat, from which singularity it obtains its name; it is about 11 or 12 leagues to seaward in clear weather.

From Cape St. Mary to Cape Brene your course will be N. by E. about 9 miles, and from Point Brene to the Virgin Rocks N.E. by E. 13 miles; these rocks lie $\frac{1}{2}$ mile from the main, and always appear above water; a little to the Southward of the Virgin Rocks are some whitish cliffs in the land, by which it may be known if falling in with the land hereabouts in thick weather.

From the Virgin Rocks to Point Verde, the Southernmost point of Placentia Harbor, the course and distance are N.E. by E. $\frac{1}{2}$ E. 5 miles. From St. Mary's Cape to Verde Point there is no harbor or place of shelter for ships of any size.

PLACENTIA HARBOR.—Point Verde, or Green Point, is low and level, and forms the Southern point of the road. It has a pebbly beach on each side, and several long stages within it. At the end of this beach is a high rocky cliff, extending to the S.E. corner of the bay, where it again terminates in a pebbly beach. This beach runs E.N.E. one mile to the Fort Point, and on the inside, which faces the S.E. end of the harbor, stands the town of Placentia. A little Southward of the town is a high hill, with a remarkable cliff on the middle of the beach. The outer side of the North Point is level, with a clay cliff on its souther part, bearing nearly N.E. by N., distant from Point Verde $\frac{1}{2}$ mile. From this point the land forms a small bay, with a pebbly beach round it, to the corner of the cliff under Signal Hill. This cliff continues to Freshwater Bay, which is formed in a valley between Signal Hill and Castle Hill, forming a pebbly beach round it. Here a small rivulet runs down the valley, at which vessels may obtain water. To sail into this road, if coming from the Southward, you should keep a league off the land, in order to avoid the Gibraltar Rock, which lies about two miles to the Westward of Green Point, and has only eight feet water over it; the mark to go to the Northward of which is the castle, standing on a hill at the Northern side of the harbor, and very conspicuous to seaward, open of Point Verde.

When you have this castle on with the point, you will pass a little to the Northward of the rock; but when you have the castle well open of the point, you will give the vessel a wide berth; run in with this mark; keep your lead going; for there are regular soundings on both sides, and give Green Point a good berth of two cables' length, passing it in 4 fathoms water; then proceed to the anchorage in Freshwater Bay, and anchor at Castle Hill, at three-quarters of the distance over from that side, where you will be in 6 or 7 fathoms water, good ground. At the bottom of the road is a long beach, which terminates in a point to the Northward, on which stand some houses and a small fortress. There is also a fort on the opposite point. The entrance to the harbor is between these. It is very narrow, not above 60 fathoms across, and has $3\frac{1}{2}$ fathoms water in it. When you get within these points the harbor opens, becomes a third of a mile wide, and extends E.N.E. above $\frac{1}{4}$ mile, where ships may lie in great security, with 6 and 7 fathoms water. In going in, keep nearer to the starboard side. The stream runs into the harbor more than 4 knots an hour. The tide is 6 or 7 feet; and it is high water, full and change, at 15 minutes after 9 A.M.

N.E. $\frac{1}{2}$ E. from Point Verde, distant two miles, and N.N.W. from Moll Point, about $\frac{1}{2}$ mile, is the Moll Rock, over which are only 12 feet water, with 8 and 10 fathoms water to the N.E. by N. $\frac{1}{2}$ miles from Point Verde, is Point Latina. S.W. from Point Latina, distant one mile, is the Wolf Rock. These lie about half a mile from the main, and between Placentia Harbor and Point Latina, and therefore must have a good berth in passing. The shore all the way is low near the sea, but high and rugged inland. A large mile to the eastward of Point Latina is Point Roche, which has a good berth off it, extending one-quarter of a mile out.

LITTLE PLACENTIA HARBOR runs in to the Southward from Point Roche; it is about $\frac{1}{2}$ E. by E. $\frac{1}{2}$ E. from Point Roche, distant 2 miles, is the opposite or Fox's Point, which may be considered to be the Eastern entrance to Placentia Sound. On the Western side of this Sound is the harbor of Little Placentia, which extends W. by S. about $\frac{1}{2}$ mile, and is nearly half a mile broad. There is good anchorage in a cove on the Northern shore, which you may know by the Western side of it being woody. The East point of the cove lies a shoal, stretching nearly one-third across the cove. In this cove are 7 and 8 fathoms water. To the Eastward an arm also runs almost a league, with deep water, but little frequented; it is called Placentia Sound. To the Westward is a small sandy cove, fit for boats only.

Placentia Harbor.

Little Placentia Harbor.

then; but when you get within the harbor there are 6 and 7 fathoms, and good

LITTLE SANDY HARBOR is a quarter of a mile to the Southward of the Great *Little Sandy Harbor.*
 Harbor; in it you will have 6 and 7 fathoms water, good ground. In sailing in, you

pass to the Northward of a low rock which lies at the entrance. You may
 easily know this harbor by the Bell Island, which lies S. E. $\frac{1}{2}$ E. one mile and a half
 from the mouth of it, and N. E. by N. 13 miles from the Western point of Merasheen
 Island. This island has a remarkable appearance, resembling a bell with the bottom

upwards.
CLATISE HARBOR, &c.—S.W. by S. from Bell Island lie the Burgoe Islands, *Clatise Harbor.*
 further South the White Islands. S.W. by W. from the Burgoe Islands, nearly

is the entrance to Clatise Harbor, between the Great Isle of Valen and the
 N. E. $\frac{1}{2}$ E. The shore all along from the Sandy Harbors is steep to, and the passage to
 these three-quarters of a mile wide, with 40 and 50 fathoms water; but the cove
 itself is very narrow. The best anchorage is in the Western branch, which is a mile
 long, from 10 to 17 fathoms, good ground. There is also a good channel from the
 Southward, between Great and Little Valen Islands and the main, with 20, 30, and 50
 fathoms in it.

GRAMMER'S ROCKS.—These are a cluster of low rocks just appearing above *Grammer's*
 water, and lying E. by N. $\frac{1}{2}$ N. 13 mile from the Northern end of Valen Island. There *Rocks.*
 is a passage between Great and Little Valen Islands, but it is enumbered with sev-

eral rocks.
MERASHEEN ISLAND—This is a long narrow island, running nearly in the di- *Merasheen*
 rection of the coast $^{\circ}$ *degrees.* Of its Northern shores are a large cluster of *Island.*
 islands, denominated the Ragged Islands. At its South-western part is a

small but good harbor, with from 6 to 10 fathoms water in it. To sail into this place,
 you should keep the starboard shore on board, in order to avoid a sunken rock that lies
 about the length of a ragged rocky point on the port side going in. There is also a
 small cluster of rocks lying off the South-eastern part of Merasheen, three-quarters of
 a mile from shore: these lie between it and Red Island. Shoals also extend 12 miles
 S.W. of Merasheen Island.

RED ISLAND is high, being visible 11 or 12 leagues, and wears a barren appear- *Red Island*
 ance, about 14 miles long and 2 $\frac{1}{2}$ broad. Its Southern point bears N. N. W., distant 11
 miles from Placentia Road, and E. by N. 16 leagues from Mortier Head. On the East-
 ern side of the island, and near its Northern end, is a small cove or bay, fit only for
 a small craft.

LONG ISLAND.—Directly N. E. from Red Island, distant 7 miles, lies the main *Long Island.*
 body of Long Island, and midway between them is Woody Island, off the S.W. of which

lie two small rocks above water. The passage between Red and Woody Islands is
 likewise clear from dangers, and nearly 3 miles wide: that between Woody and
 Long Islands is 2 miles across; both have deep water. Long Island is irregularly
 shaped, and indented with inlets. Its length is full 8 miles; its breadth nowhere much
 more one. Off its Southern end is Iron Island, and a small rock above water; the
 Northern point being formed of high and steep rocks. From Point Latina to this end
 of Long Island, the course and distance are N. $\frac{1}{2}$ E. 4 $\frac{1}{2}$ leagues, and from thence to Lu-
 cerna Harbor, which is situated on the Eastern side of Merasheen Island, N.W. by W.
 12 miles. To enter this place, you may go on either side of a small island at the en-
 trance; the passage is safe, but the only anchorage is to the Westward of the island,
 between it and Merasheen, and here the ground is uncertain.

HARBOR BUFFET.—On the Eastern side of Long Island, about a league from *Harbor*
 Island, is Harbor Buffet, a tolerably good harbor, the entrance to which is narrow, *Buffet.*
 and has 13 fathoms water in it. This place may be known by the islands that lie in the
 path and to the Southward of it, and by Harbor Buffet Island, which lies E. $\frac{1}{2}$ S. one
 mile from the entrance. To sail into this harbor, you must steer to the Northward of
 the islands at its mouth, and being within them, you will perceive the harbor divide
 into two branches, one running Westward, the other Northward. The best anchorage
 is in the Northern arm, in 15 fathoms water.

MUSCLE HARBOR.—On the Western side of Long Island, and about 4 miles from *Muscle*
 Southern end, is Muscle Harbor, the entrance to which is between a low green *Harbor.*
 island on the starboard side and a small island on your port. The harbor is nearly two
 miles long and one broad, and has from 10 to 20 fathoms water within it. Vessels
 bound to this place, may run in between Woody and Iron Islands, from the Southward,
 between Long and Merasheen Islands from the Northward; but in the latter track
 there are some rocks to be guarded against, which lie nearly mid-channel between the
 Northern ends of both islands. There are also some rocks above water, to the North-
 ward of Long Island, called the Bread and Butter Islands; but these are always
 shallow and steep to.

Presque.

PRESQUE.—W.N.W. $\frac{1}{2}$ N., distant 4 miles from the South-western point of Menehune Island, lies the little Island of Presque. The water here is sufficiently deep but there are so many rocks about its entrance, that it is rendered thereby difficult access. S.W. $\frac{1}{2}$ W. 2 miles from Presque, is the Black Rock, and a quarter of a mile within this is a sunken rock. West from the Black Rock, distant 2 miles, is the Island of Marticot, about one mile in length, and half a mile broad. Within the Black Rock and Marticot Island lie the Harbors of La Perche and Little and Great Paradise.

La Perche.

LA PERCHE runs in to the Northward of the Black Rock. Its entrance is difficult, and there is no good anchorage. Little Paradise lies to the Westward of La Perche, and to the Northward of the East point of Marticot Island. The only safe anchorage is in a cove, at the head of the harbor, on the port side; there you may moor to the shore, and lie land-locked. Great Paradise is fit only for boats; it lies to the Westward of Little Paradise. Between the North-western point of Marticot and the main is Fox Island; between these islands is a safe passage into Paradise Sound with nine fathoms; but vessels must never attempt going between Fox Island and the main.

Paradise Sound.

PARADISE SOUND.—To the Westward of Fox Island about one mile is the entrance to Paradise Sound, extending N.E. by E. 4 leagues, and being about a mile broad, having very deep water throughout, and no safe anchorage, except at its head. Just within the sound, on its Eastern side, is a cove, with 10 fathoms water; but there are several rocks above water in it, and the bottom is rocky, so that you cannot anchor there. In passing to the North-westward of Fox Island, there is a sunken rock which must be avoided. To the South-westward of Paradise Sound lies Long Island running W.S.W. $\frac{1}{2}$ S. about 3 $\frac{1}{2}$ miles: it is principally high land, making in several peaks.

Petit Fort Harbor.

PETIT FORT HARBOR.—One mile to the Westward of Paradise Sound lies Petit Fort Harbor, a very good inlet, having in it from 14 to 7 fathoms water, good ground. The entrance is more than a quarter of a mile wide, and lies N.E., distant 5 miles from the South point of Long Island, and N. by E. 2 $\frac{1}{2}$ miles from the North point of the same. There is no danger in going in; and the best anchorage is on the starboard or Eastern side, for S.E. winds heave in a great swell on the Western shore, when it blows from the North. No such Harbor has no good anchorage.

Cape Roger Harbor.

CAPE ROGER HARBOR lies close to the Westward of Cape Roger, which is a high, round, barren head, lying N. $\frac{1}{2}$ E. 3 $\frac{1}{2}$ miles from the South point of Long Island. There are several low rocks and islands lying off the Eastern point of the entrance. In the harbor, at a quarter of a mile within, on the Western side, lies a small island, the Northward of which, between it and the main, is a very good anchorage in 7 or 8 fathoms water, or further up in 6 or 7 fathoms.

Great Gallows Harbor.

GREAT GALLOWES HARBOR.—N.N.W. 2 miles from the South point of Long Island, lies a small green island, which has a shoal all round, to nearly a cable's length. From Green Island N.N.W. 2 $\frac{1}{2}$ miles, lies Great Gallows Harbor Island, which is high. Vessels may pass on either side of this island into Great Gallows Harbor, which is about one mile to the E.N.E. of the island. In this harbor is exceedingly good anchorage in 7 fathoms water, on the starboard side, just within a low stony point, taking care to give the point a small berth, in order to avoid a rock, which is alternately covered and uncovered with the tide.

Little Gallows Harbor.

LITTLE GALLOWES HARBOR lies close round to the Eastward of Great Gallows Harbor, and is only fit for small vessels, which must be moored to the shore. An above water lies at the entrance, and the two harbors are only divided by a narrow neck of land. To the North-westward of Great Gallows Harbor are Little Harbor, Bay de l'Eau, and Boat Harbor: the first of these is only fit for boats. Bay de l'Eau runs in a full league, and has deep water all the way up, except at its head, where it appears a sandy beach. Here vessels may ride in 3 fathoms.

Boat Harbor.

BOAT HARBOR lies round the Western point of Bay de l'Eau, off which is a shoal above water. This harbor runs up N.E. 3 miles, with deep water, until you get to the further end. The land from hence runs South-westward to Bane Harbor: this is the main land, and is fronted by several islands, the largest of which is called Crane Island, being two miles in length, and one in breadth. The other islands are named Gooseberry, Petticoat, Gull, and Jerseyman's Islands, and are situated between Crane Island and the main.

Bane Harbor.

BANE HARBOR is a good place for small vessels; its entrance is narrow, but you are within it, there is sufficient room to moor, with 3 fathoms water. There are good channels between all these islands, through which vessels may pass to the harbors at the Northward. One mile and three-quarters S.W. from Bane Harbor is a shoal, too shallow for any vessels; and about the same distance from Rashoan Broad Cove; here the anchorage is exceedingly good, with 8 and 9 fathoms water.

lies to the North-eastward of the
Cove lead.

RED HARBOR lies 3 miles from the Southward; in the channel, between Flat and Red Harbors, the water all round them; there is a shoal on either side of the entrance, of 10 fathoms; that on the Eastern side is only out to Placencia Bay. **AUDIERNE ISLAND** lies to the West side of the entrance from Audierne Island, and is a shoal for avoiding which, in the harbor until you open a reach, the best anchorage is on the Eastern side of the green point. Vessels bound for Audierne and Audierne Island, and the islands lying off the S.W. side of the island, to the N. about 1 $\frac{1}{2}$ mile from the Eastern, and another anchorage close to the rocky point, of 10 fathoms between it and the harbors.

THE SADDLE BACK lies to the N. from Mortier West Point, and the main are a part of the coast very dangerous. **CAPE JUDE**, or **MIDDLE** lies 1 $\frac{1}{2}$ mile North of the Cape, which is called the Cape. There are several low rocks with a great shoal, the innermost of which is called West 3 $\frac{1}{2}$ miles from the Cape. In the Bay Point, lies John's Bay, with about 8 fathoms water.

ROCK HARBOR.—From the Cape, at a distance are S.W. $\frac{1}{2}$ W. 4 miles lies Rock Harbor, not more than half a mile from the shore. **MORTIER BAY.**—Two miles from Mortier Bay, at the Western end, is a shoal of 10 feet water. The entrance there are from 50 to 70 fathoms. Westward about 2 miles from the entrance, there are 3 miles from the entrance, which vessels may anchor in all winds. There is no shoal, but low rocks above water, of 10 fathoms.

LITTLE MORTIER BAY lies between Crane Point and Island, and is to the Westward of Mortier Bay, and is a round island, called Mortier Bay: it is bold to all round, and is a shoal round the island, on the port side, and two cables' length from the shore, on which the shoal lies. At the bottom of it, is a shoal of 10 fathoms, good holding ground, and the best side of the bay is the best for all ships, where they lie in the bay, which is always covered.

lies to the North-eastward of a point of land which juts out, and is named Broad Cove Head.

BROAD HARBOR lies 3 miles from Broad Cove Head, and is a good harbor, but too Red Harbor. open to the Southward; in it are 17, 13, and 9 fathoms. S.W. from hence, distant $3\frac{1}{2}$ miles, and situated on the main, is John the Bay; in your passage to which, and nearly the channel, between Flat Islands and the shore, is a cluster of small islands, with deep water all round them; and farther on, near the land, is a rock above water; you may sail on either side of this; the channel between it and the land is narrow, and has 18 fathoms; that on the Eastern, or outside, has 18, 25, and 26 fathoms, and leads directly out to Placentia Bay.

AUDIERNE ISLAND lies half a mile to the Northward of Cape Jude, or Middle Audierne Island, on the West side of which there is a tolerably good harbor. At about a cable's length from Audierne Island, to the Southward of the harbor, is a sunken rock, the best anchorage is on the North shore, just within a small island. A spit of rocks stretches off the green point on the South shore, which is covered at high water.

Vessels bound for Audierne Harbor may pass between Cape Jude, or Middle Island, and Audierne Island, and between Crow and Patrick's Islands, which are two small islands lying off the S.W. point of Audierne Island. Off the Eastern point of Audierne is Ford's Island, to the West of which is a sunken rock, about a cable's length from the island, and another on the Eastern side, which almost always breaks. W. N. about $1\frac{1}{2}$ mile from Ford's Island is Green Island, having a little rocky islet off its Eastern, and another off its Western end; there is deep water all round it; 11 fathoms close to the rocky islets, 70 fathoms between it and Ford's Island, 73 and 85 fathoms between it and Long Island, and still deeper water towards the Gallows Harbors.

THE SADDLE BACK is an islet lying E.N.E. $8\frac{1}{2}$ leagues from Corbin Head; E. The Saddle Back. N. from Mortier West Point, and E. $\frac{1}{2}$ S. 3 leagues from John the Bay Point. Between it and the main are a great number of rocks and little islands, which render this part of the coast very dangerous. A chain of rocks extends N. E. by E. 2 miles from the Saddle Back.

CAPE JUDE, or MIDDLE ISLAND, is about $2\frac{1}{2}$ miles in length, 2 in breadth, Cape Jude or Middle Isl. and lies $1\frac{1}{2}$ mile North of the Saddle Back. On the South end of it is a round hill, which is called the Cape. Between this island and the main are a cluster of islands and low rocks with a great number of sunken rocks about them, called the Flat Islands, the innermost of which lies about one mile from the main.

West $3\frac{1}{2}$ miles from the South-eastern Flat Island, and 2 miles to the N.N.W. of John the Bay Point, lies John the Bay, in which there is tolerably good anchorage, with about 8 fathoms water, sandy bottom.

ROCK HARBOR.—From John the Bay Point to Mortier East Head, the bearing Rock Harbor. of distance are S.W. $\frac{1}{2}$ W. 8 miles. Two miles S.W. by W. from John the Bay Point lies Rock Harbor, not fit for shipping. Between lie two sunken rocks, nearly half a mile from the shore.

MORTIER BAY.—Two miles W.S.W. from Rock Harbor is the opening into Mortier Bay. Mortier Bay. at the Western entrance of which is a small harbor, called Boboy, of about 9 feet water. The course into Mortier Bay is N.N.E. for about 2 miles; and there are from 50 to 70 fathoms water, the land on each side being high. It then trends Westward about 2 miles, and is nearly 2 miles wide. On the Eastern side, at about 3 miles from the entrance, is an exceedingly good harbor, called Spanish Room, in which vessels may anchor in from 4 to 6 fathoms water, good ground, and secure from all winds. There is not the least danger in going into this harbor, only giving the low rocks above water, on the port hand at the entrance, a berth of one cable's length.

LITTLE MORTIER BAY.—Two miles and a half from the entrance of Mortier Little Mortier Bay. Bay lies Crony Point and Islands. About two miles further Southward, and nearly to the Westward of Mortier East Point, is Little Mortier Bay, at the entrance of which is a round island, called Mortier Island, lying one-third of the distance from the West side; it is bold to all round, and may be passed on either side. Close to the first point from the island, on the port side going in, is another little island, close under the rock; and two cables' length from it, in a direct line towards the outer island, is a sunken rock, on which the sea breaks in bad weather, which is the only danger in the bay. At the bottom of it, $1\frac{1}{2}$ mile from Mortier Island, on the East side, is a cove, called Fox Cove, where there is fair anchorage, and room for one ship to moor in 9 fathoms, good holding ground, two points open to the sea, from S.S.E. to S.E. On the West side of the bay is the harbor, which is small and narrow, but a very good one for all ships, where they lie moored to the shore. Off the starboard point, going in, is a rock which is always covered at high water.

One mile and a half S.W. by W. from Mortier East Point lies Mortier West Head, the course and distance S.W. $\frac{1}{2}$ W. 5 leagues from Cape Jude, lies the Mortier Bank, the shoal part of which is about one league over, and on which there are said to be only 4 fathoms. The sea breaks heavily on it in blowing weather.

Iron Island.

IRON ISLAND is small and high. Off its S.W. point is a rock under water Three-quarters of a mile to the Southward of it is Gregory's Rock, S. $\frac{1}{2}$ W. $\frac{1}{4}$ of a mile from which is Galloping Andrews; and S.E. by E. from Iron Island is the White Horse of 8 fathoms. A West S.W. course from Marticot's Island will clear all these dangers.

Great and Little Burin Harbors.

GREAT AND LITTLE BURIN HARBORS.—S.W. $\frac{1}{2}$ W. from Iron Island, distant one league, is the S.E. point of Great Burin Island; and W.N.W. $\frac{1}{2}$ mile from it is the North part of Pardy's Island. On the main, within these islands, lie the harbors of Great and Little Burin. Vessels bound for Burin may pass on either side of Iron Island. The only danger in passing to the Northward is the ledge called the Brandys, which almost always breaks, they lie near a quarter of a mile to the Southward of a low rock, above water, close under the land of Mortier West Head. Keeping Mortier West Head open to the Westward of Iron Island, you will avoid Gregory's Rock, on which are only 2 fathoms water, and which almost always breaks. Vessels may pass with safety between this rock and Iron Island, by giving the latter a berth of above a cable's length.

Galloping Andrews.

GALLOPING ANDREWS.—On the main, within Pardy's Island, are two remarkable white marks in the rocks; the Northernmost of these brought on with the North part of Pardy's Island, and Iron Island, N.E. $\frac{1}{2}$ N. will lead on the Galloping Andrews a shoal with 5 fathoms water on it.

The White Horse is a shoal with 8 fathoms on it, which bears S.E. by E. one mile from Iron Island.

The Dodging Rock lies about a quarter of a mile from the Easternmost part of Great Burin Island.

Great Burin Island is about 2 $\frac{1}{2}$ miles in length, lying N.N.E. and S.S.W., being high land. Near its South end is Cat Island, high and round, lying E.N.E. nearly 1 mile from Corbin's Head.

From Corbin's Head to Shalloway-Point the bearing and distance are N.E. $\frac{1}{2}$ N. 2 miles. Between them, and nearly in the same direction, lie Corbin and Little Burin Islands, both high and round, not more than a cable's length from the shore.

Shalloway Island.

SHALLOWAY ISLAND lies N.N.W. $\frac{1}{2}$ W. one mile from Cat Island, and N.E. $\frac{1}{2}$ E. a quarter of a mile from Little Burin Island. The passage into Burin Harbors, from the Southward, is to the Westward of Shalloway Island.

In sailing in, take care to give Poor Island a berth on your port hand, and when within Shalloway Island, you may anchor in safety between it and Great Burin Island, from 12 to 18 fathoms. The best anchorage in Great Burin Harbor is in Ship Cove. The course up to it, after you are within Neek Point, which is to the Westward of Shalloway Island, is N.N.E. about one mile. It is nearly a quarter of a mile wide. In sailing up keep the West shore on board, in order to avoid a sunken rock on the East shore, at about half way up, and near a cable's length from the shore. Directly off it is a remarkable hole in the rock, on the same side, and a gully in the land from top to bottom, on the Western shore. Another rock, with 2 fathoms on it, lies above a cable's length to the S.W. of Harbor Point, which is round and green, and of a moderate height, joined to Great Burin Island by a low, narrow, sandy neck.

Burin Bay.

BURIN BAY is about one mile N.N.E. of Little Burin Island. It is clear, about a mile wide every way. Here ships may occasionally anchor, and lie almost land-locked. In this bay are two islands, one called Poor Island, low and barren; the other lies to the Northward, before the entrance of Burin Inlet, and is high and wooded.

Burin Inlet.

BURIN INLET may be entered on either side of the island. It extends up 5 miles. A little within the entrance, on the East side, half a cable's length from the shore, a rock, covered at three-quarters flood; and 1 $\frac{1}{2}$ mile from the entrance, near the middle, is another rock, to the Westward of which is good room and fair anchorage, from 7 to 12 fathoms. There are 15 fathoms in the entrance, and in the middle, 10 miles up, 15 to 23 fathoms, and thence up to the head are from 10 to 5 fathoms.

The East passage is between Pardy's Island and Iron Island; but is not safe without a commanding gale, and that between N.N.E. and S.E.

Corbin Harbor.

CORBIN HARBOR is about a mile to the Northward of Corbin Head, and is a good harbor for small vessels. A quarter of a mile Eastward from this harbor, and 2 cable lengths from the shore, is a sunken rock, of 5 or 6 feet water, on which the sea breaks in bad weather. Vessels bound for this harbor must also avoid a shoal of 2 fathoms water, which lies E.S.E. from the South point of the entrance, distant half a mile. The best anchorage is in the North arm, and about half a mile within the entrance opposite a cove on the starboard side.

From Corbin Head, with the course and distance S.W. $\frac{1}{2}$ S. 2 miles. There is a shelter. The coast is high; but a little to the water. It lies close in. From Sauger Head, with a bearing of S. by E. 2 miles, the bearing of Great and Little St. Lawrence is S.W. $\frac{1}{2}$ W. 2 miles. Westward of Sauger Head is a sunken rock which catches off from the East, which shelters it from ships may anchor without S.S.E. winds.

GREAT ST. LAWRENCE is the westernmost, is close to the Westward of Sauger Head, and is covered with Westerly winds. The Hat Mountain, in order there is no danger but will you open the upper part of large ships is before a cable's length above Blue Beach Point, spring two points open, and Low Beach, on the same West shore, the ground only lie at the head of the Garden Bank, whereon are St. Lawrence, with Blue

FROM

FERRYLAND HEAD is a rocky island, just separate objects to point out the LAUN BAY.—W.N.W. $\frac{1}{2}$ W. the land turns to the S.W. winds, and the N. 2 miles; is near half way in, be careful to avoid the East point. The best anchorage is in 6 and 5 fathoms, to avoid rocks, which cause a great rise and fall, ascend at half tide, and LAUN ISLANDS lie off the westernmost and outermost of the Head. Nearly a quarter of a mile on the sea breaks in these islands, but not dangerous. TAYLOR'S BAY lies off the East point. POINT AUX GAUL is a small island, Westward of Taylor's Bay, called Gaul Shag Rocks: there are 14 fathoms in the Point Aux Gaul Shag Rocks, by W. one league. The bay being shallow, and having a shoal of the bay abounds with fish. Near the South point of the bay is a small island, called Lamelin Shag Rocks. Between lie the 14 fathoms, 3 miles from the land. The Lamelin Islands to the South of you; you may then steer a course. By night, approach

From Corbin Head, which is high bluff land, to Small Point, the lowest hereabout, the course and distance are W.S.W. $2\frac{1}{2}$ miles; and from Small Point to Sauker Head, W. $\frac{1}{2}$ S. 2 miles. There are many headlands between, which form coves, but afford no shelter. The coast is clear of rocks, and there are 30 fathoms water close to the shore; but a little to the S. Westward of Sauker Head there is a small rock under water. It lies close in with the land.

From Sauker Head, which is a high hill in the shape of a sugar-loaf, to Cape Chapeau Rouge, the bearing and distance are West 3 miles; between lie the harbors of Great and Little St. Lawrence.

LITTLE ST. LAWRENCE.—The harbor of Little St. Lawrence is the first to the Westward of Sauker Head. To sail in you must keep the West shore on board, to avoid a sunken rock which lies a little without the point of the peninsula, which stretches off from the East side of the harbor. The anchorage is above the peninsula, which shelters it from the sea winds, 3 or 4 fathoms water, a fine sandy bottom. Ships may anchor without the peninsula, in 12 fathoms, good ground; but this place is open to S.S.E. winds.

GREAT ST. LAWRENCE.—The harbor of Great St. Lawrence, which is the Westernmost, is close to the Eastward of Cape Chapeau Rouge. To sail in, you should be careful with Westerly, particularly with S.W. winds, not to approach too near the Flat Mountain, in order to avoid the flaws and eddy winds under the high land. There is no danger but what is very near the shore. The course in is, first, N.N.W. then you open the upper part of the harbor, then N. $\frac{1}{2}$ W. The best anchorage for ships is before a cove, on the East side of the harbor, in 13 fathoms water. A little above Blue Beach Point, which is the first on the West side, you may lie, only being two points open, and may anchor anywhere between this point and the point of Low Beach, on the same side, near the head of the harbor, observing that close to the West shore, the ground is not so good as on the other side. Fishing vessels commonly lie at the head of the harbor above the beach, sheltered from all winds. Garden Bank, whereon are from 7 to 16 fathoms water, lies about half a mile off Little St. Lawrence, with Blue Beach Point on with the East point of Great St. Lawrence.

FROM CHAPEAU ROUGE TO CAPE RAY.

FERRYLAND HEAD lies W.S.W. one mile from Cape Chapeau Rouge. It is a rocky island, just separated from the main, and with Chapeau Rouge, are infallible objects to point out the harbor of St. Lawrence.

LAUN BAY.—W.N.W. 8 miles from Ferryland Head, lies the point of Laun, from whence the land turns to the Northward, and forms the Bay of Laun. Here are two small islets, called Great and Little Laun. Little Laun, the Easternmost, lies open to the S.W. winds, and therefore is no place to anchor in. Great Laun runs in N.E. $\frac{1}{2}$ N. 2 miles; is near half a mile wide, and has from 14 to 3 fathoms water. In sailing in, be careful to avoid a sunken rock which lies about a quarter of a mile off the East point. The best anchorage is on the East side, about half a mile from the point, in 6 and 5 fathoms, tolerably good bottom, and open only to the S. and S. by W. winds, which cause a great swell, as the head of this place is a bar harbor, where boats may ascend at half tide, and find conveniences for fishing, with both wood and water.

LAUN ISLANDS lie off the West point of Laun Bay, not far from the shore; the Westernmost and outermost of which lies W.N.W., Westerly, 14 miles from Ferryland Head. Nearly a quarter of a mile to the Southward of this island is a rock, whereon the sea breaks in very bad weather. There are other sunken rocks about these islands, but not dangerous, being very near the shore.

TAYLOR'S BAY lies open to the sea, about 4 miles to the Westward of Laun Bay. Off the East point are some rocks, near a quarter of a mile from the shore. **POINT AUX GAUL** is a low narrow point of land, which stretches out a little to the Westward of Taylor's Bay. A rock lies off it above water, half a mile from the shore, called Gaul Shag Rock, which bears from Ferryland Head W.N.W. $\frac{1}{2}$ W. $6\frac{1}{2}$ miles: there are 14 fathoms close to the off side of it, but some rocks on its inside. From Point Aux Gaul Shag Rock to the Lamelin Islands, the bearing and distance are W. by W. one league. Between is the Bay of Lamelin, which is unfit for shipping, being shallow, and having several rocks and islands about it. The river at the bottom of the bay abounds with salmon.

Near the South point of the Westernmost Lamelin Island is a rock high above water, called Lamelin Shag Rock. From Lamelin Shag Rock to Point May the distance is 3 miles. Between lie the Lamelin Ledges, which are very dangerous, some of them being 3 miles from the land. To avoid them, in the daytime, you should not bring the Lamelin Islands to the Southward of E.S.E. until Point May bears N.E. by N. from you; you may then steer Northward, between Point May and Green Island, with safety. By night, approach no nearer than in 30 fathoms water.

REMARK.—Mariners who navigate this part of the coast, will do well by observing the appearance of the land, for all that part of Chapeau Rouge and Lauu is very high and hilly close to the sea; from Lauu Islands to Lamelin it is only moderately high, and from Lamelin to Point May the land, near the shore, is low, with beaches of sand, while inland it becomes mountainous.

*St. Pierre, or
St. Peter's
Island.*

ST. PIERRE, or ST. PETER'S ISLAND.—The island of St. Pierre lies 12 leagues W. by N. from Cape Chapeau Rouge. It is about 4 leagues in circumference and pretty high, with a craggy, broken, uneven surface. On coming from the Westward, Point Cronier, which is the S.E. point of the island, makes in a round hummock like a small island, separated from St. Pierre. A little to the N.E. of Point Cronier lie three small islands, the innermost of which is the largest, and called Dog Island, within it are the road and harbor of St. Pierre. The harbor is small, and has from 2 to 12 feet water; but there is a bar across the entrance, with only 6 feet at low water, and 12 or 14 at high water. The road lies on the West side of Dog Island, and will admit ships of any burden, in 8, 10, or 12 fathoms water. The best anchorage is on the North side; but in general it is rocky, and exposed to the N.E. winds. Be cautious, in going out, of some sunken rocks which lie about a mile E.S.E. from Dog Island, which is the Easternmost of the three islands above mentioned. This is the only danger about St. Peter's, but what lies very near the shore.

Light-house.

On Cannon Point, the North side of the entrance to the inner harbor, there is a light-house containing a fixed light, which is lit from the 1st of May to the 15th of November. With this light bearing W. by N., or W. $\frac{1}{2}$ N., about two cables' length distant, there is anchorage in 5 $\frac{1}{2}$ and 6 fathoms water.

Light-house.

A fixed light of the second class, 210 feet high, is on Gallantry Head, the South side of the Island of St. Peter.

Signals.

A system of signals during fog has just been adopted at St. Pierre and Miquelon, the light-house at the Point de Gallantry. For the future, from 1st April to 1st November, in each year, there will be fired at the said light-house, at St. Pierre and Miquelon, during thick fog, two guns every two hours, at intervals of three minutes between each, from 6 o'clock in the morning, until 6 o'clock in the evening.

Independently of these regular signals, gun for gun will be returned to vessels that may be desirous of ascertaining their position by these means.

*Island of
Columbier.*

THE ISLAND OF COLUMBIER lies very near to the N.E. point of St. Pierre. It is rather high. Between them is a passage one-third of a mile wide, with 12 fathoms water. On the North side of the island is a rock, called Little Columbiere; and about one quarter of a mile E.N.E. of it is a sunken rock, with 2 fathoms on it.

Green Island.

GREEN ISLAND is about three-quarters of a mile in circuit, and low. It lies N.E. about 5 miles from St. Pierre, and nearly in the middle of the channel between it and Point May, in Newfoundland. On its South side are several rocks, above and under water, extending 1 $\frac{1}{2}$ mile to the W.S.W.

*Langley,
or Little
Miquelon.*

LANGLEY, or LITTLE MIQUELON.—Langley Island lies to the N.W. of St. Pierre, with a passage of about 2 $\frac{1}{2}$ miles wide between, free from danger. It is about 8 leagues in circuit, of a moderate and equal height, excepting at the North end, which is a low point, with sand-hills; off which, on both sides, it is a flat a little way; every other part of the island is bold to. There is anchorage on the N.E. side of the island, near Seal Cove, in 5 or 6 fathoms, a little to the Southward of the sand-hills on a fine sandy bottom.

*Great
Miquelon.*

GREAT MIQUELON.—From the North point of Langley to the South point of Miquelon, the distance is scarcely one mile, and the depth of water between is 2 fathoms. Miquelon is 4 leagues in length from North to South, and is about 5 miles breadth at the widest part. The middle of the island is high land, called the Harlands of Dunne; but down by the shore it is low, excepting Cape Miquelon, which is a lofty promontory at the Northern extremity of the island.

On the S.E. side of the island is the little Harbor of Dunne. It is a bar harbor admitting fishing shallows at half flood, but no way calculated for shipping.

Miquelon Rocks stretch off from the Eastern point of the island, under the high 1 $\frac{1}{2}$ mile to the Eastward. Some are above and some under water. The outer ones are above water, and there are 12 fathoms water close to them, with 18 and 20 at off. N.E. $\frac{1}{2}$ E., about 4 $\frac{1}{2}$ miles from these rocks, lies Miquelon Bank, on which are 5 fathoms water.

Miquelon Road, which is large and spacious, lies towards the North end, and on the East side of the island, between Cape Miquelon and Chapeau, which is a very remarkable round mountain near the shore, off which are some sunken rocks, at the distance of about a quarter of a mile; but everywhere else it is clear of danger. The best anchorage is in 6 or 7 fathoms, near the bottom of the road, on fine sandy bottom; there you lie exposed to Easterly winds.

The Seal Rocks, two in number, are above water, and lie about 1 $\frac{1}{2}$ league off from the North-west side of Miquelon. The passage between them and the island is safe, and there are 14 or 15 fathoms water within a cable's length, all round them.

Point May has a rocky islet at its point, and from thence the land turns N.N.E. towards Dantzic Cove and Point, and thence E.N.E. towards Fortune Head.

FORTUNE BAY, &c.—From Point May to Pass Island the bearing and distance are N. $\frac{1}{2}$ E. 12 leagues. Between them is the entrance to Fortune Bay, which is about 22 or 23 leagues deep; and in which are numerous bays, harbors, and islands.

BRUNET ISLAND.—The island of Brunet lies nearly in the middle of the entrance into Fortune Bay; it is above 5 miles in length, 2 in breadth, and of moderate height; the Eastern part appears, in some points of view, like islands. On its East side is a bay, wherein there is tolerable anchorage for ships, in 14 or 16 fathoms water, sheltered from Southerly and Westerly winds. In the bottom of the bay, at about a quarter of a mile from the shore, are some rocks, which must be avoided. Opposite to this bay, on the South-west side of the island, is a small cove, with 6 fathoms water. The islands lying off the West end of Brunet, to the Southward, are called the Little Brunets, which, with Brunet, may be approached within a quarter of a mile all round.

The Plate Islands are three rocky islets, of a moderate height, the nearest of which is W.S.W., one league from the West end of Great Brunet. The Southernmost is about 2 miles further off, and bears from Cape Miquelon, E. $\frac{1}{2}$ S. 3 $\frac{1}{2}$ leagues; and in a direct line between Point May and Pass Island, 17 miles from the former, and 19 miles from the latter. E.S.E., a quarter of a mile from the Great Plate (which is the Northernmost) is a sunken rock, whereon the sea breaks, and this is the only danger about the Plate and Brunet Islands, which seem to have no dependency on the moon, and the course of the tides on the coast.

SAGONA ISLAND, which lies N.E. 2 leagues from the East end of Brunet, is about a mile across each way, of a moderate height, and bold to all round; on its Western side there is a small creek, admitting fishing shallops; in the middle of the entrance to this, is a sunken rock, which occasions it to be difficult of access, except in very fine weather; a sand-bank surrounds this island, running Westerly full 7 miles, on which are 14, 17, and 20 fathoms water.

POINT MAY is the Southern extremity of Fortune Bay, and the S.W. extremity of this part of Newfoundland; it may be known by a great black rock, nearly joining the pitch of the point, and something higher than the land, which makes it look like a black hummock on the point. At about a quarter of a mile directly off from this black rock are three sunken rocks, on which the sea always breaks.

DANTZIC COVES—N. by E. 1 $\frac{1}{2}$ of a mile from Point May, is Little Dantzic Cove, and 2 miles further is Great Dantzic Cove. From Dantzic Point (which is the North point of the coves) to Fortune Head, the bearing and distance are E.N.E., 12 leagues; and thence to the town of Fortune, 1 $\frac{1}{2}$ mile, S.E. by E. This is a fishing village, and the road where the ships lie has from 6 to 10 fathoms water, quite exposed nearly half the compass; it lies S. by W. from the East end of Brunet. To the N.Westward of Dantzic Point is the long narrow bank of Jerseyman's, with 24 or 25 fathoms over it, extending from abreast of the point in the direction of the Plate Islands.

SHIP COVE.—The Cape of Grand Bank is high, and lies one league E.N.E. from the Cape of Fortune. To the Eastward of this cape is Ship Cove, where there is good anchorage for shipping, in 8 or 10 fathoms water, sheltered from South, West, and North-westerly winds. Grand Bank lies S.E. half a league from the cape, and is a fishing village, where there is no security for shipping, and the entrance is barred.

From the Cape of the Grand Bank to the Point Euragœ the course is E.N.E. $\frac{1}{2}$ E., about 8 leagues. The coast between forms a circular bay, in which the shore generally is low, with several sandy beaches, behind which are bar harbors, fit only for small vessels, of which the principal is Great Garnish, lying 4 $\frac{1}{2}$ leagues from the Cape of Grand Bank; it may be known by several rocks above water, lying before it, at 2 or 3 miles distance from the shore. The outermost of these is steep to; but between them and the shore are several dangerous sunken rocks. To the Eastward, and within 2 or 3 miles, is Frenchman's Cove, where small vessels sometimes run in and anchor in 5 fathoms water, tolerably well sheltered from the sea-winds. This is a convenient place for the cod-fishery. The passage in is to the Eastward of the rocks which appear the highest above water. Between them and some other lower rocks which appear off to the Eastward of the East point of the cove, there is a sunken rock nearly in the middle of the passage, which you must be aware of. The shore is bold all the way from Point May to Cape of Grand Bank, there being 10 or 12 fathoms within 2 or 3 miles length, and 30 or 40 at a mile off. Between the latter and Great Garnish the water is not so deep, and ships may anchor anywhere in 8 or 10 fathoms water, sheltered only from the land-winds.

From Point Euragœ to the head of the bay, the course is, first, E.N.E. $\frac{1}{2}$ E., 3 leagues to Grand Jervey; then E. $\frac{1}{2}$ N., 7 $\frac{1}{2}$ leagues to the head of the bay. The land

in general along the South side is high, bold to, and of uneven appearance, with hills and valleys of various extent, the latter mostly covered with wood, and having many fresh-water rivulets.

Bay L'Argent.

BAY L'ARGENT.—Seven leagues Eastward of Point Enragée, is the Bay L'Argent, where there is anchorage in 30 or 40 fathoms water, sheltered from all winds.

Harbor Mille.

HARBOR MILLE.—The entrance to Harbor Millé lies to the Eastward of the East point of L'Argent. Before this harbor and the Bay L'Argent, is a remarkable rock, which at a distance appears like a shallop under sail. Harbor Millé branches into two arms, one lying to the S.E., the other to the E.: at the upper part of both are good anchorages. Between this harbor and Point Enragée are several bar harbors, or small bays, with sandy beaches; but the water all along the coast is very deep. You may safely anchor anywhere, but it must be very near the shore.

Cape Millé lies N.E. $\frac{1}{2}$ E., one league from the Shallow Rock above mentioned, and near 3 leagues from the head of Fortune Bay; it is a high, reddish, barren, rocky point. The width of Fortune Bay at Cape Millé does not much exceed half a league; but immediately below it becomes twice as wide, by which the cape may readily be known; and above this cape the land on both sides is high, with steep craggy cliffs. The head of the bay is terminated by a low beach, behind which is a large pond, or bar harbor, fit only for boats. In this, and in all the bar harbors between this and the Grand Bank, are convenient places for building stages, and good beaches for drying fish, fitted to accommodate numerous boats.

Grand le Pierre.

GRAND LE PIERRE is a good harbor, situated on the North side of the bay half a league from the head. The entrance cannot be seen until you are abreast of it. There is no danger in going in, and you may anchor in any depth, from 8 to 20 fathoms, sheltered from all winds.

English Harbor.

ENGLISH HARBOR lies a little to the Westward of Grand Pierre; and to the Westward of English Harbor is the Little Bay de l'Eau, both of which are small, and only fit for boats.

New Harbor.

NEW HARBOR is situated opposite to Cape Millé, and to the Westward of the Bay de l'Eau; it is a small inlet, and has good anchorage on the West side, in from 5 to 10 fathoms, sheltered from S.W. winds.

The Harbor Femme.

THE HARBOR FEMME lies half a league to the Westward of New Harbor; it is narrow, and has in it 20 and 23 fathoms; before its entrance is an islet, near to which are some rocks above water; one league to the Westward of Harbor Femme is Brewer's Hole, fit only for boats; before this cove is also a small island near the shore, and some rocks above water.

Harbor La Conte.

HARBOR LA CONTE is situated one mile to the Westward of Brewer's Hole; before this are some islands; the outer one is called the Petticoat Island, the inner Smoek Island; there are also two smaller ones between these, and a sunken rock or two; the best passage in is on the West side of the outer island, and between the two larger ones. So soon as you begin to open the harbor, keep the inner island close aboard, to avoid some sunken rocks that lie near the small island, which you will discover between the N.E. point of the outer island and opposite point on the main; there is also another rock, which appears at low water, and lies higher up on the side of the main; and when you get beyond these dangers, you may keep in the middle of the channel, and will soon open a fine spacious harbor, wherein you may anchor in any depth, from 6 to 16 fathoms water, on a bottom of sand and mud, shut in from winds. To the Eastward of the outer island there is a small cove, fit for small vessels and boats, and otherwise convenient for the fisheries.

Long Harbor.

LONG HARBOR lies 4 miles to the Westward of Harbor La Conte, and N.E. $\frac{1}{2}$ E., distant 5 leagues from Point Enragée. It may be known by Gull Island, which lies at its mouth, and a small rock, which lies half a mile without the island, and has the appearance of a small boat; there is a passage into the harbor on each side of this island; the Western one is the broader of the two; nearly in the middle of the channel, a little outside of the island, is a ledge of rocks, whereon are 2 fathoms water; and a little within the island, on the Eastern side, are others, 2 cables' length from the shore; they lie off two sandy coves, and are visible at low water. Long Harbor runs 5 leagues up into the country, but the only anchoring-place is in Morgan's Cove, on the N.W. side of the harbor, about 2 miles within Gall Island, in 15 fathoms water, unless you run above the narrows. There is a salmon-fishery at the head of the bay.

A little to the Westward of Long Harbor is Hare Harbor, fit for small vessels on two miles to the Northward of Hare Harbor is Mal Bay, having very deep water extending North-easterly about 5 miles, and having no anchorage except at its further end. To the Westward of Mal Bay, near the shore, lie the Rencontre Islands; the Westernmost, which is the largest, has a communication with the main at low water. In and about this island is shelter for small vessels and boats.

BELLE HARBOR Island; the passage in is narrow, and you have passed the island, small vessels can anchor, but in 20 fathoms, where there is a mile Westward of the island only. The Westward of the Northward of the island is 16 fathoms water.

Two miles to the Northward of the North Bay is the largest salmon-fishery, from which the

CINQ ISLES BAY Bay, and opposite to L'Argent, on the S.W. side, is a very snug place for small vessels.

CORBEN BAY.—A Bay, where there is good anchorage 2 miles South-eastward from each other; the

island; they are bold to the West side of the bay, which lies off to the

ward of Lord and Lady Bay, which rises almost 3 leagues from Point Enragée, which forms the

West side of the bay, a snug place; between the islands, which forms the

Band de l'Arier Harbor just opposite the North end of St. Jacques

ST. JACQUES.—Two islands, which may be seen from the middle of the bay, as is the

BLUE PINION.—About 12 miles from Boxy Harbor, on the N.E. $\frac{1}{2}$ E., 12 miles from the most advanced to the

3 miles from Boxy Point, sandy ground; to sail in, between the shoals which

W.N.W., one mile from the Head and Boxy Point, called Friar's Head, is John's Harbor, fit for

two rocky islets, called the Blue Pinion, and a little

GREAT BAY DE L'EAU in this bay there is good anchorage in is on the East side of the bay, can enter to the

BARRYSWAY BAY.—A Bay, near St. John's Head, is a snug anchorage for large ships, obtained with ease.

HARBOR BRITON lies 2 leagues from the Island of St. Jacques, and is a snug anchorage for small vessels. The oracles' length from the Southward of the West head. TH

BELLE HARBOR lies 4 miles N.W. by N. from the Westernmost Rencontre *Belle Har-*
Island; the passage into it is on the Western side of the island, and so soon as you *bor.*
have passed the island you will open on a small cove, on the East side, where small
vessels can anchor, but large vessels must run up the head of the harbor and anchor
in 20 fathoms, where there is most room: it is but an indifferent harbor. About 1½
of a mile Westward of Belle Harbor is Lally Cove, behind an island, fit for small ves-
sels only. The West point of this cove is high and bluff, and is called Lally Head;
to the Northward of this head is Lally Back Cove, where ships may anchor in 14 or
16 fathoms water.

Two miles to the Northward of Lally Cove Head, are East Bay and North Bay; in
both of these there is deep water, but no anchorage near the shore. At the head of
North Bay is the largest river in Fortune Bay, and appears to be a good place for the
salmon-fishery, from which circumstance it is named Salmon River.

CINQ ISLES BAY.—The Bay of Cinq Isles lies to the Southward of the North *Cinq Isles*
Bay, and opposite to Lally Cove Head; there is tolerably good anchorage for large *Bay.*
ships on the S.W. side of the islands, in the bottom of the bay. The North arm is a
very snug place for small vessels, and salmon may be caught at its head.

CORBEN BAY.—A little to the Southward of the Bay of Cinq Isles is Corben *Corben Bay.*
Bay, where there is good anchorage for any ships, in 22 or 24 fathoms water. About
2 miles South-eastward from Lally Cove Head are two islands, about a mile distant
from each other; the North-easternmost is called Belle Island, and the other Dog
Island; they are bold to all round. Between Dog Island and Lord and Lady Island,
which lies off to the South point of Corben Bay, something nearer to the latter, is a
sunken rock, with deep water all round it; and about a quarter of a mile to the North-
ward of Lord and Lady Island, is a rock which appears at low water.

BANDE DE L'ARIER BAY lies on the West point of Belle Bay, and N. ½ W. *Bande de*
leagues from Point Enragée; it may be known by a very high mountain over the *l'Arier*
bay, which rises almost perpendicular from the sea, called Iron Head. Capel *Bay.*
Island, which forms the East side of the bay, is high land also; the harbor lies on the
West side of the bay, just within the point formed by a narrow low beach, and is a
snug place; between the harbor and Iron Head there is tolerably good anchorage, and
15 or 20 fathoms.

Bande de l'Arier Bank has 7 fathoms water on it, and lies with the beach of Bande
de l'Arier Harbor just open of the West point of the bay, and Boxy Point on with the
North end of St. Jacques Island.

ST. JACQUES.—Two miles to the Westward of Bande de l'Arier is the Harbor of *St. Jacques.*
St. Jacques, which may be readily known by the island before it being high at each end,
and low in the middle. The passage into the harbor is on the West side of the island,
free from danger, as is the harbor, where you may anchor in from 17 to 4 fathoms.

BLUE PINION.—About 1½ mile to the Westward of St. Jacques, is the Harbor *Blue Pinion.*
of Blue Pinion; and a little to the Westward of that is English Cove.

BOXY HARBOR.—Boxy Point lies W. ¾ S., 6 miles from St. Jacques Island, and E. *Boxy Har-*
N.E. ½ E., 12½ miles from the East end of Brunet Island; it is of moderate height, and *bor.*
the most advanced to the Southward of any land on the coast. Boxy Harbor lies N.

3 miles from Boxy Point, in which there is anchorage in 4 or 5 fathoms water, fine
sandy ground: to sail in, bring Boxy Point open of a little black head just within the
point, called Friar's Head; in this direction you will keep the middle of the channel,
and between the shoals which lie off each point of the harbor where the stages are.

W.N.W., one mile from Boxy Point, is the Island of St. John; and N.N.W., half a
league from St. John's Island is St. John's Head, high, steep, and craggy. Between
St. John's Head and Boxy Point is St. John's Bay, quite exposed; in the bottom of
this is John's Harbor, fit for boats only. On the north side of St. John's Head are
two rocky islets, called the Gull and Shag; at the West end of which there are sev-
eral sunken rocks.

GREAT BAY DE L'EAU is about 1½ league to the Northward of St. John's Head. *Great Bay*
in this bay there is good anchorage in various depths, sheltered from all winds. *de l'Eau.*
The passage in is on the East side of the island which lies in its entrance; for only very
small vessels can enter to the Westward.

BARRYSWAY BAY.—To the Westward of Bay de l'Eau, about 3 miles North *Barrysway*
of St. John's Head, is Little Bay Barrysway; on the West side of which there is *Bay.*
good anchorage for large ships, in 7, 8, or 10 fathoms: and both wood and water to
be obtained with ease.

HARBOR BRITON lies to the Westward of Little Barrysway, and N.N.E. ½ E., *Harbor*
leagues from the Island of Sagona. The heads which form the entrance are high, *Briton*
and lie from each other S.E. and N.W., distant about 2 miles. Near the East head is
a rock above water. The only danger in going in is a ledge of rocks, which stretches
across the length from the South point of the S.W. arm, which is more than a mile
within the West head. The only place for ships of war to anchor in is above this

ledge, before the entrance of the S.W. arm, in 16 or 18 fathoms, mooring nearly East and West; the bottom is very good, and plenty of wood and water is to be obtained here. Opposite to the S.W. arm is the N.E. arm, or Jerseyman's Harbor, which is capable of holding a great number of ships, secure from all winds, in 6, 7, and 8 fathoms water: it has a bar at the entrance, on which there are 3 fathoms. The mark to sail over the bar is, the point of Thompson's Beach, which is the South point at the entrance into the S.W. arm, open of Jerseyman's Head, which is high and blind on the North side of the entrance into Jerseyman's Harbor: so soon as you open the harbor, haul up to the Northward and anchor.

From the West end of Harbor Briton to Connaigre Head the bearing and distance are W. 5 miles; between are Gull Island and Deadman's Bay, off which there is a bank stretching from the shore between 2 and 3 miles, whereon the depths vary from 31 to 4 fathoms. The sea, during storms, will sometimes break for a considerable way out from Gull Island.

Connaigre Bay.

CONNAIGRE BAY.—From Connaigre Head, which is high and craggy, to Basseterre Point, the bearing and distance are N.W. $\frac{3}{4}$ W., 7 miles; between is Connaigre Bay, which extends about 4 leagues inland. In the mouth of the bay lie the Connaigre Rocks, above water, which may be approached very near, there being no danger but what shows itself: the channel between them and Connaigre Head is the safest, as a ledge of rocks extends a mile from the North shore, which renders the other channel rather dangerous.

Connaigre Harbor is near 5 miles above the head, within a point on the South side of the bay; it is very small, and the depth of water is 7 fathoms; the passage in it is on the S.E. side of the island which lies before it. Abreast of this harbor, nearly in the middle of the bay, are two islands; on the South side of the Westernmost are some rocks above water.

Dawson's Cove is on the N.W. side of the bay, and bears N. N.E., about 4 miles from Connaigre Head, and W.N.W., 2 miles from the West end of the Westernmost (and the greatest) island; the anchorage is in 6 or 5 fathoms, quite exposed to Southerly winds. Basseterre Point, which forms the West point of Connaigre Bay, is of moderate height, clear of wood, and from thence to Pass Island bold to: Pass Island lies nearly W. by N., distant 3 miles from Basseterre Point.

Pass Island.

PASS ISLAND, which is the North-western extremity of Fortune Bay, is a full mile in length, and narrow; it bears from the N. Point of Miquelon N.E. by N., 2 leagues; and from Point May, N. $\frac{1}{2}$ E., 12 leagues. It lies near the shore, and is rather lofty; on its S.Western side there are several rocks above water, which extend a full mile from the island; and to the N.W. is a sunken rock about a quarter of a mile from the island; there is a passage between this island and the main, about the length of two cables wide; it frequently is traversed by small vessels, who sometimes anchor there on fine sandy bottom, in 6 fathoms water. The cod-fishery at out this part is generally considered good and productive.

REMARKS ON FORTUNE BAY.—The general appearance of the land on the Northern side of Fortune Bay is hilly, rising directly from the sea, with craggy barren hills extending 4 or 5 leagues inland, having many rivulets and ponds; while that on the Southern side of Fortune Bay has a very different appearance, having less of the rugged hills, and being better clothed with wood of a short brushy kind, giving to the country an air of greenness and fertility.

Soundings.

SOUNDINGS.—In the night-time, or in dark foggy weather, the mariner should not place much dependence on the soundings in Fortune Bay, for therein they might be greatly and fatally deceived, inasmuch as, in many places, the water near the shores and in its creeks and harbors, is often deeper than in the middle of the bay itself.

Hermitage Bay.

HERMITAGE BAY.—This extensive bay is bounded on the S.W. by Pass Island and to the Northward by the islands that form the Bay of Bonne and Great Jarvis Harbor, the width being more than 2 leagues; and by the Southern shores of Long Island, where it begins to narrow. In sailing along the Southern coast from Pass Island, you will discover the Fox Islands, which are distant from Pass Island 10 or 11 miles; these islands are situated opposite to the entrance to Hermitage Cove about $\frac{3}{4}$ of a mile from the land, and are said to have good fishing about them. On the Northern Fox Island are several rocks above water, and a sunken rock lies off the South side of this island. To enter Hermitage Cove, you should keep between the islands and the shore, borrowing somewhat towards the main land, where you will find 30, 32, and 37 fathoms water; here you will see the cove open, and may turn South, having deep water, and without the least danger; the anchorage is good, with every conveniency for fishing, and plenty of both wood and water. From hence Hermitage Bay runs in nearly West for 12 miles, with very deep water, until you are near the head, where it gradually lessens to 25 and 22 fathoms, and further in to 20 fathoms. There is a small islet or two on the Southern side, but no danger whatever

LONG ISLAND, of square form, about 8 miles in length, and very good, but narrow. The Passage of Hermitage Bay, is by the point are two rocks above water. **GALTAUS HARBOR**, the Easternmost of the island, the rocky islands which are from 15 to 20 miles apart. **PICARRE HARBOUR**, the Easternmost Fox Island, some sunken rocks, in 9 or 10 fathoms. **ROUND HARBOUR**, Westward of Picarre, is a bay of Long Island. This is the Eastern arm is the de- either side of an island about it.

BAY OF DESPAIR, end of Long Island and that name;) the distance of 280 fathoms. The full 3 leagues to the N. E. arm are several arms. In the North arm there are bays and coves which are good salmon- Easterly, there is a fine about this part is mount level, and has abundance of salmon.

GREAT JARVIS HARBOR. It is a safe harbor, 20 fathoms, secure from all either side of the Great there being no danger in sunken rocks. To sail above water, on the str clear of some sunken rocks appear at low water. The Great Jarvis Island, which the Northern point of the

BONNE BAY lies about N. by E., distant 7 miles. Westernmost of which is ward of the largest island is North $\frac{1}{2}$ miles, and the side of Drake Island, which and two small islets here is anchorage in 20 fathoms. The head of the bay, in 12 or 13 fathoms. On the N.W. side of Great from 16 to 21 fathoms. The Northward of the two near the South point, a quarter of a mile from

Cove, a small inlet of W.N.W., 4 miles from the entrance being 10 fathoms. This entrance being in N.N.E. 2 leagues, a in most parts of it. The anchor in from 10 to 20 fathoms wide, with 60 or 70

and then you must lie very

LONG ISLAND, which separates the Bay of Despair from Hermitage Bay, is of a square form, about 8 miles long and nearly 8 leagues in circuit. The Eastern passage is very good, but narrow, and is between the East end of Long Island and the main, called the Passage of Long Island. The West entrance into the Bay of Despair from Hermitage Bay, is by the West end of Long Island. About half a mile from its S.W. point are two rocks above water, with deep water all round them.

GALTAUS HARBOR.—There are four harbors on the South side of Long Island, the Easternmost of which is called Galtaus: this is but small, and lies near the South-west point of the island. The best channel into the harbor is on the West side of several rocky islands which lie at the entrance, wherein are 4 fathoms; but in the harbor there are from 15 to 24 fathoms.

PICARRE HARBOR.—The next is Picarre, which lies N. by E. half a league from the Easternmost Fox Island. In going in here, keep near the West point, in order to avoid some sunken rocks off the other. The anchorage is in the first cove on the East side, in 9 or 10 fathoms, sheltered from all winds.

ROUND HARBOR.—The next harbor, called Round Harbor, is about 2 miles to the Westward of Picarre, and fit only for small vessels, the channel in being so narrow. LONG ISLAND HARBOR is the fourth, and lies about 2½ miles from the West end of Long Island. This harbor has two arms, one running in to the North, the other to the Eastward. They are both very narrow, and have from 40 to 7 fathoms water. The Eastern arm is the deepest, and affords the best anchorage. The passage in is on either side of an island which lies off the entrance, and has several rocks above water about it.

BAY OF DESPAIR.—The entrance of the Bay of Despair lies between the West end of Long Island and Great Jarvis Island, (which lies in the mouth of the harbor of that name:) the distance between is 1½ mile, and midway no bottom is found with a line of 280 fathoms. The Bay of Despair forms two capacious arms, one extending full 8 leagues to the North-eastward, the other about 13 miles Northward. In the N. E. arm are several arms and islands, and tolerably good anchorage in several places. In the North arm there is very deep water, and no anchorage excepting in the small bays and coves which lie on each side of it; but in an arm of this bay, which runs Easterly, there is a fine salmon-fishery, and wood in plenty. In the N.E. arm also there are good salmon-fisheries at Little River and Conue River. All the country about this part is mountainous and barren, but about the head of the bay it becomes level, and has abundance of wood—such as fir, pine, birch, witch hazel, spruce, &c.

GREAT JARVIS HARBOR is situated at the West entrance into the Bay of Despair. It is a safe harbor, with good anchorage in every part of it, in from 16 to 20 fathoms, secure from all winds, and plenty of wood and water. The passage in is on either side of the Great Jarvis Island; but the Southernmost channel is the safest, there being no danger in it but the shore itself. In the Northern channel are several sunken rocks. To sail in you should bring the North point between the two rocks above water, on the starboard side, and then steer directly in. This will carry you clear of some sunken rocks which lie on the West point of the island. These rocks appear at low water. The entrance to this harbor may be known by the East end of the Great Jarvis Island, which is a high, steep, craggy point, called Jarvis Head, and is the Northern point of the South entrance to the harbor.

BONNE BAY lies about a league to the Westward of Great Jarvis Head, and nearly N. by E. distant 7 miles from Pass Island. It has several islands at its entrance, the Westernmost of which is the largest and highest. The best passage in is to the Eastward of the largest island, between it and the two Easternmost islands. The bay runs in North ½ miles, and there is no danger but what shows itself. You may go on either side of Drake Island, which is small and nearly in the middle of the bay; between which and two small islands on the West side of the bay, within Great Island, there is anchorage in 20 or 30 fathoms; but the best place for large ships is near the head of the bay, in 12 or 14 fathoms, clear ground, and convenient for wood and water. On the N.W. side of Great Island, within the two small islands, is very good anchorage, in from 16 to 24 fathoms, secure from all winds. The entrance from this bay is to the Northward of the two small islands. In sailing in or out of the bay, approach not too near the South point of Great Island, as there are some sunken rocks lying at one-quarter of a mile from the shore. A little to the Westward of Bonne Bay is Mosquito Cove, a small inlet of from 30 to 47 fathoms water.

N.W.W., 4 miles from Bonne Bay, is the entrance to the Bay of Facheux and Dragon. This entrance being very conspicuous at sea, the coast may here be readily known. FACHEUX, which is the Easternmost branch, is very easily seen to seaward; it is in N.N.E. 2 leagues, and is one-third of a mile wide at the entrance, with deep water in most parts of it. On the West side of the bay are three coves, where ships may anchor in from 10 to 20 fathoms. Dragon Bay lies in N.W. one league, and is near half a mile wide, with 60 or 70 fathoms water, and no anchorage excepting near the head; and then you must lie very near the shore. One mile to the Westward of Facheux is

*Long Island**Galtaus Harbor.**Picarre Harbor.**Round Harbor.**Long Island Harbor.**Bay of Despair.**Great Jarvis Harbor.**Bonne Bay.**Facheux.*

Little Hole, with shelter for small craft; and one league to the Westward of Facheux is Richard's Harbor, a place fit only for small vessels and fishing shallops, with 23 fathoms water in it.

Hare Bay.

HARE BAY.—N.W. by W., one league from Richard's Harbor, is Hare Bay, which runs in N.N.E. about 5 miles, and is about one-third of a mile wide, with deep water close home to both shores on all parts of it; except about one league up on the West side, where there is good anchorage, in from 8 to 15 fathoms, with plenty of wood and water; and a small cove about one mile up on the East side, where there are 30 fathoms, with gradual soundings to the shore.

Devil's Bay.

DEVIL'S BAY.—N.W., about 4½ miles from Hare Bay, and one league N.E. from Hare's Ears Point, is Devil's Bay, a narrow inlet, extending a league to the Northward, with deep water, and no anchorage until you come close to the Head.

The Bay of Rencontre lies to the Northward of Hare's Ears Point, and runs in N.W. by W. 2 leagues; it has deep water in most parts of it, and is near half a mile wide at the narrowest part. The anchorage is in 30 fathoms, above a low woody point on the South shore, quite land-locked. Hare's Ears Point is large, with a ragged rock upon it, which, from some points of view, looks like the ears of a hare. It lies W. by N. ¼ N., distant 10 miles from Richard's Harbor, divides the Bays of Rencontre and Chaleur, and bears N.W. ¼ W., 6 leagues from Pass Island. Off this point is a fishing-bank, extending a full mile from the shore, having from 20 to 30 fathoms over it.

Chaleur Bay.

CHALEUR BAY.—Two miles to the Westward of Hare's Ears Point is the Bay of Chaleur, which runs in about 2 leagues N.N.W. It is very narrow, and has deep water in most parts. At the North entrance into the bay, and close to the land, is a small island of moderate height, and half a league within the island, on the N.E. side of the bay, is a rock above water; a little within this rock, on the same side, is a small cove, with a sandy beach, off which you can anchor in 28 fathoms, a cable's length from the shore.

François Bay.

FRANCOIS BAY.—West, nearly half a league from the Bay of Chaleur, is the Bay of François, a small inlet running in N.W. ¼ W. one mile, being at the entrance about a quarter of a mile broad, and 17 fathoms deep, but just within are 50 and 60 fathoms. At the head are from 30 to 20 fathoms, good anchorage, and very convenient for carrying on the fishing business.

Our Bay.

OUR BAY.—Westward, 4 miles from the Bay François, on the East side of Cape La Hune, lies Our Bay. Off the East point of its entrance is a low rocky islet, and in the entrance of the bay is another, with a passage on each side of it. The bay runs in N.N.E. about 4 miles, and is one-third of a mile wide, with deep water close to both shores all the way up. At the head is a harbor for small vessels, with only 5 fathoms water. At the West side of the entrance into the Bay is Cul de Sac, a little cove, with 3 and 4 fathoms water, and good shelter for small vessels.

Cape la Hune.

CAPE LA HUNE is the Southernmost point of land on this part of the coast, and lies in lat. 47° 31' N., bearing N.N.W. ¼ N., 8 leagues from Pass Island, and N.N.W. ¼ N., 10 leagues from Cape Miquelon. Its figure much resembles a sugar-loaf. This cape may also be known by the high land of La Hune, which lies one league to the Westward of it, appearing flat at the top, and may be seen from a distance of 16 leagues.

The Penguin Islands.

THE PENGUIN ISLANDS lie W.S.W. ¼ S., 10½ miles from Cape La Hune, and N.W. ¼ N., 10 leagues from Cape Miquelon. They are an assemblage of barren rocks lying near to each other, and altogether about 2 leagues in circuit, and may be approached in the daytime to the distance of half a league all round. On the W.S.W. side of the large island, which is the highest, is a small cove fit for shallops, and convenient for the fisheries, and the ground about it is considered to be good for fishing.

WHALE ROCK.—E.S.E., 8 miles from the Penguin Islands, and S. by W., 3 leagues from Cape La Hune, lies the Whale Rock, on which the sea generally breaks; it is about 100 fathoms in circuit, with 10, 12, and 14 fathoms close to all round it. From this rock a narrow bank extends one league to the Westward, and half a league to the Eastward, with from 21 to 58 fathoms water on it, rocky and gravelly bottom. In the channel between the shore and this rock, and also between the shore and the Penguin Islands, are 120 and 130 fathoms of water, muddy bottom, and there is the same depth of water at one league without them.

La Hune Bay.

LA HUNE BAY lies close to the Westward of Cape La Hune. It is about 2 leagues deep, and one-third of a mile wide, with deep water in most parts of it; but there is a sunken rock which lies off the West point of the entrance, nearly one-third of the channel over. In sailing in or out of this bay, you should keep the Eastern shore on board, in order to avoid a sunken rock which lies off the West point of the entrance into the bay, nearly one-third over. Two miles up the bay is Lance Cove, having anchorage in 14 and 16 fathoms water, good clean ground. A cable's length off the Southern point of this cove is a small shoal with 9 feet water, and between it and the point there are 5 fathoms. To sail into this place, keep the East point of the bay open of a red cliff point, off which is a rock above water, until the round hill you will see

over the valley of the coast, then be above the shoal, the bank which stretches quite shore, whereon are the LA HUNE HARBOR on an island before its entrance. Before it lies an N.W. side of the island. To the head, in 10 fathoms being good fishing-ground for La Hune Bay; a small bay for drying fish.

Four leagues N.W. ¼ W. is about 100 fathoms wide, and anchorage in 10, 8, and 6 fathoms. The land is a low island and rocks above water, the Penguin Islands, and S. by W. ¼ W., 7 miles from the Penguin Islands, the deep water all round them. THE ISLES OF RAMEA lie N.W. ¼ N., 5½ leagues extend East and West 5 miles and breakers about them. The most island is the large Ramea, is a remarkably high, craggy rocks near it.

RAMEA HARBOR.—which lie near Great Ramea, is sheltered from all winds. The Southern point a harbor, these are all above water, a channel as you can—the anchorage in Ship Cove; there here ride safely on clean water, you must keep the North West end thereof, then stand in, about 3 fathoms, a good anchorage for fishing vessels; the bay is good for drying fish. The Ramea Rocks are distant 4 miles from the Penguin Islands, is a small bank with a green Ramea and the Penguin water. To run upon the bank with the South-western part of the entrance to Little River. **OLD MAN'S BAY.**—a bay, which runs in N.N.W. throughout the bay is very shallow, is a small island, necessary, in 30 and 40 fathoms.

MOSQUITO HARBOR. It is a snug and safe anchorage; but the entrance is difficult to get in or out. The entrance is a large white shoal water, on the South side, from this black rock to the East one-third of a mile. A small berth, keeping the black as possible in getting in, you will have 18 to 30 fathoms water. In the South and Easterly winds, it is convenient

enter the valley of the cove is brought on with the North side of the valley; you will then be above the shoal, and may haul in to the cove with safety. There is a narrow bank which stretches quite across the bay, from the S. point of the cove to the opposite shore, whereon are from 27 to 45 fathoms.

LA HUNE HARBOR lies half a league to the Westward of Cape La Hune; it has an island before its entrance, and is fit only for small vessels, and open to Westerly winds. Before it lies an island near the shore. The channel into the harbor is on the N.W. side of the island. There is no danger in going in, and you must anchor close to the head, in 10 fathoms water. This harbor is well adapted for the fishery, there being good fishing-ground about it, and a large beach quite across the head of the harbor to La Hune Bay; a space of 800 feet, exposed to the open air, and well calculated for drying fish.

La Hune Harbor.

Four leagues N.W. $\frac{1}{2}$ W. from Cape La Hune is the entrance of Little River, which is about 100 fathoms wide at the entrance and 10 fathoms deep. A little way up there is anchorage in 10, 8, and 7 fathoms water, good ground. Between Cape La Hune and Little River, the land is tolerably high, and forms a bay, where there are several small islands and rocks above water, the outermost of which lie N.N.E. $\frac{1}{2}$ E., 3 leagues from the Penguin Islands, and are called the Magnetic Rocks.

S. by W. $\frac{1}{2}$ W., 7 miles from the entrance of Little River, and N. by W. $\frac{1}{2}$ W. from the Penguin Islands, lie the Little River Rocks, which are just above water, with very deep water all round them.

THE ISLES OF RAMEA, which are of various extent, both in height and circuit, lie N.W. $\frac{1}{2}$ N., 5 $\frac{1}{2}$ leagues from the Penguin Islands, and one league from the main; they extend East and West 5 miles, and North and South 3 miles, and have several rocks and breakers about them; but more on the South side than on the North. The Easternmost island is the largest, and is very high and hilly; the Westernmost, called Columbe, is a remarkably high round island, of small circuit, with some rocky islands and sunken rocks near it.

The Isles of Ramea.

RAMEA HARBOR.—There is a harbor for small vessels, formed by the islands which lie near Great Ramea and the Columbe, called Ramea Harbor, where they may be sheltered from all winds. To enter this from the Westward, you should give the Southern point a berth, on account of some rocks that lie off the starboard island; these are all above water: steer E.N.E. towards the harbor, keeping as nearly mid-channel as you can—the passage is above a cable's length broad—and run for the anchorage in Ship Cove: this is the second inlet, on the North-western shore. You will here ride safely on clean ground, in 5 fathoms water. To enter from the Eastward, you must keep the Northern side of Great Ramea on board until you are up to the West end thereof, then steer S.W. into the harbor, keeping in the middle of the channel, in about 3 fathoms, and anchor as before directed. This harbor is very convenient for fishing vessels; in it, and also about the islands, are several places for erecting stages and drying fish, which seem to be well calculated for that purpose.

Ramea Harbor.

The Ramea Rocks are two in number, close to each other; they lie about South, distant 4 miles from the East end of Great Ramea. W.S.W., one league from these rocks, is a small bank with only 6 fathoms water on it; and nearly in the middle, between Ramea and the Penguin Islands, is the New Bank, with from 14 to 50 fathoms water. To run upon the shoalest part of this bank, bring the two Ramea Rocks on with the South-western part of Ramea Islands, and between them and Columbe, and the entrance to Little River, N.E. $\frac{1}{2}$ E.

OLD MAN'S BAY.—Four miles to the Westward of Little River is Old Man's Bay, which runs in N.N.E. about 7 miles, and is nearly a mile wide. The water throughout the bay is very deep. About one mile and a half up the bay, on the East side, is a small island, called Adam's Island, behind which vessels can ride, if necessary, in 30 and 40 fathoms water; but the best anchorage is at the head, in 14 or 18 fathoms.

Old Man's Bay.

MOSQUITO HARBOR lies about half a league to the Westward of Old Man's Bay. It is a snug and safe harbor, and will hold a great number of vessels in perfect security: but the entrance is so narrow, being only 4 $\frac{1}{2}$ fathoms in breadth, that it is difficult to get in or out. The land on both sides is high, and off the Southern point of entrance is a large white rock, about a cable's length from which is a black rock above water, on the Southern side of which is a sunken rock, whereon the sea breaks. From this black rock to the entrance of the harbor, the course is about N.N.W., distant one-third of a mile. In sailing either in or out, you should give the black rock a small berth, keeping the Western shore on board, and if obliged to anchor, be as quick as possible in getting a rope on shore, lest you drift on the rocks. In this harbor you will have 18 to 30 fathoms water, with good riding everywhere, and plenty of both wool and water. In the narrows you will find 12 fathoms, the shores being bold to the South and Easterly winds blow right in, Northerly winds right out; and with Westerly winds, it is commonly either quite calm, or descends in irregular puffs.

Mosquito Harbor.

Fox Island Harbor is formed by an island of the same name. It lies about half a league to the Westward of Mosquito Harbor; between are several rocky islands and sunken rocks. This is a commodious harbor for small vessels, which may anchor in 8, 9, and 10 fathoms water. You may go in on either side of the island, and there is no danger but what shows itself.

White Bear Bay.

WHITE BEAR BAY lies about 2 miles to the Westward of Fox Island Harbor, and N.N.E., one league from Great Ramea Island. It has several islands at its entrance. It runs in N.E. $\frac{3}{4}$ N. about 4 leagues, is near half a mile wide in the narrowest part, and has deep water close to both shores in most parts, to the distance of 8 miles up; then the ground rises at once to 9 fathoms, whence it shoals gradually to the head, with good anchorage. The best passage into the bay is to the Eastward of all the islands. On the S.W. side of Bear Island, which is the Easternmost and largest in the mouth of the bay, is a small harbor, running in about East half a mile, with from 10 to 22 fathoms of water; but there are several sunken rocks before its mouth, rendering it difficult of access. At the Western entrance is a high, round, white island; and S.W., half a mile from this island, is a black rock above water. The best passage into the bay, from the Westward, will be to the Westward of this black rock, and between White and Bear Islands. Some of the rocks are above a mile off the land.

Red Island Harbors.

RED ISLAND HARBORS.—Five or six miles to the Westward of White Bear Bay, and nearly North from Ramea Columbe, are two small harbors, called Red Island Harbors, formed by Red Island, which lies close under the land. The Westernmost is the largest and best, and has from 6 to 8 fathoms water, good anchorage. In going in, keep the island close on board, the outer part of which is composed of steep red cliffs.

The Burgeo Isles.

THE BURGEO ISLES are a cluster of islands extending about 5 miles along shore, and forming several snug and commodious harbors. They lie about 3 leagues N.W. by N. from Ramea Columbe. To sail into Burgeo from the Eastward, the best passage is on the N.E. side of Boar Island, which is the Northernmost, and lies N.N.W. from Ramea Columbe; S.E. by S. from this island, half a league, is a rock, uncovered at low water, on which the sea generally breaks. You may go on any side of this rock, the water being deep all round it. So soon as you are to the N.W. of it, keep the North side of Boar Island on board, and steer W. $\frac{1}{2}$ N. for Grandy's Cove, the North point of which is the first low point on your starboard bow; haul round that point, and anchor in the cove in 14 fathoms, and moor with a fast on shore. The best place for large ships to anchor in is betwixt Grandy's Cove and a small island lying near the West point of Boar Island, in 20 or 21 fathoms, good ground, and sheltered from all winds. To sail into Grandy's Cove, from the Westward, is dangerous, unless well acquainted. There are several safe passages in from the Southward and Eastward, between the islands, and good anchorage; and in bad weather all the sunken rocks discover themselves, and you may run in without any fear; but the island do not afford either wood or water.

Wolf Bay.

WOLF BAY extends inward, N.E. by E., one league; the entrance is E.N.E., 2 miles from Boar Island, and 2 miles to the Westward of Red Island Harbor. The East point of the entrance is composed of low ragged rocks, off which is a sunken rock, at the distance of a quarter of a mile from shore, over which the sea breaks in bad weather. Near the head of the bay is tolerably good anchorage, and plenty of wood and water.

King's Harbor lies round the West point of Wolf Bay, and runs in N.E. by E. three-quarters of a mile; before its mouth is a cluster of little islands. To sail in, keep the East point of these islands on board, and steer N. by W. and North for the entrance of the harbor, anchoring under the East shore, in 9 fathoms.

Ila Ila.

Ila Ila.—On the South side of the islands before King's Harbor, and nearly North one mile from Boar Island, is the entrance into the Ila Ila, which runs in W.N.W. one mile, and is about a quarter of a mile broad, with from 20 to 10 fathoms water, and good ground all over. Over the South point of the entrance into this harbor is a high green hill; and a cable's length and a half from the point is a sunken rock that always shows itself. Over the head of the Ila Ila is Richard's Head, a mark for running upon Ramea Shoal.

Great Barrysway.

GREAT BARRYSWAY.—About 4 miles to the Westward of the Burgeo Isles is the Great Barrysway Point, which is low, white, and rocky; and E.N.E. $\frac{1}{2}$ E., half a league from this point, is the West entrance into the Great Barrysway, wherein the room and depth of water for small vessels. Between the Burgeo Isles and the Great Barrysway Point are several sunken rocks, some of which are half a league from the shore.

Connoire Bay.

CONNOIRE BAY.—N.W. $\frac{1}{2}$ N., 4 leagues from the Burgeo Isles, is the East point of the Bay of Connoire. This point is so far remarkable, that it rises with an ascent to a moderate height, and much higher than the land within it. The West point

between two sandy cove
the shore, is a sunken

about half a league from the East point to the middle head, which is between the two arms and is half a league wide, with 14, 12, 10, and 8 fathoms, close to both shores, good anchorage and clear ground, but open to S.W. winds. The N.E. arm affords shelter for small vessels from all winds. To sail in, keep nearest the starboard shore, and anchor before a small cove on that side, near the head of the arm, in 24 fathoms. Towards the head of the arm, on the North-western side, is a bank of mud and sand, upon which a vessel may run, if necessary, and receive no damage.

THE BAY OF CUTTEAU lies about 2 leagues to the Westward of Connoire. Its depth will admit small vessels only. Round the West point of Cutteau is *Cinq Serf*, wherein are a number of islands, which form several small snug harbors. Right off *Cinq Serf*, about half a league from the shore, is a low rocky island, Westward of which is the safest passage into the largest harbor; keep near this rock, steering E. S. E. $\frac{1}{2}$ E. towards the South-eastern shore, until you get abreast of a small woody island: this is the Easternmost except one, and lies about a quarter of a mile E.N.E. from a white rock in the middle of the channel; haul short round this island, and anchor behind it, in 7 fathoms water: here you will lie safely sheltered from all winds; or you may go further up, and anchor at its head, in 4 fathoms.

GRAND BRUIT.—Four miles to the Westward of the rocky island of *Cinq Serf*, is the harbor of Grand Bruit, which is small but commodious, and may be known by a very high remarkable mountain over it, half a league inland, which is the highest land on all the coast; down this mountain runs a considerable brook, emptying itself by a cascade into the harbor. Before the mouth of the harbor are several little islands, the largest of which is of middling height, with three green hillocks on it. A little outside of this island is a round rock, rather high above water, called the *Columbe of Grand Bruit*; and a quarter of a mile to the Southward of this rock, is a low rock. In a direct line between the low rock and the rocky isles of *Cinq Serf*, half a league from the former, is a sunken rock, whereon the sea does not break in fine weather. The safest passage into Grand Bruit is to the North-eastward of this rock and of the islands lying before the harbor, between them; and the three islands, which are low and lie under the shore; and, after you are to the Northward of the sunken rock above mentioned, there is no danger but what shows itself. The harbor extends N.N.E. half a mile, and is but a quarter of a mile wide in the broadest part; but it is bold to on both sides, and has a depth of from 4 to 7 fathoms.

BAY OF ROTTE.—To the Westward of Grand Bruit, between it and *La Poile Bay*, lies the Bay of Rotte, wherein are a great many islands and sunken rocks. The Southernmost is a remarkable high round rock, called the *Columbe of Rotte*, which lies N.W. by W., 84 leagues from the Southernmost of the *Burgeos*. Between this island and Grand Bruit is a reef of rocks, some above and some under water, but they do not lie to the Southward of the direct line between the islands. Within the islands of Rotte there is shelter for shipping: the safest passage is to the Westward of the islands, between them and *Little Ireland*, which lies off the East point of *La Poile Bay*.

LA POILE BAY is large and spacious, and has several commodious harbors. It may be known by the high land of Grand Bruit, which is only 5 miles to the Eastward of it, and likewise by the land on the East side of the bay, which rises in remarkable high craggy hills. About 14 mile S.W. from its East point lies *Little Ireland*, a small low island, environed with sunken rocks, some of which are one-third of a mile off. North, about half a mile from *Little Ireland*, is a sunken rock that shows itself at low water; this is the only danger in going into the bay, excepting such as lie very near the shore.

GREAT AND LITTLE HARBORS.—Two miles within the West point of the bay, and N. $\frac{1}{2}$ W., 2 miles from *Little Ireland*, is *Tweeds*, or *Great Harbor*; its South point is low, and it extends inward W. $\frac{1}{2}$ N.W. one mile: it is about 13 cables' length wide in the narrowest part; and the anchorage is near the head of the harbor, in 18 or 20 fathoms, clear ground, and sheltered from all winds. Half a mile to the Northward of *Great Harbor* is *Little Harbor*, the North point of which, called *Tooth's Head*, is the best high bluff head on the West side of the bay: the harbor extends inwards W.N.W. about a mile. In sailing in, give the South point a small berth. You may anchor about half way up the harbor, in 10 fathoms water, before the stage which is on its Northern side.

GALLY BOY'S HARBOR lies on the East side of the bay, opposite *Tooth's Head*; it is small, snug, and convenient for ships bound to the Westward. The North point is high and steep, with a white spot in the cliff, and near its Southern point are some hillocks close to the shore. To sail in or out, keep the North side on board. You must anchor so soon as you are within the inner South point, in 9 or 10 fathoms, good ground, and sheltered from all winds. One mile to the Northward of *Gally Boy's Harbor*, between two sandy coves on the East side of the bay, and nearly two cables' length from the shore, is a sunken rock, that just uncovers at low water.

North-East Arm.

Broad Cove is about 2 miles to the Northward of Tooth's Head, on the same side of the bay. In this there is good anchorage, in 12 or 14 fathoms.

NORTH-EAST ARM.—About 2 leagues up the bay, on the Eastern side, is the North-East Arm, which is a spacious, safe, and commodious harbor. In sailing in, give the low sandy point on the S.E. side a small berth, and anchor above it where convenient, in 10 fathoms water, good holding ground, sheltered from all winds, and very convenient for wood and water.

Indian Harbor and De Plate lie just within the outer West point of La Poile Bay; these are two small coves, conveniently situated for the fishery, but fit only for small vessels, who may get in at high water.

Garia Bay.

Little Ireland bears from the Southermost of the Burgeois N.W. by W. $\frac{1}{2}$ W., 9 $\frac{1}{2}$ leagues, and lies nearly 11 leagues to the Eastward of Cape Ray.

GARIA BAY.—From Little Ireland to Harbor la Cone and La Moine Bay, the course is W.N.W. $\frac{1}{2}$ W., 9 or 10 miles; between lies the Bay of Garia and several coves, fit only for small vessels; before these there are several islands and sunken rocks scattered along the shore, but none of them lie without the above course. In bad weather all the sunken rocks discover themselves. To sail into Garia Bay, you will, in coasting along shore, discover a white head; this is the South point of an island, and lying under the land, off the Eastern point of the bay, and a little to the Westward of two green hillocks on the main; bring this white point N.N.E. and steer directly towards it; keep between it and the several islands that lie to the W.S. Westward; from the white point, the course into the bay is N. by W.; borrow towards the Eastern point, which is low. The Bay of Garia affords plenty of timber, large enough for building ships.

La Moine and la Cone Harbors.

LA MOINE AND LA COUE HARBORS.—The S.W. point of the entrance into Harbor la Cone, called Rose Blanche Point, (near to which are some rocks above water,) is tolerably high, and the land near the shore over Harbor la Cone and La Moine Bay is much higher than any other land in the vicinity; by this they may be known. La Moine Bay extends inwards N.E. $\frac{1}{2}$ E., about 4 miles, and is one quarter of a mile broad in the narrowest part. Off the East point are some small islands and rocks above water. In sailing in, keep the West point on board until you have entered the bay; then edge over towards the East shore, and run up to the head of the bay, where you may anchor in 10 or 11 fathoms, good ground; here is plenty of wood and water. To sail into Harbor la Cone, which lies at the West entrance into La Moine Bay, steer in N.N.W. between a rock above water, in the mouth of the harbor, and the West shore. So soon as you are within the rock, haul to the Westward into the harbor, and anchor in 6 or 8 fathoms water, mooring with a hawser on shore; or you may steer into the arm, which runs in N.E. by E. from the harbor, and anchor in 20 fathoms, sheltered from all winds. This has been the resort of the small fishing-vessels for many years.

Rose Blanche.

ROSE BLANCHE.—To the Westward of Rose Blanche Point is the harbor of the same name. It is small and snug, and the anchorage is in 9 fathoms water. The channel into the harbor is between the island lying off its Western point, and Rose Blanche Point. Give the island a good berth, on account of some sunken rocks which lie off its Eastern side, and keep the West side of a small island, which lies close to the point on board, anchoring within the N.E. point of this island in 9 fathoms. To enter into the N.W. part of the harbor would be dangerous, if a stranger, because of numerous islands and rocks.

Mull Race is a small cove 2 miles to the Westward of Rose Blanche Point, where there is anchorage for small vessels in 4 fathoms. Off the West point of the cove are two small islands, and several sunken rocks. The passage in is to the Eastward of these.

Several miles to the Westward of Rose Blanche Point, are the Burn Islands, which lie close under the shore, and are not easily to be distinguished from it. Behind these is a shelter for small vessels. Off these islands are sunken rocks, some of which are half a mile from the shore.

Conney and Otter Bays.

CONNAY AND OTTER BAYS.—Six miles to the Westward of Rose Blanche Point are Conney Bay and Otter Bay, both of which are rendered difficult of access by several sunken rocks outside of the passage, which do not show themselves in fair weather; but when once you are safe within Otter Bay, there is good riding in 7, 8, and 9 fathoms water.

Dead Islands Harbor.

DEAD ISLANDS HARBOR.—W.N.W. $\frac{1}{2}$ W., nearly 4 leagues from Rose Blanche Point, are the Dead Islands, which lie close under the shore. In the passage to Dead Islands Harbor, between the islands and the main, is good anchorage for shipping in 7 or 8 fathoms, sheltered from all winds; but it is very dangerous of access to strangers, as there are several sunken rocks in both the East and West entrances. The Eastern entrance can be known by a remarkable white spot on one of the islands. Bring this spot to bear N. by W. and steer in for it, keeping the starboard rocks on board, and leave the white spotted island on your port side. The Western entrance may be recognized by a high point on the main, a little to the Westward of the islands, on the

Western part of which you get within a little point of entrance; then a high hill, and steer E.

PORT AUX BASQUES—The distance are W.N.W. $\frac{1}{2}$ W., nearly one league to the shore, and the

Western part of which point is a green hillock; keep this point close on board, until you get within a little round rock, near to the Westernmost island, at the Eastern point of entrance; then haul over to the Eastward for the great island, distinguished by a high hill, and steer E. $\frac{1}{2}$ N., keeping the before mentioned little rock in sight.

PORT AUX BASQUE.—From the Dead Isles to Port aux Basque, the course is W. N. W. about 4 miles; between which lie several small islands close under the shore, and there are sunken rocks, some of which are half a mile from the shore. Port aux Basque is a small commodious harbor, which lies about $2\frac{1}{2}$ leagues to the Eastward of Cape Ray. To fall in with it, bring the Sugar-loaf hill over Cape Ray to bear N. N. W. $\frac{1}{2}$ W., or the West end of the Table Mountain N. N. W. Steer in for the land with either of these marks, and you will fall directly in with the harbor. The S. W. point, called Point Blanche, is of a moderate height, and of white appearance; but the N. E. point is low and flat, and has, close to it, a black rock above water. In order to avoid the outer shoal, on which are 3 fathoms, and which lies E. S. E. three-quarters of a mile from Point Blanche, keep the said point on board, and bring the flag-stuff, which is on the hill over the West side of the head of the harbor, on with the S. W. point of Road Island. That direction will lead you in the middle of the channel, between the East and West rocks, the former of which always show themselves, and these you leave on your starboard hand. Continue this course up to Road Island, and keep the West point on board, in order to avoid the Frying-pan Rock, which stretches out from a cove on the West shore, opposite the island; and so soon as you are above the island haul over to the E. N. E., and anchor between it and Harbor Island wherever you please, in 9 or 10 fathoms, good ground, and sheltered from all winds. This is called the Road or Outer Harbor, and is the only anchoring-place for men-of-war, or ships drawing a great depth of water, but small vessels always lie up in the Inner Harbor. To sail into it, run in between the West shore and the S. W. end of Harbor Island, and anchor behind the said island, in 3 or 4 fathoms. In some parts of this harbor ships can lay their broad-sides so near to the shore as to reach it with a plank. This place has been frequented by fishermen for many years. It is well situated for their purposes, and is capable of most excellent accommodations. One mile to the Eastward of Basque is Little Bay.

GRAND BAY lies about 2 miles to the Westward of Port aux Basque; there are several small islands and rocks in and before it, the outermost of which are not above a quarter of a mile from the shore; on these the sea generally breaks. It is only fit for small vessels.

From Port Aux Basque to Point Enragée, the bearing and distance are W. N. W. about a league, and thence to Cape Ray N. N. W. nearly 1 $\frac{1}{2}$ league. Point Enragée is some 6 or 7 miles off it, and to the Eastward of it, are some sunken rocks a mile from the shore, on which the sea breaks.

CAPE RAY is the S. W. extremity of Newfoundland; the land of the cape is very remarkable; near the shore it is low, but 3 miles inland is a very high table mountain, which rises almost perpendicular from the low land, and appears to be quite flat at the top, excepting a small hillock on the S. W. point of it. This land may be seen, in clear weather, from the distance of 16 or 17 leagues. Close to the foot of the table mountain, between it and the point of the cape, is a high round hill, resembling a sugar-loaf, (called the Sugar-loaf of Cape Ray,) whose summit is a little lower than that of the table mountain; and to the Northward of this hill, under the table mountain, are two other conical hills, resembling sugar-loaves, which are not so high as the former. One or other of these sugar-loaf hills are, from all points of view, seen detached from the table mountain.

There is a sandy bay between Cape Ray and Point Enragée, wherein ships may anchor with the winds from N. N. W. to East, but they should be cautious not to be surprised there with S. W. winds, which blow directly in, and cause a great sea. The sand is not the best for holding, being fine sand. Towards the East side of this bay is a small ledge of rocks, one mile from shore, on which the sea does not break in fine weather. The best place for large ships to anchor in is, to bring the point of the cape to W. and the high white sand-hill in the bottom of the bay N. E. in 10 fathoms water. Small vessels may lie further in. Be careful not to run so far to the Eastward as to bring the end of the table mountain on with the sand-hill in the bottom of the bay, by which means the ledge of rocks before mentioned will be avoided.

N. W. $\frac{1}{2}$ W., nearly one mile from the point of the cape, is a small ledge of rocks, called the Cape Rocks, whereon the sea always breaks; and, one mile to the Northward of the cape, close under the land, is a low rocky island. There is a channel between the ledge and the cape, with 14 and 15 fathoms water, and also between it and the island, with 4 and 5 fathoms; but the tides, which run here with great rapidity, render it unsafe for shipping.

The soundings under 100 fathoms do not extend above a league from the land to the Southward and Eastward of the cape, nor to the Westward and Northward of it, except on a bank which lies off Port aux Basque, between 2 and 3 leagues from the land, whereon are from 70 to 100 fathoms, good fishing ground. S. E. $\frac{1}{2}$ S., about 13 leagues

*Port Aux
Basque.*

Grand Bay

Cape Ray

from Port aux Basques, in the latitude of 47° 14' N., is said to be a bank, whereon are 70 fathoms.

Tides

The Tides. — Between Cape Chapeau Rouge and Cape Ray, in all the bays, &c., the tide generally flows till 9 o'clock, on full and change, and its perpendicular rise is about 7 or 8 feet on springs; but it must be observed, that the tides are everywhere greatly influenced by the winds and weather. On the coast between Cape Chapeau Rouge and St. Pierre, the current sets generally to the S. W. On the South side of Fortune Bay, it sets to the Eastward, and on the North side to the Westward. Between Cape La Hune and Cape Ray, the flood sets to the Westward in the offing, very irregularly; but generally 2 or 3 hours after it is high water by the shore. The ebb current is inconsiderable, excepting near Cape Ray, where it is strong, and at times sets quite contrary to what might be expected from the common course of the tides, and much stronger at one time than at another. These irregularities seem to depend chiefly on the winds.

THE WESTERN COAST OF NEWFOUNDLAND,

FROM CAPE RAY TO THE STRAIT OF BELLE ISLE.

FROM Cape Ray to Cape Anguille, the course and distance are N. 4 E., 17 or 18 miles. Cape Anguille is the Northernmost point of land you can see, after passing the Westward of Cape Ray. It is high table land, and covered with wood, in the country above it. Between the high land of the two capes the coast is low, and the shore forms a bay, wherein are the great and little rivers of Cod Roy; the Northernmost is the great river, which has a bar-harbor, fit to admit vessels of 8 or 10 tons draught only at high water. The shore may be approached between the two capes, half a league, there being no danger so far off. It is a good salmon-fishery, and the building small vessels and boats, there being timber in abundance.

Island Cod Roy

ISLAND COD ROY. — The Island of Cod Roy lies 1/2 or 2 miles to the Southward of Cape Anguille, close under the high land. It is a low, flat, green island, of nearly 2 miles in compass, in the shape of a horse shoe, forming between it and the main small snug bar-harbor for vessels of 10 or 12 feet draught. The safest entrance to it is from the Southward.

Cod Roy Road

COD ROY ROAD. — South eastward from the island is Cod Roy Road, wherein is a very good anchorage for shipping, in 5, 7, or 6 fathoms, on a clay bottom. With the South point of the island bearing about W. N. W., and the point of the beach on the side of the island, at the South entrance into the harbor, on with a point on the East to the Northward of the island, you will be in 7 fathoms, and nearly half a mile from the shore. One league to the Southward of Cod Roy Island is a high bluff point, called Stormy Point, off which a shoal stretches out a full mile. This point covers a road from the S. S. E. winds, and there is good anchorage all along the shore, between it and the island.

St. George's Bay

ST. GEORGE'S BAY. — From Cape Anguille to Cape St. George, the course and distance are N. N. E., 4 E., nearly 12 leagues. These two capes form the Great Bay of St. George, which extends inwards E. N. E., 18 leagues from the former, and E. E. 1/2 E. 11 leagues from the latter. At the head of this bay, on the South side, round a low point of land, is a good harbor, with excellent anchorage in 8, 10, and 12 fathoms water. The river St. George empties itself into the head of this bay, but it is not navigable for anything but boats. On the North side of the bay, before the isthmus, Port a Port, is good anchorage in 7 or 8 fathoms, with Northerly winds. From this place a fishing bank stretches two thirds across the bay, with from 7 to 10 fathoms water on it, dark sandy bottom.

Cape St. George

CAPE ST. GEORGE may be readily known, not only by its being the Northernmost of the bay of St. George, but also by the steep cliffs on the North part of it, which rise perpendicularly from the sea to a considerable height; and by Red Island, which lies 5 miles to the North-eastward of the cape, and half a mile from the shore. The island is about 1/2 mile in length, and of middling height; the steep cliffs around it are of a reddish color. There is anchorage with off-shore winds, under the N. E. and the S. E., before a sandy cove on the main, which lies just to the Northward of steep cliffs, in 12 or 14 fathoms. You will there ride, covered from the S. W. winds, the island, and from the Southerly and Easterly winds by the main land, but there is no shelter whatever with winds from the N. or N. W., although this place was formerly much resorted to by vessels in the fishing trade.

Bearings and Distances

From abreast of Red Island, distant 4 or 5 miles, to Long Point at the entrance of the bay of Port-a-Port, the bearing and distance are E. by N., 7 or 8 leagues; in

Red Island to Guernsey Island, in the mouth of the Bay of Islands, E. N. E. 4 N., nearly 16 leagues; from Red Island to Cape St. Gregory, N. E. by E., full 20 leagues; and from Red Island to Point Rich, which is the North point of Ingonmechois Bay, is E. 4 E. 1-3 leagues.

PORT-A-PORT.—The land between Red Island and the entrance into Port-a-Port, *Port-a-Port.* is rather low, with sandy beaches, except one remarkable high hillock, called Round Head, close to the shore, about 2 leagues to the E. N. Eastward of Red Island; but in the country over Port-a-Port are high lands; and, if you are 3 or 4 leagues off at sea, you cannot discern the long point of land which forms the bay. This bay is cup-shaped, being above 5 miles broad at the entrance, and 4 leagues deep, running in to the S. and S. Westward, with good anchorages in most parts of it. Long Point is the West point of the bay; it is low and rocky, and a ledge of rocks extends from it E. N. E., nearly a mile. S. E. by E. 7 E., 4 miles from Long Point, and half a league from the East shore, lies Fox Island, which is small, but of middling height. From the North end of this island a shoal stretches out nearly 2 miles to N. N. Eastward, called Fox's Tail; and nearly in the middle of the bay, between Fox Island and the West shore, lies the Middle Ground, on one place of which, near the S. W. end, there are not above 3 or 4 feet water. From the head of the bay, projecting out into the middle of it, is a low point, called Middle Point, off which, extending 2 miles N. E. by N., is a shoal spit, part of which dries at low water. This Middle Point divides the bay into two parts, called East and West Bays. From the head of the East Bay, over to the Bay of St. George, the distance is a large quarter of a mile; this isthmus is very low, and has a pond in the middle of it, into which the sea frequently dashes over, especially at high tides, and with gales of wind from the Southward. On the East side of it is a tolerably high mountain, rising directly from the isthmus, and flat at top; to the Northward of this, and at about 5 miles distant from the isthmus, is a conspicuous valley, or hollow, heretofore to be used as a mark. N. E. by E. 3 E., above 2 leagues from Long Point, and half a league from the shore, lies Shag Island, which appears at a distance like a high rock, and is easily to be distinguished from the main; and W. N. W. about a league from it, lies the middle of Long Ledge, which is a narrow ledge of rocks stretching E. N. E. and W. S. W. about 4 miles; the Eastern part of them is above water, and the channel into the bay of Port-a-Port, between the West end of this ledge and the reef which stretches off from the West point of the bay, is a league wide.

In sailing into Port-a-Port, if coming from the S. Westward, advance no nearer to the Long Point of the bay than 13 mile, until you have brought the valley, in the side of the mountain before mentioned, (on the East side of the isthmus,) over the East end of Fox Island, or to the Eastward of it, which will then bear South a little Easterly; you will then be clear of the Long Point Reef, and may haul into the bay with safety; if coming from the N. E. without the Long Ledge, or turning into the bay, in order to keep clear of the S. W. end of Long Ledge, bring the isthmus, or the foot of the mountain, (which is on the East side of the isthmus,) open to the Westward of Fox Island, nearly twice the breadth of the island, and it will lead you into the bay between the Long Ledge; and when Shag Island is brought on with the foot of the high mountain on the South side of Coal River, bearing then E. 7 S., you will be within the Long Ledge; there is also a safe passage into the bay, between the Long Ledge and the shore, on either side of Shag Island, taking care to avoid a small shoal, of 23 fathoms, which lies W. by N. one mile from the island.

To sail up in the West Bay and Head Harbor, keep the Western shore on board; the shore is bold to. In turning between it and the Middle Ground, stand no nearer to the Middle Ground than into 8 fathoms; but you may stand to the spit of the Middle Point into 12 fathoms. The anchorage in West Bay is in about 8 fathoms, and in Head Harbor in about 5 fathoms. The West Road lies before a high stone beach, about 2 miles westward of Long Point, where you may be very secure from Westerly and N. West winds, in about 10 or 12 fathoms water; this beach is steep to, and forms an excellent place for landing and drying your fish; there is a good place at the Northern end of Fox Island for the same purpose. The whole bay and the adjacent coasts abound in cod, and extensive fishing banks lie all along the coasts.

The East Road lies between Fox Island and the East shore; to sail up to it, you must keep the high bluff head, which is about a league to the E. N. E. of the island, bearing to the Southward of S. E. by E. 4 E., until the isthmus is brought to the Eastward of Fox Island; you will then be within the shoal called the Fox's Tail, and may haul to the Southward, and anchor anywhere between the island and the main, in from 10 to 18 fathoms.

To sail up the East Bay, pass between the island and the East shore, and after you have passed the island, come no nearer to the main than half a mile, until you are abreast of a bluff point above the island, called Road Point, just above which is the best anchorage with N. E. winds, in about 12 fathoms water; and to sail up to the East Bay

between the Middle Ground and the Fox's Tail, bring the said bluff point on with the S.W. point of Fox Island; this mark will lead you up in the fairway between the shoals; give the island a berth, and anchor as before directed, in from 8 to 12 fathoms water.

*Bay of Isl-
ands*

BAY OF ISLANDS.—From the Long Point at the entrance of Port-a-Port to the Bay of Islands, the bearing and distance are N.E. by E., 8 leagues. Be careful to avoid the Long Lodge; the land between is of considerable height, rising in craggy barren hills, directly from the shore. The Bay of Islands may be known by the many islands in the mouth of it, particularly the three named Guernsey Island, Tweed Island, and Pearl Island, which are nearly of equal height with the land on the main. If you are bound for Lark or York Harbors, which lie on the S.W. side of the bay, and are coming from the Southward, run in between Guernsey Island and the South Head, both of which are bold to; but with Southerly and S.W. winds approach not too near the South Head, lest calms and sudden gusts of wind should proceed from the high land under which you cannot anchor with safety. There are several channels formed by the different islands, through which you may sail in or out of the bay, there being no danger but what shows itself, except a small ledge of rocks, which lie half a mile North eastward from the Northern Shag Rock, and in a line with the two Shag Rocks in one. If you bring the South Shag Rock open on either side of the North Rock, you will go clear to the Eastward or Westward of the ledge. The safest passage into the bay from the Northward, is between the two Shag Rocks, and then between Tweed Island and Pearl Island.

*Lark Har-
bor*

LARK HARBOR.—From Guernsey Island to Tortoise Head, which is the North point of York Harbor, and the S.E. point of Lark Harbor, the course and distance are nearly S.S.W., 6 miles, Lark Harbor extends inwards W.S.W., nearly 2 miles, and is one third of a mile broad in the entrance, which is the narrowest part; in sailing into it with a large ship, keep the port shore on board, and anchor with a low point on the starboard side, bearing W.N.W., N.N.W., or N.N.E., and you will ride in 6 or 7 fathoms water, secure from all winds.

*York Har-
bor*

YORK HARBOR.—From Tortoise Head to York Harbor, the course and distance are W.S.W., nearly a league; there is good turning room between the Head and Governor's Island, which lies before the harbor, but you must be careful to avoid a shoal which runs off from a low beach point on the West end of Governor's Island, called Sword Point; there is also a shoal which spits off from the next point of Governor's Island, which must also be avoided; Tortoise Head just touching Sword Point will lead clear of it; in sailing in, give Sword Point a berth, passing which, the best anchoring ground is in 10 fathoms, along a sandy beach on the main, with Tortoise Head open of Sword Point; W. and N. Westerly winds blow here with great violence.

Harbor Island lies at the entrance of the River Humber, and S. by E. 3 E., 7 miles from Guernsey Island; at its S. W. point is Wood's Harbor, which is unfit for shipping. The River Humber, at about 5 leagues within the entrance, becomes narrow, and the stream is so rapid in some places, for about 4 leagues up, to a lake, that it is with difficulty that even a boat can stem the current.

The North and South Arms are both long inlets, with very deep water up to the heads. On the East side of Eagle Island, between the North and South Arms, is a anchorage in 8, 10, or 12 fathoms water. Under the North side of Harbor Island is good anchorage with S. W. winds; and opposite to the S.E. end of Harbor Island on the South side of the bay, is Frenchman's Cove, wherein is good anchorage in from 20 to 12 fathoms. The Bay of Islands was formerly much frequented by vessels in the cod fishery, and stages were erected at Small Bay, which lies a little on the outer side of South Head; and the large beach on Sword Point, in Governor's Island, is an excellent place for drying the fish.

*Cape St.
Gregory*

From the North Shag Rock to Cape St. Gregory, the course and distance are N.E., 8 miles; and thence 13 or 14 miles, on a similar bearing, will carry you to the entrance of Bonne Bay. The land near the shore from the North Shag Rock to Cape Gregory is low, along which lie sunken rocks, a quarter of a mile from the shore; but very little way inland it rises into a high mountain, terminating at the top in round hills.

Bonne Bay

CAPE S. E. GREGORY is high, and between it and Bonne Bay the land rises directly from the sea-shore to a considerable height; it is the most Northerly land you can discern, when sailing along shore between Red Island and the Bay of Islands. **BONNE BAY** may be known at the distance of 4 or 5 leagues, by the land about it; all that on the S.W. side of the bay being very high and hilly, and that on the N. side, and thence along the sea-coast to the Northward, being low and flat; but at about one league inland is a range of mountains, which runs parallel with the sea-coast. Over the South side of the bay is a very high mountain, terminating at top in a remarkable round hill, very conspicuous when you are to the Northward of the bay. This extends inward E. S. E. nearly 2 leagues, then branches into two arms, one of which runs to the Southward, and the other to the Eastward; the Southern arm affords the best anchorage; small vessels should ride just above a low woody point at the entrance

the arm, on the starboard side, the length from the bow, excepting at the bow, sailing into the Eastward at the entrance, you must not anchor at North Point, with anchorage S.W. winds, come on board, or should meet the wind of your anchorage, Ten miles to the Northward about three quarters of a league from Point is low land, about half a mile from the North side of the bay with off-shore wind, TOW HEAD lies about 1/2 league from the bay, a very low and narrow neck, separating Island, which is the Bay of Islands; and small ships may lie there in light winds. Shallow Bay is good for small vessels; a point E. N. E. and W. N. W. other, which general there is a channel into the bay, which you may see as there are some sunken rocks for a fishery of mackerel.

INGORNACHOIX BAY is distant 50 miles; Port-a-Port is a shallow Bay to the Southward, there being a ledge of rocks from the sea winds, occasionally with land-winds, running half a mile inland, and assembling Portland Bill, whatever point of view it is seen from. **PORT SAUNDERS** is a small bay to the Eastward of Ingornach, the distance will not easily be ascertained, as the sides of the island are steep, and will leave Keppel Island within the entrance, you should run up to the head of the bay, in order to avoid a ledge of rocks, which is to be the best harbor for the bay. **HAWKE'S HARBOR**, is a small bay, between Keppel Island, and the North side of the land, and is a good anchorage at low water, and than to the main, it bears N.E. by N. or N.E. 1/2 N. and is situated further up the coast of this island, and when you are bound to hear N.N.E. & N., or N.E. by N., you will then be in the harbor, you will then be in the harbor, or else run within the bay, it is a convenient place for both the Northward. The land is low, and you may occasionally find the prevailing wind, **POINT RICH** is the Southern point of the sea, being everywhere any other land on this coast, and an inward direction.

the arm, on the starboard side, before a sandy beach, in 8 or 10 fathoms water, about a cable's length from the shore; there is no other anchorage in less than 30 or 40 fathoms, excepting at the head of the arm, where there are from 25 to 20 fathoms water; ascending into the East Arm, keep the starboard shore on board; and a little round about at the entrance, will be found a small cove, with good anchorage in 17 to 20 fathoms, but you must moor to the shore. There is a snug cove also close within the North Point, with anchorage in 6 or 7 fathoms water; in sailing in or out of Bonne Bay with S.W. winds, come not near the weather shore, lest you should happen to be becalmed, or should meet with heavy gusts of wind, as the depth of water is too great to admit of your anchoring.

Ten miles to the Northward of Bonne Bay is Martin Point, high and white, off which, about three quarters of a mile, is a small ledge of rocks, whereon the sea breaks. Broome Point is low and white, and lies about a league to the Northward of Martin Point; about half a mile W.S.W. from it lies a sunken rock that seldom shows itself; on the North side of Broome Point lies the Bay of St. Paul, wherein vessels may anchor with off-shore winds, but it is quite exposed to the sea.

COW HEAD lies about 4 miles to the Northward of the Bay of St. Paul; this is a *Cow Head*, a promontory, which has the appearance of an island, it being joined to the main only by a very low and narrow neck of land; about three-quarters of a mile off this head lies Steering Island, which is low and rocky, and is the only island on the coast between the Bay of Islands and Point Rich. Cow Cove lies on the South side of Cow Head, and ships may lie there in from 7 to 10 fathoms, sheltered from Northerly and Easterly winds. Shallow Bay lies on the North side of Cow Head, and has water sufficient for small vessels; at the N.E. side of the entrance is a cluster of rocky islands, extending E.N.E. and W.S.W., and at the W.S.W. side are two sunken rocks close to each other, which generally show themselves; they lie a cable's length from the shore, and there is a channel into the bay on either side of them. Steering Island lies right before this bay, which you may pass on either side, but come not too near its N.E. end, as there are some sunken rocks extending from it. This is considered the best ground for a fishery of all the coast, and the ground about its environs is eminently productive.

INGORNACHOIX BAY.—From Steering Island to Point Rich the course is nearly N.E., distant 50 miles; Point Rich is the Northern point of Ingornachois Bay. From Shallow Bay to the Southern point of Ingornachois Bay the coast is nearly in a straight line, there being all the way neither creek nor cove where a vessel can find shelter from the sea winds, although there are a few places where they might anchor occasionally with land-winds. About 6 leagues from Steering Island there is a hill standing half a mile inland, which is commonly called Portland Bill, probably because it resembles Portland Bill in the English channel, and alters not its appearance in whatever point of view it is taken.

PORT SAUNDERS and HAWKE'S HARBOR.—These are situated within, and to the Eastward of Ingornachois Bay. At the entrance lies Keppel Island, which, at a distance, will not easily be distinguished from the main land. There is a passage on both sides of the island. To sail into Port Saunders there is no impediment or danger. You will leave Keppel Island on your starboard side, and when you get about half a mile within the entrance, you can anchor in 12 or 14 fathoms water; but if you are desirous to run up to the head of the harbor, you must keep the port shore on board, in order to avoid a ledge of rocks which lies near the mid-channel. This is considered to be the best harbor for vessels that are bound to the Southward.

HAWKE'S HARBOR.—To enter this harbor vessels commonly go to the Southward of Keppel Island. The starboard shore is shoal, and has a sand-bank which stretches along the land, and runs out two-thirds of the passage over, great part of which dries at low water. Your course in will be E.S.E., keeping nearer to Keppel Island than to the main, until the Eastern end of the island, which is a low stony beach, bears N.E. by N. or N.N.E., then steer S.S.E. & E. for a small island you will be situated further up the harbor, keeping the port shore well on board; round this island, and when you have brought the point at the South entrance of the harbor to bear N.N.E. & N., and are at the S.S.E. point of a bay on the starboard side of the harbor, you will then be beyond the shoal ground, and may anchor in 12 fathoms water; or else run within half a mile of the small island, and anchor there, which will be more convenient for both wood and water. This is the best harbor for ships bound to the Northward. The land round about these harbors is generally low, and covered with wood. You may occasionally anchor outside, in the Bay of Ingornachois, according as you find the prevailing winds.

POINT RICH is the South-western point of a peninsula, which is almost surrounded by the sea, being everywhere of moderate height, and projecting further to seaward than any other land on this side of Newfoundland, the coast from thence, each way, being an inward direction.

*Port au
Choir.*

PORT AU CHOIX.—Rounding Point Rich, on its Northern side, you will meet with Port au Choix, small, but yet capable of admitting a ship of burden, mooring head and stern. To sail in you should keep the starboard shore on board, and anchor just above a small island lying in the middle of the harbor. In this place, and also in Boat Cove, which lies a little to the North-eastward, there are several stages and places for drying fish.

*Old Port
au Choix.*

OLD PORT AU CHOIX lies to the Eastward of Boat Cove; it is a small but safe harbor, having at its entrance an island called Harbor Island, and on its Western side some rocks, both above and under water. There is also another island lying E.N.E. $\frac{1}{2}$ N., distant nearly a mile from Harbor Island, about which are several rocks, some of which stretch out towards Harbor Island, and render the passage very narrow between them. There are 4, 5, 6, and 7 fathoms water between Savage Island and the main, and 4 and 5 fathoms between Savage Island and Harbor Island, and nearly the same depth between Harbor Island and the Western shore. To sail into Old Port au Choix, on the Western side of Harbor Island, you must keep the island close on board; but to go in on the Eastern side of the island, give the North-eastern point of the island a berth, and having well entered, you may anchor anywhere on the port side of the harbor, only avoiding the starboard side, for a shoal of sand and mud runs all along it.

