Ledge. We have been informed there is a ledge of rocks due North from Boon Island, one mile distant; the gentleman who gave the information, since deceased, and whose veracity and experience could be relied on, said, "I have passed this place several times, but never discovered the ledge till the year 1783, when, being bound to the Eastward, the wind took me from the Westward, but the vessel having no more than steerage way, I hove over a line to catch fish, and found I had 24 fathoms water, sandy bottom, and in a few minutes I had but 10 feet of water, and my vessel drawing 9. All that saved me from striking was, that the water being entirely smooth, the current set me to the Eastward, and I got into 24 fathoms within the length of the vessel from where I sounded, and had 10 feet."

York Ledge. YORK LEDGE.—This rock is bare at three-quarters tide, extending E.N.E. and W.S.W. about 400 feet. It is about 300 feet wide.

N.E. from the main rock there is a shoal runs off a quarter of a mile, having upon it only 2 fathoms at low-water.

The soundings are gradual, from 5 to 20 fathoms, half a mile from the rock.

Beacon. An iron beacon has been placed upon this rock; it is 33½ feet high, and about 3 feet above the level of the water.

Upon the pillars rests an iron tubular column, supporting an iron base of 3½ feet diameter, upon which is inscribed, "York Ledge, 1811."

The Triangles, which break in a heavy sea, and which have 4 fathoms at low-water bear S.W., 2 miles distant from this beacon.

Lights. Boon Island light bears from this beacon E. ¾ N., 5½ miles; Whale's Back light W. by S. ¾ S., 5 miles; White Island light, S. by W. ¾ W., 8½ miles; York Nubble N. by E., ¾ miles.

York Harbor. YORK HARBOR.—This is a small harbor, but once entered is safe; 12 feet can be carried in at low-water; rise of tide 9 feet.

Portsmouth light-house. PORTSMOUTH LIGHT-HOUSE is near the mouth of the harbor, on the West side, on the N.E. point of Great Island, near Fort Constitution. It is 70 feet above the level of the sea, and shows a fixed light.

The following are the bearings and distances of places to be observed and avoided approaching the harbor:

Kit's Rocks buoy bears S. 25° 30' E., one mile 2420 feet from Portsmouth light.

Idiorne's Point, S. 14° 17' 45" W., one mile 5120 feet from Portsmouth light.

Gun-boat shoal. GUN-BOAT SHOAL.—Four miles from Portsmouth light-house, bearing S. W., lies Gun-boat shoal, having not less than 3½ fathoms on it, and that only on the shoalest part, which is small; it runs E.N.E. and W.S.W., about 2 cables' length, and bears from Whale's Back light S. by W. ¾ W.; from Odiorne's Point S. ½ E.

Light-house. Whale's Back light-house is situated on the East side of Portsmouth Harbor. Its height is 58 feet from low-water mark. It is a fixed light, varied by flashes.

The following are the bearings and distances of places from Whale's Back light:

Western Sister, N. 89° 41' E., one mile 1310 feet.

Eastern Sister, N. 75° 53' 30" E., one mile 3180 feet.

Odiorne's Point, S. 44° 30' W., one mile 1920 feet.

Phillip's Rocks (12 feet) S. 83° 30' E., one mile 300 feet.

High-water. Kit's Rock buoy, S. 23° 50' E., 2130 feet. High-water, 11h. 10m. Springs, 12h.

 S.W., 4 leagues; wh-

course you will continue until you bring Portsmouth light-house to bear N., and the *Light-house*
 light on Whale's Back to bear N.N.E., then steer N. 4 E., (leaving Whale's Back
 light on the starboard hand.) having 4 fathoms water, until you are abreast of
 Portsmouth light, which you may round within one-quarter of a mile, when you must
 steer N.W. until it bears S.S.E., and anchor in 9 fathoms, good bottom.
 A black spar buoy has been placed on Col Rock, near Fort Point, at the entrance *Buoy.*
 of the harbor, in 18 feet of water. Vessels passing into the harbor, by leaving this
 buoy on the port hand 30 feet distant, will have 6 fathoms of water.
 A black spar buoy has also been placed at the ledge, at the N.E. of Amazon's, or
 Port Island, in 10 feet water. Vessels passing up the harbor, by leaving this buoy
 on the port hand 30 feet distant, will have 7 fathoms water.
 A black spar buoy has also been placed on the Eastern edge of sunken rocks, in 10
 feet of water, bearing about East from the monument on said rocks. Vessels passing
 up the harbor, by leaving this buoy on the port hand 40 feet distant, will have 7 fath-
 oms water.

Two spar buoys have also been placed as guides, in entering Spruce Creek Harbor,
 viz: a red buoy on the S.W. point of Hick's Rock, in 13 feet water, and a black buoy
 on Jamaica Point, (Trefothern's Island,) in 10 feet water. Vessels entering Spruce
 Creek Harbor, by leaving the red buoy on the starboard hand 100 feet distant, will
 have 5 fathoms water, and by leaving the black buoy on the port hand 100 feet dis-
 tant, will have 3½ fathoms of water.

After passing the two last-mentioned buoys about 100 feet, vessels may anchor in 5
 fathoms water, in good muddy bottom; and by keeping in mid-channel, and running
 out North, may anchor in the creek in 5 or 6 fathoms of water.

N. B.—Hicks' Rocks are under water mostly at about two-thirds tide; and the
 depths of water named in the preceding directions were taken at low-water. If com-
 ing from the Eastward of the Isles of Shoals in the night, bring Portsmouth light to bear
 W. by W. 4 W., which course will carry you clear of Duck Island. Continue this
 course until White Island light bears S.S.W., when haul up W. by N., and continue *Light-house.*
 at course until Portsmouth light bears N., when you may run for it with safety.

You may also, if coming from sea, and make the Isles of Shoals, and are to the
 seaward of them, run for them until within one mile of the Eastern island, then steer
 N.W. until Portsmouth light bears N., then follow your directions, passing *Bearings.*
 Whale's Back light on the starboard hand. Beating into Portsmouth Harbor it is

prudent to stand to the Eastward farther than to bring the light to bear N. by
 4 W. or to the Westward farther than to bring it to bear N. If you are to the
 Eastward of the Isles of Shoals, give White Island light a berth of one mile and
 half, bring it to bear E., and then run N. by W. for Portsmouth light, 9 miles distant.
 On the East side of the entrance of the harbor lies Kitt's Rock, on which is a red buoy,
 S. 4 W., one-quarter of a mile from the light-house, lie Stielman's Rocks, over
 which is a black buoy; both rocks are under water. Give both buoys a good berth,
 Kitt's buoy 200 yards, and Stielman's 100 yards, and there is no danger, as you will
 have full 5 fathoms water.

Between Kitt's Rock and the Western Sister, lie Philip's Rocks, occupying an area
 about 500 feet by 900 feet, with 11, 12, and 13 feet water on them.

When you come from the S.W. and make Cape Ann, and to the Eastward of the
 Salvages, bring them to bear S. by E., and steer N. by W. or N. ½ W. In enter-
 ing this course, you will make the Isles of Shoals, from whence you may take a new
 course, by bringing the light-house to bear E., distant 1¼ mile, and run N. by W.
 Portsmouth light.

If you are bound to the Eastward from Portsmouth Harbor, you steer S. by E. one
 mile from the light-house, then steer N.N.E. for Old York or Cape Neddock, which
 is 12 leagues from Portsmouth; but if the wind should come from the Northward, you
 must be careful of York Ledge.

The following list of buoys is arranged as they are passed in entering the harbor: *Buoys.*

Bruscomb's Rock is a red spar buoy, No. 2, Whale's Back light-house bearing
 W. 1 S., 1½ mile distant.

Kitt's Rock is a red spar buoy, No. 4, the above light bearing N.N.W., half a mile.

Frost's Point Ledge is a black spar buoy, No. 1, the above light bearing E.N.E.,
 half a mile.

Jerry's Point is a red iron beacon, with letters L. H., the above light bearing N.
 ½ E., three-quarters of a mile.

Stielman's Rock is a black spar buoy, No. 3, the above light bearing S.E. by S.,
 three-quarters of a mile.

Col Rock is a black spar buoy, No. 5, Portsmouth light-house bearing S.S.E.,
 one-eighth of a mile.

Buoys.

- On *Fishing Island Ledge* is a red spar buoy, No. 6, Portsmouth light bearing S.W. by S., half a mile.
 " *Long Ledge* is a red iron spindle, copper cylinder top, Portsmouth light S.S.W., half a mile.
 " *Hicks' Rocks* is a red spar buoy, No. 8, Kittery Point church E.N.E., one-quarter of a mile.
 " *Trefethern's Island* is a black spar buoy, No. 7, the above church bearing E., half a mile.
 " *Oliver's Island* is a black spar buoy, No. 9; the above church bearing N.E. $\frac{1}{2}$ N., one mile, Navy-yard flagstaff N.W., one mile.
 " *South Beacon Shoal*, is a black spar buoy, No. 11, South Beacon bearing W., one-eighth of a mile; North Beacon N. $\frac{1}{2}$ W., half a mile.
 " *Gangway Rock* is a red and black striped buoy; South Beacon S.S.W., one-quarter of a mile; North do. N. $\frac{1}{2}$ W., one-quarter of a mile.
 " *South Beacon* is a gray stone beacon, 18 feet square, 20 feet high, with black mast and lozenge-shaped figure on top.
 " *North Beacon* is a red wooden mast, 25 feet high, with 4 diagonal braces, lozenge-shaped figure on top.
 " *Seaward's Rocks* is a black spar buoy, No. 13, Long Wharf W., 450 feet distant.
 " *Willey's Ledge* is a red iron spindle, copper cylinder, with gilt ball and vane on top; Navy-yard flagstaff E. by S., half a mile; South Beacon S.E., half a mile.

Isles of Shoals.
Light-house.

ISLES OF SHOALS.—White Island light-house is built on the Westernmost island of the Isles of Shoals; it is 87 feet above the level of the sea, and it revolves in 7 minutes and 15 seconds, showing in that time a red and white light.

The following is the description and relative situation of the islands: White Island (the South-westernmost island) is a rocky island, three-quarters of a mile in length from S.E. to N.W., and about $\frac{1}{2}$ mile distant from the meeting-house. There is a reef that extends about one-third of a mile from the N.W. end, which in passing you must give a good berth. The S.E. end bears from the meeting-house S.W. $\frac{1}{2}$ S., N.W. end S.W. by W. $\frac{1}{2}$ W.

In running by for this light there is nothing in the way when coming from the Southward or Eastward, except Cedar Island Ledge, Anderson's Rock and White Island Ledge.

Bearings from White Island Light-house.

Bearings from White Island Light-house.—Portsmouth light-house bears N.N.W. distant $7\frac{1}{2}$ miles. Square Rock lies directly in the range, distant from White Island five-eighths of a mile. Boon Island light, N.E. by N., distant 12 miles. Cape lights, S. $\frac{3}{4}$ W., distant 19 miles. Rye meeting-house, N.W. by W. $\frac{1}{2}$ W., distant 9 miles. Star Island meeting-house, N.E., distant seven-eighths of a mile. North-west point of Hog Island, N. by E. $\frac{1}{2}$ E. Cedar Island Ledge, E. by N. $\frac{1}{2}$ N., distant one mile. Anderson's Ledge, S.E. by E. $\frac{1}{2}$ E., distant $1\frac{1}{2}$ mile. White Island Ledge, W.S.W., distant one-third of a mile.

Londoner's (or Longing) Island lies about $\frac{1}{2}$ mile to the Northward of White Island, is about five-eighths of a mile in length, from S. to N., and is high at each end; in the middle is sometimes covered; a number of rocks lie close about the island in almost every direction, some of which are always bare. The South end bears from the meeting-house; the North end W.N.W. $\frac{1}{2}$ W., about half a mile distant. About half way between this island and Star Island, lies a rock, which is bare at low water; it bears from the meeting-house N.W. by W. $\frac{1}{2}$ W., one-third of a mile distant.

Star Island (on which the meeting-house stands) is about three-fourths of a mile in length from S.E. to N.W., and about half a mile in breadth; it is covered with rocks on the North side. The meeting-house stands on an eminence a little to the Northward of the middle of the island; is 12 feet high from the foundation to the top of the steeple is 30 feet more; the whole height from the surface of the water is about 65 feet; it is painted white, and the steeple is placed in the middle of the building; it stands fronting the West, and may be seen at a distance of 8 leagues, in almost any direction at sea; it bears from Thatcher's Island lights (Ann) N.E., 6 leagues distant; from Pigeon Hill, N. by E., 6 leagues distant; from Newburyport light-houses, N.E. $\frac{1}{2}$ E., 6 leagues distant; from Portsmouth light-house S.S.E. $\frac{1}{2}$ E., 3 leagues distant; from the Western Argemoneus mountain, S. by E., 4 leagues distant; from the Eastern do., S. $\frac{1}{2}$ E.; from Boon Island light-house, S.W. $\frac{1}{2}$ S., $\frac{1}{2}$ league distant; from Boon Island Ledge, (which lies one league E. from Boon Island) by W., $\frac{1}{2}$ leagues distant. Off the South end of this island, about three-quarters of a mile from the shore, lies Anderson's Rock, which is bare at half-tide; in passing give it a good berth; it lies from the meeting-house S.S.E.

Rock.

Cedar Island is small, and about one-third of a mile in length from East to West, situated between Smiddy-nose Islands. The East end of Cedar Island bears from the meeting-house E. $\frac{1}{2}$ N., and the West end E.N.E. $\frac{1}{2}$ E., three-eighths

to the windward of the bar, unless the wind is fair. If the sea is so great as to prevent the pilot's getting over, a signal will be made by him, when you must run direct for his boat, keeping the lights in range, which will carry you safe over. *This bar is constantly shifting, and should not be attempted without a pilot, unless in a case of great necessity.* If your cables and anchors are not good, bring the Western light-house to bear S. E. by S., and run N. W. by N. for Salisbury Point; but as soon as you make it, you must haul up N. W., which will carry you clear of Badger's Rocks, Black Rocks, and the Hump Sands. Across the channel, from the Hump Sands to Black Rock Creek, lie seven or eight piers, on which are from 7 to 2½ feet at low-water, which were sunk in the year 1776, and have not since been removed: the mark to pass between them is to bring the beacon, at the West end of the town of Newburyport (which may be distinctly seen in clear weather) over the South corner of the North meeting-house. The Hump Sands lie S. W. from Salisbury Point, which makes the channel very narrow and difficult. When you pass the Black Rocks, haul up W. by S. ¼ S., which will bring you in channel-way and good anchorage. And if it be night, or dark weather, when you judge yourself about half a mile from Black Rock, you may come to with safety. If you make Cape Ann lights, and wish to make a harbor, bring them or the Dry Salvages to bear S. by E., when you may run with safety N. by W. or N. ¼ W., 8 leagues, to Portsmouth. On the above course you will make the Isles of Shoals, from which you take a new departure; when you pass them, bring Star Island (on which the meeting-house stands) to bear S. S. E., and steer N. N. W., 3 leagues to Portsmouth; or give White Island light a berth of a mile and a half, bringing it to bear East, and then run N. by W. for Portsmouth light. White Island is the South-westernmost island. There is a very good harbor in the Isles of Shoals; the wind blows from North-easterly round to Southerly, and you may lie land-locked with any of them; but if the wind hauls to the S. W. or W. N. W., you may run in between Smuttynose Island (which has a windmill on it) and Hog Island, where there is water enough for a first-rate man-of-war, and where you anchor, having 12 fathoms, may be bottomed. When you come from the Eastward, with the wind E., or E. S. E., (with which you cannot weather Cape Ann,) and you are to the Northward of the Isles of Shoals, your only shift is to Portsmouth, and you are obliged to run so far to the Westward to bring it to bear N. N. W., as, generally, the wind at E. at sea, hauls two or three points to the Northward, which makes it a head wind.

Signals. Signals for vessels bound to Newburyport, when the sea is so large on the bar that pilot cannot get out to their assistance.

When a vessel comes into the bay, and cannot come over the bar at high-water, owing to insufficiency of the tide, a Red Square Flag will be hoisted, and a pendant under it, and as soon as those signals are seen from the vessel in the bay, she must keep off, and try some other port.

When the usual signals for vessels are kept up, the vessel must lie off and on the bar, keeping to windward, until signals are made for her to come in; and when it is a suitable time to come over the bar, a Red Square Flag will be hoisted at the mast; she may then come in, keeping the lights in range.

When a Pendant is hoisted half-mast, the vessel may come in, keeping the lights a little open to the Northward.

When a Blue Burgee is hoisted half-mast, the vessel may come in, keeping the lights a little open to the Southward.

When a vessel is seen in the bay, and does not come in before night comes on, following lights will be made, viz.:

For a vessel to keep off, and not attempt to come in over the bar during the night, a Lantern will be hoisted to the top of the flagstaff.

When there is a proper time for a vessel to come in over the bar during the day, two Lanterns will be hoisted, one at the top of the flagstaff, and the other half-mast high. The vessel must then lay off and on at the bar, until a light is made at the Eastern light-house, at a window about eight feet below the lantern. The vessel then come over the bar, keeping the lights in range, and when she gets abreast of the upper light, there is good anchorage.

The signal for a vessel in distress, is a White Square Flag, with a large black ball in the centre, hoisted half-mast high.

Ipswich. IPSWICH.—The light-house on Ipswich Beach shows a fixed light, which flashes once in 80 seconds, 40 feet above the sea. Run in close to the beach, and low it close up to, to avoid the Northern spit on the starboard hand; run up round the first high bluff head, where will be found safe anchorage. There are 8 feet water at the bar at low-water.

Light. IPSWICH HARBOR.—There is a light, to serve as a range with the light-house Eastern tower, for crossing the bar at night. It is exhibited from a large Pres-

tern hoisted at the top of a stake 15 feet high, placed near the beach. The stake is painted black.

In running in bring the stake light to range with the harbor light, and run for it. This will take you over the bar in not less than $7\frac{1}{2}$ feet water at low-tide, and by the inner spit buoy in 12 feet at low-tide. After passing the buoy, the course up the harbor is N.N.W. Strangers should not rely too implicitly on this range, as the bar is a shifting one.

Buoys as they are passed in entering Ipswich Harbor.

Buoys.

- On *North Breaker* is a red spar buoy, No. 2; Ipswich light bearing W.S.W. $\frac{1}{2}$ W., Annis Squam light S.E. $\frac{1}{4}$ S. $\frac{1}{2}$ S.
 " *South Breaker* is a black spar buoy, No. 1; Ipswich light W.S.W. $\frac{1}{4}$ W., Annis Squam light S.E. $\frac{1}{4}$ S.
 " *Inner Spit* is a red spar buoy, No. 4; North Breaker buoy N.E., South Breaker buoy N.E. by E. $\frac{1}{4}$ E.

A canal connects this harbor with that of Gloucester. It is about 120 rods in length 30 feet wide, and has for its depth above the whole flow of the tide, which is about 12 feet in spring tides, and 8 feet in neap.

ANNIS SQUAM LIGHT-HOUSE is a wooden building, of octagonal form, 35 feet high, containing a fixed light, 50 feet above the surface of the water at common high-tide. It is painted white, and may be known by being lower than any other light-house on the coast of Massachusetts, and its inland situation. It bears from Portsmouth light-house about S. by W., distant 8 leagues, and from Newburyport Bar S.S.E., $3\frac{1}{2}$ leagues.

ANNIS SQUAM HARBOR, IN IPSWICH BAY.—Masters of vessels out of Newburyport should generally be acquainted with the harbor of Squam, as it is of the greatest importance, when obliged to make a harbor from Ipswich Bay, through stress of weather. When a vessel at anchor off Newburyport Bar, cannot get into port, or is unable to make the land to the Eastward of Squam Bar; if she can carry double-reefed sails, she may run S.S.E., $3\frac{1}{2}$ leagues, which course, if made good, will carry her a little to the Eastward of Squam Bar; and if the weather is so clear as to see half a mile when you make the land to the Eastward of Squam, you may run within a cable's length of the shore; your course is S.S.W. Variation in 1850, 10° W.

Squam Bar bears from Halibut Point (the N.E. point of Cape Ann) from W.S.W. S.W., distant about $3\frac{1}{2}$ miles. In running from Halibut Point, you must be careful of Plum Cove Ledge, which shows until near high-water, and on which there is a black spar buoy, bearing from Squam light N.N.E., distant $1\frac{1}{2}$ mile. When you have passed this ledge, you leave a deep cove called Hodgkin's Cove, and a long point or neck of land, called Davis' Neck, on your port hand. When up with this neck, haul W. or S.W. by W., for Squam Bar.

Having made Halibut Point, or Polly Cove Point, bring either of them to bear South on a quarter to half a mile distant from them. Then run W.S.W. until you bring the light to bear S. If you judge there is sufficient water on the bar, you will then run for the light; you will pass between the two buoys. The black one is on Harraden's Neck, which you will leave on your port hand. The red one is on the North spit of the bar, which you will leave on the starboard hand. You may pass close to either of the buoys: when you have passed the red buoy 20 or 30 rods, you may run S. by W. W., which will carry you close along by the monument on the Lobster Rocks, which you must leave on your port hand, and pass on until abreast of Babson's Point; then a S.E. course will bring you into the harbor. If it is so dark that the buoy cannot be seen, continue your South course until within 60 yards of the light, then your course must be S.S.W., which will carry you abreast of Babson's Point, on your port hand, and opposite the Dry Bar Rocks, on your starboard hand, then S.S.E., before directed. The bar has 6 feet of water at low-tide. If you should judge there not water enough on the bar to carry your vessel over safe, you will come to outside the bar, and hoist a signal for assistance, which will come off if possible; if not, a flag will be hoisted near the light-house, when there is water enough on the bar for a vessel to run in in safety.

On the Lobster Rocks is a monument, 12 feet at the base, 17 feet high, built of stone, 7 feet at high-water. The light-house on Wigwam Point bears from the monument N.E. by N. $\frac{1}{2}$ N., distant one quarter mile; the red buoy placed outside the bar bears N. $\frac{1}{4}$ E., distant $1\frac{1}{2}$ mile; the black buoy near the Harraden Rocks bears N. E. $\frac{1}{4}$ E., distant $1\frac{1}{2}$ mile; leaving the black buoy on the port hand, you may steer set for the Monument, course S. by W. $\frac{1}{4}$ W. The channel abreast of the Monument is about 45 fathoms wide; the Monument, going in, is left on the port hand, may be approached at 3 fathoms distance, and then have 2 fathoms at low-water; the red buoy, just without the harbor, lies in 15 feet at low-water, and bears from the

light-house N. $\frac{1}{2}$ W., and is to be left on the starboard hand: the black buoy lies in 13 feet water off the N.W. side of Harraden's Rocks, bearing from the light-house N. by E. $\frac{1}{2}$ E., distant about one mile, which is to be left on the port hand. A red buoy is placed off the Plum Rock Ledges, in 3 fathoms water, and bears from Squam light N.N.E., distant $\frac{1}{4}$ mile. On Squam Bar, at low-water, there are about 6 feet. High water, full and change of the moon, at 11 o'clock.

Sandy bay pier.

SANDY BAY PIER.—If from the Southward, in passing outside Straitsmouth Island, be careful of Avery's Rock, which bears North from the Eastern part of Straitsmouth Island, about one-third of a mile distant. Run W. by N., until you bring the meeting-house to bear S.W. by S., then run in for the Pier Head, approaching which keep away a little, and run in until you can see into the Pier Pool; then luff and run in. Those constantly in the habit of entering said Pool when the wind is Easterly, make up the headsails and keep up the mainsail, which enables them to have command of the vessels, and avoid falling against the wharf built out from the beach. If from the Northward, after having passed Andrew's Point, bring the meeting-house to bear S.S.W., and run for it. This course will carry you clear of Dodge's Ledge, which you will leave on your starboard hand.

The passage through Straitsmouth Gap is not safe, except at nearly high-water, as there are but 3 feet water at low-tide, and rocky bottom.

Cape Ann Light-houses.

CAPE ANN LIGHT-HOUSES are built on Thatcher's Island, which lies about 2 miles East of the South-east point of Cape Ann, and forms the Northern limits of Massachusetts Bay. The lanterns are elevated 98 feet above the level of the sea, and contain fixed lights. The lights range when bearing N. by E. $\frac{1}{2}$ E., or S. by W. $\frac{1}{2}$ W., and are about one-third of a mile apart.

Thatcher's Island Ledge bears from the body of the island from E.S.E. to S.S.E., extending about 2 miles from the island. After getting the West light to bear N. by W., you are to the Westward of the ledge; then haul to the N.W. to bring the light to bear N.E. by E., and steer S.W. by W. for the Eastern point, which is about 2 miles distant from Thatcher's Island. Then your course is W. by S., distant $\frac{1}{2}$ mile for the lights on Baker's Island.

Seven to ten miles E.S.E. from Thatcher's Island, there are three or four stony spots, with 10 to 18 fathoms. There are 25 and 30 fathoms inside.

Cape Ann.

CAPE ANN.—When you come from the Eastward, and make Cape Ann Light at night, bring them to bear S.W., and run direct for them, which course will carry you within the Londoner; and when you pass the said rocks bring the two lights to bear N. by E. $\frac{1}{2}$ E., and then steer S.S.W. $\frac{1}{2}$ W., which said course about one mile, which will carry you clear of Milk Island, which is at low, and cannot be seen in a dark night. When you judge yourself to the Westward of said island, you haul to the Westward until you bring the lights to bear E. by N., when you must steer W.S.W. about 5 miles, which course will carry you to East Point. When you pass said point, keep your course W.S.W. until you bring Noman's Woe, which is the highest land on the North side of the harbor, to bear N.N.W., and run N.N.W. till you shut the lights in, then N.N.E. will carry you safe in.

Straitsmouth Island Light-house.

If you want to go inside the Salvages, keep close aboard Halibut Point, which is a tree on the Eastern part of it, and steer S.S.E. for Straitsmouth Island, on which there is a fixed light, 33 feet above the sea; but be careful to avoid Avery's Rock, by bringing the lights on the dry points of Straitsmouth Island till you get up close aboard, and haul round the point, and S.S.E. will carry you to the lights. To avoid the Londoner you must keep the lights close aboard the body of the island on which they are. The Londoner lies half a mile off, breaks at all times of tide, is quite dry at low-water, and bears E.S.E. from the middle of Thatcher's Island. A long shoal runs off N. half a mile distant from the Londoner. Between the Londoner and Thatcher's Island there are 3 fathoms at low-water. From the Salvages to Halibut Point and Sandy Bay, there lies a large spot of flat ground, which at low-water will take up a vessel. Outside the Salvages are very bold. Halibut Point bears from the Salvages W.N.W., $2\frac{1}{2}$ miles distant; and the Salvages bear from the lights N.N.W. 2 miles distant.

Beacon.

Londoner Beacon is a wrought iron shaft, 40 feet high, surmounted by an octagonal lattice, or open work day-mark, of cast iron, 7 feet high, and 5 feet diameter, painted black.

The following are the bearings from the beacon:

Dry Salvages, N. $\frac{1}{2}$ E.

Straitsmouth Island light-house, N.N.W.

Northern light-house, Thatcher's Island, N.W. $\frac{1}{2}$ N.

Southern do. do. do. N.W. by W. $\frac{1}{2}$ W.

Eastern Point light-house, S.W. by W. $\frac{1}{2}$ W.

In sailing from Cape Ann light to Cape Ann Harbor, you will open Braces before you come up with the harbor; which will, when open, bear N.N.W.

you must avoid. Cape Ann Harbor lies one mile further to the Westward, and when open bears N.N.E.

Ten Pound Island lies in the harbor of Cape Ann. There is a light-house on it containing a fixed light, 49 feet above the level of the sea.

CAPE ANN HARBOR OR GLOUCESTER HARBOR.—Vessels approaching Gloucester from Cape Ann must beware of the Londoner, a rock 200 yards in extent, half a mile S.E. by E. from Thatcher's Island South light. There is a channel to the Westward a quarter of a mile wide, with 5 and 6 fathoms, but strangers should pass to the Eastward, not approaching the lights nearer than one mile until they bear N. W. With Thatcher's Island lights in range, bearing N. by E. $\frac{1}{2}$ E., one mile distant, steer S.W. by W. $\frac{1}{2}$ W., 5 miles, until Eastern Point light bears N. nearly. Haul round the Point to the Northward and Westward, keeping half a mile off shore to clear Dog Bar and Eastern Point Ledge.

To enter South-east Harbor bring Ten Pound Island light to bear N.N.E. $\frac{1}{2}$ E., and run for it, when within half a mile of it, steer E.N.E. $\frac{1}{2}$ E., to anchorage in 5 or 6 fathoms, muddy bottom.

To enter Inner Harbor bring Ten Pound Island light to bear N.E., and steer N.E. $\frac{1}{2}$ N., leaving Round Rock Shoal, Ten Pound Island Ledge, on the starboard hand. When the light bears E.S.E., distant 300 yards, steer N.E. by E. $\frac{1}{2}$ E. into Inner Harbor.

Eastern Point light is a fixed light, 60 feet above the sea, on the Eastern point of the harbor of Gloucester. A ledge extends one-quarter of a mile to the Southward and Westward of the point.

DAAGERS.—Webber's Rock, with 7 feet water on it, lies S.W. by S., one-sixth of a mile from the light.

Round Rock Shoal is in line with, and half-way between Eastern Point and Muscle Point, and has 12 feet water. On it is a black spar buoy, No. 1.

Ten Pound Island Ledge is one-third of a mile S.W. $\frac{1}{2}$ W. of Ten Pound Island light, and has on it 7 feet water. On the West Edge is a red spar buoy, No. 2.

Field Rocks, or Fresh Water Cove Ledge, are half a mile West of Ten Pound Island, and one-quarter of a mile from the Western shore. They are dry at low-water, and have near them a black spar buoy, No. 3, in 15 feet water.

Babson's Ledge is 200 yards South of Fort Point, at the entrance of Inner Harbor, and has 8 feet water on it. On the S.S.E. edge is a black spar buoy, No. 5, in 15 feet water.

Pinnacle Rock lies off the large wharf, 80 yards S.W. of Spindle Rock, and has on it 9 feet water. Black spar buoy, No. 7, is placed close to this rock.

Harbor Rock and others, not mentioned above, are marked by iron beacons.

Bound for Gloucester Harbor, and falling in to the Westward, as far as Half-way Rock, on which there is a square granite beacon, painted black, take care not to bring the light on Ten Pound Island to bear to the Eastward of N.E. by N., until you are a mile or a mile and a half to the Eastward of Half-way Rock, to avoid the S.E. breakers at extent from Baker's Island, which bear from the lights on Baker's Island S.E. S. to S.E. $\frac{1}{2}$ E., about 2 $\frac{1}{2}$ miles distant. On the S.E. part of these breakers is placed a black spar buoy, bearing from Half-way Rock N.E. by E., about one mile distant. When to the Eastward of these breakers, you may bring the light on Ten Pound Island to bear S.E., and run for it. On this course you will leave Ten Pound Island ledge on your starboard hand, and the ledges of Norman's Woe Rock and Fresh Water Cove on your port hand. When up with Ten Pound Island, steer as above directed. Baker's Island light bears near Eastern Point light W. by S. $\frac{1}{2}$ S., distant 6 miles; South point of Kettle Island, W. $\frac{1}{2}$ S., distant 3 miles; Half-way Rock, S.W. by W., 6 miles; light-house on Ten Pound Island, N. $\frac{1}{2}$ E., distant $1\frac{1}{2}$ mile; the red spar buoy on the East end of Dog Bar, W.N.W., one-sixth of a mile.

The outer harbor of Cape Ann is safe and good anchorage against a Northerly or East wind, where you may anchor in 7 $\frac{1}{2}$ to 6 fathoms, low-tide, muddy bottom, the light-house bearing about S.E. by E., distant about one mile or a mile and a half.

Gloucester Canal, which connects the harbor with Squam River, passes immediately the West part of the town, or what is called the Harbor Parish. It is about 120 feet in length, 30 feet wide, and has for its depth about the whole flow of the tide.

DAVIS LEDGE, GLOUCESTER.—There is a buoy on this ledge has been repaired, and a second-class nun buoy substituted. It is painted black, with the words "Davis Ledge," in white letters, on three sides.

About 30 fathoms off from Norman's Woe Point is a large high rock, called Norman's Woe Rock, of 20 to 30 fathoms diameter; and about 100 fathoms off this rock, in a Southerly direction, is a ledge that has 7 or 8 feet water on it at low-tide.

Half-way Rock, and the rock on Ten Pound Island, bear W.S.W. $\frac{1}{2}$ W. and E.N.E. $\frac{1}{2}$ E. of each other, distant about 8 or 9 miles.

Ten Pound Island.

Cape Ann Harbor.

Eastern Point Light-house.

Dangers.

Davis Ledge.

*Half-way
Rock.*

HALF-WAY ROCK.—This is a high rock of about 30 fathoms diameter, lying S. $\frac{1}{2}$ E., 2 miles distant from Baker's Island lights. It is bold all round, and 40 feet high. A monument is erected upon it, the stone work of which is 15 feet high; above the stone work is a spindle 15 feet high, on which is a copper ball 2 feet in diameter.

*Satan's, or
Black Rock.*

SATAN'S, OR BLACK ROCK, is above water, steep to, and bears S.W. by S. from Baker's Island, distant $1\frac{1}{2}$ mile, and from Half-way Rock N.W. by W. $\frac{1}{2}$ W., a mile and one-sixth. On it is a red spar buoy, No. 10.

*Salem
Harbor.*

SALEM HARBOR.—Vessels inward bound, and falling in with Cape Ann, must observe the following directions, viz: When abreast of Cape Ann lights, bearing N.N.W., about 2 miles distant, steer W.S.W. about 3 leagues, which will carry them up with the Eastern point of Cape Ann, then steer W. by S. $\frac{1}{2}$ S., 7 $\frac{1}{2}$ miles, which will carry them up with the lights on Baker's Island. Variation in 1850, 10° 15' W.

Ships bound to Salem, falling to the Southward, and running for the lights, must, when they have made them, keep the Northern or lower light open to the Eastward of the Southern light, and run for them, which will carry them to the Eastward, and clear of the South breaker of Baker's Island, which bears from the lights S.E. by S., 2 $\frac{1}{2}$ miles distant, and is very dangerous.

*Baker's
Island.
Light-
houses.*

BAKER'S ISLAND lies on the South side of the principal entrance of Salem Harbor, is about a third of a mile in length, from North to South, bearing E. from Fort Pickering, distant about 5 miles East from the town of Salem. There are now two separate light-houses on Baker's Island, one of which is 61 feet, and the other 57 feet above the sea. They are both fixed, and bear from each other N.W. $\frac{1}{2}$ W., and S. E. $\frac{1}{2}$ E. The Southern light is the highest. The water is deep near the island, but there is no convenient landing-place. The North and East sides are high and rocky. There is a small channel between the South rocks and the dry breakers, but it is safe only to those who are acquainted with it.

*Misery
Island.*

MISERY ISLAND lies from Baker's Island about one mile, is joined by a bar to Little Misery, which makes the North side of the channel opposite Baker's Island. Misery Ledge, on which is a red spar buoy, has 8 feet water at low spring-tides, and bears from the light-house N.W. by W. $\frac{1}{2}$ W., $1\frac{1}{2}$ mile distant. Misery Island, or Great Misery is 474 rods in length, from North to South, and 96 rods in breadth. Little Misery is 40 rods in length, with its most Western point projecting into the channel. South part of Little Misery Island bears from the light N.W. $\frac{1}{2}$ N., three-quarters of a mile distant.

The Haste Rock is a broken rock above water, lying near the channel, bearing from Baker's Island lights W. $\frac{1}{2}$ N., distant 2 $\frac{1}{2}$ miles, and $1\frac{1}{2}$ mile from Salem Rock. On it is a black spar buoy.

Hardy's Rocks (on which a red beacon is erected) bear W. $\frac{1}{4}$ N. from Baker's Island lights, distant five-eighths of a mile. They are covered at high-water, and are dangerous. At half-tide they are visible. Rising States Ledge bears W. $\frac{1}{4}$ N. from them, 150 fathoms distant.

Bowditch's Ledge, on the East end of which is a triangular monument of granite, with a black top, 32 feet high, placed in 2 $\frac{1}{2}$ fathoms, bears from Baker's Island light-house W.N.W., $1\frac{1}{2}$ mile distant, and is seen at low spring-tides. Off the East side, at 15 feet water, is a black spar buoy.

Cat Island is situated about S.W. $\frac{1}{2}$ W. from Baker's Island, 2 miles distant, and about $1\frac{1}{2}$ mile to Marblehead Neck, and ranges from Baker's Island, just clear of Marblehead Neck. On the N.W. end is a high beach, directly opposite the point of Marblehead, called Peach's Point. The shore is irregular and rocky. Beyond, and in a line with this island, are two other heads, of nearly the same projection; and on the Southern side are three high rocks, but not so large as the former. Two of them are connected with the island by bars of sand, out of water at the ebb; the other stands boldly up within these two, but more Southerly. The Marblehead Marine Society has erected on Cat Island Rock a spar, 40 feet high, to the top of which is annexed a cask of about 130 gallons measure, which is seen at sea 20 to 30 feet above the land. A black spar buoy lies off the S.E. end, bearing from the lights S.E. $\frac{1}{2}$ S. to S.S.E. E., $2\frac{1}{4}$ miles distant.

Spar Buoy.

Eagle Island is about $1\frac{1}{2}$ mile from Peach's Point, and bears from the light-house W. by S. $\frac{1}{2}$ S., distant $1\frac{1}{2}$ mile. A bar runs off from the Western point of this island in a N.W. direction, half a mile distant, and has a red spar buoy on the end of it, which may be avoided by keeping Gray's Rocks to the Southward of Marblehead Fort.

Winter Island lies on the North side of the entrance of Salem Harbor, about half mile in length; the highest part is on the South of the island, opposite a point of rock on the neck (which is a point of land running North-easterly from the town, about a mile.) It has a store and a wharf on the Southern end, at the entrance of Cat Channel. On the Eastern point stands Fort Pickering.

The Brimbles bear S.W. by W. from the light-house, distant $1\frac{1}{2}$ mile, S.S.E. from Eagle Island, nearly half a mile distant. They are sunken rocks, bare at low-water; near to is a spar buoy, painted black. It comes out of water at half ebb.

Coney Island is a small island that lies near the mouth of Salem Harbor; it bears from Marblehead Point N.E., one mile distant; from Fort Pickering on Winter Island, E. $\frac{1}{2}$ S., 2 miles distant; and from Baker's Island light W. $\frac{1}{2}$ S., $2\frac{1}{2}$ miles distant.

Marblehead Rock bears S.W. from the Western part of Cat Island, distant three-fourths of a mile. It is above water, and may be approached on either side, very near, with safety. On it is a granite beacon, with black and white horizontal stripes.

Gray's Rock bears N.W. from Cat Island, distant three-quarters of a mile; W. by S. $\frac{1}{2}$ S. from the light-house, distant $2\frac{1}{4}$ miles, is high out of water, and may be approached with safety.

Vessels bound to Salem, having made the lights with a Westerly wind, in beating up, must not stand to the Southward or Westward further than to shut one light in with the other, on account of the South Breaker, nor to the Northward further than to bring the lights to bear W. by S. $\frac{1}{2}$ S. on account of Gale's Ledge, on which there is a red spar buoy, which bears from the lights N.E. by E. $\frac{1}{2}$ E., $1\frac{1}{2}$ mile distant, having but 4 feet water at low-tide.

In going into Salem by the common or ship channel, between Baker's Island and Misery Island, being up with Baker's Island, you may pass within 100 fathoms of it, and steer W. by N. for the Haste; this course will carry you clear of Hardy's Rocks, leaving them to the Southward, and will leave Bowditch's Ledge to the Northward. If you are in the mid-passage, between Baker's Island and the Misery, you may steer W.N.W. until you have passed Bowditch's Ledge, or until you get Cat Island open to the Westward of Eagle Island, then haul up for the Haste. Any stranger may there anchor in safety, in about 5 fathoms of water, good anchorage; but if you choose to proceed into Salem Harbor, you must steer about West for the Haste, which you will leave on your port hand, about half a mile distant, then steer S.W. by W., which will carry you into Salem Harbor; but you must observe, that there is a ledge runs off from the N.E. end of Winter Island, and that Abbot's Rock, on which there is a square granite monument with black top, lies abreast of it; to avoid which you must keep above a quarter of a mile from the shore. Abbot's Rock is found by bringing Castle Hill and house into the cove North of Fort Pickering, and Beverly meeting-house well in with Juniper Point (or S.E. point of Salem Neck.) Abbot's Rock has 7 feet at common ebb. The mean of common tides is 12 feet. In keeping off shore to avoid Abbot's Rock, you must not go too far off, for fear of the Aqua Vitæ, which are sunken rocks, lying E.S.E. from Fort Pickering, distant nearly half a mile. On Little Aqua Vitæ is a red spar buoy with two prongs; on Great Aqua Vitæ is a granite beacon with black top.

When coming from the Southward, if you are near Cat Island, you may pass to the Eastward or Westward of it; if you are to the Eastward, you must give a berth of a quarter of a mile, and steer N. by W. $\frac{1}{2}$ W., or N.N.W., leaving the Brimbles and Eagle Island to the starboard, and Coney Island Ledge, on which there is a black spar buoy, to port—that course will carry you clear of Eagle Island bar; continue upon the same course till you have passed the Haste, and get into common ship-channel, or you may continue the same course till you get under the North shore, where there is good anchorage.

If you are to the Westward of Cat Island, you may pass in the middle channel between that island and Marblehead Rock, and steer over North for the ship-channel, leaving Gray's Rock and Coney Island to the Westward. After passing the Haste and entering the ship-channel, you may proceed as before directed.

If in coming from the Southward and Eastward, you should find yourself near Half-way Rock, you may bring it to bear S.E., and steer N.W. for the Haste, passing near to Satin or Black Rock, leaving it on the port hand, and the Brimbles and Eagle Island on the starboard; continue this course, and you will leave the Haste on the port hand, enter the common ship-channel, and proceed as above.

There are several other channels for entering Salem Harbor, but they ought not to be attempted without a pilot.

BEVERLY AND MANCHESTER.—To enter Beverly Harbor, follow the directions for Salem Harbor, till you bring the Haste to bear E.S.E., and run W.N.W. about two miles, and you will reach Beverly Bar, which is a spot of sand running out from the Northern or Salem side of the entrance, and has a black spar buoy upon it. The bar has very shoal water on the Eastern or outward side near it, but good anchorage within. There is good water at the head of the bar. Having passed the bar, there is a sandy point from Beverly, on the Northern side of the entrance, and beyond this point are the Lobster Rocks, on which is a square granite beacon with a fish-shaped vane on top, painted black, and which bears from the head of the bar W. a little S., and not half a mile distant. They are above water at half-tide. To avoid this point,

Spar buoy.

Beverly and Manchester.

after having well cleared the bar, you will steer towards Ramhorn Rock, which has a square granite beacon, with red sugar-loaf shaped top, and is to be seen at half-tide, bearing S.W. by S. from the head of the bar, one-eighth of a mile distant. There are several fathoms of water within a vessel's length of Ramhorn Rock. Giving this a good berth, you then clear the sandy point, and steer for the Lobster Rock beacon, bearing from Ramhorn beacon N.W. by W., distant about one-quarter of a mile. Giving this a good berth, you are then opposite to the wharves, and may anchor in deep water, in a very safe and excellent harbor.

To enter Manchester Harbor, you must bring the Southern light on Baker's Island to bear S. $\frac{1}{2}$ E., and run N., one mile distant, where you may anchor on good bottom.

Eastern Point bears from Baker's Island lights E. by N. $\frac{1}{4}$ N., $\frac{7}{8}$ miles distant. Half-way Rock bears from the light S. $\frac{1}{4}$ E., 2 miles distant. Hardy's Rocks bear from the lights W. $\frac{3}{4}$ N., distant five-eighths of a mile. On them is a black spar buoy.

*Marblehead
light.*

MARBLEHEAD.—On the South side of the entrance to Marblehead Har is a fixed light 43 feet above the sea. Vessels bound to Marblehead, and falling to the Southward, and running for the lights, after making them, must keep the North and lower one open to the Eastward of the Southern light, and run for them, which will carry them to the Eastward and clear of the South breakers off Baker's Island, which bear from the lights from S.E. $\frac{1}{2}$ S. to S.S.E. $\frac{1}{2}$ E., distant 2 $\frac{1}{2}$ miles. Variation, in 1850, 10° 15' W.

Having made the lights with a Westerly wind, and heaving, when within two and a half miles of them, you must not stand to the Southward and Westward so far as to shut the North light up with the South light, on account of the South breakers, nor to the Northward further than to bring the lights to bear W. by S. $\frac{1}{4}$ S., on account of Gale's Ledge, which bears from the lights N.E. by E. $\frac{3}{4}$ E., distant 1 $\frac{1}{2}$ mile. Drawing near to the lights, take care of a ledge, called the Whale's Back, on the East end of which is a red spar buoy No. 6, and on the West is a red spar buoy No. 5, which bears from the lights N. by E., distant four-fifths of a mile, and comes out of water at quarter ebb.

In going into Marblehead, and being up with the lights, give the North point of Baker's Island a berth of one-quarter of a mile or less. Having the lights one in with the other, you are up with the point. When the South light is open with the North light, you have passed the point (leaving the Misery Island on your starboard hand, which bears from the lights N.W. $\frac{1}{2}$ N. three-fourths of a mile.) Then steer S.W. by S., or S.S.W., until you bring the South light to bear N.E. by E. $\frac{1}{2}$ E.; then steer S.W. by W. $\frac{1}{2}$ W., distant 3 miles, for Marblehead Harbor. You will leave Hardy's Rocks, Eagle Island, and Gray's Rock, on the starboard hand; Pope's Head, (which is a large high rock, bearing S.W. by W. from the lights, two-thirds of a mile distant, on which is a black spar buoy,) the Brimbles, and North point of Cat Island, on the port hand. The Brimbles bear from Eagle Island S.S.E. $\frac{1}{2}$ E., distant half a mile; and Gray's Rock from the North point of Cat Island, N.W. by W., seven-eighths of a mile.

Falling in with the South point of Baker's Island, and it blowing hard from the Eastward, if you cannot avoid it, you may pass the point by keeping it well on board, say at the distance of from 20 to 50 fathoms from the shore, where you will have from 4 to 5 fathoms water. When up with the S.W. point, steer W.S.W., which will carry you between the North Gooseberry Island (which bears S.W. $\frac{1}{2}$ S. from the lights, distant two-thirds of a mile) and Pope's Head, leaving the former on your port hand, between which you will have from 3 $\frac{1}{2}$ to 5 fathoms of water. As soon as you have passed Pope's Head, haul to the Northward, until the South light bears N.E. by E. $\frac{1}{2}$ E., then steer S.W. by W. $\frac{1}{2}$ W. for Marblehead Harbor.

The South entrance of the Harbor of Marblehead is bold, and may be approached with safety with the light on the point of the neck at the S.E. side of the harbor, bearing from N.N.W. to W. by N., until you are within half a mile of it; then bring the light to bear W. by S., and run for it until within two cables' length; then steer N.W. by W. until the light-house bears S.S.W.; then steer S.W., and anchor with the light bearing from E. by S. to N.E. by E., from a quarter to half a mile distant, in 6 fathoms, good holding-ground and clear bottom, secure from all but Easterly gales. The following are the bearings from the light-house:

Marblehead Rock	S.E. by E. $\frac{1}{2}$ E.	distant $\frac{1}{2}$ mile.
Half-way Rock	E. by S.	" 2 do.
Cat Island Rock	E. $\frac{1}{4}$ N.	" 3 do.
Baker's Island Light	N.E. by E.	" 3 do.
Hardy's Rocks	N.E.	" 2 $\frac{1}{2}$ do.
Eagle Island	N.E. $\frac{1}{4}$ N.	" do.
Gray's Rock	N.E. by E. $\frac{3}{4}$ E.	" 1 do.
Peach's Point	N. by W. $\frac{1}{2}$ W.	" 1 do.
Fort Head	N.	" $\frac{1}{2}$ do.

all but Easterly gales.

Vessels coming from the Eastward, and running for Half-way Rock, (described in page 248.) must not bring the rock to bear to the Southward of W.S.W., to avoid the South breaker, which bears from Half-way Rock N.E. ½ E. distant one mile. Being up with Half-way Rock, and bound into Marblehead, bring the rock to bear E. by S. ½ S., and steer W. by N. ½ N. for Fort Head, distant 3 miles, leaving Cat Island on the starboard hand, which bears from Half-way Rock W.N.W., distant 1½ mile, and Marblehead Rock on the port hand, which bears from Half-way Rock W. ½ N., distant 2 miles. Black Rock bears from Half-way Rock N.W. by W., distant 1½ mile. Cat Island Rock and Point Neck, on which is a red spar buoy in 9 feet water, and a black iron spindle on the dry rock, bear East and West of each other, distant about one mile.

Vessels being up in Boston Bay, may, by bringing Boston light to bear S.S.W., run N.N.E. for Marblehead Rock; they are distant from each other about 12 miles. Half-way Rock and Boston light bear from each other S.W. and N.E., distant 15 miles.

Hardy's Rocks are covered at high-water, and may be seen at a quarter ebb. Whale's Back is covered at high-water, and may be seen at quarter ebb. Gale's Rocks have but 4 feet water at low-tide, and bear N.E. by E. ½ E. from the lights, distant 1½ mile. The South breakers off Baker's Island are always covered. The Brimbles are covered at high-water, and are seen at half-tide. Black Rock is always out of water, but low; Cat Island Rock, Half-way Rock, Marblehead Rock, Gray's Rock, and Pope's Head, are large, and high above water. Half-way Rock is very bold all round it. Eagle Island is bold only on the South and East; from the N.E. part of it, quite to Hardy's Rocks, is very shoal water, and no passage for ships.

Bearings and distances of the principal Islands, Rocks, &c., in the vicinity of Salem, from Baker's Island lights.

The lights bear from each other N.W. ¾ W. and S.E. ¼ E., 40 feet distant.	
Eastern point of Cape Ann bears..... E. by N. ½ N.....	7½ miles distant.
Gale's Ledge, which has a spar buoy on the S.W.	
end, and on which are 3 feet water, low-tide .. N.E. by E. ½ E.....	1½ do.

Outer breakers, known generally by the name of Outer Middle, (on which is a black spar buoy) and Inner Breakers; this is a very extensive and dangerous shoal, extending from Searle's Rocks, in a S.E. direction, about two miles, and in a Westerly direction about three-quarters of a mile, bearing from the lights S.E. ½ S. to S.S.E. ½ E. 2½ miles. To pass to the Eastward of this dangerous shoal, have the Northern or low light a little open to the Eastward of the high light.

Searle's Rocks, on which is a black spar buoy: a small part comes out of water at low spring-tides, and bears from the South light S.E., three-eighths of a mile distant,

distant ½ mile.

" ½ do.

and from the S.E. point of Baker's Island, S.E., distant a small one-fourth of a mile. There is a good channel between the island and Searle's Rocks, by keeping the island best on board, say at a distance of 30 or 40 fathoms. In this channel are 3 to 5 fathoms water, at low common tides.

*Egg Rock
off Nahant.
Light.*

EGG ROCK OFF NAHANT.—The light, which is fixed, is on the keeper's dwelling, 87 feet above the sea, which bears N. N. E. from Nahant Head, and should be seen about 10 miles.

The following bearings are given from this station:

Graves Bell boat	S. E. by S.
Nahant (East Point)	S. 1 E.
Methodist Church (Swampscott)	N. N. W. 1 W.
Half tide rock beacon	N. 1 W.
Outer dry Pig Rock	N. E. 1 N.

*Boston
Light house.*

BOSTON LIGHT HOUSE is situated on the Little Brewster Island, on the North side of the entrance to the harbor. The light is revolving, and is 87 feet above the level of the sea.

*Narrows
Light*

There is a fixed red light, 35 feet above the sea, on the West end of the spit which makes out from the Great Brewster Island. It is an iron screw pile tower of a brick color, and is intended as a guide through the Narrows. This light, in range with Long Island Head light, leads clear of Harding's Ledge. The following bearings are given from the light:

False Spit buoy	E. S. E. 1 E.
Point Alderton buoy	E. S. E. 1 E.
North Centurion buoy	S. E. 1 S.
Long Island Head Light	W. N. W. 1 W.
Nix's Mate beacon	N. W. 1 W.

*Long Island
Light.
Stellwagen's
Bank*

LONG ISLAND LIGHT, on the N. E. point of Long Island, is a fixed light, 87 feet above the sea, bearing from Boston light W. 1 N.

STELLWAGEN'S BANK—The least water on the bank is 10 fathoms at six and a half nautical miles N. 30 W. (true) from Race Point light, Cape Cod. It lies generally outside of a line from Race Point light to Fletcher's Island light, Cape Ann. It is 17 nautical miles in length, 5 miles at its greatest breadth, 2 at its least, and 3 miles in average breadth.

Its direction by compass is nearly N. by W. and S. by E. The North end of the bank is in the latitude of Nahant nearly, and the South end in that of a point 5 miles South of Scituate light, so that it lies in the direct approach from the Southward to Boston, and, being at a convenient depth for sounding while crossing it, is perfectly safe. It will serve as an excellent mark in foggy or stormy weather to determine a vessel's position. From 10 fathoms at 6 nautical miles from Cape Race light, the bank deepens on the average but very slowly, reaching 43 fathoms at 9 and 11 miles, 44 fathoms at 13 and 14 miles, and 47 fathoms at 20 miles. It then deepens more rapidly to 26 fathoms, and then quite rapidly from this to 30 and 35 fathoms. The outer side of the bank slopes off gradually, and the inner quite abruptly, as a general rule.

By it you can ascertain your distance to the Eastward of the coast, and, by attention to the lead after passing inside, a good idea of the latitude may also be obtained—thus, 3 or 4 miles to Westward of the Northern half of the shoal the water deepens generally to 50 fathoms, while at the same distance inside of the Southern half the greatest depth of soundings diminishes gradually from 15 fathoms, in lat. 42° 15' N., to 35 fathoms, all the way across to the main-land.

The following buoys have been placed on this bank:

A first class can buoy, painted red, in about 11 fathoms water, N. N. W. 6 miles from Race Point light house, and S. E. by E. 1 E., 28 miles from Boston light house.

A second class can buoy, painted with white and black perpendicular stripes, in about 15 fathoms water, E. by S. 1 S., 26 miles from Boston light-house.

A first class can buoy, painted black, in about 15 fathoms water, E. 1 N., 24 miles from Boston light-house.

DANGERS IN APPROACHING BOSTON HARBOR.

*Graves bell-
boat.*

The Graves are a parcel of dry rocks, which appear white, lying to the Northward and Eastward of Boston light. On the N. E. ledge is an iron bell-boat in 10 fathoms water, Long Island light bearing W. S. W. 1 W. 4 1/2 miles distant, and Boston light S. W. 1 S., 2 1/2 miles distant.

Thieves' Ledge, of 4 fathoms, lies E. S. E. of Boston light, distant 3 nautical miles. *Thieves' Ledge.*
 Harding's Ledge, on which there is an iron bell boat painted black, is dry at low water. From the bell boat Boston light bears N. W., 2¹/₂ miles distant, and Long Island light N. W. by W., 5 miles distant. *Harding's bell boat*

Martin's Ledge lies nearly midway between Thieves' Ledge and the Graves, and has on it 43 feet at low water. Outside of the ledge, in 6 fathoms, there is a red nun buoy, No. 2, Graves bell boat bearing N. 4 E., 1¹/₂ mile, and Harding's bell boat S. 4 W., 2¹/₂ miles distant nearly. Long Island light W. 4 S., 1¹/₂ miles distant. Between the Outer Brewster and Martin's ledge, on the last-mentioned range, lies Twinkesbury's Rock, with 9 feet on it at low water.

N. W. nearly from Martin's Ledge, between Green Island and the Graves, is a ledge of sunken rocks called Roaring Bull, S. W. of which is a shoal spot of 10 feet, and N. E. is a spot of 18 feet water.

Barrel Rock lies N. W. by W. from the North part of Green Island and has 1 foot on it at low water. Near it, in 21 feet water, is a can buoy, red and black horizontal stripes, Long Island light bearing S. W. by W. 1 W., 2¹/₂ miles, and Deer Island Point beacon W. S. W. 1 W., 2 miles distant. *Barrel Rock*

West of Green Island, one half mile distant, is a ledge of rocks called the Devil's Back, on the Northern part of which is a black buoy No. 1, in 18 feet water, Barrel Rock buoy bearing N. W. one half mile, and Long Island light W. S. W., 2¹/₂ miles distant. *Devil's Back*

E. N. E. one third of a mile from Devil's Back buoy, lies Mullin's Ledge, on which are 12 feet water, and S. S. E. 4 E. of same buoy, are Half-tide Rocks, in Hypocrite Channel, near which is a red spur buoy No. 2. *Half tide Rocks.*

Egg Rocks or Shag Rocks lie East of the North point of Little Brewster Island. The ledge is about one-third of a mile long, and runs N. E. and S. W. nearly. N. E. of the ledge, about one half mile distant, is a shoal spot with 18 feet water, and about midway between the Eastern points of Middle and Little Brewster Islands is another spot of the same depth. *Egg Rocks Shoals.*

Nash's Rock, with 12 feet water on it, lies on the Northern side of main ship channel, one third of a mile S. W. of the Western part of Little Brewster. *Nash's Rock.*

Kelly's Rock, with 15 feet water on it, lies to the Westward of Nash's Rock, about midway between it and George's Island, and is also in main ship channel. *Kelly's Rock*

Tower Rock lies off the S. W. extremity of Brewster Bar, in mid channel. It has on it 17 feet water. *Tower Rock.*

Black Rock is on Brewster Bar, in Black Rock Channel, N. Eastern part.

A ledge of rocks called Ram Head makes off from the Northern part of Lovel's Island. On the Northern part of this ledge is a black can buoy No. 5, Long Island light bearing W. S. W. 1 W., 1¹/₂ mile distant. *Ram Head.*

Nix's Mate lies between Long Island and Lovel's Island, about half a mile from Long Nix's Mate Island light. There is on it a square granite beacon, with octagonal pyramid on top, painted black. *Nix's Mate*

A black nun buoy, No. 9, has been placed on the North end of Nix's Mate, in 15 feet water, low-tide.

Between Rainsford Island and George's Island is Hospital Shoal, on the Northern part of which is placed a black nun buoy No. 1, in 18 feet, low-water, Long Island light bearing N. N. W., 1¹/₂ mile distant nearly. *Hospital Shoal.*

Toddy Rocks lie E. S. E. 1 E. from the buoy on Hospital Shoal. Near them is placed a black nun buoy No. 3. *Toddy Rocks.*

South of Rainsford Island are the Quarantine Rocks, and South of the Rocks lies Haugman's Ledge, on which is a granite open-work beacon, with a small square cage on top. The rocks are dry at low-water. *Beacon.*

There is a rock with 12 feet water on it, bearing S. 45¹/₂° W. from Boston light, distant 700 yards. The new beacon on the spit open to the North with the hotel on Long Island leads clear to the South of it. *Rock and Beacon*

Another rock, with 15 feet on it, bears S. 75¹/₂° W. from Boston light, 770 yards distant, and from the new beacon on the spit South and East, distant 210 yards. *Rock.*

The hotel on Long Island, shut in entirely with the North part of George's Island, leads clear to the South of it.

Another rock, with 17 feet on it, bears S. 85¹/₂° W. from Boston light, 2313 yards distant, and from the old beacon on the spit South and West, 117 yards. *Rock*

Nix's Mate, on the Northern edge, or at the furthest the centre of Bunker Hill Monument, leads clear to the South of it.

If Bunker Hill Monument is not visible, keep Deer Island beacon on the North end of Apple Island, while passing the range of the old beacon spit on the little head of the Great Brewster.

Another rock bears E. N. E. from the Outer Brewster, distant one-quarter of a mile. There are 9 feet water on it. *Rock*

The outer Ledge, of 17 feet, bears E. N. E. from Boston light, 2 miles distant.

There is a red nun buoy, No. 10, on Seventy four Bar, in 15 feet, low water, about 20 fathoms West of the old wreck, which has but 9 feet on it at low tide. The following magnetic bearings are given

Nix's Mate beacon	W. 4 N.
Nix's Mate buoy	N.W. by W. 4 W.
Deer Island Point Beacon	N.W.

A black spar buoy, No. 1, has been placed off High Pine Ledge, in 15 feet water. The rock is dry at low spring tides. The following magnetic bearings are given

Garnet lights	S. 4 W.
Captain's Hill	W. 4 S.
Brant Point	N. by W.

Boston Har-
bor.

BOSTON HARBOR.—Coming from the vicinity of Cape Cod, keep to the Northward of the direct course, if the wind is N.E., and to the Westward if it is S.W., making allowance always for the tide. With a leading wind the direct course may be made good on the flood, but the ebb sets towards Mmots's Ledge light.

Coming from the vicinity of Cape Ann, no particular precautions are necessary. Falling close in with Scituate light, without having seen the light boat during the night or thick weather, in 10 or 12 fathoms, run North into 17 or 18 fathoms, and steer W. N.W. for Boston light. The bearings from the light boat are, Boston light, N.W. 4 W.; Mmots's outer rock, S. 4 W.; Scituate light, S.E. by S. Vessels without a pilot should not pass to the Southward of the light boat.

Bearings outside.—When near Scituate light, to clear Mmots's ledge, bring the light to bear South, and steer North, from Mmots's Ledge to Boston light, N.W. by W., and from the light boat, N.W. 4 W.; but in thick weather it is most prudent to steer N. 5°, until up with the Hardings, and then W. N.W., allowing for wind and tide. From Hardings to Boston light, N.W. 1 N. From Nahant Head, if bound for Main Ship channel, steer S. S.E. to pass the Graves, which will give a berth of one half a mile, and from the Graves S. S.W., until up with the bearing for entering the channel. Vessels may pass inside the Graves, keeping one cable's length from the S.W. point.

Bearing in Boston Bay.—Working up to Boston Harbor in the day, you may stretch safely anywhere from Mmots's Ledge to Nahant Head, until up with the Graves on one side, and the Hardings on the other.

The N.E. part of the Graves must not be approached nearer than one half a mile. At the Hardings it is safe to go close to the buoy. Inside of the line from the Graves to the Hardings, you may stand to the Southward to within one half mile of shore, and to the Northward, to within three quarters of a mile of the East end of the Outer Brewster, or the E. end of Egg Rocks.

When up with Egg Rocks, you must go no further to the North than will bring Boston and Long Island lights in range; and in passing Point Allerton, be careful not to go inside the buoy. A stranger may beat up to the anchorage inside of the light in the day, making short tacks, and keeping two cables' length from Light house Is. and, but should wait there for a commissioned pilot. Working up for Boston Harbor in the night, you will avoid the rocks off Cohasset and Harding's Ledge, by not going farther to the South than to bring Boston light to bear W. N.W. When within 2 miles of the light, go no further to the North than to bring it to bear S.W. 4 W., and when near Egg Rock, you must not pass to the North of Boston and Long Island lights in range.

Main Ship
Channel.

MAIN SHIP CHANNEL.—After making Boston light, if the weather is bad, the vessel one of heavy draught, it must be brought to bear W. N.W., to approach it, this leads South of the Thieves' Ground, and North of Harding's Ledge. A vessel of light draught may run for it when bearing anywhere from S.W. to W. N.W., and within three quarters of a mile of the light, when it must be brought to bear W. N.W., to enter the channel. When abreast of the light-house bearing N., being in mid channel, or half way between the light and Point Allerton buoy, a W. 4 N. course, made good, leads to the beacon on the False Spit; but if the tide is ebb, or you are on the North side of the channel, steer W. or W. Southerly, to avoid going on the False Spit. Leave the beacon on the spit on the starboard hand. The course by George's Island S. N.W. 4 W., with Nix's Mate and the middle of Bunker Hill monument in range, until up with the Eastern end of Gallop Island. From this point the course through the Narrows is N.W. by N., keeping in mid channel, and steering for the high land on Deer Island until up with Nix's Mate, which leave on the port hand.

Nix's Mate should be passed with Deer Island beacon on the N.E. end of Apple Island for a vessel of light draught, and off the South part of Apple Island for a vessel of heavy draught, to avoid the shoal ground about it. A W. 1 N. course leads for

Nix's Mate into President Roads, and this course is to be followed until the new beacon on the high part of Long Island is just clear of the N.E. bank of Spectacle Island, when the course is N.W., keeping this range on, until abreast of the buoy on the S.E. part of Bird Island.

This range leads safe by the Lower Middle, Castle Island Rocks, Governor's Island Point, the Upper Middle, and in the best water over the shoal ground above the Upper Middle. When up with the buoy on Bird Island, steer N.W. by W. $\frac{1}{2}$ W. towards the State House, until abreast of the buoy on Slate Ledge, and then N.W. by N. for the anchorage.

HYPOCRITE CHANNEL, enters between the Outer Brewster and Sunken Rocks, *Hypocrite Channel* thence it runs between Green and Little Calf Islands, and thence to Ram Head, where it enters Broad Sound Channel, leaving the buoys on Half-tide Rocks, Devil's Back, and Alden's Ledge on the starboard hand. Intending to run this channel, when up with the Graves, bearing N., bring the South point of Green Island to bear W., and steer for it, passing midway between Green and Little Calf Islands. After passing Green Island, steer S.W. by W., keeping the South part of the Graves open to the Southward of Green Island, until Boston light is shut in with the Great Brewster, when the buoy on Half-tide Rocks will have been passed. Then haul up W. towards Long Island light, leaving the buoy on Alden's Ledge on the starboard hand. This course leads into Broad Sound Channel at Ram Head buoy, which buoy on the port hand, 50 fathoms distant. *Hypocrite Channel* is not safe for strangers.

BLACK ROCK CHANNEL, leads from the Main Ship channel at the beacon on *Black Rock Channel* the Spit into the Hypocrite Channel, and is never used by large vessels, except to avoid the Narrows. It is narrow, dangerous, and unsafe for strangers. On leaving the Main Channel, pass close to the beacon, and steer about N.E. for the outer point of Green Island, keeping George's and the West end of Pettick's well open. Both the flood and ebb tides set across this channel. There is a passage on each side of Whiting's Ledge.

BROAD SOUND CHANNELS. Vessels intending to enter by the South Channel, *Broad Sound Channels* may come in the sound anywhere between Nahant Head and the Graves, and steering to the S. of W. until they bring Nix's Mate to bear S.W. by W. $\frac{1}{2}$ W., may run for it. The range for this channel is Nix's Mate in the Middle of the Northern and highest of the Blue Hills. The channel is short and straight; its range is perfect, and vessels of the largest draft may resort to it with safety and convenience at half or three-quarters flood, especially in going out. Vessels in going out this way will leave Ram Head, Alden's Ledge, and Devil's Back buoy on the starboard hand, and Little Fann, Great Fann, and Barrel Rock buoys on the port hand, and in running out of Broad Sound will keep Egg Rock open with Nahant Head. The North Channel passes nearer Bear Island, and is separated from the South Channel by a middle ground. The buoys are left in the same way as in the latter, except Barrel Rock buoy, which, in going out, is left on the starboard hand. The range for this channel is the North end of Long Island (on which the light stands) in line with the second bluff on the West side. It should not be attempted in bad weather, even by vessels of the lightest draft.

BACK OR WESTERN WAY. This channel is used in light winds on the ebb, *Back of Western Way* to escape being set out into the Sound at Nix's Mate, or the East end of Love's Island. Leaving President Roads, steer S.S.E. to run between Spectacle and Thompson's Islands, keeping nearly in mid channel, and passing half way between Moon Head and the West Head of Long Island. The bottom is soft in mid channel. When well past Long Island Head, steer S.E. until Long Island light is open to the South of the middle head; then N.E. by E. about half way between Bass Point and Rainsford Island. When well by Rainsford Island, steer for the South part of George's Island, leaving the buoy on Rainsford Island Shoal and Wilson's Poek on the starboard hand, which will lead into Nantasket Roads.

FOR NANTASKET ROADS. To enter Nantasket Roads from outside, when *For Nantasket Roads* Boston light bears N., three eighths of a mile distant, steer W. $\frac{1}{2}$ S. to the buoys on the Centron; leave these on the starboard hand close to, and steer W.S.W. until Long Island light opens clear of the S.W. part of George's Island, then haul up for the light, and run in for the anchorage.

Buoys. Long Island light, a little shut in on Point Alberton, or in the Outer Saddle, leads clear of the Hardings to the Southward of them.

Long Island light a little open to the Eastward of the Graves, leads clear to the Eastward of the N.E. ledge.

The mark to go between the Graves and the Sunken Rocks, to clear the latter, is Boston light, a little off the Middle Brewster, between that and the Outer Brewster, and when Long Island light shows to the Northward of Green Island, you are clear of the sunken rocks to the North.

Keeping any part of the Graves open to the Southward of Green Island clear the Half-tide Rocks.

To avoid the Ramsford E. Lead Shoal, the high water mark on the South part of Moon Head should be kept open with the high water mark on the North part of Ramsford Island to the Northward of the buoy.

Going the South Channel round Long Island, you should be careful not to let Governor's Island with Spectacle Island, in order to clear the reef between Spectacle and Lower Islands.

To sail up between Long and Spectacle Islands, go to the Eastward of the hour and close to it—do not go further to the West than to open the East head of Lower Island clear of the middle head; or in the night, to see Long Island light just over the middle head. This clears the flats E. of the reef.

After leaving the anchorage off the city, when Moon Head opens clear of Fort Independence, on Castle Island, you may run for Castle Island wharf, keeping it a little on the starboard bow.

From Castle Island wharf to President Roads the range is a high steeple in the S. part of the city, or with the N. line of Fort Independence.

To clear the Lower Middle in the night, the two lights should be kept about a ship's length open until in the East of Spectacle Island.

To pass through the channel to the N. of the Lower Middle, the North end of Lower Island should be opened a little with the Southern head of the Great Brewster, so as to show a gap between them.

Small vessels may go very near Bird Island flats with safety, by keeping Lower Island light open with the high part of Governor's Island. This answers for day and night. Vessels of large draught can only follow this range at high water.

The new beacon on the Spit, kept open to the North with the hotel on Long Island, leads clear to the South of Nash's Rock.

Shutting up entirely the hotel on Long Island with the North part of Governor's Island, leads clear to the South of Kelly's Rock.

Nix's Mate on the centre of Bulker Hill Monument (but not on or beyond the southern edge of it) leads clear to the South of Lower Rock. If Bulker Hill Monument is not visible, then Deer Island beacon kept on the North end of Apple Island, (with the passing the range of the old beacon on the Spit, or the little head of the Great Brewster,) will answer the same purpose.

Anchorage.

Anchorage.—President Roads, South of a line from Nix's Mate to Castle Island, in sticky bottom.

Nantasket Roads, Nix's Mate put on with Gallop Island, and Boston light shut well on to George's Island, give the best ship anchorage. Heavy vessels of war anchor further South.

There is a convenient refuge for coasters in N. E. winds under Spectacle Island. Vessels caught in bad weather near Nahant without a pilot, may anchor to the West of Nahant, in from 5 to 6 fathoms, by opening Lynn Harbor, and bringing the hotel to bear E. N. E.

Waiting for a pilot, you may anchor in main ship channel anywhere between the light house and Nantasket Beach.

The principal dangers in and about Boston Harbor, are the rocks and ledges near the shore, under the surface, and surrounded by deep water. Persons ignorant of the ground should not approach them without a pilot. The following are particularly to be avoided:—Davis' Ledge, near the Shoals; Martin's Ledge and Pew's Ledge, near the Outer Brewster, and Mad's Ledge, North of the Devil's Back, which are dangerous to vessels heaving in Boston Bay and Broad Sound. The rule is: first, not to go to the Southward of the light four off the Shoals; second, not to approach the Outer Brewster nearer than three quarters of a mile on the East; third, keep to the Westward of Mad's Ledge, giving it a good berth in passing. The directions for avoiding other dangers are given under the head of Ranges.

The nun and can buoys in Boston Harbor have been renumbered, and are as follows:—

Martin's Ledge.....	Red	No. 2.
Boston Ledge.....	do.	do. 1.
Pyon Alberton.....	Black	do. 4.
* Folly Rock.....	do.	do. 3.
* Hunt's Ledge.....	Red and black	horizontal stripes

Half-way Rock	N. E. by E.
Tucker's Island South point	N. E. 3 E.
Baker's Island lights	N. E. 3 E.
East end of the Graves	S. by E 3 E.
Long Island light house	S. W. 3 W.
North point of Deer Island	S. W.

Galward bound from Boston light house, to make Cape Cod, the course is S. E. by E. *Light house*
E. distant 11 leagues, thence 3 leagues to the light house. When up with the light
house, and it bears S. W. 2 leagues distant, steer S. S. E., which will carry you out of
the South channel.

In Boston Bay, and bound for Cape Cod Harbor, run for Race Point light house, which *Light house*
contains a revolving light, until within half a mile; and when it bears E. N. E., haul
up E. S. E. or as near as the wind will permit, and anchor in from 10 to 14 fathoms, in
Herzog Cove, where is a good lee, with the wind from N. N. E. to S. E. by E. Should
the wind shift to the N. W., Provincetown Harbor is under the lee, to which we refer.
Should you first make Cape Cod light, bring it to bear E. by N., and run for it until
you have six fathoms in 14 or 15 fathoms water; then steer N. E., until the light bears E.
by S.; then run in N. W. for the harbor. The course from Boston light house to Sand-
wich is first S. E. by E. 3 leagues, to Cohasset Rocks, thence to Sandwich S. S. E., 11 *Light house.*
leagues.

Between Cape Ann and Cape Cod you will have from 50 to 17 fathoms, the latter
4 miles N. by E. from the Race light, with 35 fathoms inside. S. E. by E. 3 E.
from Boston light to the Race light, there is a ridge of rocks and sand of from 7 to
3 fathoms water, with a small gully of 37 fathoms, 20 miles from Boston light. To
the North of this ridge the bottom is generally muddy, and the depth from 10 to 50
fathoms.

At full and change, it is high water off Race Point at 10 hours and 15 minutes. *High water*
Vessels entering Cape Cod, bound to Boston, should calculate the tide, as the flood
is six to the S. W. off Cape Cod, from the Race to Chatham; flood sets to the
south, ebb to the North; Southern tide, 9 hours; Northern tide, 3 hours.

The upper buoys in Boston Harbor will be taken up during the winter season; but
those in the vicinity, including Salem and Cape Ann, are not taken up.

BOSTON LIGHT HOUSE TO CAPE ELIZABETH LIGHTS.—From Boston *Boston*
light house to Thatcher's Island lights, which lies 2 miles East from Cape Ann, the *light-house*
course is S. E. 3 N., and the distance 8 leagues; but to clear the Londoner, which *to Cape*
you leave on your port hand, when bound to Cape Elizabeth, the course is N. E. by E. *Elizabeth*
about 3/4 way, and near the North shore, is a high bold rock, called Half-way Rock, *lights.*
of about 20 fathoms diameter, (on which is a monument,) bearing S. W. by W., distant
17 miles from the Eastern point of Cape Ann, before described.

From Thatcher's Island E. S. E. one half of a mile, lies a ledge of rocks, called the
Londoner, which show themselves at half tide, and extend E. N. E. and W. S. W., dis-
tant two miles from the island. If you should be forced to the Northward of Cape

Ann, there is a very clean bay, called Ipswich Bay, and N.E. from it lies the wharbor of Portsmouth, the entrance to which is formed by Great Island on the West, and Gerish's Island on the East, on the former of which the town of Newcastle is built.

From Cape Ann lights to the Isles of Shoals light, the course is N. $\frac{1}{2}$ E., distant 53 leagues.

*Cohasset
Rocks, or
Minot's
Ledge.*

Light-ship.

COHASSET ROCKS, or MINOT'S LEDGE, is 8 miles S.E. $\frac{1}{2}$ E. from Boston light, and 6 miles N. $\frac{1}{2}$ W. from Scituate light, and consists of 15 large rocks out of water, and ledges all round these rocks. The nearest land is Scituate, 3 miles distant. These rocks extend North and South from $3\frac{1}{2}$ to 4 miles. Small vessels pass between the rocks. The depth of water round the rocks is 5 and 6 fathoms.

On Minot's Ledge there is a light-ship, which bears S.E. $\frac{1}{2}$ E., 9 miles distant from Boston light. It has 2 fixed lights, 45 feet above the sea. There is a light-house building on the outer Minot's Ledge.

There is a passage within Cohasset Rocks, used by coasters.

There is a dangerous ledge near Minot's Ledge, with 10 water on it at low-water. From it the light-boat bears N.W. by W. $\frac{1}{2}$ W.; Scituate light, S. by E.; Outer Minot's Rock, W. by N. $\frac{1}{2}$ N. To avoid it do not pass to the Southward of the light-boat.

*Scituate
light.*

SCITUATE.—The light-house is on Cedar Point, North side of the entrance, and 5 miles South of Cohasset Rocks. It is a fixed light, 49 feet above the level of the sea. From the Northerly part of Cedar Point, a ledge, called Long Ledge, extends N. N.W. nearly one mile; so that vessels falling in a little more than one mile Northward of the point, may bring the point to bear South; and if they make good their course North, they will clear the outer ledges of Cohasset Rocks; half a mile East of the body of the point will clear Cedar Point, Long Ledge, and the first Cliff Ledge.

[NOTE.—There are ledges extending from all the four cliffs, but none between them, and half a mile from the shore will clear all, except frigates and large vessels.]

From the point running S.S.E. will clear Brandt's Point, consequently, giving the point half a mile berth, there will be no danger in running S.S.E.

There is a meeting-house about 2 miles W. by N. from the point; and a farm-house near the North-west side of the harbor, with two large barns a little North. To go into the harbor, (the mouth of which is about one-third of a mile wide,) bring the meeting-house, or farm-house, to bear W. by N. from the middle of the entrance of the harbor, and run in W. by N. for the farm-house, until you have passed the ledge, which is a hard bed of stones and gravel that does not shift; and after passing the bar, and coming on sandy bottom, haul up and anchor near the beach on the South side of the harbor.

Sunken rock.

There is a sunken rock with 6 or 7 feet water off Webster's flag-staff, lying three-quarters of a mile outside of a rock, on which a buoy is placed.

This buoy is likely to lead vessels upon the outer rock.

*Brandt
Point.
Buoy.
Gurnet
lights.*

BRANDT POINT.—There is a ledge off Brandt Point with 8 feet water on it. Gurnet light bearing S. $\frac{1}{2}$ E., $4\frac{1}{2}$ miles distant; Brandt Point, $1\frac{1}{2}$ mile distant. There is a buoy on Philip's Ledge, three-quarters of a mile inshore of it, bearing W.N.W. $\frac{1}{2}$ W.

GURNET LIGHTS.—On Gurnet Point, the Northern side of the entrance to Portsmouth Harbor, there are two light-houses, 93 feet above the level of the sea, 81 feet apart, containing fixed lights, which should not be brought in range when to the Northward of them; but to the Southward you may bring them in one, which is a good mark to clear Brown's Island or Sand-bank.

*Plymouth
harbor.*

PLYMOUTH HARBOR.—The high land of Manomet bears from the lights S.W. $5\frac{1}{2}$ miles; Manomet Point, S.S.E., 6 miles; and Brandt's Point, N. $\frac{1}{2}$ W., about 7 miles; Squash Head, W. $\frac{1}{2}$ S., 3 miles; the Eastermost part of Brown's Islands, Shoal, that dries, S.S.W. $1\frac{1}{2}$ mile, and the Gurnet Rock from the body of the light-house, E. by S. $\frac{1}{2}$ S., one-third part of a mile; on this rock you have but 3 feet of water, at which time all the soundings were taken, and 3 $\frac{1}{2}$ fathoms alongside at the same time. A red buoy is placed near this rock, bearing E.S.E. from the light-house distant about one-third of a mile. When you have shot in the Sandy Hill with the Gurnet Head, you are clear of the rock; after which you must mind not to haul in too close to the Head, as there are many sunken rocks some distance from the shore. There are three rocks partly bare at low-water off Manomet Point. There is also a detached and very dangerous rock lying off Indian Hill, about 4 miles to the Southward.

Rock.

Rock.

This harbor is capacious but shallow, and is formed by a long and narrow neck called N. House Beach, extending Southerly from Marshfield, and terminating at the Hen Island, and by a smaller beach within, running in an opposite direction, and connecting the main-land near Old River, about 3 miles from the town. On Salthouse Beach is the one of the huts erected and maintained by the Humane Society of Massachusetts, for the relief and relief of shipwrecked mariners. There is a beach in the inner beach, which is used for the shipping, even at the wharves, during an Easterly storm.—Magnetic variation in 1798 45' W.

of Manomet Point. It has but 6 feet water on it. When you bring Saquash Head to bear W. by N., you may steer up W. by S., and if you are bound for Plymouth you must keep that course for a large red cliff on the main, which is a very good mark to carry you clear of Dick's Flat; then you must steer more Southerly for Beach Point, or run up until you are abreast of Saquash Head, giving it one-quarter of a mile distance; then steer W. by S. 1 S., which will clear you of Dick's Flat, and carry you directly for Beach Point, keeping within 15 or 20 yards of the Sandy Point, steering away for the Southward, keeping that distance until you have shut in the lights, where you may anchor in 3 and 4 fathoms, but the channel is very narrow, having nothing but a flat all the way to Plymouth, except this small channel, which runs close by this neck of land; you will have 4 and 5 fathoms close to this point. There is a rock near Saquash Head which is dangerous to vessels beating into the harbor. It is quite sharp, and not easy to detect. If you are bound into the Cowyard, you must steer as before directed, which will clear you of the stone monument on Dick's Flat, and that on the Muscle Bank, both of which you leave on your starboard hand, when you may anchor in 7 or 8 fathoms water. If bound to Kingston, you will keep the house on Gurnet Head just open with the Saquash Head, until you have opened the high pines with Clerk's Island; then you are clear of the Muscle Bank, when you may steer N.W., until you have 3 fathoms at low-water, not running into less.

In coming from the Northward, bound into Plymouth, you must not bring the lights more Southerly than S. by W., to avoid High Pine Ledge, which lies North from the Gurnet Head, about 2½ or 3 miles. When you are on the shoalest part of this ledge, some part of which appears at low ebb, you will have the high pines in range with Captain's Hill, which will then bear W. by S. This ledge of rocks lies 1½ mile from shore, extending about N.N.E. for near a mile, and close to this ledge you will have 4 and 5 fathoms, which deepens gradually as you run from it to the Eastward; within one mile you will have 10 and 12 fathoms.

In coming from the Southward, bound into Plymouth, you must not open the Northmost light to the Westward, but keep them in one, which will carry you in 5 fathoms by the Easternmost part of Brown's Islands or Shoal, keeping that course until you are within half a mile of Gurnet Head, or higher, where you will have but 4 fathoms; then Saquash Head will bear W. by N. a little Northerly, and the two outermost trees in the head in one; then you may steer directly for them, until you bring the lights to bear E.N.E., and the house on Saquash Head to bear N.W., just open with the first sandy beach, where you may anchor in 4 fathoms in Saquash Road, good clear bottom; but if you are bound for Plymouth or the Cowyards, you must steer as before directed. If in the night, it is best to anchor here, as it is difficult to make Beach Point (being mostly covered at high-water) if dark, or go into the Cowyard.

Cowyard beacon is a square granite structure, surmounted by a granite post, 4 feet high, painted red.

In turning into Plymouth, you must stand to the Northward into not less than 3 fathoms, as it runs a flat a long way from the Gurnet Head to Saquash; and from both the heads lies off a point of rocks a good way from the shore, many of them but just under water at low ebbs. And all the way from Saquash to Muscle Bank, you have shoal water, so that you must not stand in less than before mentioned. And in standing over for the sands to the Southward, you must go about as soon as you shoalen your water to 4 fathoms, as it is bold to, and you may observe the rips, unless it is very smooth. This sand extends from abreast of the lights to Beach Point, most of which is dry at low ebbs. From the Easternmost part of this sand to Dick's Flat, it rounds off with a considerable sweep; you have but 5 fathoms water from the Easternmost part of Brown's Island to the Gurnet Head, and not more than 7 or 8 until you are abreast of Dick's Flat, where you will have 13 or 14 fathoms in a deep hole, and then shoalen 5 fathoms abreast of Beach Point.

If you should fall in to the Southward of Brown's Islands or Shoal, between them and Manomet Hill, where you have 20 fathoms in some places, you must not attempt to run for the lights, until you have them shut in one with the other, when they will bear N.N.W. ½ W.; if you do, you may depend on being on Brown's Islands or Shoal, there is no passage for even a boat at low-water.

In coming in from the Northward in the night, you must not bring the light to bear more Southerly than S. by W. to avoid High Pine Ledge, and keep that course until you have them to bear N.W., or N.W. by W., when you will be clear of the rock, and may steer up W. by S. until you have the lights to bear E.N.E., where you had best anchor in the night. Here the tide runs strong channel-course from the Gurnet to the Race Point of Cape Cod; the course is E. ½ N., about 6 leagues distant; and from the Gurnet to the point going into Cape Cod Harbor, is E. by S., 7 leagues.

If you should make the lights in hard Northerly or N.W. winds, and cannot get into Plymouth, you may then run for Cape Cod Harbor, bringing the lights to bear W. by N., and steer directly for Race Point light, following the directions given for entering

Provincetown Harbor, by the fixed light on Long Point, and come to anchor. If it should blow so hard that you cannot turn up the harbor, you may anchor off the point clear bottom; you have 8 and 9 fathoms very near the shore, so that there is no danger of being on it, unless very dark.

At the Gurnet and Plymouth the tides are much the same as at Boston; that is, S.E. moon makes full sea.

Cape Cod Light.

Race Point Light.

Long Point Light.

Cape Cod Harbor.

CAPE COD LIGHT.—A light-house, containing a fixed light, 171 feet above the sea, is erected on the Clay Ponds, highlands of Cape Cod.

RACE POINT.—(Cape Cod.) On this point is a fixed light, varied by flashes, 151 feet above the level of the sea. It cannot be seen by vessels inward bound, until it bears S.S.W. $\frac{1}{2}$ S.

LONG POINT.—On Long Point, at the entrance of Provincetown Harbor, is a light-house containing a fixed light, elevated 28 feet above the level of the sea.

CAPE COD HARBOR.—(Provincetown.) This is one of the best harbors on the coast. If bound into this harbor from the Northward, you may run within half a mile of the light-house on Race Point; after passing it, and it bears East, steer S.S.E. 10 miles, when the light on the Highlands will bear E. by N.; then run for it $\frac{1}{2}$ mile, which will put you in the fair way of the harbor; then haul up N.N.W. Westward a good mile, when you may anchor in 5 or 7 fathoms, with the light on Long Point bearing S.W. by S.

Large ships should bring the light on Race Point to bear N. by W., and steer S.E. to pass Wood End Bar in 10 fathoms; as soon as the light on Long Point bears E. by N., steer N.E. until in 80 fathoms water, when anchor, the light on the Highlands of Cape Cod bearing from E. $\frac{1}{2}$ N. to E. $\frac{1}{2}$ S.

Good anchorage may be found in a N.E. gale, by running for the Race Point light giving it one-third of a mile distance as you pass it, as soon as it bears E.N.E., when you will be safe with the wind from N.N.E. to S.E. by E.; haul up E.S.E. and anchor in from 10 to 4 fathoms.

Vessels inward bound, who fall in with the back of Cape Cod, may bring the light to bear S.W., 2 leagues distant, and then steer W.N.W. for Boston light-house, which contains a revolving light.

When up with Race Point, you will find it very bold about one mile to the Westward of the light-house, and it may be known by a number of fish-houses on it. About one mile to the Southward of Race Point, is what is called Herring Cove, where you may have good anchorage half a mile from the shore, the wind from E. to N.N.E. 4 or even in 3 fathoms water.

In passing Race Point to the Southward, you must give it a berth of one mile; there is a long flat of sand that lies to the Southward of said point. You must haul to the Eastward until you come near Herring Cove.

In running from Race Point to Wood End, after you pass the Black Land or Harwich rocks, you will come up with a low sandy beach which forms the harbor, extending between 2 and 3 miles to Wood End, which is difficult to be distinguished in the night; it is very bold, and you will have 25 fathoms water within one-quarter of a mile from the shore.

In beating into Cape Cod Harbor, you must keep the Eastern shore aboard until you get into 5 fathoms water. Stand no further to the Westward than to bring the light to bear E. by S., as there is a long spit of sand runs off from the Western shore, which being very bold, you will have 11 fathoms water within a stone's throw of the shore.

If it blows so hard that you cannot beat into the harbor, you will have good anchorage without, in from 10 to 15 fathoms water. Or if it blows hard at N.E., bring Race Point light to bear N.W. by N., and steer S.E. by S., 6 leagues, which course will carry you into Wellfleet. In steering this course you will make Harwich right ahead when you open the bay, you will bring Billingsgate Island light on your port beam when you may haul to Eastward, and anchor safe from all winds.

Light.

BILLINGSGATE ISLAND LIGHT-HOUSE is on Billingsgate Island, at the entrance of Wellfleet Bay, 5 leagues S.E. by S. from Race Point light. It is a fixed light, 40 feet above the sea, and is situated so far up Barnstable Bay that it cannot be mistaken for any other.

Billingsgate Island is about 13 feet above the level of the sea at high-water. At high-water in this bay, at the full and change of the moon, at 11 o'clock; the rise of the spring tides is from 12 to 11 feet; common tides from 9 to 11 feet. From the West end of Billingsgate Island extends a long shoal of hard sand 10 or 11 miles, in a N.W. by S. $\frac{1}{2}$ S. to W. by N. from the light-house, and in a N.W. to N.N.W. direction, 6 miles; at the distance of $\frac{1}{2}$ to 2 miles from the light, are about 8 feet at low-water common tides; and the meeting-house with a steeple in Brevster, S. by E., at a distance of 5 miles from the light-house, 10 to 12 feet, the meeting-house bearing S.S.E. at the distance of 7 miles, $2\frac{1}{2}$ fathoms of water, the meeting-house bearing S.E. by S.; at these depths of water, the light-house bore from E. by N. to E. by N. 4

thus the harbor, extend

istinguished in the night

crossing this shoal point of flats, you drop into 4 to 5 fathoms, at the distance of 40 fathoms from the edge of this shoal, when the light-house will then bear E. N. E.

In coming around the shoal, approach no nearer than 2½ fathoms. As soon as you

deepen to 1 fathoms, haul up for the light and anchor.

Vessels drawing 12 feet of water or upwards, should bring the light-house to bear

N. E. to N. E. by E., and steer in E. by S. to E. S. E., until the light-house bears N.

W., when they will have good anchorage in 3 to 4 fathoms, low-water, common

soles, soft muddy bottom, and distance from the light-house 1½ to 1¾ mile; Brewster

meeting-house on with a windmill that stands not far from it, when they will bear S.

W. ¼ W.; also the North meeting-house that stands on a hill in Eastham, and no

other building near to it, bore at the same time E. ½ N.

The following bearings and distances are taken from the light-house:—The high

land of the North point of Manomet W. by N. ¼ N., distance about 8 leagues; en-

trance of Barnstable, the Black Land, called by some Seargo Hill, in Dennis, S. W.,

distance 16 miles, S. W. by S., about 11 miles; Brewster meeting-house with a steeple

S. by W. to S., 9 miles; entrance of Orleans, S. E. ¼ S., 6 miles; Eastham,

North meeting-house, S. E. by E. ¼ E., 4 miles; Silver Spring Harbor of Eastham, E.

N ¼ N., 4 miles. The above places are all barred harbors, and flats extend off

shore from one to two miles, with little water over them.

There is a rock in the passage-way up to Wellfleet, that is about 12 feet long and

feet broad, called Bay Rock, on which there are one to two feet water at low-tide,

and around this rock are 9 to 11 feet water at low-tide, bearing from the light-house

S. by S. ½ S., distant 14 mile. When on this rock, Chipman's windmill, which is the

South mill in Wellfleet, a little open to the North of a large rock, called Blue Rock

some, and stands near the shore of Wellfleet, when it will bear N. N. E. ¼ E.: this

rock is covered at high-water; and a windmill on a hill in Eastham, over Salt Mills,

which is near the shore at Eastham, these bearing E. by S. from Bay Rock. The

East point of the Horse-shoe bears from the light-house E. N. E., distant about one-

third of a mile. On the South side of Billingsgate Island, the flats extend off the dis-

ance of one-half to three-quarters of a mile, having on them at low-water, common

soles, 6 to 9 feet water.

There is no meeting-house with a steeple to be seen to the Eastward of Barnstable

than the one in Brewster; and this meeting-house is a good mark to pass over the long

shoal point that extends off from the light-house.

From the light-house on the Race Point of Cape Cod, when bearing E. N. E., the

course to Billingsgate Point of Flats is S. by E., distant 13 miles. Vessels drawing

12 feet water, or upwards, should steer from the Race light-house S., when distant

from the Race one or two miles.

BARNSTABLE BAY.—From Centre Hill Point to Sausett Inlet is about 4 miles, *Barnstable*

bearing S. ¼ E. This is a clean and bold shore, and may be approached at the dis-

ance of one-third to half a mile, carrying 3½ to 4 fathoms, sandy bottom. There is

bar of sand that lies parallel with the shore, near Centre Hill Point, extending to

the Southward, and terminating about three-quarters of a mile to the Northward of

Sausett. From the shore over this bar to 3 fathoms water the distance is 210 to

230 fathoms, and the bar is from 100 to 110 fathoms wide, having on it from 9 to 11

feet water, and between that and the shore from 3 to 3½ fathoms. From the South

end of this bar along the shore to the entrance of Sandwich are 3 fathoms, and

about 70 to 90 fathoms, sandy bottom, and regular soundings as you approach the

shore.

On the South side of Sausett Inlet is a low rocky point of 90 fathoms. Three-

quarters of a mile off shore are 3 fathoms, and at the distance of one and a half or two

miles are 9 to 10 fathoms, muddy bottom.

Passing from Sandwich towards Barnstable, the flats run off shore 100 to 180

fathoms.

Tides.—The neap tides rise 8 feet; common tides, 9 to 10 feet; spring tides, 12 to

14 feet. High-water in the bay, at full and change of the moon, at 11 o'clock.

BARNSTABLE LIGHT is a fixed light erected on a dwelling-house. It is 33 *Light*.

It above the sea.

BARNSTABLE HARBOR.—When coming from the Northward, the bar must not *Barnstable*

approach in less than 5 fathoms water, until the light-house on Sandy Neck bears *Harbor*.

W. ¼ W., which will bring you up with the red spar buoy on the bar; haul close round

leaving it on your starboard hand, run two cables' length, S. S. W., then steer S. W.

W. ¼ W. 1½ mile, which will bring you up with the tongue of Yarmouth Flats, or

until the light bears S. W. by S., then steer for the light. Be careful to make the

true course good, as the flood sets strong over Yarmouth Flats, and the ebb strong

to the Northward over the bar. Continue to run for the light until within a cable's

length of the beach, and follow the shore round the point. There is safe anchorage

to leeward of the light, against all winds, it bearing from S. W. to N. E., in 5 to 2½

fathoms water.

Vessels drawing 8 feet water may, at high-water, bring the light to bear S.W. 4 W., and run directly for it. Full sea, at full and change, at 11 o'clock. Tide rises 10 feet, and there are 7 feet water on the bar at low-water.

Statement of the locations of Life-boats, Mortar Stations, and Huts of Refuge on the Coast of Massachusetts, under the care of the "Massachusetts Humane Society."

DIAMOND STAGE, Ipswich River, $1\frac{1}{2}$ mile from the entrance or bar, one boat under the care of A. V. Pillsbury.

IPSWICH LIGHT, near the Long Beach, one small boat and carriage, under the care of Thomas S. Greenwood, keeper of the light.

ANNIS SQUAM, Cape Ann, at the light, under the care of Dominicus Poole, keeper of the light, one boat.

ROCKPORT, Cape Ann, near the centre of the village, one boat, under the care of Mr. Bradley.

GLOUCESTER HARBOR, near the centre of the town, one boat, under the care of Mr. Geo. H. Rogers.

MARBLEHEAD, inside the harbor, two boats, under the care of Mr. Goodwin.

MANCHESTER, one large metallic life-boat, built by Francis, and placed under the charge of the Society by the Treasury Department, under the charge of Capt. Tyler Parsons.

SWAMPSCOTT, near Phillips' Beach, one boat and carriage, under the care of the selectmen of the town.

NAHANT, on the N.E. side, near the hotel, one boat, in charge of the selectmen, and handy to launch on either side of the peninsula.

DEER ISLAND, Boston harbor, one small boat, under the general care of Lt. Moriarty.

POINT ALLERTON, inside of the buoy and rocks, on the N.E. part of the point, one boat, under the care of Mr. M. B. Tower.

HULL BEACH, on the inside of the neck connecting Hull with Nantasket, one boat; also a life-ear, mortar, lawser, and other means of communicating with a wreck, under the care of Mr. Tower.