*Bay of St.
John.*

BAY OF ST. JOHN.—This is an open and extensive bay, bounded by Point Rich to the Southward, and Point Ferolle to the Northward, having several islands within it, and some sunken rocks. The largest of these islands is St. John's, about 2½ miles in length, and 1½ broad; this lies E.N.E., distant 8½ miles from Point Rich; on its South-western side is a small harbor, well calculated for the cod fishery, but too much exposed for shipping, as South-westerly winds commonly drive in a heavy sea. On the South-eastern or inner side of the island, and between it and One Head Island, vessels may lie much more secure, in 14 or 16 fathoms water, and sheltered from most winds; and this is considered to be the only safe anchorage in the whole bay. West from St. John's Island, one large mile, is Flat Island, having a rock above water at its Southern end. The channel between St. John's and Flat Island has from 13 to 35 fathoms in it, and they are both bold to. The Twin Islands lie N.E. by N. from Flat Island, distant one league, and have no danger about them. To the Westward of the Twins are several scattered rocks above water, named the Bay Islands; they have deep water around them, but no anchorage. The land at the bottom of the bay is very high, and there is the little river of Castors, the entrance to which is dangerous and shallow, therefore seldom frequented. From the Northern point of this bay a rocky shoal extends all the way to Point Ferolle, stretching out 2½ miles from the shore.

*Point
Ferule.*

POINT FEROLLE lies N.E. by E. from Point Rich, distant 22 miles; it is of moderate height, and joined to the main by a neck of land, which divides the Bay of St. John's from New Ferolle Bay, making it appear like an island, when seen from distance; its Northern shore is bold to, and this part of the coast will easily be known by the adjacent table land of St. John's, the West end of which mountain lies from the middle of Ferolle Point S. by W., and its Eastern end S.E. $\frac{1}{2}$ S.

*New Ferolle
Bay.*

NEW FEROLLE BAY is a small cove lying to the Eastward of the point, and quite flat all over, there being not more than 2 and 3 fathoms at any part; it is quite open to the Northerly winds, has a stage on each side of it, with plenty of room for others.

St. Margaret's Bay is large, and has several islands within it; also various inlets or coves admitting good anchorage, particularly on its Western side, which is the best situation for ships, being most clear of danger, and convenient for wooding and watering. On its banks are spruce and fir trees in plenty, and many rivulets of fresh water. Dog Island is to the Eastward of Point Ferolle full 3 miles, and only divided from the main at high water; it is higher than any land near it, which gives it the appearance, when seen from the Eastward, of an island situated at some distance from the main.

Old Ferolle.

OLD FEROLLE.—To the Eastward of Dog Island, about five miles, is Ferolle Island. This island lies parallel to the shore, and forms the harbor of Old Ferolle, which is very good and safe. The best entrance to it is at the S.W. end of the island, passing to the Southward of a small island at the entrance, which is bold to. As soon as you are within it, haul up E.N.E., and anchor under the S.W. end of Ferolle Island, in 8 or 9 fathoms, good ground, quite land-locked. There is also good anchorage anywhere along the inside of the island, and a good channel up to the N. end thereof. There are some little islands lying at the N.E. end of Ferolle Island, and on the outside are some ledges of rocks a small distance off.

*Bay of St.
Genevieve.*

BAY OF ST. GENEVIEVE.—From the North end of Ferolle Island to St. Genevieve Head, the course is E.N.E., 4½ miles, and thence to the West end of Currier Island, it is North-eastward about 3 miles. There are several small islands lying

before this bay, one of which is the mentioned Current Island, of moderate height, and with a flat top, but not high; and the other, called Goose Island, the highest point bears from Currier Island has a small island lying near half a mile from the W.S.W. from the main, and is to the Southward of a small island lying in this channel, which is the course in its E. end of the mentioned island, passing between Genevieve Head and the main. You may either proceed further, with the middle of the bay, in 7 or 8 fathoms, to a tolerably good anchorage. W. arm. The entrance into the bay, if you are near water immediately to the S. by N., 2½ miles; a small island between them and Anchor Point. To sail into the bay, to avoid the shoals, before you can discover the main, keep in between the two points, in 10 fathoms, quite land-locked to the South, the other the E. end of the island. Between the S. end and the N. end, there are sunken rocks, the depth of the open bay are 7, 8, or 9 fathoms, which renders it unsafe. From Anchor Point to the N. end, there are no other shoals. The Seal Islands are within their North and Western ends. From the N.W. Seal Island, the distance is 2 miles. Part of this bay is off side.

MISTAKEN COVE.—This is about 1½ mile E. by S. from the Eastern point of Nameless Cove and Flat Island. **SAVAGE COVE.**—Close to the little island in its entrance, Sandy Bay lies 2 miles E. from the main, in 4 fathoms water, with a small island about E.N.E., 5 large miles distant, W. $\frac{1}{2}$ S., from which extends nearly two miles off.

GREEN ISLAND lies about the N. end of the main, with a very low and narrow isthmus at its N. end, and a ledge of rocks at its S. end, where the sea breaks in between the island and the main. To the Westward, keep to the N. end of the island, in 8 or 9 fathoms; and going in from the opposite part of the Strait, the narrowest part of the Strait is from each other N.N.W.

before this bay, only two of which are of any considerable extent. The aforementioned Current Island is the Northernmost of the two, and the largest; it is of a moderate height, and when you are to the E.N.E. of it, the Western point will appear flat, but not high; and when you are to the Westward of it, it appears flat and white. The other, called Gooseberry Island, lies nearly a mile to the Southward of it, and its West point bears from the West point of Current Island, S.S.W. 4 W., nearly a mile. Gooseberry Island has a cross on its S.W. end, from which point stretches out a ledge of rocks near half a mile to the Southward. There is also a shoal about half a mile to the W.S.W. from the S.W. point of Current Island. The best channel into this bay is to the Southward of these islands, between the rocks which stretch off them; a small island lying S.S.W. from them, which island lies near the South shore. In this channel, which is very narrow, there are not less than 5 fathoms at low water, and the course in is E. by S., Southerly, until you come to the length of the aforementioned island, passing which, you should haul to the Southward, and bring St. George's Head between the small island and the main, in order to avoid the middle shoal. You may either anchor behind the small island in 5 or 6 fathoms water, or proceed further, with the said mark on, until the S.W. arm is open, and anchor in the middle of the bay, in 7 or 8 fathoms water. Here is wood and water to be had. There is a tolerably good anchorage in most parts of the bay, but the suggest place is in the S.W. arm. The entrance to it is narrow, and has only 4 fathoms at low water. In coming into the bay, if you get out of the channel on either side, you will shoalen your water immediately to 3 or 2 fathoms.

BAY OF ST. BARBE.—From the W. end of Current Island to St. Barbe Point, *Bay of St. Barbe.* is E. by N., 2½ miles; and from St. Barbe Point to Anchor Point it is N.N.E. nearly 1 mile. Between them lies the Bay of St. Barbe; it runs in S. by E. about 2 miles to Anchor Point. To sail in, give Anchor Point and all the East side of the Bay a good berth, to avoid the sunken rocks which lie along that shore. You must be well before you can discover the entrance into the harbor, which is but narrow; then steer South, keeping in the middle of the channel, and anchor as soon as you are within the two points, in a small cove on the W. side, in 5 fathoms water, on a sand shoal, quite land-locked. Near this place branch out two arms or rivers, one called the South, the other the East; the latter has 3 fathoms a good way up, but the former is shoal. Between the S.W. point of the bay and W. point of the harbor, is a cove, wherein are sunken rocks, which lie a little without the line of the two points. In the open bay are 7, 8, or 9 fathoms; but the N.W. winds cause a heavy sea to fall in here, which renders it unsafe.

From Anchor Point to the extremity of the Seal Islands, the course is N.E. ¼ E., 10 leagues. Off Anchor Point a ledge stretches itself W. by S. about one-third of a league. There are no other dangers between it and the Seal Islands, but what lie very near the shore.

The Seal Islands are white, and rocky, and must not be approached but with care on their North and Western sides, because there are some sunken rocks near them.

From the N.W. Seal Island to the N.W. extremity of Flower Ledge, it is N.N.E., 2 miles. Part of this ledge appears at low water, and there are 10 fathoms close to its off side.

MISTAKEN COVE.—From the North part of Flower Ledge to Greenville Ledge, *Mistaken Cove.* is about 14 mile E. by S., and Greenville Ledge lies about two-thirds of a mile W. ¼ N. from the Eastern point of Mistaken Cove; between which and Seal Islands lie Nameless Cove and Flower Cove, neither of which are fit for ships.

SAVAGE COVE.—Close to the Eastward of Mistaken Cove is Savage Cove, which *Savage Cove.* is a little island in its entrance, and is only fit for small vessels and boats.

Sandy Bay lies 2 miles Eastward from Savage Cove, where small vessels may ride in 4 fathoms water, with the winds from the E. to S.W.

About E.N.E., 5 large miles from Sandy Bay, is Green Island; between them, at 3 miles distant, W. ¼ S., from Green Island, is the North extremity of Double Ledge, which extends nearly two-thirds of a mile from the shore, and has only 8 or 9 feet water on it.

Green Island lies about three-fourths of a mile from the main, is two-thirds of a mile in length, very low and narrow, and agreeable in color to the name it bears. From the West end of it a ledge of rocks extends three-fourths of a mile to the Eastward, on which the sea breaks in bad weather. There are 4 or 5 fathoms water in the channel between the island and the main, where ships may anchor if necessary. To go in from the Westward, keep the island close on board for the deepest water, which is 4 fathoms; and going in from the Eastward, keep the main on board. From this island the opposite part of the coast of Labrador, called Castles, or Red Cliffs, which is the narrowest part of the Strait of Belle Isle, the distance is about 3½ leagues, and they are from each other N.N.W. and S.S.E.

Boat Harbor. **BOAT HARBOR.**—From Green Island to Boat's Head it is E. $\frac{1}{2}$ N., 6 leagues between there is no shelter on the coast; but to the South-eastward of Boat's Head is a cove, called Boat Harbor, where small vessels and boats may lie very secure, except with N.E. winds.

Cape Norman lies E., 4 miles from Boat's Head, and is the Northernmost point of land in Newfoundland. This has been already described. (See page 37.)

Tides.

TIDES.—The tides flow at the full and change of the moon as follows: at New and Old Ferolle, till a quarter after 11 o'clock; in the Bays of Genevieve and St. Barbe at half after 10, and at Green Island until 9. Spring tides rise 7 feet, neaps 4 feet. In the Bay of Pistolet it flows till three-quarters after 6, and in Noddy Harbor and Griquet until a quarter after 5. Spring tides rise 5 feet, neaps about 3. Before Quirpon, in settled weather, the tide sets to the Southward 9 hours out of the 12, and stronger than the Northern stream. In the Strait of Belle Isle the flood in the offing, sets to the Westward two hours after it is high water on the shore; but in blowing weather the stream is subject to many alterations.

GULF OF ST. LAWRENCE.

THE following directions for navigating this Gulf are taken, with some alterations to arrangement, from those of Captain H. W. Bayfield, R. N., who has been employed in a minute survey of this Gulf for some years.

The main entrance into this Gulf is between Cape Ray, the South-western point of Newfoundland, and Cape North, the North-east point of Cape Breton Island.

Ice.

ICE.—Among the difficulties of navigation may be mentioned the ice. In spring the entrance and Eastern parts of the Gulf are frequently covered with it, and vessels are sometimes beset for many days. Being unfitted for contending with this danger, they often suffer from it, and are occasionally lost; but serious accidents from this cause do not frequently occur, because the ice is generally in a melting state from the powerful effect of the sun in spring. In the fall of the year accidents from ice seldom occur except when the winter commences suddenly, or when vessels linger imprudently long from the temptation of obtaining high freights.

Fogs.

FOGS.—But all danger from ice is far less than that which arises from the prevalence of fogs; they may occur at any time during the open or navigable season, but are most frequent in the early part of summer. They are rare, and never of long continuance during Westerly winds, but seldom fail to accompany an Easterly wind of any strength or duration. The above general observation is subject, however, to restriction, according to locality or season. Thus winds between the South and West, which are usually clear-weather winds above Anticosti, are frequently accompanied with fog in the Eastern parts of the Gulf. Winds between the South and East are almost always accompanied with rain and fog in every part. E.N.E. winds, above Pointe Monts, are often E.S.E. or S.E. winds in the Gulf, changed in direction by the high lands of the South coast, and have therefore in general the same foggy character. I speak of winds of considerable strength and duration, and which probably extend over great distances. Moderate and partial fine-weather winds may occur without fog in any season, and in any locality. In the early part of the navigable season, especially in the months of April and May, clear-weather N.E. winds are of frequent occurrence, and they also sometimes occur at other seasons, in every part of the Gulf and River St. Lawrence.

The fogs sometimes last several days in succession, and to a vessel either running up or beating down, during their continuance, there is no safe guide but the constant use of the deep-sea lead, with a chart containing correct soundings.

The fogs which accompany Easterly gales, extend high up in the atmosphere, and cannot be looked over from any part of the rigging of a ship. They, however, are not so thick as those which occur in calms after a strong wind, and which are frequently so dense as to conceal a vessel within hail; whilst the former often, but not always admit the land, or other objects, to be distinguished at the distance of half a mile or more in the daytime.

The dense fogs which occur in calms, or even in very light winds, often extend only to small elevations above the sea; so that it sometimes happens, that when objects are hidden at the distance of 50 yards from the deck, they can plainly be seen by a person 50 or 60 feet up the rigging. In the months of October and November the fog and ruin that accompany Easterly gales are replaced by thick snow, which causes equal embarrassment to the navigator.

Winds.

WINDS.—The prevailing winds during the navigable season, are either directly or directly down the estuary, following the course of the chains of the high lands

other side of the great valley of the St. Lawrence. Thus a S.E. wind in the Gulf becomes E.S.E. between Anticosti and the South coast, E.N.E. above Point de Monts, and N.E. above Green Island. The Westerly winds do not appear to be so much guided in direction by the high lands, excepting along the South coast, where we have observed a W.S.W. wind at the Island of Bic become W., W.N.W. and N.W., as we run down along the high and curved South coast, until it become a N.N.W. wind at Cape Gaspé. These winds frequently blow strong for 3 or 4 days in succession; the Westerly winds being almost always accompanied with fine, dry, clear, and sunny weather; the Easterly winds as frequently the contrary, cold, wet, and foggy. In the spring the Easterly winds most prevail, frequently blowing for several weeks in succession. As the summer advances, the Westerly winds become more frequent, and the S.W. wind may be said to be the prevailing wind in summer, in all parts of the river and gulf. Light South winds take place occasionally; but North winds are not common in summer, although they sometimes occur. Steady N.W. winds do not blow frequently before September, excepting for a few hours at a time, when they generally succeed Easterly winds which have died away to a calm, forming the commencement of strong winds, and usually veering to the S.W. The N.W. wind is dry, with bright clear sky, flying clouds, and showers. After the autumnal equinox, winds to the Northward of West become more common, and are then often strong steady winds, of considerable duration. In the months of October and November, the N.W. wind frequently blows with great violence, in heavy squalls, with passing showers of hail and snow, and attended with sharp frost.

Thunder-storms are not uncommon in July and August: they seldom last above an hour or two; but the wind proceeding from them is in general violent and sudden, particularly when near the mountainous part of the coast: sail should, therefore, be fully and quickly reduced on their approach.

Strong winds seldom veer quickly from one quarter of the compass to another directly or nearly contrary: in general they die away by degrees to a calm, and are succeeded by a wind in the opposite direction. I do not mean, however, by this observation, that they may not veer to the amount of several points. N.W. winds seldom or never veer round by N. and N.E. to E. and S.E.; but they do frequently, by degrees, veer to the S.W. after becoming moderate. S.W. winds seldom veer by the N.W. and N. to the Eastward, but sometimes by the S. to S.E. and E. Easterly winds generally decrease to a calm, and are succeeded by a wind from the opposite direction.

In the fine-weather Westerly winds of summer, a fresh topgallant breeze will often decrease to a light breeze or calm at night, and spring up again from the same quarter on the following morning: under these circumstances only may a land breeze off the North coast be looked for. I have observed the same off the South coast also, but not so decidedly or extending so far off shore. I have occasionally carried the North land-wind nearly over to the South coast just before daylight, but have never observed the South land-wind extend more than 5 or 6 miles off, and that very rarely. Under the same circumstances, that is, with a fine-weather Westerly wind going down with the sun, a S.W. land-breeze will frequently be found blowing off the North coast of Anticosti at night and during the early part of the morning. If, however, the weather be not settled fair, and the wind does not fall with the sun, it will usually prove worse than useless to run a vessel close in shore at night in the hope of a breeze off the land. Such is the usual course of the winds in common seasons, in which a very heavy gale of wind will probably not be experienced from May to October, although else-reefed gales are usually common enough. Occasionally, however, there are years, the character of which is decidedly stormy. Gales of wind, of considerable strength, then follow each other in quick succession and from opposite quarters.

BAROMETER.—The marine barometer, which is at all times of great use to the navigator, becomes particularly so in such seasons: and the following remarks upon its general indications, when taken in connection with the usual course of the winds and weather in the St. Lawrence, may, therefore, be useful. The barometer has a range from 29 to 30.5 inches in the Gulf and River of St. Lawrence during the navigable season, and its changes accompany those of the winds and weather with a considerable degree of constancy. The fluctuations of the barometric column are much greater and more frequent than in lower latitudes; and the sudden alterations which, in other climates, would be alarming, may occur there without being followed by any corresponding change either in the wind or weather. But the navigator should not be inattentive to those minor changes, as a constant attention to the instrument can alone enable him to appreciate those decisive indications of the mercury which seldom or never prove deceptive. The following remarks will apply to those well-marked changes which usually indicate the approach of a gale of considerable strength, or a shift of wind and weather; the correct anticipation of which is often of the almost consequence to the safety of a vessel, as well as to the length of her voyage. When, after a continuance of Westerly winds and fine weather, the barometer has

Barometer.

risen nearly to its greatest height, say some ten or above 30 inches, or begins to fall a little, an Easterly wind may be soon expected. If to this notice given by the barometer be added a warm lazy atmosphere during the day, and a heavy precipitation of dew at night, with very bright twinkling stars, or a colored aurora borealis, the approach of an East wind is almost certain. If land be in sight at such a time, and appears much distorted by terrestrial refraction, or if vessels in sight have the relative proportions of their hulls and sails change by the *mirage*, or present double or treble images, such appearances will render the before probable indications of the barometer certain. At the commencement, the Easterly wind will probably be light, with fine clear weather, but this will not last above a few hours if the barometer continues to fall; on the contrary, the wind will gradually increase, and as it does so, the sky will become overcast by degrees until it is completely clouded. Rain and fog will follow, and continue during the continuance of the Easterly wind with little intermission, until they are dissipated by a fresh breeze from the contrary quarter.

If the fall of the barometer during the continuance of the Easterly wind be very slow, the gale will probably continue, and not be very violent; if rapid, it will probably be of short duration, and of greater strength; at any rate, when the mercury falls towards 29 inches, a change is certainly at hand, and the gale will in general come from the N.W. The strength of this succeeding gale will be in proportion to the fall of the barometer, and to the strength of the Easterly gale which preceded it. In such a case there is seldom many hours interval between the one gale and the other. The East wind generally dies away to calm, and in a very few hours, or sometimes in much less time, the N.W. gale springs up. A heavy cross sea remains for some time from the previous gale. The barometer sometimes begins to rise in the interval of calm which precedes the N.W. gale, at others at its commencement; the fog and rain cease, and the weather becomes quite clear, generally in a few hours, and sometimes almost immediately. The strength of the Westerly gale is usually greatest soon after its commencement, and diminishes as the barometer rises, veering gradually to the W. and S.W. It is worthy of remark, that the circumstances just mentioned are exactly the reverse of those attending the Easterly gale. The latter usually commences with clear weather and a high barometer, light at first from the S. or S.E. and gradually increasing as it veers to the Eastward, with a falling barometer. To return to the Westerly gale.—If, after it has veered to S.W. and become moderate the barometer remains steady at a moderate height, fine weather may be expected. If it remains at a considerable height, but still fluctuating and unsteady within certain limits, variable, but not heavy winds, and variable weather may be expected. If on the contrary, it rises quickly to a great height, a repetition of the Easterly gale will not be improbable. We have experienced seasons in which the barometer may be said to have been no sooner blown up by one wind, than it has been blown down by another, and this stormy alternation to have continued for several months; while in others we have scarcely had a double-reefed topsail breeze during the whole summer.

There is, in fact, so great a difference in the phenomena of the weather in different seasons, that it becomes very difficult to write anything respecting it that shall not be liable to many exceptions. There are, however, some strongly marked cases of connection, between the indications of the barometer and changes of the winds and weather, which, within our experience of eight or nine years, have been subject to few, I might almost say, no exceptions. The first of these cases is that most common one, which I have endeavored to describe, of an Easterly gale with a falling barometer being always wet and foggy, and succeeded by a strong wind from the opposite quarter with a rising barometer. A second case, not of so frequent occurrence in common seasons, excepting in spring or early in summer, is the Easterly wind with a rising barometer; which, although it may not be at first for a few hours, will almost always become fine and clear, and end in fine weather. A third case may be considered certain: if the barometer fall suddenly and greatly, at any time, a Northerly, and more probably a N.W. gale, of great strength, may be confidently expected. It does not follow that it will be immediate, for it may be preceded by a strong gale from S.W. for a few hours, during which the barometer will seldom rise, and even, probably, continue to fall: but when the S.W. gale dies away, the Northerly or N.W. will soon succeed, with a rising barometer.

In conclusion, I may remark, that as, on the one hand, a considerable fall of the barometer may occur, without being followed by a strong wind: so, on the other, a breeze of considerable strength may come on without any indication from the barometer; but not anything that deserves the name of a gale. There has never, within our experience, occurred a gale, so heavy as to be of serious consequence to a gale vessel, the approach of which has not been indicated by the barometer. But it may be remembered, that a high barometer, in this climate, and under the circumstances which I have mentioned, is often indicative of an Easterly gale. It is remarkable

that in the gulf and estuary of the St. Lawrence, a high barometer may be considered as the forerunner of wet and foggy weather, which usually accompanies its fall; whilst a low barometer renders it equally probable that dry weather will ensue, since it often accompanies its rise. I am fully of opinion, that the marine barometer is of the greatest assistance in the navigation of the Gulf and River St. Lawrence, and that by attending constantly to its state and changes, with reference to the winds and weather which preceded them, combined with the indications afforded by the appearance of the sky, &c., those changes of the wind and weather, which are about to take place, may be anticipated with a degree of certainty sufficient, in most cases, to enable us to avoid being caught on a lee shore, or in an unsafe anchorage, as well as to regulate our course in a voyage, in anticipation of the coming change.

CURRENTS.—It is a generally received opinion, that a current sets constantly to the South-eastward out of the Gulf of St. Lawrence, between Newfoundland and Cape Breton Island; and also that it is frequently deflected to the Southward, towards the shores of the island last named, by another current from the Northward, which is said to enter the gulf by the Strait of Belle Isle.

I have myself observed that a current sets out between Cape Ray and St. Paul Island, during Westerly winds and in calm weather; but it is checked by Easterly winds, and I believe that it may sometimes run in a contrary direction from the cause. Northerly winds, and perhaps also the above-named current from the Northward, may cause the stream to set to the Southward towards Cape Breton Island. But the truth is, that winds, both present and at a distance, possess so powerful and irregular an action upon the set and strength of the currents and tides in this entrance of the gulf, that I can say nothing certain or definite respecting them.

The reality of a current inwards through the Strait of Belle Isle, is confirmed by the presence of icebergs, which it transports into the Gulf every summer, against the prevailing S.W. winds, frequently carrying them as far as Mecatina, and sometimes even to the neighborhood of the East point of Anticosti. It is probable that this is a branch of the great current from Davis's Strait, which is known to run along the coast of Labrador, and to transport numerous icebergs far to the Southward every year. Its strength is very much increased by a prevalence of N.E. winds; at such times it runs at the rate of 2 knots through the Strait, and for 30 to 40 miles further to the Westward, diminishing gradually in force as it spreads out in the wider parts of the gulf. Usually, however, its rate is much less. At times, when S.W. winds prevail, it becomes very weak; and it has even been reported to me, that a current has been observed setting out of the Gulf, in a contrary direction to the N.E., for days together; but this was never observed by us during either of the three seasons which we passed there. There is, however, no doubt that this current is extremely irregular, as might be expected at the narrow outlet of a great inland sea, where winds, both within and without, must of necessity possess great influence.

After entering the Gulf, it runs along the North, or Labrador coast, at the distance of 2 or 3 miles from the outer islands, leaving a narrow space inshore, in which the streams of the tides, when uninfluenced by winds, are tolerably regular. Passing outside of Mistanoque, the islands of Grand Mecatina, and the South Maker's Ledge, it pursues a direction given to it by the trending of the coast, till it is turned gradually to the Southward, by the weak current which is often found coming from the Westward between Anticosti and the North coast, during Westerly winds, and which is set off to the Southward from Natashquan Point. The united streams continue their Southern course at a rate diminishing as they become more widely spread, and which seldom exceeds half a knot; and, finally, joining the main downward current out of the St. Lawrence, of which an account will be given immediately, they all pursue a S.E. direction towards the main entrance of the gulf, between Cape Ray and the Island of St. Paul. It is this current, from the Northward, which is felt by vessels crossing from off the Bird Rocks towards Anticosti; and which, together with neglecting to allow for the local attraction of the compass, has been the principal cause of masters of vessels so often finding themselves unexpectedly on the South coast. Many shipwrecks have arisen from this cause near Cape Rosier, Gaspé, Mal Pay, &c.

Both these currents, viz., that from the Northward, and the main downward current of the St. Lawrence, are modified by the tides, but in a way directly contrary; for the Northern current, in through the Strait of Belle Isle, is accelerated by the flood, and checked by the ebb; whilst the other is accelerated by the ebb, and checked by the flood tide. These modifying causes, viz., the tides and winds, give rise to various combinations, and consequent irregularities, in the direction and strength of these streams, which it is extremely difficult at all times to estimate and allow for correctly.

TIDES IN THE STRAIT OF BELLE ISLE.—Near the shores, on either side, there is usually a regular alternation of flood and ebb in fine weather, but it is not constant.

The flood comes from the Northward along the coast of Labrador, and also from the S.E. from Cape Bauld to Cape Norman. The latter stream, I have reason to believe,

Currents.

Tides.

is often turned off to the Northward by Cape Norman; and the same thing takes place at Green Island, on the Newfoundland side, towards Greenly Island, on the opposite side of the strait. There is, moreover, at times, a stream running from the S.W. for several days together, along the West coast of Newfoundland. This stream occasionally sets from Point Ferolle obliquely across the strait towards Forteau Bay. Sometimes, and especially with N.E. winds, the current runs directly in an opposite direction, along the West coast of Newfoundland, from Point Ferolle past Point Rich. In short, there is no constancy either in the rate or set of these streams, for the winds and the irregular tides modify the set and rate of the equally irregular currents, in a manner which it is extremely difficult, if not impossible, to calculate upon with any degree of certainty. The prevalent current from the Northward comes from between Belle Isle and the coast of Labrador. It is often at the temperature of the *freezing point*, bringing many icebergs into the strait, and consequently carrying them through it many miles up the gulf. Some of these bergs ground in deep water, whilst others are continually changing their positions. They are much more numerous in some seasons than in others, as I have seen 200 bergs and large pieces of ice in the strait in the month of August, in one year, whilst there were not above half a dozen to be seen in the same month of the following season.

I have observed this current from the Northward and Eastward, assisted by a N.E. wind, running full 2 miles an hour, whilst at other times it was almost insensible. It is even reported that there is sometimes a current in the opposite direction, and I believe that this report of the fishermen is correct, especially during the ebb-tide, and when S.W. winds prevail in the gulf. At the same time that this current is running to the Westward, there is at times a stream of water running out to the Eastward on the Newfoundland side, especially during the ebb-tide.

From these remarks it will plainly appear that the navigation of this strait is attended with very great danger in dark or foggy nights, during which no vessel should attempt to run through, for I have found that, with all our experience, we could not be sure of the vessel's position within 10 miles, under such circumstances. On the approach of a dark or foggy night, therefore, it would be prudent to anchor in some one of the bays on the North side of the strait, rather than to continue under way. A vessel bound in to the gulf, and running with an Easterly wind, will, however, find no place fit for that purpose until she arrives at Black Bay, and that is not a very good anchorage, for Red Bay cannot be entered by a large vessel with an Easterly wind. Long Bay is the first good anchorage under such circumstances, and there the vessel would be so far advanced in her run through the strait, that it would not be worth while to stop, since she might easily clear everything in the remaining short distance. But with a S.W. wind, at the approach of night, and appearance of a fog, a vessel bound out through the strait to the Eastward, had better stand off-and-on under easy sail, tacking by her deep-sea lead from the Newfoundland side till morning, if she be not further to the Eastward than Point Ferolle. If she be further advanced, she had better endeavor to make Forteau Bay before dark, and anchor there for the night. In light winds or calms, during dark nights or foggy weather, it is better to bring up with the steam anchor anywhere in the strait, than to drive about with the tides, without knowing whither; but then a lookout must be kept for drifting icebergs.

Island of St. Paul.

ISLAND OF ST. PAUL.—Vessels bound to Canada, or to any of the ports in the Gulf of St. Lawrence, should endeavor to make the Island of St. Paul, which being of considerable elevation, and bold all round, may, with care and a good look-out, be made at night, or even in fogs, unless the former be very dark, or the latter very thick.

Light-house.

On this island there are two light-houses erected: one on the Northern extremity 130 feet high, containing a fixed light. This light can be seen on any bearing, excepting between N. by E. and E. by N., when it is obscured by the hills to the Southward of it. The Southern light can be seen on any bearing, except between S.S.E. and W., when it is obscured by the hills to the N. of it.

This island lies in the main entrance to the Gulf of St. Lawrence, between Cape Ray, at the S.W. extremity of Newfoundland, and Cape North, near the Northern extremity of Cape Breton Island. From the South point of the Island of St. Paul Cape North bears W.S.W. $\frac{1}{2}$ W. by compass,* distant 13 miles; and from the North point of the same island, Cape Ray bears E. by N., distant $41\frac{1}{2}$ miles. In approaching St. Paul from the S.E. with Northerly winds, the current, which is at times coming from the Northward, and setting towards the shore of Cape Breton, should be guarded against. The South Coast of Newfoundland, Eastward of Cape Ray, is broken, rocky, and dangerous. The tides and currents, being influenced by the winds, are irregular; whilst all Southerly and Easterly winds, and often, also, South-westerly

* In these directions, all bearings are magnetic, or given by compass, unless when the contrary is expressed.

winds, bring a thick fog over this coast should not clear weather.

St. Paul Island is 2 leagues distant from the attached islet, although separated by a very narrow channel. Together with the isthmus, the greater part of the island has two parallel ridges, and attaining an elevation of 1000 feet, having two small principal streams on the Westward, well tasted and pure. The only good land on Trinity Cove. The soil, which is into Atlantic, is the extremity of the island, towards the Atlantic, and the only good land on any other part. Off the point with the wind off shore, a distance of 2 cables' length, a vessel may venture to ride with a S.W. wind or weather, but should be seen in the chart, so as to avoid this island in foggy weather.

The irregularity of the tides from the fogs, which prevail during the whole of a year, set to the S.E. at the mouth of the strait.

After having made St. Paul, the vessel should endeavor to be clear, to make the Island of St. Paul from the North point of Cape Breton.

There is a deep channel between Bryon Island, and the North point of St. Paul, and the soundings have been found to be from St. Paul, on the S.W. side, 20 fathoms of water, over a bed of sand, and a line of bearing, there is a small addition of gravel. From the North point, distant 42 miles. Followed gradually to the N.W. side, there are stones, and broken shells, and broken shells, 24 fathoms, over fine sand, and when the depth is 24 fathoms of line. At the North point, there are 43 fathoms, and 24 fathoms within a mile of the North point. Rocks at night, or in thick weather, and Southerly winds; but near the edge of the bank, to make the Bird Rock, and to make the Bird Rock, shaped up the gulf.

In Northerly winds, if the windward, it will be no danger, taking care to not approach the Magdalens, by not approaching the Magdalens, and a good shelter and anchorage.

Another advantage of the Magdalens with a S.W. wind will be a good shelter and anchorage.

From the North point of the island, the course is N.W. $\frac{1}{2}$ W. 63 miles.

From the North Bird Point, the course is N. 46° 13' W. of Anticosti, N. 14° 40'

winds, bring a thick fog, which is most dense near the lee-shore. On these accounts, this coast should not be approached, excepting with a decided Northerly wind and clear weather.

St. Paul Island is 2¹/₂ miles long by one mile broad. Its N.E. point is a small detached islet, although it does not appear as such from the sea. This islet is separated by a very narrow channel from a peninsula, between 3 and 400 feet high; which, together with the isthmus, is so precipitous as to be nearly inaccessible. The remaining greater part of the island, which is also very steep and precipitous towards the sea, has two parallel ranges of hills, that on the Atlantic coast being the highest, and attaining an elevation of about 450 feet. A valley runs through between these hills, having two small lakes or ponds, 2 or 300 feet above the sea. These supply the principal stream on the island, which is about a fathom wide, of yellowish-brown water, well tasted and wholesome, and descending into the sea in the Southern part of Trinity Cove. There are several other, but much smaller, runs of water, one of which is into Atlantic Cove. These two coves are nearly a mile from the S.W. extremity of the island, the first being on the Gulf side, and the other on that which is towards the Atlantic, as its name implies. They afford the only shelter for boats, and the only good landing on the island, which is easier of ascent from them than at any other part. Off the two coves just mentioned, small fishing-schooners anchor, with the wind off shore, in 10 or 12 fathoms, sand and gravel bottom, and at the distance of 2 cables' length from the rocks. In very fine weather, large vessels might venture to ride with a stream anchor, in from 25 to 30 fathoms, about half a mile off shore; but should be in constant readiness to weigh at the first sign of a change in the wind or weather. Further off shore the water becomes extremely deep, as will be seen in the chart, so that there is little or no warning by the lead in approaching this island in foggy weather.

The irregularity of the tidal streams and currents add much to the danger arising from the fogs, which prevail in Southerly, Easterly, and often also with S.W. winds. During the whole of a fine calm day, at the end of June, we observed the current to set to the S.E. at the rate of one knot, past the North point of the island.

After having made St. Paul, vessels bound to Canada should endeavor, if the weather be clear, to make the Bird Rocks, the largest or South-easternmost of which bears from the North point of St. Paul, N.N.W. $\frac{1}{2}$ W., 55 miles.

There is a deep channel between St. Paul and the bank on which the Magdalens, Bryon Island, and the Bird Rocks are situated. This channel is 12 miles wide, and no soundings have been found in it with 60 fathoms of line. Twelve miles N.W. from St. Paul, on the S.E. extremity of the bank above-mentioned, there are 50 fathoms of water, over a bottom of fine sand; and 13 $\frac{1}{2}$ miles from the island, on the same line of bearing, there are 35 fathoms, the bottom being the same, with the occasional addition of gravel. From this point the water shoals gradually towards the Magdalens, distant 42 miles. Following the Eastern edge of the bank to the Northward, inclining gradually to the N.W., regular soundings extend from 28 to 35 fathoms, over sand, stones, and broken shells; the latter depth being where the Great Bird Rock bears W. 5 fathoms, over fine sand, on the edge of the bank, off which there is no bottom with 70 N.W.; and when the same rock bears W.S.W. $\frac{1}{2}$ W., distant 13 $\frac{1}{2}$ miles, there will be 50 fathoms of line. At the distance of 10 miles from the rock, and on the same line of bearing, there are 43 fathoms; and at 6 miles, 33 fathoms; shoaling gradually in to 24 fathoms within a mile of the rocks. This bank is an excellent guide up to the Bird Rocks at night, or in thick weather, which almost always accompanies Easterly and Southerly winds; but under such circumstances it will be safer to run along the Northern edge of the bank, taking care not to come into less than 40 fathoms, than to attempt to make the Bird Rocks. When well past them by the reckoning, a course can be shaped up the gulf.

In Northerly winds the weather is usually clear; and if the ship be far enough to windward, it will be advisable to stand to the Westward, and endeavor to make Entry Island, taking care to avoid Doyle Reef and the sandy spit off the East end of the Magdalens, by not approaching the islands in that part nearer than 20 fathoms. Under the lee of these islands a smooth sea will be found, sufficient guidance by the soundings, and good shelter and excellent anchorage in Pleasant Bay.

Another advantage of following this course arises from the circumstance that the N.W. winds very generally veer to the S.W., so that, if a vessel has passed to leeward of the Magdalens with the Northerly or N.W. winds on the starboard tack, the succeeding S.W. wind will enable her to stand on the opposite tack towards Cape Gaspé.

From the North point of the Island of St. Paul to the East point of the Magdalens the course is N.W. $\frac{1}{2}$ W., distance 56 miles; and to Entry Island, N.W. by W. $\frac{3}{4}$ W., 63 miles.

From the North Bird Rock the light-house on the S.W. point of the Island of Anticosti bears N. 46° 13' W., true, or N.N.W., by compass, 134 miles; and the East point of Anticosti, N. 14° 46' W., true, or N. $\frac{3}{4}$ E., by compass, 80 miles. *Light-house.*

After leaving the Bank of Soundings, Northward of the Bird Rocks, the water is very deep all the way until near the shores of Anticosti, there being no bottom with 80 fathoms of line, nor probably at much greater depths. In making this part of the voyage up the gulf, the frequent current from the Northward, mentioned as having been one of the causes of shipwrecks in the neighborhood of Capes Rosier and Gaspe, Mal Bay, &c., should be considered. Accidents, however, from this cause, can never occur if the lead be used; for, upon consulting the chart, it will be seen that there are soundings to be obtained nearly all the way upon, and to the Southward of, a line joining the Bird Rocks and Cape Gaspe, whilst a few miles to the Northward of that line there is no bottom with 80 fathoms of line.

Soundings.

Light-house.

With a fair wind, the object should be to make the light-house or revolving light upon the S.W. point of Anticosti; and, with Westerly winds, any part of the coast of that island which can be attained. When the light-house on Heath Point shall be lighted, it will be easy to make the East end of the island at night, if the weather be clear; and, if the weather be thick, the Bank of Soundings, which extends off it 28 miles to the South-eastward, may seem to determine the vessel's position by the lead. At the distance from the island above named there are 62 fathoms of water, shoaling gradually in towards the island, as will be seen by the chart.

In the event of a vessel being near the Eastern extremity of Anticosti, and having succeeded in making the East point, or the light on Heath Point, with a S.W. wind, it will often be preferable to proceed to the Northward of the island, where there is a good channel, rather than to tack and stand back to the Southward and Eastward. Under the lee of Anticosti she will in this case have a smooth sea, and often also clear weather, whilst there is a heavy swell and frequently a thick fog to windward of it. She will, moreover, avoid the current out of the St. Lawrence, which runs constantly, with Westerly winds, between the South coast and Anticosti, and thus be able, at all times, to make way to the Westward in moderate weather. At night, or in foggy weather, the Bank of Soundings off the North coast, and further Westward, the banks off the Mingan Islands, will safely guide her, even although the land should not be visible.

The Magdalen Islands.

THE MAGDALEN ISLANDS.—The Magdalens are a chain of islands, assuming an irregular curved direction, the greatest length of which, from the S.W. cape of Anherst Island to the East point, is 35 miles; but if the smaller isles be included, as they evidently form a part of the Magdalen group, the whole length of the range, from the Deadman to the Great Bird Rock, will be 56 miles, in an E.N.E. direction.

There are at present upon the islands about 1,100 inhabitants, the majority of whom are of French extraction, and who all inhabit Anherst, Grindstone, and Alright Islands, with the exception of about 11 or 12 families divided between Entry Island, Grosse Isle, and East Island, near the N.E. extremity of the chain. Ships may obtain limited supplies of fresh provisions, especially at Entry Island, and water most readily from Anherst Harbor, either from a spring which issues from under the Demoiselle Hill, or from a small stream which falls into Anse à la Cabane, near the S.W. cape of the island. Wood for fuel is becoming scarce near the settlements. Large spars are not to be had, unless when they chance to be saved from wrecks; but small ones, of spruce and juniper, may be obtained. The latter, of which the inhabitants build their fishing-boats and shallops or smaller schooners, somewhat resembles larch wood. It is said to be extremely strong and durable.

When first made from sea, the Magdalens appear like several hilly islands, with channels between, but on a nearer approach they are seen to be all connected together, with the exception of Entry Island, by a double line of sand-bars and beaches, inclosing extensive lagoons, having very narrow entrances, by which the tide finds access and egress. These sand-bars are in some parts only a few feet above the sea, whilst in others they rise into hills of blown sand of considerable elevation. They appear to be increasing, since they are generally ridges of sand with from 9 to 12 feet water parallel to, and from 50 to 100 fathoms outside the beach. There are 3 and 4 fathoms of water between these ridges and the shore, a circumstance which has often proved fatal to the crews of vessels wrecked upon these shores. These hilly islands thus disposed in a curvilinear shape, and connected together by sand-bars, inclosing lagoons, reminds one forcibly of those islands in tropical seas which are connected together by coral reefs.

In a bright sunny day of summer, the cliffs of various colors, in which different shades of red predominate, and the yellow of the sand-bars contrasted with the green pastures of the hill-sides, the darker green of the spruce-trees, and the blue of sea and sky, produce an effect extremely beautiful, and one which distinguishes these islands from anything else in the Gulf of St. Lawrence. In stormy weather, the appearance is equally characteristic. Isolated hills and craggy cliffs are then dimly seen through the rain and mist which accompany an Easterly gale, and appear joined by long ranges of breakers, which almost hide the sand-bars. At such times it is dangerous to attempt

making the islands, for the first thing seen from

The Magdalens possess no harbor for ships, but three for small vessels, named Amherst, House, and Grand Entry Harbors, which will be noticed in the following concise description of the shores of the islands, and the dangers off them.

The East point of the Magdalens is of low sand, inclosing several shallow ponds, and having several sand-hills, some of which are near its extremity, while others, of greater elevation and further to the Westward, extend in a chain nearly to the N.E. Cape. These last-mentioned sand-hills are inland, and on the margin of the North-eastern part of the great lagoon. The N.E. Cape is a hill on East Island, which stands at the head of Grand Entry Harbor. It is a very remarkable cape, and its isolated cliffs, being 230 feet high, can be seen over all the sand-hills and sand-bars, so that when these last are below the horizon, the N.E. Cape appears to be the Eastern extremity of the chain.

LONG SPIT is a ridge of sand, with from 2 to 3 fathoms of water, which extends off the East point S.E. $\frac{1}{2}$ S., rather more than $\frac{1}{2}$ mile, and for $\frac{1}{4}$ mile further in the same direction, the depth is from 4 to 6 fathoms. To clear this spit observe the following remarks and directions. The Southern part of Coffin Island is a peninsula, forming the Southern shore of the Oyster Pond, and connected to the remainder of the island by a low neck or isthmus at the West end of the pond. Now the mark for the 3 fathoms extremity of the spit is the North side of this peninsula on with the Old Harry Head; and the South side of the Northern part of Coffin Island (where the narrow neck joins it, as above mentioned) on with the Old Harry Head, will lead over the spit in 1 fathom. A person with our charts before him will have little difficulty in making out these leading marks, but may, if he pleases, pass round the spit, by the lead, in 5 or 6 fathoms, taking care not to bring the Old Harry to bear to the Southward of West. To know when a vessel from the Eastward has passed it, observe that the line of the summit of the North cape on with the East side of the N.E. cape clears it nearly half a mile to the S.W., which mark will also be useful to a vessel approaching it from the Westward. The tides set rapidly over this spit, and together with the shoal water, cause a heavy breaking sea. It is extremely dangerous, and vessels should take care not to get becalmed near it without an anchor clear.

DOYLE REEF.—Doyle Reef lies S. $\frac{1}{2}$ E., distant $6\frac{1}{2}$ miles, from the East point, and consists of pointed rocks. It is very small, being only 300 fathoms long, and 50 fathoms wide, from 6 fathoms to 6 fathoms. The least water is 3 fathoms on one spot nearly in the centre, and there are 12 and 13 fathoms all round it. The only mark for this reef is the North Cape of the Magdalens open two-thirds of its breadth to the N.E. of the N.E. Cape. On the reef the angle between these marks and the Western point of Coffin Island is $21^{\circ} 27'$.

Lying completely in the way of vessels, and very seldom showing, the sea breaking upon it only in heavy gales, Doyle Reef may justly be considered as one of the worst dangers off the Magdalens. It has been examined and laid down by us for the first time, and was previously known only to a very few persons on the Magdalens.

OLD HARRY HEAD.—Proceeding to the South-westward from the East point, the first headland is the Old Harry, the S.E. point of Coffin Island, bearing from the E. point W.S.W., by compass, 4 $\frac{1}{2}$ miles. Between them is a sandy bay, in which vessels may anchor, with good shelter, in all winds from W. round by N. to N.E.: but it is not a place to be recommended, because a vessel would be there very much endangered by the shoals on either side, and might find it difficult to get out on the occurrence of a sudden shift of wind, either at night or attended with fog.

The Old Harry Head has red sandstone cliffs of a moderate height, with a reef off it to the South-eastward one-third of a mile.

COLUMBINE SHOALS.—From the Old Harry, $2\frac{1}{2}$ miles S.S.W. $\frac{1}{2}$ W. and S.S.E. by S., 2 miles from the East end of the cliffs, Westward of the entrance of the Oyster Pond, lies the outermost of the Columbine Shoals, a patch of rocks, with 3 fathoms at low water. Within this, and towards Coffin Island, are numerous small shoal patches and pointed rocks, on some of which there are not more than 3 feet at low water, as will be seen in the chart. These shoals are extremely dangerous, and much in the way of vessels hauling round the East point of the Magdalens with Northerly winds. To clear the East side of them, the whole of the high N.E. cape must be kept open to the Eastward of the Old Harry. There are no good marks for clearing the West side, or for leading clear outside of them, so that the only guide for the latter purpose is not to bring the East point to bear to the Eastward of N.E., and, for the former, is not to bring the West end of Coffin Island to bear to the Westward of N.W. $\frac{1}{2}$ N. But although there are no good marks, an angle with a quadrant will answer the purpose as well and as easily. On the outer edge of these shoals, the angle between the Old Harry Head and the left or West extremity of Coffin Island is 77° : consequently, with these points subtending any less angle, the vessel will pass outside of the shoals. Coffin Isl

South-easternmost. Hence, keeping all those cliffs open will clear the reef to the Westward, and the North-westernmost cliff completely shut in behind the other two will clear it to the Eastward. The Demoiselle Hill, shut in behind the North side of Entry Island, will clear it to the Southward; and lastly, the Demoiselle kept more than half a point open to the Northward of Entry Island will clear it to the Northward.

To the N.W. of Cape Alright, and distant 2½ miles, is the entrance of House Harbor, a narrow and crooked channel, with only 6 feet at low water.

RED CAPE.—From Cape Alright, S. 80° W., 5 miles, across the bay in which is the entrance of House Harbor, brings us to Red Cape, the Southern point of Grindstone Island, and the North point of Pleasant Bay. The opposite point of the bay, Sandy Hook, is the East point of Amherst Island, and bears from the Red Cape S. by E. ½ E., 6 miles. From this line to the shore of Amherst Island at the head of the bay, the distance is 4½ miles. Between Red Cape and House Harbor is Cape Moule, of gray sandstone, off which there is a rock, with 5 feet of water; and there is another rock, with 3 feet, off the West side of Alright Island. These will be seen in the chart, and as they lie out of the way of vessels, require no further notice.

GRINDSTONE ISLAND.—Grindstone Island is the second largest of the chain, being, in this respect, intermediate between Amherst and Alright Islands. Its summit is elevated 550 feet above the sea at high water.

AMHERST ISLAND.—Amherst Island, the largest and South-westernmost of the Magdalens, is connected with Grindstone Island by a double line of sand-bars, inclosing an extensive lagoon, 5 or 6 miles long, and from 1 to 3 miles wide, the Southern part of which is called Basque Harbor. This lagoon is full of sands, which dry at low water, and has 30 outlets into Pleasant Bay, the Southernmost being the deepest, but having only 3 feet water over its bar at low water. The others, including 3 through the sand-bars of the N.W. coast, will only admit boats at high water, and when the surf is not too high.

The hills in the interior of Amherst Island rise to the height of 550 feet above the sea. Towards the South-east part of the island, and about a mile to the N.W. of Amherst Harbor, is the very remarkable conical hill named the Demoiselle, of trap rock, and 250 feet high. The perpendicular and dark-red cliffs of the Demoiselle are washed by the waters of Pleasant Bay.

AMHERST HARBOR.—Amherst Harbor is formed by a peninsula, presenting cliffs of grey sand-stone to seaward, in the S.E. corner of Pleasant Bay. Its entrance, between this peninsula and the sands to the Southward, is 2½ miles within, or to the Westward of the extremity of Sandy Hook, which is a long and narrow sandy point with sand-hills. This harbor is the easiest of access and egress of any in the Magdalens, and has, moreover, the advantage of an excellent roadstead outside, where vessels may wait their opportunity of running in. Nevertheless, its entrance is extremely narrow and rather crooked, so that, without a pilot, it would be necessary to heave or stake the channel. The depth over the bar, which is rocky, is 7 feet at low water, and from 9 to 10 feet at high water, according as it may be neap or spring tides. Within the harbor there are from 12 to 17 feet, over a bottom of soft, black, and fetid mud, well sheltered from every wind.

PLEASANT BAY.—Pleasant Bay is the best roadstead in the Magdalens, and the only one where vessels can venture to lie with all winds during the three finest months of summer, June, July, and August. In those months, a gale of wind from the Eastward, so heavy as to endanger a vessel with good anchors and cables, does not occur above once in 3 or 4 years. The riding, however, is often heavy and rough enough in North-east gales, and a vessel should be well moored with a whole cable on each anchor, an open hawse to leeward, and all snug aloft.

The best and most sheltered anchorage is in 4 fathoms, with the rocky point of entrance of Amherst Harbor bearing S.W. ½ W., two-thirds of a mile, and a little more than half a mile from high-water mark on the sandy beach to the Southward, when a remarkable and high sand-hill will bear S. ½ E. A large ship should anchor further off, and should take notice that there are only from 3 to 3½ fathoms in one part of the bay, as will be seen in the chart. The bottom is everywhere excellent for holding, and of red sandy clay. A vessel, anchored as I have recommended, will be sheltered from E.N.E. ½ E., round by the Southward and Westward to N.E. ½ N., and will, consequently, have only 3 points completely open. Even when the wind comes right in, the sea is much lessened by passing over so much of shoal water; nevertheless, I am of opinion that the attempt to ride out a heavy Easterly gale, either before June, or after August, would be attended with great danger, and do not recommend Pleasant Bay as a pleasant place under such circumstances at any time of the year. In the Northern and Western parts of the bay, sandy flats extend more than a mile from the beach.

SANDY HOOK CHANNEL.—From the Sandy Hook to the N.W. point of Entry Island, the bearing is E., by compass, 2½ miles. There is an extensive flat sandy

shoal running out 2 miles from Sandy Hook towards Entry Island, which last has also rocky shoals off its West side. Sandy Hook Channel, between them, is two thirds of a mile wide, and 4 fathoms can be carried through it by a good pilot, but 30 fathoms is the utmost that can be safely reckoned on by a stranger. There are several rocky patches of 20 fathoms off the S.W. point of Entry Island, reaching to fully three quarters of a mile from the shore. The ebb tide sets strongly through this channel, and over Sandy Hook Flat, so that large vessels should go round to the Eastward of Entry Island rather than encounter so many difficulties. To run through Sandy Hook Channel from the sea, keep the East side of Alright Island just open to the Westward of the Shingle and sandy spit forming the N.W. point of Entry Island, until a reef of the S.W. point of the last named island, then haul up for the summit of Grindstone Island, looking out for the edge of the land shoal to the Westward, which can generally be seen.

*Entry Isl
and*

ENTRY ISLAND. Entry Island is the highest of the Magdalens, its summit being 530 feet above the sea at high water. Its red cliffs are magnificent and beautiful, rising at the N.E. point to 350 feet, and at the S. point to 400 feet of perpendicular height. Off the N.E. point there is a high rock about half a cable's length from the cliffs, and on its North side the remarkable Tower Rock of sandstone joined to the island, and which can be seen from the S.W. over the low N.W. point, as well as from the N.E.

Vessels occasionally anchor under Entry Island in Northerly and Easterly winds, but it is rough riding, by reason of the sea which rolls round the island.

The inhabitants of Entry Island raise cattle and sheep, depending more upon the sale of fresh provisions than the fisheries. Vessels may, therefore, almost always obtain supplies.

From Sandy Hook, the South coast of Amherst Island, consisting of sand hills and benches, with shoal water half a mile off, curves round to the Westward, for 6 or 7 miles to the entrance of a basin, which extends nearly across the island to within less than half a mile of Pleasant Bay. The basin is now so nearly closed with sand, that boats can only enter at high water, and in the finest weather; but formerly, the entrance was deep enough for large schooners, and it has been frequented by these vessels within the memory of the elder inhabitants.

There is good anchorage off the entrance, in from 6 to 9 fathoms, sandy bottom, and well towards from the N.W. round by North to East.

*Amherst
Cape*

AMHERST CLIFFS. A mile and a half to the Westward of the entrance of the basin, the cliffs commence and continue, except in Cabane Bay, to the Westward, which is the highest cliff of Amherst Island, its summit being 300 feet above the sea. There is a remarkable rock above water close to the shore, and about a quarter of a mile to the Southward of it.

Cabane Bay

CABANE BAY. Cabane Bay is a small bight, between the South and S.W. coasts of Amherst Island, where vessels may safely anchor with North ealy and Easterly winds, and where good water may easily be obtained. The best berth is in 8 or 9 fathoms, sandy bottom, off the centre of the bay, with the South Cape and Cape Percin one third quarters of a mile off shore.

From the Westward, the remainder of the sea coast of Amherst Island consists of red cliffs, which are high, but having shoal water over a third of a mile off the coast, the way to West Lake, a small pond at the S.W. end of the sand bars, which join Amherst and Grindstone Islands. At the N.E. extremity of these sand bars is Cape Island, which is small, rocky, and close to the Western point of Grindstone Island, and its shores are very Westward to the distance of a cable and a half. About 1/2 mile South-westward of a rocky point off the N.W. outlet of Besque Harbour, and which is a vessel's eye, called the Gros Cap in one, lies a rocky shoal with 3 fathoms low water, and leaving a good passage between it and the shore. Close to the N.E. of Grindstone Island is the Ring in Nord, a small islet, affording good shelter to boats.

*Grindstone
Rock*

ROSDALE ROCK. The Northern shore of Grindstone Island is of red sandstone cliffs, less high than those of Amherst Island. Near their N.E. extremity lies the Round Rock, close to the shore, and also some rocky 3 fathom patches, more than half a mile from the shore, as will be seen in the chart.

White Horse

WHITE HORSE. The White Horse is the name of a very dangerous reef lying N. 60° E. 1/2 miles from Dendran Island, and due W. N.W., 5 1/2 miles from Grindstone. It is extremely small, being scarcely more than a cable's length in diameter, and rising to 10 feet water over pebbled rocks, on which the sea often breaks. The reef, or the summit of Entry Island is seen over a low part of the sand-bars at the N.E. on the reef of Baye Basque, but this mark cannot be easily discerned by a stranger, nor there any other; but the bearings and distances, together with the chart, will be sufficient to guide. To those that can take a terrestrial angle with a quadrant, a matter so simple that it is astonishing that it is not more generally known and practised, the following may be of use. When on the reef, the Western extremity of Amherst Island and Hospital Cape (the North-eastern extremity of the cliffs of Grindstone Island) should

at an angle of $91^{\circ} 30'$; consequently with these points subtending a less angle by 3 or 4 degrees, the vessel will pass outside of the reef. With a greater angle, 94 or 95 degrees, she will pass inside of it, or between it and the shore.

There are irregular soundings and foul ground between this reef and the shore, but not more than 5 fathoms, excepting what has been already mentioned.

The *Pierre de Gros Cap* is another dangerous reef of rocks, nearly of the same size as the *White Horse*, and having 48 fathoms of least water. This reef is seldom seen, as the sea breaks upon it only in very heavy weather. It lies $N. 62^{\circ} E.$, 6 miles from the *White Horse*, due North from the West point of *Etang du Nord*; $N. 56^{\circ} W.$ from Hospital Cape, and 34 miles off Cape le Trou, the nearest point of Grand-stone Island. The marks on this reef are—First, the summit of *Alright Island* seen over the N. E. point of Grand-stone Island, which is in the lagoon, and very nearly on with Hospital Cape. Secondly, the *Bate de Portage*, a hill of *Anberst Island*, situated about 14 mile N. W. of the *Demoiselle*, midway or in the centre of the narrow passage between *Coff Island* and the West point of *Etang du Nord*. These marks kept open will clear the reef to the N. E. and S. W., and a vessel will pass well clear outside of it, and also of the *White Horse*, if *Dreadman Islet* be not brought to bear to the Westward of S. W. $3/4$ W.

From Hospital Cape to *Wolf Island*, of which there is a rocky 3 fathom shoal nearly half a mile from the shore, the Northern coast of the *Magdalens* consists merely of sand-benches and sand hills for a distance of 9 or 10 miles. The low sandstone cliffs of *Wolf Island*, which is about three quarters of a mile long, interrupt the continuance of the sandy shore for only half a mile; the sand benches then recommence, and continue, with high sand hills occasionally, 9 or 10 miles further, to the North cape. In all this part the sand bars may be safely approached by the lead as near as 9 or 10 fathoms of depth of water.

NORTH CAPE.—The North Cape of the *Magdalens* is the Northern point of *Grosse North Cape* Isle, and a precipice of considerable height, but not so high as the West point of the same island, which is in the great lagoon, and 300 feet above the sea.

NORTH CAPE ROCKS.—The North Cape Rocks, and some of which always show, *North Cape* lie to the Westward of the cape, the outermost being 600 fathoms off shore. The West *Rocks.* end of these rocks bears S. S. E. from the high S. W. side of *Grosse Isle*, and their extent to the Eastward is marked by the N. E. sides of the North and N. E. capes in one.

Therefore, in running down from the Westward to anchor under the North cape, do not come nearer to the shore than one mile until the above named marks open. In this anchorage, namely, to the Eastward of the North cape, vessels may ride in 8 or 9 fathoms, over sandy bottom, with all Southerly winds, and will find good holding ground, and plenty of room to get under way. Water may be had in small quantities near the houses on the East side of the North cape, but there are no good watering places excepting those already mentioned.

The coast continues from the North cape, in a curved line of sand benches and sand hills, for about 6 miles, which distance again brings us to the East point, and completes the description of the *Magdalens*.

Although I have given a general description of the appearance of the *Magdalens*, yet vessels passing to the Southward of them have been directed to endeavor to make *Entry Island*, it may be useful to add, that that island, when first made from the Eastward, will appear like a double peaked hill, sloping somewhat abruptly down to perpendicular and high cliffs on either side. The S. W. point of *Anberst Island* is also a rocky cliff, but of less height; and as there is no land to the Southward and Westward of it, it cannot be mistaken. The land rises from it in undulations to the highest parts of the island. Should the weather be foggy, the soundings, as shown in the charts, will safely guide vessels, passing to the South eastward of the islands. The general soundings around the *Magdalens*, which extend off them so many miles in every direction, and which have now for the first time been correctly laid down by us, thus affording an invaluable assistance to vessels at night or in foggy weather, will be better understood from the charts than by any written directions.

TIDES AND CURRENTS.—I have now only to notice the important subject of the set *Tides and* of the currents or tidal streams around these islands, respecting which I can say *Currents.* nothing that will not be subject to exception, for they are so irregular, that the most experienced and intelligent pilots for the islands, who are also fishermen, who have passed their lives in fishing-craft around them, can give no certain account of their set and direction, but all agree in stating, that they vary in both respects, either from the effects of winds, or other unknown causes.

Nevertheless, the following observations will hold good as a general rule, and although subject to occasional interruption, the set of the tidal streams, which I am about to describe, will be found to recur with considerable constancy in fine weather.

A few miles outside of *Bryon Island* and the *Bird Rocks*, there appears to be usually a current setting to the South-eastward, out of the Gulf; but the stream of flood-tide lies between them and the *Magdalens*. The stream of flood comes from the S. E.,

and is divided by the East point of the Magdalens. One branch of the stream sets strongly over the Long spit, which, with the Old Hurry Head and the shoals off it, turn it off to the South-westward towards Entry Island, leaving nearly slack water in the bay between Coffin Island and Cape Alright, and also in Pleasant Bay. The other branch, to the Northward of the islands, follows the shore from East Point round to the South-west cape of Amherst Island, whence the greater part of the stream continues its course to the S.W.; whilst the remainder, following the shore eastward and along the Southern coast of Amherst Island, until it meets the before-mentioned other branch of the stream from the East point setting off the East side of Entry Island; it is overcome by this other branch, and turned gradually round to join the general weak stream of flood to the Westward in the offing.

Ebb Stream.

EBB STREAM.—On the S.E. side of the islands, the stream of the ebb-tide sets strongly out of the lagoons and out of Pleasant Bay, between the Sandy Hook and Entry Island. It is also often found running to the Westward along the Southern shores of Amherst Island, and right round it in like manner, but contrary in direction to the course of the flood already described. In the offing, at the same time, the stream of ebb is from the S.W., and sets over the sand-spit off Sandy Hook Point, where it meets the stream from the N.W., which has followed the North shore of the islands, round from Amherst Island to the East point. The meeting of these two streams of the ebb-tide, together with the shoalness of the water, causes so heavy a breaking sea in strong Easterly winds, that the fishing shallops dare not venture, at times, to pass the point.

The rate of either stream seldom amounts to a knot, excepting close to the shore, or round the points. The ebb, however, is generally the strongest stream, and its rate is increased by Westerly winds, as is that of the flood by winds from the Eastward.

Deadman Islet.

DEADMAN ISLET.—The Deadman bears N. 52° W. 7½ miles nearly from the West cape of the Magdalens, and is very small, being not more than 300 fathoms long, in an E.S.E. direction, and less than half that breadth. It is about 170 feet high, with steeply sloping sides, meeting at the summit like a prism, so that when seen end on, it resembles a pyramid. When seen from a distance, with its longest side presented to view, its outline very much resembles that of a body laid out for burial, from which circumstance its name is derived. It is composed principally of trap rocks, and when seen close to, on a bright sunny day, with the white surf dashing against its variously colored sides, it is a very beautiful object. It is so bold on the West side, that a vessel may pass within a couple of cables' length with perfect safety; but a reef extends towards Amherst Island one-third of a mile.

About a mile to the Northward of it there is a rocky fishing-ground with 8 fathoms least water; and 6 miles S.S.W. ¼ W. of it, there is another with 11 fathoms. There is no danger nearer than the "White Horses," to be mentioned hereafter, and vessels may safely pass between it and Amherst Island. It is, however, much in the way of vessels passing round the West end of the Magdalens, and they should beware of it at night, or in foggy weather, for the lead will give little warning, since there is nearly as much water within half a mile of it, as at the distance of several miles.

Bryon Island.

BRYON ISLAND, which is uninhabited, is rather more than 4 miles long, in a W. by N. and E. by S. direction, with the extreme breadth of rather more than a mile. Its Eastern end bears from the East point of the Magdalens, N. by E. ¼ E., 10½ miles; but its S.W. point approaches to within 8½ miles of the North cape of these islands.

A great part of the island is wooded with dwarf spruce-trees, and there is a large upland tract covered with good native grass. Water is neither plentiful nor easy to be obtained, but it may be had in small quantities by digging, and there is a spring on the North side of the narrow isthmus which joins the Eastern peninsula to the remainder of the island.

I had no opportunity of measuring the height of Bryon Island; but I conceive it nowhere exceeds 200 feet above the sea. The cliffs on the North side are much higher than those on the South, where there are several small coves in which boats may land easily with the wind off shore. There are three reefs off Bryon Island; one off its East end extends near three-quarters of a mile to the North-eastward; another, off the W. end, extends 1½ mile to the Westward; and the third, off the sandy S.W. point, 1½ mile to the Southward. No marks can be given for clearing these reefs; but the bearing of the land, as shown in the chart, will afford sufficient guidance to the seaman. The reef off the S.W. point is so much in the way of vessels passing between it and the Magdalens, that it may be useful to add, that from the Southern ridge of this reef, Bryon Island subtends an angle of 97°; so that with the island subtending any less angle, the reef may be passed. The South reef assists greatly in turning off the sea from the roadstead to the Eastward of it, where vessels may safely anchor in 6 fathoms water and a sandy bottom, at the distance of a mile or more from the shore, and with all winds from N.E. round by N. to W.N.W. Small vessels, in heavy N.W. gales, lie at anchor close under the reef.

There are regular soundings, from 0 to 11 fathoms, with sandy bottom, between Bryon Island and the Magdalens, with the exception of an extensive patch of foul and rocky ground, lying between S.W. $\frac{1}{2}$ W. and W.S.W., from the W. end of Bryon Island, and having a clear channel on either side of it, as will be seen in the chart. We could find no less than 5 fathoms here; and although the fishermen see bottom upon it in calm weather, I have every reason to think there is no less water. Nevertheless, large ships had better not run over it when there is a heavy sea running, for a small point of rock, with a few feet less water, might escape the most rigorous examination.

These rocky places are called fishing-grounds, by the inhabitants of the Magdalens, because codfish abound upon them. There is one with 11 fathoms of water, $2\frac{1}{2}$ miles North of Bryon Island, and which extends a considerable distance parallel to the island. There is sandy bottom, and a greater depth of water, within this ridge, and vessels may anchor, in fine weather and Southerly winds, off the bay on the North side of the island. The soundings extend so far off Bryon Island to leeward in every direction, that there is no possibility of a vessel on a voyage being endangered by it, if the lead be used. But great caution is requisite in approaching the reefs, for they are very steep, especially that which extends to the Southward.

THE BIRD ROCKS are of coarse red sandstone, or conglomerate, in strata dipping very slightly to the S.W., and are constantly diminishing in size from the action of the sea. They present perpendicular cliffs on every side; yet it is possible to ascend them with great difficulty, in one or two places, but there is no landing upon them except in the calmest sea. Every ledge and fissure of the cliffs are occupied by gannets, and the summits of both rocks are literally covered with them. The white plumage of these birds gives these rocks the appearance of being capped with snow, and renders them visible, through a night-glass, in a clear and moonlight night, from the distance of 7 or 8 miles.

*The Bird
Rocks.*

The two rocks bear from each other N.N.W. $\frac{1}{2}$ W. and S.S.E. $\frac{1}{2}$ E., and are 700 fathoms apart. Sunken rocks leave only a boat passage between them. The South-eastermost is the largest and highest, though scarcely 200 fathoms long, and not more than 140 feet high above the sea. The other is divided into two precipitous mounds, joined together by a low ledge. The lesser of these mounds resembles a tower. A reef extends 700 fathoms to the Eastward, from the Little or N.W. Bird Rock, and there is a patch of breakers nearly midway between the two, and rather to the S.W. of a line drawn from one to the other. The Great or S.E. Bird Rock is quite bold, excepting in the direction of the other rock. The Little or N.W. Bird Rock, bears N. E. by E. $\frac{1}{2}$ E., distant 16 $\frac{1}{2}$ miles from the East point of the Magdalens; and E. $\frac{1}{2}$ S., 10 $\frac{1}{2}$ miles from the East end of Bryon Island.

The soundings off the Bird Rocks to the Eastward have been already stated in the description of St. Paul; they extend still further off to the Northward, so as to afford the most ample warning and assistance to vessels at night, or in foggy weather, as will be seen in the chart. Between them and the East point of the Magdalens, the depth nowhere exceeds 16 or 17 fathoms, over a bottom of reddish sand, and sea-eggs are very frequently brought up by the lead.

Between the Birds and Bryon Island, there is a ridge of rocky and foul ground, on some parts of which, it has been said, there is as little as 4 fathoms of water, because bottom has been seen in calm weather. We, however, could not find less than 7 fathoms, but it may nevertheless exist, so that a large ship had better not cross this ridge when there is much sea running. The two cliffy points on the North side of Bryon Island, in one, mark the Northern limits of this rocky ground.

ANTICOSTI ISLAND.—The Island of Anticosti, situated in the entrance of the N.W. arm of the Gulf of St. Lawrence, is 122 miles long, 30 miles in extreme breadth, and about 270 miles in circumference, following the coast from point to point across the bays.

*Anticosti
Island.*

Its shores are everywhere of rock, belonging to one great formation, namely, a very ancient secondary limestone, affording in some parts excellent building stone, of which the two light-houses have been constructed.

Streams of excellent water descend to the sea on every part of the coast. They are generally too small to admit boats, becoming rapid immediately within their entrances, and even the largest of them, Observation River, to the Westward of the S. W. point, is barred with sand, excepting for short intervals of time after the spring freshets or heavy rains.

Many of these streams abound with trout, and are visited periodically by great numbers of salmon, which are taken by the two or three resident families, and salted for the Quebec market.

Anticosti is estimated to be nowhere higher than 700 feet above the sea. Its South coast is low and shelving, with reefs of flat limestone which dry at low water. There is, however, a range of highlands in rear of the S.W. point, and extending for some

miles both to the North westward and South-eastward of it. The North coast, for 70 or 80 miles to the Westward of the East point, is bold, precipitous, and of considerable elevation. Picturesque headlands, the Eastern termination of parallel ridges of table land, that rise gently with the strata from the S.W. end in magnificent cliffs of limestone, which are externally so nearly white from the effects of weathering, as to resemble chalk. Some of these cliffs are upwards of 100 feet in perpendicular height. The remainder of the North coast is low, with reefs of flat limestone, like the Southern shores.

It is unusual to find an island so large as Anticosti without a good harbor. Limestone coasts are in general characterized by deep inlets and bays, peninsulated points, and detached islets and rocks, but nothing of the kind will be found here, and there is not a single detached shoal off any part of the coasts.

This island has been generally believed to be extremely dangerous. Its reefs of flat lime-stone, extending in some parts to 1½ mile from the shore; the want of anchorage off most parts of the coast, and above all the frequent fogs, justify this belief in part, but not in so great a degree as to render reasonable the dread with which it seems to have been occasionally regarded, and which can only have arisen from the natural tendency to magnify dangers of which we have no precise knowledge.

Provision-posts.

The people in charge of the light-houses and provision-posts, and one man at Fox Bay, are the only resident inhabitants of the island. The provision-posts have been established by the Government and Legislature of Lower Canada, for the relief of the crews of vessels wrecked upon the island. Vessels are more frequently lost here in the bad weather at the close of the navigable season, than at other times, and their crews would perish from want and the rigors of a Canadian winter, if it were not for this humane provision. The first of these posts is at Ellis Bay, the second at the light-house at the S.W. point, the third at Shallop Creek, (sometimes called Jupiter River), and the fourth at the light-house on Heath Point.*

Light-house.

The light-house on the extremity of the S.W. point has been built of a very beautiful grayish-white ennerinal limestone, quarried on the spot. The tower is of the usual conical form, and 75 feet high. The light, which is bright, and revolves every minute, can be seen from N.N.W., round by West and South, to S.E. by E. The lantern is elevated 100 feet above the sea at high water; consequently the light can be seen from a distance not to exceed 15 miles, when the height of the observer's eye is 10 feet above the sea. When the height of the eye is 50 feet, the greatest distance from which the light can be seen will be about 19½ miles; and if the eye be elevated 100 feet the light will be visible as far off as 23 miles nearly, in the average state of the refraction. Hence by ascending the rigging till the light just shows above the horizon, and then measuring the height of the eye above the sea, a very near estimate of the vessel's distance at night may be obtained. This light-house and attached provision-post, are in charge of Lieutenant Harvey, on the half pay of the navy.

Light-house.

The other light-house, on the Southern extremity of Heath Point, is of the same form, dimensions, and color as the above, and is also built of the island limestone. It has not as yet been lighted, from want of funds, but is intended to show a bright fixed light from W.N.W. round by S. to N.E. by N. The lantern will stand 100 feet above the sea.

Having given this general description of the island, I will now notice more particularly its shores, reefs, and anchoring-places.

East Cape.

EAST CAPE.—The East Cape of Anticosti is a perpendicular cliff of limestone, rising to the height of 100 feet above the sea. The ridge, of which it is the Southern eastern termination, trends to the Westward inland, and the extremity of the very low land to the Southward of it is Heath Point, on which is the light-house, bearing from the East point S.W. ½ S. 3½ miles. Between the two points is Wreck Bay, which is dangerous and affords no anchorage. Off to the S.E. from the East cape a reef extends rather more than one-third of a mile.

Light-house.

Off to the S.E. from the East cape a reef extends rather more than one-third of a mile.

Heath Point.

HEATH POINT.—Heath Point is of limestone, about 10 feet high, with a superstratum of peat, in which there are several ponds of dark bog water. Being so low this point disappears below the horizon at the distance of a few miles, the light-house then appears like a sail off the island, and is extremely useful in marking the extent of the low land to vessels, either from the Eastward or Westward, as well as in showing

* There are direction-boards erected on the shore, or nailed to trees, from which the branches have been cut off, near the beach, and on various parts of the coast. These direction-boards are intended to point out to shipwrecked persons the way to the provision-posts. The direction-boards were placed on the following parts of the shore, as I find from Mr. Lambley's mark-book, for I have not seen them all:—1st. On the West point. 4th. Four leagues S. westward of Ellis Bay. 3rd. Ten leagues Westward of Shallop Creek. 5th. Seven leagues Eastward of Shallop Creek. And there were formerly others on Heath Point and the S.W. Point, which the light-houses have rendered unnecessary.

position from the S. being hidden by the land. The most dangerous part of the coast is to the S.E. nearly 2 miles from the East point the reef is considerable, varying from 10 to 20 fathoms, and extends nearly to the East cape bearing regular soundings, in the North Point, to the South three-quarters of a mile. The vessels from W.N.W. to S.W. are in danger of the reef; and the South Point is a dangerous anchorage on the East cape bearing regular soundings, in the North Point, to the South three-quarters of a mile. The vessels from W.N.W. to S.W. are in danger of the reef; and the South Point is a dangerous anchorage on the East cape bearing regular soundings, in the North Point, to the South three-quarters of a mile. The vessels from W.N.W. to S.W. are in danger of the reef; and the South Point is a dangerous anchorage on the East cape bearing regular soundings, in the North Point, to the South three-quarters of a mile.

SOUTH POINT.—It is estimated not to be more than 10 miles in length; but there is no little difficulty in doing so. The Southward runs on from Heath Point and Cape Horn, a distance of 2 miles, but is distant 22 miles from the South Point and Cape Horn. From South Point to Cape Horn, the distance is such a sameness in the nature of the coast, that it is not possible to estimate the distance from one part from another.

The houses, however, on the South Point, will be seen 13 miles from the North Point. In this distance the deep-sea lead, the soundings, will be seen in the channel close in rear of the reef, some miles. This distance comprises the boldest part of the coast, and is only approached in the winter, when far enough to the Westward of N.N.W. to be in the whole distance, either off from high-water, or to within 2 miles of the South Point.

SALT LAKE BAY.—Salt Lake Bay, which has fine sand, and is 10 fathoms deep, is about 1½ mile long, and there is no anchorage here in some foul weather, which I have recommended to the spot to which I have named the South-eastern point of the island.

The S.W. point of Anticosti is on its North side, and is the rear of this, to the South. The point there is a beautiful cove on the North side of the point, the cliffs are perpendicular.

position from the Southward, from which direction it cannot be made out at night, being hidden by the high land behind, or to the Northward.

The most dangerous reef off this end of the island runs out from Heath Point to the S.E., nearly 2 miles, at which distance there are 5 fathoms of water. Within that distance the reef is composed of large square blocks of limestone, with very irregular soundings, varying from 2 to 5 fathoms. The rocky and irregular soundings, from 5 to 7 fathoms, extend nearly 3 miles off Heath Point, so that I recommend vessels not to approach nearer on any bearing from the point between S.E. by S. and E. by S. With the East cape bearing N. by W., the vessel will pass just outside of the shallow and irregular soundings, in about 20 fathoms of water.

Off Heath Point, to the Southward and Westward, the shoal water does not extend beyond three-quarters of a mile, and further off on that side there is one of the best open anchorages on the island. The best berth is in 10 fathoms, over sand and mud bottom, with the light-house E. by N., and Cormorant Point nothing to the Westward of W.N.W. The vessel will then be 2 miles off shore, and will be sheltered from all winds from W.N.W. round by the N. to E. by N.

CORMORANT POINT.—From Heath Point, Cormorant Point bears W. by N., 6 *Cormorant* miles; and the South point bears W.N.W., 16½ miles from Cormorant Point. In this *Point.* distance the coast is low and undulating, with points of low limestone cliffs, and beaches of sand and shingle in the bays, inclosing large ponds or lagoons, into many of which the tide flows, and also small streams from the interior of the island. This part of the coast may safely be approached by the lead, as will be seen in the chart, for the reefs nowhere extend further off than three-quarters of a mile till we come to the South Point.

SOUTH POINT.—The South Point is a cliff of sandy clay, resting upon limestone. *South* It is estimated not to exceed 60 feet in height, and there is nothing remarkable in its *Point.* shape; but there is no other clay cliff near it, and as it is an extreme point, there will be little difficulty in distinguishing it by the trending of the land. The reef off it to the Southward runs out nearly 1½ mile, and the sea usually breaks upon it. The light on Heath Point and Cormorant Point in one bearing E. by S., clear this reef at the distance of 2 miles, but I fear that the light will seldom be seen up to the reef, which is distant 2½ miles from it. The leading mark will nevertheless be of use to vessels between South Point and Cormorant Point.

From South Point to the light-house, on the S.W. point, a distance of 56 miles, there is such a sameness in the character of the coast, that it is very difficult to make out one part from another.

The houses, however, of Mr. Hamilton, in charge of the provision-post at Shallop Brook, will be seen 13 miles North westward of the South Point, and at the first limestone cliff to the North-westward of those houses is Pavilion River, 21 miles from South Point. In this distance the coast is very low, and may be approached safely by the deep-sea lead, the soundings in moderate depths extending from 5 to 8 miles off, as will be seen in the chart. The coast begins to rise at Pavilion River, there being a high ridge close in rear of the coast all the way to the S.W. Point, and beyond it for some miles. This distance of 32 miles between Pavilion River and the S.W. Point, comprises the holdest parts of the South coast of the island, but should be very cautiously approached in foggy weather, as there is little or no warning by the lead. When far enough to the Westward, the light on S.W. Point bearing nothing to the Westward of N.N.W., as before directed, will be a sufficient guide.

In the whole distance from South to South-west Points, the reefs nowhere extend further off from high-water mark than one mile, and the island may therefore be safely approached to within 2 miles.

SALT LAKE BAY.—Eleven miles South-eastward of South-west Point, is Salt *Salt Lake* Lake Bay, which has fine sandy beaches, inclosing lagoons or ponds, into which the *Bay.* tide flows. Off the centre of this bay, and with its N.W. point bearing N. by E. ½ E., distant 1½ mile, there is very indifferent anchorage, in 7 fathoms, over sandy bottom. Vessels should be careful not to anchor further to the Southward and Eastward, since there is some foul and rocky ground about a mile in that direction from the position which I have recommended. There are 7 fathoms, rocky bottom, marked in the chart in the spot to which I allude, and there is probably less water between it and the south-eastern point of the bay, so that no one should attempt to pass between it and the shore.

The S.W. point of Anticosti is a low projecting ridge of limestone, having a small cove on its North side, which forms it into a peninsula. The land rises gradually, in the rear of this, to the summit of the ridge above mentioned. On the South side of the point there is a beach of limestone gravel, on which boats may land, as well as on the cove on the North side, when the wind is off the land and the sea smooth. On the North side of the point, and for several miles along the coast, to Observation River, the cliffs are perpendicular, and washed by the sea. The light-house stands on *Light-house.*

the Western extremity of the point, and forms a very conspicuous landmark. A reef extends out from the point, to the W. and S.W., not more than half a mile; and 2 miles off, in the same direction, there are 30 fathoms, over rocky bottom, deepening rapidly to 65 fathoms, with sand and shells, at the distance of 3 miles. At the distance of 6 miles to the Southward and Westward of the point, the depth is about 110 fathoms, with mud bottom, and increases to 200 fathoms nearly midway towards the South coast.

There is a bay on the North side of the point, in which vessels may anchor in 12 or 13 fathoms, over a bottom of sand, gravel, and broken shells, and with the extremity of the point bearing S.S.W. $\frac{1}{2}$ W., distant three-quarters of a mile, when the cliffs to the Eastward will be at the same distance. The shelter is from N. by E. round by E. to S. by W., and small vessels may lie close under the point; but it is a dangerous state to be caught in by Westerly winds, which are preceded by a heavy swell. The ground, I think, is not to be trusted, so that, altogether, I do not recommend any vessel to anchor here, unless in case of necessity.

There is no anchorage from S.W. Point to Ellis Bay; and as I have already given directions respecting this part of the Western coast, little remains to be noticed. The reefs of flat limestone extend from it, in most parts, fully a mile, and often have 10 or 12 fathoms of water close outside of them; but vessels, with the lead going, may safely stand in us near as 2 miles, or, which will be safer than an estimated distance, had better tack in 17 fathoms.

Observation River.

OBSERVATION RIVER.—Observation River, $\frac{1}{2}$ miles Northward of South-west Point, is the largest stream on the island, having 5 or 6 feet of water in the entrance after the melting of the snows in the spring of the year, but soon becomes barren with sand by the S.W. gales. It becomes shoal and rapid immediately within, though it has a course from the Eastward of many leagues. Its source does not appear to be known to the people of the island. Immediately to the Northward of this river there are very conspicuous and high sandy cliffs. The St. Mary Cliffs, 21 miles from South-west Point, are also of sand, less high and less remarkable, but yet not difficult to distinguish.

Bescie River.

BESCIE RIVER.—Bescie River is a very small stream, at the head of a small cove, affording shelter to boats, and where there is a hut, at which a hunter and farmer occasionally resides. It is 7 miles North-westward of the St. Mary Cliffs, and 12 miles South-eastward of Ellis Bay.

Ellis Bay.

ELLIS BAY.—Ellis Bay affords the only tolerably sheltered anchorage in the island. Vessels whose draught is not too great for a depth of 3 fathoms, may safely lie there during the three finest months of summer: namely, June, July, and August; but they should moor with an open hawse to the Southward. Large vessels, whose object is to remain for a few hours only, may anchor further out, and in 3 $\frac{1}{2}$ and 4 fathoms; but neither the ground nor the shelter will be found so good as further up the bay.

The best berth is in a line between Cape Henry and the White Cliff, bearing W.S.W. $\frac{1}{2}$ W. and E.N.E. $\frac{1}{2}$ E., respectively, from each other; Gamache House, N. by E., and Cape Eagle between S.S.E. $\frac{1}{2}$ E. and S.S.E. $\frac{1}{2}$ E. The vessel will then be in 3 fathoms, over muddy bottom, distant about 300 fathoms from the flats on either side, and about half a mile from those at the head of the bay. The extremities of the reef off Cape Henry and Eagle, will bear S.W. by S. and S. $\frac{1}{2}$ E., respectively, thus leaving 3 points of the compass open, but in a direction from which heavy winds are of very rare occurrence, and never last long. Moreover, when they do chance to occur the sea is much less at the anchorage than might be expected, although very heavy in the entrance between the reefs. These reefs are of flat limestone, and dry at low water; and as the tides only rise from 4 to 7 feet, the sea always breaks upon them when there is the least swell. The reef off Cape Henry runs out nearly a mile to the Southward, and that off Cape Eagle near three-quarters of a mile to the Westward. The entrance between them is 600 fathoms wide, from 3 fathoms to 3 fathoms. Extensive flats project from these reefs quite round the bay, and do not entirely dry at low water, excepting in very low spring tides; but there are immense boulder-stones upon them, which always show. These flats occasion the landing to be very bad, excepting at high water, which is the only time that supplies of good water can be obtained from Gamache River.

Ellis Bay can be easily made out from sea, for Cape Henry is a bluff point, and the land being very low at the head of the bay, occasions the opening to show distinctly. On a nearer approach, Cape Eagle and White Cliff on the E. side, and the houses near the head of the bay, will be easily recognized with the assistance of our chart, whilst two ridges, or hills, will be seen far back in the country, and to the Northward and Eastward.

The long line of breakers on either side, and the numerous large stones so far from the shore ahead, will present anything but an agreeable appearance to those who may

approach this bay for the first time; but there will be no danger if the following directions be attended to: In approaching the bay from the Westward, with Westerly winds, run down along the outside of the reefs off Cape Henry by the lead, and in 10 fathoms, until the following leading marks come on—namely, the W. side of White Cliff on with the E. side of the Westernmost of two hills, far back in the country, and bearing N. E. $\frac{1}{2}$ N.; then haul up with these marks on, and they will lead you into smooth water, close under Cape Henry Reef, in 34 fathoms. Continue running on with these marks on, until Gannache House bears N. by E.; then haul up for it, and anchor in the berth which I have previously recommended. The lead should be kept going, and the reefs on either side should not be approached nearer than 3 fathoms, in any part, until you arrive at the anchorage.

In running for the bay from the South-eastward, with an Easterly wind, come no nearer to the West point of Cape Eagle Reef than 7 fathoms, until the East side of White Cliff comes on with the East side of the same hill as before; then haul up with this mark on till the houses bear N. E., and proceed as above directed. Take notice that the West side of White Cliff is used for the leading mark in Westerly winds, and the East side in Easterly winds, the intention being to keep the vessel, in either case, from going too near the lee side of the channel.

On the outside of Cape Henry, and continuing to the West point of Anticosti, reefs extend $\frac{1}{2}$ mile from the shore; and vessels approaching it should keep the lead going, and attend to the soundings in the chart.

WEST POINT is low and wooded, with reefs which do not extend beyond a mile from the shore, and vessels may pass it in 15 fathoms, at the distance of $\frac{1}{2}$ mile *West Point*.

The North coast of Anticosti, between the West and North points, is low, with reefs of flat limestone extending one mile from the shore. There are soundings, in moderate depths, for more than one mile out from the reefs. Vessels should not go nearer than 25 fathoms. In the rear of the coast, and about half-way between the West and North points, are the two hills, or ridges, mentioned as forming one of the leading-marks for Ellis Bay. From North Point to High Cliff, a distance of 13 miles, the coast is rather more bold and elevated, parallel ridges, in an East and West direction, and with small streams between them, beginning to abut upon the coast. North Point is wooded, of very moderate height, and without any cliff. It is so little remarkable as to be only distinguished by the change which takes place at it in the direction of the coast. High Cliff Cape is easily recognized, being the only cliff on the island that has a *talus* in front of it, or that has not its base washed by the sea at high water.

From High Cliff to White North Cliff, a distance of 26 miles, the coast is low in front, with ridges of considerable elevation a few miles back in the country. This is the most dangerous part of the North coast, for the reefs extend nearly 2 miles out from high-water mark, beginning at some low cliffs 7 miles Eastward of High Cliff Cape, and continue to do so for 4 or 5 miles to the South-eastward, after which they gradually diminish in breadth, till at White North Cliff they are not more than half a mile from the shore. There is, however, less warning by the deep-sea lead all along this part of the coast until we approach White North Cliff; off which there are 20 fathoms, at the distance of $\frac{1}{2}$ mile from the surf.

White North Cliff is very remarkable, for there is no other high cliff near it. It appears like a white patch on the land, and can be seen from a distance of 6 or 7 leagues.

Low cliffs commence 4 miles South-eastward of White North Cliff, and continue to Carleton Point, under which vessels may anchor, in fine weather and westerly winds, and obtain wood and water. Ten miles further to the South-eastward is Cape Observation, a bold, high, and remarkable headland. On its West side there is a magnificent range of grayish white cliffs, several hundred feet high. At the extremity of the cape, these cliffs become suddenly much lower, and then rise again to their former elevation for a short distance on the East side. As this is well described in the chart, the cape will be easily recognized. Vessels may anchor under it, with Westerly winds and fine weather, and obtain supplies of wood and water very conveniently. Twelve and a half miles further South-eastward, along a bold coast with high grayish white cliffs and small bays between, brings us to Bear Head, also of grayish white cliffs, 400 feet high, and resembling in some degree Cape Observation. This last-named cliff has no equal high cliffs to the Westward of it, whilst Bear Head has a difference which will prevent the one from being mistaken for the other.

From the West Cliff to Bear Head the coast is extremely bold, there being in most parts 160 fathoms of water within 3 miles of the shore.

BEAR BAY is situated between Bear Head and Cape Robert, which are distant *Bear Bay*. nearly 6 miles from each other, in a N. N. W. $\frac{1}{2}$ W. and S. S. E. $\frac{1}{2}$ E. direction, nearly. It is by far the best roadstead on the North coast of Anticosti, and, indeed, the only one in which a large ship would like to anchor, unless she had some particular object

in view. It is sufficiently roomy, the bottom is excellent for holding, the depth of water moderate, and the shelter extends from N.N.W. round by W., and S. to S.E. by S. In order to recognize this anchorage, it may be observed that Cape Robert consists of cliffs of the same color and elevation as those of Bear Head; and that there are two other points of cliffs 300 feet high within the bay, the South-easternmost of which is named Tower Point. Between Tower Point and Cape Robert, at a distance of one mile from the former, as well as from the Western shore, and in 13 fathoms of water, over a bottom of brown mud, is the best anchorage, where Tower Point will bear N.W. $\frac{1}{2}$ W., Cape Robert S.E. $\frac{1}{2}$ S., and Bear Head N. by W. $\frac{1}{2}$ W.

Bear Bay is divided into three smaller bays by the two high points of cliff which I have mentioned. In each of these bays there are fine bold beaches of sand and limestone shingle, and streams where water may be easily obtained. But the principal stream is Bear River, which enters the Southernmost of the three bays close to the S.E. side of Tower Point. It is too shallow and rapid to admit boats, but the water is clear and good. The cliffs in Bear Bay are magnificent: they are of grayish white limestone, in thin strata dipping very slightly to the Southward, and are perpendicular or overhanging. At the extremities of the points the cliffs are rounded by the action of the waves and atmosphere, so as to resemble towers, which resemblance is rendered stronger by the masonry-like appearance of the rock. The trees are of diminutive growth.

From Cape Robert to Table Head, a distance of 19 miles to the South-eastward, the coast is broken into small bays, with shingle beach and small streams between high headlands, terminating in perpendicular cliffs, the bases of which are washed by the sea. None of these bays afford good anchorage. Table Head is rendered remarkable by the hill from whence it derives its name, and which rises immediately from the summit of the cliffs.

Fox Point. FOX POINT is 4 miles further to the South-eastward, and much lower than Table Head. Fox Bay, which is a little less than 2 miles to the Southward of Fox Point, is about one mile wide and deep, with sandy beach at its head, where there is a considerable stream issuing from a small lake. Boats may enter the outlet of this lake at high water. The house and store of M. Godin are on the N.W. side of the head of the bay, and are the scenes of the dreadful sufferings and melancholy fate of the crew and passengers of the ship *Granicus*, wrecked on this coast in November, 1828, and who all perished from want of food, after enduring the most horrible misery, before the following spring.

Reef Point. REEF POINT, of very low limestone, is the Southern point of Fox Bay, from which a reef of flat limestone, covered with only a few feet of water, runs out to the distance of fully $\frac{1}{2}$ mile. There is a depth of 10 fathoms close off the end of this reef, so that it is extremely dangerous. To be sure of clearing it to the North-eastward, a vessel should not be brought nearer by the lead than 17 or 18 fathoms; or if any of the land to the North-westward of Table Head be open clear of it, she will pass in safety.

North Reef. NORTH REEF.—From the Northern point of Fox Bay, which is a cliff of moderate height, another reef runs out more than half a mile to the South-eastward. A point of the Southern reef before mentioned, extends to the Northward in such a way as to overlap the reef off the Northern point, leaving an entrance from the North-eastward between the two only a quarter of a mile wide, and 13 feet deep at low water. Inside there is a space half a mile wide, from 2 fathoms to 2 fathoms, and with 16 feet in the middle, over muddy bottom. A wind from E. by N. or E.N.E. blows right into the bay; but I am told that the sea does not roll in, but in heavy weather breaks on the reefs and in the entrance. This account I believe to be correct, and that small vessels would be perfectly safe there during the summer months.

Between Fox Bay and East Cape the coast is of limestone cliffs, 100 feet in height, bold and free from danger. Between Cape Sand-top and East Cape vessels may anchor with all Westerly winds in from 16 to 20 fathoms, over fine sand, at a distance of one mile from the shore.

Tides. Tides and currents around Anticosti are so irregular that I can add very little to that which has been already stated.

I have seen the stream run along the land for a whole day at the rate of a mile per hour, in either direction, without any apparent cause, and altogether regardless of the change of tide. At other times I have found the tides regular inshore. Under these circumstances, it is evident that the set of the stream, at any time or place, cannot be reckoned upon with certainty.

However, in addition to my previous remarks, I may observe that there is usually very little stream in any direction on the North coast, from White Cliff South-eastward to Table Head. From the latter to East Cape, on the contrary, there is very frequently a stream from the Northward, running at a rate varying from a half to one knot. In one or two instances I have seen this stream commence and end with the flood-tide.

At Grande Grève, that there is a portage W. side of the Portage N.E. side of the bay the country. Opposite above the seat.

DOUGLAS TOWER on the rising ground in relation deep in the outer part bottom; but on approach GASPE BAY.—To anchor in any part of bottom; but the best bearing N.W. by W. anchorage is N.W. by S.E. by E. and S.S. The riding is, nevertheless, and as the ground is summer months.

Water may be obtained 2 miles. In the spring river, which is between 12 feet of water in the river becomes shallow.

CAPE HALDIMA point of cliff, and the harbor, basin, and

GASPE HARBOR runs out to the North row point of sand, con high-water mark to the inside it is as bold as dam or breakwater, n produce no effect, except the water deepens in beach Point, and also to heat in or out of the

On the inner main-land, stands a variety of the spruce-trees of the interior. Comes in one way N. $\frac{1}{2}$ W., when ye basin, as may be desired.

When beating in, toward Sandy-beach just given, come in on

At night, when neither a difficult affair. There should soundings. Sounding outside of the entrance should be followed, if change which takes place

At Grande Grève, 3½ miles within Cape Gaspé, the ridge of land dips and narrows so that there is a portage across it, leading to the settlements of Cape Rozier. On the N. W. side of the Portage a range of mountains commences, and they continue along the N. E. side of the bay and the N. W. arm, till they are lost to view in the interior of the country. Opposite to the basin of Gaspé they rise to the height of 1500 feet above the sea.

DOUGLAS TOWN.—Douglas Town is a village of fishermen and farmers, standing on the rising ground at the South side of the entrance of the River St. John. Its position in relation to Point Peter has been already mentioned. The water is very deep in the outer parts of the bay, being from 30 to upwards of 60 fathoms, over mud bottom; but on approaching Douglas the depth decreases regularly to the anchorage.

GASPE BAY.—The roadstead off the town of Douglas is extensive, vessels may anchor in any part of it, and in any depth, from 11 to 6 fathoms, over sand and clay bottom; but the best berth is in 7 fathoms, with the entrance of the River St. John bearing N. W. by W. 11 mile. The course and distance from Cape Gaspé to this anchorage is N. W. by W., 7½ miles. There is, however, no shelter from winds between S. E. by E. and S. S. E., which blow directly into the bay, and roll in a heavy swell. The riding is, nevertheless, much less heavy on such occasions than might be expected, and as the ground is excellent for holding, a vessel may safely anchor here during the summer months.

Water may be obtained by ascending the River St. John to the islands, a distance of 2 miles. In the spring of the year there are often 9 feet water in the entrance of this river, which is between two points of sand, as will be seen in the chart; and there are 12 feet of water in the narrow channel for some distance within. At the islands the river becomes shallow and rapid.

CAPE HALDIMAND.—Cape Haldimand, 2 miles Northward of Douglas, is a bluff point of cliff, and the South-eastern termination of the range of hills which separate the harbor, basin, and S. W. arm, from the valley of the River St. John.

GASPE HARBOR.—From the N. E. side of Cape Haldimand, Sandy-beach Point runs out to the Northward, and forms the Harbor of Gaspé. It is a very low and narrow point of sand, convex to seaward, on which side the water deepens gradually from high-water mark to the depth of 3 fathoms, a distance of nearly half a mile. On the inside it is as bold as a wall. Thus this spit, apparently so fragile, becomes a natural dam or breakwater, upon which the heavy swell, which often rolls into the bay, can produce no effect, expending its strength in the shoal water before reaching the beach. The water deepens immediately outside of 3 fathoms, all along the outside of Sandy-beach Point, and also off its North extremity; so that it is both dangerous and difficult to beat in or out of the harbor at night; the lead giving little or no warning.

To the Northward of Sandy-beach Point, at the distance of nearly a mile, is the peninsula, which is a low sand, covered with spruce-trees, and it has several whale-sheds near its West point. Between the shoal water in the bay to the Eastward of the peninsula, and that which extends from the extremity of Sandy-beach Point, is the narrowest part of the entrance to the harbor, which is 420 fathoms wide, from 3 fathoms to 3 fathoms, and upwards of 11 fathoms deep in the centre.

To run into the harbor of Gaspé, attend to the following directions and remarks: On the N. E. side of the N. W. arm, there is a wooded point with low clay cliff, 2½ miles above the peninsula. This point appears as if it were the extreme on that side, when seen over the end of the peninsula from a vessel approaching the entrance of the harbor, and is called Point Panard. Now this point (seen over the peninsula) in one with the inner or North side of the whale-sheds before mentioned, is the mark for the Northern extreme of the shoal off Sandy-beach Point. The extremity of the spruce-trees is as far within the whale-sheds as these last are from the sandy extremity of the peninsula. On the inner side of Sandy-beach Point, and near to its junction with the main-land, stands a wooden windmill. Keep Point Panard in one with the extremity of the spruce-trees on the peninsula, bearing N. 47 W., until the windmill, just mentioned, comes in one with the West or inner side of the end of Sandy-beach Point, bearing S. 1 W., when you may haul into the anchorage under the point, or steer for the basin, as may be desired.

When beating in, tack by the lead from the N. E. side of the bay, and in the board towards Sandy-beach Point, put the helm down the instant the marks for leading in, just given, come in one.

At night, when neither Sandy-beach Point nor the peninsula can be seen, it becomes rather a difficult affair to tack a vessel into the harbor. The only guide then is the lead. There should be a hand in each chain one heaving when the other cries the soundings. Soundings should be first struck on the N. E. side of the bay, about 2 miles outside of the entrance of the harbor, and the edge of the shoal water on that side should be followed, in from 5 to 7 fathoms, until you judge by the distance run, and the change which takes place in the direction of the edge of the bank which you are run-

Town.*

Gaspé Bay.

*Cape Hal-
dimand.*

*Gaspé
Harbor.*

ning upon, that you are approaching the peninsula and have passed Sandy-beach Point, and can, in consequence, venture to haul to the Southward into the anchorage. To form this judgment accurately is the difficult part of the process, and as to fail in this would probably cause the loss of the vessel, if the usual heavy swell should be rolling into the bay with S.E. winds, I recommend a vessel rather to trust to her anchors off Douglas Town than to make the attempt. In case of a vessel which has lost her anchors, the directions which I have given may prove of use. Within Sandy-beach Point, that is, in the harbor of Gaspé, the shelter is complete from all winds. The bottom is mud, and the depth nowhere exceeds $11\frac{1}{2}$ fathoms.

Having now given directions to enable the seaman to take his vessel into a place of perfect security, from which he may proceed to the basin, or to any other part of the harbor, with the assistance of the chart, or of a pilot, I shall not swell these remarks by a minute description of the interior of the harbor, which the chart readers unnecessary, and which is not in any way essential to safety.

I shall merely add that the harbor is divided into the N.W. and S.W. arms. The N.W. arm has deep water for nearly 3 miles above the peninsula, and continues navigable for keeled boats about 3 miles further, where the principal river of the harbor enters the arm between Marsh and Meadow Islands.

The entrance of the S.W. arm is about 180 fathoms wide, and between two sandy points, but the navigable channel is contracted by shoals on either side to about 60 fathoms; and 5 fathoms of water can be carried in. The deep-water part of the S.W. arm, which continues for three-quarters of a mile within the entrance, is called the Basin of Gaspé. It has a depth of from 5 to 9 fathoms, over a mud bottom, and is sufficiently capacious to hold a very great number of vessels as securely as in a dock. Boats can ascend this arm by a narrow channel, between shoals, about 3 miles, as in the N.W. arm, and the navigation, for all but canoes or flat-bottomed boats, is terminated in the same manner, by shallow channels between Marsh and Meadow Islands. Above this part of the river it becomes contracted and rapid, and the water fresh. A small rivulet in the bay, on the inside of the South point of the entrance of the basin, is the most convenient watering-place in the harbor. The Collector of Customs, and the principal families, reside on the shores of the basin. Most of these families, as well as those of the N.W. arm and the harbor generally, are farmers, but several of them are also engaged in the whale-fishery, which they prosecute in small schooners. The cod-fishery is carried on by the people of the bay outside, for the most part in connection with the Jersey merchants. The great majority of the fishermen are either from Jersey or descended from the people of that island, whose language they retain.

There are regular but weak streams of flood and ebb in the entrances of the harbor and basin. In the bay the streams of the tides are so irregular, that I can say nothing certain respecting them. They are, however, usually almost imperceptible, excepting near the shores, and even there they are so weak as to be of little or no consequence to a vessel.

The current down the St. Lawrence runs strongly past Flower-pot Rock, over towards Flat Island, especially in the ebb tide, which often increases its rate to 2 knots, and this should be remembered by vessels making the bay with a Northerly wind. This current, when it meets the swell which so often prevails from the S. and S.E., causes a high, short, and breaking sea, all along the coast from above Cape Razier to Cape Gaspé, and extending across the entrance of Gaspé Bay. When the wind is light, a vessel becomes quite unmanageable in this sea, and it is extremely dangerous to be caught in it, close to the shore, by a light breeze on the land.

In fine summer-weather there is often a sea-breeze blowing right up the bay from about 9 A. M. until sunset. At such times there is generally a light land-breeze at night down the arms, which often extends for several miles out into the bay. In the outer part of the bay, however, it will generally be found to be calm, even at times when a fresh breeze is blowing outside Cape Gaspé and Point Peter. The wind at sea on such occasions is generally from the S.W.

The soundings off this part of the coast will be seen in our charts for the first time; they will prove of very great use to vessels running up in foggy weather, and had they been previously known might have saved many vessels. We had an opportunity of judging of this last spring, when a large ship, full of emigrants, ran stem on to Whale Island in Gaspé Bay. She was under all sail before a moderate S.E. wind, in a thick fog, and steering N.W., from which it appears that she must have been running in soundings from 20 to 40 fathoms, for at least 4 leagues, and probably for 3 hours before she struck. No lead was hove, the existence of the soundings being unknown. The vessel was conceived to be well to the Northward, and, consequently, to be steering a safe course. One cast of the lead would have dispelled this delusion, and might have saved the vessel. Let this be a warning to seamen.

by E. $\frac{1}{2}$ E. Then haul up for Carlisle Point, with the lead going, till the above church and Robin's flag-staff (at his Northmost large white store) come in one, bearing N.E. $\frac{1}{2}$ N. Haul in now boldly for the anchorage, only taking care not to open the same church out to the Eastward of the flag-staff until Single Tree Point (the extreme to the Eastward) is well shut in behind the sandy point, when the vessel will be within the spit, and a berth may be chosen by the lead at or near the position already pointed out. There is an excellent watering-place at a stream which will be seen falling from the cliffs just to the Westward of the outlet of the lagoon. Supplies of all kinds may be obtained here, but to a limited extent. There is nothing in the way when approaching this anchorage from the Westward, but in standing out from it with a Westerly wind, and especially with a lee tide, the marks for clearing the spit to the Westward must be carefully attended to. The Roman Catholic church should not be opened out to the Eastward of Robin's flag-staff until Single Tree Point is well open to the Southward of the sandy point; nor should the vessel bear up to the Eastward of South before Daniel Hill comes open to the Southward of Nouvelle Point.

Directions.

CASCADEPEDIAC BAY, situated on the Northern side, and near the head of the Bay of Chaleur, is of very considerable extent, being 13 miles wide, and 5 or 6 deep. At its head is the Cascadepediac River, a very considerable stream, but which can only be entered by boats, in consequence of the extensive shoals of sand and mud, which dry out 2 miles from its entrance, and occupy all the head of the bay.

Cascadepediac Bay.

BLACK POINT, bold and rocky, and rising to the estimated height of 400 feet above the sea, is the Eastern point of the bay, bearing from Bonaventure Point N.W. $\frac{1}{2}$ N. 13 miles. The shoals commence about 13 mile to the Northward of Black Point, and at Indian Point, on the East side of Little River, they extend out to the Westward nearly 13 mile, sheltering the anchorage from S.E. winds.

Black Point.

DUTHIE POINT, the East point of entrance of the Cascadepediac River, bears N. N.W. $\frac{1}{2}$ W., 5 miles from Black Point. One mile to the Eastward of Duthie Point, and in the bay, between it and Little River, stand the church and village of Richmond.

Duthie Point.

The anchorage, where the timber-ships moor in 3 fathoms, is off the village, with Duthie Point bearing North three-quarters of a mile, the church N.E. $\frac{3}{4}$ E., and Black Point S.E. $\frac{3}{4}$ S. Vessels may anchor further out, in 4, 5, or 6 fathoms, on the same line of bearing from the church, or to the Westward of it, but they will not then be so well sheltered from Easterly winds.

Anchorage.

In running for this anchorage from the Eastward, observe the following directions:

Indian

The marks for the South-western, or outer edge of the shoal off Indian Point, (already mentioned as sheltering the anchorage from S.E. winds,) are Red Point, a little open to the Southward of Black Point, bearing S.E. $\frac{1}{2}$ E. Keep these marks, therefore, well open, as you run to the Westward, with the lead going, and go no nearer to the shoal than 5 or 4 fathoms, until the church bears N.E. by E. Then haul boldly in, steering directly for the church, until you arrive at the anchorage already pointed out.

Point Shoal. Directions.

CARLETON ROAD.—This name has been given to an excellent and capacious anchorage safe in all winds. It is situated on the West side of Traacadigash Point, which consists of sand, inclosing a shallow lagoon, capable of admitting boats, or very small craft, at high water. On the Northern shore of this lagoon stands the church and village of Carleton, the latter extending to the Westward to the shore of the bay where the sand-beach of the lagoon joins the main land. A small stream, with a bridge across it, there enters the N.W. corner of the lagoon; and one mile further to the Westward, near the commencement of the clay cliffs, another small stream will be seen, which is the watering-place. Immediately in the rear of the village the Carleton Mountain rises abruptly to the height of 1-30 feet above the level of the sea—the hills of the range trending from it both to the Northward and Westward for many miles.

Carleton Road.

Traacadigash Point and Lagoon.

Carleton Mountain.

Vessels may choose their berth for anchoring anywhere in from 5 to 6 fathoms, remembering that although the sandy beach of Traacadigash Point is quite bold on the West side within the spit, yet shoal water extends off the main-land to the distance of nearly half a mile. The best berth, especially in Easterly winds, is in 5 $\frac{1}{2}$ fathoms, mud, with Traacadigash Point bearing S. by E. $\frac{1}{2}$ E.; Carleton steeple, E. by S.; and the watering-place, N. by W. $\frac{1}{2}$ W.

TRACADIGASH SPIT, of sand, and running out half a mile to the S.W. from the sandy point of the same name, is the only danger in the way when approaching this anchorage from the Eastward. Observe that Point Maguena and the summit of Dalhousie Mountain in one, bearing W.N.W. $\frac{1}{2}$ W., pass the extremity of the spit in 3 fathoms. Therefore, to clear it, keep the mountain well open, or at night go no nearer than 10 or 9 fathoms. As soon as Carleton steeple comes in one with the S.W. extremity of Traacadigash Point, bearing N.E. by E., the spit will have been passed, and the vessel may haul in to the Northward, going no nearer than 7 fathoms till the

Traacadigash Spit.

- Tides.* point bears to the Southward of East. The tides are weak in Carleton Roads, seldom exceeding one knot. Point Magnacha, of red sandstone cliffs, is the N.E. point of entrance of the River Ristigouche, and bears from Tracadigash Point, W. $\frac{1}{2}$ N., 6 $\frac{1}{2}$ miles. In the N.W. corner of the bay between them is Nouvelle Basin and River, nearly dry at low water.
- Ristigouche River.* RISTIGOUCHE RIVER, from its entrance at Point Magnacha, to where islands, shallows, and rapids terminate the navigation for all but canoes or bateaux, is an estuary or inlet of the sea, varying in breadth, for the first 17 miles, from 1 $\frac{1}{2}$ to 3 miles. At that distance Campbell Town is situated on the Southern or New Brunswick shore, and at the foot of a remarkable conical mountain called the Sugar-loaf.
- Campbell Town.* BATHURST HARBOR, at the mouth of the Nipisight, is 200 fathoms wide at the entrance between Alston and Carron Points, which are of sand, with several stores and other buildings upon them. On Carron Point, which is on the S.E. side, there are two beacons, which, if kept in one, bearing S.W. $\frac{1}{2}$ S., will lead in through the narrow channel over the bar in 7 feet at low-water, or in 14 feet at high-water in the best spring-tides. The distance from the outside of the bar, in 3 fathoms, to the entrance of the river, is 1 $\frac{1}{2}$ mile; and for the whole of that distance, the very narrow channel is between sandy shoals, nearly dry at low-water, and extending from either side of the river's mouth. In the entrance between the sandy points, or rather just outside it, there are 3 and 4 fathoms; and here the vessels usually moor to take in timber, sheltered by the bar and the sandy shoals on either side. Some of the smaller vessels load within the entrance; and some of the larger ones complete their loading outside the bar, where the anchorage, in 6 or 7 fathoms, muddy bottom, is considered safe in the summer-months, although the N.E. gales send in a heavy sea. Within the entrance there is an extensive and perfectly sheltered basin, nearly 3 miles long by 2 miles wide, but nearly all dry at low-water, excepting the channels of the four rivers, which, after uniting their streams below Bathurst, flow through it to the entrance, forming by their junction what is called the Main Channel. On the Eastern side of the basin there is an islet called Indian or Bathurst Island. The town of Bathurst is well situated at the head of the basin, 2 $\frac{1}{2}$ miles within the entrance, and on the point of land which divides the river Nipisight from the Middle and North Rivers.
- Bathurst Town.* The depth of 11 feet at high water in spring tides can be carried up to the wharves of the town, and in the main channel there are several places where vessels may lie afloat and load in 14 feet at low-water. The rate of the tides in the main channel is about 2 knots, and over the bar about 1 $\frac{1}{2}$ knot. The stream sets fair in and out and over the bar. There are good pilots for this river, and no one should attempt the bar without one, excepting in case of necessity.
- The Bar.*

- The Basin.*
- Pilots.*

THE COAST OF NEW BRUNSWICK NORTH OF MIRAMICHI.

- The course from the East side of Miscou Island to the beacon on Point Escumenac is S.W. by S., and the distance from the North point of Miscou to the beacon is 5 $\frac{1}{2}$ miles.
- Miramichi Bay.* MIRAMICHI BAY is nearly 11 miles wide from the sand-bars of Point Black-land to Point Escumenac beacon, and 6 $\frac{1}{2}$ miles deep from that line across its mouth to the main entrance of the Miramichi, between Portage and Fox Islands.
- Escumenac Point and Light.* POINT ESCUMENAC, the S.E. point of Miramichi Bay, is of pen, upon a very low sandstone cliff, and is wooded with spruce-trees. On it there is a light-house of wood, painted white, and showing a fixed light 70 feet above the sea, at high-water. It is so difficult, especially for a stranger, to distinguish one point of this low coast from another, that this light-house is very useful to vessels bound to Miramichi, and making the land from sea. It also points out the position of the very dangerous Escumenac Reef, which extends 2 miles out to the N.E. from the light-house to the 3-fathoms mark, and 2 $\frac{1}{2}$ miles to 5 fathoms, at low-water. In the night-time, vessels should not stand nearer to this reef than 10 fathoms.
- Escumenac Reef.* THE BAR OF MIRAMICHI commences from the S.E. end of Portage Island, and extends across the main entrance, and parallel to Fox Island, nearly 6 miles in a S.E. by S. direction. It consists of sand, and has not more than a foot or two of water over it in some parts, at low spring-tides. Near Portage Island there is water enough over it for small vessels, and there is a still deeper part near its S.E. end, where 13 or 14 feet could be carried over at the time of our survey; but heavy gales, doubtless, alter the disposition of the sand on this bar, although they are said not to have altered the ship channel within the memory of any of the pilots. The S.E. extreme of the bar will be cleared by keeping the church at French Village in the centre of Fox Gully, bearing W. $\frac{1}{2}$ S.; and the church in one with the high water South point of Fox Island, bearing W. by S., will lead over the S.E. end of the bar in 2 $\frac{1}{2}$ fathoms, but very close to 2 fathoms. The church will not be easily made out by strangers, being a

that I have been led to imagine a connection between them; and, if this be the case, it may arise from the circumstance of its being high-water sooner on the North coast, being thus attained a higher level to the Northward, may, in consequence, flow to the Southward. On the other hand it must be mentioned that I have observed this stream during the ebb-tide.

It frequently happens that, when this current from the Northward is running, another from the W. N. W. comes along the South coast; in which case they meet at the reef off Heath Point, and cause a great ripple, or irregular breaking sea. When this has been observed by us, there has been usually a fresh breeze along the land on either side of the island; the wind on the North side of the island being from the N. or N. by E. whilst that along the South side was W. N. W. I have seen both these winds blowing a smart double-reefed topsail breeze at the same time, and for a whole day together, and yet never meet round the East end of the island, which is nowhere more than 200 feet in height. Between the two winds there was a triangular space of calm and light baffling airs: the base of this triangle extended from Heath Point to East Cape, and its apex from 5 to 8 miles to the Eastward of the island. I mention this circumstance because it would be dangerous for a vessel to stand into the calm space between the two winds, where the high cross-sea and constantly changing light airs might leave her at the mercy of the current, in no small danger of being set on the Heath Point Reef.

I have been for hours endeavoring to get out of this singular space, trimming sails to light airs, which did not remain steady to any one point for a minute of time; and I was finally, in spite of every effort to the contrary, carried over the reef by the current, feeling the rocks distinctly under the vessel's bottom, but fortunately drawing too little water to strike upon them.

THE SOUTH COAST OF THE GULF AND RIVER ST. LAWRENCE, FROM CAPE DESPAIR TO THE RIVER MAGDALEN.

CAPE DESPAIR, the N.E. point of the Bay of Chaleur, consists of red sandstone cliffs without beach, and of a moderate height above the sea.

Cape

Despair.

Leander

Shoal.

LEANDER SHOAL bears from Cape Despair S. S. E., distant rather more than 1½ mile. It is about a quarter of a mile in diameter, from 4 fathoms to 4 fathoms, and has at least water on one spot, which, however, it is very difficult to find. It is a rocky shoal, and there is a clear passage between it and the cape. The leading-marks are as follows: the line of the White Head in one with the inner or N. W. end of Percé Rock, passes just outside of the shoal, in 7 fathoms; therefore the whole of Percé Rock well open to the Eastward of the White Head, will lead clear outside of all. From a half to the whole of the Percé Rock shut in behind the White Head, will lead clear between the Leander and Cape Despair.

BONAVENTURE ISLAND has bold and perpendicular cliffs of red sandstone and conglomerate, on all sides excepting the West. These cliffs, in some parts, attain an elevation of 250 feet above the sea, and their ledges and fissures are the habitation of innumerable gannets. From the West side, shoal water extends to the distance of a quarter of a mile, and there is anchorage in 15 fathoms between it and the White Head: but the riding is insecure and heavy in consequence of the swell, which, in bad weather, rolls round the island. The channel between Bonaventure Island and the Percé Rock is about 1½ mile wide, and free from danger.

Bonaventure

Island.

THE PERCÉ ROCK is 233 feet high, precipitous all round, and bold to seaward. It is narrow, and about one-third of a mile long in a S. E. direction, being an outlier to the range of cliffs on the S. W. side of Mont Bay. It is rendered remarkable by two large holes which have been perforated through it by the waves, and through one of which a boat can pass at high water. Between this rock and the White Head is the Bay of Percé, having a reef at the distance of half a mile to the S. W. of the Percé Rock, an extending out nearly half a mile from the shore, as will be seen in the chart. Small vessels engaged in the fisheries anchor on either side of this reef with winds off the land, but it is a dangerous place, and not to be recommended for large vessels.

Percé Rock.

The town of Percé, principally inhabited by persons engaged in the fisheries, occupies the shores of the bay, and Mont Percé, or, as it is sometimes called, the Table Rock, rises immediately from it, to the height of 1230 feet above the sea. This mountain is very remarkable, and can be seen at sea from a distance of 40 miles. A reef connects the Percé Rock with Point Percé, and off the N. E. side of the latter small vessels anchor with Westerly winds. There is generally a regular tide of flood and ebb, of about a knot, between Bonaventure Island and the main-land: the flood running to the S. W., round Cape Despair and up the Bay of Chaleur; and the ebb in

the contrary direction. Two or three miles outside, or to the Eastward of Bonaventure Island, the current to the Southward out of the St. Lawrence will often be found running regardless of the tides.

Mal Bay.

MAL BAY is between 5 and 6 miles wide by 4 miles deep, and entirely open to the S.E. On its S.W. side, and under the Percé Mountains, there are magnificent cliffs, 666 feet in perpendicular height above the sea. Its N.E. side has low cliffs of sandstone, with occasional beaches. A fine, broad, sandy beach extends right across the head of the bay, and incloses a shallow lagoon. A considerable river, and several small streams, discharge their waters into the lagoon, which has an outlet in the N.W. corner of the bay, called the Tickle, admitting boats at high-water, and in fine weather. There is anchorage all round the shores of Mal Bay, but as a heavy sea and thick fog often precede a S.E. gale, and render it difficult for a vessel to beat out, it cannot be recommended. There is an open cove or small bay on the N.E. side, in which a vessel can be occasionally moored close to the shore, and in 3 fathoms water, but this is of no use for the general purposes of navigation.

Point Peter.

POINT PETER is the N.E. point of Mal Bay, and the South point of Gaspé Bay; it is of low sandstone, and thickly covered with the white houses of the fishermen. Flat Island lies about 400 fathoms off Point Peter, and is small, low, and of sandstone. There is a clear channel between the island and the point, but no good anchorage; for although vessels occasionally anchor to the Northward of the island, yet the ground is so foul that there is great danger of losing an anchor from its hooking the rocks.

From Flat Island to Cape Gaspé, across the mouth of Gaspé Bay, the course is N.N.E., $7\frac{1}{2}$ miles.

Gaspé Bay.

GASPE BAY.—The admirable Bay of Gaspé possesses advantages which may hereafter render it one of the most important places, in a maritime point of view, in these seas. It contains an excellent roadstead off Douglas Town; a harbor at its head, capable of holding a numerous fleet in perfect safety; and a basin where the largest ships might be hove down and refitted.

The course up this bay, from Flat Island to the end of Sandy-beach Point, which forms the harbor, is N. by W. $\frac{1}{2}$ W., rather more than 16 miles. From the Flower-pot Rock to the same point, the course is N.W. $\frac{1}{2}$ N., and distant nearly 11 miles.

From Point Peter the land rises in undulations to the chain of mountains, about 5 miles inland from the South-western shore of the bay. These mountains, in some points, attain an elevation of 1500 feet above the level of the sea, and sweeping round Mal Bay, terminate with the Percé Mountains before mentioned. The South-western shore of Gaspé Bay, from Point Peter to Douglas Town, a distance of 12 miles, presents a succession of precipitous headlands; the cliffs, of bituminous shale and sandstones, being in their highest parts 200 feet above the sea. Shoal water extends nearly a third of a mile from the cliffs, and vessels beating should beware of this, since the water shoals too rapidly to allow of much warning by the lead.

Cape Gaspé.

CAPE GASPE.—Cape Gaspé is an extremely remarkable headland, of limestone, having on its N.E. side a magnificent range of cliffs, which rise from the sea to the height of 692 feet. Flower-pot Rock lies close off the S.E. extremity of the cape, and is also a very remarkable object; the base of it being worn so small by the waves, that it appears astonishing that it can resist their force, or the pressure of the ice. It is sometimes called the "Ship's Head," at others the "Old Woman," by the fishermen, and is so bold that vessels may haul round it into the bay within the distance of a quarter of a mile. Boats may pass between it and the cape when there is no surf. The limestone of Cape Gaspé dips to the S.W., so that the cliffs within the bay are very much lower than those on the outside of the cape previously mentioned.

The N.E. side of the bay is thickly covered with the houses of the fishermen for a distance of 5 miles within Cape Gaspé; the principal fishing-establishments belonging, as at Percé, to Jersey merchants. There is an anchorage, with good holding-ground, but in not less than 17 fathoms, except within a quarter of a mile of the shore, abreast of St. George Cove, Grande Grève, and Little Gaspé. The word Cove is, however, inappropriately applied to any part of the shore between Grande Grève and the cape, for though there are fishing establishments there, there are no coves whatever. This side is bold, and free from danger in every part, with the exception of the Seal Rocks, which are the only detached danger in the bay.

Seal Rocks.

SEAL ROCKS.—The Seal Rocks are $6\frac{1}{2}$ miles within Cape Gaspé, one mile S.E. by S. from Cape Brulé, and half a mile off shore. The length of this reef, from 3 fathoms to 3 fathoms, and in a direction parallel to the shore, is half a mile, and its breadth a quarter of a mile. The least water is 4 feet, and there are 3 fathoms between it and the shore. When on the outer edge of the Seal Rocks, Cape Brulé is in one with the next cliffy point up the bay, bearing N. 35 W., by compass; and this only mark is sufficient for the safety of vessels beating, for the rocks are out of the way with fair winds.

In the prolongation frequented by the fish Rock, S.S.E. $\frac{1}{2}$ E. It has 16 fathoms, and the 13 miles, respectively, and the last-mentioned as lying off this coast.

The bold and high miles, will require of harbors.

In the prolongation of the line of Cape Gaspé nearly, there are several rocky patches frequented by the fishermen. They all lie in the same direction from Flower-pot Rock, S.S.E. $\frac{1}{2}$ E. The first is a small patch with 8 fathoms least water, the second has 16 fathoms, and the third 10 fathoms. Their distances from the rock are $\frac{1}{2}$, 1 $\frac{1}{2}$, and 1 $\frac{1}{2}$ miles, respectively. There is deep water and irregular soundings between them, and the last-mentioned is on the banks of soundings which I have already alluded to, as lying off this coast.

The bold and high coast between Cape Gaspé and Cape Châté, a distance of 117 miles, will require only a brief notice, as it is free from dangers and destitute of harbors.

The mountains everywhere approach the shore, which is steep and rocky, displaying cliffs, often of great height, and without larch. After heavy rains, waterfalls, which are not to be seen at other times, descend from great heights, and small bays, with sandy beach and rapid streams at their heads, occur occasionally; yet these features are not generally so strongly marked as to enable a stranger to make out one part of this coast from another with facility.

CAPE ROZIER.—Cape Rozier, which is nearly 7 miles N. $\frac{1}{2}$ E. from Cape Gaspé, is low, and of graywacke and slate rocks. The shoal water does not extend off it above one-third of a mile, but in the bay to the Southward of it, at the distance of $\frac{1}{2}$ of a mile, there is a reef which runs out half a mile from the shore. Vessels may find shelter under Cape Rozier from N.W. winds, but the ground is not very good, and the Easterly swell that frequently rolls in renders it a dangerous anchorage. There are fishing establishments on Cape Rozier, and in its vicinity.

GRIFFIN COVE.—Griffin Cove and River are $6\frac{1}{2}$ miles N.N.W. nearly, from Cape Rozier. A small bay here affords shelter to the boats of the fishermen, whose houses will be seen around it. There are from 2 to 3 fathoms of water in this bay, over sandy bottom. It is of no use to shipping, except to obtain supplies of water, wood, and, occasionally, fresh provisions.

GREAT FOX RIVER.—Great Fox River is $11\frac{1}{2}$ miles N.N.W. nearly, from Cape Rozier. It is a mere brook, which enters a small bay about three-quarters of a mile wide and half a mile deep. Off each point of the bay there are reefs, which diminish the breadth of the entrance to less than a quarter of a mile, and afford shelter to boats, and to very small schooners, in from 2 to 2 $\frac{1}{2}$ fathoms, over a bottom of fine dark sand. Round the head of the bay there is a fine sandy beach. Outside the reefs, which extend only a very short distance to seaward, there are 15, 18, and 21 fathoms, over a bottom of sand and broken shells, at the distance of a quarter, half, and one mile, respectively. In fine summer-weather a vessel might anchor off this place and obtain water, wood, and supplies of fresh provisions; but it is otherwise of no use to shipping. Seven families of fishermen and farmers resided here when I visited it in 1829, and had plenty of cattle, sheep, and swine.

GREAT POND.—Great Pond is a small creek which affords shelter only to boats, and will be known by the houses and stages of the fishermen. It is 16 miles N.W. $\frac{1}{2}$ N. from Great Fox River, and there are no more houses along the coast, till we arrive at the River St. Ann.

MAGDALEN RIVER.—The next place worthy of notice is the Magdalen River, which is 24 miles from Great Pond, in a N.W. $\frac{1}{2}$ W. direction, nearly. The mouth of this river is on the N.W. side of a sandy bay and close under Cape Magdalen, its N.W. point, which is rocky, with cliffs of moderate height, and juts out a very short distance from the range of hills which forms the coast line. A reef of rocks, which dry in part at low water, extends from Cape Magdalen about 200 fathoms to the S.E., parallel to the coast, and shelters the entrance of the river from the Northerly winds. The river is 30 yards wide at the entrance, and 7 feet deep at low water; within, for a very short distance, there are 10 feet, over a clean bottom of fine sand. Further up the river becomes shallow and rapid, winding its way through a romantic valley between the mountains. Thirteen feet of water can be carried into this river at spring tides, and it is a considerable stream, and is occasionally visited by schooners from 30 to 80 tons, which warp in when the sea is smooth and the weather fine. The bay is not deep, being merely a gentle curve with a sandy beach for about a mile to the S.E. of the river. Vessels may anchor here in 7 fathoms, over a bottom of sand, fine gravel, and broken shells, at the distance of three-quarters of a mile from the sandy beach, and from the N.W. point bearing W.N.W. The shelter is from W.N.W., round by S.W. and S. to E.S.E., but it is only a fine-weather anchorage, which may be of use to vessels wanting wood and water.

During two occasions on which I anchored here, I observed a regular alternation of the stream of flood and ebb. The flood extended about $\frac{1}{2}$ mile from the shore, running one knot, and at the line of junction with the almost constant downward current there was a strong ripple.

We extract the annexed manly testimonial to the merits of Captain Bayfield's predecessor, in his arduous undertaking, from Captain Bayfield's book: (E. & G. W. B.) "Our survey, from the Strait of Belle Isle Westward, ended at Mistanogue inclusive, and recommenced again at Grand Mecatina. The intermediate coast was surveyed in 1768 by Mr. Michael Lane, R. N. We examined it with his original chart in hand, and although his survey does not possess the exactness which superior instruments and an improved system of hydrography gives to modern maritime surveys, yet it is such as to confer honor on his memory, being quite sufficiently correct for the usual purposes of navigation."

Chaleur Bay.

CHALEUR BAY.—The magnificent Bay of Chaleur is the largest in the Gulf of St. Lawrence, being 25 miles wide, on a S.W. & S. line, across its entrance, from Cape Despair to Miscou Island; but the entrance is more generally considered to be at Point Maquereau, from which the North point of Miscou Island bears S.S.E. 143 miles. The depth of the bay, from Miscou to the entrance of the Ristigouche, is about 75 miles, and its circumference, reckoning from Cape Despair round to Miscou, is 185 miles.

Easy Navigation. Tides.

The navigation is by no means difficult; for, although there are some dangerous shoals, yet there is everywhere good warning by the lead.

The tides are regular within the bay, and seldom amount to the rate of one mile per hour; but outside, off its mouth, and especially on the Miscou Banks, the currents and tidal streams are so irregular, both in strength and direction, that nothing definite can be said of them; and their dangerous effects upon the course of vessels can only be guarded against by the constant use of the deep-sea lead, and attention to the soundings.

Best line of entrance.

Vessels bound for the Bay of Chaleur, and approaching its entrance in a dark night or foggy weather, should not attempt to make Point Maquereau, which is so bold that there is little or no warning by the lead; but should strike soundings on the Miscou banks, which extend nearly 22 miles to the Eastward of Miscou Island. A cautious lookout should be kept for the numerous fishing-schooners which are generally riding on the banks; and the Northern edge of the latter, being followed in 30 fathoms, will safely conduct vessels past the North point of Miscou, at the distance of 4 miles, and form a sure guide up the bay. The bank of soundings off the North shore is also sufficiently wide to guide vessels everywhere within Point Maquereau; nevertheless, in a dark night and bad weather, vessels had better not approach the shore much nearer than 30 fathoms in any part of the bay to the Eastward of Carlisle Point. The soundings are generally of sand and shells on the banks, while in the central parts of the bay black and brown mud prevail, with depths between 30 and 50 fathoms. Within or to the Westward of Carlisle Point, and the opposite Bay of Nipisiguit, the depth of water decreases to less than 30 fathoms, but there is still sufficient warning everywhere by the lead, quite up to the head of the bay, as will be seen in the chart.

Soundings in Entrance.

POINT MAQUEREAU is of bold and dark-colored craggy rocks. It is also wooded, and rises to about 200 feet above the sea.

Point Maquereau. Paspebiac.

PASPEBIAC, 21½ miles W. by S. from Point Maquereau, is an excellent roadstead, and the principal fishing-establishment in the Bay of Chaleur. A triangular point of sand and shingle beach, inclosing a lagoon, extends out from the main-land to the distance of a mile, and has on its West side the extensive white buildings of the establishment of Messrs. Robin & Co., of Jersey, together with numerous huts belonging to the fishermen.

Carlisle.

CARLISLE is 3½ miles to the Westward of Paspebiac, and its jail and court-house standing on the ridge in rear of Carlisle Point, are seen from the anchorage. Carlisle Point, which is wooded, and consists of sand, bears W. by N. 3½ miles from the sandy point of Paspebiac, and the roadstead is between them, but much nearer the latter. In this excellent and convenient anchorage vessels are sheltered from the West round by North and East to S.E.; and although it is completely open to the S.W. winds, which send in a very considerable swell, yet the ground is so good that the Jersey vessels ride here moored all through the season without accident. The best anchorage is in 6 fathoms, clay bottom, with Robin's flag-staff and Single Tree Point (the extreme to the Eastward seen over the sandy point) in one, bearing East, and the extremity of the sandy point S.E. A sandy spit extends under water rather more than half a mile to the Westward from the sandy point, and nearly as far to the Southward likewise. This assists in sheltering the roadstead, and is the only danger to be avoided in approaching it.

Sandy Spit.

In running along the land from the Eastward, the low sandy point of Paspebiac, with its white stores and numerous huts, will be seen stretching out from the main-land to the Southward. When the vessel has passed Nouvelle River, and is approaching within 2 or 3 miles of the point, observe the following directions: Keep the summit of Daniel Hill open to the Southward of Nouvelle Point until the Roman Catholic church opens to the Westward of the South extremity of the sandy point bearing N.

wooden building, and is moored in 3 fathoms must therefore be N.W. from this bluff on the lamp, which channel. There is but there are holes which might be rendered narrow and intricate large vessels, the vessel on to the East and thus overlapping renders the channel of channel, until we mentioned, is in the line than half a mile wide heavy Easterly gales dangerous and heavy to vessels, rendering islands.

Within the Red Buoy is clear and straight, way to another Red Buoy and 70 fathoms from shoal with only a few. The course and distance N.W. ¾ N., 3 miles a vessel may run along by the lead. On steep, and the leading ledge (on the North side N.W. ¾ N., is neither pushed by a stranger the Red Buoy toward only 100 fathoms off the be seen on the sand-bearing S.E. ¾ E., lead Buoy of the Horse-shoe.

THE HORSE-SHOE and not more than a fathom long, North and South nearly joined to the side channel left, which is between the Horse-shoe too much water to erode. To the Southward the Fox, Egg, and Vin Islands 150 fathoms wide, and Bar, over which 18 feet side of the Horse-shoe outer or Easternmost beacons on Fox Island three lying in a line in extreme of the Horse-shoe Westernmost red buoy being within the distance usual place where vessels cross the lower Bar.

out to the Eastward the of sand and gravel, with to the S.E., so as to navigate a vessel to avoid so difficult for a large although a very narrow rendered safe by placid. The stream of the tide. The flood draws in tow

wooden building, only distinguished from the barns near it by a belfry. A Black Buoy *Black Buoy.* is moored in 3 fathoms at low-water on the inner or S.W. extreme of the bar, and must therefore be left to the Eastward, or on the right, going in. About a mile N.W. from this black buoy there is a Red Buoy moored in the same depth of water on the Lump, which is a shoal with 2 fathoms least water on the West side of the *Lump Shoal and Red Buoy.* channel. There is no passage for large vessels between the Lump and Fox Island, but there are holes with 4 fathoms water, and a channel of 2½ fathoms at low-water, which might be rendered available by buoying, if it were requisite, but which is too narrow and intricate without such assistance. In its present state, therefore, and for large vessels, the whole of this part may be considered as one shoal, extending 1½ mile out to the Eastward, from the shore of Fox Island to the red buoy of the Lump; and thus overlapping the S.W. point of the bar, where the black buoy is placed, it renders the channel crooked and difficult. The narrowest and shallowest part of the channel, until we come to the bar of the Horse-shoe, which will be presently mentioned, is in the line from the black buoy to the S.E. end of Fox Island, being less than half a mile wide, with 3½ fathoms at low-water in ordinary spring-tides. In heavy Easterly gales, in the fall of the year, especially during the ebb-tide, there is a dangerous and heavy-breaking sea here, which has in several instances proved fatal to vessels, rendering them unmanageable, so that they have been cast ashore on the islands.

Within the Red Buoy of the Lump, which must be left to the Westward, the channel *Clear Channel.* is clear and straight, about 500 fathoms wide, and from 4 to 7 fathoms deep all the way to another Red Buoy on the same side of the channel, and moored in 4½ fathoms and 70 fathoms from the edge of the shoal. This is the Red Buoy of the Spit, a sandy shoal with only a few feet of water upon it, extending half a mile from Fox Island. *Spit and Red Buoy.* The course and distance from the Red Buoy of the Lump to the Red Buoy of the Spit, is N.W. ½ N., 3 miles. Both the Lump and Spit are steep shoals, but between them a vessel may run along, or even work on the S.W. side of the channel, in 4 or 3 fathoms by the lead. On the opposite or N.E. side of the channel the bar is extremely steep, and the leading-mark for it the Easternmost white house of Burnt Church village (on the North side of the bay) just open to the S.W. of Portage Island, bearing N.W. ½ N., is neither certain (since another house may be built) nor readily distinguished by a stranger. The shoal of the Spit trends due West, not quite a mile, from the Red Buoy towards the North point of Fox Island, where the shoal water extends only 100 fathoms off shore. On the North point of Fox Island two small beacons will *Fox Beacons.* be seen on the sand-hills, the one red and the other white; these kept in one, and bearing S.E. ½ E., lead in the deepest water, from 2½ to 2½ fathoms, to the outer Red Buoy of the Horse-shoe.

THE HORSE-SHOE SHOAL, consists of sand and gravel, with 3 feet least water. *Horse-shoe Shoal.* and not more than a fathom over many parts of it. It is of great extent, being 3 miles long, North and South, and 2½ miles wide. The N.E. extreme of the Horse-shoe is nearly joined to the shoals of Portage Island, there being only a narrow and intricate channel left, which is never used. There is a good anchorage in 4 or 5 fathoms between the Horse-shoe and the South end of Portage Island, where vessels which draw too much water to cross the inner bar, may safely anchor during the summer months. To the Southward the Horse-shoe is separated from the shoal, which connects together Fox Egg, and Vin Islands, by the very narrow ship-channel, which in one part is only 150 fathoms wide, and 2½ fathoms deep. This is called the Horse-shoe Ear, or Inner *Horse-shoe Bar and Buoy.* Bar, over which 18 feet of water can be carried in ordinary spring-tides. The South side of the Horse-shoe is marked by three Red Buoys and one Black Buoy. The outer or Easternmost buoy has been already mentioned as lying in one with the two beacons on Fox Island. The other two red buoys bear W. by S. from it, the whole three lying in a line in the space of half a mile. The black buoy lies on the S.W. extreme of the Horse-shoe, and bears S.W. by W. ½ W., two-thirds of a mile from the Westernmost red buoy. These buoys must be all left to the Northward, the best water being within the distance of half a cable from them. Near the black buoy is the usual place where vessels bound to sea anchor to wait for a wind, or for a high tide to cross the Inner Bar. The S.E. point of the Horse-shoe extends 350 fathoms further *Horse-shoe Patch.* out to the Eastward than its outer red buoy; and there is moreover a patch, or mound of sand and gravel, with only 10 feet water, lying off the S.E. point of the Horse-shoe to the S.E., so as to narrow the navigable channel between it and Fox Island to a third of a mile. The use of the two small beacons on the North point of Fox Island is to *Horse-shoe Bar.* enable a vessel to avoid that mound, which renders the passage of the Horse-shoe Bar so difficult for a large vessel; but I believe there is as deep, and a more direct, although a very narrow channel, to the Northward of the mound, and which would be rendered safe by placing buoys upon it, and upon the S.E. point of the Horse-shoe.

The stream of the tides is not strong in the open bay outside the bar of Miranichi. *Tides.* The flood draws in towards the entrance as into a funnel, coming both from the N.E.

and S.E. along shore from Tabisintac, as well as from Point Escumencac. It sets fairly through the ship-channel at the rate of about $1\frac{1}{2}$ knot at the black buoy, increasing to 2 or $2\frac{1}{2}$ knots in strong spring-tides between Portage and Fox Islands, in the direction of the buoys of the Horse-shoe, although some part of it flows to the Northward between that shoal and Portage Island. The ebb sets out in the opposite direction, being strongest at the buoys of the Horse-shoe, and in the entrance between Fox and Portage Islands, where in spring-tides it often attains to the rate of $2\frac{1}{2}$ miles per hour, and is said to be still stronger when the waters are high in the spring of the year. The ebb sets out to the Eastward from the buoy of the Lamp over the tail of the bar, and should be guarded against in light winds.

The winds affected the tides very considerably, and, together with the smallness of the rise, rendered it extremely difficult to make correct deductions from a number of observations so limited as those which we were able to obtain. The Easterly winds always make high tides, and sometimes cause the neap to be higher than the spring tides. The time of high-water on the full and change days at the S.W. end of Vin Island was observed to be at about $5\frac{1}{2}$ hours, and the pilots say that it is about 5 hours on the bar. The rise of an ordinary spring-tide is 5 feet, and of neap-tides 3 feet; but the rise is at all times so uncertain that we have observed neap-tides which did not rise above a foot, and spring-tides not above 2 feet. It must also be remarked that the A. M. tides rise higher, in general, by 2 feet, than the P. M. tides, in the beginning of August, when none of us had an opportunity of observing them.

The Bar of Miramichi should never be attempted by a large vessel, or by persons not thoroughly acquainted with it, without a Branch Pilot, if one can be procured.

Pilots.*

THE COAST OF NEW BRUNSWICK FROM POINT ESCUMENAC TO BAY VERTE INCLUSIVE.

Sapin Ledge. THE SAPIN LEDGE, of sandstone, and with 12 feet least water, is very dangerous, lying directly in the way of vessels running along shore. It should not be approached nearer than 9 fathoms in the night-time; and at all times it should be remembered, that the 5-fathoms line is distant from it only about 2 cables. This ledge is $1\frac{1}{2}$ mile long, East and West, by about half a mile wide, reckoning from 3 fathoms to 3 fathoms; and its Eastern or outer extremity bears South, 6 miles from Escumencac light, and E.S.E. $\frac{1}{2}$ E., $2\frac{1}{2}$ miles from Point Sapin. There is a depth of $3\frac{1}{2}$ fathoms between it and the last-named point.

Light.

From Point Sapin to Richibucto Head, the course is S. $\frac{1}{2}$ W., and distance nearly 20 miles across.

*Richibucto
River.*

RICHIBUCTO RIVER is of very superior importance to those which have just been described: being, among the rivers on this side of New Brunswick, inferior only to the Miramichi, either in the distance to which it is navigable, or in the depth of water over its bar. It is annually visited by a considerable number of vessels for cargoes of lumber.

*Richibucto
Bar very
dangerous.*

THE BAR of the RICHIBUCTO is extremely dangerous, especially to large deep-laden and dull-sailing vessels outward bound, in the fall of the year. Taking advantage of the highest spring-tide, and sailing at high-water, if the wind becomes unsteady or too high, they are almost certain to be thrown ashore by the ebb-tide, on the South-eastern part of the bar; and should a N.E. gale occur, to be destroyed before they can be got off again. To take a ship in with a leading wind and flowing tide, is attended with no other difficulty than that which arises from the narrowness of the channel; but in all cases the assistance of a pilot is absolutely necessary, since the bar is subject to occasional changes from the effect of heavy gales. We found the branch pilots of Richibucto able, intelligent, and attentive to their duties: They keep a good lookout for vessels from the beacon, at the mouth of the river. The bar extends from the North beach for 2 miles to the E.S.E., parallel to the South beach; there is a rock in the Eastern part of it, but the remainder is of sand, dry at low-water. No part of this bar extends to seaward so much as a mile from the shore, and it may be safely approached by the lead to 6 fathoms, at any time of the tide; but for the purpose of anchorage 9 fathoms is a better depth, the bottom being there of fine brown and gray sand, affording far better holding-ground than further inshore. The situation of the narrow channel over this bar ($1\frac{1}{2}$ mile E.S.E. from the river's mouth) is indicated by two white beacons on the South beach, and by a large black buoy moored off it in $3\frac{1}{2}$ or 4 fathoms at low water, with the two beacons in one, bearing (in 1839) W.S.W. $\frac{1}{2}$ W., distant not quite a mile. These beacons in one always lead in over the bar, being shifted as required almost every spring, in consequence of changes in the channel effected by heavy N.E. gales. The North beacon, which stands on a sand-hill, 30 feet high, at the South extremity of the North beach, is large and

white, being intended to point out the situation of the river to vessels many miles out to sea.

The depth of water over the bar is 9 feet at low-water, or 13 feet at high-water, in *Tides*. ordinary spring-tides.

The ordinary spring tides rise 4 feet, and the neap tides $2\frac{1}{2}$ feet, at the North beach. On the day of the full moon in July there was only one high-water, at 3h. 30m., and one low-water, at 4 p.m. But towards the time of neap tides, two high-waters in 24 hours become apparent for a few days. There would seem to be two interfering tides, presenting phenomena which it would require accurate and long-continued observations to explain. The rate of the tides in the river is from 1 to 2 knots.

CAPE JOURIMAIN, the North extreme of the Jourimain Islands, forms the extreme point of land to vessels running through the Strait of Northumberland, either from the Eastward or Westward. It bears S.E. by E. $\frac{1}{2}$ E., 6 $\frac{1}{2}$ miles from Cape Bruin; and there is good anchorage in the bay between them in 5 fathoms, sandy bottom, and in winds from the S.E. by E. round by South to W. by N. The islands are connected together, and with the main land, by sand-bars and marshes; but still they appear as islands when seen from a distance sufficient to sink the sand-bars below the horizon.

THE JOURIMAIN SHOALS are extremely dangerous to vessels running at night without their leads going; they commence at Peacock Cove, off which there is a patch of $3\frac{1}{2}$ fathoms, 2 miles off shore, as will be seen in the chart. They extend from Cape Jourimain $\frac{1}{2}$ mile to the N.N.W.; and there is a patch of 4 fathoms, $\frac{1}{2}$ mile North from the same point. From their N.W. extreme they extend $\frac{1}{2}$ miles to the S.E. They are of sandstone, thinly and partially covered with sand; and their S.E. point, a narrow ridge with only 6 feet at low-water, and distant $\frac{1}{2}$ mile from the shore, is the most dangerous, because the boldest part of the shoals. It should not be approached nearer than 9 fathoms in the night-time; but farther Westward the shoals may be approached, with proper caution, to 6 fathoms at low-water. To the Southward of these shoals, and between them and the Tormentine reefs, there is very good anchorage with Westerly winds, in from 5 to 6 fathoms, the bottom being of sand, with clay underneath.

THE TORMENTINE REEFS are extremely dangerous, and are rendered doubly so by the strong tides. They extend off Indian Point rather more than 3 miles to the S.E., and there is rocky ground with 4 fathoms fully a mile further off shore. The part of these reefs which dries at low water is very small, and bears E.S.E. $\frac{1}{2}$ E., $2\frac{1}{2}$ miles from Indian Point. It lies about 150 fathoms to the Southward of the line joining Cape Spear and the South side of Ephraim Island, and the whole of that island upon the Southward of Cape St. Laurent will clear it more than a mile to the Southward; but these marks are not of much use, nor are there any others that can be depended upon, for the North extreme of the trees of the inner Jourimain Island, and the South extreme of the trees of the outer Jourimain Island touching, which is the mark that now leads well clear of the reef to the Northward, will change as the woods are cleared away. The only sufficient guides, therefore, are the lead and the Admiralty chart. Vessels running through the strait at night, or at any time, without a commanding breeze, should not approach this reef from any direction between North and East nearer than 9 fathoms: for the flood-tide sets over it to the Southward, into the Bay Verte, at the rate of 3 knots, causing a great rippling over the part that dries, and generally indicating its position. Nearly midway between the dry part of the reef and Indian Point there is a patch of rocks with 7 feet at low water. Small craft may take shelter under the latter in Northerly winds; but large vessels, wishing to do the same, must run round outside the whole of the reef, and will find the soundings in the Admiralty chart a sufficient guide for the purpose.

BAY VERTE is 9 miles wide across its entrance, from Indian Point in New Brunswick, to Coldspring Head in Nova Scotia, but contracts to the breadth of $2\frac{1}{2}$ miles near its head.

THE RIVER TIGNISH is the most considerable stream in the Bay Verte, which it enters on the South side near its head. It has only 3 feet depth of water, in a very narrow channel, when the tide is out: and it is approached by a narrow channel, from 3 to 7 feet deep, through flats of mud and weeds, which dry out a mile from its mouth.

There are thriving settlements on either side of the Bay Verte.

SPEAR SHOAL has a patch of rocks with 10 feet least water near its East end, and from 15 to 18 feet in other parts; it is a bank of sand and stones, resting on sandstone, about a mile long, in an East and West direction, and a third of a mile broad. From the shoalest part Cape Spear bears N.W. by N., $\frac{1}{2}$ mile, and Indian Point N. N.E. $2\frac{1}{2}$ miles. The lead gives little warning in approaching this dangerous shoal from the Eastward, on which side there are from $3\frac{1}{2}$ to 4 $\frac{1}{2}$ fathoms close to it; but

vessels will avoid it by coming into no less water than 44 fathoms, as they pass it in the Southward. There are 31 fathoms of water between it and Cape Spear.

Heart Shoal. About a mile W. N. W. from Spear Shoal, and S. W. by S. 11 mile from Cape Spear, there is Heart Shoal, with 9 feet least water, and 15 feet between it and the shore, but as it lies within the 3 fathoms mark, it will be sufficient to refer to the chart, in addition to having pointed out its position.

Laurent Shoal. LAURENT SHOAL, of rock and sand, with 16 feet least water, is about three-quarters of a mile long by half that breadth. On the shoolest part Cape St. Laurent bears N. W. by N. 21 miles, Ephraim Island N. W. 4 W., Indian Point N. E. by E. 1 E., and Coldspring Head S. S. W. 4 W. This shoal is also most bold on the East side, where there are 11 fathoms close to it.

Angermore Rock. THE ANGERMORE ROCK, with 13 feet least water, and bearing N. E. 1 E. 21 miles from Coldspring Head, is, like Laurent Shoal, merely one of the shallowest points of an extensive rocky bank, which is thinly covered with mud and sand, and which extends out from Cape St. Laurent and Ephraim Island, in a S. E. by S. direction, so as to leave a deep channel, about 2 miles wide, between it and Coldspring Head. At low water not more than 31 fathoms could be safely reckoned upon, in passing between the Angermore Rock and Laurent Shoal, or between the latter and the Ephraim Banks, extending off the Northern shore; and even that depth could only be insured by the assistance of the Admiralty chart, for there are not more than 19 feet in several parts of the banks.

Direction of Bay Verte. Vessels bound up the Bay Verte, should therefore keep the Nova Scotia coast on board, running up in 61 and 7 fathoms, till they arrive off Coldspring Head, where, at the distance of about 11 mile from the shore, they will find the water deepen to 8 or 9, and even nearly to 10 fathoms, as they pass to the Southward of the banks and shoals which have been described. After passing Coldspring Head about 3 miles, the depth of water decreases to less than 5 fathoms, and continues to shoal gradually, with mud and sand bottom, to the head of the bay. A reference to the chart will show the general extent of the shoal water off the shore; but the Boss Spit, which stretches three quarters of a mile out from the South shore between Boss and Jackson Points, and 31 miles within, or to the N. W. of Coldspring Head, is so dangerous as to require particular notice. It dries out to its edge, and is so steep to, that there is 17 feet of water close to its outer point. Vessels should be careful not to go into less water than 31 fathoms, until they are past this sand spit. Further up the bay there is nothing in the way, excepting two patches of stone with 3 and 5 feet water, at the distance of half and three quarters of a mile N. N. E. 1 E. from Tagush Head. These are perhaps ballast heaps, of which there are several at the entrance of the channel of the river; but as these are all within the 2-fathoms line, they require no further notice.

Boss Spit.

Stony Patches.

GULF OF ST. LAWRENCE—NORTHUMBERLAND STRAIT—COAST OF NOVA SCOTIA.

Eastward from the Bay Verte there is no place of use to shipping for a distance of 10 miles, or until you arrive at the contiguous rivers Philip and Pugwash, into which runs the bay between Lewis Head and Pugwash Point. The last named point bears from the former 11, by S., 21 miles; and there are reefs off both of them, which render the approach extremely perilous to strangers, and which, therefore, we shall first notice.

Lewis Reef. LEWIS REEF extends to the N. E., 21 miles from Lewis Head; its outer part is composed of detached rocky patches, on which there are from 11 to 18 feet of water, with a greater depth between them; but the inner part is very shallow, and has as little as 6 feet of water at the distance of 11 mile from the shore.

Pugwash Reef. PUGWASH REEF stretches out from the point of the same name three-quarters of a mile N. W. by W., and dries out about half that distance. There are rocky patches, with 11 and 12 feet of water, three-quarters of a mile off the point to the N. and N. E.; and others further to the Eastward, a full mile out from the shore; moreover, there is uneven, rocky ground, with a less depth than 4 fathoms, 2 miles off shore, and which renders it unsafe for a stranger in a large ship to go within the 5-fathoms line.

Pugwash Road. PUGWASH ROAD, in the entrance of Pugwash Bay, affords excellent anchorage, in from 16 to 19 feet at low water, with mud and clay bottom, being sheltered by Philip Bar and Lewis Reef from W. and N. W., and by Pugwash Reef from E. and N. E. winds. This anchorage is exposed to winds between N. N. W. and N. N. E., but the shallow water outside prevents any sea from coming in sufficient to endanger a vessel during the summer months.

To run for Pugwash Road from the Northward, the ship being in not less than 5 fathoms, proceed as follows:—Bring the English Episcopal church steeple at Pugwash soon to be seen over and only just within the West extreme of the low cliff of Fishing Point, (the East point of the bay,) bearing S. by E. 3 E.

Run towards those marks, taking care not to open out the church in the least to the Westward of the point until Bergeman Point (the South point of entrance of the River) bears S.W. by W., or until the depth decreases to 34 fathoms at low water. The vessel will then be close off the N.W. end of Pugwash Reef, and the course must be changed to S.S.W. for three quarters of a mile, when she will be in from 16 to 19 fathoms at low water, with clay bottom, directly in the line joining Bergeman and Pugwash Points, and with Fishing Point E. by S. 1 S., distant nearly half a mile. This is the best anchorage; but vessels may be half a mile further in to the Southward, or to the West of the bar, and in 14 feet at low water. Still further in the bay is all shoal, excepting the narrow channel which curves round its Eastern side, and leads to the bar.

To run for Pugwash Road from the Eastward, the vessel being in more than the low-water depth of 5 fathoms, bring Bergeman Point to bear S.W. by W., and steer West until the church opens out to the Westward of Fishing Point, when immediately change the course to S.S.W., and, having run nearly three quarters of a mile, anchor in the same berth as before directed.

PUGWASH HARBOR, at the head of the bay and entrance of the river of the name *Pugwash Harbor*, is small, but perfectly secure, and has more than a sufficient depth of water for any ship that can pass the bar, on which the depth is 14 feet at low-water, in ordinary spring-tides. Pilots are indispensable. *Pilots Tides*

It is high water at Pugwash, on the full and change days, at 10h. 30m., the ordinary spring tides rising 7 feet, and the neap tides 4 feet. The rate of the tidal stream, which is greatest in the entrance of the harbor, does not exceed 2 knots, unless it may be the ebb in the spring after the melting of the winter's snows. In the ebb it seldom exceeds a knot.

Nine miles E.S.E. from Pugwash Point brings us to Cape Cliff, and 3 miles further S.E. to Oak Island, formerly called Fox Island.

WALLACE HARBOR is the finest on this coast, excepting Pictou, having 46 feet *Wallace Harbor* water at low water, in ordinary spring tides, which rise 8 feet, so that it is capable of admitting very large ships. Its entrance, 2½ miles W.S.W. 1 W., from Oak Island, and between two sandy spits, named Flumer and Caulfield Points, is nearly 2 miles wide and 6½ fathoms deep; but the approach to this entrance, over the bar and through the bay for a distance of 3 miles, is by a crooked channel, which, although no where less than 160 fathoms wide, is, nevertheless, difficult without the aid of buoys or sufficient leading marks.

SADDLE ISLAND is low, wooded, three quarters of a mile long, in an E.S.E. 1 E. *Saddle Island* direction, and joined to the shore, from which it is distant in one part only 130 fathoms, in shoals at low-water. Its Eastern point bears S.E. by E., and is distant a long 6 miles from Oak Island.

SADDLE REEF runs out from the East point of the island one mile to the 3 fathoms mark, and is very dangerous, having on it a round backed rock called the Wash- *Saddle Reef* ball, dry at low-water, and distant one-third of a mile from the island. There are only a few feet of water much further out. In approaching this reef from the Northward, the soundings give little warning, but an excellent leading mark, namely, Green Bluff, set open to the Northward of Saddle Island, and bearing W. 1 N., just clears it in 4 fathoms. The lead affords the only guide for clearing it to the Eastward, where it may be safely approached to 6 fathoms with care. *Wash-ball Rock*

MULLEGASH POINT, the North point of Tatamagouche Bay, is one mile to the *Mullegash Point* Northward of Saddle Island; shallow water extends from the one to the other, and off the point to the distance of a long half mile.

TATAMAGOUCHE BAY, 2½ miles wide at its entrance, between the last named *Tatamagouche Bay* point and Brule peninsula, runs in 7 miles to the Westward, affording everywhere good anchorage, over a bottom of soft mud, but with insufficient depth of water for large ships far up the bay. From 5 fathoms at the entrance the depth decreases to 3 fathoms at the distance of 1½ mile up the bay, and to 2 fathoms at 4 miles, the remainder being all shallow, and in part dry at low-water, with the exception of boat-channels leading to the basin and to Mill brook. The only detached danger in this bay is a rock with 7 feet least water, 350 fathoms off the Northern shore, and 2 miles in from Mullegash Point. Amet Island and Mullegash Point touching, and bearing E.N.E., bear it to the Southward at the distance of 120 fathoms. The extent of the shallow water off shore in other parts will be seen in the chart.

A stranger may safely approach to the low-water depth of 3 fathoms in the outer part of the bay, and to 2½ fathoms further in, but in entering should keep well over to the Northward, to avoid the Brule shoals, which will be presently mentioned.

the lead and the bearing from the East end of Saddle Island, N E 7 N., are there the
 the N E side is just cleared in 5 and 6 fathoms, either by the Eastern
 extremes of Amet Island and Cape John in one, bearing S E 3 S., or by the Western
 of Cape John and the English Episcopal steeple at the River John in one, bearing
 S E 4 E. The S E side is cleared in 4 fathoms, by the Eastern extremes of Mal-
 leghash and Chambers Points in one, bearing S W 4 S. All these objects will easily be
 seen on every good Chambers Point, which, being very low, and times difficult to dis-
 tinguish from the high land behind it.

AMET ISLAND is very small, covering a space of 230 fathoms East and West, *Amet Island*
 with an extreme breadth of 40 fathoms. It is divided into two parts, of which the
 Western is the largest, presenting clay cliffs on every side, excepting where they are
 joined together by a sandy neck. It is flat at top, bare of trees, covered with a coarse
 grass, and about 20 feet above the sea at high water. It was formerly much higher
 and the cliffs still continue to be undermined by every heavy gale and
 high tide; the fracts also aid in the work of destruction, so that the time cannot be
 very distant when there will only remain a vest of the highly inclined sandstone which
 at present forms the base of the island, and dies out to the distance of about two or
 three miles, excepting on the Southern side where forests can generally be had at all times of
 the tide. Shallow water extends off this island 300 fathoms to the Westward, and
 will be cleared in not less than 31 fathoms, if the English steeple at River John be not
 seen in behind the Western side of Cape John, but large ships should stand in only
 4 fathoms, and will take notice, that in every other direction shallow water extends
 from the island to far greater distances.

THE AMET SHOALS are rocky, with very irregular soundings, and are much *Amet Shoals*
 more extensive and dangerous than have been hitherto represented. They extend
 nearly 4 miles from the island to the Eastward, and also to the S E 2 miles towards
 Cape John. In both directions there are rocky patches, with no more than 5 or 6 feet,
 along mile out from the island; at a greater distance than 2 miles there are not less
 than 10 feet, but there is a patch with that depth fully 3 miles to the Eastward of the
 island. The marks for this Easternmost patch are the North extremes of Amet Isl-
 and and Green Bluff in one, bearing W 4 N. and Cape John S W 3 S.
 Cape John's House and Cape John bearing S W clear it about a quarter of a mile to the
 S E, and in 4 fathoms, but to clear the extreme East end of the shoal in a greater
 depth, Cape John must bear to the Westward of S W by W. The Northern side of
 these shoals is very steep, and should not be approached in a large ship, especially at
 night, to a less depth than 10 fathoms. Green Bluff and Saddle Island touching, and
 bearing W by N, pass along the Southern side in 24 fathoms, but if kept distinctly
 open will clear it in 31 fathoms. The dangers which have just been described form
 three passages into Amet Sound, all of which are wide and deep enough for the larg-
 est ships.

THE WESTERN PASSAGE, between Saddle Island and Reef and the Wough *Western*
 Shoal, is a mile wide, with irregular soundings, from 5 to 24 fathoms, the lesser depth *Passage*
 being to the Southward of Wough Shoal, where the bottom is rocky and uneven,
 but the further Westward it is of mud. The description of the dangers already given,
 with the bearings and leading marks for avoiding them, will enable any vessel fur-
 nished with the Admiralty chart to safely run through this wide and clear passage
 with a fair wind. I shall add only the caution to be wary of the East end of Saddle
 Reef, when hauling round it to the Southward, 6 fathoms is near enough until Green
 Bluff is seen through between Saddle Island and the reef, after which, Mullegash
 Shoal may be rounded by the lead in any depth that may be convenient. The anchor-
 age is everywhere good in Tatnaggonche Bay, regard being had to the size of the ves-
 sel and consequent depth required, but over towards the Mullegash side will be found
 the best sheltered from N E. winds.

Bound to Brule Harbor, after rounding Saddle Reef, steer for Brule Point, or a
 little to the East of it, until the mark for clearing the North east side of the Brule
 Shoal's, namely, the English steeple, John River a little open to the Northward of
 the Point comes on; then change the course, and run towards those marks till
 the Point bears S W, by W, when you may haul in S, by W, or S S W, and run
 on the lead along the South east side of the Brule Shoals, in from 31 to 37 fathoms,
 until you reach the position which has been pointed out as the best anchorage outside
 the harbor. A pilot, or a previous buoying of the Channel, would be necessary to take
 a vessel into the harbor. If bound to the anchorage off the bar of River John, it is
 necessary to run up the middle of John Bay till the water shoals to 31 fath-
 oms, which is as near as a large ship should go, although distant 1 1/2 mile from the riv-
 er mouth. Vessels of less but of considerable burden be moored in 21 fathoms half
 a mile further in, for the convenience of taking in lumber. In beating through the
 Western Passage, the West end of Saddle Island may be approached to 5 fathoms, but
 10 fathoms is near enough to its Eastern end. In the bound towards Saddle Reef, take

care to tick with Treen Bluff open to the Northward of Saddle Island, and in the hour to the Northward, towards Waugh Shoal, in 5 fathoms. When standing towards Amet Island, let the leading marks for clearing the shallow water off it to the N.W. and S.W. be attended to. Within the sound, the directions and remarks already given, together with the Admiralty chart, will afford sufficient guidance.

Middle Passage. THE MIDDLE PASSAGE, between Waugh Shoal and Amet Island, is a long mile wide, from 5 fathoms to 5 fathoms on either side, clear of all danger, and from 6 to 10 fathoms deep, with sand and mud bottom. An excellent leading mark for running through this passage with a fair wind, is Conn's House and Brule Point in one bearing S. by W.

With heaving winds, the leading marks and directions already given for clearing Waugh Shoal and Amet Island, will direct this passage of all difficulty or danger.

Eastern Passage. THE EASTERN PASSAGE, between Amet Shoals and Cape John, is a long three quarters of a mile wide, from 3 fathoms to 3 fathoms on either side, with very irregular soundings, from 3, to 6 fathoms, and with rock, red sand, broken shells, and mud bottom.

It is difficult to carry more than 4 fathoms through at low water. To safely take this passage from the Eastward with a fair wind, bring Cape John to bear to the Westward of S.W. by W., or bring that Cape and Brule Point to touch, bearing S.W. by W. 1/2 W., and steer for them till Treen Bluff opens to the Southward of Saddle Island, when change the course to W. 1/2 S., which is for the mouth of Tatamagouche Bay, and the vessel will sail nearly through the middle of the passage. There will be no danger from the Amet Shoals, if Treen Bluff be kept open to the Southward of Saddle Island; nor yet from the shallow water off Cape John, if it be not approached nearer than 4 fathoms, or at the utmost 3 1/2 fathoms.

These last remarks apply also to the case of a vessel heaving through this passage, and in taking it from the Northward, with a scant Easterly wind, the clearing-marks for the East end of the Amet Shoals will safely guide her.

Tides. It is high water, on the full and change, days in Amet Sound, at about 10h., and the rise is from 8 to 5 feet, according as it may be spring or neap tides. The tidal streams are very weak within the sound, setting regularly up the bays and rivers. In the Western Passage both tides in general set fairly through the flood about W. by N., and the ebb about E. by S., at rates never exceeding 1 1/2 knot, and usually much less. In the Middle Passage the ebbs sets out to the Northward and Eastward less than a knot, and the flood to the Westward, at the same rate, over the Waugh Shoals. In the Eastern Passage the ebbs sets out to E. N. E., and the flood in the opposite direction, the rates varying from a half to 1 1/2 knot.

From Cape John to the West Gully of Caribou (15 miles S. E. by E. 1/2 E.) the coast is nearly straight, unbroken, and free from danger, the shoal water nowhere exceeding beyond one third of a mile off shore. Chalks of clay and sandstone, not exceeding a height of 50 feet, and in general very much lower, form the predominating feature; but there is, nevertheless, good landing for boats almost everywhere in fine weather. From the West Gully to Caribou Point, 4 1/2 miles further to E. S. E., the coast formed by the Northern shore of Caribou Island, appearing from a distance like several islands, but on a nearer approach the wooded parts are found to be joined together by sand bars. The shallow water extends off shore here to the distance of half a mile, and 5 fathoms is near enough in a large ship.

Caribou Reef. CARIBOU REEF, of large stones, which dry out to the distance of 300 fathoms from the shore, is very dangerous, the deep water approaching very near its North point and Eastern side. It stretches out from Caribou Point to the N. N. E. half a mile to the 3 fathoms, and two thirds of a mile to the 5 fathoms line.

Doctor Island. DOCTOR ISLAND lies to the Southward of Caribou Point, forming two entrances into Caribou Harbor, of which the Northern, between two sandy spits, is 100 fathoms wide, but only 4 feet deep at low water.

Doctor Reef. DOCTOR REEF is very dangerous, stretching out from Doctor Point to the Eastward 1 1/2 mile, to the depth of 3 fathoms, and showing rocks dry at low water to the distance of half a mile.

Seal Rocks. To the Southward of this reef, and two thirds of a mile S. E. from Doctor Point, are the Seal Rocks, dry at low water, and from which the shallow water, forming the bar of Caribou Harbor, extends to Logan Point, the North Point of Pictou Bay.

Caribou Harbor. CARIBOU HARBOR, between Caribou and Doctor Islands, is too difficult and dangerous to be attempted without some special object, and then a pilot should be employed.

Tides. It is high water at Caribou, on the full and change days, at about 10h.; the unequal magnitudes causing at times a difference of nearly 2 hours in the two tides of the same day, and also several feet in the height of the water. The rise of the highest of the two ordinary spring tides of the same day is 6 feet, and of neap-tides 4 feet; there are therefore 15 feet over the bar at high-water, ordinary spring tides.

CARIBOU CHANNEL, has sufficient depth of water for the largest ships, and in breadth, at the narrowest part, exceeds a half or one third of a mile, according as we conceive it to be bounded on either side by the 3 fathoms or the 5 fathoms line; but it is, nevertheless, difficult, because so crooked that no marks can lead through its whole extent.

The safest mode of running through this channel to the Westward, is to strike soundings in 6 or 7 fathoms on the edge of the shoal water off Doctor Island, and follow it to the N.W. until Mackenzie Head is just shut in behind Logan Point, bearing S. E. W. Then steer from those marks, keeping the Head just shut in, and they will lead across the deep water, and afterwards along the Western edge of the Picton Island Bank out to sea. If the wind were strong from the S.W., with an ebb tide, it would be preferable to keep on the weather side of the channel, in which case the edge of the shoal water off Doctor Island should be followed further to the N.W., until Logan Point is only a little open to the Eastward of Doctor Point, bearing S. E. E. These points in one lead along the East side of Caribou Reef at the distance of a cable, and in 1 fathoms. Keep Logan Point a little open, and it will lead clear out to sea in not less than 12 fathoms. The same marks in reverse directions, taken in reverse order, will enable a vessel to take this channel from the Northward or Westward, it being only necessary to add, that she should not haul to the Eastward until the Hawks fall is well shut in behind Caribou Point, nor open out the former again after having shut it in, until the light house at Picton is open to the Southward of Cole Point. The light house and Cole Point in one, bearing S.W. by W. 3 W., being the mark for clearing the South extreme of the Picton Island Bank in 5 fathoms.

PICTON ISLAND BANK extends from Picton Island to the West and South 31 miles, and was supposed to reach across the whole distance of 4 miles to Caribou Point, before the channel last described was known. It is of a very irregular outline, of great extent, and of sandstone thinly covered with sand, gravel, mud, and broken shells. The shoals are as irregular as the nature of the bottom, being from 21 to 6 fathoms, excepting on the shoals now to be mentioned.

THE MIDDLE SHOALS are a chain of rocky patches, with 11 feet least water, stretching across the Northern part of the bank 11 miles, in a W. by S. direction, so as to approach within half a mile of the Caribou channel on the one hand, and within 1 mile of the West point of Picton Island on the other. I have little doubt that at least 21 fathoms of low water can be carried through between these shoals and Picton Island, although the very irregular soundings forbid absolute certainty. Rogers Point and West Point (Picton Island) bearing E. S. E. 1 E., will clear them to the Northward in 1 fathoms, but large ships had better not approach them on that side nearer than 7 fathoms.

PICTON ISLAND, 11 miles long, East and West, and 11 mile wide, is of clay and sandstone, rising in the central parts to the extreme height of 150 feet above the sea. It is wooded on the Northern side, but there are settlements and farms along its Southern shore. Low cliffs form its outline, with the exception of several small bays, and Rogers Point, on the South side, which is of sand, and affords the best landing for boats.

West Point may be passed in 3 fathoms within half a mile; but on either side of the West end of the island there are rocks nearly dry at low water, just within the 3 fathoms line, and extending to the distance of 300 fathoms off shore. The shallow water runs out occasionally to the same distance off the North shore of the island, which should not be approached nearer than 8 or 9 fathoms in the night time. The Southern shore may be approached to 5 fathoms; but off the East point a dangerous reef, in great part dry at low water, runs out half a mile to 3 fathoms, and nearly a mile to the 5 fathoms line. There are 9 fathoms not far off this reef, both to the Northward and Eastward; it should therefore be approached with caution at all times, but especially at night, and with a flood tide. In most of the old charts a shoal is laid down about 4 miles to the Eastward of Picton Island, but we have not yet been able to discover any indications of its existence.

On the East end of Picton Island there is a light house 52 feet high; it is a square white tower. The light is fixed; below it is a small red light.

PICTON HARBOR, in every respect the finest on the Southern shore of the gulf Estuary of Gaspé, derives additional importance from the coal mines, valuable quarries of building stone, and finely settled country in its neighborhood. It is situated 5 miles to the Southward of Caribou Point, and at the bottom of a bay, which is 1 1/2 mile wide at its entrance, from Logan to Mackenzie Head, and 1/2 mile deep. Mackenzie Head will be recognized by its sharp pointed cliff of clay and sandstone, 40 feet high, and by its bearing nearly South from Logan Point.

MACKENZIE SHOAL lies off the head to the N.E. by E., its outer edge being distant seven-eighths of a mile. It is a rocky bank, nearly one-third of a mile in diam-

Mackenzie Shoal.

ter, with 16 feet least water, and with 19 or 20 feet between it and the shallow water to the Westward. Large vessels should not attempt to pass within or to the Southward and Westward of it. The marks for clearing it to the Eastward at the distance of a cable, are Caribou and Doctor Points in one, bearing N. by W. $\frac{1}{2}$ W.; and the light-house in one with the Town Point at Pictou bearing West, will clear it to the Northward at the distance of 200 fathoms. The shallow water extends a long half mile out to the Northward from Mackenzie Head, and its edge in 3 fathoms, trends thence to the Westward towards the light-house, the whole bay on that side being shoal, with ridges of sand drying out to a considerable distance from the shore at low-water. In the bay, between Mackenzie Head and the light-house, and on the West side of Powell Point, is Boat Harbor, the entrance of an extensive inlet or lake, full of mud and weeds, and which boats can traverse only when the tide is in. On the opposite or Northern side reefs extend off Logan Point, to the East and South-east, a long half mile, to the line of 3 fathoms. The light-house and Cole Point in one, bearing S.W. by W. $\frac{3}{4}$ W., lead over the South-eastern extreme of these reefs in 11 feet at low-water, but vessels should not go nearer than 1 fathoms. Cole Point, which is of clay and sandstone cliff 30 feet high, and lies a short mile further in or to the S.W. from Logan Point, has also a reef stretching out to the S.E., one-third of a mile, and the shallow water continues from it Westward to the commencement of London Beach, on the North side of the entrance of the harbor.

Boat Harbor.

Cole Point.

Pictou Light-house.

THE LIGHT-HOUSE, of wood, painted vertically with red and white stripes, and showing a fixed light 65 feet above the sea, stands close to the water, at the extremity of the sandy spit forming the South side of the entrance.

It is lighted when the bay is free of ice, and has below the lantern a small red light.

Pictou Bars.

The distance across the harbor's mouth from the Sandy Spit to London Beach, is 200 fathoms, and 7 fathoms deep; but the channel over the inner bar is much narrower, and has besides a turn in it, which, together with the necessity of knowing exactly the set of the tides, renders a pilot indispensable in a large ship. Vessels running for the harbor must first pass the Outer Bar, which stretches from Logan Point to Mackenzie Head, and has 21 feet at low-water, over a bottom of sand. After passing this bar, the depth increases to 4, 5, and 6 fathoms in the distance of about a mile, and then suddenly decreases to 19 feet on the Inner Bar, which is also of sand, and distant about 100 fathoms from the light-house. After passing this inner bar, which is not above a long cable wide, the water continues deep to the entrance of the harbor. There is very good anchorage between the bars, although exposed to N.E. winds, and also in Pictou Road, which is outside of the outer bar, and where the depth is 5 fathoms, with clay and mud bottom. Vessels running or beating up to Pictou Roads at night, will find the soundings in the Admiralty chart sufficient guidance, when keeping the Southern shore aboard with the prevailing S.W. winds; and on the opposite side, or with Northern winds, will have the advantage of the following excellent leading-marks: Pictou Light can readily be seen in a clear night from a distance of 12 or 14 miles, and when in one with Cole Point bearing S.W. by W. $\frac{3}{4}$ W., clears the reef off the East end of Pictou Island, at the distance of a long half mile; and also the Southern extremity of the Pictou Island Bank in 7 fathoms; therefore, if beating, tack in the board to the Northward, the instant the light begins to disappear behind Cole Point; and if running, keep the light just open to the Southward of Cole Point, bearing W.S.W. until you strike soundings in the low-water depth of 5 fathoms, on the edge of the bank off Logan Point; then follow the same depth about $\frac{1}{4}$ mile to the S.W., taking care not to bring the light to bear to the Northward of West, and the vessel will be in safe anchorage in the road, where she may wait for daylight, or a pilot, according to circumstances. The branch pilots of Pictou are for the most part able and experienced men, and are always on the lookout for vessels. Although 19 feet at low-water, in ordinary spring-tides, can be carried over the inner bar, yet the aid either of buoys, or of an able and experienced pilot, would be required to insure that depth; but 17 feet may be safely reckoned upon, if the following brief directions are strictly followed; and the greater depth will be carried in, if the endeavor to follow them exactly has been successful: Having a fair wind, and being further out than Mackenzie Shoal, the position of which has been pointed out, bring the light-house in one with Town Point at Pictou, bearing a degree or two to the Southward of West; or, which will be the same thing, with Smith Point, the extreme of the land on the same side beyond the town. Run with those marks on until Logan and Cole Points come in one, bearing N.E., when instantly sheer a little to the Northward, sufficiently to bring Town Point in one with the North extreme of the Sandy Spit. Keep the last-named marks exactly in one, until the Roaring Bull comes in one with Mackenzie Head, bearing S.E. by E. $\frac{1}{4}$ E., when change the course smartly and run from those marks, keeping the Roaring Bull only just in sight, until the North extreme of Moodil Point (the first point on the South side within the light-house) opens out to the Northward of

This inner entrance of Olling Island, is 210 fathoms by the shoal of Olling

Sandy Spit; then haul to the Westward, at first towards the S.W. extreme of London Beach, and afterwards so as to pass midway between it and the Sandy Spit into the harbor.

A pilot would be indispensable in a large ship with beating winds, and even smaller vessels must know the tides and the place well to beat in or out with safety.

It is high-water at Pictou light-house, on the full and change days, at 10h.; and the rise is 6 feet in ordinary spring-tides, and 4 feet in neap-tides. With a good tide it is possible to carry 25 feet over the bar, and 23 feet may generally be reckoned upon; the harbor, therefore, is capable of admitting very large ships, but it must be remembered, that I always speak of the best of the two tides in the 24 hours for the diurnal inequality in the rise of the tides, which occurs more or less in all parts of the Strait, is very strongly marked in this harbor. I may add, that in the month of August, when our observations were made, the A. M. tides were always the highest, following the inferior transit of the moon with North declination in the first part of the lunation, and the superior transit with South declination in the latter part. The true or corrected establishment, as nearly as we could deduce it from the observations of one complete semi-lunation, was at 9h. 45m., mean time.

From the light-house to the usual anchorage, (in 6 or 7 fathoms, mud bottom) off the Eastmost wharves at Pictou, the channel of the harbor is direct, nearly one-third of a mile wide, deep enough for the largest ships, and clear of danger; the Admiralty chart will therefore afford all further information that may be necessary; for the vessel will be in safety, and may anchor anywhere within the light-house.

Sufficient water may be obtained here to supply the largest ships. The best water-place is on the South shore of the harbor, three-quarters of a mile within its mouth, and there is another opposite the coal-loading place in the East River.

THE TOWN OF PICTOU stands on the North shore of the harbor, 2 miles with-

in the light-house. Resuming our survey of the coast to the Eastward, the Roaring Bull, mentioned in the direction for Pictou, and distant 4 miles from the light-house, first claims our notice. It is the cliffy North point of a small peninsula, united to the main-land at its Western end by a sandy beach, and having at the other extremity the gully or entrance to Chance Harbor, dry, or nearly so at low-water. A reef of sandstone runs out to the N.E. from the Roaring Bull, 300 fathoms to the 3-fathoms line.

In the shoal bay between Evans and Colquhoun Points, which are distant 5 and 6½ miles respectively from Pictou light-house, are two narrow, dangerous, and intricate channels, leading through shoals into Little Harbor. Of these channels the Eastern and best turns sharp in to the Eastward, within Roy Island, and close round the Spit at its S.W. extreme. The other is only a foot or two deep, and leads into the Western part of the harbor, which is several miles in extent, and broken into bays, coves, and picturesque points, but only fit for boats, being nearly all dry at low-water, excepting the intricate and narrow channels.

Of the North shore of Roy Island, at the distance of 350 fathoms, and three-quarters of a mile N.W. ½ W. from Colquhoun Point, its East extreme, lies Roy Ledge, a small rocky shoal, with 9 feet least water. There is also a reef of sandstone in great part dry at low water, running out from Colquhoun Point half a mile to the Eastward; and as all these dangers have 5 fathoms close to them, vessels should be careful not to stand into less than 6 fathoms along this part of the coast. Roy Island, so called, is united at its East end to the main-land by a long and narrow sand-bar, stretching to the S.E. across the East end of Little Harbor, to within three-quarters of a mile of King Head, which is the West point of entrance to Merigomish Harbor, and 8½ miles to the Eastward of Pictou light-house.

MERIGOMISH HARBOR has 11 feet at low-water over its bar, and sufficient depth within for large ships; but it is so intricate and difficult of entrance that no directions would enable a stranger to take his ship in safely; and the Northerly winds send in so heavy a sea over the bar, that to get on shore going in would probably be attended with the loss of the vessel. The outer entrance of this harbor (three-quarters of a mile wide) is between King Head and Merigomish Point, the latter being the West extreme of Merigomish Island. The bar is formed by rocky shoals running out from these points of entrance, three-quarters of a mile to the Northward. The channel over the bar, and leading in from it between the shoals, is a long cable wide; but the shoals are so steep that the lead affords little guidance, and there are no leading-marks. The course running in is at first to the Southward, and then by a sharp turn to the Eastward close past Savage Point (the sandy spit at the S.W. extreme of Merigomish Island) into the harbor.

This inner entrance of the harbor, between Savage Point and the East end of Olling Island, is 240 fathoms wide; but the navigable breadth is reduced to 55 fathoms by the shoal of Olling Island, and the tides frequently run there at the rate of 5 miles an hour. Before the timber was exhausted, this harbor was frequented annually

Roy Ledge.

Merigomish Harbor.

by shipping, which usually land moored close to the sandy S. E. point of Olding Island, but at present it is seldom visited by anything larger than a coasting schooner. The pilots are therefore incompetent from want of practice, and the channel is no longer buoyed as it used to be formerly. The harbor is of great extent, running in 3 or 4 miles to the Eastward, within Merigomish Island, and the sand bar which joins it to the main land; and also 4 miles to the Westward, up a bay full of islands, coves, and precipitous headlands, which, together with well cultivated fields, backed by mountains 800 or 900 feet high, form scenery of unusual beauty. Several small streams enter the harbor, of which French River, opposite the East end of Olding Island, is the principal. It is approached by a very narrow channel, through flats of mud and weeds, and can be ascended by boats to the bridge, about a mile within its entrance.

French River

It is high water at Refry Point, the S. E. extreme of Olding Island, on the full and change days, at 10h. 6m., and the rise is from 3 1/2 to 4 1/2 feet, according as it may be spring or neap tides, but the diurnal inequality is strongly marked here, as well as at Pictou, causing a considerable difference in the times and the heights of the two tides on the same day.

Merigomish Island
Coal

MERIGOMISH ISLAND, 31 miles long by 4 1/2 mile broad, is of clay and sandstone, belonging to the coal formation, rising to the estimated height of 150 feet above the sea. Thin seams of coal may be seen at Coal Point, where the cliffs, which form the Northern shore of the island, are 35 feet high. Its Southern shore, where there are increasing settlements, is broken into coves, cliffs, islets, and peninsulated points, similarly to the Western part of the harbor. A sand bar, 2 1/2 miles long, unites the island to the main land to the Eastward, excepting in unusually high tides, when the water washes over one part of it into the harbor.

From Merigomish Harbor to Cape George, a distance of 27 miles to E. by N., the coast is bold and free from danger. The land, rising from the sea to the summit of a ridge 2 or 3 miles in rear of and parallel to the coast line, is well settled, the cultivation extending occasionally to the summit of a ridge, which attains the extreme elevation of 1100 feet above the sea.

There is no harbor in this distance, the wooden pier at the village of Arisaig affording shelter only to boats and shallops in Easterly winds, but none in winds from between North and West.

The remarkable rock called the Wren is nearly a mile to the East of this pier, and half a mile N. E. from Arisaig church, which last is 11 miles from the entrance of Merigomish.

Malignant Cove

Malignant Cove, which has a small stream at its head, affording good landing for boats, is 3 miles further to the Eastward, and will be known by the Sugar loaf Hill, a mile in rear of it, and 680 feet high above the sea at high water.

NORTHUMBERLAND STRAIT.

Prince Edward Island

PRINCE EDWARD ISLAND, separated from the Southern shore of the Gulf of the St. Lawrence by Northumberland Strait, is 102 miles long, and in one part about 30 miles broad, but the breadth is rendered extremely irregular by large bays, rivers, and rivers, or rather sea creeks, which penetrate the island so that no part of it is less than more than 7 or 8 miles from navigable water. Its shape is an irregular crescent, concave towards the gulf, the Northern shore forming a great bay, 94 miles wide and 22 miles deep, out of which the set of the tides and the heavy sea render it very difficult to extricate a ship when caught in the N. E. gales, which frequently occur towards the fall of the year, occasionally blowing with great strength and duration, and at such times proving fatal to many vessels.

West Coast of Prince Edward Island

THE WEST COAST OF PRINCE EDWARD ISLAND, from the North to the West point, (a distance of 33 miles S. W. by W.) is unbroken, and formed of red clay and sandstone cliffs, with intervening sandy beaches, affording landing for boats in fine weather. There are several ponds where boats can be secured, such as Nail and Black Ponds, and North and South Munnegash, but their outlets through sandy beaches, are all nearly dry at low water, and of no use to vessels. The shallow water runs out to considerable distances off various parts of this coast, and as a general rule for large ships, it should not be approached nearer than the depth of 11 fathoms at night, or in thick weather.

North Point

THE NORTH POINT, which is of low red cliffs, has a reef extending from it to the Northward and Eastward, 1 1/2 mile, to the depth of 3 fathoms, and nearly 2 miles to 5 fathoms, moreover rocky and irregular soundings from 10 to 6 fathoms continue for several miles further out to the N. E., causing at times a dangerous breaking sea. Vessels should therefore always give this reef a wide berth in thick weather, or at night, and thus, the soundings in the Admiralty chart will enable them to do, it is therefore only necessary to add, that it is most steep on the West side, where there are

to fathoms of the depth of half a mile from the side as the width of Nail Pond and low water extends 2 miles in length parallel to the shore, which is 15 miles from the shore, in the summer months.

THE WEST REEF, and with very irregular water in the middle of the bay from the West part of the shore, 1 mile between Munnegash reef, and as there are no ships rounding thick weather, by fall or to fall out, there is a passage with irregular soundings in a vessel. The strength of the tide, being influenced by the age of the moon, Shobae, and which runs on the outside at 2 1/2 miles per hour, east strength and direction.

THE WEST SPIKE, 10 feet of water, runs N. by E. within the mile. There is a "ward, and in which getting into this opening is not to approach.

THE WEST POINT, the good anchorage under the sand bottom.

EGMONT BAY is West Point to Cape E. of shore winds, in frost not anchor in less than because there is rocky lying just within the shore, whilst along the shoals.

On the Northern shallow water.

PERCIVAL AND, to boats and very small being approached by clear, and oyster beds, shallows. The tides flow

The Eastern side of fathoms in a large vessel extends a mile into the bay, to the depth of 5 miles to the depth of 11 fathoms along the ridge as saw mills, half a mile and running in to the S. and Cape Egmont, and hills a sand bar, in the shore, having very heavy Westerly gales, and is marked out by two small

at fathoms at the distance of one third of a mile. The inner part of the reef dries out half a mile from the point, affording shelter to fishing schooners, which shift from side to side as the wind changes.

Off Nail Pond and Nail Head, 6 miles S.W. by W. from the North point, the shallow water extends 2 miles from the shore.

MINNEGASH REEF is a ledge of rocks nearly dry at low water, and nearly a mile in length parallel to the shore, from which its outer edge is distant half a mile. It lies directly off the sandy beach, and across the outlet of North Amnuegash Pond, which is 15 miles from the North point. There are 93 fathoms of water between the reef and the shore, and vessels have in one or two instances been moored there during the summer months to take in cargoes of lumber, but it is a very unsafe place.

THE WEST REEF is a narrow and rocky ridge, 4 miles long North and South, and with very irregular soundings, from 21 to 5 fathoms. The least water, 16 feet, is near the middle of the reef, and there are 18 feet near its Southern extreme, which lies from the West point N.W. by W. 33 miles, and is distant 23 miles from the nearest part of the shore. Its Northern end is 33 miles off shore at the highest part of the tides between MacWilliam Cove and Cape Wolfe. There are no leading marks for this reef, and as there are 13 fathoms in one part close to its outer edge, it is very dangerous to ships rounding the West point, and can only be certainly avoided at night, or in thick weather, by following the edge of the bank of soundings off the main land in 9 or 10 fathoms, which will lead past it at the distance of 3 miles to the Westward. There is a passage within the reef, between it and the West Spit, but it is narrow, with irregular soundings and strong tides, and should therefore never be attempted in a large vessel. The strength and direction of the tidal stream about this reef are very irregular, being influenced by winds, varying also with the time of tide, and probably with the age of the moon; as may be inferred from the peculiar tides at Richibucto and Shelburne, and which also occur in Egmont Bay. In the deep water channel passing close to the outside of the West Reef, the rate of the stream sometimes amounts to 24 miles per hour, causing a heavy sea when running against the wind. The usual strength and direction is shown by the arrows on the chart.

THE WEST SPIT of sand upon sandstone, covered in some parts with only a few feet of water, runs out from the West point 3 miles to the N.N.W., and then turns N by E within the West reef, so that the latter overlaps it at the distance of half a mile. There is a "cul de sac" between the spit and the shore, open to the Northward, and in which there are from 6 to 4 fathoms of water. The only way to avoid getting into this opening, or within the West reef, when running down from the Northward, is not to approach the island nearer than the low water depth of 11 fathoms.

THE WEST POINT consists of sand hills 12 feet high. Excepting in the direct front of the spit, the shallow water does not extend from it very far, and there is very good anchorage under it in winds from between North and East, and in 4 fathoms, fine sand bottom.

EGMONT BAY is 17 miles wide and 8 miles deep, the course across it from the West Point to Cape Egmont being S. by E. 4 E. It affords excellent anchorage with off shore winds, in from 1 to 7 fathoms, over sand and clay bottom; but vessels should not anchor in less than 5 fathoms anywhere, excepting on the N.W. side of the bay, because there is rocky ground, with only 3 1/2 fathoms water off the river at its head, lying just within the 5 fathoms line, and at the distance of 3 miles from the shore, whilst along the Eastern shore, 5 fathoms would be too near the edge of the shoals.

On the Northern shore of the bay, Wolfe and Brae rivers are sandy places, dry at low water.

PERCEVAL AND ENMORE RIVERS, at the head of the bay, are also only useful to boats and very small craft, having a depth of only from 1 to 7 feet at low water, and being approached by exceedingly narrow and intricate channels, through flats of sand, clay, and oyster beds, which are dry in part at low water, and extend 1 1/2 mile from the shore. The tides flow about 5 miles up these rivers, between low and marshy banks. The Eastern side of Egmont Bay should not be approached to a less depth than 5 1/2 fathoms in a large vessel, for the shallow water off Rocky Point and the Bar of St. Jacques extends a mile from the shore. The church of St. Jacques is conspicuously situated 5 miles to the Northward of Cape Egmont, having the French or Acadian settlement along the ridge to the Northward of it, and the small river St. Jacques, with its saw-mills, half a mile from it in the opposite direction. Haldimand River, shallow and running in to the Southward about 2 miles, is about half way between the church and Cape Egmont, and has sand-hills on its West or outer point of entrance. From those sand hills a sand-bar, dry at low-water, extends 3 or 4 miles to the Northward, parallel to the shore, having very narrow channels through it, which are said to shift at times during heavy Westerly gales. At the time of our survey, the principal channel was pointed out by two small beacons on the shore, about a mile to the Southward of the

*Nail Head**Minneegash Reef**West Reef**Tides.**West Spit**West Point.**Egmont Bay**Perceval and Enmore Rivers.*

within Indian Spit, and in perfect safety. If the vessel be approaching from the Eastward with an Easterly wind, Sen row Head may be safely rounded at the distance of 2 or 3 cables, Graham Head may be passed at twice that distance, and then the edge of the shallow water off Salvation Cove may be safely followed by the lead, till we approach Indian Head, where the shoal becomes very steep, as in the Indian Spit, which however can frequently be seen, being dry at low water. At a short distance within Indian Island, the harbor is divided into two arms, of which the Northern, Wilnot River, is only 2 or 3 feet deep, obstructed by oyster beds, and crossed by a bridge 2 miles from the island. Vessels can enter the Southern arm 11 miles beyond the island, the channel then becomes obstructed by oyster beds, so as to leave only an intricate channel 1 foot deep at low water; through which the new vessel built at Mr. Pope's building yard, 13 miles higher up on the South shore, are taken at high water. Half a mile above Pope's Wharf, the river, which is called Duck River, divides into two narrow and shallow channels, crossed by bridges at the distance of a mile.

At high water, on the full and change days, at Green's Wharf, on the North side of Bechoque Harbor, opposite Indian Island, at 10h, the rise being 7 feet in spring tides, and 5 feet in neap tides.

From Sen row Head to Carleton Head, S S E $\frac{1}{2}$ E, 6 miles, and from the latter to Cape Traverse, S S E $\frac{1}{2}$ E, nearly 3 miles, the points are formed of red sandstone and clay chills, with coves between, affording shelter and landing for boats, and also anchorage for small craft, with the wind off the land, or in fine weather. The shallow water does not extend beyond 300 fathoms off either of the three above named headlands, but in the bays its 3 fathoms edge is sometimes twice that distance from the shore, and as the line of 5 fathoms is sometimes quite close to it, the general rule for vessels at night should be not to approach nearer than the depth of 7 fathoms. In the old charts a shoal with 3 fathoms water is shown off Carleton Head, but a diligent search has convinced us that it has no existence.

The first 4 miles Eastward from Cape Traverse there are 3 coves, namely *Trayost, Foxost and Augustin*, and Cumberland Coves, which are spanned by points of chert, and are dry at other Coves low water.

TRAYON RIVER lies a mile further in the same direction, between Tryon Head and Tryon Birch Point, and is approached by a very narrow channel through the Western side of *Bechoque* the Tryon Shoals. There is one foot of water over the bar of this channel at low water in spring tides; but the depth increases to 11 or 12 feet for a short distance within, and then the channel becomes still narrower, winding through beds of sand, mud, and weeds to the bridge, a distance of nearly 3 miles, following the channel. Small schooners enter Tryon with the assistance of the tide, which rises from 6 to 8 feet, and there are flourishing farms on each side of the river.

THE TRYON SHOALS, of sand upon sandstone, dry out 13 miles off shore, *Tryon* between Tryon and Brockelsby Rivers; and then S W extreme, in 3 fathoms, bears *Shoals* S by W $\frac{1}{2}$ W, and is distant fully 2 miles from Tryon Head, the nearest part of the shore. At the distance of one third of a mile N E, from the S W point of the shoal, there are only 2 feet of water over rocky bottom, and at twice that distance the sands nearly at low water. The S W point is steeper than any other part of these shoals, having 14 fathoms close to it, but there is, nevertheless, sufficient warning by the lead, since the depth of 5 fathoms is nowhere less distant than half a mile from their ledge. There is, moreover, an excellent leading mark, namely, Cape Traverse and Carleton Head in one, and bearing N N W $\frac{1}{2}$ W, which clears the S W point of the shoals in 5 fathoms, and at the distance of a long half mile. Further Eastward, these shoals may be safely approached by the lead to any convenient depth, so that it will be perceived that they are by no means so dangerous as they have generally been considered; nevertheless, the lead should never be neglected when in their vicinity, for the tides round the island meet off them, causing variations in the strength and set of the streams, which it would require long continued observations to understand or account for. The stream of ebb out of Bay Verte frequently sets over to wards these shoals, so that a vessel standing along the land with a spout Southerly wind, will often find herself slipping to leeward towards them much faster than her usual amount of leeway would lead her to expect.

CRAPAUD ROAD is a small but secure anchorage off the mouth of Brockelsby *Crapaud* River, and between the Eastern part of the Tryon Shoals and the land. The space in *Road* which vessels may ride in from 12 to 15 feet at low water, is about half a mile long by 2 cables wide; but the anchorage for small craft, in from 7 to 9 feet, is more extensive, continuing nearly a mile further to the Westward in a narrow channel or cove in the sands that dry at low water. The entrance to this road, between the Eastern point of the Tryon Shoals and the shallow water off the shore to the Eastward, is only 90 fathoms wide, and 9 feet deep at low water, spring tides.

To run for Crapaud Road, proceed as follows:—Bring the two white beacons that stand on either side of the entrance of Broekelsby River in one, bearing N. 4 P., and run towards them until Wright's barn comes on with the Western side of Paul Bluff, bearing N.W. 4 N.; when change course towards the last named objects, keeping them exactly in one; and when the vessel has run a cable's length, the marks for the steep Northern edge of the Tryon Shoals will come on, namely, Richard Point (the extreme to the Westward) in one with Birch Point, bearing N.W. by W. 4 W.—Let the course towards Paul Bluff and Wright's barn be continued for the distance of two cables further; then change course towards Birch Point or W.N.W.; and when you have run a cable's length, let go the anchor, and the vessel will be in the best berth, and in from 13 to 15 feet water, over sand and mud bottom that holds well. No sea of consequence ever comes into this anchorage, the sands outside being covered only to the depth of a few feet at high water, and the shallow water to the Eastward, off Inman Point and Broekelsby Head, overlapping the entrance.

Crapaud Tides.

It is high water on full and change days at 10h, and the rise is 8 feet in spring and 6 feet in neap tides; there is, therefore, a depth of from 15 to 17 feet at high water in the entrance or on the bar of the roadstead. The tidal streams are weak and irregular; in general, their rates do not exceed half a knot at the anchorage, but they sometimes amount to 1½ knot for a short time along the edge of the shoals and in the entrance.

Broekelsby River.

BROEKELSBY RIVER is all dry at low water, excepting a very narrow winding channel through mud flats, by which boats can ascend to the bridge, 1½ mile from the entrance.—The land rises to the height of 250 feet from the Eastern bank of this river; and the neighboring country is pleasing and well settled.

Broekelsby Head.

BROEKELSBY HEAD, 9 miles S.E. by E. from Cape Traverse, is the Eastern point of the bay in which the river and roadstead last described, are situated.—It has clay cliffs, 15 feet high, based upon sandstone, which run out a mile to the Southward, forming a dangerous reef, which must be carefully avoided by vessels approaching Crapaud from the Eastward.

Inman Rock.

INMAN ROCK, with 4 feet least water, lies near the outer point of the reef just mentioned, two thirds of a mile due South from Broekelsby Head, and with from 13 to 19 feet of water around it.—Large vessels should not approach it nearer than the low water depth of 4½ fathoms.

Marle Head.

MARLE HEAD, 2½ miles S.E. from Broekelsby Head, has also a reef running out from it nearly a mile, and which should not be approached nearer than 5 fathoms.

Sable Cove.

SABLE COVE, between the two last named headlands, is nearly dry at low-water, and crossed by a bridge one mile from its entrance.

From Marle Head to St. Peter's Island, a distance of 9 miles to the Eastward, the coast is straight and unbroken, and may be approached by the lead to 5 fathoms; bearing in mind that that depth is occasionally within 2 cables' length of shallow water, extending in some places three quarters of a mile out from the shore.

Hillsborough Bay.

HILLSBOROUGH BAY, having in it the principal harbor and capital town, and being the outlet of an extensive inland navigation, is the most important, as well as the largest, of any in the island.

St. Peter's Island.

ST. PETER'S ISLAND will be recognized by its position; but I may add, that it is rather more than 3 miles in circumference, and of very moderate height, having cliffs of red clay and sandstone, 35 feet high, along its Eastern shore.—There are several farms on either side; but the central parts of the island are thickly wooded. It is joined to Rice Point, the N.W. point of the bay, and from which it is distant 1½ mile, by sands dry at low-water; boats, therefore, can only pass between it and the shore with the assistance of the tide.

Shallow water extends off the island 1½ mile to the S.W. and S.; but the soundings, deepening out gradually, afford ample guidance in that part.—Further Eastward the St. Peter's Shoals become much more extensive, stretching out 3½ miles E. by N. from the N.E. point of the island.—For the first 2 miles of that distance St. Peter's Spit of sand dries out, affording shelter to St. Peter's Road, fit only for small vessels, having only from 9 to 12 feet at low water.—Off the end of the spit lies the Spit Head, a rocky shoal, with 8 feet least water, which extends to within a quarter of a mile of the East extreme of the St. Peter's Shoals, where the Spit-head Buoy is moored in 5 fathoms, with the following bearings: viz., the West side of the Government House in Charlotte Town, in one with Battery Point, bearing N. 4 E.; the North side of St. Peter's Island W. 4 S. and Gallows Point just open to the Northward of the dry spit of Governor's Island, S. E. 4 E.; but this dry spit can seldom be seen, and bearings alone to such distant objects are insufficient; therefore a beacon should be placed on the flat off the end of the dry spit, so as to form with Gallows Point a cross-mark, to insure the same position for the buoy every year.—The 5-fathoms edge of the bank, forming the Western side of the channel, trends due North 2½ miles from the Spit-head Buoy, to about a cable's length off Block-house Point, at the entrance of Char-

St. Peter's Shoals.

St. Peter's Spit.

Spit Head.

lotte Town Harbor. The lead in 5 fathoms as above, and must be up THE TROUT ROCK, and a long haul Government House, 11 feet water on the opposite or from Sea front Point, only a passage for boats. The edge of the opposite side, ten of a mile or half a fathoms or 3 fathoms where the rocky Squid Battery and Sea front side of the channel water, from near Sea on the opposite side; large ship, although Spout are touching; the end of the island.

GOVERNOR ISLAND, 8 miles S. by E. 4 E. from upon sandstone, and extending from it to the especially claim the sandstone reef is fathoms for an equal distance to the West extreme Buoy is moored with the Squid Battery Point in one, Island and Powell Point. TITZROY ROCK, part of the buoy, and gray led to the distance of these patches, 1 of the island, has the wall from 17 to 22 fathoms in 5 fathoms is, namely, the Presbyterian West side of Governor's retreat to the West. From Point, the S.E. to 13 feet high.

THE LIGHT-HOUSE 6 feet above the sea level at the distance when approaching from and Pinette Shoals, 10 fathoms with Peter's Island bearing N. 4 E. 5 miles; and PRIM ISLAND, extremity of the point, a point.

THE PRIM REEF and the point, so as to point, in 3 fathoms, other point, W. by S. 5 fathoms (which we out to the distance of

The Square Tower Point, bearing N. same church tower, in

Charlotte Harbor. The edge of the St. Peter's Shoals may be safely followed by the land in 5 fathoms as far in as the Spit head Buoy; after which the bank becomes steep, and must be approached with caution in a large vessel.

THE TROUT ROCK, with 7 feet least water, lies 2 cables within the edge of the bank, and a long half mile out from Block-house Point, which, kept in one with Government House, bearing N. by E. $\frac{1}{2}$ E., will just clear the rock to the Eastward in about 11 feet water.

On the opposite or Eastern side of the channel the shallow water is continuous, from Sea-front Point, at the entrance of the harbor, to Governor Island, there being only a passage for boats or small craft between that island and the land to the N.E. of it. The edge of the bank, in 5 fathoms, runs to the South from Sea-front Point to opposite the Spit head Buoy; consequently parallel, in this part, to the bank on the opposite side, leaving a channel from 7 to 12 fathoms deep, and either one-third of a mile or half a mile wide, according as we conceive it to be bounded by the 5-fathoms or 3-fathoms line. The bank is most steep opposite the Spit head Buoy, where the rocky Squa Shoal, with 10 feet least water, approaches close to its edge. Barney and Sea-front Points, in one, bearing North, form an excellent mark for this side of the channel, leading along the edge of the bank, in 44 fathoms least water, from near Sea-front Point to a quarter of a mile beyond the Spit head Buoy on the opposite side; but it had better not be followed further to the Southward in a large ship, although smaller vessels may do so, until Governor Island and Gallows Point are touching; bearing in mind, that it finally leads over the reef off the West end of the island.

GOVERNOR ISLAND lies 4 $\frac{1}{2}$ miles, E. by N., from St. Peter's Island; and 4 miles, S. by E. $\frac{1}{2}$ E. from Block-house Point. It is low, in great part wooded, based upon sandstone, and has dangerous shoals round it on all sides; but Governor Shoals, extending from it to the S.W., and adding greatly to the dangers of the navigation, more especially claim our attention. Stretching out from the West end of the island, the sandstone reef is dry at low-water for the first half mile, and has less than 3 fathoms for an equal distance further; after which, rocky and irregular soundings continue to the West extreme of the shoals, in 5 fathoms, distant 2 miles from the island. Fitzroy Buoy is moored in 4 fathoms, a cable's length within the West extreme of the shoals; with the square tower of the Presbyterian church at Charlotte Town and Battery Point in one, bearing N. by E. $\frac{1}{2}$ E.; and the N.W. extreme of Governor Island and Powell Point touching, and bearing E. by N.

FITZROY ROCK, with 20 feet least water, lies about a cable's length to the Eastward of the buoy, and was considered the principal danger off the island, until our survey led to the discovery of the much more dangerous rocky patches which are scattered over these shoals (rather to the Southward).

Of these patches, Huntley Rock, bearing S. by W. $\frac{1}{2}$ W., $\frac{1}{2}$ mile from the W. end of the island, has the least water, namely, 12 feet at low-water; but there are others, with from 17 to 22 feet of water, as far out as 2 $\frac{1}{2}$ miles, and the S.W. extreme of the shoals in 5 fathoms is distant 3 $\frac{1}{2}$ miles from the island. The mark for Fitzroy Buoy, namely, the Presbyterian Church and Battery Point, bearing N. by E. $\frac{1}{2}$ E., clears the West side of Governor Shoals in 5 fathoms, excepting the small portion of the West extreme to the Westward of the buoy.

Prim Point, the S.E. point of Hillsborough Bay, is low, with cliffs of sandstone 10 to 15 feet high.

THE LIGHT HOUSE, of brick, and of the usual conical form, shows a fixed light, 65 feet above the sea at high-water, and which can be plainly seen from the deck of a vessel at the distance of 4 or 5 leagues. It is of the greatest use to vessels, especially when approaching from the Eastward, guiding them, by its bearing, clear of the Rilleman and Pinette Shoals, and enabling them to enter the bay in the darkest night. It stands 10 fathoms within the S.W. extremity of the point, the West extreme of St. Peter's Island bearing from it N.W. $\frac{1}{2}$ W., 7 $\frac{1}{2}$ miles; the W. end of Governor Island N. E. 5 miles; and Bell Point (the extreme to the Eastward) S.E. $\frac{1}{2}$ S., 10 miles.

PRIM ISLAND, which has also low cliffs, is distant $\frac{1}{2}$ mile E.N.E. from the extremity of the point, and is united to its North side by sand-beaches, including marshy ponds.

THE PRIM REEF, of sandstone, runs out to the Westward, both from the island and the point, so as to form a forked reef, with very uneven soundings; its Northern point, in 3 fathoms, bears N.W. by W. $\frac{1}{2}$ W., 2 miles from the light-house, and the other point, W. by S. $\frac{1}{2}$ mile; but if we consider the reef as bounded by the depth of 5 fathoms (which we must do for a large ship), it is much more extensive, reaching out to the distance of 3 miles.

The Square Tower of the Presbyterian Church at Charlotte Town, in one with Battery Point, bearing N. 13° E., will clear the 3-fathoms extreme of Prim Reef; and the same church tower, in one with Block-house Point, bearing N. by E. $\frac{1}{2}$ E. will clear the

whole of the reef; but it is only in very favorable weather that such distant objects can be seen, and, therefore, the lead must be the main dependence; the soundings, combined with the bearing of the light, being amply sufficient for rounding the reef, as will be seen in the chart. Having thus described the dangers of the approach through Hillsborough Bay, I must add a brief description of the harbor, and then give the requisite directions.

Charlotte Town Harbor.

CHARLOTTE TOWN HARBOR is 428 fathoms wide at entrance, between the cliffs of Block-house and Sea-front Points; but shallow water, extending from both shores, reduces the navigable width of the channel, reckoning from 3 fathoms, to 230 fathoms; and as the shoals are very steep, it would require to be well buoyed before a large ship could beat in or out with safety. Cliffs of red sandstone, from 10 to 30 feet high, form the shores on either side, the land rising gradually from them in undulations, and being partly cultivated and partly wooded. An old block-house and signal-post stand on Block-house Point, the West point of entrance. The next point of cliff on that side as we proceed is Alehorn Point, and at the distance of half a mile from the Block-house, the remains of Fort Amherst may yet be seen on the hill, 93 feet above high-water. We have next Warren Cove and Farm, with Ringwood, the place of Captain Cumberland, and lastly, Canseau Point, with its white beacon, 41 mile from the block-house.

Canseau Shoal.

CANSEAU SHOAL, extends off Canseau Point to the distance of 350 fathoms, and will be cleared by keeping the block-house just open, clear of Alehorn Point; observing that the extremes of the cliffs of Block-house and Alehorn Point in one, lead over the point of the shoal in 16 feet at low-water. On the opposite or Eastern side of the entrance, and less than a mile within Sea-front Point, we have Battery Point, with its shoal; the latter running out 200 fathoms, and having on its extreme point a buoy moored in 3 fathoms at low-water. Outside that depth, on either side, the water deepens abruptly, and there are 13 fathoms in the middle of the channel. The Red Beacon and Presbyterian church tower at Charlotte Town, clear the shoal off Battery Point in 10 fathoms and at the distance of 60 fathoms. Within the harbor, in addition to the flats of mud and weeds extending off shore, there is the MIDDLE GROUNDS, with 17 feet least water, and for the situation of which I must refer to the plan of the harbor, remarking here, that the White Beacon on Canseau Point and McKinnon's log-house in one, lead through midway between it and the flat off the Southern shore.

Middle Ground, White Beacon.

Immediately within Canseau and Battery Points, which are the inner points of entrance, the channel expands into one of the finest harbors in the world, having depth and space sufficient for any number and description of vessels. In sailing in, we see before us York River, running in to the Northward; on our right the Hillsborough, stretching away to the E.N.E. as far as the eye can reach; and on our left Elliot River, running in to the Westward. The confluence of the streams of these three rivers, between Canseau Shoal and the mouth of York River, form THE THREE TIDES, where there is excellent anchorage, used occasionally by laden vessels preparing for sea, the usual anchorage being off the wharves of the town, where the channel is 280 fathoms wide, and nearly 10 fathoms deep.

The Three Tides.

CHARLOTTE TOWN is advantageously situated on the Northern bank of the Hillsborough, a short distance within its entrance and at the point where the deep water approaches nearest to the shore; its wharves, however, still requiring to be 120 fathoms long to reach the edge of the channel.

Charlotte Town.

It is high-water, on the full and change days, at 10h. 45m., and the rise in ordinary spring-tides is 94 feet, and in neap-tides 7 feet. Their rise is considerably influenced by the winds, so that we have seen spring-tides during N.E. gales rise 11 feet, and neaps during S.W. gales only 6 feet; but these were extraordinary cases. The duration of the two tides is nearly equal, and their streams continue about a quarter of an hour after high and low water by the shore; running usually at the rate of 11 knots off the town, and 21 knots in the entrance of the harbor.*

Charlotte Town Tides.

Of the three rivers that unite in the harbor, the HILLSBOROUGH is the largest, being navigable for the largest ships to the distance of 7 or 8 miles, and for small vessels 14 miles above Charlotte Town; where there is a bridge 2 miles from the head of the river. There is a portage of less than a mile across, from the Hillsborough, near its head, to Savage Harbor, on the North coast of the island.

Hillsborough River.

* As we continued our observations here hourly, through 11 semi-lunations, with an accurate tide-gauge, it may be useful to put on record the following resulting particulars:—

The Corrected Establishment was 10h. 18m. The A. M. tide being 10h. 24m. and the P. M. tide 11h. 7m. after transit; the mean being 10h. 45m. The mean duration of the flood (by 24 observations) was 6h. 14m., and of the ebb 6h. 14m., the flood being rather the longest; as if the evaporation more than compensated for the tridling supply of fresh water added by the small streams, which discharge into the sea-creeks or inlets. It is worthy of remark that the diurnal inequality in the heights of the alternate flood-tides, so strongly exhibited at Picton, &c., is here only slightly shown, but may be plainly observed in the ebb-tides, or in the difference of the levels to which the alternate tides descend.

YORK RIVER, the smallest of the three, is crossed by Poplar Island bridge, 2½ *York River.*
miles from its mouth. Elliot River may be ascended 4 or 5 miles by large ships, *Elliot River.*
and 10 miles by small craft and boats. The shores of all three rivers are settled,
and the country generally fertile.

POWELL BAY is shallow and open to the Westerly winds; it affords shelter to *Powell*
small craft and boats near its head, which dries extensively at low-water. *Bay.*

GALLOW'S POINT, separating Powell and Orwell Bays, has a long reef of sand- *Gallows*
stone, and extensive shoals off it, on which are scatt'ed rocks covered with only a *Point.*
few feet of water. These shoals extend in the direction of Governor Island, to the
distance of 2 miles, and also a long mile, towards Point Prim. There is, more-
over, a detached shoal, with 13 feet least water, bearing W. ½ N., 2 miles from Gal-
lows Point.

ORWELL BAY, leading to Orwell, Vernon, and Seal Rivers, is 2 miles wide at its *Orwell Bay*
entrance, between Gallows and Buchanan Points; the latter on the Southern shore
being 5 miles within or to the Eastward of Prim Point.

PINETTE HARBOR, 4 miles Eastward from Prim Point, has only 2 feet at low- *Pinette Har-*
water over its rocky and exceedingly dangerous bar. The bar is nearly a mile out *bor.*
from the entrance, and the PINETTE SHOALS reach to double that distance; their *Pinette*
outer point, in 3 fathoms, extending several cables' length beyond the line joining *Shoals.*
Prim Point, and the extreme to the South-eastward, and bearing from Pinette Point
W.S.W. 2 miles. There are only 9 feet of water just within this point, and only 3
feet at no great distance, the bottom being rock. These shoals are therefore very
dangerous, and should not be approached nearer than the low-water depth of 6 fath-
oms. It is high-water, on the full and change days, at Pinette, at 10h., and the rise is *Tides.*
8 feet in spring and 5 in neap-tides.

FLAT RIVER, which is only fit for boats, is 3 miles to the S.E. from Pinette. *Flat River*
Shallow water extends off Maedougal Point, its Eastern point of entrance, to the dis-
tance of a mile.

THE RIFLEMAN REEF, of sandstone, stretches out to the distance of 2 miles *Rifeman*
from Stewart Point, which bears from Prim Point S.E. ½ S., 9 miles. On the ex- *Reef.*
treme outer point of this reef, in 3 fathoms, Prim light bears N.N.W. ½ W., 8 miles,
Maedougal Point N.N.E., and Stewart Point E. ½ S., 2 miles. Just within this point

there are 8 feet of water, and half-way between that and the shore only 5 feet, while
between those and other shallow patches there are 12 feet at low-water. The very
irregular soundings off this reef, and the deep water close to it, (16 fathoms within less
than half a mile,) while there is a much less depth further out, render it one of the
greatest dangers in the strait. The bearing of the light on Point Prim will greatly
assist vessels in avoiding it: but at all times, either by night or by day, and especially
in thick weather, it should be approached with care. There are no leading-marks for
its West extreme, which has 7 fathoms close to it: but the soundings give better warn-
ing there than further to the Southward. The wooded point, within and opposite the
Wood Islands, in one with Black Point, the extreme to the Eastward, bearing E.S.E.,
lies clear the Southern side of the reef; but the safest plan, when approaching it from
the Southward, will be to tack, as soon as the extreme of the land to the Eastward
appears within the Wood Islands, bearing E.S.E. ¾ E., when the vessel will be 1½ mile
from the reef.

When standing towards the reef at night, take care that Prim light is not brought
to bear to the Westward of N.N.W. If the light is not seen, a close attention to the
soundings can alone insure safety. Observe, in standing across the strait from the
Southward towards the reef that, after having upwards of 20 fathoms towards the
Southern shore, the soundings will decrease to between 11 and 9 fathoms for several
miles, and then suddenly increase again to from 11 to 16 fathoms. When the vessel
arrives at this deep water she will be less than a mile from the reef, and if she ventures
across it to 10 fathoms, she will be distant only 300 fathoms from its edge.

BELL POINT, a mile South-east of Stewart Point, and the extreme from Prim *Bell Point*
Point, is a cliff of sandstone 40 feet in height. The shallow water is continuous from
the Rifleman Reef to this point, from which it extends a mile to the 3-fathoms line,
having 9 or 10 fathoms close to its edge.

THE INDIAN ROCKS, considering them to be bounded by the depth of 3 fathoms, *Indian*
occupy a space of 1½ mile in length, parallel to the shore between Bell Point and the *Rocks.*
Wood Islands, and half a mile in breadth. They are of sandstone, dry to a consider-
able extent at low-water, and their Southern edge is 1½ mile off shore. The S.E.
extreme of these rocks bears S.W. by W., nearly a mile from the West end of the
Wood Islands, and will be cleared to the Southward if the S.E. point of those islands
be not brought to bear to the Eastward of E.N.E. The Western extreme of the rocks
bears from Bell Point S. by E. 1½ mile, and Maedougal and Pinette Points in one,
bearing N. by W. ½ W., will clear it to the Westward, at the distance of three-quar-
ters of a mile; but Pinette Point cannot always be distinguished. The want of

part of this extensive and irregularly shaped reef, which has 7 or 8 fathoms close to its edge, and is therefore very dangerous to vessels rounding the Cape at night or in foggy weather, when they should not approach nearer than 10 fathoms, either to the Eastward or Southward of the reef.

There are no close leading-marks for passing to the Eastward of this reef; but Panmure Head and Terras Point in one, and bearing N. 3 E., clear it the distance of one mile in that direction.

To clear its Southern side Guernsey Point must be kept well open to the Southward of Blackrock Point.

FISHERMAN'S BANK, which was first examined and laid down by us in 1844, *Fishermen's Bank.*

is a sandstone, thinly covered with stones, gravel, and broken shells. Within the depth of 10 fathoms, it is 3 miles long East and West, by $\frac{1}{2}$ mile broad; but the shallow central part, with from 4 to 5 fathoms at low-water, covers scarcely half that space. The least water, 4 fathoms, bears from Murray Head, the nearest land, E.S.

$7\frac{1}{2}$ miles; and there is another patch with 5 fathoms three-quarters of a mile further East. There are irregular soundings, from 10 to 20 fathoms, between this bank and Bear Reef, and in every other direction around it from 15 to 20 fathoms. It is very dangerous to large ships when there is a heavy sea running, and should not then be approached nearer than 13 fathoms, which, in most parts, is close to its 10-fathoms edge, and little more than half a mile from the shallow water. The steeple of the English church at George Town in one with Panmure Head, bearing N.N.W. $\frac{1}{2}$ W., leads over the bank in 5 fathoms; but the church can seldom, if ever, be seen from the bank, being distant from it 15 miles.

MURRAY HARBOR has an exceedingly dangerous bar of sand, over which 10 *Murray Harbor.* fathoms can be carried at low-water in ordinary spring-tides; but strong Easterly winds and in so heavy a sea as to render it at times impassable, a line of breakers extending across the bay from Murray Head Northward to Cody Point, a distance of nearly 24 miles.

On the outer edge of the bar a Buoy is moored in 3 fathoms, with the White Beacon on Oldstore Point (the sandy South point of entrance) in one with the black ball on the white gable of the Transit Barn, bearing W.S.W. $\frac{1}{2}$ W. The barn stands on the Southern shore of the harbor three-quarters of a mile within the entrance, and when in one with the beacon leads in through the deepest water. There is, moreover, an inner buoy in the fairway, half a mile within the outer one, which is intended to enable vessels to run in when hazy weather prevents the leading-mark from being seen.

Proceeding in from the bar, the channel, between sandy shoals extending from the shore on either side, contracts gradually in breadth to 60 fathoms, and expands again to 200 fathoms within the entrance. The depth also gradually increases, after passing the bar, to 6 fathoms, as we pass close to the steep sandy beach of Oldstore Point, on which the beacon stands. To run in proceed as follows:—Look out for the inner buoy, or, being in not less than 5 fathoms, bring the White Beacon and the black ball on the white gable of the Transit Barn in one, bearing W.S.W. $\frac{1}{2}$ W., and keep them so exactly until the vessel arrives within 200 or 150 fathoms of the beacon, when haul a little to the Northward, so as to pass Oldstore Point at the distance of 20 or 30 fathoms, and anchor within, or to the West of it, at any distance not exceeding one-quarter of a mile; because, further in, the channel which passes to the Southward of the islands becomes very intricate, and would be difficult to follow without a pilot.

The depth, in the anchorage recommended, is from 3 to 5 fathoms, with sand and clay bottom, and a tide of 2 knots. It is high-water, on the full and change days, at 9 $\frac{1}{10}$ *Tides.* hours after the moon's transit, and the rise is 6 $\frac{1}{2}$ feet in spring tides, and 3 $\frac{1}{2}$ feet in neap tides. The entrance of Murray Harbor, between Oldstore Point and the long sandy spit that runs out to the S.W. from Cody Point, is more than half a mile wide, and is all nearly dry at low-water, excepting the channel already described. Within

the entrance the harbor is of great extent, containing five wooded islands, and several pens or sea-creeks on either side, besides the main inlet, Murray River, which is much larger than the rest, and navigable to the distance of 6 miles from the entrance, or nearly to the dam which has been constructed across it near its head. There are flourishing settlements all around, the principal one being at South River, where the English Episcopal church, distinguished by its steeple, will be seen on the Southern shore, 2 miles within the entrance of the harbor. *Murray River.*

Proceeding with our survey of the coast from Murray Head, a distance of 4 $\frac{1}{2}$ miles, *Graham Point and Ledge.* N.E. $\frac{1}{2}$ E., brings us to Graham Point, from which Graham Ledge runs out one mile in 3 fathoms, and three-quarters of a mile to 3 fathoms. The shallowest part of this ledge, with 6 feet least water, bears E.N.E., 400 fathoms from the extremity of the point. There is also a rocky shoal one mile further to the Northward, which runs out two-thirds of a mile from between Terras and Smith Points, and foul ground with from 4 to 5 fathoms at low-water extends off the latter to the distance of $\frac{1}{2}$ mile. The soundings are very irregular off this part of the coast, between Graham Point

and Pannure Head, varying from 13 fathoms, mud, to 5½ fathoms, rock, until we get beyond 3 miles out from the shore.

*George
Town Har-
bor.*

GEORGE TOWN HARBOR, sometimes called Three Rivers, is situated on the S.W. side of Cardigan Bay, 3 miles within or to N.W. by N. from Pannure Head, which is distant 9 miles to the Northward from Cape Bear. It is the finest harbor in the Southern part of the gulf, excepting Charlotte Town, having depth of water and space sufficient for the largest ships. The rise of ordinary spring-tides being only 5 feet, is a great advantage as compared with Charlotte Town Harbor, but, on the other hand, the ice does not, in general, form in it so soon in the fall by several weeks, and also breaks up earlier in the spring, so that vessels can enter it later and leave it earlier, which is an important advantage in a climate where the navigation is closed by ice for so long a portion of each year. The channel leading to the entrance of the harbor passes between the shoals off Pannure Island and Cardigan Point. A brief description of these shoals, and the objects for avoiding them, will be useful in illustration of the chart, and to render the directions intelligible.

*Pannure
Ledge.*

PANMURE LEDGE, of sandstone, covered by only a few feet of water, runs on 600 fathoms from Pannure Head, the East extreme of Pannure Island, to the depth of 3 fathoms; and its outer extreme, in 5 fathoms, and 900 fathoms off shore, will be just cleared by keeping Graham Point and Murray Head in one, bearing S 8½ W. ¼ W.

*Pannure
Island.*

PANMURE ISLAND is about 2 miles long by one mile broad, in great part wooded, and has cliffs of red sandstone 40 feet high along its North-eastern shore. It is joined to the land to the Southward by a narrow sand-bar always above water, and more than a mile in length. Within this bar is St. Mary Bay, and farther Westward Sturgeon and Livingstone Bays; all three having a common entrance to the North-west of the island, between Pannure Spit and the shoal off Grave Point, and which, although very narrow, has depth of water sufficient for the largest ships.

*Pannure
Shoal and
Spit.*

PANMURE SHOAL extends to the distance of two-thirds of a mile off the Northern shore of the island; and PANMURE SPIT, which forms the Western side of the shoal, and is of sand, dry at low-water, equally as far to N.N.W. from Billhook Point, the N.W. extreme.

The Pannure Buoy (white) is moored close to the steep edge of the shoal, in 5 fathoms, with McDonald's house and store, on the West side of the island, just off to the Westward of Billhook point, bearing S. by W. ¼ W., two-thirds of a mile; and the English Episcopal steeple at George Town on with the East side of the Thrumcap bearing N. by W. ¼ W. The Pannure Shoal and Spit, and farther in the equally steep shoals off Grave and St. Andrew's Points, form the dangers on the South side of the entrance channel to George Town Harbor.

*Cardigan
Shoal.*

On the opposite side we have the CARDIGAN SHOAL, extending to the South and East from Cardigan Point, which separates Cardigan River from the harbor. This extensive shoal is of sandstone, and has only one fathom at low-water, three-quarters of a mile out from the shore. At the distance of one cable farther out there are 2 fathoms, and the Red Buoy, moored on its S.E. extreme in 5 fathoms, is distant ½ mile from the low cliffs at the extremity of the point. At this buoy Pannure Head (distant ¼ mile) should be in one with Ferras Point, bearing S. ¼ W.; and Ferras Point should be seen over the sandy spit of Aikin's Point, and in one with its wooded extreme, bearing N.W. by W. ¼ W. At the distance of one mile W. by N. from the Red Buoy, and on the S.W. extreme of Cardigan Shoal, a Black Buoy is moored in 5 fathoms, with Cardigan Point bearing N.N.E. ¼ E.; Bradenell Islet and Gull Point touching and bearing N.W. ¼ N.; and the White Buoy on Pannure Shoal S.W. ¼ W., distant one quarter of a mile. In a direct line from the red to the black buoy, the Cardigan Shoal, there is not less than 3½ fathoms, and the Southern edge of the shoal in 5 fathoms, may be followed by the lead from the one to the other. From the black buoy the Western edge of the shoal trends Northward to within one cable of the shore, sheltering the outer anchorage (in 5 fathoms, mud bottom) between it and the knoll.

Tr. Knoll.

THE KNOLL, a small sandy shoal, probably based upon sandstone, and with 900 feet of water, lies just outside the entrance of the harbor, and directly in the way of vessels. To enable vessels to beat in and out with safety, a buoy should be placed at its S.W. extreme, with the following marks and bearings; namely, Boughton Island and Cardigan Point touching, and bearing E. ¼ N.; Grave and Thornton Points in one, S.W. ¼ W.; the West side of the Thrumcap N.N.E. 425 fathoms; Cardigan Black Buoy S.E. ¼ E. nearly one mile; and lastly, the Thrumcap Black buoy, (if properly placed), N.N.W., 370 fathoms, and in one with Guadin Point.

*Thrumcap
Shoal.*

THE THRUMCAP SHOAL runs out from the Thrumcap (which is a small wooded and cliffy islet joined to the Eastern point of entrance of the harbor by a sand-bar) 4 fathoms, in a W. by S. direction. On its S.W. extreme, in 3 fathoms, a Black Buoy is moored with the cupola of the Roman Catholic church and the steeple of the

English Episcopal church N., and the beacon and dry at low-water harbor, preventing a Thrumcap and St. Andrew's Shoal, but the shoals narrower at the Knoll Cardigan and Pannure bounded by the depth of the harbor is Guadin Point, having The usual and best anchorage Shoal, in 5 fathoms and will find 2½ fathoms GEORGE TOWN Harbor of the harbor; From what has been appear manifest that would be required to clear the intelligent chart, the foregoing observe that, in ad- inner end of White- centre of his house, b- gan Shoals nearly i- in one, bearing N.N. the harbor.

Having, therefore, East to N.E., proceed- Approaching from t- for Island, at the f- the beacon and White- as the vessel arrives y- in one, and steer for - so. lish Episcopal church in one, bearing N. 4 E.; the N.W. side of the Thrumcap E. by N., and the beacon at Whiteman's Wharf S.W. 7 S. This shoal, which is of sand, and dry at low-water nearly all the way out to the buoy, completes the shelter of the harbor, preventing any sea of consequence from rolling in. The entrance, between the Thrumcap and St. Andrew's Point on the South-western shore, is two-thirds of a mile wide, but the shoals diminish the breadth of the channel to 230 fathoms, and it is still narrower at the Knoll, where it is scarcely 200 fathoms; whilst further out still, between Cardigan and Pannure Shoals, it is no more than 250 fathoms; considering it to be bounded by the depth of 3 fathoms on each side. Within the Thrumcap the Northern shore of the harbor forms a bay three-quarters of a mile wide, the N.W. point of which is Gaudin Point, having a sandy spit running out from it one-quarter of a mile to S.W. The usual and best anchorage for large vessels is between this spit and the Thrumcap Shoal, in 5 fathoms, and; but smaller vessels may anchor further within the bay, and will find 27 fathoms within the distance of one cable from the wharf at the town.

GEORGE TOWN, the capital of King's county, is well situated on the Northern shore of the harbor, just to the Eastward of Gaudin Point. *George Town.*

From what has been said of the narrowness of some parts of the channel, it will appear manifest that a competent pilot, acquainted with the set of the tides, &c., would be required to beat a large ship in or out, but with a leading wind and fine weather the intelligent seaman will find no difficulty, with the aid of the Admiralty chart, the foregoing description, and the following brief directions:

Observe that, in addition to the aid afforded by the buoys, there is a beacon at the inner end of Whiteman's Wharf on St. Andrew's Point, which, kept in one with the centre of his house, bearing N.W. by W. 4 W., leads in between Pannure and Cardigan Shoals nearly in mid-channel, until Brudenell Islet and Doctor's Point come in one, bearing N.N.W. 4 W.; when the last-named objects kept touching lead into the harbor.

Having, therefore, a fair wind, that is, any wind from S.W. round by South and East to N.E., proceed as follows:

Approaching from the Eastward, pass Boughton Point, the S.E. extreme of Eough-*Directions*
ton Island, at the distance of one mile; steering W.N.W. 4 W., and looking out for the beacon and Whiteman's house, which will be a little on the starboard bow. As soon as the vessel arrives within one mile of Pannure Island, bring the beacon and house in one, and steer for them N.W. by W. 4 W., or as may be necessary to keep them so. When Pannure Head and Terra's Point come in one, the red buoy on the Cardigan Shoal should be seen bearing N. 4 E., and distant half a mile, and the vessel should be in 7 or 8 fathoms water. At the same time, the black buoy of the Cardigan and the white buoy of the Pannure Shoal should be seen on her starboard and port bows respectively, and at the distance of one mile. Continue to run towards the beacon and house exactly in one (passing between the last-named buoys) until you have approached within half a mile of the beacon, when Brudenell Islet and Doctor's Point will be seen (up Brudenell River to the N.W. of the town) touching and bearing N.N.W. 7 W. If you can now see the Thrumcap Buoy, which should bear N. by W. 4 W. two-thirds of a mile, you will have only to steer so as to give it a berth of one cable as you pass to the S.W. of it into the harbor. But if the buoy be not seen, run towards Brudenell Islet and Doctor's Point touching, until the Roman Catholic church cupola is seen well to the N.W. of the English Episcopal church steeple, or until the latter bears not less to the Eastward than N. by E. 4 E., where you may haul towards it, and choose your berth in from 6 to 3 fathoms, over mud bottom.

Approaching from the Southward, round Pannure Ledge by the lead in 7 fathoms, or by keeping Murray Head open to the Eastward of Graham Point till the North side of Pannure Island bears as far to the Westward as N.W. by W. 4 W., when the vessel may haul in to the North-westward, following the Northern edge of the Pannure Shoal until the Beacon and House can be made out, and brought in one, as before directed. If it should so happen that, from thick weather, or other cause, the Beacon and House cannot be seen, the Northern edge of Pannure Shoal may safely be followed by the lead, in 6 fathoms, to within half a mile of the White Buoy, when the shoal becomes too steep to be safely followed further. In like manner the Southern edge of Cardigan Shoal may be followed, from the Red Buoy to the Black Buoy on its S.W. extreme, as I have already remarked; and the vessel may either bring up, in the outer anchorage, half a mile within the latter in a line towards the Thrumcap, or proceed into the harbor, as may be expedient. Between Gaudin Spit and Aitkin's Point the channel of the harbor is only 175 fathoms wide, from 3 fathoms to 3 fathoms, and 3 fathoms deep; but it expands again immediately, affording excellent anchorage all the way to Brudenell Point, one mile above the town.

Almost all kinds of supplies may be obtained at George Town, but fresh water in large quantities only from wells, as in most other parts of the island.

Tides.

It is high-water on the full and change days at 8h. 40m. after the moon's transit, by the mean of the morning and evening tides; the latter being generally the latest by about an hour in the summer months. The rise is 5 feet in spring, and 3½ feet in neap tides.

Boughton Island.

BOUGHTON ISLAND, not quite so large as Panmure Island, is united on the North-east side to Bruce Point by a dry sand-bar one mile in length, and is divided into two parts, of which the Southern, one-third of a mile long, is joined to the remainder by a double bar of sand and shingle inclosing a large pond.

Boughton Ledge.

BOUGHTON LEDGE runs out at this bar to the distance of 600 fathoms to the Eastward, and has rocks near its outer extreme which always show. Boughton Point, the North extreme of the island, is a cliff of red sandstone, 30 feet high, and has a rock that dries off it, and shallow water to the distance of half a mile.

Rocky and irregular soundings, 4 to 5 fathoms, run out to E.S.E. still further, and therefore a large ship, at night or in thick weather, should not round the point in less than 9 or 8 fathoms.