NANTASKET BEACH, about 2 miles from Point Allerton buoy, one new boat, also under the care of Mr. Tower.

PLEASANT BEACH, situated a mile or so from the entrance of Cohasset Harbor to the westward, one boat, under the care of Capt. Isaiah Baker.

COHASSET HARBOR, two boats, near Honing Point, inside the western entrance of the harbor, under the care of Alfred Whittington, and superintended by Capt. Dan. T. Lathrop.

NORTH SCITUATE BEACH, inside of Minot's Ledge and Rocks, one boat, under the care of Thomas Damon.

BASS COVE, about one mile Easterly from Scituate town, two boats in one house, under the general care of Capt. Ezekiel Jones, formerly of the Revenue Service.

SCITUATE HARBOR, near the light, one large metallic life-boat, placed under the care of the Society by the Secretary of the Treasury, and in keeping of the light-house keeper, Mr. Alonzo Jones, and superintended by Capt. Jones.

WHITE'S FERRY, near the line dividing Scituate from East Marshfield, one boat and carriage, under the care of Mr. William Harrington, wreck-master.

MARSHFIELD, inside of Cut River, one large boat, under the care of Capt. Weston, near the Webster Farm.

DUXBURY BEACH, at Powder Point, near the village, one small boat, under the general care of Capt. Frazer, wreck-master.

PLYMOUTH HARBOR, western part, one boat, under the care of the selectmen of the town; and about 1 mile to the S.E. of her, on Long Beach, one boat, also under the care of the selectmen.

MANOMET POINT, South of Plymouth Bay, one new boat.

RACE POINT LIGHT, one boat, under the care of Mr. Crocker, keeper of the light, who has also a chest of seamen's clothing, belonging to the Society, for occasional relief.

SOUTH-EAST OF THE LAST, about $1\frac{1}{2}$ mile, is a boat, also under the care of Mr. Crocker.

SOUTH-EAST OF THIS, about $1\frac{1}{2}$ mile, is a boat, back of the beach, under the care of Mr. Atkins.

PEAKED HILL BAR STATION.—At this point there is a mortar-station, with fuel, straw, &c.; and, on each side of the station, on the beach, are posts, the hands pointing towards the station; these posts are continued for a considerable distance each way, and are for the purpose of guiding the shipwrecked seaman to a

of shelter.

of shelter. Watch is kept here during stormy weather. Capt. Atkins, who occupies the first house in Provincetown, in the direction of the station, has charge of the station, and has a supply of clothing belonging to the Society. There is also a surf-boat lately put there.

HIGHLAND LIGHT.—About one mile north of the light, back of the beach, is an old boat, under the care of Mr. Small, keeper of the light.

NEWCOMB'S HOLLOW.—About 5 miles South of the Highland light is a surf-boat, under the care of Capt. Mulford Rich, who has a good surf-boat of his own, at the same station. All the boats, &c., from this point to Race Point, are under the general superintendence of E. S. Smith, Esq., of Provincetown.

CAHOON'S HOLLOW.—About two miles South of the last station is a hut of refuge and a small surf-boat, under the care of Capt. Henry Baker, who resides about 2 miles from the station.

NAUSETT BEACH.—About one mile south of the three lights is a surf-boat, under the care of Capt. Michael Collins, keeper of the lights.

NAUSETT HARBOR, North of the entrance a short distance, is a government metallic boat, mortar-station, life-car, hawser, house of refuge, &c., under the superintendence of Capt. J. S. Doane, as chairman of the committee, who lives near by at East Orleans.

ORLEANS BEACH. South of the harbor of Nausett, one new surf-boat, also under the care of the same parties.

NORTH CHATHAM, in the harbor near the new opening, one boat, under the care of Capt. Beazili Stetson.

CHATHAM, a short distance North of the lights, on the main-land, is a surf-boat, under the general care of Capt. J. Hardy, Jr.

CHATHAM BEACH, opposite the town, is a government metallic boat, a life-car and mortar station, hawser, &c., with a hut of refuge, in which the apparatus is kept; and another hut further South, all under the care of Capt. Hardy.

MONOMOY POINT, one metallic boat, furnished, like the two last, by government, and one surf-boat—the latter is near the light, and both are under the care of Asa Nye, keeper of the light.

NANTUCKET EAST END, at Kros Katy Farm, one surf-boat, in a hut of refuge, and one dory, under the immediate care of Thomas Dra, who lives at Folger's Farm, near by.

GREAT POINT, inside, near the light, one surf-boat, in charge of the light-house keeper.

NANTUCKET WEST END.—At Smith's Point is a hut of refuge and a surf-boat, under the immediate care of D. G. Patterson.

NANTUCKET BAR, a government metallic life-boat and house, under the care of D. G. Patterson also.

TUCKANUEK, one boat, under the care of Mr. Dunham.

NANTUCKET, at the town, in charge of a committee, of which Capt. P. H. Folger is chairman, and which has charge of all the stations on the island, is a mortar, hawser, and apparatus for communicating with wrecks, which can easily be transported to any necessary point.

CHAPPEQUICKLIK, West side of Tuckanuek Channel, on Martha's Vineyard, is a surf-boat, under care of Thomas Huxford, who lives one mile from the boat, inland.

SOUTH BEACH, 3 miles from Edgartown, one boat, under the immediate care of Mr. Barlett Stewart.

GAY HEAD, on the inside, northerly from the light one mile, one boat, under the care of Samuel Flanders, keeper of the light.

CUTTHUNK, near the light, on the north side, two boats, in charge of Corbit Chandler, keeper of the light.

Besides the huts of refuge attached to and connected with the boats, there are other huts near Marblehead light—on Nantucket Beach two, two on Scituate Beach, one at North Chatham Beach, one at Duxbury, one at Marshfield, two at South Scituate. Mariners are strongly recommended not to attempt landing from a stranded vessel until near low-water, and generally to wait patiently until succor comes from fresh and willing hands on the beach.

R. B. FORBES.

Chairman of Standing Committee, Mass. Humane Society.

Boston, 1st Jan., 1856.

CAPE COD TO NANTUCKET.

CAPE COD TO CHATHAM.—From the Highland light to Nausett lights, the *Cape Cod to* course is S. by E. 12 miles; thence to Chatham lights S. $\frac{1}{2}$ West 11 $\frac{1}{2}$ miles; the shore *Chatham* is sandy.

Nausett Beach lights NAUSETT BEACH LIGHTS.—On Nausett Beach three light-houses, one hundred and fifty feet apart, have been erected. They are all fixed, and 43 feet above the sea.

Chatham Lights. CHATHAM LIGHTS are two fixed lights on James' Head, 70 feet above the level of the sea; they are only in use in running over the shoals, as the beach has made out 2 or 3 miles to the South since they were erected.

Chatham Harbor. CHATHAM HARBOR.—Chatham is situated on the exterior extreme of Cape Cod, bounded E. by the ocean, S. by Vineyard Sound, W. by Harwich, and N. by Pleasant Bay. Its harbor is convenient for the fishery, in which they have usually 40 vessels employed, and contains 20 feet at low-water.

While passing Chatham in thick weather, approach no nearer than 5 fathoms to cross the Pollock Rip; edge off and on from 5 to 7 fathoms, which will carry you over the Pollock Rip in 3 fathoms. Magnetic variation in 1850, 9° 45' W.

NANTUCKET SOUND, NORTH SHORE.

Monomoy Point light. MONOMOY POINT LIGHT is a fixed light, 33 feet above the level of the sea, on Monomoy Point, the extreme Southern point of the peninsula of Cape Cod; to the North the sea has made an inlet deep enough for small craft, making it an island.

Pollock Rip Light-ship. POLLOCK RIP LIGHT-SHIP, which is painted red, bears S. E. by E. $\frac{1}{2}$ E., distant 3 $\frac{1}{2}$ miles from Monomoy Point light. The light is 45 feet above the sea.

This Rip, on which there are but 5 feet water, extends 4 miles in an E. $\frac{1}{2}$ S. direction from Monomoy Point light. There are two channels across it, the outer one of 13 feet, which has a light-ship, and which bears S. 2° W. from Chatham light, distant 8 miles.

To cross the Rip by the outer channel, bring Chatham lights to bear N. 2° E., and steer South until you make a black buoy which bears from the light-ship N. 2° E., half a mile distant, and is in 3 fathoms water, which you leave on the starboard hand, when up with the light-ship, which you can pass on either side: steer W. $\frac{1}{2}$ S., 3 miles on this course; you will pass a red buoy on the port hand on the Northern end of the Stone Horse, which bears from the light-ship W. $\frac{1}{2}$ S., distant 3 miles. You continue this course to the black buoy, No. 7, on the S.W. part of the Handkerchief, which bears from Nantucket (Sandy Point) light N. $\frac{1}{2}$ E., distant 6 $\frac{1}{2}$ miles.

To cross the Rip through the inner channel, through which you can carry 10 feet, bring Monomoy Point light to bear S. W. $\frac{1}{2}$ W., and run on that course until you judge yourself 2 short miles from the light, or see a black buoy bearing S. by E. of you, which you steer for, leaving it on the starboard hand (this buoy is in 13 feet water); keep on this S. by E. course one mile, or until you get into 5 fathoms, when you change your course S. W. by W. $\frac{1}{2}$ W., 6 $\frac{1}{2}$ miles, for the black buoy on the Handkerchief.

This channel will only do in the day-time.

When one quarter of a mile East of Bearses Shoal, a N. E. course will carry 9 feet over the Rip at low-water. This channel is half a mile wide, with much shoaler water on either side.

To cross between Shovelful and Bearses Shoal, on the East end of which is a black spar buoy, follow the beach until Monomoy light bears N. N. W. $\frac{1}{2}$ W., then steer S. E. $\frac{1}{2}$ E., until it deepens, when you will be in Butler's Hole—then steer as above directed.

Bound through the Vineyard from the Northward, to go through Pollock Rip.

When East of Chatham lights about 2 miles, bring Pollock light-ship to bear S. by W. $\frac{1}{2}$ W. and run for it, leaving the black buoy, No. 1, on the starboard hand. After you have passed the buoy on that course a quarter of a mile, steer W. by S. $\frac{1}{2}$ S., 3 miles, to the black buoy, No. 7, on the South point of the Handkerchief; then W. by S. 9 $\frac{1}{2}$ miles to the black buoy, No. 5, on the South-east point of the Horse-shoe; then W. $\frac{1}{2}$ N. 2 $\frac{1}{2}$ miles to the Cross Rip light-ship.

Stone Horse. STONE HORSE.—This shoal, on the North point of which there is a red buoy, is 10 to 12 feet water, which bears from Monomoy Point light S. 1° W., distant 14 miles, is of a circular shape, the concave part being on the Eastern side, and has a S. S. E. and N. N. W. direction, with 1 foot on it in places.

Its length from the red buoy to the black buoy of the Little Round Shoal is 3 $\frac{1}{2}$ miles; the buoys bear from each other S. E. 1° E. and N. W. 1° W. Its width is about 1 $\frac{1}{2}$ mile.

Little Round Shoal. LITTLE ROUND SHOAL.—This shoal, on which there are but 2 feet water, and which may be considered the S. E. point of the Stone Horse, bears from Chatham lights S. 7° W., distant 10 $\frac{1}{2}$ miles. There is a black spar buoy on it, in 8 feet water, which bears from Monomoy Point light S. S. E. 4° E., 4 $\frac{1}{2}$ miles. From Nantucket Point light, N. E. $\frac{1}{2}$ E., distant 8 miles. About E. N. E., 3 miles distant from the buoy on Little Round Shoal, is a spot of 13 feet. Pollock Rip light-vessel bearing N. W. by W., 2 $\frac{1}{2}$ miles distant.

GREAT ROUND SHOAL, is partly dry at low-water. On it there is a black nun *Great Round* buoy which bears from Monomoy light S.S.E. 4° E., $8\frac{1}{2}$ miles. From Nantucket Shoal. Point light N.E. $\frac{3}{4}$ E., distant 8 miles.

About $1\frac{1}{2}$ mile East of the buoy on the South point of Great Round Shoal is a shoal spot of 12 feet water, Pollock Rip light-vessel bearing N.N.W.; Great Point light, W. by S. $\frac{1}{4}$ S.

The channel between the Great and Little Round Shoals should not be attempted by vessels drawing over 9 feet, and then only from necessity.

The black buoy of the Little Round Shoal bears from the red buoy of the Great Round Shoal N.N.W. 1° W., distant 2 miles.

These may be considered the shoals to the Northward and Eastward of Nantucket. Those after described are the Vineyard Shoals.

HANDKERCHIEF.—This is, in fact, two shoals. The black buoy on the South *Handkerchief* point of the Western shoal, bears from Monomoy light S.S.W. $\frac{3}{4}$ W., distant $4\frac{1}{2}$ miles. From Nantucket Point light N. $\frac{1}{2}$ E., 7 miles distant. From here, the shoal with a width of two-thirds of a mile, partly dry, runs N. 8° E., $3\frac{1}{2}$ miles, where there is a red buoy, bearing from Monomoy Point W. by N., distant $3\frac{1}{2}$ miles.

Between the Eastern side of the Handkerchief and Monomoy light there is a channel of 20 feet. To run through this channel, after you have passed the red buoy on the Stone Horse, *Buoy*, steer N.W. by W. $\frac{1}{4}$ W. for the light-ship on the S.W. point of Shovelfull, which is in 8 fathoms water, which you leave on your port hand, and which bears from Monomoy light S.W. $\frac{1}{4}$ W., distant $1\frac{1}{2}$ miles. After you have passed the light-ship, steer N. $\frac{1}{2}$ W. for the red triangle buoy on the S.E. part of the inner Handkerchief, which you leave on the port hand. After passing this buoy steer N.W. by W. $1\frac{1}{2}$ miles, when Monomoy light will bear E. by S. $\frac{1}{2}$ S., and you will be up with the red buoy on the N.W. part of the Handkerchief.

From the black buoy of the Handkerchief to the light-ship on Cross Rip the course is W. $\frac{3}{4}$ S., distance 10 miles.

Crossing the Handkerchief in 3 or 4 fathoms water, you will run W. $\frac{3}{4}$ S. for the black buoy on the Horse-shoe, $8\frac{1}{2}$ miles, leaving it on the starboard hand, when you will confine your course for Holmes' Hole light, W. by N. $\frac{1}{2}$ N., 16 miles distant. As you enter the Swash in the Horse-shoe, Hyannis light will bear N.N.E., Cape Poge light W.S.W., Holmes' Hole light W. Part of the Handkerchief dry at low-water.

CROSS RIP LIGHT-SHIP is on the North Point of the Rip, in 7 fathoms water. *Cross Rip* The light is 39 feet above the sea. 200 fathoms South of the light there are 11 feet *light-ship* water. From the light-vessel Point Gaumon light-house bears N.; Chatham light N.E.; Sandy Point light N.E. by E.; Nantucket Great Point light E.S.E. $\frac{1}{2}$ S.; Nantucket Brandt Point light S.E. by S.; Nantucket beacon light S.S.E.; Capo Poge light W.; centre of Tuckanuck Island S.W. $\frac{3}{4}$ S., distant $9\frac{1}{2}$ miles.

From the Cross Rip light-ship to go South of the Hedge Fence.

W. by N. $\frac{3}{4}$ N., $9\frac{1}{2}$ miles, will bring you between the buoys of the Hedge Fence and Squash Meadow Shoals; then N.W. by W. $\frac{1}{2}$ W., $7\frac{1}{2}$ miles, makes Nobska Point light bear N.W. by W. $\frac{1}{4}$ W., three-quarters of a mile distant: the course through the Vineyard is then S.W. by W. $\frac{3}{4}$ W., 15 miles. To go North of the Hedge Fence, from the light-ship, N.W. by W. $\frac{1}{4}$ W., 15 miles, makes Nobska Point W. $\frac{3}{4}$ S., $1\frac{1}{2}$ mile distant: the course through the Vineyard then is S.W. by W. $\frac{3}{4}$ W., 16 miles.

Bound East, to go between Great Point and the Great Round Shoal.

When up with Cross Rip light-vessel, steer E. by S., $14\frac{1}{2}$ miles, which carries you to the buoy on the N.E. point of the Great Rip; 10 more on the same course puts you to the Eastward of McBlair's Shoals.

Running from the Horse-shoe towards Holmes' Hole, observe the following direction: *Horse-s* viz: When to the Northward of the Horse-shoe, in 12 fathoms water, one mile distant from the dry spots, at low-water, steer S.W. for Holmes' Hole, 3 leagues distant. If bound to the Northward of the Hedge Fence, between that and the Hommedieu Shoal, get the point on which the windmill stands, which is East of Wood's Hole, to bear W. by N., and run for it until within half a mile; then W.S.W. will carry you through the Vineyard Sound, leaving Tarpaulin Cove and Cutterhunk lights on your starboard hand, and Gay Head light on your port hand. You will not see Cutterhunk light till 4 leagues to the Westward of Tarpaulin Cove light, when it will open on the starboard hand; when it bears N.E. by E., distant $3\frac{1}{2}$ miles, you may run West for Point Judith light, (if bound up the sound,) 10 leagues distant.

Distances from the Cross Rip Light-boat.

Shovelful Shoal.

SHOVELFUL SHOAL.—A light-boat is moored on the S.W. end of Shovelful Shoal, (near Monomoy Point,) and shows a white light, 40 feet above the sea. The bearings from the boat by compass are as follows:

Bearings.

Light Vessel on Pollock Rip bears.....	E. ½ S.
Buoy on Stone Horse bears.....	E.
Buoy on Shovelful Shoal bears.....	E. ½ N.
Monomoy Point light bears.....	N. E. 13 mile.
Red buoy on the N.W. part of the Handkerchief bears.....	N. by W.
Black buoy on S. point of the Handkerchief bears.....	S.W. ¾ W.

On the South point of this shoal there is a black buoy, which bears from a Monomoy light S.W. ¼ S., distant 1½ mile, in 5 feet water.

The shoal extends about a quarter of a mile South of and around the light-ship, forming a crescent or light, the Western extremity of which bears from the light-ship S. by E., a quarter of a mile distant, and has on it 18 feet. Midway between the end of the shoal and the black buoy there are but 14 feet, with a slue of 19 feet close to the buoy.

There is a passage for vessels of 8 feet at high-water between Monomoy Point and Shovelful Shoal, by bringing Monomoy light to bear S.W. by W. 4 W., and running until 150 fathoms from the outer beach; keep that distance, sailing parallel to the beach, until you cross the Rip; on this course you pass a black buoy on your port hand. From the black buoy you steer N.W. ½ W. one mile, or until Monomoy light bears East, when you are in the fair way for such port as you wish to make.

Tides.

TIDES.—The flood-tide sets North about 3 hours, then E.S.E., when the ebb commences at South, and continues till low-water. At Sankaty Head the flood sets N. E., and the ebb S.W. In the middle (or E.N.E. channel) the flood sets N.E. by E. and ebb S.W. by W.

In Butler's Hole the ebb sets West, and the flood East. From Chatham to Pollock Rip the flood sets S.S.W., and ebb N.N.E.

From Butler's Hole to the Horse-shoe, ebb W.S.W.; then W. by N. to Holmes' Hole.

At Pollock Rip, Great Rip, Little Round Shoal, Point Rip, and the Handkerchief, the tide rises and falls 5 to 6 feet. At the Horse-shoe, Cross Rip, Hole's Fence, Squash Meadow and Middle Ground, the tide rises and falls 3 to 4 feet. S. 1 E. more makes full sea in the sound.

Powder Hole Anchorage.

POWDER HOLE ANCHORAGE.—From Pollock Rip light-ship steer W. ½ N. until up with the Shovelful light-ship, then N. by W. ¼ W., and steer for it until past Monomoy Point, to which give a berth of 50 yards. Anchor close inside the point in 2½ fathoms, to avoid the flats to the Eastward. A safe anchorage in all winds except from Northward and Westward.

Old Stage Harbor.

To enter North channel, Nantucket Sound, proceed by directions for entering Powder Hole, till Monomoy light bears East, when a N.W. by W. course will clear the Northern end of the Handkerchief.

OLD STAGE HARBOR.—When Monomoy light bears S.E. ¼ E. you steer N. by E., leaving a black buoy on your starboard hand; after you have passed the Northern one, or run 5½ miles, which will bring Chatham lights to bear E. by N., you can run in on that course and anchor in 5 fathoms.

Hyannis Point Gammon light.

HYANNIS LIGHT is on Point Gammon, at the entrance of the harbor, South side of Cape Cod. The lantern is elevated 70 feet above the level of the sea, and contains a fixed light.

The harbor light of Hyannis is on the main-land inside the breakwater, and is a fixed light, 36 feet above the sea. It bears from Point Gammon light N. 22° 30' W. 2½ miles distant.

East from Hyannis lies Bass River, near which are the towns of Dennis and Yarmouth. A black spar buoy is placed on Dog-fish bar.

Hyannis Harbor.

HYANNIS HARBOR.—Vessels coming from the Eastward, bound through the North Channel, must leave the Bishop and Clerks on the port hand, and not go nearer them than 4 fathoms. They are a dangerous ledge of rocks, bearing S. by E. from the light-house, 2½ miles distant, and are always dry. Between these and the Middle Ground there is a light ship, painted straw-color, Point Gammon light bearing N. by E.; East end of Hyannis Harbor breastwork, N. ¾ W.

A light is being built on the Bishop and Clerks. When finished, the light-ship will be removed to the North end of the Handkerchief.

When coming from the Eastward, bring Point Gammon light to bear N.N.W. 4° W. in 11 fathoms water, and steer N.W. by W.; on which course you will have from 34 fathoms to a quarter less 3. When the Harbor light bears N. 1° W., run for it; which course will carry you two cables' length from the East end of the breakwater. Give it a good berth towards the shore, and round to in $2\frac{1}{2}$ or 3 fathoms water. Variation in 1850, $9^{\circ} 15'$ W.

When coming from the Westward, bring Point Gammon light to bear E. by N., or E. by N. $\frac{1}{2}$ N., run for it until the Harbor light bears N. 1° W., and steer as above.

Vessels bound to the Westward from Hyannis, must run to the Southward until the light bears E. by N.; then steer W. by S., which course will carry them clear of the South-west rock, which bears West from the light, 4 miles distant, with several sunken rocks near it; said rock is dry at low-water. W. $\frac{1}{2}$ S., $4\frac{1}{2}$ miles distant from the light, is a dangerous ledge, called Collier's Ledge, 3 miles from the shore, on which is a granite beacon, with a ball and vane on top, bearing from the light-house W. There are 3 fathoms water round it, and the ledge is part dry at low-water. In running this W. by S. course, (the light bearing E. by N.) you will have from 3 to 4 fathoms, and sometimes 5, as it is ridgy. If further towards the Horse-shoe, to the Southward, you will have 4, 5, 6, 7, 10, and close to the Horse-shoe, 13 fathoms: Northern part of the Horse-shoe dry at low water. On the S. E. part of the Horse-shoe is a black buoy placed in 21 feet water, bearing from Great Point light N. W. by W. $9\frac{1}{2}$ miles, and from Tuck-neck Island N. by E. $\frac{1}{2}$ E. $9\frac{1}{2}$ leagues. Tide rises about five feet; high-water, at 1 and change, at 12 o'clock; and runs from 2 to 3 knots East and West, in the following manner, viz.: it begins to run to the Westward at half flood, and continues to fall ebb, then runs to the Eastward, the three last hours of ebb and three first of flood.

CHATHAM TO HOLMES' HOLE. South of the Great Round Shoal.—Outside of Chatham to the Rip, bring Chatham lights to bear N.N.W., then steer S.S.E., until Monomoy Point light bears N.W. by W. 4° W., 7 miles; thence, S. by W. $5\frac{1}{2}$ miles, will make Great Point light bear W. $\frac{1}{2}$ S., $9\frac{1}{2}$ miles. A W. by N. $\frac{1}{2}$ N. course, 20 miles, will carry you up with the Cross Rip light-ship. From the light-ship to Holmes' Hole the course is W. by N. $\frac{1}{2}$ N., $13\frac{1}{2}$ miles, when follow the directions on page 269, for entering the harbor.

Bound Eastward through the Vineyard—To go North of L'Hommedieu Shoal.

Nobska Point light bearing W. by S., $2\frac{1}{2}$ miles distant, steer E. $\frac{1}{2}$ S. $8\frac{1}{2}$ miles, leaving Succanisset light-ship on the port hand, which brings you up with the Red Buoy No. 6, of Eldridge's Shoal, leaving it on the starboard hand, then E. by N. $\frac{1}{2}$ N., $6\frac{1}{2}$ miles, bring you in the fairway for Hyannis.

If you mean to pass to the South of the Bishop and Clerks, after you have passed Eldridge's Shoal Buoy, steer E. by N. $\frac{1}{2}$ N., $2\frac{1}{2}$ miles, (leaving the Red Buoy No. 8 on the North point of the Horse-shoe on the starboard hand) thence E. $\frac{1}{2}$ S. $1\frac{1}{2}$ miles (leaving the Black Spar Buoy No. 5 on the South point of the Bishop and Clerks on the port hand) will bring you up with the Red Buoy No. 2, on the North point of the Handkerchief.

To go North of Hedge Fence Shoal.

Nobska Point light bearing W. $\frac{1}{2}$ S., $1\frac{1}{2}$ miles distant, steer S.E. by E. $\frac{1}{2}$ E., $15\frac{1}{2}$ miles, which brings you up with the Cross Rip light-ship; if bound through Butler's Hole, steer E. $\frac{1}{2}$ S. $2\frac{1}{2}$ miles, for the Black Buoy, No. 5, on the South-east point of the Horse-shoe, then E. by N. $9\frac{1}{2}$ miles, to the Black Buoy No. 7, on the S. point of the Handkerchief, thence E. by N. $\frac{1}{2}$ N. $6\frac{1}{2}$ miles, to the Pollock Rip light-ship, from thence to sea. The course, if bound outside of all, is E. by S. $\frac{1}{2}$ S.; if between the Rips, is N. by E. $\frac{1}{2}$ E.

To go South of the Hedge Fence Shoal.

Nobska Point light bearing N.W. by W. $\frac{1}{2}$ W., three-quarters of a mile distant, steer S.E. by E. $7\frac{1}{2}$ miles, which brings you midway between the Red and Black striped Buoy, on the East end of the Hedge Fence, and the Red Buoy No. 6, on the East end of the Squash Meadow Shoals; thence E. by S. $\frac{1}{2}$ S., $9\frac{1}{2}$ miles, will bring you up with the Cross Rip light-ship. To go to sea, follow the directions in the preceding paragraph.

NOSKA POINT LIGHT, 4 miles West of Falmouth, is a fixed light, elevated 80 feet above the sea. It is intended to guide vessels passing over the shoals through the North channel into the Vineyard Sound. The following bearings have been taken: West Chop light-house, S.E. $\frac{1}{2}$ S., distant $2\frac{1}{2}$ miles; East end of Middle Ground, S.E. $\frac{1}{2}$ S., $2\frac{1}{2}$ miles; West end of Middle Ground, S.W. by S., 4 miles; Gay

Nobska Point light.

Head light-house, S.W. $\frac{1}{2}$ W., 124 miles; Turpaulin Cove light-house, W.S.W., 61 miles; Falmouth Wharf, N.E. by E., 3 miles; Seconset Point, E. $\frac{3}{4}$ N., 7 miles; N. W. part of the Hedge Fence, E.S.E., 4 miles; Cape Poge light-house, S.E. $\frac{1}{2}$ E., 11 miles; East Chop Holmes' Hole, S.E. 5 miles. Keeping the Nobska light open by the East Chop Holmes' Hole, will clear the old town flats.

L'Homme-dieu Shoal.

L'HOMMEDIEU SHOAL.—On the West end of this shoal is a red spar buoy No. 2, in 24 feet water, bearing from the light on West Chop Holmes' Hole E. 7° S., $2\frac{1}{2}$ miles; from Nobska Point light, N.E. by N., $3\frac{1}{2}$ miles; from Cape Poge light, N.W. by N., 8 $\frac{1}{2}$ miles. The shoal extends about 4 miles in an East and West direction nearly, and on its Eastern extremity is placed a red spar buoy, No. 4, in 18 feet water, bearing from West Chop light, E. by N., 6 miles; from Nobska Point light, E. 18, 8 $\frac{1}{2}$ miles; from Cape Poge light, N. $\frac{1}{2}$ W., 6 miles. The least water on this shoal is 3 feet at low-water.

Hedge Fence Shoal

HEDGE FENCE SHOAL, lies South of L'Hommedieu Shoal, and extends W.N.W. and E. S. E. about 3 $\frac{1}{2}$ miles. On its Western end is a spar buoy, red and black horizontal stripes, and a similar one on its Eastern end, both in 22 feet water. The West buoy bears from West Chop light N.E. by E. $\frac{1}{2}$ E., 2 miles; from Cape Poge light, N.W. $\frac{1}{2}$ W., 7 $\frac{1}{2}$ miles; the East buoy from West Chop light, N.E. by E. 1 E., 5 miles; from Cape Poge light, N.N.W. $\frac{1}{2}$ N., 4 miles. The middle of this shoal is nearly dry at low-water.

Horse-shoe Shoal.

HORSE-SHOE SHOAL lies about 3 miles to the Eastward of the above shoals, and extends about 7 $\frac{1}{2}$ miles in a N.W. and S.E. direction, having a dry spot on its North-western extremity, and a second about 1 $\frac{1}{2}$ mile S. by E. of the first. On the N.W. edge, near the above dry spot, is a red spar buoy No. 8, in 4 fathoms low-water. There is a black can buoy, No. 3, in 3 $\frac{1}{2}$ fathoms, on the Western edge of the Southern part of this shoal, and a black nun buoy, No. 5, in 4 fathoms, on the Eastern edge; and about midway between the first and the red buoy No. 8, on the N.W. part of the Shoal, is a black nun buoy, No. 1, in 22 feet water. The shoal is about 1 $\frac{1}{2}$ mile wide, but the Northern part extends East and West about 4 miles. A red spar buoy, No. 10, is placed on the Eastern part of the broken ground off the N.E. part of the Horse-shoe.

Edward's Shoal. Long Shoal.

EDWARD'S SHOAL, lies about one mile S. $\frac{1}{2}$ E. from Cross Rip light-ship, and extends North and South about three-quarters of a mile. Least water, 10 feet.

LONG SHOAL.—S. W. $\frac{1}{2}$ W. from Cross Rip light-ship is a red spar buoy, No. 8, on the N.E. part of this shoal, in 12 feet at low-water. The shoal extends about 2 miles N.E. and S.W.; least water, 2 feet. The Southern part curves to the Eastward, extending in that direction about three-quarters of a mile to within one-eighth of a mile of the Western end of a shoal called the Shovelful, which lies East and West, 2 miles, between Long Shoal and Tuckanuck Shoal. Least water on Shovelful 3 feet.

Tuckanuck Shoal.

TUCKANUCK SHOAL, on the North-eastern part of which is a red spar buoy, No. 12, bearing from Cross Rip light-vessel S.E. by E., 5 $\frac{1}{2}$ miles distant, extends from its centre (which bears from the Cross Rip light-ship S. by E. $\frac{1}{2}$ E., 3 $\frac{1}{2}$ miles distant) S. by E. about 2 $\frac{1}{2}$ miles, and E. $\frac{1}{2}$ N. about 4 miles, and is about 1 $\frac{1}{2}$ mile wide, having spots on its Northern middle and Southern parts dry at low-water.

Nantucket, or Great Point light.

NANTUCKET, or GREAT POINT LIGHT, on the N. E. point of Nantucket Island, is a fixed light, and is elevated 70 feet above the level of the sea.

The buoy boat bears N. 58 $^{\circ}$ E., 3 $\frac{1}{2}$ miles from Nantucket, or Great Point light. It is in 14 fathoms water. High water 12h. 03m.; rise 3 feet.

Nantucket cliff beacons are on the South side of the harbor, on high ground some distance from the shore. They are small pyramidal buildings, and contain fixed lights. Their only use is to assist vessels entering the harbor to pass the bar.

Nantucket Harbor.

NANTUCKET HARBOR.—If the light-house on the South side of the harbor cannot be seen, bring the light on Brandt Point (which lies on the starboard hand and shows a fixed light) to bear S. by E., (none to the South of that,) and run for it 2 $\frac{1}{2}$ within about a cable's length; then run to the Eastward for the end point, and pass it as near as you please; or,

Bring the South light and the light on Brandt Point in one, at the outer buoy; and the South light should be opened to the Westward on this range one handspike's length, to run the channel from the bar, or outer buoy, to the shoaling of the water of Brandt Point. Variation in 1850, 9 $^{\circ}$ 45' W.

From Brandt Point N.N.W. $\frac{1}{2}$ W. 309 fathoms; then N. by W. $\frac{1}{2}$ W. 100 fathoms; then N. 350 fathoms over the bar.

From the bar N. by W. $\frac{3}{4}$ W. 8 $\frac{1}{2}$ miles, will cross Tuckanuck Shoal, in 17 or 18 feet water.

Bound over the Shoals of Nantucket from the Bar.

BOUND OVER THE SHOALS OF NANTUCKET FROM THE BAR.—From Nantucket Bar, the course is about N.N.E. to the Great Point; if a West tide, run for the light-house, pass the Great Point, keeping it about 3 $\frac{1}{2}$ miles distant from you; or,

East tide until you to sea in fathoms, is danger that you wind and N. to E. When of the No. At the springs of CAPE and 55 feet. A fixed the west s the sea. EDGAR town Harl to bear S. will have 6 S., and pas them up to Vessels near Cape and steer light about them up to If vessels until the ha may anchor 12h. (7m., r HOLMES of Holmes' HOLMES open with W Chop a bert then be the and clear. woods on Lo town. High Holmes' I and white li East entranc In leaving Northward o W. end of w light N.W., red and black 5 feet. The hand, when y must continue steer E. by S Cape Poge a must govern y ouse 18 mile steer, passing steer East, ta in ship-chann water. When you and then, by s xel light,) d The shoals y Lt. C. R. between the edges lying p spots of 8 feet

East tide may set you on the Point Rip. Keep the town open, clear of Great Point, until you are 3½ miles to the N.N.E. of the point; then running East will carry you to sea midway, between McBlair's and the Great Round Shoal. When you are in 25 fathoms, you are without the Great Rip. If a light wind, and a Southerly tide, there is danger of being set by the tide too near the Rip; therefore it is best, after being sure that you are without the Round Shoal, to run E. by N., or E.N.E., according to the wind and tide. When you have passed the Round Shoal, there is nothing to fear from N. to E.

When the town is shut in by the high land of Pocomo or Squam, you are in danger of the North end of the Bass Rip, also the North end of the Great Rip.

At the full and change of the moon, it is full sea at Nantucket at 12h. 18m.; rise, springs 4 feet 9 inches.

CAPE POGG LIGHT, on the N.E. point of Martha's Vineyard, is a fixed light, *Cape Pogg light.*

A fixed light is erected at the entrance of Edgartown Harbor, on a pier running from the west side, 1000 feet from the beach. It is elevated 37 feet above the level of the sea.

EDGARTOWN HARBOR.—Vessels bound Eastward, and wishing to enter Edgartown Harbor from the East end of Squash Meadow Shoal, will bring the Harbor light to bear S.W. by S., and Cape Pogg light to bear S.E., then steer S.S.W., (they then will have 6 and 6½ fathoms water,) until the harbor light bears W., then steer W. by S., and pass the light about a cable's length to the right hand, which course will carry them up to the wharves. *Edgartown Harbor.*

Vessels bound Westward, and wishing to enter Edgartown Harbor, after passing near Cape Pogg, in 4 or 5 fathoms water, bring the harbor light to bear S.W. by S., and steer S.S.W. until the harbor light bears W., then steer W. by S., and pass the light about a cable's length, leaving it on the starboard hand, which course will carry them up to the wharves.

If vessels wish to anchor in the outer harbor, they will follow the above directions until the harbor light bears W. by S., and Cape Pogg light bears N.E. ½ E., when they may anchor in 1½ or 5 fathoms water, and very good holding-ground. High-water, 12h. 17m., rises 2 feet.

HOLMES' HOLE LIGHT is a fixed light, 60 feet above the sea, on the West Chop of Holmes' Hole. *Holmes' Hole light.*

HOLMES' HOLE.—Entering this harbor from the Westward, East Chop well open with West Chop light-house, clears you of the middle ground. Give the West Chop a berth of half a mile, until you are past the buoy off Low Point. The chart will then be the best guide. You can beat in with perfect safety, the shores being bold and clear. Ships may anchor in 3½ fathoms, mud; West Chop light just open with woods on Low Point. Small vessels may anchor further in, and immediately off the town. High-water, full and change, 11h. 48m. Spring tides rise 2 feet. *Holmes' Hole*

Holmes' Hole beacons are fixed lights, red, white, and green, respectively. Red and white lights range for the West entrance; green and white lights range for the East entrance.

In leaving Holmes' Hole to pass over the Shoals, keep the West Chop open to the Northward of the East Chop, until you have passed Squash Meadow Shoal, on the N. W. end of which is a red can buoy, placed in 22 feet water, bearing from Cape Pogg light S.W., 4½ miles; from West Chop light, S.E. by E. ½ E., 3½ miles; and from the red and black buoy on S.E. part of Hedge Fence, S.S.E. ½ E., 2 miles. Shoalest water 5 feet. The buoy lies about 2 miles from the East Chop, must be left on the starboard hand, when your course will be E. by S., in 10 or 12 fathoms water, which course you must continue till you pass Cape Pogg light. If it should be time of flood, you may steer E. by S. ½ S., as the tide of flood sets very strong to the Northward, between Cape Pogg and Tuckanuck Island, and the tide of ebb to the Southward, so that you must govern your course by the tide. In clear weather you may see Nantucket light-house 18 miles, which you must bring to bear E. by S. ½ S., which course you are to steer, passing it at the distance of one league, when you must bring it to bear West and steer East, taking care to make this course good, which will carry you over the shoals in ship-channel; the ground is very uneven, and you will have from 4 to 8 fathoms water.

When you have passed over the shoals, you will have from 10 to 14 fathoms water, and then, by steering North, you will make Cape Cod light-house, (which contains a fixed light,) distant 18 leagues.

The shoals of Nantucket, between Great and Monomoy points, have been surveyed by Lt. C. R. P. Rodgers, of the U. S. Coast Survey, with great fidelity. The passage between the Great and Little Round Shoals was found to be full of narrow sand-edges lying parallel to one another, and having a N.N.W. and S.S.E. direction, with spots of 8 feet.

From Cape Poge to Skiff's Island	S 1/2 W	dry	51 do	
Rawe Shoal, the shoale part	S E 1/2 E	6 do do	23 do	

MUSKEGET CHANNEL. Coming from the Northward, pass half a mile Eastward of the buoy off Cape Poge, and bring Cape Poge light and Light house in view, then steer S 1/2 W, leaving the buoy on the Rawe Shoal on the port, and Fox's Shoal buoy on the starboard hand. Continue this course 6 miles, when you will suddenly deeper your water to about 12 fathoms, with the buoy on Muskeget Shoal ahead of you, about half a mile distant, and the church on Sampson's Head N W 1/2 N, then steer S W 1/2 S, between Mutton Shoal and Skiff Island on Starboard, the former on your port hand. Continue this course one mile, and 1/2 miles Black Point N by W, when any course from S to S W 1/2 miles, will clear the shoals. The shoal water off Cape Poge extends about two thirds of a mile, and is placed on its Eastern edge.

Hawes Shoal has 4 feet water on it. Northern end is about 14 miles N from Cape Poge, its Southern end, 24 miles S S E 1/2 E.

Mutton Shoal has 7 feet water on it. A buoy is placed on its Western end, miles S S E 1/2 E from Aquaque Shoal.

Skiff Island or Shoal is low, surrounded by shoals, bearing S S E 1/2 E, 11 miles from Aquaque Shoal.

Aquaque Shoal extends S W from the bluff 3 miles from the shore, and has 17 feet water on it. Do not approach too near the shoals off Muskeget Shoal. Muskeget Shoal should not be attempted at night.

SANKATY HEAD AND NEAR ABOUT THE SHOALS, &c.

SANKATY HEAD LIGHT is 150 feet above the level of the sea, the tower is 100 feet high, and is painted with two white and one red ring, horizontally, the red being in the center, it is a fixed light, varied by flashes, when seen at the distance of 13 miles, less, beyond that it is a flashing light, with flashes of 40 seconds duration, and of 20 seconds rest. It bears S by E, 9 miles from Long Point light, and from the Cape of the New Shore S 80 1/2 N, W, 1 1/2 miles.

OLD SHOAL. The dangerous shoal, which lies in lat. 41° 01' N, long. 69° 15' W, bears S by E, from Sankaty Head light 12 1/2 miles. It is composed of hard sand, over which the sea breaks in the most tremendous manner, having on it many rocks of 2 feet water, and the tide meeting it abruptly, passes over it in eddies and currents. The course of the tides is N E and S W, beginning to run S W 1/2 W on a day of full moon, and continues in that direction about 7 hours. The rip runs from West to West a mile, and is in breadth two cables' length. It extends in 5 fathoms, over the East and West of the shoal. The rip which extends from Westward has a depth of 7 fathoms water on it.

South from the Old South Shoal, half a mile distant, the bottom is uneven, from 5 fathoms. There is a rip part off from the West end of the shoal to the South West, and sweeps round so that the South end of the Rip bears nearly South from the shoal, on which it sometimes breaks in 7 or 8 fathoms water, at the distance of 1/2 mile.

The Sankaty Shoal, together with George's Bank, have been surveyed at the expense of the War, and published on a large scale, by T. & G. W. BLUN, 179 Water-street, corner Baring Slip, New York.

miles from the shoal, between the outer part of the rip and the shoal is a even bottom and full of rips.

The tide runs round the compass in 12 hours, but the Southern tide has the greatest duration, and runs the strongest.

All who pass near the South Shoals should, for their own safety, pay particular attention to the tides, sometimes a current sweeping them over the bottom with a velocity of 100 ft, and even much greater in some instances, than the vessel moves through the water.

Extract from the Survoying Ship Obed's Journal

"Sank in Head bearing	N W	} Came to a large swash through the Bass Rip with 3 fathoms, landing on the rip, had from 9 feet to 22 fathoms, hard sand.
Saw over the town	N W 3 N	
South end of land	W	
"Sank in Head bearing	N by W	} On the south breaker of Bass Rip, in 9 and 8 feet and less.
Saw over the town	N N W	
Tom Sawyer's Head	N W by N	
South end of land	W N W	

Kept running to the Southward in a channel of from 6, 7, and 8 fathoms, Saw Kay Head bearing N by W 8 miles, crossed a dangerous rip in 24 fathoms, lying S W by S. From this rip 17 S E, 3 mile distant, are another rip, between which are 9, 13, 17, 14, 6, and 14 fathoms, which is the shallowest water on the rip, then standing East, had 7 and 8 fathoms, 3 cables' length from this rip, came to another, with 4 fathoms, water, from this, at equal distance, came to a third, then a fourth, all of which were within the limits of 3 miles, and lay N and W. Although they have the appearance of danger, they are not less than 4 fathoms on the shoals (part). After crossing the fourth rip, came into deep water within one mile, viz. 15, 14, 12, and 5 fathoms, and anchoring well. When over, had smooth water with 3 fathoms, and made an outer course, bearing 1, 11, 13, and then 14 fathoms, and crossed the East end of the South Shoal in 2 fathoms, running down the South side in 14 fathoms, 20 fathoms distant, when we anchored in 10 fathoms. Got under way and stood to the Westward, had 7, 1, 6, 5, and 7 fathoms, double ground the West end in 3 fathoms, fine sand, when over had 7 fathoms, the tide came N N W. Kept along the North side in 3, 21, and 2 fathoms one cable's length from the breakers. When about midway the shoal, perceived a swash through which we crossed between the breakers, in a 3 1/2 days run, had 2 and 2 fathoms, and one east 9 feet, at which time it was about half tide. In a 6 w morning depended to 1, 3, 6, and 7 fathoms, 2 cables' length from the shoal, had white sand. From this, steered S W, to make a fourth course good, kept the lead going, and increased the sounding gradually to 10 fathoms, fine black and white, and then one mile from the shoal. From this sounded every 3 miles, depth increasing about one fathom per mile, that the distance of 7 leagues from the South shoal, where we found 28 fathoms, fine black and white, and that was in lat. 40° 17' N, long. 69° 56' W. The same quality of soundings continue till you get in lat. 40° 30' N, when you will have 10 fathoms, soft mud, from which it continues muddy bottom till off soundings, and to 40° N, to bottom, with 10 fathoms.

Next day the Obed, Capt. J. Coleworthy, was sent by the author of this work to ascertain the exact situation of the South Shoal, which differing so much in latitude from what had ever been laid down, induced several gentlemen in Nantucket again to engage in the enterprise, who confirm the surveys made in that vessel, and make the following report: "Observed in latitude 40° 14' N, abreast of the shoals, had down by Capt. Coleworthy; steered off S by W 22 miles, and regularly deepened the water to 35 fathoms; steered E N E, 12 miles, to 30 fathoms; N W 50 miles, to 8 fathoms; S S W, 10 miles, to 30 fathoms; and N N W, 14 miles, regularly shoaling until 6 A.M. made the hills, and came in at one P.M. There several courses formed a track over where Paul Pooklum has laid the South Shoal of Nantucket, and on which here are 3 fathoms."

NEW SOUTH SHOALS.—This dangerous shoal lies on it only 8 feet in places, and runs from 1/2 mile middle of the Old Shoal from S. 1/2 W. to S. 3/4 W. 1/2 W., by compass, distance 6 1/2 miles. It is 2 1/2 miles long from East to West; and its greatest breadth, from North to South, nine tenths of a mile.

Between it and the Old Shoal there are from 1 to 18 fathom water; but to the East and West there are ridges of only 20 to 24 feet water, to the extent of about 3 miles from the New Shoals. Deep water intervenes between these ridges, and the soundings on the ridges are very irregular.

The tide rips show that two, and perhaps three, lines of shoal ground are near each other, in parallel directions. The latitude of the centre of the New Shoals

New South Shoal

is $40^{\circ} 57' 50''$ N., longitude $69^{\circ} 51' 40''$ W., and bears from Sankaty Head S. $\frac{1}{2}$ E., 19 $\frac{1}{2}$ miles.

Tides.

The tides set regularly round the compass, the main body of the flood running to the Eastward, and the ebb to the Westward, varying North and South of East and West. But the flood begins to turn to the Southward, passing round to the West, and ebb to the Northward, passing round to the East, about $1\frac{1}{2}$ hour before the principal set and strength are attained.

Upon the shoals the tides always run across their line of direction, and are much more rapid, which makes an approach on the side to which the tide is setting very dangerous.

The tide is never still; at even slack water its velocity is seldom less than half a mile, and on the second quarter of the flood and ebb it sets at the rate of two knots.

Seven leagues to the Westward of the South Shoal, in 25 or 30 fathoms, you will have black mud of a shining smooth nature, when you will be in Tuckanuck Channel.

To the Westward of the South Shoal of Nantucket, you have no shoals, rips, nor tides to hurt you, until you come near the land; but clear sea, good navigation, and regular soundings. To the Eastward and Northward of the South Shoal, you will have a rapid tide and numerous shoals.

There is a light-vessel in 17 fathoms water, about one mile to the South of the Southern extremity of this shoal in latitude about $40^{\circ} 56' 30''$ N., longitude $69^{\circ} 51' 30''$ W. She has two masts, painted yellow, white mast-heads, with open work at an elevation of 63 feet. The hull of the vessel is red. Two lights are shown at an elevation of 44 feet, and can be seen in good weather about 12 miles from an elevation of 15 feet above the sea.

There is a bell which will be tolled in foggy weather.

Vessels bound to the Westward, after passing the light-vessel, may steer the following courses and distances:

For Tom Nevers Head, N. 26° W.	21 miles.
" Block Island light, W. N. W.	78 "
" Light-vessel off Sandy Hook, W.	180 "

being careful to use the log and lead frequently, particularly in thick weather.

Vessels bound to Boston Bay, or that vicinity, with moderate weather, may, after passing the light-vessel, steer E. N. E., 18 miles; this leaves the Fishing Rips on the starboard hand, from thence N. by W. $\frac{1}{2}$ W., 33 miles, which brings them up with Chatham lights.

Pochick Rip.

POCHICK RIP lies off the South-east part of Nantucket Island. It commences a few rods South of Siasconset town, and then runs E. S. E. one mile, when you come to a corner on which are 6 feet at low-water; between this corner and the island there are a few swashes, from $2\frac{1}{2}$ to 3 fathoms, through which vessels may pass. From the corner the rip runs South $1\frac{1}{2}$ mile, when you come to another swash, half a mile wide, with 7 fathoms. W. S. W., one-quarter of a mile from this channel, is a very shoal spot, with 6 feet, which runs S. W. by W. one-quarter of a mile, when you fall into a swash 40 rods wide, Tom Nevers Head bearing N. N. W., 3 miles distant. You then come to the East end of the Old Man, which runs W. S. W. about 4 miles, on which are from 9 feet to 3 fathoms; when over the Old Man, you will drop into 7 fathoms, fine sand, with black specks.

Between the Old Man, Tom Nevers Head, and Pochick Rip, there is a very good roadstead, or anchorage; and with the wind at N. W., N. N. E., E. S. E., and fair at South or S. S. W., preferable to any harbor in the Vineyard Sound for vessels bound to the Northward or Eastward, particularly in the winter season, provided your cables and anchors are good. Tom Nevers Head bearing E. N. E. 4° N., the Southernmost land W. by N., you will have 5 fathoms, coarse sand; from which to the Old Man, you will have 5, 6, 6 $\frac{1}{2}$, 7, 8, 9, 10, to 11 fathoms, red sand, then half way between the two; from this you shoalen to 13, 11, 8, 7, 5, 4, and 3 fathoms, fine sand, with black specks.

Bass Rip.

BASS RIP, on which there are from 4 to 18 feet water, is 4 miles long in a N. N. E. and S. S. W. direction, the N. E. point bears E. 10 S. from Sankaty Head light, 3 miles distant. On it there is a white buoy boat, with Bass Rip in red letters on each side. It has one mast, with red hoop iron day-mark.

From Sankaty Head light, North by the way of East, to the South, a sweep of 3 miles, the ground is broken and full of dangerous shoals, from 9 feet upwards. Vessels of 9 feet or over, should not attempt to navigate within this extent without a pilot.

The following are from the U. S. Coast Survey:

1. A dangerous ridge near the New South Shoal, lying in a N. N. E. and S. S. W. direction, having on it 4, 5, and 6 fathoms, and deepening very rapidly outside to 10 and 25 fathoms, and inside to 13 fathoms, on which the sea breaks in bad weather

The following bearings are taken from the centre of this ridge: Centre of New South Shoal, W. by S., distant 4 miles; the middle of the Old South Shoal, N. $\frac{1}{4}$ W., distant 6 miles.

2. A shoal spot with 16 feet of water on it in the channel-way to the Eastward of Bass Rip, from which Sankaty Head bears W. N. W. $\frac{1}{4}$ W., distant $4\frac{1}{2}$ miles; and Great Point light N. W. $\frac{1}{4}$ N., distant $10\frac{1}{2}$ miles.

3. A shoal having 14 feet of water on it to the Southward and Eastward of Great Point light, and North of Bass Rip, from which Sankaty Head bears S. S. W. $\frac{1}{4}$ W., distant 4 $\frac{1}{2}$ miles; and Great Point light N. W. by W. $\frac{1}{4}$ W., distant $5\frac{1}{2}$ miles.

Four shoals, having on them from 9 to 15 feet, bearing from Great Point light E. $\frac{1}{2}$ S., from $10\frac{1}{10}$ miles to $9\frac{1}{10}$ miles distant. From Sankaty Head light they bear N. E. $\frac{1}{4}$ E., from $9\frac{1}{10}$ miles to $9\frac{1}{10}$ miles distant. They are named McClair's Shoals, from the discoverer.

These shoals can readily be discovered by the rip (or ripples) formed on them by the tides at all stages, except during shuck water, when they can no longer be detected by this means; but in daylight they exhibit the usual discoloration of water.

Two small spots of 18 feet water; one bears from Great Point light E. $\frac{1}{2}$ S., $9\frac{1}{10}$ miles distant; from Sankaty Head light, N. E. $\frac{1}{4}$ E., $9\frac{1}{10}$ miles distant.

The other from Great Point light, E. $\frac{1}{2}$ S., $11\frac{1}{10}$ miles distant; from Sankaty Head light, N. E. $\frac{1}{4}$ E., $10\frac{1}{10}$ miles distant.

GREAT RIP is 13 miles long, and runs nearly N. $\frac{1}{2}$ E. by S. $\frac{1}{4}$ W. The Northern *Great Rip*.

point, of 5 fathoms, bears from Sankaty Head light E. by N. $\frac{1}{4}$ N., distant $10\frac{1}{2}$ miles. On it there is a white buoy boat with Great Rip in black letters on each side; one mast topped with a cedar bush.

THE SOUTHERN POINT, of 6 fathoms, bears from Sankaty Head light S. E. $\frac{1}{2}$ S., distant 15 miles. *The Southern Point.*

THE ROSE AND CROWN.—The shoal ground on the North end of the rip, having as little as 7 feet water, is 4 miles in extent. The North end bears from Sankaty Head light E. $\frac{1}{4}$ N., $10\frac{1}{2}$ miles distant. *The Rose and Crown.*

The South end of the Rose and Crown bears from Sankaty Head light E. S. E. $\frac{1}{4}$ E., distant $10\frac{1}{2}$ miles.

On the South end there is a sluc of 4 fathoms, and three-quarters of a mile wide. From thence to the South end of the Great Rip the ground is broken, having as little as 4 feet water.

DAVIS' BANK.—There is a channel of from 7 to 20 fathoms between the Great and Fishing Rips, of 12 miles in width. In this channel, S. 40° E., 18 $\frac{1}{2}$ miles distant from Sankaty Head, is a spot of 3 $\frac{1}{2}$ fathoms, on what is called Davis' Bank. This bank has an extent of 13 $\frac{1}{2}$ miles, in a N. 25° E. and S. 25° W. direction; and 4 $\frac{1}{2}$ fathoms is the least water, except in the above place. *Davis' Bank.*

THE FISHING RIP, on which there are from $1\frac{1}{2}$ to 10 fathoms water, is 15 miles extent from its N. N. E. to the S. S. W. point. *Fishing Rip.*

The N. N. E. point bears from Sankaty Head light S. E. by E. $\frac{1}{4}$ E., distant 25 miles; the centre of 6 fathoms bears S. E. $\frac{1}{4}$ E., distant 30 miles; the S. S. W. point, S. E. $\frac{1}{4}$ S., distant 28 $\frac{1}{2}$ miles.

Around the coast of Nantucket and the shoals, you will have sandy bottom, and in moderate weather had better anchor than be driven about by the tide, which is very wild. The course of the tides at and over Nantucket Shoals is nearly N. E. and S. E., and regular. The N. E. tide makes flood. S. S. E. moon makes high-water. With moon makes full sea at Nantucket Harbor. *Tides.*

S. S. E. and W. N. W. moon makes high-water on the shoals. The tide of flood sets E. by E., and ebbs S. W. by W., from 2 to 3 knots an hour. It ebbs and flows about 6 feet.

BLOCK ISLAND CHANNEL, &c.—Directions for those running for Block Island Block Island Channel, to the Southward of Martha's Vineyard, Vineyard Sound, Nantucket Island, Channel, and such as are bound into the Vineyard Sound, and intend going over the shoals to the Eastward.

In approaching the South end of Block Island (on the N. W. point of which two lighthouses are erected, as after described) from the Southward the water shoals gradually. When the island bears from N. W. to N. by W., the bottom is mud; this is commonly called Block Island Channel. This island, if you come from the Southward, bears round and high; and if you approach it from the S. E., it appears like a saddle, being high at both ends, but highest to the Southward. Your course from the S. E. point of Block Island to Gay Head light-house is E. by N., 31 miles. Variation in 1799, 82° 30' W. The current in Block Island Channel is N. N. E. and S. S. W., two sets. If you are to the Southward of Martha's Vineyard, and can see Noman's Land, and intend going over the shoal to the Eastward, bring Noman's Land to bear

W. and steer E. by S., 8 leagues, which will bring you up with Nantucket Island, which you must give a distance of two miles, until you have passed Miconic Reef, which extends one mile from the shore, has 2 fathoms water, and bears from the South Tower of Nantucket S. by W. When you get to the Eastward of this reef, you may nigh the shore to within one-quarter of a mile, until you with Tom Never's Head, which lies 13 of a mile to the Southward and Westward of a small village, called Siasconset, where you may anchor, if necessary, in 4 or 5 fathoms.

If you wish to continue through the channel, which lies between Nantucket Island and the Old Man, you may run within three cables' length of the shore, which will carry you over Poehick Rip, on which there are but 2 fathoms, and of course only safe for small vessels. When on this rip, haul to within one cable's length of the shore and continue in 5 fathoms till up with Sankaty Head, which is the highest Eastern land of Nantucket. Bring Sankaty Head to bear S.W. when in 5 fathoms water, and run N.E. till you deepen to 15 fathoms, when the Round Shoal buoy will bear N.W.; after which you shoal into 7 and 8 fathoms, fine ridges, which having passed, and come into 10 fathoms, a North course will carry you to the high land of Cape Cod, 12 leagues distant.

If you wish to go between the Old Man and Poehick Rip, bring Tom Never's Head to bear N.W. by W., and run S.E. by E. till Sankaty Head bears N.N.W. by W. where you will have 9 fathoms water, when you will run direct for Sankaty Head till in 5 fathoms, which will be close on board; then continue your course N.E. as before mentioned, for the Round Shoal. In running the S.E. by E. course, you go through a swash half a mile wide, having 7 fathoms.

The above directions are only for vessels under 10 feet.

When you pass the New South Shoal, bound to Boston Bay, to go to the Eastern end of all the shoals and rips, steer N.E. by E. about 7 leagues, when you will be up with the Fishing Rip. In running this N.E. by E. course you will deepen to 20 fathoms, which is about midway of South Shoal and Fishing Rip. From the Fishing Rip, run or 18 fathoms, steer N.N.W. for the high land of Cape Cod, 18 leagues, on which is a light-house containing a fixed light.

MUSKEGET CHANNEL.—South of Nantucket, and between it and the Vineyard, and wishing to make a harbor, you may pass through the channel to the Westward of Nantucket Island, by bringing Cape Poge light-house to bear from N. to N. by W. and steering from N. to N.N.E., until up with the red buoy on Mutton Shoal, where you leave on the starboard hand, then N.E. by N. until abreast of Skill's Island Shoal, when a N. & E. course will carry you clear to Cape Poge light, passing a buoy on the S.W. part of Hawes Shoal on your starboard hand, and a black buoy on Tom's Shoal on your port hand.

GAY HEAD LIGHT-HOUSE stands on the South-west end of Marlin's Vineyard, on a remarkable promontory, called Gay Head; elevation of light above sea 191 feet. It is a revolving Fresnel light of the first order, showing a bright flash of the natural color every 10 seconds. It should be seen about 19 miles.

The cliff, which rises about 131 feet above the water, is very conspicuous from different colors of the earth, which have been exposed by the action of the elements. Cape Poge light, at the N.E. point of the Vineyard, may be seen over the land to sea; it is a fixed light, to distinguish it from Gay Head; also Cuttyhunk light, at N.W. part of Cuttyhunk Island, South entrance of Buzzard Bay, which is also a fixed light. The Devil's Bridge, a rocky shoal, makes off about N.W. from the light, one mile distant.

Bearings and distance from the light: West part of Noman's Land Island bears S. by W. from Gay Head, 63 miles distant. The island is about three miles long and broad. Old Man, S. by E. This is a ledge of rocks which lies two-thirds of the distance from the Vineyard to Noman's Land, which has a passage on both sides, but little used. Those who go through must keep near Noman's Land Island light bears North. You will have 7 fathoms water in this passage. Sow and Tail, W. by N. $\frac{1}{2}$ N., distant 20 miles. This is a ledge of rocks which is very dangerous.

To enter the Vineyard Sound, bring Gay Head light to bear E.S.E., 4 miles distant and steer N.E. by E. $\frac{1}{2}$ E.

To enter Buzzard's Bay through Quick's Hole, bring Gay Head light to bear W., and steer N. $\frac{1}{2}$ E. to the entrance of Quick's Hole, which is 6 miles from Gay Head. Menemsha Light, which lies on the North side of Gay Head, affords an anchorage 2 $\frac{1}{2}$ to 3 miles East from the light, with the wind from E. to S.W., but much exposed to the influence of Northerly winds, it should be resorted to only in summer, or at other times from necessity.

From Gay Head light-house, the South part of Cuttyhunk Island bears N. E. distant $7\frac{1}{4}$ miles.

In running from Gay Head light into Vineyard Sound, if you wish to make a harbor on the North side, bring Gay Head light to bear S.W., and run N.E. 3 leagues, which will carry you up with Tarpaulin Cove light, where you may anchor in from 4 to 18 fathoms, on fine sand, the light bearing from W. by N. to S.W., affording safe anchorage with Northerly winds. You can anchor in this harbor in from 4 to 2½ fathoms, taking care to avoid two rocks, one on the North, the other on the South side of the harbor. To avoid the Northern one, of 14 feet, do not bring the light to bear South of S.S.W.; and to avoid the other, of 13 feet, do not bring the light to bear South of S. 4 W.

TARPAULIN COVE LIGHT lies on the port hand as you enter that harbor, and shows a fixed light, elevated 80 feet above the sea. It bears about N.E. by N. from Gay Head light.

There is a shoal of 13 feet, 2½ miles S. by E. ½ E. from Tarpaulin Cove. One-third of a mile N.E. from the light-house there is a rock of 7 feet water, on which there is a black buoy. High-water, full and change, 11 45.

When coming from sea you may run for Gay Head light when it bears from N.N.E. to E.S.E., giving it a berth of 2 miles to clear the Devil's Bridge, which bears from the light N.W. ¼ mile distant. On its outer edge is a red buoy, No. 2. As measuring the distance in the night would be uncertain, you must keep your lead going, and if you should have 7 or 8 fathoms when the light bears S.E. by E., or S.E., haul up North till you have 10 or 12 fathoms; then with flood steer N.E., and with ebb S.E. by E. 3 leagues; then E.N.E. will be the course of the sound, which will carry you to the Northward of the Middle Ground, which has a red and black buoy on the East end, in 16 feet water, bearing from Tarpaulin Cove light E., 7 miles; from West Chop light, N.W. by W., half a mile; and from the East buoy on Hedge Fence, W. ¼ N., 5½ miles, (shoalest water on Middle Ground, 2 feet) when you will see the West Chop of Holmes' Hole light, which you may run for; keep one mile from shore and you open the East Chop one cable's length, and with a flood-tide steer direct for it, and with ebb keep it one point open, till you open a windmill on the West side of the harbor about one cable's length, then run up in the middle of the river till you come 4 or 3 fathoms, where you may anchor in good ground. The usual mark for anchoring is the West Chop, bearing from N.N.W. to N.W. by N., but if you lie any time there, the best anchoring is well up the harbor, and close to the shore, mooring S.E. and N.W., in 4 or 5 fathoms water. In this harbor, which is about 2 miles deep, you will lie secure from all winds, except a Northerly one.

You must not keep further than 2 miles from the West Chop, as there is a shoal called Hedge Fence, on the East end of which is a red and black buoy, in 16 feet water, bearing from West Chop East, 5 miles, and from the black buoy on Middle Ground E. ¼ S., 5½ miles. The Hedge Fence lies about 3½ miles N.E. by N. from Holmes' Hole light, and extends W.N.W. and E.S.E. 3½ miles, is about half a mile broad, and is 4 feet water on the shoalest part. Between this shoal and Holmes' Hole there are from 8 to 12 fathoms water.

If you make the Chop in the night, when it bears S.E. you are clear of the Middle Ground; steer for the East side of it till you strike in 4 or 3 fathoms on the flat ground at the Chop, then steer S.E. by E., observing not to go nearer the land than 3 fathoms. If, in running S.E. by E., you fall into 6 or 7 fathoms, haul up S. by W., and into 1 or 3 fathoms, as before directed.

If bound into Vineyard Sound, with the wind at the Eastward, and you are near the North side of Martha's Vineyard, to go between Squibnoeket and the Old Man, run and Squibnoeket in 3½ or 4 fathoms water, continuing N.N.W. along the beach till you come to Gay Head light, and if ebb-tide, anchor in 5 fathoms, the light bearing from N. to N.E.

Vessels entering the Vineyard Sound should leave Cuttyhunk light on the port hand, giving it a berth of 3 miles, to avoid the Sow and Pigs, the Western part of which bears S. 56° W. from the light, 2½ miles distant. Cuttyhunk is one of the Elizabeth Islands.

CUTTYHUNK LIGHT stands on the South-west part of the island, at the entrance of Buzzard's Bay. It is a fixed light, elevated 42 feet above the sea.

SOB AND PIGS.—The floating light off Sow and Pigs is moored in 9 fathoms water, 2 miles from Cuttyhunk light-house. It shows two fixed lights, 31 and 23 feet above the sea. At the distance of half a mile North-easterly from the light-house, there are 3½ fathoms water on the Sow and Pigs, between which point and light-vessel there is a safe channel. One mile North-easterly from light-vessel rocks dry at half ebb.

Gay Head light house	S 43° E	6 do

In entering Buzzard's Bay, bring Cuttuhunk light to bear East, 3 miles distant, and steer N E by N, which course will carry a vessel to good anchorage, at 6 or 7 fathoms, about one mile from the Dumpling Rock light, with a bearing from N N E to N E by N. This is as far as a stranger should venture without a pilot, who can always be had on setting a signal.

*Anchor
ground*

VINEYARD SOUND. [Variation, in 1850, Western part, 9 degrees W. Eastern part, 9 deg. 30 m. W.] In coming into the Sound in the night with a strong North-westerly wind, haul to the Northward till you have smooth water under the Islands, where you may anchor in 11 or 10 fathoms. Should you have the wind to the Southward, it will be best to run down through the South Channel or Vineyard Channel. When Gay Head light bears S S E, your course is N E by E 1/2 E, or E N E, heaving not to come nearer the land than into 7 fathoms water, till you are abreast of Lombard's Cove, in which is good anchorage, with Southerly or Easterly winds, and may be known by a high sand bank, called Nikonkey Cliff, on the East side of it, about midway the cove, opposite which you may come in in 3 or 3 fathoms, spring bottom, where is the best anchorage. The Middle Ground lies about two miles within the cove, and has 12 feet water on it. If you intend running down for Holmes' Hole, your course, when opposite Nikonkey Point, is E by N, keeping near the land, clear the Middle Ground, the East End of which bears East from Tarpaulin Cove light, 6 miles distant. You may track the shore by the land in from 7 to 4 fathoms till you come near the light, but come no nearer than 3 fathoms, and you may cross the Chop ground, the same as running down to the Northward of the Middle Ground, which bears from the West Chop light N W by W, half a mile, and from the East end of the Hedge Fence, W 1/2 N 5 miles. There is good anchorage along the shore in 6 or 4 fathoms, after you are to the Eastward of Nikonkey Point, till you come near the West Chop. If you wish to make a harbor after entering the Vineyard Sound, bring Gay Head light to bear W, distant 3 miles, and run S E, till you are in 7 fathoms water, which will be on the East side of the bay in the West Chop near Clark's spring, where the best water may be had in great abundance, and a good anchorage, Gay Head light bearing W by N. The tide flows, at change of full days of the moon, at 9 o'clock, but in the channel between Elizabeth's Island and Martha's Vineyard, the flood runs till 11 o'clock. In this channel there is a Middle Ground, which is a narrow shoal of sand, the Eastern end of which bears N W by N, from the light. There are not more than 3 or 4 feet on the Eastern end. A Vineyard Chop of Holmes' Hole comes open of the West Chop, you are to the Westward of the Middle Ground. Your course from Tarpaulin Cove light to Holmes' Hole light is E 1/2 S, distant 7 miles. In steering this course, you must have regard to the tide, as the ebb may set you too far to the Southward, and stand in for a harbor when you have opened the East Chop, as before directed. From Holmes' Hole light to Cape Poge light, the course is S E, and the distance about 7 1/2 miles. In going over the channel between them there are 12 and 11 fathoms water. In going over the Sound through this channel, you must be careful to keep your lead going.

*New Bedford
channel
Quaker's
Hole*

NEW BEDFORD, THRO' QUAKER'S HOLE. Bring Gay Head light, which contains a revolving light, to bear S 1/2 W, and run N 1/2 E, till you come to the passage through the islands which form Quaker's Hole, which you must enter as the middle as possible; but if you deviate, keep the starboard head best on, to avoid a spit or flat which runs off from the S E point of Nashawana, on the point when you will have from 5 to 6 fathoms, then haul square into the Hole, keeping port hand best on board, following somewhat the bend of the shore. You will have Gay Head light open about a ship's length by the S E point of Nashawana, and are at least one mile North of the Hole, which will carry you to the Eastward of a ledge and rock that lie that distance from it, with only 5 to 12 feet water on it, the Westward of which is a good channel, and 5 fathoms all round. Then steer W, till you strike hard bottom in 5 fathoms water, on the S E corner of the ledge, which is on the Western side of the channel, to New Bedford Harbor.

NEW BEDFORD HARBOR, ROUND HILL CHANNEL.—Running in from the *New Bedford Harbor*, Southward and Westward, bring Misham Point to bear W. by S., and White Rock *Round Hill Channel* light, then steer for the Eastward of Dumpling light, and steer to the Northward, leaving the red can buoy, No. 1, on Sand spit, on the starboard hand, and the black spar-buoy off Dumpling Rock on the port hand, and keeping the Rock more open as you advance, so as to pass a quarter of a mile East of the light.

When the light bears W. by N. steer N. E. by N. 2½ miles, leaving the red and black buoys on Middle Ledge and Luce Rock on your port hand, until Clark's Point light is in range with Palmer's Island light, then steer for the beacon on Egg Island Flats, N. by E., nearly 2 miles, leaving the black buoy on Old Bartlemy on your port hand, until Palmer's Island light is in range with the tall chimney of the Wamsutta Factory, steer for them, passing the black buoys on Butler's Flats and Eleven Feet Flank on your port, and the red buoys on Egg Island Flat and Fort Flat on your starboard hand until up with the Southern end of Palmer's Island, then steer for the ends of the Fairhaven wharves, passing a red buoy on the North end of Port Flats on your starboard hand, until you are half way between them and Palmer's Island light, then steer for the most Northern spire in New Bedford, and anchor near the town.

N. B.—Wamsutta Factory is a large stone building, with a very tall chimney on its Eastern side; it is in the Northern part of the town, and may be seen over Fairhaven bridge.

CHANNEL BETWEEN NORTH AND GREAT LEDGES.—Run in through *Channel between North and Great Ledges* this channel, keeping Palmer's Island light open a handspike's length to the Eastward of Clark's Point light, until you are 1½ mile from the latter, then steer for the beacon on Egg Island Flats, and proceed as above directed. On the above course you will pass a black buoy on the Eastern part of Great Ledge on your port hand, and a red buoy on Deane's Rock on your starboard hand.

EASTERN CHANNEL.—Bring the white beacon on Fort Point in range with the high dark spire in Fairhaven, and steer for them until Palmer's Island light and the tall chimney before mentioned are in range, then steer as above directed. On the above course you will pass Hursell Rock and Packet Rock red buoys, and Henrietta Rock striped buoy on your starboard hand, and the black buoy on North Ledge on your port hand.

PALMER'S ISLAND LIGHT is on the N. E. point of Palmer's Island. It is 32 feet high, and a fixed light. With it in range with Clark's Point light, you clear all the ledges outside.

In the river, Palmer's Island light on with the most Northern mill chimney, leads to the river clear of danger.

Other directions from Quick's Hole to New Bedford are, to make a North course and, till you strike hard bottom, in 5 fathoms, on the Eastern side of the channel, and then haul up N. W., but the former directions the pilots consider safest.

In coming into New Bedford from the Westward, the Eastern channel is safest for larger craft. Give the Sow and Pigs a berth of one mile, and run N. E. till Penikese Island bears S. E.; then E. N. E. till Gay Head light bears S., and then N. W., before directed.

A rock lies off N. W. from the North end of Penikese Island, about one mile distant, which there are only 8 feet at low water. Between this and Wilkes' Ledge (on which there is a buoy) is an open ship channel, free from danger, and courses may be run as circumstances require. By those who are acquainted with the bay, the Eastern channel is most commonly used. Giving the Old Cock and Hen and Chickens sufficient berth, the only danger to be avoided in approaching Misham Point is a rock which lies about five sixths of a mile S. W. from it, on which there are only 6 feet at low water. Having passed Misham Point, S. W. of which, three quarters of a mile distant, there is a ledge, on which there are not more than 3 fathoms at low water, and becomes less, you may steer directly for the Dumpling Rock light, off the Round Hill, and which may be passed within two cables' length to the Eastward. Hence to Clark's Point light the course is N. N. E.; but to avoid the Middle Ledge, (on which there is a red buoy,) and which lies very near in direct course from the outer Dumpling light, it is better to steer N. E. by N., about a mile, and then haul up N. N. E. when you will leave the ledge on your port hand. You may also carry in 1 mile to the Westward of the ledge, but the channel between it and the Lone Rock, which lies N. W. from it, is narrow.

DUMPLING ROCK LIGHT is on one of the Dumpling Rocks in Buzzard's Bay, 3½ miles S. W. from Clark's Point light house. The lantern is on a tower on the roof of a dwelling-house, showing a fixed light, 42 feet above the sea. Buoy on Middle Ledge, N. E. ½ N., 1½ mile; buoy on North Ledge, N. E. ½ E., 2½ miles; buoy on Great Ledge, E. ½ S., one mile; Wood's Hole, E. by S. ½ S., 11 miles; Quick's Hole, S. by E. ½ E., 6 miles; buoy on Wilkes' Ledge, S. ½ E., 1½ mile; Penikese Island, S. by W., 6

3 miles distant, and anchorage at 6 and 10 fathoms from N. E. without a pilot, who

1, 9 degrees W. To light with a strong Northwester under the Ledge, if you have the wind in the channel or under the Ledge, E. ½ E., or E. N. E., or

er, till you are abreast of, or Easterly wind, and on the East side of the Ledge, or 3 fathoms, and about two miles, and down for Holmes' Hole, or near the

cept near the end of the Fairhaven wharves, and from the high dark spire in Fairhaven, and from the tall chimney before mentioned are in range, then steer as above directed. On the above course you will pass Hursell Rock and Packet Rock red buoys, and Henrietta Rock striped buoy on your starboard hand, and the black buoy on North Ledge on your port hand.

Palmer's Island light is on the N. E. point of Palmer's Island. It is 32 feet high, and a fixed light. With it in range with Clark's Point light, you clear all the ledges outside.

In the river, Palmer's Island light on with the most Northern mill chimney, leads to the river clear of danger.

Other directions from Quick's Hole to New Bedford are, to make a North course and, till you strike hard bottom, in 5 fathoms, on the Eastern side of the channel, and then haul up N. W., but the former directions the pilots consider safest.

In coming into New Bedford from the Westward, the Eastern channel is safest for larger craft. Give the Sow and Pigs a berth of one mile, and run N. E. till Penikese Island bears S. E.; then E. N. E. till Gay Head light bears S., and then N. W., before directed.

A rock lies off N. W. from the North end of Penikese Island, about one mile distant, which there are only 8 feet at low water. Between this and Wilkes' Ledge (on which there is a buoy) is an open ship channel, free from danger, and courses may be run as circumstances require. By those who are acquainted with the bay, the Eastern channel is most commonly used. Giving the Old Cock and Hen and Chickens sufficient berth, the only danger to be avoided in approaching Misham Point is a rock which lies about five sixths of a mile S. W. from it, on which there are only 6 feet at low water. Having passed Misham Point, S. W. of which, three quarters of a mile distant, there is a ledge, on which there are not more than 3 fathoms at low water, and becomes less, you may steer directly for the Dumpling Rock light, off the Round Hill, and which may be passed within two cables' length to the Eastward. Hence to Clark's Point light the course is N. N. E.; but to avoid the Middle Ledge, (on which there is a red buoy,) and which lies very near in direct course from the outer Dumpling light, it is better to steer N. E. by N., about a mile, and then haul up N. N. E. when you will leave the ledge on your port hand. You may also carry in 1 mile to the Westward of the ledge, but the channel between it and the Lone Rock, which lies N. W. from it, is narrow.

Dumpling Rock light is on one of the Dumpling Rocks in Buzzard's Bay, 3½ miles S. W. from Clark's Point light house. The lantern is on a tower on the roof of a dwelling-house, showing a fixed light, 42 feet above the sea. Buoy on Middle Ledge, N. E. ½ N., 1½ mile; buoy on North Ledge, N. E. ½ E., 2½ miles; buoy on Great Ledge, E. ½ S., one mile; Wood's Hole, E. by S. ½ S., 11 miles; Quick's Hole, S. by E. ½ E., 6 miles; buoy on Wilkes' Ledge, S. ½ E., 1½ mile; Penikese Island, S. by W., 6

miles; Cuttyhunk light-house, S. S. W. $\frac{1}{2}$ W., 7 $\frac{1}{2}$ miles; Sow and Pigs, S. S. W. $\frac{1}{2}$ W., 9 miles; Misham Point, S. W., by W., 2 miles; White Rock, N. $\frac{1}{2}$ E., two thirds of a mile. High-water, 7h. 59m.; rise 1 foot.

High-water. When bound to sea, a S. W., by S., course from the Dumpling Rocks light will carry you just without the ledge South of Misham Point, and in a fair channel way between the Sow and Pigs and Hen and Chickens.

Hen and Chickens HEN AND CHICKENS.—There is a bell buoy off this ledge in 7 fathoms water. The bell is elevated 5 feet above the water, and can be heard about one mile. The following magnetic bearings are given:

Sow and Pigs light vessel.....	S. by E.
Seaconet Point.....	W. $\frac{1}{2}$ N.
Entrance to Westport Harbor.....	N. W., by N.
Old Cock.....	N. by W.

From Seaconet Rocks (giving them a berth of one mile) to the entrance of Buzzard's Bay, the course is E. $\frac{1}{2}$ S. By this course made good, all the dangers of the Hen and Chickens will be avoided. Soundings, generally, from 9 to 7 fathoms, and mostly hard bottom till it deepens to 16 fathoms, sticky bottom, when Cuttyhunk Island light will be upwards of a mile distant, and Clark's Point light will bear N. E., and you may run directly for the light till up with the Dumpling Rocks, to which a sufficient berth must be given. Or you may stand on this N. N. E. course till in 7 fathoms, sticky bottom, which will be between Misham Point and the Round Hills, and come to anchor, or otherwise steer N. N. E. till Penikese Island bears S. E., and then E. N. E., for Quick's Hole channel, as before directed. It may be well to observe that if, when you have stood in from Seaconet Point towards Cuttyhunk Island light, and the light on Clark's Point is not to be seen, but you can see Gay Head light, you may stand on your course E. $\frac{1}{2}$ S. till you shut it in behind the West end of Cuttyhunk, but must then immediately change your course to N. N. E. If neither light is to be seen, the soundings are the only dependence, and must be very carefully attended to. In light winds you must take care the flood tide does not carry you into Buzzard's Bay, or on the Sow and Pigs.

To the S. E. of the Dumpling Rock light, one-half to three quarters of a mile distant, is a sand spit with only 7 feet of water on it. Between this spit and the rocks there are 5 fathoms water. A red buoy, No. 1, is placed on the East end of the spit.

The soundings across the Western entrance of Buzzard's Bay, between the Sow and Pigs and Hen and Chickens, and some distance within them, are very irregular, ranging from 5 to 10 and 15 fathoms, and bottom generally hard.

A South east moon makes high-water in the bay, and the average set of tide 1 $\frac{1}{2}$ knot.

Mommet River MOMMET RIVER.—Sailing for Mommet River, the best water is near to Wenammet Neck, and from the point of Wing's Neck nearly up to the Southernmost Tobey's Islands, are from 4 to 6 fathoms water. Nearly to the Island (Tobey's) commences a ridge of flats, extending over to the N. W. shore, on which are 7 to 9 feet water. Having passed over this ridge, you will have from 15 to 29 feet water, and depth you may carry until abreast of a large single rock, called the Old Cow, which lies about one-quarter of a mile from the shore, when you will come up with a ridge of hard sand from 100 to 120 fathoms wide, on which are from 7 to 9 feet water, which, after passing, you will have from 10 to 22 feet water, quite up to Back Bay Harbor. The soundings are reduced to low-water. Rise from 3 to 6 feet. High-water at full and change, at 8 o'clock. Variation, in 1850, 9° 45' West.

Bird Island is on the Eastern side of Sippien Harbor, in the town of Rochester, about 12 miles E. N. E. from New Bedford light-house. It is small, not containing more than three acres of land, and is about 5 feet above the level of the sea. The light and dwelling houses are built of stone, and are whitewashed. The light is 30 feet high; it is a revolving light, time of revolution 3 $\frac{1}{2}$ minutes.

Light.

 From the South end of Mashue Island to Bird Island, S. W. by W. A. W. $\frac{1}{2}$ miles.
 Wenammet Neck, S. W. $\frac{1}{2}$ S., 2 $\frac{1}{2}$ miles.

WAREHAM HARBOR, IN BUZZARD'S BAY.—This harbor can only be attempted in the day-time; and the only safety is to keep in between the buoys, which are 17 in number, leaving, in going in, the red buoys on the starboard hand, and the black on the port.

NED'S POINT LIGHT-HOUSE is situated on the North side of Buzzard's Bay, and on the East side of Mattapoisett Harbor, about one mile S. E. from the village, and contains a fixed light. The tower is built of stone and whitewashed, standing 15 feet from the sea, to the S. W., and 250 feet from the sea to the S. E. The lantern is elevated 43 feet.

Bearings and distances from Ned's Point light-house.

A red and black buoy on Nye's Ledge, S. S. E., $\frac{1}{2}$ S., distant 2 $\frac{1}{2}$ miles.
 A black buoy on S. E. point of Mattapoisett Ledges, S. $\frac{1}{2}$ E., distant 1 $\frac{1}{2}$ of a mile.
 A buoy on Snow's Rock, S. 10° E., distant 3 $\frac{1}{2}$ miles.
 A buoy on N. W. part of Mattapoisett Ledge, S. 33° W., distant 1 $\frac{1}{2}$ mile.
 Cormorant Rocks, S. $\frac{1}{2}$ W., distant 3 miles.
 Angelica Point, S. E. by E., distant 1 $\frac{1}{2}$ mile.
 Wood's Hole, S. E. $\frac{1}{2}$ E., distant 9 miles.

MATTAPOISETT.—Before coming up with West Island, bring Bird Island light to bear N. E. by N., and run for it until Ned's Point light bears N. N. W. $\frac{1}{2}$ W., when you may haul up N. W. $\frac{1}{2}$ W. In running this course, you will pass a red buoy on your port hand, which stands on the middle of Nye's Ledge; this ledge is about a quarter of a mile over, either way, and not more than 8 feet water on some parts of it. Continuing this course, you will pass a black buoy on your port hand, which stands on the S. E. part of Mattapoisett Ledge, in 2 $\frac{1}{2}$ fathoms of water. Continue the above course and you will pass 2 buoys, one on your starboard and the other on your port hand; the latter stands on the East side of the Sinking Ledge, in 3 fathoms of water; the former stands by the side of the Snow Rock, in 2 $\frac{1}{2}$ fathoms of water. This rock has 54 feet water on it. Keep midway until you pass them, when you may steer N. W. by W., until Ned's Point light bears East, when you may anchor in 3 fathoms water, good bottom.

BLACK ISLAND. Two light houses are erected on the N W point of Black Island, showing fixed lights, bearing N and S, distant 2½ feet from each other, and elevated 10 feet above the level of the sea. From the point extending into the sea, nearly on N E course, is a shoal, making it dangerous for a vessel to pass within 5 miles of the light. From the shoal, Mount Point light house bears S W, by W, 3 W. Point Judith light house, N E, by N. Watch Hill light house, W N W, by Clay Head, Black Island, S E, by E. Rocks of Clay Head, S E, by E, 3 E, and the S W part of Black Island, S S W, 3 W.

The two lights cannot be made separate when to the Northward, unless in a poor moon, when Point Judith light N E, when they appear like the light of a steam boat.

Vessels coming from the Southward, or South and Westward, will make Black Island, and give it a berth of about one mile, on the East and West sides. The two lights situated on the N W point of this island, are so near together, they appear as one light, and you are within 2 and 4 miles of them. On the N W point, a shoal makes the N E, which renders it dangerous for large ships to pass within two miles of the lights. Point Judith light bears from these lights N E, ½ N, distant 14 miles. Vessels making Point Judith, follow the direction—*to sailing into Newport.*

From the S E part of Black Island to Beaver Tail light house, the course is, by light house E ½ E, and the distance 10 miles, about midway between them there are 3 fathoms water. If you are on the West side of Black Island, with the body of the island bearing E N E, in 5 or 10 fathoms water, your course to Point Judith light is, E, by E, about 2 leagues. This point appears like a narrow head, and is partly hid, between Black Island and the point there are from 10 to 11 fathoms water, except a small shoal ground, which, in thick weather, is often a good departure, only 4 or 5 fathoms bearing about W, by S, from Point Judith light, distant 4 miles. From Point Judith when not more than a quarter of a mile from the point to Rhode Island Harbor, your course is N, and the distance is about 5 miles. When in 11 fathoms water, Point Judith light bearing W, or W, by N, the course to Rhode Island Harbor is, E, by N, ½ N, and the distance to the light house 2 leagues. The light house, together with the Bumpkins, must be left on your port hand, it stands on the south part of a small island. This point is called the Beaver's Tail, and is about 2 leagues distant from Point Judith.

POINT BEAVER TAIL LIGHT is a revolving light, 6½ feet above the sea, to distinguish it from Beaver Tail light, which is a fixed light. The distance from the light house to the water mark is as follows: E, from the light house to high water mark, 12 rods; S E, 14 rods; S, 14 rods; W, 14 rods, which is the extreme part of the shoal, to which a good berth should be given. The light on Point Judith bears S W, ½ S, the same distant from Beaver Tail light house. Point Judith light may be distinguished from Watch Hill light, by the light not wholly disappearing when within 3 leagues of it. High water, ½, rise 3 feet.

NEWPORT HARBOR. Commencement Island lies about 4 miles West of Newport, the South end of which (called the Beaver's Tail, on which Newport light house stands) extends about as far South as the South end of Rhode Island. The light house on Commencement Island bears N 60° E from the light on Commencement Island, and Kettle Island bears N E. The East shore forms the West part of Newport Harbor. The ground the light house stands upon is about 19 feet above the surface of the sea at high water. From the ground to the top of the cornice are 60 feet, round which is a gallery, and within that stands the lantern, which is about 11 feet high, and 6 feet in diameter. It contains a fixed light. High water, ½, rise 4 feet.

A small rock lies South of Beaver Tail, called Newton Rock, on which it bears, if there be any sea, distant 200 yards from the light house. S W from the Rock, in 60 feet water, is a black and red horizontal striped buoy, Beaver Tail light bearing N E. The rock is about midway between the light and the buoy.

The following are the bearings by compass, from Beaver Tail light house, of several remarkable places, together with the distances, viz: [1 or 1½, in D 50, about 9 W.]

Black Island (S E point)	S W	by S ½ S
Point Judith light	S W	½ S, distant 2 leagues
Black Island (N E point)	S W	½ S, or S W by S, nearly
Whale Reef	W	½ S
Brenon's Rock	E, S E	½ E
South point of Rhode Island	E	½ S
Highest part of Castle Hill	E, N E	½ E
Brenon's Point	S, E	by E

Fort on Goat Island..... E.N.E. $\frac{1}{2}$ N.
 South-eastermost Dumping..... N.E. $\frac{1}{2}$ E.
 Kettle Bottom..... N.E.
 Newton's Rock..... S., near 200 yards.
 N. B. The anchoring place between Newport and Coaster's Harbor, N.E. by E.

Brenton's Reef.

BRENTON'S REEF.—Brenton's Reef extends about one mile S. by W. from the main shore, on the Eastern side of the entrance; some portions of it are bare at low-tide, and may at all times be seen breaking, with a little motion of the sea. A buoy has been moored on the extreme S.W. part of the reef, in $5\frac{1}{2}$ fathoms at low spring-tides; it is a spar painted red, the top of which is 25 feet above the level of the sea, and may be seen in clear weather from 3 to 4 miles. Point Judith light-house bears from the buoy S.W. by W., distant 9 miles; Beaver Tail light-house, W. by N. $\frac{1}{2}$ N., 2 miles; Seaconset Rocks, E. by S., 8 miles; Castle Hill, N. $\frac{1}{2}$ E., one mile. The buoy may be heared on all sides within a cable's length, but vessels should not pass to the Northward of it, unless well acquainted.

There is a light-ship, showing 2 white lights, off Brenton's Reef, having the following bearings, viz.:

Point Judith light-house..... S.W. $\frac{1}{2}$ W.
 Beaver Tail light-house..... N.W. $\frac{1}{2}$ N., $1\frac{1}{2}$ mile distant.
 Buoy on end of Brenton's Reef..... N.E. by E.

Fort Dumping N. by E., just open with Castle Hill Point; 13 fathoms water at half-tide; bottom fine gray sand, and there is plenty of water between the light-ship and the buoy on the South point of Brenton's Reef.

Newport Harbor.

NEWPORT HARBOR.—Bound into Newport, it is only necessary to give the shores on either side a berth of one-sixth of a mile, as they are very bold. If you draw over 10 feet water, after passing Beaver Tail light, which is a fixed light, 96 feet above the sea, you steer N.E. $\frac{1}{2}$ E., about 4 miles, for the light on the North point of Goat Island. You can pass within a short distance of the light, and anchor in the harbor to the North of the Long Wharf, in $3\frac{1}{2}$ fathoms.

If you have 10 feet or less, when past Fort Adams, steer S.E. by E. $\frac{1}{2}$ E. seven-eighths of a mile for the black buoy off the South point of Goat Island, which bears on the port hand. After passing the buoy, steer N. by E. $\frac{1}{2}$ E., one-quarter of a mile, until under the lee of Goat Island, and anchor in 12 feet water.

Lime Rock light.

If night, after passing Fort Adams, steer for the light on Lime Rock, which is a fixed light, elevated 30 feet above mean low-water, and when past Goat Island follow the above directions.

Goat Island light.

GOAT ISLAND, opposite the town of Newport, about 4 miles N.E. from Beaver Tail light, has a light house on the extreme North end of the breakwater, containing a fixed light, 33 feet above the sea, from which the following bearings have been taken:—Beaver Tail light-house, S.W., distant 4 miles; West shore of Castle Hill, S.W. $\frac{3}{4}$ S., $2\frac{1}{2}$ miles; South Dumping Rock, S.W. $\frac{1}{2}$ W., $1\frac{1}{2}$ mile; Conanicut Ferry, W., 24 miles; Gull Rock, N.N.W.

You must take care to avoid the rocks which lie off South from Castle Hill, some of which are above water. Castle Hill is on the East side of Rhode Island Harbor.

Coming from the Eastward, to clear Brenton's Reef, bring Beaver Tail light to bear W.N.W., and steer for it until you see Goat Island light from the deck, which will then bear N.E. $\frac{1}{2}$ E.; then run for Goat Island light until it bears E., (or continue your course until it bears E.S.E.) at the same time keeping Beaver Tail light bearing S.W. by W., and anchor in 7 to 9 fathoms, good bottom. In coming from the West, after passing Point Judith, on which is a revolving light, steer N.E. by N., until you draw up with Beaver Tail light, to which giving a berth, run for Goat Island light, and anchor as above indicated.

Vessels coming from the Westward through Long Island Sound, bound to Rhode Island, will leave Fisher's Island on the port hand, and steer E. by N., which will carry them to Point Judith, keeping in not less than 10 fathoms water, giving the point a berth of one mile, when you will see Beaver Tail light bearing N.E. $\frac{1}{2}$ N., distant 6 miles; steer for it, leaving it on your port hand; you will then steer for Goat Island light, which bears from Beaver Tail light N.E., distant about 4 miles; keeping the latter bearing S.W. by W. until you bring Goat Island light to bear E. or E.S.E. and anchor in from 7 to 9 fathoms water, good holding-ground.

Narragansett Bay lies between Conanicut Island and the main. Your course in about North, taking care to avoid Whale Rock; you may pass in on either side, and anchor where you please. From Beaver Tail light to Gay Head, on Martha's Vineyard Island, the course is E.S.E., and the distance 26 miles.

 Warwick l

If, after passing Point Judith, as before directed, you wish to proceed towards Providence through the West Passage, your course is N. E., leaving Beaver Tail light on your starboard hand, half a mile distant, when your course will be N. by W., $1\frac{1}{2}$ league, to Dutch Island light, (erected on the South part of the island, showing a fixed light 50 feet above the sea,) which you also leave on your starboard hand, one-quarter of a mile distant, from which you steer N. $\frac{1}{2}$ E., 14 miles, for the light on Warwick Neck, leaving it on the port hand, one-quarter of a mile, where you may anchor in 3 fathoms water, as it is not safe to proceed further without a pilot, unless you choose to depend on finding the channel, which is marked out by stakes.

In entering this passage, keep nearest Cominicut Island, to avoid the Whale Rock, which bears from Beaver Tail light S. $82^{\circ} 30'$ W., distant about three-fourths of a mile, with some scattering rocks North and South of it.

Warwick Neck light-house is erected on the South part of Warwick Neck, and shows a fixed light, 54 feet above the sea. A spar buoy has been placed on Long Island Point, off Warwick Harbor, $1\frac{1}{2}$ mile distant, which must be left on the port hand going into East Greenwich.

BUOYS AND SPINDLES PLACED AT NEWPORT HARBOR.—A spindle buoy on Saddle Rock S. E., Eastward of Rose Island, on either side of which there is a passage.

A spindle with a ball, on a rock at the South end of the island, which you leave to the Northward.

One red buoy, with a cross, on Dyer's Reef, South part of Coaster's Harbor, which you leave on the starboard hand.

One on the ledge off the Bishop's Reef, called the Triangle Rock, on either side of which you may pass, giving the buoy a berth.

One black spar buoy at the South, and one at the North end of Gull Rocks, both of which you pass to the Eastward.

One spar buoy on Providence Point, which is the North end of Prudence Island, to the Northward of which is the main channel.

A spindle on the Half-way Rock, which you can pass on either side.

PRUDENCE ISLAND.—A light on Sandy Point, East side of Prudence Island, fixed, 30 feet above the sea. A black buoy on the S. E. part of the shoal off Hog Island, which you leave on the port hand going in.

A beacon on the North end of Rhode Island, South of Bristol Neck, which you leave on the starboard hand going in.

At Plum Beach a can buoy painted black, in 14 feet at low-tide, bears from Dutch Island light E. by N. Vessels bound up the bay must leave it on the port hand, and give a berth of one cable's length, and continue the course up the bay.

Brig Ledge, off Wickford, a spar buoy painted black and white perpendicular stripes, in 10 feet at low-water.

Manna Rock, a spar buoy painted red. The above buoy bears from Poplar Point light-house E. by N. $\frac{1}{2}$ N. These buoys are in a range, and the channel varying; no proper directions can be given.

A dolphin has been placed on Long Bed, in Providence River, in lieu of the buoy formerly placed there.

NEWPORT TO PROVIDENCE.—Pass Half-way Rock, which lies nearly in the middle of the river, about $5\frac{1}{2}$ miles from Newport, and $1\frac{1}{2}$ mile from the South end of Prudence Island; there is a passage on both sides of the rock. West from Prudence Island lies Hope Island, having a passage all round, giving the N. E. end a small berth.

From the Triangle Rock, which lies off the Bishop Rocks, on which is a buoy that may be passed on either side, to Warwick Neck light, the course is N. $\frac{1}{2}$ W. After leaving Prudence Island, 3 miles N. E. by N. from Warwick Neck light, you pass on your port hand a spar buoy, which you may go very close to. E. $\frac{1}{2}$ S. from Warwick Neck light lies a spar buoy, which you leave on the starboard hand. When Warwick Neck light bears W., steer N. N. E. for Nyatt Point light, leaving the spar buoy on Providence Point on the starboard hand, and running so far to the Eastward as to bring Prudence Island to bear South, by which you leave the Middle Ground, which has a buoy on it on the port hand. Nyatt Point light is on the starboard hand, and 9 miles from Providence. Soon after passing the light you come up with a pyramid, directly opposite the village of Patuxent, the base of which is painted black, with a white top, erected on a ledge of rocks, which you may approach very near, leaving it on the port hand. At a short distance you come to another pyramid and a stake, both of which you leave on your port hand. One-fourth of a mile from the last pyramid lie Lovett's Rocks, having a spar buoy on them, which must be left on the starboard hand, going very near to them.