Off the West side of the island, a bank, with from 3 to 5 fathoms, extends to the distance of 1½ mile; and further to the Westward there are dangerous shoals, which, together with Boughton Spit, and the Mosquito Sands, extend along the N.E. shore of the bay nearly to Maitland Point at the entrance of the Cardigan. There are narrow and intricate channels between these shoals and the land to the Northward, which lead into Launching Bay. Large ships should not stand into less than 5 fathoms at low-water on this side of the bay.

Off Boughton Sand-bar and Bruce Point, the shallow water extends two-thirds of a mile, and in Boughton Bay the line of 3 fathoms is a mile out from the shore.

Boughton or Grand River.

BOUGHTON OR GRAND RIVER, 5 miles N.N.E. from Boughton Point, has a dangerous bar of sand one mile out from its entrance, and over which 6 feet, at low-water, ordinary spring-tides, can be carried in a very narrow channel marked out by buoys.

Little and Fortune Rivers, Rollo Bay and Colville River, Colville Bay.

LITTLE RIVER, FORTUNE RIVER, ROLLO BAY, AND COLVILLE RIVER occurring in order as we proceed along the coast to the N.E., are tide inlets nearly barred up with sand, and having small streams at their heads; they are places only fit for small craft and boats, having from 3 to 5 feet over their bars at low-water.

There is good anchorage in Colville Bay with off-shore winds. Sharp cliffy headlands and points of red sandstone separate the bays in which these rivers are situated, the cliffs being from 25 to 50 feet high, and the shallow water off them not extending beyond the distance of 200 fathoms, excepting at Eglington Point, (separating Bay Fortune from Eglington Cove,) where the reef is very shallow for the first 400 fathoms out from the shore, and continues 600 fathoms further, with from 3 to 4½ fathoms, over rocky bottom; but this is within the line joining Howe Point and Souris Head, and therefore out of the way of vessels running along the coast. To the Eastward of Colville Bay the coast is bold and free from danger, excepting Harvey Reef, which extends 400 fathoms from Harvey Point, and has on it Shallop Rock, which always shows. Harvey Point is 5 miles from Colville Bay, and will neverover be known by its being the Eastern point of Harvey Cove, in which there are some very remarkable and high sand-hills. At Basin Head, one mile further to the Eastward, the cliffs terminate, and sand-hills and sandy beach form the shore nearly all the way to the East Point, a distance of nearly 9 miles.

East Lake.

In this distance the East Lake is all that requires notice. It is a shallow and narrow pond, within the sand-bars, extending from Basin Head to within two miles of the East Point, and having a narrow outlet (two miles from the Head), which is nearly dry at times at low-water. Boats and small craft enter it for produce, the country being well settled along its Northern shore. It is high-water, full and change, at 8½ hours, and the rise is 2½ feet in spring tides, and 2½ feet in neap tides.

*Tides**East Point.*

THE EAST POINT is a cliff of red sandstone from 30 to 60 feet high, from which a reef runs out two-thirds of a mile to 3 fathoms, and not quite a mile to 5 fathoms. In vessels approaching this reef at night, it should be remembered that the flood-tide comes from the Northward, setting strongly upon and over it, and a Corwards South-westward between it and Milne Bank, at the rate of 2½ knots. There is frequently a great ripple off the point, but the reef does not extend further than has been stated. The depth of 20 fathoms is as near as a large ship should approach when the land cannot be seen at night or in foggy weather. The anchorage is not good to the Northward of the point, the ground being either loose or rocky; but to the Southward of it there is good riding with Northerly winds as far Westward as the East Lake Outlet, in a moderate depth of water, and over a bottom of red sand. The tides run at the rate of 2½ knots between the North end of Milne Bank and the point, but are not nearly so strong further to the Westward.

Milne Bank.

MILNE BANK, if we consider it to be bounded by the depth of 10 fathoms, is 5 miles long, N.N.E. and S.S.W., and 1½ mile broad; the bottom being of sandstone chiefly covered here and there with red sand. The soundings are irregular, between

and 9 fathoms, over the close to the outer edge are less than 5 fathoms, and at low-water, in some places, are less than 2 fathoms; and South from Head and Dean Point, and Swanton Point, and Southward in the same manner, a person very well acquainted with the coast, the extreme South end of the bay, is 4½ miles; and the North end of the bay, the water being close to the shore, is 12 miles long, and the North-east. The so

THE NOB

The great bay formed by the current so frequently mentioned. The current so frequently mentioned, the Mison Banks, and an extension of that crossing from the Bird, observed to be increased by the great rise of water which the set of the tidal current into the bay, in conformity with the supposed circumstances, Point South-eastward of the N.E., from between especially near the East end of the bay.

The reflux course of the tides made during the ebb, of high-water on the full and change, is rather South-eastward from the point, Tracadie, and St. John's, namely, 8½ hours, is rather considerable increase in the tide waves meet some times from the Eastern wave.

With the exception of the generally speaking, very being of red sandstone, from the North Point, requiring notice, excepting at low water, and above the Catholic church and so on, and of the entrance a distance of 3 fathoms at low-water.

The shallow water of sandstone 30 feet high, and irregular so as to be frequently extended, CASCAPEQUE 10 W. from Cape, to reach to the Eastward, 3½ miles to the South, and the sand-hills formerly known as the sand-hills to the North, the entrance is 180 fathoms, which forms the Outer Bar, of sand, 10 feet at low-water, and the South extreme, bearing W. by N.

and 9 fathoms, over the Northern part of the bank; but towards the Southern end, and close to the outer edge, there is a shallower part, $\frac{1}{2}$ mile in length, on which there are less than 5 fathoms; and it is here that the least water is found, namely, $\frac{1}{2}$ fathoms at low-water, in spring tides. This shallowest part of the bank lies between S. by E. and South from the East point, and is distant from it $\frac{1}{4}$ to $\frac{1}{2}$ miles. Souris Head and Dean Point in one, bearing W. by N., pass over its N. extreme in 5 fathoms; and Swanton and Chepstow Points, bearing W.N.W. $\frac{1}{2}$ W., just clear it to the Southward in the same depth; but those points are so distant, that fine weather, and a person very well acquainted with the coast, would be required to distinguish them. The extreme South end of the bank, in 10 fathoms, bears from the East Point South $\frac{1}{2}$ miles; and the North extreme E.S.E. 2 miles. Between the Northern part of the bank and the East Point there are from 10 to $11\frac{1}{2}$ fathoms, red sand bottom, the deepest water being close to the bank. The Eastern or outer edge of the bank is very steep, there being from 12 to 15 fathoms close to it, and there is very frequently a great rippling along it, caused by the abrupt opposition which it presents to the flood-tide from the North-east. The sea is very heavy here, and also off the point, in strong N.E. gales.

THE NORTH COAST OF PRINCE EDWARD ISLAND.

The great bay formed by the Northern coast of Prince Edward Island, and the difficulty of beating a ship out of it in heavy and long-continued N.E. gales, has been already mentioned. That difficulty seems to be caused by an acceleration in the rate of the current so frequently found running past Cape Gaspé, Bonaventure Island, and the Miscon Banks, and which doubtless continues further South: or it may arise from an extension of that general set to the Southward so often experienced by vessels crossing from the Bird Islands towards Anticosti or Cape Rozier, and which has been ascribed to be increased by strong N.E. winds; as might have been inferred from the great rise of water which they cause in all the Southern ports of the Gulf.

Currents.

The set of the tidal streams may also at times be very unfavorable to a vessel under the supposed circumstances, for the stream of flood is known to set to the Southward into the bay, in conformity with the progress of the reflux tide-wave, from the North Point South-eastward to St. Peter's, whilst further Eastward the tide that comes from the N.E. from between the Magdalens and Cape Ercot, also sets towards the shore, especially near the East Point.

Tidal Streams and Tides.

The reflux course of the tide-wave on this coast, has been inferred from observations made during the surveys of all the harbors; from which it appears, that the time of high-water on the full and change days becomes later in succession, as we proceed South-eastward from the North Point to Casumpeque, Malpeque, Grenville Bay, Ruston, Tracadie, and St. Peter's. At St. Peter's the time of high-water, full and change, namely, 85 hours, is rather later than at the East Point; and as there is also a considerable increase in the rise of the tide, there seems reason to conclude that the two tide waves meet somewhere about this harbor, the Western being twelve hours older than the Eastern wave.

Anchorage.

With the exception of a few places off the bars of the harbors, the anchorage is generally speaking, very bad all along the Northern shore of the island; the bottom being of red sandstone, thinly covered occasionally with sand, gravel and broken shells.

From the North Point to Cape Kildare, 14 miles S. by W. $\frac{1}{2}$ W., there is little requiring notice, excepting the River Tignish, 2 feet deep in its narrow sandy entrance in low water, and affording shelter to fishing boats; and where also there is a Roman Catholic church and settlement, principally of Acadians. About a mile to the North-east of the entrance a rocky ledge runs off to the distance of $1\frac{1}{2}$ mile, with no more than 3 fathoms at low-water.

Tignish River.

The shallow water extends to the same distance off Cape Kildare, which is a cliff of sandstone 30 feet high; and generally, it must be borne in mind, that there are rocky and irregular soundings, between 3 and 5 fathoms, all along this part of the coast, frequently extending nearly 2 miles off shore.

CASUMPEQUE HARBOR, sometimes called Holland Harbor, is distant 5 miles W. $\frac{1}{2}$ W. from Cape Kildare, and at the bottom of the bay, where the land begins to extend to the Eastward. It will be known also by the very remarkable high sand-hills, 3 miles to the Southward of its entrance; these are the remains of a range of sand-hills formerly known as the Seven Sisters, and are 50 feet high. There are no high sand-hills to the Northward of the harbor.

Casumpeque Harbor.

The entrance is 180 fathoms wide, between two sand-bars resting upon the sandstone which forms the Inner Bar, over which there are 10 feet at low-water. The Outer Bar, of sand, lies $\frac{1}{4}$ mile out from the entrance, and has the same depth, namely, 10 feet at low-water, in a very narrow channel, indicated by a white beacon, on the South extreme of the Northern sand-bar, in one with a white mark on a log post, bearing W. by N.

The channel, from the one bar to the other, and between sand covered by only a few feet of water, is 100 fathoms wide, and affords tolerable anchorage in from 24 to 31 fathoms, sand bottom; the best berth being just outside the entrance, where the sands on each side dry at low-water.

Tides.

It is high-water at the beacon, on the full and change days, at 5h. 10m. after the moon's transit; and the rise in ordinary spring-tides is 3 feet, and in the neap tides 2 feet; but this is not regular, and therefore 12 feet over the bar at high-water is all that can be safely reckoned upon on any particular day; unless in strong Easterly winds, which cause a rise of a foot or more in all the harbors of this coast.

It must also be observed that the rise given is always that of the best tide in the 24 hours; and that the morning spring tides are the highest during the summer months. It frequently happens at or near the springs, that the evening tides rise only a few inches, and sometimes they entirely disappear, causing single day tides for a short time, as at Richibucto and Shediac.

The morning spring-tides are also the earliest during the summer months, as, for instance, at Casumpeque Beacon, at the full and change in July, when the morning high-water occurred at 4h. 22m., and the evening tide at 6h. 53m., after the moon's transit; the mean being 5h. 10m.; as given above and in all other similar cases.

At or near the neaps, the two tides of the same day become nearly equal in time, and rise for a short time. There is reason to believe, that the diurnal inequality of the tides ceases for a time soon after the equinox, and that it is reversed in winter, but the ice has hitherto prevented observations during that season. These remarks apply to all the harbors of this island, and of the neighboring provinces. Their importance to vessels seeking refuge and taking the dangerous bars in bad weather will be evident. The rate of the tidal streams in the entrance of Casumpeque Harbor is in general 13 knot, and it seldom if ever exceeds 2 knots.

A pilot would be indispensable to a stranger visiting this place for the first time. I shall therefore only observe, that the white mark on the house must not be opened in the least to the Northward of the beacon, since those objects in one lead in close along the Southern edge of the Northern sand. In strong Easterly gales the bar is covered with a continuous line of heavy breakers.

There is good anchorage off it in fine weather, of 5 or 6 fathoms, sand bottom. Within the entrance, the harbor has plenty of water, and a clear channel, which, after running in one mile to the Westward, turns to the Southward within Savage Island, and between it and Hill's Point, where there is a wharf at which vessels generally load.

*Casumpeque**Bay.**Richmond**Bay.**Grand**River**Malpeque**Harbor.*

CASUMPEQUE BAY is of great extent, and broken into inlets, or rivers which penetrate the country in a variety of directions, and to the distance of many miles.

RICHMOND BAY is of great extent, running in 10 miles to the S.W., and crossing the island to within 2¹/₂ miles of the waters of Bedeque harbor. It contains seven islands, and a great number of creeks or rivers, some of which are navigable for vessels of considerable burden, and all of them by small craft and boats. Grand River, which is the principal inlet, can be ascended in boats to the bridge, a distance of 7 or 8 miles.

MALPEQUE HARBOR is very superior to any other on the Northern coast of the island, having 16 feet over its bar at low-water, and from 18 to 19 at high-water in ordinary spring tides, together with depth and space enough within for any description and number of vessels. The principal entrance is to the Southward of Fishhook Island, and between it and Royalty Sand, which dries out a long half-mile from Royalty Point.

The ground is good, in the usual anchorage, just within this entrance; the bar on side preventing any sea from coming in, and the Horse-shoe Shoal, sheltering them from Westerly winds down the bay. The other entrance, to the N.W. of Billhook Island, is called the WEST GULLY, and is so narrow and intricate as to be only fit for boats, or very small craft, although it has a depth of 9 feet over its dangerous bar of sand, which is 1¹/₂ mile out from the shore. There will be no probability of this being mistaken for the main entrance, even if the beacons and buoys were gone, if it is remembered that the Main or Ship channel is to the S.E. of all the sands, including Billhook Island, and between them and the red sandstone cliffs of Cape Aylesbury, the S.E. point of the bay.

*West Gully.**Malpeque**Bar.*

THE BAR OF MALPEQUE runs out from Billhook or Fishery Island 2¹/₂ miles to the S., and then turns to the Southward so as to join the shore to the Eastward of Cape Aylesbury. It is of sand thinly and irregularly spread upon sandstone; the rock being in many places quite bare. It is exceedingly dangerous in bad weather, when the signs of a channel are obliterated by heavy breakers. The Northern part of the bar to the distance of 1¹/₂ mile out to the Eastward from Billhook Island, is very shallow, there being in some places only 4 feet at low-water; but the extent of this shallow part is well shown by a good cross-mark, namely, the Scotch church, Malpeque, at

Darley Point in on to the Northward of

The narrowest part above-named cross-mark of sandstone, and within in general a buoy upon land, kept in one, be channel and over the low-water. * Grover Island, being Binary Island behind the other may proceed Grover Island a little (W by S), and keep it so towards the latter, keep the inner bar, when the

Darnley Point in one, bearing S.W. by S. To the Eastward of this cross-mark, and to the Northward of the line of the beacons, there is more than 12 feet at low-water.

The narrowest part of the ship-channel is just within, or to the Westward of the *Ship Channel* above-named cross-mark, and is one cable wide, and 4 fathoms deep. The inner Bar, *nel*

of sandstone, and with 19 feet at low-water, is a quarter of a mile further in, and has in general a buoy upon it. The two white beacons, on the S.E. end of Billhook Island, kept in one, bearing W.N.W. $\frac{1}{2}$ W., will lead through the narrows of the ship-channel and over the inner bar; but not over the outer bar in more than 13 feet at low-water. To enable vessels to cross the outer bar in the deepest water, namely, 16 feet at low-water in ordinary spring-tides, the outer buoy is moored in $3\frac{1}{2}$ fathoms and at the distance of one cable to the Northward of the line of the beacons: the intention being, that a vessel by running from the outer to the inner buoy should carry the deepest water, but I do not think that more than 15 feet could be insured in that way, or without the assistance of a third buoy between the one and the other two; and therefore a stranger without an experienced pilot, should not reckon upon more than that depth. As the buoys are at present so insecurely moored as to be liable to drift from their positions, the directions I shall give will be irrespective of them, as follows:—

Being off the bar, in 5 fathoms, bring the beacons in one, bearing W.N.W. $\frac{1}{2}$ W.; *Directions.*

then sheer to the Northward of their line to the estimated distance of one or two cables, and the Westmost beacon will appear a little to the Northward of the other. Steer now so as to make a direct course towards the beacons, keeping the Westmost beacon open a little to the Northward, and the vessel will pass the bar in not less than 15 feet, and probably in 16 feet at low-water in ordinary spring-tides, or a corresponding depth at other times of the tide.

The water will deepen immediately within the bar to 18 feet or more, and as soon as it does so sheer at once to the Southward, and bring the beacons exactly in one, taking care that this be done before the Scotch church, Malpeque, opens out to the Westward of Darnley Point; for if not the vessel will be on shore on the shallow part of the bar on the North side of the channel. Keep now the beacons in one, running towards them, and they will lead through the Narrows, and over the inner bar, in 19 feet at low-water; after which they may either still be kept in one, or the Westmost one a little open to the Southward of the other, until the vessel is half a mile within the inner bar, or within three-quarters of a mile of the beacons, when the course must be changed to West, and the sandy South point of Billhook Island must be passed at the distance of one cable, steering that course into the harbor.* The vessel should anchor with the beacons bearing between E. by N., and E.N.E., and distant from one-quarter to three-quarters of a mile, but not further for fear of the Horse-shoe Sands, which commence at the distance of one mile from the beacons. There is less sea further to the S.W. within or to the Westward of Royalty Sand, but a stranger will have less difficulty and risk in taking up the berth first recommended. The channel passes to the Southward of the Horse-shoe Sands and between them and Grover Island, but the principal object aimed at in these directions being to enable a vessel to run into a place of safety, I shall refer to the chart for the navigation within the bay. Vessels may anchor outside the bar, in from 5 to 7 fathoms, sand bottom, to wait for a pilot; and in the event of the wind or tide failing, the anchorage is considered tolerably safe between the inner bar and the entrance, and probably is so with any wind that would prevent a vessel from running in, but the holding-ground is not good there, and should only be trusted in fine summer weather. Within the harbor the bottom is of sand and clay, and a vessel may choose any depth from 5 to 10 fathoms, the greatest depth being close off the point of Royalty Sand. It is high-water in the harbor, on the full and change *Tides.* days, at 6 hours after the moon's transit; the rise being 3 feet in spring, and 2 feet in neap tides; but the rise is so irregular, that it would not be safe to count upon a rise of more than 2 feet on any particular day. N.E. winds cause high tides, Westerly winds produce the contrary effect. The morning tides are the highest during the summer months. The rate of the tides is strongest in the entrance, and off the point of Royalty Sand, running in spring tides $2\frac{1}{2}$ knots. In the ship-channel, from the entrance to the bar, the rate is 1 $\frac{1}{2}$ to 2 knots. Within the bay the tides are in general much weaker, seldom amounting to one knot.

The coast between Richmond Bay and Cape Tryon is nearly straight, and free from detached dangers; but the shallow water runs out a considerable distance, and a large ship should not approach nearer than the depth of 7 fathoms.

* Grover Island, being distant 5 miles from the bar, can with difficulty be distinguished from Barnby Island behind it; but those who can be certain of not mistaking the one island for the other may proceed as follows:—Being off the bar, in 5 fathoms, open the North point of Grover Island a little (not more than 2 degrees) to the Northward of Royalty Point, bearing W by S, and keep it so running towards it, until the beacons come in one, when change course towards the latter, keeping them in one, and they will lead in through the narrows and over the inner bar, when the vessel must proceed as already directed.

- Cape Tryon.* CAPE TRYON, distant 7 miles, S.E. & E. from Cape Aylesbury, is a remarkable cliff of red stone, 110 feet high.
- Grenville Harbor.* GRENVILLE HARBOR, 14 mile S.S.E. from Cape Tryon, has its entrance at the North-western extremity of a long range of sand-hills, the highest of which is 55 feet above high-water mark. The entrance of this harbor is one-third of a mile wide, and 3 fathoms deep, but it is nevertheless only fit for small vessels, in consequence of its dangerous and shifting bar of sand, which is only 5 feet at low-water.
- Cape Turner.* CAPE TURNER is the highest cliff on the island, being of red sandstone and conglomerate, 120 feet high. It is distant 8 miles S.E. & E. from Cape Tryon, the harbor last described lying between.
- Great Rustico Harbor.* GREAT RUSTICO HARBOR has two narrow sandy entrances, on either side of McAuslin Island, and which are distant 3 and 5 miles respectively to the S.E. of Cape Turner. It is a place only fit for small schooners; for its shifting bars of sand are exceedingly dangerous, having a varying depth of from 4 to 6 feet, and extending out three-quarters of a mile from the shore; at which distance there are 3 fathoms at low-water.
- Stanhope Point.* STANHOPE POINT, on which there is a sand-hill 30 feet high, half a mile to the Eastward of the entrance of Little Rustico, and 9 miles S.E. from Cape Turner, has a dangerous reef running out from it three-quarters of a mile to the depth of 3 fathoms, and 1 inch to 2 fathoms. On some parts of this reef there is only one foot of water, at the distance of half a mile from the shore. Between Stanhope Point and Cape Turner the reef forms a curve or bay, in which are situated the entrances of the Rusticos already described; and where the 3 fathoms edge of the shallow water is seldom less than three-quarters of a mile off shore. Further out the holding-ground is bad, being of red sandstone, with an occasional thin covering of sand.
- Tracadie Harbor.* TRACADIE HARBOR, or Bedford Bay, is distant 4 miles from Stanhope Point, and 13 miles S.E. by E. from Cape Turner. Its entrance is at the Western extremity of a remarkable range of sand-hills, 50 or 60 feet high. The bar of sand, which shifts occasionally in heavy gales, extends out to the distance of three-quarters of a mile from the entrance, and has a varying depth of from 5 to 9 feet over it at low-water, in a channel only 40 fathoms wide.
- St. Peter's Harbor.* ST. PETER'S HARBOR has only 5 feet at low-water. St. Peter's will be recognized by its magnificent range of sand-hills, which, near the entrance, attain the elevation of 70 feet above the sea, and continue for several miles to the Eastward; after which there are no more high sand-hills till we arrive at Surveyor's Inlet, within 4 miles of the East Point.
- East Point.* From St. Peter's to the East Point, a distance of 23 miles E.S.E., the coast is unbroken, formed of red sandstone cliffs, with occasional patches of sandy beach at the mouths of small streams, where boats can land only in fine weather, or off-shore winds.

NORTHUMBERLAND STRAIT.

A full description of Prince Edward Island, and of the opposite coasts of New Brunswick and Nova Scotia, having been given in illustration of the Admiralty charts. It now only remains to offer a few general remarks respecting the Strait of Northumberland, which appears to have been hitherto avoided by large ships, as much from a want of that precise knowledge which a good chart and directions are calculated to convey, as from any supposed amount of danger or difficulty in its navigation. There are, however, few places in which such precision of knowledge is more requisite than in this strait, which presents a confined navigation 160 miles in length; and which at Cape Tormentine, the narrowest part, is only 7 miles wide from shore to shore; and only 5½ miles, if we reckon only the navigable breadth between the shoals.

The description of the dangers and of the soundings have been made very full in consequence; and the times of high-water, and the rise of the tides in the various harbors, together with the strength of the tidal streams in their entrances, have also been given; but the tides of the Strait are so peculiar, that it will be both interesting and useful to add a general view of the course of the tide waves, and of the strength and direction of the streams which they occasion.

To this will be added briefly the mode of proceeding recommended to be adopted in a vessel running through the strait in a dark night or in thick weather, when the soundings alone can safely guide her.

Tidal Streams.

For the purpose above stated, it will be convenient to divide the strait at Cape Tormentine into two nearly equal portions, distinguished by the different set of their tidal streams, and by different tide-waves, which advancing from opposite directions, meet in the central part of the strait. The course of these waves appears to be as follows:—The principal tide-wave, after entering the Gulf between Cape Breton and Newfoundland, sends off, laterally, waves to the S.W., on either side of the Magdalen

Islands. The first of those islands and the entrance of the strait water later in succession. At the same hour, at Cape Tormentine, the North wave arrives at Cape Tormentine, comparatively shallow the S.W. This wave coast of New Brunswick, from N.W. to Thus, it is high-water Point Esquemeac and entrance of the strait at 6 hours; at Shediac. When, therefore, the Western part of Cape Traverse. The tides, namely, 10 hours, or more, from Picton to everywhere more than that which occurs. The direction of the progress of the Eastern flood-stream round the East point of over towards the South rate along the land to and runs at its extreme.

Losing strength as it meets the other flood. This Eastern flood-shore, unless it be in weak, not generally extend. The other or Western of Prince Edward Island the deep water near the New Brunswick shore it pursues its course towards the longest part of the strait round and over the rate of 3 knots.

After passing these strength, and unites with the lost in the central part a contrary course to the From this account of favorable circumstance Tormentine soon after with her, with but slight vessel beating with the able to continue her voyage.

The tidal-streams within high-water or low-water to this, which it is in the Gulf greatly influenced as well as the height to meet in the central part sequence of unequal heights alternately and in turn. But it would require and continued through the main satisfactorily, the remains, of general occurrence the seaman to know. Vessels bound to Miramichi, after entering

Islands. The first of these, which I shall call the Eastern wave, coming from between those islands and the Western shore of Cape Breton Island, arrives at the Eastern entrance of the strait soon after 8 o'clock, and proceeds to the Westward, making high-water later in succession from East to West as far as Pictou, which it reaches at 10 hours. At the same nominal hour, but 12 hours later, the other or Western wave arrives at Cape Tormentine, having been retarded by the long detour which it has taken to the Northward and Westward of the Magdalen, and by the great extent of comparatively shallow water which it has passed over in its subsequent progress to the S.W. This wave makes high-water later in succession at places along the Eastern coast of New Brunswick, as we proceed to the Southward; and, after entering the strait, from N.W. to S.E., contrary to the course of the other or Eastern wave.

Thus, it is high-water on the full and change days at Miscou at about 2½ hours; at Point Escumene and the North Point of Prince Edward Island, forming the Western entrance of the strait, soon after 4 hours; at the West point of Prince Edward Island at 6 hours; at Scheldiac, 8 hours; and at Cape Tormentine, 16 hours.

When, therefore, the Eastern wave arrives between Pictou and the Wood Islands, the Western part of the preceding tide-wave arrives between Cape Tormentine and Cape Traverse. They then meet and combine to make high-water at the same hour, namely, 10 hours, or a little later in the harbors, all over the central portion of the strait, from Pictou to Cape Tormentine; causing also an amount of rise of the tides everywhere more than double, and in some of the harbors nearly three times as great as that which occurs at either entrance of the strait.

The direction of the tidal-streams corresponds generally, and in fine weather, with the progress of the tide-wave, but is disturbed occasionally by strong winds. The Eastern flood-stream enters the strait from the N.E., running at the rate of 2½ knots round the East point of Prince Edward Island, but is much weaker in the offing, and over towards the Southern shore. It runs round Cape Bear, and with an increasing rate along the land to the Westward; is strongest in the deep water near the land, and runs at its extreme rate of 3 knots close past the Indian Rocks and Magdalen Reef.

Losing strength as it proceeds further to the N.W., it is quite a weak stream when it meets the other flood-stream off the Tryon Shoals.

This Eastern flood-stream is not so strong along the Southern or New Scotian shore, unless it be in Carillon Channel for a short space near Caribou Reef, but it is weak, not generally exceeding half a knot in the middle of the strait.

The other or Western flood-stream comes from the Northward, along the West coast of Prince Edward Island, sweeping round the West Point, and running strongest in the deep water near the West Reef, where its rate is 2½ knots. Over towards the New Brunswick shore its rate seldom exceeds 1½ knot, and this is its average rate as it pursues its course to the S.E., until we arrive near Cape Tormentine, where the strongest part of the stream runs near the Jourmain Shoals, and thence to the Southward round and over the dangerous Tormentine Reefs, with a great ripple, and at the rate of 3 knots.

After passing these reefs, part of it curves round to the S.W. with decreasing strength, and unites with the other flood-stream in the Bay Verte, whilst the remainder is best in the central part of the strait. The ebb-stream, generally speaking, pursues a contrary course to the flood, and at nearly the same rates.

From this account of the tidal-streams, it appears that a fast-sailing vessel, under favorable circumstances, might enter the strait with the flood, and, arriving at Cape Tormentine soon after high-water, might there take the ebb, and thus have the stream with her, with but slight interruption, from one end of the strait to the other. Or, a vessel beating with the flood, might so time her arrival at the same point, as to be able to continue her voyage in the same direction with the ebb.

The tidal-streams were observed in general to change their direction soon after it was high-water or low-water by the shore; but not unfrequently there were exceptions to this, which it would be difficult to account for with certainty. Strong winds in the Gulf greatly influence the strength and directions of the streams in the strait, as well as the height to which the tides rise; moreover, as the two tide-waves that meet in the central parts of the strait are 12 hours different in age, so they are in consequence of unequal heights, owing to the diurnal irregularity; each of them being alternately and in turn the highest, and probably occasioning the stronger stream.

But it would require a long series of simultaneous observations at different points, and continued through the different seasons of the year, to reduce to order, or to explain satisfactorily, the seeming irregularities thus produced. Nevertheless, enough remains, of general occurrence during the summer months, which it is highly useful for the seaman to know, and which has been stated in consequence.

Vessels bound to Miramichi, and the ports in the strait to the Westward of Cape Tormentine, after entering the Gulf on either side of the Island of St. Paul, usually

Directions.

pass to the Southward of the Magdalens, and round the North Point of Prince Edward Island. The reef of this last-named point is exceedingly dangerous, and the lead should be kept constantly going when approaching it at night, or in foggy weather; bearing in mind the probability of having been previously set to the Southward in crossing from the Magdalens, especially if the wind has been from the Northward.

Under the same circumstances, after rounding the North Point, the course should be shaped well to the Westward, so as to insure clearing the West Reef, which should be passed by the lead, running along the edge of the bank off the New Brunswick shore. Proceeding South-eastward, after having passed the West Reef, the lead will afford sufficient guidance along either shore, reference being had to the soundings in the Admiralty chart, until we arrive near the narrow part of the Strait at Cape Tormentine.

There, if the vessel be bound further to the Eastward, the shore of Prince Edward Island should be preferred, the soundings on that side being quite sufficient to guide the vessel past Carleton Head, Cape Traverse, and more particularly the Tryon Shoals, if the irregular tides off the latter, and the frequent set of the ebb-stream towards them be remembered. The tides, however, in this narrow part of the strait, are not very strong along the Prince Edward Island shore, off which the anchorage is good, in the event of the wind failing; whilst on the opposite side there is deep water, and very strong tides close to the Jourmain and Tormentine Reefs.

If the wind be adverse, or scant from the Southward, with the ebb-tide running, a stranger had better not attempt this narrow passage at night, or when the land cannot be seen. Under such circumstances, it is recommended to anchor to the Westward of Cape Tormentine, till daylight or a change of tide renders it less hazardous to proceed. Vessels bound to ports in the Eastern division of the strait, enter the Gulf either through the Gut of Canso or by the Island of St. Paul. In the first case, the bearing of the light at the Northern entrance of the Gut will guide them up to Cape George, from which, if bound to Pictou, there will be no difficulty in running along the land to the Westward, if due attention be paid to the soundings in the chart, and afterwards to the bearing of Pictou light. If the weather be thick, or the light not seen, beware of the reef off the East end of Pictou Island, which should not then be approached nearer than the depth of 10 fathoms, especially if the flood-tide be running.

Vessels approaching from St. Paul's, and entering the Strait at the East point of Prince Edward Island, should not approach the latter nearer than 20 fathoms in dark nights or thick weather.

Cape Bear and its reef should not be rounded in less than 15 fathoms, under the same circumstances; and then, if bound anywhere to the Westward of Pictou, the vessel should be kept more over towards Pictou Island and the Southern shore, where the soundings will guide her, till the Indian Rocks and Rifleman Reef are passed. The light on Point Prim will greatly assist in passing the last-named danger, after which the lead will again afford sufficient guidance along the Prince Edward Island shore, past the Tryon Shoals, and through the Strait to the North-westward.

On the opposite or Nova Scotian shore, Westward of Pictou, the principal dangers to be avoided are the Middle Shoals, between Pictou Island and Caribou, Amet Island, and shoals, and the Waugh Shoal. The approach to all these is sufficiently indicated by the soundings, and therefore a constant use of the lead, and a careful reference to the Admiralty chart, will enable the intelligent seaman to pass them at all times in safety; and also to conduct his vessel to any of the harbors of the coast, where pilot will readily be obtained.

From the account which has been given of the tides in this strait, it will be perceived that they are very different from anything that can be gathered from preceding publications; and the Admiralty charts will show that the soundings are no less so for they vary greatly, both in the nature of the bottom and the depth of water; thus affording much more assistance to vessels than they would have done, if they had been of the more uniform character which has been erroneously attributed to them.

CAPE GEORGE BAY, THE GUT OF CANSO AND THE LENNOX PASSAGE

Cape George. CAPE GEORGE,* the N.W. point of the bay, is a bold and precipitous headland composed principally of slate, conglomerate, and trap-rocks, attaining the elevation of 600 feet above the sea. The shallow water does not extend off it beyond a quarter of a mile, but as there is a depth of 20 fathoms at double that distance, the lead affords but little warning, and it should therefore be approached with caution in dark nights or thick weather. Off Ballantyne Cove, on the Eastern side of the Cape, there is an anchorage in Westerly winds, but the ground is not very good.

MAC ISAAC ROCK, with 9 feet least water, is the centre of a small detached shoal, distant nearly 300 fathoms from the shore, between Mac Isaac Point and a remarkable patch of white gypsum cliff. This rock, which is the only danger on the West side of the bar, bears from the gypsum patch E.N.E. $\frac{1}{2}$ E., two-thirds of a mile; it is distant 2 $\frac{1}{2}$ miles to the Northward of Antigonish, and is shown occasionally by heavy breakers.

Mac Isaac Rock.

ANTIGONISH HARBOR, 11 miles S.S.W. from Cape George, and midway between Mac Isaac Point and Monk Head, is 90 fathoms wide at entrance, between two points of sand, from which a dangerous bar extends to the distance of half a mile. Two buoys, on the Northern point of entrance, kept in one, and bearing W. by N. North-
Antigonish Harbor.
eig. led over this bar, at the time of our survey, in 6 feet at low-water; but both the depth and direction of the very narrow channel are said to change occasionally. The anchorage off the bar is not very good, and would be quite unsafe in a gale of wind from the N.E. It is high-water in the entrance, on the full and change days, at about 9 hours; the rise being 4 feet in ordinary spring-tides, and 2 feet in neap tides. Southerly winds cause high tides, and Southerly winds the contrary. The rate of the tides in the entrance seldom exceeds 2 knots, unless it may be in spring, after the melting of the winter snow.

Tides.

MONK HEAD is a cliff of gypsum 45 feet high, 2 $\frac{1}{2}$ miles S.E. from the entrance of Antigonish Harbor. It has a rocky bank, with 3 fathoms least water, extending off to three-quarters of a mile to the Eastward; and there are no more than 4 $\frac{1}{2}$ fathoms at double that distance out from the shore.

Monk Head.

POMQUET HARBOR has its narrow entrance at the Eastern extremity of a range of low sand-hills and sand-beach, 2 $\frac{1}{2}$ miles S.S.E. from Monk Head, and in the bay between it and Pomquet Point. It is an extensive place, branching into two principal arms, and many smaller inlets, coves, and islets. It is navigable for small craft and boats nearly 3 miles in from the sea, but it is of no use to shipping, having usually only a depth of 2 feet at low-water over its shifting bar of sand. The principal settlements and the Roman Catholic church are on the Western shore of the N.W. arm.

Pomquet Harbor.

POMQUET ISLAND, which bears S. $\frac{1}{2}$ E., distant 1 $\frac{1}{2}$ miles from Cape George, is of red sandstone, low, wooded, about half a mile long, and is joined by a reef to Pomquet Point, from which it is distant 175 fathoms. The reef dries out from the point more than half way over towards the island, and leaves a passage only 3 or 4 feet deep at low-water. Shallow water runs out from the island nearly 400 fathoms to the E.N.E., and a reef, with a large rock near the end of it, dries out from its Eastern shore to the distance of 150 fathoms. The island and its reefs shelter Pomquet Road from all points excepting between N.E. by N. and East. This roadstead, which is considered safe during the summer months, but where the riding must be very heavy in N.E. gales, is in the bay between Pomquet Point and Little River; which last admits boats only at high-water, and with its English church and settlement will be seen bearing S. by W. at the distance of a long mile from the island. Vessels may anchor in any depth from 3 to 6 fathoms, over sandy bottom; but the best sheltered berth is in 4 fathoms at low-water, with the South point of the island bearing N. by E. $\frac{1}{2}$ E., distant half a mile. To run for this anchorage from the Northward, pass the Eastern shore of the island at the distance of half a mile, or in not less than 8 fathoms, until Pomquet Point comes in sight to the Southward of the island, when haul to the Westward into the bay. Approaching from the Eastward, the Bowman Bank must be avoided in a large vessel, either by the lead, or by not bringing the North point of the island to bear to the Westward of W.S.W. until the North point of the bank is passed. The bank is of great extent, running off fully 2 miles to the Northward from Quarry Point and Bowman Head; and has rocky patches on it, with 13, 18, and 19 feet at low-water, at various distances, from three-quarters to 1 $\frac{1}{2}$ mile off shore.

Pomquet Island.

Bowman Bank.

THE POMQUET BANKS, discovered by Captain Bayfield, lie off Pomquet Island to the N.N.E., distant from 3 to 6 miles. The soundings on them are rocky and irregular, the least water (6 fathoms) having been found on the outer and smaller of the two banks, when the church at Little River was shut in behind the East side of the island, bearing S. by W. $\frac{1}{2}$ W., 5 $\frac{1}{2}$ miles.

Pomquet Banks.

TRACADIE HARBOR,* 3 $\frac{1}{2}$ miles E.S.E. from Pomquet Island, has its narrow entrance about half a mile to the Eastward of Bowman Head. It is extensive, and 14 feet deep in some parts within; with many coves, islets, and small streams, the principal of which, called Tracadie River, is at the head of the Eastern arm, 2 $\frac{1}{2}$ miles in from the sea. The depth over its dangerous bar of gravel and stones is only 2 feet at low-water, in a narrow and crooked channel; it therefore only admits boats or very small vessels at high-water. The village of Tracadie and the Roman Catholic church will be seen about a mile within the entrance. The church is large and can be seen from a great distance out at sea.

Tracadie Harbor.

* See Plan.

The rate of these streams off Cape Porcupine, where it is most rapid, is ordinarily about 4 knots; but is increased occasionally to 5 knots by strong winds.

At most of the anchorages, and under almost every point, there are eddies, usually *Eddies*. running in the opposite direction to the main stream outside, but at a much inferior rate; and they render great attention necessary to insure a clear anchor.

The length of the passage through the Gut of Unso, from the light-house at the North entrance to Eddy Point, is 11 miles; and its least breadth, between Balache Point and Cape Porcupine, is 450 fathoms. The depth of water in the channel is seldom less than 15 fathoms, and in the deepest part, off Cape Porcupine, amounts to 32 fathoms. This great depth, the strength of the tides, and the rocky or gravelly bottom, render the anchorage unsafe, excepting at the places hereafter to be described.

Excepting at Ghost Beach, and for a short distance below Ship Harbor, the general character of the shore on either side is high; the land rising from it, more or less abruptly, to the summits of ridges of considerable elevation.

CAPE PORCUPINE, a precipitous headland on the Western shore, 610 feet high *Cape Porcupine*, above the sea, is the most remarkable feature, and the scenery in its vicinity is of very great beauty.

Generally speaking, the shore on either side is bold, but there are nevertheless several small rocks and shoals, which, although at no great distance off shore, have often occasioned serious accidents, and therefore require particular notice. The dangerous Duck Shoal, outside of the Northern entrance, has been already described. I shall now describe the dangers *within* this passage, as they occur in proceeding through it to the S. S. E.

BALACHE ROCK is nearly dry at low tides, but, as it is within the line uniting Balache Point and Mackeen Points, it is not much in the way of vessels. It lies 100 fathoms E. S. E. from the end of Balache Point, and 50 fathoms off shore. *Balache Rock.*

MADAGASCAR ROCK, dry at low-water, lies directly opposite to the rock last described, and not quite 50 fathoms off shore under the highest part of Cape Porcupine. The rippling of the tide over this rock can in general be seen; nevertheless, its situation, off a projecting point in the narrowest part of the passage, nearly in the full strength of the tide, and at a part celebrated for sudden flaws of wind from various directions, renders it extremely dangerous, especially to strangers, who are accordingly recommended to give it a wide berth. *Madagascar Rock.*

DIXON ROCK, reported to have only 6 or 8 feet over it at low-water, but on which we could find no less than 12 feet, bears South, distant 70 fathoms from Mackeen Point, and W. by S. 120 fathoms from the Southern point of Plaster Cove, which will then appear in one with Martel's house, low down on the Eastern shore of the cove, and just outside of the bridge. This rock is very much in the way of vessels approaching or leaving the anchorage off Plaster Cove, but will be avoided if the whole of the bridge over the cove be not shut in behind its Western point. *Dixon Rock.*

PREMIER SHOAL, of rock and sand, with 13 feet least water, is a middle ground in the entrance of Ship Harbor. Ships may pass on either side of it, but to the Northward is the widest and deepest channel. Ship Harbor Point and the Western extremity of Pirate Island in one, bearing S. W. by S., will lead clear outside or to the Westward of this shoal, in 5 fathoms; therefore, vessels standing in towards Ship Harbor, or anchoring off its mouth, should be careful not to shut in the whole of the island behind the point. *Premier Shoal.*

STAPLETON SHOAL is rocky, and extends from Ship Harbor and Stapleton Point 150 fathoms to the S. W. and W. At that distance off shore there are only 16 feet at low-water, but the depth increases almost immediately to 5 fathoms, the edge of the shoal being very steep. *Stapleton Shoal.*

CAHILL ROCK is on the opposite side of the Gut to the last, distant three-quarters of a mile to the S. E. from Holland Cove, and 60 fathoms off shore. It is dry at low-water, but becomes dangerous when covered. Roger Point in one with the N. E. side of Pirate Island, (the latter being seen over the low shingle neck of Pirate Point), and bearing N. W. $\frac{3}{4}$ N., leads clear outside of it at the distance of 60 fathoms. *Cahill Rock.*

SHIP ROCK is on the Eastern shore, rather more than half way from Stapleton Point to Bear Head. It has 6 feet least water, and is distant a quarter of a mile Northward from Ship Point, and 70 fathoms off shore. Ship Point and Bear Head in one, bearing S. E. $\frac{1}{4}$ S., lead outside of it at the distance of only 20 or 30 fathoms, and therefore, in standing towards it, tack before the head and point come in one. *Ship Rock.*

BEAR REEF has from 6 to 9 feet at low-water over large rocks, and extends 140 fathoms Southward from Bear Island. Off Bear Head also there is shallow water, extending 100 fathoms to the S. E. Great caution should be used in approaching these reefs, for the water is too deep near them for the lead to afford much warning, and there are no good clearing-marks. *Bear Reef.*

Crossing again to the Western shore of the Gut, at Critchet Cove, there is a shallow bank of mud and sand, on which small vessels frequently anchor, but of which

large vessels should beware. Its outer edge, in 5 fathoms, is nearly a quarter of a mile off shore.

M. to
Shoal

MARLIN SHOAL, 2 miles further to the S. E., and 1½ mile N. W., from Eddy Point, is of rock, and extends 170 fathoms off shore. Melford and Cletcher Points in one, bearing N. W. ¼ N., just clear its edge in 4 fathoms.

P.M. Light

EDDY SPIFF, of sand and stones, runs out a quarter of a mile N. W. from high-water mark to the N. E., and is almost always shown by the rippling of the tide. Ship Point and Bear Island in one, bearing N. W. ¼ N., just clear it to the N. E., at the distance of about a cable's length.

P.M. Light
S. of Point
Light

EDDY or SAND POINT LIGHT. A hexagon light on Eddy or Sand Point, on the W. side of the South entrance to the Strait of Causo, and is distinguished by two white lights horizontally placed 2½ feet above sea level—rise and fall 6 feet. The building is square, painted white, with a black diamond on the seaward side. The point is shelved eastwardly of the light nearly 200 fathoms, but the Northwest of it is bold water, and good anchorage. The tides are irregular, and very rapid round the point.

The following bearings by compass may assist vessels passing through the Strait

From the Light to Cape Hoggan,	S. 100° E.
" " to Western headland, which intercepts the light,	S. 10° E.
" " to Rewe Island,	N. 32° W.
" " to Pirate Cove,	N. 24° W.
" " to Mill Creek,	N. 20° W.

P.M. Point

EDDY POINT, from which the spit extends, is of sand and gravel, and snug a small point.

P.M. Point

Light

The deep channel of the Gut of Causo continues to the Southward, between Nova Island and Jewell Island into Cheslabucto Bay, and being the course of the main stream of the tides from the Gut, as well as of all vessels that use this passage, we shall continue the description of the dangers on either side, as belonging to the same line of navigation.

A. to
Shoal

ARGOS SHOAL, consists of rock, and extends to the distance of two-thirds of a mile E. by N. from Cape Argos. The least water found on it was 20 fathoms. It is shown by heavy buoys, when there is a swell from the S. E.

Cape

CAPE ARGOS, about 2½ miles to the Southward of Eddy Point, will be easily recognized, being a small but high peninsula, bare of wood, with red cliffs, and round to the north end by a low isthmus or shingle. Off the point of cliff next to the North of the cape, and distant a third of a mile from it, a reef runs off toward Argos Shoal, which is so nearly perpendicular to leave no passage for large vessels. Eddy Point and the Head touching, and in one with the First side of a hill behind the latter bearing N. by W. ¼ W., clear these dangers in 7 or 8 fathoms, and at the distance of 170 fathoms eastward of Flat Head is the N. E. point of Bear Island, and if it be well to port, eastward of Argos Shoal, at a greater distance, let the above named marks be kept proportionally open.

At Cape Argos the coast runs to the S. W. into Cheslabucto Bay; we now cross to the Eastward of this passage, where the shoals off Jewell Island have already been crossed.

S. of

THOMAS SHOAL, runs out from Thomas Head (the N. W. point of Jewell Island), through a narrow channel to the Westward, with rocky and irregular southerly ends. It is a long, narrow, low water. The clearing mark for the Western extremity of the Strait is a red buoy on a rock of Washing Islet touching the S. end of Peninsula Point, and a green S. E. buoy on its northern side; the two points forming the North end of the Strait. The clearing mark for the Eastern end of the Strait is a red buoy on the N. E. side of the Strait, when Cape Flat Head will appear just clear to the N. E. by the light.

S. of

JAVARIN SHOAL, runs out from Point two-thirds of a mile to the Westward, the bank of sand and stones is dry and half that distance, and being a rocky and irregular shoal, it is a distance of 500 fathoms out from the point there is at least a water of the least water, from which the S. W. extremity of Washing Islet and Peninsula Point shall appear in one. The marks for clearing this dangerous shoal on the S. W. side, at the distance of 170 fathoms, and in 5 fathoms water, are the S. W. side of Washing Islet in one with the N. end of Peninsula Point, and bearing S. E. ¼ E. On the N. W. side, where there are no clearing marks, it should be kept open by the centre of the water, as too deep for the lead to afford much warning.

W. of

WASHING ISLET and **PENINSULA POINT**, appearing like two such shoals, on the edge of the bank that runs out from the S. W. side of Jewell Island, will be easily recognized, the islet being most to the N. W. They both have low water marks to seaward, and long narrow spits at their North points, but a long line of shingle marks the general end of Jewell Island. The very shallow water of the tides only 200 fathoms off Washing Islet, with a depth of 4 or 5 fathoms for a considerable distance farther out to the S. W., but the Peninsula Point Shoals are much more

extensive and dangerous. It extends out 300 fathoms to the Southward there are three quarters of a mile, bearing N. W. ¼ W. from Roman Catholic steamer, bearing E. S. E. ¼ E. of a mile.

The foregoing bearings of the Strait of Causo, is in Admiralty Chart, uncorrected out.

Vessels may anchor in the North entrance, as a reasonable stopping place, both exposed to North and South winds. Moreover, the anchorage is clear.

PLASTER COVE, is the first safe anchorage on the N. W. side, and a small islet is dry at low water, towards. In North winds, it is very rising, but it is

The only directions to be observed, to keep the cables above it, may be gone further in them, with mud bottom out towards the steep in the deep water and

The tidal streams are really in a contrary direction, one knot, vessels having occasion to anchor should be kept in a high water here during spring tides, but sometimes rise 6 or 7 feet.

There is an excellent anchorage between Cape Porcupine and Western side, except in other places, except

SHIP HARBOR is a small cove, and a further to the sea. It is a small cove, causing of trouble in the harbor, where the depth is 100 fathoms, mud bottom.

There is a fine settlement on the N. E. side of the harbor, or winter in

Vessels of less than 100 tons, should be kept in the North side of the harbor, where the depth is 100 fathoms, mud bottom.

Being outside the harbor, on the N. E. side of the harbor, and first point will be just in a bearing W. S. W., when the wind blows from the N. E. and the weather so deep in the harbor with Southerly winds, it is a great advantage.

The roadstead off the harbor is frequented by vessels from the opposite

kenne and dangerous, running off both South and S.E. In the latter direction the
 fathoms out 300 fathoms, and under water extends to double that distance; while to
 the Southward there are 6, 16, and 25 feet, at the distance of a quarter, a half, and
 three quarters of a mile out from high water mark. Ship Point and Bear Head in
 one, bearing N.W. & N., clear these shoals to the S.W. in 6 fathoms; and the
 Roman Catholic steeple at Arichat and the South extremity of Creighton Island in
 one, bearing E.S.E. & E., will clear them to the Southward at the distance of a third
 of a mile.

The foregoing brief description of the dangers on either side of the channel of the
 Gut of Canso, is intended to illustrate and to be used with reference to the
 Authority Chart, and with the same design the anchoring places shall now be
 pointed out.

Vessels may anchor for a tide, and in fine weather, near the light house at the
 North entrance, as already remarked; and also off Mill Creek, which is another or-
 dinary stopping place; but neither of these can be recommended, since they are ex-
 posed to Northerly winds, which often commence suddenly, and send in a very
 heavy sea. Moreover, off Mill Creek irregular eddies render it very difficult to keep
 anchor clear.

PLASTER COVE, on the Eastern shore, and distant 5 miles from the light house, *Plaster*
 is the first safe anchorage after entering the Gut from the Northward. It will be *Cove.*
 known at once by the conspicuous cliffs of white gypsum, which are 120 feet high on
 the N.W. side, and a short distance within the bridge near its entrance. The cove
 itself is dry at low water, but the anchorage off its mouth is convenient and safe in
 all winds. In Northerly gales the swell, deflected by Cape Porcupine, causes rather
 uneasy riding, but it does not endanger vessels well anchored in a clear berth.

The only directions necessary, both for avoiding Dixon Rock and choosing a good *Dixon Rock*
 berth are, to keep the cove open, so that the whole of the bridge as well as the plaster
 cliffs above it, may be seen. Large ships should keep Balche Point well open, and
 come further in (from 7 or 8 fathoms; but smaller vessels may anchor in 4 or 5 fath-
 oms, with mud bottom. The bottom is more and more sandy as we proceed further
 out towards the steep edge of the bank in 10 fathoms, after which it becomes rocky
 in the deep water and strength of the tide.

The tidal-stream at this anchorage are eddies, running often irregularly, but gen- *Tides.*
 erally in a contrary direction to the main stream in the channel, and at a rate seldom
 exceeding one knot. These eddies render it advisable to moor, especially in large
 vessels having occasion to remain some time (to water, for instance), in which case
 one anchor should be laid well out to the Southward in 9 or 10 fathoms water.

The high water here, on the full and change days, at 3h. 10m. a. m.; the rise in or-
 dinary spring tides being 13 feet, and in neap tides 3 feet; but extraordinary tides
 sometimes rise 6 or 7 feet, and at other times only 2 feet.

There is an excellent watering place directly opposite this anchorage, in the bay *Water.*
 between Cape Porcupine and Kenton Point. The post office is at Mackenzie's store on
 the Western side of the cove, and the mails from Sydney, Arichat, &c., to Halifax
 and other places, cross the Gut from thence to Mill Creek.

SHIP HARBOR is on the same side of the channel as the anchorage last described, *Ship Harbor.*
 and 2 miles further to the S.E. It is a large cove terminated by a bridge nearly a mile
 across the sea. It is completely open to N.N.W. winds, which blow directly through
 the inlet, causing at times a very heavy sea, excepting when well in towards the head of
 the harbor, where the anchorage is quite secure, out of the stream of the tides, and
 in 4 fathoms, mud bottom.

There is a fine settlement, with a Roman Catholic and a Wesleyan chapel, on the
 N.E. side of the harbor, together with stores and wharves where vessels may receive
 coals, or winter in safety.

Vessels of less than 12 feet draught may run in without difficulty, passing over the
 PREMIER SHOAL at all times; but larger vessels should prefer the channel to the *Premier*
 North of that danger, and attend to the following directions: *Shoal.*

Bring outside the shoal, bring Cayamagh Point, composed of low sandstone and
 shaly beach, on the N.E. side of the harbor, to bear S.E. & S., when a large store
 beam pile, and further up the harbor, will appear in one with it, and the end of the
 pier will be just in sight. Run in with these marks on until Ship Harbor Point
 bears W.S.W., when you will be within the Premier Shoal, and may steer to the
 Southward into the middle of the harbor. The channel to the Southward of the shoal
 is rather so deep nor so wide as the other, but it is more convenient for entering the
 harbor with Southerly winds; in which case, the chart and the lead will afford suffi-
 cient guidance.

The roadstead off the mouth of this harbor, and outside of the Premier Shoal, is much
 frequented by vessels detained by S.E. winds, but the riding is very rough there in
 winds from the opposite quarter. The depth is from 7 to 9 fathoms, over sand, gravel,

and mud bottom, and the only direction necessary is to keep Pirate Island in sight to the Westward of Ship Harbor Point.

Venus Cove. VENUS COVE, on the Western shore and nearly opposite to Ship Harbor, is an excellent anchorage, especially in N.W. winds. The best berth is in 6 or 7 fathoms, with mud bottom, directly off the mouth of the cove. Macneir Point in one with Plaster Cove, and bearing N. by E., should then be distant about 200 fathoms. There is a good watering place here, with wharfs for landing at all times of the tide; there is a fine settlement, near which a small English Episcopal church has been recently erected.

Holland Cove. HOLLAND COVE is 13 mile further to the Southward, and also on the Western shore. The anchorage off its mouth, although deep enough, is inconveniently small for large ships; but safe and good for small vessels. The best berth, for anything larger than a fishing schooner, is in 7 or 8 fathoms, mud bottom, with Pirate Island bearing S. E. by S., and distant a cable's length.

Pirate Island. PIRATE ISLAND, small, rocky, and united to the main-land by a bench of shingle, forms the S.E. point of the above-mentioned cove; and all within it and a line drawn across to the wharfs on the N.W. side is dry at low-water, excepting a narrow boat-channel, 3 or 4 feet deep, which leads to the bridge across this cove about a quarter of a mile from its entrance.

The remaining anchorages are less secure, either from exposure to particular winds, or loose holding-ground. On the Eastern shore, off Madden Cove, and Decola Pond, N.W. of Bear Island, and East of Bear Head, vessels frequently anchor to wait for wind or tide in fine summer weather; as they do also at Byers, Critchet, and Eddy Coves, on the opposite side of the channel. There will be no difficulty in choosing a berth at any of these with the aid of the chart.

Habitants Bay. HABITANTS BAY lies to the N.E. of the Gut, and is about 2¹/₂ miles wide at the entrance, between Bear and Turbalton Heads. In addition to the harbor at its head, it contains the two following useful anchorages: Sea-coal Bay, on the Western shore, and 1¹/₂ mile from Bear Head, will be readily known by the high cliffs of Capleton Head, which forms its N.E. point. This spacious anchorage, secure in all winds, excepting those from between South and S.E., is very convenient for vessels bound in through the Gut, and detained by strong N.W. winds. The depth in the mouth of the bay is 5 fathoms, the bottom of mud, and there is no danger in the way.

Turbalton Bay. TURBALTON BAY, opposite to, and distant 2 miles from the last, is a small but secure anchorage, to the Northward of Turbalton Head, and between it and Evans Island. In approaching this anchorage, the only danger to be avoided is the reef off Turbalton Head, which is partly dry at low-water, and runs out 275 fathoms to the Westward. Juvrin and Peninsula Points in one, bearing S. by E. 1/2 E.; or the two extreme points on the Western side of Evans Island in one, bearing N. N. E., will put lead clear of this reef in 11 fathoms. There is no other danger in the way, excepting the shallow water extending from the shore on either side, and from the small islets in the bottom of the bay. To avoid the latter, in a large vessel, go no further in than the line of Turbalton Head and Cape Argos, touching where the depth is 11 fathoms at low-water. With the Cape a little open to the Westward of the Head, the depth is 5 fathoms; in either case, the bottom will be of mud, and the reef will break off the swell from the Southward.

Habitants Harbor. HABITANTS HARBOR is not at present much frequented, being out of the track of general navigation; but it has space and depth of water sufficient for any number and any class of vessels, and is perfectly secure at all seasons. The Southern side of the harbor is formed by islands enclosing The Basin, in which vessels might spend winter, but of which a minute account would only confuse a stranger. Referring, therefore, to the exact graphical representation in the Admiralty chart, as far superior to any written description, it is only necessary to remark, that the channel leading into the harbor, between Long Ledge on the N.W. and Evans Island on the S.E., is nowhere less than 150 fathoms wide, from 3 fathoms to 3 fathoms on either side, and 10 or 12 fathoms deep, with mud bottom.

Long Ledge. To avoid LONG LEDGE, which is distant about 300 fathoms from Evans Island, and to run in far enough for safe anchorage, proceed as follows:—

Approaching from the S.W. through Habitants Bay, and with a leading wind, stand so as to pass the West end of Evans Island, at a distance between 150 and 200 fathoms, or by the lead in 6 fathoms; remembering that the bank on either side is very steep for vessels drawing more than 10 feet water. Follow the shore of the island round to the N.E., but approaching it at the same time very gradually, so as to pass Steep Head, its Northern extremity, at the distance of 100 or 150 fathoms. Having passed Steep Head, the vessel will be in safe anchorage, but she may go further in without danger, by simply keeping in the mid-channel as she runs towards Bumbo Island, which will be seen (small, round, with low clay cliffs) bearing E. 1/2 N. and distant nearly a mile from her track while passing Steep Head as just directed.

As the vessel proceeds, the channel between Round and Freeman Islands, leading into the Basin, will be passed; and when she has arrived within a third of a mile of Round Island, the main channel between it and the Indian Point, and leading into the Harbour to the North and East, will appear open, as well as the entrance of Habitant's River, which lies three quarters of a mile to the Northward. The shallow water extends 100 fathoms off Round Island, and the main channel, which passing to the N.W. leads into the wide expanse of the harbor to the Eastward, may be followed without difficulty with the aid of the chart. It is, however, not necessary to go beyond Round Island for good anchorage, as that may be found everywhere in the channel; and if the depth of water there be considered inconveniently great, the anchorage to the Southward of Round Island, between it and Freeman Island, affords a good berth in a moderate depth of water. The tides in this harbor are weak, seldom exceeding a knot in the entrance, where they are strongest.

At high-water, on the full and change days, at 8h. 20m.; the rise in ordinary Tides, is being 63 feet, and in neaps 47 feet.

HABITANT'S RIVER enters the harbor from the North, and is navigable for *Habitants River.* vessels by a narrow and winding channel for several miles, while boats can ascend the bridge, a distance of 7 miles. There are some good farms on the banks of this river, but the shores of the harbor are as yet very thinly settled, and present a very barren appearance. There is said to be workable coal at Little River, just outside the harbor's mouth.

With the foregoing description of the dangers and anchorages, and the aid of the *Causeau Gut.* chart, it is presumed that little or no difficulty will be experienced in the *causeau Gut.* passage of the Gut of Causo, either with a leading or a bearing wind. In the latter *causeau Gut.* case, and when bound to the Northward into the Gulf, the aim should be to gain the anchorage at Plaster Cove, and to start from thence with the turn of the tide; so as to come a good offing in George Bay before the ebb makes. The set of the flood stream from the Gut is nearly towards Cape George, diminishing rapidly in strength as it expands in advancing to the Northward. It is weak in the Western part of the bay, sweeping round it to the N.W., with slight indraughts towards Pompey, Antigonish, &c. The ebb stream will be found setting in the contrary direction.

On the Eastern side of George Bay, the flood stream from the Gut is usually met by a much weaker and contrary stream of flood, coming from the N.E., along the West coast of Cape Breton. These opposing flood streams will be found, in general, to meet somewhere off the Indian Island, and then to set towards the N.W. The two remaining ebb streams are generally divergent from about the same place; the one running towards the Gut, with increasing strength as it proceeds to the Southward; the other in the contrary direction, towards Port Hood. All, however, that has been said respecting these streams, can only be understood as of a general and not of constant force, since they must necessarily partake of the irregularity in the strength and duration of the tidal streams of the Gut of Causo. Nevertheless, it will be highly useful, and may materially aid the progress of the vessel, to bear in mind the usual set of these streams.

Vessels outward bound, and proceeding through the Gut to the Southward, very frequently meet a S. or S.E. wind, with its usual accompaniments of fog and rain; in which case the roadstead of Ship Harbor will be found the most roomy and convenient anchorage. Eddy Cove, from its more advanced position at the entrance of the Gut, offers to vessels sailing with the first of a fair wind, a better chance of clearing the Pointe Bay and the Causeau Lodges before dark; but it can only be recommended in a settled summer weather, for the ground is not good, and the anchorage is much exposed to the occurrence of a sudden change of wind. Turboton Bay is much more secure, but it is rather small for a large and weakly manned vessel to weigh anchor in the event of a strong wind setting in suddenly from the Westward.

UNNOX PASSAGE, between Breton Island and the island, Juvavin and Madame, *Unnox Passage.* is very narrow, and 15 miles in length, with a low water depth of 18 or 19 feet in the narrowest part. There are seldom less than 23 feet at high water; nevertheless, a great part of the channel is so narrow, crooked, and full of shoals, that it would require to be well buoyed before it could be safely navigated by large vessels.

It is, however, a safe and convenient channel for coasting vessels; avoiding the shoals well in Chedabouctou Bay, and affording them an advanced anchorage, from which to start with a fair wind when bound out to sea. These vessels usually not exceeding the draught of 10 or 12 feet, frequently run through with a leading wind, losing their time of tide; but large vessels seldom attempt it, even with the assistance of some persons there who profess to act as pilots, but whose knowledge of the channel is far from perfect. It will be enough to notice very briefly the intricate parts of this channel; a written description would avail but little, and be far less effectual, than a faithful representation afforded by a chart on a sufficiently large scale; but at some distance in from either entrance, the passage is not so difficult; and as a

knowledge of the anchorages there may often prove highly useful to vessels desirous of shelter on the approach of bad weather, those places shall now be described.

*Western
Entrance
Macedonal
Shoal.*

THE WESTERN ENTRANCE between Rabbit and Jauvrin Islands is a mile wide, but the navigable breadth is reduced to half a mile by Macedonal Shoal, a bed of rocks, with 5 feet least water, and extending nearly three-quarters of a mile along the Northern shore of Jauvrin Island, from which it is separated by a narrow and shallow channel. This dangerous shoal, as well as the reefs off Turbalton and Thomas Heads, must be carefully avoided in entering the passage. The West end of the shoal is distant half a mile N.N.E. from Thomas Head, which in one with Jauvrin Point will just clear it to the Westward. These marks are distinct and good; but when they are in one, it may be observed that a small part of Wasting Islet will be seen to the Westward of Jauvrin Point, and must not be mistaken for it. In standing towards the shoal, keep the last-named point in sight, and there will be no danger. The mark for clearing the North side of the shoal is the high-water sand-bench of Strawberry Point kept open of Maerea Point, bearing E.S.E., but it is not very clearly defined, and therefore on that side the shoal should be approached with great caution, and no nearer than the low-water depth of 6 fathoms.

Anchorage.

The anchorage in this entrance of Lennox Passage is capacious and secure, in from 5 to 7 fathoms, anywhere to the Northward of Macedonal Shoal; but the best berth off Cary Pass, at the East end of Rabbit Island, in 7 fathoms, mud; and where the main channel is a mile wide and free from danger. It is only necessary to observe that the shallow water extends a cable's length off the South shore of Rabbit Island and 2 cables' length off the East point of entrance of Cary Pass, where there is a rocky patch, with 10 feet least water, 150 fathoms off shore.

*Campbell
Island.
Fish Shoal.*

From the anchorage just mentioned, Campbell Island will be seen at the distance of 11 mile to the Eastward. The navigable breadth of the passage is there reduced to 300 fathoms by Fish Shoal, which is rocky, with 10 feet least water, and lies a quarter of a mile off a small cove of Breton Island. From thence the passage becomes intricate. The following leading-marks, with brief directions, will enable any person, who can recognize the objects named, to take a vessel through with fair wind.

Approaching from the Westward, and before arriving at Fish Shoal, open out Burn Point a little to the Southward of Low Point, bearing E. 1 N.; keep them so, and they will lead to the Southward of that shoal, and for a mile farther to the Eastward. When Thorn Island is just about to disappear behind Glasgow Point, bearing S.S.W. 1 W., change the course, and steer E.S.E., or towards Martinière Cove, where there are several houses, until Parat and Seal Islands close and appear in a line, when they will bear E. 1 N. These last-named points kept exactly touching will lead through between the shoals as far as Burnt Point, where the channel narrows to the N.E. between that point and the Burnt Islands, and where the deep water is only half a cable wide. Passing midway through this narrow opening, and with the aid of the chart, rounding the Burnt Islands to the N. and E., steer S.E. between them and Seal Island, until the Eastern point of Seal Island comes in one with Heron Point, about W.S.W. 1 W.; then change course directly to E.N.E. 1 E., keeping the last-named points abreast and exactly touching, and they will safely lead through between the Middle Ground and Seal Island, where the channel is again only half a cable length wide. The Middle Ground is rocky, with 4 feet least water; and when the channel between it and Seal Island is fairly entered, steer half a point more to the North, E.N.E. 1 E., or so as to keep Heron Point only just shut in behind the Eastern point of the Burnt Islands, until Grande-digue Point (the *land*, not the shingle-spit) and Hawk Islet are touching, upon the bearing of E.S.E. 1 E. Now keep to the last-named marks, and they will lead to the excellent anchorage off the Ferry Grande-digue, where there is room enough for the largest ships in from 5 to 8 fathoms, mud bottom. The long Spit of Shingle, from which the name is derived, runs out from Grande-digue Point 150 fathoms across the channel, to about N.E. by N. and shelters the anchorage completely from the Eastward. A great part of the spit is covered at high-water, but can generally be discerned by the rippling of the water. The only other danger here is the Ferry Reef, which lies to the N.W. of the spit, being a deep and clear channel, 200 fathoms wide. This reef is nearly dry at low water, and very much in the way here, as it may be said to extend half-way across the passage, being separated from the Northern shore by a channel so narrow as to be only navigable by boats or very small craft. On the Southern edge of this reef, there is also, in the North extremity of Grande-digue Spit, Birch and Ouetique Islands, just in a line, on the bearing of E. 1 S.; and therefore, to clear the reef, keep Ouetique Island open; and to clear the spit, partly shut in behind Birch Point. The channel, after passing to the Southward of the Ferry Reef, turns to the N.E., between Seal and Grande-digue Spit, and then round the latter to the East and South, forming a crooked and, for a stranger, a difficult pass. At Grande-digue there are extensive

quarries, several tolerable farms, and the ferry by which the mail crosses the passage, on its way to Arichat.

Its high-water, on the full and change days, at Grande-digue at 7h. 55m., mean *Tides* time: the rise at spring tides is 6½ feet, and at neap tides 4½ feet. The tidal-streams are often irregular, but when not so, change about three-quarters of an hour after high and low water by the shore; the flood coming in from the Eastward, they are stronger around the spit at Grande-digue than in any other part of the Lennox Passage; but their rate, even there, seldom exceeds 2 knots.

With a beating wind, an intimate knowledge of the place and the set of the tides is indispensable; but to run through the Narrows at Grande-digue to the Eastward, with a fair wind, proceed as follows:

Approaching the anchorage at Grande-digue from the Westward, steer for Grande-digue Point and Hawk Islet touching, as already directed, until the South point of Cassequette Island opens out a very little to the Southward of Birch Island; and then East, to this last-named mark, which will lead well clear of the Ferry Reef; and when the middle channel to the Westward of Birch Island becomes open, and bears to the Northward of N.E., steer towards it until the Southern extremity of Ouetique Island is seen over the bench of Birch Point, bearing E. & S. Run towards the last-named marks in Grande-digue Spit is passed, which will be when the West end of Birch Island bears due N.; then change the course instantly to S.S.E., or so as to make a direct course towards the middle of the Western entrance of Poulant Bay, and continue that line until the North ends of Crow and Eagle Islands come in one; then East towards Ouetique Island until the Roman Catholic steeple at Discousse is in one with the N.E. point of Hawk Islet; and lastly, E.S.E., or so as to pass Hawk Islet at the distance of 100 or 150 fathoms. The vessel will then have arrived at the comparatively wide and open part of the passage off the Eastern entrance of Poulant Bay, hereafter to be described.

By following the directions just given, the vessel will have taken the ship-channel *Birch Shoal* and to the Southward of Birch Shoal, which lies 130 fathoms S.W. by W. of Birch Point. Not less than 13 feet were found on that shoal; but as boulders may occasionally be dropped upon it by the ice, or a small point of rock might possibly, although not probably, have escaped discovery, it will be best to follow the example of the country vessels, and avoid running over it. To the Eastward of Hawk Island the passage becomes much wider, and is navigable for the largest ships; but as our main object is to guide vessels into a safe anchorage, we shall now reverse the order of description, and give it as the objects would appear in succession from East to West to a stranger running in from seaward.

THE EASTERN ENTRANCE OF LENNOX PASSAGE, between Cape Round *Eastern en-* and Mark Point, is 2½ miles wide. The shoals off St. Peter's Bay occupy much of that *trance.* space, but still leave a clear channel, a mile wide, between them and Cape Round. This channel leads to the only anchorage which a stranger could venture to run for in the approach of bad weather in this very dangerous neighborhood, an accurate knowledge of it becomes of very considerable importance.

First, taking the dangers and objects on the North side of the channel. *Horseshoe* *Shoal* HORSESHOE SHOAL is rocky, irregular in shape, and of great extent, and the greatest danger off St. Peter's Bay. Besides several shallow patches, occasionally covered by breakers, there are 3 rocks near its Northern side which only just uncover at low tides, and on which the sea usually breaks heavily. These were formed by the name of the Three Stones. On the North point of this shoal, in 13 fathoms, the Northern faces of Cassequette and Ouetique Islands are in one, bearing W. by N. Its Western side will be cleared in 5 fathoms, if the bench of Beak Point be opened out to the Eastward of Cape Round. The South side of the Horseshoe Shoal is the way of vessels running in from the sea, and is just cleared by bringing the S.W. extremity of Ouetique Island and Sycamore Point in one, when Cassequette Island will appear just open to the S.W. of them, and bearing N.W. by W. If a vessel cannot be clearly made out, take care to keep Cassequette Island open 2 degrees East to the S.W. of Ouetique, and to keep the lead going; remembering also that there can be no occasion to approach this dangerous shoal nearer than the depth of 10 fathoms: the channel between it and Cape Round is a full mile wide, and from 5 to 10 fathoms deep.

With the aid of the chart, there will be little difficulty in distinguishing Ouetique and Cassequette Islands by a vessel entering this channel. They lie 4 or 5 miles to the W. of Cape Round, and will be seen towards the Brown Island shore. Ouetique, especially, is very remarkable, being small, precipitous, dark-looking, comparatively low (about 50 feet) and with a few pine-trees upon it; and Cassequette is the next largest to the Westward of it, much larger, not so high, wooded, with low cliffs at its N.E. and a sandy point at its S.W. extremity

The steeple of the chapel, and the other buildings of the village on the shore opposite the island, will immediately point out this place to strangers. It is a secure and very pretty little harbor for the small vessels by which the fisheries are extensively prosecuted, and generally belonging to Jersey merchants residing at Arichat.

POULAMENT BAY is a secure and capacious harbor, with three entrances, bounded by Eagle and Crow Islands, which lie nearly in a direct line from Bernard Island to Grande-digue, a distance of 2 miles to the Westward. Poulament Islet, small, round, and wooded, lies within Eagle Island, and, together with the shallows, divides the bay into two parts, of which the Eastern division leading to Poulament Bay, and containing most of the houses, and affording the most roomy anchorage, is 3 fathoms, with mud bottom, is the most frequented. An equal depth might be found into the bay if the channel were buoyed, but the shoals extending in opposite directions from Bernard and Eagle Islands so overlap as almost to form a bar over which from 13 to 17 feet, according as it may be low or high water, are all that can be considered to a stranger, running in with the leading marks a stern; namely, Cascaresse Island and Cordouan Point touching, and bearing N.E. $\frac{1}{2}$ N. Vessels drawing much water, or not wishing to run in, may safely anchor in the roadstead outside the bay, as will be presently directed.

At high-water, on the full and change days, in the entrance of Poulament Bay, at low-water, the rise in ordinary spring-tides is 6 feet, and in neap tides 4 feet. The streams are weak in the bay, and seldom exceed a knot in the channel of its length.

HAWK ISLET, united at low water to the East end of Eagle Island, and distant three-quarters of a mile W.N.W. from Bernard Island, forms the N.W. point of the bay entrance to Poulament Bay; it is bold to the Northward, but to the Eastward a narrow off towards Bernard Island to the distance of 2 cable's length. In the remaining distance of $\frac{1}{2}$ mile, to Grande-digue, the principal dangers in the way are, first, a shoal which runs out, E. by N., from Crow Island a quarter of a mile, and which is pointed by bringing the North point of Hawk Islet and the steeple at Di-cousse in line, and secondly, the Birch Shoal, already described.

To the foregoing brief description, which should be read with reference to the Admiralty chart, the following directions are added for the use of vessels desirous of entering on the approach of bad weather; and especially at the commencement of gales from between the South and East, as they seldom continue beyond a very few days without bringing thick fog and rain. In a vessel so circumstanced, and approaching the Lennox Passage from the S.E., proceed as follows:

Pass Cape Round at any distance between half and three-quarters of a mile, steering N.W. until Oucetique and Cascaresse Islands touch; then change the course, steering towards those islands, N.W. by W., or so as to keep them touching, until Poulament Islet appears just open to the Northward of Bernard Island; and then run, or towards the last named marks, keeping the islet just open until the chapel of Bourgoise Islet comes in one with the Eastern point of Oucetique Island, bearing N. The vessel will now be in about 9 fathoms, with mud bottom; and if she bring up in the last mentioned marks on, will be distant a long cable's length from the shoal water off the North side of Bernard Island, and in safe anchorage, being sheltered from S.E. winds by Bisceousse and Galion Shoals, and by land in every other direction.

If the anchorage off the Eastern entrance of Poulament be preferred, then, instead of approaching when the steeple at Bourgoise Islet and the Eastern point of Oucetique Island come in one, change the course to W.N.W., or, as may be found necessary, to run from the North point of Crow Island a little to the Northward of Hawk Islet, and do so, run towards them, W. by N., until the steeple at Di-cousse comes in one with the high-water Western extremity of Bernard Island, when the vessel will be distant within 100 or 150 fathoms of her intended anchorage. Continue the W. N. course until Poulament Islet and Eagle Island close; and when they touch, bearing W. by S., Cordouan Point will either be touching, or only just shut in behind the Western end of Cascaresse Island, bearing N.E. $\frac{1}{2}$ N. Round to, to the Southward, with these last named marks on, and bring up either in 7 fathoms, with the Western extremities of Crow and Hawk Islets abreast; or a little further in, with two points on the North side of Bernard Island abreast; there the depth will be 6 fathoms, and the bottom in both places mud. If the vessel does not draw more than 6 feet water she may safely run into Poulament Bay by keeping the leading marks a stern as she runs from them, (namely, Cordouan Point and Cascaresse Island touching, or very slightly open, and bearing N.E. $\frac{1}{2}$ N.), and when the South side of Crow Island appears in sight to the Southward of Eagle Island, she will be within the bay, and may bring up in 13 fathoms, mud, and in a perfectly secure harbor.

With an accurate chart on a sufficient scale, and off Grande-digue, and in company with hands, there would be little difficulty in taking a large vessel to the anchorage at

Poulament Bay.

Tides.

Hawk Islet.

Sheltered anchorage off Bernard Island.

off Poulament Bay.

in Poulament Bay.

Grande-digue; but written directions would avail but little in such a narrow and difficult channel, where there are neither buoys nor beacons, and where the least mistake in making out the objects named as leading-marks would almost instantly run her on shore.

St. Peter's Bay.

ST. PETER'S BAY,* which is 2 miles wide, opens immediately to the Northward of the Samson Rocks and of Horseheads Shoals, and may be approached either East or West of those dangers. It has excellent anchorage for any class of vessels, especially at Grande-grove on its Eastern shore; but it is rendered almost inaccessible by the numerous rocky shoals scattered over the bay, and which could scarcely be avoided in a large ship without the assistance of buoys. Vessels not exceeding 10 or 12 feet draught may run in without difficulty, with the aid of the chart, on which they may rely, for no directions would avail in so intricate a place.

The principal settlements are at Grande-grove and along the South side of Jerome Point, a high headland projecting from the North-east side of the bay and rising to the summit of Mount Granville, on which the remains of an old fort may be seen, 100 feet above the sea. Vessels usually anchor in the N.E. corner of the bay, within Jerome Point, where there are the remains of another old fort, and a wharf at the *Haul-over*, across to the Bras Dor Lake.

Haul-over.

On the North side of the Haul-over there is a wharf at the ship-building establishment of Mr. Handley, and there is also a post office.

An canal has been more than once proposed at this place, and will probably be formed at no very distant day. A survey has recently been made for it by Mr. Wm Fairbanks, an intelligent civil engineer of Nova Scotia. The distance across the neck of land is 2400 feet; its greatest height, extending only for a small part of the distance, is 15 feet; and the cutting easy. The advantages of such a canal to the numerous vessels engaged in the coal trade to and from the Sydney mines would be very great, they would thus be enabled to substitute for the long and comparatively dangerous circuit by Senturi, a short and safe route through the Bras Dor. Scarcely less would be the benefit it would confer upon the settlers along the shores of the Bras Dor, by opening for them a way to markets for agricultural produce at Arichat, Canso, and other places where the fisheries are almost exclusively prosecuted.

Tides.

It is high-water, on the full and change days, in St. Peter's Bay, at 7½ hours, the tide being 6 feet in spring, and 4 feet in neap tides.

The main level of the Bras Dor, at the Haul-over, was found to be rather more than 2 feet below the high-water of ordinary spring-tides in the bay of St. Peter, but the influence of the tides is unperceptible in that part of the former, though without cause a fluctuation of level to the amount of about 2 feet.

CHEDABUCTO BAY.

Chedabucto Bay, North Coast.

CHEDABUCTO BAY, through which all vessels entering or leaving the Gulf of St. Lawrence by the Gut of Canso must pass, is 17½ miles wide at the entrance, from Michaux Point to Cranberry Island light-house; but the entrance is generally considered to lie between Green Island and the Canso Ledges, in which case the breadth is only 7½ miles. The whole depth of the bay, from the Easternmost of the Canso Ledges to Guysborough, is 26 miles. The following description of its shores, with the dangers, anchorages, and harbors, on either side, is given from East to West, or they would be passed by a vessel running in from sea:—

Michaux Point.

MICHAUX POINT, the N.E. point of the bay, (in some charts Cape Michaux broke, in others Peninsula Point, names unknown to the inhabitants,) is a peninsula united to the main-land by a double beach, inclosing a pond; and Red Point and Islet are distant from it 2½ miles to the W.N.W. Off these points, and extending across the bay between them, lie the Michaux Ledges, dry at low-water, and usually shown by heavy breakers. Lying nearly a mile from the shore, with deep water close to them, they are extremely dangerous in dark nights or foggy weather. The S.E. extremities of St. Peter's Island and Mark Point in one, lead close outside of them, 4 fathoms; therefore, in standing towards them, tack while the point is west of the West of the island.

St. Peter's Island.

ST. PETER'S ISLAND lies 3½ miles further to the N.W.; and in the shoal between it and Red Point will be seen the Roman Catholic church steeple and the laze of Ardoise. The island is low, and about three-quarters of a mile long.

The cove, on its inner or north side, affords shelter to numerous small craft boats; this being one of the principal fishing-stations in these parts. The island bold to seaward, but off its N.W. side is Haddock Rock, at a distance of a quarter of a mile; and in the bay between it and Mark Point there is much shoal water, but

* Formerly Port Toulouse.

however, a clear channel within the Horseheads and Samson Rocks into St. Peter's Bay. The distance across the Eastern entrance of the Lennox Passage, from St. Peter's Island to Cape Round, is 3½ miles W. ¼ N.

All objects of importance on the North side of Madame Island having been noticed, we have now to review the Eastern and Southern shores, commencing at Beak Point, distant 1½ mile S.W. by S. from Cape Round. The shoal water runs out from Beak Point only to the distance of 2 cables' length, but off it there is much rocky and irregular ground, on which the sea is said to break occasionally in very heavy gales. The least water we could find there was 4 fathoms, which bears from the point S.E., and is distant 1½ mile. Another rocky patch, with 4 fathoms, lies E. by S. a mile from the point. A large ship should pass outside this rocky ground, especially when there is a heavy sea running.

THE BAY OF ROCKS, lying between Beak Point and the Grosnez, a rocky islet at the N.E. extremity of Petitegroat Island, is 3 miles wide, and deep. It is a dangerous place, affording no safe anchorage for ships, being open to all Easterly winds, which send in a heavy sea. Hewes Shoal, with 21 feet least water, lies nearly in the middle of the bay, and besides the low rocky islets near its head, there are many other rocks around and off its shores.

RED HEAD, the S.E. extremity of Petitegroat Island, is a remarkable cliff, 70 feet high, and 2 miles S.W. from Grosnez. Shallow water runs out from it a quarter of a mile, to clear which, keep Beak Point open to the Eastward of Flat Point.

GREEN ISLAND, of slate, with precipitous shores, 90 feet high, and a third of a mile long, lies off Red Head, a mile to the S.E. It is bold all round, and there is a clear channel three-quarters of a mile wide between it and Red Head.

ORPHEUS ROCK (called Boss by the fishermen), is 15 mile E.S.E. from Green Island. It is awash at low-water, and the sea consequently almost always breaks on it; otherwise it would be still more dangerous than it is. It is small, with deep water all round, at the distance of a cable's length to the S.W. there being 50 fathoms. A lead from Heath Head (the Southern extremity of Petitegroat Island, and distant a mile West from Red Head) will lead clear of this rock, either to the Northward or Southward, according as it may be kept open to the North or to the South of Green Island.

PETITEGROAT INLET, separated from Madame Island by a very narrow channel, through which boats may pass at high-water into the Bay of Rocks, is 3 miles long, and has water enough for large vessels; but the rocks are so numerous, and the channel between them so narrow, as to render the aid of a native pilot indispensable. The fisheries are extensively prosecuted from this inlet; and its shores, as well as almost every cove in the island, are occupied by the fishermen and their employers.

CAPE HOGAN, the Southern promontory of Madame Island, separates Petitegroat from Arichat, and is a bold and remarkable headland, with cliffs 100 feet high.

ARICHAT HARBOR is sheltered by Jerseyman Island, which stretches across the bay. It is a spacious and secure harbor, capable of containing any number of the largest ships. It has two entrances, of which the Western is the least difficult for strangers, although only a cable's length wide. The Eastern entrance is 3 cables' length wide, but it lies between shoals, which, with the other dangers and the marks for clearing them, must first be briefly described; referring as usual to the Admiralty chart for the objects named.

THE HAUTFOND SHOALS are a chain of rocky patches, now for the first time correctly shown in any chart. The least water, 10 feet, is on the outermost patch, and bears from Moyne Point, N.W. by W., from Marache Point, W.S.W. ¼ W., and is nearly a mile from each of them. The other patches lie in a line from the outer one to the North side of Forest Cove; the least water on them is 21 feet, and there is deep water between them; but the safe channel for ships is outside, or to the Westward of them all. Cape Hogan and Green Island in one, lead past these shoals at the distance of a third of a mile to the Southward; and Hubert's White House and Flagstaff seen over the Eastern extremity of the cliffs of Jerseyman Island, bearing N.E., will just clear them to the N.W.

MARACHE POINT is quite bold to the Westward, with the exception of two small rocky patches which lie off it at the respective distances of 300 and 400 fathoms to the N.W., and on which the least water is 4 fathoms. To the Northward of the point, and for some distance to the Eastward, the shoal water extends 150 fathoms off shore.

ARICHAT BEACON.—A beacon light on Point Marache, on the East side of the Southern entrance to Arichat Harbor. The building is square, painted white, and shows a white light, 34 feet above sea-level—rise and fall 6 feet. The point is bold and the following are the bearings of the principal head-lights:—

"	" " to Ragged Head, North Shore, Chedabucto Bay, N. 79° W.
"	" " to Madame Island, East side of entrance to Strait of Canso in one with Jerry Island Reef, N. 48° W.
"	" Little Arichat Head, N. 40° W.

Capodiette Bay. CAPODIETTE BAY, 14 mile wide, between Marache and Kavanagh Point, although open to Westerly winds, and to the heavy swell rolling in at times round the point from the Southward, nevertheless affords a tolerably good occasional anchorage in 10 or 12 fathoms, and mud bottom: the best ground being in the deepest water.

Fiddle Shoal. FIDDLE SHOAL has 10 feet least water at the outer end of the rocky bank which extends from Kavanagh Point, 300 fathoms to the W.N.W. There is no passage for large vessels between it and the point, which has several dry rocks off it, and shoal water all along its S.W. side, to the distance of 150 fathoms off shore. On the North side of the Point within the harbor, a reef, with only 3 feet at low-water, runs off a quarter of a mile, which is half-way across to the wharves of the town of Arichat. This danger must be carefully avoided when hauling to the Eastward towards the head of the harbor.

Henley Ledges. On the opposite side of this Eastern entrance lie the Henley Ledges, forming the S.W. extremity of the rocky bank off Jerseyman Island, and a mile from Marache Point, from which they bear N.W. by W., though the breadth of the deep water between them is three-quarters of a mile. They are black rocks, covered only at high-water, and almost always shown by breakers. To seaward, the shallow water extends from them only 150 fathoms, but there is a rock awash a third of a mile from them to the N.N.W. ½ W., and two others between them and Jerseyman Island, thus leaving no passage for ships. There are no good leading-marks for passing to the S.W. of these rocks; but vessels will pass well to the S.E. of them, if the English church steeple at Arichat be not shut in behind the Eastern extremity of Jerseyman Island.

Pilot Rock. PILOT ROCK is on the N.W. side of the channel, and at the extremity of the shallow water off the East end of Jerseyman Island, from which it is distant 200 fathoms to the S.E. It is small, with 4 feet least water, and quite bold to the Southward. There is no channel between it and the island for large vessels. The leading-mark to clear it to the S.E. is De Carteret's Flagstaff, near to the East end of Arichat, seen over Kavanagh Point; but this mark leads very close to the rock.

Poule Reef and Islet. POULE REEF, with 7 feet least water, lies 200 fathoms E. by N. from Poule Islet, which is nearly united to the East end of Jerseyman Island at low-water. There is a narrow channel, fit only for small craft, between the shoal and the islet; but the ship-channel to the Eastward of this shoal, between it and the Fiddle, is 500 fathoms wide, from 3 fathoms to 3 fathoms on either side, with depth sufficient for the largest ships.

Directions. If bound to Arichat, with a leading wind, that is, any wind from S.S.E. round by South, and W. to W.N.W., proceed as follows:—If the approach be from the Westward, avoid the Cerberus Rock by attending to the marks which will be presently given: if from the Eastward, pass the Hantford Shoals by keeping some part of Green Island in sight to the Southward of Cape Hogan, until Arichat church appears only a little open to the Eastward of Jerseyman Island, bearing N.E. by E. 4 E. Having brought the church steeple on that line of bearing, steer for it, but keeping it a little open, until the beacon on Marache Point bears S.E. by E., or until the Henley Ledges are in one with Arichat Head, the Western extremity of Creighton Island bearing N.W. by N., and are distant a quarter of a mile. Then change the course to E. ½ N. or so as to make a direct course towards Little Barachois at the head of Capodiette Bay; and as soon as the Roman Catholic church steeple opens a little to the Eastward of the Priest's Flagstaff, bearing N., run towards it until the Southern extremity of Creighton Island is seen through the Crid Pass. The vessel being then within Poule Reef, may safely haul to the Westward, and select her berth at pleasure, in the most roomy part of the harbor, anywhere to the North of the line from Poule Islet to Beach Point. South of that line, the Eastern bight of Jerseyman Island contains Cage Shoal, with only 7 feet water, and much foul ground.

If the vessel should have occasion to go to the Eastern part of the harbor, she should stand well over to the North shore before bearing up to the Eastward, and run along it at the distance of a cable's length from the ends of the wharves, until after Marache Point has disappeared behind Kavanagh Point, when she will be to the Eastward of the reef, off the last-named point, and will find bold shores and plenty of water to within 120 fathoms of the entrance of the cove at the head of the harbor.

The foregoing are safe and simple directions for a stranger in a large vessel, be-

with an Easterly wind required to bring the Jerseyman Island; and of distinguishing the latter outside of the H to the N.W., namely, the summit of the cliffs. Roman Catholic steeple within a quarter of a point and the shoal water Chedette Bay until the m cable to the Eastward.

In approaching Arichat Cerberus Rock, is Creighton Shoals, Beach Catholic church at Arichat which also leads clear The Crid Islands, which whole breadth of which rocks off both ends of channel to 100 fathoms easily passed as near a commences immediately Western extremity of to the N.W. and W.;

With the necessary N. to N.N.E., proceed, bring the Roman a little to the Northward running towards it, and Beach wharf and store Northward of Beach Ister for them E.S.E. 100 fathoms, into the b

THE CERBERUS. Lying directly in the dangerous in dark night passing over it can alarm S.S.W., 2½ miles S.W. line of bearing. Then in one, bearing E.S. the distance of 100 fathoms the extremity of the West will lead a cable's length Wasting Islet; or Edd in the Westward, and run to be often clearly in the Westward, keep begun until the English two peninsulas of Jersey the course may be safe

with an Easterly wind it would not be desirable to run so far to leeward as would be required to bring the English church steeple in one with the Eastern extremity of Jerseyman Island; and for persons sufficiently acquainted with the place to be certain of distinguishing the leading-marks, it would not be necessary. They could pass either outside of the Hautfoud Shoals, upon the leading-marks given for clearing them to the N.W., namely, Hubert's house and flagstaff shut in behind the Eastern extremity of the cliffs of Jerseyman Island; or inside of them, by steering for the Roman Catholic steeple and Marahe Point exactly in one, bearing N.N.E. ½ E., until within a quarter of a mile of the point; then, after keeping away a little to pass the point and the shoal water mentioned off its North side, they will have to bent up Caporette Bay until the marks for running in, namely, the Roman Catholic church open a little to the Eastward of the Priest's flagstaff bearing North, come on.

In approaching Arichat from the Westward, the only out-lying danger, besides the *Western entrance to Arichat*, Cerberus Rock, is Creighton Shoal; and this last will be avoided if, after passing the Peninsula Shoals, Bear Head be not shut in behind Peninsula Point until the Roman Catholic church at Arichat is seen to the Southward of the Crid Islands; a mark which also leads clear of Picard Reef, and of all the shoal-water off Creighton Island. The Crid Islands, which are small and rocky, form the North side of Crid Pass, the *Crid Islands*, whose breadth of which across to Beach Point is 166 fathoms; but there are half-tide rocks off both ends of those little islands, which reduce the navigable breadth of the channel to 100 fathoms. The extremity of Beach Point, which is all shingle, may be safely passed as near as 30 fathoms but on the outside of the point the shoal water commences immediately, and continues increasing in breadth from the shore to the Western extremity of the island, where it extends a third of a mile out from the cliffs to the N.W. and W.; and still further to the S.W. and S.; in which last direction it unites with the Henley Ledges.

With the necessary leading wind, that is, any wind from South round by West, and N. to N.N.E., proceed as follows:—Having cleared Creighton Shoal, as already directed, bring the Roman Catholic steeple to appear through the middle of the Pass, or a little to the Northward of Beach Point, when it will bear E. ½ S. Keep it so while running towards it, and when the vessel has arrived within half a mile of the point, if the wharf and stores (on the South side of the harbor) be not already seen to the Northward of Beach Point, sheer a little to the Northward till they are so, and then steer for them E.S.E. ½ E., or so as to pass the point at any distance between 30 and 100 fathoms, into the harbor, where a berth may be selected as already directed.

It is high-water at Arichat, on the full and change days, at 8h. 10m. after the moon's transit; and the ordinary rise is from 4 to 5 feet; but extraordinary spring-tides may rise 6 feet. The stream of flood comes in by the Eastern entrance, running through the harbor to the Westward, and the ebb-stream to the contrary; but these streams are not very regular, and seldom exceed the rate of one knot.

The straggling but well-placed town of Arichat extends nearly 3 miles along the bold and steep North shore of the harbor, where there are many wharfs and stores. Of the two churches, the Roman Catholic is the largest and the Westernmost; and the only other public building at all remarkable is the court-house, standing more to the Eastward, and distinguished by its cupola.

Arichat is the head quarter, of the fisheries in its neighborhood, and the most important seaport, both in commerce and in population, on the Atlantic coast of Nova Scotia Eastward of Halifax.

The usual watering-place is at a spring near Hubert's wharf, where good water may be obtained on payment of a small sum. Water may also be obtained at Irish Point, from the outlet of the chain of small lakes in rear of the town.

THE CERBERUS ROCK, just awash at low-water, with deep water all round, lying directly in the way of vessels to and from the Gut of Canso, is exceedingly dangerous in dark nights and foggy weather. In the day-time either breakers or a rapping over it can almost always be seen. It bears from Arichat Head, the nearest point, S.S.W., 24 miles; and is rather more distant from Jerseyman Island, on a W.S.W. line of bearing.

The clearing-marks are as follows:—Cape Pogan and Green Island in one, bearing E.S.E. ½ E., will lead clear to the Southward of the Cerberus at the distance of 100 fathoms. The English church steeple at Arichat and the Eastern extremity of the Western peninsula of Jerseyman Island in one, bearing E.N.E. ½ E., will lead a cable's length to the S.E. of it. Carleton Head, open to the Westward of Westing Islet; or Eddy Point and Ship Point in one, will, either of them, lead clear to the Westward of this rock at the distance of a mile; but those objects are too distant to be often clearly distinguished, therefore, to avoid this danger in a vessel bound to the Westward, keep some part of Green Island in sight to the Southward of Cape Pogan until the English church at Arichat is seen over the shingle isthmus uniting the two peninsulas of Jerseyman Island, or until Arichat Head bears N.E. by N.; then the course may be safely shaped direct for the Gut of Canso. In a vessel outward

bound, take care that the course made good from the middle of the Southern entrance of the Gut of Canso is not more to the Eastward than S.S.E. until Green Island appears to the Southward of Cape Hogan; or until the English steeple at Arichat is seen over the Jerseyman isthmus, when the course may be safely shaped more to the Eastward and out to sea.

*Little
Arichat.*

LITTLE ARICHAT is a small and secure harbor, where the fisheries are extensively prosecuted; it lies inside of Creighton Island, and 2 miles N.W. from Arichat. The approach is from the Westward, and over a bar, with 17 feet at low-water, which extends across to the Northward from Arichat Head, the West extremity of Creighton Island. The entrance of the harbor, half a mile within this bar, is 150 fathoms wide between Creighton and Bosdet Points; the former being a long spit of sand and shingle, with stores and a wharf, on the North side of Creighton Island. The vessels lie immediately within the entrance in 3½ fathoms, and as securely as in a dock, the harbor being closed at the East end by a bar of shingle, which dries at low-water. A stranger might require the aid of a pilot, but the chart, with the following brief directions, would enable any intelligent seaman to take a ship into this small but very pretty harbor:

Bring the wharf on the North side of Bosdet Point to bear between E. by S. and E. ½ S., and steer for it; the vessel will then pass the bar in not less than 15 feet at low-water. Continue the same course until the shingly S.W. extremity of Bosdet Point and the N.E. extremity of Creighton Island (at the East end of the harbor) are touching, and bearing S.E. ½ S., when change the course, and keep the last-named marks in one exactly, running towards them until Bosdet Point is distant only 150 fathoms ahead, and the shingly S.E. extremity of Creighton Point bears S.W. by S., and is distant 100 fathoms; then change the course to the Southward, so as to be two-thirds of the distance over from Creighton Point towards Bosdet Point, as you pass between them into the harbor.

*Leblanc
Harbor.*

LEBLANC HARBOR has its entrance half a mile from Little Arichat, and in the North-east corner of the same bay. Six feet at low-water can be carried in through its very narrow entrance, and there is much more within. It is an extensive place, containing a population of fishermen and small farmers. At the N.W. extremity of this harbor is the Mousselier Pass, very narrow, between muscle-bed, and only one foot deep at low-water. Boats pass through it into Haddock Harbor, the principal entrance to which is by the Lennox Passage, by a very narrow channel, to the Eastward of Campbell Island, but 20 feet deep at low-water. Both these last-named harbors are occasionally resorted to by small vessels in the fishing season, but they are of no use to large ships.

*Creighton
Shoal.*

CREIGHTON SHOAL is the only danger outside of the line joining Arichat Head and Peninsula Point, if we except the Peninsula Shoal. It is rocky, and the least water, 11 feet, lies with the Roman Catholic church at Arichat just shut in behind the Southern extremity of a mile from Arichat Head. The marks for passing to the Northward of it will be useful to vessels bound to and from Little Arichat, and are, Bosdet Point and wharf just open to the Northward of Creighton Island, and bearing E. ½ N. Bear Head and Peninsula Point in one, bearing N.W., lead past it at the distance of a third of a mile to the S.W.; and the Roman Catholic church at Arichat open to the Southward of the Grid Islands, bearing E. ½ S., not only leads a quarter of a mile to the Southward of Creighton Shoal, but also clears Picard Reef, which extends from the S. point of Creighton Island 200 fathoms to the Westward.

*Janvrin
Harbor.*

In the bay between Arichat Head and Peninsula Point, which is 3½ miles across, in a N.W. by W. ½ W. direction, are Deep Cove and Janvrin Harbor, barred by Dorey Ledge, and only useful to small craft and boats. In the entrance of Janvrin Harbor, and 1½ mile Eastward from Peninsula Point, lies Delorier Island, from which extend the rocky Bentinck Shoals 700 fathoms out to the S.W. The least water on these shoals is 4 feet, but as they lie in a bay, they are not much in the way of vessels. They join the Peninsula Shoals to the Westward.

Cape Argos.

In order to complete the description of the North side of Chedabucto Bay, we must now cross the Gut of Canso to Cape Argos, and proceed thence to the Westward. From Cape Argos to Guysborough, at the head of the bay, a distance of 12 miles, the prevailing features are peninsulated points of drift sand, clay, and boulders, resting on sandstone, and presenting low cliffs to the sea. These are united to the main-land by beaches of shingle, inclosing large ponds, several of which admit boats at high-water when the surf is not too heavy. In the rear of these ponds are the houses of a scattered population, subsisting by fishing and farming, and situated on the Southern slope of ridges rising to the height of 200 feet above the sea.

*Murdock
Ledge.
Hydra Rock.*

Proceeding from Cape Argos, 2 miles S.W. by W. brings us to Oyster Point, whence Grady Point bears W. by S., 1½ mile. Midway between the two last-named points lies Murdock Ledge, dry at low-water, and half a mile off shore. Hydra Rock, on

of the greatest depth S.S.E. ½ E., and a shelf on which there is less than a mile.

The outermost depth than 30 feet water, Cape Canso S.S.E.

Next to the Point 1½ mile from Cape Canso has obtained a mark while this survey was

of the greatest dangers in the bay, lies directly off Grady Point, from which it bears S.S.E. $\frac{1}{2}$ E., and distant $1\frac{1}{2}$ mile. It carries 12 feet least water. The part of the shelf on which there is less than 3 fathoms, is only a cable's length in diameter, but there is less than 5 fathoms over a much larger space. There are 8 or 9 fathoms between it and the land, and 11 or 12 fathoms outside of it at the distance of a quarter of a mile.

During the heavy swell from the Eastward, so frequent in this bay, its position is shown by heavy breakers; at other times it is exceedingly dangerous, especially to vessels approaching it from the S.W., as on that side there are no good leading-marks. The mark for passing a quarter of a mile to the S.E. of it, is Cape Argos and Thomas Head touching, and bearing N.E. $\frac{1}{2}$ N.

RAGGED HEAD, 4 miles W. $\frac{1}{4}$ S. from Grady Point, is a rocky peninsula, forming the apex of a triangle, whose sides are long shingle beaches, inclosing a large pond 5 or 6 fathoms deep, but which boats can enter only at high-water by a narrow outlet on the Western side. This remarkable headland, which appears like an island when seen from a distance, forms the Eastern point of Moose Bay, which is $2\frac{1}{2}$ miles across to Moose Point, in a W. by N. direction, and three-quarters of a mile deep. In shape, this bay is a semicircle, with shingle beach, unbroken, excepting by the shallow outlets of ponds. It affords anchorage in from 5 to 7 fathoms, sand and mud bottom: but it can be considered safe only in fine summer weather, on account of the heavy swell which accompanies Easterly gales at other seasons. The only danger to be avoided is the flat of sand which extends nearly half a mile off the Eastern side of the bay.

In the remaining distance of $2\frac{1}{2}$ miles, from Moose Point to Guysborough, all that requires particular notice is a rocky bank, extending half a mile out from the shore midway between them, and on which there are 19 feet at low-water.

From Cape Canso to Guysborough, a distance of 25 miles, the South coast of this great bay is composed of primary rocks, partially covered with drift sand, clay, and boulders.

The harbor is formed by Piscataqua and George Islands on the East, and by the main-land and Durell Island on the West. Cutler Island, together with the shallow water between it and Durell Island, shelter it from the North; while Grave Island and the bar uniting it to Lanigan Beach, protect it from the S.E. Grave Island is very small, with steep clay banks fast wasting away by the action of the sea. The entrance to the harbor is between the latter and Cutler Island, towards the wharves of the town, off which the anchorage is perfectly secure, with water for the largest ships; but the ship-channel, which runs through into Chedabucto Bay, passes to the Eastward of those islands, between them and Piscataqua. The least water in this channel, 4 fathoms, is on a bar which stretches across from Grave Island to Piscataqua Island.

The town of Canso is on the main-land, the more ancient part standing on hills of red sand, clay, and large boulders. The Roman Catholic church, built on the summit of a ridge 100 feet high, is a conspicuous object, seen over the islands from a great distance at sea. The newer part of the town, together with the Baptist and Wesleyan chapels, are further Westward, along the shore of "The Tickle," a narrow boat-channel, separating Durell Island from the main-land. The whole forms a long straggling village, with a population of about 600 souls. Near the North point of Durell Island, which is $1\frac{1}{2}$ mile long, is Flag Hill, 105 feet high, and mentioned hereafter as an important leading-mark.

The following description of the objects and dangers on either side of the ship-channel, in the order in which they would be passed by a vessel running in from sea, will sufficiently elucidate the Admiralty chart, without which, or the aid of an experienced fisherman of the place, to whom the appearance of every rock and breaker is familiar, no one should attempt a navigation so hazardous.

Approaching from the Southward, the entrance of the ship-channel between Cape Canso and Cranberry Island is a mile wide.

CAPE CANSO is a low islet, nearly joined to the East point of Andrew Island: and the Cape Rock, small, and 8 feet high, will be seen off it, 120 fathoms to the S. E. by S. Crossing the entrance of Glasgow Harbor, a distance of $1\frac{1}{4}$ mile to N. W., we arrive at Glasgow Head, a remarkable red clay cliff 50 feet high. An equal distance further in the same direction, along an unbroken shore, brings us to the town and harbor of Canso.

The outermost danger on this side is the Patch, a rock, on which we found no less than 30 feet water, but on which the sea is said to break occasionally: it bears from Cape Canso S.S.E. $\frac{1}{4}$ E., $1\frac{1}{2}$ mile.

Next to the Patch comes the Boom Rock, with 12 feet least water, bearing South, $\frac{1}{4}$ mile from Cape Canso; and E.S.E., $1\frac{1}{4}$ mile from the South point of Andrew Island. It has obtained a melancholy celebrity, by the loss of a schooner on it, with all hands, while this survey was in progress.

- Cape Breaker.* The CAPE BREAKER, with 16 feet least water, bears from Cape Canso S.E. by E., 1 mile; and is cleared to the Eastward by Crow and Cranberry Islands touching, on a N. by W. bearing. As it can be seen only when there is a heavy sea, this rock is extremely dangerous, and would be still more so were it not that the Roaring Bull, 400 fathoms to the Westward, almost always shows, and therefore points out the position of its treacherous neighbor.
- Roaring Bull.* THE ROARING BULL has 2 feet least water, and bears from Cape Canso S.E. $\frac{1}{2}$ S., two-thirds of a mile.
- Keeper and Kirby Rocks.* KEEPER and KIRBY ROCKS, with 24 and 15 feet least water, are distant half a mile and one mile, respectively, N.W. by N. from the Cape Breaker; and Kirby Rock bears from Cape Canso E.N.E., 300 fathoms. The Roman Catholic steeple at Canso, open to the N.E. of Glasgow Head bearing N.W. $\frac{1}{2}$ N., leads just clear to the N.E. the Cape Breaker, and of the other dangers above mentioned.
- Black Rocks.* THE BLACK ROCKS lie half a mile N.N.W. from Kirby Rock, the passage into Glasgow Harbor being between them. They are two masses of trap rock about 5 feet high above spring tides; they can therefore always be seen, and as the shoal water extends from them only a cable's length to the Eastward, they are of great use in pointing out the Western side of the channel.
- Bootes and Man-of-war Rocks.* The BOOTES with 6 feet least water, and the Man-of-war Rock, which covers at half tide, lie further N. by W.; the latter, the most distant, being a long half mile from the Black Rocks. There is no safe channel for ships between these three last-named dangers, which all stand on a shoal and rocky bank, that stretches across the entrance of Glasgow Harbor; but there is a navigable channel between them and Glasgow Head, though narrow and difficult.
- Man-of-war Rock.* MAN-OF-WAR ROCK bears from Glasgow Head E.N.E., about half a mile. It lies much in the way, but is usually shown by breakers, and the marks for it are distinct and good. The Eastern ends of the Black Rocks and of the Cape Rock when in one, bearing S. $\frac{1}{2}$ E., lead just to the Eastward of it, and, of course, clear the Bootes; therefore let the Cape Rock be kept open to the Eastward of the Black Rocks until Man-of-war Rock is past; which will be the case when Flag Hill comes in one with the steep bank (not the beach) of Fort Point, bearing N.W. The last-named marks lead just clear to the N.E. of this dangerous rock.
- Mackerel Rock.* The MACKEREL ROCK lies half a mile further to the N.W. Having 10 feet least water, it seldom shows, and is therefore the more dangerous. When on it, the Eastern extremities of Oliver Island and of Derable East Rock are in one, and just open to the Eastward of Petit-pas, which bears from it N.E., 400 fathoms. The same marks that clear Man-of-war Rock, namely, Flag Hill and the steep bank of Fort Point, as above mentioned, lead to the N.E. of this rock also, at the distance of half a cable's length. There is a clear channel on either side of the Mackerel Rock, but that to the North-eastward of it has the advantage of leading-marks.
- South Shoal.* SOUTH SHOAL is the last danger on the West side of the channel, until we arrive at Grave Island, and the entrance of Canso Harbor. It has 7 feet least water, and extends 300 fathoms off shore, or half-way across towards the Eastern extremity of Grassy Island, leaving a clear channel between it and Grass Reef, of 180 fathoms in breadth. The shoal water extends only 50 fathoms off Grave Island, leaving a channel between it and Piscataqua Island 100 fathoms wide, and 4 fathoms deep at low-water.
- Cranberry Island.* CRANBERRY ISLAND, with its most useful lights, marks the East side of the entrance of the channel, as already mentioned. The island is low, rocky, and a quarter of a mile long. The light-house stands near its Northern end, and is of wood, octagonal in shape, painted red and white horizontally, and displays two lights vertically. The upper light, 75 feet above high-water, can be seen from a distance of 13 miles; the lower, only from a distance of 9 miles. They bear from Cape Canso N.E. by N., 14 mile; but dangers on either side reduce the breadth of the clear channel to half a mile.
- Frying-pan and Crow Islets.* THE FRYING-PAN, a low islet of shingle, a quarter of a mile N. by W. from the light-house; and Crow Islet, a low rock, covered with dark spruce bushes, not exceeding 20 feet in height, and distant three-quarters of a mile further in the same direction, will easily be distinguished. Still more remarkable is Petit-pas, a small, round, grassy islet, a cable's length in diameter, with a red clay-cliff 50 feet high, and 14 mile N.W. $\frac{1}{2}$ N. from the light-house.
- Oliver Island.* OLIVER ISLAND, wooded, and separated from the East end of George Island by a narrow boat-channel, must also be noticed. Its Eastern extremity, Lock Point, forms a leading-mark, and bears from Petit-pas N.E. $\frac{1}{2}$ E., a quarter of a mile.
- Grassy Island.* GRASSY ISLAND, a third of a mile to the westward of Petit-pas, is a hill of drift-sand, clay, and boulders, half a mile long, and 66 feet high. It is covered with grass, and displays the only other clay-cliff besides that of Petit-pas on this side of the channel. It is no longer insulated, being now united to George Island by a bar of shingle, which is never covered. The remains of an extensive redoubt give the name of Fort

Point to the high Western extremity of the steep, grassy bank of this island, which, as it is used for a leading-mark, must be carefully distinguished from the edge of the shingle beach, extending from it 100 fathoms to the N.W., and also used for a leading-mark. There is a narrow channel for boats between the Grassy Island beach and Pistacquia Island; which last forms the Eastern side of the channel for the remaining distance to Canso Harbor.

Confining our attention at present to the dangers bordering on the ship-channel, we have first to notice Stanley Shoals—three small rocky patches a quarter of a mile apart. The least water on them, 4 fathoms, is sometimes shown by a breaker, and lies with Flag Hill and Fort Point in one, and with Cranberry light-house, bearing N.N.W. $\frac{1}{2}$ W., 1 $\frac{1}{2}$ mile. The Eastern extremities of Crow and Cranberry Islands in one, bearing N. by W. $\frac{1}{2}$ W., lead clear to the Westward of this shoal at the distance of a cable's length. From Nickerson Rock, with 1 fathom least water, the light-house bears N.W. $\frac{1}{2}$ W., 1 $\frac{1}{2}$ mile, and lying half a mile N.N.E. $\frac{1}{2}$ E. from Stanley Shoals, it bears less in the way than them. The same remark applies to David Rock, with 13 feet least water, it being half a mile nearer to the light-house, which bears from it N.W. $\frac{1}{4}$ N., three-quarters of a mile.

THE WASHBALL, a rocky patch, dry at low-water, lies 200 fathoms W.S.W. from David Rock, and 700 fathoms from the light-house, which bears N.N.W. $\frac{1}{4}$ W. from it is, therefore, half-way out from the light-house towards the Stanley Shoals, and, as it can almost always be seen, is of great use in guiding vessels. These two last-named rocks lie so near the edge of the Cranberry Island bank as to leave no safe passage between them.

THE PINK, a rock with 4 feet least water, lies half a mile to the Southward of the light-house; but an arm from it with 18 feet water extends 150 fathoms W. by N. From this rocky arm, which forms the extreme Southern edge of the Cranberry Island bank, the light-house bears N.N.E. half a mile. Flag Hill and the S.W. extremity of the beach of Fort Point in one, and bearing N.W. $\frac{1}{4}$ N., lead just clear to the Southward of this danger; but the beach cannot always be made out, in which case, Flag Hill should be kept 4 or 5 degrees open to the S.W. of Fort Point, until the bearing of the light-house shows that the rock is passed. The shallow water, less than 3 fathoms, including 2 rocks awash called the Cow and Calf, does not extend off the West side of Cranberry Island beyond 200 fathoms, but there are several rocky patches further off which carry 4 $\frac{1}{2}$ fathoms, and therefore only dangerous to large ships when the sea is heavy; from the outermost of them the light-house bears S.E. by E. $\frac{3}{4}$ E., 460 fathoms. Proceeding to the Northward, the next danger bordering the channel is the Frying-pan Reef, running out N.W. by W., 400 fathoms, from the low Frying-pan Islet, and separated by a narrow channel from the Pas Reef, which runs out half a mile in the opposite direction, or S.E. by E. from Petit-pas. From Pas Reef the edge of the shoal continues to the Westward, skirting Petit-pas at the distance of 150 fathoms, and then crossing the bay, between it and Grassy Island, where it joins the shoal water off the latter.

GRASSY REEF is extremely dangerous. Projecting from the S.E. extremity of Grassy Island, a quarter of a mile S. by E., it diminishes the breadth of the deep water, between it and the equally dangerous Mackerel Rock, to 130 fathoms, and as the channel is crooked there, as well as narrow, they form a difficult pass for large vessels.

We have now only to notice the shallow water extending 100 fathoms off the S.W. side of Grassy Island, before we arrive at the beach of Port Point, which is quite bold; and after which the channel, although much narrowed by Grave Island, is direct and clear to the harbor.

To enter Canso Harbor from the Southward, with a leading wind, proceed as follows:—Having first studied the foregoing description with reference to the chart, for the nature and appearance of the objects and dangers on either side—

At any distance not less than 3 miles, bring Cranberry Island light-house to bear N. by W. $\frac{1}{4}$ W., when Crow Island will be in one with, and seen over it. Steer for the light-house on that line of bearing, taking care not to open the whole of Crow Island out to the Westward of Cranberry Island (for fear of the Cape Breaker) until the Roman Catholic church steeple at Canso is seen to the N.E. of Glasgow Head (bearing N.W. $\frac{1}{4}$ N.) As soon as that steeple opens to the N.E. of Glasgow Head, steer N.N.W. $\frac{1}{4}$ W., or so as to make a direct course towards the S.W. side of Petit-pas; and there will be no difficulty in passing between the Black Rocks, which can always be seen, and the shoals off Cranberry Island, if attention be paid to the leading-marks for clearing the last-named dangers. Continue the course towards Petit-pas, taking care that the Cape Rock is kept open to the Eastward of the Black Rocks, until Flag Hill comes in one with the steep bank of Fort Point, bearing N.W. Then steer N.W. on the last-named leading-marks, taking care not to open Flag Hill in the least to the S.W. of the steep bank of Fort Point until the Eastern extremities of Petit-pas and

and 4½ feet, respectively. The duration of the rise and fall, and, still more, of the streams, is influenced by winds or other causes; but the rate of the streams in the N. W. entrance of the harbor, where they are strongest, does not often exceed one knot. The flood comes from the Southward, the ebb from the opposite direction.

The small islands lying outside Canso Harbor, and not previously mentioned, have the names of Hog, Cook, Welsh, and Derabic, and with many nameless rocks, form a chain 1½ mile long in an E.S.E. direction, terminating with the East Rock, which is of bare granite, 20 feet high, and distant a long half mile N.N.E. from Crow Island. The rocks awash, and shallow water, continue from the East Rock 400 fathoms to the Eastward; but on the North side these islands are bold to within a cable's length, excepting at their West end, where Black Rock and the shoal around it extend 200 fathoms from Hog Island to the Northward. Black Rock, which is seldom if ever entirely covered, is half a mile E.N.E. of Bald Rock, and between them lies the entrance to a channel between Piscataqua and George Islands, which is full of rocks, and only navigable by boats and very small fishing-vessels. The outer islands are occupied by fishermen during the season, but the North shore of George Island by the more permanent residents. All these islands are formed of granitic rocks, excepting Grassy Island and Petit-pas, and most of them are sparingly wooded with dwarf spruce-trees.

The East Rock bears from Cranberry light-house N. ½ W., 1½ mile; and to the East of the line joining them lie a number of dangerous rocks with deep water between them. The innermost of these, the Farming and Scott Rocks, with 12 and 9 feet least water, respectively, lie on the Eastern edge of the Cranberry Island bank, and at the distance of half a mile from the light-house; while Park Ledge, always above water, Crow Reef, and Budget Rock, are in like manner nearly united by shoal water to Crow Island. There is a deep channel between Budget Rock and the Frying-pan, but it is narrow, and destitute of good leading-marks. Next outside of the dangers which have been mentioned, are the Kelp Rocks, Inner Bass, Middle Rock, and Broad Shoal: of these, the first and last have 12 and 9 feet least water, respectively, and only show when there is a sea running; but the Inner Bass is awash at low-water, and the Middle Rock having only 4 feet water, can almost always be seen.

From the Middle Rock, the light-house bears S.W. by W. ¼ W. 1½ mile; and the Roman Catholic steeple at Canso is seen over Petit-pas, and open a little to the Southward of Park Ledge. The breakers on this rock and the Inner Bass, which lies 300 fathoms from it to the N.N.W., often serve as a guide to fishing and coasting vessels, which prefer passing close to them to going round outside all; but this cannot be recommended for large ships, for although the passage between the Middle Rock and Bass Rock is a mile wide, yet the Sand Shoal and White Rock, with 5 and 4 fathoms, respectively, and another nameless patch of the same depth as the latter, render the passage in the heavy swell which so frequently prevails.

BASS ROCK has 6 feet least water, and therefore breaks frequently. From it the light-house bears W. by S., 2½ miles; and the Roman Catholic steeple at Canso and the Southern extremity of Petit-pas appear in one.

GRIME ROCK has 12 feet least water, and is therefore only shown by breakers when the sea is heavy. It lies further out than the Bass Rock, from which it bears N.E. 370 fathoms; and there is a patch of 28 feet of water a quarter of a mile to the Eastward of it. From Grime Rock the light-house bears W.S.W. ¾ W., distant 2½ miles, and the Roman Catholic steeple at Canso, the Southern extremity of Grassy Island, the Northern end of Petit-pas, and Park Ledge, all appear in one, and open a little to the Southward of Crow Island.

POPE ROCK has 5 feet water; from it the light-house bears West, 5 miles distant.

These last-named rocks are the outermost of the Canso Ledges, and lying off a great headland, which so many vessels are continually rounding, and in a region celebrated for fogs, they are exceedingly dangerous; but they have been rendered even more so by the errors of the charts hitherto in general use, in which they are represented fully half a mile too near the light-house.

In passing round these dangers in thick weather, great caution and the constant use of the lead are indispensable. If the approach be from the Northward, remember that they lie only 400 fathoms within the 30-fathoms edge of the bank; if from the Southward and Eastward, go into no less than 25 fathoms until the soundings indicate that the vessel is off the bank to the Northward; and lastly, in clear weather, do not haul to the Westward into Chedabucto Bay until the high land of Black Point opens to the Northward of Derabic Island, bearing W.N.W.

Proceeding Westward from Canso, we have first to notice the Fox Rocks, lying between Durell and Fox Islands, and dry at low-water. They lie off Lazy Head, the Outer Fox being half a mile off shore, and the same distance Eastward from Fox Island. Neither of these rocks lie outside the line joining the North extremities of the

Hog, Cook, Welsh,

and Derabic Islands and Rocks.

Black Rock.

East Rock.

Sand Shoal. White Rock.

Bass Rock.

Grime Rock.

Pope Rock.

Fox Rocks.

islands, and are therefore not much in the way of vessels running along the coast. The North point of Fox Island and the pitch of Black Point in one, clear the Outer Fox in 5 fathoms; and also the shoal off Tickle Island.

Fox Island. FOX ISLAND, $4\frac{1}{2}$ miles to the Westward of Canso, is granitic, half a mile long, and 40 feet high. There are rocks, above and under water, off both ends of this island, to the distance of 2 cables' length; and it is connected with a shingle point of the main-land, distant 350 fathoms, by a bar of sand and stone nearly dry at low-water. The shingle beaches on the main-land and on the S.W. side of the island are covered

Fisheries. with the huts of the fishermen, who resort here in great numbers during the season; this being one of the greatest fishing-stations in these seas, especially for mackerel and herrings. The fishing vessels lie in Fox Bay to the Westward of the island, in 4 to 7 fathoms, sandy bottom; but this anchorage is insecure, being exposed to North-westerly winds, and also to the heavy Easterly swell which occasionally rolls in round the reef. In N.W. winds and fine weather, these vessels sometimes shift round to the Eastward of the island, but the ground there is rocky and the anchorage unsafe.

Half Island Cove. HALF ISLAND COVE, $4\frac{1}{2}$ miles from Fox Island, affords a small and unsafe anchorage, being open to the winds and swell from the North and East. Off the small island, on the West side of this cove, there is a dangerous rock, lying 100 fathoms from it out to the Eastward.

Philip Cove. PHILIP COVE, 2 miles further to the Westward, affords shelter to boats; the sea being kept out by rocks in the entrance, that become dry soon after high-water.

Crow Harbor. CROW HARBOR, celebrated for its mackerel and herring fisheries, is a mile from Philip Cove, and 12 miles to the Westward of Canso. It has excellent holding-ground, and water enough for the largest ships; but there is not room for many large vessels in the Eastern part of the harbor, where alone they would be secure from the heavy Atlantic swell that occasionally rolls in.

Rook Island. ROOK ISLAND is a rock 100 fathoms long, lying nearly in the middle of the entrance; and Rook Rock, with 3 feet least water, lies 35 fathoms off the N.W. extremity of the island, with deep water close to it. The channel to the Westward of the island is 17 fathoms deep, and 300 fathoms wide at the entrance, between Rook and Corvean Rocks, which last are dry at low-water, and form part of the reef off Lamb Point.

Brodie Rocks. The channel to the Eastward of the island, between it and the Brodie Rocks, is generally preferred with Easterly winds, although only 23 feet deep, and 100 fathoms wide. The Brodie Rocks, which become dry at low-water, form part of the reef that extends 225 fathoms from Lazy and Brodie Points towards Rook Island, giving scenery to the Eastern part of the harbor. The mark for clearing these rocks and the shoal water within them on the N.E. side of the harbor, is Lamb Point and the extreme land to the Westward in one, bearing N.W. by W. In the absence of buoys and beacons, vessels wishing to enter this harbor should proceed as follows: First, in approaching from the Eastward, to avoid the shoal that extends 150 fathoms off Lazy Point, bring the East end of Rook Island to bear nothing to the Westward of S.W. by W., and steer for it until within the distance of 2 cables' length; then change course to S.S.W., or, as may be necessary, to pass between 50 and 150 fathoms to the Eastward of that island. When the vessel has run 150 fathoms past the island, the marks already given for clearing the Brodie Rocks, and the shoal water on the N.E. side of the harbor, will come on, and enable her safely to haul in to the S.E., and choose her berth in 6 or 7 fathoms, on a mud bottom. Secondly, in approaching from the Westward, to avoid the shoal off Lamb Point, as well as the Corvean Rocks, bring the West end of Rook Island to bear nothing to the Eastward of S.E. by S., and steer for it until within the distance of a quarter of a mile; then change course to the Southward, so as to pass a cable's length or more to the Westward of the island; and then steer about S.E., passing at the same distance from the island, and having regard to the leading marks for clearing Brodie Rocks, she may take a berth as before.

Tides. It is high-water, on the fall and change days, in Crow Harbor, at 8 hours, and the rise is from 6 to 4 feet, as it may be spring or neap tides. There is little or no situation of tide within the harbor.

Crow Cliffs. Proceeding Westward at the distance of half a mile beyond Lamb Point, we arrive at the first of three remarkable high clay cliffs, which point out the position of Crow Harbor from a distance:—after which, there is nothing deserving particular notice along the hilly, bold, and rocky coast, until we arrive at Salmon River; unless it may be Half-way Cove, as affording a landing-place for boats.

Half-way Cove. SALMON RIVER, $8\frac{1}{2}$ miles from Crow Harbor, is navigable for boats to the distance of 2 miles in from its very narrow entrance, on the bar of which the depth is only 3 feet at low-water. Shoal water extends a quarter of a mile out from the entrance, and a rocky ridge with 4 fathoms least water projects three-quarters of a mile further to the Eastward. Bigby Head, a remarkable cliff 100 feet high, separates this river from Toby Cove, another place for boats, with 4 feet on its bar at low-water.

GUYSBOROUGH from Bigby Head, in to the Northward, a dangerous bar, which, that no one acquainted with the safety of a vessel harbor; as will appear from the description:

The light-house which forms the N. small square, and is visible from a distance, and Stoney Patch, lying across from Toby Head at low-water, and is called the Outer Light. THE INNER Light is between Eliza Point and low-water, and there is room enough out of the strength of the current across the O house until within 20 fathoms, and from then becomes E.N. Ely, through a clear anchorage GUYSBOROUGH the deep water approaches on either side of the rocks, where the deep vessels may proceed at 5 miles from the inlet, flowing thence. It is high-water, the moon's transit; feet. The rate of the knots.

The Northern entrance at Hesteran Point, detached dangers, not half a mile from the distance of half the sea, and which is a remarkable object in will be seen bearing point, a low cliff of sometimes so to Eme JUDIQUE SHOALS a mile in length, if we and 3 fathoms, and n seen in the chart.

On the outer and that in behind Susan Campbell Point (the a large woollen built close to the outer point high land of Cape Point, which form t of Canso, and which

GUYSBOROUGH HARBOR, at the head of Chedabucto Bay, lies a mile N.N.W. *Guy* from High Head, and 10 miles from Crow Harbor. It is an extensive inlet, running *bor-* into the Northward, with a depth of water sufficient for large ships; but with such *ough Har-* a dangerous bar, an entrance-channel so narrow and crooked, and such rapid *bor.* tides, that no written directions could be available. The assistance of a pilot acquainted with every local peculiarity of the tides and winds, is indispensable for the safety of a vessel, even of very moderate size, either in entering or leaving this harbor: as will appear from an inspection of the chart, and the following brief description:

The light-house stands on the Southern end of the shingle beach of Peart Point, *Guy* which forms the West side of the entrance. It is a temporary structure of wood, *ough Light.* small, square, and painted white; it shows a fixed light, 30 feet above the sea, and visible from a distance of 7 or 8 miles. The entrance-channel, between Peart Point and Stony Patch, is 40 fathoms wide and 6 fathoms deep; but further out, and stretching across from Toby Point to Hadley Beach, there is a bar of sand, with 17 feet on it at low-water, and which is rendered impassable at times by heavy breakers. This is called the Outer Bar.

THE INNER BAR lies across the inner entrance, which is 115 fathoms wide, *Outer Bar.* between Eliza Point and Hadley Beach. The depth that can be carried over it is 13 *Inner Bar.* feet at low-water, in a channel only 40 fathoms wide. Before arriving at this bar, there is room enough for a vessel or two to anchor in the mouth of Ingersol Creek, out of the strength of the tide, and sheltered from the sea by Stony Patch. The course across the Outer Bar, in the deepest water, is W.N.W., steering for the light-house until within the distance of 100 fathoms; then curving gradually to the Northward and Eastward, as the vessel passes the beach of Peart Point at the distance of 20 fathoms, and crosses the mouth of Ingersol Creek to the Inner Bar. The course then becomes E.N.E. for a cable's length, while crossing that bar; and then Northward, through a clear and deep channel, for three-quarters of a mile, to the safe and spacious anchorage of the town.

GUYSBOROUGH is advantageously situated on the Western side of the harbor, *Guy* the deep water approaching close to its wharves. The hills attain the height of 500 *ough Town.* feet on either side of this beautiful inlet, which is navigable for ships up to the Narrows, where the depth is 8 feet at low-water, at 4 miles from the entrance. Small vessels may proceed 3 miles still further, and boats to the bridge, where the tide ends, at 5 miles from the entrance; and where Guysborough River, a small stream, enters the inlet, flowing through rich meadows, called the Guysborough Interval.

It is high-water, on the full and change days, on Hadley Beach, at 8h. 20m. after *Tides.* the moon's transit; the rise in ordinary spring-tides being 6½ feet, and in neap tides 3½ feet. The rate of the streams, in the narrow entrance of the harbor, is from 4 to 5 knots.

BRETON ISLAND, WEST COAST.

The Northern entrance of the Gut of Canso, from the light-house to Breton Island *Breton Is-* at Heffernan Point, is a distance of 1½ mile. For the first 7 miles we meet with no *and, West* detached dangers, nor does the shallow water anywhere extend to the distance of *Coast.* half a mile from the shore. The land is high, and rather barren-looking, rising, at the distance of half a mile from the shore, to the summit of a ridge 850 feet above the sea, and which continues parallel to the coast-line for 5 or 6 miles. The only remarkable object in this interval is the Roman Catholic church at Craignish, which will be seen bearing N.E. ½ E., and distant 2½ miles from the light-house. At Long Point, a low cliff of red sandstone, the coast becomes dangerous of approach, and continues so to Emerson Head, a distance of 7 or 8 miles.

JUDIQUE SHOAL, the greatest danger in the bay, is of rock, and about half a *Judique* mile in length, if we reckon only the very shallow part; but there are patches with 2 *Shoal.* and 3 fathoms, and much rocky ground both to the North and South of it, as will be seen in the chart.

On the outer and N.W. point of the shoal, the church at Port Hood is only just out in behind Susan Point, bearing N.N.E.; Long Point bears S. by E. 2½ miles; Campbell Point (the nearest part of the shore) E. ½ S. 1½ mile; and Judique church a large wooden building without a steeple) N.E. by E. The least water (4 feet) is close to the outer point of the shoal, and when on it, the Western extremity of the high land of Cape Porcupine will appear in the same line as Flat and Heffernan Points, which form the right extremity of Breton Island at the entrance of the Gut of Canso, and which bear S. ½ W. If the whole of the high land of Cape Porcupine

be kept open to the West of Hefferman Point, the shoal will be cleared in 6 or 7 fathoms; or if the church at Port Hood be kept open to the West of Cape Susan, the shoal will be cleared in not less than 4 fathoms. There are 4 fathoms of water between this shore and the land, but only small craft should attempt the passage.

JUDIQUE BANK lies 24 miles N.N.W. from the shoal, with 13 fathoms least water, on a small rocky patch, with a great deal of foul ground around it. When on this patch, Portsmouth Point (the South end of Smith Island) and Cape Linzee will appear touching, and bearing N.N.E. by E.; Judique church, P.S.E. 4 E., 34 miles behind Hefferman Point. This bank, which is only dangerous to very large ships when there is a heavy sea running, will be cleared by keeping Cape Linzee shut in behind Smith Island; or the whole of the high land of Cape Porcupine open to the Westward of Hefferman Point.

JUDIQUE POND, close to the North of the church, is barred by a sandy spit, so as only to admit boats at high water. The shallow water extends off it to the distance of 14 miles. Catherine Pond and Susan Creek, distant 3 and 5 miles respectively to the North of Judique church, are similar places; the latter admits boats at high water, and is situated just to the North of Cape Susan, rendered remarkable by the white gypsum in its cliffs.

PORT HOOD,* the only safe anchorage on the West Coast of Breten Island to the North of the Gut of Canso, was formerly a much more secure harbor; Smith Island being then a peninsula, united to the main land by a range of high sand hills, which has since been entirely swept away, and the sand widely spread over the Northern parts of the harbor. The first breach in this sand-bar was formed by the sea about 20 years ago, during a heavy gale from the North; it was at first a very narrow channel, and might perhaps have been easily closed; but, being neglected, the tidal currents enlarged it with increasing rapidity, until the present channel, 60 fathoms wide, and 9 feet deep at low-water, was formed between the island and the main land. The combined action of the waves and tides is said to be still widening and deepening this passage, thus admitting more and more the heavy swell from the North, and thereby rendering the harbor insecure, excepting over towards Smith Island, the Eastern side of which forms a bay, where the anchorage is still perfectly safe with all winds. At this anchorage, in which vessels may choose any depth from 3 to 14 fathoms, the bottom is of mud that holds well, and the heavy swell is prevented from rolling in round the N.E. extreme of the island by a long shoal, derived from the ruin of the sand-hills, and which runs to the Southward from Smith Point, with only 4 feet of water for the first 300 fathoms, and less than 3 fathoms for an equal distance farther. This shoal must be carefully avoided in hauling in to the anchorage. The shelter from all South winds is complete, being afforded by the Spit end, which is a sandy flat nearly dry at low-water, extending 600 fathoms to the Eastward from Portsmouth Point, the South extremity of the island. The Spit end, which is steep, and can usually be seen, will be cleared at the distance of 50 fathoms, by keeping the vessel fish-shed, on the wharf next within Smith Point, exactly in one with the chimney of the house behind it, bearing N. 4 W.

On the opposite, or main-land side, there is also a steep sandy flat, called the Pean Shoal, which runs off from the sandy beach at Mill Creek to the distance of 300 fathoms; this, and the shallow water on that side, as far out as opposite Portsmouth Point, but not farther to the South, will be cleared at the distance of 100 fathoms, by the line of Cape Linzee and Isthmus Point in one, bearing about N. by E. On the same side, but outside the entrance of the harbor, a rocky shoal, with 13 feet low water, runs out 300 fathoms from the shore, half a mile to the Northward of Regent Point. This being very steep, must be carefully avoided by a large vessel. Cape Susan and Kate Point in one, bearing S. by W., just clears it, but may not be easily made out by strangers.

SMITH ISLAND is 2 miles long and 210 feet high; it possesses much fertile land, and the two Smiths, father and son, have flourishing farms on the inner side of the island. The elder Smith's house and barn will be seen in the bay, and those of the younger, together with his fish-shed and wharf, further to the N.E., near the end of the sandy beach, and a quarter of a mile within Smith Point. These objects are mentioned because they form leading-marks for the anchorage. With the exception of the sandy beach in the bay above-mentioned, the island is everywhere surrounded by cliffs of various heights up to 123 feet. They are formed of soft red sandstones, shales, and marls, containing occasionally thin seams of coal, with beds of gypsum, limestone, and trap, which last are well shown at the N.W. end of the island.

HENRY ISLAND, or *Just au Corps*, lies about a mile outside, or W.S.W. from *Henry Island*. It is much the smaller of the two, being one mile long, and its greatest height is 115 feet above the sea at high-water. It is of the same rock formation, and is nearly surrounded by cliffs, which yield rapidly to the action of the waves and of the atmosphere; and which, on the outer side, attain the elevation of 100 feet above the sea. It has no permanent inhabitants, but is much frequented by fishermen during the fishing seasons.

This island is bold to seaward, but shallow water runs out from Fishery Point, its S.E. extremity, one-third of a mile to 3 fathoms, and three-quarters of a mile to 5 fathoms.

The passage between these islands is rendered so extremely intricate and dangerous by rocky shoals, that it should never be attempted, unless in a very small vessel and with fine weather.

The village of Port Hood will be seen on the main land opposite the Northern part of Smith Island; it is well situated, and will be recognized by the steeple of the Roman Catholic church, and the court-house of stone.

On the South entrance of the harbor there is a light-house 52 feet high; it is a fixed light with a small red light below it.

The following directions, with reference to the plan, and to the foregoing description of the dangers and leading-marks, will enable the intelligent seaman to take his vessel in or out of Port Hood with safety:—Having a fair wind, pass to the Southward of Henry Island, at a distance not less than a quarter of a mile, steering E. by S. until the Roman Catholic church at Port Hood opens out to the Southward of Portsmouth Point, then change course so as to pass the latter at the distance of three or four hundred fathoms, or in not less than 5 fathoms of water; taking notice, that the shallow water off it extends to the distance of 210 fathoms. This course should be a little to the Northward of E.N.E., and directly towards a house rendered remarkable by its lower story being of stone, while the upper part is of wood, and which should be near some wharf, or only just open to the Northward, of a hut near the entrance of a small creek at the North end of a range of cliffs. Continue the course thus indicated, until Henry Point (N. end of Henry Island) and Portsmouth Point come in one; when change the course immediately, and steer directly for the Roman Catholic church, or N.E. & N., and the younger Smith's fish-shed (on the wharf next within Smith Point) comes in one with the chimney of his house, bearing N. 4 W. Keep these marks exactly in one, steering towards them, (they will lead in clear of the Spithead bank, as already mentioned) and when the S.W. end of the elder Smith's barn comes in one with the chimney of his house, bearing N.W. by N., change the course, and steer directly towards them, until Cape Linzee comes in one with Smith Point; when the vessel will be in the best anchorage, and in 4 fathoms at low-water, with mud bottom.

If any difficulty be experienced in distinguishing the younger Smith's fish-shed, let the N.E. & N. course towards the Roman Catholic church be continued, until Isthmus Point and Cape Linzee are in one, then change the course, and keep them so, running towards them until the S.W. end of the elder Smith's barn comes in one with the chimney of his house, bearing N.W. by N.; and these last-named marks will lead to the anchorage as before stated.

It is high-water here, on full and change days, at 9 hours. The rise in ordinary tides is 11 feet, and in neap tides 2 feet. The tidal-streams are weak at the anchorage, and their rate does not ordinarily amount to one knot anywhere within the harbor. The flood comes from the North, and the ebb from the South. The flood-stream from the North meets that which comes in through the Gut of Canso off Long Point, whence they set to the N.W., curving round the bay towards Cape George.

At Cape Linzee, 11 miles Northward from Port Hood, the West coast of Breton Island trends away to the N.E. by E., continuing in that direction to Cape St. Lawrence, a distance of 73 miles, without either harbor or safe anchorage for ships. The general character is high and bold, the dangers being few and close inshore, but it is nevertheless a dangerous coast to be near in autumn or early winter, when the prevailing W. winds send in a heavy sea, and the set of the current is often in the same direction. The swell frequently precedes the wind by many hours, and, as there is no good holding-ground, becomes dangerous to vessels caught close inshore. Even with smooth sea, and in fine summer weather, vessels are set in towards this coast; an effect which seems to be due sometimes to the general current from the N.W. coming from between the Magdalens and Prince Edward Island, and at other times to the action of the ebb-stream from the strait of Northumberland inclining towards these shores. These streams, being inconstant and irregular, both in strength and direction, are therefore the more dangerous, and require the more to be guarded against.

In the summer months, however, the rate of the current or tides will not be found to exceed one knot, even close inshore: excepting round Cape St. Lawrence and Cape

Anchorage.

Tides.

North, where it sometimes runs at the rate of 2 or 3 knots, causing a heavy breaking sea. Its direction for three-fourths of the time is from the Westward; this appears to be due to the combined action of the current and ebb-tide predominating over the flood-stream from the N.E., so as to render it nearly imperceptible, excepting at or near the spring tides. There is no doubt that winds, present or at a distance, also influence these streams, as they have been observed to do in all parts of the Gulf.

Fisheries.

The fisheries are valuable. Salmon are taken in all the principal streams, and Margaree is so celebrated for its salmon fishery that it has sometimes been called Salmon River. Herring, mackerel, cod, &c., abound in their seasons, and are frequently taken in large quantities.

Mabou River.

MABOU RIVER,* 5 miles from Port Hood, admits small schooners, having 4 feet at low-water over its bar of sand. The bar shifts occasionally during heavy N.W. gales, but is seldom disturbed during the summer months, when those gales are of rare occurrence.

Tides.

The entrance, at the Southern end of a low sand-bar, is only 50 fathoms wide, and the tides frequently run there at the rate of 4 knots; it is therefore a dangerous place to enter, excepting with a flowing tide and a smooth sea. It is high-water there, on the full and change days, at about 9 hours; the rise in ordinary spring-tides is 4 feet, and in neap-tides 2 feet. N.E. winds often cause high tides; S.W. winds the contrary.

The scenery is very beautiful, the mountains rising immediately from the Northern shore to the height of 870 feet.

Mabou Highland.

THE MABOU HIGHLAND is a very remarkable feature of the coast, seen from great distances out at sea. It extends 11 miles along the coast to the N.E., forming a lofty and precipitous shore, and rising to the height of 1000 feet above the sea. After passing these highlands, the coast becomes less elevated, the beaches and landing places more frequent, and the settlements are continuous until we pass Chetican Island.

Sea-Wolf Island.

SEA-WOLF ISLAND, distant 23 miles N.E. from Port Hood, is of an oval shape, 1100 fathoms long, parallel to the shore, 300 fathoms broad, and 200 feet high. It is of sandstone, precipitous, and quite bold all around, excepting at the N.E. point, and there the shallow water extends only to the distance of one cable. It affords some shelter to small fishing vessels and boats, which can land upon it only in fine summer weather; at other times the sea rolls completely round it, and the anchorage is never safe, the ground being everywhere rocky.

The depth between this island and the shore, from which it is distant rather more than 2 miles, is 7 fathoms, over a bottom of rock, with loose sand and gravel occasionally. The neighboring sea abounds with fish.

Margaree River.

MARGAREE RIVER,* which is 7½ miles further to the N.E., has 5 feet over its rocky bar at low-water, in a very narrow and intricate channel, through which the tides run at the rate of 4 knots. It is only under favorable circumstances of wind and weather, and with a smooth sea, that schooners can safely attempt to enter it. The surf on the bar is at times very heavy and dangerous to boats, especially when the strong tide is running out against the wind and sea. The shores of this river are well settled, principally by Acadians and Scotch highlanders, who, besides farming, prosecute the salmon and other fisheries.

Tides.

It is high-water, on the full and change days, at 8h. 40m., the rise in ordinary spring tides being 3½ feet and in neap tides 2 feet. Boats can ascend 5 or 6 miles from the entrance, at which distance the tide ends.

Between Margaree and Chetican there are several places where boats can land in fine weather, especially at Squirrel Pond, distant 3 miles from the last-named place. There are farms all along this part, the mountains running parallel to the shore, at a short distance back, and attaining, at Mount Squirrel, in rear of the point of the same name, the elevation of 1220 feet above the sea.

Light.

On Sea-Wolf or Margaree Island there is a light-house 55 feet high; it shows red light on the Northern side, a bright light on the Southern side.

Chetican Island.

CHETICAN ISLAND, distant 10 miles N.E. from Margaree, is only an island when high tides overflow the low and narrow beach of sand and shingle, which, at other times unites it to the main-land at its Southern extremity. This beach forms the shore of a bay, within the S.W. point of the island, where the Jersey brig, employed in the fishery, usually lies moored in the summer months; receiving some shelter from the shoal which runs out half a mile to the Southward from Chetican Point, but completely exposed to winds from between S.W. and N.W., which send in a heavy sea. The depth of water in this roadstead is 4½ fathoms, but the bottom, of sand and gravel, is so loose and bad for holding, that the anchorage becomes quite unsafe after the month of August, as was experienced by one of the Jersey vessels several years ago, when she was

driven from both anchors, and completely wrecked on the beach; since which accident they endeavor to leave before the commencement of the September gales.

At no time is this anchorage to be recommended, and therefore vessels merely wishing to communicate with the shore had better anchor outside at the distance of a mile or two, where they will have room to get under way in the event of the wind coming in from the Westward.

CHETICAN HARBOR,* between the island and the main-land, is entered from the N.E. between the shingle spit at Gros Cape, the N.E. extreme of the island, and Carreau Point. Within this entrance, but outside the bar, which is half a mile further in, small fishing-vessels sometimes anchor, but the Northerly winds send in so heavy a sea, that this is considered even less secure than the unsafe anchorage at the S.W. end of the island. There is a depth of 3½ fathoms within the harbor, but only 2 feet at low-water over its bar of sand, which is then in great part dry.

It is high-water here, on the full and change days, at 8½ hours; the rise in ordinary spring-tides is 3½ feet, and in neap tides 2 feet. N.E. winds cause high tides, and S.W. winds the contrary.

THE CAVEAU SHOALS are two rocky patches, with 11 feet least water, lying at the distance of half a mile off Cavenu Point, and from one-third to three-quarters of a mile from Gros Cape, on a N.E. by E. line of bearing. They are much in the way of vessels wishing to anchor off the entrance of the harbor.

THE JEROME LEDGE, with 5 feet least water, lies in the same direction from Gros Cape, and at the distance of 1½ mile. It is of considerable extent, being two-thirds of a mile long, and its N.E. point reaches to the distance of a mile out from the shore. The line of 10 fathoms water is only 300 fathoms outside this ledge and the Carreau Shoals; there is therefore little warning from the lead; but vessels beating along shore, and standing towards them, will avoid them by tacking when the points on the outside of Chetican Island, namely, Enragée Point and the Capes, come in one bearing S.W. ¾ W.

At **PRESQU'ILE**, 3 miles E.N.E. from Gros Cape, the mountains come close down upon the shore, after which there are no inhabitants, nor any good landing-place, till

we arrive at Grandance, 15 miles from Chetican, where there is a settlement of seven families, and a small river silted up by a shingle beach, on which boats can land, and be hauled up in case of need. From Grandance to Cape St. Lawrence, a distance of 13 miles, the coast is mountainous, with precipitous shores, affording an indifferent landing for boats at one or two places, and there only with a smooth sea.

CAPE ST. LAWRENCE, which forms the termination of the West coast of Breton Island, is of slate rock, affording no landing excepting on the West side, where there is a brook, and a steep stony beach, on which a boat can be hauled up with difficulty.

Proceeding round this headland to the S.E., we first observe the remarkable Bear Hill, a sugar-loaf 750 feet high, and close to the shore. This is distant less than a mile from the cape; and at an equal distance further on Black Rock will be seen, always above water, and about 160 fathoms off shore. Meat Cove, where there is a settlement, and good landing for boats, lies 300 fathoms further in the same direction, and one mile N.W. from Black Point.

ST. LAWRENCE BAY, between Black Point and Cape North, is 4½ miles wide and 1½ mile deep, with bold shores, and a depth of water not too great for anchoring; but the bottom is not to be trusted, being either of rock or loose sand. Vessels requiring supplies may anchor there in the summer months, when strong Northerly winds are of rare occurrence, and will find 9 or 10 fathoms water at the distance of half a mile off shore in the bottom of the bay, but they should be ready to weigh immediately on the approach of a wind from the sea. At Wreck Cove and Deadman Pond there are settlements, and good landing, the principal fishing-establishment being at the last-named place.

CAPE NORTH, the N.E. extremity of Breton Island, is a very remarkable, bold, steep, and rocky headland, of slate, in nearly vertical strata, rising abruptly from the sea to the height of 1100 feet. There is no shallow water off it, only some rocks above water, which at Money Point, a mile to the S.E. of the cape, run off to the distance of a long cable. The passage between this headland and the Island of St. Paul is 13 miles wide, with very deep water, and no other danger than that which arises from the frequent and heavy squalls which prevail off this great promontory.

BRETON ISLAND, N.E. COAST.

BRETON ISLAND, N.E. COAST.—The N.E. coast of Breton Island, from Cape North to St. Anne's Harbor, a distance of 47 miles, is bold, mountainous, and

* See Plan.

free from outlying dangers, until we arrive near Ciboux Island, hereafter to be noticed. The mountains attain the elevation of 1390 feet above the sea.

Currents.

Notwithstanding the bold nature of this coast, wrecks have not been unfrequently upon it in the dense fogs which accompany the Easterly winds. They have generally occurred to vessels running and steering, as they supposed, a safe course, to pass St. Paul's Island into the Gulf of St. Lawrence. Unaware of, or not allowing for, the current so frequently found running out of the Gulf from the Northward, and which had been acting upon their starboard bows for many hours, setting them many miles to the S.W. of their reckoning, they ran on shore under full sail. On one occasion we found this current running out of the Gulf for many successive hours, at the rate of 2 knots from N.N.E.; at another time its rate was one knot from N.N.W.; and at a third it was imperceptible. After long-continued winds from the E. or N.E., which raise the level of the water in the Bras Dor and neighboring harbors, it is not unusual to find a current of one knot running for several successive days along the land from off St. Anne to near Cape North, where it meets the current out of the Gulf, and is turned to the Eastward with a great rippling. The fishermen affirm that it as often runs in the opposite direction; and again, that at other times there is a regular alternation of the flood and ebb streams.

These remarks are intended to show the inconstant nature of these currents, and the consequent great care required for the safety of a vessel when approaching this neighborhood in the fogs which so often hide the lights on St. Paul's Island.

Aspee Bays.

There are only two anchorages, and those unsafe, in the portion of coast under review: The first of these, Aspee Bay, is 8 miles wide, and 4 miles deep. On its North side, and distant 5½ miles S.W. by W. from Cape North, is Wilkie Sugar-loaf, a remarkable conical hill 1200 feet high.

Aspee River.

To the Southward of this, and occupying the head of the bay, are three ponds with narrow entrances through sandy beaches, and into which boats can only pass at high-water. The Northernmost and largest of these ponds has several islands in it, and a depth of 3 fathoms; it extends 3 miles inland, and has at its head a large brook called Aspee River. It has often a depth of 3 feet in its entrance after the melting of the winter's snows, but in summer seldom more than a foot at low-water. There are settlements at all these ponds, where fresh provisions and water may be obtained. The best anchorage with N.W. winds is off the North Pond, in 8 or 9 fathoms, and bottom, and with South winds off the South Pond, or in the cove under White Head, which, with a small island lying close off it, forms the S.E. point of the bay. In this cove there is a settlement for prosecuting the fisheries, and good landing for boats in all but Northernly winds. It is the anchorage generally preferred, especially by small vessels, as being the least embayed, and the most sheltered from the prevailing swell from the S.E. To vessels unable to beat round Cape North, or in want of supplies, this bay affords convenient anchorage; but it is only safe in fine weather, and with Westerly winds: a vessel should therefore be in readiness to weigh instantly on the approach of a wind from the opposite quarter.

Cape Egmont.

CAPE EGMONT, distant 12 miles to the Southward from Cape North, and 3 miles S.S.E. from White Head, is a comparatively low headland of granite, and nearly bare of trees. The coast there turns to the S.S.W., and at Neal and Blackbrook Coves, which are distant 2½ and 4 miles, respectively, in that direction, there is good landing for boats. Off South Point, between those coves, there is a sunken rock 2 cables' length off shore; and there is also a rocky shoal, with 2 fathoms least water, half a mile from the shore at Rocky Bay, where there are several buildings, 2 miles to the Northward from Inganish.

Inganish Island. Past Rocks.

INGANISH ISLAND is distant 10 miles from Cape Egmont, and half a mile S.E. from Archibald Point, the North point of Inganish Bay. The island is of rock, half a mile in diameter, and 206 feet high. The East Rocks, 12 feet high, lie off it to seaward, and extend out to the distance of nearly 400 fathoms. There are several high rocks close to the outer shores of the island, and one small one off its S.W. extremity at the distance of 80 fathoms. The N.W. side of the island forms a small bay, in which there are several buildings, and where the small fishing-vessels and boats are sheltered from the swell from the Southward, and from all but Easterly winds.

From the West point of this small bay a spit and reef extend nearly half-way across to Archibald Point, leaving a channel of 18 or 20 feet in depth, but so narrow and crooked, that only 14 feet can be relied on at low-water.

Inganish Bay. Fisherman Rock.

Inganish Bay, between Archibald Point and Cape Smoke (Cape Enfumé) is 3½ miles wide, and 2½ miles deep. It is divided into North and South Bays by Middle Head, a long, narrow, rocky, and precipitous peninsula, off which lies Fisherman Rock at the distance of a cable's length to the S.E. At the head of South Bay there are two ponds, having a common outlet, which boats can enter only at high-water. There are several houses near these ponds, as well as on the tongue dividing the two bays, and at some parts of North Bay; but the principal settlement of Inganish is on the

Approaching from winds; avoiding, if i the bay, by keeping between Bentinck and of Bentinck Point a

North side of the bay, where, besides the establishment of Mr. Archibald on the inner side of the point, which bears his name, there is a small Roman Catholic chapel, together with most of the houses and fish-stages. Vessels usually anchor on the North side of the bay within Archibald Point, shifting their berths as the winds may render necessary; but the bottom is in general only a thin coating of sand over rock, and the anchorage consequently unsafe, especially with Easterly winds, which send in a very heavy sea.

The mountains in rear of Inganish are the highest on this coast, attaining an elevation of 1390 feet; and Cape Smoke, its South point, rises precipitously from the sea to the height of 950 feet. The squalls from these highlands are at times very violent.

It is high-water, full and change, at Inganish, at 8h. 14m., M. T.; the rise in ordinary spring-tides is 3 feet 11 inches, and in neaps 2 feet 9 inches.

Proceeding to the S.W. from Cape Smoke to Bentinck Point, a distance of 12½ miles, the coast assumes a less sterile appearance; the mountains receding a short distance from the shore, so as to leave space for scattered farms. A brook called French River, and especially at Breeding Cove, there is good landing for boats. At the first-named of those places, the 30-fathoms line of depth turns off to the S.E., and passes outside the Ciboux Shoal; thus affording sufficient guidance to those vessels that do not neglect the duty of sounding at night or in foggy weather.

In the next distance of 5½ miles, which brings us to Island Point, the shallow water extends 100 fathoms off shore; as it does also in the remaining distance of 2½ miles to St. Anne's Harbor. At the distance of 15 miles past Bentinck Point there are cliffs of white gypsum; and at Indian Brook, one mile North from Island Point, there is good landing.

Island Point looks like an island, but is a small wooded peninsula, joined to the mainland by stony benches inclosing McDonald Pond.

ST. ANNE'S HARBOR* (formerly Port Dauphin) is capable of containing any number of vessels in security; but the entrance is very narrow, with a tide of 4 knots; and there is a dangerous bar outside, over which a depth of 16 feet can be carried at low-water, with the aid of the Admiralty chart and these directions. Without such assistance, a stranger unacquainted with the leading marks, could only safely rely on finding 12 feet instead of 13 fathoms, as erroneously stated in the chart; and directions heretofore in general use.

In a strong N.E. wind, and especially when the tide is running out, the bar is covered with heavy breakers. The harbor is completely sheltered by Beach Point, which is formed of large rolled stones and shingle, and reaches across from the North to within 90 fathoms of the Southern shore; it is quite bold at its Southern extremity, and the entrance-channel between it and Weed Pond Shoal is 13 fathoms deep, but only 65 fathoms wide. Within the entrance, on the North side of the channel, lies the Port Shoal, of mud, extending half a mile in from Beach Point, and just cleared to the Southward by the line of Weed Pond Beach and Bar Point in one.

On the Eastern side of the entrance the small green mound of the old fort will be easily recognized: its summit forms with the plaster, or white gypsum cliff of Macleod Point, in the head of the harbor, a leading-mark for crossing the bar in the best water.

Immediately outside of Old Fort Point the stony Weed Pond Beach commences, from which a rocky ledge, with 2 feet least water, extends to the distance of 40 fathoms, and continues Eastward to Bar Point, half a mile from the entrance.

The marks for clearing this ledge, which is much in the way of vessels in this narrow channel and rapid tideway, are Lead-in Point and Conway Point in one; these are the two points next within Old Fort Point, on the South shore of the harbor. Proceeding out along the Southern shore, Willhausen Point will be easily distinguished, being the first point of cliff outside the entrance; and so also will Fader Point, which is likewise a cliff, and just beyond the beach of Oyster Pond. These points are distant three-quarters and 1½ mile, respectively, from the entrance, and, together with the objects previously mentioned, form the principal leading-marks for entering or leaving the harbor.

Further out, the South-eastern shore of the bay is quite bold all the way to Cape Dauphin, and the only remarkable object is Mourie Beach and Store, where there is good landing for boats with off-shore winds.

Vessels bound to St. Anne's Harbor with a fair wind should proceed as follows, referring to the leading-marks, to the Admiralty chart, and the preceding remarks:

Approaching from the Northward, pass to the N.W. of Ciboux and Hertford Islands; avoiding, if it be wished, the rocky 6-fathoms fishing-ground, in the mouth of the bay, by keeping well over towards Cape Dauphin. Go no nearer to the shore between Bentinck and Island Points, than the depth of 7 fathoms. Observe that the line between Bentinck Point and Cape Smoke in one clears the shoal off Island Point in 5 fathoms.

* See Plan.

oms; and that in approaching the bar, Cape Smoke should be kept open. Before arriving at the steep outer side of the bar, which is distant one mile from the entrance, bring the white gypsum cliff of Macleod Point in one with the summit of Old Fort,* and steer for them until Fader Point is seen only just open clear of Wilhausen Point (the vessel will then be only 40 or 50 fathoms from the shore near Bar Point); then port the helm instantly, and run from the last-named leading-marks, keeping Fader Point a little open, until Conway Point makes its appearance to the Westward of Lead-in Point, or until the gypsum cliff of Macleod Point is open only half a point to the Southward of Beach Point, or until the latter bears S.W. by W., and is distant a quarter of a mile; then again change course, and keeping Conway Point in sight, (to avoid Weed Pond Ledge,) steer so as to pass Beach Point at a distance between 30 and 50 fathoms. Having now entered the harbor, avoid Port Shoal, by not opening out Bar Point to the Northward of Weed Pond Beach, until the shingly Price Point bears to the Northward of N.W.; the vessel will then be within the shoal, and may haul to the Northward, and anchor to the Westward of it in 8 fathoms, mud, and out of the stream of the entrance. But the best-sheltered anchorage is in the entrance of the North Arm: the riding elsewhere in so large a harbor being at times rather rough for a small vessel. The N.E. gales, on entering this harbor, between mountains 1000 feet high, and only 2 miles apart, blow with concentrated force. They may be expected at any time after the middle of August, and a vessel should be well moored to withstand their fury.

*Port Shoal.**North Arm Anchorage.**Tides.*

It is high-water, within the harbor, on the full and change days, at 8h. 42m., M. T. The rise in ordinary spring-tides is 5 feet, in neap-tides 3½ feet. Extraordinary tides rise 6 feet.

It is high-water 10 minutes earlier on the bar, and the rise is there less by about one foot. The rate of the tidal-streams in the entrance is from 3 to 4 knots. The best watering-place will be found on the Northern side of the harbor, 1½ mile from the entrance, where a torrent descends a ravine in the mountains of St. Anne, which rise precipitously to the height of 1070 feet above the sea.

Monroe Cove.

A reference to the chart will show the North Arm, which boats can ascend N. by E., 3 miles; also Monroe Cove, with Ship-yard Rock in its entrance; and the gypsum cliff and the reef at Macleod Point, which divides the head of the harbor into two arms. The Kirk, or Presbyterian chapel, stands near the head of a convenient boat cove on the South side of Macleod Point, and near the Mause, or residence of the Presbyterian minister, whose flock of highlanders form the greater part of the inhabitants of the harbor. They subsist by very indifferent farming, aided by occasional employment in the fisheries, and in getting out lumber for ship-building.

Cape Dauphin, Ciboux Islands.

CAPE DAUPHIN, the dividing point between St. Arac's Bay and the Bras Dor, is a high and precipitous headland, and the North-eastern termination of the range of mountains that separates them. Hertford and Ciboux Islands lie off it in a straight line N.E. by E.; and, including Ciboux Shoal, extend to the distance of 1½ miles. They are long and narrow islands of sandstone, precipitous on every side, nearly bare of trees, and half a mile apart. There is no passage for ships between them, but boats, or small craft, can pass through a narrow channel, which is distant from 50 to 100 fathoms from Hertford Island, and between it and the middle rock. Hertford Island is the highest, and 100 feet above the sea. It is distant from Cape Dauphin 1½ mile; but the dangerous Hertford Ledge, which has 5 feet least water, extends from it nearly half way across to the Cape, leaving a channel 600 fathoms wide and 7 or 8 fathoms deep.

Hertford Island and Ledge.

To avoid this ledge, vessels should keep well over towards the Cape, from which the shallow water does not extend beyond 2 cables' length. From the outer point of Ciboux Island a reef runs off half a mile to N.E. by E.; and Ciboux Shoal, with 15 feet least water, lies five-eighths of a mile further out in the same direction. This dangerous shoal, on which the sea at times breaks heavily, was only known to the fishermen previously to Capt. Bayfield's survey.

Great Bras Dor Entrance, Carey Point Shoal.

THE GREAT BRAS DOR is the principal of the two channels, on either side of Boulardrie Island, leading to the interior sea called the Bras Dor Lake. Its entrance between Carey Point and Noir Point, is only 170 fathoms wide, with deep water; and, at a short distance outside the channel, is still further contracted by shoals to 110 fathoms; measuring from the depth of 3 fathoms on either side. Carey Point, the N. W. side of the entrance, is a shingle beach, quite bold at its Southern extremity, but having a dangerous shoal running out from it E.N.E., so as to form the Northern side of the channel outside for seven-eighths of a mile. On many parts of this shoal the depth is only 3 feet at low-water, so that it is shown by breakers when there is any sea running; and a wide bar commences immediately outside of it, and conti-

* If the gypsum cliff of Macleod Point cannot be made out, pass Wilhausen Point, at the estimated distance of 100 or 120 fathoms, steering for the Old Fort, until Fader Point is only just open; then proceed as already directed.

coal formation, un

runs one mile further out, with irregular soundings, from 3 to 6 fathoms, over gravel and sand bottom. The shallowest part, (3 fathoms,) called the Middle Shoal, lies on the North side of the channel, and $1\frac{1}{2}$ mile out from Carey Point. Nearly opposite to this, and on the South side of the channel, is Blackrock Shoal, extending from the red cliffs of Blackrock Point 200 fathoms to the North, and half a mile in a N.E. direction.

Blackrock Shoal.

These are the principal dangers of the entrance; they render the channel indirect as well as narrow; and together with the rapid tides and the want of buoys and beacons, make this a very dangerous pass for a stranger to attempt; except under favorable circumstances of weather, wind, and tide. Further out, it is only necessary to observe, that the shallow water extends 150 fathoms off Table Islet, which will be seen lying close off the cliff of Table Head, and distant 3 miles from the entrance. Haddock Bank has 4 fathoms least water, and lies from 1 to $1\frac{1}{2}$ mile off shore, midway between Table Head and Comet Point: the last being the remarkable N.E. extremity of Boulardrie Island, formed of cliffs of the coal formation, which are fast yielding to the waves; and from which a rocky shoal extends to the distance of two-thirds of a mile.

Haddock Bank.

Within the entrance, off the small bight between Duffus and Mackenzie Points, lies Eddy Rock, with one foot least water, and which will be cleared by keeping Blackrock Point open to the Northward of Noir Point. On the opposite or Northern side of the channel, from Carey Point to Kelly Cove, a distance of one mile, the shore is granite bold. To this cove, which is a convenient anchorage, we shall restrict our present notice of the Bras Dor, the object of this chapter being the North-eastern seaboard of Breton Island, leaving the description of its noble inland waters to a future page.

Kelly Cove.

Off the mouth of Kelly Cove, in 5 or 6 fathoms, sand bottom, the anchorage is good, and out of the strength of the tide; but it is still more secure further in, within a cable's length of its head, where the bottom is of mud, and the depth 3 to 4 fathoms.

If the entrance-channel of the Great Bras Dor were buoyed, a large ship might back and fill in against the wind, with the aid of the strong tide; but without that guidance, a fair wind, and weather clear enough to allow the leading-marks to be seen, are indispensable. Having those requisites, proceed as follows: observing first, that Duncan Head, 4 miles within the entrance, shows like a well-defined point on the South-east side of the channel. Pay a due regard to the dangers which have been pointed out, off the points of the bay; and before advancing further in than Table Island, bring Carey Point and Duncan Head to touch, bearing S.W. by W. $\frac{1}{2}$ W.; and steer for them until Cape Smoke and the North end of Hertford Island are in one; then change the course to the Southward and keep those marks in one astern, running from thence (for about 150 or 200 fathoms) until Mackenzie and Duffus Points come in one, when change course again and steer S.W. by W. $\frac{1}{2}$ W. for them, or so as not to open out Mackenzie Point until Blackrock Point and Table Head come in one. These last-named well-defined points kept in one astern, or as the vessel runs from them, on a W.S.W. $\frac{1}{2}$ W. course, will lead nearly in mid-channel through the narrow entrance between Carey and Noir Points; after which there is nothing in the way of a vessel heaving up for Kelly Cove. Should, however, the strong flood-tide carry her above the cove, she will find good anchorage 2 miles further in, on the same side, in 5 fathoms, and to the Westward of Jane Point.

Bras Dor Entrance.

If the weather should be so hazy that Cape Smoke cannot be seen, run in upon the S.W. by W. $\frac{1}{2}$ W. course, with Carey Point and Duncan Head touching, until Blackrock Point is abeam; then sheer to the Southward until Mackenzie and Duffus Points come in one, and proceed as before directed.

It is high-water, on the full and change days, at Carey Point, at 7h. 30m. m.t.; the rise in ordinary spring-tides being 3 feet, and in neap tides $1\frac{1}{2}$ foot. The usual rate of the tidal-streams in the entrance is from 4 to 5 knots; but in the spring, or after long-continued N.E. gales, which have previously raised the level of the Bras Dor, they may amount to 6 knots. They form strong ripples and eddies, especially off Carey Point.

Tides.

In unsettled weather the stream runs out until half an hour before high-water by the shore; and in, until half an hour before low-water; but strong winds cause great irregularities. It will be observed, therefore, that the stream ran out nearly all the time the water was rising; and in nearly all the time it was falling.

The rise of the tide diminishes rapidly as we proceed into the Bras Dor, and beyond the strait of Barra comes nearly or altogether insensible.

There are houses and farms on either side of the entrance of the Great Bras Dor, at which supplies of fresh provisions may be obtained; water is easily procured.

THE GREAT BRAS DOR, separating the coal-bearing strata of Boulardrie Island and the country further to the S.E. from the older rocks, forms the boundary of a great change in the character of the coast. Instead of mountains we have now a coast of moderate elevation, characterized by cliffs of sandstone, and shale of the coal formation, until we arrive at older rocks on the South shore of Mira Bay, and at

Boulardrie Island.

Scatari Island; the latter being distant from the Great Bras Dor 36 miles. The dangers of this coast are such as to render great caution necessary at night or in fogs, when 30 fathoms, or at least 20 fathoms, is as near as a stranger should approach; the latter depth being in some parts within 2 miles of the shore.

Little Bras Dor Pass.

THE LITTLE BRAS DOR is the narrow and winding passage on the Eastern side of Boulardrie Island; which, at the distance of 5 miles from its entrance, expands into the wide and deep channel of St. Andrew.

It can only be entered by small craft and boats under favorable circumstances, the entrance being closed with breakers when there is a heavy sea running, and especially when the strong tide is running out against the wind. The depth at low-water, over the rocky bar, is 7 feet, in a channel between reefs, and only 25 fathoms wide.

Tides.

It is high-water, full and change, at 7 1/2 hours; and the rise in ordinary spring and neap tides is 3 and 2 feet respectively. The usual rate of the stream in the entrance is 4 knots. There is a fishing establishment on the shingle point just within the entrance, and scattered houses and farms on either side. The approach to the Little Bras Dor is rendered dangerous to strangers by the shoals on the East side of Cimet Point, extending 600 fathoms off shore; and by the reefs off Alder Point and Mope Head to the East of the entrance.

Bird and Bonar Rocks.

THE BIRD ROCK, 6 feet high, will be seen on the reef 400 fathoms S.E. from Mope Head; and the Bonar Rocks, dry at low-water, at the same distance off Bonar Head. In addition to these dangers, observe that in the distance of 6 miles from Cimet Point to Cranberry Head, the shoal water for a large ship frequently extends to nearly a mile off shore.

Sydney Harbor.

SYDNEY HARBOR* is one of the finest ports in the world, being equally easy of access and egress, and capable of containing any number of the largest vessels in perfect safety. It is 3 miles wide at the outer entrance; but the navigable channel contracts rapidly to the breadth of half a mile between the two bars; which are of sand and shingle, and extend from the shore on either side, at 5 miles within the light-house on Flat Point. Inside these bars the harbor divides into the West and South Arms; the former being open to the E.N.E. winds, except at the coal-loading ground, where the vessels anchor under shelter of the N.W. bar; and at North Sydney, where they may lie in like manner under Allen Point. The South Arm, being completely sheltered from the sea by the S.E. Bar, affords safe anchorage in every part. The Town of Sydney, 23 miles up this arm, is exceedingly well situated on the West side and summit of a peninsula, 55 feet high.

It has deep water close to its wharfs, and the arm continues navigable for vessels to Sydney Bridge, a distance of 2 miles; and for boats to the Fork's Bridge, where the tide ends 6 miles above the town, and from which a road leads across to the East Bay of the Bras Dor.

Sydney Light.

The light-house on Flat Point is octagonal in shape, painted red and white, vertically, and shows a fixed light 70 feet above the sea. Leaving this on the left, on entering the harbor, the high and conspicuous colliery chimneys, the Episcopal, Scotch, and Roman Catholic churches, together with the other buildings at the mines, will be seen on the opposite shore, at the distance of 1 1/2 mile within the cliffs of Cranberry Head; as will also the Sailors' and Roman Catholic churches, with the stores, houses, and wharfs at the loading ground, which is 2 miles further in along the same side of the harbor.

Approach to Sydney Harbor.

Vessels bound to this harbor should observe the following directions:—

First. When approaching from the Northward with a leading wind, steer so as to pass the reef off Cranberry Head (on which lies Cran Rock, with 16 feet water, half a mile off shore) in 10 fathoms; and when the high cliff of Mine Point opens out to the Eastward of Swivel Point, haul into the harbor. If bound to the loading ground, run along the N.W. shore, in not less than 5 fathoms, until past Mine Point, then steer off to the Southward, sufficiently to bring Jackson and Allen Points (two shingle points, up the West Arm) in one; or until the light-house comes in one with Petre Point; either of which, or at night the depth of 6 1/2 fathoms, will lead clear of the N.W. bar, which is very steep, having 5 1/2 fathoms close to it.

When the wharfs at the loading ground near N.W., the vessel will be well within the bar; and may haul in and choose her berth in 5 or 6 fathoms, mud bottom, and at the distance of 150 or 200 fathoms from the wharfs.

South Arm.

If the vessel be bound up the South Arm, run in as before, or in mid-channel, until the Easternmost of the high colliery chimneys appears to the Westward of the Episcopal church, which is the Easternmost church on Mine Point; then run from those marks, keeping the Easternmost chimney a little open to the Westward of the church, and they will lead clear of the S.E. bar; the Western extremity of which will be passed, when the West point of its shingle beach begins to bear to the Northward of East.

The vessel may be 6 or 7 fathoms, mud bottom, and it will only be necessary to anchor either shore; not further than 1/2 of a mile out N. by N. if outside a line joining the shoals, as will be seen in all the way to the harbor.

Secondly. When the vessel is less than half a mile, or more, from the water, a mile within the entrance opens out to the Northward, and further in, do not run along the Eastern side of the harbor, then so as you run toward up the South Arm, or with the former side of the Eastern colliery, when proceed as before. In beating into the harbor, N.W. and S.E. bars are to be warned.

There is, however, no danger to intelligent seamen.

It is high-water at change days, at 8 1/2 hours, and the ordinary rate of the tide being, at the change days, at 8 1/2 hours, the ordinary rate of the tide being, at the change days, at 8 1/2 hours, the ordinary rate of the tide being, at the change days, at 8 1/2 hours.

The most convenient anchorage in the harbor is the Sawmill Lake, where the water may be obtained in several other places around the harbor.

INDIAN BAY, a small bay, well sheltered from the East winds and fine weather, is 3 miles wide.

It is high-water at change days, at 8 1/2 hours, and the ordinary rate of the tide being, at the change days, at 8 1/2 hours, the ordinary rate of the tide being, at the change days, at 8 1/2 hours.

In approaching the harbor, observe that the shoals and head of the bay are to be warned.

The best anchorage is in greater depths than 10 fathoms.

It is high-water at change days, at 8 1/2 hours, and the ordinary rate of the tide being, at the change days, at 8 1/2 hours.

GLACE BAY, 5 miles from the town, is Dyson Pond, extending 1/2 mile from the hills and sand-beneath bay, at Glace Cove, on the opposite side from the cliffs.

Proceeding 4 miles from the headland, where the water is 10 feet deep, off its North side 1/2 part of a reef which is 10 feet least water, lies on which there are pits, 60 feet high.

* See Plan.

The vessel may then either haul to the Eastward, and anchor in Fishery Cove, in *Fishery Cove*. 6 or 7 fathoms, mud bottom, or proceed on to the town of Sydney. In the latter case, it will only be necessary to consult the chart for the extent of the shallow water off either shore: not failing to observe that the reef off Battery Point extends a quarter of a mile out N. by E. The anchorage is good anywhere off the wharfs of the town, if outside a line joining the English church and Shingle Point; within that line there being shoals, as will be seen in the chart. The depth at this anchorage is from 5 to 5½ fathoms, with mud bottom; and there is sufficient depth of water for large vessels all the way to the bridge, between which and the town is the most secure part of the harbor.

Secondly. When approaching from the Eastward, pass the light-house no nearer than half a mile, or in not less than 7 fathoms; and to avoid Petre Reef (dry at low-water, a mile within the light-house) do not haul into the harbor until Daly Point opens out to the Northward of Gillivray Point: and to clear the shoal at Petre Point, and farther in, do not approach nearer than half a mile, or than 5½ fathoms, as you run along the Eastern shore. When the light-house and Petre Point come in one, keep them so as you run from them, and they will lead to the loading ground as before. If bound up the South Arm or to Sydney, run with the light-house and Petre Point in one, or with the former only just shut in, until the marks for clearing the S.E. bar, namely, the Eastern colliery chimney and the Episcopal church on Mine Point become in one, when proceed as before directed.

In beating into this harbor, great care must be used, especially when between the N.W. and S.E. bars, both of which are so steep that the lead will afford little or no warning. *Turning in.*

There is, however, plenty of room; and, with the aid of the Admiralty chart, the intelligent seaman will experience no difficulty even in the largest ship.

It is high-water at the S.E. bar, and also at the town of Sydney, on the full and change days, at 8½ hours after the moon's transit, the rise at ordinary spring and neap tides being, at the bar, 3½ feet and 2½ feet respectively; and at the town, 5 and 4 feet. The ordinary rate of the streams is half a knot off the town, but much weaker further out into the wider parts of the harbor. *Tides.*

The most convenient watering-place is at the creek, which discharges the waters of the Sawmill Lake, a short distance to the Westward of the loading ground; but good water may be obtained on the East side of the South Arm, also opposite the town, and in several other places where brooks enter the sea. The country is well settled around the harbor, and supplies of every kind may be readily obtained.

INDIAN BAY, 5 miles S.E. from Sydney light-house, is open to the wind and swell from the Eastward, and therefore affords a safe anchorage only in off-shore winds and fine weather. *Indian Bay.*

It is 3 miles wide by 1½ mile deep: at its head a dry sand-bar, a mile long, extends across from the Southern to within 75 fathoms of the Northern shore; leaving an entrance of that breadth into Bridgeport Harbor, a shallow pond, extending 2 miles inland. The depth of 8 feet at low-water is all that can be carried into this harbor, the interior of which is occupied by flats of sand and weeds, partly dry at low-water; except in a narrow and winding channel from 7 to 15 feet deep, and which leads into a wide expansion 8 feet deep at low-water. *Bridgeport Harbor.*

In approaching this bay, in order to anchor, give its points, which are cliffs of the coal formation, a berth of full half a mile, or pass them in not less than 5 fathoms; and observe that shallow water extends to the same distance from the North shore and head of the bay, as well as further Eastward towards Table Head.

The best anchorage is near the middle of the bay, and within the depth of 5 fathoms; in greater depths the bottom is in general rocky, and not to be trusted.

It is high-water in the entrance of the harbor, on the full and change days, at 8 hours; and the rise is from 3½ feet to 2½ feet, accordingly as it may be spring or neap tides. The ordinary rate of the stream in the entrance is 2 knots. *Tides.*

GLACE BAY, 5 miles further to the S.E., affords no safe anchorage. At its head is Dyson Pond, extending 2 miles inland, and having a narrow outlet, through sand-hills and sand-beach, which is usually dry at low-water. On the N.W. side of this bay, at Glace Cove, the shallow water extends three-quarters of a mile off shore; and on the opposite side a Macroea and Dyson Points, the reefs run out fully half a mile from the cliffs. *Glace Bay.*

Proceeding 4 miles further to the Eastward we arrive at Cape Percy, a precipitous headland, where the cliffs of coal-bearing sandstone rise to 110 feet above the sea. Of its North side lies Schooner Rock, with 5 feet least water, being the shallowest part of a reef which extends 400 fathoms out from the shore. Percy Rock, with 7 feet least water, lies 200 fathoms off the North-east shoulder of the cape. Flint Island, and, on which there is a revolving light, is of sandstone, broken by the waves, precipitous, 60 feet high, and 300 fathoms long, in an E. by N. direction. On its North *Cape Percy.* *Schooner Rock.* *Percy Rock.* *Flint Island.* *Revolving Light.*

point there is a fish-store where alone boats can land. It lies 1600 fathoms E. by S. from Cape Percy. Shallow water extends only a third of a mile from it in any direction; but off its West end, to the distance of 400 fathoms, there are very irregular soundings, 4' to 12 fathoms in a cast of the lead; which cause, with the tide, a strong rippling, and at times a heavy breaking sea.

Between these dangers and the Cape there is a clear channel a mile in breadth, through which an irregular tidal-stream runs at times 2 knots.

At Cape Percy the direction of the coast changes from S.E. to S.S.W., and continues in the latter direction for about 14 miles, across the mouths of Morien and Mira Bays, to Cape Breton, the Eastern extremity of Breton Island.

Morien Bay. MORIEN BAY is 2½ miles wide at its entrance, between Capes Percy and Morien. On its North side, just within Cape Percy, lies Cow Reef, dry in part at low-water, and extending to half a mile from the shore. The head of the bay is occupied by flats of sand and mud, partly dry at low-water, and through which a narrow shallow channel leads to False Bay Beach, on the North side of Mira Bay. Being completely open to Easterly winds, Morien Bay affords no safe anchorage.

Cape Morien CAPE MORIEN is a bold headland, the shoal water extending only 150 fathoms from its sandstone cliffs; which abound in coal, and rise, on its South side, 150 feet above the sea. It is the N.E. extremity of a peninsula, which forms the precipitous North shore of Mira Bay, for a distance of 5 miles, and terminates at the shingle isthmus of False Bay Beach, already mentioned.

Mira Bay. MIRA BAY is, also open to winds from the Eastward, and affords no safe anchorage. It is of great extent, stretching in 9 miles to the Westward of Cape Morien; and being 7½ miles wide at the entrance between that cape and Moque Head. Mira River, after flowing for several miles between precipitous banks, enters the head of the bay between points of sand and shingle, 40 fathoms apart. It discharges the waters of Mira Lake and Salmon River, and is the outlet of an inferior navigation of about 20 miles: but the ordinary depth on its bar of sand and stones is only 4 feet at low-water, and seldom exceeds 8 feet, except in extraordinary spring-tides.

Mira Lake. CATALOGNE LAKE has only one foot at low-water in its very narrow outlet, through a sand and shingle bench, 2 miles South of Mira River. It is broken into coves, peninsulas, and islets, forming picturesque scenery. There is a Presbyterian church at its head, three miles in from the entrance, and its shores are occupied by farmers and fishermen.

Menadou Harbor. MENADOU HARBOR, on the North side of Menadou Bay, three-quarters of a mile within Moque Head, is a semicircular cove, a quarter of a mile wide. Its shingle beach is occupied by fish-stages, and its shores by a busy village of fishermen and small traders. It has a Roman Catholic and English Episcopal chapel, the former only being distinguished by a steeple; and the population, including those scattered around the bay, amounts to about 300 souls. The depth at low-water in this small harbor is from 10 to 14 feet, over sandy bottom. It is sufficiently sheltered by the numerous rocks in the bay, and by the Island of Scatari, to afford safe anchorage to fishing schooners and coasting vessels, drawing less than 10 feet water: but larger vessels would be endangered by the swell or *under-tow* that accompanies a gale from the Eastward, and which would cause them to strike the ground at low-water. The approach to this harbor, between numerous rocks above and under water, is so difficult and dangerous, that no written directions could avail; the plan of the bay on a large scale, or the assistance of a fisherman of the place, would be indispensable to any stranger.

Tides. It is high-water at Menadou, on the full and change days, at 8½ hours; the rise in ordinary spring-tides is 5½ feet, and in neap tides 3½ feet.

Menadou Passage. THE MENADOU PASSAGE is a mile wide between Moque Head and the West point of Scatari Island, and has a clear deep-water channel of nearly half that breadth, in the narrowest part, which is between the Great and Little Shag Rocks in the Northern part of the entrance. Nevertheless, it should only be used in cases of emergency, or in such circumstances of wind and weather as would insure the not being surprised by the prevailing dense fog, in a channel rendered indirect by numerous dangers, destitute of good holding-ground, and in which there is no shelter from the heavy sea that accompanies all Easterly and Southerly winds. The principal dangers of this passage are the Shag Rock and Bar Reef, the other rocks in the mouth of Menadou Bay being less in the way of vessels.

Shag Rock. THE SHAG ROCK is black, 30 fathoms long and 15 feet high; it will, therefore, readily be seen; but a rocky shoal extends from it 400 fathoms E.N.E., and 180 fathoms E.S.E. In this latter direction there is a patch with 12 feet least water on the extreme edge of the shoal. The Little Shag and the Cary Rocks, half a mile to the Eastward of it and 70 fathoms off shore, can also be seen, being small black trap rocks, respectively 6 and 4 feet above high-water. The Little Shag lies 150 fathoms North from the West Point of Scatari, and the shoal water outside of it does not

extend beyond the and 9 fathoms deep.

* From L'Anse a
† From Puerto N

extend beyond the distance of 50 fathoms; leaving a clear channel 450 fathoms wide, and 9 fathoms deep, between it and the Shag Shoal.

This is the main channel, that to the West of the Shag being rendered dangerous by Neering Rock, which, with 9 feet least water, lies 350 fathoms N.W. from the Shag Rock; also by Duck Rock awash at high-water, and lying 175 fathoms South from Moque Head; and by Mad Dick, which, with 3 feet least water, lies 200 fathoms further to S.W. To these dangers, on the W. side of the channel, we may add the Black Rock, which can always be seen, and the other rocks in the mouth of Menadou Bay, but they are out of the way of passing vessels. There remains the Bar Reef, which runs out from Bar Point, to the Southward of Menadou Bay, and more than half-way across to the Island of Seatari. It was formerly a dry bar, covered with sand and grass; at present the only part uncovered at high-water is the Bar Stone, a single mass of rock, about 4 feet high; but at low-water the reef still dries extensively, and completely shelters Menadou from the South wind and swell. The Bar Stone lies three-quarters of a mile off shore, and the reef continues a quarter of a mile further out, towards the West point of Seatari, which it approaches to within three-quarters of a mile, and then turns to the S.E.

In this last-named direction, the reef continues three-quarters of a mile, and terminates at the Helen Rocks, in only 4 and 6 feet at low-water, on which the sea often breaks heavily. The Eastern extremity of this dangerous reef, in 5 fathoms, bears S. by W., 1½ mile from the West Point of Seatari; and N.N.E., 2 miles, from Cape Breton. A line from one of those points to the other passes over the East end of the reef in 6 feet at low-water; and vessels will clear it to the Eastward, if Portnova Island be not entirely shut in behind Cape Breton.

CAPE BRETON, the extreme Eastern Point of Breton Island, is low, rocky, and covered with grassy moors. It is bold to the Eastward, with the exception of a rocky 12 feet patch bearing S.S.E. ½ E., a quarter of a mile. On the North side of the Cape, three-quarters of a mile, lies L'Anse au Coin,* in the mouth of a shallow bay. This island, which is about 2 cables' length in diameter, and 50 feet high, is bold to seaward; but there is a rock dry at low-water between it and the cape.

PORTNOVA ISLAND† lies off the South side of the cape, from which it bears S.S.W. ½ W., three-quarters of a mile. It is rocky and precipitous, 150 fathoms in diameter, and 59 feet high. It is bold to seaward, but Chameau Rock, which is awash, and on which a French frigate was lost, lies nearly midway between it and the cape, leaving no passage for ships.

On the opposite side of the passage, the reefs off the S.W. side of Seatari can always be seen, and do not extend more than 2 cables' length off shore. We need only mention here the Hatch Rocks and Ragged Rocks; the former being most in the way, will be cleared, as long as Shag Rock is not shut in behind the West Point.

MENADOU PASSAGE has hitherto been considered too dangerous for any but fishing and coasting vessels; but with the aid of the Admiralty chart, and the description and directions here given, the largest ship may take it without danger, in case of need, and under favorable circumstances of wind and weather. All Southerly and Easterly winds are unfavorable, because either accompanied by or liable to the sudden arrival of dense fogs. Winds from between the West and North are as constantly free from fogs, and being, moreover, smooth-water winds, are favorable for this passage.

In a vessel approaching from the Southward, with a Westerly wind, and wishing to avoid running to leeward to pass outside of Seatari, proceed as follows:—Pass Portnova Island and Cape Breton at the distance of half a mile or more, steering for a remarkable hill called Steering Hummock, which stands 600 fathoms to the Eastward of the West Point of Seatari. Take care not to shut in Portnova Island behind Cape Breton, until sure that Bar Reef has been passed; and when the West Point of Seatari bears a point or more to the Westward of North, steer so as to pass round it at a distance between a quarter and half a mile; keeping gradually away to the Northward and Eastward, so as to pass between the Little Shag Rock and Shag Shoal. When the Shag Rock comes in one with West Point, or when the latter bears to the Westward of South, the Shag Shoal will be past, and the vessel may be steered for Cape Morien.

If coming from the Northward, with a fair wind, bring the West point of Seatari to bear to the Westward of South, and steer for it until the Eastern extremity of Shag Shoal is past, which will be when the Shag Rock and Moque Head come in one: then change course so as to pass the Little Shag and West Point at the distance of 200 or 300 fathoms; which having done, steer out S.E. by S.; remembering the marks for clearing the Hatch Rocks and the East end of Bar Reef.

* From L'Anse au Coin.

† From Puerto Nuevo, a very inapplicable name, there being no port near.

- Tides.* The ordinary rate of the tidal-streams in Menadou Passage is from 1 to 2 knots, the flood from the Southward, and the ebb in the opposite direction; but they are often very irregular.
- Scatari Island.* SCATARI ISLAND, forming the extreme Eastern dependency of Breton Island, is in shape a triangle; the longest side of which faces the North, and extends 5½ miles; while a line at right angles to it, and terminating at Howe Point, the Southern extremity of the island, gives an extreme breadth of 2½ miles.
- The natural features of this island are similar to those of the adjacent main-land, the highest hill rising 190 feet above the sea. It is not permanently inhabited, being reserved by the colonial government, but is much frequented by the fishermen in the summer season. Near the centre of its Northern shore is the N.W. Cove, affording a smooth-water anchorage in Southerly winds; but the holding-ground is not good, and vessels should be prepared to weigh promptly with the change of wind. The S.W. and S.E. sides of the island are broken, by the heavy and almost incessant Atlantic swell, into rocky points and coves, which afford excellent fishing-stations, but no shelter to shipping.
- Eastern Harbor.* Eastern Harbor, formed by Hay Island on the South side of the East point, does not deserve the name, being merely a very insecure anchorage within the reefs; but it is used occasionally in fine summer weather by small vessels employed in the fisheries, and in saving things from wrecks.
- Scatari Light.* THE LIGHT-HOUSE, on the East point of Scatari, is octagonal in shape, painted white, and 70 feet high. It stands on Trap Rock, 90 feet above the sea, and shows a Revolving Light, visible a minute and eclipsed for half a minute. It is furnished with a gun for signals, and a boat to assist vessels in distress.
- The reefs off the S.W. side of the island have been already mentioned, as extending only 2 cables' length off shore; those off the North side are still shorter. The principal dangers are on the S.E. side, where a reef runs out half a mile from Hay Island. Outside of this, and bearing South 1½ mile from the light-house, lies Watnie Rock, with 21 feet at low-water; and still further out, and bearing S. 4 E., 1½ mile from the light, there are two rocky patches, with 5 fathoms, on which the sea occasionally breaks.
- Hay Island Reef.* THE CORMANDIERE ROCKS lie nearly three-quarters of a mile off the light to the Eastward. They are small black trap rocks, from 6 to 16 feet high, and can therefore always be seen. They are bold to seaward, and there is no passage between them and the light for ships.
- Watnie Rock.* Scatari, like St. Paul Island, has become celebrated for many fatal shipwrecks; but these casualties, which have been mainly occasioned by the neglect of the lead, in vessels bound for the Gulf of St. Lawrence, and meeting the prevailing current on the starboard bow, have been greatly diminished since the establishment of the light, in 1839.
- Cormandiere Rocks.*

BRETON ISLAND, SOUTH COAST.

- Louisbourg Harbor.* LOUISBOURG HARBOR is situated on the S.E. side of Cape Breton, to the Westward of Scatari Island, and is very easy of access; you may be soon in, and you may likewise be soon out, if you please. In doing so, be careful to avoid the Nag's Head, a sunken rock on the starboard hand going in. The East part of the harbor is the safest. On the East Head, and on the site of the old French light-house, a light-house, 15 feet high, showing a fixed light, has been erected; it is painted white, with a perpendicular black stripe on each side. The inhabitants consist of a few fishermen only. Water is plenty here, but wood is scarce. The Nag's Head Rock lies nearly one-third from the light-house point, and has no more than 3 feet on it at low-water. The port side, going in, is the boldest.
- Gabarus Bay.* GABARUS BAY.—From the entrance of Louisbourg to Guion Island, called also Portland Isle, the course is S.W. by W., and the distance more than 3 leagues. Between lies the bay called Gabarus Bay, which is spacious, and has a depth of from 20 to 7 fathoms. Off the South point of this bay, called Cape Portland, lie the Cormorants, a number of islets and rocks, which are dangerous. About 4 leagues to the Westward of Gabarus Bay, is the Forked Harbor, a narrow winding inlet, where small vessels may run into, and lie land-locked. And 5 miles South-westward of this is the remarkable white cliff already noticed, and called Cape Blancherotte. The shore now winds to the Westward, to Cape Hinchinbroke and the isle of Madame.
- Blancherotte, or White Cliff.* BLANCHEROTTE, or WHITE CLIFF.—On the South coast of Breton is a remarkable cliff of whitish earth. Four miles to the Westward of it is a small woody island, lying at the distance of 2 miles from shore, and off the little harbor called St. Esprit. Without this island, at the distance of a mile and a half, on the S.E. is a breaker.

The land hence several banks of Breton South side of Madag of this island is the In the description appearance of its from the Isles of Can rocks and breakers. Its North shore cor Off the Gut of C throughout, is high the North end of th by high, rocky, red sum, or plaster, wh very high, its summ

The land hence to the Isle of Madame, or Richmond, is generally low. It presents several banks of bright red earth, with benches between them. Albion Cliff, on the South side of Madame, is rocky, remarkably high, and precipitous. On the S.W. side of this island is the settlement called Arichat.

In the description of the Gut of Canso, already given, we have noticed the general appearance of its coasts. On proceeding towards this strait, it should be remarked that the Isles of Canso, on the Nova Scotia side, are surrounded with many low white rocks and breakers. The South shore of Chedabucto Bay is iron-bound and steep to. Its North shore consists of red cliffs and benches.

Of the Gut of Canso, from the Southern entrance Northward, the Western shore, throughout, is high, rocky, and steep; the Eastern shore low, with beaches. From the North end of the gut, the Eastern shore to Jestic, or Fort Hood, is distinguished by high, rocky, red cliffs. The opposite shore has several remarkable cliffs of gypsum, or plaster, which appear extremely white. Cape St. George is iron-bound, and very high, its summit being 420 feet above the level of the sea.

THE SOUTHERN COAST OF NOVA SCOTIA.

CAPE CANSO TO CAPE SABLE.

DESCRIPTION OF THE LAND.—The Eastern part of Nova Scotia is broken into the several islands and passages as represented on the charts.

DOVER BAY is a wild deep indent, with a number of islands and sunken rocks at *Dover Bay*. Its head; yet shelter may be found on the Western shore, or during a South-east gale, by giving a berth to the rocks that lie off the South end of Big Dover Island; these are very visible in bad weather; haul up under the Island, and anchor between the small islands on the Eastern side; within these islands Little Dover Passage confines out South-eastward, having 5, 6, and 7 fathoms water, and quite safe.

Eastward of Little Dover is St. Andrew's Channel, for which no directions can be given, for even those who are well acquainted with the navigation cannot keep themselves clear of the rocks. This channel leads to Glasgow Harbor, which is, in fact, a part of Canso Harbor.

These places, says Mr. Lockwood, deserve notice, as they may afford shelter in cases of emergency, and in war time are nests for privateers; while from the heights adjacent may be had an extensive view of whatever passes in the offing.

RASPBERRY HARBOR is to the Westward of that of Canso, or Port Glasgow; it is small, and the shore is within quite bold. At the entrance on the Eastern side is an island, having a ledge close to it on the S.E. By rounding this ledge, you may steer directly into the harbor, and come to an anchor under the island which lies in the middle of it, in the depth of 7 fathoms, where you will ride safely. The country here is rocky and barren, and there is a quarry of granite, much in request for millstones. The outlet between Raspberry Island and the main is a complete dock, where vessels can lash themselves to both shores, and ride in 30 feet water; but half way through it has only 10 feet.

WHITE HAVEN, which is 2 leagues to the Westward of Raspberry Harbor, is a *White Haven* place of hideous aspect. Of its rocky islets, the larger and outer one, called *White Head*, from the color of its sides, is 70 feet above the level of the sea. This islet appears round and smooth, and is a useful mark, as the passage in on either side is in a narrow channel, not difficult to navigate, and the anchorage is good throughout, in a muddy bottom. Off the head are two breakers, one S.S.E., and the other E. by S., half a mile off.

On the S.W. point of the island there is a revolving flashing light: flash of 10 seconds; *Light* eclipse of 10 seconds; the tower is white; the lantern is 55 feet above high-water.

TORBAY.—The entrance of this bay is formed on the West by a bold headland, *Torbay*, called *Berry Head*. The channel in is between this head and the islands to the Eastward. E.S.E. from the head, and South of George's Island, are three very dangerous rocks, which do not break when the sea is smooth. Within the bay, under the Western peninsula, there is excellent anchorage, in from 6 to 4 fathoms, muddy bottom, up to the Eastern part of the bay; there is also anchorage on the Western side of the bay, in from 7 to 3 fathoms, similar ground, where a vessel may lie in safety during any gale. The adjacent lands are rocky, but vessels are built here of from 40 to 120 tons, which are employed in the fisheries.

The principal dangers to be avoided in entering are the small sunken rocks in the offing, which in smooth water do not break; they should be left to the Eastward.

Within the bay the anchorage is excellent, in a muddy bottom, with the exception of a few spots of rocks, sheltered from every wind.

Town to Country Harbor

Town to Country Harbor. From Town, Westward, to Country Harbor, the bottom in general continues rocky and stony, with deep water close in, but regular soundings without, and from 30 to 20 fathoms of water.

Coalle's Harbor, which is 3 leagues to the Westward of Berry Head, affords shelter to small vessels only, and these enter on the Eastern side to clear the breakers. It is a deep inlet, called New Harbor, which lies about 7 miles from the island, and is connected with a chain of extensive lakes, but its navigation is obstructed by a bar at its entrance, and it is open to Southerly winds.

New Harbor.

NEW HARBOR. This place is so much exposed, that even small vessels which occasionally resort there in the fishing season, are under the necessity of leaving it the moment a Southerly wind arises.

Inland Harbor lies between Harle Island and the main, and affords excellent anchorage, on a bottom of mud, it is particularly convenient for going to sea with almost any wind.

Isaac's Harbor is on the North east side of Country Harbor, and lies on a hard ground, with sufficient depth of water for any vessel. Between Isaac's Harbor, Harle Point the ground is foul and rocky.

Country Harbor

COUNTRY HARBOR. The fine harbor, called Country Harbor, is nearly the longest slips, 12 miles from its entrance. It is, at present, but thinly settled, and there are reasons for believing that, in consequence of improvements in this mode of work, the population will speedily increase. The shores are bold, the anchorage is mud, with a depth of 3 to 5 fathoms. Mr. De Laet has said that, "no port in the province is more advantageous for sailors than this harbor, at its mouth the mud affords shelter to fishermen and small vessels, as well as the means of curing the storges, and the fishing grounds, at a short distance in the offing, abound in cod, haddock, cod, and what they call the butt fishery, that is, mackerel, gulls, snails, &c. Salmon are plentiful in their season, and, but for the want of a considerable addition to the means of subsistence, would continue to be the staples of the harbor generally broken, and between them are deep passages, and advancing from the Eastward there are two rocks to be avoided, which lie as shown in the charts, proceeding inward, you should give Green Island a small berth, and dangers on that side will be avoided. The rocks on the West of the entrance, Casimiro and Pollex, are above water and hold to. When above them, give a good berth, and a good berth, so as to avoid the Bull, a dangerous broken rock, that lies to seaward, when, and lies about half a mile from the extreme tip of the cape. The rocks are partly dry, and from them upwards there is no danger, and the anchorage is good. Vessels entering this harbor must use the utmost caution in steering between the ledges and rocks which are scattered about, fortunately they commonly show themselves whenever there happens to be any sea, this will render the passage less difficult, but having passed the Black Ledge, which is the main danger, navigation will be perfectly safe for the largest feet. The tide is scarcely to be perceived, except when in the spring the ice and snow dissolve, and heavy rains are prevalent. At the entrance of Country Harbor, it is high water, on full and change at 8 1/2 hours. Tides rise from 6 to 9 feet.

Black Ledge Harbor

FISHERMAN'S HARBOR. In entering this place between Cape MacLeod and the Black Ledge, great care must always be taken to avoid the Bull Rock, which rises at low water, but is covered at high water, and only breaks when the weather is bad.

Harbor Island

HARBOR ISLAND. The islands on the East side of the entrance, Green King, Goose Island, and Harbor Island, or the Witham and Augustus Islands, of the Barres are low and covered with scrubby trees. Within Harbor Island is excellent anchorage.

Rickerton Harbor

RICKERTON HARBOR, to the West of Fisherman's Harbor, is fit for small vessels only. At 2 miles to the West of this Harbor, a piece of shelter for vessels, and resorted to by the fishermen. Indian Harbor is a shallow and unsafe anchorage, but has good lands, well clothed with pine, maple, birch, and spruce. The next inlet, called Wine Harbor, has a bar of sand, which is nearly dry. There are a few and but few settlers on these harbors.

St. Mary's River

ST. MARY'S RIVER. The navigation of this river is impeded by a bar of 12 fathoms water, which extends across at the distance of a mile, and three quarters above the Point, the West point of the entrance. Below the bar, towards the Westward, is a middle ground, which appears uncovered in very low tides, and, above the bar, nearly in mid channel, is a small rocky islet. The passage over the bar is on the Eastern side of this islet. The tide, which is very rapid, marks out the channel. The latter is deepens, between mud banks, extending from each shore, and dry at low water. The depths upward are from 24 to 18 feet. Sailing in, you should proceed

Under N N W., then 2 miles N. by W., and afterwards N N W. to the fork, where it divides; the Western branch terminating in a brook, the Eastern branch remaining navigable a quarter of a mile further up to the rapids. The town of Sherburne is, at present, a small village at the head of the river, about three leagues from the sea.

WEDGE ISLE.—The islet called Wedge Isle, which lies at the distance of half a league South from the S W. point of St. Mary's River, is remarkable, and serves as a bent guide to the harbor in the neighborhood. The side of this islet towards the main land is abrupt, and its summit is 115 feet above the sea. From its S.W. end ledges stretch outward to the distance of half a mile, and some sunken rocks, extending towards it from the main, obstruct the passage nearly half way over. About a mile South from the Wedge, is a fishing bank of 20 to 25 feet, the area of which is about 200 acres.

JEGOGAN HARBOR may be readily found, on the Eastward, by Wedge Island, *Jegogan Harbor* on the Westward by the bold and high land called Redman's Head. The passage is, at the distance of a quarter of a mile from the head, and anchorage good, in nearly bottom. Three quarters of a mile from it is a dry ledge, called the Slag.

LISCOOMB HARBOR. The entrance of this harbor, which is one of the best on the coast, is between Liscomb Island and the headland on the West, called Smith or *Liscomb Harbor.* From the N.E. end of Liscomb Island, a ledge, with breakers, extends to the distance of three quarters of a mile. Within and under the lee of the island is an anchorage in from 13 to 8 fathoms. On the N.E. of the island, a vessel caught in a S.E. gale may be sheltered by Redman's Head, already described, with the head S.E., in 6 and 7 fathoms, on a bottom of clay.

On the West side, the ground from Smith Point is shoal to the distance of nearly a mile S.E., and at 2½ miles South from the point is a rock, on which the ship *Black* once was lost. It constantly breaks, and is partly uncovered. The island side is flat. The first direction of the harbor is nearly North, then W N.W. Opposite to the first fish stage, at half a mile from the shore, is as good a berth as can be desired, in 5 fathoms. From this place the harbor is navigable to the distance of four miles, but, however, to be observed, that there are two sunken rocks on the North side. At the Bay (Liscomb Harbor) spring tides rise 7½ feet, neaps 14.

BAY OF ISLANDS. The coast between Liscomb and Beaver Harbors, an extent of 18 leagues, is denominated the Bay of Islands. Within this space the islets, rocks, and ledges, are innumerable. They form passages in all directions, which have, in general, a good depth of water. At the Eastern part of this labyrinth, near Liscomb, Mine of Joseph, an excellent harbor for the largest ships, but requires caution to enter. Niouquique is a small settlement in the same range, the inhabitants of which are an industrious set of people. Newton quiddy, next East of Beaver, is very fit for any but fishing and other small craft, as the channel in is rocky and narrow.

The White Islands, nearly half way between the harbors of Beaver and Liscomb, are of a light stone color, with green summits. The latter are about 60 feet above the level of the sea. The isles are bold on the South side; the passage between them is good and there is good anchorage within them, in from 10 to 7 fathoms. From these rocks and ledges extend 5 or 6 miles from E. to E.N.E. They are bold to, and very dry, the water within them being always smooth.

BEAVER HARBOR. The Pumpkin and Beaver Islands are very remarkable to *Beaver Harbor.* sailing along the coast, particularly Pumpkin Island, which is a lofty and barren rock; but they afford a smooth and excellent shelter inside of them during a Southerly gale. Southerland Island has, on its N.W. side, a deep and bold inlet, where a vessel may lie concealed and secure as in a dock. When in the offing, the bay is remarkable on account of the small island which lies North of the Black Bay, having at its Southern end a red cliff, being the only one of this part of the coast. Having entered the harbor, you may choose your anchorage, according to the direction of the wind, the bottom being generally mud. The basin on the West side is so deep, that a small vessel may lie aloft, her side touching the bench.

On the Outer Beach, or Williams Island, there is a light house 70 feet high, *Light-house.* bearing a revolving light, visible 1½ minute, obscured half a minute.

The lighthouse is on a square building, with two black balls painted on the seaward

side. A reef extends from the East end of Beaver Island a considerable distance, so that in entering the bay you should give the light a berth of three-quarters of a mile.

The harbor is too intricate to be recommended to a stranger.

SHEET HARBOR.—This harbor is nearly half-way between Country Harbor and *Sheet Harbor.* It is dangerous for vessels to approach in thick weather. The narrow

channel between Sober Island and the main affords secure anchorage, on a bottom

Without the harbor are several ledges, which show themselves, excepting the outer one, called by the fishermen Yankee-jack, and which, when the sea is smooth, is very dangerous. It has been asserted that a rocky shoal lies half a mile to the South of the Yankee, but its position has not been ascertained.

Within the entrance is a rock, two feet under water, which will be avoided by keeping the Sheet Rock open of the island next within it, on the Eastern side. In sailing out or turning up the harbor, give the sides a very moderate berth, and you will have from 11 to 5 fathoms, good holding-ground.

Tides.

The flood at the entrance of Sheet Harbor sets S.S.W. about one mile an hour. High-water, full and change, at 9h. 50m. Tides rise 7 feet.

Mushaboon.

MUSHABOON, to the Westward of Sheet Harbor, is a small bay, open to the S.E., which affords shelter at its head only, in from 7 to 5 fathoms, muddy bottom. It is connected to Sheet Harbor by a clear, deep, and bold passage, between an island and the main-land, not having a shoal or obstruction in it. Here you may lash your vessel to the trees, and, lying in 5 fathoms, soft bottom, with the side touching the cliff, be perfectly sheltered from all winds. This place is uninhabited, the land being incapable of cultivation. In going through the passage to Sheet Harbor, you must guard against a sunken rock at its mouth, which, from the smoothness of the water, seldom shows its position. This rock lies 400 yards off Banbury Islands, and may easily be cleared by keeping the Sheet Rock open of the island.

Spry Harbor.

SPRY HARBOR has, on each side of the entrance, a high rocky, barren cape, easily distinguishable at a long distance. When sailing in, you will perceive the land in the centre of the harbor, appearing in three distinct hills; keep the valley between the two Easternmost on with the Bald Rocks, which will lead you between Mad Mad Reef and Maloney Rock. You may now steer in for the anchorage, at the Western head of the harbor, where a fleet may be land-locked, in a muddy bottom.

This harbor is open to S.E. and E.S.E. winds. The tide at the entrance of Spry Harbor sets in with the velocity of about one mile an hour.

Pope Harbor.

POPE HARBOR has a depth of water sufficient for large ships, but it is only secure within Harbor Island, where the deep water being little more than a cable in width it would be necessary to moor. In the bay outside, a heavy swell rolls in during Southerly gales.

Dangers at Entrance.

DANGERS AT ENTRANCE.—Of the formidable dangers off this harbor, the Horse Rock, with only 4 feet water on it, lies the furthest out, bearing from Pope Rock, in line with the East end of Iron-bound Island, S.S.E. $\frac{3}{4}$ E., $1\frac{1}{2}$ mile. The Pope Shoals, which are exceedingly dangerous, extend more than half-way out from Pope Rock towards the Horse Rock, and the soundings are rocky and irregular in the remaining distance. Pope Rock is above water, and distant three-quarters of a mile from Iron-bound Island, but the passage between them is rendered impassable to strangers by sunken rocks, including Drunken Dick, Soap Rock, &c.; and so also is the passage between the island and the main. All these dangers are to be left to the Westward in running in, and so also must Schooner Rock, which has only a fathom of it, and which lies a quarter of a mile out from the islets at the entrance of Shelter Cove, in which the fishing schooners lie land-locked in 2 or 3 fathoms at low-water. From Black Rock, which lies a third of a mile further in on the same or Western side, and is always above water, the shallow water does not extend beyond a cable length to the Eastward; leaving a clear channel between it and the Barrier Reef a quarter of a mile wide.

A reference to the Admiralty chart will show that the dangers on the Eastern side are few, and easily avoided: that the Western side of Phoenix Island is quite bold and the channel between it and the Pope Shoals is a third of a mile wide, and twenty fathoms deep. Also, that some part of the reef off Gerard Head, and of the Barrier Reef can always be seen, and that the shallow water does not extend from the parts more than a cable's length. Lastly, observe that the steeple of the Episcopal church, which stands more than 100 feet up on the grassy hill in rear of Bollong Point, can be seen from distances of many miles out at sea; and that the Roman Catholic chapel stands low down near the water on the Western side of the point, and had crossed upon it, but no steeple at the time of this survey.

Directions

DIRECTIONS.—In a vessel bound to Pope Harbor with a fair wind, refer to the chart and proceed as follows:—When not less than two and a half miles from the outer islands, bring the Episcopal church steeple in line with Gerard Head, bearing N. by W. $\frac{3}{4}$ W., and it will lead in between Phoenix Island and the Pope Shoals. As soon as Pope Head and Taylor Head come in one, bearing E. $\frac{1}{4}$ S., alter course to N.W. by N., which will lead midway between the reef off Gerard Head and Schooner Rock; and when the two Western points of Harbor Island come in one, bearing N. by W. $\frac{1}{2}$ W., (when they should also be in line with the Roman Catholic chapel, which is not easily distinguished,) alter course to N.N.W. $\frac{1}{4}$ W., (for the head of the harbor

to pass midway between Harbor Island and Grum Point,) until the channel through the harbor and to the Northward of Gerard Island begins to open; then keep to the N.E. by N., or for the Episcopal church, until the points of Long Island on the Northern side of the harbor come in one, bearing E. $\frac{1}{2}$ N., when run in with the marks on, and anchor midway between Bollong Point and the Northeast point of Harbor Island, in 4 $\frac{1}{2}$ fathoms, over mud. Should the wind be from the Eastward, the vessel may anchor outside on the last-named leading-marks, and in 6 $\frac{1}{2}$ fathoms, if the bottom is soft, and may either wait for a fair wind or warp into the harbor. Small craft can pass from this harbor Eastward through the narrow channel between Long Island and Gerard Islands, into a far more capacious and land-locked anchorage, but which is not accessible to large vessels only from Spry Bay, through very narrow and intricate channels on either side of a shoal, between Dutchtown Point and Gerard Island.

TIDES.—It is high-water in Pope Harbor, full and change, at 7h. 40m. p. m., rise 6 $\frac{1}{2}$ feet; at neaps 4 $\frac{1}{2}$ feet; but strong winds cause great irregularities. The tides in the streams are weak and irregular.

TANGIER HARBOR communicates with Shoal Bay by a very narrow and intricate channel, between the inner Baltee Island and the main-land; and there is also a narrow passage between Baltee and Tangier Islands, but it is full of rocks.

This harbor is too shallow and too full of rocks for large ships, but it affords a secure anchorage for small vessels near its head, especially in Mason Cove, which is on the Eastern side, and 2 $\frac{1}{2}$ miles from the entrance.

DIRECTIONS.—In approaching the harbor, Porcupine Hill should be kept well open to the Westward of Iron-bound Island, to clear the Pope Shoals; and, on the other hand, Porcupine Point should be hidden behind Sandy Cove Point, to clear the shallow water off Tangier Island. These marks, however, might not be easily recognized by a stranger, who might safely do without them by proceeding as follows:

In running for the anchorage, avoid the ledges off Iron-bound Island, by bringing Sandy Cove Point to bear N.N.W., or pass the Eastern point of Tangier Island at a distance of between 1 $\frac{1}{2}$ and 3 cables' length, or midway between it and Drunken Dick, which is almost always shown by a breaker. Having passed Sandy Cove and Porcupine Points at a distance of between 1 $\frac{1}{2}$ and 2 $\frac{1}{2}$ cables, and midway between the Shaleback and Shag ledges (which are dry at low water) and the Eastern shore, haul to the Western point of Hog Island, and anchor within it in Mason Cove, where the vessel will lie land-locked in 15 or 16 feet at low-water, and over a bottom of stiff mud. There are rocks, with only 16 and 17 feet over them at low-water, so scattered about this harbor, that no written directions would enable a stranger to avoid them; therefore, vessels of too great draught to pass over them in safety should not attempt to run in.

Around the head of the harbor, and also on the point of the main-land that separates it from Pope Harbor, there are tracts of tolerably good pasture land, from which, together with the fishing and coasting trades, the inhabitants derive a comfortable subsistence.

SHOAL BAY is sufficiently wide for large ships to beat in and out with ease, the coasting schooners anchor off Shellnut Cove in 3 or 3 $\frac{1}{2}$ fathoms, mud, with the small Mary Island in one with Borgle Bluff (the North-east extremity of Charles Island) bearing S. by E.; but the only secure anchorage for large ships is on the opposite or South-western side, near the head of the bay, where the Middle-ground, with only 12 feet water on it, and which bears from the North point of Charles Island N.W. $\frac{1}{2}$ N. 5 $\frac{1}{2}$ cables' length, and from Moose Island N.E. by E. $\frac{1}{2}$ E. 3 cables' length, is the only danger much in the way.

ANCHORAGE.—Vessels should anchor with Borgle Bluff and Outer Island together, and bearing S.E. $\frac{1}{2}$ E.; either midway between the Middle-ground and the North point of Charles Island, in 5 $\frac{1}{2}$ fathoms, over sand, when Round Islet should be in one with Tucker Point, bearing S.S.W. $\frac{1}{2}$ W., 2 cables' length; or else to the North-west of the Middle-ground, in 4 $\frac{1}{2}$ fathoms, over mud, with Hardwood Island seen through the Tickle, and bearing W.S.W.; the latter being much the preferable berth.

DIRECTIONS.—In running for this anchorage, the dangers on the Western side of the bay, namely, the ledges off Charles Point and also Borgle Shoal, which has 16 feet water on it, may be avoided by keeping the remarkable and highest red clay cliff at the head of the bay open of Borgle Bluff, bearing nothing to the Northward of N.N.W. on the Eastern side, round Outer Island, at the distance of half a mile or more, to avoid the reefs off it, and pass to the Westward of Baltee Shoal, (on which, however, there are not less than 4 fathoms,) by bringing Borgle Bluff to bear to the Northward N.W. $\frac{1}{2}$ N. as you run up the bay. Leave Net Shoal, which has 18 feet water on it to the Eastward, by keeping the Western extremity of the remarkable and highest red clay cliff, already mentioned, open to the Westward of Mary Island, bearing nothing to the Westward of N.W. by N. The same marks lead close to the S.W. of Eye Shoal, the only other danger in the way, which is awash at high-water, and there-

Vides.

Anchorage.

Directions.

fore always visible. It is bold on the S.W. side, and having passed between it and the North point of Charles Island, (where the channel is clear, and nearly half a mile wide,) avoid the Middle-ground, as you pass between it and Mary Island, by not bringing Borgle Bluff to bear to the Eastward of S.E. by S. until the South sides of Mary and Tull Islands come in one, bearing E. $\frac{1}{2}$ N., or until Hardwood Island appears through the Tickle; then keep away to the Westward, and anchor on the line of Borgle Bluff and Outer Island touching, and bearing S.E. $\frac{1}{2}$ E., with the whole of Hardwood Island seen through the Tickle, bearing W.S.W., and in $4\frac{1}{2}$ fathoms, over mud, as already pointed out. This anchorage is perfectly safe, although some swells may roll in during or after heavy South east gales. The head of the bay is well settled, the hills of red clay affording a productive soil, but the islands are almost everywhere barren. Supplies of fresh provisions, wood, and water may be obtained.

Ship Harbor.

SHIP HARBOR is absurdly called Charles River in the old charts and directions, whilst the channel which leads to it between the islands is termed the harbor, although it is completely open to a Southerly wind and swell, and affords no secure anchorage for ships, excepting in Day Cove, which is within Passage Island, and in the mouth of the shallow passage leading Westward into Owl's Head Bay; and even there a vessel must lie in less than 4 fathoms, to be entirely out of the swell that rolls in after heavy Southerly gales. On the Eastern side, Deep Cove in Charles Island, and the narrow passages leading to Shoal Bay, are full of rocks, and therefore too dangerous for general use. Nichol and Charles Islands are among the largest on this coast; they are barren, of gneiss, and nowhere more than 100 feet above the sea.

Danger at Entrance.

DANGER AT ENTRANCE.—The entrance of Ship Harbor, although very narrow, is not difficult with a fair wind, and within it any number of the largest ships may be moored in perfect security; nevertheless, the interior of the harbor is far from being free from shoals, as misrepresented in the old charts. In approaching the harbor, the principal dangers lie outside the islands off its entrance. Friar Island and Friar Ledges lie on the Western side, and off them Flat Ledge, always above water, and from which the West Bull Rock, with only a fathom water on it, bears W. by S. $\frac{1}{2}$ S., a quarter of a mile, and the East Bull Rock, with 4 fathoms on it, East $\frac{1}{2}$ cables' length. Bald Rock and Egg Island in one, bearing W. $\frac{1}{2}$ S., lead a third of a mile to the Southward of these dangers. There is also the Middle-ground with 21 feet on it, bearing from Flat Ledge E.N.E. 6 cables' length, and the more dangerous N.E. shoal, with only 15 feet water on it, bearing from the Eastern end of Friar Ledge N.E. by E., 43 cables' length, and from Bear Rock W. by S. three-quarters of a mile. These dangers lie to the Southward of Nichol Island, and vessels in approaching the harbor should pass to the Southward and Eastward of them all. Further in, the rocks and shallow water off the Eastern side of Nichol Island, including Pol Rock, with 4 fathoms on it, will be avoided, if Wolf Point (the high North-eastern extremity of Nichol Island) be not brought to bear to the Northward of N.N.W.

Bear Rock.

BEAR ROCK, which is small, and rises 4 feet above high-water, is quite bold on the Eastern side, but a reef, in great part dry at low-water, extends from it $1\frac{1}{2}$ cables' length to the Westward. It lies nearly in the middle of the entrance between the islands, with a clear channel on either side, about $4\frac{1}{2}$ cables broad.

On the Eastern side of the entrance the principal dangers are the ledges off Charles Island, the outermost being the Bull Rock, with only 4 feet on it at low-water, and which is often shown by a breaker. It bears from Charles Point (the South extremity of Charles Island) S.E. $\frac{1}{2}$ S., 6 cables' length, and, together with the numerous other rocks above and under water, will be cleared to the Southward if Long Point (the Southern extremity of Nichol Island) be kept open to the Southward of Bear Rock, bearing not less than half a point to the Northward of West. The mark that leads clear to the Westward of these dangers, including the ledges further in off Western Islands, is Passage Island, just hidden behind Wolf Point, bearing N.W. $\frac{1}{2}$ W., and Ship Rock seen over Bald Island, and in one with Tucker Point bearing N. by W. $\frac{1}{2}$ W. There are also several outlying dangers, which are equally in the way of vessels running along the coast, or approaching this harbor. These are, Little Rock, bearing from Flat Ledge S.S.E. about 2 miles; Broad Shoal, from Charles Point S. by E. Easterly $1\frac{1}{2}$ mile; Silver Shoal, from Charles Point S.E. $\frac{1}{2}$ S. $3\frac{1}{2}$ miles, and from the South-east point of Outer Island nearly South $2\frac{1}{2}$ miles. The least water on the first is 4 fathoms, and on the last 5 fathoms. The sea breaks occasionally over them after heavy gales.

Directions from Westward.

DIRECTIONS FROM THE WESTWARD.—In approaching Ship Harbor, Ship Rock (which gives its name to the harbor) may be recognized, being a remarkable cliff of clay slate, 70 feet high, on one of the islands on the Eastern side of the passage, and a mile within Charles Island. It appears, when seen from a distance over the sea, like a vessel under sail; and, together with the Western extremities of Bald Island and Tucker Point, forms the leading-marks for running in on either side of Bear Rock.

When running the East and West or pass outside of a mile or more: Island, bearing N. and the reef off between Wolf Point not extend beyond Passage Island. Point is in one with shingle islet off bearing N.N.W. $\frac{1}{2}$ W. Rock (which lies O'Brien Reef, which narrow channel. (where the channel fathoms deep.) but Point and the Wolf Salmon Point and the shelter completely mile within Bear feet high, near its

FROM THE EAST a fair wind, Bull keeping Long Point ward of W. $\frac{1}{2}$ N. N.W. $\frac{1}{2}$ W.; then Western Islands; the harbor's mouth. If the wind should midway between in to the Westward vessel. In the first Eastern point of proposed to the swell there is little or no With a beating stranger, for the harbor to stand with Western Islands.

An inspection of Salmon Point becomes exceeding Island, 2 miles with Ledge and the Wolf through into the amounts to 9 fathoms

TIDES.—It is the ordinary rise is irregularities both only 4 feet.

The ordinary rates, the melting driven the water in

OWLS HEAD a round mound Western shore, 14 of Bald Island, and place, on account of nowhere less than side, according to fathoms at low-water locked in 6 or 7 fathoms erroneous.

The greatest danger towards the Eastern South point of Friar Wisdom Point (at the

When running in with the wind from the Westward, proceed as follows:—To clear the East and West Bulls, run to the Eastward with Bald Rock and Egg Island in one; or pass outside of Flat Ledge, which can always be seen, at the distance of a third of a mile or more; and when Ship Rock comes in one with the Western point of Bald Island, bearing N. $\frac{3}{4}$ W., steer for them, and they will lead in between the N.E. shoal and the reef off Bear Rock. Having passed the latter, steer so as to pass midway between Wolf Point and Bald Island (from either of which the shallow water does not extend beyond 60 fathoms), and thence for the harbor's mouth. When abreast of Passage Island, haul to the Westward towards Day Cove, until the house on Eisan Point is in one with the North-east point of Caroline Island, and seen over the small shingle islet off Salmon Point, and nearly touching the clay cliff of the latter, bearing N.N.W. $\frac{1}{2}$ W. Keep these marks exactly on, and they will lead in past Black Rock (which lies outside Black Point on the Eastern side of the entrance) and O'Brien Reef, which lies half a mile further in, and also on the Eastern side of the narrow channel. Having passed between O'Brien Reef and Beach Point of shingle, (where the channel is only 70 fathoms wide, between the 3 fathoms line, and 11 fathoms deep,) haul in more to the Westward, and anchor midway between Salmon Point and the Western shore, where the depth is 7 fathoms, or anywhere between Salmon Point and Whale Island in 4, 5 or 6 fathoms; the bottom being of mud, and the shelter complete. Caroline Island lies over on the Western side of the harbor, a mile within Beach Point, and will be easily recognized by a round wooded hill, 190 feet high, near its North-east point.

FROM THE EASTWARD.—Approaching the harbor from the Eastward with a fair wind, Bull Rock, and the other ledges off Charles Island, will be avoided by keeping Long Point open to the Southward of Bear Rock, and bearing to the Northward of W. $\frac{3}{4}$ N., until Passage Island disappears behind Wolf Point, bearing N.W. $\frac{3}{4}$ W.; then steer for Wolf Point, keeping Passage Island shut in until past the Western Islands; then, midway between Wolf Point and Bald Island, and thence for the harbor's mouth, as already directed.

If the wind should be unfavorable for running in, anchor outside in Day Cove, either midway between Passage Island and Day Point in 4 fathoms, over mud; or further in to the Westward, in any depth from 4 to 2 fathoms, according to the size of the vessel. In the first-named berth the Western Islands are just shut in behind the Eastern point of Passage Island, bearing S.E. by E., and the vessel will only be exposed to the swell rolling round the latter after a South-easterly gale; further in there is little or no swell.

With a beating wind the passage to the Eastward of Bear Rock is preferable for a stranger, for the rock is bold close to on the side, and the leading-marks will enable her to stand with confidence over towards the ledges off Charles Island, including the Western Islands.

An inspection of the chart will show that shoals commence immediately within Salmon Point on one side, and Whale Island on the other; and that the channel becomes exceedingly intricate after passing Caroline Island and the opposite Muselle Island, 2 miles within the entrance. If the very narrow channel between Garret Ledge and the White Rocks were buoyed, 21 feet at low-water could be carried through into the clear part of the harbor within Eisan Point, where the depth amounts to 9 fathoms, with space sufficient for a large fleet to lie in perfect safety.

TIDES.—It is high-water, at full and change, at 7h. 59m. after the moon's transit; *Tides.* the ordinary rise in springs is 6½ feet, and in neaps 4½ feet; but winds cause great irregularities both in the times and rise; extraordinary springs rising 7 feet, and neaps only 4 feet.

The ordinary rate of the tidal-streams does not exceed half a knot; but after heavy rains, the melting of the winter's snow, or strong South-easterly gales, that have driven the water into the harbor, the ebbing stream is said to be much stronger.

OWL'S HEAD BAY.—Owl's Head, which gives its name to the bay, has a remarkable round mound and cliff at its extremity, and is the most prominent point on the Western shore, 1½ mile within the entrance. The bay lies 1½ mile to the Eastward of Bald Island, and is much frequented by coasting vessels, as an occasional stopping-place, on account of the facility with which they can beat in or out, the channel being nowhere less than half a mile wide. They anchor near the head of the bay, on either side, according to the wind; but to be well sheltered, they must lie in less than 3 fathoms at low-water. The statement in former directions, that "shipping lie land-locked in 6 or 7 fathoms," or in 5 fathoms, according to the old charts, being entirely erroneous.

The greatest danger to be avoided in entering this bay is Owl Rock, which lies over towards the Eastern side, with only 9 feet water on it, and which bears from the South point of Friar Island N.W. $\frac{1}{2}$ W. three-quarters of a mile. The peninsula of Wisdom Point (at the head of the bay) and Cable Point touching and bearing N.N.W.,

From the Eastward.

Owl's Head Bay.

lead clear to the Westward of it, and also of the reef which runs out 3½ cables length to the South-west from Friar Island, and which can almost always be seen. On the Western side, the only dangers in the way are a rock, with only 10 feet water on it, 1½ cable's length North from Black Ledge; and the reef running out 1½ cable's length from Cuckold Head. Further in the points are comparatively bold, and the bay free from hidden dangers. There are a few settlers at the head of the bay.

The False Passage.

THE FALSE PASSAGE between Nichol and Cable Islands, on the Eastern side of the bay, is only fit for boats or very small craft, 4 feet being all that can be carried through at low-water.

Egg Island.

EGG ISLAND bears from the South point of Long Island S.E. by E. 1½ mile, and is the outermost of the islands off this part of the coast. It is of rock, 1½ cable in length and 40 feet in height, and has been strongly recommended by Commander Shortland as the most eligible site for a light-house on this part of the coast.

Light-house. Pyche and Grizzle Rocks.

PYCHE AND GRIZZLE ROCKS.—Outside of Egg Island, at the distance of a quarter of a mile to the Southward, are the Transport Ledges, always above water; and the far more dangerous Pyche Rock, with only 18 feet water on it, and which bears from Egg Island, in line with Jedore Rock, E.S.E. ¼ E. three-quarters of a mile. Also the Grizzle Rock, with 4 fathoms on it, and which bears from Egg Island, in line with the North-east point of Long Island, N.W. ¾ N., a little more than half a mile. The passage is clear between Egg Island and Flint Ledge, with the exception of Passage Rock, which has nearly 5 fathoms on it.

Between Flint Ledge (which is 10 feet above water) and Long Island, are the Tomfool Shoals, with 3 fathoms water on them, and within them Stoddart and Goose Ledges, lying off the entrances of Clamb and Little Harbors, which admit only small craft and boats; and for which, together with all in Clamb Bay, we again refer the seaman to the chart, in order to avoid extending these remarks to a useless or inconvenient length.

The Jedore Ledges.

THE JEDORE LEDGES lie further off shore, and will require a more particular notice, including Maedonald and Hopkin Rocks, now for the first time laid down in any chart. The Maedonald, which has 14 feet water on it, bears from the South point of Long Island East, 1½ mile; and from it the East head of Jedore is seen over Spritsail Rock and the West point of Barren Island, bearing N.W. ½ N. Hopkin Rock has 11 feet on it, and from it the Old Man, with the breakers on Arnold Rock just open to the Southward of it, bears West 1½ mile; Mehanny Rocks, W.N.W. one mile; the East end of Spritsail Rock, North, one mile; and the South Sister Rocks, N.N.E., a long half mile. Both these rocks are very small, with deep water all around them, and break only in heavy weather.

South-West Ledges.

THE SOUTH-WEST LEDGES, so named in reference to Long Island, are three rocky patches which dry at low-water, and cover a space of 3 cable's length in S.W. ½ W. direction. From the North-easternmost ledge, the South point of Long Island bears N.N.E. ½ E., 1½ mile, and the passage is clear between them. The South-westernmost ledge is covered only during spring tides, and can, therefore, always be seen.

Bull Rock.

THE BULL ROCK bears from the last-named ledge S.E. ¼ S., 6½ cable's length distant, and is one of the most dangerous of the ledges, having only a depth of 5 feet over it at low-water, and at high-water it is only shown by a breaker when there is a considerable sea running. From it the South end of Long Island bears N. by E. ¼ E. 1½ mile, and Egg Island E.N.E. 2 miles.

Bull Shoal.

THE BULL SHOAL has 3 fathoms water on it, and bears from the Bull Rock W.S.W. ½ W., 4½ cable's length distant, and from the South-westernmost of the South-west ledges, South, 5½ cable's length. From it the Old Man, Jedore Rock and Jedore Head are nearly in one, and bear N.W. ½ W. It is rarely shown by a breaker, and therefore is extremely dangerous.

Brig Rock.

THE BRIG ROCK has only 3 feet on it at low-water, when it is usually shown by a breaker, and in low spring-tides, accompanied by a heavy sea, its top becomes visible between the swells. Egg Island bears from it E.N.E. ¾ E. 3½ miles; Jedore Rock N.W. ¼ N. 3½ miles; the Old Man (on with the centre of Jedore Cliff) N.W. by N. Northerly about 3 miles; and the Westernmost of the South-west Ledges, which always shows, N.E. by ¾ E. 1½ mile.

Brig Shoal.

THE BRIG SHOAL, which has 5 fathoms on it, bears from the Brig Rock S. by S. 4 cable's length, and from it the Bull Shoal and Rock are in line with the South side of Egg Island, bearing E.N.E. ¼ E. This shoal is dangerous after very heavy gales, when it is said to break at irregular intervals. The Brig Rock is most dangerous in fine weather, and at high-water, when it is not shown by a breaker. The Eastern extremity of Jedore Cliff in one with the Old Man, bearing about N.N.W. ¼ W. leads 4 cable's length to the Westward of these dangers, and between them and the East Pollock.

THE POLLOCK gales, but on which know of any lesser dore Rock, in one the Old Man in one E. by N. 5½ mile.

The channel, be water, continues el off English Point,

THE POLLOCKS are rocky fishing-grounds, on which the sea breaks after heavy gales, but on which we could find no less than 5½ fathoms; neither did the fishermen know of any less. The least water, 33 feet, is on the Inner Pollock, from which Jedore Rock, in one with the Eastern extremity of Jedore Cliff, bears N. by W. 3 miles; the Old Man in one with the West head of Jedore, North 2½ miles; and Egg Island, E. by N. 5½ miles.

The Outer Pollock has 6 fathoms on it, and lies nearly a mile further off on the same line of bearing from Jedore Rock, and with Egg Island bearing E.N.E. ¼ E. 5½ miles.

The Middle Pollock, in 7 fathoms, lies nearly midway between the Inner and Outer Pollocks; and the Eastern Pollock, a very small patch of 7 fathoms, with deep water all around it, bears from the Inner Pollock 1 ¼ N. half a mile. Jedore Cliff open to the Westward of Jedore Rock, leads to the Westward of them all.

DIRECTIONS.—Vessels running along the coast should pass outside of all the Jedore ledges, and in not less than 40 fathoms water at night or in foggy weather; for the soundings are deep and very irregular near them all. There are 30 fathoms less than half a mile to the Southward of the Brig Shoal and Outer Pollock.

FISHING GROUNDS.—Of the dangers just described, the Hopkin and Maedon-old Rocks, Tomfool Shoal, Pyelic and Grizzle Rocks, and the Bull and Brig Shoals near the rocks of the same name, are discoveries resulting from this survey. So also are the following rocky fishing-grounds, on which the sudden shoaling of the water causes at times a very heavy sea, but which are not otherwise dangerous. Of those, the Yankee Bank bears from Shut-in Island S.S.E. ¾ E., 6½ miles; and the Darby Bank, S.E. ¼ S., 6½ miles, the least water on them being 14 fathoms. The other two lie off Egg Island, from which the Duck Bank, in 7 fathoms, bears S. by W. ¼ W., 1½ mile; and the John Bank, in 12 fathoms, S. ½ E. 2½ miles.

“THE POLLOCK RIP” of the old charts, and also the “foul ground” said to be doubtful off Shut-in Island, were searched for in vain, and doubtless do not exist, since they are unknown to the native fishermen. The rock grazed by H.M.S. Resistance was doubtless the Brig Rock; and the 8 fathoms, according to H.M.S. Carnation, one of the Pollocks. These should all be removed from the charts.