BRISTOL HARBOR.—Bristol Harbor lies 9 miles from Newport, and East of Bristol Warwick light. At the mouth of the harbor lies Castle Island, having a pyramid on

it, which is left on the starboard hand, and a red spar on the port, steering N E when entering.

Beaver Tail light and the Sound

BEAVER TAIL LIGHT AND THROUGH THE SOUND. The first course from the light house on Beaver Tail is S W by S, distant 2 leagues, to Point Judith light; thence from Point Judith light through the Race to Little Gull light, the course is W by S, 14 leagues distant, leaving Watch Hill Point light, Stonington light, and Fisher's Island on your starboard hand, and Little Gull light on your port hand.

Watch Hill light is situated on Watch Hill, at the entrance of Fisher's Island Sound. The light is fixed, 62 feet above mean low water.

Stonington light

STONINGTON LIGHT HOFF SE shows a fixed light, 50 feet above the sea, on the extreme point of land at Stonington, and bears from Watch Hill Point light house, N W by W, 2 miles distant. From Napatree Point, on which there is a red conical buoy, No. 1, N N W by W, 1 mile, from Catumbsett Rock spindle, N, 2 miles. Wapopen, N by E, 1 E, 2 miles; Lattimer's Reef, on which there is a black and red stripe buoy, N E by E, 1 mile; Wampusssett Shoal, on which there is a red buoy, No. 6, E by N, 3 miles; North Dumpling, E by N, 1/2 N, 5 miles distant. High water 3/4 mile, rise 2 feet.

Stonington Harbor and Fisher's Island

STONINGTON HARBOR AND FISHER'S ISLAND. If off the Southern part of Fisher's Island, being the highest steeples in Stonington open to the East, you will see a light house, and steer for it N 6 E, until Watch Hill bears East, when you will have passed through Land's Channel, which is between Wapopen Light, Spout, and the spindle of Catumbsett; you will then be in 12 to 14 fathoms water, then steer North westerly to clear the shoal water extending from Bartlett's Reef, the light bears N by E, when you may steer directly for the light house, and be clear of the harbor.

If you should be to the Eastward of Watch Hill light, and bound through Fisher's Island Sound, give the light a berth of one third of a mile, and steer W N, until the light on Stonington Point ranges with the highest steeples in the town, when you may steer as above directed into Stonington; or, if bound West, you may come on your course on, passing the red and black striped buoy on Lattimer's Reef on your starboard hand, about 150 yards off, until Morgan's Point light bears N 1/2 N, when a West by S course will lead you in a fair way for the Sound. In so steering, you will pass Fort Cross Shoal and Ram Island Reef on your starboard hand, and Catumbsett, Napatree Rock, Fox's Middle, and West Clumps on your port hand. If you wish to go through the Southern Channel, you will, on passing Lattimer's Reef, continue on your W 1/2 N course, until Stonington light bears E N, and then by use of Ram Island N W, when you may steer W S W, and pass clear between the North and South Dumplings, which are two small islets of a rocky nature. You see them plain at all distances, and in a fair way for the Sound. The North Dumpling is high at, except on the East side. There is on it a fixed light 62 feet above the sea.

North Dumpling

NORTH DUMPLING, which just washes, lies without Lattimer's Reef. White's Key light is at a short distance East of Lattimer's Reef buoy.

South Dumpling

SOUTH DUMPLING, the Dalrymple's and Fort Hummock, is the West Harbor of Fisher's Island, where there is good anchorage in 24 fathoms, soft bottom. The Hummock bears N and the West point of the harbor W N W. Ram Island Reef, on which is a small house, south of the house on Ram Island, distant about one third of a mile. There is a very narrow passage between of 5 fathoms water. Potter's Reef lies N W by W from the North Dumpling, distant one mile. Between them there is a fine passage, free from anchorage; this reef is on a small extent, and lies on it a spindle which may be passed with a berth on either side. W 1/2 S from Ram Island, on the light way to Potter's Reef, is the extreme point of Groton Long Reef. This is a conspicuous point of Fisher's Island Sound, and may be known by being clear of of trees at the South end; it is not to be approached from the South nearer than half a mile. A black and red striped buoy, on which there is a red spar buoy, No. 15, lies West of Groton Long Reef, and N E of Potter's Reef. Vessels should avoid going much to the West of Potter's Reef.

There is good anchorage to the East of Groton Long Point, in 24 fathoms, or so near one third of a mile off shore.

After you have passed Fisher's Island Sound, you should be careful to clear the South Dumpling in range with the N E point of Fisher's Island, to clear the Long Rocks, which form the South point of Bartlett's Reef, on which there is a buoy. The Two Tree Island bears N by W, or Little Gull N by E, you are past this point, and may follow the general directions up the Sound.

If bound through from the Westward, you should not go to the Southward of the South Dumpling, but should, after passing either between the Dumplings, or North

them, bring Morgan's Point light to bear N N E. 1 N., and steer E 4 S., until the lighthouse bears S., when you may steer for the anchorage.

If you wish to pass through the Sound, when Stonington light bears E N E., and the buoy on Ram Island N W., steer E 4 S. for Watch Hill light, leaving Lattimer's Reef on your port hand, and giving Napatree Point and Watch Hill Point a berth of one third of a mile, leaving Watch Hill Reef, on the East end of which is a spar buoy, on your starboard hand. This buoy bears from Watch Hill light S S W. 4 W., distant about two thirds of a mile. A rock, with 6 feet water on it, lies South from Watch Hill Point, distant about one eighth of a mile.

High water 9h. 50m., rise 2 feet

The spindles on Lighthouse, Turner's, Watch Hill, and Lattimer's Reef, having been carried away by the ice, the positions of the three first have been marked by spar buoys. On Lattimer's Reef is placed a can buoy painted black and red horizontal stripes.

Fisher's Island Sound is perfectly safe with the fair going directions, and to be preferred if bound East on the flood, or West with an ebb tide, to going through the Race, but it should not be attempted without a leading wind, by strangers, and great attention should be paid to the lead.

The Pel grass shoals lie between Ram Island and Stonington light, and extend in spurs for some distance, the biggest of these shoals lie South of the White Rock, Shoals, which is E N E. from Ram Island, half way to the light house on Stonington Point, and is always conspicuous; but you are clear of them when Stonington light bears E N E. On them is a light vessel and a red spar buoy, No. 10.

A spar buoy, painted black, is moored on the Middle Ground of the harbor of Stonington, in 10 feet water at low tide, and Stonington light house S. by W., one mile distant. Vessels bound into Stonington Harbor, of a larger draft than 12 feet, must give the buoy a berth of one fourth of a mile on the starboard hand, and steer N. by E. for the light house. East end of Fisher's Island from the buoy S. W. by S. 2 S., distant 2 miles; Napatree Point, S. E. by S., 4 miles.

On the S. E. part of Butler's Reef, there is a light vessel painted black, with white stripes on her bulwarks, and showing 2 lights, 29 and 35 feet above the sea. A spar buoy painted black is also moored upon it in 9 feet water. Stonington light house bears on it S. by E., one quarter of a mile distant. Vessels bound to Pawcatuck River must leave this buoy on the starboard hand.

A Pel Rock (mouth of Pawcatuck River) is an iron spindle with a log upon the top. It bears from Stonington light house E. by S.

Race Rock buoy is a spar painted black, with a red top, the top of which is 4 1/2 feet above the level of the sea. It is moored in 2 1/2 fathoms at low tides, and bears from the light house on Watch Hill South, one quarter of a mile.

Watch Hill Reef buoy is a spar, painted black, moored E. from the reef about one mile's length, in 21 feet of water at low tides, the top of which is elevated 10 feet above the level of the sea, and may be seen in clear weather 3 miles. This buoy bears from the Watch Hill light house, S. by W. 4 W., 1/4 mile.

Napatree Point buoy is a spar painted red, with a white top, which is elevated 13 feet above the sea, moored in 24 feet of water at low tides, and bears from Watch Hill light house W. by N., 2 1/2 miles. Napatree Point bears from the buoy N. by E. about quarter of a mile. Watch Hill Reef buoy bears E. S. E., about 2 miles distant, depth of water between Race Rock buoy and Watch Hill Reef buoy 6, 5, and 4 fathoms, and 3 fathoms may be found within one cable's length of either buoy. Vessels on the Eastward who intend going through Fisher's Sound, should leave Race Rock buoy on the starboard hand, and Watch Hill Reef buoy on the port hand, after passing should follow the directions.

LONG ISLAND SOUND. [Magnetic variation, in 1850, Western part, 6 W.; eastern part, 8 W.] Little Gull light is situated on Little Gull Island, at the entrance of Long Island Sound, through the Race. This light may be considered as the light to the sound. The lantern is elevated 44 feet above the level of the sea, and can be seen 15 miles distant. High water 9h. 48m., rise 2 feet 9 inches.

You must be careful to avoid a reef which runs off from the West of Fisher's Island S. W. W., towards Race Rock, on which is a spindle, distant half a mile from the island, which you must leave on your starboard hand, and continue your course until the Little Gull is South of you, if the tide should be flood, about one third of the tide should be ebb, you should, as soon as the Little Gull bears West, and the Ledge light in range with the highest steeple in the town, (N. 2 W. 3 S.) stand by westerly until it is South of you 2 miles, when you may steer W. for Ledge Island light, elevated 98 feet above the level of the sea, which exhibits a fixed light 8 leagues, on which course you should be careful to avoid the Long Island Point, which extends East and West 5 miles. Off Cornfield Point there is a light vessel to mark this shoal. She is sloop rigged, and has a square eye and a day mark, and is moored in 7 1/2 fathoms, south of the Ledge Point bearing N

and Faulkner's Island light S.E. by E. $\frac{3}{4}$ E. Should you make the above course, you will, when off Cornfield Point, be $\frac{1}{2}$ mile South of the shoalest part. This shoal is very narrow, and as you approach it, you will shoalen your water from 12 to 2 fathoms very suddenly. You should in the night-time come no nearer to Faulkner's Island, when North of you, than 11 fathoms, (three-fourths of a mile distant) when you may steer S.W. by W. $\frac{3}{4}$ W. for Old Field Point light, 8 leagues, which carries you to the South of the Middle Ground, on the South end of which there is a light-ship.

*Middle
Ground
light-ship.
Old Field
Point light.*

The light-house on Old Field Point shows a fixed light, elevated 67 feet above the sea. It bears from Eaton's Neck light E., 12 $\frac{1}{2}$ miles distant; from Stratford light S. 9° W., 10 $\frac{1}{2}$ miles distant; from Black Rock light, S. $\frac{1}{2}$ E., 11 miles distant; from New Haven light, S.W. $\frac{1}{4}$ S., 18 $\frac{1}{2}$ miles distant.

You should come no nearer Old Field Point than 8 fathoms, (distant half a mile,) in the night; and when it bears South of you, steer W. $\frac{1}{4}$ N., 17 miles, which will take you to the North of Lloyd's Neck, in 13 fathoms water, leaving Norwalk light, which is revolving, on your starboard hand, and Huntington light (on Eaton's Neck) on your port hand, from whence you may steer S. 66° W., which will take you between Sands' Point and Execution Rocks lights, on the latter of which, on the East end, are two spar buoys, red and black horizontal stripes, one on East and one on West end, both in 18 feet water. Off Sands' Point is a black spar buoy, No. 9, in 21 feet water. If when up with Faulkner's Island, you should prefer going to the North of the Middle Ground, steer W. $\frac{1}{4}$ S. for Stratford light, 20 miles, and giving it a berth of half a mile, in 3 $\frac{1}{2}$ fathoms water, steer S. 66° W., for Sands' Point light-house,

*Execution
Rocks buoy.
Sands' Point
buoy.*

*Eaton's
Neck light.*

Eaton's Neck light-house, fronting from the East round North to the South-west, is elevated 138 feet above the level of the sea, and shows a fixed light. It bears S. 5° 15' E. from Norwalk light, distant 5 miles and nine-tenths. A reef extends from the light N.N.E., half a mile, on which are a number of rocks. High-water 11h. 1m. rise 9 feet 2 inches.

Vessels should not come nearer the shore than three-fourths of a mile, when the light bears between West and South. On the West side the shore is sandy and pretty bold.

*Sands'
Point light.*

Sands' Point light-house is N. 12° 30' E. from Throg's Point light, distant 1 mile and six-tenths; it is 53 feet above the level of the sea, and is revolving, showing a flash once in 30 seconds. The rocks extend from the shore opposite the light N.W. one-eighth of a mile. High-water 11h. 12m., rise 8 feet 7 inches.

*Stratford
light.*

Stratford light-house contains a revolving light, 53 feet above the sea. The revolution is such as to exhibit the light once in 70 seconds. From it Old Field Point light on Long Island, bears S. 9° W.; New Haven light, N. 63° E., 10 miles distant; Middle Ground, S. 5° W., 5 $\frac{1}{2}$ miles distant; Black Rock light, W.

In case of flood-tide and Southerly wind, when you come through the Race, your course should be W. $\frac{3}{4}$ S., until you come up with Old Field Point light, distant 12 leagues, taking care to allow for the tide, which runs very strong, and flows on the full and change days of the moon until 11 o'clock. In coming up with Old Field Point light, you should not bring it to bear to the West of W. by S. $\frac{1}{2}$ S., on account of shoal off Mount Misery; or if in the daytime, keep Crane Neck, which is a bluff, 1 $\frac{1}{2}$ miles to the West of the light, open clear of the light, and pass the point in 8 fathoms as above directed.

If a ship could have a fair departure from the middle of the Race, and is compelled to run in a dark night, or in thick weather, the best course would be West, 15 leagues towards Stratford light, as it would afford the largest run on any one course, and made good will carry you $\frac{1}{2}$ mile South of Stratford Point light, in 6 fathoms water, and $\frac{1}{2}$ miles to the North of the Middle Ground; on this course you will leave Sands' Point, Faulkner's Island, and New Haven lights on your starboard hand, Plum Island light on your port hand, and will pass 3 miles South of Faulkner's Island, in 15 fathoms water. When up with Stratford light, and it bears North, $\frac{1}{2}$ mile distant, your course to Sands' Point light is W.S.W., 11 leagues. West of Stratford light is Point-no-Point, which is shoal for some distance from the shore, but you are clear of it when Black Rock light bears W. $\frac{3}{4}$ N.

*Plum Island
light.*

Plum Island light is a revolving light, 63 feet above the level of the sea, on the West point of the island.

*Kimberly's
Reef.*

Faulkner's Island light is fixed, varied by flashes, 98 feet above the sea. KIMBERLY'S REEF, on which there are 13 feet water, bears E. $\frac{1}{4}$ N. from Faulkner's Island light, distant $\frac{1}{2}$ mile.

Should you wish to anchor under Faulkner's Island, there is good holding-ground on the East and West side, in 2 $\frac{1}{2}$ and 3 fathoms water; but the best place with the wind from the West, is close to the N.E. point of the island, the light-house bearing S. by S., in 2 $\frac{1}{2}$ fathoms. North from the island a narrow shoal puts off one-quarter of a mile, and is bold to, but you are to the North of it, when the centre of Goose Island bears S.W. by W.; and when the light bears S.E. by E., you may run for it and anchor.

The passage inside of Faulkner's Island is perfectly safe, but you should not, in standing over towards the Connecticut shore, bring Hammonasset Point to the South of East. This point may be known by having two small bluffs at the extremity, and it bears E.N.E. $\frac{1}{2}$ E. from Faulkner's Island, distant $5\frac{1}{2}$ miles. When standing to the South towards Goose Island, you should be careful of the shoal extending to the North of it, and you are just clear of it when Faulkner's Island light bears E.S.E. and Goose Island S. by W., in 21 fathoms, rocky bottom; after you have passed Goose Island you should keep more to the Southward, to avoid Wheaton's and Brown's Reef, lying off the Thimble Islands, and Branford Reef, which is dry at very low-tides: on this reef is a spindle bearing from Faulkner's Island light W. $\frac{1}{2}$ N., distant $6\frac{1}{2}$ miles, and from New Haven light, S.E. by E. $\frac{1}{2}$ E., distant $4\frac{1}{2}$ miles. To the North of Branford Reef there is a good passage, but it should not be attempted by strangers without a favorable opportunity; but in case you should be compelled to navigate, you may, after passing Goose Island, bring the light-house to bear E.S.E. and steer W.N.W. for the Outer Thimble, giving it a berth of 30 or 40 yards, then steer W. $\frac{1}{2}$ S., on which course, if made good, you will keep the outer rock of the Thimble in range with the large hotel on Sachem's Head, astern of you. Vessels of any draft of water may go through this passage, and you will leave Wheaton's Reef, which is one-fourth of a mile S.S.W. from the Outer Thimble, and Brown's Reef, on which there is a buoy on your port hand, and Thimble Buoy to the West of the Thimble, half a mile, and the buoy on the Negro Heads, on your starboard hand; this range takes you within 100 yards of the Negro Head Buoy, and about seven-eighths of a mile North of Branford Reef, when you may steer W. by S. $\frac{1}{2}$ S. for Stratford Point. Goose Island is W.S. $\frac{1}{2}$ W. from Faulkner's Island, one mile distant; it is shoal on the East and North sides, and a resting-place for gulls, which are purposely left unmolested, as their noise serves to give notice of your approach to the island in thick weather.

S. W. from Stratford light, distant $5\frac{1}{2}$ miles, is the Middle Ground, which bears from Eaton's Neck light E. by N. $\frac{1}{2}$ N., $11\frac{1}{2}$ miles; from Black Rock light, S.E. $\frac{1}{2}$ S., $7\frac{1}{2}$ miles; and from Old Field Point light, N. by E. $\frac{1}{2}$ E., distant 5 miles. On this shoal are 2 feet water at low-tide; on the South side is a white spar buoy, and on the North side a blue spar buoy, both in 19 feet water, bearing nearly N. by E. and S. by W. from each other, half a mile distant. You may go on either side of the shoal you please: on the North are from 3 to 11 fathoms, and on the South side from 8 to 14 fathoms water; a mile either to the East or West of this shoal you will have 12 fathoms.

Stratford Point light-vessel is on the Middle Ground. It is straw-colored, and shows two lights, at 32 and 40 feet above the sea, Black Island light bearing N.W. $\frac{1}{2}$ N.; Stratford Point light, N. $\frac{1}{2}$ E.

A ledge lies off the N.E. point of Eaton's Neck, three-fourths of a mile from the shore, but after the light bears S.E. the shore is bold to all the way up on the East side of Huntington Bay, where you may anchor in Easterly winds.

Black Rock light is on Fairweather Island, at the entrance of Black Rock Harbor. Black Rock is a fixed light 52 feet above the sea. High-water 11 hours 4 minute; rise 9 feet 1 inch.

In beating up Sound, when Eaton's Neck light bears S.W. by S., you should not stand over to the North shore nearer than to bring Norwalk light to bear W. by S. $\frac{1}{2}$ S., on account of the reef which puts off from Cockenoe's Island, E. by S. $\frac{1}{2}$ mile, and which there is a buoy, red and black horizontal stripes. When Goose Island, which is the first island S.W. from Cockenoe's, is West from you, you are South of the reef, here is a passage for small vessels between these islands, but to the West of Goose Island there is no passage, as the reefs extend to the buoy on Green Ledge, $1\frac{1}{2}$ mile W. S. $\frac{1}{2}$ S. from Norwalk light. W. by S. from Norwalk light, $2\frac{1}{2}$ miles distant, is Long Neck Point: there is good anchorage to the Eastward of it when the light bears E. on you, but when you are to the West of Long Neck Point, you should be careful of the reef, which lies S.W. one mile from it, and also of a reef called the Cows, which is S.W. by W. from Long Neck Point, $2\frac{1}{2}$ miles, and South from Shippan Point three-fourths of a mile, on both which there are buoys, and they are bold to until you are close on the rocks. After you pass the Cows, the first point is Greenwich Point, which is bare of trees, and is the S.E. point of a neck of land running into the Sound, the S. point of which is called Flat Neck Point, and covered with trees: the water off these points is shoal. The Easternmost of the Captain's Islands lies S.W. by W. $\frac{1}{2}$ W. from Flat Neck Point, $1\frac{1}{2}$ mile distant, between which is a fair passage; but in going in you must keep half-way between Flat Neck Point and the island, on account of the rocks extending N.E. from the island and S.E. from the point, and steer North, when Flat Neck bears East you may anchor. The passage between Captain's Island and the main should not be attempted by a stranger. Captain's Islands are three

number, the largest of which is the Westernmost one, which has a light-house on its East end, showing a fixed light, 62 feet above the sea, bearing from Norwalk light

Captain's
Islands.

Light-house.

W. by S. $\frac{1}{2}$ S., distant 10 $\frac{1}{2}$ miles; from Eaton's Neck light, W. by N. $\frac{1}{2}$ N., 10 $\frac{1}{2}$ miles, and from Sands' Point light, N.E. $\frac{1}{2}$ N., 8 $\frac{1}{2}$ miles. You may approach near these islands, but after you have passed them to the West, you should keep at least half a mile from the shore, on account of several rocks and reefs between these islands and Rye Point. High-water 11 hours 1 minute, rise 8 feet 2 inches.

On the South shore of the Sound, after passing Eaton's Point to the Westward, is Lloyd's Neck, the North point of which is low and sandy, East from which is a reef on which there is a buoy, lying off the highest bluff, half a mile from the shore; the reef is very small, and has 3 fathoms close to it. To clear this reef and the Sands' Point, you should not bring Eaton's Neck light to the N. of E. $\frac{1}{2}$ S., in passing it. To the West of Lloyd's Neck is Oyster Bay, in standing in towards which you should be careful of the shoal which puts off from the North point of Hog Island, in a N.W. direction, nearly a mile; you are to the North of it when Oak Point is open of a hill on Matinecock Point (S.W. by W.) and Cooper's Bluff, which is the highest up the bay, is open clear of the East point of Hog Island, (S.S.E.) when you may steer S.E. for the Eastern side of the bay, to clear the Middle Ground, and make a harbor either in Cold Spring or Oyster Bay, keeping but a short distance from the shore.

Oyster Bay.

Pulpit Rock.

One mile East of Sands' Point light is the Pulpit, a large rock on the shore, when this rock is between S.S.W. and S. E. from you, you should not bring Sands' Point light to bear W. of S.W., on account of a reef of rocks off it; and in standing to the North, you should, when the light is S. by E. from you, make but short tacks, on account of the Execution Rocks, which lie N.N.W., seven-eighths of a mile, from the light, and also on account of some scattering rocks, one-eighth of a mile from the point. After you pass the point, your course is S.W. for the South point of Hog Island, on which course you pass Success and Gangway Rocks, on both of which are buoys, left on the port hand on the above course, although you may go on either side of them. Success Rock is bare at low-water, and is S.W. from the light-house on Sands' Point about one mile. Gangway Rock has 6 feet of water on it, and is one-sixth of a mile W.N.W. from Success Rock, lying (as its name imports) in mid-channel. The South point of Hart Island has 2 single trees on it, and is bold to. The course from this point to Throg's Point light-house (which stands on the S.E. point of Throg's Neck, and contains a fixed light, 66 feet above the sea) is S.S.W. $\frac{1}{2}$ W., on which course you will leave the buoy on the Stepping Stones on your port hand, and you may stand over to the Westward, guiding by your lead; but as you come up with the Stepping Stones, which is about half-way, do not bring the trees on Hart Island to bear to the N. of N.N.W., and give Throg's Point a berth of one-eighth of a mile. You may, after passing Throg's Point light, steer West towards Whitestone Point, which is the first point on your port hand, and Old Ferry Point, which is beyond it, on your starboard hand, between which and Throg's Point there is good anchorage. Other bays that put in, to the West of Old Ferry Point, are shoal until you are beyond Waddington's Point, which is opposite Riker's Island. Between Old Ferry and Waddington's Point are Clauson's and Hunt's Points, the former of which has a buoy off it, and both are shoal for a short distance. South of Clauson's Point, and nearly two-thirds over to the Long Island shore, is a reef of rocks, on which there is a buoy, which must be left on the port hand; you open Flushing Bay when you come up with it, and from that channel may continue your course on West from the North point of Riker's Island, which is bold to; you can anchor to the Westward of it in such water as you think proper, with the North point bearing East.

Success Rock.

Gangway Rock.

Old Ferry Point.

EXECUTION ROCKS LIGHT is a white fixed light, 54 feet above the sea. It bears from Sands' Point light N.N.W., distant seven-eighths of a mile; from Throg's Point light, N.E. by N., 5 miles.

The rocks extend one mile in a N.N.E. and S.S.W. direction, and are one-quarter of a mile wide in the broadest part, where the light-house is placed, near the middle of the reef.

Execution Rocks light.

Buoy.

There is a spar buoy with red and black horizontal stripes on the N.E. point of the reef, in 18 feet water, and a similar one on the S.E. part, in 18 feet. High-water 11 $\frac{1}{2}$ m., rise 8 $\frac{1}{2}$ feet.

Throg's Point.

THROG'S POINT.—At Throg's Point it is high-water, full and change, at 10 $\frac{1}{2}$ m., rise 7 feet.

Hell Gate.

HELL GATE.—It is high-water, full and change, at 10 $\frac{1}{2}$ m.

Hart Island.

HART ISLAND affords good anchorage either in Easterly or Westerly winds. To anchor on the East side you may stand towards a barn which is in the bend towards the South part of the island, and anchor in 3 fathoms, the trees bearing S.S.W., distant half a mile. Should you wish to anchor on the West side, between that and City Island, you may haul close round the South part of Hart Island, and anchor West of the trees, in such water as you think proper.

Huntington Bay.

HUNTINGTON BAY has a fair entrance and good ground. There is good anchorage in Lloyd's Harbor, in 2 fathoms water, secure from all winds. To enter

steer S.W. $\frac{1}{2}$ S. from the light, when it bears N.E. $\frac{1}{2}$ N., until the North point of Lloyd's Harbor, which is a low sand point, is W. from you, when you may steer directly into the harbor, leaving Sandy Point 20 yards on your starboard hand. High-water 11h. 1m., rise 9 $\frac{1}{2}$ feet.

In going in or coming out of Lloyd's Harbor, you should be careful of the shoal water which is to the East of the Sandy Point, and on the West side of Huntington Bay.

SHOALS IN THE SOUND.—We will now notice more particularly the shoals in *Shoals in the Sound.*

Long Island Sound.

Hatchett's Reef, to the East of Connecticut River; it bears E. by S. from Saybrook light-house, and S.S.W. from Hatchett's Point, and is dangerous. Between this reef and the shore is Burrows' Rock, lying W.N.W. from it. Strangers should not approach the North shore, on account of these reefs, the bar off Connecticut River, and the shoal off Cornfield Point.

Should you want a pilot to enter Connecticut River, by making a signal off the bar, *Pilots.* they will come on board. The bar extends $\frac{1}{2}$ mile from the shore.

To the S.W. of Horton's Point, which is on the Long Island side, and S.E. from Faulkner's light, the water is shoal for the distance of 3 miles, but from thence the shore is bold until you come up with Romoke Point, a distance of 10 miles; at this point you should not come nearer to the shore than two miles until you are West of Wading River, on account of a shoal off the Friar's Head and Herod's Point; after passing Wading River, you may come within half a mile of the shore; till nearly up with Mount Misery, when you should not bring Old Field Point light to bear W. of W. by S. $\frac{1}{2}$ S., on account of a shoal already described.

The Friar's Head is a remarkable sand-hill to the East of the Horse and Lion, which resembles the bald head of a friar, it being bare of trees on the top, and the soil white. The Horse and Lion are two small spots in the bank, bare of bushes, which some years ago resembled those animals.

SAYBROOK DIRECTIONS FOR BLACK ROCK HARBOR.—Bring the light on Fairweather *Sailing di-* Island to bear N. $\frac{1}{2}$ W., and run for it, if it should be in the day-time, when on that *rections.* bearing it will range with a single hill, situated in the interior several miles, which

you must keep in range until you are distant half a mile from the light-house; you will then have passed the spindle on the Cows, and will be in 4 fathoms water, when you may steer N.N.W. until the light bears E. by S., leaving a rock, S. by W. from the light, on which is a buoy, on your starboard hand, when you may anchor. In steering the above courses, you will have 5 fathoms, when up with the spindle on the Cows, and it shoalens gradually. High-water 11h. 2m., rise 6 feet 6 inches.

MONTAUK POINT LIGHT is on the East end of Long Island, bearing W. by S. *Montauk Point light.* S. from the S.W. point of Block Island, 4 leagues distant; from Montauk light-house to the West point of Fisher's Island, N.W. by N. $\frac{1}{2}$ N., 13 $\frac{1}{2}$ miles distant. The light-house contains a fixed light, elevated 160 feet above the level of the sea. High-water 5h. 15m., rise 2 $\frac{1}{2}$ feet. This light will be altered, during the present year, to a first-class Fresnel light, 225 feet above the sea.

BLOCK ISLAND TO GARDNER'S BAY.—Montauk Point, the Easternmost *Block Island to Gardner's Bay.* part of Long Island, is 4 leagues W. by S. $\frac{1}{2}$ S. from the S.W. point of Block Island; on the N.W. point of which are two light-houses; between the Island and the point there are 16 and 18 fathoms water. As you approach the point, you will quickly come into 9, 7, and 5 fathoms water. A flat runs off from the above point, on the outer part of which there are 5 fathoms water, rocky bottom, and S. by W. from the light, 3 miles distant, lies Frisby's Ledge, extending N.W. and S.E. 4 miles, with from 8 to 15 fathoms on it, hard rocky bottom, and deep water very near.

Between Montauk Point and Block Island there is a shoal with only 4 $\frac{1}{2}$ fathoms on *Shoal.* its shallowest part, on which the sea breaks in moderate gales from the Southward. It lies nearly half-way between the Point of Montauk and the S.W. part of the island, W. by S. from the latter, and about E. $\frac{1}{2}$ N. from the light-house on Montauk, distant 3 $\frac{1}{2}$ miles. You suddenly shoal your water from 13 to 6 fathoms on the N.W. side of the shoal, and before you get a second east of the lead, you are over the shallowest part, into 7, 8, 10, and 12, and then into 14 fathoms. The rippling of the tide is very conspicuous when approaching the shoal in fine weather, and the sea breaks on it so in bad weather, that, even in small vessels, it is recommended to avoid coming near it, especially in Southerly or S.W. gales. You will suddenly shoal from 13 to 9 fathoms, and Montauk light bearing W. $\frac{1}{2}$ S., 8 miles distant, you will have 5 $\frac{1}{2}$ fathoms. The soundings from the shoal towards Montauk are 6, 9, 11, 13, 11, 10, and 9 fathoms, towards the light-house, when it bears from W. to S.W. by W., the bottom is strong; towards the shoal the bottom is coarse sand, and a very strong tide. A shoal runs off from the North side of Block Island 2 miles.

In rounding Montauk, come no nearer than 9 fathoms, or keep the two bluffs, or high parts of the land, (to the Westward of Montauk,) open one of the other, until Willis' Point comes open of Montauk False Point. These marks will carry you clear

*Shagawanock Reef.**Tide.*

of all the shoals, in 3½ and 9 fathoms, and a N. by W. course will then carry you clear of the Shagawanock Reef, which lies N.W. ¼ N., 3½ miles from Montauk light-house, and has 6 feet on its shoalest part, 6 fathoms on the N.E. and N.W. sides, 3 and 4 fathoms on the S.E. and S.W. sides, and 3, 4, and 5 fathoms between the shoal and Montauk False Point. The tide sets strong round Montauk Point; the flood N.E. and ebb to the contrary. At the Shagawanock the flood sets W. by S. and ebb to the contrary. The following bearings were taken when on the Shagawanock, in 6 feet

1. Willis' Point in a line with the Westernmost point of Fort Pond Bay, or the bay closed by the points being brought in a line, S.W. by W. ½ W.

2. Montauk False Point S., about 1½ mile.

3. The White Cliff, or high sand-hills, on the West end of Fisher's Island, called Mount Prospect, N. by W. ¾ W.

4. The Gull Islands N.W., and the bluff sand-cliff of Gardner's Island, W. Montauk False Point is 2 miles N.W. from the light-house. Willis' Point is the Easternmost point of Fort Pond Bay.

In rounding Montauk in the night (when the land or light can be seen) with westerly gales, you may anchor when the light-house bears S.W. by S., in 8 or 9 fathoms, course sand. Having brought Montauk to the Southward of West, the weather thick, you cannot clearly ascertain the distance you are from the point, the lead must be your guide. Steer as high as W.N.W., until you have got into 9 fathoms. Steer off again into 13, and if you suddenly shoal from 10 to 6, steer off E. by N. until you are in 11 or 12, which suddenly deepens, (as a bank of not more than 5½ fathoms extends from the N.E. reef to the Shagawanock,) and a good lead kept going will prevent you going too near these shoals, by steering off in 12 or 13 fathoms, before you attempt to steer to the Westward, after having sounded in 6 or 7 fathoms. In the day-time, having rounded Montauk, and homed to Gardner's Bay, steer N. by W. until you clearly discover that Fort Pond Bay and the red cliff on the Western point are open of Willis' Point; you may then steer W. by S. for the bluff point of Gardner's Island, and you will pass between the Shagawanock and Middle Ground, or Cerberus Shoal.

Light-house. Middle Ground, or Cerberus Shoal.

On the North point of Gardner's Island there is a fixed light, 29 feet above the sea. The Middle Ground (or Cerberus) is a rocky shoal, having from 2½ to 5 fathoms on the shoalest part; the North and East sides are steep, having 10 and 15 fathoms within half a cable's length of the shoalest part. It extends N. by E. and S. by W. three-quarters of a mile. The South and West sides shoal gradually from 13, to 9, 8, 7, to 5 fathoms, sandy bottom. It lies N.W. ¼ N., 7½ miles, from Montauk light-house; E.S.E. ¼ S., 7 miles, from the Gull light; S.W. by S., 9½ miles, from the light-house on Watch Hill Point; 5½ miles S. by E. ¼ E. from Mount Prospect, or the high sand-hills, on the West end of Fisher's Island. The tide in general makes a great rippling over the shoalest part. To avoid these rocks in the day-time, observe a conspicuous hill, with a notch in its centre, at the back of New London, called Pole's Hill. This kept a ship's length open, either to the Eastward or Westward of Mount Prospect, (or the sand-hills of Fisher's Island,) will keep clear of the rocky shoal, in 10 or 15 fathoms to the Eastward, and in 8 or 9 fathoms to the Westward. The tide sets strong over the shoal. In calm or little winds, ships should anchor before any of the marks or bearings are too near.

Bound for New London, and having brought the Gull light W. by N., and the light on Watch Hill N.E., steer so as to open New London light-house of Fisher's Island, and when the spire of New London church is in one with a gap on Pole's Hill, steering with it in that direction will carry you between the Race Rock (on which is a spindle or beacon) and the Middle Race Rock, on which are 17 feet at half flood, and lies about half-way from the Race Beacon and the Gull light; or you may bring New London light-house a sail's breadth to the Eastward of the church spire, bearing 2½ 5° (or 5°) which will carry you to the Westward of the Middle Race Rock, or between that and the Gull light-house. You may then steer direct for New London light-house.

*Race Rock spindle**Reef.*

About 3 miles within Montauk Point, 1½ mile from the shore, lies a reef, bearing N.W. ¼ N. from the point, on which there are 6 feet water, which is very dangerous.

S. by W., about 9 miles from Montauk light, is a small fishing-bank, having 8, 11, and 15 fathoms on it, before mentioned.

High-water.

In the offing, between Montauk and Block Island, it is high-water at half-past 9, and change.

Montauk False Point is about 2 miles W.N.W. from the true point. The Shagawanock, or Six-foot Rocky Shoal, lies N., 1½ mile from it, and has been previously described. Willis' Point is on the East side of the entrance of Fort Pond Bay. The bay is very convenient for wooding and watering; the ground is clear and good, and you may anchor in any depth you please. In a large ship you may bring Willis' Point to bear N.E., and even N.E. by N., and then have in the middle about

fathoms water.

e in the middle about

fathoms water. Near the shore, at the bottom of the bay, there is a pond of fresh water.

The N.E. part of Gardner's Island is 10 miles W.N.W. ¼ W. from Montauk Point. With Westerly winds you may anchor off this part of the island, which is sandy; the marks for anchoring are the light-house of Plum Island, N.W., and the South part of Gardner's Island in sight, bearing S. by W. or S.; you will have 12 or 10 fathoms water. The bottom is sand and mud.

The entrance of Gardner's Bay is formed by the North end of Gardner's Island and the South end of Plum Island. If you are bound through the Sound towards New York, your passage from Gardner's Bay is between the West end of Plum Island and Orsterpond, through which channel you will have from 1 to 10 fathoms water. When going into the bay, you may go within a cable's length of Gardner's Island, where you will have 10 fathoms water. You should be careful not to go too near Gull Rock, which is a single black rock between Plum Island and Great Gull, and called "Old Silas," as there is a rocky spot ¼ mile from it, on which there are 3 fathoms at low-water. This shoal lies with the following marks and bearings, viz.:—A house on Plum Island (standing about one-third of the way between the middle and the N.E. end) on with the Northernmost of the two trees which appear beyond the house; the North end of Plum Island to bear N.N.W., or N. by W. ¼ W., and the Southernmost end of Plum Island on with the Northernmost point of Long Island. In order to avoid this rock, when going into, or coming out of, Gardner's Bay, you must be sure to keep the South point of Plum Island open of the N.W. point of Long Island, whilst the house on Plum Island is on with the Northernmost of the two trees, as before mentioned. There are several trees, but they appear, when viewed at a distance, to be only two trees. This shoal is called by some the Bedford Rock. E. by N., one league from Plum Island, lies a dangerous reef, which extends to the Gull Islands, and the passage between is not fit to be attempted, as there are several rocks, some of which may be seen. In Gardner's Bay you may anchor in what depth of water you please, from 5 to 8 fathoms.

On the S.W. side of Gardner's Island there is very good riding. If you are to the Eastward of this island, with an Easterly wind, and wish to take shelter under the S.W. side, you must give the N.W. end of the island a large berth, as above directed, and as you open the West side of the island, you may haul round the N.W. point, and anchor where you please. The soundings are regular.

Ships, in turning up into Gardner's Bay, and standing to the Southward, will observe a single conspicuous tree on the S.E. part of Plum Island, and tacking before it is brought to touch the South end of the wood on Plum Island, will avoid the Super's Reef, which lies E. by N. ¼ N. from the low point on Gardner's Island, one-third of a mile distant. It then extends S.E. by E. about two-thirds of a mile, and is about 200 yards broad: three fathoms on the middle, 6 fathoms close to the N.W. end, 1, 4, and 5 fathoms close to the S.E. end, 5 and 6 fathoms close to the East side, lying parallel with the low point of the island. To avoid this shoal, the leading-mark into Gardner's Bay is to keep Plum Gut a ship's breadth open. Stand to the Northward until Plum Gut is nearly closing on the N.E. bluff of Long Island, nearly touching the S.E. point of Plum Island, and until New London light-house is brought to the North and West of Gull light-house, but tack before the points close, or stand into no less than 7 fathoms water, otherwise you may shoot over on the Bedford Reef, which is a bed of rocks, about 30 yards wide and 400 long, lying S.E. and N.W., with 16 or 17 feet on its shoalest part. You may anchor in Gardner's Bay in 5 or 6 fathoms. New London light-house kept a ship's breadth open to the Eastward of Plum Island will run you up into the middle of the bay, into the deepest water, and out of the tide. Ships going in through the Race, or going out of New London, in order to avoid the Middle Race Rock, (which has only 17 feet on it at half flood, and lies about half-way from the Race beacon and the Gull light-house,) having from 30 to 32 fathoms on the North side, and from 10 to 30 on its South side, should observe the following marks:—Going out of the roads, and to the Westward of the rock, which is the best channel, bring the spire of New London church a sail's breadth open to the Westward of the light-house: keep this mark until a grove of trees standing on a high hill on Fisher's Island comes on with the East side of Mount Prospect, or the white sand-hills on the N.W. side of Fisher's Island, N. 60° E., or the Gull light W.S.W. High-water at the Gull 11h. 30m., full and change.

To go to the Northward of this rock, and to the Southward of Race Rock beacon, bring New London church spire in one with the middle of the gap on Pole's Hill, at the back of New London, (N. 8° W.) keep this mark until Watch Hill light-house comes a little open of the South side of Fisher's Island, N. 70° E., and when the Gull light-house is in one with the middle of Great Gull Island, S. 73° W., you are then to the Eastward of the rock. Coming up the Sound through the Race, bring Watch Hill

Gardner's
Bay.

Old Silas
rock.

Bedford
Rock.

High-water.

light-house just open of the South side of Fisher's Island, until the South Dumpling comes open to the Northward of the North part of Fisher's Island, or until New London light-house bears North; you are then to the Westward of the Race Rock, and may steer for the light-house of New London, and anchor in the roads, with Montauk light-house S. E. by S., then just open of the West point of Fisher's Island, Gull light-house S. W. by S., and New London light-house N. by W., and the Gap and spire of the church in one. You will have 12 fathoms, still clay bottom.

Going to the Westward through the Race, and to the Southward of the Race Rock, steer for the Gull light-house, keeping it to the Northward of West until New London light-house bears N. $\frac{1}{2}$ E., then steer for it, leaving the Gull light-house half a mile on the port hand.

Tide

The first half-flood sets N. W., the last half about W. N. W., and the ebb E. S. E.

The above is to be observed in case the weather should be thick, and New London church spire not to be seen, or when Gull light-house bears S. by W. You may then steer N. N. E. for the roads, making allowances for tides, which are very strong in the Race. Flood runs to the Westward till 9h. 38m., full and change days of the moon; but in New London roads only 9h. 30m. It rises 2 $\frac{3}{4}$ feet, spring tides. The flood sets through the roads, first half flood, W. N. W., last half, W. S. W. Ebb, first quarter sets S. S. E., the last three-quarters, S. E., for the S. W. point of Fisher's Island.

Vessels bound Eastward through the Race, in the night, when abreast of Gull Island light, with the tide of flood and a leading wind, should steer E. by S., or E. S. E., until Gull Island light bears S. by W.; preserve that bearing until you see Strongton light over the low land of Fisher's Island; they are then clear of Race Point and Race Rock. The spring tides in the Race run about 5 knots per hour; neap tides about 4 knots. High-water, full and change, at 9h. 38m. The first half flood sets N. W., the last half about W. N. W.; consequently, upon steering E. by N., which is the Sound course, they have a strong tide upon the starboard bow, which forces them over to the Northward, and instead of making, as they suppose, an E. or E. by N. course, often carries them on Race Point, from which runs out far off a reef of rocks under water.

Pine Point.

To go through Plum Gut to the Westward, give Pine Point, which is steep, a berth of 2 $\frac{1}{2}$ cables' length, and steer so as to bring the North bluff of Plum Island N. by W. $\frac{1}{2}$ W. Keep it in that bearing until you have brought the poplar-tree clear of the East end of Mr. Jerome's house, or until you have got Pine Point to the Southward of East; you will then observe a wood close inland of the high bluff of Long Island, which, when bearing W. $\frac{1}{2}$ S., will be in one with the rocky point, which is the next point to the Oysterpond Point. Steering with the wood and this point in will carry you clear of the reef, which lies off the North bluff.

Oysterpond Point.

In running through to the Eastward, keep the point over the middle of the wood before mentioned, until the poplar tree is to the West end of the house; then steer to the Southward, giving Pine Point a berth as before. Pine Point E. $\frac{1}{2}$ S. will lead clear of the shoals coming to the Eastward.

Tide.

The tide runs 4 or 5 knots in the Gut. The flood sets about N. N. W., and the ebb S. S. E. It is high-water at 9h. 3-m., full and change.

Marks for the Valiant or Middle Race Rock, which has only 17 feet on it at half flood, and lies about half-way from the Race beacon and the Gull light-house.

1. New London light-house in one with two conspicuous trees, which stand on the declivity of a hill, at the back of New London, being remarkable for a gap on its summit, N. 4° W.

2. The West side of the South Dumpling just touching with the North hill or point of Fisher's Island, N. 11° E.

3. The East bluff point of the Great Gull Island in one with the West lower extreme of Little Gull Island, or the Gull light-house a small sail's breadth open to the Eastward of the East part of Great Gull Island, S. 64° W.

4. The North end of Long Island just shut in with the N. W. point of Plum Island S. 71° W.; Gull light-house, S. 63° W., and Mount Prospect, or high white sand-hill on Fisher's Island, N. 60° E.

Marks for the New Bedford Reef, a bed of rocks about 30 yards broad and 100 yards long, lying S. E. and N. W., with 16 or 17 feet on its shallowest part.

1. The N. E. end of the Northernmost grove of trees on Plum Island touching the South declining end of the Southernmost of the white sand-hills on Plum Island. These sand-hills are the two next South of the houses in the bay.

2. A large notch or gap in the wood on the main-land, to the Westward of Black Point, a sail's breadth open to the Northward of a single black rock, which is between the South end of Great Gull Island and the N.E. end of Plum Island, N.W. by N.

Appearance of the rock called Old Silus.

Marks for a bed of rocks, about 40 yards square, lying three-quarters of a mile off shore, on the S.E. side of Plum Island. At low-water the shallowest part has not more than three feet on them, and about the size of a small boat's bottom. It may be seen at low-water; 3 fathoms all round, not more than 8 feet from the rock. Other parts of the reef, 8 fathoms are around the shoal.

1. The largest house with 2 chimneys, in the bay, East side of Plum Island, in one with a large stone or rock on a hill behind the house, N. 33° W.
2. The Gull light-house touching the East end of Great Gull Island, N. 65° E.
3. The white sand-hills on the South side of Fisher's Island, or Mount Prospect, half way open to the Westward of Great Gull Island; S.E. part of Plum Island, S. 74° W., and the N.E. end of same, N. 45° E.

Marks for a shoal in the middle of Plum Gut, which is a compound of rocks and large stones, with only 16 feet on it, having 16 and 17 fathoms on the N.E. side, 20 on the N.W., and 6 and 7 on the South side. When on the shoal, took the following marks:

1. A small poplar tree in one with Mr. Jerome's door, N.N.E.
 2. A single conspicuous tree in one with the East side of a gray cliff on Gardner's Island, S.E. by E.
 3. Oysterpond Point, W. $\frac{1}{2}$ N.; the S.E. (or Pine Point) of Plum Island, E. by N., and the rocky point or bluff point of Plum Island, North. The passage through Plum Gut is to the Northward of this rock.
- There is another rock, with only 21 feet upon it, about 100 yards from the rocky or bluff point on Plum Island, on the latter of which is a revolving light.

Marks for anchoring in Plum Island Roads.

Mount Prospect, or the white sand-hills of Fisher's Island, touching the Gull light-house, N.E., and the N.E. part of Long Island in one with the S.E. end of Plum Island, bearing W., or the East bluff points of Gardner's Island in one with the low beach which extends from the North side of the island, S. 45° E. With these marks you will have from 7 to 8 fathoms, soft mud, and quite out of the tide, and not more than three-quarters of a mile from the shore of Plum Island, where there is very convenient and good water.

From Block Island a reef of rocks lies one mile distant from the North end of the island.

South-west Ledge lies W.S.W. from Block Island, 4 miles distant, having 4 fathoms at low-water, and breaks with a heavy sea. As you open the passage between Montauk and Block Island, you will deepen your water, and have soft bottom on an E.N.E. course, and when abreast of Block Island, you will shoalen your water to sandy bottom; when past it, you will again deepen to soft bottom.

Bearings and distances of sundry places from the light-house on Montauk Point.

The S.E. part of Block Island bears E. by N. from the light-house on Montauk Point, 15 miles distant.

The Eastern rips lie E.N.E., 5 miles from the light-house. The Northern rips lie N.E. 14 mile from the light-house. These rips, although they may appear to the mariner dangerous, may be crossed with any draught, in 6, 7, 8, and 9 fathoms.

Stagawanock Reef, on which a black buoy is placed, bears N.W. $\frac{1}{2}$ N. from the light-house on Montauk Point, 4 miles distant; the reef ranges N. by W. and S. by E., about one-half of a mile in length. There is a good channel-way between the reef and Long Island, about 14 mile wide, in 3, 4, and 5 fathoms water.

Fisher's Ledge is only a place of hard rocky bottom before you approach the light-house to the Westward, from 8 to 15 fathoms, and no ways dangerous to any vessel. You may keep the shore on board from the Highlands (say three-quarters of a mile, and haul round Montauk.

The East end of Fisher's Island bears N. 4 W. from the light-house on Montauk Point, 13½ miles.

Watch Hill Point light-house (which contains a repeating light) bears N. 4 E. from Montauk Point light house, distant 14 miles. There is a reef extending from Fisher's Island to Watch Hill Point, leaving a passage between the E. end of the reef and Watch Hill Point, half a mile.

The Race Rock, where there is an iron spindle placed, bearing S.W. by W. half a mile from the West point of Fisher's Island, bears from Montauk light-house N.W. by N. 4 N., 13½ miles distant.

The Gull Islands bear S.W. by W. from the Race Rock, 4 miles distant. The light-house standing on the West Chop of New London Harbor, bears N. by W. 4 W., 5 miles from the spindle on the Race Rock. On the Little Gull Island there is a light-house containing a fixed light, bearing S.W. by W. from the West point of Fisher's Island, 4 miles distant.

Bartlett's Reef, on which a buoy and light-vessel, with one mast and a bell, are placed, bears N.W. by W. 4 P. miles distant from the Race Rock.

Little Goshen Reef, where a buoy is placed, bears E.N.E., 1½ mile distant from the buoy on Bartlett's Reef.

The light-house at New London Harbor, bears from the buoy on Little Goshen Reef S.N.E. 4 E., about 14 mile distant, and contains a fixed light.

The S.W. Ledge, New London Harbor, where a buoy, black and red horizontal stripes, is placed, bears N. by W. from the Race Rock, 13 miles distant.

The East Chop of New London Harbor, bears N. by E. 4 E. from the S.W. Ledge, three-fourths of a mile distant.

The light-house bears from the buoy on S.W. ledge N.W. by N. one mile distant. RACE ROCK, which has but 4 feet water on it at low tide, lies half a mile S.W. of Race Point, the S.W. extremity of Fisher's Island, and has on it an iron spindle to the S.E. of which, in 17 feet water, is a red and black striped spar buoy.

Race Rock.

*Valiant
Rock*

VALIANT ROCK, lies about S.W. 4 W. from Race Rock, 13 mile distant, at 17 feet at low-water. On the S.W. part of the reef, in 18 feet water, is a nun buoy, with red and black horizontal stripes. This reef is about midway between Race Rock and Gull Island light.

*Gardner's
Island to
Shelter Is-
land.*

GARDNER'S ISLAND TO SHELTER ISLAND.—If you fall in with Gardner's Island, you must sail on the North side of it till you come up with a low sandy point at the W. end, which puts off 2 miles from the Highland. You may bring the boat to bear East, and anchor in 7 or 8 fathoms water, as soon as within the low sandy point.

*Gardner's
Island to
New Lon-
don*

GARDNER'S ISLAND TO NEW LONDON.—Your course from the East end of Gardner's Island to New London is 4 leagues, to the buoy on S.W. Ledge, West side of the entrance to New London Harbor; then steer as directed by the low. This course will lead you through the Race, to the Eastward of Gull Island light and Westward of Valiant Rock, where you will have a strong tide. This tide breaks when there is any wind, especially when it blows against the tide. Your soundings will sometimes be 5 fathoms, at others 15 and 20.

*New London
light-house.
High-water.*

NEW LONDON LIGHT-HOUSE stands at the entrance of the harbor, on the Western side. The lantern is elevated 86 feet above the level of the sea, contains a fixed light, and bears N. by E. from Little Gull light, about 6 miles. High-water, 30m; rise 24 feet.

*New Lon-
don.*

NEW LONDON.—If you are bound into New London, after getting to the Westward of the S.W. part of Fisher's Island, keep New London light bearing from N.W. to N.N.E., if you are beating to windward, but if the wind is fair, bring the light to bear N. when at the distance of 2 leagues, and run directly for it; leave it on your port hand in running in; when in, you may have good anchoring in 4 or 5 fathoms water, clayey bottom. In coming out of New London, and bound West, when you have left the harbor, bring the light to bear N.W. by W. 4 W., and steer S.W. 4 S. 24 miles, or until the light bears N. by E., when a W. by S. course will be the way for the sound.

*Niantic
Harbor.*

NANTIC HARBOR.—This is one of the best harbors of refuge on the Northern shore of Long Island Sound with the wind anything between West and East by way of North. To run in when you are between Bartlett's Reef and Black Point, run for a small island called on the chart White Rock, which is bold. You can run it on either side, and anchor to the North of it in 3½ fathoms.

High-water.

The bottom between Bartlett's Reef and Black Point is soft, which is a good advantage when running for an anchorage in thick weather, as off the reef and the point the bottom is hard. High-water, at 9h. 30m.

In coming in, or going out of New London, (when opposite the Gull light,) bring the Gull light to bear S.S.W. 4 S., and New London light, N.N.E. 4 E.; leave the light on your port hand in going into the harbor; keep well to the W. if it be with a

 the W. if it be within

the wind at N.E. and stormy—your course to break off a N.E. gale in good anchorage, is W.S.W. from the Gull, distance 5 miles, then haul up, if the wind be N.E., and steer W.N.W. until you get into 10 fathoms of water, muddy bottom; anchor as soon as possible—you will be between Hatcher's Reef and Black Point; this is the best place you can ride in, if you have a N.E. gale and thick weather, and cannot get into New London. Saybrook light will then bear W. by N. or W.N.W.

SAYBROOK POINT LIGHT is a fixed light, at the mouth of the Connecticut River, on the West chop of the entrance to that river; it stands on a low sandy point, projecting into the sea, having on its West side a considerable tract of salt marsh, containing a pond of brackish water, which, by its evaporation, creates a mist, at times, which very much impedes the light, the weather at the same time clear off shore. Height of the light from the sea 80 feet.

Saybrook is not a good harbor to enter, but if you must attempt it bring the light-house to bear N.N.W., and steer for it until within one mile, then steer N.E. till the light bears N.W. by W., and then run for it until within half a mile distant, from which a N.N.W. course will carry a vessel up the river to good anchorage near the town.

When bound up Sound, and off Saybrook light in clear weather, give it a berth of 3 or 4 miles; your Sound course then is W.S.W. 1/2 W., 50 miles distant, which will carry you up with Eaton's Neck light, leaving Stratford Shoal on the starboard hand. This shoal, which has a white spar buoy on the South, and a black spur buoy on the North, between which you cannot go, bears North from Satauket (Long Island) and S. 3 W. from Stratford Point light. The buoys are placed in 10 feet water. In leaving Faulkner's Island light North 2 miles, steer W., until you get into 5 or 7 fathoms water, distance 20 miles to Stratford Point light, hard bottom, which leaves Stratford Shoal, that bears S. by W. from the light, on your port hand; then your course is W. S.W. to Marinicock Point.

FROM PLUM GUT TO GREENPORT.—Vessels bound to Greenport may make their course S.W., and run three miles, which will carry you up to Ren's Point, on Long Beach. This beach is 3 1/2 miles long, and covered with low cedar-trees, which you leave on your starboard hand going up to Greenport. You will have, from Plum Gut to Ren's Point, from 4 to 11 fathoms water, and then your course is W.S.W., 3 1/2 miles. In running this course, you will shoal your water to 3 fathoms, and if you get any less water, haul to the Southward, and as soon as you get 3 fathoms, keep your course, and run until you, by heaving your lead, from one heave will have from 3 to 7 fathoms water. As soon as you get 7 or 8 fathoms water, your course is W.N.W. one mile, which will carry you to Hay Beach Point, on Shelter Island, which you leave on your port hand; haul close round Hay Beach Point, and your course is W.S.W., 1 mile to Greenport; then you may come to anchor in a good harbor.

FROM GARDNER'S POINT TO GREENPORT the distance is 12 miles, and your course is W. by S. Running this course you will shoalen your water from 6 fathoms gradually to 3 fathoms, on Long Beach side; and then you follow the above directions to Greenport. Five fathoms of water can be carried into Greenport, but large vessels should take a pilot—one is always to be had.

OYSTERPOND POINT AND PLUM ISLAND.—In sailing through this passage, (called Plum Gut) you leave the light on the West point of Plum Island, which is a revolving light, 63 feet above the sea, on your port hand, running boldly for the cliff on which it stands, then steering S.E. by E., till the Gull light bears N.E. by E. when you may shape your course for Point Judith, or wherever you may wish.

When passing the light you will open Gardner's Bay, which is the passage to Sag Harbor, and also leave Oysterpond Point on your starboard hand, off the eastern part of which a shoal extends one-third over towards the South end of Plum Island.

*The bearings of the light-house have been taken from the following places:—*From Oysterpond Point and the reef, N.E. by E., distant from the outer part of the reef one mile; from Saybrook light, S.E. 4 S., distant 8 miles; from Pine Point, the S.W. part of Plum Island, N.W. by N., distant three-quarters of a mile; from Cherry Harbor Point, the S.W. part of Gardner's Island, N.N.W., distant 6 miles; from Gardner's Point, N.W., distant 3 1/2 miles; from New London light, S.W. 1/2 S., distant 10 miles; from Cedar Island (at the entrance of Sag Harbor) N.E. 1/2 E., distant 8 miles.

On Cedar Island is a fixed light; it is elevated 34 feet above the sea, and as it may be seen from a high-decked vessel over the sandy point of Gardner's Island, vessels could not run for it when passing that point, until it bears S. of S.W.

The bearings and distances, by compass, of this light from the following places, are, from Head S. by E. 1/2 E., distant 24 miles; Plum Island light-house, S.S.W. 1/2 W., 24 miles; Gull Island light-house, S.W. 1/2 S., 12 miles; sandy point of Gardner's Island, W. 1/2 W. 7 1/2 miles.

Oysterpond Point and Plum Island.

Bearings.

Light-house.

*New Haven
light-house.*

NEW HAVEN LIGHT-HOUSE is situated on Five-mile Point, at the entrance of the harbor, and lies on the starboard hand. The lantern is elevated 93 feet above the sea, and contains a fixed light. From New Haven light the following bearings and distances are taken, viz:—Stratford Point light, S.W. by W. $\frac{3}{4}$ W., 10 $\frac{1}{2}$ miles; Middle Ground, S.W., 11 miles; buoy on Adams' Falls, S.W.; buoy on S.W. Ledge, S. 20° W.; beacon on Quick's Ledge, S. 1° E.; Faulkner's Island light, S.E. by E. $\frac{1}{4}$ E., 12 miles.

If bound into New Haven, give Faulkner's Island a berth of one mile, and steer W. by N., until New Haven light is North of you, in 6 $\frac{1}{2}$ fathoms water, when you may steer N.W., giving the light a berth of 1 $\frac{1}{2}$ mile, to avoid the S.W. Ledge, on which there is a black buoy, bearing from the light-house S.W. by S. $\frac{1}{4}$ S., distant one mile, which you leave on your starboard hand, and when the light bears N.E. you may steer up N. E. by N. for the Fort, to the North of the Palisades, leaving the white buoy on Adams' Falls on your starboard hand. When you are nearly abreast of the Fort, give it a berth of one-fourth of a mile, and steer up N. $\frac{1}{4}$ W. for the end of the Long Wharf, on which there is a small fixed red light, 21 feet above the sea, leaving black Ledge, which is one-fourth of a mile N.W. of the Fort, on your starboard hand.

The buoy on Adams' Falls bears from the light S.W., half a mile, and from the S.W. Ledge N. by E., half a mile.

There is a spindle on Quick's Rock, which bears from the light S. $\frac{3}{4}$ E., distant three-quarters of a mile. The buoy on Adams' Falls bears from the spindle N.W., distant half a mile. The buoy on S.W. Ledge bears from the spindle W.S.W., distant half a mile.

Vessels bound in from the Eastward may pass in between the buoy on the South-west Ledge and the Spindle, as there are 3 fathoms water in this channel, keeping about midway between them, and leaving the white buoy on Adams' Falls 20 rods to the Eastward of them, and then steer for the end of the wharf. On this ship, in channel-way, you will have 3, 4, and 5 fathoms water, muddy bottom. Prizing the light to bear S.E., you may anchor in Morris' Cove, near the East shore, in 2 fathoms water, muddy bottom. Your course from this up the harbor, with a fair wind, is North. Give the Fort Rock, in running for the pier, a small berth.

Vessels bound in from the Westward will leave both buoys on the starboard hand, and they may pass with safety within 20 rods of either of them. If beating in, your soundings will be from 2 to 3 and 4 fathoms. Stand in no further than 2 fathoms upon the West shore, on which you will have hard bottom. In beating up, after getting to muddy bottom, (which is channel soundings,) it is best to keep the lead going often on account of bordering on the West shore, where you will have hard bottom, and soon aground. High water 11h. 16m., rise 6 feet 6 inches.

*High-water.
Bridgeport.*

BRIDGEPORT.—Vessels bound into Bridgeport must leave the outer buoy on the port hand, and steer direct for the beacon on Well's Point, which bears N.E. from the outer beacon that is on the West flat, about 350 yards distant, leaving the buoy on Stony Bar on the starboard hand, and Allen's Flats on the port.

Light.

Bridgeport light is a fixed red light, 23 feet high.

In the Harbor of Bridgeport are 3 buoys, placed as follows, viz: One on Mareham Flats, which lies a mile S. $\frac{1}{2}$ W. from the outer beacon; one on Stony Bar, bearing E. from the beacon, 150 yards distant; one on Allen's Flats, being inside the harbor. High-water 11h. 11m., rise 8 feet 8 inches.

*High-water.
Black Rock
light.*

BLACK ROCK LIGHT is on Fairweather Island, East side of the entrance of Black Rock Harbor, and is a fixed light, 52 feet above the sea.

*Fairweather
Island.*

FAIRWEATHER ISLAND, OFF BLACK ROCK HARBOR.—The harbor of Black Rock, although safe and easy of access, is so situated that no direct course can be given to steer for the light that will carry you direct into the harbor, as that depends wholly on the distance you are from the light at the time you make for it: the proper judgment is to be used in varying the bearing of the light as you draw near in, which is easily done by observing the following rules: In coming from the Westward if you mean to harbor, to avoid the reef called the Cows, you bring the light to bear N. 20° W., and run directly for it, until within three-quarters or half a mile distant, when, occasion requires, you may stretch in to the Westward, in a fine beating channel, bearing from 5 to 3 fathoms water, and good ground. As you approach the light, which stands on the East side of the harbor, the water gradually shoals to about 2 fathoms. The mouth of the harbor, although not very wide, is not difficult; the light bearing East brings you completely into the harbor. The island on which the light-house stands, and the reef called the Cows, on the South and West sides, form the harbor of Black Rock. On the Easternmost rock of this reef stands a spindle, distant from the light half a league, and from which the light bears North. The light stands 30 rods from the South point of said island, at low-water. From this point puts off a single rock, 30 rods distant, on which are 8 feet at high-water, and in all about 10 rods distance. The light bears from this rock N. by E. $\frac{1}{4}$ E. As soon as you pass

this point or rock, the harbor is fairly opened to the Northward, in any point from N. to W.N.W. You can run for the light with safety, observing, as you draw nearly in the above directions, and due attention to the lead. The bottom, for some distance from this rock, southerly, is hard, but you may continue your course, and it will soon deepen. It is safe and good anchorage to the Eastward of the light for all winds from W.S.W. to N.N.E., quite down to the mouth of Bridgeport Harbor, which is distant about 2 miles. The shore on the Eastern side of the light is bold to, in 3 fathoms, close aboard the light, and so continues until you are quite down to the South point of the island. This bay, to the leeward of the light, between that and Bridgeport, of the island. This bay, to the leeward of the light, between that and Bridgeport, is one of the best bays for anchorage on the North shore in Long Island Sound, and affords from 4 to 3 fathoms water, the light bearing West. In coming from the Eastward, crossing Stratford Point light close aboard, your course to Black Rock light is W. by N., and you keep sounding on the starboard hand, not less than 4 fathoms, nor more than 8 fathoms, to the North of Bridgeport Harbor, which is distant about 2 miles. The shore on the Eastern side of the light is bold to, in 3 fathoms close aboard the light, and so continues until you are quite down to the South point of the Island.

Between Fairweather Island and the entrance of Bridgeport Harbor there is good anchorage, in from 2 1/2 to 4 fathoms, sticky bottom, with the wind from E. N.E. to S.W., by way of North. Bring the woods on the West of the harbor to bear N.E., and anchor in such depth of water as you wish.

Beacons and Buoys as they are passed in sailing through Main Ship-channel, Long Island Sound, from Montauk light to East River.

MONTAUK POINT is the Eastern end of Long Island; it is 75 feet high, and *Montauk* has on it a fixed light, varied by flashes, once in every 2 minutes, 85 feet high, making the elevation of the light 160 feet. The South shore of Long Island is sandy, with the exception of a few boulders about 2 miles West from the light-house.

MONTAUK SHOAL lies S. by E. from the light-house, distant 2½ miles, is of hard *Montauk* sand, extending N.W. and S.E. about one mile, having 4 fathoms on it, shoaling suddenly, and breaks in heavy weather. It has 12 fathoms on the inside.

FRISBIE'S LEDGE.—See pages 293 and 297.

Frishie's

From *Montauk Point* light to that of *Shinnecock*, the course of the shore is W. by S. 33 miles.

SHINNECOCK LIGHT is a first order Fresnel fixed light, and is 164 feet above *Shinnecock* the level of the sea; it is on *Pondquogue Point*, a short mile North of the outer beach light of Long Island. From it *Fire Island* light bears W. by S. 3 S., 35 miles, nearly.

FIRE ISLAND LIGHT is on the East side of *Fire Island Inlet*; is a revolving *Fire Island* light, and is 160 feet above the level of the sea. From *Fire Island* light to *Coney Island* and, the West point of Long Island, the course is W. by S., 36 miles.

The soundings are in general very regular, shoaling gradually as you approach the shore; there is, however, deeper water to the East of *Fire Island* light-house, when opposite *Raccoon Woods*, near the shore, than in other parts of the coast, as 10 fathoms are found about a mile distant. The shoal off *Fire Island* light-house, composing part of the bar, extends about a mile from the shore, and one mile from where the light-house stands. It is bold to on the Eastern side, having 6 fathoms close to it; to the West of the light-house it shoals more gradually.

FIRE ISLAND INLET is navigable for vessels drawing 9 feet water. It is subject to change, and those who are acquainted with its entrance are guided by the breakers in entering as much as by anything else.

Fire Island Inlet.

OAK ISLAND, GILGO, CROW, and HOG ISLAND INLETS, are all barred harbors, having very little water; they do not extend out more than half a mile from the general line of the shore.

Oak Island, Gilgo, Crow & Hog Island Inlets.

ROCKAWAY INLET lies N.E. from *Sandy Hook*, distant 9 miles. The bar is subject to change; 12 feet may be about the average depth at low-water, and the bar extends about 2 miles from the shore.

Rockaway Inlet.

BLOCK ISLAND TO NEW YORK.—Bound into New York, if you fall into *Block Island* Channel, you will have soundings in lat. 40° N., 60 fathoms, mud and ooze, which soundings continue till you get into 40 fathoms. In 38 fathoms, *Block Island* bearing N. by W., 1½ leagues distant, you will have fine red and black sand; 2½ leagues distant, same bearing, you will have 28 fathoms, coarse sand. When *Block Island* bears N., distant 4 or 5 leagues, you cannot see any land to the Northward or Eastward; but as you approach the island you see *Montauk Point* to the Westward, making a long low point to the Eastward, on which is a light-house. In sailing W.S.W., you will make no remarkable land on Long Island—from the Eastward of said island to the Westward, its breakers and appearing at a distance like islands—but may see *Shinnecock* or *Fire Island* light-houses. From *Fire Island* light a shoal extends South three-fourths of a mile, and joins the bar, which is very dangerous, as it shoals suddenly from 8 to 6 fathoms, then directly on the shoal, on which the flood-tide sets very strong, is not safe to approach the shore nearer than 2 miles when the light bears to the E. N. To the Eastward of the light the shore is bold; the bar is subject to change, and is 7 feet water on it. When *Fire Island* light bears N., in 10 fathoms water, you may

Block Island to New York

Light-house.

steer W. by S., which will carry you up with Sandy Hook light. The quality of the bottom is various, viz.: yellow, red, brown, blue, and gray sand, within short distances. About 10 miles S. by E. from the Highlands, lies a bank, extending from N.E. by E. to S.W. by W., having on it from 10 to 11 fathoms, pebbles. On the bank is plenty of fish. Within this, a short distance, you will get 20 fathoms, when it shoals into 15 fathoms, gray sand, which depth you will carry till you get into what is called the Mud Hole, where are from 20 to 30 fathoms water, mud or green ooze, and sometimes pebbles, the deepest part of which bears East from the Northernmost part of the Woodlands, 10 miles; and S.E. by S., 15 miles, from Sandy Hook light. From the Mud Hole to the bar of Sandy Hook the water shoals gradually, as laid down in the chart.

You will have 20 or 22 fathoms water out of sight of the land, sandy bottom in some, and clay in other places. Before you come in sight of Sandy Hook light-house, you see the Highlands of Neversink, which lie W.S.W. from Sandy Hook light, and is the most remarkable land on that shore. On the Highlands there are two light-houses.

Current. CURRENT.—In running for New York, after passing Nantucket, particular attention should be paid to the log as well as the lead, as the set of the current is about three-fourths of a mile per hour to the Westward, and with Northerly and North-easterly winds, it is much accelerated. It requires careful attention to this fact in making the course to be steered, or vessels will make the land to the South of the Light.

Light. LIGHTS.—New York pilots are to be found from George's Bank to Cape May. By a recent decision of the New York Pilot Commissioners, it has been determined that the proper pilotage ground is West of a line drawn from Fire Island light to the north light.

Masters of vessels are requested by the Pilot Commissioners not to give the charge of their vessels to the pilot until within sight of the marks for the bar, as it is presumed that the master understands the navigating dependent on astronomical observations better than a pilot.

New York. NEW YORK.—If you fall in to the Southward, and make Cape May, on which a light-house exhibiting a revolving light, it would be prudent to keep about 2 leagues off, to avoid Hereford Bar, which lies from 4 to 6 leagues from the Cape May Northward, and 8 miles from the inlet of that name. This inlet is frequented by Delaware pilots, having no other harbor to the Northward until they reach Egg Harbor. After passing Hereford Bar, you may steer N.E. when in 10 fathoms water, taking care that the flood-tide, which sets very strong into the inlet, does not run you too close. This course continued will carry you up with Egg Harbor; you then have fine white and black sand, intermixed with small broken shells. By continuing the same course you will deepen your water, and so continue till you reach Barnegat Inlet. [In running along the shore, do not steer to the Northward of the light in 10 fathoms water or less, as you will be apt to get on Absconm Shoals or Harbor Bar.] On the South side of Barnegat Inlet there is a light-house containing a flashing light, off which you will get bright coarse yellow gravel. The South Bar light does not extend beyond 2 miles from the beach, and is steep to. A vessel should in 6 fathoms water, within pistol-shot of the outer breaker. It will be prudent to keep in 9 or 10 fathoms water during the night, and not to steer South of North-east, unless certain of being to the North of the shoals, as the tides are so much to be depended on, that the moment you lose the above soundings past the shoal, when you will have fine black and white sand, and very deep water. You may then haul in for the land, N. by E., which course will bring you in from 15 to 17 fathoms water; but if the wind and weather permit, you may stand on for the Woodlands, which is very remarkable, having no other such land between Cape May, up to the Highlands, and can be distinguished by its distance from the beach, and extending to Long Branch.

Light. LIGHT.—In coming from Barnegat to Sandy Hook, when to the Southward of the light on the Highlands, you must not open the Northern light (which is a fixed light) Westward of the Southern light, (which is a revolving light,) as that will carry you near the Jersey shore.

The South part of the WOODLANDS.

By passing Barnegat in the day-time, it may easily be known. Should you off-shore to the Westward, you may perhaps see a grove of woods back a little way, apparently 3 or 4 miles long, known to the coasters by the name of Little

and lies directly in the rear of the inlet of Barnegat; so that, by sailing to the Northward, your leaving the North end of this land directly abreast, you are certainly to the Northward of Barnegat. There is also another grove directly in the rear of Egg Harbor, known by the name of the Great Swamp, which has the same references as respects Egg Harbor; but that the one may not be taken for the other, it must be observed the Great Swamp of Egg Harbor will appear much higher, and in length 6 or 7 miles; neither can they be seen at the same time, as Barnegat and Egg Harbor are 15 miles apart. Barnegat bears due S. by W., 11 miles, from Sandy Hook. In hauling in for the Woodlands before mentioned, you may, if the wind is off the shore, keep within a cable's length of it all the way, until nearly up with the Highlands.

As a number of vessels have been lost, bound into New York, from heaving to with their head on shore, we cannot too strongly urge on the shipmaster the necessity, if he is in doubt of his position, of heaving to with the head off shore.

The bottom on the New Jersey shore is of uncertain depth, not at all dependent on the distance, there being ridges parallel to the shore, with 7 and 8 fathoms, and 9 and 10 fathoms inside.

HIGHLANDS, N. 63° W.

LIGHT-SHIP—A light-ship painted red, of about 350 tons burden, and showing *Light-ship*, two lights, is anchored off Sandy Hook. The forward light is 30 feet above the deck, and the after one 10 feet. She is also provided with a bell of 800 pounds weight, which will be rung in thick weather. She is placed in 13 fathoms water. Sandy Hook light house bears from the light-ship W. by N., distant 6½ miles; Highland light-house, W. S. W., distant 7 miles.

HIGHLANDS OF NEVERSINK—Neversink Hills, on which 2 light-houses are *Highlands of* built, extend N. W. and S. E., about S. W. from Sandy Hook, on the Atlantic ocean, to *Neversink*, Raritan Bay. The correct altitudes of the following places, which present themselves to mariners as they approach them, are—

Mount Mitchell, the highest point of Neversink, Monmouth co., (N. J.)	282 feet.
Tompkins' Hill, on Staten Island	307 do.
Hempstead Hill, Queen's county, Long Island	349 do.

HIGHLAND LIGHTS.—On the Highlands of Neversink there are 2 light houses, *Highland* bearing N. 23° W. and S. 23° E. from each other, distant 100 yards. The *Southern lights*, light is a revolving one, on the Fresnel plan. It is 248 feet above the level of the sea. The Northern light is a fixed light, 246 feet 7 inches above the sea.

SANDY HOOK LIGHT is on the Northern point of Sandy Hook, and is a fixed *Sandy Hook* light, 90 feet above the level of the sea.

Two beacons are erected on the Hook, 35 feet above the sea; the Easternmost one ranges for the buoy of the Upper Middle, and the Westernmost one ranges for the buoys of the S. W. Spit; they are both lit at night.

LEDGE SOUTH SANDY HOOK.—On this reef there are but 9 feet water. The *Ledge South* Northern light on the Highlands a little open to the Eastward of the Southern one. *Sandy Hook*, leads right on the reef.

This ledge is S. E. from Sandy Hook light, 7 miles distant, and about 1½ mile from the shore, and on which the ship William Thompson struck.

OIL SPOT.—E. S. E., 17 mile from Sandy Hook light, is the Oil Spot, having only *Oil Spot*, 10 feet water in one spot, at low-water; it is of a triangular shape, and about half a mile on each side in extent; the Along-shore Channel is inside of it.

FALSE HOOK.—1½ mile N., a little Northerly, from Sandy Hook light, there is a *False Hook*, small shoal spot, with only 12 feet water upon it at low-water; it is the remains of the old False Hook.

NEW YORK HARBOR.—There are 4 channels over New York Bar; the first is *New York* that along and parallel to the Jersey shore, inside of the Outer Middle; the second *Harbor*, is the South channel, between the black can buoy No. 1 and the red can buoy No. 2;

the third is the main ship-channel, between the red can buoy No. 2 and the black nun buoy No. 1; the fourth is Godney's Channel, between the black nun buoy No. 1 and the red nun buoy No. 2. This channel runs nearly W. by N., and is used by our largest class ships-of-war.

There are 6 lights intended as ranges for the channels:

1st. **GEDNEY'S CHANNEL** lights are 2 in number: the front one on Point Comfort Jersey shore, is on the keeper's house, in a turret. The focal plane of the light is 40 feet above high-water. The rear light is in a tower, 76 feet above high-water. These lights in range will, after crossing the bar, clear every thing until inside of Sandy Hook.

Lights.

2d. **SWASH CHANNEL** lights, 2 in number, are on Staten Island. The front one is in a tower—the focal plane of the light is 59 feet above high-water. The rear light is on the keeper's house, in a turret, 189 feet above high-water. These in range, when outside of the bar, will cross the bar in 20 feet water, and lead through the Swash Channel up to the red buoy of the Upper Middle, 17 feet at low-water.

Lights.

3d. **MAIS SHIP-CHANNEL** lights, 2 in number, are on the Jersey shore. The Northern light bears from Sandy Hook light S. W. 34 miles, to be used after turning the S. W. Spit buoy. The front light is in a tower—the focal plane of the light is 60 feet above high-water mark. The rear light is on the keeper's house, in a turret. The focal plane of the light is 224 feet above high-water. After turning the S. W. Spit buoy, bringing these in range, you run in mid-channel until Robbins' Reef light is open with the light at the Narrows; keeping these open clears the West Bank.

They are all fixed lights.

Along-Shore Channel.

ALONG-SHORE CHANNEL.—If bound into New York from the Southward, do not close in with the Jersey shore. If you do not draw over 10 feet water, you may continue on parallel to the shore 100 yards distant, until you get Sandy Hook light to bear W. or W. by N., when you steer N. by E. to avoid the point of the false Hook, until you get deep water, 10 fathoms, Sandy Hook light bearing S. W. 48 miles, then steer W. 4 N., until Point Comfort lights are in range; keep them in range, and run up the main ship-channel, passing red buoy, No. 12, of the S. W. Spit, on the starboard hand, a N. 10° E. course, which keep until you open Robbins' Reef light with the bluff of the Narrows, when a N. by W. course carries you clear.

South Channel.

SOUTH CHANNEL.—The red can buoy, No. 2, of the South Channel, bears from the Hook light E. 4 N. To cross the bar, steer W. by N. 4 N., leaving the black buoy on your starboard hand, and the black can buoy, No. 1, on your port hand, until you are up with the striped buoy on the Outer Middle, and the Swash Channel lights are in range, when steer for them, N. W. 4° N., until you get the Hook light to bear S. W. by W. 4 W., when, if you wish to go the main channel way, you steer W. 4 N., until you get Point Comfort lights in range, when steer as before directed.

Swash Channel.

SWASH CHANNEL.—To pass through Swash Channel, continue your N. W. N. course, keeping the range lights on Staten Island in one until you are over the striped buoy on the N. W. end of Swash Channel, when the new lights on the Highlands will be in range, and a N. 10° E. course will carry you to the Narrows.

In going over the East Bank, be careful you do not get set by the Childen Point. The mark to keep clear of Romer is, to keep Sandy Hook light open with the East end of the Highlands.

Beacon on Romer.

BEACON ON ROMER.—A granite beacon, 25 feet high, has been placed on the North-western point of Romer, 9 feet above water.

It bears from the light on Sandy Hook N. 10° W.; from the light at the Narrows S. 15° E.

This beacon was intended to mark out the Swash Channel. It is on the wreck of the shoal.

Vessels bound in will infallibly get on shore if they run for it. N. B.—The iron beacon on Romer Shoal, S. E. part, was carried away by ice during the winter 1856—7. It will be replaced as soon as possible.

North Channel.

NORTH CHANNEL.—The black buoy, No. 1, of the North Channel, bears from N. 49° N. from Sandy Hook light; the light and Mount Pleasant in range is the mark for it; the course is W. until you get Point Comfort lights in range, then steer as before directed. To go through Swash Channel, when the channel lights are in range, steer as directed under that head.

Geincy's Channel.

GEDNEY'S CHANNEL, the best water.—From the light-ship to the black buoy, off the entrance to Gedney's Channel, the course is N. W. 2 W. distant 4 miles. The course then is W. by N., leaving the red buoy on the port hand, until you get the light-houses on Point Comfort in range; keep them in range, (the rear light W. by S. 4 S.) and they carry you between the Hook and Flynn's Knoll into Sandy Hook Bay. When the new lights on the Highlands are in range steer as before directed; or,

If you can see Prince's Bay light, (page 310.) get it to bear W. by N., and run it until you get the Point Comfort lights in range, when steer as before directed. If you cannot see any of the distant ranges or Prince's Bay light, bring the light-ship on Sandy Hook to range with the black buoy, and the beacon on Romer to bear

W. Steer W.N.W. with the ebb, and W. by N. on the flood, until you drop into 6 fathoms water, when the light-house will range with a clump of trees on the Highlands, with the Eastern side cut down square. You then steer for the E. beacon on the Hook, keeping it a little open on the port bow until you get mid-channel way, when you steer for the buoy of the S.W. Spit.

EAST CHANNEL.—North of Gedney's Channel buoys there is a channel over the East Bank; it is buoyed with spar buoys, having a general direction from N.W. by W. to S.E. by E.; it may only be attempted with safety in the day-time, with 14 feet. The only directions are, to keep between the buoys.

When you open the light on the bluff of Staten Island with that on Robbins' Reef, keep them open until you pass the Narrows; this keeps you clear of the West Bank. When in the Narrows, the course to Quarantine is N.N.W. 4 W.; from thence to the Battery the course is N.E. 4 N. On the Eastern side of the channel extending from Governor's Island, there is a mud-flat, having on it as little as 11 feet; to avoid this keep Trinity Church steeple open with Castle Williams.

After you have passed the buoy of the S.W. Spit, steer N. by E. 4 E. for the red buoy of the Upper Middle, which is 2 1/2 miles distant from the S.W. Spit buoy; on this course you will leave the black buoy of the Knoll on your port hand; after you get up with the red buoy of the Upper Middle, steer N. by E. until you pass the black buoy, No. 13, of the West Bank, when you open two hummocks in New Jersey; the Westernmost one is called Snake Hill; keep this hummock open with the bluff of Staten Island, and steer N. by W., which course will carry you through the Narrows. When thus far, to pass Fort Diamond, keep near mid-channel, but the shores are bold on both sides. The mark to pass Fort Diamond is to keep Bedlow's Island open with the point of Long Island; for if you can see Bedlow's Island in coming through the Narrows, there is no danger from the Narrows to come up to New York; you will steer up for Bedlow's Island to avoid the Mud Flat from the South side of Governor's Island; the mark for which is to keep Trinity Church steeple open to the Westward of the fort on Governor's Island. This flat is a kind of oyster-bed, or bank of mud and shells, and has not more than 11 feet on it at low water; but to avoid this flat do not stand too far to the Westward, on account of the light-house, on which there is a light-house. To avoid running on the West side of the channel, the mark is to keep the point of land up the North River (on which Fort Lee stands) open with the East side of Bedlow's Island, after which there is nothing in the way to New York, it being bold near the point of Governor's Island, and the rocks near the Battery do not extend 100 yards from the shore. There are two reefs of rocks in the East River below Corlier's Hook—the Diamond Reef of 12 feet, on which there is a red spar buoy; Coenties Reef of 17 feet, and the channel is between Diamond and Coenties Reef, but a pilot is necessary with a draft over 12 feet, unless well acquainted with the set of the tide, and the ranges to run between the reefs.

These directions are for slack water; those following them should remember that the flood-tide below the Narrows sets to the Westward, and the ebb to the Eastward.

Between the buoy of the West Bank and Staten Island there is a shoal, dry at low-water; the mark to avoid this is to keep Snake Hill open with the Bluff of Staten Island, or Robbins' Reef light open with the light on Staten Island.

Other Directions.—Or you may, after making the Highlands of Neversink, run in within three miles of the beach, and in steering along the Northward, keep in about 8 fathoms water, until you get the light-house to bear W. 1/2 N.; then, if you have a round hill, called Mount Pleasant, some distance in Jersey, in one view with the land about one-quarter of a mile to the Southward of the light-house, you are in a situation to pass the bar; steer in W. by N. until you are over it; you will have on it at low-water 3 fathoms; when over you will be in 4 1/2 fathoms. Pass the Hook about half a mile, at which distance you will have 5 and 6 fathoms. When you have the point of the Hook on which the beacon stands bearing S.S.E., you may then haul to the Southward, and round the Hook and come to, from 1 to 2 miles distant, the Hook bearing from E. to N.E., in good holding-ground, 5 fathoms water. When you make Long Island, it is necessary to keep somewhat in the offing, on account of the East Bank, and observe the same marks running in as before mentioned.

If sailing up in the night, when abreast of the S.W. Spit, the 2 lights on the Highlands will range, when you may steer N. by E. 4 E. until you make the buoy of the Upper Middle, when the East beacon and Sandy Hook light will range in one. After passing the Upper Middle, you will deepen your water to 6 fathoms, when you may steer N. up through the Narrows, and you will deepen your water to 7, 8, 10, 12 and 15 fathoms.

High-water at full and change of moon on the bar and Sandy Hook, 7 hours 29 min- *High-water.*

A. N.

Average rise and fall of the tide on the bar, 5 1/2 feet.

Light-house.

Do	do	do	third	do	do S.E.
Do	do	do	last	do	do S

In the spring of the year, when freshets run, the flood runs to the S.W. and West.

N. R. The above answers for the Upper Middle, and buoy of West Bank, with exception of one half hour later.

High water—High water at Governor's Island, full and change, 8 hours 49 minutes, 1/2 inch less.

Bearings from the Telegraph at Neversink Hills

Bearings—Sandy Hook light house N. 7° W., with the West side of Fort Leaf, very near the Telegraph on Staten Island N. 10° W. Level of the hill at the Telegraph, where the light houses are erected, 205 feet, making the 2 lanterns 250 feet above the level of the sea.

Other Directions are—In coming up with the bar, when mid way between the Hook and the Highlands, you may then steer W. until you get the West Beacon and the light house in range, and so keep them till you make the red buoy of West Spit, after hauling round the spit, steer N. by E. 1/2 E., until you make the Upper Middle, but be careful of the flood tide, which sets directly east of the West bank, after you have passed the buoy on the West bank (which is the buoy) you should not bring Staten Island light North of N. by W., as the West bank is very shoal, and tends to the point of the island.

If you wish to run for Prince's Bay, bring the light to bear W. N. W., and anchor as near the shore as you please—E. S. E. 1/2 S. from the light, 1/2 mile on the N. point of the shoal, on which a buoy is placed, this buoy is a good broad going in, but as it is liable to be carried away by the ice, the light can be brought to bear North of W. N. W.

Light—PRINCE'S BAY LIGHT HOUSE, stands on a bluff on the West side of the bay, bearing W. N. W. from Sandy Hook light, distant 10 miles, and West from the buoy. It shows a fixed light, varied by flashes, being E. S. E., 106 feet above the level of the sea.

Bearings from Prince's Bay Light house.

Point of the Neversink Hills, S. 51° E.

Sandy Hook light house, S. 71° E., distant 10 miles.

Spit buoy, on the North side of the Round and Middle Shoal, at the entrance of Prince's Bay, S. 86° E.

Light—PORT TOMPKINS LIGHT is on Staten Island, West side of the Narrows, a fixed light, 89 feet above the sea.

Channel's Shoal—There is a shoal 2067 yards S. 30° E., (true) from the light house on Staten Island. It lies North and South, and its length in that direction is 503 yards. The width from East to West is 164 yards. Soundings 18 feet at low water. This shoal is composed of sand and shells, or, strictly, is a *shell bank*.

Light—ROBBINS' REEF LIGHT is situated on Robbins' Reef, N. 1/2 W., 3/4 mile from Port Tompkins light, it is a fixed light, 66 feet above the sea.

The bearings and distances of the buoys of the harbor of New York are given that if one of them is fallen in with in thick weather, the course may be kept to the next one—Variation in 1850, 6° W.

Nun Buoys of the Bar.

Striped buoy outside the bar bears from the light ship N.W. 1/2 W., distant 1/2 mile; from red buoy No. 2, Gedney's Channel, S.E. by E. 1/2 E. nearly a mile; from black buoy No. 1, of the bar, N.E. by E., distant nearly two miles.

Red buoy No. 2, South Channel, bears from the light ship W. N.W., distant 1/2 mile; from black buoy No. 1, South Channel, N.E. 1/2 N., distant nearly two miles.

Black buoy No. 1, South Channel, bears from the light ship W N W, 4 W, distant 11 miles

 Red buoy No. 6 bears from red buoy No. 4 N.W., by N, " 13 "

[Note.—In sailing ship channel, inward bound, the black buoys are to be left on the port, and the red buoys on the starboard hand.]

THE LIFE SAVING BENEVOLENT ASSOCIATION OF NEW YORK, chartered by the Legislature on the 20th of March, 1840. Its object is to furnish means to save lives from shipwrecked vessels, and by donations, to reward meritorious conduct and acts of courage in the preservation of human life. Its means are derived from voluntary contributions. By the aid of an appropriation from the United States Government, the association has erected the following houses, and placed on them Francis' superior metallic life boats and other facilities for communicating with wrecked vessels, and for taking persons from them to the beach. Houses have been built under the superintendance of Mr. Watts, United States Engineer, between Coney Island and Montauk Point.

These houses are under the supervision of the Philadelphia Board of Underwriters. Each house under the charge of the Life Saving Benevolent Association, when complete is to be furnished with the following articles

One metal surf boat with air chambers and cork fenders, seven oars and two India rubber hauling buckets

One metal life car, with cork of India rubber, floats and fenders, and rings and chains for each end

One Manila hawser, 43 inch, 180 fathoms.

One hauling line, 23 inch, 310 fathoms

Two rocket lines, $\frac{1}{4}$ of an ounce per yard, 300 yards each.

One coding frame for rocket line and box.

One croch and range for throwing rockets.

One sand anchor, strop and bull's eye.

One tackle with 20 fathoms fall, 23 inch Manila.

One heavier and strop

One mortar of iron, and 10 shot fitted with spiral wire.

One copper powder canister, and 4 lbs. powder for same.

Twelve blue lights and box, containing 50 quick matches.

Five rockets and rocket box of tin

Eight pieces of match rope and 12 pieces of port-fire.

Two lanterns and oil can, and oil for same.

One lamp feeder and wick.

One stove and pipe.

One cord of wood.

Two shovels.

One painting wire.

JOHN D. JONES, President.

South side of Long Island.

BARNEGAT TO SANDY HOOK.—Barnegat light house is 150 feet above the *Barnegat* to level of the sea, and contains a fixed light, varied by flashes of 10 seconds; it is on *Sandy Hook*, the Southern side of the entrance.

The shore, from Barnegat to the North end of Long Branch, is nearly straight, running N by E, $\frac{1}{2}$ E, 33 miles. It then bends gradually to the N, latitude of Sandy Hook light house, distant 9 miles from the Northern part of Long Branch. Variation in 1850, 3° W.

The beach North of Barnegat is bare of timber, until nearly up with Squam Inlet, (10 miles) but the pines, which are on the main land from 2 to 3 miles inside, show plainly over the sand hills

The Woodlands, which commence about one mile South of Squam, are close to the shore, and extend to Long Branch, 8 miles.

Long Branch is that part of this shore where low table land shows itself close to the beach; numerous houses are built on it and they are generally known to the ocean as "the Tavern Houses." It is about 5 miles in length.

North of Long Branch the beach is low, and nothing remarkable until up with the entrance to Shrewsbury River, opposite the light houses on the Highlands of Never-sink, where it is free from sand hills, and when the entrance is closed, which is sometimes the case, it appears perfectly level. After passing this flat part, distant about 6 miles from Long Branch, the cedars on Sandy Hook commence, and extend up to the light-house.

Squam Inlet is navigable for small vessels; and as they are frequently detained at anchor on the inside of the bar, strangers, not knowing their latitude, have supposed themselves opposite Barnegat from seeing them at anchor. At Barnegat the pines show as remote from the shore, while at Squam they are near.

The shore between Barnegat and the Highlands may be approached with the aid of a mile by all classes of shipping, in clear weather, in the day time, and is nothing to fear, save a spot to the North of Long Beach, about one mile to the north, on which there are but 14 feet. It lies S. S. E. from the light house Highlands, distant 3 miles.

At low tides, and, in clear weather, may venture with safety near this rocky shore in the day time, they cannot be too careful in thick weather at night, and when in less than 13 fathoms water should keep the lead constant, as there are many places on this coast where 10 and 12 fathoms depth is found within one or 2 miles of the shore, where the bottom is rocky, where your approach to the beach can only be known by the rapid changes of depths.

Soundings between Cape May and Montauk Point.

The average extent of the coast of New Jersey is 60 miles. This will take the Forty Fathoms Line, from which it shortly afterwards deepens to 50 and 60 fathoms. The Forty Fathoms Line extends itself parallel with the coast until Barnegat, when it becomes wider, and from thence extends over towards Montauk Point, S. S. E. from which, 10 miles, you have 40 fathoms, 20 miles, 50 fathoms, 30 miles, 60 fathoms.

When you get soundings on the edge of this bank, and are uncertain as to your station, never rely on soundings *one or twice* to determine it, but sound frequently, proportion your course, distance, and depth of water, the same scale, as you do on a plain sheet of paper. After you have continued the same for sufficient time, get a profile of the ground sailed over, compare the depth and changes by such parts of your proportion where there are no soundings, so as to enable you to slide it over the chart to such place as it will correspond to, or, what is better, your own proportion and soundings on transparent paper, and slide it over such part of the chart near which you suppose yourself to be, until the profile of depth corresponds with the meridians on both parallels.

NOTE.—The chart of approach to New York has been published by the Coast Survey, and by attention to the above one may navigate with the greatest safety with it, he may be misled, but a single depth of water will no more inform your location at sea, than your altitude above the sea would give your position on land. If you wish to navigate with the lead, in addition to having a good chronometer watch the elements, as you would the aspect of a country over which you are travelling.

COAST SOUTHWARD OF SANDY HOOK.—If you come in near Cape May, be careful of its shoals, and make your way to the N. E., which will bring you on the sandy shores of the Jersey shore. When you get 30 fathoms water, run E. N. E., then haul in to make the land, by which you will avoid the shoals of the coast, and the shoals nearer in shore, but if you cannot see the land, follow:

When you are up with Chincoteague Shoals, in 16 fathoms water, it is near to approach them; from this station, if bound into the Delaware, steer N. E. by E., which is the course parallel to the land, until Cape Henlopen light bears W. by N. 10 miles, or, if bound to New York, keep on that course until you have passed the patch of Long Beach, taking care, as remarked before, not to run less than 10 fathoms water, at night. You can then steer for the Hook, if running up, you deepen your water suddenly, from 11, 18 to 25 and 30 fathoms, ooze bottom, you are in what is called the Mud Hole, the centre of which is 13 miles from the taverns, at Long Branch, and S. E. 10 miles from Sandy Hook light house.

SANDY HOOK, CAPE MAY, AND CAPE HENLOPEN.—When sailing from Sandy Hook light house, as soon as to the Eastward of the bar, steer South by E. 10 miles, pass Barnegat, if day time when passing, you may go nigh the breaker 50 fathoms. In sailing between the Highlands and Barnegat in the day time, you may within one quarter of a mile of the land, if the wind is off shore. When you have passed Barnegat, steer S. W. by S. 10 or 11 leagues, which will carry you to Great Egg Harbor, which has a shoal bank one league from the shore, that is more than 6 feet water on it.

In the day time you may go within 2 leagues of the shore, but at the night you are prudent to keep further off. When you have passed Great Egg Harbor, steer N. by W. 10 leagues, which will bring you up with Cape May light.

Between Barnegat and Cape May there are 3 inlets, one of which is fitted for water, for vessels drawing 15 feet, viz. Little Egg Harbor, as below. (See

Harbor may be run for in time of danger, and will give 12 feet at high water. The navigation is not so safe as other places.

In running for Cape May, while steering your S. W. by W. course, you will pass 5 miles before you come up with Cape May light, viz. Coston's, Townsend's, Heretford, Turtle Gut, and Cold Spring, all of which have buoys lying off their entrance; when abreast of Heretford Inlet, you may, if bound to Cape May, steer W. by S., but if bound to Cape Henlopen, steer S. S. W. till the light house bears W., when you may run for it till within 2 miles.

E. by S. from Cape May light, 13 miles distant, lies Five Fathom Bank, with 12 feet water on it. The South end bears E. S. E. from Cape May, and from Cape Henlopen it bears E. $\frac{1}{2}$ N., 24 miles distant, and ranges N. and S. It is dangerous for vessels with over 10 feet water.

BARNEGAT.—*Buoys as they are passed entering Barnegat Inlet.*

Sea buoy is a white and black striped can, No. 1, in 18 feet water, light house bearing W. by S., Bar buoy N. W.

Bar buoy is a white and black striped spar, No. 2, in 12 feet water, light house bearing W. S. W., Channel buoy N. W.

Channel buoy is a white and black striped spar, No. 3, in 11 feet water, light house bearing S. W.

Port side of Channel buoy is a black spar with a cross, in 10 feet water, light house bearing S. S. W.