BALD ROCK is small, and only 8 feet high, and bears from Egg Island W. ½ N., 2½ miles. It is bold on the North and South sides, but reefs extend from either end of it to the distance of 1½ cable's length; and there is a sunken rock, with only 6 feet water on it, bearing from it W. by S. a quarter of a mile. The passage is clear, and a third of a mile wide between Bald Rock and the shoal water off Bald Island, within which, and the other islands next Eastward, there is a passage for small craft rendered dangerous by sunken rocks.

THE BARSE ROCK AND HURLEY SHOAL are small rocky patches with 4 fathoms water on them, and with deep water all around them. They bear from Bald Rock, nearly S. by W., 2½ miles, and S. by E. 2¼ miles respectively, and lie directly in the way of vessels running along the coast, and are dangerous to large ships. The sea breaks over them in heavy gales.

JEDORE HEAD is a remarkable headland, 207 feet high, having at its S.W. extremity a small peninsula united to the main-land by shingle beaches inclosing a small pond, and from which a reef runs out half a mile to the S.W. On its Western side, the cliffs of red clay are 70 feet high, whilst on its South-eastern side Jedore Cliff may be seen, also of red clay, and 135 feet in height.

JEDORE HARBOR, the first harbor for ships to the Eastward of Halifax, has been inexpressibly misrepresented in the old charts. Its entrance, which is distant 2½ miles to the E.N.E. from Jedore Head, is 430 fathoms wide from the West head across to the opposite shore; but Thorn Shoal, with only 9 feet water on it, stretches out from the Western shore, just outside and across the entrance, so as to be greatly in the way of vessels entering. The channel between this shoal and the East head is 320 fathoms wide from the 3-fathoms line, and carries a depth of 26 feet at low-water over what is, properly speaking, the bar. On the Eastern side, and immediately within the entrance, Bar Point, composed of shingle, and inclosing a pond, will be seen; and from it Bar Shoal, a continuation of the shingle of Bar Islet, extends more than half-way across to the Western shore, diminishing the breadth of the channel to a cable's length, but forming no bar, the depth there being 6½ fathoms. The sandy beach of Marsh Point will be seen running out from the Western shore at 1½ mile within the entrance. The anchorage is secure within this beach in 7 fathoms, over mud, and in a channel 150 fathoms broad; but outside of it the bottom is of sand, and a considerable swell rolls in with strong winds from the Southward; nevertheless, the coasting schooners anchor there in fine summer weather.

The channel, between flats of mud, weeds, and muscle-beds, which dry at low-water, continues clear and deep enough for the largest ships up to the Bown Islands, off English Point, which separates the Eastern and Western arms of the harbor, at

Jedore Harbor.

the distance of 4 miles from the entrance. Vessels may pass close round to the Eastward and Northward of these small islands, to the secure anchorage within or to the North-west of them; but the entrances to the arms, instead of being clear and deep, as misrepresented in the old charts, are nearly closed by shoals, which leave only very narrow and intricate channels, through which not more than 14 or 15 feet can be carried at low-water. But for all within these arms, we must refer the seaman to the Admiralty chart resulting from this survey, since no written description would avail; only remarking, that they are navigable for any vessel that can enter them, nearly to their heads, including Salmon Inlet to the Rapids at the entrance of Salmon River, which is 2 miles above the long wooden bridge that crosses the entrance of the inlet, 1½ mile up the Eastern arm.

Light-house

To render Jedore harbor, with its narrow and crooked channel, easy of access, a buoy would be required on Thorn and Bar shoals; meanwhile, the following remarks and description of the dangers, together with the directions that follow, will enable the intelligent seaman to use it as a harbor of refuge in case of necessity.

Jedore Rock.

JEDORE ROCK.—Approaching the harbor, refer to the chart, and observe that Jedore Rock, of clay-slate, and 50 feet in height, is the Westernmost of the islands off its mouth. It bears from Jedore Head S. E. ½ E., 1½ mile, and the passage is clear between them, excepting some patches of 5 and 6 fathoms, on which the sea very rarely breaks. Arnold Rock is the only danger to the Westward of Jedore Rock, from which it bears S. S. W., half a mile distant, and dries at low-water, and can almost always be seen; but to insure passing to the Westward of it, and also of Arnold Shoal, which lies three-quarters of a mile further to the Southward, and has 6 fathoms on it, the harbor's mouth must be kept open to the Westward of Jedore Rock, from the West end of which a reef runs out 1½ cable's length. To pass to the Southward of Arnold Rock, Long Island must be kept open to the Southward of the Old Man, bearing E. by N.

The Old Man.

THE OLD MAN is a small rock 12 feet high, and bears from Jedore Rock in line with Jedore Head, S. E. ½ E., two-thirds of a mile. It is bold on the Eastern side, but a small sunken rock, with only 4 feet water on it, lies a cable's length from it to the S. W. by S. Jedore Head, open to the Westward of Jedore Rock, leads clear to the Westward of it; and the passage is clear between it and Arnold and Jedore Rocks. There is also a clear passage between the Old Man and the Mehanny Rocks, some of which are dry at low-water, and can almost always be seen. They bear from the Old Man N. E., three-quarters of a mile; and beyond them, in the same direction, Gull Rock, together with Barren and Roger Islands, will be seen; the latter lying half a mile off shore, and three-quarters of a mile to the Eastward of the harbor's mouth.

Directions.

DIRECTIONS.—To run for the anchorage in Jedore harbor from the Westward, proceed as follows:—Pass mid-way, or nearly so, between Jedore Head and Jedore Rock, steering E. N. E., so as to keep outside of Thorn Shoal until the steep bank (not the sand-beach) of Marsh Point touches the shingle beach of Bar Point, bearing N. by E. ½ E. Run in with these marks touching, until Roger Island touches East Head, bearing S. E. by E.; then alter course to N. by W. (to clear the Bar Shoal), and when between 1 or 1½ cable's length from the shingle beach on the Western shore of the harbor, keep away to the Northward and Eastward, so as to run along the shore at any distance between a cable and half a cable's length, until up to the sand-beach of Marsh Point, which must be rounded to the Northward at the same distance, and anchor between it and Pea Point on the opposite shore, in about 7 fathoms, over a muddy bottom. At or near low-water, when a part of the Bar Shoal is shown by breakers, and the steep mud-flats are visible on either side of the channel, is the most favorable time for entering this harbor.

In approaching the harbor from the Southward, the harbor's mouth should be seen between the Old Man and Jedore Rock, or the whole of Jedore Cliff should be open to the Westward of Jedore Rock, to pass to the Westward of the Pollocks, on which, however, no less than 5½ fathoms could be found. Leaving Arnold and Jedore Rocks to the Westward, pass midway between them and the Old Man, taking care to avoid the sunken rock off the latter; or, if it be preferred, pass to the Eastward of the Old Man, which is quite bold on that side, and when approaching the harbor's mouth bring the marks on for running in, namely, the steep bank (not the sand-beach) of Marsh Point and the shingle beach of Bar Point touching, and proceed as before directed.

In approaching from the Eastward, the coasting vessels pass within Erg Island and between the South-west ledges and Long Island, steering for Jedore Rock, or leaving outside of them the outermost of the ledges; but this should never be attempted by any who are not well acquainted with the place, for Macdonald and Hopkin rocks lie nearly in the way, and are the more dangerous because they are seldom shown by breakers. Besides, with a wind from the Southward or Eastward, a tide

for often comes in very suddenly, and it would be perilous in the extreme for a stranger to be surprised by it among the ledges.

TIDES.—It is high-water, full and change, at Arnold Cove, $2\frac{1}{2}$ miles within the entrance of Jedore Harbor, at 7h. 45m. after the moon's transit, and the rise in ordinary spring and neap tides is 6 $\frac{1}{2}$ and 4 $\frac{1}{2}$ feet respectively. The streams change almost immediately after high and low water, and do not exceed the rate of 2 knots. In the entrance of the harbor the times will be a few minutes earlier, the rise 2 feet less, and the ordinary rate of the streams one knot. The in-draught of the flood-tide is felt several miles off this harbor, and the inlets to the Westward of it.

CLAMB BAY.—Immediately to the Eastward of Jedore Harbor are Roger and Barren Islands (already noticed), which vessels may pass within or between in case of necessity, and which may afford shelter to fishing vessels in fine summer-weather, but no safe anchorage for ships. Outside of these islands are Gull and Mehanny Rocks, and to the Eastward of them Middle or Sunk Rock, Spritsail, Sister, North Sister, and Siteman Rocks; Duck Island, with its ledges, rocks, and shoals; the Sugar-loaf and Goose Island, with its ledges. These all lie across Clamb Bay, which affords no safe anchorage; and as they are out of the way of shipping, we shall merely refer the seaman to the chart for them, naming only Loug Island, which being three-quarters of a mile in length, and bearing from the East head of Jedore harbor S.E. by E. 4 miles, may be easily distinguished.

HARBOR ISLET lies three-quarters of a mile off the entrance of Musquidoboit Inlet, and bears from Jedore Head N.W. $\frac{3}{4}$ W., about 1 $\frac{1}{2}$ mile. It is small and stony, and from it a rocky shoal, on which are the Musquidoboit ledges, extends upwards of a mile to the Southward, and to within half a mile of the Musquidoboit shoal. A depth of 2 $\frac{1}{2}$ fathoms may be carried past Harbor Islet on either side, but it is all covered with breakers in a strong Southerly wind, and is altogether an exceedingly dangerous place. At low-water, when the Duke Rocks and the Bull Reef on either side of the entrance, and the mud flats on either side of the channel, become visible, is the most favorable time for a stranger to attempt to enter this, and also the other inlets.

The shores of these inlets are well settled, especially near their heads, where the road from Dartmouth passes and continues to Ship Harbor, and is soon to be extended further Eastward.

TIDES.—At the entrances of these inlets it is high-water, at full and change, 7 $\frac{1}{2}$ hours after the moon's transit. The rise in ordinary spring-tides is 4 $\frac{1}{2}$ feet, and in neaps 3 feet. The ordinary rate of the tidal-streams in the entrances is from 2 to 3 knots; but heavy rains, or the melting of the winter's snow, have been known to increase the rate of the ebb-stream in the entrance of the Musquidoboit Inlet to fully 4 knots.

MUSQUIDOBOIT INLET is much larger than that of Perpissawick, and contains many islands, and is navigable for small craft and boats 7 miles inland, to where it receives the waters of the Musquidoboit River. Over the bar, at the entrance of the principal channel, which is on the Eastern side of the inlet, and 1 $\frac{3}{4}$ mile N.N.W. from Jedore Head, a depth of 10 feet can be carried at low-water; but Dunbrock Rock, with only 3 feet water on it, lies directly in the way, and renders the entrance both difficult and dangerous. Within the bar there is a depth of 4 fathoms in a channel 120 fathoms wide, and between flats of sand, mud, and weeds, which uncover at low-water. At about 4 miles within the bar, the channel becomes very narrow, and only 7 or 8 feet deep; but small craft and boats can ascend with the tide to the head of the inlet.

PERPISAWICK INLET is the next to the Eastward, and is also half a mile wide at the entrance, which lies on the West side of Perpissawick Head. After crossing the bar of sand, about a mile within the entrance, and on which there are only 6 feet at low-water, a narrow channel, between mud-flats uncovered at low-water, commences, and is navigable for any vessel that can cross the bar to the head of the inlet, a direct distance of 5 miles. Within a mile from the head of the inlet, the mud-flats retire on either side, leaving an open space, in which there are 9 fathoms water. There are reefs off the entrance-points of these inlets, and a small rock, with only 6 feet water on it, lying a quarter of a mile off the Western side of Perpissawick Head. On these the sea breaks heavily, as it does also on the bars, which are very dangerous to boats.

CHISSETCOOK INLET is half a mile wide at its entrance between Cape Entry and Story Head, the latter bearing from Shut-in Island N.E. by E., 3 $\frac{1}{2}$ miles; but it is of no use to shipping, having only 3 feet at low-water on the bar of the Western and principal channel.

*Tides.**Clamb Bay**Harbor Islet.**Tides.**Musquidoboit Inlet.**Perpissawick Inlet.**Chissetcook Inlet.*

Jedore Head. **JEDORE HEAD.**—From Shut-in Island, Jedore Head bears about due East, nearly 10½ miles; a distance in which the features of the coast are exceedingly remarkable, every headland being a peninsula, presenting a cliff of red clay to the wasting action of the waves. These peninsulas are joined to the main-land by benches of rolled stones and shingle; they are more or less wooded, and nowhere exceed the height of 140 feet above the sea.

Before noticing the inlets, we will describe the dangers off this part of the coast, which are not to be found in the charts in general use previous to our survey. **PAT SHOAL**, is a small rocky patch, with only 4½ fathoms water on it, bearing from Shut-in Island E. ½ N. nearly 3 miles, and from Story Head S. by W. 13 miles. There are 12 fathoms water a quarter of a mile to the Southward of it.

Perpissawick Shoal. **PERPISAWICK SHOAL**, is a similar patch of rock, with 4½ fathoms water on it, bearing from Shut-in Island E. ½ S. 5½ miles; and from Perpissawick Head S. ½ W. 2½ miles. There are irregular soundings of 6½ and 7 fathoms for a short distance around it, and 16 fathoms outside, or to the Southward of it, within the distance of half a mile.

Musquidoboit Shoal. **MUSQUIDOBOIT SHOAL**, is of rock, and 600 fathoms in length, from N.E. to S.W. The least water on it, 3 fathoms, is nearly in its centre, and bears from Jedore Head W. by S., distant 2 miles. These shoals, which all lie outside of a line drawn from Shut-in Island to Jedore Head, are exceedingly dangerous to large ships. The last-named is frequently shown by breakers; the two first only occasionally, after heavy gales, when they break at irregular intervals, and become dangerous to small craft and boats.

Copray and Round Shoals. **COPRAY AND ROUND SHOALS** lie nearer inshore, and are, therefore, less in the way of vessels. The least water on them is 4½ fathoms. The former bears from Perpissawick Head, the reefs of which extend nearly out to it, S.W. by S., nearly a mile; and the latter from Flying Point, on the Western side of the entrance of Musquidoboit Inlet, S.W. ½ W., about the same distance.

FROM MARS HEAD, OR CAPE PROSPECT, TO SHUT-IN ISLAND, INCLUDING HALIFAX HARBOR.

Mars Head, Cape Prospect. **MARS HEAD, or CAPE PROSPECT**, a rocky peninsular cape, rising 70 feet above the level of the sea, forms the Western limit of Pennant Bay, the entrance to which is 3 miles wide in an E.S.E. and W.N.W. direction, and about 2 miles deep.

The bay is much encumbered with rocky shoals and islands, but it affords shelter to those acquainted with the passages between them. The land at the head of the bay is of moderate height, Hospital Hill, the highest point, rising 250 feet above the sea.*

Turner Bay. **TURNER BAY**, at about 2 miles from Mars Head, the North-western angle of Pennant Bay, is open to the South-south-east, but the anchorage is good in 8 or 9 fathoms, mid. off the fishing coves, within Church Point, on the Southern shore.

Western Passage. **WESTERN PASSAGE.**—To enter by the Western passage, bring Turner Bay Rock (formerly White Rock) to bear N.E. ½ E., and steer for it, passing midway between Broad Rock, which covers at high-water, and the Puffer Shoal, on which the sea is said always to break. Pass Westward of Turner Bay Rock, between it and Black Shoal, keeping nearer to the former, which is quite bold on that side, taking care not to haul to the Westward into the bay until past the 13-foot shoal, which lies a quarter of a mile N.N.E. ½ E. from Black Shoal, and 2 cables' length off Pennant Point, formerly called Macivoith Point. On the old charts, this passage is recommended, but its principal dangers, the Flat-roof and Puffer Shoals, are omitted.

Eastern Passage. **EASTERN PASSAGE.**—This passage is preferable in some winds. Stand in far the Western end of Mackerel Island on any bearing not to the Eastward of N.E. by N., until Church Point is in line with the North-east side of Turner Bay Rock, bearing N.N.W. ½ W., then alter course, and steer with those marks in one, until you approach the rock; when sheer gradually to the Northward, so as to pass one cable's length to the N.E. of it, and then to the N.W., to the anchorage off the fishing-cove, as before.

Pennant Harbor. **PENNANT HARBOR**, at the North-eastern angle of the bay, has secure anchorage above the islands, as stated on the former chart, in which the dangerous Middle Ground, with 13 feet least water, is omitted, being directly in the way of vessels taking what is called the good channel, between Pennant Point and Pennant Island. Two other shoals at the head of the harbor, are also omitted.

DIRECTIONS.—To enter, pass Eastward of Bull Rock, at the distance of one cable, steering N. E. for the Thrumcap until the Seven Islands open out to the Northward of Penmant Island, when the Middle Ground will be passed, and you may haul round to the Eastward and Northward of the Thrumcap at the distance of one cable, so as to pass between it and the rocky 18-foot shoal that lies a quarter of a mile N. E. by E. from it. Having passed to the Westward of this shoal, anchor within Martin and Saddle Islands, as convenient, from one to two and a half cables from them, in 6 or 7 fathoms, mud bottom. In rounding Penmant Point, beware of the reefs which extend 2 cables off it to the Southward and Eastward.

SAMBRO HARBOR lies at the head of the bay formed between Penmant Point on the West, and Cape Sambro on the East. It has anchorage within the Isle of Man, the Thrumcap of the fishermen; the name Isle of Man, however, is preferable, although not used by the natives, to avoid the confusion of so many Thrumcaps. The heavy sea in South-west winds is in great measure broken by the ledges outside, but the shelter is imperfect, and the dangers off and in this harbor are so numerous, that it should never be attempted by a large ship, excepting in a case of extreme necessity.

DIRECTIONS—From the Westward.—Enter between the Bull Rock and Penmant Point, steering N. E. by E. for the Isle of Man; and, having passed Bull Rock, at the distance of 1½ or 2 cables, to avoid the shoal water off it to the Northward, keep to the East side of the Isle of Man and Round Island in line, if the latter can be made out; if not, pass one or two cables to the Eastward of Island Rock, still steering N. E. by E. for the Isle of Man, until beyond Torpy Ledge; then, to avoid the Middle Ground, steer more Easterly, so as to pass not more than a cable to the Northward of the West end of Inner Sambro Island, which is quite bold. As soon as Fairweather Rock and the Western edge of Inner Sambro Island are nearly in line S. W. by S., alter the course to N. E. by N., running from them, and they will lead clear to the Eastward of Cowley Rock; having passed this, haul to the Northward and Westward round the Isle of Man, and anchor within it and Black Reef, from a half to two cables from them, in 6 or 7 fathoms, over mud bottom.

Further in there are several secure anchoring-places for small vessels, as the Mud Hole, the Basin, &c.; but the rocks are too numerous for a large ship to venture among them with safety.

FROM THE SOUTHWARD.—Having Chedabucto Head open to the Eastward of Sambro Island, to insure being outside of the S. W. breaker, which, however, can generally be seen, bring Cook Point (on the West side of Sambro Harbor) in line with the Western point of Inner Sambro Island, bearing N. 4 W., and steer for them, and they will lead clear to the Eastward of the S. W. breaker; having passed it, continue the N. 4 W. course, keeping the marks touching until nearly abreast of Fairweather Rock; then alter the course so as to pass midway between that rock and the Western end of Inner Sambro Island, and round the latter to the N. E., until the marks come on for clearing Cowley Rock, namely, Fairweather Rock and Inner Sambro Island touching, and bearing S. W. by S.; when steer from them N. E. by N., as before directed.

FROM THE EASTWARD.—In passing either between or within the Sambro Ledges, and within or without Inner Sambro Island, the aid of the new chart, or of a native fisherman acquainted with all the dangers, would be indispensable; for Cowley Rock, having 10 feet water, seldom breaks, and being in mid-channel, directly in the way of vessels running into Sambro Harbor, it is among the most dangerous of the obstructions in the former chart; whilst the Thrumcap Rock, which, having 24 feet least water, breaks only in heavy weather; the Paddle Rock, with 8 feet, and shoals around it, and Bigfish Shoal, with 12 feet, are also omitted.

But still more dangerously erroneous are the tracks, drawn on the chart (Nova Scotia, Sheet VII.) at present in use, for running, in case of emergency, between the Sambro Ledges and the main-land. They are said to be adapted for a line-of-battle ship, but to follow them would probably be fatal, for the inner of the two tracks passes directly over the Paddle Rock and Bigfish Shoal, and also over rocky patches of 18 and 21 feet between Whaleback Rock and Fairweather Rock; whilst the outer track, besides leading over several rocky patches of 24 feet, which break in heavy weather, passes also very near Colt Rock, in 15 feet water, and close to Nick Shoal. None of these dangers are shown in the old chart. Nearly half the Sambro Ledges are omitted in it, and the outermost of them are laid down too near the shore by half a mile.

SAMBRO ISLAND LIGHT-HOUSE is a white octagonal tower, showing a fixed light 115 feet above the sea at high-water, and visible 21 miles distant in clear weather. It is 1½ mile from the shore at Cape Sambro, and hence from Chedabucto Head (the Western point of entrance to Halifax Harbor) S. W. 4¼ miles. In foggy weather vessels are warned, by heavy guns on the island, of their approach to the dangerous ledges around it. It is the resort of pilots.

Sambro Ledges.

THE SAMBRO LEDGES will be found fully and correctly represented for the first time in the Admiralty chart resulting from our survey; and it will, therefore, only be necessary here to state that, from the outermost of the Western ledges, the Smithson Rock, in 12 feet least water, Sambro light bears E. N. E. nearly (N. 63° E.) 2½ miles; and Pennant Point, N. W. by N. (N. 33° W.) 2½ miles. Fairweather Rock in one with the Isle of Man, bearing N. N. E. 4 E., and Gull Rock little more than its own breadth open of White Head (Catch Harbor Head of the fishermen), bearing N. E. 4 E., lead right over this dangerous rock, and also over the Mure, which, with 6 feet least water, is nearly three quarters of a mile further in.

South-west Breaker.

THE SOUTH-WEST BREAKER, which almost always shows, is 1½ mile further to the Eastward; Chedabucto Head is seen from it over the Eastern extremity of Sambro Island, bearing N. E. 1 N., 14 mile.

The Sisters.

THE SISTERS are the outermost of the Eastern ledges, and are distant 13 mile from the light-house, between the bearings from it of E. by N. and E. by S. Their position is pointed out by Black Rock, which is 15 feet high, and from which they are distant one-third of a mile to S. E. by E. Several of them uncover at low-water, and can always be seen, but the Blind Sister is more dangerous, being covered by 9 feet at low-water; the Black Rock bears from it N. 4 W., half a mile, and Broad Breaker, which almost always shows, W. 4 N., 4 cables. Nick Shoal and Ede or Owen Rock, the latter in 9 feet least water, are nearly midway between the Sisters and Morris Point, on the Western side of Catch Harbor.

Clearing Marks.

CLEARING MARKS.—The fixed light of Sherbrook tower, on Manger Beach, kept just open East of Chedabucto Head, bearing N. by E., will clear all the Sambro Ledges, and also Bell Rock and Duncan Reef; and Sandwich Point in line with Chedabucto Head, bearing N. 3 E., will lead one mile to the Eastward of them.

The lead gives little or no warning when approaching these ledges from the Eastward, on which side the bank is very steep, there being 45 fathoms within less than half a mile from the Sisters. The erroneous position assigned to these ledges in the charts hitherto in use, has greatly added to their danger.

The Hennesy and Lockwood Rocks, of the old charts and directions, could not be found by our parties, nor by Captain Shortland, who has also examined the alleged positions in H. M. S. Columbia. They doubtless do not exist, for rocks covered only by 8 or 12 feet water would cause breakers almost constantly, and thereby become conspicuous; but neither the native fishermen nor the light-house keepers have ever seen them.

The Hennesy Bank.

THE HENNESY BANK, of the fishermen, is a small rock with 8 fathoms instead of 8 feet over it, and is three-quarters of a mile to the Southward of the Blind Sister; Sambro light-house bears from it N. W. by W., 14 mile. The shoal ground is a mile further out, with 8 fathoms least water on it; the light-house bears from it N. N. W. 4 W., 2 miles.

Barse Ground.

THE BARSE GROUND is a rock with 9 fathoms least water; the light-house bears from it N. by E. 2½ miles, and from the Outer Bank in 14 fathoms, N. by W. 4½ miles. These are rocky fishing-grounds, which are no further dangerous to vessels than that they cause a heavy half-breaking sea in bad weather. The Sambro Bank continues out 2½ miles beyond them to the depth of 30 fathoms, terminating in a point from which the light-house bears North 63 miles.

Catch Harbor.

CATCH HARBOR bears due North from the Easternmost of the ledges, and is 2 miles S. W. from Chedabucto Head. It has 9 feet on its bar, and 16 feet mud within, where its shores are occupied by the houses and stages of fishermen. At its head there is a chapel and a fine stream, the outlet of the waters of several small lakes which lie about a mile to the Northward.

Bell Rock.

THE BELL ROCK, with 7 feet least water, is half a mile East from White Head, and 4 cables' lengths off shore, with Chedabucto Head bearing N. N. E., distant one mile. We discovered another rock with 27 feet water on it, one cable N. by W. from the Bell Rock; and as Duck Reef extends a cable and a half from the shore towards them, the channel between them and the land is reduced to this breadth, and is, moreover, nearly overlapped by Duncan Reef; it, therefore, cannot be recommended, as it is no shelter to boats.

Halifax Harbor.

HALIFAX HARBOR is one of the finest in the world, affording space and depth of water sufficient for any number of the largest ships with safety; and although the dangers of its entrance are such as to render great caution necessary, especially in the fogs which usually accompany all winds from the sea, it is yet easier of access and egress than any other large harbor on the coast. It is 53 miles wide at its entrance from Chedabucto Head on the South-west, to Devil Island in the North-east, and continues inland 15 miles, in a Northerly direction, to the head of Bedford Basin. The city of Halifax, the capital of Nova Scotia, containing at this time about 25,000 inhabitants, stands on the declivity of a peninsula on the Western side of the harbor

and 9 miles within a bay of 227 feet above the level of the sea, and is easily recognized.

The town of Halifax is situated on the Eastern side of the harbor, and is a fine city, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

CHEDABUCTO HEAD is a small rock, bearing from Sambro light-house N. N. E. 4 E., 14 miles.

DEVIL ISLAND is a small island, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine island, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

MACNAB ISLAND is a small island, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine island, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

SHERBROOK TOWER is a small tower, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine tower, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

SMITHSON ROCK is a small rock, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine rock, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

WATERBURY POINT is a small point, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine point, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

WHITE HEAD is a small head, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine head, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

YORK REDOUSSANT is a small redoubt, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine redoubt, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

CHEDABUCTO HEAD is a small head, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine head, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

DEVIL ISLAND is a small island, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine island, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

MACNAB ISLAND is a small island, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine island, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

SHERBROOK TOWER is a small tower, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine tower, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

SMITHSON ROCK is a small rock, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine rock, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

WATERBURY POINT is a small point, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine point, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

WHITE HEAD is a small head, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine head, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

YORK REDOUSSANT is a small redoubt, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine redoubt, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

CHEDABUCTO HEAD is a small head, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine head, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

DEVIL ISLAND is a small island, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine island, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

MACNAB ISLAND is a small island, bearing from Sambro light-house N. N. E. 4 E., 14 miles. It is 15 feet high, and is a fine island, with its harbor well protected by the harbor fort, with its guns, and the harbor fort, with its guns.

and 9 miles within its entrance. The Citadel, immediately in rear of the city, is elevated 227 feet above the sea at high-water, and with its flagstaff forms a leading-mark easily recognized from a vessel off the entrance of the harbor.

The town of Dartmouth stands on the Eastern side of the harbor, immediately opposite the Naval Yard; steamers ply between it and the city continually; and East Fort, with its tower, will be seen 2 miles further to the Southward, on the same side of the harbor.

CHEBACUETO HEAD, the Southern extreme of the Western shore at entrance, *Chebucto Head*, bears from Sambro Island light-house N.E. 41 miles. It is 100 feet high, and consists of a whitish granite, which, together with clay slate, forms the steep and barren Western shore of the harbor. Proceeding Northward, Portuguese Cove, with its village of fishermen, and Camperdown flagstaff, on a hill in rear of it, 168 feet above the sea, will be seen 2 miles within Chebucto Head.

HERRING COVE, distinguished by the steeple of a chapel, and the houses of the fishermen on its rocky shores, is 3 miles further in, and distance 1 1/2 mile S.W. from Sandwich Point. It is a secure harbor for small craft and boats, having 6 feet at low-water in its narrow entrance, and 8 feet over soft mud within. At its head a brook discharges the waters of a chain of small lakes.

YORK REDOUBT, 177 feet above the sea, will be known by its flagstaff, and by its position, three-quarters of a mile within Sandwich Point, and nearly opposite the Light-house Tower on Maugher Beach. Pleasant Point, at the entrance of the North-west arm, is 1/2 mile further in, and will be recognized by its batteries, and by the tower on its summit, 134 feet above the sea; and also will George Island, by its redoubt and tower, which is at the same distance further in, and off the outer part of the city.

DEVIL ISLAND, on the Eastern shore of the harbor, is composed of clay slate; it is 15 feet high, one-third of a mile in length, and the same distance from Hartland Point, the Eastern point of entrance of the harbor. A reef connects it with the shore, and shallow water extends from it one-third of a mile to seaward. The light-house, of wood, painted brown with a white belt, stands on the South-west point of the island, and shows a fixed light, red to seaward, 40 feet above high-water, and visible in clear weather from a distance of 8 miles. Pilots are stationed on the island, and several families reside there.

The Eastern shore of the harbor is less rocky and barren than the Western, being formed of ridges of drift sand, clay, and boulders, resting on clay slate; it is inhabited all the way to Dartmouth. Three-fourths of a mile Northward from Devil Island is Barrie Beach (of shingle), and inclosing a shallow pond, which affords shelter to boats.

EASTERN PASSAGE.—The entrances to the Eastern passage lie on either side of Lawler Island; that to the Eastward, between the island and the main being the deepest, and having 10 feet over its bar at low-water. Only 5 feet at low-water can be carried through between Lawler and Macnab Islands; and there are rocks in the entrance, and off the South end of Lawler Island, as will be seen in the chart.

This passage being very narrow, and fit only for small vessels, it will only be necessary to direct attention to the 6-foot shoal, a cable and a half distant from a brook on the Eastern shore of the main-land, and half a mile within Lawler Island, as well as to the rock 60 fathoms off the North-east point of Macnab Island; these being the only detached dangers in the passage after passing the bar.

MACNAB ISLAND, which forms the Eastern side of the ship-channel, is 3 miles long, including its shingle beaches. It is well cultivated, and its hills of sand, clay, and boulders, rise to the height of 152 feet above the sea.

THE THRUMCAP is connected to its South-west extremity by long shingle beaches, inclosing a shallow pond. It is an islet at high-water, at present 33 feet high and 150 fathoms long, but its cliff of red sand and clay is fast wasting by the action of the waves. The Thrumcap Shoal extends from it one mile to the Southward, forming one of the principal dangers in the entrance of the harbor. At its South-west extremity is a red buoy, carrying a small flag, like all the other buoys, excepting that on Pleasant Shoal. It lies in 8 fathoms water, with George Island just open to the Westward of Ives Point, Graham Head (ten miles to the Eastward) well open to the Southward of Devil Island, and the light-house on the latter bearing E. 1/2 N. 2 miles.

SHERBROOK TOWER LIGHT, at the West extremity of Maugher Beach, bears from the Thrumcap buoy N. by W. 2 1/2 miles, and shows a bright (not red) fixed light, 55 feet above the sea, and visible from a distance of 12 miles.

THE LIGHT-HOUSE BANK continues out from this beach three-quarters of a mile to the Southward. Devil Island light-house open South of Macnab Island, seen over the shingle beaches, and bearing S.E. by E. 1/2 E., clears its South point in 5 fathoms. From the least water, (18 feet,) the light-house is in one with Ives Point, and is distant half a mile.

Shallow water extends also Westward and Northward from Maugher Beach to the distance of 2 cables. In the latter direction it dries at low-water, and is called the

Chebucto Head.

Herring Cove.

York Redoubt.

Devil Island.

Eastern Passage.

Macnab Island.

Thrumcap.

Sherbrook Tower Light.

Light-house Bank.

Horse-shoe, which vessels should beware of in entering or leaving Macnab Cove, where the anchorage is good in 7 or 8 fathoms, mud; the best berth being with Sandwich Point seen over the Horse-shoe, and the Western sides of George Island and Ives Point in one.

Ives Point.

IVES POINT, the North-west extremity of Macnab Island, is a steep clay bank, with a shingle beach curving out from it to the N.E., and Ives Knoll, washed in low spring-tides, stands on the rocky bank which runs out 4 cables from the beach to the Northward, or towards George Island. A red buoy is moored in 8 fathoms, near the Western side of this bank, and distant one cable West from the knoll.

Rock Head Shoal.

ROCK HEAD SHOAL.—Having pointed out the dangers on the Eastern side of the ship-channel, let us turn to the dangers in the entrance, and afterwards to those of the Western shore. Of the first, the outermost and most dangerous is the Rock Head Shoal, with 20 feet least water, which lies with the tower of George Island in line with Ives Point, bearing N. by W. $\frac{1}{2}$ W.; Sambro Light-house Island touching White Head, bearing S. W. $\frac{1}{2}$ W., the light-house being open; and Devil Island light-house bearing N. E. $\frac{1}{2}$ miles.

A black and white beacon buoy carrying a bell, has been replaced on this shoal as formerly, and is moored near its South-west end in 61 fathoms water, rocky bottom, with the Eastern end of George Island in line with Ives Point, and Sambro Light-house Island open of White Head.

Portuguese Shoal.

PORTUGUESE SHOAL (omitted in the old chart) is half a mile W. S. W. from the Rock Head. The least water on it, 5 fathoms, is with George Island just touching the West side of the light-house tower on Maugher Beach, with Sambro Light-house Island concealed behind Chedabucto Head, and Camperdown Flagstaff bearing W. by S. A black buoy on its Western side marks the Eastern side of the preferable channel for large ships; it is moored in 6 fathoms, with George Island just open to the Westward of the light-house tower on Maugher Beach, bearing N. $\frac{1}{2}$ W.; Camperdown flagstaff bearing W. by S.; and Devil Island light-house, N. E. $\frac{1}{2}$ E.

Leading-marks.

LEADING-MARKS.—Sambro Light-house Island well open S. E. of White Head, and bearing S. W. $\frac{1}{2}$ W., leads clear to the Southward of the Rock Head and Portuguese Shoals. The tower on George Island touching the East side of the light-house tower on Maugher Beach, bearing N. $\frac{1}{2}$ W., will lead through between them; and George Island well open to the West of the light-house tower on Maugher Beach, bearing N. $\frac{1}{2}$ W., will lead clear to the Westward of them, and also nearly midway between the Neverfail and Thrumcap Shoals.

Neverfail Shoal.

THE NEVERFAIL SHOAL carries 27 feet least water, from which the Eastern side of George Island appears in line with the steeple of the R. C. chapel at Dartmouth, and the tower on Pleasant Point over the point at York redoubt; the South-east end of Lawler Island over the South-east extremity of the shingle beach, Southward of the Thrumcap; and Harland Point over the Northern point of Devil Island, and in line with the Thrumcap buoy bearing E. by N., distant about one mile.

Litchfield Rock.

THE LITCHFIELD ROCK, with 15 feet least water on it, lies two-thirds of a mile W. N. W. $\frac{1}{2}$ W. from the Neverfail. The white buoy, on its Eastern side, lies with the tower on George Island in line with Sandwich Point; Devil Island and Harland Point touching, and bearing E. by N.; and the steeple of the chapel at Herring Cove bearing N. W. by N. George Island open East of Sandwich Point bearing N. $\frac{1}{2}$ E., leads clear to the Eastward of it, and the Citadel flags, all in line with Sandwich Point bearing N. $\frac{1}{2}$ W., will lead through between it and the Neverfail, which is the most direct, and therefore the preferable channel, although the deepest water is between the Litchfield and the land, from which it is distant three-quarters of a mile.

Mars Rock.

MARS ROCK, in 20 feet least water, is on a rocky bank, separated from the shore by a very narrow channel; a white buoy is moored in 6 fathoms on the Eastern side of it, with the Citadel flagstaff, and also the town clock, just open East of Sandwich Point, distant three-quarters of a mile; Harland Point open South of the Thrumcap beaches, and the North side of Herring Cove, W. by S.

Middle Ground.

THE MIDDLE GROUND, carrying 23 feet least water, bears W. $\frac{1}{2}$ N. half a mile from the Northern point of Macnab Cove, and E. N. E. from the steeple of the R. C. chapel at the village of Falkland. The steeple of the R. C. chapel at Dartmouth in line with the Eastern side of George Island, leads clear to the Eastward of it; and Chedabucto Head only just open East of Sandwich Point, to the Westward of it.

Pleasant Shoal.

PLEASANT SHOAL, which extends nearly half a mile S. E. from Pleasant Point, dries in some parts, and is covered by only a few feet of water nearly out to its edge. It is much in the way of vessels, diminishing the breadth of the channel between it and Ives Point to half a mile. A white buoy, without a flag, is moored close to its Eastern extremity in 71 fathoms, with Sandwich Point open East of Chedabucto Head, and with the North point of Macnab Island only just open North of the bank of Ives Point, and seen over its beach, bearing E. by N. The entrance of the North-west arm is between the Western side of Pleasant Shoal and the shoals in Purcell Cove. It

is 8 fathoms deep, to within half a mile of shore. It is so moored in 8 fathoms W. by N. had Eastward of Reid BELLE-ISLE of a mile from the George Island beach on the edge of the Engineer wharf, is the Western side deep, and a cable

To the Eastward from obstructions lie from either end DOCKYARD approaches very near a cable and a half

est buoy is moored there are only 9 fms DARTMOUTH extends a cable N. South from the point carrying 23 feet of the Ferry wharf bearing N. W. $\frac{1}{2}$ N.

THE NARROW longest ships through navigable quite to low-water, about 100 with the outermost the basin, and between the Rock, the channel cable and a half; of the entrance of

NAVY ISLAND from the Narrows, entrance is to the wreck, over which ASPECT.—The near shore being so far as Jadore, almost to the wasting extended, granite rising in for the land, markable difference shores, which, if Westward of it.

APPROACHING at the depth of 50 fms to vessels are frequently prevail. by the absence of depending out with 6 miles from the shore the depth exceeds there. Attention Light-house Island, ing the fog, but it is circumstances.

FROM THE W at night, steer so as and light, steering North; when, if no Southern prolongate, change the cou

is 8 fathoms deep; and the largest ships may ascend the arm through a narrow channel to within half a mile of its head, or nearly to Melville Island, a distance of 2½ miles.

REID ROCK is 6 cables further in, on the same side of the channel, and 2 cables off shore. It is small, with 5 feet least water, and its position is pointed out by a buoy moored in 8 fathoms, and bearing from Ives Knoll buoy on the other side of the channel W. by N. half a mile. Chedabucto Head open of Sandwich Point, leads to the Eastward of Reid Rock, at the distance of 2 cables. *Reid Rock.*

BELLE-ISLE SPIT lies two-thirds of a mile further in, and continues out a quarter of a mile from the shore to a buoy in 5 fathoms, from which the South-east point of Belle-isle George Island bears E. N. E. one-third of a mile. About a quarter of a mile further in, on the edge of the bank, in 5 fathoms, and distant three quarters of a cable from the Engineer wharf, is the Leopard buoy, which, together with the Belleisle buoy, marks the Western side of the channel, between them and George Island, which is clear and deep, and a cable and a quarter wide, from 5 fathoms to 5 fathoms. *Belle-isle Spit.*

To the Eastward of George Island the channel is half a mile wide, and equally free from obstructions; the shallow water does not extend beyond three-quarters of a cable from either end of George Island, and not above half a cable from either side.

DOCKYARD SHOAL.—After passing the Leopard buoy, the deep water approaches very near the wharves of the city, until we arrive at the shoal, which extends a cable and a half out to the South-east from the dock-yard wall. The Commissioners' buoy is moored on the Eastern edge of this shoal in 5 fathoms, and just within it there are only 9 feet at low-water. *Dock-yard Shoal.*

DARTMOUTH.—It only remains to notice the shallow water off Dartmouth, which extends a cable and a fifth out from the wharves to 5 fathoms, and a cable and a half South from the point of clay cliff in Dartmouth Cove. There is also a detached rock carrying 23 feet outside the 5-fathoms line, and bearing S. W. ½ S. a cable and a half from the Ferry wharf. The points on the Eastern side of the Narrows in one, and bearing N. W. ¼ N., lead half a cable to the Westward of this rock. *Dartmouth.*

THE NARROWS AND BEDFORD BASIN.—There is a clear passage for the largest ships through the Narrows into Bedford Basin, which is 36 fathoms deep, and navigable quite to its head. The principal danger is the Wellesley Rock, 13 feet at low-water, about one-third over from the Eastern towards the Western shore; and with the outermost bare rock off the Eastern shore in one with a house at the head of the basin, and bearing N. N. W. 3 cables. Immediately after passing the Wellesley Rock, the channel is contracted by islets and rocks on either side, to the breadth of a cable and a half; but it is 9 fathoms deep, and leads to a perfectly secure anchorage of the entrance of Sackville River, in 7 fathoms, mud. *Narrows and Bedford Basin.*

NAVY ISLAND ANCHORAGE.—On the Eastern side of the basin, 1½ mile from the Narrows, there is a small but secure anchorage within Navy Island. The entrance is to the Northward of the island, and the only thing in the way is an old wreck, over which there is a depth of 18 feet at low-water. *Navy Island Anchorage.*

ASPECT.—The coast in the vicinity of Halifax is of moderate height, the hills near shore being seldom 200 feet above the sea. To the Eastward of the harbor, as far as Jalore, almost all the headlands present cliffs of reddish sand, clay, and boulders, to the wasting action of the waves; whilst to the Westward, as far as our survey has extended, granite rocks nearly white predominate. Hence the remark, that, "in standing in for the land, you may know on which side of Halifax Harbor you are, by a remarkable difference that takes place immediately from its mouth in the color of the shores, which, if red, denotes that you are to the Eastward, and if white, to the Westward of it." *Aspect.*

APPROACHING FROM SEA.—The bank off Sambro, terminating in a point, and at the depth of 59 fathoms, 5 miles South of the Ledges, offers considerable assistance to vessels approaching Halifax from the Westward in the thick fogs which so frequently prevail. From the Eastward the approach is rendered comparatively easy, by the absence of outlying dangers after passing Shut-in Island, and by the soundings deepening out with tolerable regularity to 30 fathoms, at distances varying from 4 to 6 miles from the shore, until within 2 miles of Chedabucto and White Heads, where the depth exceeds 30 fathoms, until we arrive within one-third of a mile from the shore. Attention to these soundings, combined with the guns fired from Sambro Light-house Island, may enable steamers at times to enter the harbor notwithstanding the fog, but it is seldom prudent for a large sailing vessel to attempt it under such circumstances. *Approaching from Sea.*

FROM THE WESTWARD AT NIGHT.—In approaching from the Westward at night, steer so as to pass not less than 3 miles to the Southward of the Sambro Island light, steering E. N. E., and in not less than 30 fathoms water, until the light bears North; when, if not more than 6 miles from it, the vessel will have arrived at the Southern prolongation of the Sambro Bank. Having crossed the bank into deep water, change the course to N. N. E., until the light on Maugher Beach opens out East *From the Westward at Night.*

of Chedabucto Head, bearing N. by E., when steer for it, or so as to pass within a mile or less from Chedabucto Head, which is quite bold. Having done so, keep the light bearing between North and N. by E. as you run towards it, and all the dangers will be avoided excepting the Neverfail, on which there is not less than 4½ fathoms.

Having arrived abreast of the Thrumcap, or brought Devil Island light in line with its South extremity, bearing E. S. E., change the course to N. by W., or as may be necessary, to avoid the Light-house Bank; and as soon as the light bears East, change the course to N. by E. for Ives Point, (or N. N. E., if necessary, to avoid the Middle Ground, on which, however, there are not less than 4½ fathoms,) until the light on Maugher beach bears S. by E.; then a N. by W. course, keeping the light astern, will lead between the Pleasant Shoal and Reid Rock buoys on the one side, and Ives Knoll buoy on the other into the harbor. Having passed Ives Knoll, the vessel may proceed in on either side of George Island, or may anchor in the stream of Maenab Island until daylight, according to circumstances. The light on Maugher beach disappearing behind Ives Point, will show the vessel's distance from George Island, as she runs in to the Eastward of that island, which is the wider and preferable channel in a dark night.

Within George Island there is nothing in the way, excepting the Dock-yard Shoal, and the shallow water off Dartmouth.

*From the
Westward by
Day.*

FROM THE WESTWARD BY DAY.—Approaching from the Westward in the day-time, pass Sambro Island light-house at the distance of 3 or 4 miles, and when Sandwich Point opens out East of Chedabucto Head, stand in N. by E. or N. N. E., according to the wind, until the Citadel flagstaff opens East of Sandwich Point, bearing N. ½ W. Keep the Citadel flagstaff only just open, running towards it, and it will lead between the Litchfield and Neverfail Shoals, and up to Mars Rock buoy, which lieve to the Westward, and having passed Sandwich Point, from which the shallow water does not extend beyond a cable's length, steer towards George Island, keeping Chedabucto Head only just in sight East of Sandwich Point until you have passed close to the Westward of the Middle Ground; then open out the head more, so as to leave the Pleasant Shoal and Reid Rock buoys on your left hand, as you run towards George Island; or, if it be preferred, the R. C. steeple at Dartmouth in one with the Eastern side of George Island, bearing North, will lead to the Eastward of the Middle Ground. Either of the marks just given will lead clear up to George Island, on either side of which the vessel may pass into the harbor, leaving the Belle-isle and Leopard Buoys on her left, if she passes between them and the island, and choosing her anchorage off the wharves of the city, or off the dock-yard, where the Commissioners' buoy will point out the dock-yard shoal.

*From the
Eastward
by night.*

FROM THE EASTWARD BY NIGHT.—Approaching from the Eastward by night, and being to the Westward of the Jedore ledges, run along the land in not less than 30 fathoms, until the fixed light on Sambro Island is seen; then, if it be intended to pass to the Southward of the Rock Head and Portuguese Shoal, steer for Chedabucto Head (remembering that, to clear the Rock Head, the light on Sambro Island must be kept wide open S. E. of White Head, bearing nothing to the Southward of S. W. by W.; and the red fixed light on Devil Island nothing to the Eastward of N. E. by N.), until the light on Maugher Beach bears North; when steer for it, keeping it bearing between North and N. by E., and proceeding as we directed.

In the day-time, steer for Chedabucto Head until the Citadel flagstaff is only just open East of Sandwich point, bearing N. ½ W.; then steer for it, and proceed as before directed.

*Between the
Rock Head
and Thrum-
cap.*

BETWEEN THE ROCK HEAD AND THRUMCAP.—If a N. E. wind, or other circumstances, should render preferable the passage between the Rock Head and Thrumcap Shoals, proceed as follows by night: Having made Sambro Island light as before, and passed Shut-in Island, steer so as to pass not less than half a mile, or more than one mile, to the Southward of the Red light on Devil Island, steering W. ½ S. (made good), until the light on Maugher Beach bears North, when steer for it until abreast of the Thrumcap, or until Devil Island light bears E. S. E.; then change the course to N. by W., or as may be necessary, to avoid the light-house bank.

In the day-time, pass the light-house on Devil Island, steering W. ½ S., as before directed, or so as to keep Graham Head open South of Devil Island the whole breadth of the island, which mark will lead to the Southward of the Thrumcap Shoal and buoy; and when George Island opens out West of the light-house tower on Maugher Beach, bearing N. ½ W., steer for it, until abreast of the Thrumcap; then edge away to the Westward, keeping the light-house on Devil Island in sight, South of Maenab Island, and over the beaches between it and the Thrumcap (so as to clear the Light-house Bank), until the steeple of the R. C. chapel at Dartmouth comes in one with the East side of George Island, bearing North. These last-named marks kept in one will lead clear of all dangers into the harbor.

In adverse winds, the Admiralty chart resulting from our survey, and the leading-marks herein given for clearing the dangers, will enable vessels to beat in or out without difficulty in clear weather.

TIDES.—The mean of two years' observations, with a self-registering tide-gauge at Halifax dock-yard, gives us follows, viz.:—High-water, full and change, (the true Establishment,) at 7h. 39m.; ordinary springs rise 6 feet; equinoctial springs 7 feet; neap tides range to 3 feet or rise to 4 feet above the level of low-water springs.

The true Establishment (or time of high-water on the day when the sun and moon are on the meridian together) for the year 1852, was 7h. 30m. after the moon's transit. The vulgar Establishment, (or time of high-water on the full and change days,) 7h. 49m., being the mean of fifty inferior and superior, or a. m. and p. m. transits; but the diurnal inequality, aided probably by winds, caused the vulgar Establishment to vary from 17m. to 7h. 20m. after the moon's transit.

The rise also is greatly influenced by the winds, Southerly winds causing high, and Northerly winds low tides; and if the winds chance to act in accordance with the diurnal inequality, the rise of the morning and evening tides of the same day may differ to the amount of a foot, or even more in extreme cases. From the above-mentioned causes, the rise of spring tides varies from 5 to 7 feet, and of neap tides from 4 to 5 feet above the ordinary low-water in spring tides. Extraordinary spring-tides, aided by strong Southerly winds, have risen 8 feet; and extraordinary neap-tides only 1 foot above the average low-water in spring tides.

The ordinary rate of the tide-stream nowhere exceeds half a knot.

POSITION.—The position of the Observatory in Halifax dock-yard is in lat. 44° 37' N., long. 63° 31' 57" W. of Greenwich. The variation in 1852 was 18° West. In proceeding along the coast to the Eastward of Halifax Harbor, the course and distance from Devil Island to Shut-in Island across the first bay Eastward of Halifax, is E. 4 S. 8 miles.

COLE HARBOR, in the bottom of this bay, has a dangerous bar of sand, over which 3 feet can usually be carried at low-water, and which is covered with breakers whenever there is any sea running. It is only with fine weather and a smooth sea that boats can safely cross it to the entrance, which is barely 40 fathoms wide between points of shingle and sand. In this narrow entrance the depth is 5 fathoms, and the rate of the tide-stream from 1 to 2 knots; but immediately within it the depth diminishes to 4 or 5 feet, and narrow channels between mud-flats extend 2 miles inland. Two miles to the Eastward of this harbor is the low Egg Islet, joined to the shore by a reef and shingle beach, and having shoal water off it 3 cables to the Southward, where it terminates in 5 fathoms, nearly 1 mile out from the shore.

LAURENCETON LAKE.—The entrance of Laureceton Lake, admitting boats in fine weather, is half a mile further to the Eastward, and on the West side of Laureceton Head. This is one of those peninsulas, composed of drift sand, clay, and boulders, resting on clay slate, and united to the shore by long beaches of stones and shingle, whose red cliffs form the distinguishing feature of this part of the coast. The peninsula is 92 feet high, and the kirk, which stands on its inner slope, is therefore not very conspicuous from the sea.

PORTER LAKE is 3 miles further to the Eastward, its entrance being on the western side of Graham Head, which is another and similar peninsula, with red cliffs 100 feet high. The lake extends 7 miles to the Northward, and receives the waters of other lakes still further inland. It is in some parts 4 or 5 fathoms deep, but has only one foot at low-water in its narrow entrance.

SHUT-IN ISLAND, 3 cables long, and of low clay-slate rock, is distant half a mile from Graham Head, but united to it by a reef and beach of shingle. It forms the western side of the entrance to Three Fathoms Harbor.

THE SHUT-IN SHOALS extend 1½ mile to the Westward, and three-quarters of a mile to the Southward of the island. They are of rock, with 16 feet least depth, and are extremely dangerous. The red cliffs of Sellar Head open East of the western point of entrance of Three Fathoms Harbor, bearing N.E. by N., will clear the S.E. point; and Devil Island Red Light, when in sight, should not be brought to bear to the Westward than on a W. by N. ½ N. bearing. There is a depth of 20 fathoms water within a mile of them, and vessels should not approach nearer than 1 mile depth at night, or in foggy weather.

THREE FATHOMS HARBOR is quite open to the Southward, and affords shelter only to small vessels, that can run in to the narrow channel to the Eastward of Egg Islet, one mile within the entrance. The depth is 3 fathoms, over muddy bottom; but to reach it, the low-water depth of 8 feet (with a 4½ feet rise) must be passed. The entrance to this harbor, between reefs that partly dry at low-water, is 2 cables wide from 3 fathoms to 3 fathoms on either side, and the depth is 22 feet, but it decreases to 8 feet a short distance within, as already indicated. It is an excellent fishing station, but is of no use to shipping, excepting as a harbor of refuge

in case of distress, when a vessel might run in until she grounded on the mud within the reefs. The leading-mark for running in is, the West side of Ball Islet, and a white house on a hill at the head of the harbor in one, bearing N. $\frac{1}{4}$ W.

HALIFAX, WESTWARD.

Remarks.

REMARKS.—Leaving Halifax and sailing Westward, you will find the shores to be steep, and appear from seaward broken and rocky, with whitish cliffs: the high lands of Aspotogon and Le Have, are conspicuous and remarkable; to the Westward the rocks about the land appear black, with reddish banks of earth. Le Have appears bald or barren at the top, with red earthy hillocks under it, and between Cape Le Have and Port Medway, or Jackson, are some hummocks inland, the coast to the seaward being level and low, and the shores marked with white rocks, with low barren points; from thence to Shelburne and Roseway it is woody. Near Port Latour are several barren places, and thence to Cape Sable the land is low, with white sandy cliffs, particularly visible at sea.

Prospect Harbor.

PROSPECT HARBOR lies about 3 miles to the N.W. of Cape Prospect, or Martin Head, which forms the West side of Bristol Bay; and its entrance is encumbered with a cluster of islands which form the Western side of Bristol Bay. At the base of these islands is a considerable inlet, called by Des Barres, Parker's River, but little frequented. Prospect Harbor wears, at its entrance, a rugged broken appearance, but it is safe, commodious, and extensive, and in rough weather the dangers mostly show themselves. Vessels coming from the Eastward, and rounding Cape Prospect must beware of a rock with 17 feet over it; it lies South about one-third of a mile from the cape; go not between it and the cape, but proceed on its Southern side in 20 and 21 fathoms water; by keeping more than half a mile from the land, you will steer quite clear of danger, and may sail boldly up its Eastern channel, between Prospect and Betsey's Islands; having passed these, the channel narrows; the Western passage is between Hobson's Nose and Dorman's Rock: there is good anchorage for large ships above Pyramid Island, and also for small vessels within Betsey's Island in 4½ fathoms, blue stiff clay. At the entrance to this harbor, depths are very irregular, and there is a rock over which the sea breaks, having 3 fathoms water over it, and lying 2 cables' length to the Eastward of Dorman's Rock. There are some residences on the Western side of the bay.

Leith Harbor.

LEITH HARBOR.—This lies about 2½ miles to the North-westward of Prospect Harbor, and here are situated the inlets called Shag and Blind Bays, both possessing excellent anchorages. At its entrance lies the Hog, a sunken rock, having 6 feet water over it, and bearing E.S.E. about one mile and a half from Taylor's Island. In fair weather the Hog Rock may readily be perceived by a constant ripple over it, and in bad weather, with an on-shore wind, it will be distinguished by the breakers. There are good channels on both its sides, but the Eastern one is always to be preferred on account of the ledge which extends E.S.E. about half a mile towards it from Taylor's Island.

Dover Port.

DOVER PORT lies at the Western side of the entrance to Blind Bay, and is chiefly formed by Taylor's and the adjacent islands; this is the Port Durham in former charts, and affords safe and good anchorage; the Eastern passage is the best, and sailing in, you must give the reef that stretches off the East end of Taylor's Island a sufficient berth, anchoring within the body of the largest island, in 7, 8, 9, or 10 fathoms, muddy bottom. The Western entrance has some sunken rocks in it, and the water is in some places but shallow.

Between the harbors of Halifax and Dover the shores are craggy, broken, and barren, steep to, iron-bound, and destitute of trees: but the creeks and inlets abound with fish, and great quantities of cod, herrings, and mackerel are caught and carried here for the markets.

Margaret's Bay.

MARGARET'S BAY.—The entrance to this bay is to the Westward of Taylor's Island about one league. The bay itself is full 25 miles in circumference, in length 9 miles, and in breadth, from Peggy's Point to Owl's Head, about 2 miles. Here are harbors capable of receiving ships of war, even against the sides of the shore, sufficiently wide to turn in. In choosing a berth, it is usual to be guided by the direction of the wind, taking the Western anchorage in S.W. gales, and the Eastern in S.E., where you lie land-locked, the bottom mud.

Owl's Head.

OWL'S HEAD is very remarkable, being round and abrupt. The lands and islands in the neighborhood are rugged and barren. The body of flood-tide sets in from S.W. at the rate of one mile per hour.

Following the coast, which runs nearly 2 miles W.N.W. from Taylor's Island to East Point, there is a rock uncovered at low-water, which lies near the land, having a passage between, with 4 and 5 fathoms water. The shore all the way is rugged and steep, against which the sea beats violently. N.N.W. from East Point, one mile is Contact Point; and in the same direction, 1½ mile further, is Peggy's Point; beyond

which, a short Southern point it and the islands to the North become forms a place to sea. To the East a cove or harbor Wedge Islands off the force of is good anchorage.

FRENCH COASTENSIVE, with plenty opposite to the ends of the Mass approach too near HEAD HORN North-eastern extending so completely by side, and lands are high and cattle, and excellent sheepfolds. The feet high.

INGRAM RIVER in to the Northward, with 7, 6, a is shallow and seldom frequented, and it is from these &c. the former of are both shallow trout abound in great numbers.

HUBERT'S COAST the entrance is a reef so that when the sea you have only to keep sides are bold to. and by keeping the press, or without any safety.

Long Cove is 2½ with a westerly wind without any danger and.

NORTH-WEST at its entrance is 1 passage with 10 fathoms anchorage behind in Owl's Head is an at rest Bay.

SOUTH-WEST, 20 feet high, and steep of the South-west Island of the island is white Owl's Head, which low passage, not even the place is seldom more than half a mile, is a rock weather, but it cannot water.

THE HORSE-SHOE half from the South-east-quarters, and several small sunken rocks, shelving out at a little distance, at a similar distance.

which, a short mile, is Shut-in Island, 200 feet high, and covered with trees. Off the Southern point of this island there is a shoal of 9 feet, with 6 and 7 fathoms between it and the island; and near to Peggy's Point there is another of 15 feet, with 6 fathoms to the Northward of it. During Southerly gales the water on the lee side of the islands becomes smooth, and the bottom holds well. Indian Harbor runs in here, and forms a place fit for small vessels, but affords no shelter, being entirely open to the sea. To the E.N. Eastward of the Indian Harbor is Hagget's Cove, distant one mile, *French Cove.* a cove or harbor of similar description. Luke's Island, Thrumcap, Jolliman and Wedge Islands all lie off the Eastern side of Margaret's Bay, and contribute to break off the force of the sea, so that under the lee of Luke's and Jolliman's Islands there is good anchorage at all times for ships of every description.

FRENCH COVE is easy of access, and may be considered as a natural dock, extensive, with plenty of water, and well sheltered. There is a shoal of 10 feet water opposite to the entrance of this cove, at the distance of two miles; but as the islands of the Eastern shore are bold to, no vessel need go so far out into the bay as to approach too near this danger.

HEAD HARBOR, OR DELAWARE RIVER, lies at the further end, on the North-eastern extremity of the bay, and is an anchorage of most excellent description forming so complete a place of safety that a fleet of ships might be securely moored on either side by side, and remain undisturbed by the most violent hurricane. The surrounding lands are high and broken. Mason's Point is in itself a good farm, well stocked with cattle, and excellently cultivated; and Moser's Islands, at its entrance, are used as sheepfolds. The land on the port side of the entrance to the Head Harbor is 446 feet high.

INGRAM RIVER.—To the Westward of Head Harbor is Ingram River, running Northward to the Northward of Moser's Islands. At its entrance it is one-third of a mile wide, with 7, 6, and 5 fathoms water; it then gradually decreases to its head, which is shallow and sandy. To the Westward is Gasper's Indent, open, shallow, and seldom frequented. These indents or coves have rugged points projecting Southward, and it is from these places small craft are employed to take limestone, building sand, &c., the former of these being of a very superior quality. Cooper and Indian Rivers are both shallow rocky nooks, but are the resorts of salmon, and in the lakes above, trout abound in great quantities, of delicate flavor, and commonly of a deeper red than the salmon.

HUBERT'S COVE is situated at the N.W. corner of Margaret's Bay. Here at the entrance is a ridge of rocks about 100 fathoms long, and covered at high-water, so that when the sea is smooth it becomes invisible. In order to avoid this danger, you have only to keep towards the Western or Eastern side of the harbor, for both sides are bold to. The Western channel is much the wider, and better of the two, and by keeping the port shore on board, a stranger or a ship dismasted, or in distress, or without anchors, may turn in and find shelter, running aground with perfect safety.

Long Cove is $2\frac{1}{2}$ miles to the South of Hubert's Cove, and affords good anchorage with a westerly wind. To the Southward of Long Cove the coast is bold and rugged, without any danger, except a small rock of 6 feet water, which lies close in to the land.

NORTH-WEST HARBOR is about one league to the Southward of Long Cove; at its entrance is Horse Island, which divides it into two channels. There is a good passage with 10 fathoms water on each side of the island, and small vessels may find anchorage behind it, in from 6 to 9 fathoms, or further up, in 5, 4, or 3 fathoms. Owl's Head is an abrupt precipice, and forms the South point of entrance to North-west Bay.

SOUTH-WEST, or HOLDERNESS ISLAND, is a remarkably rocky island, full of steep and steep on all sides; directly to the Northward of the Northern part of the South-west Isle is a small spot of 3 fathoms water, and to the North-westward of the island is what is commonly called the South-west Harbor, formed between Owl's Head, which literally is a rocky island, separated from the main by a very narrow passage, not even navigable for boats; here are 5, 6, and 7 fathoms water, but the place is seldom frequented. To the E.N.E. of South-west Island, distant nearly half a mile, is a rocky shoal of 4 fathoms; this the sea frequently breaks over, in bad weather, but it cannot be considered dangerous, unless to vessels that draw very deep water.

THE HORSE-SHOE, or DOG ROCK, lies about South, distant one mile and a half from the South-west Island; directly West from East Point, distant 2 miles and three-quarters, and from Taylor's Island W. by N. 4 miles and one-third; there are several small sunken rocks about it: part of it is consequently above the surface of the water, shelving on all sides, and the sea in stormy weather breaks violently over it; at a little distance from it, on the Western side, are 6 fathoms, and on its Eastern side, at a similar distance, are 8 fathoms; it then sinks into deep water; between the

horse-shoe and the South-west Island there are 12, 14, 26, 34, and 30 fathoms water. Vessels from the Eastward, bound for Margaret's Bay, commonly go in between the Horse-shoe and East Point; a Northerly course will carry you midway between them right up to the head of the bay, without encountering any danger, except those already described.

To the Westward of South-west Island is Aspotogon Harbor, too shallow for shipping; at its entrance are Black Saddle and Gravelly Islands and Shoals; to the Southward of these is Seal Ledge, shallow and dangerous; it lies W. $\frac{1}{2}$ N., distant 2 $\frac{1}{2}$ miles from the Horse-shoe, and W.S.W., nearly 3 miles from the Southern part of South-west Island.

*Iron-bound
Island.*

IRON-BOUND ISLAND.—W.S.W. $\frac{1}{2}$ S. from the South point of South-west Island, distant 5 miles, is Iron-bound Island, about one mile long, narrow, and steep to; it lies S.S.E. $\frac{1}{2}$ S. one mile and a half from the extremity of the peninsula which divides Margaret's and Mahone Bays, and is called New Harbor Point; between which is a good channel, with from 6 to 17 fathoms water, the ground being chiefly a black sand.

*Green
Island.*

GREEN ISLAND.—S. $\frac{1}{2}$ E., distant one league from Iron-bound Island, S.W. by S. 7 miles from South-west Island, W.S.W. 3 leagues from Taylor's Island, and W. N.W. $\frac{3}{4}$ W. from abreast of Sambro light-house, lies Green Island; it is small. Midway between Iron-bound and Green Island, there is said to be a shoal of only 2 fathoms, but its exact position is not accurately known, and therefore it is omitted in the charts; the mariner, in passing through the channel between these islands, will do well to look out for and guard against the probable existence of such a danger; there is otherwise water sufficiently deep for any vessel.

*Mahone
Bay.*

MAHONE BAY is separated from Margaret's Bay by the peninsula upon which the high and conspicuous mountain of Aspotogon is situated, whose appearance, in three regular risings, is a very remarkable object to seaward, being visible more than 20 miles off; its entrance is encumbered with several islands, between all which are good passages, with plenty of water and few dangers; these lead to most excellent harbors, and places convenient and well adapted for the fisheries. We have already noticed Green and Iron-bound Islands; these lie on the Eastern side of the entrance to the Bay of Mahone; adjacent to these, and on the same side, are the Tancook Islands, Flat Island, and the Knobme Rock; there are also the Bull Rock and the Outer Ledge. On the Western side are the Duck and other islands.

Great Duck Island lies W. by S. from Green Island, distant 4 $\frac{1}{2}$ miles. Little Duck Island lies N.W. $\frac{1}{2}$ N., about one mile and two-thirds from Great Duck Island, and W. $\frac{1}{2}$ N. 5 miles and one-third from Green Island; nearly midway between Green Island and Little Duck Island lies the Outer Ledge, over which the sea always breaks; this danger bears from the East end of the Great Duck Island N.E. $\frac{3}{4}$ N., distant one mile and two-thirds; and from Green Island W. $\frac{1}{2}$ N. one league; over it are 4 feet water, and round it are 4 $\frac{1}{2}$, 5, and 7 fathoms.

Flat Island lies due West from Iron-bound Island, distant one mile and a quarter and in a similar direction from Flat Island, somewhere about one mile off, lies the Bull Rock, but the exact situation of this danger is not correctly ascertained, for Mr. Des Barres places it more to the Southward, and Mr. Lockwood to the Northward of this position: it is a blind rock, uncovered at one-third ebb, with deep water all round it. The Southern part of Flat Island, in a line with the Southern points of Iron-bound Island, will lead on the rock, as Mr. Des Barres has placed it, while the Northern part of Flat Island, in a line with the Northern shore of Iron-bound Island, will lead to the Northward of it; and Chester Church open of Great Tancook Island, will carry you to the Westward of it, in 7 and 10 fathoms water.

Great Tancook is one mile and three-quarters long, and about a mile broad; to the Eastward, between it and the main-land, is the Little Tancook Island, separated by a channel a quarter of a mile broad, in which are 7, 8, and 9 fathoms; a similar passage is between Little Tancook and Indian Point, on the main, but there is a middle-ground in it of 4 fathoms. Knobme Rock is above water, and shoals all round; it lies to the Eastward of the South-east part of Great Tancook, and at this part of the island anchorage in 8 or 10 fathoms water.

Westward of Great Tancook, one-third of a mile, is a rocky shoal of six feet, which between them the channel has 10 fathoms water; to the W. by N. of this shoal, one mile, is another, with from 6 to 12 feet over it. Between these shoals the passage is good, and has from 12 to 25 fathoms over it. Off the North-west part of Great Tancook is Star Island, and a little to the Eastward of it is a rocky patch of shallow ground, so that vessels should never attempt the passage between Star and Tancook Islands. There is yet another danger, called the Coachman's Ledge; it lies 2 miles to the Northward of Great Tancook, and is only visible at low-water. To lead clear to the Eastward of this ledge, you should bring the Eastern point of Great Tancook and the East side of Flat Island in one; to clear it to the Southward, bring the West side of Iron-bound Island open of the West part of Little Tancook, and Frederick's Island North point bearing W.S.W. $\frac{1}{2}$ S. will carry you safe to the Northward of it.

Having passed the high land and anchor; the Northward is 6 and 8 fathoms, distance out. lies on the Eastward, in 8 fathoms.

Chester Town by a fine and flat islands are well vessels are built town are good, danger is a shoal Chester, from W.

On the port side inlet or branch are very safe, on mid-channel, and in 5 or 6 fathoms.

To sail into Mahone Bay, Green Island, westerly Flat Islands, will pass between them between them are 6 fathoms water; but you must beware of a mark to lead clear of Tancook Island; this already described, steer out Westward lead you up to the

LUNENBURG and considerable employed from here anchorage to the and containing 25 taining two lights is flashing or dark is low and thick where coasters must have a berth from its Southern There are good channels.

Vessels sailing about the middle of these, you should

nearly N.W., by the

The Sculpin or three-quarters of three feet over the low-water. Sailors should endeavor to will have 10 and 1

low land to the Eastward of the Outer for the soundings are

burg open to the Westward of the Sculpin Battery Points in the direction of the Chester round Battery Point you clear into the harbor when you may direct water alongside the perfectly secure.

Having passed the Coachman, the head of the bay lies open; on your starboard side is the high land and small river of Aspotogon, where small vessels occasionally run in and anchor; there is a rocky shoal at its entrance, which must be avoided. To the Northward is Cumberland Arm, easy of access, and affording good anchorage, with 7 and 8 fathoms, observing to give a berth to the starboard shore, which shallows some distance out. There is also good riding on the port shore, behind an island which lies on the Eastern side of the Chester Peninsula; here vessels can ride, well sheltered, in 8 fathoms water.

Chester Town is situated at the Northern part of Mahone Bay, and is surrounded by a fine and fertile country; its inhabitants are industrious people, and the adjacent islands are well clothed with sheep; wood and water are in abundance, and several vessels are built here; the anchorages between the various islands and before the town are good, well sheltered, and secure, and the depth of water moderate: the only danger is a shoal, which partly dries at low-water: this lies W. $\frac{1}{2}$ S. from the town of Chester, from which it is distant one mile and three-quarters.

On the port side of Mahone Bay, and directly West of Tancook Islands, is a large inlet or branch of a river, named by Des Barres, Princes Sound. The passages into it are very safe, only giving a wide berth to the Southern end of Edward's Island; steer mid-channel, and, when well in, anchor in 9 fathoms, or within the innermost islands, in 5 or 6 fathoms; further in it becomes flat and shallow.

To sail into Mahone Bay from the Eastward, the first land visible will commonly be Green Island, which is round, bold, and moderately high; thence to Iron-bound and Flat Islands, both steep to, is two miles and three-quarters; you may proceed and pass between them towards the Tancook Islands; these are inhabited; the channels between them are bold, and the anchorages under their lee good, in from 7 to 12 fathoms water; but if you are proceeding for Chester between Green and Duck Islands, you must beware of the Outer Ledge, which always shows itself by breakers; the mark to lead clear through this passage, is Chester church well open of Great Tancook Island; this mark will also carry you safe to the Westward of the Bull Rock, already described; and when you get near, or within half a mile of Tancook Island, steer out Westward, and bring the same church to bear about North, and this will lead you up to the town.

LUNENBURG BAY, called also Malaguash, is now a place of great population and considerable trade; vessels, carrying wood, cattle, vegetables, &c., are constantly employed from here to Halifax; the harbor is very easy of access, and there is good anchorage to the very town. At its entrance lies Cross Island, about 30 feet high, and containing 253 acres of land, on which a light-house, painted red, is erected, containing two lights, one 30 feet above the other: the lower one is fixed, the upper one is flashing or darkened at intervals of one minute: the building is red. Crop Island is low and thickly covered with trees. On the N.E. side of this island is a nook, where coasters ride in safety; off this part lie the Hounds Rocks, which, in passing, must have a berth; the West and South sides of the island are bold; and two miles from its Southern end is an excellent fishing-bank, with from 14 to 17 fathoms water. There are good channels on either side of Cross Island.

Vessels sailing in or out through the Northern passage, should endeavor to keep about the middle of the channel, in order to avoid the shoals and rocks above mentioned, and also those adjacent to the opposite, or Colesworth Point; having passed these, you should keep the Northern shore on board, bringing Battery Point to bear nearly N.W., by which you will also go clear of the Sculpin or Cat Rock.

The Sculpin or Cat Rock lies nearly in the middle of the bay, bearing N.E., distant three-quarters of a mile from Ovens Point; according to Des Barres, there are but three feet over this danger, but it will easily be discovered by the breakers over it at low-water. Sailing through the Western channel, which is to be preferred, you should endeavor to steer N.N.W. between Cross Island and Rose Point, where you will have 10 and 12 fathoms water; keep the town of Lunenburg in sight, over the low land to the Eastward of Battery Point, and this will lead you clear of the rocky reefs about the Ovens Point; but beware lest you lessen your water below 7 fathoms, for the soundings about the point are very irregular; bring the wagon-road at Lunenburg open to the Westward of the Battery Point; and this will run you to the Westward of the Sculpin, and between it and a rocky knoll of 4 fathoms water; having passed the Sculpin, haul up towards the Northern shore, until you bring Moreau and Battery Points in one; this being the direct mark for the Sculpin Rock, steer on in the direction of the Battery Point, approaching it no nearer than a cable's length; then round Battery Point, and bring the road well open of the Moreau Point: this will run you clear into the harbor, and between the Long Rock and the shoals off Battery Point, when you may direct your course for the town, where you will find 12 and 13 feet water alongside the wharves, and near to them 20 and 21 feet, soft muddy ground, and perfectly secure.

Vessels having occasion to go to the Southward of the Long Rock, which is the wider and safer passage, will observe there is a reef runs out from Woody Point called the Shingles, which must be carefully avoided; to do this, when you have so far entered the bay as to be equidistant between the Ovens, which are hollow cliffs, Battery and Woody Points, then edge off a little to the Westward, until you bring a farm-house that stands over the middle of Sandy Bay on with the end of a wood close to an opening like an avenue, bearing N.W. $\frac{1}{2}$ N.; steer with this mark on, until the West end of Lunenburg Town comes over Morean Point; then steer North-eastward a little, approach Battery Point, and proceed as before directed.

The best anchorage in the Bay of Malaguash or Lunenburg, is on its Western side, about half a mile from the shore, and nearly midway between Ovens and Woody Points; where, with good ground-tackling, you may safely ride out a South-easterly gale; but the bottom is generally rocky and uneven. It is high-water, full and change, at 9 o'clock.

*High-water.**Dartmouth Bay.*

DARTMOUTH BAY.—This is situated between Ovens and Rose Points; there are some settlements about the shores, and on an island at the bottom of the bay. It is easy of entrance, and you may anchor abreast of this island in 3, 4, 6, or 7 fathoms. In sailing into this bay, it will be always advisable to borrow somewhat towards the Rose Point shore, because of the shoals which lie to the Southward of the Ovens Point; there is otherwise no danger whatever.

From Lunenburg to the Iron-bound Island at the entrance to Le Have River, the shores are bold, and much indented with irregular islets or bays. Iron-bound Island lies about W.S.W. $\frac{1}{2}$ S., distant nearly two leagues from Cross Island. It is inhabited, and some small rocky islets surround its Northern shore; S.E. $\frac{1}{2}$ E., $\frac{1}{2}$ mile from this island, is a bank of 20 and 25 fathoms; and W.S.W., three-quarters of a mile from that, is a small spot of 15 fathoms. These have from 30 to 40 fathoms about them.

Le Have River.

LE HAVE RIVER.—Vessels coming from the South-eastward for Le Have River, will not fail to discover Cape Le Have, a steep abrupt cliff, 107 feet high, bearing W. $\frac{1}{2}$ S., about 12 leagues distant from Sambro light-house. S.E. by S., one mile from the cape, is the Black Rock, 10 feet high, and 100 feet long, with deep water all round it, and 9 to 11 fathoms between it and the shore, except on a small knoll lying off, and opposite to the cape, over which there are only 4 fathoms. W. by S., distant 34 miles, is Indian Island; and to the Northward of the cape lie several islands, with passages between them; but the best entrance to the River Le Have is to the Northward of them all. There is also a channel to the Northward of Iron-bound Island, but it is narrow, and to navigate this, you must give the Iron-bound Island a good berth. You will then have from 12 to 4 fathoms water all through it; but the best passage is to the Westward of the island, which is above one mile and a half broad, and has from 10 to 14 fathoms water within it. About 3 miles to the North-westward of Iron-bound Island, is a bar which runs across from shore to shore. Over this are 12 and 15 feet, the deepest water being one-third across from the Eastern shore. The soundings from Iron-bound Island towards the bar are 11, 14, 12, 9, 7, 6, 5, 4, and 3 fathoms, the latter depth being close to the edge of the bar; but when you are well over that, you drop into 4, 5, and 6 fathoms, the river continuing navigable 12 miles up, or so far as the falls. The general width of the river is half a mile, and when you are 8 miles up it, you will meet with the road from Lunenburg to Liverpool, where a ferry is established.

Light.

On the Southern side of Iron-bound Island, there is a light-house; it is a square white tower, the lantern is 70 feet above high-water mark; the light flashes once in 30 seconds.

Within and to the Westward of Cape Le Have is Palmerston Bay, at the head of this is Petit Riviere. Off the Eastern entrance of this bay lies Indian Island, bearing W. by S., distant 34 miles from Cape Le Have.

Port Metway.

PORT METWAY lies between Cape Le Have and Liverpool Bay; and is a place now rising into considerable consequence on account of its navigable capacity, and its convenience to the fisheries. The entrance to this port bears from Indian Island W. S.W., distant 7 miles, the land to the Eastward of it being remarkably broken and hilly. On the starboard point of the entrance lies Frying-pan Island, which is connected by a sandy reef to numerous islets which stretch along in a N.N.E. $\frac{1}{4}$ Northernly direction, until they join the main-land. That which is next to Frying-pan Island is commonly called Glover's Island, and lies half a mile to the Northward, and bears S.E. $\frac{1}{2}$ S., a good mile and a half from Metway Head. The entrance to this port may be known by the high land at Cape Metway, and the low ragged islands before mentioned. The width of the channel is about seven-eighths of a mile, and the depth of water from 5 to 14 fathoms. Directly in the way of your making for the entrance of the channel, lies the South-west Ledge and the Stone Horse Rock. The former bears from the Frying-pan Island S. $\frac{1}{2}$ E., distant three-quarters of a mile; there are 19 feet

water upon it, and Rock, lies E. by low-water. The should you pass which runs out fr out the best cou pass in 12 and 1 pentelt Head, yo will avoid the S ward, by bringin land to the East mile, steer in N. water upon it, and the sea, in rough weather, breaks over it. The latter, or Stone Horse Rock, lies E. by S., distant one-third of a mile from the S.W. Breaker, and dries at low-water. There are 6, 7, and 8 fathoms between it and the Frying-pan Ledge, and should you pass this way, you must give the island a good berth, on account of a spit which runs out from it, in the direction of the Stone Horse Rock, a full quarter of a mile; but the best course will be half a mile outside of both these dangers, you will then pass in 12 and 14 fathoms water, and running on W. a little Southerly, towards Kempenfelt Head, you will open the channel, and may steer in directly North. Or, you will avoid the South-west Ledge and Stone Horse Rock, in coming from the Eastward, by bringing the Liverpool light-house, which stands on Coffin Island, open of the land to the Eastward of it; and when Frying-pan Island comes N.N.E., distant 14 mile, steer in N. $\frac{1}{4}$ E.; this will carry you past Metway Point, and when opposite to Neil's Point you may anchor in 4 or 4½ fathoms water. From hence mud-banks considerably narrow the passage, and a pilot will be found necessary; but should you proceed further without one, you will continue mid-channel from abreast of Neil's Point, N.N.W. $\frac{1}{4}$ N., until Collin's Island bears West, and until Alicia River is just opening of Point Lucy, then steer N.W. by N. and W.N.W. $\frac{1}{4}$ W., and anchor in 3 or 4 fathoms, muddy ground.

Light-house.

To run up Alicia River, you must sail between Grass Island and Point Lucy, keeping close to the Southern and Western shores, in order to avoid the flat which extends from the Northward, leaving a deep but narrow channel. Barry Bay, or Branch, which runs up to the Westward, is shallow and full of rocky shoals; and so is Brier Bay, which is situated on the N.E. side of the port. The tide runs commonly with great strength, and it is high-water at 45 minutes after 7.

At Cape Le Have it is high-water, full and change, at 8 o'clock, tide rises from 5 to 7 ft. *Tides.*

Malaguash Bay.....	6 to 8
Green Island.....	6 to 8
Mahone Bay.....	7

LIVERPOOL BAY.—The entrance to this bay bears about W. by S., distant 17 or 18 leagues from Sambro light-house, Halifax; and W.S.W. $\frac{1}{4}$ W., 15 miles from Cape Le Have. Before it lies Coffin's Island, which is now distinguished by a light-house, painted red and white horizontally, 80 feet above the level of the sea. The light is on the revolving principle, and appears full, at intervals of 2 minutes. Between this island and the Western land is the bay, affording good anchorage for large ships, especially with the wind off shore. In the bay there is sufficient room for turning to windward, and the deepest water will be found near the Western coasts. The land in the vicinity of the harbor is broken, rocky, and of a barren appearance, yet the commerce of the town is very considerable. The channel to the Northward of Coffin's Island is shallow, having a sandy spit, running from it and joining the main-land; therefore none but small vessels ever attempt it; but the passage to the Southward is full one and a half mile wide, and has 15, 16, 17, and 18 fathoms water. Give the light-house point of the island a small berth, as a flat of 3 or 4 fathoms encompasses it, and there is no other danger. Bald Point, or Western Head, is bold to, and rendered remarkable by its having no trees upon it. Having entered this bay, and passed between Coffin's Island and Moose Head, bringing the light-house to bear E. by N., distant 14 mile, steer W. This will bring you abreast of Herring, or Schooner's Cove, situated on the N.E. side of the bay, and affording good shelter from sea-winds in 3 fathoms water, on a bottom of mud; or, proceeding further, vessels of two or three hundred tons, with high-water, may pass over the bar, which stretches from Fort Point to the opposite shore; but at low-water this cannot be done, for then it has not more than 9 or 10 feet over it. When within the bar, you will perceive the channel winds South-westerly, and you can anchor, in not less than two fathoms, opposite the town of Liverpool. Herring Bay is much exposed to the heavy South-westerly swells of the sea, and has not room for more than two sloops of war.

Light-house.

On Fort Point there is a fixed light in a square white tower, 30 feet high. *Light.*
It is high-water in Liverpool Bay, full and change, at 50 minutes after 7, and the *Tides.*
tides rise from 5 to 8 feet.

PORT MATOON, or MOUTON, called by Des Barres, Gambier Harbor. This *Port Ma-*
port is formed by the Island Matoon, which lies across its entrances, dividing it into *toon,* or
two channels. In the Eastern passage lies the rocky ledge called the Portsmouth, *Mouton.*
or Black Rocks, partly dry. This is about one mile to the Eastward of the island,
and lies S.W. by W., distant 5 miles from Bald Point. The passage on either side of
the ledge has deep water, with sufficient room to turn into the harbor. From the
N.W. part of Mouton a shoal runs off a full mile, having 2½ fathoms near its outer
extremity. Over some parts of this shoal you will have 3, 3½, and 4 fathoms. Here
also is a small spot of foul ground with 20 feet over it; this lies N.N.W. $\frac{1}{4}$ W. from

the N.W. end of Mouton Island, and N.E. $\frac{1}{2}$ E. from the Northern Spectacle Island, distant half a mile. The Spectacles lie to the W.N. Westward of Mouton Island, and are visible as you enter the port. To the Northward and Westward of them, are 10, 11, and 12 fathoms water, muddy and sandy ground, with good anchorage, secure from all winds. To sail into Port Mouton by the Eastern channel, and with a leading wind, to the Northward of the Black Rocks, you may steer in W. by N., passing at the distance of three-quarters of a mile from White Point, until you bring the Spectacle Islands to bear S.S.W. $\frac{1}{2}$ W.; this will carry you clear to the Northward and Westward of Mouton Island N.W. Shoal, then haul up S.W. by W. for the anchorage before mentioned. To sail in to the Westward of the Black Rocks, you should steer in N.W., mid-channel, or nearly half a mile from Mouton Island. In this passage you will find from 8 to 15 fathoms water; always giving the Southern part of the island a berth, on account of a sandy flat which runs off it. In adopting this channel, mariners must look out for a small knoll of 6 feet, said to lie E.N.E. $\frac{3}{4}$ E., distant one mile and a half from the Southern extremity of Mouton Island. This appears to be a modern discovery.

The Western passage to Port Mouton is between the island and the main, and only frequented by coasters and vessels of a small draught of water. It is encumbered with shoals, and too intricate for strangers. The channel is narrow, and close to the main-land, passing between it and the Bull Rock; having passed which, you can proceed to the anchorages, either off the N.W. shore, or Mouton Island, or round the Spectacles.

The land now turns S.W. $\frac{3}{4}$ W. from Point Mouton towards Port Jolie; midway is a black craggy point, with several rocks about it. S. $\frac{1}{2}$ E., distant 2 $\frac{1}{2}$ miles from Black Point, and S.W., 1 $\frac{1}{2}$ miles from Liverpool light-house, lies Little Hope, an island 21 feet high, and 200 fathoms long. This is a very great danger, and should have a beacon to distinguish it; round the island is a shoal ground, partly drying, and with 3 and 4 fathoms upon some parts; it lies direct E.S.E. from the Eastern point of the entrance to Port Jolie, from which it is distant 2 good miles. Between the island and point, somewhat nearer to the latter, there is said to lie a dangerous shoal, not hitherto noticed in the charts.

Port Jolie is an inlet more than 5 miles deep, but very shallow, and having scarce water enough for large boats; the lands adjacent appear barren and stony, yet have some families of fishermen settled there. Nearly South from the Eastern point of Port Jolie, distant one mile, is a spot of 3 fathoms, over which the sea commonly breaks; and on the Western entrance of the port are some rocky ledges, which show themselves by the breaking of the water over them. There is also a small island, lying to the South-westward, called the Little or Lesser Hope.

Port
L'Ebert.

PORT L'EBERT.—This is the third inlet West of Liverpool, and may readily be known by the steep and abrupt appearance of its Western head; and also by Green Island, which lies to the South-westward of its entrance. This island is somewhat remarkable, being destitute of trees. Port L'Ebert is divided from Port Jolie by a peninsula, which, at the head of the respective ports, is scarcely half a mile across. The channel in runs nearly North 6 or 7 miles; but although small vessels may run a considerable way up, ships of larger size can only find anchorage at its entrance. The depth, half a mile from the head, is from 9 to 12 feet; but at the mouth of the port are 6, 4, and 3 fathoms.

Sable River.

SABLE RIVER lies to the South-westward of Port L'Ebert, distant 5 miles. At its entrance, nearly midway of the channel, is a rocky islet. This lies S.W. by W. of Green Island, distant 3 $\frac{1}{2}$ miles; there is a passage on either side of the rock; that to the Eastward has 12, 13, and 15 fathoms water, but that to the Westward is somewhat shallower. The two points of the entrance of this river are distant from each other one mile and a quarter, with from 6 to 11 fathoms; but there is a bar which renders this place totally unfit for affording shelter to any but the smallest class of vessels. It is, however, not destitute of inhabitants, some of whom are settled in a small nook close to the Westward of the river, which is called the Little Harbor.

Rugged
Island Har-
bor.

RUGGED ISLAND HARBOR lies W. by S., distant 15 miles from the Hepe Island, and E.N.E., 9 miles from Shelburn light. It seems to have been so named from its craggy and rugged appearance, and the numerous dangerous ledges and sunken rocks at its entrance. This harbor is difficult of access, and seldom resorted to unless by the fishermen, who are familiar with its navigation, yet the anchorages are good, with 4 $\frac{1}{2}$ and 4 fathoms. During gales of wind, the unevenness of the ground frequently causes the sea to put on a most formidable appearance, breaking violently from side to side. Off the Western head, distant about a mile, is the Gull, a bed of rocks, over which the water always breaks; but between the land and the Gull are from 6 to 8 fathoms. Vessels coming from the Eastward will perceive St. Thomas's or Rugged Island, lying S.W. by W. from Green Island, distant 6 $\frac{3}{4}$ miles. This island, having high rocky cliffs on its Eastern side, affords a good mark for the harbor. To the S.

W. of Rugged Island are some rocky ledges. The outermost of these is called the Bear Rocks, being distant from the island three-quarters of a mile. Between Rugged Island and the Bear Rocks are other dangers; and a little Westward of the Bears is a sunken rock; these three latter lying in a sort of triangular form. W. by N. from the Bear Rock, distant one mile, is the Blow Breaker, a rock with only 4 feet over it. This appears to be the Tiger of Des Barres, by whose description it should bear South from Rugg Point, which is the Eastern boundary of the harbor. To sail from the Eastward for Rugged Harbor, you will see the Eastern cliffs of Rugged Island bearing North, distant $1\frac{1}{2}$ mile. Keep a good look-out for the Blow, or Tiger Rock, and pass well to the outside of the foregoing dangers; and having cleared these, haul up N.N.W. for the islands on the left or port side of the harbor. In so doing, you must be careful to avoid a shoal which stretches half way over from the starboard shore, narrowing the channel very considerably, so that between the shoal and Muffatt Island, the passage is not above a quarter of a mile wide. Pursuing this direction, you will readily reach the anchorage in the Northern Arm. In the best of the channel, Centre Island will be just open of Muffatt Island. Small vessels may be well sheltered within Cubb Basin, which is to the Northward of Muffatt Island; and vessels coming from the Southward or Westward will have deep water on either side of the Gull Rocks, or between the Bear and Blow Rocks. On the Gull Rock there is a fixed light, 51 feet high. At Cape Negro and Rugged Island Harbor, it is high-water, full and change, at 8 o'clock; and the rise of the tide is about 7 feet.

GREEN HARBOR.—This port is to the Westward of Rugged Island Harbor, having an island on its Western side of entrance, and running in full 3 miles. This and the River Jordan, situated still further to the Westward, appear to be places where good anchorages may be obtained, but they are at present little frequented by shipping, although they have many inhabitants. They are open to Southerly winds, which cause a heavy rolling sea.

SHELburne HARBOR, or PORT ROSEWAY, is, according to Mr. Lockwood, justly esteemed the best in all Nova Scotia, from the ease of its access, and perfect security of its anchorage. At the entrance of the harbor is the island of Roseneath, or M'Nutt's, which is nearly 3 miles in length, and $1\frac{1}{2}$ in its broadest part. On the S.E. point of this island stands an excellent light-house. This point is a high cliff of white rocks, the summit of which is without trees; the West side of the island is low. The light-house is painted black and white, vertically, and has a remarkable appearance in the day-time, on account of a dark wood that is behind it; while, at night, two lights are exhibited from it. The upper light is 100 feet above the level of the sea, and the lower about one-third from the top of the building. This light-house bears from the light-house of Sambro W.S.W., distant 30 leagues; from Cape Negro N.E. $\frac{1}{2}$ N., 7 miles; from Point Beny S.W. $\frac{1}{4}$ S., $2\frac{1}{2}$ miles; from the breakers South-west of Rugged Island W.N.W. $\frac{1}{4}$ W., 8 miles; and from the Jigg Rock, which has only 6 feet over it, N.N.E. $\frac{1}{2}$ E., 11 mile. When coming in from sea, make for the light-house, bringing it to bear N.W., or N.W. by N.; then steer directly towards it. The dangers to be left to the Eastward of you, are those adjacent to the Rugged Rocks already mentioned, the Bell Rock, which is always visible, appearing black and bold to, lying E.N.E. $\frac{1}{4}$ E., distant $2\frac{1}{2}$ miles from the light-house. In coming from the Westward, you may steer for the entrance on either side of the Jigg Rock; and if for the Eastward, on either side of the Bell Rock. When you get abreast of the light-house, you may sail in to the Northward of M'Nutt's Island, about N.W. by N., keeping nearly in mid-channel; the island's side is bold to, and the anchorage is good, in 7, 8, or 10 fathoms, the bottom mud; keep the Western shore on board, for there is a shallow spot somewhere about the Eastern side, between George's and Sandy Points. Sandy Point is about two miles beyond the N.W. part of M'Nutt's Island; give it a berth for a sandy spit extends from it 300 yards. With M'Nutt's Island locked to this point, the anchorage is exceedingly good, and shipping may, with good ground tacking, ride in safety during the most violent storm. In the channel, about S. by E., distant nearly one mile from Carlton Point, lies the Adamant Rock, abreast of Durfey's House. This will easily be avoided by going into no less water than $4\frac{1}{2}$ or 5 fathoms, or by keeping Petit's Island open of Surf Point. The inlet which runs up to the N.W. has several shoals in it, but the Eastern shore has regular soundings, from Sandy Point upwards, and is free from danger, while in the upper part of the harbor, above Carlton Point, vessels may ride in 5, 6, or 7 fathoms, the ground holding well. We have already stated, that your course from the entrance towards Sandy Point, will be about N.W. by N., and having rounded Sandy Point, you can proceed N. by W. and North, according to your wind.

In coming from the Eastward of this harbor, be careful to avoid, and give a good berth to, the shoals off Rugged Island; and do not haul up for the harbor until you get the light-house to bear W. by N. $\frac{1}{4}$ N., by which precaution you will go clear of

Light.
High-water.
Green
Harbor.

Shelburne
Harbor.

Light-house.

every danger; or you may stop a tide at the entrance, in from 16 to 10 fathoms, sand and clay.

Shelburne affords excellent shelter for ships in distress, and is secure against any wind, except a violent storm at S.S.W. abreast of the town. The wind from S. to E. does no harm, although from S. by W. to S.W. by S., if blowing hard for some considerable time, it will set the smaller vessels adrift at the wharfs; but in the stream, as has been observed before, with good cables and anchors, no winds can injure you. Here you may be supplied with cordage, duck, spars, provisions, and water. Carpenters, pump, block, and sail makers can be obtained, if required; and the port charges for vessels which put in for supplies only, is no more than 4d. per ton, light money, on foreign bottoms; but should you enter the custom-house, the duties become much higher. It is high-water, full and change, at 8 o'clock; spring tides rise 8 feet, neaps 6, but a fresh breeze from the South-east commonly brings on high-water sooner, and causes an additional rise of 2 or 3 feet.

High-water.

Cape Negro Harbor.

CAPE NEGRO HARBOR is named from Cape Negro, the Eastern limit of an isl. and which lies before its entrance; this cape is remarkably high, rocky, and barren, bearing S.W. $\frac{1}{2}$ S., distant 7 miles from Shelburne light-house; this island is very low midway, and has the appearance of being two islands. There are two passages into the harbor, one to the Eastward of the island, and the other to the Westward of it: the former is much the better of the two, but this is rendered dangerous, on account of two sunken rocks which lie off its entrance; these are called the Gray Rock and the Budget: the Gray Rock lies N.N.E. from the cape, distant a full mile, and is situated nearly on the starboard side of the channel; some parts of these rocks are always visible, and serve as a mark for the harbor. The Budget is a blind rock of 6 feet, lying nearly mid-channel, and only a quarter of a mile from the island, having deep water round it. In the channel to the Eastward of the Budget you will have 10, 12, and 14 fathoms, and the best direction to enter the harbor will be to steer one-third from the rocks off the Eastern point, until Shelburne light-house is shut in, then you will be within the danger. There is excellent anchorage off the N.E. part of Negro Island, in from 6 to 4 fathoms, on a bottom of stiff mud. The Northern part of the island presents a low shingly beach, from which a bar extends quite across to the Eastern shore, over which are 15 feet at low-water; above this bar it is navigable full 6 miles, having a smooth clayey bottom, with 3, 4, and 5 fathoms water.

The passage to the Westward of Negro Island, is intricate, encumbered with rocks and dangers, and should not be attempted except in cases of extreme emergency. Mr. Des Barres says, "if coming from the Westward, in hauling round Point Jeffrey, to avoid the ledges, blind rocks, and shoals, extending Easterly from the Western shore, you should shape your course N.N.E. $\frac{1}{2}$ N. towards the cape, giving the Sarge Rocks a berth of 3 cables' length, until you open David's Island a sail's breadth off Point William; Davis's Island is the largest and Westernmost at the head of the harbor; run up in that direction, observing to keep clear of a sunken rock which lies E.S.E. from Point William, about 300 fathoms from the above. Fishery beach is bold to."

To sail through the North-east passage, which is not so difficult, keep Gray's Rocks on board, and steer N.W. for Point John, until you see across the isthmus in the middle of Cape Negro Island, or until Shelburne light-house is shut in, and having passed the Budget; from thence haul over to the Westward, keeping along the shore about 2 cables' length from the island, to avoid the shoal, which extends half the distance over from Point John towards the island; and when you have opened the small islands at the head of the bay, shape your course N.N.W. to the anchoring ground, the bottom is mud and clay; along the N.E. side of Cape Negro Island, the anchorage is good stiff clay.

The River Clyde, which descends from a chain of lakes that extends E.N.E. and W.S.W. a considerable distance in the interior, falls into the head of Negro Harbor, after a run of 23 miles.

Port Latour, or Haldimand.

PORT LATOUR, or HALDIMAND, is situated a little Westward of Negro Harbor, being separated from it by a narrow peninsula; the extreme points which bound the entrance to the Southward, are Point Jeffrey, or Blanche Point, to the Eastward, and Point Baccaro to the West; between and within there are several clusters of rocks, rendering the harbor unfit for any but small craft; and the tide leaves the head of the inlet dry in many places. "To sail into this port, coming from the Westward, continue your course Easterly, until you have Brehem Isle a ship's length open to the Eastward of North Rocks; thence you may steer Northerly for Isle George, and when you come up within the distance of 2 cables' length from its South end, incline to the Westward in a direction with the Western extremity of Pond Beach, until you open Prospect House on the North side of the Northernmost Mohawk Ledges, and then haul into anchorage, in 3 fathoms, muddy bottom.

"Nearly mid-sunken rock, w Vulture, a danger BARRINGTON

THE BRAZIL, which are only 8 s having 6 to 8 fath makes the rock aj stance of about a m nearer to it; but to 15 fathoms; you at the edge of the direction of the Banks this latter depth yo nil Rock bears from in 43° 24' 15" N., t

Nearly midway between Baccarro Point and the South Ledge lies the Folly, a sunken rock, within which and the Western shore is a channel of 6 fathoms. The Vulture, a dangerous breaker, lies W.S.W. $\frac{1}{2}$ S., 13 mile from Baccarro Point."

BARRINGTON BAY.—This is a spacious inlet, situated to the Westward of Port Barrington Bay. Latour, and formed by Cape Sable Island, which lies in front of its entrance; there are two passages into it, that to the Eastward is between Baccarro Point and Sable Island, being at its entrance 3 miles wide; that to the Westward is not more than a mile broad; both are encumbered with numerous and extensive flats, narrowing the passages, and rendering the navigation dangerous; for although the channels may generally be discovered, by the water appearing dark, yet it will require a leading wind to wind through to the anchorage, which is towards the head of the bay, and about one mile and a half below the town; here there are from 18 to 26 feet water. The passage to the Northward and Westward is used by small vessels only, and is not safe without a commanding breeze, as the ebb-tide is forced unnaturally through to the Eastward, by the Bay of Fundy tide, at the rapidity of 3, 4, and sometimes 5 knots an hour; setting immediately upon the rocks which lie within it.

On Baccarro Point, the Eastern side of the entrance, there is a flash light of 15 seconds' duration, with eclipses of 25 seconds from it. Cape Sable bears S. 77° W., distant $7\frac{1}{2}$ miles; Brazil Rock, S. 4° $10'$ W., distant $5\frac{1}{2}$ miles; Bantan Rock, S. 45° W., distant $1\frac{1}{2}$ mile.

The town of Barrington is situated at the North-eastern extremity of the bay. Vessels entering into this bay by the Eastern passage, must be very careful to avoid Baccarro Point, giving it a wide berth of full 2 miles on account of the Bantan, Shot Potob, the Vulture, and other rocks which lie off it; the Vulture rock is very dangerous, and lies W.S.W. $\frac{1}{2}$ S. from Baccarro Point, distant 13 mile; the Bantan bears S.W. from the point $1\frac{1}{2}$ mile, and from the Vulture S.E. almost one mile; they are both exceedingly dangerous.

CAPE SABLE is the South-eastern extremity of a small narrow island which is separated and distinct from Cape Sable Island; it is low and woody, but the cape itself is a broken white cliff, apparently in a state of decomposition, and visible 4 or 5 leagues off; from this island spits of sand extend outward, both to the South-east and South-westward: the Eastern Ledge is called the Horse-shoe, and runs out $2\frac{1}{2}$ miles S.E. by S.; the Western or Cape Ledge stretches to the S.W. about 3 miles. The tides, both flood and ebb, set directly across these ledges at the rate of 3 and sometimes 4 knots an hour, causing a strong break to a considerable distance, particularly when the wind is fresh; it will then often extend full 3 leagues out, shifting its direction with the tide, the flood carrying it to the Westward and the ebb to the Eastward, the former running a considerable time longer than the latter. This rippling or breaking of the water, may be considered hazardous to pass through in a gale of wind, but there is not less than 8, 10, 13, and 20 fathoms, rocky ground.

It is high-water, at Cape Sable, full and change, at three-quarters after 7 o'clock, High-water. and the spring tides rise 12 feet, neaps 6.

BONNETTA COVE.—To the North-westward of Cape Sable is a small island, Bonnetta called Green Island, to the North-east of which an inlet runs in to Cape Sable Island, forming Bonnetta Cove, where good anchorage may be found in 3 fathoms water; the entrance to it is narrow, and runs in between a spit and the island; this will be too difficult for a stranger to discover, but is frequented by the coasters and fishermen.

FAVORITE COVE is situated in the Western Channel, and about the middle of Favorite Cape Sable Island; here also small vessels may run in and anchor in 2 fathoms, behind a small islet which lies mid-channel, at its entrance, affording a passage on either side, but that to the Eastward is the best, and has the deeper water. With S.W. gales there is always good anchorage off the N.E. side of Cape Sable Island; but the Shag Harbor, which lies on the opposite side of the Western Channel, and bears N.N.W. from Bonnetta Cove, is full of shoals, and must not be attempted unless you are well acquainted with it. It is high-water, full and change, at 9 o'clock, High-water. Spring-tides 11 feet, neaps 8.

THE BRAZIL ROCK.—This is a flat rock, covering a space of 10 yards, over Brazil Rock. which are only 8 and 9 feet at low-water; a tail extends 90 to 100 yards from its base, having 6 to 8 fathoms water: the tide running strong over this, causes a ripple and makes the rock appear larger than it really is. Southward of the rock, at the distance of about a mile, you will have 35 and 34 fathoms, then 30 and 22 as you approach nearer to it; but towards the Cape Sable shore the soundings are regular, from 19 to 15 fathoms; you will then lessen your water to 10 and 7 fathoms, when you will be at the edge of the Race-horse Shoal; to the Northward of the Brazil Rock, in the direction of the Bantan Rock, you will have 16, 19, 15, 17, 16, 15, and 10 fathoms; with this latter depth you will be near the Bantan, and must tack to the Westward. Brazil Rock bears from Baccarro Point light S. 4° $10'$ W., distant $5\frac{1}{2}$ miles: its latitude is 43° $21'$ $15''$ N., and longitude 65° $22'$ W.

THE ISLE OF SABLE AND BANKS OF NOVA SCOTIA.

THE dry part of this island is 22 miles long, and the bars at each end nearly 30 miles, making a bow or crescent of 52 miles in length. Caught within the horns of this crescent in a strong Northerly gale, the situation of a vessel would be extremely perilous; for the ebb-tide sets to the Southward, directly on and over the bars, usually at the rate of 1½ and 2 knots, and when accelerated by winds much faster; whilst the flood-stream runs at a much less rate in the opposite direction.

Bars.

The whole extent of the North-west bar, from the end of the Grassy Sand-hills to the depth of 10 fathoms, is nearly seventeen miles; the dry part being succeeded by nine miles of foaming breakers in bad weather, and the remaining seven miles, from five to ten fathoms of depth, being usually shown by a great ripple, or a heavy cross sea.

The direction of this bar is N. W. ¼ N. magnetic, for the first twelve miles, then W. by N. for the remaining distance; beyond which the water deepens gradually to the Westward for many miles.

The North-east bar extends fourteen miles out from the Grassy Sand-hills to the depth of ten fathoms. Its direction is N. E. by E. ¼ E., for the first seven miles, beyond which it curves gradually till it terminates to E. S. E.

The dry part of nearly four miles is succeeded by eight or nine miles of breakers, when there is any sea running. I have considered this bar as ending at the depth of ten fathoms, but the ridge of sand continues, with a depth of from ten to thirteen fathoms, and often a heavy breaking sea, ten miles further to E. S. E., and then ends abruptly; the soundings increasing to 170 fathoms, in a distance of three miles further in the same direction.

Both bars are extremely steep, and consequently dangerous of approach on the North side; the North-east bar, especially so, having thirty fathoms of water close to it. To the Southward, on the contrary, the water deepens gradually out for so many miles, that it would seem almost impossible for any vessel, using common precaution, to run on shore on that side, either of the island or bars.

Lat and Lon.

The West Flagstaff near the principal establishment is in lat. N. 43° 56' 33", long. W. 60° 3' 19". The West extreme of the Grassy Sand-hills, lat. N. 43° 56' 52", long. W. 60° 09".

Tides.

N. E. extreme of the Grassy Sand-hills is in lat. N. 43° 59' 05", long. W. 59° 46' 0.15".
TIDES.—It is high-water, at full and change, at 7h. 30m. nearly, on the North side of the island; rise not exceeding four feet. On the South side it is high-water a little earlier, perhaps an hour. The opinion of the people on the island is that anything floating in the vicinity of the island is sure to be found on the beach sooner or later. (Capt. H. W. BAYFIELD, R. N.)

Extract of a Letter from Capt. Joseph Darby, Superintendent of Sable Island, to the Editors.

"I have known the island for the last twenty-eight years, in which time the West end has decreased in length about 7 miles, although the outer breakers of the N. W. bar have the same bearing from the West end of the island that they then had, about

* This course cannot be sailed, upon account of the intervention of the land.

N.W. by compass, distant about 8 miles, which clearly shows that the whole of the bank and the bar travels to the Eastward. The ground is high, and the water shoal outside of the breakers 7 or 8 miles in a N.W. direction. The flood-tide sets across the bar to the Northward and Eastward very strong, and the ebb-tide to the opposite point, changing alternately at half flood and half ebb. The ground to the Southward and Westward of the bar is very regular, deepening very slowly to a considerable distance; but to the Northward and Eastward the ground is very steep, and from the breakers, or from very shoal ground outside of the breakers, you fall into deep water all at once. The bank to the N.W. is very uneven, and curves round to the Northward in a steep ridge, and at the distance of about 35 miles from the island, in a N.W. direction, are 10 fathoms water; and W.N.W. and E.S.E. from that the ground falls very suddenly into deep water. This ridge joins the middle-ground, and extends in an Easterly and a N.E. direction to a considerable distance, with shoal water; the bottom in small ridges, with 11, 12, 11, 13 fathoms water, and so on, over it; and between this bank and the bar, or the island, the water is very deep, 80 or 90 fathoms. The bank extends to the Eastward abreast of the island, the Southernmost edge of the bank, from 20 to 25 miles to the Northward of the island.

The East end is altered very little since my knowledge of it, except in height, which is much greater than it was, and the whole island seems to increase in height every year, but grows narrower. There is a low bar of dry sand running from the high land of the East end, in a N.E. direction, about 3 miles, from whence shoal water, that always breaks, extends about 2 miles further, in an E.N.E. direction, outside of which, for a distance of about 6 miles, is a passage across the bar, with from 24 to 3 fathoms of water on it. Outside of that, again, is a piece of high ground that always breaks, and is sometimes dry, and extends in an E.N.E. direction between 2 and 3 miles, from which the shoal ground continues in the same direction some miles further. The flood-tide across this bar sets very strong to the Northward, and the ebb-tide in the opposite direction, but not so strong. The soundings to the Southward and Eastward of the bar are flat and regular for a considerable distance, but to the Northward and Westward the ground is very steep—close to the breakers 10 fathoms, and goes down suddenly into 70 or 80 fathoms to 100 or upwards. I believe, in general, there is a very strong current setting to the W.S.W. between the Sable Bank and the Gulf of Mexico stream; and there is a strong current sets down the Western side of the Gulf of St. Lawrence stream, in a S.S.W. direction. The current along the South side of the island is very shoal water, runs both East and West, and is principally influenced by the winds. The most of the wrecks that happen here are in error of their longitude; for instance, vessels bound to the Eastward think themselves past the island when they get on shore upon it, and vessels bound to the Westward (say from Europe) do not think themselves so far to the Westward when they get on shore upon it. I have known several cases of vessels from Europe that have not made an error in their longitude exceeding half a degree, until they came to the Banks of Newfoundland, and from that here, in moderate weather and light winds, have made errors of from sixty to a hundred miles, which I think goes far to prove the existence of a Westerly and Southerly current between the Grand Banks and here, and also of the existence of a Westerly current between the Sable Bank and Gulf of Mexico stream, which will be stronger or weaker according to the distance between the stream and the banks.

When a casualty has occurred, and you find that you are on the body of the island, I would recommend that nothing of masts and rigging be cut away, without the vessel should be very tender, and then you may do it to ease her a little; but a vessel of ordinary strength will bear her spars until she heaves up on the beach, or settles in the sand and lies quiet, as lives and property have often been saved by a vessel having her spars standing, as from the heads of which you may often send a line on shore when it is not possible to work a boat; and by sending a good hawser after it and securing it well on shore, a chair or other more efficient article may be rigged for conveying passengers, or others, or valuable property, over the breakers in safety; as from the nature of the soft sandy bottom, a vessel will not go to pieces as soon as if she was on rocks, and by the rigging being left standing, it may afterwards be saved, whereas, if the masts are cut away, the whole of the rigging goes with them, and all get tangled and buried in the sand, and are generally totally lost. But if you are on either of the bars, the first consideration should be to secure the boats and lighten the ship, and leave her as soon as ever you have to abandon the hope of getting her off; endeavor to get to the leeward of the breakers, and land on the island, according to circumstances, endeavoring to land on the North side if possible, as vessels that get on the bars very soon disappear altogether, either by going to pieces in the irregular sea and strong currents, or by rolling over the steep bank to the Northward, and sinking in deep water. When property can be saved on the island, it is proper for the master and his crew to do the utmost in their power to save it; they can get the assistance of the people of the island, with a boat and teams of horses, not for hire, for they are employed by gov-

ernment, and the island draws a salvage of whatever may be saved on it, which is apportioned by the magistrates at Halifax; the more there is saved by the master and crew the less salvage will be taken; but it is very often the case that the crews will not assist to save property, and whatever is saved is done exclusively by the establishment, in which case the salvage is pretty high. There are buildings on the island for the shelter of persons cast away on it, with provisions for those who save none; also some buildings for the reception of perishable goods. These buildings, and whatever is put into them, are under the charge of the superintendent. All property saved must be sent to Halifax by the first opportunity: the master can keep inventories and continue with the goods if he likes, but he has no control over their destination; but I believe, by petitioning the governor at Halifax, he might get permission to take them where he pleases, on paying the duty and salvage. When any property is saved on the island, it is sent to Halifax, where it is advertised and sold by order of the commissioners, and the proceeds paid into their hands, out of which they pay the king's dues, the salvage apportioned by the magistrates, the expenses of freight and other small charges, and the residue is paid over to the master, or other authorized agent, for the benefit of the underwriters and all concerned. The superintendent is under the control of the governor and the commissioners, and can take no new step without orders from them. The above and before mentioned custom is an old and long established rule, and supported by many acts of the Provincial Legislature, and more particularly by an act passed the 4th day of April, 1836, and in the sixth year of his Majesty's reign, which does more fully explain and set forth the rules for the guidance of the establishment.

"The North side is very safe, as a vessel may approach any part of it within a mile, and vessels in distress might, by standing in on the North side and near the West end, where the principal establishment is, get a supply of fresh water or fuel, or a partial supply of provisions and fresh meat, except in cases of a strong breeze and in heavy sea on shore. There is no difficulty in working boats on this side of the island. The South side is also very safe to approach in clear weather, but from the heavy sea that constantly breaks on it, the communication with a vessel by boats is extremely difficult, except after a spell of Northwardly winds for three or four days, when the sea becomes smooth, and boats may work."

As when a vessel is on shore in a fog, it is of the utmost importance to ascertain her true position, in order to save the ship or the lives of those on board, the following directions should be attended to:

Directions. If breakers are seen to extend in a direction N.W. and S.E., you are on the N.W. bar.

If breakers are seen to extend W.S.W. and E.N.E., you are on the N.E. bar.

If breakers are seen to the Northward ahead, and extending from East to West, you are on the South side of the island.

Ice. If breakers are seen to the Southward ahead, and extending from East to West, you are on the North side of the island.

Ice.—H. M. packet brig Express fell in with two islands of ice on Sable Island Bank, the 7th July, 1836, in 45 fathoms water, estimated heights 180 and 150 feet. Latitude 43° 13' N., long. 25° 17' W. Air 46°, water 42°.

The Nova Scotia Banks extend nearly 70 leagues in a Westerly direction. From the Isle of Sable they are from 20 to 25 leagues wide, and their inner edges are from 14 to 18 leagues off shore. They are intersected by narrow winding channels (the bottom of which is mud) running N.W. and S.E. Between these banks and the shore are several smaller inner banks, with deep water and muddy bottom. The water deepens regularly from the Isle of Sable to the distance of 22 leagues, in 50 fathoms, fine gravel; thence proceeding Westward, the gravel becomes coarser, continuing Westward to the Western extremity of the banks, the soundings are rocky, and shoalen to 18 and 15 fathoms water. Cape Sable bearing N. by W., distant 15 leagues.

Soundings.

The South-west extremity of Banquereau lies seventeen leagues E.N.E. one half E. from the East end of the Isle of Sable. This bank extends E. by N. 35 leagues, and is near 8 leagues in width; its shoalest part is about 5 leagues from its Eastern extremity, in 16 and 18 fathoms water, slimy sand and clams; whence it deepens regularly every way to 60 and 70 fathoms, towards the edges of the bank.

This bank is steep to; and from its soundings on the North side, you fall immediately into 90 or 100 fathoms water, black mud; and on the South side, into 120 fathoms.

Soundings.

REMARKS.—It may be observed generally, that the soundings all along the Nova Scotian coast, between Cape Canso on the E.N.E. and Cape Sable to the W.S.W., are very irregular; from 25 to 40 and 50 fathoms; therefore, in foggy weather, do not stand nearer in shore than 35 fathoms, lest you fall upon some of the ledges. By no means make too bold with the shore in such weather, unless you are sure of

The weather on the coast is frequently foggy in the spring and some part of the summer; in particular at the distance of 4 or 5 leagues from the shore; but on approaching nearer, the weather is found more clear: and with the wind from the land, it is perfectly clear and pleasant.

BETWEEN CAPE SABLE AND SEAL ISLAND.

SEAL ISLAND is low and thickly wooded, with a light-house on its South end, *Seal Island*, exhibiting a fixed light, 98 feet above high-water.

The dangers off it are:—

PERDY ROCK bears from the light-house S.E. by E. $\frac{1}{2}$ E., rather more than 2 *Purdy Rock*, miles distant; it is of very small extent, and has only 11 feet on its shallowest part and deep water all round, but it shows a tide-rip during the strength of the tide, and breaks in heavy weather.

THE BLONDE ROCK, which bears from the light-house S. $\frac{1}{2}$ E., distant 3 $\frac{1}{2}$ miles, *Blonde Rock*, uncovers about 2 feet above low-water springs; it generally breaks, and can be passed to the Southward at a quarter of a mile distant. There is also a rock, with only 11 feet on it, the eighth of a mile to the Southward. About a mile to the Westward of the Blonde, there is a heavy breaking tide-rip during the strength of the tide, but the Columbia carried good water through it.