Bulkhead buoy is a white and black striped spar, No. 5, in 13 feet water, light house bearing S. E. by E.

Buoy on a wreck is a red and black striped spar, No. 6, in 6 feet water, light house bearing E. by S.

South bulkhead buoy is a red spar, in 5 feet water, light house bearing E. S. E.

After making the sea buoy steer N. W., one quarter mile for the Bar buoy No. 2, which pass on either side, and continue on three eighths of a mile to Channel buoy No. 3, from which steer N. W. by N. for the point of the North Beach, and when within 100 yards of it steer N. W. $\frac{3}{4}$ N., for the Black buoy with a cross on it, on the port side of the channel, leaving it on the port hand. Then steer W. three quarters of a mile for bulkhead buoy, No. 5; thence S. S. E. for buoy No. 6, which is on a wreck, to which you must give a good berth. Leave it on either hand, and steer for South Bulkhead buoy. You have then good anchoring ground all the way up to the Westward to Point of Beach.

LITTLE EGG HARBOR light is a fixed white light varied by red flashes, on Tucker's Island, near the entrance to the harbor; the tower is red, 50 feet high.

The light is about 18 miles in a S. W. by W. direction from Barnegat light. Vessels making it should not steer to the N. of N. E. until they make Barnegat light.

This notice is deemed necessary, as the land at Barnegat runs nearly in a N. by E. direction, and to one not acquainted, both lights being of the same character the Tucker's Beach light would be apt to make him haul to the Northward too soon.

About midway between the light at Little Egg Harbor and that of Barnegat, there is a large hotel, which is a good mark to know the land by.

SOD CHANNEL.—Coasters bound to the Northward will generally make this harbor, when night by a North easter, after having passed to the Northward of it, and before being able to make Sandy Hook. In running down within sight of the land, pass the buoy near the point of Long Beach, giving the breakers off the Old Inlet a berth of half a mile, and keeping in 24 feet water until the light house on Tucker's Island bears N. W. by W. High water 7h 10m., rise 4 feet.

Buoy in 24 feet water, fine black sand, with the light house on Tucker's Island bearing N. W. by W., steer W. by S., for the outer buoy, near the middle of the entrance of Sod Channel.

While abreast of Tucker's Island, and before reaching the outer buoy, there will not be much tide, and the least water will be 10 feet at low water. When up with the outer buoy, the S. W. point of Tucker's Island being 900 feet distant to the Westward, steer S. W. $\frac{1}{2}$ S. for the middle buoy, keeping on the outside. Strong tide will here be met—the flood setting over the shoal off the point of Sods, and the ebb setting over towards the Round Shoal, for which allowance must be made. Turn the middle buoy in 19 feet water, and steer for the inner buoy. With a scant wind and an oblique vessel, will be obliged to anchor here, or even before reaching this point.

With a change of tide a better anchorage will be found further up, between Anchoring Island and the marsh to the Northward. This part of the harbor, from the N. W. extremity of Anchoring Island to Hatfield's store, is 14 mile long, and a quarter of a mile wide.

Little Egg Harbor.

Yes Light.

Sod Channel.

ward; keep on that course until up with the Brandywine light, then steer from the buoy to the light boat, near Cross Ledge. Your course, on the flood tide, is N. W. by N. 4 N., and on the ebb, N. N. W., the distance 14 miles. Soundings from 4 to 8 fathoms. You leave the buoy on the North end of the Brandywine Shoal to the Eastward, and the one on the 11 feet bank to the Westward. The former being 4, and the latter 5 miles, from the light boat.

The tides are influenced very much, in direction and strength, by the winds; but as the channel is well defined by the two light boats, (which are moored in line with it,) in connection with the buoys, there can be no difficulty in clear weather.

Your next Egg Island fixed light bearing about North, soon after leaving the Brandywine, it is upon a dwelling house, elevated 15 feet, visible 12 miles. N. W. by W. 1/2 mile from the buoy on the 11 feet bank, is the Southern extremity of Joe Flogger, or Folger Shoal, a narrow ridge running N. N. W., 15 miles, nearly dry in places, and forming for that distance the West side of the main channel. In beating up do not stand to the Westward into less than 4 fathoms. In thick weather Joe Flogger may be safely tracked along the whole extent, hauling on to 4 fathoms, hard, and deepening off to 5 and 6 fathoms, soft.

The ledge light-boat shows a single light, elevated 15 feet, visible 7 miles, and is moored about mid channel between Joe Flogger and the buoy on the lower end of Cross Ledge, which is a narrow ridge of hard sand on the East side of the channel, 4 miles in length, and nearly dry in places. Leave the light boat to the Westward, close aboard, and the course then to the Middle is N. W. by N. 1/2 N., on the flood, and N. N. W. on the ebb tide, distance 4 miles, soundings from 7 to 5 fathoms. These courses carry you about mid channel between Joe Flogger and Cross Ledge. From the buoy of the Middle into Bombay Hook Bay, the Thrum Cap, the lower of two islands of clumps of trees on the Western shore, bearing S. W. 1/2 W. the course is N. W. 1/2 W. on the flood, and N. W. by N. on the ebb, distance 9 miles. Soundings from 6 to 6 1/2 fathoms. Bombay Hook Bar is very bold; the soundings in the channel off it are from 6 to 6 1/2 fathoms. It should not be approached nearer than 5 fathoms.

There is a fixed light, 15 feet above the sea, on the S. W. side of Haystack Island, New Jersey shore, bearing about West from Egg Island light.

The gray light, on the Jersey shore, is in sight from the buoy of the Middle, bearing N. N. W. 1/2 N.; it is upon a dwelling house, elevated 66 feet, and visible 16 miles. *Coker's light*

The light is also upon a dwelling-house, elevated 30 feet, visible 10 miles, and in sight bearing W. by S. Egg Island light bears E. by S. 1/2 S. The above 3 lights are all fixed.

When nearly up with the Northern end of Joe Flogger, Bombay Hook light will be made just open with Bombay Hook Point, and bearing N. W. It is elevated 10 feet, and is visible 12 miles. When up with Bombay Hook Point, Reedy light will be made, bearing N. W. by N., elevated 55 feet, and visible 11 miles. Both of the above are fixed lights. *Lights*

The channel Westward of Joe Flogger cannot be considered available until it is buoyed.

The following directions are given, because it has sometimes been entered by mistake, and considerable embarrassment experienced in working back to the main channel again. This channel is as direct as the main channel, though not so wide. The Southern extremity of Joe Flogger shoal, as already observed, bears N. W. by N. 1/2 mile from the buoy on the 11 feet bank. Catering with that buoy bearing East 1/2 mile, steer N. W. by N. 1/2 N., which course will carry you along the West side of the shoal, in not less than 4 fathoms, until N. from the light bears W. by N., when you strike a middle ground 1/2 mile long, least water 13 feet, by means of which you drop into 4 fathoms again.

When the buoy of the Middle (main channel) bears E. by N. 1/2 N., and the light bears W. by N. 1/2 S., steer N. W. by N. 1/2 N., and you pass through into the main channel a little to the Thrum Cap, and not less than 3 1/2 fathoms.

The following directions will also serve for this channel, and with a little more caution, from the foregoing. — If you are before anchor, track the West side of the channel along, shoaling to 3, and deepening to 4, and when you are at 4 M. you will be bearing W. N. W., when you take your soundings close aboard. The general average of the shoals is not less than 3 fathoms, the depth of the shoals is not more than 4 fathoms, and the depth between it and the Middle ground is 11 fathoms, and the shoals are not tracked to the West of the channel, along as before.

Note. — Courses and bearings in entries, and distances, are in miles, unless otherwise stated.

The name of Plake's Channel has been given to the passage between the light boat, which was made known in the process of the U. S. Coast Survey.

From Bombay Hook Bar to Light's, the true bearing is N. W. 1/2 N., distance 11 miles; soundings, as far as Bombay Hook light, 6 to 4 fathoms, and

between the light and Liston's 3' to 34 fathoms being the least water in any part of the channel between Cape Henlopen and the Pea patch.

From Liston's, (the tree bearing South), to give Stony Point, (our berth, since for Port Penn Pier, a little to the Westward of Reedy Island light, 14 mile, or until Barney's house, on the Delaware shore, (yellow, with 2 single poplars near it) bears S. W. by W., soundings 4 fathoms; then your course is N. by E. 4 E., 4 miles, to Stony, or Elsingborough Point, on the Jersey shore; soundings, up to the middle of Reedy Island, 4 to 5 fathoms; then deepening to 7 and 8 fathoms. There are two channels to pass the Pea patch: for the Eastern, or Goose Island, Channel, track the stream flats along, which commence at Elsingborough Point, hauling on and off, shoals to 34, and deepening to 5 and 6 fathoms.

When up with the North end of the Pea patch, take your soundings from the New Jersey shore, hauling on to the flat to 3, and deepening to 4 fathoms, to the flat along until New Castle's spire bears N. by W., when you are clear of the North-eastern end of Bulkhead Shoal, and may haul out into the middle of the river.

The channel Westward of the Pea patch is divided by a middle ground, commencing about midway between the Pea patch and Delaware shore, and following the bend of the river about 14 mile; least water upon it 10 feet.

The channel Westward of this Middle is narrow; least water 20 feet. To be clear, run from Elsingborough Point for the Pea patch, until up with Reedy Point, from which the shore trends suddenly to the N. W.; then track the flats on the Delaware shore along, passing between the E. and W. buoys, and near the W. buoy, up to the Hamburg buoy.

The channel East of the middle is not so difficult; least water 13 feet. When up with Reedy Point, take your soundings from the Pea patch side, and track the flats up to the E. buoy, and then the middle to the Hamburg buoy.

From New Castle to Marcus Hook the general course of the river is N. E. by N. 10 miles. The best water off the Eastern shore, until past Cherry Island flats, and the ground off Christiana Creek, about 24 miles long; least water 14 feet. Having passed the flats, the best water is off the Western shore; keeping it pretty well about, you clear Marcus Hook Bar, which lies off that place.

At the mouth of Christiana Creek there is a 6x4 light, 18 feet above the surface of the Western shore. When one mile above Chester, you are up with the light on the spit which makes down the river from a Tamenon Island, which you pass Westward. The trend of the river is a nearly East of the bar, below Fort Mifflin, upon which there are 2 buoys.

Cross the bar between the 2 buoys, and steer for Fort Mifflin, passing just Northward of the Old Pier, which lies off that work. The river then trends Northward, and runs up to the Old Chain, upon which there is a buoy, which is to be kept to the Northward.

At Fort Mifflin, on a pier on the river, there is a fixed light, 28 feet above the surface. Having passed the Old Chain, the trend of the river is nearly North up to the Point, the best water on the Eastern shore, and the Old Pass, on the Western side, bears W. by N. 4 Steer up the river, and keep the Western shore up to the city.

Remarks

Reedy Island light is a 12x12 lamp, used, particularly in winter, to mark a running. A small spit makes a shoal from the lower end of the light, 1/2 mile; being clear of this, your course is North. Anchor off the pier, in 14 fathoms, and

For Day Hook Roads is an anchorage much used by vessels waiting under the Point, (the bay Hook Point) to bear S. by E., the light W. by N., and anchoring to 4 fathoms, rocky bottom.

The above directions are by Lt. Geo. S. Blake, U. S. Coast Survey, commanding the U. S. Schooner, which was a survey in 1816, by Lt. Arthur, the channel having made it necessary.

A fixed light on Reedy Island.....	39 29 57
A fixed light at Christiana River.....	39 13 12

The following sailing directions for entering Delaware Bay, are given by Lieutenant R. Bache, in connection with these buoys:

RICKARD'S CHANNEL.—Vessels drawing 15 feet water can pass through this channel *Rickard's Channel.*
of ordinary low-water—smooth sea.

BLUNT'S CHANNEL.—Not yet buoyed. *Blunt's Channel.*

THROUGH CHANNEL TO BREAKWATER.—Vessels drawing 16 feet can pass through this channel at ordinary low-water—smooth sea. *Through Channel to Breakwater.*

The rise of the tide may be estimated at 5 feet. Strong tides running, an allowance of two points must be made on the course steered, crossing the direction of the tides. The bed is a guide. The shoals, although pretty steep to, can be avoided by constant and true soundings.

When off the boarding houses on Cape Island, in the Coaster's or Cape May channel,

buoy No. 1, on Eph's Shoal, will be seen by N. 4 N. per compass—steer for it, bearing it close on board on starboard hand in passing—when up with buoy No. 1, buoy Nos. 2, 3, 4, 5, and 6 in clear weather will be in sight.

To pass through the "THROUGH CHANNEL" to BREAKWATER.—This channel is *To pass through the*
narrow on the S. E. is a shoal with 7 feet water upon it, and the Round or E. N. E. *through the*
shoal is to the Northward, and has 4 feet water upon it, and the breakers show plainly *through*
to any breeze. When abreast of No. 1, on Eph's shoal, stand W. 1 N. towards buoy *Channel to*
No. 3, keeping it open on the port bow a point, and gradually heeling up for it. When *Breakwater*
up with No. 3, leave it on the starboard hand, and steer S. W. by S. for No. 2, *which*
which leave close on board on starboard hand, and continue on S. W. by S. for Break *water.*

To pass through RICKARD'S CHANNEL.—This channel lies between Crow and the *To pass through*
Mummy shoals: the Crow shoal having on it 7 feet water, and the Mummy shoal 6 *through*
feet water. After passing buoy No. 4, it is a good heaving channel. *Rickard's Channel.*

From buoy No. 4 steer N. W. 1 W. for No. 1, which leaves No. 1 on the starboard hand at a short distance, and steer N. N. W. Westerly for No. 5, which pass on either hand, and haul up N. W. 1 W. Westerly for No. 6, which pass on either hand, and shape your course W. 4 N., which brings you between the buoy and the Brown and light-bout on the Branlywine Shoal, in the main ship-channel.

Note.—All soundings are given at low-water.

Buoys and buoys as they are passed in entering Delaware Bay and River.

The Hen & Chickens

THE HEN AND CHICKENS.—On this shoal there are 5 feet water in the Southern point, on which there are 13 feet water, bears S. E. by S. 2 miles from Cape Henlopen light. The beacon in range with the light on the br. water you on the edge of the shoal. On the Southern part is a spar buoy, red and black horizontal stripes, No. 4, in 25 feet water. Coasters may pass inside, and anchor beach around the Cape.

Cape Henlopen to Cape Henry.

INSIDE OF THE SHOAL, AND PARALLEL TO THE SHORE, THERE IS A CHANNEL OF 1 1/2 TO 2 FATHOMS DEPTH. CAPE HENLOPEN TO CAPE HENRY.—The coast is studded with shoals, at a distance off, from 3 to 6 miles, to the nearest point of land. The Channel there are 3 fathoms, lies S. E. Easterly, 6 miles.

Indian River Shoal, of 3 fathoms, bears S. S. E. 1/2 E., 11 miles, from Cape Henlopen light.

FENWICK'S ISLAND SHOAL.—The centre of this shoal is in $38^{\circ} 27' 30''$ N. *Fenwick's Island Shoal* lat. and in $74^{\circ} 56' 09''$ W. long. It is about 2 miles long, running from S.W. to N.E. The least water on it is 15 feet. It bears S.E. by S. $\frac{1}{2}$ S., distant 11 miles, from Indian River Inlet, and E. $\frac{1}{4}$ or $\frac{1}{2}$ N. from the North end of Fenwick Island. On the seaward side the soundings change suddenly from 10 to 23 fathoms, and there are 10 fathoms about 2 miles West of this shoal, which appears to be extending on the West side and towards the North.

There is an iron bell-boat off the middle of this shoal, in 10 fathoms water, Fenwick's Island bearing by compass W. $\frac{1}{2}$ S., distant 64 miles. The boat is close to the outer edge of the shoal, which is very steep, and runs N.E. and S.W. Vessels finding themselves unexpectedly in with the boat, should make Easting before shaping a course for the Delaware or any other Northern port. The hull is painted black, the mast red. The bell rings by the action of the sea.

ISLE OF WIGHT SHOAL, on which there are but 3 fathoms water, lies 4 miles S. $\frac{1}{2}$ E. from the centre of Fenwick's Island Shoal. It is nearly 6 $\frac{1}{2}$ miles East of the beach, and bears East from the Isle of Wight woods. There are 10 fathoms water within a mile on either side of this shoal.

Midway between these two shoals there is a spot with 3 $\frac{1}{2}$ fathoms water on it.

LITTLE GULL BANK is S.W. by S., 10 miles, from the Isle of Wight Shoal, and has 12 feet water on it. *Little Gull Bank.*

GREAT GULL BANK is 15 miles S.W. by S. from the Isle of Wight Shoal, and has 3 fathoms on it. *Great Gull Bank.*

THE SINEPUXENT SHOALS are several knolls near the shore, inside of Fenwick's Island Shoal, having 3 $\frac{1}{2}$ fathoms on them at low water. *Sinepuxent Shoals.*

CHINCOTEAGUE LIGHT is a fixed light, 80 feet above the level of the sea, and is on the S.E. point of Chincoteague Island, lat. $37^{\circ} 55'$, long. $75^{\circ} 21'$. This light can be seen about 12 miles in clear weather. From Chincoteague to Cape Charles, the land trends S.W. $\frac{1}{2}$ W., with several barred inlets. The land is low, sandy, and marshy. Variation, in 1850, 3 W. *Chincoteague Light.*

WINTER QUARTER SHOAL is one mile long and one-third of a mile wide, running in a direction E. by N. $\frac{1}{2}$ N., and W. by S. $\frac{1}{2}$ S., with not over 3 $\frac{1}{2}$ fathoms water upon it. The least water is 12 feet, in several places, at low tide. On the seaward side the soundings change suddenly from 9 to 4, and then to 2 fathoms. It is 6 $\frac{1}{2}$ miles distant from the nearest land, with 10 fathoms water between it and the shore. In clear weather the lantern of Chincoteague light house is just visible from it. The centre of the shoal bears from Chincoteague light E. by N. $\frac{1}{2}$ N., distant 11 $\frac{1}{2}$ miles. This is a highly dangerous shoal, as the soundings change suddenly, and it lies directly in the track of vessels. The sea breaks upon it in heavy weather. *Winter Quarter Shoal.*

CHINCOTEAGUE SHOAL is a long narrow bank or ridge running in a direction N.E. $\frac{1}{2}$ E. and S.W. $\frac{1}{2}$ W., $\frac{1}{2}$ miles long, with an average width of a quarter of a mile, and distant from 4 to 6 miles from the shore, with from 3 $\frac{1}{2}$ to 5 fathoms water upon it. Its North end bears E. by S., distant 7 $\frac{1}{2}$ miles, and its South end S.E. $\frac{1}{2}$ S., distant 5 $\frac{1}{2}$ miles from the light-house. *Chincoteague Shoal.*

A dangerous shoal lies S. by E. $\frac{1}{2}$ E., distant 1 $\frac{1}{2}$ miles from the light-house, with 3 feet water upon it.

Another, with 9 feet water upon it, lies S. $\frac{1}{2}$ E., distant 1 $\frac{1}{2}$ miles from the light-house.

Another, with 9 feet water upon it, lies S., distant 3 $\frac{1}{2}$ miles from the light-house.

Within a semicircle of 12 miles, the light-house being the centre, the bottom is exceedingly broken and uneven. The general set of the current along this part of the coast is to the Southward and Westward; and vessels from the West Indies and Southern ports, bound into Delaware Bay, have been set inshore among these dangers by it. The coast in this vicinity is dangerous for large vessels navigated by persons not well acquainted with it. Vessels supposing themselves in this vicinity, after striking 11 and 12 fathoms of water, should keep the lead going, and keep a bright look-out. In the day-time, large vessels should not approach nearer the land than 8 or 9 miles, with the trees just in sight from the deck; nor at night, even in clear weather, when coming from the Southward, nearer than just to keep the light in sight, and if it is brought to bear, by compass, to the Southward of West. After that it will be necessary to keep further off, and run it out of sight, in order to avoid "Winter Quarter Shoal."

REHOBOTH BAY lies 9 miles to the Southward of Cape Henlopen light-house. This bay is only for small vessels that draw not more than 6 feet water. *Rehoboth Bay.*

The North end of Fenwick's Island lies 10 miles to the Southward of the light-house, and separates Delaware from Maryland. It has a grove of trees on it, and you will have 6 or 7 fathoms of water within a league of the land, and a strong current setting to the Southward.

Chincoteague Inlet. CHINCOTEAGUE INLET.—The following buoys, black and white, with perpendicular stripes, have been placed at the entrance of Chincoteague Inlet.

Buoy No. 1, on Chincoteague Bar, is a can buoy, in 10 feet water. From it Chincoteague light-house bears N.E. by E. Buoy No. 2, inside the bar, is a spar buoy, in 8 feet water; buoy No. 1 bears S.E. Buoy No. 3, on the lower end of Williams Shoal, is a spar buoy, in 9 feet water. From it Buoy No. 2 bears S.E. Buoy No. 4, on the upper end of Williams' Shoal, is a spar buoy, in 20 feet water. From it Buoy No. 1, on Wallop's Island, bears W. by S. All the above buoys have black and white stripes.

Directions.

Dangerous.—Bring buoy No. 1, or bar buoy, W.N.W., and run for it, leaving it on the starboard hand, close aboard, then stand for buoy No. 2, which stands in mid-channel, and then for buoy No. 3, thence to buoy No. 4. When up with the bar, stand W. by S. for a lone tree on Wallop's Island, and anchor within about 200 yards.

Matomkin Harbor

MATOMKIN HARBOR has 12 feet water on the bar at spring tides. In running in for the bar, you will have gradual soundings from 7 fathoms. One cable's length from the bar you will have 2½ to 2 fathoms.

In running over the bar, keep the North shore on board, and steer S.W. on the port hand, one mile from the bar, give the point a small berth, and round into the N.W., and anchor in 4 fathoms water.

To the Northward of the bar, one-quarter of a mile, lies the wreck of a vessel. From the outer bar up the inlet the navigation is very dangerous, being filled with oyster beds.

Matomkin outer bar buoy is a red nun buoy, No. 2, in 10 feet water. Chincoteague light bears N.E.

The inward buoy is a black nun buoy, No. 1, length of staff 10 feet. The south part of Matomkin Beach bears from the buoy North; Paramore's Beach, S.W. by S. To cross the bar, run from the outer to the inner buoy. There are 8 feet at low-water on the bar. Rise of tide 5 feet.

Hog Island light

HOG ISLAND LIGHT is a fixed light, 60 feet high, on the S.E. point of the Island, 16 miles N.N.E. from Smith's Island light.

Hog Island outward buoy is a black and white nun buoy, in 12 feet water. The light-house bears N. by W. ¾ W. from the buoy; Revel's Island, North. To cross the bar, range the outward and middle buoys, and run to the middle, then range the middle to the inward buoy. The shoal water is crossed between the outward and middle buoys, and is 9 feet at low-water.

The middle buoy on the bar is a black and white nun buoy, in 24 feet water. The light-house bears from the buoy W.N.W.; Prouf's Island Point, S.W. by W.

The inward buoy is a black and white nun buoy, in 30 feet water. The light-house bears W.N.W. from the buoy; Prouf's Island Point, W.S.W.

White Point buoy is a red nun buoy, in 15 feet water, to be left on the starboard hand coming in. Hog Island light bears from the buoy E.N.E.; Prouf's Island, E. S. E.

Buoy in the mouth of the Deep is a black and white nun buoy, in 13 feet water. Hog Island light bears E.; Prouf's Island, S.E.

Buoy in lower Draft is a black and white nun buoy, in 36 feet water. Hog Island light bears E.S.E.; upper bluff woods, N.

Buoy in upper Draft is a black and white nun buoy, in 36 feet water. Revel's Island bluff bears N.E. by E.; Hog Island light, S.E. by E.

Elbow buoy is a black and white nun buoy. Upsher's Point bears from the buoy N.W. by N.; Fowling Point, S.W. by W. Depth of water, 24 feet. The depth in this channel 6 feet.

Each of the above buoys has an 8 feet staff with a cross on top.

These are very dangerous harbors in a gale of wind, but you may ride along with the wind from N.W. to S.W. When the wind blows hard at N.E. or N. and you are in sight of Chincoteague Shoals, your only chance for safety is to run to the Southward; for you cannot clear the land to the Northward, or go into the harbor of Chincoteague. When the wind is to the Eastward, it is generally weather on the coast. After you pass to the Southward of Chincoteague, steer S. for the light-house on Cape Henry, for the Northern part of Matomkin Shoals, 4 or 5 leagues to the Northward of Smith's Island, and the Southern part of it comes near abreast of said island. In steering to the S.W. Westward, 5 or 6 leagues S.E. of Smith's Island, you will have 12 or 13 fathoms, and in some places 4 fathoms. When you are 20 leagues from the Inlet, in the latitude of 37° 30', you will have from 30 to 35 fathoms; but when to the Southward of Cape Henry, you will have from 7 to 8 fathoms, within a league of the land, and a Southerly current in general runs from 1 to 1½ knot an hour.

miles from the island, and also Machungo Island; the latter is a smaller island.
Hog Island and Smith's Island have lights on them. Hog Island is longer than
Smith's; the trees stand more open, and are not so thick as on Smith's Island; and
in going on to the Southward from off Hog Island, you will make sand-hills which lie
between Hog Island and Smith's Island, being a sure mark you have not passed Smith's
Island. Be careful not to come nearer than 7 fathoms when off the sand-hills, as
nearer than that depth the ground is broken.
CAPE CHARLES LIGHT is a revolving light, 69 feet above the sea, and is on
Smith's Island, 4 miles from its S.W. point, lat. 37° 07' 48", long. 75° 52' 12".
Magnetic variation, in 1850, 2° W.
E. by S. 1 S. nearly, distant 7 nautical miles from Smith's Island light-house, is a
shoal, with 34 fathoms upon it at low-tide, with 7 fathoms water between it and the
land.
S.E. by E. nearly, distant 11 miles from Smith's Island light-house, is another
shoal, with 17 feet water upon it at low-tide, and 5 fathoms water between it and the
land.
Smith's Island is the first island after passing the sand-hills above mentioned. On
the Northern end of it there are some straggling trees, which appear like a grove, but
which join on to the island. As you draw up with Smith's Island, you may haul into
6 and 5 fathoms, till you get near abreast of it.
Smith's Island is a good place to anchor under, with the winds from N.N.W. to
W.N.W., and vessels often come to there if the wind is coming out from N. and
Westward.
If you intend to anchor there, bring the light to bear W.S.W. and run for it, and
you may go in as near as you can draft of water. At a depth, into 3 fathoms, or less, if you
choose. You will have blue mud and sand; and when you get under way from
thence, steer S. by W. till you cross the North channel in 74 fathoms. Keep on till
you raise your ground into 5 fathoms on the Middle Ground, then steer S.W., which
will cross the Middle in 4 fathoms; keep on S.W. until you deepen into 6 or 7 fathoms,
ship-channel; then, with a strong breeze, steer W. by N., which will carry you across
been water, until you raise your ground on the Horse-shoe. When at anchor under
Smith's Island, Cape Henry light bears about S.S.W.
In coming in from the Southward, bound to Cape Henry, keep in 7 fathoms until you
begin to draw up with False Cape, which lies about 7 leagues from Cape Henry to-
wards Writtick; then 9 or 10 fathoms is full near enough to False Cape. After you
have got to the Northward of False Cape, you may then keep again in 7, 8, and 9
fathoms (ship-channel) till you get up with Cape Henry. From off Roanoke the
soundings along shore are hard and all along until nearly up with Cape Henry, when
it is sticky bottom, and you will be in channel-way.
The shore between False Cape and Cape Henry makes in like a bay, something like
Lynhaven Bay, and in thick weather a stranger might mistake it for Lynhaven Bay,
and False Cape for Cape Henry, if it is so thick that the light-house on the latter
cannot be seen; but in round False Cape it is all hard bottom, and in Lynhaven Bay
it is soft or sticky bottom, and in some places very tough bottom.
The passage between Cape Charles and Outer Middle is little known, and not fre-
quently by large vessels. It is only used by small vessels of 8 or 10 feet water.
CAPE HENRY lies 12 miles S. by W. from Cape Charles, both of which form
the entrance to Chesapeake Bay. On it is a light-house, the lantern of which is ele-
vated 124 feet above the level of the sea, showing a fixed light.
When coming in from sea, in the latitude of Cape Henry, you meet with soundings
about 25 leagues off, which you may observe by the color of the water. In the South
edge of the bank you will have 10 fathoms water, which will shoal to 20, and still de-
epen as you approach to the shore generally sandy bottom. In clear weather, you
see the land when in about 10 or 11 fathoms, regular soundings, at which time
will be about 5 leagues to the Southward of it. To the Northward of the land, in 10
fathoms, the soundings are irregular, and the ground coarser. In coming in with
and Northwardly, you must be careful of the outer part of the Middle Ground,
which lies 9 miles E.N.E. from Cape Henry, and 7 miles S.E. by E. from Cape
Charles. You may go so near it as to bring Cape Henry to bear W. 3 S., which will
bring you round the tail of it, in 13 or 5 fathoms water, when you will deepen into
15, or 13 fathoms, and then haul away for the bay, the Cape being steep to. The
channel between the Cape and Middle Ground is about 4 miles wide, and 5 and 6
fathoms water close to the latter. When Cape Henry light-house bears W.N.W. 3
distant about 3 leagues, it appears thus:

*Cape
Charles

(716) 872-4503

vessels ought, therefore, to be very careful in rounding them. There is a small reef projecting from the S.W. point, but it always shows itself.

Captain Dowers, of the navy, has stated that, in the route from New Providence to Jamaica, in 1811, when "passing along the West side of Watling's Island, about 1½ mile from the sandy beach, with the S. by W. point bearing S.W., just at dusk we discovered a ledge of breakers (about a ship's length East and West) close to us:—

"When about a cable's length to the Westward of them, we had the following bearings, viz.: a remarkable black rock, close to the shore, and breakers in one, E.S.E., the N.W. point of the island E., the S.W. point S. by E.

"We had 5 fathoms at about 2 cables' length to the Northward, and deepened our water gradually as we increased our distance to the Westward. No bottom with hand-line about half a mile outside; the water the same color as the ocean; at this time land was distinctly seen from mast-head, bearing S.W., and very low."

Rum Key.

RUM KEY.—No reef of any extent lies off this island, except Pindar's Reef. This lies off the N.W. part of the island, extending out North about 2 miles. There is a small reef very close in, near the S.E. harbor point. The shore in general is bold; and if a trifling reef, shoals, or sunken rocks are known, they are chiefly on the North side of the island, not frequented by any shipping, and lying very near the shore. The S.W. point is a sand-spit, with very bold water on either side of it; vessels of any size can anchor within 200 yards, and procure fresh water from wells dug near the beach.

With the exception of Pindar's Reef, vessels of any size can approach with safety any part of the island within a quarter of a mile, and many places (particularly the West end) within 150 to 200 yards.

The West side of Pindar's Reef is very bold; vessels may run a North course so close along us to throw a biscuit on it. The East part of the island shows white cliffs; more Northerly again, black cliffs.

The vessels that load at Old Pond run down the South side in going to sea, round the West end, keeping to the Eastward of Little Island, in sight, distant 13 miles, and to the Westward of Watling's Island, about 20 miles from Rum Key.

If the vessels returning homeward cannot pass to the Eastward of Rum Key, and are obliged to take to the South side, they should keep close in with Rum Key, and well in with the West end, which would allow them to pass well to windward of Little Island. Variation, 5° E.

There are settlements all round the island. Rum Key has two salt ponds; the old salt pond situated on the South side of the island, nearest the end. The anchorage is good about half a mile from the beach, and will admit vessels of any size, affording shelter from the S.E., E.N.E., and round to N.W. Pilots will go out, on vessels making the usual signals. There is always a considerable quantity of large graded salt for sale, and every dispatch given while loading.

Carmichael Pond, a new one, is at the West end of the island, and the facilities for procuring salt are good; the anchorage, an open roadstead at the West end, and immediately off the pond, is protected by the island, with the wind from N. by E. round to S.E. by S. Not far from the beach is a signal-staff; vessels may anchor in it, within 250 yards of the shore. Should the anchorage prove rough, by the wind getting out Westerly, vessels can easily weigh anchor and run round Sandy Point. A few minutes after weighing anchor a vessel will be out to sea. The salt is carried alongside in boats and put on shipboard.

Conception.

CONCEPTION is a little island surrounded by a reef, and lies half-way between Rum Key and Catt Island. From its N. side a reef extends 5 miles to the N.N.E. and N.N.W., which was not known until the year 1812, at which time the British frigate Southampton was wrecked upon it. This reef is accounted one of the most dangerous in the Bahamas, having several dangerous rocks or heads, which cannot be perceived by the color of the water before you are close to them.

Atwood's Key

ATWOOD'S KEY is 3 leagues from East to West, and narrow from North to South. The island is surrounded by a white shoal, bordered with a reef. Off the West end the reef extends out one league; and under this point, in the extent of another league along shore, there is an opening or interval in the reef; and here vessels may anchor in the white ground, in 7 or 8 fathoms, but very close to the shoal. Off the edge of the white ground no soundings are to be found. To the East of the island are two small islets; the outer one at a league and a half from the shore; they are surrounded with reefs and white shoals.

Atwood's Key is low, with bushes, and presents the same appearance as the other isles in this passage. Its greatest breadth is about 3 miles, which is in the middle for each extreme terminates in a point. The reef on the North side breaks, and extends above 2 miles from the land. The same reef, continuing to the West, forms

head, which is a mile and a half to the Southward of the point. "On the South side, about 2 miles from the West point, you may anchor at 3 cables' length from the land, and for half a league at least along the shore, sheltered from Westerly and N.E. winds. Having brought the West end N.N.W., about one mile off, we saw that end was a point only, and that the other side rounded away E.N.E., full of breakers, which were at least 2 miles from it; we also saw some ahead of us, and to leeward: we were obliged to haul our wind, and stand for the anchorage before mentioned, on the South side of the island. This anchorage extends about a mile each way from whence we were, and about 3 cables' length from the island. You may let go your anchor in 8 fathoms, sand and broken shells, but it is not good holding-ground."

THE CROOKED ISLANDS.—Of this singular group the best idea may be formed by referring to the particular plan of them. The positions appear to be well ascertained; and particularly of Castle Isle, or South Key. Pitt's Town, a settlement on the N.W. part of the Northern island, is the port of entry. *The Crooked Islands.*

CASTLE ISLAND is an islet off the South end of Aeklin, the Southern Crooked Island; between are several white rocks, one of which is very remarkable, appearing when you first make it, like a white fort or castle, from which the islet takes its name. The position of the islet is $22^{\circ} 7' 45''$ N., and $74^{\circ} 19'$ W. Variation $4^{\circ} 40' E.$ *Castle Isl.*

Between Castle Island and Fortune Island the land forms a great indent, named the Great Bay, at the entrance of which lie the Fish Keys. These keys are not to be approached too near. Between Castle Island and Salina Point is a fine sandy bay, called Jamaica Bay, wherein ships may anchor in 9 fathoms, well sheltered from S. W. winds. To the N.E. of this bay are two wells, with excellent water, and wood may be obtained.

FORTUNE ISLAND, distinguished by its salt-ponds and wharfs, is rather more than 10 miles in length, and $1\frac{1}{2}$ in breadth. It lies nearly N.N.E. and S.S.W. The South end is very bold. Off its North end are two islets; and a little to the North of these islets is a sandy point, known by the name of the French Wells. From this a small settlement will be seen on the high land to the Northward. A vessel may anchor in 8 fathoms, with the French wells due East, 2 miles. The anchor should be let go immediately when on the bank, only taking care to pick out a clear spot. At this place are several wells of excellent water, which give name to the point: stock and wood also may be obtained here. *Fortune Isl. and*

THE BIRD ROCK, or PASSAGE ISLET, is a little islet off the N.W. point of Crooked Island. A very dangerous reef extends 2 miles from it, in a N.N.W. direction; it then trends in a circular direction to the E.S.E., or towards the shore. This reef forms the Bird Rock anchorage, which is rather indifferent, the ground being partly foul. *The Bird Rock, or Passage Islet.*

Southward of the Bird Rock is a sandy bay, called Portland Harbor, in the middle of which, close to the beach, is a well of spring water. The best anchorage in this place is off the first rocky point to the Southward of the sandy bay, at about 3 cables' length from the shore, in 7 or 8 fathoms. You may anchor as soon as you are on the bank with the Bird Rock bearing nearly N.N.W., but without great caution the anchor will be lost.

If you anchor in the sandy bay above mentioned, you must be careful to avoid a rocky head, having only 16 feet water on it, and which lies off the centre of that bay, at about three-fourths of the distance between the beach and the edge of the soundings.

CROOKED ISLAND PASSAGE is the best of all the windward passages for ships to sail through. *Crooked Isl. and Passage.*

The prevailing winds being from the North quarter, as soon as you enter the passage you will find smooth water and plenty of sea-room. In the event of its blowing strong from the N.N.W., or N., you will find good anchorage under the South end of Fortune's Island, in 5 or 6 fathoms, about three-quarters of a mile from the shore, with the point bearing N.W. by N., and the sand-breaker E. $\frac{1}{2}$ S., just on the edge of soundings.

There is also anchorage at Bird Rock, but the ground is very rocky. Wood, water, and stock can be procured.

Of the Crooked Island Passage, the Count Chastenot de Puysegur says, this is the longest of these passages, but it is far the most convenient for ships coming out of the Bay of Gonaives, or from the Southern ports of Hayti, and for those which are bound to the United States. These commonly take their departure from Cape St. Nicholas; and being 2 leagues from the cape in the offing, must steer N. by W., 23 leagues, to make the S.W. point of Henegua. This course will generally lead 2 leagues to the Westward of the point.

When you are opposite the West point of Great Heneagua, at 2 leagues off, steer N. N. W. 2° or 3° W., for 25 leagues, when you will make Castle Isle, which you may approach within 2 miles, or nearer, without fear. If you should depart from Heneagua in the evening, it would be better to steer N. W. 1° N., for 17 leagues, to avoid the Hogsties; then to haul up, and make a good N. by W. course; when, having run 8 leagues, you will be one league to the Westward of Castle Island. The Hobart Breakers lie about 3 leagues to the S. W. of Castle Island.

Should you make Heneagua towards noon or afternoon, it will be best to drop anchor in the N. W. in the Great Bay, and get under way at midnight, or at 2 in the morning, according to the strength of the breeze, and steer N. W. 1° N., until you have run 16 or 17 leagues; then haul up N. N. W., or N. by W., when there will be daylight for anything through the passage. But should there be light baffling winds in the night, with probably a weather current, keep the lead going, and you will avoid the Hogsties, as, in advancing towards them, there will be found soundings of 50 to 30 and 20 fathoms.

From the West end of Castle Isle you steer N., or N. by W., 7 $\frac{1}{2}$ leagues, to make the West end of Long Key. This course and distance will lead within a league of it. Continue in the same direction, to make Bird Rock, off the Western extreme of Crooked Island. Having thus run 6 leagues, you will be 1 $\frac{1}{2}$ league West of this islet; so that the direct course from Castle Isle to the end of the passage is N. 5° W., 14 leagues.

When you are come to this place, you may consider yourself out of the passage; but should the wind happen to the N. E. or E. N. E., you have to fear Watling's Island, which bears from Bird Island N. 4° W., true, 23 leagues; therefore, to avoid it, you ought, in leaving the passage, to keep as much to the Eastward as the wind will permit; but should the wind be at S. E., and you steer at N. E., you would make Atwood's Key; so that, keeping the wind when you are out, you must observe not to steer higher to the Eastward than N. E., nor more to leeward than N. by E.

Diana Bank. DIANA BANK is a bank of 5 miles in extent from East to West, and 3 miles from North to South. From Com. R. Owen's, R. N., surveys, who has surveyed all the windward passages, it appears there are not less than 9 fathoms on it. The centre is in lat. $22^{\circ} 31' N.$, long. $74^{\circ} 46' W.$

Currents. CURRENTS.—You have little reason to fear the currents in this passage, which, in a fresh breeze, are scarcely perceptible; but, in calms and light winds, they may set you to the Westward, but slowly, and so feebly, that, in a passage so short, you need not mind them, especially if you make it with a large wind. But in the months of June, July, and August, when calms or light Westerly winds are common, you may experience a current setting to the West strong enough to alter your course; which effect only can happen in this passage, and is occasioned by the proximity of the extensive shoals, forming the channel of Bahama, and those of Providence Island. In this season, if you have sufficient to make you go more than 2 knots an hour, allow a quarter of a mile an hour for the current setting to the Westward; if you go 3 knots and upwards, this allowance will be unnecessary.

Winds. WINDS.—The N. E. trade generally prevails here, except from October to April, which are considered the winter months, during which you have sometimes strong gales from the N. W., and very variable weather, particularly about the full and change of the moon, which ought to be guarded against.

Mira-por-Vos. The MIRA-POR-VOS, an assemblage of barren rocks, with one low sandy islet, lie to the West of Castle Island, in $22^{\circ} 7' N.$, on a shoal similar to that of the Hogsties. They are very dangerous, and should be carefully avoided, particularly when the islands bear in a N. W. direction.

When the wind blows from the Northward, they break very heavy, and have always a heavy swell; the current generally sets from the N. E. one mile per hour. On the Western side is an indifferent anchorage: the East side is bold, and on the S. E. side, at a mile distant, there are from 20 to 25 fathoms, coral and rocky ground. As these keys are to leeward, they are not often seen by vessels in ranging along Castle Island; however, if it is necessary to turn, you may approach the bank within half a league. All the dangerous parts break, and the white ground will give you notice in good time. You may, if you choose, pass to the Westward of the Mira-por-vos, with the precaution only of not approaching too near. Captain William Dowers was passing this way in an evening of January, 1814, and came suddenly on a reef stretching out from the S. W. Key, which bore East, $2\frac{1}{2}$ miles. Captain Dowers says, "We had 10 fathoms sand, while in stays; but observed black rocks and less water in many places."

"This reef appears to run off West for 3 miles, and then extends to the S. S. E. for some distance. We counted 10 above water. They are all barren rocks, excepting the S. W., which is a low sandy island, about half a mile in length, and covered with brushwood."

The Mira-por-vos range nearly N.E. and S.W. The middle of the group bears W.,
11 miles, from Castle Island. In making them you will gain soundings in 11 fathoms;
and at three-quarters of a mile thence may pass to the Westward of them; but the
general channel is between them and Castle Island. High-water, full and change, *High-water.*
9h. 30m.

RAGGED ISLANDS.—These have been surveyed by Commander R. Owen, R.N. *Ragged Isl-
lands.*

The flagstaff is in lat. 22° 11' 40" N., long. 75° 44' 07" W. If bound to them from
the Windward Islands, a N.W. course from Cape Maize will make them, distance 45
leagues. Vessels bound to Ragged Island should pass 15 miles to the Northward and
Eastward of Key Verde, thence steer W. by compass for Ragged Island. The island
is surrounded by many dangers, whose positions are shown on the chart. All masters
of vessels bound to it, in coming up the straits, had best keep the Cuba shore on
board, until they run up as high as the well-noted high hills of Givari, which is a sad-
dle hill; then steer as above directed, and if they exceed 8 feet draught of water, keep
the island under their lee, and run the shore close on board until they bring the flag-
staff and houses to bear due South, then you will open the entrance into the harbor,
when you must haul in S.W.; then ahead of you a small key, with store-houses on it,
will appear, and at your entrance into the harbor, a low black rock on your starboard
side; give it a berth, and in running in, you will observe a large red Cal Bank on your
port side, which you may run close to until you come abreast of a low black point of
rock on the same quarter, and when you come abreast of a couple of cannon mounted
thereon, you may drop your anchor in 3 or 4 fathoms water, until a pilot boards you,
unless he have met you on the outside. Ragged Island is distinguishable from all other
surrounding keys by a lofty hill about the middle of it, the number of houses and inclo-
sures, and by the flagstaff that appears on it. Vessels running far from Cape Maize, or
Barracoa, generally make Cape Verde, close up to which, either to windward or lee-
ward, there is plenty of water for vessels of any draft. South of Ragged Island,
distant 10 miles, there are three small keys close to each other, called the Brothers,
that have from 2 to 3 fathoms water close up to them. St. Domingo Key lies S. 4 E.
of Ragged Island, distant 9 leagues, to leeward of which there is plenty of water; but
no vessel should attempt to edge the bank to windward of it, until close under the lee
of Key Verde, as there are many dangerous ledges and rocks betwixt them, on the
edge of the straits, on which many vessels have been lost.

Tides.—From the first of January to the last of April they flow from 16 to 18 inches, *Tides.*
and the tide that flows an hour after the rising of the moon, is uniformly 6 or 8 inches
higher than the tide which flows after her setting.

They have frequently, during the above months, been observed not to flow more than
from 6 to 12 inches. The spring tides, during the above months, generally rise from
6 to 10 inches higher than the common tides.

From the beginning of May to the first of October, both tides gradually flow till
they arrive at the height of from 10 inches to 2 feet 4 inches, and from 18 inches to 3
feet 6 inches, and then continue diminishing until the month of January.

*Directions for sailing from Jamaica, through the Windward Channel and Crooked
Island Passage.*

Those who are bound from Jamaica to Europe, or any part of the North-eastward,
should, if possible, take the Crooked Island Passage in preference to any other. From
Point Morant, Jamaica, you should endeavor to gain Easting as soon as possible; and
by taking advantage of the wind's shifting from N.N.E. to East, which it generally
does in the night, you will gain ground very fast; and by working up under Cape
Dame Marie, on Hayti, you avoid a strong set to the S.W., caused by the trade-
wind.

There is, at times, great difficulty in working around Cape Maize, owing to the
strong lee current which generally prevails with a strong N.N.E. wind, particularly
in the months of January, February, March, and April, during which the strong North-
easterly winds prevail. This current is found to run strongest between Cape Maize and
Cape Dame Marie, (or Donna Maria,) the stream occupying a space in breadth, equal
to the distance between the contracting points, and runs at the rate of 2 knots an
hour, setting, during the strong N.E. winds, to the S.W., between the N.E. end of Ja-
maica and the Morant Keys.

Some commanders, after clearing the East end of Jamaica, have stood over to the
Cuba shore, in order to round Cape Maize; but they, also, have found a strong lee
current, and having little or no land wind to assist them in working along the South
side of that land in the months above mentioned, they have at last been obliged to
bear up for the Gulf Passage.

It is to be understood that the following directions are not intended as a standing
rule for working, at all times, around Cape Maize. In the fine season there are va-

riable winds, and the current is sometimes in your favor, of which every advantage should be taken according to circumstances.

In sailing between Cape Maize and Cape St. Nicholas, the Montagnes de la Hatté, or grand Anse Mountains, (the Westernmost high land of Hayti) are often seen. They may be descried at the distance of 30 or 40 leagues; and by their situation and bearing, become a good guide in working up the Windward Channel.

In sailing from Port Royal to windward, and finding a strong lee current against you, stand well out, and work in the stream of the Morant Keys, endeavoring to get to the Eastward of those keys as soon as possible. The Morant keys are by no means dangerous, as they can at all times of the day be seen at a sufficient distance to avoid the dangers that surround them, for under the N.W. side is anchorage.

Having made the Morant Keys, stand well to the Eastward, and keep working in a direct line, for the high land over Point Boucan, which is to the E.S.E. of Cape Tiburon; and by not standing further to the Westward than with Cape Tiburon bearing N.E., you will avoid the stream of the current, and gain ground very fast. When you have advanced as far to the Northward as $27^{\circ} 10'$, you will sometimes meet with a counter current, and it frequently happens, particularly in the night, that squalls are met with from the Southward, which are caused by the highlands of Hayti. In this case, keep well to the Eastward of the Isle Navaza, between it and Cape Tiburon. With frequent flays of wind in your favor, endeavor to get close under Cape Tiburon, and keep working along that shore, which is very bold, to Cape Dame Marie; and, by not standing further off shore than 7 or 8 miles, you will find very little current. It has, however, been observed, that *by keeping too close in with the land about the S.W. end of Hayti, you may be becalmed for a month.*

In the channel between Cape Nicholas and Cape Maize, the current sets with great strength, particularly on the Cuba side, where it, however, varies with the seasons. It is, therefore, necessary to work up to Cape Nicholas, before you attempt to weather Cape Maize; and by keeping within the line of Cape Nicholas and Cape Dame Marie, you will work to windward very fast. When Cape Maize is brought to the Westward of North, you may venture to stand across the channel to the Northward, and you will generally, as you stand over, find the wind more Easterly. Stretch over to the Great Henegua, as that island should always be made if possible.

In proceeding from off Cape Maize for the Crooked Island Passage, make the land of Henegua if possible, as short departures are best in navigating among these islands, particularly as the currents are found in various directions.

On proceeding from Great Henegua to Castle Island, you should leave Henegua so as to allow sufficient time for entering the Crooked Island Passage before dark, or in the evening, so as to arrive there by daylight in the morning. The latter is generally preferred. The course from Great Henegua to Castle Island is N.W. by N.

Having entered between Castle Island and the Mir-por-vos, the course to Long Key is N. by W. $\frac{3}{4}$ W., 7 or 8 leagues. Towards the Northern end of Long Key is a rise of land, with a flagstaff on the summit. In advancing towards this place, you will perceive a sandy point, called the French Wells, off which there is good anchorage for men-of-war, in 7 fathoms, about 2 miles from shore.

From abreast of Fish Keys to the Bird Rock, off the N.W. point of Crooked Island, the course and distance are North, 84 leagues. You may run along shore, there being no danger but what may be seen in the day. The Bird Rock lies in lat. $22^{\circ} 50'$, long. $74^{\circ} 23'$.

When you get abreast of this Key, you may with safety haul up N.E., if the wind permits, to go clear of Watling's Island. It is very dangerous to approach Watling's Isle in little wind or calms, the current setting wholly on it: as it is very rocky and steep to, there would be no possibility of saving the ship. In going to the Northward you can seldom clear Watling's Island, after you have passed Crooked Island, without beating to windward; and going to the Southward, after you are past the Mir-por-vos, and the Hogsties, it is difficult weathering or rounding Cape Maize.

THE HOGSTIES are three low keys, encompassed to the Eastward by a reef of 4 miles in extent. The South Key is in lat. $24^{\circ} 40' 30''$ N., long. $73^{\circ} 50'$ W. They lie at the distance of 11 leagues N. by W. $\frac{3}{4}$ W. from the N.W. point of Henegua. About them are many rocks and broken ground, and when it blows hard the sea breaks over them all. The Southernmost is the smallest, and bears from the middle key, which is the largest, S.S.E. The smallest requires a good berth, it being shoal all round; but you may sail close to the largest, and anchor in 4 or 6 fathoms, with that key bearing E.S.E. About a mile to the Westward of the Hogsties is a depth of 18 and 20 fathoms.

GREAT HENEAGUA, OR INAGUA.—Great Henegua is rather low, and cannot be seen at a considerable distance, in consequence of the haze which constantly prevails in these latitudes. In making the West end there is no danger whatever. Two sandy bays at that end afford good anchorage. From the trade-

The Hogsties.

Great Henegua, or Inagua.

wind's blowing over the island, the Northernmost bay is the best. Stand in, and you will perceive the line of soundings by the color of the water, extending about half a mile from the beach. As soon as you are in soundings, let go your anchor, in 6 or 7 fathoms.

This island is about 15 leagues in length, and 10 miles in breadth. The body of it lies in lat. $21^{\circ} 5' N.$ Fresh water may be procured in the Northernmost bay, on the West side, at a small distance from the beach.

A shoal, marked doubtful, which is exhibited on some charts, as lying off the S.W. end of Great Henegua, has been carefully sought for, and said not to exist, but we think otherwise.

On the night of March 17, 1812, the steamer Clarion, Capt. B. Williams, drawing 10 feet water, struck on this shoal and knocked off part of her false keel.

Capt. W. supposes it to be about S.W., 15 miles distant, from the S.W. point of Henegua; it being night, he could not see the land.

M. Chastonet de Puysegur says, "Great Henegua, like all the islands which bound the Windward Passage, is very low, with small hummocks, which, at a distance, appear like detached islets." The land, in clear weather, may be seen at the distance of 5 or 6 leagues, and you need not fear coming within half a league on the Western side. In a fine bay, which you leave on your starboard side when going through the passage, you may anchor on white bottom, choosing your ground by your eye, as in many parts of such bottom there are stones which sometimes rise to a considerable height above the level of the sand."

There are some rocks about the S.W. point, with a reef which stretches out to nearly the extent of a mile. In the bay between this and the West point, called Shallow Bay, you may anchor close in. The bay is surrounded by a reef, which shows itself, although there are 2 or 3 fathoms over it. Without the reef, is white sand, to the distance of 3 cables' length, and on this is the anchorage, in 7 or 8 fathoms. Further out, in a line between the two points, which lie S.S.E. and N.N.W. from each other, in 15 fathoms, is rocky ground. This bay is not so deep as the Great Bay, but, as the bank is less steep, ships are not so liable to drive here; neither is the landing so easy, but there are clear places in the reef. There is no water but in the rainy season; then it is not very good, as it lies among the mangrove bushes.

THE GREAT BAY is sheltered from the North by the N.W. point, and from the South by the West point. This bay is 2½ leagues wide, and one deep; and all along the shore there is a border of sand 1 cable's length wide, on which you will have 5 fathoms, at a pistol shot from the shore, to 15 fathoms; and at half a cable's length from that, 15 fathoms of water. If you should be there in the season of the Norths, you may anchor under the N.W. point, so as to be sheltered from the W.N.W.; and if there when the Southerly winds prevail, you may anchor under the South point so as to be sheltered from the W.S.W. There are not more than 4 or 5 points of the Westerly winds which could hurt you; but they are not to be feared, as they seldom blow, and never violently. It is easy landing all round the bay.

Having rounded the N.W. point, you will see a little islet to the E.N.E. and a ledge of reefs for more than a league along the shore, and upwards of a mile from it. This coast will be known by a hummock, (le Mornet,) the only one on the North side, which is lower than the South, and covered with bushes.

At the Eastern part of the North side of Henegua is a bay, 3 leagues wide, and nearly one deep, where you may anchor, but will be sheltered from Southerly winds only. This bay is little known. About a mile from the S.E. point is a small islet, and around it the bottom appears white; upon this you may anchor at about musket shot from the island. The white bottom continues along the South part, with here and there some reefs with breakers.

STATIRA SHOAL, on which H. M. ship Statira was lost, bears South, nearly 3½ miles, from the South-east point of Inagua.

LITTLE HENEAGUA.—This island, which lies to the Northward of the N.E. point of Great Henegua, is low and uneven, except a little mount or hummock, which is at an equal distance from the N.E. and S.W. points; not far from the shore, almost round the island, it is sandy, except at the S.E. point, where a ledge of rocks stretches off and breaks, nearly ¼ mile. On the South side there is a white bottom, bordered with a reef, at the foot of which is a depth of 40 fathoms. This island is divided from Great Henegua by a deep channel, a league and a half in breadth.

CIDADADO REEF.—This, on the authority of Com. R. Owen, we believe does not exist.

MAYAGUANA, or MARIQUANA, is an island, 8 leagues in length, between the parallels of $22^{\circ} 18'$ and $22^{\circ} 30' N.$ It is surrounded by a reef, which runs above a league and a half to the Eastward. On the Eastern part of this reef are several keys, and 5 or 6 huge rocks above water. Near the Northernmost part of it is an islet, three-quarters of a mile long, with a small key to the S.W. of it. The rest of the

The Great Bay.

Statira Shoal. Little Henegua

Cuidado Reef.

Mayaguana, or Mariguana.

reef is bordered with rocks under water, on which the sea breaks. On the South side is a passage for small vessels to go through, and be sheltered by Mayaguana on one side, and the reef on the other.

Captain McGowen was lately cast away on Mayaguana Reef. He says it lies a mile and three quarters further out than the charts show. I previously considered that it did, a mile and a half. He has, I understand, determined the position of some points in the Passage Islands, and found a spring-well on Heeneagua; a matter of much importance under a tropical sun.

From the S.W. to the N.W. point of Mayaguana, the coast is clear, and forms two bays, the bottoms of which are of white sand, where you may anchor at about two cables' length from the land. The two points lie N. N. E. and S. S. W. from each other, distant 7 miles. It is very necessary to be acquainted with these anchoring-places, as you might be caught here with a North; then it would be better to anchor under the N.W. point, where you would be sheltered from the N. N. W., N. E., E. S. E., and as far as the S. S. W., by the island and reefs, which run a long league to the N.W., and on which the sea breaks with great violence. From the N.W. point the coast inclines to the E. and E. S. E., forming a kind of bay, bordered by reefs 3 miles from land, and having some passages for very small vessels. At the East point of this bay a little inland, are two small hillocks; then the coast trends E. S. E. full 5 leagues to the East point, which we have already described. Mayaguana and Caycos Islands form the Caycos Passage.

*The French
or Plana
Keys.*

THE FRENCH or PLANA KEYS, between Mayaguana and the Crooked Islands, have been described by the pilot of the Eagle, a French bark, as follows: "These keys, hitherto but little known, have been said to be three; but what probably gave rise to that, was a rock which appeared out of water as high as a boat. It is about half a mile to the N. E. of the largest island, among the reefs and banks. East from which, 1 mile distant from the N. E. point, lies a dangerous rock, even with the water's edge. We stood for the French Islands, and anchored in the white water on the West side of the largest, about 2 cables' length from it, sheltered by a reef, which runs to the N. and N. W. 2 miles.

"This island is no more than 3 miles North and South, and half as much East and West. The East and North sides are surrounded by reefs which break. The anchorage is about three-quarters of a mile from the South point, near which is a landing place; and by digging two or three feet in the sand, you will get good fresh water. Some English people, who were wrecked here, had made a pond, which dried up on the Eagle's filling four casks out of it, but in a quarter of an hour it was as full as ever.

"It is very surprising, that at about 10 paces from it there is a salt water pond. The island is low and almost even, though when you are at a distance there appear some small risings, which diversify a little its appearance. The ground is nothing but sand or rock, with some bushes upon it, fit only for firing. The other island, which is the smallest, lies East and West, about 2 miles to the Eastward of the first; but the passage between them, made very narrow by the reefs on both sides, is not a mile wide, and is fit only for small craft."

On Mayaguana and Atwood's Key Passage—from the French.

This passage may be very useful and convenient:

1. For ships intended for Crooked Island Passage, and meeting, after they are past Heeneagua, with the wind at North, N. N. W., or N. W.; then, not being able to sail up to Castle Island, they are obliged to sail to the Southward of these islands, going along the Planas or French Keys, and between Mayaguana and Atwood's Key.

2. For those intending to go through this Caycos Passage, who, when advanced to the West Caycos, if the wind is at N. N. E., would be obliged to sail to the Southward of Mayaguana, and to pass between this island and Atwood's Key.

When they are about passing between the two islands, if the N. N. E. wind is too near, they may advance Westward, and sail between Atwood's Key and the Crooked Island.

It is therefore of great importance that you should be acquainted with the dangers, and also with the places where you may anchor about these islands. If, in going for Crooked Island Passage, the wind obliges you to pass to the Southward of the Crooked Islands and the French Keys, it is usual to sail mid-channel, between the Hogstons and Castle Island, from which they are distant 11 leagues, and then make the Planas, which are in lat. 23° 36', or thereabout. They bear N. by E. from the Hogstons about 19 leagues, and lie 5 leagues to the Eastward of the N. E. point of Crooked Islands. You may safely pass them and the latter, keeping mid-channel, or rather over to the French Keys; for in case of necessity you may anchor on the West side of the largest of them.

lands, if the N.N.E. wind blows between Atwood's Key and the

acquainted with the dangers of these islands. If, in going to the Southward of the Crooked Islands, between the Hogsties, and then make the Planeta N. by E. from the Hogsties, the N.E. point of Crooked, keeping mid-channel, or rather may anchor on the West side

Those who are obliged to pass to the Westward of the French Keys may go between Crooked Island and Atwood's Key, which is a very good passage, 5 leagues wide. After having the French Keys about a league to the Eastward of you, make your course N.N.E., a little Eastwardly, 10 leagues; you will then get sight of the East point of Atwood's Key, which you must not approach nearer than 4 or 5 miles; but having brought it S.W. from you, 2 or 3 leagues, there is nothing to be feared.

It is necessary to observe that the Norths in this passage are very dangerous winds, and may throw you upon the reefs, which border all the banks on the East side of the Crooked Islands.

Being in sight of the French Keys, you may also, according to circumstances, pass to the Southward of them, giving them a berth of 4 or 6 miles; and, having cleared them, stand away to the Northward, to sail between Atwood's Key and Mayaguana, which is a fine clear passage.

The CAYCOS.—The Caycos are an assemblage of several islands and islets, *Caycos*, which inclose a white bank, some parts of which are very shallow, and others tolerably deep. There are five principal islands, viz., the East Caycos, the Grand Cayco, the North Cayco, the North-west or Providence Cayco, and the Little or West Cayco. These form a semicircle from the East to the West, round by the North, and are terminated on the South part by a great bank, on which there are from 3 to 15 feet water.

The Northern part of these islands is bordered with a white shoal, on which is a reef, extending half a league from the shore; at the N.E. part the white shoal extends onward a whole league; and at its extremity is a reef called Basse St. Philippe, or St. Philip's Reef, on which the sea breaks with violence. At a cable's length to the North and East of this shoal, you will not have less than 7 fathoms. South of it the white bottom extends to the South, and approaches imperceptibly towards the shore; you find 4 or 6 fathoms between it and the shore, which in an urgent case makes a sure passage.

From the South point of the Little Cayco, a chain of breakers extends to the East 3 leagues, after which they decrease, trending Southward and Westward, to join a sandy islet called French Key. This is low, with some bushes on it, and bears from the South point of Little Cayco nearly E.S.E., 5 leagues. The reef from the French Key stretches to the South $7\frac{1}{2}$ leagues, to join another sandy islet, which has not more than 20 paces extent, and is entirely drowned at high water; all this part of the reef is bold, and, as the water breaks pretty strongly upon it, you readily see it; but, south of the sandy islet there are no breakers, and you have no notice of the edge of the bank but the whiteness of the water.

From this sandy islet the bank sweeps a short league to the South, then to the S.E., 3 leagues, whence it trenches to the East, $5\frac{1}{2}$ leagues, and N.N.W., 2 $\frac{1}{2}$ leagues, to the breast of the Southern islets, which are situated more than a league within the white water.

From the sandy islets, as far as abreast of the Southern ones, the bank is very dangerous; you cannot see land, and come suddenly from a sea without bottom into 2 or 3 fathoms. The color of the water is the only thing that can warn you of the danger; and this is by no means certain, for navigators accustomed to see on the surface of the water the shadow of clouds, which sometimes has the appearance of shoals, are often lulled into a fatal security. No motive then ought to induce you to approach the part of the bank, and you will do well to keep at a good distance.

If after having been turned to windward several days in this neighborhood, you are not seen the land, the safest way is never to cross the latitude 21° in the night, but to wait for daylight; then, should you perceive any change in the water, which indicates white grounds, without seeing either land or breakers, you may be sure you are on the Western side; when you may steer N.W. $\frac{1}{2}$ W. to fetch the Little Cayco, and go through the passage to the leeward of these islands.

Should you see the Southern islets bearing about North or N.W., you may stand on upon the white water, in from 7 to 12 fathoms; then make a tack or two to get to windward, and go through the Turk's Island Passage, which is to windward of the Caycos.

So soon as you see the Southern islets, the bank is no longer dangerous, and you may go on it as far as one or one and a half league: South and S.W. of these islands you will not have less than 7 fathoms, and generally from 9 to 11.

The channel between the Caycos and Turk's Islands is 4 leagues across in the narrowest part: it is a good passage, and without any danger; you may come within half a league of the Caycos, and on the Eastern side of the islets without fear.

Through this passage you may turn with great safety, and will not feel the current, if you do not come within 1¹/₂ league of the shore.

A shoal called the Swimmer Bank is on the Western side, in lat. 21° 05', long 71° 31'. It is dangerous, and should not be approached without great caution.

You will find an anchorage on the white shoals, near the South point of the Great Cayco, which may shelter ships that do not draw more than 15 or 16 feet; West of this point there is a fresh-water lagoon.

The best anchorage for small vessels is to the West of the North Cayco, near the small Island of Pines, in the inlet which that island makes with Providence Island. Within the reefs that border that part of the coast lies L'Ause à l'Eau, (Watering Bay,) where you anchor in 3 fathoms upon a white bottom: there is good water, and it is the watering-place of the Providenciers. You will discover the entrance of the bay, by coasting along the reef, from the rounding in of the coast, after passing the West point of the Three Marias and Booby Rocks. When you perceive a great extent of white water within the reef, you must send your boat to find the channel, and moor her in it, making use of your lead; and, if you want to get in, be not afraid of coming near the reef. When you are once within the reef, you may let go your anchor in 2 fathoms: you may go further in, by towing or turning with caution; the entrance is not more than half a league or two miles from the shore.

At the N.W. point of Providence Key the reef terminates. There is anchorage on the coast in 8 or 10 fathoms, but you must range the shore pretty close to be on the White Shoals, bringing a steep hummock, seen a quarter of a league inland, to bear S.W.; then you will see the shoal recede a little from the shore, and afford a large space for the turning of the ship. Four miles South of the N.W. point, a reef commences from the coast, running S.W. Westerly, 24 leagues: this reef is terminated by a small sandy islet, almost under water.

From this sandy islet the reef runs in to the Eastward, and afterwards trends out to join the North part, off the Little Cayco, which is surrounded with white shoals.

The Little Cayco bears S.W. by S. from the N.W. point of Providence Cayco, which is of a middling height, and of a white color; you may range along the N.W. part, close to the edge of the white grounds: the West part is very bold to the South point, where you may anchor in from 5 to 7 fathoms, on white bottom.

Off the Caycos and Mayaguana Passage, Captain Livingston has said: "For vessels bound from North America to Jamaica, I consider the Caycos Passage preferable to that of Turk's Islands, which has been commonly used; because, if you can only distinctly make out the N.W. point of the Caycos, and bring it to bear E., or E. by N. however dark the night may be, you may run safely, steering at first S.W. by W. on compass, 5 leagues, and then S. by W. till daylight; and by which course you run no risk, either from the Caycos reefs or the Henegua; and, however fast your vessel may sail, you have more distance than you can run in one night before you can make Hayti or St. Domingo. By steering this course, or rather these courses, you also avoid all danger of being dragged by a lee current down upon the coast of Cuba."

The Caycos Passage is also recommended as the best passage for ships bound from Cape Haytien, formerly Cape François, when the winds are not steady from the E. by E. You will always go with a large wind, which is of great advantage; and will avoid all the white grounds to the S.E. of the Caycos, which it has been customary to make. This custom of coming to the white grounds is very dangerous; but there is no risk in making the land some leagues to leeward of the Little Cayco.

In leaving the cape, you must steer a N. by W. course; and after having thus run 25 leagues, you will find yourself 24 leagues S.W. of the Little Cayco; then you may haul your wind, first as high as North only, on account of the reefs off Sandy Hook, which lie to the North of Little Cayco; after which you may steer N. by E. 3 or 4 leagues, when you may haul up N.E., or continue to steer North without fear. Having run 10 or 12 leagues on this course, you will be out of the passage.

If, when you are 2 leagues S.W. of the Little Cayco, the winds do not permit you to steer N. by E., or to make a good North course, after having run 13 leagues, without getting sight of Mayaguana, the best way, if night comes on, is to tack and stand to the S.E., 3 or 4 leagues; then tack again to the North, and you will weather by 3 or 4 leagues, the breakers off the East point of Mayaguana.

If, when you are to the S.W. of the Little Cayco 2 or 3 leagues, and the wind does not suffer you to lay North, you must not attempt to go to windward of Mayaguana, but must fetch the channel between it and the French Keys. You steer for it N.W. by N. Having run 18 leagues, you will come in sight of the S.W. point of Mayaguana, which ought to be North of you, 2 leagues distant; you do not run any risk in approaching this point, which is safe. A small white shoal extends from it, with 3 fathoms water on it, almost close to the shore.

ou do not run any risk in
pal extends from it, with 3 fa-

When you have doubled the West end of Mayaguana, so as to bring it to bear East, you may, if the wind permits, steer N. In that case you will pass 4 or 5 leagues to the windward of Atwood's Key; but if your course is not better than N. by W., after having run on 12 or 13 leagues, and the night comes on before you can see that island, tack and stand on for 5 or 6 leagues. Then, if you can make a good N. by W. course on the other tack, you will weather the Eastern breakers of Atwood's Key, at about 3 leagues. Should you be 2 leagues from the West point of Mayaguana, and the wind will permit you to make a course only N.N.W., after having run thus 6 leagues, you will see the French Keys, bearing nearly W.N.W., 2 leagues. You may pass to windward or to leeward of them, as the wind may admit. When you are 2 leagues N.N.W., or N.W. by N. from them, upon running in that direction 12 or 13 leagues, you will be out of the passage. You must not go in the least to the Northward of this course, as the breakers off the West point of Atwood's Key bear nearly N.N.W. from the Westernmost of the French Keys.

The French Keys are very low; they bear from the S.W. point of Mayaguana N. W. ½ N. 8 leagues. You may go pretty close on the East, North, and South sides, the white bottom which incloses them being pretty steep. On the N.W. of the large island, the reef running out some distance, it is necessary to give it a good berth. You may anchor in the S.W. part on the white bottom, but very close to the shore. There is a small lagoon of fresh water supplied entirely by the rain. The isles have been previously described.

On leaving Cape Haytien you will generally find the wind at S.E. or E.S.E., and near the shore the current runs to windward; these are two powerful inducements to engage you to steer N.E., or N.N.E., for the Turk's Island Passage; but, at about 10 or 11 o'clock, the wind generally chops round to the E.N.E., or N.E. Being then 2 or 3 leagues from the coast and the current no longer felt, you would necessarily make the white grounds to the Southward of the Caycos. This circumstance has caused in my shipwrecks, merely from the eagerness of going 20 leagues to windward, in a voyage of perhaps 1500 leagues. On this account, mariners from the cape should steer at once for the Little Cayco.

Remarks on the Coasts, Isles, &c., which form the Windward Passages, by several French and English Navigators.

CAYCOS PASSAGE, &c., by Captain Hester.—After having cleared the East Caycos Passage of Jamaica, I would endeavor to get to the Eastward as fast as possible, taking every advantage of wind. In so doing, when advanced to Cape Nicolas, I would prefer beating up as high as the Island of Tortue, (or Tortuga, or Turtle Island,) and make my departure for the Caycos Passage, thinking it less tedious and difficult than the passage by Crooked Island.

From the Mole to the West end of Tortue, in latitude 20° 5' 20", the course is N. by E., about 11 leagues. It is all a bold clear shore, giving it 2 or 3 miles berth. The N.E. part is foul 3 or 4 miles, but from that part down to the West end it is bold; and the West end is as steep as a house-side. When the high hill which is seen near Point Paix bears S.W. by S., then the East end of the island is between you and it.

From off the middle of the Island Tortue, to go between Henegagua and the Caycos, take your departure in the evening, steering North by compass, taking care not to run more than 18 leagues at the most before daylight, with the distance off from it at making your departure included; when, if you see nothing of the East end of Great Henegagua continue your course for 7 or 8 leagues, and you will not fail of seeing the Little Caycos, or Little Henegagua.

You may keep near to the Caycos, and haul your wind to N.E., which will clear you of Mayaguana and its reef, the outer point of which lies in latitude 22° 20'; then you are in the open ocean, clear of everything.

If you find a leeward current or a scant wind, between Henegagua and the West Cayco, so that you cannot weather Mayaguana and its reef, you may bear up and run under the lee or West end of Mayaguana, there being no danger but what you may see, the sail between Mayaguana and the French Keys, which is a wide and fair channel. When you haul your wind to windward of Atwood's Key, which lies in latitude 23° 15'. In going through either of these passages, there is a greater advantage gained, with less trouble, and sooner, than by Crooked Island Passage.

CAYCOS, from the French.—The Little Cayco extends N.N.E. and S.S.W., about 10 miles, being its whole length. You may anchor all along the Western side, there being 4 or 5 fathoms water close to the land; but it is hard bottom, and too near the shore. At the N.E. point is a bank of rocks, extending to the N.E. near a mile, on which the sea breaks; there are 2 and 3 fathoms close to it.

There are some ponds with brackish water; and, as rain is not uncommon here, people who have the misfortune to be cast away on this island, may obtain fresh water.

The latitude of the S.W. point is $21^{\circ} 30'$, longitude $72^{\circ} 30'$; you may run along the South side, very close to it, upon the White Bank, in 5 or 6 fathoms, and no reef. When that point bears North, you will have a full view of all the Cayes Bank. The elbow is a shelter against the North, for there are 5 or 6 fathoms of water close to the breakers, which are very near the land.

Although the West side of the Little Caye is quite clear of rocks, and there are 6 or 7 fathoms within musket shot of the shore, so that you may anchor there, yet the best place to anchor (and which is most known) is under the N.W. point, rather within it, in 8 fathoms, sandy bottom; there you are sheltered from Easterly breezes. It is prudent, however, to have another anchor S. by W., in 11 fathoms, clear of the reef; this precaution will secure you against a sudden Westerly wind, and by that means it should continue, you get easier under way.

The North side of the Little Caye is covered by a reef, beginning off the N.W. point, and stretching as far as the Great Caye. This reef is the only barrier in the passage between. It is nearly 4 leagues from the N.W. point of the Little Caye to the N.W. point of the Great Caye, and the reef extends along that space; it is, as far as the Western point of the Great Caye, which is about 23 miles, distant from the N.W. point of the island. To the Southward of the last point is a small islet (I'Vaise an' Canot) the only good anchorage in this Western part, of which we shall speak hereafter.

On the West side of the reef there is a little key, called Sand Key, being N.W. westerly from the East part of the Little Caye. It is very low, and has a reef on its North part. Many ships have been lost on it, by its not having been laid down in the charts; for, after their running along the West side of the West Caye, they have hauled to the Eastward for the Providence Caye; whereas, when they run along the former about a league, you should make a N. by W. course, to the North of the Little Key, and the reef which stretches to the Northward of it.

To the Southward of the islet, between that and the reef, is a passage of about a mile to the bank. Without the islets are 10, 5, and 6 fathoms; in the middle 4 fathoms, and within it, 3; but then you immediately come into 2 fathoms.

From Sand Key the reef runs N. N. E., 2 leagues, being bordered with a narrow reef, on which you have 10 fathoms, within musket shot of the reef that joins the N.W. part of the Great Caye, a little to the Southward of Canoe Caye.

It has happened that ships intending to go through the Cayes Passage have run the Little Hemagn, either by mattrition or from the currents. To make sure of it, run far enough to the windward, when bound from Cape Haytien, you should make a course good N., or N. by E., 25 or 30 leagues, and you will see the white water of the banks, which you may run along the distance of a league, without fear; the Western edge of the bank is the islet called Sandy Key, which you may see within that distance; then make a N.W. course, and 4 leagues from Sandy Key you will see French Key; when the latter is North from you, then steer W. by N. 4 leagues, which will bring you South from the Little Caye, and being past it, you are to make a N., or N. by E. course, as before directed.

The white bank and the reef continue between the French Key and the Little Caye. You may run along them very near, in 10 fathoms, and you will see the edge of the reef through which small vessels go in upon the bank.

The reef which borders the White Bank from the Little Caye to French Key, begins one league East from the former, and it always breaks. You may stand near it coming from sea; but if you are upon the bank, you must take great care, for half a mile within you will find but 3 fathoms water; and in getting in water, the vessel sinks very quickly. There is a great deal of swell, it being open to the breeze. The bottom is sand, and good holding ground.

The Little Caye, &c. from the Journal of the Emerald

"Being at noon, with the Hope, a small vessel, off the S.W. point of the Little West Caye, a mile from it, we ran along the West side at that distance, and made the Hope anchor in 7 fathoms, hard sand, within half a cable's length of the N.W. point. Seeing that the vessel drove, the bank being very steep and narrow, and the weather inclined to be squally, we preferred keeping under sail, and made several trips, keeping well in with the land, at one mile distance. Along the reef on the West side, we landed very easily in some hollow places, filled with sand, and not by the sea in the sandy stones which compose the island. Opposite these holes, about three quarters of a mile from the N.W. point, is the best anchorage.

"The West side of the Little Caye runs N. by E., and S. by W., about 3 miles. On this side is the anchorage, sheltered from the trade winds, nearer the North

which is nothing but a steep border of sand, of a cable's length, you anchor at about a pistol shot from the shore, in 9 fathoms; at two ships' length there are 13 fathoms, and at half a cable's length further, there was no ground under the ship. If you want to stay there, the best way will be to have the outer anchor in 15 fathoms water, and to carry another on shore. There is no swell with the E. N. E. and E. S. E. breezes, however land they may blow.

"CANOE CAYE" is a little bay on the West side of Providence Caye, and may be of great use. There is water enough for all sorts of ships, sheltered from the Norths, which you should always guard against in this passage. The largest ships may anchor in it in 7 fathoms, on a sandy bottom, looking out for a clear ground, and here and there you will find it rocky. You are sheltered from the N. to the E., and to the S. E. by S. The anchorage is within the West point, which you bring to bear N., taking care not to come near the reef, which runs round this point for a quarter of a league; the reef ends there, and does not begin again 600 near 2 miles further to leeward; then it must bear S. by W. from you.

From the N. W. point of the Little Caye to this cove is N. N. W., 34 leagues; but you must make a more Westward course, in order to avoid the reef and the Little Key, as already spoken of.

"WATERING BAY AND PINE'S KEY" To the N. E. of the N. W. point of Providence Caye the coast forms a bight, the two points of which are 5 leagues asunder, between them is Watering Bay and Pine's Key.

At this anchorage you are sheltered from the N. E. to the S. S. W., passing by the E.

The greatest advantage of Pine's Key is a great lagoon of fresh water, sufficient for 50 ships; it is very drinkable, and not far from the beach.

The bottom is too white near the land and in the cove for you to catch large fish with a seine; but you must go in a boat on the edge of the reef without, and you succeed still better, if you sail over with your lines about.

From the East part of Pine's Key you may discover all the islands and keys, which are scattered within the Caye, from N. to S. E.

The following remarks on the Cayes, &c. have been written by Captain Livingston.

The whole of the North side of the Cayes is bounded by a reef, through which there are various openings, though they might not to be attempted by a stranger with out a pilot. Vessels ought not to run the land within a league and a half, to run down to the Northward of the Cayes. Watering Bay is extremely dangerous, and is most mercifully hid down in every chart which I have seen. The Providence Cayes are bounded to the Eastward, and Northward, and Westward, by as dangerous reefs as I ever saw; among which, if a vessel once gets embayed, it is next to impossible that she can escape. The American sloop of war *Chippewa*, the ship *Amelia*, of London, and brig *Messenger*, of Cambridge, were all lost upon these reefs in 1746, within a few weeks of each other; and two days after the *Amelia* was lost, another vessel narrowly escaped the same fate; to this I was an eye witness, as I observed her run well on shore before dark, and had to all night, with the view of rendering her assistance; and when daylight came, I perceived a brigantine completely embayed, and those on board of her seemed to discover their error, and, profiting by the wind's changing at the time off shore, escaped.

After rounding the N. W. point of the Cayes, and bound to the Southward through the passage, having brought the N. W. point to bear E. or E. by N., you may sail safely even in the darkest night, steering at an E. S. W. 4 W., by compass, 5 leagues, and then S. by W. till daylight. By these courses you will clear the elbow reef, and Pine's Key, between the Providence and Little Cayes, and, at the same time, keep sufficiently to windward of the Henegua and Bishop's Shoal.

The Cayes are connected by a reef of coral rocks, and there is no danger of them in the day, as the white water shows itself. Vessels making the land about dark should never attempt to run through this passage in the night, unless sure of their situation.

"EAST or COCKBURN HARBOR" is in latitude $21^{\circ} 59' 23''$ N., longitude $71^{\circ} 30'$ East or $2^{\circ} 20'$ W. The harbor is one mile in depth, and the course is N. W., when the harbor is Cockburn Harbor.

High water at 7 o'clock. Tide rises 3 feet. Depth of water about 14 feet. High water.

"TINKER'S ISLAND LIGHT" A white light, revolving every 27 seconds, with a 7 m light between the intervals, has been placed on the North point of the Grand and light mark.

The tower, which is painted white, and 60 feet high, is situated 100 yards S. W. W. of the extremity of the point in

of the Emerald.

the S. W. point of the Little Caye at that distance, and the reef is a half a cable's length of the reef being very steep and narrow, and ending under sail, and making some noise. Along the reef are rocks, filled with sand, and some are of coral. Opposite these holes, the best anchorage is to be made, and S. by W., about 3 miles, nearer the Northward.

Caution to avoid danger off Cape Comete, East Caycos.—Vessels running for the Turk's Island Passage from the Northward must endeavor to make the light on a bearing to the Westward of South, as its range does not extend sufficiently far to guard against the dangers lying off Cape Comete, East Caycos.

Caution to avoid N.E. Reef, Grand Turk, Turk's Islands.—A reef runs off from the North point of Grand Turk, its extreme bears from the light N.E., distant 3 miles, and from thence extends Southerly and runs parallel with the East side of the Key, at the distance of 2 miles; consequently, vessels, on making the light between the bearings of S.W. and West, should (if intending to take the Turk's Island Passage) be careful to avoid this danger.

On the bearing of South the light may be safely approached to within 2 miles, and have the passage open.

This light cannot be seen from the dangers at the Southern entrance of Turk's Island Passage.

Turk's Isl- TURK'S ISLAND PASSAGE.—There are three principal islands, Grand Turk, and Passage. Salt Key, and Sandy Key, which should always be made in going through the passage.

The Western side of these islands is bold, and they may be approached very near, although there is a white shoal, with many rocky spots, which extends about a quarter of a league from the shore.

You may anchor in two places off the Grand Turk; one towards the middle of the island, opposite the huts, the other off the South part of the island; but neither of them can be considered as good. You let go your anchor as soon as you are on the white ground, and take care to find out a clear bottom, as, in some places, the points of rocks rise to within 8 or 10 feet. After you have let go your anchor, and veered to half a cable under your stern, you will not get any ground. Off the South part of the island the anchorage is of more extent, and you will find, on the point near which you anchor, a lagoon of water that may serve for cattle. The white shoal S.W. of Sandy Key decreases gradually to 5 fathoms, half a league from the shore.

East of these islands are several islets, which are connected by white grounds with very little water on them: they are bold on the East side, and surrounded with a white ground that extends to the Southward and S.W.

TURK'S ISLAND PASSAGE.—This passage is very short and good; but you cannot always be sure of fetching it from Cape Haytien. You ought to steer N.E. 4° E., and the wind often will not admit running so much to the Eastward; it is, therefore, recommended, in leaving the cape, to keep the wind as close as you can with the early breeze, and tack so as to fetch the Grange before night. You will generally bring it to bear S.E., or S.S.E. If the ship sails well, or has been favored by the breeze, you may bring it to bear S., whence, making good a N.N.E. course, you need not tack until you have run 18 or 19 leagues. If your last course should not have been better than N. by E. or N., you must be particularly cautious not to pass the latitude of 21° . In the night, when you think you are near that latitude, be sure to sound; and the moment you have bottom, about ship and stand the other way till morning, when you may again tack and fetch to the windward of the white shoal of the Caycos.

The white bottom is very readily seen; you may run on the edge of the bank to the Southward of the Southern Keys for a league, or perhaps a league and a half, from 7 to 11 fathoms; but further on there are rocks, with 3 fathoms, at most, between them. In the day-time you may stand on to the Northward, (supposing that you have not seen the land,) and you will desery the Southern Keys of the Caycos; or, if you see the further to the windward, Sandy Key. You must be careful not to go to leeward

of the white shoals which extend South of a small sandy islet, which is entirely
drowned at high-water. It is very difficult to be seen, and your lead even cannot
give you warning, as you fall suddenly into 3 fathoms.

To the South-westward of Sand Key, lies the Endymion Reef or Shoal, which is
described below.

When you have Sand Key bearing E., at the distance of 2, 3, or 4 leagues, steering
N. by E., or N.N.E., 8 or 10 leagues, will entirely clear you of the passage. In going
through, keep the Turk's Island side on board, in order to avoid the Reefs of St.
Philip, which extend from the N.E. point of the Grand Cayco.

Sand Key is one mile long, and, in fine weather, may be seen 3 leagues off; when
you are to the Southward of it you would take it for two islands, its middle part
being a low drowned land. On the West side are 7 or 8 fathoms, upon the bank
which borders the key, at the distance of 3 leagues, and joins a reef that extends a
mile from the North point of it.

The South point has, at about 2 cables' length, three rocks close to each other, by
which it may be known; but, to have them open and clear of the land, you must not
be far off, nor bring them to the Eastward of N.E.

The most certain mark by which you may know Sand Key, is that from the N.E.
and the W.N.W., you will see no other island, and the sand upon it is quite white in
the sun. The anchorage is only known by the white water, from 6 to 4 fathoms,
within swivel-shot of it; but ships which draw much water must anchor about half a
mile off, bringing the South point to bear S.E., and the middle of it from E. to E. by
N.; the North rocks there cover you as far as N.N.E., and you may easily get under
way with any wind, as the Norths, which are most to be feared, blow only along the
coast, so that the West side may be reckoned a good roadstead. A ship which, by
accident, has been prevented from sailing through the passage, may find a good shel-
ter here, and wait for a favorable wind. The reef on the North part of the key
stretches to it North a little Westerly, a long mile, when it makes a little hook to
the S.W., but breaks everywhere, and within pistol-shot there are 8 fathoms; though
you must not come so near on the other parts of the island, for here and there are
some rocks which have only 2 fathoms water upon them. The East side has high
breakers quite to the shore.

Sand Key is low and barren, being burnt by the sun, and continually beaten by the
winds and the sea: it produces some small bushes only.

SAND KEY.—Sand Key may be seen about 3 leagues off: it makes at first like *Sand Key*,
three islands, being formed of two little hillocks and a rock, known by the name of
Split Rock, though there is water knee-deep between it and the key. This rock
serves to distinguish Sand Key, over which it is probable that the sea breaks in all the
Norths, and other impetuous winds, for it is very low; you may easily land upon it
under the hillock, where there was formerly a pyramid.

This key is scarcely more than 1300 geometrical paces (of 5 feet each) long. From
the South end the reef runs off three-quarters of a mile S. and S. by W., at the end
of which are three rocks, which always break and show themselves. The hillock on
the South part is joined to that of the middle part by a low land, which looks like
savannah; and from that to the West point the land is also very low and even; you
cannot land here, nor must you anchor near this part, but towards the South, where
all the dangers show themselves. From the N.W. point is a reef to the N. by W.
North N.W., more than 2 miles, and about a swivel-shot from the end of this reef, is
a large rock, always above water; three-quarters of a mile from which you have 6
fathoms, rocky ground. You cannot land at the East side, which is surrounded with
rocks. The anchorage may be made very convenient, by carrying an anchor, with
two or three hawsers, to the Westward, and then you would clear the island with
every wind. But in the months of May and June, you had better anchor about a mile,
or a mile and a half off, to be less exposed to the swell sent in by the S.E. breeze,
which is generally violent.

THE ENDYMION SHOAL has on it 4 feet water, and bears S.S.W. $\frac{1}{2}$ W., 5 $\frac{1}{2}$ *Endymion*
miles, from Great Sand Key. *Shoal.*

THE SWAMMER, on the S.E. elbow of the Caycos Bank, has but 7 feet water on
it, and bears from the Endymion Shoal W. $\frac{3}{4}$ S., 14 miles distant. *The Swam-*
mer.

South-west of Sand Key is a white shoal, extending about 2 $\frac{1}{2}$ miles from shore, on
which may be found from 7 to 9 fathoms.

SALT KEY, or the **LITTLE TURK**.—When you leave Sand Key, and steer for *Salt Key*, or
Salt Key, you must take a North course along the reef, which runs off more than one *the Little*
side; or these bearings from you, you come almost within a stone's throw of it; for *Turk.*
at that distance there are 8 fathoms. Having got round the head of it, you are to
make a N.N.E. course to the Little Turk, which you may then see; and you will
see the soundings as soon as you have brought the reef to the Southward of you. It
is 2 leagues from the reef to the N.W. point of the Salt Key, near which you may

anchor; but the bank is very steep; for, when your anchor has gone in 5 fathoms, within musket shot of the shore, you will find the ship in 20 fathoms, and no ground a very little way astern. You bring one point N. N. E., or N. E. by N., and the other point S. by W., or S. S. W.; you must look for clear ground, or you will have your cable cut with the rocks. These places are fit only when the trade wind is settled; for you must not be caught here with any other.

Salt Key is N. by E. from Sand Key, and lies N. by E. like the two others; it is of a triangular form, its length something more than 3 miles; it is higher than Sand Key, and you will see here and there some little risings or hillocks, and a great many bushes and small trees, fit only for fire wood.

*Grand Key,
or Grand
Turk.*

GRAND KEY, or GRAND TURK.—Having advanced to the North point of Salt Key, you will see the Great Key bearing N. N. E., 24 leagues; so soon as you are clear of the reefs, which stretch off from the Little Turk 2 cables' length, it will be found that the bank continues from this N. E. by N., to the South point of the Great Key, for which you should make a N. N. E. course, though you might run along the West edge of the bank in 4 fathoms, or might indeed anchor upon it, as you would be sheltered from the trade wind by the bank and its keys. You must, however, be cautious in steering N. E. of a reef that runs off from Cotton Key W. by N., seldom showing itself in moderate weather, and stretching as far as the South point of the Great Key.

If you mean to anchor on the West side, which is much like the Salt Key, (though not so good as the Sand Key,) you had better keep along the bank, lest you get too far to the leeward, and haul in West from a hillock, which may be plainly distinguished when nearly in; the bank is very steep, and looks shoal; but you will find 4 or 5 fathoms water very close to the land. You must, however, stand in only upon white water, till you bring English Point E. by N.; off that point are some breakers quite close to the shore, and there is shoal water. When the before-mentioned hillocks bear E. by S., you may anchor within half a cable's length of the island, looking out for clear ground; English Point will then bear North, and the South Point S. E.; your anchor will be in 4 or 5 fathoms, the ship in 9 or 10, and the stern in 20, 25, or perhaps no ground to be found. It will be prudent in staying here to observe when the trade wind dies, for you have very little room to turn; you should always buoy your cables, for the sandy bottom is full of large stones, among which cables and anchors have often been lost.

The vessels which load salt generally anchor to the Northward of English Point, that being nearer to the Salt Pond; but neither the shelter nor the ground are so good as at the other place. No passage is to be found to the Southward of this island, except for boats, as there is a reef, which is a branch of that surrounding the weather side of these keys and banks. The Great Key has the best ground of the three islands.

Of the two salt ponds which are on the key, one only furnishes salt; it is about 1,200 yards wide, and its middling breadth above 200. It produces three times as much as the pond of Salt Key; but the grain of the salt is coarser, and not so bright as that of the latter.

The latitude of the North point of the Grand Turk is $21^{\circ} 30' N.$

*Square
Hankkerchief,
chief, or
Manchoy
Quarre
Shoal.*

SQUARE HANKKERCHIEF, or MOI CHOIR QUARRE SHOAL.—This is a bank of 31 miles in extent, in an East and West direction; the Eastern end is 21 miles wide, running nearly North and South. On the N. E. point of the bank, in lat. $21^{\circ} 06' N.$, long. $70^{\circ} 30' W.$, there is a shoal that breaks; and on the Northern edge of the bank there are two large shoals, each of 6 miles in extent. The S. W. end of the bank is in lat. $20^{\circ} 56'$, long. $71^{\circ} W.$ The S. E. end is clean, having on it from 9 to 15 fathoms.

Ships ought never to venture within any part of the white grounds, because they may often fall from 11 fathoms to 10 feet; if, by accident, they find themselves in the middle of them, the best way is to tack, and go out the same way they came in, ranging along the grounds.

*Silver Key
Bank.*

SILVER KEY BANK.—This bank is of great extent, the N. W. point being in lat. $20^{\circ} 51'$, long. $69^{\circ} 56'$, running South easterly 39 miles; thence South westerly 28 miles; thence West, to lat. $20^{\circ} 18' N.$, long. $70^{\circ} 02' W.$ On the Northern eastern edge of the bank there is a shoal of coral rocks a-wash, of 17 miles in extent, in a South-easterly direction, and of a triangular form. The Western edge of the bank, with the exception of the N. W. point, and a reef in lat. $20^{\circ} 27'$, long. 70° , is clear.

Your experience on the edges of the shoals weak currents, which generally follow the directions of those edges. On the Square Hankkerchief they are scarcely felt; on the S. E. part of the Silver Keys you find them setting to the West and N. W.; but a short league from the grounds their effect is not perceivable.

In general you ought not to mind, in your reckoning, the weak currents which exist in these passages, they being nowhere to be feared.

SILVER KEY PASSAGE.—Should you, by any circumstance, be forced to go *Silver Key* from Cape Haytien through the Square Handkerchief, you must at the departure make your course good N.E. by E. and E.N.E. If the wind suffer you to steer that course, you would pass in the mid channel; but if you are forced to turn, and should not get sight of the Haytien shore, after you have once got into the longitude of $70^{\circ} 20'$, you must not pass the latitude of $20^{\circ} 25'$ without frequently heaving the lead. If you come as far as $20^{\circ} 35'$ without getting ground, you have nothing to fear from the Silver Keys, and must only look out for the Square Handkerchief, which is not dangerous on the South, the bottom giving you notice in 10 and 15 fathoms. In the latter case, continue to get to the North eastward, and when you come into the latitude of $21^{\circ} 20'$ N., you will be entirely out of the passage. A very strong current is found to set to the S.W. through the Silver and Handkerchief Passages, after strong breezes from the N.E., particularly on the decrease of the moon.

BAJO NAVIDAD.—The North point of this bank lies in long. $68^{\circ} 46'$ W., and lat. $20^{\circ} 12'$ N., and extends in a Southerly direction about 25 miles; it is 12 miles wide in the centre, and has on it from 14 to 26 fathoms water, and is perfectly free of danger. Vessels bound to the North side of St. Domingo, can have an excellent opportunity of correcting their longitude by running for this bank, which is laid down from the surveys of Capt. R. Owen, R.N., and published by E. and G. W. Hunt.

In passing to the Northward of Porto Rico, a lookout should be kept for a rock or shoal (if not more than one) which certainly exists there, although its exact situation is not yet known. This danger has been noticed, where it is stated that an American schooner struck upon it in 1817, in latitude about 20° N.; and we have since met with another notice which states that, "at 50 miles North from Porto Rico, Captain Baxter, in the brig Robert, struck on a rock, and remained several hours."

General Directions for the Coast of Cuba

In the rainy season, or season of the Southerly winds, vessels bound from Europe to Cuba ought to pass to the Northward of Porto Rico and Hayti or St. Domingo; and during the season of the Norths, they should pass to the Southward of these islands, unless their port of destination requires them to do otherwise. There are other reasons for adhering to this mode of navigating. In Cuba the ports to which vessels are bound from Europe may be reduced to two, these are the St. Jago de Cuba and the Havana. If bound to the first, it is necessary, in every season, to direct your course directly to it; that is, in the season of the Norths to steer from Cape Tiburon, the S.W. point of Hayti, in order to make some point on the South side of Cuba, to windward of the intended port, or even to windward of Guanamao; and, in the season of the Souths, to steer from Cape Nicholas' Mole, on the N.W. coast of Hayti, almost West for the port, making, in the first place, the various points of the coast of Cuba, which are after described. But if bound to Havana, attention should always be paid to the season; that is, if your passage is made in the time of the Norths, you should go to the South of Cuba, although you have to return the distance between Cape Antonio and Havana; because this inconvenience is not comparable to that which might be occasioned on the North side by a hard North, which would not only expose a vessel to heavy risks, but might retard the voyage much longer than the time required to reach Havana from Cape Antonio; for this distance may be worked up in a short time, as you may have the assistance of the current to the Eastward, as more particularly described in the directions for the Strait of Florida.

Those navigating on the South of Cuba, who have no occasion to touch at Trinidad, or any part of that coast, should give it a good offing, and proceed to the West from Cape de Cruz. Here it may be observed, that at the distance of 35 leagues from that cape is the Western end of the low island called the Caymanbreck, the N.E. end of which is surrounded by an extensive reef, the making of which is dangerous by night, because a reef extends from it 4 miles out to sea; and allowance must always be made for the current, which, although variable, is generally prevalent here. The safest course appears to be to the Northward of the Caymans.

The navigation on the North of Cuba is that of the Bahama or Old Channel. For this channel it is customary to take a pilot, who may be engaged at Aguadilla, on the N.W. coast of Porto Rico, or at Gibara, in Cuba, but it is very uncertain. If approaching Baracoa, it will be requisite to determine the ship's place in the vicinity of Cape Maysi; for otherwise you may happen to fall in to leeward of Baracoa; it will, at all times, be proper to make the land in the neighborhood of the cape, for the sake of a departure hence to the Westward, and for correcting any error produced by current. The remarkable points of all this coast will be described. These descriptions must, of course, be especially regarded and strictly attended to.

We have already noticed that in this channel, independent of any current, there is a regular tide. The current itself is very uncertain, and no doubt fluctuates according

to the variations of the Gulf Stream, winds, &c. It sometimes sets E.S.E., at other times W.N.W., and again ceases. With every precaution, a vessel ought not to cross the meridian of Point Maternillo, without having made and remarked it well; as all the care of the most zealous and attentive navigator may otherwise be of no avail to keep him clear of the Mucaras Shoal, on the North side, which shows no sign of its existence until a vessel is aground upon it. If obliged to beat up at night, it ought to be done so as not to prolong the tack more than will completely and cleanly clear the Mucaras. Having passed over the night in this manner, so soon as it is clear day, steer so as to make the coast and recognize it well. If it be not in sight, steer to the South until you make it.

Having once recognized Maternillo Point, direct your course so as to pass Guincho, or Ginger Key, at the distance of 2 leagues, if by night; or make it by day, and thence keep over towards the edges of the Great Bank and Salt Key Bank, rather than to the keys of the coast of Cuba, which offer few marks that can be depended upon; and an approach to which is therefore dangerous. You will have passed all these keys when abreast of Point Yeacos, and may thence proceed. But the safest way, as before noticed, is towards the Southern edge of the Salt Key Bank, passing thence to the Westward, according to judgment, the state of the current, &c.

ISLAND OF CUBA.

Cuba

CUBA.—This is the largest island in the West Indies, and is situated at the Western extremity of the multitude of islands, keys, and banks, which separate the Caribbean Sea from the Atlantic Ocean. Its length, from Cape Maysi, on the East, to Cape San Antonio, on the West, is about 208 leagues; its breadth is unequal, being from 12 to 24 leagues.

Cape Maysi, the most Easterly point of the South part of Cuba, is situated in or near latitude $20^{\circ} 15'$ N. and longitude $74^{\circ} 7' 30''$ W. The point itself is a low bench, and cannot be clearly seen until you are nearly up with it. Landing on it is extremely dangerous, for a reef extends from it nearly a mile to the Eastward; and advancing towards it during the night is very unsafe, unless you have previously, in daylight, marked the highlands of the interior country, either of Cuba or of Hayti. From this point the coast trends to the N.W., and rounds to River Maysi, at a mile from the cape. From this river to Point Azules, which is another mile, nearly in the same direction, the coast is bounded by a reef, which extends out about a cable's length, and has a break at the mouth of the Maysi. From Point Azules the land begins to rise and the coast is clean and trends about W.N.W. for 5 miles to Punta Frayle, or Frayle's Point; whence it extends West 6 miles to the River Yamuri, and continues in the same direction 2 miles more, to the harbor of Mata. All this coast is very clean, and you may run along it within half a mile.

The harbor of Mata is very small, and too shallow to admit vessels drawing more than 12 feet. To enter it you have only to keep in mid-channel, and anchor in from 14 to 18 feet water, almost in the middle of the bay. All the shores have shoal water from them, so that there is a space of only 2 cables' length in diameter, in which there is sufficient depth for anchoring.

From Puerto de Mata the coast trends nearly N.W., 6 miles, to Port Majana, and at 2 short miles from it is the mouth of the River Bonni. This piece of coast, as well as the preceding, is very clean.

Point Majana and Baracoa Point, which lie nearly East and West, 2 miles distant from each other, form a bay, in the East part of which is the anchorage of Playa de Miel, (Molasses Beach) and in the West, the mouth of the port of Baracoa; in the middle, between these two anchorages, is the town of Baracoa, standing on the S.E. point of the harbor of the same name.

The anchorage of Playa de Miel is very open to the Norths. To anchor in it, you have only to approach Point Majana, and anchor something to the South of it, in from 10 to 30 fathoms, on a sandy bottom, taking care not to get to the East of that point, where you would be immediately in 4, or even in less than 4 fathoms water. As the Playa de Miel is entirely open to the Norths, in the season of them it is much exposed; and, therefore, any vessel under the necessity of anchoring, should steer at once

for Baracoa, to the entrance of which there is no obstacle, as it is completely clean, having no danger but what may be seen; and consulting the plan of it, you may choose the spot to anchor in which best suits the draught of water of your vessel.

BARACOA HARBOR, though secure and sheltered, has the great inconvenience of presenting its mouth to the breeze, and a great swell consequently sets in; and being able to get out of it with the land breeze only, vessels are often detained much time in it during the Norths, when the land breeze is not frequent; but in the rainy season, you may almost reckon on having it every night. The Anvil Hill of Baracoa, (El Yunque de Baracoa,) which is a little mountain about 5 miles to the Westward of the harbor, is an excellent mark to recognize it by, as, in clear days, it may be discovered at a distance of more than 12 leagues, and appears, over the other high land, like the flat top of an anvil.

Baracoa Harbor

From the Harbor of Baracoa the coast trends almost true North, 3 miles, to Point Canas, which, although very clean, ought not to be approached, because, being completely open to the breeze, there is always a heavy swell setting upon it. From Point Canas to the Harbor Maravi is 2 miles; the coast trends nearly West, and is very clean.

PORT MARAVI, though small, is well sheltered from the Norths. Its entrance is not difficult, for you have only to keep in mid-channel, which is less than a cable's length in width; and running in for the middle of the bay, anchor as soon as an islet which is on its Western side bears in the same direction.

From Maravi the coast trends nearly North, making a bend (or right) to Point Van, and from thence it runs to the N.W., forming another bend to Port Navas, which is an opening of about 2 cables' length in extent, in all directions, with its mouth to the North; therefore, useful only as a shelter from the breezes. To enter it, no more is necessary than an inspection of the plan.

From Port Navas to Port Cayaguaneque, the distance is only 2 short miles. Cayaguaneque is fit for very small vessels only, and its entrance is only 40 yards wide. The plan will give a perfect knowledge of it, and of the difficulties which present themselves in taking it.

TACO.—Three and a half miles from Cayaguaneque is the harbor of Taco. It is well sheltered; but though, in its interior, there is a depth for any class of vessels, yet its entrance has a bar with only from 13 to 18 feet on it, and it is also obstructed by rocky shoals with little water on them, which stretch out from both shores; but as, on account of the bar, only vessels drawing 10 or 12 feet water, or less, should go in; those will run no risk in running over the shoals, and therefore may enter this harbor by keeping in mid-channel; and when once past the entrance, they may steer to that part of the harbor which suits them best.

Taco

From the harbor of Taco to Point Jaragua is 2½ miles; and the coast, which is a sandy beach, is clean. At Point Jaragua it ceases to be so, though all between it and Cape Maysi may be run along at a mile's distance. Point Jaragua has a reef stretching to the N.W. of it; it is the Eastern point of the anchorage of the same name, which is only an opening in the reef, by which a vessel may enter upon the bank or shoal, and find shelter from the sea behind the reef. The break or mouth is only two-thirds of a cable's length wide; and from it to some islets which are to the S.W. of it, the distance is 2 cables' length. The islets are three in number: the Southern one is the largest; the anchorage for large vessels extends only until you are E. and W., true, with the South part of the middle islet, as further in there are only 12 to 18 feet of water. To enter this anchorage it is necessary to sail outside the reef, which extends out from Point Jaragua, until the East part of the great islet bears nearly S. W., then steer directly for it; and if the vessel be large, anchor as soon as you are E. and W. with the middle islet, in 6 fathoms, on a sandy bottom; but if the vessel draw not more than 14 feet, you may run further in, keeping, if you choose, within a quarter of a cable of the great islet, and about a cable's length from the middle of it, you may anchor in 19 feet, on clay. You may also enter the mouth without attending to the given bearing of S.W., because the reef itself shows the opening. This harbor is never entered except in a case of necessity, as there is no other motive for vessels coming to it.

From Point Jaragua the coast trends, first to the N.W., and afterwards to the North, forming a great bay to Point Guarico, which is 7 miles distant from the former. The reef which extends from Point Jaragua rounds the whole of it, and stretches out about 2 miles from Point Guarico. In approaching this side of Cuba, be careful not to mistake Guarico Point for Cape Maysi, it being dangerous at night and in thick weather, when you cannot recognize and use as marks the Eastern lands of the island, and particularly when you are uncertain of your latitude.

From Point Guarico the coast trends nearly N.W., 8 miles, to the River Moa; it is all bordered by a reef, which extends about 2 miles out to sea. Almost N. by W. from

the mouth of that river, and between the reef and the shore, is an islet named Cayo Moa, which offers an excellent anchorage, sheltered from all sea. It is entered by an opening in the reef, almost due North from the mouth of the river. This opening is about 2 cables' length in width, and continues W. by S., forming the channel and anchorage, until the East part of Cayo Moa bears North. To enter it, run along the East side of the reef until up with the opening, which will be when the Eastern part of Cayo Moa bears W. by S., and then steer S.W. until the South part of Cayo Moa bears W.N.W. $\frac{1}{2}$ W.; then steer W. $\frac{1}{2}$ S., and continue so until you anchor to the Southward of the Eastern part of Cayo Moa, in 6 $\frac{1}{2}$ or 7 fathoms, clay. The plan of the port will give a perfect idea of this anchorage; for recognizing or finding which, some mountains about 4 leagues inland, named the Sierras de Moa, may serve as landmarks.

From the anchorage of Moa, the coast trends about West; it is all bounded by a reef which extends 2 or 3 miles from it, as far as Port Yaguaneque, which is 11 miles distant from the former. On this part of the coast, and between it and the reef, are two keys, the Eastern one named Burros, (Asses,) and the Western Arena, (Sand;) these keys may serve as marks for knowing this part of the coast. The Harbor of Yaguaneque is fit for small vessels only, because its bottom is shallow and unequal, and its entrance narrow and difficult, for the mouth is formed merely by a break in the reef. To enter this port, it is necessary to follow the edge of the reef to windward, until you come to the opening, which lies N.W., two-thirds of a mile, from Arena Key; then steer to the Southward, keeping along the edge of the weather-reef, because the lee-reef, which commences when you are West from Arena Key, narrows the entrance so much, that there is scarcely a cable's length of width in the channel.

Cananova. CANANOVA.—A mile and a half from Yaguaneque is the port of Cananova, which is properly an opening of the coast only, and must be entered by another opening through the reef.

Three miles to the Westward of Cananova harbor is that of Cebollas, which is alike difficult to enter, or to get out of, and therefore unfit for large vessels.

Tanamo. TANAMO.—Ten miles West from Cebollas is Port Tanamo; and the intermediate coast is foul, with a reef which extends out about 2 miles from it. Tanamo is a large harbor, and fit for vessels of any size. To enter it you must run along the edge of the windward reef until you find the opening in it; then steer S. $\frac{1}{2}$ E. until you have passed the leeward point, when you may keep away up the elbow which the channel makes, in the middle of which you ought to keep; but no more is necessary than to give a berth of a third of a cable to all that is visible. With the plan and your eye, no further directions are needed.

Cabonico and Livisa. CABONICO AND LIVISA.—From Tanamo the coast trends West, 10 miles, to the entrance of the harbors of Cabonico and Livisa; a reef extends also 2 miles from this piece of coast. These two harbors have one common entrance, which divides within into two branches; one to the Eastward, leading to Cabonico, and the other to the Westward, leading to Livisa. To enter these harbors you must go in by the opening in the reef, and then steer for the windward point until it bears S. $\frac{1}{2}$ E., and then, being near it, keep mid-channel, avoiding a reef which runs out from the windward shore, and which lies out about a cable's length from the interior point. You may approach within a third of a cable of the leeward shore; once abreast of the interior points, steer for the channel of the harbor you wish to take, without any other care than to keep mid-channel.

Nipe. NIPE.—From these ports the coast continues foul, having a reef about W.N.W., 5 miles, to the harbor of Nipe. This bay is very extensive, and has a spacious entrance. The harbor is always accessible, for with either the breeze or the Norths, you will run in free; coming out is quite the reverse, for this requires the land breezes, which, as we have said before, are often very rare in the season of the Norths.

To distinguish this part of the coast, the mountains of Cristal may serve as marks; these are a continuation of the Cordillera, (or range,) which comes from Baracoa, and extends to the South from Port Livisa, at about 13 miles inland. The Pan of Sama, to the West, is also another excellent mark; its figure being such that it cannot be mistaken, because the summit of it forms a table. It rises on the land to the North of Nipe and Banes, and is almost N. and S., true, with the harbor of Sama; and as the mountains of Cristal terminate to the East, and the Pan of Sama, which begins to rise gradually almost from Point Mulás, forms an opening or break in the chain of hills or mountains, it is almost impossible for any one to mistake the place. The Pan of Sama may be seen 20 miles off.

Banes. BANES.—From the harbor of Nipe the coast trends N.W., 11 miles, to the Port of Banes; it is all clean, and may be run along at half a mile's distance. The harbor of Banes has its entrance in the middle of a bay formed by the coast, and which has 2 $\frac{1}{2}$ miles of opening, whence it narrows into the entrance of the port, which is only a cable and a half in width, so that it resembles a funnel. The shores of both the bay

is an islet named Cayo

The shores of both the bay

and the channel are uncommonly clear and deep to, and you have to fear nothing but what is seen. Only thus could this port be entered with facility, and its entrance is so tortuous, and with such elbows and turnings, that you must alter your course, almost in an instant, from S. to N. It is excellent, as a place of shelter, for any class of vessels. It is extremely difficult, however, to get out of; because its mouth stands open to the trade-wind, and it is necessary to avail yourself of the land breeze to get out clear, at any rate as far as the middle of the bay, that you may have room to tack and clear yourself from the rest of it, as well as of the coast, which there trends about N. by E., 10 miles, to Point Mulas, and which is foul, with a reef that stretches a mile from it.

POINT MULAS.—To enable any one to recognize Point Mulas, which, on account of its being very foul, and lying further to the Northward than any of the anterior coast, may be very suspicious, the marks already given may suffice; these being the mountains of Cristal and Pan of Sama.

About 5 miles N.W. from Point Mulas is Point Lucretia, which is clear and high; the coast thence continues to the West, with some inclination to the South, for 13 miles, to the Port of Sama, forming a bay named Rio Seco (Dry River.) All this coast is very clear and scarped, excepting the bay, which has a beach.

THE PORT OF SAMA is only fit for vessels which do not draw more than 12 feet of water; and as the shores, both of its entrance and the interior, are very clean, the inspection of the plan will afford all the necessary instruction for taking it. You may know this part of the coast and harbor by the Pan of Sama, and a hill or mountain near its Western part, which is pretty long, and lies N.W. and S.E., and the top of it seems to be plain and equal, and at its West end are scarped rocks which seem white. From this slope a sandy beach, named Gaudalaboca, continues to the West; to the South of it may be seen a detached hill, in the form of a sugar-loaf, and to the S.W. a small mountain covered with trees, the top of which forms a table, and which is named Mesita de Naranjo, (Little Orange Table.) Between the hill and the mountain is Port Naranjo, which is 5 miles distant from Sama.

PORT NARANJO is a good harbor for vessels of every class. Its windward point may easily be known by being high and scarped, while the rest is of beach. To enter the harbor you must sail without the reef, until the windward point bears S. $\frac{1}{2}$ E., when you may steer towards it, taking care to give it a cable's length berth, to keep clear of a shoal which surrounds it and stretches out about two-thirds of a cable from it. It is also necessary to be cautious of another shoal which stretches out from the leeward coast, and which sallies out to the North of the exterior sloping point, about $\frac{1}{2}$ cable. You should run in mid-channel until you are past the two points of the entrance; and as soon as you are well past that to windward, you may luff up and anchor in a bight formed by the East coast, at about two-thirds of a cable from it, and in 10 fathoms water, opposite the spot where the mangroves come down so as to be bathed with the water.

This harbor has the peculiar advantage that a vessel may sail either in or out with the breeze.

From Port Naranjo the coast, which is a foul beach, trends W., 2 $\frac{1}{2}$ miles, to Point Presquera Nuevo, which is sloping and clean; thence it descends W.S.W., 3 miles, to Port Vita, and is very clean. This little port is very good for vessels which do not draw more than 18 feet, and the inspection of the chart of it will be a sufficient guide. Three miles to the West of Vita is another small harbor, named Bariay, at the mouth of which there is shelter from the breezes, but only in the interior from the Norths. Very small vessels only can get up there. The coast between Vita and Bariay is very clean. A mile to leeward of Bariay there is another port named Jururu, the entrance to which is very difficult, being very narrow; and although vessels drawing 20 feet may enter it, only small vessels ought to do so.

GIBARA, OR XIBERA.—Five miles West from Jururu is the harbor of Gibara, its entrance is 5 cables in breadth, and completely open to the North. The coast between it and Jururu is very clean. To find the port, three hills, or mounts, which are to be seen to the South of it, and which, at a great distance, appear to be islands, are excellent marks. The first and most Easterly of these is named Silla de Gibara (Saddle of Gibara); the middle one resembles the shape of a sugar-boiler; and to the West of the third are some hills of a regular height. Pilots for the Old Bahama Channel may sometimes be obtained here, but it is uncertain.

From Port Gibara the coast, which is clean and sloping, trends to the North, 2 miles, to Point Brava, from which follows N.W. 10 miles of the same kind of coast, to Punta Mangle, (Mangrove Point,) and from it continues 6 miles in the same direction, but it is a sandy beach, and clean. From this point it trends West, but is foul, with a reef of 6 miles, to Puerto del Padre. All this land is low, and on the coast may be seen some small palm-trees, called Miraguamas. At the West side of Port Padre there are two little mounds, very close together.

Puerto del Padre

PUERTO DEL PADRE.—The harbor of Padre is excellent, and fit for any class and number of vessels. Its entrance is long, and only 2 cables in width, its shores are very clean, and have deep water. To enter this harbor it is necessary to navigate outside the reefs, until the East point, named Jario, bears S. by E. 3/4 E., when you may steer for the outer leeward point of the entrance channel, and it is necessary not to confound this point with another which is to the N.E., upon the same coast, and which, for distinction, is named Ganchos. The last has an islet of the same name very close to it, and it may assist much in finding the mouth of this harbor. Running for the before mentioned point to leeward, and then close past the S.E. part of Ganchos, no more remains than to steer for the channel, without its being necessary to beware of any more than what is visible.

From Port Padre the coast follows to the West, 5 miles, to Point Piedras, or Rock Point. Here is the entrance of the great bay of Malagueta, which is no more than a lagoon formed in the interior, in consequence of the land being low and wet. The coast then trends N.N.W., 5 miles, to the Point of Covarobius, from which it trends W.N.W., 10 miles, to the harbor of Manati. All this coast is foul, with a reef which stretches out from it about 2 miles.

Puerto de Manati

PUERTO DE MANATI.—The harbor of Manati may be known by a mount, which may be discovered inland from it, shaped like a sugar loaf. It is called the Manueco, and may be seen at the distance of 15 or 20 miles. Close to the West of this may be seen another hill, not quite so high as it, which is called Enrdo, or the Table of Manati, which, when shut in with the Manueco, looks like one hill, and presents to the view the appearance of the Saddle of Gibaru, which appearance has deceived many, and is dangerous to navigation.

This harbor of Manati may be considered as a lagoon, formed in low wet land, with a long, narrow, and crooked channel in it, and in which there is depth of water for small vessels only; as this channel, throughout its extent, is bordered with shoals of 6 and 8 feet of water, it is running much risk to enter it with middling sized vessels.

Three miles N.N.W. from Point Manati is Point Brava, which is foul, with a reef. The coast thence, which is also foul, with a reef, trends about West, for 5 miles, to the port of Nuevas Grandes, (Great News). To enter this port, which is fit only for vessels of 12 feet draught, it is necessary to go in at the break in the reef, (the reef lies out 6 cables, or two thirds of a mile from the coast,) and follow in afterwards all that distance by a channel which the reef forms, and which in some places is only half a cable's length in breadth. This channel is very crooked, and therefore any one who is not well acquainted runs much risk. As soon as you are abreast of the points of the harbor, you may run along the coast at the distance of one quarter of a cable without fear.

NUEVITAS DEL PRINCIPE. From Nuevas Grandes the coast trends about N.W., 11 miles, to the harbor of Nuevitas. It is all foul, with a reef, and may, as well as the harbor, be recognized by three mounts of short extent, which rise within the harbor. There are also three islets in the harbor, named Ballanates. These seem high to the East, and diminish towards the West. Nuevitas harbor is a large bay, with many shoals, but fit for any number and class of vessels. To enter, it is necessary to avoid its windward or East point, to which you ought not to approach nearer than a cable's length; approaching, if you choose, within half a cable's length to the leeward point; but the best way is to keep in the middle of the channel, which is very long and crooked.

From mid length of the channel, going in, the coast is lined with shoals, to keep clear of which requires good practice, which practice is equally necessary in the interior of the bay.

POINT MATERNILLOS LIGHT ('Colon') is situated on the Point, in lat 21° 39' 10" N., long 77° 10' 53" W. It is about 110 feet South of the Point. It is a revolving light of the first order, time of revolution one minute, height of the light above the sea 176 feet.

From Nuevitas the coast trends about N.N.W. to the Point of Maternillos, and is very clean. From Point Maternillos it trends about W.N.W., and is bordered with a reef which stretches out a mile and a half. All the coast from Maternillos rises a little; and nearly at the end of it, about 11 miles from Maternillos, there is a little mount called Juan Danue, which forms a kind of Table. At this point commences a great white shoal or bank, which extends far to the West, and upon which are many keys and reefs. Here we cease from describing the coast, as being of no use to navigation, and begin to describe the edge of the white ground or shoal, with islets and keys upon it.

About W.N.W. from the Point of Juan Danue, but almost joined to it, there is a small islet, and in the same direction, and at the distance of 6 miles, is the island Guajaba. This island may be known by four little mounts, which lie almost in a line, East and West. The first three may readily be seen, but it is not so with the fourth

which being of less elevation than the third, remains hidden by it; but as you advance to the Westward it opens out, and the whole four may be perceived. At about 4 or 5 leagues beyond these are hillocks appearing like many islets, caused by the lower lands of the coasts being visible above the horizon.

KEY ROMANO, &c. To the West from Guapaba, at the distance of 8 miles, lies *Key Ro* Key Romano, an island stretching N. W. and S. E., in which direction it is 16 leagues *mano, &c.* in extent. This land properly consists of two islands, separated by a channel half a mile wide. The Eastern isle has some heights, which, in the middle of it, form a kind of saddle. The Western isle is of low wet mangrove land. Key Romano lies considerably within the white grounds, and two small keys, called Key Verde and Key Confites, lie nearly N. W. from its Easternmost height, the first at the distance of 7, and the second at 12 miles. Key Verde lies N. W. 3/4 W. from the West part of Guapaba, and Key Confites N. W. by N. Between these two keys is an anchorage, which may be taken in case of necessity.

The Key Verde, or Green Key, lies 13 miles S. by E. from Key Confites, and a reef extends from it Northward to the distance of a mile and a half. From Key Confites a reef likewise extends to the Southward one mile, and there is a clear passage of more than 2 miles within these reefs.

On Key Confites a light house will probably be shortly erected. It is also proposed *lights* to erect one on the Northern part of Key Paredon Grande.

In order to gain this anchorage, when coming from the Eastward, you must stand in for the passage formed by these reefs, keeping a little nearer to Confites than to Key Verde; and when the middle of Confites bears due N. W. by N., and the middle of Key Verde S. by W., you will be on, or nearly on the edge of the bank. Then lay the ship's head W. N. W., and stand on until the Southernmost part of Key Confites bears N., when you will stand N. N. W., or a little more to the Northward. Having at length brought the South end of Confites N. N. E., half a mile distant, you may anchor in 31 or 4 fathoms, on sandy ground.

In getting under weigh from this anchorage, should the wind not allow you to stand to the S. E., you must bear away to the N. W. by N., until you have cleared a reef of rocks extending three quarters of a mile to the N. W. from Confites Key; after which you may stand to the North, in order the sooner to gain the main channel.

West from Key Verde there is a round key, named Palomas, (pigeon's,) with various other small ones in its neighborhood. To the Northward is the island named Key de Cruz, (key of the Cross,) which is about 13 miles in extent, N. by W. and S. by E. To the N. E. of this isle, at the distance of 3 miles, there is, on the very edge of the grounds, a shoal, named Tributaria de Minerva, which lies N. 41° W. from Key Confites, at 12 miles distance.

The edge of the grounds, which is reef, stretches out a mile and a half from Juan Dama, 23 miles from Guapaba, and from the E. N. E. to N. E., from the high part of the Key Romano, forms an opening, by which, according to report, a vessel may enter, and anchor in 6 fathoms, upon sand, but good holding ground; but as we cannot guarantee this, any one who makes the attempt ought to exert great caution.

From this opening the reef rises again, but makes the opening already described between the Key Verde and Key Confites; and thence the edge of the ground continues, sometimes foul and at others without reef, to the Tributario Shoal. This shoal breaks with a fresh breeze, and shows above the surface at low water. Six miles W. by N. from it is Key Baril, (Barrel Key,) and further to the West is Great Paredon Key. The edge of the grounds, which is sometimes foul and sometimes clean, lies but 2 miles from Key Baril, and 13 miles from the North part of the Great Paredon. The latter key affords good anchorage, for either the time of breezes or land winds. To ascertain and take it, remember that, at a cable's length to the North of its North point, there is a small round key, which you ought to leave on the port hand when coming in, and pass within from half a cable to a cable's length from it. You anchor as soon as you are sheltered from the land of the Great Paredon, in the depth of water that suits the vessel's draught. On entering, you will leave to starboard another key, other larger than the one you leave to port; it is called the Middle Paredon, and lies about 23 miles from the first.

From the Middle Paredon to the West, there is another large key, called Coco, from the middle of which to the West end there is anchorage on its North side.

To the West of Coco follow the groups of trees called St. Phillip's, Guilermos, and Santa Mari's. To the West of these, at the distance of 16 leagues from Coco Key, lies Key Francis. Key Francis may be known by a white flagstaff with a pale top-*Key Fran-* mast, an 1/2 barrel on the top, painted red, and two pilot houses near. The flag-*cis.* staff is on a low point of rocks at the West point. If the pilots are there they will hoist the Spanish flag near one of the houses, but will not come outside of the point, so you may stand in, giving the point 31 miles berth, and if there is no pilot there, run in until a square white spot at the head of the bay bears E. N. E., and then run for it

until the flagstaff bears N. or N. N. W., and anchor in 34 or 4 fathoms, good holding ground. Do not anchor off the point, (the point bearing East,) there being 5 fathoms and rocky bottom, and danger of losing anchors, or you may anchor, the point bearing N. E., but run into 3 or 4 fathoms as outside of 4 fathoms it is rocky bottom. The land to the Westward of Key Francis trends to the S. E. and N. W.; to the Eastward of the key E. by N. and W. by S. The Arredinos Shoal bears N. W. W. from Key Francis, about 10 miles, and always breaks, and is about 3 miles from the land. Westward from this key is another portion of keys, one of which cannot be distinguished from another without difficulty, as they are so much alike.

*Signal
Grande*

SIGLA LE GRANDE—This port has been recently opened, and a chart of it published. There are 9 feet water at the anchorage. There are three entrances, the Easternmost one is in long. 80°, and the Western one is in 80° 48'. An inspection of the chart is necessary to safe navigation.

The edge of the ground is from Key Francis, and even something before that, and the lead will there warn you before you are in any danger upon it. Nevertheless, there is considerable risk from the Hoyo Nicolao, or Nicholas Shoal, which is a spot of sand, lying at a considerable distance to the Northward of the other keys, and is 16 fathoms long, and 5 fathoms wide. It is surrounded by a reef to the N. E., N., and N. W., to the distance of a cable and a half. Two miles to the West from another shoal breaks, which is named the Aletraeces, and as these shoals present great dangers to the navigator, it is necessary to give some marks to recognize them by, and which will indicate the position of the vessel in respect to the shoals.

Among other mountains which are on the land of Cuba, and about S. S. E. and S. from these shoals, the Sierra Morena (Black Mountain) is the best known. It is long, and lies N. W. and S. E. The S. E. head of it is moderately high, and upon its extremities are various points or peaks (puchinos). Of these peaks the two which are on the N. W. extremity of the Sierra (mountain) are high, and lie N. and S., true, with Nicolao Shoal. A little more to the West of the Sierra Morena rises another mountain, with three heights upon it, of which the middle one is the highest, and lies S. by W., true, from the Nicolao Shoal. These heights are named the Tetras de la Bella, (Bella's Paps,) and being N. and S., true, with the middle one of them, you will be also N. and S. with the bay of Cadiz Key, and past both the Nicolao and Aletraeces Shoals.

To the West of the Tetras de la Bella, two mountains are seen. The first is of regular extent, the second, or Westernmost, very long, and at the end of it are two hills, named Sierra de Lemaes (Lame Mountain), which runs S. by W., true, with the Western extremity of the bay of Cadiz Key. Further to the West lies another mountain, of proportional extent, named Santa Clara, and something to the West it may be seen the Paps of Camarico, of which there are four, though in some positions there do not appear to be so many. The middle one is the largest, and lies S. W., with the Westernmost part of Key Cruz del Padre (Key of the Father's Cross). These mountains are the highest which are to the North coast of Cuba, but it may be remarked that those which are on the East and West of them are little less elevated than these mountains. Such are the lands that are seen in the interior of the island from the proximities of the Nicolao Shoal. A light-house is being erected on Cruz del Padre Key. It will be a revolving light.

Light

The White Ground still trends to the West. There are many keys upon the edge or border of it, and the edge is dangerous, having some reefs on it. The ground keys terminate at Point Jacos. The keys named Mono, Piedras, and Monillo are the Westernmost on the reef. These afford good anchorage, where shelter from the swell of the Norths may be found.

*The Yacos
Keys.*

THE YACOS KEYS—North eastward from Port Yacos, at the distance about a mile from the edge of the bank, lie the three islands called by the Spaniards Cayo Mono.

*Piedras and
Monillo.*

PIEDRAS AND MONILLO—These keys afford convenient anchorage to vessels which cannot advantageously use the harbor of Matanzas. The Southernmost and smallest is the Monillo, which lies at the distance of 3 miles from Point Yacos. From Monillo to Cayo de Piedras (Rocky Key), the distance is only half a mile, and from the latter to Mono Key it is 2 miles. At a mile and a quarter N. E. from Mono there is a dangerous reef.

*Cardenas.
light-house.*

CARDENAS—On Cayo Piedras or Stone Key, there is a light-house 96 feet high; it is a revolving light; time of revolution one minute; fifty seconds of light and ten seconds of darkness.

Light.

On Cayo Diana, which is about 4 miles S. of Cayo Piedras, there is a light 18 feet high; it is a fixed light, red and white.

Bring the light on Piedras or Stone Key to bear South, distant 5 miles, then S. E. 3 E. for a small round island, distant about 2 miles. When you are within a quarter of a mile of this island, you will perceive two islands to the Eastward.

bearing S S E, and the other S 4 E. Steer for the most Western extremity of the one bearing S S E., until within half a mile of it, and then take the middle channel between them.

There are two spar buoys on each side of this channel, painted white, with a strip of white hunting-bent on to their tops. There is also a lookout station erected upon the island, on the port hand going in. It is a great clumsy log house, with a high platform upon it, and it is said a light is sometimes carried upon it, but this is doubtful.

Upon the island, on the starboard side, is a large fishing house, built of logs, with the gable end towards the water. When you have reached the centre of the channel, so that the spar buoys are upon either beam, steer S W, 4 W., for the centre of the three hills, and the town of Cardenas will soon open on your port bow, and when it bears S W., by S., haul up for it, and come to in from 9 to 11 feet water.

Plains can always be obtained in pleasant weather, by making the proper signals. In heavy weather, however, they are unable to board you, their light skills being usually unfit for a heavy sea. If you make the harbor in heavy weather, you will have to take your vessel in without a pilot. The channel is an intricate one, abounding in shoals and reefs, which put out from the numerous islets that fill the harbor, but by observing the above directions, vessels of 10 feet draught and under will be brought in safely.

Jaceno lies to the East of Cardenas, distant about 6 miles. It is nothing but a collection of warehouses for the storage of molasses and sugar, and has not depth of water sufficient even for the small schooners that ply along the coast.

The anchorage in regular soundings, of 5 to 7 fathoms, bottom of sand, is to the Southward of Mono, and on the East and South of Piedras, where ships may be detoured from any sea coming from the Northward. The ground is sandy and clean, with from 5 to 6 fathoms, and vessels here may at all times get under sail. To make the anchorage so soon as you discover the keys, stand for the middle of either passage, and let go the anchor at pleasure. It is only necessary (in approaching from the N.E.) you must take care to avoid the reef above mentioned, lying to the North-eastward of Mono.

MATANZAS.—From Point Yacuos the coast trends to the S.W. and W.S.W. 11 leagues, to the Point of Maya, which is the Eastern point of the great Bay of Matanzas. You may run along this coast at the distance of a league. The Pan of Matanzas, which distinguishes the bay, appears from this direction like an insulated mountain, having a round surface, and without peaks, water courses, precipices, or other irregularities, excepting a small fissure near the S.E. part of the summit, which can hardly be noticed at a distance, being of so little depth. When bearing from S.S.W. to S., it appears like one round hill, but on any other bearing, another appears on each side of it adjoining, and not so high. The land to the Eastward is even, though not very low; but it begins to rise at Matanzas with a gradual slope, and to the West the coast may be seen at the distance of 3 leagues, but it is alike even or level, without any remarkable height, other than the pan, which appears over it.

The harbor of Matanzas, which is at the bottom of the bay, is well sheltered from the North, but it has several reefs. The Derrotero says it is difficult to get out of this place; for, as there is not room to beat out, it is necessary to get clear of it with the land breeze, which, during the season of the Norths, occurs but seldom. The harbor is of easy entrance, but it is necessary to avoid some shoals which lie almost in the very anchorage. To accomplish this, it is advisable to keep along the leeward coast, at the distance of 2 or 3 cables' length, passing Point Maya at the distance of a mile and a half, while it bears to the Southward. With the vessel's head nearly south, you pass the Western shore at the distance above mentioned; and so soon as you see the castle of St. Severino bearing W. 3 S., steer in that direction, until the vessel, which will be seen in the S.W. corner of the bay, bears S. 35 W., when you must steer towards them, and anchor so soon as the Castle of St. Severino bears between N.W. 3 W. and N.W. 4 N., where you will have 5 or 6 fathoms of water, of a loose clay or ooze.

To get out of this harbor, it is best to clear yourself by towing, or by the aid of the land breeze, if you have any, at a time when you consider the weather as settled, and there is no appearance of Norths coming on. If agreeable, you may cross over, and make an anchor on the bank or shoal point of Maya, which will be a proper situation to make sail from, when convenient.

Remarks on the Harbor of Matanzas, by Mr. Bellamy.—"This harbor is easy of access, and capable of holding a great number of shipping of different sizes, completely sheltered from all winds, except those from the N.E. quarter, which send in a heavy sea.

The anchorage is partly protected on the N.E. by two shoals, named Buxo Negro, or New Shoal, and La Leija. On the shallowest part of the New Shoal, which is also the Northernmost, is a buoy, with a pole and a white flag, in 2 fathoms water, and on the Southernmost (La Laja) is a pole with a white flag, in 2 feet of

principal entrance is between the two flags, and the channel is about 2 cables' length wide. These flags are very small, and at times cannot be seen at more than half a mile distant; and as they are badly fixed, very often break adrift. Therefore a stranger ought to pay strict attention to the leading-mark, and keep a good lookout for the shallow water.

"The leading-mark is the South side, or notch in the gun, on with a large white house, standing on a hill at the back of the town, and is the Westernmost house visible, bearing W.S.W. $\frac{1}{2}$ W., by compass. This mark will carry a vessel in mid-channel between the shoals; and when the castle of St. Severino bears from N.W. $\frac{1}{2}$ W. to N.W. $\frac{1}{2}$ N., you may, if in a large ship, anchor in from 5 to 10 fathoms, and at the distance of a mile from the town. Small vessels may anchor further up, within one-third of a mile from the town, according to their draught of water.

"There are also two other good channels into Matanzas: one between the New Shoal and the castle of St. Severino, having 8 or 9 fathoms in it; and the other to the Southward of the South Bank; but the middle channel is that preferred.

"The Spanish plan, in the Portulano de la America Septentrional, published at Madrid, in 1809, is very incorrect, with respect to both distance and soundings, and should not be relied on. The tides rise and fall at times between 2 and 3 feet; but they are influenced by the winds, and very irregular. It is not so difficult to get on of this place as has been described. During the 19 days that we lay here, the sea and land breezes were regular; and in the event of their not being so, vessels may be out at almost any time, if acquainted with the place."

The Derrotero continues: From the harbor of Matanzas the coast rounds to the N.W., to the Punta de Guanos, which is the most projecting point to the Northwest, and is distant from the mouth of the harbor or bay about 4 miles. From Point Guanos the coast runs almost (West) W. $\frac{1}{2}$ N., a distance of 40 miles, to the Morro de la Havana: it is all clean and bold to, and may be run along at the distance of a league, or less if required; inasmuch as there is no other risk than a rocky shoal 11 feet, extending 2 miles from the land, 19 miles from Point Guanos, which stretches off from the coast between the Rincon, or Corner, and the Punta de Farara, or Cabece. Along this coast are soundings on sand, which extend more or less from shoals and of which the edges are steep and clear, so that you suddenly pass from 100 fathoms to 20. With the lead going there is no risk running along, because the soundings will warn you of the limits into which you stand without danger; and in any weather you may pass the night by dropping a kedge upon these soundings, which manœuvre may sometimes be convenient, either to avoid passing your port if the wind blows fresh at night, or that you may not lose ground, if the land breeze is light or calm, as the current constantly runs Eastward at the mean rate of one mile per hour. The hills or mountains of Jaruco, which rise nearly in the middle of this coast, are a point which serves to recognize it by, and ascertain your situation.

Havana.

HAVANA.—This, as noticed, is in point of importance the principal harbor of Cuba, and has been described as one of the best in the world, being deep enough for vessels of the largest class, sufficiently capacious to receive a thousand ships at war, and so safe that vessels ride securely without cable or anchor. The entrance is by a channel half a mile long, so narrow that only a single vessel can enter at once, and fortified through the whole distance with platforms, works, and artillery. The mouth of this channel is secured by two strong castles, as exhibited in the figure beneath. That on the Eastern side, called Morro Castle, is built in the form of a triangle, fortified with bastions, and mounted with 40 pieces of cannon, most level with the water. On the opposite side of the channel is another strong castle called the Punta Castle, connected with the castle town on the North. The Punta is situated on the Western side of the harbor, and is surrounded by ramparts, bastions, and ditches.

The Morro Castle, Light-house, and Entrance to Havana.

s surrounded by ramparts, h

MORRO LIGHT is upon Morro Castle, and is 110 feet high; it is a fixed flashing *Morro light*, showing a bright flash every half minute.

The entrance to Havana is between the Morro Castle and Fort Punta: here it is about one-fourth of a mile wide, and the direction is S. E. by E.; the channel narrows so much, that, when you are one half of a mile from the Morro, it is only 600 feet wide. The best water is nearest to the Morro side.

In passing the first castle, (Morro,) you must not come too near, as a reef lies off the star-board hand as you enter, which is dangerous.

The harbor of Havana may be distinguished at a distance by the Paps of Managua, which, as already stated, lie on the meridian of the entrance; while the land, both to the Eastward and Westward, is low and equal, with the exception only of the Morro, a little hill, surmounted by the fortifications and light-house. At 6 leagues to the Eastward, the hills of Jaruco, or iron hills, may be seen; these are of moderate height, and detached. The tables of Mariel are about 6 leagues to the Westward; and in advancing, not only these, but the hill of Cavanos may at times be seen. [The extent of the harbor can be best understood by reference to the particular plan of it, from the survey of Don Jose Del Rio, by whom the position of the Morro Castle has been determined and delineated on a chart, published by E. & G. W. BLUNT.] The entrance lies nearly S. E. by E. and N. W. by W., and is, therefore, very difficult when the breeze is not to the Northward of E. N. E. The breeze enters at about 10h. A. M., and blows until sunset: and therefore it is only between these hours that you can sail into the port. It is very difficult, if not impossible, to sail in when the breeze is from E. N. E. to S. E., which it often is in the rainy season, and sometimes even in the dry season. Under such circumstances, the only resource is to anchor in the Morro Shoal, or Bank, and enter by towing or warping, when the breeze takes off, which, as already stated, is at night. As, on entering, these difficulties are to be encountered; so, on going out, you will not be quite free: for when the breeze comes to the N. E., which it often does in the dry season, or that of the Norths, it is not only inconvenient, from the wind being scant, but also because a swell sets into the mouth of the harbor, which renders this operation much exposed to danger. Generally speaking, it is best to enter about mid-day, and to go out at the dawn of the day. Should the wind be scant for setting in, it is advisable to anchor outside the Morro, and tow or warp in at night.

In approaching Havana from the Eastward, care should be taken to avoid a shoal not more than a quarter of a mile from the shore, the shoal of Morro Castle bearing out N. E., distant one mile. This notice is given from the information of Mr. Power, who was mate of the ship *Jane*, of Glasgow, then in company with the anchor.

The Morro Bank affords anchorage safe enough in the time of the ordinary winds and breezes, but is much exposed in the season of the Norths, and in the hurricane months. It is, therefore, advisable to anchor so as to have the mouth of the harbor open, and to be extremely vigilant, lest you should be surprised. To direct yourself into the harbor, the eye may suffice, for in the channel there is no other danger than the shallows, which stretch out from each side. That on the Morro side does not extend one-third of a cable from the shore. To avoid the leeward shoal, it is requisite not to go further from the Eastern shore than a cable's length; working a vessel so as to run along half a cable's length from the coast on the N. E. side, and the channel being at about three-quarters of a cable's length. When once abreast the middle of Castle Blanca on the N. E., which will be when you are abreast of the N. E. or front side of the city, you may keep away, and anchor opposite to the western part of the city, at what distance you choose. The largest ships may approach near enough to lay a plank on shore.

A short distance without the Morro Castle, to the S. W., is a very small shoal, 15 fathoms over it. This bank is to be feared only when there is much swell on, at other times the largest ships may pass over it without touching. Even when the water begins to shoalen, you need not be afraid of it, as at half a cable's length from the Morro you will be perfectly clear. Finally, if you wish to pass in without risk, send a boat to place herself on the Capstan Shoal,* which will serve you for a mark; then steer so as to pass outside of her, and you will be free from all danger.

An English navigator, in giving directions for Havana, has said, "On going in, with a wind from the Eastward, keep as close to the Morro as possible. As soon as you

*The Capstan is the projecting edge of the shelf within the Morro at about a cable's length from the light-house. A similar projection further in, on the same side, is the Pastora or Shepherds Shoal.

Entrance to Havana.

are within it, you may meet with flaws and variable winds; and should you be obliged to let go an anchor, great care should be taken to shorten sail and veer cable quickly, as the ground at the entrance of the harbor is not very good for holding. All ships lying in the channel of the lagoon, moor head and stern. There are two wrecks lying rather more than 2 cables' length within the entrance of the harbor, and denoted by buoys with small flags; the channel lies between them."

Ships-of-war and large merchant-vessels generally warp up the harbor, and anchor off the sheers or arsenal, where there is sufficient room for a great number of ships to moor, in from 7 to 5 fathoms.

From the Morro, or Castle of Havana, to Punta de Yacoo, (or Yacoo,) the distance is 20 leagues, and the course is nearly E. $\frac{1}{2}$ N. From this point may be seen the Loaf or Pan of Matanzas, to the W.S.W. This hill, which is the Northernmost that you will descry to the Eastward of the Havana, lies over the bay of Matanzas, and constitutes the grand point of departure for ships bound hence to the Northward through the Strait of Florida.

Pan of Matanzas to the E. S. E.

ISLAND OF CUBA.

SOUTH COAST.

We now commence with the South coast of Cuba from Cape Maysi, proceeding regularly Westward to Cape Antonio, including the Isle of Pines, &c. From Cape Antonio we continue to describe the coast Eastward along the North side to Havana.

The greater portion of the coasts of Cuba are extremely foul. Those most dangerous are the Southern coasts, from Cape Maysi to Cape Cruz, the N.E. coast from Cape Maysi to Punta [Point] Maternillo, and the N.W. coast, from the port of Matanzas. On the other parts are many shallows, keys, and reefs, so thickly packed and so numerous, that in many places they form barriers which prevent access to the coast of the island.

The land to the South-westward of Cape Maysi, at about half a mile from it, is to be high and clean, and it trends about S.W. $\frac{1}{2}$ W., $6\frac{1}{2}$ miles, forming a small bay with a sandy beach, named Cala de Ovarado. From this cove, the shore trends about S.S.W., 4 miles, to Punta Negra, or Point Negra, whence it winds to the W.S.W., about 4 miles more, to Punta Caleta; 28 miles W. $\frac{1}{2}$ S. from which lies Point Savana-la-Mar, and 4 miles to the Westward from the latter is the port of Baitiqueri.

The Derrotero says that, "From Cape Maysi to Point Negra the shore ought not to be approached nearer than 2 leagues; for, as there is no inducement to approach it, surely it would be foolish to run in upon a coast which lies completely open to the breezes, and along which there is no anchorage, although it is clear, and has no visible danger. From Point Negra to Baitiqueri, there is no risk in running along the coast at the distance of a mile; and along this part, and to the leeward of the cape, at the points thereon, you may anchor in the depth of water which suits you, from 35 fathoms; but the best bottom is in 16 fathoms, where you will be at a good distance off shore. In this place, several rivers discharge, from which you may provide yourself with excellent water, and plenty of firewood may be procured.

The Cape Bueno, or Ocoa Point of the English charts, lies to the Eastward of Punta de la Caletas of the Spanish: a British navigator remarks, "Within this cape is the Bay of Ocoa, in which there is anchorage. The marks for anchoring are the Easternmost point bearing E.S.E., about $1\frac{1}{2}$ mile, when the table-land of St. Xmas' Mole will be in a line with the point. You may anchor in any water, the depth being from 35 to 7 fathoms, but 16 and 18 are the best; and plenty of fish may

caught with hook and line. Two fresh-water rivulets run into this bay: the one named Rio du Miel, or Honey River, lying 2 or 3 miles to the Westward of the anchorage; the other, which lies nearer, is to the Eastward, and at the bottom of the Easternmost gully, but it is generally dry, from the infrequency of rain."

The harbor of Baitiqueri, already mentioned, is very small, and has a very narrow entrance; it has only from 15 to 20 feet of water, and therefore is fit for small vessels only; it is well sheltered from all winds, and the rivulet of the same name, which runs into the interior of the harbor, affords an opportunity of watering. There is rather more than a cable's length between the two other points of the entrance; but a rocky reef, with from 10 to 17 feet on the edge of it, runs out from the windward point; and there is, also, a reef running out about a quarter of a cable from the leeward point. Between these two reefs lies the entrance-channel, which is only 50 yards wide, and continues thus narrow for about a cable's length, after which it widens as you approach the two interior points; and the depth of water admits of approaching the shore.

From Baitiqueri the coast trends about W.S.W., true, for 5 miles, to Point Tortuguilla, from which it follows W., true, 3 miles, to the river Yateras; S.W., 4 miles, is Point Mal-Ano; and at 3 miles West from the latter, lies Puerto Escondido, (Hidden Port.) All the coast between Baitiqueri and Port Escondido is clean, and may be safely sailed along at the distance of a mile.

Port Escondido forms an anchorage sheltered from all winds: in the interior of it are various bays fit for all classes of vessels, but its entrance is very narrow, for between the outer points there is only one cable's length; and as each of them has a reef, of which the windward one lies out a third of a cable, the channel is only 90 yards wide; it, however, has no windings, and the whole length of the strait is not more than a cable and a half; and as to enter it, you must steer N. 43° W., it may always be done with a free wind, even if the breeze is at N.E. The most prudent mode of entering this harbor, is to order a boat to be placed on the outer point of the windward reef, which is nearly in mid-length of the channel, and which will serve as a mark to sail in by. You have then only to bring the vessel's head in the direction above given, and run on in that direction, passing close to the boat, until you have passed the inner point to leeward, where you may anchor in 5 or 6½ fathoms, clay ground.

As there is no town on this harbor, nor any proper leading-marks for running in, it is proper to allow the vessel sufficient room to alter her course from windward to N. 43° W., the course for entering the harbor. We therefore recommend, although the windward coast of the entrance may be passed at half a cable's length, that it should not be passed at less than 3 or 4; because thus, although in luffing to, the vessel may pass the demarkation given, (N. 43° W.) yet there will be room to rectify this, by luffing to windward before you are between the points, so as to gain the proper bearing, which is absolutely necessary, as the channel cannot otherwise be passed without danger. Any one wishing to run further up the harbor, instead of bringing to in the anchorages we have mentioned, may easily do so by the eye, by towing, or even under sail; but for this it is necessary to consult a plan of the harbor.

Puerto Escondido* having no commerce, it is seldom that any vessel is bound into it; and if in any storm or hurricane, one is obliged to seek anchorage, we would rather advise every exertion to be made in order to reach the next harbor to the West, named Guantanamo; because, if it be difficult to enter Port Escondido in good weather, it must be much more so in storms and obscure weather; and it will be by no means strange if, without a pilot, or even with one, a vessel might be driven on one of the reefs of the entrance; or, what is still worse, might get on the rocks at some point of the coast, which might be mistaken for the entrance of this harbor.

GUANTANAMO, or CUMBERLAND HARBOR, a very extensive and excellent anchorage, lies more than 2½ leagues to the Westward of Cape Maysi, and 4 leagues from Puerto Escondido. The coast, in the latter distance, forms some very small, and very narrow bays, and it is very clean. The entrance of Guantanamo, between the two outer points, is more than a mile broad. The Derretoro says—"The East point may be approached without fear, as there is no danger but what is visible. The coast trends nearly North, about a mile and a quarter, whence it changes to the N.E. to form the harbor. On the windward side of the entrance, and at about three-quarters of a mile within the outer point, a rocky shoal stretches from the shore, upon the edge of which are from 4 to 5 fathoms of water; this shoal is rather more than a cable's length broad, and may be easily avoided by attending to the subsequent directions. On the western side there is also a reef of rocks, but it is narrower than that on the East. To enter this harbor, it is necessary only to place your vessel so as to pass its windward point at the distance of one or two cables' length, and thence luff up to N.W. by

* Puerto Escondido, or Hidden Port, is well termed so, as I have been within less than a mile of the entrance of it, and could not make it out distinctly —A. L.

Guanta-
namo, or
C. Cumberland
Harbor

N., on which course you must continue until the North point of the River Guantamano, or Augusta River, bears West; you may then change your course to N. by W., until you have the interior point of the windward shore bearing East, when you will be clear of the reef which stretches from it. You may next haul by the wind, and anchor where it may suit you best; or, if you wish to run into the interior of the harbor, and the breeze will not allow you to lay through, you may beat in with the assistance of the lead only."

The following remarks on the harbor of Guantamano were made by an officer on the Jamaica station, in 1809:

"The appearance of a remarkable spot of land on the side of a hill, at a distance inshore, determines the situation of Cumberland Harbor, which if you fall in to the Westward, exactly resembles a kite, and is totally open when it bears N.E. $\frac{1}{2}$ E.; but if you are far to the Southward, it will either be partly or entirely hid, unless you are far enough to the Westward to bring it over the hills on that side of it."

The following directions for sailing in, have been given by Mr. J. Town, from observations made by him in 1817:

"On coming in, you will observe in the middle of the bay a remarkable light yellow (or brown and white) cliff; bring this cliff to bear about N. by W. or N. by W. $\frac{1}{2}$ W., run in with that bearing until you open, on the Eastern side, a small sandy point with two huts on it. This point, called Fisherman's Point, cannot be mistaken, as there is no other sandy point on the East side of the harbor. After you have opened Fisherman's Point, with the bearing above described, you may steer N.N.E. and when Fisherman's Point bears E. by S., haul up N.E. or N.E. by E. and anchor in 6 or 7 fathoms, muddy bottom. The best marks for anchoring are—Fisherman's Point S. by E. or S.S.E., the West head of the harbor S.W. $\frac{1}{2}$ W., and the light yellow cliff W. $\frac{1}{2}$ S., in 7 fathoms.

"On coming in from the Eastward, you may keep in as near to the East head of the entrance as you please, there being 10 fathoms close to it; after passing, run to the Westward, and bring the before-mentioned bearings on, which will clear the reef that lies off the point a little to the S.W. of Fisherman's Point. The marks for the South end of this reef, which has heretofore been described as a single rock, are the two huts on Fisherman's Point on with each other, bearing N.E. by E., and the point within the East Head S. by E., West Head S.W. by W. $\frac{1}{2}$ W., entrance of Augusta River W. $\frac{1}{2}$ S., the yellow cliff N.W. by N. The marks for the North end of the reef are—the N.E. hut about its breadth open to the Northward of the S.W. hut, bearing N.E. by E. $\frac{1}{2}$ E., the point within the East Head S. $\frac{1}{2}$ E., the entrance of Augusta River W.S.W. The reef lies N. by W. and S. by E. about $1\frac{1}{2}$ cable's length, and 50 fathoms in breadth. It has 17 feet water on its shallowest part, 3 $\frac{1}{2}$ fathoms within it, and 5 fathoms close to the outer edge, which is about 2 $\frac{1}{2}$ cable's length from shore.

"On coming in from the Westward, you may approach the point to a cable's length as it is steep to; but, from the appearance of the point at a distance, a stranger would suppose there was a reef extending from it; at least, when you are within a quarter of a mile. After you are within this point, haul more to the Eastward, as there is a flat that extends from the entrance of Augusta River in a straight direction for a yellow cliff; this flat extends nearly one-third of the distance across the harbor towards Fisherman's Point; but the soundings to and along it are very regular.

"If the wind is off the land, and you have to work in, your lead will be the pilot when standing to the Westward; but in standing to the Eastward, be careful not to do not approach the land nearer than 3 cable's length, as the reef already described is steep to.

"In running in, with the marks described, you will be within the points before you get soundings: after which the soundings are very regular, from 18 to 6 fathoms.

Augusta River is narrow at the entrance, and has only 12 or 11 feet water at low water, one-quarter of a mile up. You may go up the river by keeping the starboard shore on board; or go into a large lagoon on the port side.

When the entrance of the harbor bears nearly North, 5 or 6 miles distant, the land to the Westward of the harbor and the Morro Castle of St. Jago de Cuba will be in line, bearing W. $\frac{1}{2}$ N., and the outermost land to the Eastward E.N.E.

From Guantamano to Point Barracos, the coast trends nearly true West, and it is generally clean, and you may run along it at a mile from the shore. Point Barracos may be known by a morro or hill which rises on it. From this point, the coast bends to the North-westward, and forms the Bay of Cabo Baxa (Low Cape), where it trends West to the River Juragua. The space between Cape Baxa and Laguna named las Altas, or the Altas, because the coast forms three beachy bays, separated from each other by high scarped mounts. The River Juragua is 10 miles distant from Point Barracos.

From the River Juragua the coast continues nearly West, 12 miles, to the entrance

of the Port of St. Jago de Cuba; it is all clean, and may be run along at the distance
of a mile. The rivers De Sardinero and De Aquadores disembogue upon it; and
near this last may be seen some small houses, inhabited by water-carriers.

ST. JAGO DE CUBA LIGHT is a revolving light, 226 feet above the level of the sea; time of revolution 7' 20". Lat. 19° 48', long. 75° 58'.

The HARBOR of ST. JAGO DE CUBA is very good; but the entrance being nar-
row and crooked, is difficult. On the East point stands the Morro castle, and a little
further in Estrella (Star) castle, which is separated from the Morro by a bay, at the
end of which is another small fort or battery. A rocky shoal runs out from the wind-
ward, which extends out about 2½ cable's length from the Morro Point; and, on the
leeward side, another shoal runs out, about a cable's length South of the point. The
channel lies between these two shoals. At its entrance it is a cable's length in
width, and further in is reduced by about a third of a cable; so that, when abreast
of the bay, which is between the Morro and Estrella castles, which is the narrowest
part, it is only two-thirds of a cable in width; and from this it continues, with the
same width, until you pass Cape Smith, when the harbor begins to open.

To make this port you ought to sail half a league or 2 miles off the shore, until the
Estrella castle bears N.E., when, steering in that direction, you will enter the chan-
nel formed by the reefs; but, as soon as you are abreast of the Morro Point, within
a quarter of a cable's length of which you may pass, you may begin to keep away; so
that, when up with the battery, which is at the bottom of the bay, between the Morro
and Estrella castles, the vessel's head shall be N. ½ W., which course it is necessary
to follow until you are past Cape Smith, when you may anchor.

The necessity you are under (from the crookedness of the entrance) of keeping away
four points, viz.: from N.E. to N., renders it almost needful that a large vessel should
have sufficient space to make the turn in. To this end we advise that, so soon as you
are abreast of the Morro Point, you ought to begin to keep away; for without this,
you may very easily get ashore at the Estrella castle. It must here be remarked, that
it would be improper to keep away to the North at once, though it may sometimes be
done under favorable circumstances; for, by doing this, you incur a risk of getting
ashore on the corner of the leeward reef.

The distance between the Morro Point and abreast of the battery, at the bottom of
the bay, on the East, is one cable's length; with the knowledge of this, the pilot will
know how to regulate the steerage, and trim the sails, &c., as may be necessary to
gain his purpose, and according to the facility with which the vessel can be worked.

At the bottom of this harbor, on the N.E., is the city of St. Jago, de Cuba, which
is the most ancient city in the island.

From St. Jago de Cuba the coast continues to the West, forming various bays, with
anchorages of little importance, the knowledge of which is alone useful to coasters.
Upon this coast are the high Copper Mountains (Sierras del Cobre), which are about
11 miles distant from St. Jago. In clear weather these mountains have been seen 33
leagues off.

Forty miles W. by S. from St. Jago de Cuba rises another very high mountain,
named the Peak of Tarquia, which is an excellent landmark. Cape Cruz is the last
place on this part of the island where the coast is plain. It lies more than 30 leagues
from St. Jago, and you may run along the whole intermediate coast at the distance
of a league or even less; but, as there is no motive to induce one to approach it so near,
it is more advisable for those bound to the Westward, to run along at 2 or 3 leagues
distance from the shore. At Cape de Cruz commences a white bank, which extends
10 leagues to the North-westward, and terminates at Trinidad. Upon this bank are
reefs and reefs without number, which form channels of more or less width. Of the
reefs on the edge of the bank, the principal are those called the Cayos de las Doce
Leguas, or the Twelve-league Keys, the whole range of which extends not less than
12 leagues in a N. N. W. direction.

SANTA CRUZ.—The proper channel through the keys to Santa Cruz is the
channel of Cuatro Reales. Steering up N. by W., by compass, from Cape Cruz, will
lead you a chain of keys stretching East and West, nearly, eleven in number. The
entrance of the channel is between the two Westernmost keys, which are large, and
extend from each other 6 miles, and is about 2 miles to the Westward of the Eastern-
most one, immediately to the Eastward of which is a small sandy key, unlike any
other about here, which serves as an excellent mark for the channel. There is con-
stantly one pilot, (perhaps more now,) on one of the keys near the sandy key, who stops
here one month and then is relieved by another. The entrance of the channel bears
from Cape Cruz N.W. by N. A knowledge of these facts will save much uneasiness;
because, on referring to the chart, an unacquainted person would directly decide that
the best channel was the one named the Este Channel on the charts. The marks to
be observed are as follows: it is bounded on the West side by the Eastern head of the Twelve-
league keys, and on the East side by three keys, and a bank runs off from either side,

St. Jago de
Cuba light
The Harbor
of St. Jago
de Cuba.

Santa Cruz.

leaving the channel very narrow and nearly in the middle; bring three keys, which are inside, (and form a triangular figure.) to bear North-east by North, and then haul up North, when you will have a small round key directly ahead, for which you may steer until quite over the shoal water, and which makes an excellent mark to steer by. This will carry you over in about 3 fathoms. When the Eastern head of the Twelve-league keys bears N.N.W., and the flattest keys on the Eastern side of the channel, East by North, there will be the shoalest water, from which the course up is N.E. by N. $\frac{1}{2}$ N., passing between the keys that form a triangle, leaving one on the port hand and two on the starboard; the depth of water between which will be from 10 to 13 fathoms. When the Eastern head bears W. by N., and the flattest key to the Eastward E. $\frac{1}{2}$ S., the depth of water will be from 6 to 7 fathoms, and quite clear of the shoal water. It is high-water, full and change at 12 o'clock; the water rises about 4 feet, but the tides are not regular about the keys, sometimes earlier and sometimes later, and appear to be very much influenced by the wind. Near to the main-land, in the first of the morning, the wind is more Northerly than in any other part of the day, and draws round gradually after the sun frequently going so far as West. After the sun sets there is an interval of calm which is succeeded by the land wind.

High-water.

To coast along the Doce Leguas Keys, being 3 miles to the Southward of Cape de Cruz, steer W.N.W. $\frac{1}{2}$ W., with which course you will run along the edge of the bank; and, having run 12 $\frac{1}{2}$ miles in this direction, alter your course to N.W. $\frac{1}{2}$ N. with which you will enter upon the bank in 40 fathoms, on sand and rocks; keep this course for 23 miles, when, with the edge in sight, you will leave it in nearly 50 fathoms. Continuing the same course 17 miles more, you will again find 40 fathoms, or less, and soon afterwards will see Livisa Key to the N.N.E., and ahead will be seen the Eastern end of the Doce Leguas Keys.

Having recognized these two points, you must run along on the bank, but without getting along into less than 4 fathoms, until you find yourself 3 miles to the South of the Eastern head, and in 7 fathoms water, over a bottom of sand; you must then run W. by N. With this course you will shortly run off the bank, and may coast along the Doce Leguas Keys, at the distance of a league, without any fear; and having run 21 $\frac{1}{2}$ miles, steer W.N.W. 18 $\frac{1}{2}$ miles, and you will then have the Boca de Caballones (or mouth of the Caballones Channel) open; and it may be easily known, as it is broader than any other to the Eastward, and because the S. and E. points of its entrance are very low, and the edges at the water of soborueo rock.

Having ascertained your situation from seeing this Boca or Channel, you may continue coasting along the keys, at the distance of 3 miles, continuing on the preceding course; and having run 21 miles, you will see to the Northward a great opening formed by the keys, which is the Boca Grande; passing by it, pursue the same course, keeping the Cinco Balas, or Five Balls Keys, in sight, at the distance of 2 leagues, and noting that a reef extends 3 miles to the S.W. of Key Breton. The latter is the Westernmost of the Doce Leguas Keys, nearly in a line between Key Breton and Puerto Casilda. On the main of Cuba, is the Placer de la Paz, a sand-bank, having on its Eastern part good anchorage, and nowhere less than 14 fathoms, on sand and shells.

If night comes on, when you are in the vicinity of Cape de Cruz, or to the South of it, as assumed in the preceding directions, you must steer W. $\frac{1}{2}$ S., for 14 miles, and thence N.W. $\frac{1}{2}$ W., to keep completely free of the Doce Leguas Keys: continue this course till daylight, changing it afterwards so as to make and recognize the keys, and thus include yourself in the route already recommended.

Should night overtake you in the traverse between Cape de Cruz and the Eastern Head, when it might suit you to anchor on the bank, you may do so on any part of the bank, observing only that the edges of the banks are rocky, and that to get clean ground you ought to run in upon it into 20 or even 10 fathoms, on sand.

If night falls when you are coasting along the Doce Leguas Keys, as already directed, steer true West, until you consider yourself from 3 to 3 $\frac{1}{2}$ leagues from them, and even then continue the same course, considering that hereabout the current sets N.E. and S.W., and, if the tide happens to set in, it is very possible to get aground on the reef: hence no precaution ought to be omitted which similar cases require.

If, when in sight of the Canal de Caballones, you wish to anchor in its mouth, in a case of emergency, you can do so without getting into less than 3 fathoms, on sand, and, in case of being unable to continue your course to the South of the keys, you can shape your course so as to desery the land of Cuba, passing between the Betton and Manuel Gomez Keys, in 12 fathoms, on clay; following afterwards to the North, to make the Anaa Maria Keys, and giving a berth to the shoal of Yaguajay, which you leave to port, and to some heads which are to the East of it, and which

for this interior navigation.

MANZANILLA.—The reef which extends 2 miles off Cape Cruz, can be passed *Manzanilla*
within 50 yards, in 3 fathoms water. This reef is very steep. As soon as you have
passed the reef, haul in for the land; you will then have 24 fathoms water within
one-half a mile of the beach. The first point from the cape is called Point Calrado;
this cape lies N.E., 6 miles, from Cape Cruz. The anchorage is good from the Cape
to Manzanilla in the sloop-channel. In passing Point Calrado, you will have 3 fath-
oms; as soon as you have passed the point, you will have from 8 to 10. This point
should be passed within one-half a mile. Three-fourths of a mile from Point Calrado,
in a N.W. direction, lies a shoal; it extends about 3 miles in the same direction. Six
miles from Point Calrado, in a N.E. by E. direction, is Point Balona; this point has
a shoal extending off from it, in a N.W. direction, 14 mile. Three miles N.W. from
Point Balona, lies what the pilots call the Balona Shoal; the shoal extends N.W., 24
miles. Three miles from Point Balona, in a N.E. direction, lies a small key, called by
the pilots Mona Key; this key lies close to the main-land, and cannot be seen as a
key in passing along in the channel. The shoal water extends off this key about a
mile. Two miles distant, in a N.W. direction, is what the pilots call the Mona Shoal;
between there are 6 fathoms. Back of the Mona Key is Lime River, being the
best fresh-water about the cape. N. by E., 7 miles, as estimated by the pilots, lie
two small keys, called by the pilots Swago. N., 4 miles from Swago, lies a group of
keys, trending E. by N. and W. by S., 4 miles, called Sloop-channel Keys. There
are two shoals lying W. by N. of the Swago Keys. From Sloop-channel Keys the
passage is clear to Manzanilla.

N.W. by W., 7 miles from Point Balona, commences the Great Bank, which ex-
tends 75 miles. Between this and the reef before mentioned, lies the main channel
to Manzanilla.

A pilot can most always be found at Cape Cruz. There are but four pilots at Man-
zanilla, and in some cases a vessel might be detained for want of one.

Directions for sailing from Cape de Cruz to the neighborhood of these ports have
already been given. We have only to repeat that it is always advisable to keep a good
lookout, and the lead going, especially by night. Having recognized Key Grande,
continue the N.W. course until Key Breton bears N.E., bringing it the distance of 9
miles. From this spot a N.N.W. $\frac{1}{2}$ W. course, 38 miles, will bring you to another,
from which the Pan de Azucar, or Sugar-loaf Hill, will appear on with the most East-
erly of the hills of Bonao, which are some high ridges immediately to the Westward
of it. In this navigation the keys called the Zarza and Machos will be seen from
without; and when the leading mark above given is on, you will still be in sight of
the Machos, and of another very small key, named Puga; the latter is rendered re-
markable by the breaking of the sea upon it, and it will bear about N. $\frac{1}{2}$ W., a mile
distant. From the same spot the Key Blanco will be seen, bearing about N.N.W. $\frac{1}{2}$
W. This key is remarkable, both as the Westernmost key on the bank, and because
the shore is bordered with white rocks.

The place where you ought to enter upon the White Ground is between the Keys
Puga and Blanco; to do which you must steer so as to pass about half a mile, or
rather less, from the reef of the Puga, which reef always shows; and in the passage
you will always have 6 fathoms water. Having passed Puga, you must steer N. $\frac{1}{2}$
W. in order to anchor in 4 fathoms, sand and weed, with the South part of Key
Blanco W. $\frac{1}{2}$ S.; that is, if the approach of night, or waiting for a pilot, render it
necessary.

On the route between Key Grande and Key Blanco, no one need be at any loss, who
has the particular chart of the navigation between the Rio Guanabo and the Boca
Grande. By it may be seen that any one who wishes to enter upon the bank by the
Boca Grande may always do so, provided his vessel does not draw more than 14 feet
of water; and it may even sometimes be convenient to run in here to anchor, under
the shelter of Key Grande or those of Cinco Balas, in case of bad weather coming on,
which will frequently happen, and which is much to be feared in August, September,
and October; or, if he does not choose to anchor in the shelter of these keys, he may
run in until he recognizes the key called Rabi-horeado, which he will leave on the
starboard, and will afterwards see Cayo Bargayo; having passed to the Eastward of
the latter, he may run N.N.W. without fear, being guided in running by the vessel's
sight of water; and entering by the Machos Channel, he may run for Masio or Pu-
erto Casilda, as he sees proper.

The key called Blanco de Zarza lies N. by W., 8 miles, from Cayo Zarza de Fu-
er, and half a league to the Southward of Punta del Caney. Between this key and
the coast there is anchorage, as there also is in various other places hereabout, which
will be found more or less commodious, according to the winds and draught of the

vessel. The keys, in general, are but little above the surface of the water, and their low shores have no extent of beach; but rocky banks stretch out to a short distance from their points; excepting, however, those which form the Machos Channel, which within the strait, are very clean.

The Coast from the River Jatibonico, Westward to Port Casilda, Trinidad, &c.

The coast between Point Jatibonico and Point Passabano, in a distance of two leagues, forms a bay with 2) and 3 fathoms. The shore is drowned and covered with mangroves. At Point Jatibonico the river of the same name enters the sea. To water in it, you must ascend the river for a league. Many cedar and mahogany trees are brought down this river, and many vessels take in cargoes here. Three miles to the West of Passabano is the Estero de las Caovas, (Mahogany Creek,) in which small craft not drawing above 6 feet may find shelter from the South east winds. Another Estero de las Caovas, at 3 miles, follows Point Manati, on which there are some wells of tolerable sweet water. Point Manati, with Point Tolete, which lies two leagues to the West of it, form a small bay, in the middle of which is the mouth of the Estero Noevo, (New Creek.) Point Tolete and Point Zarza, $\frac{1}{2}$ miles distant, form another bay, in which is the Estero de San Marcos, with very little water at its entrance. On the Eastern part of Point Zarza, the river disembogues itself. By this river there is much traffic carried on with the town of Sancti Espiritu, which is two leagues inland. West of Zarza point is the creek of the same name, with 7 fathoms water, where small vessels may find shelter from the South-easters, as they may also to the Westward of Point Zarza, under the lee of a reef, which runs out from the W. S.W. of it for nearly a mile, and which forms a bay, with a clayey bottom, of 3 and 3 $\frac{1}{2}$ fathoms.

A league to the West of Point Zarza is Point Caney; between is a small bay, with 3 and 5 fathoms, clay and grass bottom. On the West of Point Caney is the Estero (creek,) the same name, with 7 feet of water. To the South of this point is Cayo Blanco de Zarza, (the white key of Zarza,) and between the reef which runs out from it and the point there is a good channel, navigable for any vessel, which, as before said, may find good shelter to the West of the key. Beyond Point Caney, on the West, is the Desembocadero de Mangle (Mangrove Mouth;) two leagues West of Point Caney is Point Ciego; between is a bay with from 3 to 5 fathoms; in the middle of it is the River Tallabacoa, which has very little water in the dry season; and that brook, at a very short distance to the Westward of Point Ciego, is always preferable. After Point Ciego comes that of Yguanojo, at which is the river of the same name, the water of which is excellent, but to procure it, it is necessary to ascend the river for a league. One league and a half West from Point Yguanojo is that of Agabama to the Eastward of which run out the Caycos de Tierra, (Keys of the Land,) which with Point Yguanojo, form a bay called St. Pedro's, having from 3 $\frac{1}{2}$ to 6 fathoms, clay.

The Caycos de Tierra, with Point Agabama, form another small bay, having 7, 4 and 4 fathoms, on clay and sand. At Point Agabama is the river of the same name.

The shores from Agabama to Point Casilda, are drowned, and covered with mangroves, (literally, watery mangrove land,) and from Casilda to Point Guanarabo, are of sand and scarp'd rock. Relative to the interior of the land, we shall only mention that the Potrehillo, which is the highest point of the mountains above Trinidad, may be seen in clear days at 21 leagues off, and the Sugar-loaf (Pan de Azucar) and the Machos, are excellent marks for accurately ascertaining your position.

From Boca Grande the reef forbids entering on the bank as far as the outer Zanja between which and the Outer Machos there is a spacious entrance, with depth for vessels. Nevertheless, if when in sight of Key Breton, and to leeward of Boca Grande you wish to anchor upon the bank, in order to regulate the time for making Point Cayo Blanco, or for any other course, it may be done by steering towards Key Breton, until the N.W. part of that key bears E. $\frac{1}{2}$ N.; but in running thus, sound frequently, until you have from 4 to 3 fathoms, on sand, when you may anchor. If the wind will not allow you to steer in for the anchorage directly East, and you are obliged to beat to windward, observe not to prolong the tacks to the Northward longer than until the N.W. part of the key bears E.S.E., or the South tack further than the same bearings of the key bears N.E. by E. Between these bearings you may work tack and tack, till you reach the anchorage, in which there is a shelter from the wind from N. by E. to S.W., caused by the cordon of reefs and keys which lies in these directions. All these reefs show above water, and the outer part of them lies not more than 3 miles S.W. from the West part of Key Breton.

Any large vessel seeking shelter from the weather, or any other cause, upon the bank, may enter between the outer Zarza and outer Machos, and run over the

ice of the water, and their

Tides.—We shall now terminate this part of the subject by remarking that the tides produce streams more or less rapid, and in various directions, according to the channels which the reefs form; but they are of very little importance, because the greatest rise of water, which is at the time of the new moon, is not more than a foot and a half, except with S.E. winds, when it sometimes rises 3 feet.

MASIO.—To enter Port Masio, being within the bank, steer N. $\frac{1}{2}$ W., until the South part of Key Blanco bears W. $\frac{1}{2}$ S., in which situation you will find 4 fathoms, on clay and weeds, or grass, (yerba.) From thence run N. 50° W., with which course you will run along the middle of the channel of Masio, which is formed by a shoal extending N.W. by W. from Key Blanco, and a shoal, with some heads nearly even with the water, on the land side; and you must continue thus till you have Point Jobabo N. $\frac{1}{2}$ W. This point may easily be known by a sandy beach. You must then huff up with the prow to the West point of the harbor; and steering N.N.W., take care to keep a very little away until you are past the Guard-house point, that you may keep clear of the reef which runs out from it. Being past this, keep the prow as above directed to the West point, until near the entrance, when you may run up the middle of it by the eye, because the edges of the shoals show distinctly, and the eye and lead are the best guides. Having run up the middle of the entrance, huff up N. by E. until having passed the points, and being in 4 or 34 fathoms, you may anchor where it suits you, being cautious solely of a clay bank which runs out from the landing place on the West shore, and the extremity of which is in one with the West point of the port, at South.

Passing in for Masio, you leave the Bay of Caballones to the starboard; and if you wish to anchor in it, for shelter from the N. and S.E. winds, you may do so by keeping in the middle between the two points which form it, and directing yourself mid-trait, and with the prow N.E. by E., anchor when you are in 34 fathoms, clay or sand.

CASILDA, TRINIDAD DE CUBA.—When up with Cape Cruz, say it bears N.E., distant 3 miles or so, steer (if you have daylight enough to run it, say 60 miles) N.W. by W. 55 miles, and you will be up with the Eastern heads or Keys of the Twelve-League Range. If night is coming on steer N.W. by W., 30 miles, or less, which will run you off the bank of white water; then steer W.N.W. until daylight, and then haul your ship to the Northward, and make the keys if they are not in sight, and coast along them at 3 or 4 miles distance, bearing in mind that Key Breton has a reef running out some 2 or 3 miles S.W., and very dangerous. This coast along these keys is not clear, and too near a proximity is very dangerous, as strong sets of current are felt here, setting on and off, as the tide may be. When you have doubled Cape Breton, your course to Zarza Fuera Key will be N. N.W. $\frac{1}{2}$ W., distant about 63 leagues. By steering this course you will leave Key Zarza about 5 miles on your starboard hand, and when it is abeam, you steer a half point more Westerly, (or say N.W. by N.) until you raise Key Blanco, which will be nearly ahead, and you will not mistake it, as its base is covered with white sand, (from which it derives its name.) You will in this course have some keys on your starboard hand, called the Machos. When up with Key Zarza, if night is coming on and you have not daylight enough to reach Key Blanco, you can bring your ship to anchor by running on the bank, giving the N.W. end of Key Zarza a berth of about a mile, and keeping the lead going until you get 6, 5, or 4 fathoms water, sandy bottom. There is good anchorage anywhere on the bank between Zarza and the Machos Keys, taking care not to approach too near the Machos in the night, say 2 miles or more distant, as its vicinity is bordered with reefs, all danger of which is plainly visible by daylight. Also observe there is a strong set of current on the bank here and its vicinity, setting E.N.E. and W.S.W. From Zarza Key to the Machos the bearing by compass is N.W. by W. $\frac{1}{2}$ W., not in sight from each other.

The vicinity of the Machos is dangerous to approach in the night—by daylight all danger is plainly visible. They are connected by reefs extending to the Purga Keys, which are low drowned keys, or rocky heads, on which the sea continually swashes, and lie nearly West from the Machos. There is also a reef runs out about East from the Machos, from 1 to 2 miles. The entrance on the bank between the Machos and Key Blanco is not clear, as it is from Zarza to within 2 miles or less of the Machos. Key Blanco bears W. by N. (by compass) from the Machos. Nearly on a line, say about half way or a little more of the distance from the Machos to Key Blanco, is a dangerous reef, nearly drowned, a little above the water's edge, and extending to within about one mile of Key Blanco. Between said reef and Key Blanco is a good entrance to the bank, as also between the Machos and said reef. You are now up with Key Blanco, where you will get or ought to get a pilot, as it is the pilots' station by law, but they are very negligent, as their pay is arbitrary whether services are rendered or not.

Tides.

Masio

*Casilda,
Trinidad de
Cuba.*

Here you may wish to anchor, from many causes, viz., no pilot on board, night coming on, weather bad, and the danger of drifting about in such near proximity to so many shoals, &c. Follow these directions, and you may safely come to anchor, viz.: Having Key Blanco in sight, steer for it till you have it well aboard, say 2 cables' length or less, you may then leave it on your port hand, and steer N.E. or N.E. by E. until it bears West, then let go your anchor in 3 or 4 fathoms water. There is a spit nukes out from Key Blanco about N.E., say one cable's length, which you will avoid in your N.E. course, and the reef on your starboard hand. This is the entrance to the deep-water channel, say 16 feet. With the wind to the Eastward or off the land, you will, when well up with Key Blanco, steer for it till within one cable's length, leaving it on your starboard hand, giving the West Spit a berth, haul around it, luff up, and let go your anchor in 3 fathoms water. This is the common entrance to the port with vessels not drawing over 13 feet, viz., when you have Key Blanco well aboard, then steer (if not wishing to come to anchor under Key Blanco, as above directed, to wait for a pilot) N.W. by W., which course will bring you into a ridge of white water or shoal-looking bank, and inside of a reef on your port hand; and if you do not draw over 11 or 12 feet water, choose the narrowest part of the white ridge to cross over; you will also see on this course some 2 stakes with tufts of Palmetto leaves tied to their tops—you may leave them on your port hand—you will then, on your course N.W. by N. or N.W. $\frac{1}{2}$ N., raise more stakes, which leave on your starboard hand, as also all the others as you proceed down. The stakes denote the best water, you will therefore keep near to them. If you draw over 12 feet water, you had better come to anchor as directed, under the West side of Key Blanco, and wait a moment.

A good mark is now to place your ship's head on for the South end of the town of Trinidad, which will bring you along the range of stakes, and will leave them on the starboard hand until you open the shipping in the harbor. Then steer for the fort on the point, or for the shipping; your eye will now be your guide; only avoiding the white shoal or spit running off from the fort, and leaving Rat Island or Key on your starboard hand. Enter the harbor, choose your position, and let go your anchor.

NOTE.—If you should fall to leeward of Key Blanco, bring the town of Trinidad (on the hill side) and the fort on the point or entrance to the harbor in one, until you see a large red building or house on the East end of the town, then place the fort and the house in one, you will be then on a line with the West end of the reef; you can now bring said red house on with the Lookout House on the top of the hill back of or above Trinidad, or steer North till you see some stakes inside the reef, or which are a part of the before-described stakes, run for them, or steer N.E. till the fort bears N.W., and if no pilot, and you are a stranger, come to anchor. You are now inside the reef which extends from Key Blanco nearly down to the fort, and which has some 2 or 3 openings for light vessels. In lying off and on, off the last-mentioned channel, do not stand inshore with the fort bearing to the East of N.N.E., as there is a dangerous reef on shore, Westward of the fort, called the Mulattos.

NOTE 2d.—The weather channels are always to be preferred, and the leeward one to be avoided, except in extreme cases, &c.

From the River Guanabo the coast Westward is very clean, and you may run along it at the distance of a league. For 8 long miles it trends W. $\frac{1}{2}$ N., as far as the West point of the River Honda; from this it continues N.W. by W. $\frac{1}{2}$ W., 9 miles, to the point of San Juan, which is well marked, as the coast afterwards trends N. by W. W. for a long mile, to the River Guagimico.

Between the River Guanabo and the Point of San Juan, the Rivers Guaynabo, Cocabagan, Honda, Yaguanabo, and San Juan, run into the sea. In all these coasting vessels, which do not draw more than 6 feet sometimes anchor. To get fresh water from any of them, it is necessary to proceed a league up from their mouths.

Along this part of the coast the water is deep, and the bottom clean, excepting a small reef, which stretches out between the River Yaguanabo and San Juan, and which does not extend from the coast so much as half a mile. The shore is sandy and of soboruco rock. The land is mountainous or hilly for a little to the West of San Juan's Point, and at it commences the mountains of San Juan, or of Trinidad.

From the River Guagimico the coast trends 14 miles N.W. by W. to the Colorado Point, which is the East point of Port Xagua, and is so clean that it may be run along at less than half a cable's length. The land is level without mountains, and in it the Rivers Gavilan, Gavilancito, and Aramao, are met with; but they are of little importance.

Cienfuegos light.

CIENFUEGOS LIGHT is a flashing light, 82 feet high, with a Villa Nueva painted on the tower. It is on Point Colorados, and is in lat. $22^{\circ} 2' N.$, long. $80^{\circ} 28' W.$

NOTE.—The longitudes of the keys and the coast adjacent of the South side of Cuba between Cape Cruz and the S.E. point of the Jardinillos, are from 10 to 14 miles far to the Westward on the charts.

The port or harbor of Xagua, or Jagua, is very spacious, secure at all times, and has deep water, but its entrance is very narrow and crooked. The East point, named Colorados, and the West, Sabanilla, or de la Viga, are the exterior points of this port, and the distance between them is a large mile. The windward shore, from Point Colorados, trends N.W. 4 N., 2 miles, to Point Pasa Caballos, whence it sweeps to the N. by E., about two-thirds of a mile, to Point Milpa, which is the interior Eastern point of the strait. The leeward shore of the entrance follows nearly the same direction as the windward, and narrows the channel so much, that opposite Point Pasa Caballos it is only a cable and a third in width, and thus it continues to Point Milpa.

To enter Port Xagua, pass Point Colorados, at the fourth of a cable's length; but show the exterior coast to windward, as a reef stretches from it, and it cannot be approached nearer than a mile; you run on, inward, preserving the same distance of a cable, until you arrive at Point Pasa Caballos, when you must lull for the purpose of keeping in mid-channel, or rather nearer to the leeward side; and so soon as abreast of the interior points, steer towards the S.E. point of Cayo de Caremas, in order to avoid a shoal which lies to the Northward of Point Milpa, and of which you will be clear when the Northern point of the Key Alcastraz bears East. When once the interior points are passed, you may anchor where you please, a chart of the harbor being a sufficient guide.

The town of Fernandina, or Cienfuegos, is in the harbor of Xagua. You can carry in 18 feet water, and it is the third town in importance on the South side of the island. Rise of tide 2 feet.

The coast West of Xagua, or Jagua, is all of soboruco rock, and without any bank or shoal, for nearly 21 1/2 miles, to the point of Caleta Buena, (Good Cove); it thence trends W. N.W. 4 W., 6 1/2 miles, to the East point of Cochinos, or Swine's Bay.

There is a shoal S. by W., true, 30 miles from Cienfuegos; it is nearly circular, the least water on it being 10 feet on the N.E. part. It is coral in formation, and is rising gradually. It is called Placer de Jagua.

COCHINOS BAY is formed by the point above mentioned, and another point which lies W. by N. from it. The last is named Punta del Padre, (Father's Point.) The bay extends 13 miles to the N.N.W. The edge of its Eastern coast is of soboruco rock, without a bank, until at about a mile from the shore, when bottom is found in 15 fathoms, on sand and rock, diminishing the depth rapidly towards the coast. The Western coast is a sandy beach, and sends out a bank to a short distance, but all of it is rocky bottom. In the Northern part of the bay is a landing-place, which leads to the stock farms, (Haciendas de Ganado,) but it is little frequented on account of its having so little bank, and the little there is having generally a bottom of sharp rocks.

Point Padre is very low, with a sandy beach. S.E. from it, at the distance of 6 1/2 miles, lies Piedras Key, which is low, and of small extent. A little to the East of the point the bank which borders the West coast of the bay continues towards the South, and along the edge of it is a reef, which almost joins the North part of Piedras Key. The Eastern side of this reef is very steep to, and has some openings, of 3 and 4 fathoms, which allow a passage on the bank. The most frequented one is that formed by the Southern extremity of the reef and Piedras Key, both because the key serves as a mark for it, and because it has a greater depth of water than any of the others. The break which terminates this reef ends to the Westward at the Lavendera (Washerwoman) Rocks, which lie about 4 leagues W. 4 N. from Piedras Key.

From Padre Point to that of Don Christoval, all the coast is broken with lagoons, forming many keys with groups of mangroves, having their roots growing in the water, or so close to it that the water washes in among them, and having no navigable channels. In this large space is comprehended Cayo Blanco, the South side of which is a sandy beach; and there is fresh water in holes at its Eastern part. On that side, at the distance of a mile and a half from the shore, is the Lavendera Reef, which extends 2 miles East and West. The West point of it lies West 15 1/2 miles from Point Padre, and with another key which lies to the N.W., forms the Bouqueron (Little South) of Calvario, which has little depth.

The Bouqueron of Calvario, with the Southern extremity of Diego Perez Key, which lies 6 miles distant from it S.W. by W., forms the Bay of Cazones, which extends inland, N.W. by W., for about 7 miles. At the bottom of this is Masio Key. There are various small channels at the bottom of the bay, formed by Masio Key, which are connected with lagoons, lying along its sides, and at the North end of it. To the South of this key is a bank of 3 or 4 fathoms, sand and rock; but it is of no use, there being no communication thence to the main-land of Cuba. At the distance of more than a mile and a half to the East from the South point of Diego Perez Key, a reef begins, which, stretching out with a turn to the S.E., unites in the Eastern part of the Jardinellos, and is steep to. Between the same point of Diego Perez and the commencement of the reef, there is a passage on the Western Bank, which begins

Tide.

Cienfuegos Shoal.

Cochinos Bay.

with 7 fathoms, but in a short distance has only 14 feet. Four miles to the S.E. of the same point there is another channel, with first 3 fathoms, and very soon after only 2. There is no good mark for it, and the former is most frequented.

S.W. by W., a mile and nine-tenths from the Point of Diego Perez, lies the Southernmost part of Palanca Key, after which follow in order to the N.W. by W., true, the chain of keys named Sal and Fabrica, and which, connecting with the main land of Cuba, at Don Christoval's Point, form innumerable passages, but with very little water. The Southernmost keys of this chain, named Bointo, Cacao, and Palanca, are the marks for vessels sailing along the bank, which has no more in many places than 11 feet of water, and its bottom of fine white sand, is studded with heads of rocks, with only 6 feet over them, but their color indicates what they are. This passage is bounded by the keys above mentioned, another key, Rubihorcado, to the South, and the edge of the Jardine's Bank.

From Palanca Key, which lies 12½ miles W.N.W., true, from Flamenco Key, the Western Fabrica Keys take a turn to the N.E. by N., true, towards the main-land, and they form a passage or channel with another chain of keys, to the West of them, called Don Christoval's.

Don Christoval's Point lies N.N.W., 2 miles, from Palanca Key; and from it the coast, which is low and swampy, trends W.N.W., for 18³/₄ miles, to a little key which lies at the entrance of a small bay called Matahambre. The interior of the country along this part of the coast is firm land, and is called the Savannas of Juan Luis. To the South of it extend a chain of keys which are also called Juan Luis' Keys. There is a passage between them and the coast, as there is also between the East part of them and the West part of Don Christoval's; not, however, in any of the channels, for vessels which draw more than 10 feet.

N.W., at the distance of 3½ miles from the little key which lies in the mouth of Matahambre, the Great Mangrove Point and the swampy land ceases. From this point the coast trends to the N.N.E. and N.E. for a short distance, and then to the East, to form the Ensenada, or Bay of Broa, which extends inland in that direction about 7 leagues. On the North it is bounded by the Point of Mayabeque, which lies N. by W., 15½ miles distant from the Punta Gorda. The shores of this bay are all of mangrove and swampy land; and on its North side are the branches of the Cienega, or Shallow Lake, which the natives of the country call the Rivers Guines, Guanamon, Mora, Nueva, and Belen, as far as Mayabeque Point. In this bay, as well as in the whole space of sea comprehended between the coast of Batavano and the keys in front of it as far as the Cayamas Channel, the depth is from 3 to 4 fathoms, clay.

To the N.W., and about a mile distant from the Point of Mayabeque, is the river of that name, in which vessels trading to Batavano can easily provide themselves with water. From this river the coast trends W. 4 S. to the anchorage of Batavano, which is 8½ miles distant from it.

From this place the coast trends to the West, 13 miles to Point Cayamas; but in the intermediate space lies the Point of Cagio, and the river of the same name, in which the Batavano vessels sometimes also procure water.

The River Cagio, formed by the branches of the Cienega, runs into the anchorage of that name, in which at a moderate distance from the coast, from 2½ to 3 fathoms water are found, sheltered from all winds by the chain of keys which lies in front of it. The bight of the Cienega comprehended between its mouth and the main-land, is more extensive than that of Batavano or Mayabeque, and the lands around it are well cultivated.

Cayamas Point, and the chain of keys to the South of it, form the channel of the same name, which has 7 feet of water; this chain of keys extends, with a bend to the S.E. by S., about 11 miles, when it forms the channel of La Hacha, which divides it from another chain of keys, which extends from this place as far as Cruz Key, lying 13 miles S. by E. 4 E. from Batavano. The Canal de la Hacha has 11 feet of water, and is much frequented by vessels trading to Batavano, when they either enter or sail out to the Westward of the Isle of Pines and Cayos de San Felipe, (St. Philip's Keys.)

At a short distance to the Westward of Cruz Key lies another, called Redondo, under which the vessels belonging to Batavano secure themselves in the season when the fresh (or stormy) S.E. winds blow: that is, in the months from July to October, (hurricane months,) which are much to be feared on all this coast.

At Batavano is a fixed light, 31 feet above the sea. It is a lantern hoisted upon a mast.

To the Southward of Cruz Key, at the distance of 2 leagues, lies Monte Rey Key, and between is a channel with 2½ fathoms, clay. This channel is the largest of those leading to Batavano, although care must be taken to keep clear of a spit which runs out about 7 miles to the S.W. of the key, and to the heads, which are to the South of those keys, forming the North side of the channel.

Light

From Cayamas Point, the coast of Cuba trends W. by N. 4° N., forming a regular bay, called Enseñada de Majama, which terminates to the South, at Point Salinas, 10 $\frac{1}{2}$ miles to the W.S.W. from the former. In the intermediate space, and near Cayamas Point, is the mouth of the river Guanima, at which the Cienega ends.

S.W. 4° W., 12 $\frac{1}{2}$ miles, from Salinas Point, a small point stretches outward. At a short distance to the North of it is the Creek of Savana-la-Mar, which is much frequented by trading-vessels. From the same point the coast continues, forming a bay with Medicasa Point, which lies 15 $\frac{1}{2}$ miles to the S.W. of the former.

Between this coast and the Bank, or Middle Ground, on which stand the keys to the Northward of the Isle of Pines, the depth of water is from 3 to 4 fathoms, clay, except a spit with 1 $\frac{1}{2}$ and 2 fathoms, which stretches out from the Southernmost key about 2 leagues, to the S.W. 4° W. of the Guanima Keys. The extremity of the spit lies S. 4° E., 5 $\frac{1}{2}$ miles from Salinas Point.

The Guanima Keys are included in the group which, to the Westward, forms the Channel of La Hacha, and are situated to the Southward of the River of Guanima and of Point Cayamas.

S. 7° E., 12 miles from Medicasa Point, lies Dios Key, between which and that point is the passage for vessels trading from this quarter to Batavano. Dios Key is low, and of small extent; it is detached, and the bank on which it stands turns to the Eastward, and unites with that which surrounds the keys to the North and East of the Isle of Pines. It also forms a channel with the Indian Keys, and those of St. Philip, with from 3 to 4 fathoms depth of water.

From Medicasa Point the coast trends W. by S., true, for about 2 leagues, after which, following S. and S.W., it terminates at Fisga Point, forming the Bay of Ayaniguanas; this point lies S.W. 4° S., distant 10 $\frac{1}{2}$ miles from the former.

About S. 3° E., 10 $\frac{1}{2}$ miles from Fisga Point, lies the Easternmost of the keys of San Felipe, from which this chain of keys continues in a Westerly direction as far as the meridian of Guanma Point; between these keys and the Indian Keys, there is a passage with 2 fathoms of water; and the depth in the space of sea comprehended between the coast and the North part of them, is generally from 4 to 5 fathoms, on clay and weeds.

From Guanma Point the coast follows to the West, for about 2 $\frac{1}{2}$ leagues, to the Point and Creek of Guano, where the Bay of Cortez begins. From this place the coast runs W. by N., true, for about 2 leagues, to the bottom of the said bay; and the inconsiderable rivers of San Juan, Martinez, and Galafre, disembogue in it.

About W.S.W., true, at the distance of 3 leagues from the Point of Guano, disembogues the River Cynajuteje; to the S.E. of which, at the distance of about a mile, begin three small keys, which, extending themselves in the turn more to the East, for about a league, form, with the main-land of Cuba, the Lagoon of Cortez, which has about 3 fathoms of water; but the small passes formed by the keys have not more than 7 feet. Some huts have been established on them by persons who fish for hawksbill turtle, or the turtle which produces the tortoise-shell.

The Southern extremity of this lagoon, which is on a parallel with the keys of San Felipe, and about 5 leagues distant from them, is the termination of the Bay of Cortez, in which there are 3 and 4 fathoms water, on a grassy bottom. About 2 miles to the East of the South end of said lagoon, begins the deep water; the edge is very steep; it begins with 7 and 8 fathoms on a rocky bottom, and continues on so as to join the coast close to the Northward of Point Piedras.

Point Piedras lies about S. by W. from the Lagoon of Cortez, 7 miles distant; the coast, which is low, but of firm land and rocky, with spaces of sandy beach at the shore, running nearly in the same direction.

From Point Piedras the coast, which has no bank, runs nearly S.W. by S. to the Point Llana, distant about 5 miles. This point is low, and has no other marks to distinguish it than the different directions of the coast, and some huts near it, and to the West of it there is a small sandy beach. To the S.E. a reef, which is very steep to, extends out about 2 cables' length.

From Llana Point the coast trends W.S.W. 4° W., and more Southerly to Point or Cape Leones, and then again follows the first of these directions as far as Cape Corrientes. All this piece of coast is of high soborneo rock, and without danger at a stone's throw distance.

CAPE CORRIENTES ends in a low point, with a sandy beach; and to the S.W. Cape Corrientes. A short bank stretches off, on the edge of which are 15 fathoms; and close to the shore there are some rocks on which the sea breaks.

From the cape the coast trends, without any bank, N. 3° E., true, for about a league, to Cape Cayman, or the Point of Muria Gorda, and from it to the bottom of the bay, N. 40° E. The place called Muria Gorda is remarkable, being of soborneo rock, scarped, and higher than any other part of the bay; from it the bank again begins to run off with bad holding-ground, the bottom being rocky; although further to

the North, and from the inflection which the coast makes, the bottom is sand; and very near the beach an anchor may be let go in 5 fathoms, with the precaution of having a cable on shore, as the edge of the bank is very steep. This is the only anchorage in this bay, and affords shelter from the strong trade winds and S.E. winds, none of the rest of the bay has any bank. The water met with in the lagoons of Maria Gorda is brackish; but the fresh may be perceived rising in bubbles in the middle of the salt, and near the bottom of the bay, and about 6 yards distant from the water's edge. With industry, and in case of necessity, it may be obtained in a drinkable state.