THE ELBOW SHOAL lies between the Blonde and Seal Island; it is of some *Elbow Shoal*, extent, and has a rock on it called the Elbow, with only 5 feet on its shallowest part at low-water, which bears from the light-house about S. by W., distant $\frac{1}{2}$ mile: the Eastern tangent of Seal Island on with the rock off its South point, leads to the rock. There is a heavy tide-rip over the shoal during the strength of the tide.

THE ZETLAND SHOAL, so called from a vessel of that name striking on it, and *Zetland Shoal*, reported one small rock with only 17 feet water over it; not less than 21 feet at low-water was found on it, which bears from the light-house S.W. $\frac{1}{2}$ S., nearly 2 miles. The shoal breaks in heavy weather and shows a tide-rip during the tide.

THE DEVIL'S LIMB is a small rock, about 10 feet above high-water springs, *Devil's Limb*, bearing from the light-house N.W. $\frac{1}{2}$ W., distant $\frac{1}{2}$ mile. At about a quarter of a mile to the Southward of the rock is a small detached shoal, which just uncovers at low springs, called the Loch Foyn, from a ship of that name which was wrecked on it; the passage between the Devil's Limb and Seal Island should only be used by those well acquainted with it.

THE LIMB'S LIMB, which lies upwards of half a mile to the Northward of the *Limb's Limb*, Devil's Limb, is small, with deep water close outside of it, and shows itself one hour after high-water; the Columbia mail steamer was wrecked on it.

Between the Limb's Limb and Crowell beach on Seal Island there is anchorage in 5 fathoms, over sandy bottom, and safe with all winds, except those between North and West.

THE MUD ISLANDS lie to the Northward of Seal Island, and consist of 4 small *Mud Islands*, islands, namely, Noddy, Mud, Round, and Flat; they all may be approached on their Eastern side, except the former, to which a berth should be given of half a mile, as many rocks lie off it within that distance. A shoal runs off about a third of a mile from the Northern end of Flat Island, and shows a heavy tide-rip during the strength of the tide. There is a good channel between Noddy, the Southernmost of these islands, and Seal Island; mid-channel is to be recommended to vessels passing through it, but in foggy or thick weather Seal Island's side is the best to make. About a third of the way across the channel from Noddy Island is a shoal on which Lockwood states are only 18 feet water; the least water that could be found on it was 5 $\frac{1}{2}$ fathoms, and it shows a tide-rip during the strength of the tide. The tide-stream sets strong through this channel, at a rate of about 4 knots per hour during its strength, in about a N.W. and S.E. direction. In fogs, however, it is better to go to the Southward of Seal Island and the Blonde Rock.

BLACK LEDGE lies to the Westward of Mud Island, and to the Southward of *Black Ledge*, Flat Island, and bears from the centre of Noddy Island N.W. $\frac{3}{4}$ N., distant $\frac{1}{2}$ mile; it is always visible, except at high-water springs, when it generally breaks.

THE SOLDIER'S LEDGE uncovers about 2 hours after high-water, and is very *Soldier's Ledge*, dangerous, but it generally breaks when covered. It bears from the North end of Flat Island about N.W. $\frac{3}{4}$ N., distant 2 $\frac{1}{2}$ miles. There is a passage between this ledge and Flat Island, but it had better not be used. This shoal is improperly laid down by Lockwood, and agrees nearly in position with the Acteon of Des Barres.

Mud Island, West Shoal. MUD ISLAND, WEST SHOAL.—To the Westward of Mud Island lies a shoal with only 21 feet on it at low-water springs, but it shows a tide-rip during the strength of the tide, and is said by people on Seal Island to break in very heavy weather. It should, however, be avoided by vessels of large draught, because, the bottom being very irregular, it is highly probable that the least water has not been obtained. The 21 feet bears from the light-house on Seal Island nearly North 5 miles, the light-house showing just open to the Westward of Division Point, and from the centre of Noddy Island N. W. by W. $\frac{1}{2}$ W. 24 miles. In running between Noddy and Seal Islands, the South side of this shoal should be passed.

The soundings between the Seal and Mud Islands and the main are irregular, varying from 22 to 6 fathoms water; the shoal patches show a tide-rip during the strength of the tide.

Stoddart Cove.

STODDART COVE.—From Bear Point to Stoddart Island is a bay full of rocks and ledges. This bay and the South point of Stoddart Island require a good berth. To the Northward of Stoddart Island is Stoddart Cove, which affords good anchorage in all weather for vessels of not more than 9 feet draught. The best entrance is the Western, keeping the island on board to avoid a rock off the Northern point of the entrance, which just uncovers at low-water springs, and has good water around it. It lies about a sixth of a mile from the point, and about half way between it and the shore is another rock, which shows at half tide.

Shag Harbor.

SHAG HARBOR lies between Bon Portage or Shag Harbor Island and the main, and affords anchorage for vessels of good draught with all but strong Southerly winds.

Cockerwit Passage.

COCKERWIT PASSAGE.—At the entrance of Cockerwit or Woods Harbor, and between it and the Mutton Islands, there is good anchorage in from 5 to 5 $\frac{1}{2}$ fathoms at low-water, over a muddy bottom. In the passage to this anchorage there is a rock to be avoided, which just uncovers at very low springs, and has deep water close to it. Robinson's Ball station (built of stone) on with the centre of Little Stony Island, leads right on it; and in running up, a house standing on the Northern end of Stoddart Island just open to the Eastward of a detached rock off Prospect Point clears it to the Eastward. Cockerwit Passage can only be used by vessels of small draught, from 8 to 9 feet water, and steered by experienced persons.

The passage to the Northward of Bon Portage Island, between it and Robinson's Ball, can only be used by small vessels.

St John Ledge.

ST. JOHN LEDGE is a dangerous shoal, which generally shows itself except at very high springs. It bears from the South-west point of St. John Island, S. by W. $\frac{1}{2}$ W., $\frac{1}{2}$ mile. Publico light-house open to the Westward of the island, bearing N. E. by N., leads to the Westward of the ledge.

Publico Harbor Light-house.

PUBLICO HARBOR.—A light-house has been erected on Beach Point, the Eastern side of the entrance to Publico Harbor, in the shape of the frustum of a pyramid on a square base, and exhibits a fixed red light, at about 28 feet above high-water. On entering this harbor, care must be taken not to pass St. Ann Point, on the Western side of the entrance, nearer than a quarter of a mile. Beach Point, a low shingle point on the Eastern side, has good water, and may be passed pretty close. A long ledge, which uncovers at low-water, runs off the Western side of the harbor, nearly abreast of Beach Point; a buoy is placed at its Eastern extremity, and should be passed at about half a cable's length to the Westward. After passing the buoy, haul a little more to the Westward, steering towards the church, which is a conspicuous object on the Western shore of the harbor, to clear a shoal which lies off the Eastern shore, and on which were found only 11 feet at low-water; the bottom is, however, so peaked and uneven, that it is possible there may be less than that given by the lead. A good mark for clearing the ledge off the Western shore, after rounding Beach Point, in case the buoy should not be seen, is the point to Southward of Beach Point, seen over the high-water line of Beach Point; this will also clear the ledge on the Eastern side before mentioned, but will lead rather close to it.

Vessels had better not proceed farther than the two Southernmost wharves, unless under charge of a good pilot; off these there is good anchorage in 9 or 10 fathoms over a muddy bottom, a little nearer the Western than the Eastern side of the harbor. The lead will give the best information at high-water when everything is covered, and which is the most difficult time to enter; but at low-water, when everything shows itself, the banks of the channel point out the anchorage.

A spring of fresh water close to the Southernmost wharf affords about four tons of very good water daily.

Directions.

DIRECTIONS.—Cape Sable bearing North 2 miles, a W. by N. course 16 miles, will lead a mile to the Southward of the Blonde Rock.

To pass between Seal and Mud Islands, keep the extremity of Cape Sable to the Northward of E. by N. $\frac{1}{2}$ N. until Green Island bears N. by E. $\frac{1}{2}$ E., this will clear the S. W. ledges; then haul up N. W. by W. 16 miles, which will lead through the channel about midway.

To pass to the Tusk, when the Island bears S. by

flows: Steer for V. by E. $\frac{1}{2}$ E., at a distance of half a mile from it; immediately to the

led to on the Eastern side nor less than 2 feet water on Island E. $\frac{3}{4}$ S., 1

When abreast of W., and run for the east of the latter distant; good anchorage.

To pass to the Northward of the Mud Islands and to the Southward of the Bald Tusket, when clear of the S.W. ledges, haul up N.W. $\frac{1}{2}$ N. 17 miles, and when Round Island bears S. by W. $\frac{1}{2}$ W., the vessel will be in the fairway.

If bound for Palmico Harbor, haul up N.N.W. $\frac{1}{2}$ W. 10 $\frac{1}{2}$ miles, when St. John Ledge will be on the starboard beam, distant 1 $\frac{1}{2}$ miles, and the harbor will open out to the Westward of St. John Island, and may be run for, that island being bold to; Beach Point (the Eastern point of the entrance) must be passed close to.

AT NIGHT, Palmico light, open to the Westward of St. John Island, bearing N. E. *At Night.*

by N., leads to the Westward of St. John ledge, and the light may be steered for on that bearing by vessels running for the harbor, giving the island a berth of a cable's length, and rounding the light-house at the same distance; when the light bears S.S.W., steer N.N.E. In running for the harbor from any other direction, the light must be brought to bear to the Northward of E.N.E. before it can be steered for, to avoid the shoal off St. Ann Point.

When the Blonde Rock is in sight, and the vessel bound to the Northward, Flat Island just open to the Eastward of Seal Island, will lead between the Blonde Rock and the Elbow.

TIDES.—The tide-stream between Cape Sable and Seal Island sets about N.W. *Tides.*

by N. at flood, and S.E. by S. at ebb, from 2 to 3 knots per hour; a due allowance on the above courses must therefore be applied to determine that which ought to be steered. The direction and rate of the stream becomes much modified when near the land. Through the channel between the Seal and Mud Islands it sets N.W. and S.E., nearly 4 knots per hour.

The tide-stream sets very strong round Seal Island, and except at slack water there are heavy tide-rips over the shoal ground to the Eastward of the island, which may, however, be approached. The tide commences running along shore to the Northward at half ebb, and continues so to run until high-water.

BETWEEN PUBNICO AND TUSKET ISLANDS.

ST. ANN SHOAL.—A shoal, with 16 feet at low springs, rocky bottom, called *St. Ann Shoal*, bears from St. Ann Point N.W. $\frac{1}{2}$ W. 1 $\frac{1}{2}$ mile, and from the South *Shoal*.

Twin S.W. $\frac{1}{2}$ S. 1 $\frac{1}{2}$ mile, and shows a tide-rip during the strength of the tide.

THE TWINS are two small islands lying about half a mile from the shore, from *The Twins*.

which they are separated by a channel with more than 5 fathoms in it at low-water, and between them is a channel of similar depth; they can be approached pretty close. There are two dangers off the Northern Twin, one bearing N.W. by W. $\frac{3}{10}$ of a mile, with 16 feet on it at low-water springs, and the other bearing N. $\frac{1}{2}$ W. a third of a mile, with 8 feet; they are both of small extent, and carry good water close to.

ARGYLE lies to the Northward, and has several good anchorages, but the chan- *Argyle.*

nels to them are too intricate to be entered without a good pilot.

WHITE HEAD ISLAND is rendered conspicuous by earthy cliffs of a reddish- *White Head* gray color, nearly 70 feet in height, which form its boundary to the South-west. *Island.*

It can be safely approached on all sides except the Northern to a quarter of a mile.

WHITE HEAD LEDGE bears from the South end of White Head Island E. $\frac{1}{4}$ S. *White Head* distant three-quarters of a mile. It uncovers at low-water, round which part it is *Ledge.* shoal for about a cable's length. After half ebb, the kelp marks the position of this ledge.

WHITE HEAD WEST SHOAL bears from the South end of White Head Isl- *White Head* and N.W. half a mile. It has only 13 feet on it over a rocky bottom, at low springs. *West Shoal.*

JONES LEDGE dries about one hour before low-water in one spot, but the kelp *Jones Ledge.* shows at half-tide; it bears from the South extreme of Jones Island S. by W. $\frac{1}{2}$ W. three-eighths of a mile.

JONES ANCHORAGE.—In case of distress, Jones Anchorage may be entered as *Jones* follows: Steer for White Head Island, and run along its Eastern side, steering about *Anchorage*

by E. $\frac{1}{2}$ E., at a distance of not less than a quarter of a mile, and not greater than half a mile from it; this will avoid White Head Ledge, leaving it to the Eastward. Immediately to the Northward of White Head Island lies Pumpkin Island, which is bold to on the Eastern side, and must be left to the Westward at not more than a third nor less than a quarter of a mile; this will avoid Pumpkin Ledge, which has only 2 feet water on it at low springs, and which bears from the South end of Pumpkin Island E. $\frac{1}{4}$ S., half a mile; at eal-ebb the kelp marks its position.

When abreast of the Northern end of Pumpkin Island, alter course to N. by W. W., and run for mid-channel between Jones Island and the Thrum; and when abreast of the latter, run along Jones Island from about one or two cables' length distant; good anchorage in 6 fathoms, mud, will be found, at 1 $\frac{1}{2}$ cable from the shore.

To run in on the Western side of White Head Island, proceed as follows: Steer for the South end of White Head Island, and pass it at not more than 3 cables' nor less than one cable's length distant; this will avoid White Head West Shoal, passing between it and the island. Then run along Pumpkin Island, but not nearer than a quarter of a mile; and when it bears E. by S. $\frac{1}{2}$ S., take care to open the Western side of Hog Island with the Eastern side of Jones Island; this will clear Jones Ledge. Then run along the Eastern side of Jones Island, and anchor as above.

Gull Island. GULL ISLAND.—To the Westward of White Head Island lies a small low green island called Gull Island, which may be approached on the Southern side to about half a mile: the bay between it and White Head Island should not be entered without a good pilot, especially at high-water, when the dangers are covered.

Gull Ledge. GULL LEDGE.—To the Southward of Gull Island lies the Gull Ledge, which has only 5 feet on its shallowest part at low-water springs. The large barn on Sheep or Wilson Island on with the Western high-water mark of the Gull, leads right on the shallowest part, distant 2 miles.

S.W. Shoal. S.W. SHOAL.—To the South-west of Gull Island is a small shoal with only 15 feet on it at low springs. It is distant from Gull Island about a mile, in the direction of Pumpkin Island on with Gull Island.

There is good anchorage all the way in mid-channel between Hog and Jones Islands, but it is not recommended for a vessel to pass beyond Hog Island without a pilot. There are no regular pilots, and the fishermen are not used to carry vessels of any size through those passages, and therefore cannot be trusted with a vessel of more than 6 or 8 feet draught.

Tusket River Entrance. Eastern Passage. TUSKET RIVER ENTRANCE.—EASTERN PASSAGE.—Between Gull and Sheep Islands there is a rock which uncovers at half-tide, and between the former and Eastern Bar Island there is a rocky patch with only 4 feet on it at low-water springs; hence the Eastern passage into Tusket River should not be attempted, except by persons well acquainted with it. The passage between Eastern Bar Island and the Fish Islands is obstructed by Fish Ledge, which uncovers at half-tide, and which bears from the Southern point of Eastern Bar Island N. $\frac{1}{2}$ W., half a mile, and from Little Fish Island, S. by E. $\frac{1}{2}$ E., half a mile. The East tangent of Tucker Island on with the inner Fish Island, leads over the ledge, and when open to the Westward, clears it.

Western Passage. WESTERN PASSAGE.—To enter Tusket River by the Western passage (which is to be recommended when coming from the Southward, and clear of Gull Ledge), steer N. by W. $\frac{1}{2}$ W. for Western Bar Island, until Tucker Island opens to the Westward of inner Fish Island (which clears Fish Ledge to the Westward); then steer N. $\frac{1}{2}$ E. for Big Fish Island, passing Little Fish Island, which is bold to, at about a quarter of a mile to the Westward. The course should then be altered a little to pass Big Fish Island to the Westward, at from one to 14 cable distant, taking care not to exceed the latter distance, in order to avoid Big Fish Rocks, which lie N.W. by W. $\frac{1}{2}$ W., 2 cables' length from the North end of Big Fish Island, and just uncovers at low springs; the large barn on Sheep Island a little open of the North tangent of Big Fish Island, and the high-water tangents of the South points of Eastern Bar and Big Fish Islands in line, lead over these rocks.

From thence steer N. by E. $\frac{1}{2}$ E., and give Tucker Island a berth of from one to two cables' length, passing to the Westward of it; take care not to exceed the latter distance to avoid Tucker Island Ledge, which has only 5 feet on it at low-water springs, and bears from the North end of Tucker Island N.W. by W. $\frac{1}{2}$ W., 21 cables' length. After passing Tucker Island, steer about N. by E. $\frac{1}{2}$ E., for Pinch Gut Island, which may be passed to the Westward at a cable's length; care must, however, be taken not to incline too suddenly to the Eastward, as a shoal bank of mud runs off the North end of Tucker Island, having only 12 feet on it at low-water springs, and at 3 cables' distance from that end of the island there will be equal danger by inclining to the Westward, from a mud-flat which runs off a considerable distance along the Western shore, commencing just above Tucker Island. To the Southward of this, the Western shore is very ragged and shoal, which is the reason for keeping the islands (where Western shores are bold) aboard. There is sufficient room for a good pilot to turn a vessel of 12 feet draught in or out of the river with the tide. Big Fish Rocks have deep water all round them, a buoy would greatly facilitate the navigation, when the night may be passed on either side.

One mile above Pinch Gut Island is Half-tide Rock, which lies a third of the way across from the high line of the Eastern shore towards that of the Western. The deep-water channel is to the East of this rock.

Anchorage. ANCHORAGE.—Good anchorage over mud bottom can be obtained anywhere between Tucker Island and Half-tide Rock, beyond which it is strongly recommended for no vessel of any draught to attempt going without a very experienced pilot and

ending wind, because the channel is very intricate, and the tide rapid. In the Nar-
rows, by Plymouth, the stream at half-tide springs runs about 5 knots per hour, and
breast of Pinch Gut Island about 2 knots.

When bound out of Tusket River and proceeding to the Westward, being abreast
Little Fish Island, steer S.S.W. $\frac{1}{2}$ W., taking care not to bring Western Bar Island
to bear to the Eastward of N. by E. $\frac{1}{2}$ E., until the South point of Spectacle Island
opens to the Southward of Peases Island, when the course may be altered to the
Westward. This will clear the Old Woman, a rock which uncovers at about two
hours' ebb, and bears from the South end of Western Bar Island about S.S.W., distant
4 miles, and from the South point of Bald Tusket Island N.E. by E., 3 miles. A
long piece of shoal broken ground runs from the Old Woman towards Western Bar
Island.

Before carrying a vessel through the passages between Round Island, the Tuskets
and the main, we will describe the principal dangers in the neighborhood.

THE OLD MAN uncovers about one hour before low-water springs, at which *The Old
Man.*

It is about 2 or 3 feet above water, with some straggling rocks just uncovered, ex-
tending to the Northward of it about the eighth of a mile. The large rock bears
from the Bald Tusket about N.E. by E. $\frac{1}{2}$ E., a little better than a mile. Owls Head
to the Eastward of Allen Island, clears the Old Man to the Eastward; and the
North end of Half Bald Tusket Island open to the Northward of Little Bald Tusket
Island, clears it to the Northward.

LITTLE BALD TUSKET LEDGE lies between the Old Man and Little Bald *Little Bald
Tusket Island*, from which it bears about E.S.E., distant half a mile, and has 9 feet *Tusket
Ledge.*
It is its shallowest part at low-water. The North end of Half Bald Tusket on with the
North end of Little Bald Tusket, leads right on the 9 feet; and Owls Head open to
the Eastward of Allen Island, clears it well to the Eastward.

HARRIET LEDGE covers at a third flood, and bears from Bald Tusket Island *Harriet
Ledge.*
N.W. $\frac{1}{2}$ W. nearly a mile, and from the Southern point of Half-Bald Tusket Island
N.W. by S., distant half a mile. Holmes Island just open to the Eastward of Spec-
tacle Island, and the South point of Peases Island just touching the North point of
Little Half Bald Tusket Island, lead right over this ledge, which shows a considerable
tide-rip when covered during the run of the tide.

CLEOPATRA SHOAL bears from the South point of Bald Tusket Island S. by *Cleopatra
Shoal.*
distant $\frac{1}{2}$ mile, and is rocky and uneven, having only 12 feet on its shallowest part,
and a few long pieces of kelp show at low springs. It has deep water all round
land shows a considerable tide-rip during the run of the tide. Half Bald Tusket
Island open to the Eastward of the Bald Tusket, clears it to the Eastward; and open
to the Westward, clears it to the Westward.

Between the Cleopatra Shoal and the Bald Tusket are two small shoals, one with
10 feet and the other with 19, at low-water springs, which show a tide-rip during the
run of the tide. There is a good passage between them and the Bald Tusket.

PEASES ISLAND LEDGE covers at a third flood, and lies nearly mid-channel *Peases Isl-
and Ledge.*
between Peases Island and the main, at a quarter of a mile distant from the former.
It shows a considerable tide-rip during the run of the tide. The North point of Peases
Island, clears it to the Westward, and leads between it and Peases Island; and the
North point of Spectacle Island just open to the Southward of the South point of
Peases Island, clears it to the Southward.

MARKS ISLAND LEDGE just uncovers at low-water springs, and lies 11 cables' *Marks Isl-
and Ledge.*
length off the Western side of Mark Island. It shows a considerable tide-rip during
the run of the tide, which runs over it with great rapidity.

ALLEN ROCK lies off the South end of Allen Island, at 11 cables' length distant, *Allen Rock.*
the direction of Peases Island; it has good water all round it, and shows a whirl
of the strength of the tide. The barn on Ellenwood Island open of the South-west
end of Allen Island, clears it to the South-westward.

SCHOONER PASSAGE ROCK lies nearly mid-channel between Owls Head *Schooner
Passage
Rock.*
and Turpentine Island, and has 10 feet on it at low-water springs, and deep water all
round. Bird Rock, just open to the Southward of Owls Head Island, leads over it.
BIRD ROCK lies in Ellenwood Passage, nearly mid-channel between Ellenwood
Island and Owls Head Island. It always shows, being about 2 feet above water at
low springs.

SPECTACLE LEDGE has 11 feet on it at low-water springs, and shows a large *Spectacle
Ledge.*
tide-rip during the strength of the tide. It bears from the South end of Spectacle
Island S.S.W. three-quarters of a mile, and from the North end of Half Bald Tusket
Island W. by S. $\frac{1}{2}$ S., a good mile. The South point of Peases Island just overlapping
the Northern point of Half Bald Tusket Island, clears the ledge to the Southward;

The cliff on the S.W. end of Ellenwood Island open of the Eastern tangent of
Spectacle Island, leads clear to the Eastward. It runs in this direction, being very
narrow.

Schooner Passage.

SCHOONER PASSAGE.—To run through Schooner Passage, keep Owls Head open to the Eastward of Allen Island until Half Bald Tusk Island opens to the Northward of Little Bald Tusk Island, taking care to keep the South point of Spectacle Island open to the Southward of the South point of Peases Island until McKinnon's barn on the North end of Ellenwood Island touches the N.E. tangent of Peases Island; this leads clear to the Westward of Peases Island Ledge, which must be rounded close to on the flood-tide, which sets strong on the South point of Peases Island. Keep about mid-channel, taking care not to approach the Eastern side, to avoid Haymaker Ledge Shoal, which lies off the South end of Haymaker Island, with only 2 feet on it at low-water, and which will be cleared by keeping Candle-box Island open to the Westward of Haymaker Island. After passing Allen Island, take care not to open the S.E. tangent of Murder Island to the Eastward of Candle-box Island, in order to pass to the Westward of Schooner Passage Rock. Keep midway between Owls Head and Candle-box Island, and run along the Western side of Murder Island, which may be approached to about 2 cables' length on its S.W. side.

Anchorage.

ANCHORAGE.—Good anchorage will be found off the North end of Allen Island. In this passage the tide runs with great rapidity, about 3 knots an hour, in its strength.

Ellenwood Passage.

ELLENWOOD PASSAGE.—After passing Peases Island Ledge, keep McKinnon's barn open to the Southward of Allen Island; this clears Allen Rock, passing to the Southward of it. Run in mid-channel between Mark and Ellen Islands, and mid-channel between the Bird Rock and Ellenwood Island; and after passing the rock, at cable's length, get it on the Eastern tangent of Mark Island, which will clear the shoal ground which lies on either side of the passage. Murder Island can be passed on its S.W. side at 2 cables' distance.

Anchorage.

ANCHORAGE.—Through the North entrance to this passage, off the North-eastern point of Ellenwood Island, the tide runs 4 knots an hour. There is an anchorage off McKinnon's house, about 1½ cable to the Northward of the Bird Rock.

To approach Ellenwood anchorage from the S.W., keep the cliff on the South-western point of Ellenwood Island open to the Eastward of Spectacle Island, taking care not to open Holmes Island until the Harriet Ledge is passed; this will clear Spectacle Ledge, passing to the Eastward of it. Keep Bald Tusk Island entirely open to the West end of Half Bald Tusk Island until the South Point of Allen Island opens to the Northward of the North point of Mark Island; this clears Mark Island Ledge, passing to the Westward of it. Then keep in mid-channel between Mark and Ellenwood Islands, giving the Southern point of the latter (which runs shoal) a good berth; hence proceed to the anchorage as before.

Tides.

TIDES.—The tide runs very rapidly through the Tusk Island passages, and the tide-rips thrown up by it are numerous and heavy. Its general set is to the North-west and South-east, but this is modified by the position and shape of the islands, which form considerable eddies, and by the main-land in the vicinity, of which the tide follows its direction. The average rate is from two to four knots per hour, and round some points its rate probably exceeds the latter. The tide turns a little at high and low water respectively. The establishment, or the times of high-water, full and change, at the port at Ellenwood Island, is 9h. 47m.

Directions.

DIRECTIONS.—To pass between Round Island and the Bald Tusk, having clear Cape Ledge, steer N.W. ½ N., which will lead clear to the Eastward and Northward of Round Island, and midway between the Cleopatra Shoal and the Soldier's Ledge, which must be carefully avoided. When the South-eastern extreme of Frenchman Point opens to the Northward of Bald Tusk Island, a vessel will be clear to the Westward of the Soldier's Ledge, and the course must be altered to W.N.W. to pass to the Southward of Gannet Dry Ledge, and to the Northward of the South Ledge and S.W. Shoal, which lie much in the way, and must be carefully avoided by vessels of large draught. When the Gannet bears N.E. by E., the Dry Ledge is passed, and the course may be altered to the Northward. When the Dry Ledge is seen, it may be safely approached to within half a mile, as it has good water all round it.

Gannet Rock.

GANNET ROCK.—The Gannet is a remarkable rock, the sugar-loaf peak which is 50 feet above high-water, and the lump to the Northward of it has only 10 feet less elevation. Yarmouth or Cape Fourchu light-house bears from the rock N. by E. ½ E., and Seal Island light-house S. ½ E.; they are both in sight in clear weather. The rock is about three-eighths of a mile long in a Northerly direction, being very narrow, having deep water all round, except on its Southern side. The variation of the compass is 2° less Westerly on Gannet peak than in the neighborhood, but there only 14° W.

North Rock.

NORTH ROCK bears from Gannet Peak about N. ½ E., 3 cables distant. It covers at a third ebb, and generally breaks when covered.

SOUTH-EAST ROCK bears from Gannet Peak S. by E. $\frac{1}{2}$ E., distant nearly $1\frac{1}{2}$ miles, and shows two breaks in heavy weather, and a good tide-rip during the tide. *South-east Rock.* It has good water to a cable's length on its East and West sides. Yarmouth light-house, touching the Eastern tangent of Green Island, leads over it.

SOUTH LEDGE bears from the Gannet Peak nearly South, distant $4\frac{1}{2}$ miles; the least water found on it was 24 feet at low springs; it shows a tide-rip, and breaks in very heavy weather. The outer high lump of Cape Fourchu, just open of the East tangent of Green Island, leads over this ledge. *South Ledge.*

SOUTH ROCK bears from the Gannet Peak S. $\frac{1}{2}$ W., distant three-quarters of a mile; it shows at a third flood, and generally breaks. *South Rock.*

JACCO'S RIDGE.—The shoalest water found on this ridge was 27 feet at low-water springs on its North end, which bears from the Gannet Peak S. by W. $\frac{1}{2}$ W., distant 6 miles; from thence it extends $1\frac{1}{2}$ mile in a Southerly direction, and is narrow, with deep water on its East and West sides, and shows a tide-rip during the tide. Green Island, on the Eastern edge of the Gannet, leads over it. *Jacco's Ridge.*

S.W. SHOAL bears from the Gannet Peak S.S.W. $\frac{1}{2}$ W., $3\frac{1}{2}$ miles, and extends a quarter of a mile in a Southerly direction; it has only 19 feet on it, and shows a tide-rip, and breaks in heavy weather. Green Island, just open to the West of the Gannet, leads over this shoal. *S.W. Shoal.*

S.W. DRY LEDGE bears from the Gannet Peak S.W. $\frac{1}{2}$ W., $1\frac{1}{2}$ mile; it uncovers at ebb, and generally breaks at high-water; there is plenty of water between it and the Gannet, but it is prudent to go outside. *S.W. Dry Ledge.*

The bottom at the above shoals and ledges being very uneven, it is highly probable that there may be less water on them than that given by the lead, and therefore vessels are recommended to avoid them.

BETWEEN ELLENWOOD PASSAGE AND BRYERS ISLAND.

MURDER ISLAND WEST SHOAL has 18 feet on it at low-water, which depth lies half a mile from the high-water line of the island, there being a good channel between it and the island. From the North-west point of the island a shoal also extends in that direction, having 12 feet on it at low-water, about a third of a mile from the shore. *Murder Island and West Shoal.*

REEF LEDGE, which uncovers at a quarter ebb, is shoal all round for a considerable extent: and there is very little water all the way between it and Reef Island, from the Southern point of which its shoalest part bears W. by N. $\frac{1}{2}$ N., half a mile; and from Jebogue Point S. E. by S., about a mile distant. *Reef Ledge.*

REEF SHOAL has 13 feet on it at low-water, and shows a tide-rip during the ebb. Although it can be passed on either side, it had better be kept to the Eastward. Yarmouth light-house open to the Westward of the West tangent of Jebogue Point, bears it to the Westward. From it the South end of Reef Island bears E. by N. $\frac{1}{2}$ N., $1\frac{1}{2}$ mile, and Jebogue Point is distant 14 mile. *Reef Shoal.*

JEBOGUE POINT SHOAL is a large broken patch, with 14 feet water on it, there being a passage with 25 feet in it between the shoal and the point, which is the channel generally used, though the deepest channel lies between it and Jebogue shoal. *Jebogue Point Shoal.*

JEBOGUE LEDGE OR SHOAL, is very dangerous, having only 2 feet on it at low-water springs; it shows a large tide-rip during the tide, and breaks, if there is any sea on, at low-water. It bears from Jebogue Point about S.W. $\frac{1}{2}$ W., nearly a mile from the high-water line. There is a good channel between this shoal and Green Island. *Jebogue Ledge or Shoal.*

THE FOUL GROUND lies to the North of Jebogue Ledge; it has only 9 feet on it, (which is two-thirds of a mile from the shore,) and shows a considerable tide-rip; there is a good channel between it and Jebogue Ledge. *The Foul Ground.*

THE ROARING BULL lies nearly midway between Green Island and Yarmouth light-house, and very nearly in the line joining them, and a mile distant from the shore. It is about 2 feet above water at low springs, has good water to a cable's length all round, and shows a small tide-rip, but breaks if there is any sea on. *The Roaring Bull.*

TIDES.—From Yarmouth to Ellenwood Island the tide runs inside (Green Island and through the above ledges at full 3 knots per hour during its strength; there is a very short interval of slack water. It sets strong round Cape Fourchu, so that, if a vessel is steering for Yarmouth Sound with the flood-tide running, she must be careful to haul up the moment she has cleared the Roaring Bull. It is necessary to impress on the mariner that he should keep clear of these shoals, from the strong probability that the shoalest water has not been obtained by the lead, and that the chances are in favor of there being in reality less water than that marked on the chart. *Tides.*

Anchorage. ANCHORAGES.—The anchorage inside Murder Island and in Little River etc. only be used by small vessels.

Jebogue is a safe little anchorage, and may be used in cases of necessity by vessels drawing from 12 to 14 feet. The following are the directions for entering it:

A vessel being to the South-west of the entrance between Gannet Rock and Green Island, should bring the Gannet to bear about S.W. by S., and steer N.E. by N., so as to pass midway between Garden Head and the small earthy cliff (on the North-west side) from which it runs off shoal full a third of the way across, and a bar extends right across, over which there are only 12 feet at low-water springs. Keep mid-channel in the entrance, and anchor $1\frac{1}{2}$ cable's length inside the point, on the Eastern side of the entrance, round which the channel makes a sudden turn to the Eastward, taking care to keep the Gannet in sight in the middle of the entrance, in order to keep clear of the mud-bank that runs along the Western side, and also of two small mud-banks in the middle of the channel at its head. The depth of water will be about 16 feet at low springs, over muddy bottom, excellent holding-ground, and the water always smooth. Good fresh water can be obtained, the supply being about 3 tons per tide.

If the vessel be to the North-west of Jebogue Point, bring the South end of the earthy cliff to the Northward of Garden Head just open to the Southward of Jebogue Point, and run for it in that direction, which will carry her clear in good water between the Foul Ground and Jebogue Ledge; when about three-quarters of a mile from Jebogue Point she will have passed the Ledge, and may haul more to the Southward, so as to pass round Jebogue Point at a distance of from a quarter to half a mile, when she should steer so as to run along the Northern shore at half a mile distant, until the opening of the harbor bears N.E. by N., and the Gannet Rock S.W. by S., when the course should be altered to the former bearing, to pass half-way between Garden Head and the earthy cliff opposite; when proceed as before.

Yarmouth Sound.

YARMOUTH SOUND can be used with all winds, except those between South and West, when it is dangerous if the wind is strong. The best anchorage is in about 20 feet, over sandy bottom, the light-house bearing W. by N. $\frac{1}{2}$ N., about a quarter of a mile. The shore inside the light-house should not be approached within a cable's length, as there are several detached patches of rocks lying off it. At about 2 cable's length from the opposite shore to the light-house, from which they bear about E. by S. $\frac{1}{2}$ S., lie the Hen and Chickens, which begin to uncover at two-thirds ebb. The independent church at Yarmouth on with the middle of a low beach at the head of the sound, clears them to the Westward. The inner anchorage should not be attempted without a good pilot; but in case of a vessel being caught in the sound in a S.W. gale, the following directions will be of use:

The principal dangers are, a rock outside the beacon, lying $1\frac{1}{2}$ cable's length from the extremity of the Ship's Stern, with only a foot on it at low-water springs; and a rock in the middle of the harbor, inside the beacon, from which it is distant about cable's length, which uncovers 3 feet at low-water springs. Run for the Ship's Stern so as to pass it at a cable's length, leaving it on the port hand, and pass the beacon at the same distance, leaving it on the starboard hand, taking care not to let the light-house, the top of which may be seen over the land, pass beyond the first little island inside the entrance. From thence steer for the independent church, keeping about cable's from the land, and give Battery Point a berth of half a cable's length, and when about $1\frac{1}{2}$ cable distant from it, you will find safe anchorage. Fresh water can be obtained from wells; that from the lake is not good, and is difficult to get. In Yarmouth Harbor the establishment or times of high-water, at full and change, is 10h. 0m., and the rise varies from 16 feet 9 inches to 12 feet 5 inches. The tide-stream changes its direction a little after high and low water respectively.

Tides.

The Lurcher. THE LURCHER consists of two shoal patches, bearing from each other N.E. and S.W. $\frac{1}{2}$ W., with 16 or 17 fathoms water between them. That to the South-westward is the larger and shoaler, having only 9 feet on it at low springs, and shows considerable tide-rip during the run of the tide, near the South-west end of which the shoalest water is, and breaks in heavy weather. The other, bearing from the first N.E. $\frac{1}{2}$ E., distant $2\frac{1}{2}$ miles, has 5 fathoms on it, and is very small, but shows a good tide-rip. The South-west shoal bears from Yarmouth light-house N.W. by W. $\frac{1}{2}$ W. $14\frac{1}{2}$ miles.

Tides.

TIDES.—At the North-east shoal the ebb commences running 1h. 30m. after high water at Yarmouth; at neap tides it attains a velocity of $2\frac{1}{2}$ knots, the average being 9 $\frac{1}{2}$ miles in a Southerly direction. The flood sets in the opposite direction, with the greatest velocity at neaps being $2\frac{1}{2}$ miles, its average set 8 miles. The slack water full one hour in duration.

The Trinity Ledge.

THE TRINITY LEDGE consists of three small rocks which uncover at low spring tides, the highest being between 2 and 3 feet above water, and the others just seen. They bear from Cape St. Mary S.W. $\frac{1}{2}$ W. 6 $\frac{1}{2}$ miles; from Black Point W. $\frac{1}{2}$ S. 6 miles,

from Fourchu I. approached near during the tide, weather they bring Black Point, but strength at the bearing S. $\frac{1}{2}$ W., and BRYERS ISLAND, nearly 4 miles only 13 feet waterward of the Gulf west Shoal. Between the rock can be DIRECTION W. of Grand Machias Seal Island should steer N. the shoalest part of Machias Seal Island Westward of the Sound, passing to the West part of the L. W. course for 4 miles.

The average speed of the current constant, E. $\frac{1}{2}$ E.; to the and at Machias I. shore.

Machias Seal and when they bear E. for 8 miles, 16 miles will bring light should not lie about that distance.

In the above direction, foggy, the lead must according to the ages, keep in 30 fathoms under 20 fathoms will carry her out the latter rock, and increase to 30 and 40 W. $\frac{1}{2}$ W. for the 30 fathoms, haul net Rock. A good lead kept good course, with the Libby Island, which be altered to N. E. reaches Quody light.

In running for Yarmouth, inside the Lurcher the Gannet Dry I. 10 miles, will lead 10 miles to the West Bound Island and Tusk Island, which will clear the Island, which is to E., until the light side the Roaring tides. After running the low part which cable's length from pass between islands. When Yarmouth will be clear of

from Fourchu light-house N. by W. $13\frac{1}{2}$ miles. The highest rock should not be approached nearer than a quarter of a mile. They cause a considerable tide-rip during the tide, at the South-west extremity of which the rocks lie, and in heavy weather they break. There is broken ground all the way from the Trinity Ledge to Black Point, but nothing that will bring a vessel up. The tide-current runs with great strength at the ledge, attaining in the middle of the tide 2 knots per hour; the ebb setting S. $\frac{1}{2}$ W., and the flood N. $\frac{1}{2}$ E.

BYRERS ISLAND S.W. SHOAL bears from Byrers Island light-house S.W. by *Byrers Isl-* S. nearly 4 miles, and from the Gull Rock S.W. by *and S.W.* $\frac{1}{2}$ W., distant 2 miles. It has only 13 feet water on a small patch where Dartmouth Point is just open to the Westward of the Gull. A long tide-rip extends from the Gull to a mile beyond the South-west Shoal. Between this shoal and the Gull Rock there is a channel $1\frac{1}{2}$ mile broad, and the rock can be approached to a quarter of a mile on its sea side.

DIRECTIONS.—In running into the Bay of Fundy, and intending to pass to the N. *Directions.* W. of Grand Manan Island, a vessel being 4 miles to the S.W. of the Blonde Rock, should steer N. by W. $\frac{1}{2}$ W. 37 miles, which will carry her 4 miles to the S.W. of the shoalest part of the Lureher; from thence a N. by W. course for 48 miles will bring Machias Seal Islands to bear N.N.E. $\frac{1}{2}$ E., distant 4 miles; or a vessel having passed Mud Island West Shoal on its Southern side, the light-house being well open to the Westward of Division Point, a N.W. $\frac{1}{2}$ N. course 7 miles will clear Jacco's Ridge. Passing to the Southward of the ridge, steer N.N.W. $\frac{1}{2}$ W. 24 miles, when the shoalest part of the Lureher will bear N.E. by E. $\frac{1}{2}$ E. 14 mile; from thence a N. by W. $\frac{1}{2}$ W. course for 48 miles will bring Machias Seal Islands to bear N.E. by E. $\frac{1}{2}$ E. 14 mile.

The average set of a tide on the above courses is from 8 to 10 miles per tide, its direction constantly altering, as follows: At the Blonde Rock the ebb sets about S.E. by E. $\frac{1}{2}$ E.; to the Northward of Seal Island, S.S.E. $\frac{1}{2}$ E.; at the Lureher, South; and at Machias Islands, about S.W. $\frac{1}{2}$ S., beyond which it takes the direction of the shore.

Machias Seal Islands should be passed to the Southward, at a distance of 4 miles; and when they bear N.E. by E. $\frac{1}{2}$ E. 4 miles, the course should be altered to N. by E. $\frac{1}{2}$ E. for 8 miles, when the light will bear S. by E. $\frac{1}{2}$ E. 6 miles, and a N.E. $\frac{1}{2}$ E. course 16 miles will bring the vessel due East of Quody light-house, $1\frac{1}{2}$ mile distant. This light should not be approached nearer than half a mile, to avoid the Sail Rocks, which lie about that distance from it.

In the above directions the weather has been supposed clear; should it, however, be foggy, the lead must be frequently used, and the vessel kept on nearly the above courses, according to the following considerations: when nearing the land abreast the Salvages, keep in 30 fathoms, and pass to the Southward of the Brazil Rock by not going under 20 fathoms water over a sandy bottom; after which keep in 20 fathoms, which will carry her outside all the dangers from the Brazil to the Blonde Rock. When near the latter rock, and the vessel making a W. by N. course, the depths will suddenly increase to 30 and 40 fathoms; she will then be past Seal Island, and can haul in N. by W. $\frac{1}{2}$ W. for the Bay of Fundy. After altering the course, if the depths shoal under 20 fathoms, haul more to the Westward, as the deep water runs close up to the Gannet Rock. A good look-out must be kept for the Lureher, (which shows a tide-rip,) and the lead kept going when in its neighborhood. The vessel, by continuing the above course, with the lead going and a good look-out, will approach the American shore near Libby Island, when the soundings will shoal, and when in 20 fathoms, the course should be altered to N.E. by E. $\frac{1}{2}$ E.; she will then be running parallel to the coast until she reaches Quody light, when the coast trends more to the Northward.

In running for Yarmouth, or intending to pass to the South-east of the Grand Manan inside the Lureher, after passing Jacco's Ridge, a N. $\frac{1}{2}$ E. course for 7 miles will clear the Gannet Dry Ledge, and lead to the Northward of the Gannet; then N. by E. $\frac{1}{2}$ E. 10 miles, will lead outside Green Island, which is bold on its West side, to within 3 miles to the Westward of Yarmouth light-house. If the vessel has passed between Round Island and Bald Tusket, there is a good passage between the Gannet and the Tusket Island. Keep the light-house well open to the Eastward of Green Island, which will clear all the dangers off the Gannet, passing inside of them; pass Green Island, which is bold on the East side, from half to a quarter of a mile, then steer N. $\frac{1}{2}$ E., until the light-house bears to the Eastward of N. by E. $\frac{1}{2}$ E., in order to pass outside the Roaring Bull.

After running through either Schooner or Ellenwood Passage, and being abreast of the low part which connects the two high portions of Murder Island, and from 2 to 4 cables' length from the shore inside Murder Island West Shoal, alter course to N.W. to pass between it and the shoal that extends off the North-west point of Murder Island. When Yarmouth light-house opens of the West tangent of Jebogue Point, a vessel will be clear of and outside Reef Shoal, and wishing to run along the coast inside

the dangers, the course should be altered to N. $\frac{1}{2}$ W., running for the light-house, keeping it a little open to the Westward of the West tangent of Jeboque Point, so that when the point bears E. by S. $\frac{1}{2}$ S. its high-water line will be from a quarter to half a mile distant. Run along shore, preserving this distance to keep inside the foul ground; and when Pinkney Point shuts in of Jeboque Point, the distance may be gradually increased to two-thirds of a mile until the Roaring Bull is passed, which is about a mile from the land. Cape Fourchu is bold, and may be safely approached to 2 cables' length. If wishing to run outside the dangers, preserve the former (N.W.) course until the line joining Green Island and the light-house is passed, when the course may be altered to N. $\frac{1}{2}$ E. until the light-house bears to the Eastward of N. by E. $\frac{1}{2}$ E.

From Cape Fourchu, to run inside the Lurcher and Trinity Ledge, for Grand or Petit Passages: With Yarmouth light-house bearing E. by S. $\frac{1}{2}$ S. 3 miles, a N. $\frac{1}{2}$ E. course for 28 $\frac{1}{2}$ miles will carry a vessel to Peter Island, leaving the Trinity about a mile to the Westward, and Cape St. Mary about 3 $\frac{1}{2}$ miles to the Eastward. If bound to Petit Passage, a N. by E. $\frac{1}{2}$ E. course will carry her well inside the Trinity, and about three-quarters of a mile to the Westward of Cape St. Mary. In foggy weather it will be better to make the land in the vicinity of Cape Fourchu, when a N. $\frac{1}{2}$ E. course for 16 miles will bring her near Cape St. Mary. When passing Cheggoggin Point, care must be taken not to approach the land to the Northward of it nearer than half a mile until abreast of Cranberry Head, after which the projecting points to Cape St. Mary are pretty bold and may be approached, bearing in mind that the lead should be kept constantly going and the depth not decreased under 8 or 10 fathoms; if any doubt arises, anchor. When near Cape St. Mary, great care must be taken to avoid a shoal which dries at low-water, and which runs off a quarter of a mile in a S.W. by S. direction; the flood-tide round this shoal shows a considerable tide-rip to the extent of full half a mile. From Cape St. Mary to Montegan, the coast is bold, and the cliffs in some places rise 100 feet above high-water. From Cape St. Mary to Grand Passage, steer N. by W. $\frac{1}{2}$ W., in order to make the South-eastern part of Bryers Island at from one to two miles to the Southward of the passage, a small allowance being made for tides. Across the entrance of St. Mary Bay the flood-tide has a greater general effect than the ebb, which is chiefly confined to two strips of current from Petit and Grand Passages respectively in the direction of Cape St. Mary. At Montegan, the current sets along the coast, the flood at its greatest velocity attaining one knot, and the ebb about two-thirds of a knot per hour.

GRAND PASSAGE AND WESTPORT.

The principal dangers in Grand Passage are:

Passage Shoal.

PASSAGE SHOAL, which has 5 feet on it at low-water springs, lies in the middle of the passage, bearing from Peter Island light-house N. $\frac{1}{2}$ E., 4 cables' length distant, and shows a tide-rip during the tide.

Cow Ledge.

COW LEDGE.—The highest part shows soon after high-water, and is distant 11 cable's length from Long Island, to which it is joined at low-water. Peter Island light-house bearing S. by W. $\frac{1}{2}$ W., with the island its own breadth open to the Westward of Sand Point, clears the ledge to the Westward.

Cow Ledge Shoal.

COW LEDGE SHOAL has 11 feet on it at low-water, and lies a quarter of a mile to the Northward of the highest part of Cow Ledge, and S.E. $\frac{1}{2}$ E. 3 cables' length from the North point of Bryers Island. Peter Island bearing S. by W. $\frac{1}{2}$ W., with the island open its own breadth to the Westward of Sand Point, clears it to the Westward.

Directions.

DIRECTIONS.—Grand Passage has two entrances to the Southward, one on each side of Peter Island; that on the West side is the shorter and narrower, and has 21 feet in it, and no dangers. In entering the latter passage keep in mid-channel, and if the flood is running great care must be taken, as the tide sets directly on the South point of Peter Island with great strength. When through the channel, and wishing to anchor at Westport, haul to the Westward, giving the point on Bryers Island a berth of nearly a cable's length. Anchor with the Episcopal church bearing S.W. $\frac{1}{2}$ W., and the Baptist chapel W. $\frac{1}{2}$ N., in from 5 to 7 fathoms at low-water, over hard bottom, but the water will be smooth. A small supply of fresh water may be obtained from wells.

Tides.

TIDES.—The establishment at Westport is 10h. 39m.; the greatest rise at high-water was 21 feet 6 inches, and the least 16 feet 3 inches; the highest low-water 7 feet, and the lowest 11 inches. The tide commences running to the Southward full half an hour before high-water. The tide-stream runs with great velocity through Grand Passage, especially through the two channels at its Southern entrance, where it attains the rate of from 5 to 6 knots per hour.

If wishing to run through the Western entrance without anchoring at Westport, instead of hauling to the Westward preserve a Northerly course, taking care not to approach Bryers Island nearer than 1 $\frac{1}{2}$ cable, to avoid a rocky shoal which runs off the

island a little beyond the other hand, keep a mile to the Northward must be kept to avoid the light-house Ledge, and may be must, however, for it is shoal for a Northerly direction.

To run through on the port bow the flood, pass a half a cable's light-house to be nor to approach cables' length; house on Peter Island recommended.

When Peter Island sharp round the the high-water Shoal, on which a buoy on Peter and the entrance except from N. smooth in the port

FROM CAPE

DIRECTION:

distance 16 $\frac{1}{2}$ miles South point of Peter Island approached close to direction.

In running through bold, and may be passage; the Eastern to about 1 $\frac{1}{2}$ cable's Beer's Head, (the rock with only 8 cable's length and breaks in head this rock and the

When running middle of Long Island the Passage to the formed, running in breadth on approach can be rounded edge

When through eight-tenths of a N.N.E. $\frac{1}{2}$ E., 49 $\frac{1}{2}$ When in the Bay the Digby Neck passage, in order shore can be approached 5 fathoms at low-water. Petit Passage be preferred by passage, not only from dangers. A

TIDES.—The hour. High-water Grand Passage be

island a little beyond the North end of Westport, about that distance off; and on the other hand, keep Peter Island light-house to the Southward of S. $\frac{1}{2}$ W., until half a mile to the Northward of the island, in order to clear Passage Shoal, when the light must be kept to the Southward of S. by W. $\frac{1}{2}$ W. until the North end of Bryers Island bears N.W. $\frac{1}{2}$ W., when a vessel will be clear of Cow Ledge and Shoal, and by keeping the light-house in sight, will pass a long way to the North-eastward of the N.W. Ledge, and may approach Long Island, which is bold, to a cable's length. Care must, however, be taken, not to run very close to the Northern point of Bryers Island, for it is shoal for a cable's length in a North-easterly direction, and also $1\frac{1}{2}$ cable in a Northerly direction from the high-water line of the point.

To run through the Eastern Entrance, keep the South point of Peter Island a little on the port bow to avoid Dartmouth Point, which should be given a wide berth; on the flood, pass along the Eastern side of Peter Island, which may be safely approached to half a cable's length. Preserve a Northerly course, taking care not to bring the light-house to bear to the Southward of S. by W. $\frac{1}{2}$ W., until half a mile beyond it; nor to approach the Long Island shore, until arriving at Sand Point, nearer than two cables' length; after passing Sand Point, care must be taken not to bring the light-house on Peter Island to the Westward of S. by W. $\frac{1}{2}$ W., and then steer as before recommended.

When Peter Island is passed, and wishing to anchor at Westport on the flood, haul sharp round the North end of the island, taking care to keep a full cable's length off the high-water line, or two cables' length from the light-house, in order to avoid the shoal point off the Northern end of the island, and pass between it and Passage Shoal, on which the flood sets directly and with great strength.

A buoy on Passage Shoal would greatly facilitate the navigation of this passage, and the entrance to Westport, which affords a very safe anchorage with all winds, except from N. $\frac{1}{2}$ E. to N.N.E. $\frac{1}{2}$ E., to which it is exposed; but the water is always smooth in the position recommended for anchorage.

FROM CAPE SAINT MARY TO RUN THROUGH PETIT PASSAGE.

DIRECTIONS.—Cape St. Mary bearing East one mile, a N. by E. $\frac{1}{2}$ E. course, *Directions.* distance 16 $\frac{1}{2}$ miles, will carry a vessel to the South entrance of Petit Passage, the South point of Digby Neck bearing E.N.E., half a mile; this point must not be approached close to, for some rocks run off it nearly a cable's length in a Southerly direction.

In running through the passage, keep about mid-channel. The Western shore is bold, and may be approached, especially at Eddy Point, which projects into the passage: the Eastern shore to the Northward of Sand Point has a ragged rocky bottom to about $1\frac{1}{2}$ cable from the high-water line. Care must be taken in approaching the Boer's Head, (the point at the North-west entrance of the passage,) off which lies a rock with only 8 feet on it at low springs; it bears from the point about N. by E. $\frac{1}{2}$ E., $1\frac{1}{2}$ cable's length distant, and shows a tide-rip during the strength of the tide-stream, and breaks in heavy weather. There is a passage with 25 feet at low-water between this rock and the shore.

When running for Petit Passage on the ebb, and off Cape St. Mary, steer for the middle of Long Island about N. $\frac{1}{2}$ E., until the strip of tide is passed which runs from the Passage to the Cape, beyond which, on the Long Island shore, a feeble eddy is formed, running towards Petit Passage, which increases in strength and diminishes in breadth on approaching that passage, where it reaches up to Eddy Point, which can be rounded close to.

When through the passage, or on the Bay of Fundy side, Boar's Head bearing S.W. eight-tenths of a mile, Partridge Island light (St. John, New Brunswick) will bear N.N.E. $\frac{1}{2}$ E., 494 miles distant.

When in the Bay of Fundy, and wishing to enter Petit Passage on the ebb, make the Digby Neck shore to the Eastward of the passage, and skirt it along until in the passage, in order to prevent the tide sweeping the vessel by the entrance. The above shore can be approached with safety to about $1\frac{1}{2}$ cable, where there is a depth of about 5 fathoms at low-water.

Petit Passage is the shortest route between St. John and Cape Fourchu, and is to be preferred by steamers and smart sailing vessels with a leading wind through the passage, not only on account of the lesser distance, but because it is entirely free from dangers. A small light on Eddy Point would be of great advantage.

TIDES.—The tide runs through Petit Passage at a rate of from 6 to 7 knots an hour. High-water happens about two minutes before, and the range exceeds that in Grand Passage by one-twentieth. An eddy is formed on the Western shore of the *Tides.*

passage to the Northward of Eddy Point, where small vessels can anchor close to the shore, but require to be moored head and stern on the ebb-tide.

St. Mary Bay.

ST. MARY BAY.—When off Cape St. Mary, and bound up St. Mary Bay, the coast is bold, and may be approached until you arrive at Montegan, where it becomes low, and beyond which rocky ridges run off the shore in a direction at right angles to its trend as far as Groscoq; the shore should be given a berth of a mile. Beyond Groscoq the coast becomes bolder, until within a short distance of the entrance of the Sisibou River, where a shoal runs off; by keeping rather more than half a mile from the shore, a vessel will pass outside in about 5 fathoms at low-water springs; after which, when the remarkable notch in Sandy Cove shows open, she can haul in towards the entrance of the river, and find good anchorage in about 5½ fathoms at low-water, over mud bottom, at rather less than half a mile from the shore.

Long Island.

LONG ISLAND.—The St. Mary shore of Long Island is very bold, and a vessel can run close along it, except in rounding Dartmouth Point, off which some ragged rocks lie nearly one and a half cable distant.

The Bay of Fundy shore of Long Island is bold, and after passing Cow-ledge Shoal, can be approached to one cable's length, until you reach Boar's Head, where only small vessels or steamers should attempt to pass inside the rock before described.

Bryers Island N.W. Ledge.

BRYERS ISLAND NORTH-WEST LEDGE.—This ledge, which is of large extent, and lies to the North-west of Bryers Island, has very deep water to the North-west close to it, and a good passage between it and the island; the North-western shore of the island may be safely approached to 2 cables' length.

On this ledge there are several shoal spots, the principal of which are the N.W. Rock, Batson's Rocks, and the Frenchman's Elbow.

North-west Rock.

NORTH-WEST ROCK has only 6 feet on it at low springs, and is of small extent. The 6-feet bears from Bryers Island light-house N. by E., 4½ miles, and from station on Bryers Island, N. by W. ¾ W., 3½ miles; a large granite boulder on a hill on Long Island, on with the North point of Bryers Island, (over which it is seen) leads clear of this rock and of the whole ledge, passing in good water to the Northward of it.

The Batson.

THE BATSON consists of two rocks, or small shoals, the least water on which is respectively 12 and 13 feet at low springs; they lie S.W. ¼ W. and N.E. ¼ E. from each other, and nearly a cable's length apart, with 5½ fathoms between them. The 12-foot spot bears from the North-west rock, W.S.W. ¾ W., distant one mile; from Bryers Island light-house nearly North, 3¼ miles; and from Bryers Island station, N. N.W. ¾ W., 3¼ miles.

The Frenchman's Elbow.

THE FRENCHMAN'S ELBOW is a long shoal strip, with 5½ fathoms water on it, and lies between the North-west Rock and Bryers Island, in the direction of the North point of the latter, and distant about one mile from the former.

To the South-west of the Batson, the ridge extends to a considerable distance in that direction, gradually increasing in depth, with deep water on both sides of it.

The North-west Ledge shows a large heavy tide-rip during the strength of the tide, and breaks heavy on its shoal parts when there is much sea.

The Gull Rock, well open of the point of Bryers Island to the South-east of the light-house, clears the Batson Rocks, passing to the Southward of them; and the Gull on with the point will lead over the North-west Ledge, between the Batson and North-west Rock.

Tides.

TIDES.—The tide-stream runs very strong over the North-west Ledge, the ebb taking a Southerly and the flood a Northerly direction, at the rate of about 4 miles an hour at half-tide, when it attains its greatest velocity. The stream changes its direction here about three-quarters of an hour after that in Grand Passage, or nearly about the time of high and low water there.

Directions.

DIRECTIONS.—In sailing from Cape Fouchu to St. John, and intending to run between the Grand Manan and Bryers Island, with Cape Fouchu light-house bearing E. by S. ½ S., 3 miles, a N. by W. ¼ W. course, 27 miles, will lead 3 miles to the Westward of Trinity Ledge, and about the same distance to the Westward of Bryers Island South-west Ledge; from thence steer N. ¼ W. 8 miles, when the Batson Rock on the North-west Ledge will bear about E. by S. ½ S., rather more than 5 miles; the course to St. John is then clear of all danger, and Partridge Island will bear N.E. ½ N., 60 miles.

Caution.

CAUTION.—In foggy weather it requires a very careful look-out, and the vessel frequently have, to make this passage; in which case, when abreast of the Trinity Ledge at the distance above mentioned, if a depth of less than 30 fathoms is obtained, haul more to the Westward. When approaching the South-west Ledge, she should be in about 40 fathoms. The tail of this ledge runs out a considerable distance to the South-west, and shows a ripple during the tide; if, therefore, you haul from deep to shoal, and then deepen again and see the ripple, you will know you have

crossed the tail of the shoal, and by referring to the chart and depth of water, will pick up your place pretty exactly. In approaching the North-west Ledge, keep beyond 40 fathoms; and in a similar manner to the above, you may pick up your position, when crossing the tail that runs out a considerable distance in a South-west direction from the Butson.

TIDES.—The tide-stream from Cape Fourchu to Bryers Island will set a little across the above courses from 5° to 10°, and run about 2 knots an hour during 4 hours on each tide, the ebb setting the vessel to the Westward, and the flood to the Eastward of her apparent course. After passing Bryers Island, the direction of the stream suffers a considerable alteration, setting N. E. and S. W.

ANNAPOLIS GUT.—Pursuing the coast along shore from Bryers Island to Annapolis Gut, it has very few curvatures; the shore is bound with high rocky cliffs, above which a range of hills rises gradually to a considerable height; their summits appear unbroken, except at the Grand and Petit Passages, at Sandy Cove, and Gulliver's Hole, where they sink down in valleys, and near the gut, where they terminate by an abrupt and steep declivity. The mariner, in navigating this coast, will, by keeping about a mile, or a mile and a half from the land, have 50, 40, and not less than 30 fathoms water all the way; and when at the entrance of the gut, one and a half mile distant from the light-house on Point Prim, he will find the latter depth. The shore on both sides of the gut is iron-bound for several leagues; the stream of ebb and flood sets through the gut with the velocity of 5 knots an hour, causing various eddies and whirlpools, but the truest tide will be found off the Eastern side, which is so bold to approach that a ship may rub her bowsprit against the cliffs, and yet be in 10 fathoms water. There is a light-house upon Point Prim, the light from which is exhibited from a window 120 feet above the sea, and is an object of pitiful and useless economy; but it may perhaps serve to prevent the fatal error of mistaking the real entrance of the gut from Gulliver's Hole, which the land much resembles, but which the latter has no such distinguishing building upon. Point Prim runs off shoal about 20 fathoms, and off the Eastern entrance is the Man-of-war Rock; it lies about a cable's length from the land, and has no channel within it. The entrance to the gut is very narrow, but keep mid-channel, and after you get within it the harbor widens, and ships can anchor on the East or West side of the basin, or run up to Goat's Island; if the latter, they should observe that when they get within half a mile of the island, they must stretch two-thirds of the way towards the port shore, until they are past the island, which is shoal all round, and from thence they can steer up mid-channel towards the town.

In addition to the above, Mr. Lockwood observes, "That the abrupt precipices of the highlands which form the gut, cause those gusts of winds which rush down so suddenly and so violently from the mountains. The tide also hurries your vessel through with great force. At the entrance there is no anchorage except close inshore, near the outer Western point; in some places the depth is from 40 to 80 fathoms."

BLACK ROCK POINT.—On this point there is a light-house, 45 feet above sea-level at high-water, (rise and fall about 50 feet,) three-quarters of a mile East of it, and at Givan's Breakwater, 24 miles Westerly. It will be a guide-light in clear weather, making Spencer's Island anchorage and the channel leading into the Basin of Mines. The following are bearings of the prominent headlands within view from the light:

Long Point, South shore.....	S. 86½ degrees West.	<i>Bearings.</i>
To Givan's Breakwater.....	S. 81 " "	
Isle of Haute.....	N. 49 " "	
Cape Chignecto.....	N. 21 " "	
Cape D'Or.....	N. 13½ " East.	
Spencer's Island.....	N. 35 " "	
Cape Split.....	N. 66½ " "	
Range of shore towards Hall's Harbor.....	N. 89 " "	

ANNAPOLIS TO THE BASIN OF MINES.—From the Gut of Annapolis up the bay to Cape Split, the coast continues straight and nearly in the same direction, with a few rocky cliffs near the gut or narrows, and many banks of red earth under highlands, which appear very even. In the channel or narrows leading into the Basin of Mines, from Cape Split to Cape Blow-me-down, and from Cape D'Or on the North side, to Partridge Island, the land rises almost perpendicularly from the shore to a very great height. Between Cape Blow-me-down and Partridge Island, there is a great depth of water, and the stream of the current, even at the time of neap tides, does not run less than 5 or 6 knots. Having passed Cape Blow-me-down, a wide space opens to the Southward, leading to the settlements of Cornwallis, Horton, Falmouth, and Windsor, &c.; these are now rising into great mercantile consequence, and abound in

mines of coal, plaster, limestone, and other valuable minerals: while to the Eastward the river extends to Cobequid Bay, having on its banks the towns of Londonderry, Truro, and Onslow, this latter place forming a direct communication with the Bay of Tatmagouche, in the Gulf of St. Lawrence. Off Cape Split there are considerable whirlpools, which, with spring tides, are very dangerous, and frequently run 9 knots an hour. Should a vessel be at anchor between Cape Sharpe and Partridge Island, and you should be desirous of proceeding to Windsor River, it will be necessary to get under way two hours before low-water, in order to get into the stream of the Windsor tide on the Southern shore; otherwise, without a commanding breeze, a vessel would run the hazard of being carried up with the Cobequid tide, which is the main stream, and runs very strong both with flood and ebb; while the Windsor tide turns off round Cape Blow-me-down to the Southward, and is then divided again, one part continuing its course up to Windsor, and the other forming the Cornwallis tide, running up the river of that name.

In sailing up Windsor River, the house on Horton Bluff should be kept in a South bearing, and the gap in the Parrsborough River, North; this will carry you through the channel between the flats, which cannot be passed at low-water by a vessel drawing 15 feet much before half-tide. Off Horton Bluff the ground is loose and slaty, and a ship will be likely to drag her anchors, with a strong breeze, particularly at full and change; therefore, it might, perhaps, be better for men-of-war to moor across the stream, and fall one-third from the bluff.

HORTON BLUFF LIGHT.—A beacon light on Horton Bluff, in the Basin of Mines, 95 feet above sea-level, high-water—rise and fall, 40 to 45 feet.

The building is square, painted white; stands 60 feet from the bluff, and shows a white light, which may be seen in clear weather over the greatest part of the Basin of Mines, (after passing Cape Blow-me-down) and above the Five Islands, and up Windsor River, until intercepted by the continuation of the bluff to the Southward of it.

*Light.**Haute Island.*

HAUTE ISLAND.—This island is situated at the entrance of the Mine's Channel, and is not 1/4 mile in length, and about half a mile broad; it bears from Cape Chignecto S.W., distant 4 miles; the channel on either side is good; that between it and the cape has 14, 20, and 22 fathoms water in it, and that between Haute and Jolyffe Head from 20 to 40 fathoms; it forms a prominent and very remarkable object, from the height and steepness of its rocky cliffs, which, in a most singular manner, seem to overhang its Western side; there is, however, a fair landing at its Eastern end, an anchorage half a mile off in 18 fathoms, with the low point bearing about N.E. by N.; here also is a stream of fresh water running into the sea. Cape D'Or and Cape Chignecto are highlands, with very steep cliffs of rocks and red earth, and deep water close under them. You have nearly the same kind of shore to the head of Chignecto Bay, where very extensive flats of mud and quicksand are left dry at low-water. The tides come in a bore, rushing in with a great rapidity, and are known to rise, at the equinoxes, from 60 to 70 feet perpendicular.

*Chignecto Bay.**Light-house.*

CHIGNECTO BAY runs up E.N.E., and may be considered to be the North-eastern branch of the Bay of Fundy; it is divided from the Mine's Channel by the peninsula, of which Cape Chignecto is the Western extremity; having advanced about 12 or 13 miles within it, you will see a point on the port or Northern shore running out to seaward; this is called Cape Enragée, on which there is a light-house containing a fixed light; 11 miles beyond which it divides into two branches, the one leading to Cumberland Basin, and by the River Missequash to Verte Bay, in the Gulf of St. Lawrence, and now becoming a place of very considerable commerce; the other running Northerly, and taking the name of the Pentadiac River; these parts, like the Basin of Mines, are fast rising into consequence, and becoming the seat of numerous settlements. The Cumberland Branch is navigable to within 13 miles of Verte Bay; and it is remarkable that when the rise of the tide in Cumberland Basin is 60 feet, that at Verte Bay will only rise 8 feet. The River of Missequash, which runs across the isthmus, is the present boundary between the provinces of Nova Scotia and New Brunswick.

*Cape Capstan.**Light-house.*

CAPE CAPSTAN.—On this cape there is a light-house which shows two lights horizontally, when approaching it from the Westward or seaward side. The lights are about 40 feet above high-water (rise and fall about 55 feet). The building is square and painted white, and is a conspicuous beacon in the day-time to mark the entrance

CHIGNECTO BAY TO THE MANAN ISLANDS AND PASSAMAQUODDY BAY.

THE NORTH COAST OF THE BAY OF FUNDY, from Cape Enragée towards *North Coast* Quaco, in the township of St. Martin's, is, at present, but thinly inhabited, and it con- *of the Bay of* times to be so as far as St. John: the land is good, but much broken with steep *Fundy.* valleys; the weather is generally humid, the winds boisterous and changeable, and the intervals of sunshine limited and evanescent; but from Quaco to St. John the interior hills rise in easy inequalities; the ravines of the cliffs are deep and gloomy, and the indentations frequently have beaches; at Black River, which is about 12 miles West of Quaco, is a safe inlet for a small vessel, although it is dry from half-tide.

QUACO LIGHT, white and red, horizontal, is on a small rock off Quaco Head, *Quaco* W. 1 S. from St. Martin's Head; it is a revolving light; time of revolution 30 *light.* seconds.

QUACO LEDGE.—This is a dangerous gravelly shoal, situated about 12 miles S. *Quaco* E. ½ E. from Quaco, and W. by N., distant 11 miles from Haute Island; it extends N. *Ledge.* W. by N. and S.E. by S. about 3½ miles, and is half a mile broad; vessels have frequently grounded upon this bank; there are several irregular patches of rocks lying off its N.E. side; the ledge shows itself at half-tide, and dries for about 100 yards, having but 12 feet water over it with common tides; half a mile to the N.E. the eddies with the flood-tides are strong and numerous, the ship's head going nearly round the compass in the space of half an hour; the ebb is a true tide, and sets in a W.S.W. direction towards the ledge; the soundings are from 7 to 14 fathoms, at about 2 cables' length all the way round, but they shoal more gradually from the N.E.

At low-water, spring tides, the highest rock is 12 or 14 feet above water, and as much under at high-water. In light winds and smooth water it is not visible, and therefore dangerous.

The night tides here, and generally throughout the bay, are highest; at St. John they are so during the summer, but the contrary during the winter months, or between the equinoxes. The mark to go clear to the Southward of the Quaco Ledge is Cape D'Or on with the South side of the Island Haute.

ST. JOHN HARBOR.—The entrance to this harbor bears from the Gut of An- *St. John* nepolis about N. ½ W., distant 11 leagues; it is distinguished by a light-house which *Harbor.* stands on Partridge Island, after mentioned. Vessels coming from seaward and making for this harbor, should, so soon as ever they can well discern the light-house, make their signal for a pilot; but if unable to succeed in reaching the harbor that tide, then endeavor to run in between Meogenes Island and the main, going either on the South or on the North side of this island, in doing which you will have nowhere less than 4, 5, and 6 fathoms water, with a bottom of sand and mud. Here you will obtain the best anchorage, by bringing the three hills in the country to the N.E. in a line over Rocky Point Island, and the house on Meogenes Island S.E. by S. High-water 14h. 44m., *High-water.* rise 21 to 25 feet.

THE CITY OF ST. JOHN stands on an irregular descent, having a Southern as- *City of St.* pect, and on entering the river has an imposing appearance. Partridge Island is *John.* about 2 miles to the Southward of the city, answering the double purpose of protect- ing the harbor, and by its light-house, painted white and red, vertical, guiding and directing the mariner to its entrance; the lantern is 166 feet above the level of the *Light-house.* sea, and the light is good and well attended. The ground for several miles to the Southward of Partridge Island is muddy, the depth gradual from 7 to 20 fathoms, affording excellent anchorage; the passage Westward of this island has in it 10 feet, that to the Eastward has 16 feet, and abreast of the city are from 7 to 22 fathoms. Three-fourths of a mile to the Northward of the light-house is a beacon, black and *Beacon.* white, vertical, fixed on the edge of a rocky ledge, forming the West side of the chan- nel, and having deep water close to it. A breakwater is erected further on at the Eastern side of the channel and below the town; this greatly intercepts the violence of the waves, which Southerly gales usually occasion. Every possible assistance is

hero given to ships wanting repair, they lie upon blocks, and undergo a thorough examination, without incurring the expense, injury, and loss of time occasioned by hearing them down.

Vessels having made the harbor, and finding themselves able to enter, may, when they have passed Meogenes Island, edge inshore towards Rocky Point, until they perceive Meogenes Point is in a line with, or over the N.W. corner of Meogenes Island; and then, sailing in between Rocky Point and Partridge Island with these marks on, will lead them in the deepest water, over the bar, until they open Point Maspect to the Northward of the low point of Partridge Island; when putting the helm starboard, they should edge over towards Thompson's Point, until they get the red store at the South edge of St. John in a line over the beacon; keep them in one until they have passed the beacon at the distance of a ship's breadth; then haul up N.N.W. for the harbor, keeping the block-house, at the upper part of the harbor, open to the Westward of the king's store, situated by the water-side; which mark will lead them into the channel, up to the wharves, where they may lie aground, dry at half-tide, and clean the ship's bottom; or ride afloat in the stream at single anchor, with a hawser fastened to the posts of the wharves on shore. The flood-tide is weak here, but the ebb runs down rapidly past Meogenes Island into the Bay of Fundy.

Tide.

Should the tide of ebb have taken place at the beacon, then it would be highly improper to attempt gaining the harbor that tide; but wait for the next half-flood to go over the bar; as both sides of the entrance to the harbor are composed of sharp rocks, which dry at low-water; and the tide of ebb, especially in the spring of the year, when the ice and snow are dissolving, is so exceedingly rapid and strong, that all the anchors you possess will not be sufficient to prevent the ship from driving.

From St. John out of the Bay of Fundy.

FROM ST. JOHN OUT OF THE BAY OF FUNDY.—To run mid-channel between the Gannet Rock and Batson North-west Ledge; after leaving Partridge Island, steer S.W. $\frac{1}{2}$ S., about 55 miles, which will lead about half-way between the rock and the ledge, when you will have soundings in about 100 fathoms, or rather more. The deep water runs close up to the Old Proprietor off Grand Manan, on the one hand, and the North-west Ledge on the other, so that when sailing in this direction, and in 60 or 70 fathoms, a sharp look-out is requisite.

From the above position, half-way between the Gannet and the Batson, the shallowest part of the Larcher will bear about S. $\frac{1}{2}$ W., distant 35 miles; there will be plenty of room to pass either side of it.

To the W.S. Westward of Meogenes Island is Flat Bay, called also Visarinkum; it is a small harbor, with 5 and 4 fathoms water, used sometimes by the coasters. From hence the land runs nearly W.S.W. passing Negro Head to Coupe Musquash, off the point of which is Split Rock; it lies close to the cape, and has 8 fathoms water very near it, being distant from Partridge Island 8 $\frac{1}{2}$ miles; the shore is iron-bound all the way, and has deep water close in to the land.

Musquash Harbor.

MUSQUASH HARBOR lies about a mile to the Westward of the Split Rock; its entrance is about half a mile wide, and there is good anchorage a little way in, with 4 fathoms water, but further on a bar runs across the harbor, over which is only 1 $\frac{1}{2}$ fathoms; small vessels sometimes pass to the Westward of the islands, and run up the river, which, when past the bar, has 2, 2 $\frac{1}{2}$, and 3 fathoms water; but this harbor is open to the Southward.

Point Lepreau, Light.

POINT LEPREAU.—From the entrance to Musquash the coast runs W.S.W. Westerly, nearly 10 miles to Point Lepreau, on which there is a tower, 81 feet high, red and white, horizontal, with two fixed lights, one elevated 28 feet above the other. In this space are 4 or 5 inlets, but only calculated for small craft; the first of these is about 1 $\frac{1}{2}$ mile to the Westward of Musquash Western point, and is of no note whatever; in your way to it a berth must be given to the shore, particularly about Musquash Point, on account of some rocks lying off that part; there are channels between these rocks, but few vessels will venture through them. About a mile further is Chance Harbor, which is a mere shallow cove of 2 fathoms water. Little Dipper is more Westerly still, and situated 3 $\frac{1}{2}$ miles from Musquash Point; this also has only 12 feet water in it, and scarce fit for anything but boats. Great Dipper is divided from Little Dipper by a flat point of land, round which are several scattered rocks; this harbor can accommodate small craft, which sometimes run in there for shelter; but is by no means to be recommended, unless in cases of necessity; there is a creek of fresh water runs into it, called Moose Creek. Further Westward, and about 1 $\frac{1}{2}$ mile from Point Lepreau, is Carriage Harbor; this is open to the Eastward, and affords anchorage at its entrance in from 7 to 3 fathoms. The land all the way from Musquash to Point Lepreau is high, broken, and many scattered rocks lie off it; therefore vessels in passing should carefully give it a good berth.

Maces, or Mason's Bay.

MACES, or MASON'S BAY, is formed to the Westward of Point Lepreau, between it and Red Head; these bear from each other N.W. $\frac{1}{2}$ N., and S.E. $\frac{1}{2}$ S., distant full 5 miles. There are numerous rocks, shoals, and small islets within it, but its naviga-

tion seems insecure, for Mr. Lockwood emphatically observes, "this point ought to be classed as one of the dangers of the Bay of Fundy; for many serious accidents have lately happened in the neighborhood of this promontory." Maces Bay he calls a deep and ugly indent; so much so, that ships bound to the River St. John, dreading to pass its entrance, get frequently embayed there, and some valuable vessels have thus been lost. "Yet, at the head of this bay," he observes, "is a place called Pok Logan, where there is good shelter. Several rivers appear to fall into this bay; and, perhaps, a better knowledge would tend much to strip it of its fancied dangers."

W. by S. from Point Lepreau, distant $3\frac{1}{2}$ and 4 miles, there is supposed to be a dangerous shoal, but its actual situation is not known; if such should exist, it must be surrounded with very deep water, for a small distance from this imagined situation are 26 fms, and 31 fathoms, mud, mud and sand, and gravel.

BEAVER HARBOR lies about 4 miles to the Eastward of Bliss Island, and is *Beaver Harbor*. above a mile wide at its entrance, with 10 fathoms water on each side, and 20 fathoms mid-channel. In entering keep the Western shore on board, until you bring the Goal Rock to bear East, distant about half a mile, when you may anchor in 4 or 5 fathoms, good holding-ground. There are no regular pilots, but the fishermen on the coast are well qualified for the task, although in clear weather they are not absolutely necessary, yet strangers to the place will most probably require their assistance. There are several rivulets running into various parts of the harbor, but there is no convenient watering-place.

ETANG HARBOR is situated to the Southward of the Magagadawe, and runs in *Etang Harbor*. to the North-eastward of Campo Bello; before it lie many islands. There are three entrances into this harbor, so that vessels may go in or out at any time. The Western entrance leads to La Tete Harbor, where anchorage may be obtained in from 10 to 15 fathoms, but there is no passage for ships round the Northern end of Payne's Island. The channels between Payne's and Bliss Islands are considered to be the best, as they will admit of vessels working through them; but the Eastern passage requires a leading wind. A pilot will be necessary on account of the intricacies of the channel, but one can easily be obtained anywhere on the coast; water can be procured in various places. The bay is extensive, secure, and well sheltered, having good anchorage throughout. High-water 11h. 10m., rise 21 to 25 feet.

ST. ANDREW'S HARBOR lies on the Eastern side of the entrance of the River Scodie, and has two entrances; the Eastern one is narrow and intricate, but is the deeper, having 4 or 5 feet at low-water; the dangers in entering through this passage are a reef of rocks with a beacon on it, extending nearly three-quarters of a mile from Navy Island, and a reef of sand and large stones with a pole on it, extending nearly 2 miles from the block-house on the main-land; the narrowest part of the channel is not more than a cable's length; the mark for entering is to keep the town of St. Andrews open, and steer directly in for the harbor. In the bay, in general, there are from 17 to 25 fathoms water.

The Western entrance is not so difficult, but has less water than the Eastern, the bar being dry at the last quarter ebb. A dangerous reef of stones, with a floating beacon on it, lies off the West end of Navy Island. In steering you must keep close to the Northward of the two poles on the bar, where, at high-water, you will have from 18 to 20 feet water.

There is a harbor-master and branch pilots belonging to St. Andrews, and large vessels should never attempt to enter without having one of them on board. High-water 10h. 50m. Common tides rise 20 feet; spring tides 26 feet.

LIGHT.—On the North point of the entrance there is a light 35 feet high; it contains a fixed light.

WOLF ISLANDS.—The Wolves may be passed on either side, having deep water close to them; but they afford no sheltered anchorage, except for small fishing-vessels in summer time; they are from 60 to 100 feet high. With light winds, a lee tide, or thick weather, you may let go an anchor anywhere between the Wolves and Beaver Harbor, in good holding-ground, with a depth of 20 or 25 fathoms.

THE MANAN ISLANDS.—Grand Manan is an island situated at the North-western entrance of the Bay of Fundy; it is in the province of New Brunswick, and forms a part of Charlotte County; being 14½ miles in length and 7 in breadth. According to the chart, the North-western part of this island is distant from Passamaquoddy Head about 7 miles; its North-eastern point, or Bishop's Head, bears from Cape Maspect W. S.W. nearly 10 leagues, and W.N.W. from the entrance to the Gut of Annapolis, about 14 leagues; and from Petit Passage, N.W. by N., 32 miles. Its S.W. end, or Seal, bears from the light-house on Bryers Island N.W. by N. nearly, from which it is distant 28 miles; and N.W. by W. from the Northern entrance to Petit Passage, distant 30 miles. Thus situated it commands an uninterrupted view of every vessel that passes to or from the Bay of Fundy. It is naturally strong, and possesses harbors

where the largest ships may ride in perfect security. Its fisheries are in great estimation.

On its Western side the cliffs are nearly perpendicular, rising 600 feet above the level of the sea; but on this side there is only one little inlet along the whole range that can shelter even boats. It is commonly called Dark Cove, being situated about 4 miles from the Northern part of the island: there is indeed a place called Bradford's Cove, about 5 or 6 miles more to the Southward, but this is of no note whatever. There are soundings all along the shore, from Bishop's Head to the S.W. Head, 3, 4, 5, and 6 fathoms close to the land, deepening to 13, 20, 21, and 22, half a mile off; to 30, 40, and 50 fathoms at a mile distance, and still deeper as you increase your distance from the island.

The Northern or Bishop's Head is abrupt and bold; but on its Eastern side there is anchorage in a place called Whale Cove. This is situated between Swallow's Tail and the North Point; here vessels frequently ride during Southerly winds, to wait the turn of tide. The soundings are from 15 to 25 fathoms; but it must not be resorted to in Northerly gales.

Long Island Bay.

LONG ISLAND BAY.—This lies to the S. Eastward of Whale Cove, and is formed by the Swallow's Tail, which is a bold, high, ragged, and barren-looking point, and Long Island, which bears nearly South from it, distant 14 miles. This bay is easy of access, and possesses all the advantages of a harbor. The bottom of the bay is generally mud, excepting a ridge of rocks and gravel, which extends from the ledge that shows itself within the Swallow's Tail, and the cluster of sunken rocks that lie half a mile N.N.E. from Long Island Point, and these are 5 feet under water at low spring-tides. In the Northern part of the bay the bottom is a stiff clay, and vessels ill provided with gear have often rode out the severest gale there; and under Long Island opposite the beach is good anchorage, even locking in the Northern end of Long Island with Swallow's Tail. The ground here is a strong mud, and you will ride safe and unaffected by sea or wind from any quarter.

Further to the Southward, and on the Eastern coast of Grand Manan, are the Duck Islands. Here a pilot will be necessary, for though the ground is good about Great Duck Island, yet there are dangers which, when the tide becomes high, are completely hidden. To the South-westward of Duck Islands are the Islands of Ross, (the Northern point of which is scarcely separated from Manan,) Cheney's Island, and White Head Island; these are connected together by a sandy and rocky reef of foul ground, which extends S. & W. to the Diamond Rocks, of which we shall speak hereafter. On White Head Island resides an able and active pilot, and the cove opposite to his house is commonly a great resort for vessels employed in the fisheries; but with Easterly winds this is no desirable place. At the Western side of Ross Island is part of what is called Grand Harbor. It is a shallow muddy basin; but vessels may enter and lie securely in it, on the mud; a convenience somewhat desirable, should you have lost your anchors and cables on any of the outer ledges. The entrance to this place has 4, 5, 6, and 7 fathoms water, with a clayey bottom; the channel is narrow, but secure from the sea.

A little to the Westward of White Head Island are the Green Islands, and to the Southward of the Green Islands, about one mile, are the three Kent's Islands; these latter are low and ledgy; the Eastern, or largest one, is bold to the rocks, which are at all times to be seen; and to the North-westward of these rocks is a ledge called the Constable, which dries at low water. Under the lee of these and the Green Islands, occasional anchorage may be obtained in from 11 to 7 fathoms.

Wood Island.

WOOD ISLAND lies off the Southern part of Grand Manan, and is one mile and three quarters long; it runs parallel to the South-west head of Manan, and forms an excellent harbor between. The upper part of this inlet, and the head of it, afford the most secure anchorage; and the inhabitants about Seal Cove and Red Head will furnish you with all necessary supplies you may stand in need of, for these places are well settled.

The Manan Ledges.

THE MANAN LEDGES are those more distant islets, rocks, and dangers which lie to the Southward of Grand Manan. The outer and most dangerous of these is the Clerk's Proprietor, covering a space of half an acre at low-water, and drying at half ebb, when covered the tide sets directly over it, at the rate of 4 miles an hour. It lies $\frac{1}{2}$ E., distant 93 miles from Great Duck Island; S. by E. nearly 7 miles from the Northern end of White Head Island; E. 4 S. 64 miles from the Gannet Rock; S.E. 4 E. 4 leagues from the South-west head of Manan; N.N.W. & N. 184 miles from Proprietor Island light-house; N.N.W. & W. 48 miles from the Northern entrance to the Petit Passage; N.W. & W. 184 miles from the Petit Passage; West 35 miles from the Cape of Annapolis; and S.W. 15 leagues from the light-house on Partridge Island.

About 24 miles N.E. $\frac{1}{2}$ N. from the Old Proprietor is the Clerk's Ground, a red shoal of 4 fathoms. N.W. by N. one mile and two-thirds from the Old Proprietor is Crawley's Shoal, of 7 feet only; and West of the Crawley, one mile and a half, is

Raus, of 5 fathoms; and, a little to the Southward of the highland of Manan, is a little bay, the marks to which are Southward of the Easterly wind. There are a few small islands on the west point of occasion a corner are called the

of these show S.S.E. & S. Islands, is a little it bears about the mark given of all the islands distant 2 miles, doubtful.

SEAL ISLAND islets. On the distant from each which they are distant about 50 feet above the following bearings: To the Southern Gannet Rock, To N.E. Rock, To the Southern West Quodd, To Little River, To Libby Island, To South Point ROCKS. — There are several islands N. E. of the Gannet Rocks, N.E. by E. 7 miles from the end of Little River

THE

SHIP-MASTERS will find under the name of the arrival and departure DIRECTIONS. — On the 23rd, 1847, the Coasts are approaching order. In approaching the Coast, the marks to be found on the land hand in passing

Rans, of 5 feet. The Roaring Bull bears N. 4 E. from the Old Proprietor, distant 4 miles; and, although it has 6 fathoms over it, it usually has a heavy dangerous ripple. The marks to go clear to the Eastward of all these dangers, is the North-easternmost highland of Manan well open of the Long and Duck Islands; the mark to lead to the Southward of them is the South-west head of Manan open to Kent's Three Islands. In Easterly winds the tide-rips are impassable.

There are also other rocks within these, a range of which lies South of the South-west point of White Head Island; some of these have deep water between them, and occasion a continual ripple 3 miles from the shore, quite home to the long point; these are called the Tinker, Three Diamonds, Rans, and many others without names; some of these show themselves, others have only 3 and 4 feet water over them.

S. S. E. 4 S., about three-quarters of a mile from the Southern point of the Three Islands, is a knoll called the Kent; it is dangerous, and has only 7 feet water over it; it bears about W. N. W. 4 W. from the Rans, and is not included within the confines of the mark given to avoid the dangers to the Southward, viz., the South-west head open of all the islands. There is also a danger said to lie S. E. 1 S. from the Kent Knoll, distant 2 miles, and W. S. W. 4 S. one mile and a quarter from the Rans, but this is doubtful.

THE GANNET ROCK, on which there is a light-house, painted black and white, *The Gannet Rock.*

vertical, containing a flashing light, which flashes three times each minute, 66 feet above water, and lies S. W. by S., distant 3 1/2 miles from the Southern point of the Three Islands, and S. S. E. 6 1/4 miles from the South-west head of the Grand Manan; it has a number of small ledges and sunken rocks about it, which are always breaking; this mark is conspicuous, being in the immediate vicinity of all the sunken rocks and dangers. Nearly W. S. W. from the Gannet, distant one mile and a half, is St. Mary's Ledge, part of which is always above water; and to the Northward of St. Mary's Ledge, one mile, is the Long Ledge, equally visible; between and around these are numerous rocky shoals, with deep water between them, rendering this part particularly dangerous. Other reefs are supposed to exist to the Westward, and between the Gannet Ledges and the Machias Seal Islands; their imaginary situations are marked on the chart, but no further particulars of them are known.

SEAL ISLANDS.—W. by S. 4 S. from Grand Manan lie the Western Seal *Seal Islands.* On the Western Island two light-houses are erected, showing fixed lights, distant from each other about 165 feet, in the direction of E. S. E. and W. N. W., by which they are distinguished from all other lights upon the coast; they are elevated about 50 feet above high-water mark. From the Westernmost of these light-houses the following bearings were taken:

To the Southernmost of the Murr Ledges, E. S. E.

To Gannet Rock light-house, E. by S. 1 S., about 12 miles.

To N. E. Rock, N. E. by N., about 1 1/2 miles.

To the Southern head of Grand Manan, E. by N. 1 N.

To West Quoddy light-house, N. N. E.

To Little River Head, N. by W.

To Labby Island light-house, N. W. by W.

To South Point of Kent Island, (on the chart three isles.) East.

ROCKS.—There is a rock of 11 feet at low water, which bears from the light on Seal Island N. 15 E., distant 2 1/2 miles; and a rock 6 feet above water, which bears N. E. by E. 4 E., three miles from the light.

PILOTS.—The pilots for St. John, St. Stephen's, and St. Andrew's, are to be of Little River, or the Seal Islands.

Bearings.

Rocks.

Pilots.

THE COAST OF THE UNITED STATES.

FROM PASSAMAQUODDY TO CAPE COD.

Some-masters will please remember, by following the directions given below, published under the authority of the Light-house Board, that it will render their entering and departure from a port much easier.

DIRECTIONS.—In conformity to the terms of the act of Congress, approved December 23th, 1850, prescribing the manner of coloring and numbering the Buoys on the Coasts and in the Bays, Sounds, Rivers, and Harbors of the United States, the following order must be observed, viz.:

1. In approaching the channel, &c., from seaward, RED BUOYS with even numbers be found on the STARBOARD side of the channel, and must be left on the STARBOARD side in passing in.

2. In approaching the channel, &c., from seaward, BLACK BUOYS with odd numbers will be found on the port side of the channel and must be left on the port hand in passing in.

3. BUOYS painted with RED and BLACK STRIPES will be found on obstructions, with channel ways on either side of them, and may be left on either hand in passing in.

4. BUOYS painted with WHITE and BLACK PERPENDICULAR STRIPES will be found in MID-CHANNEL, and must be passed close to avoid danger.

5. All other distinguishing marks to buoys will be in addition to the foregoing, and may be employed to mark particular spots, a particular description of which will be given in the printed lists of buoys.

6. Perches with balls, rings, &c., will, when placed, be at turning points, the color and number indicating on what side they shall be passed.

7. No deviations from the foregoing directions will be permitted.

Tides.

TIDES ON THE UNITED STATES SEA-COAST.—The article on the tides will be found in the first part of the Coast Pilot, immediately after that on the Gulf Stream.

Banks.

BANKS.—There are four banks on this part of the coast: Jeffrey's Bank, Jeffrey's Ledge, on both of which there are from 30 to 50 fathoms water; Cashe's Ledge, which is dangerous, and George's Bank and Shoals, also dangerous. We have no particular information excepting of the two latter.

Cashe's Ledge.

CASHE'S LEDGE.—The position of this shoal has been accurately determined by Lieut. Charles H. Davis, U. S. Coast Survey. It is in latitude $42^{\circ} 56'$, longitude $68^{\circ} 51' 30''$, and has on it 26 feet.

East by the compass, 17 to 18 leagues from Thatcher's Island, you get soundings upon the Fippanies, a bank of 8 or 10 leagues in extent from North to South, about 8 miles wide in the centre and the Northern end; on the Southern end it is 2 to 2½ miles wide. The depth varies from 27 to 46 fathoms, shelly and pebbles.

From the Eastern edge of the Fippanies, East 4 to 5 leagues, will bring you upon Cashe's, on the shoal ground, which is on the Eastern edge of the bank, and is a flat white rock of from 200 to 300 feet in extent.

South of the flat rock there is a gully, 90 fathoms water, which runs in upon the bank in a South-westerly direction. Upon the South side of this gully, 3 miles South of the flat rock, there is a shoal of 7 fathoms, from which the soundings run suddenly to 15 and 30 fathoms on all sides except the East, where it deepens suddenly to 9 fathoms.

N. by W. 9 miles from the flat rock, there is another shoal of 14 fathoms; between this and the flat rock there are from 10 to 35 fathoms, rocky bottom; on the rocky bottom there is kelp of 15 feet in length; on the flat rock there is none.

GEORGE'S SHOAL.

A Report relative to the Survey of George's Shoal, made in Sloop Orbit, by direction and at the expense of E. M. Blunt, assisted by the United States Schooner Science, under the authority of Capt. Isaac Hull, at his request, in 1821.

There are properly four shoals on George's Bank; the whole of them included between latitudes $41^{\circ} 31' N.$ and $41^{\circ} 53' 30'' N.$, and longitudes $67^{\circ} 18' W.$ and $67^{\circ} 30' W.$ Between them there are from 15 to 35 fathoms water.

The largest and on which is the chief danger, is the most Southerly and Westerly. It is somewhat triangular, with a long and narrow spit making out from the S.E. angle. The S.E. point is in latitude $41^{\circ} 34' N.$, and longitude $67^{\circ} 10' W.$ The West point is in latitude $41^{\circ} 42' N.$ and longitude $67^{\circ} 59' W.$ The N.E. point is in latitude $41^{\circ} 48' N.$, and longitude $67^{\circ} 17' W.$ The Eastern side of this shoal, although somewhat irregular, runs nearly S.S.E. and N.N.W., having on it from 3 feet to 9 fathoms at common low-water. It is composed of a great number of sand-spits, very narrow so that the width of a narrow vessel will make several fathoms difference in the depth of water. The general range of the spits is from S.E. to N.W. As there are no rocks they are consequently liable to change, in some measure, their positions and ranges. On the Eastern edge, even in calm weather, unless it be high or low water, the waves run with great rapidity, and form considerable breakers when setting to the Westward, and a large waterfall when setting to the Eastward. This is accounted for by a knowledge of the fact that, directly on the edge of this shoal there are from 12 to 15 fathoms of water, so that the edge forms a species of dam, stopping the force of the flood-tide, and over which the ebb falls.

When there was considerable wind, we observed that the breakers were high within the edge, to the Westward, than on the edge; and I have no doubt that the water there was still shallower, and that we should have seen the sand had it not been

for the heavy impossible to the vessels.

would have been at nearly slack was not thought was danger on without the risk had not the

to have gotten wind was to the bare with any

I think there which indicated some that the bank on the chart.

The centre of $43^{\circ} W.$ It extends, is very narrow fathoms of water, miles length from shoal are very high they may be seen shallowest part is might avoid it.

The centre of is about 2 miles South, there are 30 fathoms.

The above-mentioned Their positions, which I have taken celestial observations two vessels, and breakers were found after our return, not appeared.

At anchor, at the strength of the wind them is from one mile, setting S.E. a mile's distance

by the strength of the wind, as a principal cause in a few hours' time in our situation, for the longitude varies: which is owing for the sets proceed very nearly what may be considered the edge of the course. And they can be easily

In going from the shoals, muddy bottom gradually decreases toward there are 10 fathoms sand and gravel, on the Northward of the North channel $67^{\circ} 51' W.$, there is bottom at 175 fathoms 2 miles Southward.

for the heavy sea. The breakers were such, unless it were entirely calm, that it was impossible to go among them in boats; nor was it considered safe to attempt it with the vessels. For, besides the danger of striking on the hard sand-spits, the vessels would have been liable to be filled by the breakers. Even on the Eastern edge, and at nearly slack water, the vessels were at times nearly covered with them. And it was not thought necessary to attempt it, as the objects of survey, to ascertain if there was danger on the shoals, and the situation and extent of them, could be accomplished without the risk.

Had not the sea been very smooth, and at high-water, we should not have been able to have gotten on where we found 3 feet, reducing it to low-water. The prevailing wind was to the Eastward; and I have no doubt but that this place would have been bare with any continuance of an off-shore wind.

I think there are no rocks about the shoals. We had one east on the S.W. side, which indicated rocky bottom in 15 fathoms; but I believe it to have been some sharp stone that the lead struck on, although I have marked it according to the appearance on the chart. (This chart is published by E. & G. W. Blunt.)

The centre of the Northern shoal is in latitude $41^{\circ} 53' 30''$ N., and longitude $67^{\circ} 43' W.$ It extends East and West about 4 miles. The shoalest part, having 6 fathoms, is very narrow, and composed of hard sand. But there are not more than 12 fathoms of water for 3 miles South of the above latitude. On the North side, at 2 cables' length from the shoal, the sloop dropped into 33 fathoms. The breakers on this shoal are very heavy, and when there should be a sufficient sea to endanger a vessel, they may be seen some miles, and heard at a very considerable distance; and as the shoalest part is not more than a cable's length inside, and no danger near it, a vessel might avoid it.

To the Eastward of the last-mentioned shoal, in latitude $41^{\circ} 51' N.$, and longitude $67^{\circ} 26' W.$, is another small shoal, with 8 fathoms water, having, however, considerable breakers. There are but 17 fathoms for 3 miles North of it; but very near to the East of it are 31 fathoms, and from 20 to 30 fathoms to the South and West.

The centre of the East shoal is in latitude $41^{\circ} 47' N.$, and longitude $67^{\circ} 19' W.$ It is about 2 miles long from East to West, and has several fathoms water. To the South, there are but 17 fathoms for 2 miles. In other directions there are from 20 to 30 fathoms.

The above-described shoals, I am confident, are all which are on George's Bank. Their positions and sizes may be relied on, as well as the places of the soundings which I have laid down on the chart. They were ascertained by a vast number of celestial observations, taken with good and well-adjusted instruments on board the two vessels, and very carefully and faithfully calculated. The rates of the chronometers were found by a transit instrument previously to sailing from Boston, and after our return, and all the observations re-calculated for the small variation which appeared.

At anchor, at different places, and on different days, we determined the set and strength of the tides, and as nearly as possible their rise and fall. The rise of them is from one to one and a half fathom. They set round the compass every tide, setting S.E. nearly, at full moon, and running from one to four knots per hour, at a mile's distance from the breakers. The mean rate, however, is materially varied by the winds: they set strongest at W.S.W. and E.N.E., and which is undoubtedly the strength of the flood and ebb. From these causes and variety in the tides, arises a principal danger in approaching the shoals. When under way about the shoals, in a few hours' time we found ourselves drifted far out of our reckonings, and to ascertain our situation, when both vessels were under way, we took continued observations for the longitude by the chronometers, and at the same time double altitudes for the latitudes; which latter were calculated by Brossier's new and certain method. By allowing for the sets of tides, as ascertained at anchor, the observations and reckoning agreed very nearly, so that the latitude and longitude of every sounding-place on the chart may be considered as certain. Should any vessel fall in with the shoals, a knowledge of the course and strength of the tides would be of the greatest importance. And they can be calculated for any day and hour by the preceding facts.

In going from Cape Cod to the shoals, at 5 leagues from the light, there are 86 fathoms, muddy bottom. The water gradually deepens to 133 fathoms; and then gradually decreases towards the shoals. In latitude $41^{\circ} 51' N.$, and longitude $68^{\circ} 14' W.$, there are 90 fathoms. In lat. $41^{\circ} 50' N.$, and long. $68^{\circ} 3' W.$, there are 39 fathoms, sand and gravel, on the Western edge of the bank. The water then shoals fast. To the Northward of the shoal, in lat. $41^{\circ} 59' N.$, and long. $67^{\circ} 52' W.$, on the South side of the North channel, there are 60 fathoms, soft mud. In lat. $42^{\circ} 12' N.$, and long. $67^{\circ} 50' W.$, there are 102 fathoms. In lat. $42^{\circ} 10' N.$, and long. $67^{\circ} 18' W.$, there is no bottom at 175 fathoms. To the Eastward we did not ascertain the extent of the bank. At 2 miles Southward of the S.E. point of the shoals, there are from 20 to 26 fathoms

of water, which soundings continue for at least 20 miles to the Southward and Westward.

The bottom of the bank, so far as we ascertained it, is of such a narrow character, that it is difficult for a vessel to ascertain her situation by it. We often found a great variety of soundings in a very short distance; such as sands of various colors, and differently mixed, coarse and fine, gravel pebbles of various colors, stones, sponge, and shells. Of all these, except sand, I saved a number of specimens, with marks to note the places from which they were taken.

It may be worthy of remark, that at one cast of the lead, on examining the arming, I found one-third black sand, one-third white, and one-third green shells, in as distinct dimensions as they could have been drawn.

Notwithstanding this variety, some general character of the soundings may be useful. To the Westward of the shoals, and at some distance from them, the bottom is coarse sand and gravel of all colors; to the N.W. a mixture of white, black, and yellow sand; to the N. black and white sand; to the N.E. chiefly gravel and pebbles; to the E. fine white and yellow sand—and in lat. $41^{\circ} 57' N.$, and long. $68^{\circ} 40' W.$, some white moss; to the S.E. fine white and yellow sand.

As the shoals are approached, in whatever direction, the soundings become coarse, and are frequently mixed with shells of different kinds. Near the shoal much of the bottom is pebbles; and to the East of the largest and most dangerous shoal, there are stones of the size of hens' eggs, with moss and sponge on some of them. Near the S.E. point are from 15 to 20 fathoms; a prevailing character of the soundings is green shells, and chiefly the species usually called sea-eggs. If a vessel be far enough South to avoid danger, she will have no shells. The quality of the soundings, as far as we were able to survey the bank, will be best understood from the chart, where they have been carefully rated.

The time and weather prevented making a complete survey of all parts of the bank, and although we ascertained the boundaries of it to the Westward and Northward, I have not delineated it on the chart, being unwilling to borrow any thing from charts which disanger so essentially, and which we found very incorrect in the material points. Of the shoals themselves, I do not believe a more perfect survey can be made, unless in a calm time the main shoal could be penetrated. This, however, does not seem to be an object, as no vessel would be safe in attempting to pass over it.

The reports that rocks have been seen on the shoals are undoubtedly incorrect. Had there been any there, we could not have failed of discovering them. At the West part of the bank, in strong tide-rips, we saw large quantities of kelp and sea-weed, which, at a distance, had the appearance of rocks. But on sounding we found good water, and regular and clear bottom.

It will be seen by the bottom that the holding ground is not good. But the vessel employed in the survey, by having a long scope of cable, rode out a considerable quantity of wind for 22 hours, on the East side of the main shoal, and to windward of it. At this time the sea broke very high in 10 fathoms water.

Since this survey, in 1821, the shoal has been re-surveyed by Lieut. Charles Wilkes and others, in the U. S. brig Porpoise, in the year 1837, and from his report the following is taken:

"The shallowest water found on any part of the bank was 23 fathoms, or 15 feet reduced to low-water; and this is only to be found in two small places, viz.,

Lat. $41^{\circ} 40' 13''$ Long. $67^{\circ} 41' 40''$

Lat. $41^{\circ} 40' 33''$ Long. $67^{\circ} 44' 30''$

"The whole of the shoal is composed of hard sand-spits—fine sand on the shoaler places, and coarser as the water deepens, until it becomes large pebbles without sand.

"The rise and fall of tides is 7 feet, extremely regular, the first part of the flood setting N.N.W. the latter part N. by E., and ebb S.S.E. and S. by W. The flood runs 43 hours, ebb 53 hours; greatest velocity two and six-tenths of a mile, from half an hour to two hours in changing, going round with the sun on from North by way of East. The wind has but little effect on the velocity. High-water, at full and change, at 10 o'clock 30 minutes. Variation of the compass $8^{\circ} 45''$."

High water.

Clark's and Little George's Banks.

Stellwagen's Shoal Ground.

CLARK'S AND LITTLE GEORGE'S BANKS of the charts are proved, by long examinations, not to be accurately defined, and are but parts of the shoal ground of George's Bank. They are erased from E. & G. W. Blunt's charts, and the name of Stellwagen's Shoal Ground substituted, after the commander of that name, on the U. S. Coast Survey.

STELLWAGEN'S SHOAL GROUND.—Commander H. S. Stellwagen, U. S. N., by his soundings has shown the existence of this bank of over 2,000 square miles, extending from George's Shoal to the Westward 25 miles, to South-west 50 miles, to

Southward 30 miles, its Eastern limits not yet defined; having on it as little as 9 fathoms water, in some cases rocky bottom.

THE FISHING GROUNDS of George's Bank are between latitudes $42^{\circ} 05'$ and $41^{\circ} 18'$, longitudes 66° and $67^{\circ} 45'$, in depths of water varying from 15 to 80 fathoms, generally 20 to 35 fathoms.

NOTE.—In coming from the Southward for George's Bank, you will get soundings in lat. $40^{\circ} 1' N.$, if on the S.S.W. part of the bank. Should you not get soundings in the lat. of $40^{\circ} 30' N.$, you may be certain you are to the Eastward of the shoal, when you must direct your course accordingly to clear it, when your first soundings will be in 75 to 60 fathoms. When steering to the Northward, you will shoalen your water gradually to 20 fathoms, when you will be in latitude $41^{\circ} 20' N.$, which depth of water you will have 10 or 12 leagues distant, either East or West.

Soundings from George's Bank continue W. by S. until you are nearly abreast of the East of Long Island, then Southward to Cape Hatteras.

THE BAY OF PASSAMAQUODDY abounds in good anchoring places, well sheltered from all winds, and divides the United States from that of the British territory.

There are three passages into Passamaquoddy Bay, namely, the Western Passage, the Ship Channel or Middle Passage, and the Eastern Passage. The first is that between the Isle of Campo Bello and the main land to the West. Middle Passage lies between Campo Bello and Deer Island, and the Eastern Passage is to the Eastward and Northward of both islands, which is preferred, being of easy access, with good depth of water.

WESTERN PASSAGE.—Vessels bound to West Quoddy Bay, and being to the Westward of the light-house, should give the shore a berth of three-quarters of a mile, and steer N.E. by E., which will carry you clear of Sail Rock; and when the light or sound of the bell bears W.N.W., you may steer N.W. 14 mile, which course and distance will bring you up with the Spar Buoy or the Middle Ground, and if low water, here you may anchor and wait for the tide to go over the bar, which you cannot cross until 2 hours flood; but if high-water, and you wish to continue through the Narrows—

Bring the Red Buoy to bear N. by W. $\frac{1}{2}$ W. and steer direct for it. You may go on either side, by keeping it close on board, and after passing it one cable's length, steer N.E. by N. for the Black Buoy, which you leave on your port hand; and after passing it half a cable's length, steer N. by W. for Delesdernier's Point, which you must keep close on board.

After passing this point you must keep in the middle of the Narrows, due regard being had to the tide, as it runs upon the flood and ebb from 3 to 5 knots.

West Quoddy Head light may be seen at sea, in clear weather, 6 leagues.

It is situated on the S.E. side of Quoddy Head, and contains a fixed light, elevated 123 feet above the level of the sea. It bears from the Southern Head of Grand Manan N. $\frac{1}{2}$ E., distant about 16 miles; and from the Northern Head of said island W.N.W., distant about 9 miles.

Sail Rock bears from the light S.S.E., about $\frac{1}{2}$ of a mile; it is not covered at high-water, and at some distance has the appearance of a snail, from which it derives its name. There is a passage between it and the main shore, at low water, but which had better not be attempted, unless forced by the currents and light winds. Near the above-mentioned light-house is an alarm bell, weighing 28 cwt. 2 qrs. (twenty-eight hundred weight and two quarters,) which is at present rung by hand, and may be heard at sea, from 3 to 6 miles, in thick weather.

Liberty Point bears from the light E.N.E. about one and a half mile, this being the Southernmost point of Campo Bello Island, and forming the Eastern side of West Quoddy Bay.

West from said point, about three-eighths of a mile distant, lies a rock, called Black Rock, which is not covered at high-water, and is bold around.

The Middle Ground is a shoal, near the middle of West Quoddy Bay, about one-quarter of a mile in circumference, with a good channel on either side of it. The shoal part is often dry. On the Western part of the shoal is a spur buoy, moored in 5 feet at low water, and which bears from West Quoddy Head N.N.W., distant about one mile.

From the above-mentioned buoy, N.W. by N. $\frac{1}{2}$ N., about 14 mile distant, is a nun buoy, painted red, and moored in 2 fathoms at low-water. To the Southward of this buoy is a rocky bar, extending from Campo Bello Island to the main shore of West Quoddy Bay, and which is nearly dry at low-water. N.N.E., distant half a mile from the above red nun buoy, is a similar buoy painted black, moored in 4 feet at low-water, on the Eastern part of the Muscle Bank, so called, which is bare at half tide.

From the black buoy to Delesdernier's Point, it is N. $\frac{1}{2}$ W., distant about three-eighths of a mile. This point is very bold, and may be known by a number of fish-houses upon which may be seen on the port hand, in running through the narrows.

Pilot. The entrance of West Quoddy Bay is wide, and the shores are bold, and may be neared until up with the spar buoy. If in want of a pilot, by displaying a signal one can be obtained at the light house.

Middle Passage, Light house. MIDDLE PASSAGE.—If bound into Passamaquoddy in a large vessel, your best way is to go to the Eastward of Campo Bello Island, on the North east point of which is a light house, 10 feet above high water mark, containing a fixed light; it is placed between the main ship channel and the Northern entrance into Head Harbor, and within 250 feet of the extreme point. Ships in entering into the main channel, or vessels bound to Head Harbor, may safely pass at a cable's length from the light house. In sailing up the main channel, care should be taken not to keep far from the shores of Campo Bello, as the flood tide sets directly over from the point at the light house, to the islands and ledges on the North side of the channel, which is here upwards of a mile in width, and at two hours' flood the tide sets directly towards the Black Rock, which is a very dangerous ledge between Spruce and Casco Bay Islands, upon which several vessels have been wrecked; after passing up and leaving the light about a mile to the Eastward, the tide becomes more regular, and sets along the direction of Campo Bello shore.

High water. Common tides rise here 25 feet. At full and change it is high water at half past 11 o'clock at Casco Bay, and runs when strongest, between Moose Island and Marble Island, and Casco Bay, Deer Island and Campo Bello, near 5 miles an hour.

In the West Quoddy Bay, common tides rise from 20 to 25 feet, and within Passamaquoddy Bay to 30 feet, and the tide is scarcely perceptible.

Vessels from the "antiward" when bound up for this bay, should make for the Western coast, or that of the United States, as it is the most clear and the flood most favorable, being from 7 to 8 miles wide; both shores bold, the depth quickly increasing, on each, from 12 to 70 and 75 fathoms; the greatest depths near Grand Manan, where you haul quickly from 10 to 75 fathoms.

With the light bearing S. S. E. or S. E. there is a depth of 19 and 20 fathoms, where ships may anchor securely from all winds.

Off the N. E. end of Camp Bello, is a remarkable large rock, called the White Horse Rock.

Campo Bello Light house. CAMPO BELLO LIGHT-HOUSE.—The following bearings were taken from the top of it:

To the East point of Grand Manan, (Fish Head,) S. 48° E., or S. by E. $\frac{1}{2}$ E.

To the Southernmost of the Wolves, S. 66° 30' E., or E. S. E.

To the Northernmost do., S. 87° E., or E. $\frac{1}{2}$ S.

To Point Lepreau, N. 84° E., or E. $\frac{1}{2}$ N.

To entrance of Beaver Harbor, N. 70° E., or E. N. E. $\frac{1}{2}$ E.

To the White Horse Island, the top of the rock, which is white, N. 45° E., or N. E. $\frac{1}{2}$ E.

Spruce Island bearing from N. 60° E. to N. 45° W.

To Black Rock, very dangerous, N. 61° 30' W., or N. W. by W. $\frac{1}{2}$ W.

To Casco Bay Island, N. 33° W., or W. $\frac{1}{2}$ N.

Head Harbor. HEAD HARBOR, at the N. E. point of Campo Bello Island, is a secure and safe place, small, but of easy access, and with 6, 7, and 8 fathoms water, muddy bottom.

Harbor Delute. HARBOR DELUTE lies on the Western side of Campo Bello, and at its S. W. end is Snug Cove, a good harbor. Moose Island is on the opposite side of the channel, and belongs to the United States. The entrance to Passamaquoddy comprehends a space of nearly 12 miles.

If bound for Moose Island up the River Scodie, as you pass Todd's Head, (which is half a mile N. E. from the town landing on Eastport,) give it a berth of half a mile, as a ledge of rocks lies off it. Having passed this head, the course and distance to Oak Point or Devil's Head, will be N. by W. 8 leagues; in going which distance, (3 miles,) you pass Fross' Ledge on your port hand, 6 miles from Todd's Head, and three quarters of a mile from the land; when continuing your N. by W. course 5 leagues you will come to Robinstown, 2 miles above which, off a small island, from which it bears N. E., is a shoal on your port hand, and to avoid it, you must keep your starboard hand best on board, till you come up with Neutral Island, which you leave on your port hand, one-fourth of a mile distant; and your course from this to the Devil's Head (before mentioned,) which you leave on your port hand, is N. N. W. 3 miles. When you have passed the Devil's Head, your course is W. N. W. one league, when you will come to a large ledge of rocks that you must leave on your port hand, which is but 2 hours' ebb, and extends half way across the river. Keep your starboard hand on board, and when you pass this ledge, your course is W. S. W., distant one mile to Turner's Point, and from said point to the harbor, your course is N. W. by N., distant 3 miles, and the next reach to the falls is W. N. W., distant one mile; the tide here 25 feet, and there are only 6 or 7 feet in the channel at low-water, with flats of mud on both sides. The Devil's Head may be seen at the distance of 10 or 12 miles.

There are is the great a good harbor ward of St. bay between distant.

LITTLE Island, and is shore. You point of rock harbor. As passed it had from all wind by E. $\frac{1}{2}$ E., d 50 feet high.

MACHIAS Western side sage well on starboard hand ledges lying large white rock high island on W. for a point starboard hand after you pass to Cross River S. W. mills, your ker's house and to the South-w on your starboard JONES HA course, had to covered with bottom.

MOOSE-A-I level of the sea in that time two

MOOSE-A-I Island on your your port hand berth, for at to S. E. of said it may steer East on board, for the above 2 feet of Head's house.

When bound fore 2 hours' do you go to the entering on the stands on the 1 Breasts, one on Chandler's River Rogue's Island-1 Island and the n has a good harbor from Chandler's

When you go Breasts, as before pt Rock, on your Southward of the starboard, may a MOOSE-A-BB leaving it on the with Lobby's Isl will bring you up third of a mile, from which follo

There are several good harbors on the West side of this river, and all the difficulty is the great depth of water, which is in general, from 18 to 24 fathoms. There is also a good harbor on your starboard hand going into Deer Island, which lies to the Southward of St. Andrew's, 2 leagues distant. It may be easily known, as there is a large bay between the two islands, which lies N.E. from the River St. Croix, 3 leagues distant.

LITTLE RIVER.—This harbor bears due West from the middle of Grand Manan Island, and is called Little River, but you cannot see it except you are near the North shore. You must not run in for it before it bears N.W. or N.N.W. There is a bluff point of rocks on the starboard hand as you go in, and an island in the middle of the harbor. As you pass in, leave the island on your port hand, and when you have passed it half a mile, you may anchor in 4 or 5 fathoms, muddy bottom, and remain safe from all winds. Your course from this harbor to West Passamaquoddy light, is N.E. by E. 4 E., distant 4½ leagues. On the island, at the entrance, there is a fixed light, 40 feet high.

MACHIAS.—Machias light is a fixed light, 52 feet high, on Libby Island, at the Western side of the entrance. After you have passed the light, and have the passage well open, steer North, until you pass Cross Island, which you leave on your starboard hand; but in passing Cross Island, you must be careful of some dangerous ledges lying off it ½ mile, in a S.W. direction, on which course you will leave a large white rock on your port hand; keep on this North course until you pass a round high island on your port hand, when you may shape your course W. N.W. or N.W. by W. for a point that is covered with young birch trees, and a house on it, for on the starboard hand there is nothing but flats and shoals. You may keep your port hand after you pass this house, until the river opens to the Northward, when you may run to Cross River, where you may anchor in 4 fathoms; but if you are bound up to the S.W. mills, you must haul away to the Westward. When you get up with Mr. Parker's house and barn, which are on the starboard hand, you must leave the bar open to the South-westward of the Pott Head. This Pott Head is a large hill that you leave on your starboard hand.