From the bottom of Corrientes Bay the coast trends West, true, to the Balcones, which is a short piece of coast of high soborneo rock. From this place it continues W.S.W., to Holandes or Olandes Point. This point, which bears nearly West, 54 leagues, from Cape Corrientes, terminates to the Westward of the bay of that name. Near and to the East of it begins a reef, which extends in that direction about half a mile, but offers no danger, as it lies very close along the coast, and is very steep to Point Holandes has an agreeable appearance, having a resemblance to the curtains of a wall, and extending with this figure about 2 miles, beyond which it descends in a kind of falls or steps, and the shore continues woody after passing it.

From Point Holandes, or Olandes, the coast trends nearly West to the point of Caynelos, which is the Southernmost point of the front of Cape San Antonio, or Cape Antonio.

CAPE ANTONIO LIGHT is a revolving light, 108 feet above the sea; time of revolution one minute.

The Westernmost point of the cape is called Pocillos, or Little Wells Point; and from this the coast trends N. 9° E., true, three-tenths of a mile, or thereabout, to Sorda or Deaf Point, whence the coast inclines more to the North-eastward.

To the Eastward of, and near Caynelos Point, extends the bank, which thence surrounds the cape half a mile from shore, and continues on to the Northward, where it forms the Colorado Bank. Its depth begins with from 20 to 25 fathoms, on a rocky bottom, and diminishes regularly towards the coast, with some spots which have a sandy bottom.

The front of Cape Antonio is of low land, very rocky, and its shore appears with mixed streaks of soborneo rock and sandy beach. In its wells, called those of *Cueva de la Sorda*, (Deaf Woman's Cave,) and the *Pocillos*, (Little Wells,) water is abundant and of good quality.

Cape Antonio light.

Cape Antonio (A) bearing N.W. 4 N., true, dist. 5 miles.

Cape Corrientes looks very much like Cape Antonio; and in order to ascertain it, observe it is rather level land, of moderate height; but being near or off it, in clear weather, some hills in Cuba, named the *Sierras del Rosario*, which stand toward the North coast, may be seen, bearing nearly true North. They are the only hills that can be seen from a similar situation, and present two summits only to the view.

Cape Corrientes (A) bearing N. 35° E., true, distant 4 miles.

The Isle of Pines, Jardines, and Jardinillos.

The form of the bank and reef which surround the isles or keys called the *Jardines*, &c., can be best understood by reference to the chart. Towards the N.E., on this bank, is *Diego Perez Key*, already noticed, and the edge of the bank thence extends to the S.E., forming a bight at the *Megano* or *Sand Islet of Biscayno*, whence it extends to the Easternmost key of the *Jardines*. From the North end of the latter reef stretches out to the Eastward about a mile, and the bank extends in the same direction about 3 leagues, and nearly 2 North and South, with a depth of 15 fathoms at the edges, and 7 or 8 on the whole of it, excepting the proximity of the key, where

4 fathoms are found, on sand and rocks. This key, as well as all those which follow to the Westward, under the name of Jardillos, extending as far as Key Largo, are regularly high, and scarped at the shores.

To the S.W., about 2 leagues from the Easternmost key, follows the edge of the shoal water, thence West for 4 leagues. It is studded or streaked with reefs, as far as a key which lies a league to the West of Trabuco. For about 5½ miles the same edge forms a bend, as it approximates the East end of Key Largo.

Key Largo, which extends W.S.W. and E.N.E., 13½ miles, is the Easternmost of the Jardines, under which name are comprehended all of those which follow it to the West as far as the Isle of Pines. The South side of Key Largo is a sandy bench, bordered with a reef, which runs out about a mile from the East end, and afterwards approaches nearer, so as almost to join the West end of the key, whence the same reef continues, without any break, W. by S. and W. by N., true, to the Rosario Channel, which is 5 leagues distant from Key Largo. On the very reef, and near the West point of Largo Key, there are two rocky keys, named the Balleantes, distant a league from each other, and they are of moderate height. In all the space comprehended between the Eastern head of the Jardillos and the Rosario Channel, the bank which extends along the South side of the keys does not reach further out than one or two miles. Its edge begins with 15 and 18 fathoms of water, on a rocky bottom, and the depth diminishes rapidly to the very reef itself.

JACK TAYLOR'S REEF.—This dangerous reef, on which there is less than 2 fathoms water, lies South, 9 miles distant from Largo Key, between which and the shoal there is deep water; it is placed on the charts on the authority of Lt. Holland, H.M.S. Pickle.

Rosario Key, the West end of which bears North, true, from the channel to which it gives name, forms a channel of 3 and 4 fathoms of water, with another key to the Westward of it, named Caniles; but its outlet on to the interior bank, to the Westward of the Passage Keys, has not more than 10 feet of water. The opening or channel through the reef is a third of a mile in width, with a depth of 3 fathoms in the middle. It is steep at the sides, and at half a mile from its North part there is a rock, which shows above water. Vessels smuggling into Cuba generally enter and sail out by this passage.

From the Rosario Channel the reef trends S.W. 4 W., 10 miles; then W.N.W. ¾ W., 19 miles, to join the East point of the Isle of Pines. In this space are included the keys named Abalo, the Aguardientes, Campos, Matias, and many others which have no names. The outer edge of the bank is parallel to the reef, and generally extends out about 2 miles, excepting opposite of Abalo Key, where it runs out almost 3 miles, at about 7 miles to the South of the key. The least water on all this bank is 5 fathoms, on a rocky bottom, with some scattered spots of sand.

The ISLE OF PINES, when first seen, appears mountainous or hilly, of a moderate height, and the tops of its mountains very sharp. From its East point the South coast trends S.W. ¼ S., for 5½ miles, with sandy beach, as far as a point, which may be easily known, being of high soborneo rock, and having a detached rock (Farallon) very near it. From this point the coast continues, without any bank along it, for 7 miles, to another small point, which, with the former point, are the boundaries of the piece of coast denominated Playa Larga (or Long Beach.)

From the Western point of Playa Larga the coast continues W. and W. 5° N., true, for 8 leagues, to Cocodrillo, (or Crocodile Point,) which is the S.W. point of the island; and from the latter to the cove of the same name, is 3½ miles N.W. by W. In this cove fishing-vessels sometimes take shelter. The coast continues N.W. for 5½ miles, to Point Pedernales. All the ground between this and the West of Playa Larga is low and rocky, with shores of soborneo rock, and may be coasted along at less than half a mile. From Pedernales Point the coast bends (forming a bay) N.W. by N. 2½ miles, to Key Frances, which is the Westernmost point of the island. Near the point is found the anchorage and watering-place of Puerto Frances. This small roadstead, the bank of which extends about half a mile, with a depth of 5 fathoms, sand, (and the shore is also a sandy beach,) is much frequented by vessels coming for timber, and affords shelter from winds of the N.E. and S.W. quarters.

s or keys called the Jardines, Towards the N.E., on this of the bank thence extends t of Biscayno, whence it ex- the North end of the latter e bank extends in the same with a depth of 13 fathoms e proximity of the key, where

Key Frances is separated from the coast by a small channel, and forms the West point of the deep Bay of Siguanca. From that point the coast trends to the S.E., for 5 leagues, all watery or swampy, and broken into keys; thence it turns to the N.E., up to the Lagoon of Siguanca, which lies at the foot of the hills of the same name, and has from 4 to 6 fathoms of water, but its entrance has not more than 9 feet; from it branches off a strip of water, which, in nearly an E. and W. direction, divides the island into two parts. At the foot of the hills of Siguanca there are two filters of excellent water, which, at a short distance from the beach, rise out of the land.

From the Lagoon of Siguanca, the coast trends N.W. by W. $\frac{1}{2}$ W., for 10 miles, to a small point which forms, to the West, the mouth of the Rio de los Indios, (Indian River,) whence the coast continues N.W. $7\frac{1}{2}$ miles, to Buenavista Point, which is the Northernmost point of the Bay of Siguanca, and is $10\frac{1}{2}$ miles N.N.E. from Key Frances. Siguanca Bay extends $17\frac{1}{2}$ miles N.W. and S.E., and has from $2\frac{1}{2}$ to $4\frac{1}{2}$ fathoms water, grassy bottom; but the passage between Key Frances and the Southernmost of the Indian Keys has not more than $3\frac{1}{2}$ fathoms, sandy and grassy bottom.

The Indian Keys, separated by small channels, extend themselves to the N.W. by W., 8 miles, from the Southernmost of them. The Southern extremity lies N. $\frac{1}{2}$ W. from the point of Key Frances, $9\frac{1}{2}$ miles distant, and $4\frac{1}{2}$ miles W. $\frac{1}{2}$ S. from Buenavista Point; in the channel between them and the latter, there are from 4 to 5 fathoms water, clay and grassy bottom.

From the Point of Buenavista the coast inclines to the Eastward as far as the Cove of Barcos and the point of that name, which terminates it to the North, and lies 4 leagues N.E. by E. from the former. From the last point the coast trends N.N.E. $\frac{1}{2}$ E., to a short distance, and afterwards E.N.E., true, to the Northernmost part of the island, which lies $3\frac{1}{2}$ miles distant from Barcos Point. From the Northernmost point the coast continues E. $\frac{1}{2}$ N., $5\frac{1}{2}$ miles, to a small point which lies to the N.E. of, and close to, Nuevas River; thence it follows E. by S., true, about 5 miles, to the high hill, called Ojos del Agua. This hill or mountain is one of the highest in the island, scarped or precipitous on the North side; and close to are 3 fathoms water. Nearly in the middle, between this point and the former, is the mouth of the river of Casas, which rises at the foot of the hills of the same name; and which, together with Nuevas River, are the most frequented in the Isle of Pines by those carrying on traffic with Cuba.

In the same direction, from the mountain of Ojos de Agua, at the distance of 5 miles, is the hill of Vivigagua, also precipitous and of moderate height: from this hill the coast runs S.E. by E., $4\frac{1}{2}$ miles, to Salinas Point, and thence continues S.E. by E., $7\frac{1}{2}$ miles, to another point, to the North of the River Guayabo, and between the two disembogues the River of Santa Fe, which has excellent water. From the first a spit runs out, which, separating about 2 miles from the coast, joins it again at the river.

From the last point the coast winds to the Southward as far as the Eastern mouth of the Cienega. This part is named San Juan; and in the space is comprehended Mulatas Point and the River Guayabo, which disembogue close to the North of it. From the Eastern mouth of the Cienega, (which divides the island in two,) the coast trends S.E. to Piedra Point, which lies N. by W., true, from the East point of the Isle of Pines, distant 2 miles.

From the Bay of Siguanca to Nuevas River, the shore is all watery and covered with mangroves; and from this river to that of Santa Fe, it is firm land, continuing generally so, though with some watery places, as far as the East head of the island.

From the Bay of Siguanca, as far as the River Guayabo, the coast may be run along at 2 miles distance, in 3 and $3\frac{1}{2}$ fathoms water, on a clay and grassy bottom; but a passage further to the Eastward is prevented by the shallow bank which surrounds the Jardine Keys, and is here connected with the Isle of Pines.

Indian Keys,
&c.

INDIAN KEYS, &c.—From Key Frances the edge of the deep water follows nearly N.W., 11 $\frac{1}{2}$ miles, as far as the parallel of the Southernmost Indian Keys, and at 7 miles to the West of it; and continuing from thence to the Northward and N.W., so as to approximate the most Northerly of the Indian Keys, it then extends so as to pass about a league to the Southward of the Easternmost of the Keys of San Felipe, running parallel to those keys, as far as the middle of the chain; whence it nears them to within a mile, and continues along them at that distance, as far as the Westernmost key, on the parallel of which it runs off to join the main-land of Cuba, near Point Piedras. Generally, from Francis Key to the parallel of the Southernmost Indian Key, from 13 to 25 fathoms are found at the edge of the bank; from the last-named key to the meridian of the Easternmost of the San Felipe Keys, from 20 to 50 fathoms; to the Southward of these keys, as far as the Westernmost, 9 to 10 fathoms;

and forms the West trends to the S.E., for it turns to the N.E., all of the same name, not more than 9 feet; 1 W. direction, divides guanea there are two bench, rise out of the

of the deep water follows hermost Indian Keys, and o the Northward and N.W. ys, it then extends so as to of the Keys of San Felipe, he chain; whence it nears istance, as far as the West- ne main-land of Cuba, near el of the Southernmost In- f the bank; from the hese n Felipe Keys, from 30 to 30 urthermost, 9 to 10 fathoms;

and between it and the main-land of Cuba, about 26 fathoms, except in the proximity of the latter, where it shoalens to 7 or 8 fathoms. The bottom of the whole is rocky; and very soon after entering on the bank, the depth diminishes to 5, 4, and 3 fathoms, on sand. All these keys have sandy beaches towards the South.

This great bank, which we have now described from East to West, is studded with keys, which, with the coast, and among themselves, form the outer channels of Diego Perez, of the Rosari, of Siguanea, and of Cortez; which afford a passage to Batavano, by the inner narrows of Don Christoval, Las Gordas, Monte Rey, and of La Hacha, all with a depth of 11 feet, except Monte Rey or Redonda Key Passage, which has 2½ fathoms, on clay.

Remarks on Cape Antonio, the S.W. of Cuba, and the Isle of Pines.

At about 2 cables' length to the Northward of the pitch of the cape, you may, when the weather is moderate, land with your boats, picking out by the eye the best place among the rocks. At about 50 yards within the first trees or bushes, you will perceive a space of about 2 acres in extent, clear of wood. On the opposite side of that opening, where the wood again commences, and at about 10 or 15 yards into the wood, you will meet with very sharp coral rocks, among which are two wells, in cavities of the rocks, of about 7 feet deep. The water of the Northernmost well is excellent, that of the Southernmost not so good, but yet very palatable. There is a good rolling-way from them to the beach, but hoating large casks off is attended with difficulty, from sharp rocks which lie under water.

There are plenty of excellent gray land-crabs at Cape Antonio, which are quite safe to eat, there being no manehional trees hereabout; also plenty of pigeons and other birds, some of which are likewise excellent.

There is a fisherman's hut and a turtle crawl on the Southernmost part of the cape, at which you may, in the fishing-season, generally find a person to point out the wells; but what has been said will enable any person who looks carefully to find them, though you may be within 8 or 10 yards of them and not perceive them, without a good lookout. Men sent for water should always have their shoes on to protect their feet from the sharp rocks. There is abundance of sponge to be found at the cape, although it is by no means of first-rate quality. The fisherman's hut is one of the best mooks for Cape Antonio, when coming from the Eastward. Off the cape, about 2 miles out, the current often sets very strong to the S.E. When the current sets thus, it is advisable for handy working vessels to keep pretty close inshore, by doing which they will avoid the strength of the current; this, however, is to be understood as applying only to vessels coming from the Eastward.

JARDINES.—In all the Jarlines excellent fresh-water may be found by digging a few inches deep in the sand, at a very short distance from the sea, while in the Caycos de San Felipe, to the Westward of the Isle of Pines, no fresh water can be procured. On the Jardines are also plenty of thatch-trees. Some of the Spanish fishermen have remained six or seven days at a time on one of the Jardines, living upon the heart of the thatch-tree, and upon the water got by digging as before described.

Jardines.

The North-west Coast of Cuba, from Cape Antonio to Point Ycaeos and Mitanzas.

Having already given the description of Cape Antonio, &c., from the Derrotero and the notes of Captain Livingston, we shall here only notice that the cape has since been described as a low sandy point, with a flagstaff upon it, and several huts. From Cape Antonio the coast sweeps to the N.E., and thence to the E. and E.N.E., in a broken and variegated form, which can be best understood by reference to the chart. Without this coast, to the W., W.N.W., and N., is the extensive bank and reef called the Colorados, after described, which are naturally divided, and ought, therefore, to be distinguished by different names, that is to say, the Antonio Bank and Colorados.

Following the Colorados, to the East, are the banks and reefs of Isabella, which terminate at the entrance of the harbor called Bahia Honda, in longitude 83° 7'. A too near approach here is very dangerous, as the reefs are generally very steep, and the current from the gulf sets along them mostly from the N.W. to W. and S. W., whence it sweeps along the edge of the bank, near the shore, round Cape Antonio, and thence Eastward towards Cape Corcuetes, &c.

The Derrotero says, that "between the bank (that of San Antonio) and the reefs and keys of the Colorados there is an interior passage for vessels of 11 or 12 feet draught, but much experience is required for taking it; and all vessels are recommended to pass outside, keeping well away from the edge of the reef, which is very steep to;

and near it a vessel may be entangled by eddies proceeding from the general current of the strait."

When you are abreast of Cape Antonio, you will perceive the discolored water on the bank, and should take care not to approach too near, particularly in light winds, the edge being steep to, with generally a current setting over it.

High-water. It is high-water at Cape Antonio, on the full and change, about 9h. 33m., and the vertical rise is 18 inches. The flood sets to the Southward, (the flood, therefore, bends with a Southerly current; and thus it appears to confine Eastward, within the Isle of Pines, &c.) and the ebb Northward. The velocity is about three-quarters of a mile an hour.

From Cape Antonio, the bank, which appears of a whitish color, with only 10 or 12 feet water on it, trends North, by compass, about 8 miles, whence the edge turns gradually round to N.E. by N., and North-eastward, to lat. $22^{\circ} 8'$, with very uneven soundings, from 6 to 3 fathoms, rocks and sand. To the Eastward and Southward the soundings decrease from 6 fathoms very gradually to the shore, all fine sandy ground. The edge of the bank is clean all along, and steep to.

In proceeding from Cape Antonio to the Northward, there is a bank of 10 and 15 fathoms, and which is 12 miles N.N.W. $\frac{1}{2}$ W. from the cape. In the day-time you may safely take the passage between this shoal and the edge of the bank; but in the night, or in thick weather, it is better to make sure of passing outside of it.

If, when at Cape Antonio, the wind comes to the North, it will be best to maintain yourself to leeward of the cape, either on short boards, or by coming to anchor; because, with such a wind, in place of advancing on your passage, you would probably be caught in a gale, or storm.

The Colorado Reefs and Keys are very extensive. The S.W. extremity lies in about $22^{\circ} 07' N.$, and $81^{\circ} 47' W.$ The whole are, in general, steep to. Of the principal rocks or keys, the Westernmost, or Black Key, shows itself above water like the hull of a ship, and may be seen 4 miles off; the other two, Colorados, or Red Keys, are not seen unless the weather be quite calm; they have not above 2 feet of water on them; and to the Westward no ground is to be found at a short distance, or less than a mile. The channel between is a half a mile wide. Between the Black and Red Keys is a depth of 4 fathoms, but very foul ground. Capt. Street, in his account of these rocks, gives the following detail: "We took our departure from 1 or 5 leagues, abreast of Cape Antonio, and made our way good N.E. by N., 15 leagues, and then fell upon the Colorados in 3 feet water. They were about me dry in several places, without any distinction of swells and breakers: we saw flocks of pelicans sitting upon the reddish white sand. In this place we could see no dry land from the topmast head, though very clear weather, but we saw to the East of us three hummocks on Cuba; the innermost, or biggest, bearing E. by N., so near us, that we could see other hummocks within and without these three, and low land trending away from the innermost hummocks to the Southward, and likewise the hummocks almost join with the low land between them. All this we could see on deck, or but two or three rattlings up; but the three aforesaid hummocks we raised upon deck, when we were about 10 or 11 leagues off our aforesaid station of 5 leagues to the Westward of Cape Antonio."

The highlands of Cuba are in many places particularly marked. The principal lands thus remarkable, in a regular succession from West to East, have been enumerated as follows: the Highlands of Buenavista, the Coxcomb,* the Saddle Hill, Dolphin Hill, Tables of Mariel, Maiden's Paps, to the Southward of the Havana, Iron Hills, to the Eastward of the Havana, and the Pan, or Loaf, or Hill of Matanzas, to the S.W. of the port of that name. Those noticed in the Derretero, are the Hills of Rosario,† the Gap of Yoldal, (we presume, the notch in the Coxcomb,) the Pan of Cayanos, or Dolphin Hill, the Tables of Mariel, the Tetos de Managua, or Maiden's Paps, the Sierra de Jaruco, or Western part of the Iron Hills, and the Pan of Matanzas. These are all points from which a ship's situation may be ascertained in clear weather: but it frequently happens, in hazy weather, that they cannot be seen from sea at 5 leagues off.

Bahia Honda.
da. &c.

BAHIA HONDA, &c.—The harbor called Bahia Honda, or Deep Bay, is situated at the Eastern end of that range of islands and reefs distinguished by the name of Isabella. Its entrance, according to the Spanish officers, is in latitude 23° , longitude $83^{\circ} 15'$. When you are before that entrance, it bears nearly South, but you cannot get in till the sea-breeze comes on, at about ten in the morning.

Bahia Honda is a spacious and well-sheltered harbor, but the points which form the entrance, as well as its interior points, are bordered with a reef and edge of shallow

* Mr. Finlison says, "With the Coxcomb Mountain bearing S. $\frac{1}{2}$ E., you will be in longitude $84^{\circ} W.$ "

† Probably the highlands of Buenavista; for the charts of this port are yet inaccurate and contradictory.

water. The outer point, on the East or windward side, is named El Morillo, (Little Morro,) from its presenting a rising ground. From this a shoal extends two-thirds of a mile to the N.W., having, however, at its extremity, a depth of 5 fathoms. The outer point on the West, is Punta Pescadores, (Fisherman's Point,) from which a reef extends to the N.N.E. about one-third of a mile. The distance between the two points, which are nearly East and West, true, from each other, is about two-thirds of a mile; but the channel formed by the edges of the shoals is only a cable and a half in width.*

At a third of a mile within the exterior points are two others, Punta del Cayman, on the West, and Punta del Real, on the East; and between these the breadth of the channel does not exceed 2 cables' length. From Point Real the edge of the bank extends at the distance of two-thirds of a cable; but from Point Cayman not more than half a cable's length. At half a mile further in, the harbor opens, and you arrive off Punta del Carenero, which is on the Eastern side. At a third of a mile to the Southward of Point Carenero is an island, Key Larga, or Long Key, † the West point of which (Punta di Difuntos) lies a little more to the West than Point Carenero, and it may therefore be seen from the sea.

To enter this port it is requisite to keep at some distance from the coast, and outside the edges of the reefs, till you are N. $\frac{1}{2}$ W., from the mouth, when you may run for it. When near it, or at about the distance of a mile, you may perceive Point Difuntos; and placing your vessel most carefully to S. $\frac{1}{2}$ E., you may steer in that direction; as with that course, keeping Point Difuntos open, in the mid-channel, you will run in with sufficient water, 18 to 6 fathoms. When abreast of Point Carenero, you will see to the W.S.W. a long point on the West side of the harbor, named Punta de Mangles, or Mangrove Point. ‡ With this in sight, you may steer to the S.W., and when you have arrived on a line between it and Point Difuntos, you may anchor in 7 fathoms, clay; or, if more convenient, you may luff up to the South-eastward of Point Difuntos, and anchor in 6 fathoms, same ground. There is also anchorage to the Northward of Key Largo, between it and Punta del Carenero, in 6 or 7 fathoms, which may be found, after sailing in by the lead, along the reef on the Eastern side.

THE BAHIA BANK does not exist.

PUERTO DE CAVANAS.—This harbor lies rather more than 4 leagues to the Eastward of Bahia Honda. It has an extensive reef on each side of its entrance; yet it is a fine bay to sail into, having 5 and 6 fathoms at the entrance, deepening to 8 and to within, with room enough for several hundred sail of ships. The Derretero says, you may run along the coast between Bahia Honda and this place, at the distance of 2 miles. Puerto Cavanias is a good anchorage, sheltered from all winds, and fit for any class of vessels. It may be known by a round hill, which forms a gap or break, and upon the summit of which there is a grove of trees, and by another hill, named the Pan of Cavanias, (Dolphin Hill.) The latter descends gradually towards the East, until it ends in low level land, which continues for a long league, until it meets the table-land of Mariel. In addition to these marks you may see upon the coast two rows of hillocks, which resemble shepherds' huts, and from which the place has derived its name. These hillocks lie to the Eastward of Bahia Honda, and the Pan of Cavanias appears as if in the middle of them.

To enter this harbor, you ought to open the mouth well out, until you are on its meridian, and that of the East part of an island, (Isla Larga,) which is within the harbor, on its West. Steer S. $\frac{1}{2}$ E. until past the reef of Punta Larga, on the East side, when you may luff up and anchor in from 7 to 9 fathoms. Be cautious, in advancing, not to touch on the reefs on either side; that to windward extends out more than half a mile, and that to leeward, about 2 cables' length. At the extremity of Punta Larga, the reef extends out only two-thirds of a cable; but the channel here is only 2 cables in breadth. Another reef extends the same distance, Northward from the Eastern point of Larga Island.

PUERTO DEL MARIEL, or PORT MARIEL, which is $4\frac{1}{2}$ leagues to the Eastward of Port Cavanias, is large, well sheltered, and fit for any class of vessels. You may know when you are to the North of it by the Tables of Mariel, which are moderately high, and form very broad table-lands or hills. On approaching these you will perceive various white patches. The coast hence trends to the Eastward towards Havana, and is very low. In proceeding towards the latter, you may descry the Paps of Managua, commonly called the Maiden's Paps, which are two round hillocks, lying on the meridian of the port. To the West of Mariel the coast is likewise low, for a long league, until it rises and forms the Hill of Cavanias. Further to the West

*Bahia Bank.
Puerto de
Cavanias.*

*Puerto del
Mariel.*

* In a late description of Bahia Honda, by a British officer, it is said that it may be known by a remarkable tower and a small hut on the Eastern side of the entrance, and a large plantation on a round hill just on the back of it, and two small huts about $\frac{1}{2}$ mile to the Westward of the West point of the entrance. † Wood Island of the Old English Charts.

‡ Long Point of the old charts.

may be distinguished other highlands in the vicinity of Bahu Honda, and which seem to rise from, or to be surrounded by the water.

To enter Port Mariel, you have only to steer towards the Western extremity of the tables, and having recognized it, may run in, along the windward shore, at the distance of a cable's length. This will lead clear of the reef which borders the coast, and on which the sea breaks. Having the mouth of the harbor well open, steer towards a small rocky key, off the leeward point, and as soon as you are within two-thirds of a cable from it, steer S. 4 E., when the leeward point of the interior part of the entrance has the same bearing. Continue this course until you pass the round tower, which you will see on the windward side. You may then luff to port, so as to maintain yourself at a cable's length from the Eastern shore, and you may anchor upon it where you please, in 8 or 10 fathoms water. If more agreeable, you may run into the interior of the harbor, for which a reference to the plan of the harbor will be a sufficient guide. We only add, that as the narrowest part of the entrance is only 50 yards wide, it is requisite to be very cautious on entering with a large vessel.

It sometimes happens that strangers mistake the land to the Westward, and about Bahu Honda, for the table land of Mariel; but it is to be observed that the latter is not so high, and is more regular than any land near, or to the Westward of Bahu Honda.

The Mona Passage

THE MONA PASSAGE. The channel called the Mona Passage, between Porto Rico and Hayti, is 26 leagues in breadth, and generally clear and safe, with the exception of shoals in the vicinity of the coasts of the two islands. On the N. E. side, the land of Porto Rico is low, to the Westward of the harbor of Arreebo, until it reaches Punta de Pena Aguerenda, (or Point of the Hotted Rock,) where a kind of chilly high land begins, which trends S. W., rather more than a mile, to Point Brungen, the North westernmost point of Porto Rico. The coast again declines in height, and forms a convex bow to Punta de Penas Blancas, (Whitestone Point,) the North point of Aguadilla Bay.

The winds are generally light in this passage, and but little current. The Island of Zacheo, bearing W. by N. 4 N., 11 miles, from Aguadilla Bay, may be seen on a clear day from any part of it. It is high and very bold. Off the North and South ends there are a few rocks, but close to the shore it is covered with small brushwood, and the landing place is on the South side.

Zacheo or Zacheo

DESECHO, or ZACHEO. This little island, nearly covered with trees, stands like a beacon in the ocean, at the distance of 113 miles W. 4 N. from Point St. Francisco, or Porto Rico. It appears like a green mountain, 500 or 1000 yards broad at the base, and is so high as to be seen at 12 leagues off. The coast is generally clean, and there is no danger but what may be seen.

Report of the Master of the U. S. Ship *Macca-man*, for the month of April, 1845.—In the Mona Passage met with a current of 1 knot, setting nearly North; about lat. 28° N., long. 74° W., a current of 4 miles, running W. 234 instead, lat. 35° 13' N., long. 72° W., entered the Gulf Stream; left it at lat. 37° 32' N., long. 72° 08' W. Found the direction of this current to be about N. E. by N., 2 knots per hour: the highest temperature of which was 77°, the mean 76°, being 1° warmer than the water immediately bordering it.

Mona and Monto and

MONA AND MONTO.—These isles lie nearly in the middle of the Mona Passage towards the South.

MONA ISLAND.—This island is nearly level, and of moderate height. We could not see it further than 18 miles on a clear day. Its North east, South east, and South west sides are bounded by a reef a quarter of a mile off shore. At the distance of 13 miles, we ran along these sides, but saw no other danger than a reef which extends 13 miles off the South point.

The S. W. point (to the Northward of which is the anchorage) is sand, long and low with brushwood and small trees on it. There is a reef off this point, about a quarter of a mile in length, to the Westward.

There is anchorage here with the sandy point bearing S. by W., one mile and a half. Island of Monto, N. 4 E.; N. W. Point of Mona, (high, and bluff) N. E. 4 N.

We came to our anchorage from the Northward, passing Monto to the Westward within 6 miles, but had no soundings; neither could we see broken water, or any danger between it and Mona. This island is the resort of innumerable quantities of boobies; its sides are very white, and are inaccessible. Our anchorage was off the sandy bay formed by the S. W. point, (bearing as above mentioned,) sandy bottom; thus, the N. W. side, is also bounded by a reef, about 3 cables' length from shore; the passage through it is nearly in the centre of the bay, but it is narrow, and a vessel must pick her way through. The soundings are very regular; we found 1 fathom close to the reef; and there would be no danger in anchoring within a quarter of a mile of it, bearing in mind it is open to all Westerly and from South to Southeast winds.

HAYTI, OR SAINT DOMINGO.

The principal towns are, the city of Cape Haytien, formerly Cape Francois, in the N. W., the city of St. Domingo, in the S. E., Port au Prince, Leogane, and the Mole of St. Nicholas, in the West.

Hayti, or Saint Domingo, from Punta Espada to Petit Trou.

PUNTA ESPADA is too remarkable in its outlines to be mistaken. It lies about 10 miles from the East point of the island of Saona. Punta Enguon, the true East point of the island of Hayti, is a low point stretching sharply to the Eastward.

PUNTA CANA. The first anchoring place to the South of Cape Enguon, is Punta Boca Cana, in lat. $18^{\circ} 30' N.$, and long. $68^{\circ} 23' W.$ The shore is skirted by a reef, which obliges the vessels that have to take in cargo at this place to be according to size from one to one and a half sea miles from the shore. The reef affords passages for the boats to take off the cargo from the beach, which is sandy.

The tides are not always of equal strength, running sometimes 6 hours to the S. S. W., and 6 hours to the N. E.; at other periods the ebb tides are stronger than the flood tides, and if such a case occur, the North easterly tide runs even with greater velocity than the South westerly.

Vessels, excepting small sloops that draw no more than 6 feet) are obliged to come to an anchor outside of the reef. A vessel of from 200 to 400 tons, we did not see closer than a mile and a half from the land. There are two breaks in the reef, which are used for taking the wood from the shore on board. They have 6 and 6½ feet water; it is, however, requisite to use caution with the launch, as the passages are narrow, and much impeded inside by beds of coral rocks. The swell or ground sea is sometimes very severe along this coast, and a stiff Northerly wind renders all communication with the shore impossible. The months from May to October are the best qualified for loading here. The breeze is generally at that time to the South of East, and calms prevail more than at any other period.

PUNTAXAI, and GUAYACANES. These loading places are a few leagues further to the North of Punta Espada, and the remarks made with regard to Punta Cana apply equally to Puntaxai and Guayacanes. There are some ranchos or huts on the beach, inhabited by the laborers of the adjacent mahogany cuts. Puntaxai is about 3 sea miles South of Punta Cana.

BOCA YUMA, or HIGUEY. The anchorage is good but exposed to the breezes, near the windward point of the river, in 12 fathoms water. A bar, which affords only from 8½ to 9 feet water, prevents large vessels from entering the river. Within the bar there are 12 feet water. The anchorage is well protected, but small in extent. Fresh water may be procured by ascending the river to the Derumbadero. This can only be done in a small boat.

CABO FALSO. The anchorage between Cabo Falso and Punta Yuma is good, but exposed to the North easterly winds. It must likewise be observed, that the tides run with great velocity, chiefly near Punta Cuevita, where it races with a velocity of from 4 to 5 knots.

Punta Yuma lies in lat. $18^{\circ} 22' 16'' N.$, and long. $68^{\circ} 37' 36'' W.$ From this determination I have deduced the position of Cabo Falso as in lat. $18^{\circ} 20' 40'' N.$, and long. $68^{\circ} 35' 21'' W.$

The land of Cabo Falso rises in mural precipices of coralline limestone from 150 to 200 feet. The false cape is the projecting Southern point of this elevation, and presents, as seen from the North, the profile of a grotesque head.

GRANCHORA. This loading place ought never to be included in a charter party, as it is situated about 3 miles to the S. W. of Cabo Falso. The vessel cannot approach within several miles, and has to anchor to the lee of Catalinita, or to the lee of the reef that stretches from Granchora towards that islet. Such a heavy sea prevails usually along the shore, that weeks may elapse before the launch can take off a cargo.

PUNTA MARTEL. The same remarks refer to Punta Martel.

SAONA. This small island extends from its Eastern point about 16 miles N. 50° N. to its projecting Southern point, and is at its widest part from South to North about 5 miles across. Between it and the main lies the islet of Catalinita, bearing about 5 miles North easterly from Saona N. 50° W., distant 5½ miles. A large horse-shoe reef extends from Catalinita towards Saona, affording, however, between the North east of the latter, and the South eastern extent of the reef, a fine channel, with

6 fathoms water. When the reef has been cleared, the vessel ought to keep North-westerly, to avoid a shallow that runs from Saona, and anchor in 5 fathoms water, Catalinita bearing N. by E.

Small vessels may pass through the channel between Saona and the main coast of Saint Domingo; at its Eastern outlet, however, are mud-banks, with only 7 feet water over them.

Catalinita.

CATALINITA.—When keeping for the anchorage of Catalinita, you may make hold with the Northern shore of Saona until the Horse-shoe is cleared. The anchorage is well protected, and the bottom clear and sandy. The currents sweep with great force towards the N.W.

The North-eastern point of Saona is bold, consisting of high cliffs; but its South-eastern point is low; and there is a reef to the South-eastward which breaks near the shore, and extends nearly 3 miles, with only 4 and 5 fathoms over it. The reef keeps this depth until within a mile of the low South-eastern point of Saona. Large vessels coming from the East, ought not to approach the shore within 4 miles, until the extreme Southern point is cleared.

There is a good anchorage about 3 miles to the West of the South-eastern point, in front of a sandy beach, called Bahía Cabello; but at about 1½ to 2 miles to the South of the bay, where the sandy beach ends and the shore becomes rocky, lies a dangerous shoal.* The shallowest part has only 6 feet, with the water breaking upon it during a heavy sea. A quarter of a mile to the N.N.W. of it, is another dangerous shoal, with from 9 feet to 3 fathoms water. There is a good pass between it and the Eastern shoal. Vessels frequent occasionally Bahía Cabello for the sake of fire-wood and fresh water.

The opening or Western entrance to the channel of Catalinita, between Saona and the main coast, is called Boca del Catujano. As already observed, it has only 7 feet water at its shallowest part, being narrowed in by mud-banks and coral rocks.

It ought likewise to be noted, that a reef stretches from the Western point of Saona towards the main shore, which must be guarded against should a vessel on beating up keep the shore. The late Captain Lawrence, of H. M.'s surveying vessel Scorpion, determined the position of the sandy beach (Cascón) a little to the South of the two Western points, as in latitude $18^{\circ} 10' 18''$ N., and long. $68^{\circ} 36' 33''$ W., the latter relative to St. Thomas, taken as in long. $64^{\circ} 55' 40.5''$ W.

Boca de Quiabon.

Boca DE QUIABON.—This is an open roadstead with good anchoring ground. Large vessels anchor in from 8 to 9 fathoms water; the mark for the anchorage is, to keep the point Las Minas in one with Point Aguila, that forms the Eastern point of La Romana, and to bring the two cocoa-nut trees on the shore, in front of the largest house in the small village, to bear North. The bottom shallows very gradually, and at the distance of 3 cables' length from the shore, there is still a depth of 3 fathoms. The ground to the windward of the mark just given is rocky, and there is likewise said to be a shoal with only 13 feet water on it.

The mouth of the River Quiabon is impeded by a bar, which affords only from 2½ to 3 feet water; and that small depth is sometimes reduced to half a foot during dry weather, while freshes, on the other hand, deepen and widen the entrance. The mouth of the river is sometimes entirely blocked up by sand-banks. Formerly, vessels that drew 12 feet could go up the river as far as the Malena, at that period a well-cultivated estate, for the purpose of loading wood or produce. The river is now much impeded; boats nevertheless manage to ascend the Quiabon to the small village Gamaco, which may be called the port of the town of Higüey. It lies on the left bank, and following the course of the river, 5 miles from the mouth.

The village of Quiabon consists merely of a number of buhios or small huts, built of wood and covered with palm-leaves. It suffers from want of fresh water. At present the inhabitants either use brackish water, or they send up the river. The river rises seldom more than 22 inches or 2 feet, hence the sea does not extend far up the river. The weather point or Punta Barlovento is in lat. $18^{\circ} 24' 20''$ N., and long. $65^{\circ} 54' 23''$ W.

Bayahibe.

BAYAHIBE.—Two miles and a half E.S.E. from Punta Barlovento, near Quiabon lies Bayahibe, where recently vessels have commenced to load wood. It is considered a better anchorage than Quiabon. The sea is smoother, as Saona and the projecting point of Las Palmillas protect the anchorage. Vessels lie in from 6 to 7 fathoms, distant about one mile from the shore, sandy bottom.

* I have already drawn attention to the strong currents to the South of Porto Real and Saint Domingo. The master of the bark Abert considered himself, on the 14th of August, 1825, at 6h. p. m., about 35 miles to the S.S.E. of the East end of Saona. Shortly after 10 o'clock in the evening, the vessel struck on the above shoal.

GUARAGUAO and LAS PALMILLAS.—S.E. ½ E., nearly 8 miles from the Punta *Guaraguao*
Barlovento, near Quiabon, lies the anchoring-place of Guaraguao; and some miles *and Las*
further to the East, is Point Las Palmillas, from whence to the North-western shore *Palmillas.*
of Saona it is only 3 miles. The reefs that extend from the North-western point of
saona, have already been mentioned, and may prove dangerous to a vessel that has to
proceed from Las Palmillas to a port or anchorage to the East of it. Guaraguao and
Las Palmillas are seldom included in a charter-party.

LAS MINAS and BURGADO.—About half a mile to the West of the anchorage *Las Minas*
at Quiabon, is the landing-place of Las Minas; and somewhat further downwards, El *and Burgado*
Burgado. Las Minas is a sheltered place for small vessels; but those of larger bur-
den must lie in 20 fathoms, and masters frequently prefer to remain with their vessel
at the anchorage of Quiabon, and to send the launch for the wood to Las Minas and
Burgado.

CALETON.—This landing-place, to the East of Punta Aguila, offers scarcely a *Caletón.*
good anchorage. The tides sweep with great strength, and render it laborious, when
wind and tides are contrary, to reach the ship at anchor.

BOCA DE LA ROMANA.—The River Romana affords within a short distance *Boca de la*
from its mouth one of the best sheltered ports on the South coast of the island. The *Romana.*
entrance is narrow, (it being not quite a cable's length from point to point) and 31
fathoms from the lee point there is a small shoal, with only 3½ to 4 feet water on its
shallowest part.

On entering the river, which must be with a leading breeze, and having reduced
your soundings to 9 or 10 fathoms, keep the two *inner* points of the river (the first or
Western of which is then about 600 fathoms, the second or Eastern 800 fathoms dis-
tant, bearing N. 17½° W.) about 14 degree open of each other; the two inner points
being *in one* is a mark for the shoal. Continue that course until you are abreast of
the weather point, remembering that there is a reef a little to the East of that point.
Having entered the river, you will observe two rocks, from 6 to 10 feet above water,
on your starboard. Keep the lee bank a little closer than the weather bank, and pro-
ceed up the river until you near the inner lee-point. Keeping now the Northern rock
you noticed on entering the river on your starboard, looking over your stern in one
with the weather point at the mouth, come to anchor in 5 fathoms. You will then
notice two rocks a little South of the inner lee-point, around one of which you may
make fast,* and if you do not wish the vessel to swing to the tides, do the same round
a rock on the Eastern bank. Small vessels anchor round the inner lee-point in 10 or
11 feet water. A short distance to the North of this anchorage is a shallow with only
6 feet water.

I need scarcely observe, the river being so narrow, and not permitting any room for
working a ship, the vessel ought to take her departure only with a land breeze suffi-
ciently strong to give her headway. The two dangers against which she has to guard,
are the sunken rock off the lee point, and the weather reef. The River Romana has
broken through the hills of coralline limestone; they frequently approach the shore
in perpendicular walls. Small sailing-vessels may ascend for nearly 2 miles from the
mouth, but they require a pilot. Boats frequently get as high up as the Demibade-
nos, and even to the rapid, for fresh water. There are no difficulties for boats until
coming to the little island, where a shelf of rocks shallows the river to 2½ feet during
its mean stand, and to only one foot on approaching the rapid. The river falls here
over a shelf of rocks, so that the boat may almost lie under it and permit the water
to run into the casks.

The small village La Romana lies on the hills above the river on its right or West-
ern bank; the ascent is steep, and very inconvenient. The commandant has his
residence on the left bank, opposite the village. The position of this place was, ac-
cording to my observations, in lat. 18° 27' 32" N., and long. 68° 58' 37" W.;† from
which determination I have deduced the position of the left or weather point of the
mouth of the river La Romana, as in lat. 18° 25' 10" N., and long. 68° 58' 20" W.,
but as the distance from any point of observation to the mouth of the river has not
been trigonometrically ascertained, this determination may deviate somewhat from
the truth.

SANTA CATALINA.—The island of Santa Catalina, or merely Catalina, lies *Santa Ca-*
about 2 miles off the Southern coast, between the mouths of the rivers Cumayasa *talina.*
and La Romana. The channel between the main of the principal island and the islet
tends East and West, and affords a passage to the largest vessel by keeping the
main-land close on board. There is a good anchorage in 3½ fathoms on the North-

*I have given to these rocks the name of the Mooring Rocks.

†The Anzold gave for the height of the place above the river 180 feet.

western part of Catalina, near a bay where the vessel is protected by the two jutting points of the island. The North-western point has a reef, on which the water breaks to warn against the danger.

Boya de Cumaysa.

BOYA DE CUMAYSA.—I have not examined the mouth of this river, which it is well known affords us good anchorage as La Romana, with the preference that the entrance is not endangered by a shoal. Mr. Lundstrom, master of the Swedish bark *Jenny Lind*, has communicated to me the sketch of the entrance, with the following particulars:—"The anchorage for vessels that require more than 18 feet, is about $\frac{1}{2}$ cable's length from the entrance, on the river's Eastern bank. There is a rock above water, near which the vessel may anchor. The bank of the river forms on the left, or Eastern side, two small coves, and has much more the appearance of an inlet of the sea than the mouth of the river.* Large vessels may anchor in 4 fathoms, a little South of the small cove.

"On ascending the river, a large mud-flat extends from the first point on its left or Eastern bank. There is a channel close on the right bank, with only from 6 to 8 feet water. Small craft that draw no more than 6 feet pass over it, and may ascend to the rocks of San Pedro, about $\frac{1}{4}$ mile from the entrance. Higher up there are three islands, beyond which the river gets quite narrow, and is only passable for boats up to the Derumbadero of San Juan, $3\frac{1}{2}$ miles from the entrance."

Fresh water is somewhat higher up than San Juan, where the river forms a basin called Agua Dulce, but the boats cannot approach within a couple of hundred yards.

The River Soco.

THE RIVER SOCO, although one of the largest that flows from the mountains in the Eastern part Southward to the sea, is unfortunately impeded by a bar and narrowed in by sand-banks, covered with drift wood, so that only boats can enter to the fine basin that extends beyond the bar. Vessels of 300 tons have to anchor in 5 fathoms, distant about 3 miles from the shore, the mouth of the river bearing N. by E. or N.N.E.; smaller ones may lie in 3 or 4 fathoms. The anchorage is naturally open to the winds, and receives scarcely any protection from Point Morisco, which bears from the mouth of the river S. by E.

The embarcadero or loading-place is about a cable's length from the mouth, on the river's right or Western bank, and has deep water close in. According to my observations the house of Dona Felipe Morales is in lat. $18^{\circ} 27' 46''$ N., and long. $69^{\circ} 12' 41''$ W. The mouth of the river bears from here S. by E., distant about 2 cable's length.

The Port of Macoris.

THE PORT OF MACORIS.—The bay, with the exception of the channel which the river has pathed itself, is a mud-flat. An islet, with a reef extending North-eastward, protects the anchorage. The channel affords here only 18 feet water, and shoals to 15 and 14 feet as soon as the South passage point is abreast. Between this point and the North passage point, lies, about half a cable's length from the former, a dangerous shoal, with only from 6 to 7 feet water on it. The mark for this shoal is the North passage point on with the second cocoa-nut tree, near the commandant's house.

If the draught of your vessel permits it, and you have cleared the outer reef on entering the harbor, keep your course for Mr. Peck's house at the North-western light of the bay, until you have fairly opened the small sandy beach Playa Peter. The soundings give you then 12 feet. Steer for the Playa until you are abreast of the North passage point, keeping the shore on board, and go in $11\frac{1}{2}$ feet water. This anchorage can only be used by small vessels, as at a short distance to the North-west from the North passage point the water shoals to 7 $\frac{1}{2}$ and 6 feet. The rise of tide is scarcely 4 feet. Schooners and sloops requiring no more than 10 feet water, may anchor in front of the village, and ascend the river for some distance. The anchorage can only be left with a good land-breeze, and it ought to be noted that the current sets towards the shoal. The South passage point and Playa Muerto being in one, it is a mark on leaving the bay, that you are free of the Edward's Shoal, and you may then take a South-eastern course until the reef of the Isleta is astern.

There are two small villages on the shores of the bay. The larger lies on the left or Eastern shore, and bears in common parlance the name of Mosquito y Sol. This village belongs to the district of Seybo, and surpasses in the number of houses and inhabitants La Punta, the village on the projecting right or Western point of the bay, which belongs to the jurisdiction of Los Llanos. The situation of the latter is much healthier, and the prospect more open, but even small sloops cannot come close to it in consequence of the mud-flat. My observations give me for the projecting point of La Punta, lat. $18^{\circ} 27' 0''$ N., long. $69^{\circ} 19' 17''$ W.; according to which Punta Morisco would be in lat. $18^{\circ} 25' 50''$ N., and long. $69^{\circ} 19' 25''$ W. There is no fresh water in either village that can be recommended, except it be procured by ascending the river for about 2 miles.

* This supposition is perfectly correct, from what I have seen of Cumaysa at a distance of 2 miles from its mouth.

GUAYACANES.—About 8 or 9 miles to the West of Mucoris is the anchorage of *Guayacanes*; it is an open roadstead, with a reef inside of it. The anchorage is from 1 mile to 1½ mile off the land, in 8 to 9 fathoms, entirely exposed, but the bottom is sandy and holds well. The boats, in order to take off the cargo, have to pass the reef. There are a few inhabitants settled at the beach.

JUAN D'OLIO is equally exposed as the preceding, and the anchorage is about the same distance from the land. There are likewise some houses on the shore.

MAGDALENA forms the Easternmost, and Cauceado the Westernmost point of the Bay of Andres. It is an open and bad anchorage, and vessels prefer to lie in *Agua del Rey*, 4 miles further inside the bay, sending their boats to Magdalena for the wood they have to take off there.

AGUA DEL REY, on the Eastern shore of the Bay of Andres, affords the best anchorage within that expanse of water. Vessels of 300 tons may lie in 5 fathoms, being protected against the East and South-east wind by Magdalena Point. The beach is good for loading; it must, however, be noted that the swell sets in with great force, in consequence of the bay being so large and open to the sea.

PLAYA DE ANDRES.—The anchorage is from 2 to 3 miles from the land: there is a large reef, with breakers inside, which affords a passage 3 feet in depth. The Playa de Andres is famed for the prodigious and almost incredible number of pigeons that between the months of May and October come to roost there; their numbers are so large that they may be knocked down with sticks.

PUNTA CAUCEDO.—There is a Derumbadero near Punta Cauceado, only approachable for boats; large vessels must lie off and on to take in cargo from here.

LA CALETA, to the North-west of Punta Cauceado, although small is a very good port, where the vessel at anchor is protected against South-easterly winds. There are no dangers, and the vessel may select her anchorage from 3 to 7 fathoms. The expanse of the bay is small, and affords only place to a few ships; the landing is good.

ST. DOMINGO LIGHT is on the West side of the entrance S. 14° W., 617 yards distant from the signal-tower of the Fort. It is a fixed light, 113 feet above the sea, lat. 18° 28' 05" N., long. 69° 52' 30" W.

In running for this light from the Eastward, after doubling Punta Cauceado, give Punta Toreillo a berth, as there is a reef running from it to the S. W., on which, when there is any sea, it breaks.

The port is formed by the River Ozamo, where it enters the sea. There is a bar at its mouth with only 12 feet water. After passing the same, there are from 16 to 19 feet water for more than 3 miles up the river. Large vessels are therefore prevented from entering this port, otherwise so commodious and secure; for a vessel can lie so close to the shore, that she discharges her cargo by means of planks.

The bar extends from East to West; it is larger on the left than on the right bank, and ends in a narrow strip close to the rocky point, on the right or Western bank, somewhat South of the signal-tower.

The tide rises seldom to more than 20 inches, and the current sweeps with great strength through the month. It prevents the vessel from obeying the helm when not favored by a fair land-breeze, and has in several instances caused the ship to touch. The same danger threatens vessels on entering the river. It should not be attempted, under any circumstances, to enter the port without a pilot on board, and a good breeze to fill the sails.

Large vessels anchor in the roads, in from 8 to 12 fathoms water, distant about a mile from the shore. They are here exposed to the South wind, and the heavy swell of the sea. The anchorage consists of good holding ground; but should a misfortune befall the vessel, she would be sure to be smashed to pieces against the steep rocks that form the shore at this part of the coast. If the weather has a threatening appearance, chiefly during the hurricane months, all preparations should be made to be able to slip and stand out to sea.

The bank of anchoring-ground off St. Domingo is very steep, and for the first few fathoms irregular, 10, 15, 10, 8. After that, the soundings decrease gradually towards the shore. In coming in, give the East point a berth of two cables' length, to avoid a rocky reef with 2½ fathoms on it, which stretches off to that distance. This danger will show itself by the breakers when there is any swell.

If bound inside, keep a square white house, on the East bank of the river, twice its breadth open of the West point, on which stands the signal-tower. Keep this mark full you are within 2 cables' length of the West point; you will then discern a low sandy spit,* running off from the Eastern side; steer directly for it and pass it close; there is no danger, as there are 16 feet at a distance of 10 feet from it; but on the

* This spit has greatly changed in appearance since the severe gale in August, 1851, when it was nearly swept away. There is still the depth of water above expressed.

other side is a sunken rock with only 2 feet on it. With the marks given above, you will carry 13 feet over the bar, and after passing the sandy spit you will have from 16 to 19 feet 3 miles up the river.

If intending to anchor outside, do not shut in the houses on the East side of the river at all, but anchor with them rather open; the last point bearing N. E. by E., in 8 fathoms, sand and mud. With the houses open, the bank extends off rather more than one nautic mile from the shore, narrowing considerably to the Westward. The bottom also becomes rocky and uneven, when the houses on the Eastern bank become shut in by the West point. The best anchorage is decidedly when they are well open.

The Port Regulations are as follows:—

Art. 1. Every master of a vessel entering from abroad shall remit to the pilot who comes on board all the letters and newspapers intended for this port, excepting the consignee's letters. It remains at the option of the master to take the pilot or not, in order to anchor his vessel in the roadstead, or to bring her into port.

Art. 2. When the health officer visits the vessel, the master will deliver the requisite bill of health, and will muster the whole of his crew and passengers.

Art. 3. After the vessel has anchored, the officers of the custom-house will come on board, to whom the master shall give up the register of the vessel and the manifest of his whole cargo; he shall afford them every facility to affix the seals, and shall allow one of their number to remain on board until the vessel has finished discharging.

Art. 4. The pilot will bring the vessel, whether with cargo or in ballast, to anchor at the proper place for its discharge, and in no instance can the vessel change place without the previous authorization of the commandant of the port.

Art. 5. The throwing overboard of ballast is prohibited to all masters of vessels, as well in the port as in the roadstead; they have to address themselves to the captain of the port in case of such a necessity, who will assign to them the proper place for its discharge.

Art. 6. In order to obtain a coast-pilot, and the necessary laborers for a vessel which is to load on the coast, the master, accompanied by his consignee, will address himself to the commandant of the port to assign them to him, and to see that all contracts and advances may be made to them in his presence.

Art. 7. When the commandant of the port passes his visit, previous to the departure of the vessel, the master shall produce the passports of such passengers as might be on board, and he shall likewise deliver the port-pass to the guard-ship before he makes sail.

To the West of the city is

Boca de Zaina.

BOCA DE ZAÏNA.—The anchorage is entirely exposed and foul; vessels are obliged to lie off at a great distance, and the swell being at all times very heavy, easterly and Northerly winds are the only period that loads can be taken off. It ought not to be included in charter-parties.

Boca Nigua.

BOCA NIGUA.—Although vessels take frequently a part of their cargo in this place, it is considered to be one of the most difficult loading-places on the South coast of Saint Domingo. The anchorage seems to be merely on a bank, with a difference in soundings of 12 to 13 fathoms by the vessel swinging to the tides or currents. A strong breeze and current forces the sea with such violence into the anchorage, that it rises from 12 to 15 feet. It is only safe to load here when the wind is from the North. The banks on shore are so steep, that such wood as lignumvite can be taken at once in the boat from the rocks above. A gale from any other point than North would inevitably cause the loss of a vessel tying at anchor at Boca Nigua. The miasma of the river is considered very unhealthy; indeed it is only with reluctance resorted to as a loading-place. There is a small village a short distance from the mouth, and fresh water may be procured a quarter of a mile up the river; the water is not considered healthy.

Boca de Najallo.

BOCA DE NAJALLO.—The bight which the river forms at its mouth is somewhat more than a mile in extent, but the anchorage is as objectionable as that of Boca Nigua, with the difference that the landing is better than the former. The vessel lies about three-quarters of a mile from the land.

Palenque.

PALENQUE.—This is the next port to the West. It would be a most desirable anchorage did the port afford more space; the vessels lie in 4 fathoms water, good bottom, and well sheltered; the water is so deep, that close to the beach there are 6 fathoms. A South wind would prevent a vessel from leaving the port, but she comes out with the usual trade-winds. A reef which stretches from the windward point S. and N.W., ought to be guarded against.

Boca de Nizao.

BOCA DE NIZAO.—To the West of Punto Nizao is an open roadstead where vessels frequently take wood on board. The ground shallows gradually, and the vessels of from 250 to 300 tons have to lie in from 7 to 9 fathoms water, at a distance

the marks given above, you will have from 16

soles on the East side of the point bearing N.E. by E., which extends off rather more westerly to the Westward. The point on the Eastern bank becomes evidently when they are well

Exposed and foul: vessels on at all times very heavy, can be taken off. It ought not

a part of their cargo in at the ding-places on the South coast, ly on a bank, with a difference to the tides or currents, to fence into the anchorage, the ro when the wind is from the good as lignumvitæ can be taken on any other point than North, chor at Boca Nigua. The anchored it is only with reluctance a short distance from the a mile up the river; the water

er forms at its mouth is some is objectionable as that of Boca than the former. The vessel

It would be a most desirable lie in 4 fathoms water, gradually close to the beach there are leaving the port, but the craft es from the windward point.

so is an open roadstead where of shallows gradually, and to 9 fathoms water, at a distance

of 14 to 2 miles from the mouth of the river. Smaller vessels may anchor in 4 fathoms, but it must be recollected that the sea breaks often a great distance from the shore.

This anchorage is no more dangerous than other open roadsteads along the coast; indeed more vessels load here than at Bani and the other Southern anchoring places.

The tide runs frequently with a strength of from 4 to 5 knots, and renders the loading of the vessels somewhat tedious. It is next to an impossibility for a boat to enter the river; the current sweeps out with a very great force. On proceeding, therefore, from on board to the place where the rafts of wood are to be made up, it is better to land the people at Palenque, and to let them walk over land to Nizao. With regard to these local arrangements, however, and the manner in which the raft of wood is to be got on board, it is best to trust to the orders of the pilot, and to the laborers acquainted with the management.

The water of the river is good, and may be procured fresh a quarter of a mile from the mouth. There is at a short distance from the shore a small village.

PUERTO VIEJO.—On entering from leeward keep close to a remarkable white cliff, which forms the South western point of the great entrance, and where there are 9, 8, 7, 5 fathoms water, until you have passed that point. The passage to the inner port or Boca Corillo is between this point and a reef which lies nearly West from the great entrance. Keep the mid channel between the Northern cliffy shore and the South side of this reef. The water shallows gradually to 3 fathoms. Let go your anchor at 4 fathoms, the reef bearing North.

The Eastern anchorage is exposed to the South east wind. You may anchor in 3 fathoms. South of the loading-place, the high mountain Martin Garcia bearing South west.

PUNTA CATALINA is not much frequented as a loading place. There is no anchorage on the East part, but on the Western small vessels may anchor in 3 fathoms. To the South of Punta Catalina, distant one mile, is a shoal with only 12 feet water over it, which ought to be guarded against when beating up the coast. Punta Palenque forms the Eastern point, and Punta Catalina the Western, of a large bight which contains Boca Nizao and Puerto Viejo as loading places in that extent of the coast.

SAVANA.—About 3 or 4 miles West of Punta Catalina is Savana, where large vessels may anchor with safety in from 5 to 6 fathoms; the anchorage is good, but to the windy and only protected by Punta Catalina, which bears about E. S. E.

PAVA is an open roadstead, shallowing very gradually, so that a vessel of 200 to 300 tons has to lie at a distance of from 24 to 3 miles. It is much frequented as a loading-place.

AQUA DE LA ESTANCIA.—It is the anchoring place of the village Bani, and is, like the former, an open roadstead. The vessels have to lie at anchor at the same distance, but it is good holding ground, consisting of mud and weeds, with sand.

ESTANCIA COLORADA.—Somewhat further to the Westward is La Estancia, to which the same remarks refer that have been made with regard to the previous place.

LA SALINA.—The soundings are from 15 to 18 fathoms, at a distance of a cable's length from the shore. Two mountain cabbage-trees kept in a line with a large sea-side grape-tree, bearing then between E. and E. by N., are a mark for a good anchorage. Small vessels anchor in 5 fathoms, with a hawser ashore, for fear the anchors might not hold. The depth increases so suddenly, that with 5 fathoms forward, the vessel will probably have from 18 to 20 fathoms over the stern.

LA CALDERA.—This is one of the finest ports on the South coast; a vessel may here anchor in from 15 to 3 fathoms water, as it best may suit her.

PLAYA VIEJA.—Outside of La Caldera, about N. by E. from La Salina, is Playa Vieja, affording a good anchorage under the hills of Ocoa. The bottom is so clear that it may be seen in 6 fathoms water. Three or four hedges of mango-trees, that are visible at a great distance, are a good mark for this anchorage.

OCOA.—This beautiful bay affords an excellent and well-protected port near the mouth of the river of that name. You may anchor close in on either side of the river, but the Northern is preferable. A whole fleet may anchor here in safety.

CARACOLLES.—At the bight of the bay of Ocoa, you have to anchor at a distance of 14 mile from the shore, in 5 or 6 fathoms of water. The landing is good, but the large bay is sometimes subjected to a heavy swell when the breeze is Southerly.

AZUA, OR TORTIGUERO.—The sea sets into this anchorage with great force. When the breeze rises, the vessels labor much, and the boats seldom can go off with wood to the ship after 11 o'clock in the morning. There is no room for working a vessel in the bay. On the Western point is a reef, and near the East point is broken

Puerto Viejo de Azua.
The Bay of Neyba, or Juliana.

ground. Vessels leave the bay with the land breeze. Tortuguero is the port of Azua, and is considered to be a tolerable good anchoring-place.

PUERTO VIEJO DE AZUA.—This is an excellent port for small vessels, where they lie quite land-locked. It is only 12 to 15 feet water at the entrance, but for such vessels as require no greater depth, it is one of the safest ports in the republic.

THE BAY OF NEYBA, or JULIANA, extends from Punta Martin Garcia to Punta Truxillo, 9½ miles, and has a depth of 8½ miles; the largest vessels of war may anchor in the bay, along its Eastern coast. It contains the anchorages of Rancho del Cura and Bahía Alejandro on the Eastern, and the port of Baraona on the Western coast. The river Neyba, or Yaque, enters the bay S. 84½° W., 10 miles from Punta Martin Garcia. The ground shallows to 11 feet, and has a bar with less water, which prevents small sailing-vessels entering the river. Its course has been very changeable, and formerly it entered the bay further Southward, in several arms.

Rancho del Cura.

RANCHO DEL CURA.—At the distance of one mile from Punta Martin Garcia, in the fine bay of Neyba, and a little to the North of some red cliffs, is a very good anchorage under the above name. You lie 2 cables' length from the shore in 5 fathoms, protected by Punta Martin Garcia from the East winds. To the North of the anchorage are some white cliffs, almost equidistant from the anchorage and the red cliffs.

Bahia Alejandro.
Baraona, or Barahona.

BAHIA ALEJANDRO.—The anchorage is very exposed, and there is a reef inside. It is not a desirable place for loading vessels.

BARAONA, or BARAHONA.—This harbor offers a very good anchorage, but the vessels ought to await a pilot to lead them through the passage between the reefs. On entering the bay of Neyba, and being abreast of the red cliffs, hold a W.S.W. course for the entrance; the water is bold close in to the reef. At four cables length from the reef you have no bottom with 120 fathoms, and it suddenly shallows to 5 fathoms and 10 feet. When you are within 2 miles of the reef, you will discern the village very plainly, and you will note above it two ridges of hills, one overlapping the other; each ridge has a saddle or hummock, in a direction of nearly W.S.W. with the village; keep these two saddles in one. Coming close to the entrance, your soundings being probably 10 fathoms, you will note on the square of the little village a house, larger and more prominent than the others, with a palm-tree before it, standing likewise in the square. Bring that palm-tree on a line with the Northern gable end of the house, or with the gate that leads to the yard, bearing then S. 69° W. and let go your anchor. After having cleared the weather reef in 5 or 4 fathoms, there is a good anchorage in 7 to 8 fathoms, the little islet bearing West; and sometimes vessels anchor much closer inshore, in 22 feet, but some sunken rocks, called the fishing-rocks, may prove of danger in getting the vessel under way. The reefs possess several passages for schooners and smaller vessels. The village of Baraona is in lat. 18° 12' 2" N., and long. 71° 5' 15" W.

Baburuco.

BABURUCO.—This place ought to be avoided, although vessels have loaded there at various times. Baburuco is not a proper shipping-place for large vessels, and masters should be careful in accepting any charter in which this place is included. There is scarcely sufficient room for a vessel to lie at anchor, and with the wind blowing on shore, there is not sufficient opening to tack out. Moreover a very heavy sea sea into the anchorage. The vessels are anchored in from 12 to 17 fathoms, at a distance of one mile and a half from the shore, with a reef towards the South of the anchorage, and one to the north. The shore is uninhabited.

Mala Pasa.

MALA PASA.—About 3 miles S.W. of Baburuco is Mala Pasa. It may be easily recognized by its steep white cliffs. It is less qualified for an anchorage than Baburuco; the same refers to Paradise and Petite Banane.

Riocito.

RIOCITO is about 5 miles from Mala Pasa. The water is so deep that the vessel is obliged to anchor close in, which renders her situation dangerous; the anchorage is moreover exposed to every wind, and all the sweepings of the sea. Vessels have loaded here to my knowledge, during fair weather, but it cannot be recommended as a loading-place. After Riocito follows

P. de Carlos.
Petit Trou,
or Ajugero Chico.

PUNTA DE CARLOS, and PETIT TROU, or AJUGERO CHICO.—A long reef, about 3 miles in extent, encompasses this anchorage. This barrier has two passages; the windward passage is about 2 cables' length in width, with several sunken rocks, one of which has only 10½ feet water, but there is deeper water on both sides; this entrance is called the reef passage. The lower entrance, or sea passage, has 18 to 20 feet, but the room within, having once cleared the passage, is so narrow and impeded by sunken rocks, that no vessel could beat up to the proper anchorage; it is therefore only of use for vessels that stand out to sea. A vessel bound for Petit Trou, ought not to draw more than 10 feet and a half. In approaching the reef you should shorten sail, to prevent the vessel going too quick through the water. The time for passing through the passage ought to be between 11 o'clock in the morning and 1 o'clock in the afternoon, when

guero is the port of Azua,

t for small vessels, where the entrance, but for such ports in the republic.

Punta Martin Garcia to largest vessels of war may anchorages of Rancho del Barroca on the Western W., 10 miles from Punta bar with less water, which course has been very change- several arms.

from Punta Martin Garcia, e red cliffs, is a very good gth from the shore in 5 fath- inds. To the North of the anchorage and the red

sed, and there is a reef in-

ery good anchorage, but the passage between the reefs e red cliffs, hold a W.S.W. the reef. At four cables' us, and it suddenly shallows of the reef, you will discern ridges of hills, one overtop- a direction of nearly W.S. oming close to the entrance, e on the square of the little ers, with a palm-tree before e on a line with the Northern yard, bearing then S. 60. W., ther reef in 5 or 4 fathoms, et bearing West; and some- t some sunken rocks, called vessel under way. The reef sels. The village of Barroca

gh vessels have loaded their ce for large vessels, and this place is included. There nd with the wind blowing on eover a very heavy sea sets to 17 fathoms, at a distance s the South of the anchorage.

lala Pasa. It may be easily or an anchorage than Bab-

er is so deep that the vessel n dangerous; the anchorage ts of the sea. Vessels have t cannot be recommended as

reef, about 3 miles in extent- ages; the windward passage ocks, one of which has only is entrance is called the reef 20 feet, but the room within, led by sunken rocks, that no efore only of use for vessels ight not to draw more than shorten sail, to prevent the passing through the passage lock in the afternoon, when

the sun is high, and shows the rocks under the water more clearly. The pilot stands in the bowsprit, and gives directions how to steer the vessel through the rocks (some of which are only covered with 6 and 7 feet water) to the anchorage. It is therefore requisite to have a clever and quick person at the helm.

The ground for anchoring is not very good. There is scarcely a berth to be found where the vessel with 70 fathoms chain can swing round, without striking a rock; it is therefore advisable to moor the craft. The bottom shallows gradually, and at a distance of 1½ mile from the land there are only 3 fathoms water. The breeze blows fresh from the North-east, and the weather is uncertain and squally. The North-easterly breeze sets in about 2 o'clock in the morning, and continues to blow from that quarter un'til half-past 7 or 8 p. m., when it veers more to the Eastward, and blows from E. by S. until midnight. During increasing moon the current sets regularly for 12 hours with the ebb to the East, with a velocity from three-quarters to one knot per hour. The flood rises at Petit Trou above 3 feet. During a decreasing moon the flood sets uninterruptedly towards the West, and there is no ebb at all. It runs then with a velocity of from one to one and a quarter knot.

In spite of these drawbacks, vessels load frequently at Petit Trou, and a person acquainted with the dangers he has to meet, will take accordingly the requisite precautions, if that place should be included in his charter party. A careful master will lie to when he has the slightest mistrust in his pilot, and sound the passage, placing moreover a buoy on the 10 fathoms rock, which presents the greatest danger to a vessel on entering. I have already observed that the sea passage affords more water and less danger. It is nevertheless necessary to be cautious when standing out to sea, as there are sunken rocks in the course before the reef is cleared.

Petit Trou is the most Western loading-place that, on the South coast of the republic, is at present resorted to.

From Petit Trou to Cape Tiburon.

BEATA POINT, or LITTLE CAPE MONGON, is the Southernmost point of *Beata Vela*. Hayti. Its bearing and distance from Punta de Salinas are about S.W. ½ W., 16 leagues. Of the coast between we have no particular description. Eight miles to the North-eastward of Beata Point is Cape Mongon, and between these points appears the high mountainous land of Baugo.

ISLE OF BEATA.—This island lies to the South of Beata Point; and is 1½ league *Isle of Beata* in length from N. to S., and about 2 miles broad from E. to W. It is low and cov- ered with bushes. There is a breaker off the N. by E. side of it, stretching towards Cape Mongon, at the extremity of which is a white shoal, that very much narrows the passage between Beata and the shore. In the passage are but 3 fathoms water. There is anchorage to the Westward of Beata, between it and the shore, in 7, 8, and 10 fathoms, sandy and weedy bottom, with the N.W. end bearing about N. by E., or N.N.E., one mile, and the S.W. end S. by W., 4 miles.

East of the isle the water is deep, and there is no ground at a short distance from it with 50 fathoms of line. There is, nevertheless, a shoal stretching from the S.W. point, to which a small berth should be given, as there are no more than 4 fathoms of water West, 3 cables' length from the point. When the latter bears E.S.E. you may haul up from the N.W. end. In the anchorage there is good fishing.

The Frayles, or Priars, a number of steep rocks above water, lie West 3 leagues from Beata. The sea breaks over part of them, and they are so bold to that vessels may sail within a quarter of a mile round; but it will be prudent not to approach within a mile.

Near all the isles off the main coast the bottom may generally be seen; but near the shore of Hayti the water is very deep. The coast hereabouts is a flat of white and hard rocks, about 40 feet high, in which appear large holes and breakings, with some prickly shrubs.

ALTAVELA, or the Little Mount, a high rocky islet, lies at the distance of 5 *Altavela* leagues South from Beata Point, in lat. 17° 28', and long. about 71° 38'. The islet is peaked, but its summit has a rotundity resembling the upper part of a bell. It is generally seen before any other land in the vicinity, particularly from the Southward, and appears like a dome emerging above a mist or fog. Being very bold, it may be approached with safety.

At the distance of 2½ leagues N.N.E. from Altavela lies the South end of Beata Island. Between is a good and very deep channel. There cannot, however, be any motive for preferring a passage between these islands to passing Southward of Altavela; and therefore vessels bound to the Westward from Ocoa Bay, may steer S.S.W. 22 leagues, and a West course will then lead well to the Southward of Altavela; a more Southerly course is, however, to be preferred, in order to avoid danger

should the wind become scant, with a Westerly or W. by N. current, which has often been found to prevail here with considerable strength.

*Point Agu-
jas.*

POINT AGUJAS, or the False Cape, bears from Beata Point W. N. W. $\frac{1}{2}$ W., 6 leagues, and from the Frayles N. W. by N., 3 leagues. Cape Lopez bears N., true, 5 miles from Point Agujas. The coast between forms a bay, affording good anchorage. From Cape Lopez, Cape Roxo bears N. by W., 2 $\frac{1}{2}$ leagues, and between is the Ensenada sin Fondo, or Bottomless Bay; from this bay the coast trends to the N. W., and at 5 leagues from Cape Roxo is the mouth of the Rio de Pedernales, or Pitre Cove, which constituted the old limit between Hispaniola and Hayti. At this place is a good anchorage, which it is easy to make, a bank here extending along shore, and there is no risk in nearing the coast.

From Cape Lopez, the promontory called Morne Rouge, or Red Hill, bears N. W., 12 leagues. A league and a half to the Eastward of Morne Rouge, is the village of Sale Tron, or Foul Hole, where there is a good anchorage for vessels drawing less than 16 feet: larger ships may anchor there, but they must lie further out, where the ground is not so good.

From Morne Rouge the coast trenches in a little to the Northward, then out again E. S. E. to the Anses à Pitres, or Pitre Cove. All the coast is clear, and may be approached with great safety, as noticed above.

There is good anchorage at the Anses à Pitres, and of very easy access. At 2 miles from the shore the water is very deep. All the coast hereabout appears white, being chalky. You may anchor either before the plain of Anses à Pitres, or Southward of a small cape before the mouth of a river, which is considerable enough to be easily distinguished. The water is smooth, and you will be well sheltered in 6 or 8 fathoms, good ground, or in 4 fathoms and better ground nearer shore.

From Morne Rouge the coast rounds to Cape Jaquemel, or Jacmel, which bears from the former W. S. W. $\frac{1}{2}$ W., 29 miles. From Cape Jaquemel Cape Marchand bears N. by E. $\frac{1}{2}$ E., distant rather less than 2 miles.

In approaching Morne Rouge from Cape Jaquemel, it may be known by its white hummocks. The coast in the space between forms several little creeks, where in small vessels may anchor; but in none of them will they be sheltered.

*Jaquemel, or
Jacmel.*

JAQUEMEL, or JACMEL.—Between Cape Jaquemel and Cape Marchand lies the bay of Jaquemel, in the upper part of which there is anchorage for shipping of every class. The town of Jaquemel stands at the head of the bay, to the East of the River Guachee, which has several mouths in the beach. In the middle of the bay no bottom is to be found at 70 and 80 fathoms; but the bank around the coast, which is about 3 cables in breadth, has from 20 to 3 fathoms, shoaling to the land. On this bank, upon the N. E. side of the bay, is a dangerous reef, nearly half a mile long, the outer edge of which is 3 cables' length from the shore. To the Westward of this reef, and opposite the town, is the anchorage, having from 5 and 7 to 3, and in one spot 2 $\frac{1}{2}$ fathoms. You may sail in with a remarkable white cliff, the last cliff on the Western side, bearing from W. $\frac{1}{2}$ N. to N. W. $\frac{1}{2}$ N., until the wharf near the middle of the town comes on with the Eastern side of an old battery, bearing N. by E. $\frac{1}{2}$ E.; and with this mark on, you luff up to the anchorage, which, at half a mile to the Southward of the town, has the depths above mentioned.

Jaquemel Harbor may be distinguished, at a distance, by the sudden cut off or drop of a hill, seen over another long hill at the upper part of the harbor. Running in towards that drop will lead directly to the entrance.

Bayenette.

BAYENETTE.—From Cape Jaquemel Cape Bayenette lies nearly W. $\frac{1}{2}$ S., distant 5 leagues. The latter may be known by the white hummocks and cliffs on its extremity. This cape forms the South side of a bay of the same name, which is open to the S. E. Its name, Bayenette, signifies clear bay, and is supposed to have been given from its great depth of water, and being entirely clear of shoals. This bay is unsheltered, but there is anchorage on the North side near the shore.

*Leighton
Rock.*

LEIGHTON ROCK, of 3 feet water, is in lat. 17° 45' 9" N., long. 73° 21' W. South 28° 06' E., 19 miles distant from South end of Isle Vache.

La Vache.

LA VACHE.—From Cape Bayenette to the East point of La Vache, the bearing and distance are W. S. W. $\frac{1}{2}$ W., 13 $\frac{1}{2}$ leagues. The isle is 3 leagues long and about one broad: it is hilly, and at the distance of 6 or 7 leagues, appears like an assemblage of small islands. The South side is bold, and along the North a reef extends to the distance of a cable's length. From off the East point is a white shoal, connected with the reef, extending from an islet to the N. W., called La Folle, or the Fool's Rock.

From the Fool's Rock to the N. W. end of La Vache, there is a range of islets and shoals, among which are some narrow passages. On the North side of La Vache is a bay, called the Baie de Feret, where there is good anchorage, but it is accessible only to those who are well acquainted. The Northernmost of the islets above mentioned, is Grosse Caye, called also Caye de l'Eau, or Water Key, which is readily

known by a great tuft of large trees. It is bold to, and at some distance from its North side there is good anchorage, in from 15 to 30 fathoms.

The Western end of La Vache forms the East side of the entrance of the great bay, called Bay of the Cayes; and from its S.W. Point, called Point Diamant, Point Abaco bears nearly W. by S., 5 miles. In mid-channel between, there is a depth of 25 fathoms, thence decreasing towards the island. From the S.W. point of the isle a white rocky spit extends to the South, having from 7 to 5 fathoms over it, at about 2 miles from shore.

Remarks on the Anchorages within La Vache.

"The N.W. point of La Vache is in latitude $18^{\circ} 6' N.$, longitude by chronometer, &c., $73^{\circ} 43' 15'' W.$ Variation $6^{\circ} 20' E.$ Ships coming from the Westward, and intending to anchor here, ought to round Abaco Point, at a good mile off, as a reef stretches to the S.E. to nearly that distance from it. Having rounded this reef, there is nothing in the way, and you may steer for the N.W. point of La Vache. At half way between it and Abaco Point there are soundings in 15 fathoms, and the bottom thence shoalens gradually to the island. The best anchorage here is with the N.W. part of the island bearing E.N.E., in 5 fathoms; you will then be about three-quarters of a mile from the shore, on a white sandy bottom. The soundings all over this part are so very regular, that you can hardly err in anchoring anywhere, so long as you keep the N.W. point of the island bearing to the Northward of East. From the N.W. point to the S.W. point of the island the soundings are not so regular, and strangers ought not to come nearer than in 7 fathoms, especially near the S.W. point, for a reef stretches from it to the Southward not less than 2 miles, having very foul ground with irregular soundings to upwards of a mile or more. Therefore, ships coming from the Eastward and intending to anchor, ought to keep Abaco Point bearing West until the West point of La Vache bears N. They may then haul in to the Northward and steer for the anchorage.

"About a mile to the Eastward of the town of Aux Cayes, which stands to the North, there are three small white cliffs close to the seaside; and the mark I have generally run in and out by, is the Eastermost cliff bearing North, and in a line with a small round hill on the highest land behind it; and anchoring with this mark nearly on the N.W. point of La Vache, bearing E.N.E. or N.E. by E.

"The whole of this large bay to the Westward of La Vache is clear, and the soundings very regular, while you keep the West end of the island bearing to the Northward of East, between La Vache and Aux Cayes, the bay is covered with large reefs, and several are above water."

THE CAYES, ST. LOUIS, &c.—Point Abaco is composed of two points or *The Cayes*, reefs, which stretch three-quarters of a mile to seaward; but you may pass without fear, at the distance of half a league, and will find no ground with a line of 40 fathoms. *St. Louis.* The town of the Cayes bears from Abaco Point nearly North, 4 leagues. In sailing towards this place and approaching Point Diamant, before noticed, you will not find the white ground for more than a quarter of a league from it; and the ground is good in 6 or 7 fathoms. With Point Diamant bearing East, there are soundings all across. There is good anchorage to the West of Diamant Point, and further to the Northward, opposite a sandy cove, in from 6 to 7 fathoms, mud and sand.

To go into Aux Cayes you range along the N.W. point of La Vache, in 6 fathoms water, and you steer nearly N. by E. to make, on your starboard hand the white hummocks of Cavillon. You will then leave on the port hand a large reef, surrounded with a white shoal, which takes up almost all the middle of the bay. When you have brought the town to bear N.W. $\frac{1}{2}$ W., you must haul up two points to windward of the town, standing towards the Company's Islet, where you may anchor, if you do not mean to go into the road; if you do, you shorten sail a mile from the shore, and wait for a pilot. The channel is two-thirds of a cable in breadth. Ships drawing more than 13 feet water cannot go in; those of 15 and 17 feet water always anchor at Chateaudin, half a league to the Westward, and which is separated by shoals from the port.

To anchor in the road of Chateaudin, (coming from the mooring of La Vache.) W. or W.N.W. off Diamant Point, in 8 or 11 fathoms, you must steer directly for Torbee, which is a small town very easily distinguished, in the cod of the bay; this tack will be about N.W. When you are within about 2 miles of the shore, you will discover a little white flag, which is on a shoal; you double it to the Westward at about half a cable's length, leaving it on the starboard hand. When you have brought it to bear South, you steer along the coast for the road of Chateaudin, and anchor in 6 or 7 fathoms, mud. In all this passage, if you keep the proper channel, you cannot have less than from 7 to 9 fathoms, and often 12 and 16, muddy ground.

In advancing towards the Tapion of Cavaillon, you must not approach too near its S. E. side, as a shoal of only 6 feet water, called *Le Mouton*, or the *Sheep*, lies S. E. from the Eastern point, at the distance of about half a mile. There is a depth of 5 fathoms between it and the coast.

Cavaillon Bay.

CAVAILLON BAY is spacious, although its anchorage is of small extent. The coast on the Western side is very steep, and the bottom full of rocks; but there is anchoring-ground on the Eastern side, opposite a coast covered with mangroves, which may be approached without fear, the bottom being clean, with 5 fathoms close to the shore.

This bay affords shelter from the sea-breezes, by the Eastern point of an island, which leaves a passage into the *Baie des Flamands*, next described.

Baie des Flamands.

BAIE DES FLAMANDS, or *Flamingo Bay*, lies a quarter of a league from *Cavaillon Bay*, and extends upwards towards the N. E. Its entrance and shores are clear and bold, and it is the place where ships lie up the hurricane months. There is a good careening-place, and anchorage in every part.

Baie du Mesle.

BAIE DU MESLE.—From *Flamingo Bay* the coast extends E. by N., 2 miles, to the *Grande Baie du Mesle*, all over which the anchorage is good; but as the entrance is broad and open to the Southward, there is no shelter from Southerly winds. The coast hence continues its direction to *Point Pascal*, half-way towards which is the *Petite Baie du Mesle*, in which a vessel may anchor, but it will not be sheltered even from the sea-breeze.

Of the *Great Bay du Mesle* is a shoal, lying like a bar across the bay, and extending opposite the point, which is to the Westward of the *Little Bay du Mesle*. This bank has not, in some places, more than from 15 to 18 feet water. It is very narrow, and leaves a passage of three-quarters of a mile only between it and the coast. To the Southward it extends about half a league from the shore.

To go into the *Great Bay*, with a ship drawing more than 15 feet, you must keep close to the shore on the Western side, steering by *Point Pauline*, which forms that side of the entrance.

Bay of St. Louis.

BAY OF ST. LOUIS.—The great entrance of the bay of *St. Louis* lies between *Point Pascal*, which is steep and wide, and a little isle called *Orange Key*; the bearing and distance from one to the other being E. & N., rather more than half a league. This isle may be seen from the entrance of the *Cayes* 13 miles distant, whence it appears nearly in a line with the Southern extremities of the intermediate coast.

About two thirds of a mile N. E. by N. from *Pascal Point* is the *Vigie* or *Old Look-out Point*; between is a cove called the *Baie du Paradis*. When off the *Vigie Point*, you will have the whole of the bay of *St. Louis* in sight. The bay is shut in on the Eastern side by *Cape Bonite*, which bears from the *Vigie Point* N. E. & E., distant 14 miles.

In proceeding to the anchorage of the *Bay of St. Louis*, run along past *Pascal* and *Point Vigie*, and thence along the Western coast of the bay, in 8 or 10 fathoms. The anchorage is West of the *Old Fort*, about a quarter of a mile from the Western shore, and the town may be seen from it, between the *Old Fort* and shore, in the bottom of the bay. The *Old Fort* is on an island of rocks towards the middle of the bay, half a mile to the Southward of the town. In the passage between it and the shore there is a depth of 6 fathoms.

In the anchorage before the town, called the *Little Anchorage*, the greatest depth is 5 fathoms.

S. S. E. three-quarters of a mile from the *Old Fort*, and West of *Cape Bonite*, at nearly the same distance, is a shoal called *Le Mouton*, (*The Sheep*). There is a good passage between it and the shore, as well as between it and the *Old Fort*; but the depth of water is less on the Eastern than on the Western side of the bay.

Between *Orange Key* and the shore, in a N. E. direction, there are two islets and some shoal-ground; the first of which, next to *Orange Key*, is called *Rat's Key*. You may pass into the *Bay of St. Louis* through a small passage immediately on the North side of this key.

Aquin Bay.

AQUIN BAY.—One mile and a half E. by N. from *Orange Key* is *Moustique Key*, a little island clear of shoals, unless very close inshore. You may pass without or within it, at the distance of one-eighth of a league, in 10 fathoms. *Cape St. George* is North of *Moustique Key*, and N. W. of a key called *Caye à Ramiers*, (or *Pigeon's Key*), which bears E. by N., 2 miles from *Moustique Key*, and is known by a white hummock, rather steep, and seen at some distance. There is a deep passage between it and *Moustique Bay*, by which ships pass into the great Bay of *Aquin*.

South of *Caye à Ramiers* is a shoal, extending half a league, which has, on its middle part, only 3 fathoms. East of the same key is a small isle, called *L'Anguille*, or the *Eel*, and to the N. E. is another, called *La Regale*; the three form an equilateral triangle, having each side half a league in length.

N.E., three-quarters of a league from Caye à Ramiers, lies the West end of the great Key of Aquin, which is 2 miles in length, and distinguished by two very remarkable white hummocks. It extends E. and E. by N., true, and its South side is bold to; but the white shoals of L'Anquille extend to its Western point, so as to prevent a passage between it and Caye à Ramiers, for ships that draw more than 12 or 14 feet.

East of Aquin Key, at the distance of a short quarter of a league, is a white insulated rock, called Le Diamant, or the Diamond; to the Eastward of this, at the distance of 2 cables' length, is the Point of Morne Rouge, or Red Hill. Thus the Eastern end of Aquin, the Diamond Rock, and the Point of Morne Rouge, form the two passages into the bay. All the islands and shores are bold. In the Morne Rouge passage are 5 and 6 fathoms water, and in that between Aquin Key and the Diamond, 6, 7, and 8. The bay is extensive, and trenches considerably inland, but the water is shallow, and there are only 3 fathoms at a distance from shore.

The Point of Morne Rouge may be readily known at a distance, by three very high white hummocks, called the Tapisons of Aquin, which together form a great cape, under which is an anchorage, in 10 and 12 fathoms, at a distance from land. This bottom continues as far as the Petite Baie des Flamands, or Little Flamingo Bay, which is W.N.W., 14 leagues from the Tapisons of Aquin.

To enter the passage into Aquin Bay, between Caye à Ramiers and Mousfique Key, before-mentioned, steer N.N.E., so as to get into the mid channel between the shore and the island. Having doubled Caye à Ramiers, you will see La Regale, which is a very low isle of sand; leave this on the starboard side, keeping in mid-channel between it and the shore; then haul up for Aquin Key as much as the wind will permit, and anchor to the Northward of it in 6 or 7 fathoms, or further in, at pleasure.

GENERAL REMARKS.—Observe that from Point Pascal all the capes are broken and steep, and from the S. and S.E.; and as, on all this coast, the land is white, many white hummocks will be seen. Aquin has two, above mentioned; but the Eastern-most and highest are those of Morne Rouge; and, with attention, it will be impossible to mistake them. From the point of Morne Rouge, or the hummocks of Aquin, the true direction of the coast, after having trenched in to form the Petite Baie des Flamands, is East, Southerly, 10 leagues, to Cape Bayouette. The whole of this coast is free from danger and bold to, but has no bay or anchorage, or shelter from the common breeze. Two leagues and a half Westward of Bayouette the coast is iron-bound, and the water near it of great depth.

POINT ABACOU TO CAPE TIBURON.—From Point Abacon to Point Gravois, the bearing and distance are West, Southerly, 23 leagues. The latter is low, not easily distinguishable, and has frequently been mistaken for the land of Port Salut, a small cove lying a league further to the N.N.W.

From Point Gravois, N.W. by N., 4 leagues, there is a bight of half a league, in which anchorage may be found. This bight lies about 2 miles to the Southward of Les Coteaux. From this spot to a large hummock, called Les Charloniers, which is very remarkable at a distance, the bearing and distance are nearly W.N.W. 10 miles.

From Les Charloniers to the Fond des Anglais, or English bottom, the coast extends W. by N., 4 miles, and a bay thence rounds to within a league and a half of Pointe des Vieux Boucaus, or Boucan Point. All this part is safe, but it has no anchorage. A ship may, indeed, anchor very near the land, but it is everywhere exposed to the sea-breeze.

From Boucan Point to Point Burgos, which is a low point, the coast trends Westward, 4 miles. Between these places, off a point called Aigrettes Point, there are some white shoals, rocks, and breakers; but their extent is not more than half a league.

Ports and anchoring-places to the North of Punta Engaño.

The following anchoring-places, Cabeza de Toro, Bóbaro, Los Ranchitos, and Arena Gordó, come nearly all under one and the same category with regard to their practicability as landing-places. During the summer months, when the trade-wind is to the South of East, and calms are prevailing, there is no danger to be apprehended, and vessels load in as short a time as anywhere on the coast; but during the winter months, when North-easterly winds are frequent, the vessel is not only endangered, but the loading is rendered difficult, as days and days may elapse before a boat can pass from the anchorage to the land. Nevertheless, a vast deal of wood is loaded at the North-eastern anchoring places, and the master who has accepted a charter-party in which one or the other of the above-named places is included, ought to be provided with good chains.

Los Algodones.
Cabeza de Toro.

LOS ALGODONES.—The first rocky point to the North of Punta Engaño, is Los Algodones, which does not afford any anchorage.

CABEZA DE TORO.—The quantities of wood in the neighborhood of this anchoring-place cause it to be frequently visited by vessels. The reef affords two passages; the one to the leeward, called La Naybe, is even passable for schooners that draw no more than 10 or 12 feet. Large vessels anchor outside the reef, in from 10 to 12 fathoms water, sandy and rocky bottom.

Bábaro.

BÁBARO, about 6 miles from Cabeza de Toro, is considered a better anchoring-place than the former; the sea is somewhat calmer and the reef approaches more the land. Vessels lie in 10 to 12 fathoms, distant $1\frac{1}{2}$ to 2 miles from the land. The beach is sandy, and the loading may be effected rapidly when there is no North-easterly breeze or heavy ground-swell.

Los Ranchitos.

About nine miles North-easterly from Bábaro are :
LOS RANCHITOS.—The reef has two passages with about 4 to 5 feet water. Vessels lie outside in 11 or 12 fathoms of water, distant $1\frac{1}{2}$ to 2 miles from the land. It is a sandy beach and a good loading-place.

Arena Gorda.

ARENA GORDA, about 2 miles from the former, has three passages through the reef, which a small sloop with 5 feet water can safely pass, to the anchorage within; vessels of large burden lie from $1\frac{1}{2}$ to 2 miles, according to their size, in 10 or 12 fathoms water.

Mácao.

MÁCAO.—All the remarks respecting Bábaro, Cabeza de Toro, &c., refer equally to Mácao. The anchorage is here still further off the shore than at Bábaro, and the place is much more exposed to the winds and sweepings of the sea. The vessels anchor about half a mile North of the reef, which stretches from Cabezote Barlovento in a line towards El Infernito, and send their boats for the wood to the bight of the bay and to the mouth of the Anamuya. The two rocks high out of the water, called the Cabezotes, are excellent landmarks, and afford along them good boat-passages. The passage for the bight of the bay, where there are some ranchos for the shelter of the laborers, is between Punta Mácao and the Cabezote Barlovento; and that for the mouth of the Anamuya close to the Cabezote Sotavento, likewise called El Infernito. At the mouth of the Anamuya is a bed of excellent oysters.

The position of Punta Mácao, deduced from observations taken near the ranchos, is in lat. $18^{\circ} 48' 0''$ N., and long. $68^{\circ} 29' 50''$ W.

There is an anchoring-place between Punta Mácao and Cape San Rafael.* The latter cannot be mistaken. Nearly 2 miles inland from the cape is a round hill, which, at the distance, has the appearance of being isolated; it is, however, connected with the Southern shore of the bay of Samana by low land.

Port Jicaco or English Harbor.

PORT JICACO or ENGLISH HARBOR.—Port Jicaco or English Harbor, (Puerto de los Ingleses,) lies about 11 miles W. by S. from Cape San Rafael. A rock, which rises above the reef stretching from Punta Jicaco towards the Keys, is seen at a distance of 2 leagues, and serves as a mark to point out the passages Barlo and Sotavento. At the same time a high double-peaked mountain will be observed inland, bearing S. by W.; keep the hummock between the two peaks as your mark, and come to anchor in $5\frac{1}{2}$ and 6 fathoms, distant a quarter of a mile from the land. The anchorage within the reef is safe, and has the advantage that the vessel can leave with the trade-wind, selecting the lee pass for her passage when standing out to sea.

Cape Samana.

CAPE SAMANA is a broken rugged point of land, which appears, from a great distance, like a ship with her topsails down, and seems not to join the main, but on a nearer approach this shape changes. The cape makes with two points, both high, blunt and steep, about the height of Beachy Head in the English Channel, but not so white. They are 4 or 5 miles asunder, with a small bay and harbor between them. At 2 or 3 miles to the Westward of the Westernmost point, there is very high land, which falls down to the water-side, and is twice as high as Cape Samana.

Samana Bay.

SAMANA BAY.—There is good anchorage in Banistre, or Lavantados Road, on the South side of the peninsula of Samana. In advancing for this place, observe that when Cape Samana bears N.W. by W., about a league, it appears like two points, the Westernmost of which, as you come further in, you should bring open with a white spot of sandy ground, which may, at first, be mistaken for one of the sand-keys, although it is connected with the main shore. In order to ascertain the true point, observe that in coming about it, it will appear as if a small rock were lying off it, which, on a nearer approach, will be found to join the land. The soundings are uncertain. Having well shot into the bay, you may have 10 fathoms, and then no ground in 20.

Or, bring off Cape Samana, and bound for this port, sail S.S.W., 3 or 4 miles, along shore, (you may go within a mile, for it is bold to,) to Point Valandras, or Blue Point, which has two or three black rocks lying near it. When at the length of this point steer thence West about half a mile, and you will leave three keys, which are

* Lieut. Baper, R.N., gives, in his table of Maritime Positions, (1849.) for Cape San Rafael, lat. $19^{\circ} 1' 0''$ N., long. $68^{\circ} 55' 0''$ W.

of Punta Engaño, is Los

neighborhood of this anchorage affords two passages; the schooners that draw no more than 10 feet of water, in from 10 to 12 fathoms.

There is a better anchorage in the reef approaches more than 10 miles from the land. The beach here is no North-easterly

but 4 to 5 feet water. Ves-

three passages through the reef, to the anchorage within; and to their size, in 10 or 12 fathoms.

le Toro, &c., refer equally well to the sea. The vessels anchor from Cabezote Barlovento to the edge of the water, called the good boat-passages, the ranchos for the shelter of Barlovento; and that for the likewise called El Inferni-
rs.
ons taken near the ranchos.

Cape San Rafael.* The latter cape is a round hill, which, at low water, is connected with the

English Harbor, or English Channel, is seen at low water, and the passages Barlo and Southward will be observed inland, as your mark, and come from the land. The anchorage vessel can leave with the standing out to sea.

which appears, from a great distance, not to join the main, but on a point with two points, both called the English Channel, but not so deep, and harbor between them. At this point, there is very high land, as Cape Samana.

stre, or Lavantados Road, on the coast for this place, observe that it appears like two points, the middle being open with a white rock for one of the sand-keys, also ascertain the true point, which rock were lying off it, which The soundings are uncertain, and then no ground in 20 fathoms S.S.W., 3 or 4 miles, along to Point Valandras, or Blue

When at the length of three miles, leave three keys, which are

high and woody, a mile from you on your port side. With the Westernmost of the three keys bearing S.S.W., you may anchor in 15 fathoms, half a mile from shore, and have good water. Then Lavantados, or Banistre Key, will bear W. by N., one mile off.

There is good easy riding in this harbor, in from 7 to 3 fathoms. You may also find good fresh-water in many places, with plenty of fish and fowl. Here is commonly a fresh breeze from the Eastward all day, and open to the North.

The preceding paragraphs are from the French of the Count Clastenet de Puységur, &c., the following from the Spanish Derrotero:—

SAMANA BAY.—From Cape Rafael the coast trends nearly West, and forms a gulf, shut in to the N.W. by the peninsula of Samana. The East point of this peninsula, named Cape Samana, lies 7 leagues N.W. by W. $\frac{1}{2}$ W. from Cape Rafael. This bay, which is more than 11 leagues in extent from East to West, and 4 from North to South, is obstructed and almost shut up by a great reef, which extends from the South coast, and so far to the North, that a channel of only 3 miles in width remains between it and the peninsula of Samana. The Northern extremity of this reef is marked by some keys or islets, the largest of which, called Key Lavantados, must be left on the port hand on going into the bay. Within there are several anchorages, but little frequented, as there is scarcely any commerce here. The first anchorage is on the coast of the peninsula, and near the entrance of the bay, it is named the Carenero Chico, (or Little Carenero;) to enter and anchor here, it is necessary to approach within half a mile of Point Valandras, which is the S.E. point of the peninsula, and to keep along the edge of the coast at this distance, until sheltered by Vinas Point, when you may anchor in 6 fathoms, taking care to keep half a mile from a key, named the Key of the Carenero Chico, which is at the West part of the reef, and has, to the South of it, either four or five small islets. Behind this key, and between it and the coast, is the proper anchorage; but it is much narrowed by shoals, and must be entered by warping. Point Vinas is easily known, as it bears true North from the West part of Lavantados Key. In the entrance there is nothing to be feared, because there is no danger but what may be well seen; and only inward from Point Vinas is there a shoal, having on it 2 feet of water; to keep clear of this shoal, bear in mind that it bears East, a long mile from Vinas Point. By following the coast, as we have directed, at the distance of half a mile, you will go safe from it; but, for greater certainty, keep something to starboard, when you will sound in 5 fathoms water; for in the channel, between it and the coast, there are 6 and 7 fathoms.

A league and a half to the West of the Carenero Chico, is the Puerto de Santa Barbara, or of Samana: the anchorage here is very narrow at the entrance, which is formed by a great reef, that runs out to the East from Point Escondido, the S.W. point of the harbor; and on this reef are several keys or islets, of which the outermost is named Topozon; the second is the Greater Carenero; and the third, Cayo Escondido, is very near the Point Escondido, on the West. There is not only this reef at the entrance, for there are two off the North coast, which stretch far to the South, and form two bays: of these the first is called Aguada, or Watering Bay, and it has Point Gomero for the N.E. point of its entrance. The second roadstead lies between the two reefs. In Aguada Bay there is good anchorage, in 6 fathoms, clay; the second anchorage is very narrow, but has 7 fathoms water. To the West of these two reefs and roadsteads, lies the principal harbor and anchorage of Samana, with a depth of 5 and 6 fathoms, on clay, which is found to the South of the town. To enter this harbor it is necessary to run along the North coast, at half a cable's distance, and steer to the West, taking care neither to get nearer to, nor farther from Point Gomero, than half a cable; for you will thus run in mid-strait; and, keeping further off, you would incur the risk of getting on the Southern reefs, or, by coming nearer, get on those of Point Gomero, which lie out one-third of a cable. So soon as past Point Gomero, you may see a little rivulet in Aguada Bay; and then you ought to head direct for the Western extremity of Carenero Key, until Point Escondido, or its key, bears W. $\frac{1}{2}$ S., when you may run about W. by N., towards the bottom of the harbor, and perfectly free from the Northern reefs, and may anchor to the South of the town, in 5 or 6 fathoms water, upon clay. If you wish to anchor in Aguada Bay, you must run in, tiding up to the Northward, so soon as past Point Gomero, in order to anchor in the middle of it, and about S. E. from the rivulet of Aguada.

From this anchorage the coast of the peninsula continues bold, and with roadsteads, in which there is nothing to fear, except the South winds, which, in their season, are often violent. Two leagues to the West of Samana lies Point Espanola, with an islet; and thence, in the interior of the bay, there is no establishment whatever. A large clay bank, in the interior of the bay, runs out more than 2 leagues.

From Espanola Point, in which you will be well to the West of the reef at the entrance of the bay, you should steer to the South for the Bay of Perlas, or of St. Lorenzo, in which there is no necessity to run far in; and it may suffice to anchor at its

Samana Bay.

entrance, and about South of Arenas Point, which is the North point of this bay; for, although further in there is sufficient depth, yet there are sand-banks, on which you might easily get aground. To find this bay, it is better to make the land to the East than to the West; for the South coast of Samana, from Perlas Bay to the West, is very wild and unsafe, on account of the many islets along it. Steering from Point Espanola, to the S. $\frac{1}{2}$ E., you will fall to the East of the bay, and make a little town, named Savanna de la Mar, which affords anchorage for very small vessels; and thus, as soon as you discover Arenas Point, when crossing over, steer towards it, and you may approach within a cable's length of it.

The entrance of Samana Bay is effected with the regular breezes; but you can get out with the land-breezes only, which blow by night.

Cape Samana is of considerable height, and steep down to the water's edge; on nearing it you may also discover Cape Cabron, which is N.W. from it, nearly 3 leagues; this is even more high and scarped, or steeper, than the former, and the coast between is green, and covered with large trees; on it there are some islets, and as it is foul, it should not be approached nearer than one league. From Cape Cabron the coast takes to the West, and forms a great bay, called Escocesa Bay; the coasts of this bay are low, and very foul, from which reason, as there is neither town nor establishment in it to induce vessels to visit it, they ought to proceed direct from Cape Cabron to Cape Viejo Francois, or Old Cape Francois, which lies 15 leagues from it W.N.W. $\frac{1}{2}$ W. Old Cape Francois may be seen, in clear weather, at the distance of 10 leagues. It is known by a mountain inland, which may be seen at the distance of 15 leagues.

Ships coming from the Eastward, towards the N.E. coast of Hayti, should, previous to their making the island, run down between the latitudes of $19^{\circ} 20'$ and $19^{\circ} 50'$, taking particular care not to pass either to the Northward or Southward of these latitudes. In this track they will make the land, either by Cape Cabron, or Old Cape Francois, and they will pass clear of the Silver Key Bank on the one side, and the current commonly setting towards Samana Bay on the other.

*Old Cape
Francois.*

OLD CAPE FRANCOIS.—The point of the Old Cape is rather low, and stretches out in the form of the snout of a porpoise; at 5 or 6 leagues distant, to the N.N.W. of Cape Cabron, in a clear day, the Old Cape is seen making like an island, whose ends slope gradually into the sea. When you have made Cape Cabron, being 1 or 5 leagues to the North-westward of it, you must sail 13 or 14 leagues N.W. $\frac{1}{2}$ W., and you will pass 5 leagues to the Northward of the Old Cape; then steer W. by N. when, having run 15 leagues, you will see Point Casroque at about 3 leagues distant from you; continue on for 5 leagues, when Ysabella or Isabella Point will bear S. W. $\frac{1}{2}$ W., distant 4 leagues; having advanced thus far, you have nothing to fear, and, if necessary, you may keep within half a league of the shore, the coasts being very clear.

At about 4 leagues off to the Northward of Old Cape Francois its point appears like a porpoise snout, projecting to the Eastward; and 3 leagues further West is a point named Cabo de la Roca, or Rocky Cape, very much resembling it, and projecting to the Westward. The coast between lies W. $\frac{1}{2}$ N. and E. $\frac{1}{2}$ S.; it is low, rather steep to the seaside, and covered with trees remarkably green.

Towards the point of the Old Cape a mountain is perceived inland, which, in clear weather, can be seen 15 leagues off, and is a good mark to point it out.

There is some foul ground lying off the pitch of the cape, and a harbor a little to the Westward of it for small vessels. When sailing from Cape Samana to Old Cape Francois, which is about 6 or 7 hours' sail, you see a point of land on the East side of the cape, which oftentimes, at first sight, you suppose to be the cape, but coming nearer, you will see your mistake. And when you are due North of Old Cape Francois, you will perceive to the Eastward of the cape a very steep point, which seems to be divided from the main, and running off the land, rises higher and higher in such a manner that the highest part of it lies open to the sea, so high that you cannot see the land within.

When from Old Cape Francois you sail for Monte Christi, observe to steer a more Northerly course in hauling off, giving a good distance between you and the shore, because the currents always set upon it; and unless you do this you will run the hazard of being ashore.

From Cape de la Roca, the land trenches in to the distance of 2 leagues, and forms a bay pretty deep, which is sheltered by reefs. This coast trends to the W.N.W., and rising in height to the Northward, comes to Punta Macuris, or Point Maseury, which bears W. $\frac{1}{2}$ N. from Cape de la Roca. This point is high, and its shore bold; it serves as a mark for the small harbor of St. Jago, which is 3 leagues distant from, and to the Eastward of, Puerto de Plata.

*Puerto de
Plata.*

PUERTO DE PLATA, or Port Plata, lies 17 leagues from the point of the Old Cape, and bears from it West. It is known by a mountain at some distance inland.

point of this bay; for, on the banks, on which you see the land to the East and Bay to the West, is Steering from Point Casrogue and make a little town, small vessels; and thus steer towards it, and you

reezes; but you can get to the water's edge; on N.W. from it, nearly 3 miles the former, and there are some islets, and one. From Cape Cabron to Cocosa Bay; the coast is neither town nor proceeded direct from Cape Hayti 15 leagues from it, rather, at the distance of 10 leagues from the point of Hayti, should, previous of 19° 20' and 19° 50'. Southward of these latitudes Cape Cabron, or Old Cape on the one side, and the other rather low, and stretches 10 leagues distant, to the N.N.W. being like an island, whose Cape Cabron, being 1 or 5 leagues N.W. of W., and then steer W. by N. about 3 leagues distant Isabella Point will bear. To have nothing to fear, and, therefore, the coasts being very

of Hayti, should, previous of 19° 20' and 19° 50'. Southward of these latitudes Cape Cabron, or Old Cape on the one side, and the other rather low, and stretches 10 leagues distant, to the N.N.W. being like an island, whose Cape Cabron, being 1 or 5 leagues N.W. of W., and then steer W. by N. about 3 leagues distant Isabella Point will bear. To have nothing to fear, and, therefore, the coasts being very

Francois its point appears 10 leagues further West is resembling it, and projecting E. $\frac{1}{2}$ S.; it is low, rather even.

veiled inland, which, in clear point it out. To be, and a harbor a little to Cape Samana to Old Cape of land on the East side to be the cape, but coming North of Old Cape Francois steep point, which seems to higher and higher in such a to high that you cannot see

sti, observe to steer a more between you and the shore, be this you will run the hazard

ance of 2 leagues, and forms east trends to the W.N.W., Macuris, or Point Mascare, is high, and its shore bold; which is 3 leagues distant from

s from the point of the Old in at some distance inland.

which appears insulated like the Grange, although not in so precise a manner. This mountain, which is called Isabella de Torre, has a large white place on it, caused by a slide, in the great rains of 1837 and 1838. This is a good mark for the port, and you must run for it, until you discover the fort at the foot of the mountain. In running in, keep midway between the points; and as soon as round the point, on the port hand, let go your anchor, in 3½ fathoms. There are not now any mangrove bushes.

On approaching the coast, you will discover to the Westward a great cape, very high and steep; the extremity of this is Punta del Algarroba, or Point Casrogue, which is readily known by its magnitude.

The bight from Port Plata to Point Casrogue, is bordered with reefs close to the shore, and does not admit of any anchorage.

Old Cape Francois and the great Point of Algarroba, or Casrogue, bear from each other W. $\frac{1}{2}$ N. and E. $\frac{1}{2}$ S., 19½ leagues. When at the distance of about 3 leagues to the Northward of Casrogue, you will see a low point projecting out to the Westward, which is remarkable by its having the appearance of being detached from the coast like an island; it is Ysabella, or Isabella Point, the Northernmost point of Hayti.

YSABELLA, or ISABELLA POINT, according to late observations, lies in latitude 19° 59', longitude 71° 40' 30", and at the distance of 4½ leagues W.N.W. $\frac{1}{2}$ W. from Algarroba, or Casrogue Point. To the Eastward of it lies the deep bight, called Puerto Caballo, or Port Cavallo. In the bight between these is an anchorage for vessels drawing 12 or 13 feet water, and sheltered by the reefs; the entrance is readily known by running to it along the reefs.

On the Western side of Isabella Point is a more extensive anchorage, and easier to gain than that of the East, but the ground in many places is foul; there is a depth of from 5 to 7 fathoms water.

From Isabella Point to the Grange, the bearing and distance are W.S.W. $\frac{1}{2}$ W., 10 leagues. The coast between is bordered with reefs, among which the entrances are narrow and dangerous.

West of Isabella Point is Punta Roca, or Rocky Point, to the Westward of which is an anchorage for large vessels, which being very bad, ought to be used only in case of necessity.

To gain this anchorage, you must haul very close to Rocky Point, and anchor so soon as you are in 12 fathoms, white bottom.

This anchorage, which is sheltered by the reefs that stretch N.N.W. from Punta Roca, lies about 4 leagues from Isabella Point.

THE GRANGE.—The Grange Point is known by the mountain of that name, and is seen at a great distance before you perceive the coast. This mountain, which is insulated, and stands upon a low peninsula, has very much the appearance of the roof of a barn, from which it takes its name. The North-west part of it is bold, and you may approach it within a quarter of a league, or even less. Close to the West part of the Grange Point is a rocky islet, named the Frayle, or Friar; and from its S.W. part, at 3 cables' length, is another, somewhat larger, and named Cabras, or Goat's Islet. These are the islets of Monte Christi.

HAUT-FOND.—Two leagues to the N.N.E. of the Grange Point lies a white shoal, of not more than 2 cables' length each way, called the Haut-fond; there is a small spot on the shoal, with only 25 feet of water. Close to it is a depth of 6 fathoms, then 10 and 15, and suddenly no ground. The white ground has generally scattered rocks, so that it cannot be ascertained whether there may not be some spots on it even with less than 25 feet. When you are on this shoal, the Grange bears S. by W. $\frac{1}{2}$ W.; you will then have the islets of Monte Christi open of each other, the Westernmost of them bearing S.S.W. $\frac{1}{2}$ W.

MONTE CHRISTI REEF.—About 3 leagues to the Westward of Haut-fond lies another reef. It extends nearly N.E. and S.W., is about three-quarters of a mile in length, and half a mile broad. On the shoalest part the points of rocks stand up like sharp spires. On other parts are white patches of sand. The shoalest water 3 fathoms; thence 3 to 4, 5, 6, and 7 fathoms. It is steep to, and has from 15 to 17 fathoms close to it, and 20 to 25 all around. The bottom is soft in 20 fathoms; and in some places you will have coarse sand. The water, when smooth, is very clear, so that you may see the pinnacles of the rocks as you pass over them in a boat. From the shoal, in 5 fathoms, the Eastern end of a grove of trees open to the South-westward of Monte Christi (and between it and the key) bore S.E., and the mount of Cape Francois (now Cape Haytien) S.W. by W. The variation was 6° 20' E.

With Isabella Point bearing S.W., distant 4 leagues, the course and distance, to pass without the shoals called the Haut-fond and Monte Christi Reef, will be a few degrees to the Northward of West, 17 leagues; and then the latter will bear about S. E. But should you be up with Isabella Point, and prefer the mid-channel between these shoals and the coast, a W. by S. course, 16 leagues, will clear the shoals and

Ysabella, or
Isabella
Point

The Grange.

Haut-fond

Monte
Christi
Reef.

bring you in sight of the high head of Cape Hayben, (formerly Cape Francois,) at the distance of about 5 leagues.

In sailing between Old Cape Francois and the Grange, be careful to keep sufficiently to the Northward in hauling out, that you may not be driven ashore by the current which always sets upon the coast.

There is anchorage under the Grange to the West, to take it you must run along the Frayle, or islet of Monte Christo, and let go your anchor so soon as you have 10 fathoms; but under the South side of Cabras, the Westernmost islet, you may anchor further in with 14 fathoms. From the Grange you may see the mountains above Cape Hayben.

In approaching this anchorage you must be cautious of a shoal which lies W. by S. from Cabras Isle, at the distance of a long mile, to keep clear of it, on entering and leaving the anchorage, take care not to bring Cabras Isle to bear anything to the Northward of E. 3 N., but, on the contrary, keep it rather to the Southward of the bearing.

The shoal or bank of Monte Christo extends 11 miles to the West, and to the South as far as Manzanilla, or Manchoncal Point, and it thence continues to border the coast at the distance of half a mile, more or less, according to its sinuosity. On this bank rise the islets named the Seven Brothers, which are low, and covered with mangroves. The islet named Monte Grande is the most remarkable of all of them. It is the second from the Eastward, and has high trees upon it. This bank, as well as many others in these seas, has a very white bottom, and is very dangerous, because the bottom is very irregular in its depth, with stones and rocks; you may have it, and sometimes it will be after 3 fathoms. You should therefore avoid sailing on this or similar banks unless they have been well examined and sounded.

From the
R. S. A.

MANZANILLA BAY, &c. To the East of Manzanilla Point there is an excellent anchorage in Manzanilla Bay. From this bay the coast trends in to the S. E., and then turns to the West, in which direction it continues to a distance of 8 leagues, when it ascends to the North, and terminates with Point Foclet. The Grange Point with Point Precet form a great bay, in which, besides Manzanilla Bay, there are two other harbors, the first of these, named Bayaha, or Port Dauphin, is to the S. W. of Manzanilla Point, and about 2 leagues from it, and the second, at the Western extremity of the bay, is known as Guasco, or the City of Cape Hayben, or City of the Cape.

The coast from Bayaha to the West is bounded by a white bank and reef, on the edge of which there are from 50 to 30 fathoms. Between the reef and the coast is a channel, with 2 or 3 fathoms of water, to which there are various passes in the reef known to the coasters and pilots only.

The navigation from Grange Point to Manzanilla Point should be made on the white bank of the Seven Brothers, it is, therefore, very necessary to know the channel, and though you may proceed on the outside of the islets and the bank, extending to the Westward, it follows that, in doing this, vessels must get much to leeward and are then obliged to beat up to the anchorage. The delay in following this route is not so great when bound to Bayaha, or Port Dauphin, but the channel for crossing the bank, which we are about to describe, being very safe, it does not seem requisite that any one should go round about, but that all should proceed as follows.

Having passed near the Grange Point, steer W. 3 S., without going to the Southward of that bearing until you are to the North, or on the meridian of Yuma Point, which is low, and bears S. W., true, 5 miles, from Grange Point; the vessel, having arrived at this situation, should now steer towards Yuma Point, until the islet named Monte Chico, which is the Easternmost of the Seven Brothers bears West, whence you must steer S. W., leaving to starboard the Islet or Key Tororn, which is the Southernmost of the Seven Brothers, and when you mark it at about N. by E., you must steer S. 3 E. until you have Manzanilla Point E. 3 N., when you must haul to the wind on the port tack to take the anchorage, if you can, and if not you must prolong the stretch to the Southward as far as necessary to enable you to get into the bay upon the other tack, in the understanding that you may run along the whole of the South shore at half a mile, or even less. In running by the way we have pointed out, you will find upon the bank 7 to 8 fathoms of water, on sandy clay, and you may anchor on any part of it commodiously, especially to the S. W. of the Eastern Keys, Monte Chico and Tororn; and it may even be convenient to anchor in case of night coming on, by which the necessary measures arising from darkness may be avoided.

The edge of this bank is so steep, that from 12 to 20 fathoms you rapidly pass into 100 fathoms, and of the same nature is Manzanilla Bay, for from 7 fathoms you pass to 100 in the short distance of 5 cables' length. From which reason an anchor should never be let go until the depth has been previously ascertained by the lead, keeping in mind, that the best anchorage is in from 5 to 10

by Cape Francois, at an

 a mile from the shore.

In the River Papou, (E. S. E. of Manzanilla Bay,) and also in that of Axhoun, to
 the S. E., water may be conveniently got, and you may cut wood on any part of the
 coast that is desert and uncultivated. In this bay there are always fresh land breezes,
 which facilitate much the communication between Bayaha and Monte Chispa. For
 those to whom the breeze is contrary, navigate at night by aid of the land breeze
 in Manzanilla Bay, no hurricanes are felt, which is an advantage of great consi-
 deration.

THE HARBOR OF BAYAMA, or PORT DAU PHIN, is one of the finest ports *The Harbor*
 in Hayti. As to its great extent it might shell a equal to a dock, with an excellent clay *et Bayaha,*
 bottom and the depth does not exceed 12 fathoms, nor is it less than 5 fathoms, which *or Port*
 are found at half a cable from the shore, but notwithstanding these singular qualities, *Dauphin*
 of the difficulty of entering and getting out of it, in consequence of the narrowness and
 boldness of the channel or mouth, is considered, it will be seen that it would not be very
 for any vessel to get her service to enter and be shut upon a harbor from which she could
 not sail, unless she could with the land breeze, and thus exposing herself not only to
 the danger of getting aground on the shoals of the entrance, but also, in case of the
 land breeze failing, she may both lose the time for getting out and the object for com-
 ing in. The interior of this harbor needs no description more than the chart, by which
 it may be seen that its entrance is only a cable and two thirds in width, and this nar-
 row breadth continues onwards to the distance of a short mile. The several points
 which are in this passage render the entry still more difficult. The risk of this entrance
 is a shallow ridge which borders both sides of the channel, and which, at the points,
 stretches out more than half a cable, and reduces the channel to one cable's length in
 width. Again, this channel being serpentine, it is necessary that a vessel, in running
 in, should take the turns with much dexterity and promptitude, in order to avoid
 getting aground. It is, therefore, necessary to enter this harbor when the breeze
 is to the Northward of E. N. E., for, if more scant, an attempt to take the entrance
 will be unprofitable. Keeping well in the middle of the channel, you proceed to
 the White Shoal, which runs out from the windward point of it, and, when abreast
 of it, you must haul up so as to place the prow towards the second point on the wind-
 ward side, so as to free yourself from the ledge which lies off the second point to leeward,
 and as soon as you have thus cleared the port side, you must haul up for the
 last point to windward, till you have passed the third leeward point, when you may run
 in and anchor between Port Dauphin and the little isle called Tomatoes Island, with-
 out approaching near the N. E. part of the latter, because a shallow bank stretches off
 it. From what has been said, it may be seen that the harbor requires no other direc-
 tion than that of an eye accustomed to run in and channel through a devious passage,
 and he who knows how to do this, need never get ashore here, for his eyes will
 direct him when to haul and when to be a way, without particular leading marks.
 From the mouth to the third leeward point you cannot anchor, from want of space to
 breathe the vessel, and because the bottom is of sharp rocks. The tide, at full and change
 of the moon, flows here at 7h. a. m., and spring tides are 57 feet, but neaps only
 34 feet.

THE HARBOR GUARICO, or CAPE HAYTIEN, is no more than a bay formed *The Harbor*
 by the coast, and shut to the East and North by a group of reefs which rise upon the *Guarico, or*
 white bank, extending outward, at this place, more than a league. These bound *Cape Hay-*
 the part ought to run from the Grange Point towards Picolet Point, outside the *tien*
 Seven Brothers, and to place themselves so as that they may run down towards Point
 Picolet, with a vessel's head to the S. or S. S. W. In this direction they may ap-
 proach without fear, within the distance of a mile, but, and may wait for a pilot,
 or, if obliged to take the anchorage without one, they must steer
 from Point Picolet S. E. and S. E. by E., leaving a white flag by there; on the port
 hand, and which, placed upon the Northern extremity of a reef, serves for a beacon,
 taking care to carry plenty of sail to clear a red flag, which they will see a little after-
 wards, and which must be left half a cable's length to the starboard, and so soon as
 they have this flag on their beam, they may steer for the cry, and anchor in from 7
 to 10 fathoms.

Those who go out from Manzanilla, or Bayaha, (Port Dauphin,) to the cape, ought
 to steer to the Northward until Picolet Point bears to the Southward of the true
 West, and then direct their course to the West, as convenient. For they will be clear
 of the White Point off Point Picolet, but if bound to the East, they must run to the
 Northward until the Grange Point bears to the Southward of the true East, in order
 to clear the Seven Brothers' Bank.

The Count Chastenet de Puységur, in his directions for the coast of Hayti gives
 the following for Cape Haytien, &c. These were written in 1757, but they include

some descriptions not given in the *Derrotero*, and we therefore insert them here, with a trifling correction.

"Ships bound from the Eastward to Cape François, always make the Grande, for the coast, in the environs of the cape, offers nothing remarkable, unless they be near enough to distinguish the hummock of Picolet, and the rock of that name, lying to the North, and very near the hummock. Having brought Monte Christ to the South, distant about a league and a half, the proper course, in order to hold a little to the Northward of Picolet Point, is between the W S W. and S W. by W., distant a league.

"The mark is better when you approach the cape from the Grande, in steering W S W. and S W. by W., for in this last position the hummock of Picolet must appear to project in the sea more than the rest of the coast. The best mark that can be given is, that the hummocks which are to the West of the road to the cape, are the highest of all this part; besides, you can distinguish in them large white spots. With some attention you will discover Point Picolet, which is lower than the said hummocks, and seems to lose itself among them. This point terminates the road of the cape on the West side, in coming near you to Picolet itself, built upon the point, at whose end lies the rock of the same name, which is not discernible at a greater distance than a league.

"So soon as you have deserted Point Picolet, you steer directly against it, because you must sail very near that fort to enter the road, whose opening is hindred with dangers or keys, which you leave on the port hand in coming in. We would advise no stranger to attempt the channel without a pilot, for whom he must wait in the offing.

"At half past 10 the wind comes to the E S E., but it must blow from the N E. to carry you into the harbor, for you are obliged to steer S E., and even E S E. The breeze is very regular. The land wind blows in the evening, and often during the night; but, about 10 or 11 in the morning, after an interval or calm, it turns to the E N E. or N E. So that at 1 o'clock, ships are able to enter the harbor.

"The city of Cape Haytien is under Picolet Mount. There is no danger in running in for Picolet Point, if you keep it bearing from S S W. to S S E. Should you not have time to wait for a pilot, you must come along Picolet Point, having it about S. or S S W. at the distance of a short musket shot.

"*From 10 to 11 1/2*, bring Point Picolet to bear S. by W. 3/4 W., and steer N. by W. A remarkable mountain called the Bishop's Cap will then be seen directly ahead, being the mountain which appears in three points, in a line with a remarkable hummock, by the water side, in the harbor, which will bear S. by W. Steering in this direction will lead to the Westward of the outer reef, named Le Cogue Avelle. The way generally breaks over this reef, which has for head a buoy, or white flag, upon a Column in the same direction, leaving the buoy at the distance of about 1/2 fathoms on the port side, and a small rock, standing detached, and a little from Picolet Point, appears just open of that point. Now head to the S E. or S E. by S., keeping the rock just open, and you will pass between the Cogue Avelle and Le Grand Mouton Bank, a bank having a buoy, or flag, on its Eastern edge, which is left on the starboard side. The Petit Mouton, a danger that always breaks, and a shoal named Trouponne with a buoy or white flag on it, are to be left on the port side. You must, therefore, have sufficient sail to outweather round the Grand Mouton Bank, giving a buoy, or flag upon it, a berth of half or two third of a cable's length, and having passed, steer for the town, and you may anchor where you please, in 8 or 9 fathoms, good ground.

"A ship cannot enter the harbor unless the wind be at N E., as she is obliged to steer S E. by S., and even S S E. The breezes are very regular, they come in the land in the evening, and very often during the night; but, at about 10 or 11 in the morning, after an interval of calm, they chop about E N E., or S E. Strong North winds heave a great swell into the bay."

The town is on the Western side, about 2 miles from Point Picolet, in lat. 19° 20', long. 72° 44'.

Port François
1788

PORT FRANÇOIS. — From Point Picolet the coast trends West to Honorat Bank, which is the North point of Port François, whence a reef stretches out a cable's length to the N W. At its extremity are 3 fathoms of water. The anchorage of Port François is a small bay, and about 2 cables in extent. Between the points of the bay there is good shelter from the breezes. To enter you must run along the edge of the reef of Honorat, which is on the North side, and after having gone about 2 cables to the S S E., you may anchor in 8 or 10 fathoms, on clayey sand, about S W. by W. from the fort.

Bay of Avel

BAY OF AVEL. — From the South point of Port François a reef extends into the entrance of the Bay of Avel, without leaving any practicable pass. The Bay of Avel is extensive. It has three entrances, but the Western is the best, the Eastern

being narrow and devious. The first entrance is between Rat Islet and Sandy Islet, situated on the reefs extending from Port Francois, and which shut in the entrance to the N and N E. That to the N W is shut in by other reefs and shoals, which, though among themselves they have only difficult and narrow passages, form an excellent channel with the West coast of the bay. The three channels into the harbor are called the East, the Middle, and the West, or Lambé Channels. To enter any one of them, it is necessary to approach on the outside of the white bank, extending along shore between Port Francois and the Bay of Ancl, until Rat Islet bears S. by W. 3/4 W., and as soon as you are a league from the sandy islet, you will plainly see Trois Marées Point, which is the Eastern point of the bay, and approaching nearer, you will also see a low point on the Western side, in the interior of the bay, named Point Belie, which is known by a clump of trees that is upon it. Having recognized these points, bring them in a line, and steer in with this mark, keeping by small variations of course the depth of 10 fathoms. Thus, you will run in and anchor, which is not more than a cable's length wide, and the bottom of clay. On both sides, at a distance of one white bank, with 4 fathoms of water on their edges. It is necessary to notice that you must have recognized the two points which serve for the leading mark, 3 miles from Trois Marées Point, for, from that distance, it is necessary to come in by the mark described. In thick or hazy weather, when these objects cannot be seen at the proper distance, you must not attempt to enter by this channel. At about 3 cables' length within, the channel begins to widen, so that when Rat Islet, which you have to the starboard, bears N W., you may anchor, in from 14 to 16 fathoms. All the reefs which lie within Rat Island are visible.

To enter by the Middle Channel, you must run outside the bank until Rat Island bears S. by E. 3/4 E., and steering that course, and keeping in 9 fathoms of water, you will pass very near to some reefs which are about one quarter of a league to the Northward of Rat Islet. These are easily seen, and it is necessary to approach them within a cable's length on the port hand, and to haul up to S E., or S E. by E., to pass along the North side of that which stretches to the East from Rat Islet, and which must be left to starboard. Having once got to the S E. of Rat Islet, you may anchor, as above stated. All the reefs show clearly, and therefore there is no danger in entering by this channel when the winds allow you to shape the proper courses, but if you cannot do this, you ought not to attempt it, as there is not room to work in. If even the wind becomes scant in the channel, you must anchor in a moment, and you will be free from danger, for the hobbling ground is very good, being hard clay, and you are sheltered from the swell of the sea.

The West, or Lambé Channel, is the best and widest, for you may work in it, in all quadrants. To enter by this channel, run outside the banks or shoals, until Point Leanne, on the West side, bears South. This point lies between Lambé and Grand Bournead Points. That of Lambé is the North westernmost, and has an islet at its base.

Point Leanne is easily known by the scarped or bluff rocks which form it, and from its being the only one of any elevation lying to the South of Lambé. So soon as Point Leanne bears South, steer towards it, and as you get near it you will see, by port, the breaking of a reef of considerable extent, named Copevedalle, on the edge of which there are 5 fathoms of water, having recognized this reef, taking care to pass in and channel between it and Point Leanne, in 10 or 15 fathoms of water, and with nearly a S E. course, with which you must run in, rounding successively a little to the East to pass about 3 or 4 cables' length from Grand Bournead Point. You may then anchor to the West of Trois Marées Point. If obliged to tack, you must prolong the tacks, and fall very near the reefs, on the supposition that their breakers afford the best marks for guiding them; and that, at the very edge of them, there are 5 and 6 fathoms of water. You may also prolong the tacks to a cable from the reef, without any risk, for, though Bournead Point is foul, the reefs show above water, and have 8 and 10 fathoms up and down at their edge. The anchorage, or place which we have assumed for anchoring, between Rat Islet, Trois Marées Point, and Bournead Point, is not properly that which is called the Bay of Ancl, but, as there is good shelter in it, those who have no occasion to make a long delay, or to discharge, may avoid entering the bay.

To enter the Bay of Ancl, you must not approach Trois Marées Point nearer than 3 cables' length, for it is foul and shallow, and as soon as you are past it, steer towards the point of Morne Rouge, (Red Hill) on the East, which you may pass at about half a cable's length, in order to give a berth to a shoal which lies off Point Belie, opposite. Having passed Morne Rouge Point, you will see a fine cove, on the same side, called Lombard Cove, in which you may anchor in 7 fathoms water, at about a cable's length from the shore. From this cove, Southward, into the interior of the bay, there are many shoals; and no one should pass the cove who has not a practical knowledge of them. In the route above described, you will always find from 10 to 15 fathoms of water, on clay.

Between Trois Marées Point and that of Morne Rouge, in a line with them, and

about half a mile from the first, there is a shoal of small extent, which you will shun by clearing a way to pass, or not less than 100 fathoms length from Point Marie. You are not to place the ship's head towards Point Marie, Point Marie and you are at least 100 fathoms from the two points. The anchorage at the Landward Cove is a narrow Channel by And Day it is difficult to get a way, the best is on the Eastern side of the cove between Point Marie and Point Marie Point.

1800
1800
1800

ANSE-À-CHÈVRE-HOTTE, or CHEVRE-HOTTE BAY. To Point Embou follows the Bay of Anse, which has a round bottom lying rather to the east than that of Point Marie. It is very useful to make this bay an outer harbor, and to direct you into Chevon Bay, which is 2 miles West from it. In this bay there is a good depth of water, 10 fathoms, so that if you must keep towards the East point, which has 10 fathoms depth, and as soon as you have passed it, and the vessel begins to be headway, you may anchor. At the moment you enter under the point the bay is closed, and the little bay is closed ahead. This happens even when the wind is very fresh without the bay. To the West of this bay there is a small one, called La Riviere, which is not so favorable, which has little depth, and is fit for small craft only.

1800
1800

POINT LA TRINITE. Four miles Westward from the Bay of Chevon Bay, there is Point La Trinite, of the former Bottom 100 fathoms broad, and the West point which is named Palmarie, is abutted by a chain of rocks extending nearly a league to the West, and almost to Point La Trinite. Land to Chevon is a good roadstead, and it is, if necessary, a ship of the line may ride in it, for throughout it there are not less than 10 fathoms water, and at least a cable's length from the shore. To anchor in it you must pass in at the East point, and anchor in about the middle of the bay, or else a shoal. At a short league Westward from Palmarie Point lies that of Point Marie. The cove between is foul, with sunken rocks, which extend half a league out to sea.

1800

PORT PAIX. Eight miles from Point La Trinite is that of the Chevon, which the North coast is all land at this part of the coast, and which, from a distance, may be mistaken for Point La Trinite. The coast between is very clear. From the point the coast trends S. W. by S. to form the cove of Port Paix. To enter here you must avoid the East shore, because from a point which has a little to the N. E. of the town a reef reaches out about a cable's length, and immediately without it there is a depth of 10 fathoms, with oozy sand. To avoid this reef, keep in the middle of the entrance, which has only 7 cables length in breadth, and anchor to the N. W. from the town, or 10 or 11 fathoms, on oozy sand, about a cable and a half from the shore.

1800
1800

CHANNEL OF FORTUNE. Nearly North from Point La Trinite, or the East point of Point Marie, there is a channel, which extends nearly East and West, and, in that direction, is about a league in extent, but only one from N. to S. All the North side is irregular, and steep, and the South side, for the most part bounded by a shoal and reefs. The only good anchorage in Fortune is that of Besseterre, on the South side, at a league, and a half from the East point. Here formed by the shore and the reefs which run out from it, and no vessel drawing more than 10 or 12 feet, can ride in it. The passage is narrow, but easy to fetch. You must keep the weather reefs to the left, leaving them on the starboard head, and steer N. N. W. and N. by the light, you leave on the port hand. Do not be afraid of coming near the line, and anchor in good ground, so soon as you have brought the lee reef to bear S. W. by W. you may come to anchor outside of the reef, upon white ground a mile to the westward of Besseterre.

To the Eastward of Besseterre, towards Portugal for the East Point, there are several bays or coves, in which boats or schooners may anchor, but nothing of consequence.

The channel which the Isle of Fortune forms with Hayti, is 10 miles wide, and fit for every class of vessels, which may commodiously beat in it, and often with great advantage, for getting to windward, when the currents in it run to the Eastward, which they do for the greater part of the year, for rarely, and only do they sometimes change their direction to West. In the latter case, it is necessary to ride near Northward, and get away 7 leagues from the Fortune, to beat to windward. When beating in the Fortune Channel, you ought to stand on within less than a mile of the coast on every tack, for towards the coast the current is stronger, and the wind more favorable, than in mid channel. As there are several bays on each side, the setting of the current is neither uniform, nor in the same direction. You will sometimes see it run in numerous directions, and some times, in the middle of the channel, it will run contrary to the edge of the shore.

1800
1800
1800

PORT PAIX, PORT NICOLAS' MOLE. Four leagues from Port Paix, or Point Marie, is Port Montique. The coast between is clear, and full or scraped. Port Montique has severely an opening of 1 cable's length, its bottom is uneven, and riddled with rocks, which render it necessary to examine it with the lead before you let go a cable, for between the two outer points you cannot find bottom with 10 fathoms of line.

To
Port

 it is stronger, and the
 wind blows on each side,
 a direction. You will
 in the middle of the channel,

league from Port Par-
 in scouped. Port Mont-
 is unequal, and runs
 to land before you, let
 of bottom with 10 fathoms

At a league and a half from Port Mont, is Port Vieux, and the canal between
 the two is only a step or two wide. There are no better than Port Mont, and
 an anchor for Fair ships, as the entrance is narrow, and composed of a reef which
 reaches all along a cable length from its Eastern point, and upon which there are
 more than 1000 or more trees. To enter this anchorage, it is necessary to keep
 close to all the East point, and land by the wind, steering about the reef to anchor
 as a full 10 fathoms in the center of the reef, on a bay, and about N. N. E. from a buoy,
 which is at the bottom of the reef.

From the Port Vieux, the anchorage of Fair Harbour, which is good, and
 may be used. On approaching this place you ought to run in the reef on the East side,
 which has 10 fathoms deep to its edge. The anchorage for Fair ships is about 3
 cables length from the Eastern head of the reef, 10 fathoms, and care must be taken
 not to get to the two points which are on the East side, for though it is possible to
 anchor in a bay it is not advisable, as the depth suddenly differs, and the bot-
 tom is not very clear.

You should you lie to the North west of Fair Harbour, at a short league, with Fair
 to land, and half the distance, Fair open with the point, you will find 10 fathoms of
 water very good, and a little further out 50 fathoms.

From Fair Harbour, the coast forms a great light to the southward, and forms the pen-
 insula called Presque Isle, in the Middle West, the point of which is called the Middle
 Point, has 10 miles W. S. W. from it. All this shore, between is rocky, and does not
 offer any shelter. At all times the current here are very perceptible near the shore,
 and generally set west. At 9 leagues in the offing, they are less so, and run to the
 North east. Near the peninsula they are much stronger, and commonly set to the
 North.

FAIR HARBOR, MIDDLE BAY, OR HARBOUR. This harbor is large, and some
 great, but not very deep, and the town, which you will see very soon, is
 surrounded the cape. You may stand very clear to either shore, but it is not a safe
 to do in the South side, more room for vessels than on the south side, as there is
 an anchorage around which you have an 100 fathoms cable, though very near the shore.
 The anchorage is before the town, and under this bay is 10 fathoms, sandy
 bottom. In a mist, you must be prepared against the pull of a rapidly which
 comes down the bay with such violence, as to endanger the vessels.

Within the bay, or harbor, you will be sheltered from every wind. There is a
 river to water, and places where a ship may be encircled with her side to the shore.
 When it blows hard it is difficult to get to the anchorage, and if you are not quick in
 getting on, the anchor may fall from 10 to 15 fathoms.

The Direction says that the North coast from Cape St. Nicolas has a white bank
 which stretches about one third of a cable from the shore, and on which there is 10
 and 15 fathoms water. The South shore has a white bank, which extends
 about a cable length from an interior point N. W. of the town, upon which there is a
 battery. From this point the white bank extends directly to the East Point, the
 East of the town, and there, from when to the North west of that point, you may
 not push the bank to the South further than to have the South part of the town to
 be fact. You should also be aware, that on the South coast, and a little to the
 West of the shore mentioned point, no bottom has been found, therefore you ought
 not to get out and back in time. On the northern bank, there is not an anchorage, but
 it is possible to get on an anchor, although it must be done very near to the shore. In
 the anchorage, which is well sheltered from all winds, you will see the deep
 ground of the harbor.

In coming out you will see, to the South west, the point of the cape, which forms the
 entrance, and further to the South west you will then see the Point de Cap au
 Fort, and Ends Cape. The latter has 5 miles to the South west of the Point de
 Cap au Fort, and the coast thence extends 10 leagues more, nearly in the same direction,
 to the Point de la Perle, or Point Point.

The sea breeze of the Middle is from N. E. by N. It comes on at 9 in the morning,
 and blows very strong till 10 or 11 at night. The land breeze comes on near sunset
 at 5. It continues till 6 in the morning, then dies away, and it is calm till 8. It
 then blows Northward, ship generally weigh at 8 or 10 at night, when the sea
 breeze begins to slacken enough to run them out.

Directions for ships bound to Cape Haytien, &c. from the Westward

In advancing from the Westward towards Cape Haytien, go to the N. E. part of
 Pointe Island a good berth, and after you get to windward of the East end of the
 Point you will see the cape.

The land to the West of Pointe Parv shut to the Northward, a low point, and rises
 gradually towards the South to a high mountain, with a sugar loaf top, and then a

*See also
 M. D. 10
 P. 10*

declines on the same side to a large valley, whence it rises quickly to a prodigious high mountain, smooth at the top, and the highest land in this part of Hayti. The high land after this, to the Southward, is of sugar-loaf form, with a little one to the South of it, which are both 10 or 12 miles in the country. The next high land, or point, which is seen by the water side, is Cape Haytien. The land, at first, makes like a saddle; but on nearer approach, a low point will appear, which shuts from the Eastward the Eastern part of the saddle land. This is Point Picolet, or the Cape land, the extremity of the cape already described.

The Western coasts of Hayti or St. Domingo, between St. Nicolas' Mole and Cape Tiburon.

In proceeding from St. Nicolas' Mole, as already observed, you will besery to the Southward the Pointe du Cap-au-Foux, or Fools' Cape, which lies 5¹/₂ miles to the Southward of St. Nicolas' Point; and the coast thence trends 2¹/₂ leagues more, nearly in the same direction, to the Pointe de la Perle, or Pearl Point.

This part of the coast is steep, without any shelter; but here it is generally a calm. The currents inshore set to the Northward, and 2 leagues in the offing, to the W. and W.S.W.

*Platte-
forme, or
Platform
&c.*

PLATTE-FORME, or PLATFORM, &c.—From Point de la Perle, the coast rounds to the South eastward and East, to the Point of the Platform, which is at the distance of 3 leagues from the former. This point is easily distinguished, as well by its flat form as by its being the Southernmost of this part of the island. The anchorage is before a small sandy cove, at the bottom of which some houses are seen. You anchor near the shore in 8 or 10 fathoms, weedy bottom. At this place water may be obtained after rains, but there is none to be had at other times.

To anchor under the Platform, bring its Souther most point E. by S., the Western most point in sight W.N.W., the watering-place N.N.E. Then come to in about 9 fathoms. In deeper water the ground is foul; and the nearer the shore the clearer the bottom. The bank is very steep for 2 cables' length. Without, 10 fathoms soundings will not be found. The bay is very convenient for cruising ships to heel and boom top in, &c.

From the Platform Point to Point Pierre, on the South side of the entrance of the Port of Gonaïves, the bearing and distance are E. 48° S., 10 leagues. The point is high and steep, and all the coast between is safe, and may be ranged very near. There is anchorage, even for large ships, at Henne Bay and at Port Piment, but it ought to be used only in case of necessity. In the winter months there are tremendous or gales of wind almost every night, coming from the S.E., some of which are violent; and unless you have business on this part of the coast, it is best to stand off 2 or 3 leagues, so that you may, with any wind, keep to the Westward.

Gonaïves

GONAÏVES.—The bay of Gonaïves is very large and fine, the anchorage excellent, and the entrance very easy. You range along the shore, at half a league or 2 miles distance, steering nearly East, and let go your anchor in from 10 to 6 fathoms, *ooze*. You will find from the entrance under Gonaïves Point, which is low, and one mile East of Point Pierre, 15 and 12 fathoms; the water decreases as you get into the bay. When you are a good half league from the land, and 2 miles from the Debarcadere, (or landing place,) you will have 6 fathoms. After you have doubled the point, bearing it on your port hand, you will see Fort Castres on a point of land, which you must not approach too near, as there is a key that lies about a mile South of the point.

Observe that from the South point of the entrance, a reef extends to the N.E. to the distance of a quarter of a mile. It is nearly steep to from 6 fathoms.

The harbor of Gonaïves is an excellent one, and capable of containing any number of ships of the largest size completely shut from all winds; it is of very easy access, and generally clear, excepting a small reef that extends about 2 cables' length from Fort Castres, on the North side. The latitude of the town is 19° 26' 41", and its longitude 72° 41' 7" W. Var. 5° 50' E., 1817.

Ships intending to anchor at Gonaïves, and having advanced to Point Pevis, on the North side of the entrance, will gain soundings in 15 or 16 fathoms, and have the town in sight, bearing about E. by N; they may proceed for the town on that bearing, keeping in mid-channel or any way near it; then soundings will be very regular. When well up the harbor, you will see Fort Castres, which stands on the North side, on the top of a small hill, about one mile without the town. When this fort bears N. by E. ½ E. you will have 7 fathoms in mid-channel, fine soft mud. When it bears N. by W. ½ W., in 5 or 6 fathoms, this seems to be the best anchorage, and as close in as a ship-of-war ought to go. You may go so far up the harbor as to have Fort Castres bearing N.W. in 4 fathoms; but the best anchorage is with it bearing N. by W ½ W., and the middle of the town E. ½ N., nearly in mid-channel.

The soundings all over the harbor are so very regular, that it is not necessary to

, that it is not necessary to

have marks for running in and out by; but in the event of having to bent with the sea-breeze, you must not stand too near Fort Castres, as there is a small reef extending from it to the Southward; the mark for keeping clear of this reef is a large tree behind the town on with the Northernmost houses, bearing E. by N.; but this reef stretches to so short a distance that a ship will scarcely stand so near the shore as to touch it. In standing to the South side of the harbor, give the shore a good berth until without the inner point, and after that you may stand from shore to shore, by your lead, with safety.

ST. MARK.—From Point Pierre, without the entrance of the bay of Gonaives, *St. Mark* the distance to Cape St. Mark, in a direction nearly South, is nearly 7 leagues. A league and a half to the Northward of St. Mark's Bay is a low point, which appears at a distance like an island, and forms a cape that is called La Pointe de Morne au Diable, or the Devil's Bluff Point: it points out the mouth of the River Artibonite, which falls into the sea 2 miles Northward of the point. There is an anchorage the whole length of this coast for small vessels only.

Cape St. Mark is high, and of a round form: you will desery at a great distance the hillock which forms it, and stands only one mile from the seaside.

The opening of the Bay of St. Mark lies to the North of the cape; it extends one league within the land, and the water in it has a great depth. Ships anchor in the bottom of the bay under the town, in 15 or 18 fathoms of water; small vessels may come into less water, but they will be very near the shore. In the South side of the bay is a piece of foul ground, extending 2 miles from a bluff point to the S.E., and on which a reef stretches out about 2 cables' length from the coast.

The following Description of the Navigation between the Platform and St. Mark, is given by Capt. Hester, an English navigator.

"About 9 leagues Eastward of the Platform is the fine bay in the harbor of Gonaives. All along this coast you are sure, about 10 o'clock in the forenoon, to have the sea-breeze, which lasts till night, and then you have the wind off shore; therefore you may stay till that time, before which there is little or no wind at all. If you intend to go into Gonaives, you must keep a good distance off the South point, which is flat for a considerable distance. When you are about the point open with the bay you will desery a small island, which you must leave on your port side, and run in with your lead in 10 or 12 fathoms of water. You may also run along close by the island, if you choose, in 4 or 5 fathoms.

"About 2 leagues to the Southward of Gonaives is Artibonite Point, and 2 leagues further South, Artibonite River. In sailing from Gonaives to the latter place, it is good to keep your lead; for, as you come near the river, you will find the water shoalen to about 4 fathoms, and after that deepening again to 7 or 8 fathoms.

"This place is very remarkable, the land being high and uneven, and a bold clear shore all along to the Northward, from the Platform to Gonaives. When you have run 8 or 9 leagues E.S.E. ½ E., you will see the land ahead, or Eastward, very low by the water-side, and prodigious mountains over it; this low land reaches from Gonaives to the Southward of Artibonite River, about a mile; and its South end, somewhat higher than the rest, appears like a table-land, overgrown with weeds and green trees; this is the Devil's Bluff: round its South end is the Bay of St. Mark, the other point of which you can see to the S.W. of the Devil's Bluff. To anchor off the river, bring the South end of the low land to bear South, 3 miles distant; and, as you run in, you will see five or six small houses by the water-side; bring them to bear E.S.E., 2 miles; then the river will bear S.E. On the starboard side, or the South side of the entrance of the river, there is, likewise, a small hole, which you may see. Be sure to keep these bearings, and you will be upon a fine level bank, where you may anchor in what water you please, from 20 to 6 fathoms. But if you go within 2 miles of the shore, you will drop off that bank from 6 fathoms to 20 the next east, then 50 or 60, and then 90 or 100 fathoms, w... in less than half a mile of the shore, and from that to 5, at once. When you are at anchor at Artibonite, you may see the Platform, bearing W.N.W., about 10 leagues.

"Artibonite River is not a place of great note, because it ebbs almost dry at low-water; neither is there any town in this place, but only some plantations, 5 or 6 miles up the river; there you can have good water, but no wood. The sea-wind comes on at noon, at N.W., until 10 at night, and the land-wind at E. by S., until 8 in the morning."

From St. Mark's Point the coast of Hayti trends nearly S.E., true, 6¹/₂ leagues, to La Soufriere, or Vazes Point; and thence E.S.E., 5 leagues, to Port an Prince. The coast is generally clean and bold, and you may run along it at the distance of a mile, in 10, 15, and 20 fathoms water. In proceeding thus, you will first perceive the magazine of Moutroni, and afterwards the villages of Arcahuis, or Arcahye, and

Boucaasin; and finally the city of Port au Prince. Off the coast, at about half way between St. Mark's Point and Port au Prince, are three small islets, called the Arcadins, which are situated at nearly a league from the shore, and separated by channels about half a mile in breadth. Near these islets, on every side, the depths are 5 and 6 fathoms.

To the E. by S. of Boucaasin, and very near the coast, is Monton, or Sheep Key. A passage ought never to be attempted within this key; near it, on the outside, the coast is clear, and water deep. About 2 leagues to the Southward of this island is the roadstead.

Foso; this to the N. E., and Lamentin Point to the S. W., form the entrance of the bay of Port au Prince. To the Westward of this roadstead is an extensive bank with a cluster of islets, of which the Easternmost is distant about 2 miles from Foso Roadstead, and the Southernmost 3 miles from Lamentin Point. There are, besides two other islets, which lie almost in the direction of the two points of the bay, and which are 4 miles from Foso Road, and 2 from Lamentin Point.

*Port au
Prince*

PORT AU PRINCE.*—The shore at the bottom of Port au Prince is very good, and has a large group of islets. These form the inner anchorage; and to go in this the aid of a pilot is indispensable; but the Grand Road is without the reefs, and may be entered without a pilot.

Those bound to Port au Prince from the N. W., after having made St. Mark's Point, may shape their course, either to pass between the Arcadins and the coast, or between them and the island Gonaive. The first appears to be the best route, for thus the foul grounds on the S. E. side of Gonaive must be avoided. It is also to be observed that the wind in the channel is generally from the N. E.; the nearer, therefore, you pass to the main land, the more free will you run to the Eastward.

Again, almost every afternoon in the rainy season there are tornadoes in the channel, which compel vessels to lie to, and to keep on boards or tacks, that they may not fall upon the reefs of Gonaive. If you can foresee the gale, it will be best to gain an anchorage near Arcadins Point, and there ride it out; or, you may anchor to the Northward of Leogane, on the South side of the channel, upon the ground extending from Gonaive Island, as shown in the chart.

When past the Arcadins, your course will be about S. E. by S. to get near Lamentin Point. If caught by night to the Eastward of this point, here you may anchor. From the point to the anchorage of Port au Prince the distance is 4 miles, and to make it you must steer towards the city, and anchor about half a mile outside the islets in 10 or 15 fathoms.

The channel between the Arcadins and coast is 2 miles wide, and in the middle of it you will never have more than 28, nor less than 10 fathoms. The water deepens towards the Arcadins to 6 or 8 fathoms, corally ground; at the same distance from the opposite shore is the like depth, with muddy bottom.

From Pearl Point the entrance of St. Mark's Channel, midway between Cape St. Mark and the island of Gonaive, the course and distance are S. E. 4 E., 16 leagues. This will bring you to the Westward of Cape St. Mark, for which you may steer, or, you may continue the same course 6 leagues further, which will lead clear of the Arcadins.

Should it be night when you enter the channel of St. Mark, you should steer S. S. E. 4 E., in order to clear the Arcadins and the Eastern end of Gonaive Island. Having run about 4 leagues on this track, the course will be about S. E. by E., 3 leagues, to make Point Lamentin, which is on the South side, to the Westward of Port au Prince. You may range along this coast without fear, only avoiding the shoals of the sandy key, which lie at a short league Northward of the point. Should you pass this point in the night, you would do right, after you have run a mile, or a mile and a half, to anchor; you will find 12 or 18 fathoms water, the ground good, and the water always smooth.

You may be forced to turn in this channel, but you must not go so near to the Gonaive as to the St. Domingo side; the latter being safe, may be approached anywhere, within half a league.

The Arcadins, as before noticed, are not to be feared; a shoal stretches on from them a mile, or half a league at most, with 5 or 6 fathoms on it; on the edge of the West and S. W. sides you will have from 12 to 15 fathoms, corally ground. On the East side is good ground to be found in 8, 12, and 14 fathoms, coarse sand and shells.

*Gonaive
Island.*

GONAIVE ISLAND.—The greatest length of Gonaive Island is 10 leagues E. S. E. and W. N. W. its breadth, which is very regular, is nearly 2 leagues.

This island was surveyed in 1787, by M. de Licende de Sepinauville, who has given the following description of its coasts and the adjacent dangers:

* See Plan by Com. R. Owen, published by E. & G. W. Blunt, 1833.

Sepmanville, who has given
ngers:

The most dangerous reefs are those which lie to the S. E. of Petite, or Little Gonaive, which is situate near the S. E. point of the great island. These seem to be joined with the land of the Little Gonaive, and stretch more than a league into the offing, lying at about 800 toises, or nearly a common English mile from the shore. A vessel may pass, in an urgent case, between them and the Little Gonaive; but the attempt would be imprudent, especially if the wind be not well set in, as the currents are very strong and irregular. I have observed, however, that in this part they run more generally to the N. N. E., and between the two Gonaives.

Small vessels, drawing 8 or 9 feet water, may find a good anchorage to the West of the Little Gonaive, which may be best entered from the Southward.

The N. E. point of Gonaive, called Galet Point, is low, and bordered with a reef, which stretches along the East coast, towards the South, and extends 1,100 toises, (1,170 English fathoms,) opposite the place called Trou a l'Eau, or Water Hole. Within is a wide ground, where there are from 4 to 6 fathoms of water.

To sail near this reef, which every vessel can do that draws 9 or 10 feet, you must, coming from the East, take a channel which is opposite to a fisherman's hut. There are several other channels, which are easily known by the non appearance of white gravel. About 88 fathoms within the reef, you may range along the coast as far as Anse a Galet, or Galet Cove, in case the wind should fail. There is anchorage everywhere; but the places to be preferred are Port Cove, Consantin's Hole, and especially Galet Cove, which are very convenient; the hold is good, and the reefs shelter you from the swell of the sea.

The several anchorages on the North coast, for boats or schooners, are l'Isle à Mare, Grand Lagoon, and Bahama Channel, where you are equally sheltered; the remainder of the coast is likewise bordered with reefs, but they are very near the shore, and you find there no anchorage.

The Western part is an iron bound coast, along which you may range pretty near; but it is not so from the S. W. point of Pointe à Retoumes, where you may find a number of small detached reefs, almost even with the water. Several small vessels may anchor in that part, on the spot named Les Baleines, or the Whales, but not without a pilot well acquainted.

The only place where two or three large ships, such as frigates, can anchor, is La Baie du Parc, or Park Bay, which lies to the N. W. of Pointe Fantastique, the South point of the island, but coming into it is dangerous, on account of several detached reefs, which are never seen.

ROCHELOIS.—The reef called Rochelois had been fatal to many ships, its true situation having never been well ascertained: it lies in the channel which separates the South coast of the Gonaive from that of Hayti. M. Le Compte de la Luzerne ordered me to survey, and determine the position of that reef. I went and anchored within a cable's length of the rocks, which are above water: I landed on these rocks, where I took four observations of latitude, as well as the bearing of all the objects in sight; and having measured the whole extent of the shoal, I found its breadth to be 2000 toises, (2130 fathoms,) in a direction N. and S., nearly, and its length 3155 toises, (3360 fathoms,) from E. to W.

The rocks, called Progues, which are towards the middle of this reef, were already known; I found their extent to be 125 toises, (133 fathoms;) they are quite uncovered at low-tide, but three heads only are perceived at high-water. M. Le Compte de Chastenot Puysegur, who had occasion to explore the extent of this reef, says, in his account of the navigation along the coast of St. Domingo, that the rocks which show themselves at low-water, are the only things to be feared on the Rochelois: but I have found two other shoals of very small extent, which are very dangerous, since they have only 2 fathoms water. They lie to the N. W. of the rocks in the middle, one at 800 toises distance, and the other at 300. There may be some other dangers on the Rochelois, but I could not make myself sure of it, having been only four days on that expedition. Prudence requires that, with a large ship, you should avoid it entirely: there is more room for lacking to the North of that reef than to the Southward of it: you are only to keep at the distance of one mile, at least, from Gonaive, if you pass by the North; whereas, in passing by the South, you may range along the Haytien coast, which is clear and safe.

The latitude of the middle of the Rochelois, deduced from four observations, is 18° 37' 20" N.

PORT AU PRINCE, to the WESTWARD.—On leaving Port au Prince, when bound to Petite Gonaive, you may range along the South coast, at the distance of one or two miles, all the shores being bold and safe, as far as Point Leogane.

From Point Lamentin to Leogane Point, there is no anchorage; but you will find a good bottom for anchoring between the latter point and the anchorage off the town of Leogane.

From Leogane, the coast trends to the South, and forms the bays of Grand Gonaive

Rochelois

Port au Prince

and Petite Gonaive, which are separated by a point and a hill, named the Tapion, or Hummock of Gonaive. You enter into Petite Gonaive Bay, by leaving on the port hand an islet which is very near the coast, and which lies to the North of the town; to the Westward of this islet you may anchor in 9, 12, and 15 fathoms. Petite Gonaive is 10 leagues from Port au Prince; but, as you are forced to double Point Legendre, the run is longer.

Miragoane.

MIRAGOANE.—From the Hummock of Petite Gonaive to the Tapion du Trou Choucheou, or Hummock of Miragoane, the coast runs West, 8 miles; thence W. & S., 6½ miles, to the careening island, or Miragoane Bay.

Bound to Miragoane, and off the West end of Gonaive, give it a berth of 3 or 4 miles, and steer E.S.E. or S.E. by E.; or keep the Gonaive side of the channel best on board to clear Rochelois. Steer up in the same way until the highest hummock on Gonaive bears North. This hummock is the Western part of the table land, so called, and from the West end of Gonaive appears like a high mountain. When this highest land bears North, steer S. or S. & E. for Miragoane. The land about Miragoane may be known by a remarkable clearing up and down the side of the mountain, presenting the appearance of a long narrow grass-field scorched by the sun. This is 6 or 7 miles to the East of the town. Continue standing in for this mark until near the land, when the town of Miragoane may be seen to the Westward.

To anchor at Miragoane, you come within a mile of the careening island, when you perceive a small town at the foot of a mountain, and some mangrove islands to the Westward. You keep the mid-channel between the first islet and the shore, where the village is situated, and come to an anchor within, in from 18 to 8 fathoms, sandy bottom. This anchorage ought not to be taken without a pilot; the channel is not more than a cable's length in width, and you must anchor so soon as you are within.

From Miragoane Careening Island, the coast bends in, and forms the bay of that name. It is shut in on the North by Frigate Island, a small islet, from which a white shoal extends half a league to the Eastward, and nearly North, to the anchorage at Miragoane; which obliges you, in coming in or going out, to keep the island shore very close aboard. From this place the coast trends West, to the village of Rochelois, which is situated at the foot of a large hummock.

From Miragoane, the coast to the Westward is clear and deep; and beyond Rochelois, are seen the towns of L'Anse-a-Veau and Petit Trou. From the last, the coast forms a large bay, Baradaïres.

Baradaïres Bay.

BARADAÏRES BAY.—From the village of Rochelois to the entrance of the Bay of Baradaïres, the coast runs W. 5 leagues. Baradaïres Bay is formed on the S.E. by Roitelets Point, and on the N.W. by the Bee du Marsonin, or the Porpoise Snout. These points bear from each other nearly N.W. and S.E., 4 miles. Near the East coast of the bay there is an island, with several islets, which send out a reef and shallow, that almost join the Western coast, leaving a pass, or channel, of only 5 or 6 cables' length in breadth. To proceed into the bay, you keep along the peninsula of the Bee, and come into from 8 to 10 fathoms. There is a good depth of water in the middle of the bay, which is of great extent; but there are several weedy shoals, which prevent you going in without a pilot, well acquainted.

The Caymites.

THE CAYMITES, &c.—The Northern extremity of the Bee du Marsonin, and the North part of Grand Caymite Island, bear nearly W.N.W. and E.S.E., 4 leagues.

The coast West of the peninsula of the Bee bends in to the Southward, and forms a bight; thence, rounding out a little, it trends W. by N., as far as Point Jeremie. This bight and Grand Caymite Island, form a large bay, called Caymite Bay, where there is very good anchorage for all sorts of vessels. You may come to it without a pilot, and anchor under the island, in what depth you choose. You may also proceed to Plamand's Bay, near the peninsula, ranging along the peninsula side, and anchor opposite a sandy beach, in what depth you please.

The Bay of Caymites presents several very fine anchorages, very easy to come at with the assistance of the lead alone; but there is not a good passage between the Grand Caymite and the shore; and you will not find more than 13 feet water upon the white shoals of the Little Caymite, or of Foucaud Islet; and then there are several coral rocks, which rise within 2 or 3 feet of the surface of the water, so that no vessels but very small ones, ever attempt it without a pilot. These white shoals extend 3 leagues W.S.W. from the Grand Caymite.

Jeremie.

JEREMIE.—From the North point of the Grand Caymite to the Point Riviere Salce; or Cape Rosa, which is 1½ league W.N.W. of Point Jeremie, is 9½ leagues; this Salt River Point is the Northernmost point Westward from Port au Prince. Under Point Jeremie is the village of that name, whose anchorage is very small, and not proper for large ships; schooners and small vessels may anchor within the reef, but no ships which draw upwards of 12 or 14 feet should ever anchor here, except in case of necessity, there being no shelter for them; in short, it is a bad anchorage, which must be avoided during the Norths.

mite to the Point Riviere int Jeremie, is 9 $\frac{1}{2}$ leagues ard from Port au Prince, anchorage is very small, and may anchor within the reef, ever anchor here, except in ort, it is a bad anchorage,

From Cape Rosa, or Salt River Point, to Cape Dame Marie, or Donna Maria, the coast trends W. S. W., 13 miles.

All this shore is safe and bold within a quarter of a league; it does not present any shelter, although, in case of necessity, you might anchor in the Anse a Claire, or Clair Bay, which is 1 $\frac{1}{2}$ league from Salt River. This bay, or rather cove, is so very small, that two ships, 100 feet long, would be embarrassed by each other; it can only serve as a shelter to very small vessels, and is easily discovered by keeping along shore.

CAPE DAME MARIE, or DONNA MARIA.—So soon as you desery Cape Dame Marie, by the false cape of that name, and are half a league distant from it, you will strike soundings of from 15 to 18 fathoms, and may range along this cape at the distance of a quarter of a league, in from 8 to 10 fathoms, weedy bottom.

To anchor in the Bay of Dame Marie, you must keep the shore on board, steering about S. E., the wind being generally adverse; and with your lead you come to an anchor W. N. W. of a large white tapion, or hummock, on which stands a battery, and within a musket shot of which you will find 5 fathoms. There is anchoring bottom all over this bay; a mile from the shore you will have from 1 to 6 fathoms, and at 2 miles, from 6 to 10. You will be sheltered from the winds between the North and South, passing by the East; notwithstanding which, ships that lie in 8 or 10 fathoms will feel the swell, if there is a fresh breeze without. In entering, keep about half a mile off, but not less, in order to keep clear of a reef which extends to the length of a cable and a half to the West from the cape. Preserve this distance from the coast until past the False Cape, to the Southward of Cape Dame Marie, and which is also foul. When once past False Cape, you may haul to the wind, which is generally sent in the bay, to get the vessel's head to S. E., with which course, and keeping the lead going, you may gain the anchorage as above.

From Cape Dame Marie the coast runs S. by W., 5 leagues, to Pointe des Irois, and forms, at that distance, several bays and coves, where vessels may anchor. In general, a frigate may run in along this coast with her lead, and anchor in any part, there being no shoals, or any danger under water, the ground gradually increasing towards the shore.

To the S. by W. of Cape Dame Marie, 2 $\frac{1}{2}$ leagues distant, and about half a league off Point Ministre or Minister Point, are some rocks, called Les Balemes, or the Whales. These rocks are above water and surrounded with a white shoal, which does not extend more than half a cable's length from them, and on which are 4 fathoms. A ship can sail between it and the shore. In the mid channel she will have 6 fathoms, and may go as close as she pleases to take them on the off side. The sea always breaks on this shoal.

One league to the S. S. E. from the Whales lies Pierre Joseph's Islet, where a corvet may anchor. The anchorage is very good and easy, and large ships anchor to the S. W. of the islet.

All along this Western coast you have ground at 2 leagues from the shore, the depth gradually increasing as you leave the land; so that, in general, you will find 4 and 5 fathoms, at one mile distant; 10 or 12, at 2 miles, and regularly from 15 to 17, at 3 miles. When you get into 30 fathoms, you will lose soundings suddenly.

POINTE DES IROIS, or IRISH POINT, as the English sailors call it, is the Westernmost point of Hayti. It is not very high, though remarkable from a small hummock on its extremity, which appears detached from the coast, and makes like an island. This point forms the North part of the Baie des Irois, or Irish Bay. You may range very close to the land on the North side of the bay, there being from 9 to 18 fathoms touching the shore.

The anchorage is to the N. W. of a black rock, which is seen a little way to the Southward of the town. It is in from 9 to 10 fathoms, shelly ground. You may anchor likewise to the Southward of the rocky islet, N. N. W. of a small hummock, towards the middle of the bay. The depth is here from 8 to 9 fathoms, sandy and muddy ground.

The bay is exposed to Southerly winds. There is always a great sea within, and the D-barcaire, or landing-place, is of course a bad one. It is situated in the eddy of the currents, which set to the Northward on the West side, and to the S. E. on the East coast. Besides, the sea in the eddy is alternately agitated with violence by the N. E. and East breezes, which prevail on the West coast, and by the S. E. winds that blow on the South coast. Irois Bay is terminated to the South by Cape Carcasse, which, with Cap-an-Foux, or Fools' Cape, forms a large roundish point, whose end is at Cape Tiburon.

CAPE TIBURON.—These three capes, seen at a distance, form but one, which is called Cape Tiburon, and is very easily known by its form and height. It is a large mountain, very lofty, whose top is rounded like the back of a dosser, or French hand-basket, and comes gradually down towards the sea.

Pointe de Irois, or Irish Point.

con.

Cape Tiburon, properly speaking, is 5 miles S. 25° E. of Irish Point, and forms the entrance of Tiburon Bay, which is to the Eastward of it. Its situation is lat. 18° 19' 25", long. 74° 27' 32". You will get no ground at 50 fathoms, 2 cables' length from the coast, between Cape Carcasse and very near Cape Tiburon; but at the latter, at that distance, you will have from 24 to 30 fathoms, and a little further out quickly lose soundings.

On the North shore of Tiburon Bay, the water is deep to within 2 or 3 cables' length of the rocks, and within half a cable's length you have 6 and 7 fathoms, stiff clayish ground. On the East and S.E. shores you have 4 and 13 fathoms, fine muddy ground, within a cable's length all round. The edge of soundings runs as the bay forms, half a mile from its head. You may anchor anywhere in the bay; but bring Point Burgos, the South point, (which is foily) S. by E., and the pitch of Cape Tiburon W.N.W., in 4 or 5 fathoms. From that to 8 or 9 is very good ground. Wooding and watering in plenty. You may either land your casks, and roll them over a narrow neck of land into the river, or fill them in your boats with buckets.

The Windward Channel between Hayti and Jamaica.

By the Windward Channel is meant that channel which lies between Hayti on the one side, and Cuba and Jamaica on the other. The coasts which form it on the East and North have already been described, and the coasts of Jamaica are described hereafter. The breadth of the channel between Cape Tiburon, in Hayti, and Morant Point, the Eastern end of Jamaica, is 31 leagues, in a W.S.W. direction; and to the Northward of this line is the little isle called Navaza, and a dangerous shoal bank, called that of the Formigas; to the Southward is a bank of soundings, but clear of dangers, and the Morant Keys, with their surrounding bank. These we shall describe in order.

Navaza.

NAVAZA is about 2 miles in length, E.S.E. and W.N.W., and about 14 mile broad at its widest part. Lat. 18° 25' N., long. 75° 2'. It was surveyed in 1803 by Mr. Francis Owen, Master, R. N., who says, "This island is a flat level rock, apparently of volcanic origin, is above 300 feet in height, and covered with small shrubs. It may be seen on a clear day from the deck of a line-of-battle ship, about 7 leagues. Every part the roof shows a rocky perpendicular cliff, except a small space on the Northern side, which is but little above the surface of the sea. From the Western extremity of the island, a coral reef stretches to the Westward about 100 fathoms on which are only 27 feet, with 15 fathoms all round it. In every other part there are 12 fathoms water close to the shore. On the Western and Southern sides, soundings from 16 to 40 fathoms, sand, extend to the distance of three-fourths of a mile, on which you may anchor and lie smooth in a strong sea-breeze. On the North side the bottom is rocky, and the bank does not extend beyond half a mile. In crossing this island, on its Eastern side, at the distance of about one-third of a mile, you will have 34, 25, and 18 fathoms; and at half a mile, 38, and soon after no ground with 75 fathoms. At the distance of 14 mile from the East end, no bottom will be found with 236 fathoms. The N.W. end bears N. or N. by E., and the S.E. point E.S.E., or a little more Southerly, you may anchor in 16 fathoms, fine sand, about half a mile from the shore. There are great quantities of sea-fowls on the island; and round the rocks, cod and red-snappers in abundance. Between Navaza and Cape Tiburon there is a small bank of fine white sand, with plenty of fish thereon. The depth is from 14 to 16 fathoms, with the following bearings: Navaza, W. 4 S.; Cape Tiburon, E.S.E. ½ E.; and Cape Dame Marie, N.E. ½ E., by compass.

From Navaza to Cape Dame Marie, the bearing and distance are N.E. by E. ½ E., 11 leagues.

From Cape Tiburon to Morant Point, which is the East end of Jamaica, the bearing and distance are W.S.W. ¼ W., 31½ leagues; and from Navaza to the same point, S.W. by W. ¼ W., 23 leagues.

The Formigas, or Ants.

THE FORMIGAS, or ANTS, are some dangerous coral spots upon a sand-bank, nearly 9 miles in length, extending in a N.E. and S.W. direction, about 10 leagues to the Westward from Navaza. Its Eastern part bears N.E. by N., 10 miles from Morant Point, Jamaica; and from the body of the shoal, the N.E. end of Jamaica bears S.W. by W., 38 miles. The Eastern part is the shoalest, not having in some places more than 13 or 14 feet of water. The edge here is nearly steep to, and there is generally a great swell upon it. In standing over the bank, when the depth increases to 7 or 7½ fathoms, there will be a sudden increase to 13 and 15 fathoms, and thence no bottom at 20. On the Eastern edge the bottom is dark, and not easily seen in hazy weather; but to the Westward the water is discolored, and appears lighter.

The centre of the bank is about 18° 30' N., and 75° 40' W. The fall of the high land over Plantain Garden River, which is the Eastermost high land on Jamaica, bearing S.W. by S., leads directly on the bank.

THE MORANT KEYS.—These keys, which lie at the distance of 32 miles S.S. *The Morant Keys* E. from the East end of Jamaica, consist of four low islets or keys, situate in form of a crescent, and are surrounded by a dangerous reef. They are named N.E. Key, S.W. Key, Savanna or Bird Key, and S.W. Key. You may approach within 2½ miles of any of them. The reef on the Eastern side is a most dangerous ledge of coral. The keys lie between lat. 17° 24' and 17° 28', long. 75° 55'. To the N.W. of them is good anchoring ground, in 5 or 6 fathoms, white sand and shells. To anchor, give the N.E. Key a berth of 14 or 2 miles; and when the S.W. Key bears S. by E., steer directly for it, and you will pass close to Westward of the rocky spit that extends to the Westward from the N.E. Key, and has but little more than 3 fathoms over it. When the N.E. Key bears E. by N., or E. N.E., you may lead more to the Eastward, and anchor with the S.W. Key bearing S., or S. by W., and Savanna Key, the next to it, S. E., in from 5 to 6 fathoms, sandy bottom. As there are some spots of coral, it is requisite to ascertain that the bottom be clear.

These keys are only 7 or 9 feet above the water. The body of them lies from Port Morant, Jamaica, S.S. E., ¼ E., about 14 leagues. With the keys bearing S.W., nearly 1 miles, there are about 18 fathoms water, stony ground, mixed with fine red speckled gravel. With them S.W. by S., about 4 miles, there are 16 fathoms; and when S.S.W. ¼ W., 6 miles, there are 23 fathoms, with ground as above.

In order to ascertain when you are to the Eastward of the keys, observe that Morant Point, or the East end of Jamaica and the N.E. end of the same, bear from each other N.W. ¼ N. and S.E. ¼ S., so that when the North-east end, which is high and bluff, is to be seen on that bearing, or to the Westward of it, you will be to the Eastward of the keys.

Also, when coming in from the Southward for Jamaica, by keeping Vallah's Hill, hereafter noticed, to the Northward of N.W. ¼ N., you will pass clear of the keys to the Westward.

Be very cautious on approaching the keys in the night, lest you be driven on them by the current.

In turning between the Morant Keys and the East end of Jamaica, there is a good s ledge of turning-ground; and as it seldom happens that the land is not discovered before night, its bearing may direct in turning or sailing.

The coconut trees formerly on Morant Keys have been cut down, and there is not a shrub of any kind to be seen, except a few small coconut bushes on the N.E. Key. Very great care should be taken in approaching the N.E. Key, on either side, as it is foul to a great distance off; and vessels intending to anchor at the keys ought not to come on the white water at all, that is, to the Westward of the N.E. Key, until they are far enough to the Southward to have the South part of the N.E. Key bearing E. by N.; they may then haul up to the Eastward of Savanna, or Bird Key, and when it bears S.E., and the S.W. Key S., or S. ¼ W., anchor in 5 or 6 fathoms. If it is necessary to work up to this anchorage, with the wind East, you may stand to the S.W. Key by your lead, not going nearer than 5 or 6 fathoms; but the reef off the N.E. Key is steep to, and you will have 6 fathoms at one end, and the next 3, or perhaps less; therefore, in working up, keep the point of the N.E. Key always to the Northward of E. by N., after you are in the white water.

Directions for the Windward Passages, including those for sailing to and from Jamaica, and thence to New Providence, Havana, Europe, &c.

Ships from Europe, when bound to Jamaica, generally take the broad and safe channel between the islands and Guadaloupe, but they may pass it with equal safety between St. Bartholomew's and Saba, or St. Eustatius, and thence make the parallel of 17° 20' to the Southward of Hayti, or on the meridian of 70° W. When thus far advanced, they may continue W. ¼ S., until they make Altavella, or the Little Mount, which lies off the Southern point of Hayti, as already described. They will thus avoid the dangers in the vicinity of Neiva Bay, towards which there is frequently an indraught, as before noticed.

Should you happen to miss Altavella, you may probably make the land of Jacquemel, or Jaemel, before described; or, if not, with the next great promontory, of which Point Abacon and Point a Gravois are the extremities. Jacquemel may, as already shown, be distinguished from sea by the sudden cut off or drop of a hill, seen over another long hill at the upper part of the harbor. This mark leads directly to the harbor's mouth.

The Isle a Vache lies to the Eastward of Point Abacon, and forms the channel to Anse Cayes, &c. From Altavella to the East end of the Isle a Vache, the bearing and distance are W. by N., 12½ leagues. From the East end of the Isle a Vache to Point Abacon, W. by S., 14 miles; thence to Point a Gravois, W. ¼ S., 2½ leagues.

W.W. The fall of the high
most high land on Jamaica.

When off at sea, abreast of the Isle à Vache, the middle of a saddle mountain over Port St. Louis bears nearly N. by E., and then the Eastern end of Isle à Vache is between it and the ship. The island is low, though hilly, and lies so under the land of the main, that is not distinguishable from it at any considerable distance. At 6 leagues off it appears, as already said, like an assemblage of small islands. The water towards it shoalens gradually.

The saddle mountains over St. Louis, which are called the Grand Anse Mountains, are the second high range from the West end of Hayti. The Westernmost, which is highest, may be seen in clear weather 30 or 40 leagues off, on both sides of the island. Observe, however, that after noon the exhalation of vapor is sometimes so great as to render them invisible. Be cautious, at such times, of making the land, lest you run on the dangers of the Isle à Vache.

From Point à Gravois to Cape Tiburon, the bearing and distance are N.W. by W. $\frac{1}{2}$ W., 13 leagues. The land about Cape Tiburon is so high as often to be seen at more than 20 leagues off.

Morant Point, the Easternmost extremity of Jamaica, already noticed, bears from Point à Gravois W. $\frac{1}{2}$ S., 12 leagues; and from Cape Tiburon W.S.W., 21 leagues.

In running for Jamaica from the West end of Hayti, or the Isle of Albavilla, be cautious of tacking too far North, lest you should get on Morant Point, this point being extremely low. In thick hazy weather it may possibly be approached so near as to become difficult to weather; the wind setting right on, and the current always going to the East. By keeping the proper parallel, ($17^{\circ} 45'$) you will run down without danger to the Yallah's Point, off which you are sure to meet with pilots, who will conduct you to Port Royal Harbor, if required.

Sailing Directions for the Coast and Harbors of Jamaica.

*Morant
Point.
Light.*

*Morant
Point to
Kingston.*

MORANT POINT.—On this point there is a revolving light, 113 feet above the level of the sea, which can be seen in clear weather 21 miles. Yallah's Hill bears from the light-house W. $\frac{1}{2}$ S.; North-east Point, N.W. $\frac{1}{2}$ N.; and the Morant Keys, S.S.E. $\frac{1}{2}$ E., 33 miles distant. Latitude, $17^{\circ} 50' N.$ Longitude, $76^{\circ} 11' W.$

MORANT POINT TO KINGSTON.—The Southernmost high land of Jamaica to the Eastward of Port Royal is Yallah's Hill, which is very remarkable. The middle of this hill is 20 miles to the Eastward of Port Royal Point. When the fall of this hill bears W. $\frac{1}{2}$ N., a W. by S. course will carry a vessel a league or more to the Southward of the East end of the island, which is very low. The latitude at noon will be a guide; for when Yallah's Hill bears W. $\frac{1}{2}$ N., 11 or 12 leagues distant, the ship will be in lat. $17^{\circ} 50'$ or $17^{\circ} 51'$.

Should you make the Southernmost high land, bearing W.S.W., 9 or 10 leagues distant, when bound to the South side of the island, you must haul up S.W., to clear the East end, which will not be in sight at a greater distance than 4 leagues; and observe, also, that a current frequently sets to the Northward around this end of the island.

From off Morant Point, or the East end of Jamaica, when bound to Port Royal, ships should keep at a distance of 4 miles from shore, until past Morant Bay, as the coast from the East end to the Southward of Rocky Point is lined with a reef that stretches nearly 2 miles outward, and over a part of which the sea generally breaks.

To the Westward from Rocky Point the coast continues rocky to about one mile from the shore, as far as Morant Bay; it is then clear to the white cliffs called the White Horses, off which there are some rocks, at about half a mile from shore.

From the White Horses to Yallah's Point, the distance is one league. In running down, when the former bear North, and Yallah's Point West, you will have soundings, and frequently see the bottom in 7, 8, 9, and 10 fathoms; and on approaching Yallah's Point, the water will be found to deepen until you lose soundings.

From Yallah's Point to Cow Bay Point there is no danger; the latter is bold to, as well as all the coast to the Westward, as far as Plum Point. The course and distance between the two points are W. by N., 8 miles; but should you be 3 or 4 miles from Cow Bay Point, you must steer more to the Northward.

Plum Point is the S.E. point of the Palisadoes; you may run in boldly for it, and approach its extremity within half a cable's length, having nothing to fear until abreast of it, or between it and the Middle Ground, in the entrance of the Eastern channel to Port Royal.

When you have brought Rock Fort N. by E., you will come on a cross ledge without the entrance of the channel, and must then bring the leading-mark on, which is the North part of the Apostle's Battery and the magazine of Fort Charles in a line.

This mark is to be kept on until you are abreast of Lime Key. When thus far advanced, steer a little to the Southward towards Raekham Key, giving Lime Key a good berth, until Port Royal Point comes open between Gun Key and Raekham Key. Now steer in mid-channel between these keys, and immediately after passing them proceed directly towards Port Royal Point, till you bring the fall of Yallah's Hill on the centre of Gun Key, which will bring you between the Knoll and Port Royal Point; you may approach the point within half a cable's length, and by sailing close to it you will also pass between it and the Harbor Knoll, which lies to the Westward about the length of $1\frac{1}{2}$ cable, with 19 feet on it.

Having passed the point, steer to the Northward till the Admiral's Penn comes to the North of Gallows Point. This mark leads you clear of Old Port Royal, where you may anchor abreast of the dock-yard, or even before you come to it. With a land or North wind, the channel between Gun Key and Port Royal is to be preferred: then the Twelve Apostles' Battery on the South angle of Fort Charles leads you clear of Gun Key Reef.

Strangers, in case of necessity, may pilot their ships down to the anchorage in the channel, even when the marks are not to be seen, as nothing is to be feared on the side of the Palisadoes, which is low and bushy. They must only keep within half or three-quarters of a mile from Plum Point, and steer down by the Palisadoes, till they bring Lime Key to bear S.S.E., or S.E. by S., then they anchor in 15, 16, or 17 fathoms, near the middle of the channel.

SHOALS IN THE EASTERN CHANNEL OF PORT ROYAL.—The most remarkable shoal in the Eastern Channel is the Middle Ground, or Eastern Middle Ground, which lies $\frac{1}{4}$ mile S.S.W. from Plum Point; it consists of two patches, the rocky bottom: the East patch having 12 feet, and the West patch (about 70 fathoms to the W.N.W. of the other) having 9 feet; they are divided by a narrow wash, 10 fathoms deep, and both break with strong sea-breezes.

A beacon with a small triangle, about 50 feet above the level of the sea, was erected on the Palisadoes, between Great and Little Plum Points. When bearing N. by W., by compass, or in one with Kingston church, it will lead clear to the Eastward of the East Middle Ground.

You may sail within the Middle Ground, or without it to the Southward, as necessity requires; but to the Northward is the best and safest channel. The soundings in that channel are uneven, from 7 to 19 or 20 fathoms; but when you are past the Middle Ground they are regular, from 19 to 13 fathoms, between Raekham and Gun Keys.

The first key you meet with, in steering from the Middle Ground towards Port Royal, is Lime Key, from the North end of which a reef stretches about a cable's length: your eye is the best mark for it, as it is generally seen; to the Westward of the key lies another shoal, with 8 or 10 feet upon it.

The Knoll off Port Royal Point is the third shoal: it is a small hard coral bank to the Southward of the point, with only 16 feet water upon it. If your ship draw 12 or 13 feet water, you must be careful to keep clear of it.

To go within the Knoll, the leading-mark is to bring the highest bush on Gun Key (which is near the middle of it) in one with Yallah's Point: you have then 10 fathoms water, and the channel is 70 fathoms wide. The mark to strike the Knoll is the South point of Gun Key, on the high hill of Yallah's, or a ship's length open of Yallah's Point: the best mark is the church on the seventh or eighth embrasure of the fort. Sandy Key just open with Lime Key, and you will have 16 or 17 feet of water.

To go between the Knoll and the Western Middle Ground, which lies about 300 fathoms to the South-westward of it, the leading-mark is True Land's Hummock within Yallah's, on the Southernmost part of Gun Key, or Yallah's Point well open to the Northward of the North point of Raekham's Key. This channel, which is the widest, and has 12 fathoms of water, is mostly used when taken with the land-breeze.

The anchorage is good all over Port Royal Harbor: but the best anchoring for ships that are bound for sea, is in 9 fathoms, with a notch on the East side of a high mountain, called the Leading Notch, a little open to the Eastward of Fort Augusta, and Raekham Key in one with Port Royal Point.

SOUTH CHANNEL OF PORT ROYAL.—To go to sea from Port Royal, you may make use of the South, or the New Channel; the small craft generally go through the East Channel, but it is to be avoided by large vessels, unless they are prime sailers, and have a strong land-breeze or North, with an appearance of its lasting long enough to carry them through.

When bound through the South Channel, you should get under way with the land-wind, as soon in the morning as you can see the marks, observing that the current sets most commonly to the Westward. The general leading-mark is the Leading Notch in one with the magazine of Fort Augusta, which is the Easternmost building of the fort. This mark leads ships of 16 or 17 feet water clear through; but

for heavy ships, the notch should be kept very little to the Eastward of the magazine until Hellshire Hummock comes open with Fort Small.

To keep well to the Westward of the Middle Ground, be careful not to bring the church steeple upon the corner of the wall with embrasures, until Yallah's Hill is brought in one with Lime Key. In case you should not see Yallah's Point, look out for a hummock on Hellshire, and when it is open of Salt Pan Hill, you will be to the Southward of the Middle Ground.

The Middle Ground is a large coral bank, which often breaks, with only 3 feet on it in the middle; the North and West sides are almost steep. On its N.W. edge lies a buoy, whose marks are, Port Royal tower on the fourth embrasure of Fort Charles, counting from the Westward, and Hellshire Hummock on the flagstaff of Fort Small.

When you have opened Hellshire Hummock with Fort Small, you steer out with the Leading Notch a little to the Eastward of the magazine, which carries you between the Drunken Man's Key, the Turtle Heads, and the South Knoll; or, to avoid these heads, you are to haul up so as to bring the church steeple to the Easternmost part of the fort, and continue to keep that mark until the South Key is brought on with Yallah's Point. Then you may haul to the Westward, if the wind will permit. But if you should not keep up the leading-mark, and the church steeple should come near the corner of the fort, you must then come to, or tack and stand in. The mark, when ashore on the Turtle Heads, is the church steeple upon the magazine of the fort, and Spanish Town land just open.

When Maiden Key is open a ship's length to the Southward of Drunken Man's Key, you will be to the Southward of the South Knolls, and should bring the Leading Notch in a line with the magazine, which will bring you close to the Westward of the Little Portuguese, in 8 or 9 fathoms: when Yallah's Hill comes to the Southward of South Key, you are clear of the Portuguese, and may haul to the S.E., giving South Key a berth of about a mile.

Drunken Man's Key is a narrow ledge of rocks just above water, covered with some loose sand, that gives it the appearance of a sand-bank. To the Southward of it, about half a mile, there is a shoal which breaks with strong sea-breezes; and between it and Drunken Man's Key is a channel, having 6 or 7 fathoms of water.

The Turtle Heads are three dangerous spots, with 10 or 11 feet of water on their shoalest part, and deep water close to them. The South knolls, to the S.E. of these heads, are two small patches, about 70 fathoms asunder, with 23 feet water on them. And to the S. by W. of these lies One-bush Reef, which always breaks, and is almost steep to. The Three-fathom Bank is a large coral shoal, with 19 or 20 feet of water, which breaks with strong sea-breezes. A small patch, about a quarter of a mile to the S.S.E. of it, has 20 feet of water; it is called the Warrior's Bank.

The Little Portuguese is the Southernmost shoal on the Eastern side of the South channel. It has from 22 to 39 feet water over it, and in general a great swell.

When Portland makes an island open about three-quarters of a point, or a point, with Hellshire, you will be to the Southward of the Three-fathom Bank and Warrior's Bank.

It frequently happens that the land-breeze fails before a ship can get clear of the channel; and there is sometimes a long interval of calm between the land and sea breezes. Should this occur, it will be requisite to anchor so soon as the breeze fails, or there will be danger of being set, by the swell, on the Three-fathom Bank or One-bush Reef. By inattention to this precaution, there have been instances of ships slipping or cutting their cables, when the sea-breeze has come on, and running into Port Royal for safety.

The best anchorage is within the length of the Little Portuguese, with the Leading Notch a little open to the Eastward of the magazine of Fort Augusta. Then, if the wind changes Southerly, a ship may easily return to Port Royal, or, with the common sea-breeze, may proceed to sea.

When clear of the channel, if bound to leeward, you may steer S. by W., or not further than half a point more Westerly, in order to avoid some shoal spots that lie to the South-eastward of Wreck Reef.

Wreck Reef always breaks. This danger lies about a mile, or little more, to the S.E. from Hellshire Point, and is about a mile in length from N.E. to S.W. There is a channel for small craft between it and Hellshire Point. About a mile to the S.W. of the reef there is a shoal spot of 3½ fathoms, with 7 fathoms around it.

To sail through with the sea-breeze.—Ships of war, or those that sail well, may safely proceed to sea from Port Royal, if they can lie S. by E., or a little to the Eastward of it, if the foregoing precautions be strictly attended to. When through the channel, soundings will be found of 10 and 11 fathoms, if steering S. by W., until Portland bears W.N.W.

The shoals in general, when the sea-breeze prevails, may be distinctly seen from the mast-head. They appear of a brownish color, being covered with large branches of coral. The greatest part of them are very steep, having a depth of several fathoms close to them. The bottom of the channels between is mostly soft mud or coral.

Ships bound to windward from Port Royal, if they can weather the Middle Ground by the time the sea-breeze comes on, may pass through the Eastern or Windward Channel, and thus they may gain 6 or 7 miles more to windward than by going through the South Channel. Small sloop-rigged vessels generally pass this way; but to others it is hazardous; because, if the land-breeze fails, with an interval of calm, a swell may come on ahead, and be extremely dangerous.

NEW CHANNEL OF PORT ROYAL.—The New Channel lies to the East-*New Chan-*
ward of the South Channel, and almost parallel to it; it is preferable, on many ac-*nel of Port*
counts, to the South Channel; it has smooth water till you come to South Key, with
Royal
good anchoring-ground, easy riding, and a facility of going to sea to the Southward
with the sea-breeze as far as S. E., &c.

The leading-mark to enter this channel, is a remarkable flat hummock on the moun-
tain to the N.N.W. of Port Royal. When the middle of this hummock is in a direct
line with the white house standing to the N.W. of Port Augusta, it leads to the
Westward of the harbor and Point Knolls, as well as between the East edge of the
Western Middle Ground and the West end of Backham's Key Shoal. Steer with
these marks on until a remarkable round billock, to the Westward of Stony Hill bar-
racks, comes open to the Eastward of Gun Key.

After you have opened this hummock, you steer away to the Southward, keeping it
open until a saddle in the mountains to the N.W. comes in a line with Fort Small.
Then you bring the same hummock on the centre, or West edge, of Gun Key; which
marks carry you to the Westward of the shoals on the East side of the channel, and
about a quarter of a mile to the Eastward of the Great Portuguese. As soon as Port-
land appears like an island, you may haul to the Eastward, being clear of the reef and
shoals of South Key.

The shoals in this channel are: 1. The Western Middle Ground, (on the East side
of which there is a buoy,) and the small shoals to the Southward of this ground.

2. The Great Bay Shoal, which has 16 feet least water, and a floating beacon, in 18
feet.

3. The Four-fathom Knoll is a very small spot, with no less than 24 feet water on
it, and deep water all around. Ships of 20 feet draught may sail over it, as the water
is smooth.

Between Great Bay Shoal and South Key Breakers there are two shoals; the
Northernmost, at about half a mile S. by W. from the former, is steep, and a small
part of it appears just above the surface of the water. This shoal always shows
itself by the rippling on it. About half-way between this and the breakers lies the
second shoal, having only 16 feet of water.

The South Key Breakers have a buoy upon them. The marks for the West edge
of this reef are, the Leading Notch open a little to the Eastward of the capstan-house,
and a saddle-mountain to the N.W. and Fort Small in one.

Half a mile to the Southward of these breakers is the Eighteen-foot Reef, remark-
able by the great swell upon it. To the Westward of that reef lies the Great Portu-
guese, which is the Southernmost shoal on the West side of the channel.

The preceding description of, and directions for, the South Channels, may be con-
sidered as more for the use of the pilot, than of the general navigator. Captain Liv-
ingston remarks, "I think the Derrottero is right in omitting directions for any of the
channels at Port Royal, Jamaica, excepting the Eastern one, as directions for the
Southern channels are absolutely useless; because no one who is unacquainted
ought to be fool-hardy enough to attempt carrying any vessel in or out, except by the
Eastern channel, even with the most correct instructions and almost accurate chart."

OLD HARBOR, LONG'S WHARF, &c.—Mr. Leard's directions for these har-
bors are as follows: Being clear of the South or New Channels, steer to the South-
ward, or S. by W., and give Wreck Reef a berth of 2 miles; and then edge away, and
bring the fall of Braziletto Hill to bear W. $\frac{1}{2}$ N., or W. by N., and steer for it; this
will lead you to the Southward of the foul ground off the Pelican Keys; and as you
approach them you will see Pigeon Island, which is low and bushy, in a direction
of the fall of Braziletto Hill; keep it so, and pass the Pelican keys in 7, 7, and 6
fathoms; and, as you steer down with those marks on, you will see a remarkable hum-
mock on the mountain to the Northward, called Cudpe Hill; it is like a jockey's cap.
When this hummock comes on the West extremity of the shant fall of Goat Island,
and will bear N. $\frac{1}{2}$ W., then haul to the N.W. by N. for Old Harbor. This last mark
leads you clear to Westward of Dry Shoal, part of which is even with the surface of
the water, and you will see it.

You will have from 64 to 6, or 54 fathoms; and, after you have passed Dry Shoal,
continue steering N.W. by N., and you will deepen your water to 8 fathoms; and
as you approach Careening Key will shoalen it to 7 and 6 fathoms. You must
give Careening Key a berth of nearly half a mile, to avoid a reef that runs from it to
the South-east; and steer direct for the wharfs at Old Harbor, and anchor in 4 $\frac{1}{2}$

*Old Harbor,
Long's
Wharf, &c.*

or 4 fathoms, keeping clear of the reef on the South side of the harbor, which generally shows itself.

The most frequented and best channel for entering into this great bay, is between Pelican and Bare-bush keys, and to enter it, those who come from Cow Point must steer W S W 4 W, 9 leagues, until the slope of the Braziletto mountain bears W by N. With this mark and bearing you proceed to Pigeon Island, &c. The Braziletto mountain cannot be mistaken, it being the Northernmost of the two which are seen to the West, and the Southern is of a round shape. The opening which these mountains form, is the point to be used as the leading mark, bearing W by N, as above. *Derroturo, &c.*

Buoy. There is a black buoy on the S W, Pelican spot.

Long's Wharf and Salt River. If you are bound to Long's Wharf, in sailing to the Northward of Pigeon Island, there is a small white shoal of only 48 feet, it shoals gradually on the East end, and bears North from Pigeon Island, distance one mile. The South edge of Round Hill just open with the Braziletto Hill leads on it. You may sail between this shoal and Pigeon Island, in 8, 7, 6, or 5 fathoms, but to the Northward is the straightest course. After passing Pigeon Island steer to the North west and bring the top house about one third from the North side of the large opening or gap in the mountains; this mark leads between the reefs to the anchorage at Long's Wharf, in 4 or 3½ fathoms.

Salt River Anchorage. If you are bound to Salt River, after passing Pigeon Island, keep the South part of Braziletto Hill open a little on your port bow, which will lead you close to Salt Island; you may go either to the Northward or Southward of Salt Island, but the North passage is the best. You may pass within a cable and a half's distance of Salt Island, on the North and West part, on the South part is a reef which shows itself, and is steep close to. There is a reef extending along the East side of Long Island, which you see, and also a reef extending from the Salt River shore to the Eastward, which sometimes breaks. Therefore, steer round the North end of Salt Island, at about 2 or 2½ cables' distance from it, and then steer towards the entrance of Salt River, until you bring the South edge of Pigeon Island almost in a line with the South edge of Salt Island. Keep them in that direction, and when you are in 1½, 1, or 3 fathoms, anchor, according to the size of your ship. If you are in a low vessel, it will be necessary to go a little up the shore to see Pigeon Island over Salt Island. The South end of Pigeon Island, a little way to the Southward of Salt Island, leads on the edge of the Salt River Reef. There is a good anchorage under the West part of Salt Island, in 5 fathoms, good holding ground.