JONES HARBOR.—After passing the above large white rock in your N. by N. course, haul to the Westward for one half mile; bring a high round island that is covered with trees to bear N., when you may anchor in 4 or 5 fathoms, muddy bottom.

MOOSE-A-BEE HEAD LIGHT is on Mistake Island; it is 65 feet above the level of the sea, and contains a revolving light; time of revolution 4 minutes, showing in that time two bright faces.

MOOSE-A-BEE REACH.—When you come from the Westward, and pass Ludle Island on your port hand, steer N.E. by E. for Tibbet's Island, which you leave on your port hand. When you come to the East end of this island, give it a good berth, for at low-water there is a ledge of rocks that lies a cable's length to the S.E. of said island. When you pass it and bring Moose-a-Bee Reach open, you may steer East for Mr. Beal's house; but you must keep the starboard hand best on board, for there is a rock that lies about the middle of the sound, which has not above 2 feet of water on it at low-water. You may anchor to the Westward of Mr. Beal's house.

When bound to the Eastward over Moose-a-Bee Bar, which you must not cross before 2 hours' flood, you steer for Kelly's Coffee-house, which lies on the port hand, as you go to the Eastward, on the N.E. point of Moose-a-Bee Reach. When you are entering on the bar, you will bring a bushy tree right against Kelly's House, which stands on the point. Your course over the bar is East. You leave the Virgin's Breasts, one on your starboard and one on your port hand; but if you are bound to Chandler's River, you will leave the Virgin's Breasts on your starboard hand, and Rogue's Island on the same hand. There is a muddy bar that lies between Rogue's Island and the main land, but water enough on it at 2 hours' flood. Rogue's Island has a good harbor at the N.W. of it, safe from all Easterly winds, and a small distance from Chandler's River.

When you go over Moose-a-Bee Bar, bound to Machias, you leave the Virgin's Breasts, as before mentioned, keeping your course East, and a bare rock, called Pulpit Rock, on your starboard hand; you must keep Libby's Island light open to the Southward of this bare rock. [N. B.—This bare rock, which you leave on your starboard, may also be left on your port, and steer E.S.E. for Libby's Island light.]

MOOSE-A-BEE HEAD TO MACHIAS.—Give the light a berth of one mile, leaving it on the port hand, and steer N.E. by E. 2½ leagues, when you will be up with Libby's Island light on your starboard hand; then run N.N.E. 2 leagues, which will bring you up with Stone's Island, on your port hand, having a rock lying E., one-third of a mile from the centre of the island; from this steer N. for Round Island, from which follow the Eastern direction for Machias.

*Little River**Light.**Machias Light.**Jones Harbor.**Moose-a-Bee Head Light.**Moose-a-Bee Reach.**Moose-a-Bee Head to Machias.*

Cape Split Harbor.

CAPE SPLIT HARBOR.—When you pass Petit Manan light, bring it to bear S. W. $\frac{1}{2}$ S., and steer N. E. $\frac{1}{4}$ N. for Cape Split, distant 5 leagues, which course will carry you safe into the harbor. In steering said course you will make a black rock, which you leave on your starboard hand, distant one mile from Cape Split. This harbor is safe from all winds but S. W., which blows right in; but if you anchor in a cove on the starboard side, and moor N. W. and S. E., you will lie safe from all winds.

Nash's Island, Light.

NASH'S ISLAND, at the entrance of Pleasant River. There is a light-house, 47 feet above the level of the sea, on this island, containing a fixed light of a deep red color, which you leave on your starboard hand going in.

Coming from the Westward, you must leave Petit Manan light on your port hand, giving it a berth of half a mile; then steer N. E. 10 miles, which will carry you up with Nash's Island light, leaving it on your starboard hand, one-fourth of a mile, when you must steer N. E. by E. 23 miles, which will take you into Tibbet's Narrows. These narrows are formed by Tibbet's Island on the N. W. side, and Ram Island on the S. E.; this passage is a quarter of a mile wide; from the middle of which you must steer N. E. $\frac{1}{4}$ E. one mile, which will bring you up with Shabby Island, leaving it on your starboard hand, one-eighth of a mile, and when half a mile above it, you may anchor in from 5 to 6 fathoms, good holding-ground, Shabby Island bearing S. W. by S.

Coming in from sea, and to the Eastward of all the shoals and ledges hereinafter mentioned, bring Nash's Island light to bear N. by W., and run for it, taking care not to approach the Southern end of the Island nearer than half a mile, as there is a sunken ledge fully one-third of a mile from the shore.

Vessels may anchor on the N. W. side of Nash's Island, and find a tolerable shelter from Easterly and S. E. winds, one-fourth of a mile above the light, and one-eighth of a mile from the island, in 10 fathoms, soft bottom, being but a little out of the regular track from the light to Tibbet's Narrows. In coming from the light to the narrows, leave on your port hand, about half a mile, a large black rock, generally known by the name of the "Pot;" the next is Ledge Island, formed very much like a ladle, and about one mile above the light; this you pass within a quarter of a mile in steering the regular course; the next land on the left is Tibbet's Island, the entrance of the narrows, as before described. It may be proper to observe that Tibbet's Island appears to be a part of the main-land until you get above the narrows.

On the right hand, between the light and said narrows, are several islands and ledges, but they lie a good distance from the regular track.

Any ship, no matter how great her draught of water, may enter Moose-a-Dee Reach by following the above directions.

Narragansett light-house.

NARRAGANSETT LIGHT-HOUSE is on the S. E. point of Pond Island; it is 45 feet above sea-level, and painted red. The light is fixed. It bears from Petit Manan light-house N. E. by N., distant 7 miles; from Nash's Island light-house W. $\frac{1}{4}$ N., distant 6 miles. From Narragansett light, Strout's Folly Rock bears S. E. by E. $\frac{1}{4}$ E., distant 6 $\frac{1}{2}$ miles; East point of Black Ledge bears S. S. E. $\frac{1}{4}$ E., distant 1 $\frac{1}{2}$ mile. S. W. point of Jordan's Delight bears S., distant $\frac{1}{2}$ mile; S. W. point of Trafton's Island bears N. $\frac{1}{4}$ E., distant 1 $\frac{1}{2}$ mile.

Jordan's Delight.

JORDAN'S DELIGHT.—On Jordan's Delight ledge is a red buoy, No. 2; from it Nash's Island light bears E. by N. $\frac{1}{4}$ N., 5 miles, and Petit Manan light S. W. $\frac{1}{4}$ S., 6 miles distant.

Pond Island.

POND ISLAND.—There is a black spar buoy, No. 1, on the North point of Pond Island 150 fathoms from shore, Stanwood's house bearing S. W. $\frac{1}{4}$ S.

Trafton's Island Ledge.

TRAFTON'S ISLAND LEDGE.—Thirty fathoms West of the middle ledge is a red spar buoy, No. 4, the East end of the island bearing S. by E. $\frac{1}{4}$ E., three-quarters of a mile distant, and West end of same, bearing S. S. W. $\frac{1}{4}$ W., one mile distant.

Lower Middle Ground.

LOWER MIDDLE GROUND.—There is a black spar buoy, No. 3, off the middle of this bank, in 12 feet low-water.

Upper Middle Ground.

UPPER MIDDLE GROUND.—On the lower end of this bank is a red spar buoy, No. 6, in 5 feet low-water.

Ledge off Long Point.

LEDGE OFF LONG POINT.—Off this ledge, and close to, is a black buoy, No. 5, in 5 feet low-water.

Half-Tide Ledge.

HALF-TIDE LEDGE.—Thirty fathoms South of the dry part of this ledge is a red buoy, No. 8, in 3 feet low-water.

Petit Manan light.

PETIT MANAN LIGHT is a flashing light, 125 feet above the level of the sea, on the South end of Petit Manan Island, and there are several dangerous ledges bearing from the light. The tower is of granite, and of that color.

Jackson's Ledge, or Eastern Rock, on which there are 12 feet at low water, bears East, 4 miles.

South-east Rock, on which there are 7 feet, bears S. E. by S., 4 miles.

A ledge with 16 feet S. S. E., 2 miles.

Moulton's Ledge. There are also miles distant.

Moulton's Ledge, W. by N., 4 miles, nearly bare.

There are also several shoal spots bearing from the light, from S. to S.S.W., about 3 miles distant.

PLEASANT RIVER.—When you come from the Westward, and bound for Pleasant River, in passing Petit Manan light, bring it to bear S.W. by S., and steer N.E. by N., 3 leagues distant.

In steering said course, if it is clear weather, you will see Captain Wasse's house open between the island and main-land; but this passage will not do at low-water. You must leave this island (and a high dry ledge of rocks that lie to the Westward of it) on your starboard hand; when you pass the bare ledge, you will see a bare isle, which you leave on your starboard hand; then you may haul up for Captain Wasse's house and anchor, and take a pilot for Pleasant River, as it is not safe going without one, except you are well acquainted.

Narrow Gauges is one mile to the Westward of Pleasant River, too difficult to be described, as there are sundry small islands at the mouth of the harbor or bay. The best way for a stranger is to go into Cape Split Harbor and get a pilot, as there is no difficulty in going into Cape Split in the day-time, keeping the port hand best on board.

BOWBEAR HARBOR.—In coming from the Westward, bound to Pigeon Hill, Bowbear Harbor, bring Petit Manan light to bear N.E., and run for it, giving it a berth of one-fourth of a mile, and then steer N. & W., 4 miles; in steering this course you will leave the Egg Rock on your starboard hand, when you will make the West-erly shore, giving it a berth of half a mile; then steer N.N.E. one mile, when you will be opposite Dyer's house, where you may anchor safe from all winds, in 3 fathoms water.

DYER'S BAY.—In coming from the Eastward, bound to Dyer's Bay, give Petit Manan light three-fourths of a mile berth, leaving it on your starboard hand; bring the light to bear N.E., three-fourths of a mile distant, then steer N. by W., which will carry you into the mouth of the bay, leaving a large dry ledge on your port hand; when abreast of this ledge, which is bold to, give it a berth of 5 or 6 rods, then steer N. & E. 4 or 5 miles, where you may anchor safe from all winds, in 4 or 5 fathoms, muddy bottom.

GOLDSBOROUGH HARBOR lies N.N.W. from Petit Manan light-house, 2 leagues distant, leaving one island, covered with trees, on your starboard hand, and two on your port hand; then your course is N.N.W. 1½ mile, then N. & E. 4 miles, which will bring you up with Goldsborough Point, where you may anchor safe from all winds, in 3 or 4 fathoms, muddy bottom.

PROSPECT HARBOR has a revolving light on the East point of entrance. From Petit Manan it bears N.W. & W., distant 6 miles, but is not visible from that point; from Sheepick Island it bears N.N.E., distant 4 miles—and in sailing along the coast is visible only between the bearing N. by E. & E., and N.W. by N.

Clark's Ledge (the old point of entrance to the harbor) lies S.W. by S., distant one-third of a mile from the light; Big Ledge S. by E., distant 2½ miles; Little Black Ledge S. by E. three-fourths of a mile. Little Black Ledge is nearly covered at high tide, and bears S. & E., one mile from Cranberry Point, and E. & S. from Big Ledge, which is high above water. There is a good passage between the two ledges.

Bring the light to bear N.W. by N. & N., and steer for it, leaving Little Black Ledge on the port, and Cranberry Point on the starboard hand; when up with the light give it a berth of 200 fathoms, leaving it on the starboard, and Clark's Ledge on the port hand, sailing W.N.W. for the middle of the harbor. Anchor with the light bearing E. & N.

WINTER HARBOR.—There is a fixed white light on Mark Island. The tower is painted brown.

MOUNT DESERT TO GOLDSBOROUGH AND MACHIAS.

In going from Mount Desert to Goldsborough, you must steer E. & N. for Scuttock Point, 4 leagues, where there is an island which you may pass either side of, but it is best to leave it on your port hand, and then steer N.E. about 3½ leagues, which will carry you up with Goldsborough Harbor. You will see three islands which lie in the mouth of the harbor; you must leave them on your port hand, and go in the East-ern Passage. In standing in for this place, you will see Petit Manan light-house, which you leave on your starboard hand. North from Petit Manan, one-eighth of a mile distant, lies a ledge, bare at half tide, which you keep within half a ca-ble's length of when going over the bar, which you pass on your starboard hand, when bound Eastward, at which, as you pass the bar, Scuttock Island will be a handspike's length open to the Southward of Scuttock Point; but to go over this bar requires a pilot. When near the bar, and up with Petit Manan Island, keep E.S.E., one-half mile distant, which will clear a ledge having 9 feet water at low-water, that lies E. of the

channel going over the bar, one-fourth of a mile distant. There is a bar that runs from the shore to this little island, which is about one league from the land. This bar has 34 fathoms at high-water, and 9 feet at low-water.

Mount Desert Rock. MOUNT DESERT ROCK.—This rock is 15 miles S. 12° W. from Baker's Island light; on it there is a light-house 56½ feet above the level of the sea, containing a fixed light. There is a fog-bell on this rock, near the light-house. It is about 50 feet above the level of the sea, and strikes about 7 times in one minute. S. W. by S. 30½ feet from the rock, there is a ledge of 3 fathoms; inside there are 22 fathoms; outside, close to the rock, there are 17, 18, 20, 25, 30, and 35 fathoms water; it has been called Columbia Ledge by Capt. Owen, R. N., who surveyed it.

Mount Desert Island. MOUNT DESERT ISLAND forms the Northern side of the passage to Bear Island, and may be known by several high hills upon it. This island is about 15 miles long, from North to South, and 12 broad; it is nearly divided by a stream of water, called Soames Sound, at the head of which is Eden; at the entrance of Soames Sound are two good harbors, N. E. and S. W. Harbors.

Light. Bear Island lies near the centre of the passage between Sutton's Island and Mount Desert; it is a small island, covered with spruce trees. The light stands upon its Western end, elevated 65 feet above the level of the sea, exhibiting a fixed light, and may be seen in clear weather a distance of 12 or 15 miles.

Mount Desert, Eastern Pass. MOUNT DESERT, EASTERN PASS.—In coming from the Westward, and intending going into Mount Desert, bring Baker's Island light to bear North, and run for it, leaving it on your port hand. After passing it steer N. N. W. until the light on Bear Island bears W. N. W., and run direct for it. In running this course, you will leave Sutton's Island on your port hand. The shores around this island are very bold, and you may near it within one cable's length.

Pumpkin Island light. PUMPKIN ISLAND LIGHT.—A light-house has been erected on Pumpkin Island, as a guide to the Western entrance of Edgemoggin Reach, and to Buck's Harbor. The tower is of brick, and painted white. The keeper's dwelling is painted brown. The tower is 17 feet high, and the light is 27 feet above the level of the sea. It is of the 5th order.

Edgemoggin Reach, Triangle Ledges. EDGEMOGGIN REACH.—WEST TRIANGLE LEDGE bears N. E. by E. ½ E., distant one-third of a mile.

EAST TRIANGLE LEDGE bears E. N. E., distant one-half of a mile. These ledges have about 4 feet water on them at low-water, and there is a good passage between them and the light.

The ledge making out to the Northward and Eastward from Pumpkin Island is covered at high tides, but the water is bold close to the outer point.

The water is bold close up to the North point of Pumpkin Island, and the point can be passed safely within the distance of the length of the vessel.

At about a cable's length from the shore, on the West and North-west part of the island, there is shoal ground with 1 feet at low-water.

There is a good passage of 6 feet at low-water between Pumpkin Island and Deer Island. When bound to the Eastward, the port shore must be kept close on board.

Merriman's Ledge. MERRIMAN'S LEDGE bears West, distant five-eighths of a mile; bare at extreme low tides. The leading-mark for this ledge is Billing's house (on the North side of the Reach) in range with the light-house. By keeping the house out either way of the high part of the island will lead clear of the ledge. The cross-mark is to bring the points of Deer Island and Birch Island open an oar's length. The ledge is about 2 fathoms in width, and the water bold.

Two-Bush Ledge. TWO-BUSH LEDGE bears W. by S. ¼ S., distant about 1½ mile. It has 4 feet water on it at low-tide; it is about the dimensions of the deck of a vessel of 150 tons, and the water bold. This ledge bears N. by W. ¼ W. from Eagle Island light-house. The leading-mark for Two-Bush Ledge is the barn on Beach Island open a hands-pike length from the South point of Hog Island. The cross-mark is Two-Bush Island, in the gap North of Eagle Island light. Two-Bush Island is small, without bushes or trees, produces grass, and appears green in summer. It had formerly two bushes upon it, from which it derived its name. The water is bold close to it. It bears S. W. from the Pumpkin Island light, and N. by W. ¼ W. from Eagle Island light.

Spectacle Island Shoal. SPECTACLE ISLAND SHOAL.—This shoal lies on the North side of the channel leading to Buck's Harbor; bears from Pumpkin Island light W. by N., distant 2½ miles from the South point of Spectacle Island E. ½ S., distant half a mile; from Long Ledge S. W. ½ W., distant one mile, and has 4 feet water on it at low-tide. It is about half an acre in extent, with a number of large rocks on it.

In passing Cape Rosiere, bound to the Eastward, to clear it to the Southward, keep the passage between Pumpkin Island and Deer Isles open a hands-pike's length, when Two-Bush Island and the West end of Pickering's Island are in range, you are up with the ledge.

N. of the channel lead

N., distant 2½ miles

In running for Buck's Harbor, to clear the ledge, keep Walker's house (a conspicu-
ous white house on the Eastern part of Buck's Harbor) open an oar's length from
Long Ledge.

Low Ledge lies on the North side of the channel, and is nearly covered at high-
water, but is exposed at low-water; may be known by a single rock which lies a cul-
ter's length S. E. from it, and which is visible at half-tide. This ledge bears N. W. 4
W., distant about one mile from Pumpkin Island light, and from the West entrance to
Buck's Harbor, S. W. 4 W.

Point HEAD (N. E. point of Hog Island) bears from the light W. S. W.; South
end of Spectacle Island, W. 1 N.; East point of Bench Island, S. W. by W. 1 W.;
North point of Buck Island, S. W. 1 W., distant half a mile.

The middle of the Western entrance to Buck's Harbor bears from the light N.
by E. 1 E.

The Eastern entrance N. E. by N. 4 N., distant 2½ miles. From Pumpkin Island
down the Reach, giving the North point a small berth, the course is E. S. E., leaving
the Triangle Ledges on the port hand, and Pulpit Ledge and Howard Ledges on the
starboard hand.

Pulpit Ledge lies about E. S. E. 1 E. from the light, distant three-eighths of a mile,
N. N. E. of a detached rock off the Deer Island shore, which resembles a pulpit, and
has about 5 feet at low-water.

Howard Ledges lie about 1½ mile to the S. E. by E. from the light. There is a
channel inside of these ledges which is seldom used. The mark for bringing up with
them is Captain Gray's two chimneys in range.

The main ship-channel is to the Northward of the Triangles, which must be left on
the starboard hand in going down the Reach. Vessels coming by Hog Island must
keep on a N. E. course. Vessels coming by Cape Rosiere, after getting Conder's
Point, on the Western entrance of Buck's Harbor, to bear N. E., must run for it
until up with or have passed the middle of the head of the Reach, which will
take them to the Northward of the Triangle Ledges, between which and Buck's Har-
bor, on North shore of the harbor, there is good water and free from dangers.

The port hand, on the North side of the Reach, must be kept on board. Run S. E.
for a tolerably high bluff point, called Bayard's Point, which should be given a good
berth in passing, then haul in to the N. E. and anchor in a good harbor called Pleasant
Cove.

If bound to Sedgwick, continue the S. E. course about 2½ miles from the bluff point,
or until the village of Sedgwick is opened by the West entrance to the harbor bear-
ing to the N. E., when haul in and anchor one-quarter of a mile from the entrance, with
good bottom.

W. by S. from Carter's Point (the West entrance to Sedgwick) one-third of a mile,
lies Stumpy Cove Ledge, with only 3 feet water on it at low-water. With the excep-
tion of this ledge, the North shore is pretty bold to the head of the Reach.

The Deer Island side of the Reach is not so bold until up to the Narrows, or Bay-
ard's Point, when vessels may stretch from side to side. After leaving Scott's, or the
mountain landing, going East, give the starboard shore a good berth, as there is a
straggle of ledges well out from the shore covered at high-water.

It bound through the Reach, continue S. E. for a red, bare ledge, with round stones
on it, called Torry's Castle. This ledge lies off the West point of the Western
Torry's Island, and the water is bold on either side. It must be left on the port
hand, continuing to the S. E. for a bluff, rocky point at the Eastern extremity of the
Reach.

It will be necessary to look out for a ledge which is sometimes visible at low-water,
called Conroy's Ledge, which lies S. S. E. of Torry's Castle, and N. W. by N. of Con-
roy's Island.

Conroy's Island is large, and lies off the Eastern end of Deer Island. To go clear,
keep Eaton's house in range with Torry's Castle. Eaton's house is the first one seen
to the Eastward of Bayard's Point.

In running for the bluff point before named, called "Dutch City," a large number of
islands will be left on the port hand, which may be passed close to.

After passing Conroy's Ledge, stand two-thirds of the way to the Deer Island side,
until near the lower end of the Reach or "Dutch City," when it will be necessary to
keep a good lookout for ledges which lie off "Dutch City," and about midway, known
as Half-Tide Rocks, being visible at half-tide.

The S. E. course should be continued by "Dutch City," and until the Southern
Mount Desert Hill is brought out by the South point of Harbor Island, when haul to
the Eastward for Mahony's Island, leaving it on the starboard hand if bound to Blue
Hill, Ellsworth, or Mount Desert.

Edgemoggin Reach.—A light will be shown on and after January 20, 1857, on Fly
or Green Island, near the Eastern end of Edgemoggin Reach. It will be a fixed

" Triangles.....	Red.....	do.	" 4.
" Howard Ledges.....	Red.....	do.	" 6.
" Eastern Half-tide Rock.....	Red.....	do.	" 10.

Bunker's Ledge.

BUNKER'S LEDGE, on which is built a stone beacon, with a cask placed upon a staff in its centre, bears from the Eastern end of Sutton's Island E. $\frac{1}{2}$ N., distant about one mile, which you leave on your starboard hand. You may near the ledge within 2 cables' length. When the light on Baker's Island is entirely obscured behind the Eastern point of Cranberry Island, you are then to the Westward of Bunker's Ledge, and should you have a head wind, you may stand to the Northward until the light on Bear Island bears W. by N. In running for Bear Island light, you may cross Bunker's Ledge within one cable's length, leaving it on your starboard hand. After passing the light one-quarter of a mile, you may anchor, with the light bearing from E. to E.N.E., in 12 fathoms, good holding-ground; or you can run for N.E. Harbor, about one mile to the Northward of the light.

N.W. by W., distant half a mile from Bear Island light, lies a ledge, bare at low-water, having on the Western edge a spar buoy painted black, which you leave on your starboard hand. Said ledge bears from the centre of N.E. Harbor S. $\frac{1}{2}$ W.

Sutton's Island lies near the centre of the passage, but the best water is to the Northward of it. If you wish to go to the Westward of it, when between Bunker's Ledge and Cranberry Island, steer W. by S. until Sutton's Island Eastern point bears N.E. You can then anchor, or run further in, into Hadlock's Harbor, to the south of you, or steer W.N.W., distant about 3 miles, for S.W. Harbor.

Bunker's Ledge bears from Baker's Island light N. by W., distant about 1 mile. Bear Island light bears from Bunker's Ledge W. by N. $\frac{1}{2}$ N., distant about 3 miles. The middle part of Cranberry Island bears from Bunker's Ledge S.S.W., distant 1 mile.

Light.

Baker's Island and Cranberry Island form the Western side of the entrance of the passage to Bear Island, and are covered with spruce-trees. The light on Baker's Island is located near the centre of the island, elevated 70 feet above the level of the sea, exhibiting a fixed light, and may be seen a distance of 15 miles in clear weather.

A bar extends from Baker's to Cranberry Islands, covered at high-water, which is often mistaken by strangers for the passage going into Cranberry Island Harbor.

You must always recollect that before entering Cranberry Island Harbor the light on Baker's Island will be entirely obscured behind the Eastern point of Cranberry Island.

You may go in on either side of Bunker's Ledge; but strangers should leave it on the starboard hand. Between Herring Cove and Bear Island light, near the North shore, there are several rocks and ledges covered at high-water.

S.W. Harbor.

S.W. HARBOR.—This is one of the best harbors on that coast. As many as 60 vessels have been at anchor at one time here. To run in, if coming from the Westward, when up with Long Island, steer N.N.E. 6 miles, leaving the two Duck Islands on your starboard, and the three Calf Islands on your port hand. This will bring you up midway, between the Great Cranberry and Mount Desert; steer up midway until you open S.W. Harbor, when you may haul in (keeping nearest to the starboard hand, on account of a ledge on the port hand which runs off half a mile) N.W. or W.N.W., and anchor in 5 or 6 fathoms, muddy bottom, safe from all winds. High-water at 12 o'clock; rise of tides 12 feet.

High-water.

Off the S.W. point of Cranberry Island there is a rock, bearing West, distant three-quarters of a mile.

Light.

The Eastern Passage into S.W. Harbor is between Bear Island (on which there is a fixed light) and Sutton's Island; after you have passed these, run until you get the harbor open, then follow the above directions.

Hull's Cove, Mount Desert.

HULL'S COVE, MOUNT DESERT.—Bring the light on Baker's Island to bear S.W. by S., and steer N.E. by N. for the Great Porcupine Island; when up with it haul to the Westward of Hull's Cove, leaving a dry ledge on your starboard hand, where you may anchor in 3 fathoms, one-quarter of a mile from the shore.

Bass Harbor.

BASS HARBOR.—When you leave this harbor, bound to the Eastward, steer S.W. till you bring Bass Harbor Bar to bear S.S.E., then run S.S.E., keeping the port hand best on board. This bar has not water enough for a loaded vessel to

half-tide, having water, keeping E. by S. till you run N.E., leaving at low-water, water enough, keep you pass Cranberry Island lie in front of 7.

When you leave with Baker's Island you steer G. by bound to Goldst.

till you bring Goldst. on your port and lie safe from all CRANBERRY

most island, and y

half-tide, having 8½ feet only at low-water; but a light vessel may go over at low-water, keeping the port hand best on board. When you get over this bar, you steer E. by S. till you bring the S.W. entrance of Mount Desert to bear N.E., then you may run N.E., leaving Cranberry Island on your starboard hand. But this passage is shoal at low-water, and not fit for loaded vessels to go through; but at full tide there is water enough, keeping the middle of the passage. Continue your course to the N.E. till you pass Cranberry Island; then you may steer E.S.E., and anchor between the two Cranberry Islands, where you will be safe from Easterly or S.W. winds. You may lie to from 4 to 7 fathoms, good holding-ground.

When you leave this port bound to the Eastward, you steer E. by S. till you get up with Baker's Island light, which lies to the Eastward of the Cranberry Islands; then you steer E. by N. 4 leagues, to Sautok Island. When you pass said island, and are bound to Goldsborough, you must steer N.E. about 5 leagues, and keep that course till you bring Goldsborough Harbor to bear N.N.W., then you must leave three islands on your port and one on your starboard hand, and run into the harbor, where you may lie safe from all winds, and anchor in 5 or 6 fathoms.

CRANBERRY ISLANDS are three islands lying South of N.E. Harbor, Mount Desert, making a good roadstead for all winds but Easterly.

BAKER'S ISLAND.—On this island, which is the South-eastern of the Cranberry Islands there is a light-house containing a fixed light, 70 feet above the level of the sea. It bears W.S.W., 22 miles distant, from Petit Manan light.

BLUE HILL BAY.—If you are bound to Blue Hill Bay, or Union River, as soon as you pass Long Island you will open a large sound to the N.N.W., which course you are to steer 7 leagues, when you will be up with Robertson's Island, leaving the Ship and Barge on your port hand. Robertson's Island is the only island near that place that has a house on it. The South part of the island is clear of trees, on which the house stands. When you come near the South part of the island, give it a berth of three-quarters of a mile, as there are several sunken rocks off said point. When you bring this island to bear from S.W. to N.W. you may anchor in 6 or 7 fathoms water, muddy bottom; but if you are bound to Blue Hill Bay, you may stand to the Northward direct for the Blue Hills, which you may see 10 or 15 leagues off. If you are bound for Union River, you had better take a pilot at Robertson's Island, for it is not fit for a stranger to go without one.

ISLE-AU-HAUT.—The Isle-au-haut is remarkable land, composed of high steep hills, and makes with a large bay on each side of it; has good landing on its Eastern end, and anchorage half a mile off, in 18 fathoms, with the low point bearing about N.E. by N., where is also a stream of water running into the sea. The highest part of the island is in the middle, and represents a saddle.

SADDLE BACK LEDGE is a high black rock, formed somewhat like a saddle, on the S.E. end of which is erected a light-house, built of heavy granite, and of that color. It is elevated 40 feet above the level of the sea, exhibiting a fixed light, and may be seen in clear weather a distance of fifteen miles. You may near it on all sides within one cable's length.

About two miles N.W. by W. from the light lies a small sunken ledge, which breaks at low tides, with a little motion of the sea.

The Southern head of Isle-au-haut bears from Saddle Back light S.E. by E. 4 E., 4 miles distant; Seal Island, S. by W., about 15 miles; Wooden Ball Island, S.W. by S., Matineus Island, S.W. 4 W., 18 miles; Brimstone Island, W. 4 N., 2 miles; Little Isle-au-haut Harbor, N.E. by E. 4 E., 6 miles distant; Eagle Island light, N., distant about 20 miles; Fox Island Thoroughfare, N. by W., distant about 15 miles.

Isle-au-haut and Deer Islands form the Eastern side of Isle-au-haut Bay, Brimstone and the Fox Islands the Western side. The bay is about five miles in width, and Saddle Back lies near its centre.

In reaching Saddle Back light, coming from sea, bring it to bear from N.W. by N. 4 N. by W., and run it close aboard, leaving it on your port hand. If you are bound up the bay, bring the light to bear S., and steer N. for Eagle Island light, which you may near within one cable's length, by leaving it on your port hand. After passing Eagle Island light, steer N.N.W., about 8 miles, which course and distance will bring you up with Channel Rock, which you leave on your starboard hand. Give it a berth one eighth of a mile, and steer N. by E., about 13 miles for Dice's Head light. In running this course you will pass Cape Rosier, a high bluff, which you leave on your starboard hand. When up with Dice's Head light, if you wish to go into Castine, or up the Penobscot, follow the directions given.

Channel Rock may be known by its being a small rock of a yellowish cast, lying to the Westward of a small group of islands, and may be seen at all times above water.

N. B. In coming from sea, and bound for the Isle-au-haut Bay, you leave the Wooden Ball and Seal Islands on your port hand. The Seal Island is the Eastern-most island, and you may near it within three-quarters of a mile.

Cranberry Islands.

Baker's Island.

Light-house.

Blue Hill Bay.

Isle-au-haut.

Saddle Back Ledge.

Light.

In coming from the Westward, and intend going to the Northward of Matineus Island, and are bound for Saddle Back light, bring it to bear E.N.E. and run for it follow the directions before given.

Wooden Ball Island bears from Seal Island E.N.E., 34 miles distant; Wooden Ball from Matineus Rock Light, N.N.E., 7 miles distant; Seal Island from Matineus Rock light, N.E. by N., about 4 miles; from Matineus Island, N. 3 miles distant.

Matineus Island. Lights.

MATINEUS ISLAND, at the mouth of Penobscot Bay. On the rock South of this island there are two fixed lights, 82 feet above the level of the sea, attached to a dwelling house, 40 feet apart, bearing N.N.W. and S.S.E. from one another. There is a bell on this rock, which is rung by machinery.

Penobscot Bay and River.

PENOBSCOT BAY AND RIVER.—This extensive bay is included between Sedgwick Point on the East, and White Head on the West; the distance between these points is about 11 leagues; and it therefore includes the Isle au Haut, Bear Island, the Fox Island, Long Island, and a number of small isles, rocks, and ledges. Through the bay to the mouth of the river of its name, the Western channel is by the headland on the West, called Owl's Head, on which there is a light house containing a fixed light, 117 feet above the level of the sea; thence by Camden on the West, Cape Rosier on the East, to Bagaduce Point or Castine River. The Eastern channel is between Isle au-Haut on the West, and the smaller isles on the East, through a channel called Long Reach, formed by the shore of Sedgwick on one side, and Bear Island on the other, until it unites with the main channel between Cape Rosier and Long Island. Above this, on the East, stands Fort Castine, near to which is the town of Castine, opposite to Penobscot. Castine is the port of entry. This noble town, which empties its waters into the bay, and which is now decorated with numerous townships, is the most considerable in the State of Maine, and has its sources at Bangor, about 30 miles from the same; but vessels of 30 tons may approach within a mile of this place. At the entrance of the river is a depth of 10 fathoms.

Light-house.

Penobscot River.

PENOBSCOT RIVER.—From Segunne to Manheigen, the course is East, but you must bring Segunne to bear W. until you have passed Bantion Ledge, as it bears E. about four miles from Segunne. Manheigen is good land to run for, being on the East, about four miles from Segunne. There are several high rocks on the N.W. side, but they are also bold.

From Manheigen to White Head the course is N.E., leaving George's and Mosquito Islands on the port, and Mittenk on your starboard hand. The latter is bold. There are two ledges off George's Island, called the Old Man and Old Woman, with a passage between them. The first lies more than a mile off. When you can see Mosquito Island to the Eastward of George's, you are clear of them. There is a ledge between George's Island and Mosquito Island, called Scilly; and also another about one third of a league way from Mittenk to Manheigen, called the Roaring Bull, which latter bears S.E. 3 E. from Manheigen; but you have a clear bay until you come near White Head. There is a ledge S. by E., half a mile from the head, and several near the head to the Westward. The head is very bold. When a little inside the head, haul up on the N.E. point of a large white island, with trees on it, on the port hand, to avoid a ledge called the Gangway Ledge. It lies directly off the mouth of Seal Harbor, and bears N.E. from the light. The course from White Head to the point of Ash Island is N.E. The point of Ash Island is bold at low water, but at high-water some of the rocks are covered. There is a sunken ledge off this point, the kelps on which are seen at low water, called also Gangway Ledge, which you leave on the starboard hand, and run to Owl's Head about N.N.E. The course from Owl's Head to Castine is N.E. by W., passing close to Mark Island, which is the first you come to, and leaving several islands and ledges on the starboard hand—Mark Island on the port. The passage here rather narrow, but with a fair wind there is no danger. The bay, however, is so clear to the Eastward to the Westward of Long Island. From Owl's Head to Camden the course is N. by E., 10 miles, leaving a high rock called the Graves on the starboard, and Negro Island, on which there is a light house, on your port hand. There are some sunken rocks between the Graves and the Northern point of Seal Harbor, nearest the latter, which are on the starboard hand. From Owl's Head to Seal Bay the course is N.N.E. Easterly, to Spruce Head, in Northport, 7 leagues. You may pass a good harbor on Long Island side, called Gilkey Harbor. It is easy of access, but it is bad to find in the night, the land back being higher than that in the harbor. A light has been put on Grindle Point, at the entrance of Gilkey Harbor. It is in a tower on the keeper's house. It is the best harbor in the whole bay. Run directly opposite Ducktrap. From Spruce Head to Old Fort Point the course is E., 3 leagues, leaving Belfast and Cape Jellison Harbors on the port hand, if you wish to harbor in Cape Jellison, you enter with Brigadier Island on the port hand, keeping it nearest aboard, as there is a long ledge makes off from Squaw Island on the starboard hand, which is covered at high-water. There is a ledge off

Light-house.

Light

Point, in a S.S.E. and N. end of it. There is a good channel ever, to the E. you have turn Point Cove, 100 feet at low-water. The port Narrows, is nearly ever best channel, of a mile, where village, 5 miles point on the of three-fourths. Should you no length, and run land on the S. starboard hand is N.E., 5 miles of a mile. There is a spare 1 mile. Thence N.E., three miles Crosby's Narrows of a mile. The Mill, N.E. by N. a mile. There or, bound up miles distant, and giving it a berth as before directed. River; it is in a FOX ISLAND, Island thorough Island. It stands Fiddler's Ledge from Cabrice's the surface of the Crabtree's Ice Ledge bears from may be seen by Inner Dog Fish Ledge bears In running from near W. and E. side and then steer for this course, you see's Ledge on separated by a either of them. ster N.E. 3 E. to somewhat like Seal The entrance of rocks, which are the port hand, pumps (see this passage is 12 you pass this point, and to the starboard hand, you see whether cable, the main or if here the tool may only against when you leave your starboard

Point, in a Southerly direction, called Fort Point Ledge, half a mile or more. It lies S.S.E. and N.N.W., and is bare at half-tide. There are two buoys, one off each end of it. There is a light-house on the point, near which it is so bold that there is a good channel between that and the ledge for beating. The extreme point, however, to the Eastward of the light, is shoal, and you must give it a good berth. When you have turned this point, you have an excellent harbor on the port hand, called Fort Point Cove. There is one small rock near Sandy Point, on which there are about seven feet at low-water, near which there is a log buoy placed. From Fort Point to Bucksport Narrows, the course is North, 5 miles. Above Sandy Point lies Odum's Ledge, which is nearly covered at high-water. You may go either side of it, but the Eastern is the best channel. When you open Bucksport village, your course is N.E. three-fourths of a mile, when you will open Marsh Bay N.W., at the head of which is Frankfort village, 5 miles. Run up midway till you come near Marsh River, on the port hand. The point on the opposite side of the bay is called Drachin Point, from which a flat extends three-fourths the distance across to Marsh River, on the end of which a buoy is placed. Should you not see the buoy, shut Peard's Point, on Melkenzie's Point, a hands-pike's length, and run until you fairly open the reach to Oak Point. Peard's Point is on the S.E. side of Marsh River, and Melkenzie's Point is the first point on the starboard hand, above Bucksport village. From Marsh River to Oak Point the course is N.E. 5 miles, good anchorage all the way. Thence to Huckleby's, E. by N. one-third of a mile. Thence to Mill Creek, N. by E., one mile, leaving Buck's Ledge, on which there is a spire and hall, on the starboard hand. Thence to Bald Hill, N.W. by W. 1/2 mile. Thence to Huggus', N.N.E., one-fourth of a mile. Thence to Bragdor's Castle, N.E. three-fourths of a mile. Thence to Crosby's, N.N.E., 2 miles. Thence through Crosby's Narrows, N.E. half a mile. Thence to Crosby's Old Wharf, N.N.E., one-third of a mile. Thence to Brewer village, E.N.E., 2 miles. Thence to Mitchell's Steam Mill, N.E. by N., one-fourth of a mile. Thence to High Head, N.E., three-fourths of a mile. Thence to Bangor, N.E. by N., three-fourths of a mile.

The bound up Penobscot Bay, leave Manheizen on the port hand from one to two miles distant, and steer E.N.E. for Green Island; when up with the Easternmost island, giving it a berth of one mile, steer North for Owl's Head; then N.N.E. for Castine, as before directed. A light has been put on Indian Island, at the entrance of Goose River; it is in a tower on the keeper's house.

FOX ISLAND PASSAGE.—On Brown's Head, at the Western entrance of Fox Island thoroughfare, a light, showing a fixed light, is erected on the Southern Fox Island. It stands two rods from the shore, and is 42 feet high.

Fiddler's Ledge bears from the light W. 1/4 S., distant about 3 miles; Fiddler's Ledge from Crabtree's Point, W.S.W., distant about half a mile. Fiddler's Ledge is above the surface of the water at two hours' ebb.

Crabtree's Ledge bears from the light W. by S., distant about 1 1/2 mile; Crabtree's Ledge bears from Crabtree's Point S.W. by S., distant about half a mile. This ledge may be seen breaking at high-water with a little motion.

Inner Dog Fish Ledge bears from the light S.W., distant about 3 miles; Inner Dog Fish Ledge bears from Crabtree's Ledge S.S.E., distant about 1 1/2 mile.

In running from Owl's Head light for Fox Island thoroughfare, bring the light to bear W., and steer E. 1/4 S., until you bring the light on Brown's Head to bear E.N.E., and then steer for it until you are within one cable's length from the light. In running this course, you pass between Crabtree's Ledge and Dog Fish Ledge, leaving Crabtree's Ledge on the port hand, and Dog Fish Ledge on the starboard, which is separated by a channel 1/2 mile broad; you may then run half a cable's length of either of them. When abreast of the light, and between the light and Sugar-loaves, steer N.E. 1/2 E. for Young's Narrows. The Sugar-loaves are two high rocks, formed somewhat like Sugar loaves, and are located nearly in the centre of the passage. There is good anchorage between the Sugar loaves and light, in 7 fathoms, at low water.

The entrance to Young's Point is narrow at low water, off which lies a ledge of rocks, which are covered at high water. There is also a quantity of sunken rocks at the port hand, near a mile to the W.N.W., which lie off the Dumplings. These dumplings are three islands, which you leave on your port hand. Your course in this passage is E.S.E. and W.N.W., keeping your starboard hand on board. When you pass this point on your starboard hand, you must keep your starboard hand on board, and steer E.S.E. about 2 miles, when you will make Deep Cove on your starboard hand, which lies to the Eastward of a very high bluff or rocks. If you have under cables nor anchors, you may run into said cove, or secure your vessel with the main or fore sheet, or come to anchor in 7 fathoms water off the said cove. Here the Cool meets, one from the W.N.W., the other from the E.N.E., which makes a eddy against this cove and highland; here you may ride safe with any wind. When you leave this place, and are bound to the Eastward, you steer E.S.E., and keep your starboard hand on board till you come up to a clear spot of land, where the

*Light-house.**Log buoy.**Buoy.**Light.**Fox Island.**Passage**Light.*

reefs have been cut off. As soon as said spot bears W.S.W., you steer E.N.E. for the middle narrows. When you draw near the narrows, you will see two large white rocks in the middle of the passage, unless at high-water, at which time they are covered about one hour, but may be seen at all other times of tide. You may go on either side, but the deepest water is at the Southward of them. Continue your course E.N.E. about one league, when you must keep your starboard hand on board, as there are several sunken rocks and ledges on your port hand, which are covered at high-water. You will make the Eastern narrows on your starboard hand, and as soon as you bring it to bear S.S.E., you may run through, where you will have a fine harbor, which is safe to ride in with all winds, except at E.N.E.; but you may remain in the West passage with the wind at E.N.E., or anchor at the Northward of a bare island, that you will see on your starboard hand as you go back to the Westward. When you pass the Eastern passage of Fox Island, you must steer E.N.E. about 4 miles, which course will carry you into a large bay that lies between Fox Island and the Isle-au-lout. This bay lies N. and S., and about 4 leagues E. and W. When you get into this bay from the above-mentioned passage, and are bound to the Eastward of the Isle-au-lout, you may steer E.S.E. 6 leagues, which course will carry you to the Southward of the Isle-au-lout.

Heron Neck Light.

HERON NECK LIGHT is a fixed red light, 92 feet above the level of the sea, on the South point of Green Island, (the Southernmost of the Fox Islands in Penobscot Bay.) It can be seen 15 miles.

The following magnetic bearings have been taken from the light-house, viz:

To the East end of Seal Island,	S. by E. $\frac{3}{4}$ E.	distance	13 miles.
" West " Wooden Ball Rock,	S. $\frac{3}{4}$ W.	"	12 "
" Bay Ledge (3 feet at low-water),	S. by W. $\frac{1}{4}$ W.	"	3 "
" Matineus Rock Light,	S. by W. $\frac{1}{4}$ W.	"	15 "
" Heron Neck Ledge (dry),	S. by W.	"	1 "
" West end of Matineus Island,	S.S.W. $\frac{1}{4}$ W.	"	11 "
" Hurricane, or Deadman's Ledge, $\left\{ \begin{array}{l} \text{covered at high-water,} \\ \text{ } \end{array} \right.$	W. by S.	"	1 "
" Saddleback Light-house,	E. by S.	"	7 "

The whole distance, from Heron Neck Ledge to Otter Island, Brimstone Island, and Saddleback light, is full of sunken ledges.

Camden Harbor.

CAMDEN HARBOR.—North-east Ledges bear from the light on Negro Island at the mouth of Camden Harbor, N.E. $\frac{1}{4}$ N., distant about three-eighths of a mile. North-east Ledges to Morse's Point, N. by W., distant about 1.77 a mile; these ledges are covered at high-water, but are above the surface of the water at two hours ebb. Barri's Point forms the Western side of Camden Harbor, and bears from the light S.W. by S. $\frac{3}{4}$ S., distant about three-eighths of a mile. Morse's Point lies opposite the light-house, and forms the Eastern side of the harbor. Barri's Point to the Graves, S.E. $\frac{3}{4}$ S., distant about 14 miles. From the light to the Graves, S. by E. $\frac{3}{4}$ E., distant about 2 miles. Owl's Head light bears from Camden light S. $\frac{3}{4}$ W., distant about 12 miles. From the Graves to the Owl's Head light S. by W. $\frac{3}{4}$ W., distant about 10 miles.

Light-house.

Camden light-house is situated on the S.E. part of Negro Island, and contains a fixed light, elevated 49 feet above the level of the sea.

In coming from the Westward, and bound to Camden Harbor, bring Owl's Head light to bear South, and steer N. $\frac{3}{4}$ E. for Camden light, leaving the Graves and North-east Rocks on the starboard hand; the Grave is a small black rock, and is above the surface of the water at all times, and you may near it within a cable's length on all sides. When up with the light-house, leave it on the port hand one cable's length, and steer N.W. by N. $\frac{1}{4}$ N., or N.N.W., distance nearly half a mile, and anchor on the North shore, in from 4 to 5 fathoms water, good holding-ground. If you go to the Eastward and bound for Camden Harbor, bring the light to bear W.S.W. or S.W. by W., to clear the North-east Ledges, then follow the above directions.

Castine Light-house.

CASTINE LIGHT-HOUSE is on Dice's Head, at the entrance of Castine Harbor. It is a fixed light, 116 feet above the level of the sea, N.W. $\frac{1}{4}$ W. from Fort Point ledges, and from the Eastern end of Long Island, S.E. by E. $\frac{1}{2}$ E. The shore near the light-house is bold.

Beacon.

CASTINE.—The beacon on Otter Rock bears from the light-house on Dice's Head at the entrance of Castine Harbor, S.E. $\frac{1}{4}$ E., distant half a mile; Noddle's Island Point, S.E. $\frac{3}{4}$ S., distant about 14 miles; Bull Head, on Holbrook's Island, South, distant about 2 miles; Turtle Head, W. N.W., distant about 44 miles; Belfast, N.W. $\frac{1}{4}$ W., distant about 11 miles. From the Beacon on Otter Rock to Noddle's Island Point, S. by S. $\frac{3}{4}$ S., distant about three-eighths of a mile; from Noddle's Island Point to the Beacon on Hosmar's Ledge, E.N.E., distant about three-quarters of a mile; (the

Otter Rock Beacon to the Beacon on Hosmar's Ledge, E., distant about three-quarters of a mile; Hosmar's Ledge Beacon to the town of Castine, N.E., distant about half a mile.

Otter Rock is a small round rock, and lies about 2 cables' length from the Northern shore, and has on it an iron beacon, with a cask placed upon a staff at its centre, and is about 12 feet above the level of the sea at high-water. Noddle's Island Point is a low black rock, and very bold. Bull Head is a high bluff of rocks, and of a yellowish cast, and lies on the South side, without the entrance of the harbor.

Hosmar's Rock lies about one-eighth of a mile from the Southern shore of Castine Harbor, and has on it an iron beacon, as described on Otter Rock. Turtle Head is the Northern head of Long Island. Stubb's Point Ledge, on which there is a beacon erected, lies opposite to the town, but is not in the way of vessels going into Castine Harbor.

If you are bound up Penobscot Bay, and are to the Eastward of Long Island, and intend going into Castine Harbor, bring the light on Dice's Head to bear N.E. by N., and run for it until you are within half a mile of it, then steer E. by N. for the beacon on Hosmar's Ledge, leaving Otter Rock Beacon on the port hand, one cable's length distant, and Bull Head, Noddle's Point, and the beacon on Hosmar's Ledge on the starboard hand. You may near the starboard shore off the entrance of Castine Harbor within one cable's length, and steer E.N.E., which will carry you in ship-channel way. You may anchor off the town, near the wharves, in from 8 to 10 fathoms water.

This harbor is easy of access, and vessels may approach it with safety by following the above directions.

WHITE HEAD.—Vessels bound from the Southward, and intending to fall in with

White Head light-house, should endeavor to take their departure from the high land of Cape Cod, from which, to Manheigen light, the course is N.N.E. $\frac{1}{2}$ E., distant 35 $\frac{1}{2}$ leagues. The shore near Manheigen is bold, with good water on all sides, having no shoals or sunken rocks about it; there are some dry islands and ledges on the North side, but they are bold, and good water all among them. From Manheigen light to White Head light the course is N.E., distant about 7 leagues, with a fair open sound. There is a small ledge lies about half a mile from White Head light, bearing S. by E., which is just out of water at common tides; at low-water you pass between this ledge and the light to go in the Muscle Ridge Channel, or into the harbor. You continue your course N.E. by the light about three-quarters of a mile, when you will open the harbor on your port hand, between a small ledgy island near the light, and a high white island, with some spruce-trees on it. When you open the harbor N.W., you steer N.W., and sail on till you pass all the ledges on your port hand, and anchor in about 5 or 6 fathoms, good holding ground.

White Head light is on White Head Island, remarkable for the many white rocks on the head. It is 7 leagues from Manheigen, bearing N.E.; is a fixed white light, 20 feet above the level of the sea. Attached to this light is a bell, weighing 100 lbs., striking in foggy weather 12 times a minute. The light is small, but of great importance, as all vessels bound to Penobscot Bay, going inshore, are obliged to pass by the light through the Muscle Ridges. A stranger wishing to pass the light must, if coming from the Westward, run in for the land East of Manheigen, until the light bears S.W.; then steer N.E., and you can pass within half a cable's length of the head.

Vessels of 60 or 70 tons may double close around the head of the light, as soon as they bear N.E., and anchor right abreast of the shore. This is called Sail Harbor. Vessels taken with calm and ebb-tide may anchor anywhere off the light, in from 12 to 20 fathoms of water. If the wind takes you at N.E. and ebb-tide, that you cannot get into Sail Harbor, you may run into Tenant's Harbor, which bears W. by S., about 10 miles distant. You will continue your W. by S. course till the first house on the starboard hand bears N.N.W., when you may anchor in about 4 or 5 fathoms water, good ground.

SAIL HARBOR lies to the Northward and Eastward of White Head, about three-quarters of a mile. If you wish to go into this harbor, haul up round the Head within about a cable and a half's length; run until the light bears S.W., then steer S. by W.; run in and anchor in 8 fathoms, sticky bottom. This is a good harbor in winter.

TENANT'S HARBOR, MUSCLE RIDGE, AND PENOBSCOT BAY.—In sailing from this harbor, you may steer East one league to White Head light, but be careful to haul in for it till it bears N.E., as there is a large ledge of rocks bearing about N.W. from said Head, one mile distant, but within it, a pistol-shot from the shore, a safe navigation. In going in, you must give the port hand a berth, as there is a sunken ledge, which extends about two-thirds across the mouth of the harbor, that runs when there is any sea, unless at high water.

Your course from White Head light is N.E. to Ash Point, or Island, one league distant, which has a large rock to the S.W. of it, about half a mile distant, which you must give on your port hand. It is not in the way, except you are obliged to go about. Then you haul round this island, give it a small berth, and steer N.N.E., or N.E. by N. for the Owl's Head, leaving two islands on your starboard hand; but when you

draw near the port shore, you steer about E.N.E. for the Owl's Head, which has a good harbor on the port hand as you go to the Eastward. This harbor makes with a deep cove. You may bring a rocky point that lies on your starboard hand to bear N.E., and a ledge of rocks that lies without said point to bear E.N.E., and anchor in 4 fathoms, muddy bottom.

This harbor is open to the wind at E. by N. and E.N.E., but in all other winds you are safe. The tide of flood sets to the Eastward, and the tide of ebb S.W., through the Muscle Ridges.

If it is night when you come to White Head light, you had better not attempt going through the Muscle Ridges. Your best way is to go by Two Bush Island, which you must leave on your port hand, keeping the course E.N.E., or N.E. by E. [Two Bush Island is round and barren, but has only one bush on it. Formerly it had two bushes.]

If you are in a large vessel, your best way is to go in this passage, as it is the most safe. You must follow your course, as above directed, about 2 leagues, when you will have Penobscot Bay open, and then you may direct your course to either side of Long Island. If you go to the Westward, your course is N.N.E. to Great Spruce Head, which having passed 7 leagues, your course is N.E. by N. 5 leagues, to Old Fort Point. In steering said course, you will leave Belfast Bay and Brigadier's Island on your port hand, which island has a good harbor, and if you mean to go into it, you must leave it on your port hand, and steer in about N., or N. by W.

You may run up above this island, and anchor on the starboard hand, if the wind is to the Eastward; but if to the Westward, or S.W. you must not. There is a bar that lies from this island to the main land, which is covered at high-water. There is also a good harbor to the Westward of this island, called Long Cove. If you turn into either of these harbors, you must be careful of some rocks that lie to the Southward of this island, more than half a mile from the main-land. But in going to Penobscot, proceed as above, and keep your port hand on board. When you pass this island for the Old Fort Point, which has no trees on it, you must observe before you come to it, that a large ledge of rocks lies about three-quarters of a mile to the E.S. of it, which is covered at high-water, but bare at half-tide. You may go within a cable's length of Old Fort Point, in smooth water. These rocks may be discovered when the wind blows.

On Fort Point Ledge there is a stone beacon with a wooden spindle. (See list below.) If you are bound up Penobscot, from Old Fort Point, with the tide of ebb, and the wind ahead, you may make a good harbor in the East river, which lies about E.N. from Old Fort Point, about one league. This river lies to the South westward of Orphan Island, in which place you will be safe from all winds, and anchor in 6 or 7 fathoms, good holding-ground.

Beacons and buoys as they are passed in entering Penobscot Bay

Buoys.

On Old Man's Ledge is a.....	Black wooden buoy.
" South Breakers.....	Red iron buoy, No. 2.
" Yellow Ledge.....	Red iron spindle—copper cylinder on top.

Orphan Island is a large island, which you are to leave on your starboard hand, and under rocks on your port hand, which are above water. When you pass Orphan Island, you may anchor to the N.W. of it, on your starboard hand as you go through; but if the wind and tide are in favor, you may proceed up to Marsh Bay, keeping the port hand best on board. Marsh Bay is about 2 leagues from Orphan Island. When you pass Marsh Bay, you may keep in the middle of the river, and you have neither rocks nor shoals till you get up to the falls. You have no particular course in going up this river, but may sometimes go to the Westward of N., and sometimes to the Eastward of N.

When you enter Penobscot Bay, and are bound to the Eastward of Long Island, you must steer N.E. by N., leaving Long Island on your port hand, which course will carry you up to Castine. If you intend going into this harbor, as soon as it bears E.N.E. you may run in, steering E.N.E., keeping the middle of the channel until you pass the first island, giving it a berth of half a mile; then haul to the Southward until the island bears W.S.W., when you may anchor in 8 or 10 fathoms, muddy bottom, and be safe from all winds.

In going into the harbor of Castine, you leave three islands on your starboard hand; but if you are bound up Penobscot River, you must steer North, leaving the ledge of rocks off the Old Fort Point on your port hand; then follow the same direction you have for running into the Penobscot River, which will carry you up to the falls. The tide ebbs and flows, at full and change, about 10 or 11 feet.

MANHEIGEN LIGHT.—On Manheigen Island, South of the entrance to George's River, is a revolving light of the natural color; time of revolution one minute, elevation 75 feet above the level of the sea. You can run close to the island on either side, taking care to go between some dry ledges on the Northern side of it. In the island here is a small harbor open to the S.W.; it bears E.N.E. from Seguin light.

FRANKLIN ISLAND LIGHT is on the North end of Franklin Island, which is on the Eastern side of the entrance to George's River, and is a fixed light, varied by flashes. The tower is of brick, painted white, and the dwelling-house is painted brown. The lantern is painted black.

The centre of the light is 35 feet above the ground, and 51 feet above the level of ordinary high-water. It is visible, in good weather, at the distance of 12 nautical miles. The following compass bearings have been taken from the new light-house, viz:—

Seguin light-house,	S.W. by W. $\frac{3}{4}$ W.,	distant 22 miles.
Pemaquid Point light-house, ...	W. by S. $\frac{1}{2}$ S.	" 8 "
Marshall's " " " " " " " "	E. $\frac{1}{4}$ N.	" 6 "
Manheigen " " " " " " " "	S. $\frac{3}{4}$ E.	" 9 "

PEMAQUID POINT LIGHT, on the South end of Pemaquid Point, is a fixed light, 75 feet above the level of the sea. It is a guide to Bristol, Wadsworth, and John's Bay, and bears N.W. $\frac{1}{4}$ W. from Manheigen light, distant 12 miles.

GEORGE'S RIVER.—Bring the North Demise Cove Island, which is called White Island, (from its being white) to bear W.S.W., and steer E.N.E. for Franklin light-house, that you leave on your starboard hand, and which you may pass within a cable's length of. When abreast of Franklin Island light, (which is on your starboard hand,) steer N.E. by E. for Otter Island, 4 miles distant, and continue until within one-quarter of a mile of it, leaving it on your port hand; then steer E.N.E. for Cauldwell's Island, at the S.W. end of which is a high round rock, called Goose Rock. When abreast of said rock, which you may pass within one cable's length of, leaving it on your starboard hand, steer N.E. by E. and N.E., keeping Cauldwell's Island best on starboard, to avoid a ledge in the middle of the river.

In beating into George's River, you must be careful of a sunken ledge which bears N.E. from Franklin Island light, 6 miles distant; also of a ledge off the S.E. end of Otter Island, which extends one-third of the way across to Goose Rock.

Should you fall in with Manheigen Island light, and bound to George's River, you may steer N.N.W., leaving Manheigen Island on your starboard hand until Franklin Island light bears N.E. by E., when you may run for it, and steer as above directed. Franklin light may with safety be run for when bearing from N.E. by N. to E.N.E.

In running from White Islands for George's River, be careful of New Harbor ledges, which bear E.N.E. from Pemaquid Point light one league, distant, on which are 5 feet deep-water. After passing these ledges, you will see a large dry rock, called the Western Egg Rock, which bears E.N.E. from Pemaquid Point, 2 leagues distant, and 7 by S. from Franklin light, one league which you leave on your port hand; you will also see the Eastern Egg Rock, which bears South from Franklin light, one league distant, which you leave on your starboard hand. These Egg Rocks bear E.S.E. and N.W. from each other, one league distant, and their appearance much alike, which you pass between, with a clear and open channel. You may distinguish one from the other by their bearings from the light.

Should you have the wind ahead, and be obliged to turn to windward, you may stand to the Northward until Franklin Island light bears E. N. E., and to the South-eastward until it bears N. N. E., without danger.

From the Eastern Egg Rock there is a chain of breaking ledges, extending nearly to Franklin Island. Vessels heaving in will avoid these rocks by not standing too far to the Eastward.

To the Northward of the range of Pemaquid Point and the Western Egg Rock and McCobb's Island, the ground is foul and rocky, and also to the Eastward of the range of Franklin Island light, and the Eastern Egg Rock. [NOTE.—McCobb's Island is the Western entrance of George's River, and bears N.W., $1\frac{1}{2}$ mile distant from Franklin Island light.]

Buoys.

 " Goose Rock, Red & Black " " "
 " Gay's Cove Ledge, Black " " 3.
 " Fullerton's " Black " " 5.

John's Bay Harbor.

JOHN'S BAY HARBOR.—John's Island bears from Thrum Cap Island N. N. E. distant about 3 miles. Thrum Cap Island is a small bare island, and forms the Western side of the entrance of John's Bay, bearing from Pemaquid Point W. S. W., distant about 2 $\frac{1}{2}$ miles. Pemaquid Point forms the Eastern side of the bay, and is a low barren point; but the shores are bold on all sides. The light-house is situated on the S. E. side of Pemaquid, and bears from the Western point E. N. E., distant about half a mile from John's Island to Butford's Island, West, distant about one mile; Stuart's Island, N. W. by W., distant about one mile; High Island Head, N. $\frac{1}{2}$ W., distant about 1 $\frac{1}{2}$ miles; McFarling's Point, N. W. by N., distant about $1\frac{1}{2}$ mile—one-eighth of a mile from McFarling's Point there are several ledges, covered at high-water, but they are not in the way of vessels running into this bay, as they lie so near the Western shore, they may be seen at all times with a little motion of the sea;—McCobb's Point from John's Island, North, distant about $1\frac{1}{2}$ mile; Pemaquid Point, S. by E., distant about 3 miles; Pemaquid Harbor, N. E., distant about half a mile. Thrum Cap Island bears from White Island N. E., distant about 2 miles. High Island Head is a high island covered with trees, and you may near it within 200 feet of the shore.

John's Island is small and high, covered with spruce-trees, located near the center of the bay, and has a house on the N. W. part of it, which cannot be seen until you are abreast of the island; if you wish to run into Pemaquid Harbor, you may go to the Eastward of John's Island, leaving two dry rocks on the starboard hand, keeping them close aboard; or you may leave them on your port hand, and after passing them you will see the entrance of the harbor, bearing about N. E., half a mile distant, where you may run in, and lie safe from all winds.

Vessels Westward bound, falling in with Manheigen Island, and wishing to make harbor in a strong S. W. wind, must observe the following directions:—Bring Manheigen light to bear S. E., and steer N. W., distant about 11 miles, for Pemaquid Point; and when the light on said point bears E. N. E., distant half a mile, you are abreast of the Western point of Pemaquid; leave it on your starboard hand, and give a berth of one-eighth of a mile, then steer North for John's Bay Harbor, leaving John's Island and McCobb's Point on your starboard hand; Butford's Island, Stuart's Island, and McFarling's Point, on the port hand. If you are from the Westward, and come into this harbor, you may bring John's Island to bear N. by E., and run until you are within one cable's length of it; then steer North for High Island Head, which you may leave on your port hand, and when abreast of said head, steer N. $\frac{1}{2}$ E., about one-eighth of a mile, and anchor in from 4 to 5 fathoms water, good holding-ground. John's Bay lies about 5 miles to the Eastward of Townsend Harbor, and is a fine bay, having no rocks or shoals at its entrance, and vessels may run in without fear following the above directions.

Damariscotta River.

DAMARISCOTTA RIVER.—The buoy at the mouth of Damariscotta River, and the bearings of different objects about it, and directions for the river: Heron Island, W. part, bears from the buoy E. by N., distant about a quarter of a mile; White Island, S. $\frac{1}{2}$ W., distant 2 $\frac{1}{2}$ miles; Varnum's Point, North, distant about 3 $\frac{1}{2}$ miles; Heron's Point, N. by E., distant about 2 miles; from Heron Island to White Island S. W., distant about 3 miles. Heron Island forms the Eastern side of the entrance of Damariscotta River, and is high, covered with spruce-trees. Varnum's Point is a bluff point, and is on the Western side of the river, and is also covered with trees. The shores on both sides of the river are bold.

Buoys.

Incoming from the Westward, and bound to Danmriscotha River, bring White Island to bear S. $\frac{1}{2}$ W., and steer North, leaving the buoy, Hern Island, and Foster's Point on the starboard hand; give the buoy a berth of a cable's length, and steer N. by E., keeping in the middle of the river, and when up with Varnum's Point, which you leave on your port hand, you will see Hodgson's mills on the Western side of the river, about $\frac{1}{4}$ mile. Hodgson's house and mills are painted red; you may anchor abreast of them, near the middle of the river, in 5 fathoms water, good holding-ground, where you may be safe from all winds. The above-mentioned buoy is a spar buoy painted red, elevated about 12 feet above the surface of the water, and is moored about 100 feet to the Westward of the ledge, in 6 fathoms at low-water.

Should you fall in to the Eastward of Seguine, and wishing to go outside of Danmriscotha Islands, bring Seguine light to bear E. $\frac{1}{2}$ N., and steer E. $\frac{1}{2}$ S., 5 leagues distant, to clear Bantam Ledge, which lies East from Seguine, 3 $\frac{1}{2}$ leagues distant, and S.S.W. from Pumpkin Rock, one league; you then steer N.E. until you make Franklin light, and then steer as above directed, or continue your E. $\frac{1}{2}$ S. course until Pumpkin Rock bears North, then steer N.E. for Franklin light. Your course from Pumpkin Rock to Franklin light is N.E. by E., 5 leagues distant. In hazy weather you will do well to get a departure from this rock, as you cannot see Franklin light more than 4 miles distant. You may anchor in Gay's Cove, taking care to avoid a smoken ledge which lies E. from Gay's cove, near the middle of the channel, and has 4 feet at low-water. This ledge must be left on your port hand, keeping Caudwell's Island close on board. Gay's Cove lies on your port hand, about 8 miles to the E.N.E. of Franklin Island light. You may know this cove, as Gay's house and barn lie to the N.W. of it. But you are bound through Herring Gut, bring Capt. Henderson's house to bear N.N.W., and steer S.S.E. for Herring Gut. This Herring Gut has a bar from side to side, but you may go over it at 2 hours' flood, keeping your port hand best on board. As you come on the bar, you will see a large rock on your starboard hand, and the deepest water is within a cable's length of the rock; your course over the bar is S.S.E. You may anchor to the N.W. of the bar in 4 or 5 fathoms, muddy bottom, and wait for the ebb. The tide of flood sets to the Northward, and the ebb to the Southward.

A spar buoy, painted white, has been moored N.W. about 100 feet from Bantam Ledge, in 6 fathoms water, bearing from Burnt Island light, in Townsend Harbor, S.W., distant about 8 miles.

SEGUINE LIGHT-HOUSE is on an island near the mouth of Kennebeck River, 30 feet above the level of the sea, and is a fixed light. Cape Sual Point bears N.W. from it, and Wood Island N.N.W., $\frac{1}{4}$ mile distant. There are several rocky ledges near Seguine, which bear from the light as follows: Five Fathoms Ledge, S.W., distant three-quarters of a mile; Ellingwood's Rock, North, one-quarter of a mile; Seguine Ledges, N.N.E., half a mile, always dry; Jack-knife Ledge, N.W., $\frac{1}{4}$ mile, 8 feet water; Wood Island Reef, N.N.W., $\frac{1}{4}$ mile, 4 feet water; Whale's Back, N.N.E., $\frac{1}{4}$ mile; and White's Ledge, with 8 feet on it, bears E., one mile.

MARSHALL'S POINT.—On Marshall's Point, at the Eastern entrance of Herring Gut, there is a fixed light, elevated 30 feet above the level of the sea.

HERRING GUT HARBOR.—Old Cilly bears from the light on Marshall's Point, at the entrance of Herring Gut Harbor, S., distant about 3 miles; Black Rock, S. $\frac{1}{2}$ W., distant about $\frac{1}{4}$ mile; Henderson Island, S.S.W., distant one mile; Bradford's Island, S. by S., distant half a mile; Gunning Rock, S.E. by S. $\frac{1}{2}$ S., distant about one mile; the Brothers, S.E., distant about $\frac{3}{4}$ miles; Henderson Island from Gunning Rock, S., distant about half a mile; Gunning Rock to Black Rock, S.W. $\frac{1}{2}$ S., distant about $\frac{1}{4}$ mile—S.E. by S. $\frac{1}{2}$ S. from Gunning Rock, distant a quarter of a mile, lies a smoken ledge, which can be seen breaking at low-water in a heavy sea;—from Old Cilly to the light on Munhoigen Island, S.W. by S., distant about 9 miles; Mosquito Island from Old Cilly, N.E. by E., distant about 4 miles; Green Island from the Brothers, S.E. $\frac{1}{2}$ S., distant about a quarter of a mile. Old Cilly is a low black rock, which can always be seen above the surface of the water. A reef extends off East, nearly a quarter of a mile, which must be avoided. Black Rock is a small rock, and is also above the surface of the water. Henderson Island is a small island, with no bushes or trees on it. Bradford Island is high, and covered with spruce-trees, and forms the Western side of Herring Gut Harbor. Green Island is a small bare island. The two islands called the Brothers, are small, and covered with spruce-trees. Gunning Rock is high and bare, with a yellowish color; this ledge is very bold, and you may near it within 100 feet.

Buoy.

Seguine Light-house.

Marshall's Point light Herring Gut Harbor.

Danmriscotha River.
 No. 2.
 " 1.

In running from Manheigen for Herring Gut Harbor, bring the light on Manheigen to bear S.W., and steer N.E. by N., and when the light on Marshall's Point bears N. by W. 4 W., then run for it: in running for the light you will leave the Old City, Black Rock, and Henderson Island on the port hand; Mosquito Island, Green Island, Two Brothers, and Gunning Rock on your starboard hand. Give the light a berth of 2 cables' length, and when it bears East of you, steer N.N.E., distant about one mile, and anchor in from 4 to 5 fathoms, where you lie safe from all winds. You will find good anchorage anywhere between Marshall's Point and Bradford's Island.

You may run into the harbor by bringing the light on Marshall's Point to bear W. N.W., leaving the Green Island, Two Brothers, and Gunning's Rock on the port hand, Mosquito Island on the starboard. This passage is full of shoals, and had better not be attempted unless well acquainted.

This harbor is easy of access, and vessels may approach it with safety, by following the above directions.

When you go out of this harbor, and bound to the Eastward, be careful and give the port hand a good berth, for there are two ledges of rocks on the same hand of the Eastern point, which are under water, and lie off about a cable's length. When you are clear of these ledges, you may steer E. by S., or E.S.E., one mile, to the Green Island, which you leave on the port hand, and three or four islands and ledges on the starboard hand. When you pass these ledges and Mosquito Island, if bound to White Head, you may steer N.E. by E. 2 leagues, and when you bring the light to bear N. E., run for it: but when you pass the S.W. White Head, leave it on your port hand,

Sunken rock. and be careful of a sunken rock that lies S.E. from the Eastern White Head, about one cable's length distant, on which is a buoy. Your course through to the Eastward is N.E., and to the Westward S.W., keeping near the middle of the passage.

Sunken rock. When you come up with Ash Point, you must be careful of a sunken rock, on which is a buoy, which lies off the point about one-third of the passage, which has not more than 8 feet at low-water. But if you should go through this passage in the night, keep Potato Island, (which is right against Ash Island, about S.S.W. from it, and bare of trees,) which you leave on your starboard hand, best on board. When you pass Potato Island, and are bound into Owl's Head, your course is N.N.E. about 2 miles, which will leave two islands on the starboard hand. When you open the passage to Owl's Head, and bound to Edgemavoggan Reach, your course is N.E. by N. and you pass the Lime Islands, which you leave on your port hand. Continue said course, you will make a large bare rock on your starboard hand, and a little round island to the Eastward on the same hand, which is covered with trees. Continue your course to the N.E., and you will make a large island on your starboard hand. When you pass this island, you have the passage open to Buck's Harbor; continue your course N. till you pass by all the islands to the Southward and Northward. In the day-time you may see blue hills, bearing E.N.E., over all the land. This passage is safe to go through with a first-rate man of war. When you come within 2 miles of the Bay, you will make a small island on your starboard hand, which has a sunken rock to the Northward of it. Your safest way is to keep the middle of the passage, as there is a

Sunken rock. sunken rock (or ledge) on the port hand, that lies E. by S. from an island, which you leave on your port hand, about half a mile distant. If you want to make a landing, you may go into Buck's Harbor, by a N.E. or N.E. by N. course. When you come into this harbor, (which is 12 leagues from Owl's Head,) you must leave an island covered with young birch-trees on your starboard hand, steering N.N.W., and when you get to the Northward of said island, you steer E.S.E. till you bring it to bear S.W., where you will be land-locked from all winds, in 4 or 5 fathoms, soft bottom.

Sunken ledge. When you leave Buck's harbor, and bound to the Eastward, you steer S.E. till you come to a large rock and four islands, which you leave on your port hand, keeping said rock and islands best on board, for there is a sunken ledge that lies S.S.W. from them. You will make a black island on your starboard hand, with burnt trees on it. This ledge lies N.N.E. from said island, near the middle of the passage, but, keep the Eastern shore best on board, you will go clear of it. When you have passed said ledge, you leave two islands on your starboard, and two or three on your port hand. Continue your course to the S.E., till you make two islands, between which is Buck's Harbor the course is S.E. and N.W. 6 leagues. To the Eastward you will go between both islands, steering E. by S. one league, which course will carry you up with Thrum Cap, which island has a bar of rocks, that lie near half a mile to the Northward; but if you have a head wind, and are obliged to run through, you observe the channel is 2 miles wide at Channel Rock, which is always above water.

Rocks. When you leave this Thrum Cap, steer E. by S., which will carry you between Slip and Barge and three islands which you leave on your port hand, which are covered with large rock-maple trees. The barge is a bare rock, which you leave on your starboard hand; but there is a rock about a cable's length, distant to the Northward of Barge. Continue your course E. by S. for Bass Harbor, distant from Thrum Cap

leagues; but the S.S.E., at you keep Rich there is a large tale, and bears You give the you must give this harbor, and fathoms, much

TOWNSEND from Squirrel are some small miles of the island and Manheigen open sound, (for ber) on your port gross rocks, B Man and the O mile from the s not appear. If when you are b gen to bear S., George's Island Eastern island, of it, which are to the Northward it and the West of you. Here y

If you are bot the Eastern Islan mid island, whic heigen light to t head, you may leagues from Ge will make Mosqu trees. The entr about 2 miles, ke quit trees on it, and, which also W.N.W. before, or anchors, as y bottom, which w

B continuing N, icters of a mile hich you leave o E for the East harbor to bear e land, or you n ecks nor shoals In coming from about 5 leagues the outer islan and light, bearj

leagues; but you must have some regard to the tide of ebb, which sets very strong to the S.S.E., and the tide of flood to the N.N.W. If you are bound into Bass Harbor, you keep Rich's Point within a cable's length, which you leave on your port hand, for there is a large ledge of rocks, which lies off about half a mile, which is bare at low-tide, and bears S. E. from Rich's Burn, and S. by W. from the entrance of Bass Harbor. You give the port hand a good berth in going into Bass Harbor; in entering which you must give both sides a berth, for at low-water it is shoal. When you get into this harbor, anchor on the port hand, with a cove to the Westward of you, in 3 or 4 fathoms, muddy bottom.

TOWNSEND TO MANHEIGEN HARBOR.—When you take your departure from Squirrel Island, you steer E.S.E. for Manheigen light, on the North side of which are some small dry islands and ledges, but good water between them and the other sides of the island, keeping that course until the passage between George's Island and Manheigen bears N.E. You may then steer N.E. about 7 leagues, through a fair open sound, for White Head light, leaving George's Islands (which are three in number) on your port hand. The Eastern island has no trees on it. There are two dangerous rocks, bearing due South from the middle of the middle island, called the Old Man and the Old Woman, which are bare before low-water. They lie about one mile from the shore, and at high-water, when the wind blows off the land, they do not appear. If you are bound to the Eastward, and the wind should take you ahead, when you are between Manheigen and George's Islands, bring the middle of Manheigen to bear S., and run in N., which course will carry you between the Eastern George's Island, and the middle island. You may run as near as you wish to the Eastern island, but the middle island has a ledge of rocks that lies to the Eastward of it, which are always dry—that you are to leave on your port hand. When you get to the Northward of this island you must haul to the Westward, and run up between the Eastern and the Western island, so as to bring the body of the middle island to bear N.E. of you. Here you moor your vessel, if you stay any time.

If you are bound to the Eastward of this island, you may go to the Northward of the Eastern island, but you must be careful of a ledge that lies to the Eastward of the said island, which you must leave on your starboard hand; and when you bring Manheigen light to bear S.W. you may go N.E. If night should come on, or the wind ahead, you may haul up about N.E. by N. for Tenant's Harbor, which lies about 8 leagues from George's Islands. You cannot miss this harbor in the day-time. You will make Mosquito Harbor, which lies between two islands, covered with spruce-trees. The entrance to the harbor is North. Having passed this harbor, you will run about 2 miles, keeping your course N.E. by N., when you will pass an island with burnt trees on it, which you leave on your port hand, and two islands on your starboard hand, which also have burnt trees on them; then you must bring the harbor to bear W.N.W. before you enter. This is a good harbor, provided you have neither cables nor anchors, as you may save your vessel by running up to the head of it, on muddy bottom, which will be dry at low-water.

TOWNSEND HARBOR.—The entrance of Townsend is wide. From the Cuck-
old's to the Damiseove Islands, is about 3 miles; and Squirrel Island lies N.E. by N. about 2½ miles; and from Squirrel Island to the Western shore is about 1½ mile; and Burnt Island, on which there is a fixed light, 56 feet above the level of the sea, bears N. by E., distant about 2 miles from the Westerly point of Squirrel Island. Bunting Ledge lies South a little Westerly from Burnt Island light. If you are outside of Damiseove Islands, be careful to stand so far to the Westward as to bring Burnt Island light to bear N. by E.; then you may run for it without fear.

If the wind should be ahead, and you have to beat into the harbor, you may stand on your shore to shore without fear, and beat up either to the Eastward or Westward of Squirrel Island; you may find good anchorage under the lee of Squirrel Island, and around the island with any vessel.

In coming from the Westward, leave Segnine Island on your port hand, giving it a berth of about half a mile; then steer N.E. by E. 3 leagues, when you will, if clear weather, open Townsend light, on Burnt Island, bearing about N.N.E., but still continue your N.E. by E. course, until Burnt Island light bears N. by E., then stand for it, continuing N. by E., leaving it on the port hand, till up the harbor. About three-quarters of a mile N.N.E. from the light, there is a small island, called Mouse Island, which you leave on your starboard hand, which is bold; after passing it, you haul up N.E. for the Eastern harbor, or continue your course N. by E., till you get the Western harbor to bear W.N.W.; then you may run in till you shut Burnt Island light in by the land; or you may anchor anywhere inside of Mouse Island, as there are neither rocks nor shoals lying off from the land.

In coming from the Eastward get Manheigen light to bear E.S.E., and steer W.N. about 5 leagues, which course and distance will carry you into the passage between the outer islands and the main; and in steering said course you will make Burnt Island light, bearing about N.W. by W.; then steer W. by N. till you get Burnt

Rocks.

Island light to bear N.W., then haul up for it, keeping it on your port bow till you get up with it, then steer N. by E., and follow the directions before given in coming from the Westward.

Kennebeck.

KENNEBECK.—If coming into Kennebeck River from the Westward, keep about one-fourth of a mile from Seguine Island light, in doing which you will avoid Jack-knife Ledge, on which there is a black nun buoy, No. 3, with J. K. in white letters, which bears from Seguine light N. W., distant 1½ mile, and Ellingwood's Rock, lying N., one-fourth of a mile from Seguine. After passing Ellingwood's Rock, bring Seguine light to bear S., and steer N. for Pond Island light, which is a fixed light, 52 feet above the level of the sea, and bearing N. ½ W. from Seguine light, distant 2½ miles. Leaving Pond Island a cable's length on the port hand, care should be taken, on the flood-tide, to haul quickly round Pond Island Point, to avoid the Sugar-loaves, (two small islands N., one-half mile from Pond Island,) upon which the tide sets very strongly. On Pond Island Reef there is a black cast-iron nun buoy, No. 5. The course, after passing Pond Island, is about N.W. to the fort on Humicwell's Point, (which you will give a berth of a cable's length,) and steer North for Cox's Head (on which also is a fort,) one mile. The course is then N.E. to Perkins' Island, which you will leave on the starboard hand, about one mile, and you will give it a berth of a cable's length, to shun two sunken ledges that lie nearly abreast of Perkins' Island, and about in the middle of the river; then steering about North, one mile, you will have fine anchorage at Perkins' Flats, in 4, 5, and 7 fathoms. This is as far as it would be prudent for a stranger to attempt with a heavy vessel. On Perkins' Ledge there is a spar buoy, with black and red horizontal stripes.

Light.**Sunken ledges.**

There is a good anchorage in moderate weather anywhere between Seguine and Pond Island, within half a mile of the latter, in from 5 to 8 fathoms. Should the wind blow violently, or in case of stress of weather, and if far enough to windward to weather Ellingwood's Rock and Seguine Ledges, it might sometimes be advisable to run to Townsend Harbor.

If bound into Kennebeck, and fallen to the Eastward of Seguine, bring the light on Pond Island to bear N.W. by W., and run for it till within a cable's length, then follow the preceding directions.

There is safe anchorage, with an off-shore wind, anywhere between Small Point and Seguine, avoiding Jack-knife Ledge, before mentioned.

Tide.

Safe anchorage may be had from Cox's Head to Perkins' Island, nearest the Eastern shore. The usual rapidity of the tide, between the Seguine and the mouth of the river, is 3 and 4 knots.

There is also a passage into Kennebeck River, leaving Pond Island on the starboard hand; but only 16 feet can be carried at high-water, and it is not recommended.

You have deep water to the Eastward of Seguine. At the Westward the tide of flood sets strong to the Northward into New Meadows, and W.N.W. into Broad Sound, and up to Portland, and the ebb-tide the reverse. Your soundings between Seguine and Cape Elizabeth are various; at times you have 18 or 20 fathoms, rocky bottom, and within a cable's length you will find 30 or 35 fathoms, muddy bottom.

Buoys.

Buoys arranged as they are passed by vessels entering Kennebeck Harbor.

On Thom's Rock is a Red nun buoy, No. 4.
 " White's Ledge, Black nun buoy, " 1, W. L. in white letters.
 " Jack-knife Ledge, Do. do. " 3, J. K.
 " Pond Island Reef, Do. do. (iron) " 5.
 " Black Jack Rock, Black and red spindle, with iron cage on top; the shaft, red; top, red and black stripes.

The buoys on Thom's Rock and White's Ledge will not be seen by vessels entering the Kennebeck West of Seguine.

Buoys arranged as they are passed by vessels entering Kennebeck River.

On Perkins' Ledge, is a spar buoy, Black and red horizontal stripes.
 " Parker's do. Black spar buoy, No. 3.
 " Seal Rock, Black spindle, with copper cylinder, painted black
 " Lee's Rock, Red spindle, like the above, with red ball on top
 " Ram's Island Ledge, Do. with 2 red balls on top.
 " Lithoc's Rock, Black spar buoy, No. 5.
 " Lincoln's Ledge, Do. " 7.
 " Truitt's Ledge, Do. " 9.
 " Winslow's Rocks, Red spindle, with red cask on top.
 " Stetson's Rocks, Red spar buoy, No. 2.
 " Thorne's Island Rock Black spar buoy, " 11.
 " Grace's Rock, Red spar buoy, " 4.
 " Trott's Rock, Black spar buoy, " 13.
 " Twing's Rock, Do. " 15.

All buoys in the Kennebeck River, above Bath, are taken up in the winter, and replaced in the spring.

HENDRICK'S HEAD LIGHT is a revolving light, 30 feet above the level of the sea, on the starboard hand going in, near the mouth of Sheepsfoot River. *Hendrick's Head Light.*

SHEEPSFOOT RIVER.—If you are bound to Sheepsfoot River from the Westward, and make Seguire light, you may leave it on your starboard hand, giving it a berth of half a mile; when you pass it to the Eastward you must bring it to bear S.W. by S. and steer N.E. by N., which course will carry you to Ebenicook Harbor, distant 3 leagues, leaving three dry ledges on your starboard hand, and one on your port. This harbor is very narrow at the entrance, but makes a large basin when you get into it; in the entrance it lies E.N.E. You cannot get in here with a N.E. or Easterly wind, but must have the wind South or Westerly. After you get into this harbor, you must haul up N.E. or N.E. by N., for there are several sunken rocks on the starboard hand as you go in, which you are to avoid. The best anchorage is against Captain Smith's wharf, where there are 4 fathoms, muddy bottom, and you will lie safe from all winds. But if you are bound up Sheepsfoot River, in a large vessel, and come from the Westward, pass Seguire light to the Southward, steer N.E. until you bring Hendrick's Head to bear N. a little Westerly, then run for it, keeping the starboard shore close aboard. There are many rocks and ledges, some of them above and some under water, which are all to the Eastward of Seguire. When you get up as high as Ebenicook, you leave the two Mark Islands on your port hand, keeping your course North a little Easterly; but if you only come here to make a harbor, when you get up to Capt. Hodgson's you will see a bare ledge on your port hand, if it is low-water, which is covered at high-water; you may anchor at 8 fathoms to the Northward of it. *Sunken rocks.*

MARK ISLAND.—On Mark Island a stone column is erected as a landmark for vessels running into or passing either Harpswell or Broad Sound. It is also a conspicuous mark for the mariner, standing in from sea, in any direction between Cape Elizabeth and Cape Small Point. This island, at the entrance of Harpswell Sound, (half-way between Portland and the entrance of the River Kennebeck,) is one-fourth of a mile in length, without trees, its elevation 40 feet above the level of the sea; the column is placed near the centre of the island, 50 feet high, painted perpendicularly in black and white stripes, except near the top, which is black on each side. Course up Harpswell Sound N.E. $\frac{1}{2}$ N. *Mark Island.*

Bearings by compass, and distance in statute miles from the column.

Bearings.

If you want to go up to Wiscasset Point, you must keep your starboard hand best aboard, North-easterly, till you come to Cross River, which you leave on your starboard hand. You will not attempt to go up to Wiscasset Point with a head-wind and the tide of ebb, for it is 13 league from Cross River, but when you have a fair wind and tide you may proceed without fear. This river is narrow, and lies more to the Westward. When you are about a mile or a mile and a half up, you must keep your port hand best on board, for there is a ledge of rocks which reaches near half-way across the river, which is on your starboard hand, and the rock near the middle is covered at high-water, but may be seen 2 hours before. The river runs straight to Decker's Narrows, then turns round to the Westward; when you enter these narrows, you may see the town. In case you should go up in the night, you must be careful of 2 large rocks that lie W.S.W. of these narrows; the tide of flood sets very strong for them, and they are covered at half-tide; you may go on either side of them, and may anchor in 10 or 12 fathoms water, muddy bottom.

Tide.
New Meadows.

It is high-water here, at full and change of the moon, about 10h. 45m.
NEW MEADOWS.—This river bears N.E., 8 leagues distant from the pyramid on Cape Elizabeth, and W. about one league distant from Cape Small Point. If you should fall into this bay, with the wind at S.E. or S.S.E., and bound to the Eastward, you may make a good harbor in the above river. In standing to the Northward, you will have a large round island on your starboard hand, covered with spruce-trees, together with 2 large rocks, one called the Brown Cow, and the other the White Bull, which are some distance from each other. You must leave the Brown Cow on your starboard, and the White Bull on your port hand, the latter of which you may go within a cable's length of, and when you have passed it, must stand over for Horse Island, that lies on the starboard, which has a house on it, that you may go within a quarter of a mile of. To the Westward of the island lies a large rock, which is covered at high-water, but bare at half-tide; you may go on either side of it when it is in sight, but the widest passage is to the Eastward. When you have passed this rock steer N. by W. or N.N.W., which course will carry you up with a large island, called Bear Island, which is covered with spruce and birch trees. When you have passed this island about one-quarter of a mile, you may haul in for the starboard shore, and anchor in 5 or 6 fathoms water. This is the best place to anchor, with the wind at S.S.E. or E., but be careful of a ledge of rocks that runs to the Northward of this island, about half a mile off. You may anchor in this bay according as the wind may be; if it should be at the Eastward, anchor on the East side. If you have lost your cables and anchors, there is a large cove on the starboard hand, about 2 miles from Bear Island, bearing about N., which is sufficient to hold 30 or 40 sail of vessels. It is land-locked all round, so that no wind can damage a vessel after she gets into it. There is a black spar buoy on Jameson's Ledge, and a black and red striped one on Gorley's Ledge, both in 18 feet, low-water.

Hussey's Sound.

HUSSEY'S SOUND.—If bound into Hussey's Sound, give Cape Elizabeth a berth of a quarter of a mile, and steer N., which will bring you up to the sound, about 9 miles distant. When up with the sound give the N.E. outer point of Peak's Island a good berth, as a reef extends E.N.E. nearly half-way across the passage, and breaks in heavy weather. Then giving Overset Island a small berth, as its shores are very bold, continue your course midway the passage N. by W. or N.N.W., up to Cow Island, about 2 miles distant, thence steer N.E. by N. about a half or three-quarters of a mile, and anchor between Clapboard Island, which is a high island, covered with trees, and the centre of Long Island, bringing Clapboard Island to bear N.W., and centre of Long Island S.E. The anchorage is good holding-ground, in 5 or 6 fathoms at low-water. You will then have Little Lebeig Island to the N.E., and Hog and Cow Islands to the S.W. This anchorage is about 6 miles from the wharves in Portland Harbor. The flood-tide sets strong into, and the ebb out of Hussey's Sound. Here 500 sail may be moored safe from all winds and weather, and when wind and tide serve, they can be taken to sea in half an hour.

Good anchorage can also be had between Little Crow Island, at the N.E. end of Peak's Island and Great Hog Island, in 6, 8, or 10 fathoms, good holding-ground. S.E. from Little Crow Island, 50 fathoms distant, there is a sunken ledge, having only 12 feet on it at low-water, which will be avoided by keeping the starboard shore of Hussey's Sound best on board.

Half-Way Rock.

HALF-WAY ROCK is high and black, about 600 feet in diameter, elevated 16 feet above the level of the sea, at high-water. At the distance of 600 feet from the rock, on the N.W., North, N.E., E., and S.E. sides, there are from 5 to 6, and gradually deepens to 25 fathoms, within three-quarters of a mile of it. A reef extends off W. by S., distant about an eighth of a mile. Within one cable's length of said reef you will find from 10 to 12 fathoms water. Seguin light-house bears from the rock E. $\frac{1}{2}$ N., distant about 12 $\frac{1}{2}$ miles; Drunken Ledges, N.N.E., distant about 2 miles; Mark Island, N. by E. $\frac{1}{4}$ E., distant about 4 $\frac{1}{2}$ miles; the light-house on Cape Elizabeth,

S.W. by W. $\frac{3}{4}$ W., distant about 9 miles; Bulwark Reef, (shoalest part,) S.W. by S., distant about $1\frac{1}{2}$ miles; Portland light-house, W. $\frac{1}{4}$ S., distant about $7\frac{1}{2}$ miles; Green Islands, W. $\frac{1}{4}$ N., distant about 4 miles; Jewell's Island, N.W. by N., distant about 3 miles; Eagle Island, N., about $4\frac{1}{2}$ miles. Drunken Ledges may be seen at all times breaking with a little motion of the sea. Mark Island is a small bare island, and has a stone monument erected on it as a guide for vessels running into Broad Sound. Eagle Island is a small high island, covered with trees, at the entrance of said sound. Mark Island and Eagle Island form the Eastern side of the entrance to Broad Sound. Brown Cow and Jewell's Islands form the Western side. Green Islands are two in number, and bear from Jewell's Island S.W., distant about $1\frac{1}{2}$ mile.

WEBSTER ROCK.—About a quarter of a mile N. by W. of the centre of Half-way Rock is a small rock with but 8 feet on it at lowest tides, and 10 fathoms inside of it. On this rock the steamer Daniel Webster struck in October, 1856. A spar buoy will be placed upon it. *Webster Rock.*

PORTLAND HARBOR.—Cape Elizabeth lights are situated on Cape Elizabeth, South of the entrance to Portland Harbor, about 140 feet above the level of the sea, and 300 yards apart, bearing from each other S.W. $\frac{1}{4}$ W. and N.E. $\frac{1}{4}$ E. The Western light revolves once in one minute and thirty seconds, the Eastern is a fixed light. *Portland Harbor Lights.*

Dangers in approaching Portland Harbor.

BULWARK LEDGE is about half a mile in circumference, and has on the shoalest part of it 15 feet at low-water, which gradually deepens from 3 to 12 fathoms. It bears from Portland Head light E.S.E., $6\frac{1}{2}$ miles; from Cape Elizabeth Eastern light, E. by N. $\frac{1}{4}$ N., 6 miles, and from Green Island, S.S.W., 5 miles; it breaks in heavy weather. There is on it a nun buoy, red and black horizontal stripes, one-eighth of a mile S.E. of the shoalest water. *Bulwark Ledge.*

ALDEN'S ROCKS are two in number, bearing from each other E.S.E. and W.N.W.; the distance between them is 420 feet. *Alden's Rocks.*

The Western rock is about 12 feet in diameter, and has $5\frac{1}{2}$ feet on it at low-water. The Eastern rock is about 30 feet in diameter, and has but 7 feet at low-water. Between these rocks are 3, 4, and 5 fathoms. The Western rock bears from the buoy S. by W., distant 240 feet. The Eastern rock bears S.E. $\frac{1}{4}$ S., distant 520 feet. At the distance of 600 feet from the Eastern rock, on the S.E., E., and N.E. sides, are 4, 5, and 6 fathoms water. At the distance of 300 feet from the Western rock, on the S.W., W., and N.W. sides, are 6, 7, and 8 fathoms.

Alden's Rock buoy is a black spar buoy, No. 3; it is 450 feet North of the shoalest part of the ledge, and bears from Cape Elizabeth East light S.E. by E., 3 miles, and Portland light S.S.E. $\frac{1}{4}$ E., $6\frac{1}{2}$ miles.

Alden's Rock bell buoy bears from the spar buoy N.W., one-quarter mile; Cape Elizabeth light, S.E. by E., 3 miles; Portland light, S.S.E. $\frac{1}{4}$ E., $6\frac{1}{2}$ miles.

Spring Point Ledge has a Black spar buoy, No. 11, in winter, and a nun buoy in summer. *Buoys.*

There is a fixed red light on the end of the breakwater, Portland Harbor.

Light.

HFE AND CRY has a black spar buoy, marked 1. From it Eastern Cape Elizabeth light-house bears N.W. by N., distant 1 miles; Alden's Rock buoy, N. $\frac{1}{4}$ W., distant 2 miles. It is in 36 feet, low-water, is 125 feet E.S.E. of the ledge, which has 16 feet on it at low-water. *Hue and Cry.*

VAPOR ROCK.—This rock lies N. by W. $\frac{1}{4}$ W., 3 miles distant from Cape Elizabeth Eastern light, and N.W. by W. $\frac{1}{4}$ W., 3 miles distant from the barn on Richmond's Island. *Vapor Rock.*

Vessels should not pass inside of Alden's Rock, unless well acquainted, or having a pilot, although the deepest channel is inside of it. This bears from Eastern Cape Elizabeth light-house, E. by N. $\frac{1}{4}$ N., distant $2\frac{1}{2}$ miles; from Wood Island light-house, S. by E. $\frac{1}{4}$ E., distant 9 $\frac{1}{2}$ miles.

OLD ANTHONY LEDGE bears from Eastern Cape Elizabeth light-house S. by E. $\frac{1}{4}$ E., 2 $\frac{1}{2}$ miles distant; from Wood Island light-house, E. by N. $\frac{1}{4}$ N., $9\frac{1}{2}$ miles distant, and has 22 feet on it at low-water. *Old Anthony Ledge.*

On the East end of the Middle Ground, Portland Harbor, is a red buoy, No. 4, in 17 feet water at low-water; which bears from the shore end of the breakwater N. $\frac{1}{4}$ E., and from the observatory S.E. $\frac{1}{4}$ E.

On the West end of the Middle Ground is a red buoy, No. 6, 16 feet water at low-water which bears from the shore end of the breakwater N.W. by N. $\frac{1}{4}$ N., and from the observatory S.E. by S.

Taylor's Reef.

TAYLOR'S REEF bears from Eastern Cape Elizabeth light-house S. by E. $\frac{1}{2}$ E., distant three-quarters of a mile; from barn on Richmond's Island, E. by N. $\frac{1}{2}$ mile. It has 8 feet over it at low-water.

Broad Cove Rock.

BROAD COVE ROCK has a black spar barrel buoy, replaced in summer by a nun buoy, marked B. C. R. From it Cape Elizabeth light-house bears S.W. $\frac{1}{2}$ S. $1\frac{1}{2}$ mile; Portland Head light-house N. $\frac{1}{2}$ W., $2\frac{1}{2}$ miles. It has 24 feet water, and lies to the Northward of a shoal which has 16 feet water on it, and to the Southward of Trundy's Reef buoy.

Trundy's Reef.

TRUNDY'S REEF has a black spar buoy, replaced by a nun buoy, marked T. R., in summer. Cape Elizabeth light-house bears S.S.W., $2\frac{1}{2}$ miles; Portland Head light-house, N.N.W., $2\frac{1}{2}$ miles. It has 24 feet on it at low-water.

Bell Rock.

BELL ROCK has a spar buoy, red and black horizontal stripes. From it Portland Head light-house bears N.W. by W., distant $1\frac{1}{2}$ mile; Eastern Cape Elizabeth light-house, S.E. by S. $\frac{1}{2}$ S., distant $4\frac{1}{2}$ miles. It is in 42 feet, at low-water, and is 150 feet South-east of the ledge, which has 18 feet over it at low-water.

Bearings.

The following are the bearings and distances, from the North-easterly light, of the shoals and reefs, and of other light-houses in sight of, and near the Cape, viz.:

S.E. side of Richmond's Island	S.W.	$2\frac{1}{2}$ miles.
Seguine light	E. by N. $\frac{1}{2}$ N.	20 "
Wood Island light	S.W. $\frac{1}{2}$ W.	8 $\frac{1}{2}$ "
Portland Head light	N. $\frac{1}{2}$ E.	3 $\frac{1}{2}$ "

Light-house.

Portland light-house is on a point of land called Portland Head, at the Western entrance of the harbor. It is a stone edifice, 81 feet high, and is a fixed light.

Vessels bound to Portland, falling in to the Westward, and making Wood Island light, must bring it to bear S.W. by W. $\frac{1}{2}$ W., and steer N.E. by E. $\frac{1}{2}$ E., 12 miles, which will bring them up with the buoy on Alden's Ledge.

Should they fall in to the Eastward, and make Seguine light, they must bring it to bear E. by N. $\frac{1}{2}$ N., and run W. by S. $\frac{1}{2}$ S. 19 miles, which will bring them up with the buoy.

In running for Portland Harbor, bring the buoy to bear S.S.E. and steer N.N.W. $6\frac{1}{2}$ miles, which will bring you up with Portland light. Continue this course until you are half a mile within the light-house, then bring it to bear S., and steer N. by W. for House Island, which is 2 miles N. by W. from Portland light. Should you wish to go further up the harbor, follow the directions given here.

The course from the buoy to Hussey's Sound is North.

N.B.—Vessels of large draught will find the best water by bringing Portland light to bear N.W. by N., and running directly for it.

Buoy.

Coming from the South-westward, when within half a mile of Cape Elizabeth, the black buoy on Broad Cove Rock may be seen; it bears N.N.E. from the pitch of the cape, distant $1\frac{1}{2}$ mile, and lies in 24 feet water. When up with this buoy, leave it on the port hand, half a cable's length distant, and steer N. by E. $\frac{1}{2}$ E. one mile, which will carry you up with the black buoy on Trundy's Reef, which lies in 24 feet water. Giving it the same berth as the other, you may then run N. by W. $\frac{1}{2}$ W. for Portland light-house, 3 miles distant. When up with the head on which the light-house stands, give it a small berth, and steer N. by W., leaving Bang's Island on the starboard hand, till you come to House Island, the S.W. part of which bears N. from the light-house, distant about 2 miles. Before you are up with this island, the black buoy on Spring Point Ledge may be seen; it bears N.W. by W. from the S.W. part of House Island, distant half a mile, and lies in 18 feet water. When up with this buoy, you open the town. Giving the Spring Point Ledge buoy a small berth, you may haul up N.W. for the black buoy on Stanford's Ledge: this buoy lies in 17 feet water, one mile distant from Spring Point Ledge buoy. There is a fixed red light, 23 feet above the sea, on the N.E. point of the breakwater, Stanford's Ledge. Giving this light and the black buoy a small berth, keep midway up the river, and anchor opposite the town where you please, in safety.

Light.

Vessels coming from sea, and bound into Portland, may, by giving the lights on Cape Elizabeth a berth of 4 miles, run to the Northward and Eastward until Portland light bears N.W., and then stand directly for it, which will clear all the ledges.

There is a red spar buoy on Green Island Reef, and a black wooden spindle with basket, upon Whitehead Ledge. This passage is narrow, and but seldom used with large vessels.

By keeping midway in coming in, you will have not less than 5 fathoms water. Keep midway the passage, leaving the Spindle half a cable's length on the port hand, and steer for the fort on House Island, passing between the N.E. end of Bang's Island, and the S.W. point of Little Pumpkin Island, which will carry you into ship-channel the same as if you had passed the light-house.

NOTE.—If by accident either of the buoys should be removed, the following directions for sailing into Portland Harbor will be found useful.

When you come from the South-westward, and intend to go into Portland, give Cape Elizabeth a berth of half a mile, and steer N.N.E. until you bring Portland light-house *Light.*

to bear N.N.W., when you must haul up N.N.W., if the wind will permit; but if you are in a large ship, and the wind N.W. or W.N.W., your safest way is to continue your course N.N.E., which will carry you safe into Hussey's Sound, allowing it to be tide of flood, as Portland Sound is narrow, but bold between the light-house and Bang's Island, the latter of which is on your starboard hand. If you should turn into Portland in the night, in standing to the South-westward, you must go about as soon as the light bears N.N.W.; and in standing to the Eastward, you must go about as soon as the light bears W.N.W., for there is a ledge of rocks that bears S. by E. from Portland light-house, and also a low island, called Ram Island, East Northerly, one mile distant from the light-house; but if you have a leading wind you may go in without fear, keeping about middle of the channel-way, and when abreast of the light, steer about N. by W. for House Island, which you leave on your starboard hand; when you pass House Island, bring it to bear S.E. by E. and steer N.W. by W., or W.N.W. with the tide of flood. In steering the above course, you will see a round bushy tree to the North of the town, and a house with a red roof and one chimney; bring the tree to the West of the house, which course will carry you up the channel-way, in 6 or 7 fathoms water; but when you come abreast of the fort, which stands on a hill, haul away W.S.W., as there is a shoal bank on your starboard hand, that has not more than 10 or 12 feet on it at high-water, which you are to avoid. Here you will be careful of 2 ledges of rocks, one called Spring Point Ledge, 2 miles N. by W. *Ledges* $\frac{1}{2}$ W. from the light-house, and the other 3 miles, bearing N. by W. $\frac{1}{2}$ W., called Stanford's Ledge, which has a buoy on it, and stretches off from your port hand near half a mile in length. They lie to the S.W. of House Island, and are all bare at low-water. If you are obliged to turn in here, they are much in the way, and when you are standing to the Southward, be careful of them. The marks will do in the day-time, but are of no service in the night. There is a pilot who generally attends here. This harbor is open to the wind at N.E. and E.N.E. If you should come in a dark night, your best way is to go into Hog Island Road, which may be done by steering as follows:—when you pass the light-house, steer N. by W., until you pass Bang's Island, which you will leave on your starboard hand; in steering this course, you will make House Island, which you will leave on your port hand; when you are between both of these islands, you steer N.E. by E. till you come to the second island on your starboard hand. If it is day-time, you will see a large house on said island; and may anchor as soon as abreast of it, in 10 or 12 fathoms, muddy bottom.

If you should fall in to the Eastward of Portland, and make Seguin light, bring it to bear E. and steer W., which course you are to continue till you make Portland light to bear from N.W. to W.N.W., when you may run for it without fear.

You must have some regard to the tide of flood, which sets very strong between the islands to the Eastward of Portland.

Masters who sail from Portland, or ports adjacent, are informed, that from the Observatory on Fort Hill, by means of the telescope placed there, vessels approaching the coast may be discovered at 15 leagues distance; and their colors or private signals can be distinguished 8 leagues, if the weather should be clear and the colors hoisted, or suspended in such a manner as to present them fair to the observatory. Should any need assistance, they will set their ensign over their private signals; and may be assured, if they can be discerned, that their situation will be made known to their owners.

The observatory bears N.N.W. $\frac{1}{2}$ W. from Portland light-house, 4 miles distant; and these in range are a good mark to clear Alden's Rock; which, keeping the above in range, you will be nearly three-quarters of a mile to the Eastward of.

The observatory is on an eminence 141 feet above high-water mark; and the building 32 feet high, painted red, and the telescope placed near the top.

Vessels falling in with Cape Elizabeth, and wishing to make a harbor in a strong N.W. wind, must observe the following directions:

Give this cape a berth of one-quarter of a mile, and steer N.E. 9 miles, leaving the *Directions:* Green Island on the starboard hand, which will carry you up with the S.W. point of Crotch Island. Give this point a berth of half a mile, and steer N.N.E. $\frac{1}{2}$ E., which

will carry you between Hope Island on the North and Crotch Island on the South. You may anchor midway between the 2 islands, in about 13 fathoms water. The shores on each side are very bold.

RICHMOND'S ISLAND HARBOR.—To enter Richmond's Island Harbor, stand *Richmond's* in by the Western extremity of the island N. $\frac{1}{2}$ W., (giving the West Ledge a berth of about the eighth of a mile.) until the Western light on Cape Elizabeth is well open; *Harbor.* then haul up until the wharf bears E., is the best anchorage for vessels of heavy draught. Vessels of lighter draught may stand in until the wharf bears S. by E.

The anchorage is good holding-ground, being of clay, with a crust of coarse sand, from six inches to a foot in thickness.

In beating in, the only precaution necessary is to look out for the Old Proprietor and the Chimney Rock, both of which are out of water at half-tide.

In coming from the Eastward, give the island a berth of one-quarter to half a mile, until the Western extremity of the island bears N.E. by N.; then haul up N. $\frac{1}{4}$ W., and proceed as above.

Richmond's Island Harbor is a safe anchorage with the wind from any point between N. and S.W., and is easily entered when vessels cannot get into Portland.

The soundings on the chart indicate the best water. No pilot is required.

In sailing by Richmond's Island, you must be careful of a sunken ledge, called Watch Ledge, that lies off about S.E., near half a mile from the N.E. end of the island. It does not show itself except the wind blows fresh, but you need not go so near the island, unless you have a scant wind, or turning to windward.

Sunken ledge.

White Hills.

WHITE HILLS.—These hills lie N.W. from Portland, and N.N.W. from Wood Island light-house. You may see them in clear weather when no other part of the land is in sight. At the first sight they appear like a cloud, and are always white. They have been seen when in latitude $43^{\circ} 10'$ North, 23 miles South from the light-house on Cape Elizabeth. The depth of water in the above latitude is 80 fathoms, muddy bottom. When you steer N.W. or N.N.W. from this latitude, you will make Agamenticus Hills, and when bearing W. by N., 6 or 7 leagues, they appear like three hills, the smallest of them to the Eastward. At the same time you will make Weil's Hills, bearing W. N.W., and when you are on the Northern part of Jeffery's Ledge, in 45 fathoms water, you will see the hills of Agamenticus, bearing W. by N. or W. N.W.

Between Jeffery's and the isles of Shoals you will have 76 and 75 fathoms water, muddy bottom, and a strong current setting to the S.W. You may see the Isles of Shoals 5 or 6 leagues, when you are to the Eastward of them; but will first see the light-house, which is on White Island, and the meeting-house on Star Island, bearing N.E. and S.W. from each other, distance seven-eighths of a mile.

Cape Porpoise to Wood Island light.

CAPE PORPOISE TO WOOD ISLAND LIGHT.—Wood Island light is situated near the entrance of Saco River, on the East side of the island. It is 63 feet above the level of the sea, and is a red revolving light. Wood Island is a high woody land, and very even, and lies N.E., 12 leagues distant from Cape Porpoise. In running for the light, bring it to bear N.N.W. or N.W., and run till within a cable's length with safety. You may go into this harbor either at the Eastward or Westward of the island. There are several rocks to the Westward of the island, and also a long bar, which lies to the S.W., about three-quarters of a mile distant, together with 2 ledges, one of which bears S.E. by S. from the light, distant half a mile, having 10 feet water on it at low tide, and the other is a dangerous ledge called Danceberry, bearing S. by E. from the light, distant about three-fourths of a mile, and breaks at all tides. When you have the wind to the Southward, you may lay your course in, and anchor near Stage Island, on which is a monument: this is called Winter Harbor. You may go in the Eastern way, and have room to turn your vessel, which is an advantage you cannot have in going in to the Westward; but here you are exposed to the wind at N.E. and E.N.E., but if your cables and anchors are not good, you may run into the Pool, and lie safe from all winds.

In running in the Eastern passage, you open a small channel for boats only, between Wood and Negro Islands, but no man of experience would mistake it. Negro Island is small, with two stores on it, and is left on the port hand.

Saco.

Saco lies about a league to the North-west, but is a barred place, and has not above 10 feet at high-water, which makes it not fit for a stranger to go in; there is, however, considerable navigation owned here, and the inhabitants are enterprising.

Cape Neddock to Cape Porpoise.

CAPE NEDDOCK TO CAPE PORPOISE.—Your course from Cape Neddock to Cape Porpoise is N.E., distant 43 leagues. Cape Porpoise is a bad harbor, and not to be attempted unless you are well acquainted, or in distress. In going in you must leave two small islands on your port hand and three on your starboard. It may be known by the high land of Kennebunk, which lies to the North-west of it. When the harbor bears N.W., you must haul in, but be careful of the point on your port hand, and not go too near it, as it is very rocky. As soon as you are in the harbor, and clear of the point of rocks on your starboard hand, your course must be N.W. about 2 cables length, when you must come to, and moor N.E. and S.W., or run direct for the wharf. A vessel that draws 10 feet will be aground at low-water. The harbor is so narrow that a vessel cannot turn round; is within 100 yards of the sea, and secure from all winds, whether you have anchors or not.

Cape Porpoise Harbor, Goat Island light.

CAPE PORPOISE HARBOR.—The light-house stands on the South-west part of Goat Island, and contains a fixed light, elevated 38 feet above the level of the sea. The following are the directions for the harbor:—If you are to the Eastward, and make Wood Island light, and bound to Cape Porpoise Harbor, bring Wood Island

light to bear N.E. by N., and run S. W. until you bring Goat Island light to bear N. by W.; then steer direct for the light, until you shut Wood Island in by the Eastern head of Cape Porpoise Harbor; then you are abreast of a breaking ledge called the Old Prince, which bears from Goat Island light-house S.E. by S., half a mile distant; then steer N.N.W., until Goat Island light bears E.N.E.; you are then up with the entrance of the harbor. Then, if low-water, keep midway between the two points; but if high-water, keep the port shore best aboard. When up with the points, steer N.W. a quarter of a mile, and anchor in 3 fathoms water, at low-water. By following these directions you will find from 3 to 6 fathoms water. In coming in from sea, and making Cape Porpoise, and intending to go into the harbor, bring the light to bear N. by W., and follow the above directions. This harbor is not so safe for large vessels, and must not be attempted, unless with a fair wind. Wood Island lies about 10 miles to the N.E. of Cape Porpoise, and has on it a repeating light. Folly Island lies opposite the light-house, and forms the Western side of Cape Porpoise Harbor. The S.S. E. part of Folly Island point bears from the light S. $\frac{1}{2}$ W., distant about $\frac{1}{4}$ mile. The shoal runs off nearly three-quarters of a mile.

Note.—A spar buoy painted red, elevated 9 feet above the surface of the water, has been moored near the Old Prince, in 8 fathoms water, at low-water, and bears from Goat Island light-house S.S.E., distant about five-eighths of a mile; Old Prince bears from the buoy N.N.E., distant about one-eighth of a mile; Folly Island Point, West, distant about one-quarter of a mile. In running for Cape Porpoise Harbor, you may go on either side of the buoy, by keeping it close on board, and after passing it bring it to bear S.E. by S., and steer N.W. by N. for the entrance of the harbor, and follow the above directions.

There is a fixed red light on the pier head, at the mouth of Kennebunk River. It is a small frame structure, and the lantern is placed on the outer end of the building.

Kennebunk.—A black spar buoy has been moored near the Fishing Rocks, at the mouth of this harbor. The Fishing Rocks extend E.N.E. and W.S.W., nearly half a mile distant. The shoalest parts of the rocks are bare at 2 hours' ebb, and may be seen breaking at all times, with a little motion of the sea. On this shoal there is a spindle erected, with a small cask upon its end; the buoy bears from the spindle N.E. by E. $\frac{1}{2}$ E., distant about a quarter of a mile; from the spindle to the piers, at the entrance of the harbor, N.E. by N. $\frac{1}{2}$ N., distant about one mile; Flying Point, E. by N., distant about three-fourths of a mile; Fox Point, N.E., distant about three-fourths of a mile; Boothby Point, N. by W., distant about three-fourths of a mile; Harding's Rock, W.N.W., distant about three-eighths of a mile. This is a barred harbor, and cannot be entered except at high-water. If bound to Kennebunk, you must leave the spindle and buoy on Fishing Rocks on the port hand, about a cable's length distant, and Flying Point and Fox Point on the starboard hand, and after passing them steer North, or N. by W., a quarter of a mile, and anchor in from 3 to 4 fathoms water, sticky bottom, where you may lie safe, with the wind from N.E., N., or N.W. Flying Point and Fox Point are bold, and you may near them to within an eighth of a mile. The above-mentioned buoy is a spar, painted black, elevated 10 feet above the surface of the water, and is moored in 4 fathoms at low-water. Kennebunk is not frequented as a harbor, but vessels may, in stress of weather, run in and lie safe, with the wind above mentioned.

At the mouth of Kennebunk harbor are two piers, one on the Eastern, and one on the Western side of the channel, running from the shore about 300 or 400 feet towards the bar, extending a little beyond low-water mark, with a flagstaff and beacon on the top, which may be seen about one mile distant. A ledge of rocks lies off the harbor, called the Fishing Rocks, distant about three-quarters of a mile from the head of the piers, between which is the anchoring-ground. The ledge bears due South from the head of the piers, and is all covered at high-water. Vessels approaching the harbor should keep well to the Eastward of the ledge; though there is a tolerable passage to the Westward, but it ought not to be attempted by a large vessel without a good pilot.

Depth of water on Kennebunk Bar, at low-water, from 2 to 3 feet; rise and fall of common tides from 8 to 9 feet, increasing sometimes to 10 and 12 on full and change. Time of high-water, full and change, 11h. 15m.

BOON ISLAND.—This island is very low, about one-quarter of a mile in length. A light house is built on the West part of the island, a little to the Westward of the former light. It shows a fixed light, elevated 133 feet above the level of the sea.

There is a passage between the island and the main, half a mile within the former, between 1 and 5 miles wide, in from 12 to 20 fathoms, nearly up with York Ledge. There is a ledge off the North part of Boon Island, one-fourth of a mile distant, which shows at low-water.

BOON ISLAND LEDGE is about 200 feet long, and about the same in width; is are at low-tides, and may be seen breaking at all times in a heavy ground-swell.

The ledge bears from the island E. $\frac{1}{2}$ S., $\frac{1}{4}$ miles distant. There is a passage between the ledge and the island, but it will not do for strangers, as there is a reef extends three-fourths of a mile from the S.E. point of the island.

The following are the Soundings around Boon Island.

Soundings.	Boon Island Light-house bearing	W. ½ S. 1 mile distant,	21 fathoms.

From Agamenticus Hill, Boon Island bears S.E., distant 5 or 6 leagues, and when you come in from sea, and make Agamenticus Hill, being N.W. by N., you are then to the Westward of Boon Island Ledge, but when said hill bears N.W. by W. you are to the Eastward of it. From Boon Island to Cape Elizabeth the course is N.E., distant about 29 miles.

We recommend to all mariners, in coming from the Eastward, not to go to the Northward of lat 43° N. in thick weather, unless they are well acquainted, and judge themselves to be to the Westward of Boon Island Ledge, as this has proved fatal to many who were unacquainted.