Peaks Bay. *Peaks Bay.* To sail into this bay, give the reef that runs off Rocky Point a half of a cable's length, or more, and steer towards the North part of the sandy beach, and anchor in 4, 4, or 3½ fathoms, good holding ground. The reef off Rocky Point, and the reef on the South side of the bay, are nearly even with the surface of the water, so that you generally see them. There is a great sea in this bay with strong southerly breezes.

West Harbor. The entrance into this harbor is between two coral reefs, that are nearly even with the surface of the water; and the heads of coral frequently show above water. The channel between the reefs is above half a mile wide, with about 6 fathoms in it. There is very good anchorage, with smooth water, just to the Westward of the North reef, in 5½, 5, or 4 fathoms, good holding ground. The land to the Westward does not show any mark to guide you into this anchorage, but it is not difficult. As you go to the Westward in the West harbor, the water shoals to 8 or 9 feet. It is also shoal on the South side, towards the mangroves, and smooth water.

Going to Sea from Old Harbor, Long's Wharf, &c. Ships generally go under way with the land wind, so as to get clear of the reefs near the anchorage before the sea breeze comes on. Being clear of the reefs, you may turn out with the sea breeze on either side of Pigeon Island. The channel between Pigeon Island and the reef of the Half-moon Keys is 2 miles wide, with deep water; but the smooth water is to the Northward of Pigeon Island. You may stand towards Goat Island or Cabarita Point, by your lead, (the soundings are gradual), and tack when you come to 5 or 12 fathoms. If the sea breeze should be very strong, you may anchor near Morris' Shoal, and wait for the land wind. But with moderate sea breezes, any ship may turn out between the keys and reefs. Being as far to the Eastward as Dry Shoal, and standing to the Southward, your leading mark for the channel between the bare-bush key and Morris' Shoal, is Chimney Hill, on the slant fall of Goat Island, (these marks for Dry Shoal); keep it so until the Half-moon Keys come in one; then you may stand to the Eastward of Morris' Shoal, and may edge away a little, keeping the Cross Key about a large sail's breadth on the lower part from the slant of Goat Island, (this mark will lead you along the white water on Bare-bush side to sea). But in a north-

ing to the Southward from Dry Shoal, you find that you cannot weather Morris' Shoal, which you will know by the fall of Cudjoe Hill not being within a sail's breadth of the fall of Goat Island; in this case you must tack to the Northward when Bare-bush Key bears E. S. E., or when a saddle hill to the North west of Pigeon Island is just coming on the North end of Pigeon Island. And in standing to the Northward, tack when the fall of Braziletto Hill comes on the centre, or near the North end of Pigeon Island; you may approach the white water on the side of Bare-bush to 5 fathoms. There is a good channel between Morris' Shoal and Bill moon Keys, but it is dangerous to approach the latter on the South east side, for you will have from 6 to 7 fathoms to 12 feet, in one or two casts of the lead. To the E. S. E. and S. E. of Bare-bush Key, distant about one mile, are some spots of coral, with from 3 to 5 fathoms on them, and 7 fathoms close to them. And to the Southward and S. S. E. of the Portland Keys, distant about 2 miles, are some spots of 33 and 4 fathoms on them. After you have passed those keys in sailing to the Westward, come to near Portland (from 2 or 2½ miles, or 7 or 8 fathoms), for the reef off Rocky Point, which is the West part of Portland, extends nearly 2 miles from the point to the Southward.

It is said, that about thirty years ago ships sailed over Morris' Shoal, if so, it must have grown fast, for there is not at present more than 9 or 10 feet on the North edge of it, and a great swell in general. Marks for the East end of it—Cudjoe Hill, about half way from the fall of Goat Island, upon the low and bushy land towards the rising to the Westward, (this rising is commonly called Little Goat Island,) and the Bill moon Keys about 1 mile open, and North part of Bare-bush Key bearing E. 4 S. Marks for the West end are, Cudjoe Hill, on the before mentioned rising of Little Goat Island, and Bare-bush Key bearing E. 4 S. It is in length little more than a quarter of a mile, and in breadth about one sixth of a mile, and shoaldens too suddenly for your lead to be a guide in standing towards it.

PORT ROYAL, TO PORTLAND. In proceeding towards Portland, observe E. of *Port Royal* Wreck Reef, which is a large shoal composed of dry rocks and breakers, lies about half way between Port Royal and Old Harbor, at the distance of more than a mile from the shore. This danger, which appears in the day, consists of two parts, having between them a channel of 4 fathoms water. Ships passing in the night should approach no nearer than in 12 fathoms, nor come to an anchorage until morning. Within the reef there is good shelter, and tolerable anchorage, in 4 and 5 fathoms, bottom of mud, with shells and mud. Here vessels occasionally ride during the prevalence of a breeze, &c.

From Port Royal to Portland, the distance, on a circuitous course, is 9 leagues. In this track, when clear of the South Channel, give Wreck Reef a berth of 2 miles.

There are soundings outward as far as with the Easternmost land of Hellshire bearing N. 4 E., and Rocky Point, or the Southernmost land of Portland, N. W. 3 N. With these bearings, soundings have been found of from 17 to 23 fathoms, and the nearest no ground at 80 fathoms, although not a ship's length from the former.

The Pedro Keys.

THE PORTLAND ROCK is elevated from 15 to 20 feet above the level of the sea. The *Port* HMS Winchester rounded it on the South side, and brought it to bear East, *land* Rock carrying from 10 to 14 fathoms water, on a sandy bottom, with pieces of coral. In this being a vessel might anchor with safety in moderate weather.

We made the latitude 17° 7' 23" N
— longitude 77° 25' 20" W,

which is only 20' difference from De Mayne's meridian distance reduced; he having considered Port Royal in 76° 52' 28" W; whilst we use 76° 19' W.

We stood from the Portland Rock to the S. W., carrying from 12 to 15 fathoms, and making these soundings further to the Southward than had done by the chart. We saw the Eastern Breakers, so called by De Mayne—they appeared to have an extent of about 2 cables' length, with two small rocks above water, and were breaking in all quarters.

Near these the water shoaled to 8 fathoms and a half; and when they (the rocks) bore N. E., distant 4 miles, we had only 7 fathoms, the Pedro Keys just then coming in sight. Steering W. by S., we soon after had no bottom, having got into the edent, as shown in De Mayne's chart, so that the shoalest water we had must have been very near the edge of the bank.

We did not go nearer than a mile and a half to the Eastward of Pedro Keys, and had no soundings with the hand lead, but the chronometers gave the centre of the middle of 77° 47' 13" W., or 58° 13' West of Port Royal.

The South west breakers.

THE SOUTH WEST BREAKERS. They are dangerous, and require a strict lookout. The sea breaks over two small rocks, not more than 3 feet above the level of the sea, constantly, but so irregularly, that from the deck of a vessel, and in a moderate breeze, a high breaker might not be distinguishable oftener than once in 5 minutes, and the ordinary ones would be taken for waves. In the Winchster, with a good mast head lookout, we passed within 3 miles of these, without their being discovered.

On the West side they are bold to. Having stood to the Northward on the bank, passing them at the above named distance, we turned H, T, and 40 fathoms for 6 miles. When the breaker bore S S.W. about that distance, we tacked, and stood for it, and when about 3 miles distant, the soundings became irregular, varying from 11 to 84 fathoms.

We were at noon as near to it as one mile, bearing East, and we had not less than 9 fathoms.

The whole breaking part does not extend more than 1 or 1½ cable's length; but it is to be supposed there is foul ground to the Eastward of it for a mile or so. The ocean color of the water above it is remarkable even in soundings, and I should befor this reason cautious in approaching it to the Eastward.

Latitude of South west Breaker 16° 47' 56" N.
Longitude of do. 78° 40' 32" W.

or 1° 21' 32" West of meridian of Port Royal, which is nearly a mile to the Eastward of De Mayne's reduced.

The Pedro Shoals (Bivora Bank of the Spaniards) have been regularly surveyed, and the representation of them in the chart is to be relied on. Of the Casabel, or Rattlesnake, which is supposed to distinguish the N.W. end of the Pedro Bank, it does not exist, as there has been an accurate survey of the bank, and it was not to be found.

Carlisle, or Withy-wood Bay.

CARLISLE, or WITHY WOOD BAY, to the West of Portland, is an open bay, winds from W. to S.E. Its S.E. extremity is the rocky point of Portland, from which a spit, of 12 feet water, extends about three quarters of a mile to the S.W. Westward of Rocky Point is a bank, called Robertson's Shoal, on some part of which there are only 6 feet at low water. The outer edge of this shoal is one mile and a half West from Rocky Point. The form of the shoal is nearly oval, from E. to W. Its breadth N. and S. is three quarters of a mile.

To sail into the bay, bring a remarkable round hill to bear nearly North, and steer for it until Rocky Point comes almost on with the East point of Portland. Hence, rounding Robertson's Shoal, you may come to an anchor in from 5 to 4 fathoms. With the hill above mentioned N. by E., there is a spot of 33 fathoms at about 2½ miles from the beach. With the fort N.E., or N N.E., is the best place to anchor in for loading, because your boats can sail both on shore and aboard with the sea winds. No tides here, but a strong Westerly current generally runs in the offing. Var 65 50 E.

Along the coast to the Westward, to the distance of nearly 20 miles from Carlisle Bay, at a mile or a mile and a half from the shore, there is a regular depth of 1 and 1½ fathoms.

Alligator Pond Key.

ALLIGATOR POND KEY—Alligator Pond Key is a key just above the surface of the water, with a reef all round it. Its distance from the shore is about 1 mile, and vessels may approach it by the lead, or on seeing the breakers. There is good anchorage for small vessels along shore, between it and the main, in 3 and 4 fathoms.

Briene Bank.

BRIENE BANK, a small bank, having on it a little more than 4 fathoms, with 12 or 13 close to it, lies 6 miles S.E., by compass, from Alligator Pond Key. The shoals about a mile and three quarters in extent, from East to West, and one mile and a half in breadth. It has from 4 to 6 fathoms water on it, and the outer edge is about 5 miles from the shore.

Pedro Bay.

PEDRO BAY, &c.—In Pedro Bay, to the Westward of Pedro Bluff, there is good anchorage for any vessels, but it is open to Southerly winds. The lead is here the best guide for anchoring. The coast hence to the Westward, nearly to Paratee Point, is bold to. Off Paratee Point is a small reef; and to the N.W. of this point at Black River, which is formed by extensive reefs. To clear these reefs, keep Pedro Bluff open with Paratee Point.

Entrance of Black River.

The entrance of Black River is between two reefs, and has not more than 8 feet water. To sail into the river, when advancing from the Eastward, keep Pedro Bluff open of Paratee Point, till you bring the church on with a gap in the high land, or to bear N.E.; then steer directly for the church, which will carry you into the best of the channel. It is full of heads of coral rocks.

PORT ROYAL TO BLACK RIVER.—On leaving the South Channel of Port Royal, when bound to the Westward, you may clear Wreck Reef by keeping the muzzle of Fort Johnson open of St. George's Rocks, until Portland bears West; thence you may alter your course along the land, as there are no dangers to be apprehended until you approach Alligator Key, about 4 miles S. E. & E. from which is the Brane Reef, already described.

Pedro Bluff is very remarkable, and may be known from any other land on the coast. At 4 or 5 miles to the Eastward of the bluff, there is a remarkable white spot in the cliff called the White Horses, which, when you first make it from the Eastward, appears like a schooner under sail, close to the land.

From Parratee Point to Luana Point, the bearing and distance are N. W. by W. 4 W., 9 miles. The coast between forms the bay of Black River, which is obstructed by a number of reefs, all of which lie within the line of the two exterior points, and a course N. W. by W. & W. will therefore lead clear of them. The bay does not appear to have been regularly surveyed. The main channel, which is between two reefs, is only 18 feet of water.

If going to Black River, or its bay, when advancing towards Parratee Point, take care not to approach the point nearer than one mile, as there is a reef extending off to the S. W. nearly a mile. Your leading-marks into this bay, to the anchorage where merchant-ships load, will be the church just open to the Eastward of a large cotton tree; run in with this mark, until you are within half a mile of the town, and anchor in about 18 feet. Large ships, that cannot approach so near the town, should anchor under the Eastern shore, in 8 or 9 fathoms. Your best mark for anchoring, is Pedro Bluff shut in about a cable's length of Parratee Point, in 9 fathoms, with the town bearing about N. E. by E. & E. There is a very dangerous reef lying on the Western side of this bay, with only 1 foot of water on the shallowest part. There is also a coral bank nearly in the middle of the bay, with only 2 fathoms over the shallowest part.

From Luana Point the coast continues clear for a league and a half to the N. W., but it thence becomes foul, and so continues to Bluefield's Bay, &c. The direct course and distance, clear of danger, from Luana Point to South Negril, the S. W. end of Jamaica, are W. N. W. 1/2 W., nearly 10 leagues.

South 4 leagues from Bluefield's, lies a rocky bank, discovered in 1821, with from 13 to 20 fathoms on it.

BLUEFIELD'S BAY.—This part of the coast is environed by reefs, and the anchorage here for large ships is without a rocky ledge which stretches from Crab Pond Point to the West of Bluefield's, and joins the reef of Savanna la Mar. Vessels coming from the Eastward to anchor in the bay, must keep down by the outside of the reef, or keep the land to the Eastward open of the point, until the leading mark is brought on, which is the overseer's house a little open to the Eastward of the tavern, bearing N. E. by E. & E. For anchoring, bring the overseer's house and tavern in a line, N. E. by E. & E., and the Easternmost point E. S. E. Ships drawing 16 or 17 feet water, may sail over the rocky ledge, in 34 or 4 fathoms, with the overseer's house and tavern as above, until over the ledge, which may be known by finding a sandy bottom, and a depth of 53 or 6 fathoms. The watering-place is to the Northward of the Bluff Point, on the lee side of the bay. Water may also be obtained at a stream off Bluefield's River, near the Tavern.

In steering in, keep the lead going, and be ready to anchor, as the water shoalens rather suddenly.

SAVANNA LA MAR.—The coast from Bluefield's to Savanna la Mar is rocky, in some places, to the distance of 2 miles from the shore. The entrance to Savanna la Mar is very narrow, an F lies between a small reef called the Middle Ground, (on which there is a depth of only 4 feet,) and another reef having 7 or 8 feet over it. In the channel there is a depth of 19 or 20 feet. The leading mark in is a large gap on the highland, called the Dolphin Head, in a line with a remarkable large tree on the lowland to the Eastward of the town, and bearing N. 3/4 W. This mark leads close to the Middle Ground, which will be seen. After passing the latter, haul to the Eastward, and anchor in 17, 16, or 15 feet water. This channel should never be attempted without a pilot.

A mile and a half to the Westward of the former channel, is the Great Channel of Savanna la Mar, which is a mile in breadth, and has a depth of 21 to 19 and 13 feet towards the shore. To sail through, in mid-channel, it is only requisite to bring the fort on, bearing N. N. E.

On the Southern extremity of the bank extending from shore, between Savanna la Mar and John's Point, the British ship *Monarch* struck, in 1782, upon a bottom of coral. This extremity lies with John's Point bearing N. W. by W. & W., and will be avoided by keeping one half of the highland of South Negril open to the Southward of John's Point.

In traversing hereinabout, it is necessary to be very particular in the use of the lead, for the bank which extends along the front of Bluefield's, and thence to opposite Savanna la Mar, &c., is rocky, and has on its edge from 20 to 24 feet of water; and on it, as on the White Banks, there are many shoals with little water on them, some of which uncover, and many have breakers. Without the edge of the reef, and very near to it, are 5 fathoms of water, which deepens to 13 fathoms at three-quarters of a mile from the edge of the bank: the depth therefore is the best guide, for, when you get from 8 to 10 fathoms, you will be from one-third to half a mile from the edge of the reef; and when you get 13 fathoms you will be three-quarters of a mile from it; and, pursuing your route, you should not keep in the depth of 8 or 10 fathoms, but in that of 13 to 15, for only in the vicinity of the anchorage they wish to make, should vessels get into the first of these depths. The anchorage of Savanna la Mar is of the same nature as that of Bluefield's: large ships must anchor outside of the reef, and, in such a situation, they will not be sheltered from the sea from East round to S. by W. It seems probable that such will very seldom come to this place, because they here run much risk of losing their anchors; as the instant there is the least appearance of the wind freshening they must make sail. Such vessels as do not draw more than 12 or 13 feet water may anchor upon the bank, and behind, (or in the lee of the reefs,) in 15 or 16 feet of water, with the town bearing N. N. W. $\frac{1}{2}$ W., nearly three-quarters of a mile distant. You may cross over the edge of the bank as soon as the wharves at Savanna la Mar bear N. W. by W., which will be three-quarters of a mile to windward of the Eastern Channel, (that is, if the vessel is on the edge of the reef, or near it,) and sending a boat to be placed to the Westward of the Middle Ground; it will serve for a guide and buoy; and then you have only to shave close to the boat, as the mean to keep clear of the reef to leeward. The boat may proceed with the leading mark as above, or may steer Northerly until she comes to the edge of the reef which runs along to the East of the anchorage; and, keeping along the Southern edge of this reef, she must thence steer N. W. $\frac{1}{2}$ N. so soon as the wharf of Savanna la Mar bears on that rhumb, with this course she will pass over the rock.

*Western end
of Jamaica.*

WESTERN END OF JAMAICA.—From St. John's Point to South Negril the coast is bold to, or high and steep. The inlet between South and North Negril is called Negril, or Long Bay, and affords tolerable anchorage. Close to the South side of North Negril is Negril Harbor, a small harbor with good anchoring ground for small vessels; and to the North are Orange Bay and Half-moon Bay, places fit for droghers, &c. Six miles to the N. E. from North Negril is Green Island Harbor, and about 23 miles from the latter is Davis Cove. These are places seldom resorted to but by those who go thither on purpose to load, and have pilots.

A rock, with 24 feet water on it, was seen some years since by one of the ships in a convoy lying to, about (as well as I can recollect) 10 miles West of Negril Point, Jamaica; and I am pretty certain it was in lat. 18° 24'.

Between Negril and North Pedro the coast is bold, excepting at Green Island, which is low, and environed by a reef, nearly even with the water. From Pedro Point to the harbor of Lucea, vessels may stand within a mile of the shore.

Mr. Town says, a ship being off the West end of Jamaica, and bound to any port on the North side, should endeavor to round the points called South and North Negril, as close as she can; for the current, in general, sets to the N. E. If proceeding for the Harbor of Lucea, you may know its entrance by a remarkable notch in the mountain, called the Dolphin Head. At a little to the Westward of the harbor there is, also, a remarkable white spot in the land, which may be seen 8 or 10 miles off.

*Harbor of
Lucea.*

HARBOR OF LUCEA.—This harbor is one of the best on the North side of the island. It is safe, there being little danger in sailing in or out. The N. E. point is called Lucea Point, and on the Western point stands the fort. Vessels, having opened the harbor, stand directly in, only giving the Fort Point, on the Western side, a berth, as a reef stretches from it, on the extremity of which there is generally a buoy. To sail in, bring the remarkable mountain called the Dolphin Head open to the Westward of Barbara Hill, which has a house on the top of it, and is on the East side of the harbor, bearing nearly S. by E. Continue on in this direction, until the fort bears West, when you will be within the Fort Reef. Hence proceed towards the town on the West, and anchor in 5 or 6 fathoms, muddy bottom, with the fort bearing from N. by W. to N. N. W., and Lucea Point, at the Eastern side of the entrance, from N. N. E. to N. E. $\frac{1}{2}$ E.

Those approaching this place from the Eastward, must observe to keep at least 3 miles from the shore, until past Buckner's Reef, which lies off Mosquito Cove, and sometimes breaks. It is also to be observed that around Lucea Point, and to the North-eastward, there is a rocky flat extending out to a considerable distance.

Within the point the reef extends to a cable's length from the shore. It is nearly steep to, and the heads of coral sometimes appear above water.

For passing clear of the edge of the Eastern bank, the mark for the Malcolm House, which stands on a small hill or rising at the East end of Lucea Town, brought on the East end of the fort, and kept so until you bring the Dolphin Head, as already mentioned, to the Westward of Barbara Hill. This mark leads through 8, 7, and 6 fathoms, then deepening to 13, and shoaling again into the harbor.

MOSQUITO COVE, an excellent harbor, lies 3½ miles to the Eastward of the harbor of Lucea. Here a hundred sail of merchant-ships may lie secure from all winds. The channel, at the entrance, is little more than a cable's length in breadth, but widens inward to where the harbor has from 7 to 1½ fathoms. The bottom in general is muddy. To sail in, you may pass to the Eastward of Buckner's Reef, or over its Eastern end, in 5 or 6 fathoms. The course into Mosquito Cove is nearly S.E. by S., but it should not be attempted by a stranger without great caution, as the entrance is much contracted by a reef from the Eastern side.

MONTENEGO BAY.—The Northern point of Montego Bay lies in lat. 18° 32'. This is a good bay with the wind from N.N.E. to the Eastward and Southward: but it is open to the North and West; and the Northerly wind in December and January has frequently driven vessels on shore.

To sail in from the Eastward, give the point, on coming down, a berth of 2 miles, in order to avoid a reef which extends from it, and which may be distinctly seen from the bows, when in 4 or 5 fathoms. When you open the town you may approach the reef, which is pretty steep, into 10, 9, or 8 fathoms, and will see the bottom. You now haul round towards the town, but must not venture to anchor until you have well shut in Sandy Point, (without the bay on the North,) with Old Fort Point. For, with Sandy Point in sight, there are from 35 to 30 fathoms, and the bank is so steep that the anchor will not hold. If a ship drives off, she will, with a sea-breeze, be in danger of grounding on the lee reefs. The mark for the best anchorage, is the barracks upon the hill in a line, or nearly so, with Redwick's stone wharf, on the N.E. side of the bay. The ground here is good in 11, 10, and 9 fathoms. On entering from the Westward with a fair wind, the church bearing East leads directly to the anchorage.

The following descriptions and directions are those of Mr. Town: Montego Bay affords good anchorage for 20 or 30 vessels, except during the prevalence of strong North winds, which generally commence in the beginning of November, and end in the latter end of February. With the general trade-wind, which is from the N.E. to the E.N.E., ships will ride here with perfect safety. There is a small harbor or cove, in the N.E. part of the bay, which will hold from 10 to 12 vessels. This is the only safe place for ships during the strong North winds.

On coming into this bay with the sea-breeze, which is from N.E. to E.N.E., you should endeavor to get well to the Eastward before you attempt to run in.

The leading-mark for clearing the Old Fort Reef, which extends from the anchorage in the bay to the Northward of the Northernmost point, is the Bogue Road end on, bearing South, or South a little Westerly. Proceed with this mark until Montego church comes open of Old Fort Point; then haul in for the S.E. part of the town, and when Sandy Point is shut in with Old Fort Point, you may anchor in from 17 to 19 fathoms, fine sand and mud. The reef off and to the Northward of Old Fort Point, lies nearly 1½ mile from the shore: advance, therefore, no nearer to the point Northward of Old Fort Point than 2 miles.

About 5 miles to the Westward of Montego Bay is a small creek, a bay without, which is called Great Roads. In this bay merchant-vessels lie to load; it should extend nearly the whole of the way across, which affords a good shelter for ships lying here during the North winds.

All ships lying either in Montego Bay or at Great Roads, pay harbor dues, at the rate of one shilling per ton, register tonnage; and in the event of any ship's going into the inner harbor, at Montego Bay, she is charged one-half penny per ton for every day that she may lie in this harbor, in addition to the fee that is paid for anchoring in the bay.

If bound from Montego Bay to the Eastward, it is best to leave the bay in the evening, as soon as the land-breeze comes off, which will generally run you clear of the bay, and in a good offing for the sea-breeze. It is generally best to beat to windward close to the land, in order to have the advantage of the Eastern currents; but I am of opinion that the only advantage you have by keeping inshore is that you meet the land-wind, which sometimes will carry you well to the Eastward during the night, for the current sets to the Westward as often as to the Eastward. If your destination be Falmouth Harbor, endeavor, if by night, to keep the shore close aboard, and the land-breeze will lead you to the Eastward.

er in the use of the lead, and thence to opposite to 21 feet of water; and the water on them, some edge of the reef, and very oms at three-quarters of best guide, for, when you a cable from the edge of quarters of a mile from it; 8 or 10 fathoms, but in ey wish to make, should of Savannah la Mar is of echor outside of the reef, e sen from East round to me to this place, because ant there is the least apch vessels as do not draw and behind, (or in the lee ng N.N.W. ½ W., nearly edge of the bank as soon y will be three-quarters of the vessel is on the edge of Westward of the Middle ave only to shave close to l. The boat may proceed til she comes to the edge rance; and, keeping along W. ½ N., so soon as the course she will pass over

Point to South Negril the South and North Negrils e. Close to the South sea good anchoring ground for moon Bay, places fit for Green Island Harbor, and places seldom resorted to pilots.

Since by one of the slips in des West of Negril Point.

excepting at Green Island, h the water. From Pedro nide of the shore.

men, and bound to my port illed South and North Vets to the N.E. If pnce by a remarkable note the Westward of the har- hich may be seen 8 or 10

st on the North side of the r out. The N.E. point is ort Vessels, having opened in the Western side, a berth re is generally a buoy to n Head open to the West- and is on the East side of ection, until the fort be sreed towards the town on th the fort bearing from N the entrance, from N.N.E.

observe to keep at least 3 es off Mosquito Cove, and d Lucea Point, and to the onsiderable distance.

*Peak of
Tarquino.*

PEAK OF TARQUINO.—In working hence to windward, in clear weather, when Cuba is visible, a remarkable hill will be discerned. This is the Pico de Tarquino, the highest land on this side of Cuba, which bears from Montego Point N. E. $1\frac{1}{2}$ N., distant 35 leagues; from St. Anne's Bay, N. by E., 23 $\frac{1}{2}$ leagues; and from the East end of Jamaica, N. N. W., 10 leagues, by which you may judge how far you are to windward on any other bearings. The Peak of Tarquino, &c., have already been described.

*Falmouth
Harbor, or
Martha
Brae.*

FALMOUTH HARBOR, or MARTHA BRAE.—This harbor, which lies 6 leagues to the Eastward of Montego Bay, is a bar-harbor. Its channel, or entrance, is very narrow, not more than 16 or 17 feet in depth, and too intricate to be attempted without a pilot. The town of Falmouth is on the Western side of the harbor, throughout the greatest part of which there is a regular depth of from 5 to 10 fathoms.

*Marabona
Bay.*

MARABONA BAY.—At about 3 leagues to the Eastward of Falmouth is Marabona Bay, which is very remarkable. It has a low pleasant plantation close to it, and on the hill over it is a large house or castle. Within a league to the Eastward of this is the small harbor of Rio Bueno.

*Rio Bueno
and Dry
Harbor.*

RIO BUENO AND DRY HARBOR.—Rio Bueno, which lies nearly 11 leagues to the Eastward of Falmouth, is a bay exposed to all winds between N. and N. W., and has but indifferent anchorage, the bank being steep. It is seldom visited by other than merchant-vessels, which go there to load. From the entrance to the place of anchorage, the distance is about 2 miles. The harbor is formed by two reefs. A ship may lie, with the point N. N. W. $\frac{1}{2}$ W., in 9, 8, or 7 fathoms. Dry Harbor, which lies 3 miles more to the Eastward, is a good harbor for small vessels, although its channel be narrow, and has a depth of only 16 feet.

*St. Anne's
Bay.*

ST. ANNE'S BAY.—The entrance of this bay lies in lat. $18^{\circ} 31'$, long. $77^{\circ} 15'$. It is narrow, and lies between two reefs, which have on their edges 3 and 33 fathoms, deepening abruptly in the channel to 10 and 11 fathoms. The entrance is less than half a cable's length in breadth, and lies with the barracks on the rise of the hill bearing nearly S. $\frac{1}{2}$ E., but it is not to be attempted without a pilot. With a Northerly wind, a stream of considerable strength sets outwards through the channel; this is occasioned by the great quantity of water thrown over the reefs by the swell. In passing in, as the water is clear, vessels generally pass close to the Western reef, on the starboard side.

Mr. Town says, St. Anne's Bay lies about 12 miles to the Eastward of Dry Harbor. This bay may be known by its having a very regular row of cocconut-trees around it close to the water's edge, and the town of St. Anne, which stands on the side of the hill on the S. E. side of the bay. The houses stand close to the water's edge on the Western side, and the plantations are, in appearance, in a state of cultivation much superior to any Westward of this place. The harbor of St. Anne is small, and is close to the town. You may anchor here in from 6 to 9 fathoms, good ground.

Ocho Rios.

OCHO RIOS, which lies 7 miles to the Eastward of St. Anne's, is an anchorage open to the North and N. W. winds. To enter, you sail by a reef which spits off from the Eastern side of the bay, running up and bringing the Westernmost part of it N. W. $\frac{1}{2}$ W. to N. W., in 7 fathoms. There is another reef to the Southward, but, as the water is very clear, it will be seen. This is a small harbor frequented by merchant-vessels only, which go there to load.

Ora Cabeca.

ORA CABECA, 10 miles to the Eastward of Ocho Rios, is another anchorage, exposed, like the former, to North and North-west winds. To sail in here when advancing from the Eastward, first make Galina Point; in order to do which, when off at sea, bring the Westernmost highland of the Blue Mountains S. S. E., which, thus kept on, will lead to the point. To anchor, give the small reef on the East side a berth, and when the Westernmost bluff point bears W. or W. by N., anchor in 5, 6, or 7 fathoms.

In Allan's Hole, which is formed by reefs level with the water on the one side, and the Eastern shore of the bay on the other side, vessels drawing from 10 to 12 feet may lie as secure as in any harbor in Jamaica. When once inside the reefs the bottom is quite clear, and the reefs completely break the sea of vessels drawing not more than 12 feet of water may warp into this place. At the North end of the reef is an islet, with bushes on it, divided from the main-land by a narrow and shallow channel. Allan's Hole has two entrances; one through the reef, which is extremely narrow, and one by the point of the reef; but neither ought to be attempted without a pilot.

GALINA POINT lies 4 miles to the Eastward of Ora Cabeca. This point is long, but the land to the Southward of it is high; and in making it from the Westward, a remarkable round hill that studs within the point will, on its first appearance, be

the point; but, on a nearer approach, the land slopes off to the Northward to a low point.

PORT MARIE.—The entrance of this harbor lies in lat. $18^{\circ} 27'$, and long. 76° *Port Marie.*
 Its anchorage is open to N.N.E., N., and N.W. winds. In coming in, the high island, named Cabarita Island, must be seen, and its Northern point should have a berth of 2 cables' length. You may haul into the bay, and anchor with the N.W. point of the island N.E., or N.E. by N., at the distance of about a cable or a cable and a half's length. Small vessels drawing 10 feet of water may anchor between the island and the main. The bottom is foul in the outer part of the bay, and ships have injured it by heaving over their ballast. There is not room for more than ten or twelve vessels to lie here, as the foul ground extends nearly over the whole harbor.

From Port Marie the coast trends E.S.E. 6 miles, to Blowing Point; thence it continues S.S.E. $\frac{1}{2}$ E., about 5 miles, to Anotta Bay.

ANOTTA BAY, which lies about 11 miles to the S.E. of Port Marie, has its anchorage open to N. and N.W. winds. To sail in, give the reef on the Eastern side, which is called the Schoolmaster, a sufficient berth: then steer down until you bring the tavern, a building easily known, S. by W. or S. When advanced within the Schoolmaster, haul a little to the Eastward, and have the anchor clear, the bank being steep and narrow. The first sounding will be 10 or 9 fathoms. Let go in 7 fathoms, which is about a quarter of a mile from shore, with good holding-ground. Be cautious of anchoring on the Western edge of the bank, as it will not hold, and you may be in danger of getting on shore to the Westward.

Anotta Bay is an extremely unhealthy place; so is Port Maria; but Ora Cabeen is a tolerably healthy situation.

Of Anotta Bay, Captain Livingston says, "This is the wildest road I ever saw. No vessel ought to enter it, without being uncommonly well found in ground-tackle. They ought, by all means, to have chain-cables. The following is from memory only: The reef off Gibraltar Point, the Schoolmaster, is much more dangerous than is generally supposed. It extends fully $\frac{1}{2}$ miles out; and some places have only from 6 to 9 feet of water, while there are gaps or gateways through them with as many fathoms."

PORT ANTONIO, which lies about 8 miles from the N.E. end of Jamaica, was formerly a king's port, where there are still to be seen the remains of a careening wharf, &c. It is formed by nature into two harbors, divided by a peninsula, on which stands the town of Titchfield, to the N. and N.W. of which lies the island called Navy Island, extending E. and W., and about half a mile in length. *Port Antonio.*

To sail into the Eastern harbor, first bring the Eastern part of the Blue Mountains to bear about S.S.W., and steer in that direction until you approach near Folly Point, the East point of the Eastern harbor. Next bring the church (which is a large square building, on the side of the hill in the S.W. part of the bay) on with the second wharf from the Westward, bearing S. by W. $\frac{1}{2}$ W., and you will thus pass safely into the harbor. But observe that on approaching the fort, (which stands on the Western side, upon the point of Titchfield peninsula,) to open the church to the Eastward of the wharf. When the fort bears N.W., you may anchor in 8, 9, 10, or 11 fathoms, good holding-ground. The bottom is, indeed, so stiff, that it is rather difficult to get up the anchors.

The preceding directions must be particularly attended to, in order to avoid a reef which stretches from the Eastern end of Navy Island, as well as from the point of the peninsula. The Eastern side of the harbor is shoal, and there is a reef nearly in the middle, having over it only 8 or 10 feet of water.

To sail into the Western harbor, after having brought the church well open to the Eastward of the fort, proceed, under easy sail, into the entrance of the channel between Navy Island and Titchfield, bringing a long building, which is a store house, standing on a hill to the Westward, open of the South-western point of Navy Island. This mark is to be kept on until the church appears open to the Westward of the peninsula; then haul round to the S.W., and anchor in from 7 to 4 fathoms, where there is good ground.

A channel, called the Hog Channel, leads directly from sea into the Western harbor, from the West end of a long reef that extends from Navy Island; but it is crooked and narrow, has only 13 or 14 feet of water on the Western part of it, and is therefore used only by small vessels.

The tides here are not regular, being influenced by the winds. The variation in *Tides.* \angle was $7^{\circ} 15' E.$, and it is still nearly the same.

The Western harbor is the best, the Eastern being open to the North winds. When entering the port with the sea-breeze, keep as nearly in mid-channel between Navy Island and the main as you can. Run in with the leading-marks on, and anchor in from 6 or 7 fathoms. If in a small ship, anchor in 4 or 5 fathoms, as the ground without the latter depth is foul.

Port Morant.

PORT MORANT. This is a good harbor, but the reefs extend to the distance of half a mile from shore on each side of the entrance, and the breadth of the channel between is only a cable's length and a half. As the direction of the entrance is N. by W., it can be attempted only with the sea breeze, or between the hours of 10 and 2 in the day. To sail in, a ship must lay N., or N. by E., until the leading mark is on. This mark is a remarkable house, which stands upon a hill, in a line with the East end of the Easternmost red cliff, bearing N. 3 W. With this mark you may sail into the bay with safety. Take care not to approach too near the reefs, but bring the marks exactly as described. You will thus have 9, 8, 7½, 7, 6½, 6, 5, and a quarter less 5 to 1 fathoms of water. There is anchorage in 6½ and 7 fathoms, with the leading mark on, and Pero Battery, which is on the Eastern side, bearing E. S. E.

The Caymans.

The CAYMANS are three islands lying between the meridians of 79° 30', and 81° 35' W., and parallels of 19° 10', and 19° 45' N. The larger and Westernmost is named the Grand Cayman, the second, the Little Cayman, and the Easternmost the Cayman Brack.

The Grand Cayman.

The GRAND CAYMAN is about 8 leagues long, and 2½ broad. The S. E. end lies in latitude 19° 16' N., and the N. E. point in latitude 19° 22'. The Eastern end is surrounded by a reef, extending 1½ mile from shore, which thence extends along the North and South coasts. Off the S. W. point there is also a key and reefs, to which a good berth must be given. The N. W. or W. point is 3 leagues from the S. W. point, and between is the spot called the Hogsties, where there is a small village, off which you may anchor in from 12 to 7 fathoms, by bringing the Southernmost house to bear E. by S., at half a mile from shore. The bottom is rocky, but you may see the ground where you let go, as the water is very clear; it will, however, be proper to buoy up the cables, and steady the ship with a small anchor.

Captain Dalzel, in some observations on passing the Grand Cayman, has said, "The island is low, covered with cocoanut and other trees, and of greater extent than is generally imagined. The North side forms a bay, across the mouth of which runs a reef of sunken rocks, which may be readily seen in the daytime, before you are near enough to run any kind of risk. It is impossible for anything but small craft to anchor on this side, for there are no soundings close to the reef, and the deepest water over it is 6 feet, though there are 2 or 3 fathoms within it. The small vessels of the island go in here; as they do, likewise, on the South side, which is also foul and not to be approached by strangers.

"The West end of Grand Cayman, which is best inhabited and mostly resorted to, is the only place large vessels can come to, though even here it is but indifferent anchorage. For, without the utmost care, you are in danger of getting your cables cut by the rocks, or may, perhaps, let go your anchor in a place where it cannot be purchased. Our anchor got under the shelf of a rock, and we had two days' hard work to purchase it, nor could we have weighed it at all, if we had not borrowed a small anchor, (we rode by our only anchor,) and braked with a swivel. This luckily hooked another shelf, we hoove upon the cable that was fast to it, and then with much difficulty purchased our own anchor from under the rock. We came to in 11 fathoms, but most of the inhabitants say that 8 fathoms is the anchorage.

"Your first soundings going in are about 17 fathoms, three quarters of a mile off shore; after which you shallow your water 2 or 3 fathoms every ship's length, till you get into 8 fathoms, where you may come to in one of the white holes. These holes are patches of sand among the rocks, which you can easily see when looking over the side. Let a careful person look out forward, to pick a large hole, and be sure you let go your anchor well towards the weather side of it, that when you let away a cable it may not come upon the rocks. If it should come to blow, and you are in danger of dragging your anchor towards any of the shelves, you must haul it up again. You can plainly see your anchor as often as you please, and you can easily distinguish the rocky bottom from the white holes, by its blackness. Observing the above directions, you cannot get amiss; perhaps you do best not to take a pilot, as they are not over careful.

"The West end forms a kind of double bay; the Southernmost is the road. Give the middle point a good berth, as some rocks lie off it; you need not heave the lead until you see the bottom, for you will get no ground until then."

The Grand Cayman is inhabited by many persons, descended from the old buccanniers, exclusive of negroes. The climate and soil are singularly salubrious; the people are vigorous, and commonly live to a great age. They raise various produce for their own use, and have some to spare. As navigators, their chief employment is to fish for turtle, and to pilot vessels to the adjacent parts.

Refreshments may be obtained here, as fowls, turkeys, yams, plantains, coconuts, &c., but no beef nor mutton. Water is procured by filling a bucket about 20 yards from the beach, the well bearing N. N. E., or N. by E., from the anchoring place.

From the S.W. end of the Grand Cayman to Cape Corrientes, the true bearing and distance are N. 47° W., 74 leagues; and to Cape Antonio N. 51° W., 84 leagues.

THE CAYMAN BRACK is very level land, covered with small trees, and at a *Cayman* short distance presents a smooth, unbroken surface, very like Navassa, except towards *Brack*.

At the S.W. point, where there is a small bunch of trees, a little higher than the rest, apparently logwood trees, as they are small leaved. The S.E. point appears very bad, and the South side also very bold. We ran down it at less than a mile distant, and saw no danger of any kind, except the breakers on the shore. From off the S.W. point, which is low and sandy, a reef runs off an eighth of a mile, but you can easily see the breakers, and even the colored water, 1/4 mile distant. We were not far enough to the Eastward to ascertain whether any reef extended from the East end or not; but, from the bold appearance of the S.E. point, I should think that if there are any reefs, they do not extend to the Southward of the East point. The East end of the Cayman Brack is the highest, and with a slight but even declination towards the West end. The Cayman Brack is considerably higher than the Little Cayman, and before leaving the Cayman Brack you will raise the Little Cayman, of which you will at first discern scarce anything, except three large cocoonut trees on the East end, and which, at a distance, appear like two vessels at anchor. These cocoonut trees are the only ones I saw on this island. These islands are separated by a deep channel, and are resorted to by the turtles.

CAYMAN BANK. A bank was discovered in July, 1839, lying on it from G to *Cayman Bank* 15 fathoms water.

It is about 1/4 miles long, in an E.N.E. and S.W. direction, and from a mile to 1/4 mile in width.

The North eastern end is in long. 81° 32' W., lat. 19° 20' N.; the South western point, long. 81° 36' W., lat. 19° 18' N.

PICKLE BANK. On this bank there are from 11 to 17 fathoms water. It runs *Pickle Bank* about W. by N. 1/2 N. It lies in lat. 20° 18' N., long. 80° 23' W.

THE ISLAND OF PORTO RICO.

This island is 30 leagues in length, and throughout this extent, from East to West, is a chain of mountains, with branches diverging to the North and South, and extending to the coasts. The whole are covered with wood, and in the intervals are fertile valleys and plains, watered by more than fifty rivulets, in the sands of which gold dust has been found. The highest summits of the mountains are called the Peaks of Cayonita. They are often covered with snow, and may be seen from a great distance.

The capital, St. Juan, stands on the Western part of an island on the North side, which forms a good harbor, defended by a citadel, called the Morro Castle, and other works. The town is populous and well built, the residence of the governor.

The Northern coast, which extends like the Southern coast, nearly East and West, is but imperfectly known. It is rugged and uneven, having many rocks and islets on which the sea breaks heavily. The town of St. Juan, which stands at the distance of 9 leagues from Cape St. Juan, is the N.E. point of Porto Rico.

There are no large bays, either on the Northern or Southern coast, and a vessel may generally run along the former without any risk, at the distance of 3 miles, and along the South coast at 5; fully observing, in the latter case, to give sufficient berth to the small isle, called Bend Chest, which lies about half way between the S.E. and S.W. points of Porto Rico.

On the Morro there is a light, 174 feet above the sea. It is a revolving light, showing eight seconds of light every two minutes.

The harbor of St. Juan is very capacious, and the largest ships may lie there with the utmost safety, in 5, 6, and 7 fathoms. The entrance is along the island on which the town is erected, and between the Morro Point and three islets, called the Cabias, or Goat Islands. South of the latter is a small islet, occupied by a little square fort, or castle, called the Canaleta, which defends the Western side of the harbor. The channel is generally buoyed.

The Western and Southern sides of the harbor are flat and shoal. The Western side of the entrance is rocky, but in the channel the ground is generally of gravel and sand, with a depth of 5, 6, 7, and 8 fathoms. From the South side of the town a low point of land extends to the Southward, and is surrounded by a shoal. Ships

generally ride to the Eastward of this flat, and out of the wash of the sea, occasioned by the trade-wind, which commonly sets directly into the harbor.

If you make the harbor with the wind Southerly, you must run into the channel with all the upper sails well set, in order to preserve your way, when you come under the lee of the Morro, and have a boat out for towing, or to carry out a warp, both of which are frequently necessary. It is high-water in the harbor at 8h 21m, on the full and change; and the greatest rise is about 1 foot.

High-water.

Off the Eastern coast of Porto Rico are numerous keys and rocks, which cannot be approached by large vessels, and therefore serve as a rendezvous for smugglers. Before these are the Isles Culebra and Vieque, or Snake and Crab Islands. The passages among these isles and rocks are generally deep; but no one should venture in who is not intimately acquainted with the place.

Passages between St. Thomas' Island and Culebra and Crab Islands.

In this channel there are soundings, with 20 fathoms, on the West side of it; and approaching either the island of Culebra or Vieque, it is shoaler. We had 10 fathoms, with the following bearings:—East end of Crab Island, S. by W. 4 W.; East end of Culebra, N. by W. 4 W.; and Sail Rock, E. by N. 4 N. The currents set through this channel strong to the Westward, which would render it necessary, in case of being becalmed, to anchor before you are drifted on the Western shore.

Vieque, or Crab Island.

VIEQUE, or CRAB ISLAND.—It is of moderate height, and well wooded. The S.W. end is hilly, and to the Westward it is low and uneven. On the West end is a low and sandy point; and with it bearing N. by E., about 1½ mile, is the anchorage. In working in, do not bring this point to the Southward of East, as there are numerous shoals between it and the East side of Porto Rico. We found the soundings regular, and 1 mile from shore you will have 6 fathoms. The shore should not be approached nearer, as the soundings there are irregular, and the ground rocky. There are a few settlers, principally on the North end. There are two sandy bays on the West side: the Northernmost is bold, and the bottom of sand. You may approach it to within three-fourths of a mile, with 4 fathoms. The Southern one has a rocky bottom—soundings irregular.

Carlita, or Serpent's Island.

CARLITA, or SERPENT'S ISLAND, sometimes called the Great Passage Island, is more than 6 miles in length. It has numerous reefs and keys about it, which require a large berth when passing. Off its Eastern side is Culebra, or Little Passage Island, from the South end of which a dangerous reef extends to the S.S.W. and S.W. 3 miles. To the West of the Southern part of this reef is the harbor of Culebra, which is 2 miles in extent from the entrance. There are 2 channels into this harbor, which are divided by a bed of rocks, and bordered with reefs, but the interior is clear and secure. Great caution is required when entering, but a pilot lives in the port. Plenty of wood, water, and fish may be obtained. The neighboring keys are famous for the great number of tropical birds which breed here.

The course through the Virgin's Passage, on the East of Vieque and Carlita, is N.W. by N., or rather N.N.W., in case of a calm and lee current; the Western side being foul and without wind, it is dangerous. Continue on this course until you see St. Juan, the N.E. point of Porto Rico, bears W. by S., or W.S.W., and you will be clear of all danger.

If you are bound down the South side of Porto Rico, you will see the S.E. point of that island when lying at anchor at Crab Island; it bears from thence S.W. by W. 4 W., or W.S.W., about 1½ leagues, and is called Pasqui, or S.E. Cape. You must run down until you come abreast of that cape, within 3 or 4 miles of it, and thence run West; and by the time you have run 3 leagues down past the cape, and it bears N. E., you will see a large breach, or shoal, 2 or 3 miles in length, which lies 3 or 4 miles from the coast. By keeping a mile or two without the breach, in running down, you will desery a small building by the water side, which is a guard-house, and by running down as directed until the guard-house bears N., or a little to the weatherward of that bearing, you may land in N., or N. by E., for it, and anchor in 4 fathoms, with the house bearing N., or N. by E., one mile distant, and the West end of the beach S. by E. This place is called Guayama, or Yammo. The wind may be known by a windmill on a hill, one mile to the Westward of the anchorage, and is much frequented, though there is no shelter from the winds, as the sea breezes than the reef. In going in, although you give the West end of the reef a good berth, you must keep the lead going. The soundings are irregular, from 10 to 8 fathoms, where it shoalens gradually inshore. The land by the water side is low, but up in the country, high and uneven, as before explained. In going out of Guayama Bay, run S.S.W., or S.W.

From Guayama Bay the next trading-place is Salinas, a good place to lie in. The Caxa de Muertos, or Dead Chest, may be seen from, and is a guide to it. When at the distance of from 2 to 3 leagues from Guayama Bay, you may steer W. 4 S., passing several keys to the Northward which lie near the shore; then, having run to a sufficient distance, haul in for the Western end of the outermost of these keys, and about a mile or a mile and a half off that end is a reef, or sunken key, which cannot be seen, but the sea breaks over it; leave this to the Westward, and run with the Westernmost key on board, within a cable's length. This key is bold to, but shoaler to leeward towards the beach. The guard-house is 3 or 4 miles from this key, and may be seen before you get within. You may run in boldly for 2 miles towards the guard-house, and anchor within a mile of the same, in 4 or 5 fathoms, good ground, and moor to the North-west.

When at anchor at Salinas, with the guard-house bearing N. 4 E., there is a good watering-place close to the water-side, a kind of lagoon, which will be about N. by W. from the ship, and half a mile to Westward of the guard-house. The water appears white to nearly a league without the key. The soundings are from 12 to 7 fathoms, very gradual, and there is no danger.

Within the key above mentioned, there are several other keys a little to the Eastward of it; and in running in you will see, at about 3 leagues to Westward, two small keys at a little distance from each other, one appearing double, the other single; you leave them to windward.

In quitting Salinas, steer outward in the same way as you entered. When without the key steer S. S. W., until the Dead Chest bears West; you may then run down boldly, giving that isle a berth of a mile. There is a small key about a cable's length from the S. W. end of the Dead Chest, to which a berth of a mile and a half should be given. You may then haul in, and anchor under the lee of the isle, at pleasure, in from 7 to 12 fathoms. With the West point of the small key S. by E. 4 E., 13 mile distant, and the North end of the Dead Chest N. E. 4 E., there are 10 fathoms of water, at a mile from shore.

CAXA DE MUERTOS, or DEAD MAN'S CHEST.—This island is on the South *Caxa de*
 side of Porto Rico, and bears E. 4 S., 36 miles, from Cape Roxo. When made, it ap- *Muertos,*
 pears in the form of a wedge. The North end is high, the centre low, and the South *or Dead*
 end has a sugar-loaf mountain, which at a distance appears a detached island. The *Man's Chest.*
 anchorage is on the West side, off the low land, half a mile off shore, in 8 fathoms,
 in the following bearings:—South-east point of the small island, connected to Caxa
 by a reef above water, S. W.; the only sandy bay S. by E.; the North-west point
 and Northern peak in one, East. There is no danger on the West side of this island,
 and off the low land the soundings are regular; but to the Northward of it the water
 is deeper, and you will have 17 fathoms close to the shore. Off the Southward of
 the island there is a shoal, which breaks, about half a mile off shore.

PONCE.—The town and harbor of Ponce, lie about 5 leagues to the East of Guanico. *Ponce.*
 To run for this port keep a mile off the small key off the S. W. end of the Dead
 Man's Chest, and run N. W. 4 N., or N. W. by N. The land is low near the water,
 covered with mangrove bushes and some cocconut-trees; but the houses are also low,
 so you will not see them until you open the harbor. In running over, you will see a
 low sandy island, which you leave on the port hand. If it blows fresh, the reef which
 you turn round on the starboard hand, will appear as though there were breakers across
 the mouth of the harbor; but, as you approach, you will find the breakers do not make
 off far from the bushes. You may pass them within 2 cables' length, and keep near-
 est the shore on the Southern side of the harbor.

In proceeding on a West course towards Cape Roxo, that cape, when first seen, ap-
 pears low, gray, and like two keys. A shoal, called the White Grounds, encompasses
 the cape, and extends to the S. W. At 2 or 3 leagues to the Eastward and Westward
 of this cape there are 10, 12, and 15 fathoms. It is a coral bank, and close to the
 outer edge no bottom is to be found. The Southern extremity bears from the cape
 S. W. W. 8 or 9 miles.

GUANICO.—On this coast the best anchorage is in the harbor of Guanico, 5 leagues *Guanico*
 to the Eastward of the Morillos—it is fit for vessels of all classes, with from 65 to 2
 fathoms of water, which latter depth is found in its interior. The bottom is of sand
 and gravel. The mouth of the harbor is in the middle of the bay, formed by the point
 and end of Brea (Pitch Point) on the West, and that of Punta on the East. In the
 neighborhood of this last are two islets, and from them to Punta de la Meseta, which
 is the East point of the entrance of the harbor, there is a reef, which reaches out from
 the east about a mile, and nearly forms a circle, uniting at one end with the islets,
 and at the other with Punta de la Meseta.

Between Punta de Brea and Punta de los Pescadores, (Fisherman's Point,) which
 is the West point of the mouth of the port, the coast forms another bay, of which
 the mouth is shut by a reef that, running out from Punta de Pescadores, ends on the

South side of the bay, about a mile within the point and cliff of Bren. It is necessary not only to give a berth to the reef which runs from Punta de Punta to Punta de la Meseta, but also to a rocky shoal which stretches out a short half mile from it.

To enter this harbor you must steer on the outside of these banks or reefs. To do this bring the Punta de la Meseta exactly in one with one of the Paps of Cerro Gordo, which are at some distance inland. If you run in with the point in one with the Western Pap, you will have the bank very close, but will have 10 fathoms of water; but if you run in with Punta de la Meseta in one with the Eastern Pap, you will pass without any risk whatever. You will have passed the shoal when the islets at Punta Picua bear E. 4 N., or perhaps a little sooner.

If you advance to the harbor by Punta de Bren, or Pitch Point, you may pass this point or bluff at a cable's length, and thence steer to within the Punta de la Meseta, passing it, if necessary, at a quarter of a cable's length, and thence proceeding for the interior of the harbor, only observing that you may make bold with the South thence with the North side of the entrance. You may anchor where you please, in 1 or 2 fathoms of water.

Mayaguez.

MAYAGUEZ.—The best leading-mark in, is a hill, about 10 miles inland, with a double summit called Montoso, in range with the custom-house, (which has one steeple,) bearing E. by S. 4 S.

In beating in, stand to the N. until the custom-house and church (which has two steeples) come in range, sounding for the Manchilas, and to S. tack, before Montoso ranges with the church, until you have over 5 fathoms inside the bay, when the land S. of Guanagiva shuts in behind it you are inside all the reef South of Algarroba.

The Manchilas extend about 3 miles W. N. Westward from Algarroba Point the soundings upon them are very irregular; the least water found was 2½ fathoms, the bottom shows very plain, the brown spots being generally shoalest: they break sometimes in rough weather. There is a good channel inside from Anasco Bay, going to Algarroba Reef a small berth, and taking care not to haul round it until Montoso opens to the South of a white sugar-house chimney, (Vico's,) which stands conspicuously near the shore, N. of Puntilla.

Algarroba Reef is nearly bare, and is bold to the South-westward. Vico's white chimney on with Montoso, is the mark for it. They intend to erect a light house on the point.

The Puntilla Reefs are nearly dry, and bold to the South-westward.

The church and Montoso in range, lead into 12 feet water on the bar.

Montoso shut in with a hill South of the church, having a remarkable reef upon the side of it, is the range for Piedra Blanca, which has only 8 feet water in one spot.

The Rodriguez Reef is dry in several spots, and always shows itself. The true passage through the midst of it, about N. E. by E.: least depth 12 feet, green water. To the N. and N. N. W., for nearly 2 miles, the soundings are irregular, and there are probably spots having less water than what is marked.

Zacheo Island is 22 miles N. 50° W. (true) from Guanagiva, and 2½ miles N. 60° W. from Algarroba.

Lat. of custom-house, N.	18° 13' 00"

Tides.

Tides rise and fall 2 to 4 feet; time irregular.

Description of Porto Rico, from the "Derrotero de las Antillas," &c.

This island is 31 leagues in length from East to West, and 11 leagues in breadth in the broadest part. The N. E. point of it is named Juan, (St. John's Head,) where the range of mountains, called Luquillos, commences. The highest part of these, Yunque, or the Anvil, may be seen at the distance of 68 miles. The range continues to the Westward with many intervals or openings, until it ends at the hill named S. de Caballa, (Horse's Saddle,) which is to the Southward of Arrecibo.

The harbor of San Juan requires a pilot. The harbor of Arrecibo is about 9½ leagues more to the West; it has a small town on its Western side, and a good river, but little frequented, being open to the North winds. From Arrecibo the coast trends nearly true West to the N. W. end of the island. The land here is generally low, until it reaches Punta de Pena Agujerada, (or Point of the Holed Rock,) where a range of lofty highland begins, which trends S. W. rather more than a mile, to Punta Guayn, the North-westernmost point of Porto Rico. The coast again declines inland

and forms a convex bow, to Punta de Penas Blancas, (Whitston's Point,) the North point of Aguada Bay.

AGUADILLA BAY, called Aguda on some charts.—From the Point Penas Blancas, the little town of Aguda bears S. S. E., 2 miles. In the bay before the town, rather village, is anchorage for the largest ships, with shelter from the sea breeze. This bay may be entered at any hour of the day, with facility and safety; but not at night, as the breeze then dies away, and a calm ensues. There is excellent water to be obtained at a rivulet which passes through the middle of the village. The situation of the latter, as given by the Spanish officers, is lat. 18° 25' 53", long. 67° 0' 20".

This bay is much frequented by vessels bound from Europe to Cuba, both on account of the facility with which they can procure refreshments, and because pilots for the Bahama, or Old Channel, may always be found here. If intending to anchor in Aguada Bay, after rounding Point Bruguera, keep about 3 cables' length from the shore, in order to avoid a shoal which spits out from Punta de las Palmas; whence to half of Penas Blancas you may approach the coast nearer, as it is very clean; and at half a cable's length from the shore you may find 4 fathoms of water.

To anchor, bring Point Aguda N. N. W., 2 or 3 miles, the church tower E. N. E., the Island of Zacheo W. by S., when you will be in 10 fathoms water, about 3 cables' length from the shore. There is a good river of fresh-water; the sea in general smooth, with usual trade-wind; but should the wind incline to the Northward, avoid anchoring, or weigh as soon as it sets in.

At S. W., by W. 7 miles from the village of Aguada, is Point St. Francisco, with various rocks about it. All the coast between has a beach, with many shoals, formed by the rivers that empty themselves into the sea. At 2 cables' length from the coast are 4 fathoms, with bottom of rocks and sand; but there is no anchorage. At S. W., by E. 1/2 S. W., or less than half a mile from Point St. Francisco, is Point Ganguera, the Westernmost point of Porto Rico, otherwise called El Rincon. About it the ground is shoal, with many rocks.

Remarks on Aguadilla Bay, &c.

The town is in lat. 18° 21' 57", and long. 67° 8' 15". In proceeding for the anchorage from the Northward, you may run round the N. W. point of the island, about S. W. or S. S. W., within a mile of the shore; your depth of water will be 20 or 25 fathoms. Point Bruguera, the N. W. point, is a high steep cliff; about a mile to the Southward of it is Point Palmas, a low sandy point, covered with trees. The latter forms the North side of the bay; and in rounding you must give it a berth of a mile, as a reef stretches off at that distance. Having rounded this reef, with the bay fairly open, you will see the town, lying on the N. E. side of the bay, with straggling houses to the S. W. for 2 miles. The anchorage is before the town and near the shore. The whole of the bay is perfectly clear, with the exception of the white reef, (Penas Blancas,) extending from Point Palmas; and you may stand to a quarter of a mile from shore anywhere, for the depth of water will not be less than 7 or 8 fathoms. The marks for anchoring are, a large house standing by itself, about a cable's length from the North end of the town. Between it and the town is a small battery of three guns. Bring this house to bear N. E. 3 N., the church steeple E. 3 S., and the North point of the bay N. by W. Here you will have 18 fathoms, and very good bottom, at about half a mile from shore. The anchorage is very good farther inshore, in from 10 to 15 fathoms. If you moor, lay your anchor in 10 fathoms, and under one from 15 to 18. There is also good anchorage in from 20 to 24 fathoms, but there you are more liable to drive off the bank. Inshore the anchorage is so extensive that you can hardly err in anchoring any way before the town. The winds are frequently variable, and render it difficult to get up to the anchorage. At times the sea-breeze blows fresh over the land from the N. E.; then you may beat in with ease.

In the winter months, when the North wind blows strongly, there is a heavy swell into the bay, and great surf on the beach. Large ships ought not then to anchor further in than from 23 to 25 fathoms; they will thus have room to get under way and back out, in event of its coming on to blow; and as the West point of the bay bears from the anchorage S. W. 1/2 W., a ship will lie out with the wind at N. W., and may run through between Zacheo and the S. W. point of the island.

Ships coming from the Southward for Aguada, may also pass between Zacheo and the island; and when Zacheo bears W. by S., they will have the bay fairly open, and may work up as above; taking care to keep the West point of the island bearing to the Southward of East; for off it there is foul ground all the way to the Southward, as far as Cape Rojo, but all clear to the Northward.

From Point Ganguera (says the Derrotero) the coast trends S. E. by S., 34 miles, to Punta de la Cadena, having one small bay, named Del Vincon, which, although well sheltered from the sea-breeze, has a very unequal bottom, and is full of rocks. After

vessels ought, therefore, to be very careful in rounding them. There is a small reef projecting from the S.W. point, but it always shows itself.

Captain Powers, of the navy, has stated that, in the route from New Providence to Jamaica, in 1811, when "passing along the West side of Watling's Island, about 1½ mile from the sandy beach, with the S. by W. point bearing S.W., just at dusk we discovered a ledge of breakers (about a ship's length East and West) close to us:—

"When about a cable's length to the Westward of them, we had the following bearings, viz.: a remarkable black rock, close to the shore, and breakers in one, E.S.E., the N.W. point of the island E., the S.W. point S. by E.

"We had 5 fathoms at about 2 cables' length to the Northward, and deepened our water gradually as we increased our distance to the Westward. No bottom with hand-line about half a mile outside; the water the same color as the ocean; at this time land was distinctly seen from mast-head, bearing S.W., and very low."

Rum Key.

RUM KEY.—No reef of any extent lies off this island, except Pindar's Reef. This lies off the N.W. part of the island, extending out North about 2 miles. There is a small reef very close in, near the S.E. harbor point. The shore in general is bold; and if a trifling reef, shoals, or sunken rocks are known, they are chiefly on the North side of the island, not frequented by any shipping, and lying very near the shore. The S.W. point is a sand-spit, with very bold water on either side of it; vessels of any size can anchor within 200 yards, and procure fresh water from wells dug near the beach.

With the exception of Pindar's Reef, vessels of any size can approach with safety any part of the island within a quarter of a mile, and many places (particularly the West end) within 150 to 200 yards.

The West side of Pindar's Reef is very bold; vessels may run a North course so close along as to throw a biscuit on it. The East part of the island shows white cliffs; more Northerly again, black cliffs.

The vessels that load at Old Pond run down the South side in going to sea, round the West end, keeping to the Eastward of Little Island, in sight, distant 13 miles, and to the Westward of Watling's Island, about 20 miles from Rum Key.

If the vessels returning homeward cannot pass to the Eastward of Rum Key, and are obliged to take to the South side, they should keep close in with Rum Key, and well in with the West end, which would allow them to pass well to windward of Little Island. Variation, 5° E.

There are settlements all round the island. Rum Key has two salt ponds; the old salt pond situated on the South side of the island, nearest the end. The anchorage is good about half a mile from the beach, and will admit vessels of any size, affording shelter from the S.E., E.N.E., and round to N.W. Pilots will go out, on vessels making the usual signals. There is always a considerable quantity of large grained salt for sale, and every dispatch given while loading.

Carmichael Pond, a new one, is at the West end of the island, and the facilities for procuring salt are good; the anchorage, an open roadstead at the West end, and immediately off the pond, is protected by the island, with the wind from N. by E. round to S.E. by S. Not far from the beach is a signal-staff; vessels may anchor off it, within 250 yards of the shore. Should the anchorage prove rough, by the wind getting out Westerly, vessels can easily weigh anchor and run round Sandy Point. A few minutes after weighing anchor a vessel will be out to sea. The salt is carried alongside in boats and put on shipboard.

Conception.

CONCEPTION is a little island surrounded by a reef, and lies half-way between Rum Key and Catt Island. From its N. side a reef extends 5 miles to the N.N.E. and N.N.W., which was not known until the year 1812, at which time the British frigate Southampton was wrecked upon it. This reef is accounted one of the most dangerous in the Bahamas, having several dangerous rocks or heads, which cannot be perceived by the color of the water before you are close to them.

Atwood's Key.

ATWOOD'S KEY is 3 leagues from East to West, and narrow from North to South. The island is surrounded by a white shoal, bordered with a reef. Off the West end the reef extends out one league; and under this point, in the extent of another league along shore, there is an opening or interval in the reef; and here vessels may anchor in the white ground, in 7 or 8 fathoms, but very close to the shore. Off the edge of the white ground no soundings are to be found. To the East of the island are two small islets; the outer one at a league and a half from the shore; they are surrounded with reefs and white shoals.

Atwood's Key is low, with bushes, and presents the same appearance as the other isles in this passage. Its greatest breadth is about 3 miles, which is in the middle for each extreme terminates in a point. The reef on the North side breaks, and extends above 2 miles from the land. The same reef, continuing to the West, forms

head, which is a mile and a half to the Southward of the point. "On the South side, about 2 miles from the West point, you may anchor at 3 cables' length from the land, and for half a league at least along the shore, sheltered from Westerly and N.E. winds. Having brought the West end N.N.W., about one mile off, we saw that end was a point only, and that the other side rounded away E.N.E., full of breakers, which were at least 2 miles from it; we also saw some ahead of us, and to leeward; we were obliged to haul our wind, and stand for the anchorage before mentioned, on the South side of the island. This anchorage extends about a mile each way from whence we were, and about 3 cables' length from the island. You may let go your anchor in 8 fathoms, sand and broken shells, but it is not good holding-ground."

THE CROOKED ISLANDS.—Of this singular group the best idea may be formed by referring to the particular plan of them. The positions appear to be well ascertained; and particularly of Castle Isle, or South Key. Pitt's Town, a settlement on the N.W. part of the Northern island, is the port of entry. *The Crooked Islands.*

CASTLE ISLAND is an islet off the South end of Acklin, the Southern Crooked Island; between are several white rocks, one of which is very remarkable, appearing when you first make it, like a white fort or castle, from which the islet takes its name. The position of the islet is $22^{\circ} 7' 45''$ N., and $74^{\circ} 19'$ W. Variation $E. 40' E.$ *Castle Isl. and.*

Between Castle Island and Fortune Island the land forms a great indent, named the Great Bay, at the entrance of which lie the Fish Keys. These keys are not to be approached too near. Between Castle Island and Salina Point is a fine sandy bay, called Jamaica Bay, wherein ships may anchor in 9 fathoms, well sheltered from S. W. winds. To the N.E. of this bay are two wells, with excellent water, and wood may be obtained.

FORTUNE ISLAND, distinguished by its salt-ponds and wharfs, is rather more than 10 miles in length, and $1\frac{1}{2}$ in breadth. It lies nearly N.N.E. and S.S.W. The South end is very bold. Off its North end are two islets; and a little to the North of these islets is a sandy point, known by the name of the French Wells. From this a small settlement will be seen on the high land to the Northward. A vessel may anchor in 8 fathoms, with the French wells due East, 2 miles. The anchor should be let go immediately when on the bank, only taking care to pick out a clear spot. At this place are several wells of excellent water, which give name to the point: stock and wood also may be obtained here. *Fortune Isl. and.*

THE BIRD ROCK, or PASSAGE ISLET, is a low islet off the N.W. point of Crooked Island. A very dangerous reef extends 2 miles from it, in a N.N.W. direction; it then trends in a circular direction to the E.S.E., or towards the shore. This reef forms the Bird Rock anchorage, which is rather indifferent, the ground being partly foul. *The Bird Rock, or Passage Islet.*

Southward of the Bird Rock is a sandy bay, called Portland Harbor, in the middle of which, close to the beach, is a well of spring water. The best anchorage in this place is off the first rocky point to the Southward of the sandy bay, at about 3 cables' length from the shore, in 7 or 8 fathoms. You may anchor as soon as you are on the bank with the Bird Rock bearing nearly N.N.W., but without great caution the anchor will be lost.

If you anchor in the sandy bay above mentioned, you must be careful to avoid a rocky head, having only 16 feet water on it, and which lies off the centre of that bay, at about three-fourths of the distance between the beach and the edge of the soundings.

CROOKED ISLAND PASSAGE is the best of all the windward passages for ships to sail through. *Crooked Island Passage.*

The prevailing winds being from the North quarter, as soon as you enter the passage you will find smooth water and plenty of sea-room. In the event of its blowing strong from the N.N.W., or N., you will find good anchorage under the South end of Fortune's Island, in 5 or 6 fathoms, about three-quarters of a mile from the shore, with the point bearing N.W. by N., and the sand-breaker E. $\frac{1}{2}$ S., just on the edge of soundings.

There is also anchorage at Bird Rock, but the ground is very rocky. Wood, water, and stock can be procured.

Of the Crooked Island Passage, the Count Chastenot de Puysegur says, this is the longest of these passages, but it is far the most convenient for ships coming out of the Bay of Gonaves, or from the Southern ports of Hayti, and for those which are bound to the United States. These commonly take their departure from Cape St. Nicholas; and being 2 leagues from the cape in the offing, must steer N. by W., 23 leagues, to make the S.W. point of Henegua. This course will generally lead 2 leagues to the Westward of the point.

When you are opposite the West point of Great Henegua, at 2 leagues off, steer N. N. W. 2° or 3° W., for 25 leagues, when you will make Castle Isle, which you may approach within 2 miles, or nearer, without fear. If you should depart from Henegua in the evening, it would be better to steer N. W. 4° N., for 17 leagues, to avoid the Hogsties; then to haul up, and make a good N. by W. course; when, having run 8 leagues, you will be one league to the Westward of Castle Island. The Hobart Breakers lie about 3 leagues to the S. W. of Castle Island.

Should you make Henegua towards noon or afternoon, it will be best to drop anchor in the N. W. in the morning, and get under way at midnight, or at 2 in the morning, according to the strength of the breeze, and steer N. W. 4° N., until you have run 16 or 17 leagues; then haul up N. N. W., or N. by W., when there will be daylight for anything through the passage. But should there be light baffling winds in the night, with probably a weather current, keep the lead going, and you will avoid the Hogsties, as, in advancing towards them, there will be found soundings of 50 to 30 and 20 fathoms.

From the West end of Castle Isle you steer N., or N. by W., 7 $\frac{1}{2}$ leagues, to make the West end of Long Key. This course and distance will lead within a league of it. Continue in the same direction, to make Bird Rock, off the Western extreme of Crooked Island. Having thus run 6 leagues, you will be 1 $\frac{1}{2}$ league West of this islet; so that the direct course from Castle Isle to the end of the passage is N. 5° W., 14 leagues.

When you are come to this place, you may consider yourself out of the passage, but should the wind happen to the N. E. or E. N. E., you have to fear Watling's Island, which bears from Bird Island N. 4° W., true, 23 leagues; therefore, to avoid it, you ought, in leaving the passage, to keep as much to the Eastward as the wind will permit; but should the wind be at S. E., and you steer at N. E., you would make Atwood's Key; so that, keeping the wind when you are out, you must observe not to steer higher to the Eastward than N. E., nor more to leeward than N. by E.

Diana Bank. DIANA BANK is a bank of 5 miles in extent from East to West, and 3 miles from North to South. From Com. R. Owen's, R. N., surveys, who has surveyed all the windward passages, it appears there are not less than 9 fathoms on it. The centre is in lat. $22^{\circ} 31' N.$, long. $74^{\circ} 46' W.$

Currents. CURRENTS.—You have little reason to fear the currents in this passage, which, in a fresh breeze, are scarcely perceptible; but, in calms and light winds, they may set you to the Westward, but slowly, and so feebly, that, in a passage so short, you need not mind them, especially if you make it with a large wind. But in the months of June, July, and August, when calms or light Westerly winds are common, you may experience a current setting to the West strong enough to alter your course, which effect only can happen in this passage, and is occasioned by the proximity of the extensive shoals, forming the channel of Bahama, and those of Providence Island. In this season, if you have sufficient to make you go more than 2 knots an hour, allow a quarter of a mile an hour for the current setting to the Westward; if you go 3 knots and upwards, this allowance will be unnecessary.

Winds. WINDS.—The N. E. trade generally prevails here, except from October to April, which are considered the winter months, during which you have sometimes strong gales from the N. W., and very variable weather, particularly about the full and change of the moon, which ought to be guarded against.

Mira-por-Vos. The MIRA-POR-VOS, an assemblage of barren rocks, with one low sandy islet, lie to the West of Castle Island, in $22^{\circ} 7' N.$, on a shoal similar to that of the Hogsties. They are very dangerous, and should be carefully avoided, particularly when the islands bear in a N. W. direction.

When the wind blows from the Northward, they break very heavy, and have always a heavy swell; the current generally sets from the N. E. one mile per hour. On the Western side is an indifferent anchorage; the East side is bold, and on the S. E. side, at a mile distant, there are from 20 to 25 fathoms, coral and rocky ground. As these keys are to leeward, they are not often seen by vessels in ranging along Castle Island; however, if it is necessary to turn, you may approach the bank within half a league. All the dangerous parts break, and the white ground will give you notice in good time. You may, if you choose, pass to the Westward of the Mira-por-vos, with the precaution only of not approaching too near. Captain William Dowers was passing this way in an evening of January, 1814, and came suddenly on a reef stretching out from the S. W. Key, which bore East, $2\frac{1}{2}$ miles. Captain Dowers says, "We had 10 fathoms sand, while in stays; but observed black rocks and less water in many places."

"This reef appears to run off West for 3 miles, and then extends to the S. S. E. for some distance. We counted 10 above water. They are all barren rocks, excepting the S. W., which is a low sandy island, about half a mile in length, and covered with brushwood."

RAGGED ISLANDS.—These have been surveyed by Commander R. Owen, R.N. *Ragged Isl-
ands.*

The flagstaff is in lat. 22° 11' 40" N., long. 75° 44' 07" W. If bound to them from
the Windward Islands, a N.W. course from Cape Maize will make them, distance 45
leagues. Vessels bound to Ragged Island should pass 15 miles to the Northward and
Eastward of Key Verde, thence steer W. by compass for Ragged Island. The island
is surrounded by many dangers, whose positions are shown on the chart. All masters
of vessels bound to it, in coming up the straits, had best keep the Cuba shore on
board, until they run up as high as the well-noted high hills of Givari, which is a sad-
dle hill; then steer as above directed, and if they exceed 8 feet draught of water, keep
the island under their lee, and run the shore close on board until they bring the flag-
staff and houses to bear due South, then you will open the entrance into the harbor,
when you must haul in S.W.; then ahead of you a small key, with store-houses on it,
will appear, and at your entrance into the harbor, a low black rock on your starboard
side; give it a berth, and in running in, you will observe a large red Cal Bank on your
port side, which you may run close to until you come abreast of a low black point of
rock on the same quarter, and when you come abreast of a couple of cannon mounted
thereon, you may drop your anchor in 3 or 4 fathoms water, until a pilot boards you,
unless he have met you on the outside. Ragged Island is distinguishable from all other
surrounding keys by a lofty hill about the middle of it, the number of houses and inclo-
sures, and by the flagstaff that appears on it. Vessels running far from Cape Maize, or
Barracoa, generally make Cape Verde, close up to which, either to windward or lee-
ward, there is plenty of water for vessels of any draft. South of Ragged Island,
distant 10 miles, there are three small keys close to each other, called the Brothers,
that have from 2 to 3 fathoms water close up to them. St. Domingo Key lies S. 4 E.
of Ragged Island, distant 9 leagues, to leeward of which there is plenty of water; but
no vessel should attempt to edge the bank to windward of it, until close under the lee
of Key Verde, as there are many dangerous ledges and rocks betwixt them, on the
edge of the straits, on which many vessels have been lost.

TIDES.—From the first of January to the last of April they flow from 16 to 18 inches, *Tides.*
and the tide that flows an hour after the rising of the moon, is uniformly 6 or 8 inches
higher than the tide which flows after her setting.

They have frequently, during the above months, been observed not to flow more than
from 6 to 12 inches. The spring tides, during the above months, generally rise from
6 to 10 inches higher than the common tides.

From the beginning of May to the first of October, both tides gradually flow till
they arrive at the height of from 10 inches to 2 feet 4 inches, and from 18 inches to 3
feet 6 inches, and then continue diminishing until the month of January.

*Directions for sailing from Jamaica, through the Windward Channel and Crooked
Island Passage.*

Those who are bound from Jamaica to Europe, or any part of the North-eastward,
should, if possible, take the Crooked Island Passage in preference to any other. From
Point Morant, Jamaica, you should endeavor to gain Easting as soon as possible; and
by taking advantage of the wind's shifting from N.N.E. to East, which it generally
does in the night, you will gain ground very fast; and by working up under Cape
Dame Marie, on Hayti, you avoid a strong set to the S.W., caused by the trade-
wind.

There is, at times, great difficulty in working around Cape Maize, owing to the
strong lee current which generally prevails with a strong N.N.E. wind, particularly
in the months of January, February, March, and April, during which the strong North-
easterly winds prevail. This current is found to run strongest between Cape Maize and
Cape Dame Marie, (or Donna Maria,) the stream occupying a space in breadth, equal
to the distance between the contracting points, and runs at the rate of 2 knots an
hour, setting, during the strong N.E. winds, to the S.W., between the N.E. end of Ja-
maica and the Morant Keys.

Some commanders, after clearing the East end of Jamaica, have stood over to the
Cuba shore, in order to round Cape Maize; but they, also, have found a strong lee
current, and having little or no land wind to assist them in working along the South
side of that land in the months above mentioned, they have at last been obliged to
bear up for the Gulf Passage.

It is to be understood that the following directions are not intended as a standing
rule for working, at all times, around Cape Maize. In the fine season there are va-

rible winds, and the current is sometimes in your favor, of which every advantage should be taken according to circumstances.

In sailing between Cape Maize and Cape St. Nicholas, the Montagnes de la Hotte, or grand Anse Mountains, (the Westernmost high land of Hayti) are often seen. They may be descried at the distance of 30 or 40 leagues; and by their situation and bearing, become a good guide in working up the Windward Channel.

In sailing from Port Royal to windward, and finding a strong lee current against you, stand well out, and work in the stream of the Morant Keys, endeavoring to get to the Eastward of those keys as soon as possible. The Morant keys are by no means dangerous, as they can at all times of the day be seen at a sufficient distance to avoid the dangers that surround them, for under the N.W. side is anchorage.

Having made the Morant Keys, stand well to the Eastward, and keep working in a direct line, for the high land over Point Boncan, which is to the E.S.E. of Cape Tiburon; and by not standing further to the Westward than with Cape Tiburon bearing N.E., you will avoid the stream of the current, and gain ground very fast. When you have advanced as far to the Northward as 17° 40', you will sometimes meet with a counter current, and it frequently happens, particularly in the night, that squalls are met with from the Southward, which are caused by the highlands of Hayti. In this case, keep well to the Eastward of the Isle Navaza, between it and Cape Tiburon. With frequent flays of wind in your favor, endeavor to get close under Cape Tiburon, and keep working along that shore, which is very bold, to Cape Dame Marie; and, by not standing further off shore than 7 or 8 miles, you will find very little current. It has, however, been observed, that *by keeping too close in* with the land about the S.W. end of Hayti, you may be becalmed for a month.

In the channel between Cape Nicholas and Cape Maize, the current sets with great strength, particularly on the Cuba side, where it, however, varies with the seasons. It is, therefore, necessary to work up to Cape Nicholas, before you attempt to weather Cape Maize; and by keeping within the line of Cape Nicholas and Cape Dame Marie, you will work to windward very fast. When Cape Maize is brought to the Northward of North, you may venture to stand across the channel to the Northward, and you will generally, as you stand over, find the wind more Easterly. Stretch over to the Great Henegua, as that island should always be made if possible.

In proceeding from off Cape Maize for the Crooked Island Passage, make the land of Henegua if possible, as short departures are best in navigating among these islands, particularly as the currents are found in various directions.

On proceeding from Great Henegua to Castle Island, you should leave Henegua so as to allow sufficient time for entering the Crooked Island Passage before dark, or in the evening, so as to arrive there by daylight in the morning. The latter is generally preferred. The course from Great Henegua to Castle Island is N.W. by N.

Having entered between Castle Island and the Mira-por-vos, the course to Long Key is N. by W. $\frac{3}{4}$ W., 7 or 8 leagues. Towards the Northern end of Long Key a rise of land, with a flagstaff on the summit. In advancing towards this place, you will perceive a sandy point, called the French Wells, off which there is good anchorage for men-of-war, in 7 fathoms, about 2 miles from shore.

From abreast of Fish Keys to the Bird Rock, off the N.W. point of Crooked Island, the course and distance are North, 84 leagues. You may run along shore, there being no danger but what may be seen in the day. The Bird Rock lies in lat. 22° 50', long. 74° 23'.

When you get abreast of this Key, you may with safety haul up N.E., if the wind permits, to go clear of Watling's Island. It is very dangerous to approach Watling's Isle in little wind or calms, the current setting wholly on it: as it is very rocky and steep to, there would be no possibility of saving the ship. In going to the Northward you can seldom clear Watling's Island, after you have passed Crooked Island, without beating to windward; and going to the Southward, after you are past the Mira-por-vos, and the Hogsties, it is difficult weathering or rounding Cape Maize.

THE HOGSTIES are three low keys, encompassed to the Eastward by a reef of 4 miles in extent. The South Key is in lat. 21° 40' 30" N., long. 73° 50' W. They lie at the distance of 11 leagues N. by W. $\frac{3}{4}$ W. from the N.W. point of Henegua. About them are many rocks and broken ground, and when it blows hard the sea breaks over them all. The Southernmost is the smallest, and bears from the middle key, which is the largest, S.S.E. The smallest requires a good berth, it being shoal all round; but you may sail close to the largest, and anchor in 4 or 6 fathoms, with that key bearing E.S.E. About a mile to the Westward of the Hogsties is a depth of 10 and 20 fathoms.

GREAT HENEAGUA, OR INAGUA.—Great Henegua is rather low, and cannot be seen at a considerable distance, in consequence of the haze which constantly prevails in these latitudes. In making the West end there is no danger whatever. Two sandy bays at that end afford good anchorage. From the trade-

agna is rather low, and cause of the haze which comes from the East end there is no danger anchorage. From the trade

wind's blowing over the island, the Northernmost bay is the best. Stand in, and you will perceive the line of soundings by the color of the water, extending about half a mile from the beach. As soon as you are in soundings, let go your anchor, in 6 or 7 fathoms.

This island is about 15 leagues in length, and 10 miles in breadth. The body of it lies in lat. 21° 5' N. Fresh water may be procured in the Northernmost bay, on the West side, at a small distance from the beach.

A shoal, marked doubtful, which is exhibited on some charts, as lying off the S.W. end of Great Henegua, has been carefully sought for, and said not to exist, but we think otherwise.

On the night of March 17, 1812, the steamer Clarion, Capt. B. Williams, drawing 10 feet water, struck on this shoal and knocked off part of her false keel.

Capt. W. supposes it to be about S.W., 15 miles distant, from the S.W. point of Henegua; it being night, he could not see the land.

M. Chastouet de Physegur says, "Great Henegua, like all the islands which bound the Windward Passages, is very low, with small hummocks, which, at a distance, appear like detached islets." The land, in clear weather, may be seen at the distance of 5 or 6 leagues, and you need not fear coming within half a league on the Western side. In a fine bay, which you leave on your starboard side when going through the passage, you may anchor on white bottom, choosing your ground by your eye, as in many parts of such bottom there are stones which sometimes rise to a considerable height above the level of the sand."

There are some rocks about the S.W. point, with a reef which stretches out to nearly the extent of a mile. In the bay between this and the West point, called Shallow Bay, you may anchor close in. The bay is surrounded by a reef, which shows itself, although there are 2 or 3 fathoms over it. Without the reef, is white sand, to the distance of 3 cables' length, and on this is the anchorage, in 7 or 8 fathoms. Further out, in a line between the two points, which lie S. S. E. and N. N. W. from each other, in 15 fathoms, is rocky ground. This bay is not so deep as the Great Bay, but, as the bank is less steep, ships are not so liable to drive here; neither is the landing so easy, but there are clear places in the reef. There is no water but in the rainy season; then it is not very good, as it lies among the mangrove bushes.

THE GREAT BAY is sheltered from the North by the N.W. point, and from the South by the West point. This bay is 2½ leagues wide, and one deep; and all along the shore there is a border of sand 4 cables' length wide, on which you will have 5 fathoms, at a pistol shot from the shore, to 15 fathoms; and at half a cable's length from that, 15 fathoms of water. If you should be there in the season of the Norths, you may anchor under the N.W. point, so as to be sheltered from the W. N. W.; and if there when the Southerly winds prevail, you may anchor under the South point so as to be sheltered from the W. S. W. There are not more than 4 or 5 points of the Westerly winds which could hurt you; but they are not to be feared, as they seldom blow, and never violently. It is easy landing all round the bay.

Having rounded the N.W. point, you will see a little islet to the E. N. E., and a ledge of reefs for more than a league along the shore, and upwards of a mile from it. This coast will be known by a hummock, (le Mornet,) the only one on the North side, which is lower than the South, and covered with bushes.

At the Eastern part of the North side of Henegua is a bay, 3 leagues wide, and nearly one deep, where you may anchor, but will be sheltered from Southerly winds only. This bay is little known. About a mile from the S.E. point is a small islet, and around it the bottom appears white; upon this you may anchor at about musket shot from the island. The white bottom continues along the South part, with here and there some reefs with breakers.

STATIRA SHOAL, on which H. M. ship Statira was lost, bears South, nearly 3½ miles, from the South-east point of Inagua.

LITTLE HENEAGUA.—This island, which lies to the Northward of the N.E. point of Great Henegua, is low and uneven, except a little mount or hummock, which is at an equal distance from the N.E. and S.W. points; not far from the shore, almost round the island, it is sandy, except at the S.E. point, where a ledge of rocks stretches off and breaks, nearly ¼ mile. On the South side there is a white bottom, bordered with a reef, at the foot of which is a depth of 40 fathoms. This island is divided from Great Henegua by a deep channel, a league and a half in breadth.

CIDADADO REEF.—This, on the authority of Com. R. Owen, we believe does not exist.

MAYAGUANA, or MARIQUANA, is an island, 8 leagues in length, between the parallels of 22° 18' and 22° 30' N. It is surrounded by a reef, which runs above a league and a half to the Eastward. On the Eastern part of this reef are several keys, and 5 or 6 huge rocks above water. Near the Northernmost part of it is an islet, three-quarters of a mile long, with a small key to the S.W. of it. The rest of the

Cidadado Reef.

Mayaguana, or Mariguana.

reef is bordered with rocks under water, on which the sea breaks. On the South side is a passage for small vessels to go through, and be sheltered by Mayaguana on one side, and the reef on the other.

Captain McGowen was lately cast away on Mayaguana Reef. He says it lies a mile and three quarters further out than the charts show. I previously considered that it did, a mile and a half. He has, I understand, determined the position of some points in the Passage Islands, and found a spring-well on Heeneagua; a matter of much importance under a tropical sun.

From the S.W. to the N.W. point of Mayaguana, the coast is clear, and forms two bays, the bottoms of which are of white sand, where you may anchor at about two cables' length from the land. The two points lie N.N.E. and S.S.W. from each other, distant 7 miles. It is very necessary to be acquainted with these anchoring-places, as you might be caught here with a North; then it would be better to anchor under the N.W. point, where you would be sheltered from the N.N.W., N.E., E.S.E., and as far as the S.S.W., by the island and reefs, which run a long league to the N.W., and on which the sea breaks with great violence. From the N.W. point the coast inclines to the E. and E.S.E., forming a kind of bay, bordered by reefs 3 miles from land, and having some passages for very small vessels. At the East point of this bay a little inland, are two small hillocks; then the coast trends E.S.E. full 5 leagues to the East point, which we have already described. Mayaguana and Caycos Islands form the Caycos Passage.

*The French
or Plana
Keys.*

THE FRENCH or PLANA KEYS, between Mayaguana and the Crooked Islands, have been described by the pilot of the Eagle, a French bark, as follows:—These keys, hitherto but little known, have been said to be three; but what probably gave rise to that, was a rock which appeared out of water as high as a boat. It is about half a mile to the N.E. of the largest island, among the reefs and banks, East from which, 4 miles distant from the N.E. point, lies a dangerous rock, even with the water's edge. We stood for the French Islands, and anchored in the white water on the West side of the largest, about 2 cables' length from it, sheltered by a reef, which runs to the N. and N.W. 2 miles.

This island is no more than 3 miles North and South, and half as much East and West. The East and North sides are surrounded by reefs which break. The anchorage is about three-quarters of a mile from the South point, near which is a landing place; and by digging two or three feet in the sand, you will get good fresh water. Some English people, who were wrecked here, had made a pond, which dried up on the Eagle's filling four casks out of it, but in a quarter of an hour it was as full as ever.

It is very surprising, that at about 10 paces from it there is a salt water pond. This island is low and almost even, though when you are at a distance there appear some small risings, which diversify a little its appearance. The ground is nothing but sand or rock, with some bushes upon it, fit only for firing. The other island, which is the smallest, lies East and West, about 2 miles to the Eastward of the first; but the passage between them, made very narrow by the reefs on both sides, is not a mile wide, and is fit only for small craft.

On Mayaguana and Atwood's Key Passage—from the French.

This passage may be very useful and convenient:

1. For ships intended for Crooked Island Passage, and meeting, after they are past Heeneagua, with the wind at North, N.N.W., or N.W.; then, not being able to sail up to Castle Island, they are obliged to sail to the Southward of these islands, going along the Planas or French Keys, and between Mayaguana and Atwood's Key.

2. For those intending to go through this Caycos Passage, who, when advanced to the West Caycos, if the wind is at N.N.E., would be obliged to sail to the Southward of Mayaguana, and to pass between this island and Atwood's Key.

When they are about passing between the two islands, if the N.N.E. wind is too near, they may advance Westward, and sail between Atwood's Key and the Crooked Island.

It is therefore of great importance that you should be acquainted with the dangers, and also with the places where you may anchor about these islands. If, in going through the Crooked Island Passage, the wind obliges you to pass to the Southward of the Crooked Islands and the French Keys, it is usual to sail mid-channel, between the Hogskin and Castle Island, from which they are distant 11 leagues, and then make the Planas, which are in lat. 23° 30', or thereabout. They bear N. by E. from the Hogskin about 19 leagues, and lie 5 leagues to the Eastward of the N.E. point of Crooked Islands. You may safely pass them and the latter, keeping mid-channel, or rather over to the French Keys; for in case of necessity you may anchor on the West side of the largest of them.

Those who are obliged to pass to the Westward of the French Keys may go between Crooked Island and Atwood's Key, which is a very good passage, 5 leagues wide. After having the French Keys about a league to the Eastward of you, make your course N.N.E., a little Eastwardly, 10 leagues; you will then get sight of the East point of Atwood's Key, which you must not approach nearer than 4 or 5 miles; but having brought it S.W. from you, 2 or 3 leagues, there is nothing to be feared.

It is necessary to observe that the Norths in this passage are very dangerous winds, and may throw you upon the reefs, which border all the banks on the East side of the Crooked Islands.

Being in sight of the French Keys, you may also, according to circumstances, pass to the Southward of them, giving them a berth of 4 or 6 miles; and, having cleared them, stand away to the Northward, to sail between Atwood's Key and Mayaguana, which is a fine clear passage.

The CAYCOS.—The Caycos are an assemblage of several islands and islets, *Caycos*, which inclose a white bank, some parts of which are very shallow, and others tolerably deep. There are five principal islands, viz., the East Caycos, the Grand Cayco, the North Cayco, the North west or Providence Cayco, and the Little or West Cayco. these form a semicircle from the East to the West, round by the North, and are terminated on the South part by a great bank, on which there are from 3 to 15 feet water.

The Northern part of these islands is bordered with a white shoal, on which is a reef, extending half a league from the shore; at the N.E. part the white shoal extends outward a whole league; and at its extremity is a reef called Basse St. Philippe, or St. Philip's Reef, on which the sea breaks with violence. At a cable's length to the North and East of this shoal, you will not have less than 7 fathoms. South of it the white bottom extends to the South, and approaches imperceptibly towards the shore; you find 4 or 6 fathoms between it and the shore, which in an urgent case leaves a sure passage.

From the South point of the Little Cayco, a chain of breakers extends to the East 3 leagues, after which they decrease, trending Southward and Westward, to join a sandy islet called French Key. This is low, with some bushes on it, and bears from the South point of Little Cayco nearly E.S.E., 5 leagues. The reef from the French Key stretches to the South $7\frac{1}{2}$ leagues, to join another sandy islet, which has not more than 20 paces extent, and is entirely drowned at high water; all this part of the reef's hold, and, as the water breaks pretty strongly upon it, you readily see it; but, south of the sandy islet there are no breakers, and you have no notice of the edge of the bank but the whiteness of the water.

From this sandy islet the bank sweeps a short league to the South, then to the S.E., 3 leagues, whence it trenches to the East, $5\frac{1}{2}$ leagues, and N.N.W., $2\frac{1}{2}$ leagues, to the breast of the Southern islets, which are situated more than a league within the white water.

From the sandy islets, as far as abreast of the Southern ones, the bank is very dangerous; you cannot see land, and come suddenly from a sea without bottom into 2 or 3 fathoms. The color of the water is the only thing that can warn you of the danger; and this is by no means certain, for navigators accustomed to see on the surface of the water the shadow of clouds, which sometimes has the appearance of shoals, are often lulled into a fatal security. No motive then ought to induce you to approach this part of the bank, and you will do well to keep at a good distance.

If, after having been turned to windward several days in this neighborhood, you are not seen the land, the safest way is never to cross the latitude 21° in the night, but to wait for daylight; then, should you perceive any change in the water, which indicates white grounds, without seeing either land or breakers, you may be sure you are on the Western side; when you may steer N.W. $\frac{1}{2}$ W. to fetch the Little Cayco, and go through the passage to the leeward of these islands.

Should you see the Southern islets bearing about North or N.W., you may stand on upon the white water, in from 7 to 12 fathoms; then make a tack or two to get to windward, and go through the Turk's Island Passage, which is to windward of the Caycos.

So soon as you see the Southern islets, the bank is no longer dangerous, and you may go on it as far as one or one and a half league: South and S.W. of these islands you will not have less than 7 fathoms, and generally from 9 to 11.

The channel between the Caycos and Turk's Islands is 4 leagues across in the narrowest part: it is a good passage, and without any danger; you may come within half a league of the Caycos, and on the Eastern side of the islets without fear.

Through this passage you may turn with great safety, and will not feel the current, if you do not come within 1/2 league of the shore.

A shoal called the Swimmer Bank is on the Western side, in lat. 21° 05', long 73° 37'. It is dangerous, and should not be approached without great caution.

You will find an anchorage on the white shoals, near the South point of the Great Cayco, which may shelter ships that do not draw more than 15 or 16 feet; West of this point there is a fresh-water lagoon.

The best anchorage for small vessels is to the West of the North Cayco, near the small Island of Pines, in the inlet which that island makes with Providence Island. Within the reefs that border that part of the coast lies L'Anse à l'Eau, (Watering Bay,) where you anchor in 3 fathoms upon a white bottom: there is good water, and it is the watering-place of the Providenciers. You will discover the entrance of the bay, by coasting along the reef, from the rounding in of the coast, after passing the West point of the Three Maries and Booby Rocks. When you perceive a great extent of white water within the reef, you must send your boat to find the channel, and immerse in it, making use of your lead; and, if you want to get in, be not afraid of coming near the reef. When you are once within the reef, you may let go your anchor in 2 fathoms; you may go further in, by towing or turning with caution; the entrance is not more than half a league or two miles from the shore.

At the N. W. point of Providence Key the reef terminates. There is anchorage on the coast in 8 or 10 fathoms, but you must range the shore pretty close to be on the White Shoals, bringing a steep hummock, seen a quarter of a league inland, to bear S. W.; then you will see the shoal recede a little from the shore, and afford a large space for the turning of the ship. Four miles South of the N. W. point, a reef commences from the coast, running S. W. Westerly, 24 leagues: this reef is terminated by a small sandy islet, almost under water.

From this sandy islet the reef runs in to the Eastward, and afterwards trenches out to join the North part, off the Little Cayco, which is surrounded with white shoals.

The Little Cayco bears S. W. by S. from the N. W. point of Providence Key, which is of a middling height, and of a white color; you may range along the N. W. part, close to the edge of the white grounds; the West part is very bold to the South point, where you may anchor in from 5 to 7 fathoms, on white bottom.

Off the Caycos and Mayaguana Passage, Captain Livingston has said: "For vessels bound from North America to Jamaica, I consider the Caycos Passage preferable to that of Turk's Islands, which has been commonly used; because, if you can only distinctly make out the N. W. point of the Caycos, and bring it to bear E., or E. by N., however dark the night may be, you may run safely, steering at first S. W. by W. on your compass, 5 leagues, and then S. by W. till daylight; by which course you run with less risk, either from the Caycos reefs or the Henegagua; and, however fast your vessel may sail, you have more distance than you can run in one night before you can make Hayti or St. Domingo. By steering this course, or rather these courses, you also avoid all danger of being dragged by a lee current down upon the coast of Cuba."

The Caycos Passage is also recommended as the best passage for ships bound from Cape Haytien, formerly Cape François, when the winds are not steady from the N. E. You will always go with a large wind, which is of great advantage; and will avoid all the white grounds to the S. E. of the Caycos, which it has been customary to make. This custom of coming to the white grounds is very dangerous; but there is no risk in making the land some leagues to leeward of the Little Cayco.

In leaving the cape, you must steer a N. by W. course; and after having thus run 25 leagues, you will find yourself 24 leagues S. W. of the Little Cayco; then you may haul your wind, first as high as North only, on account of the reefs off Sandy Key, which lie to the North of Little Cayco; after which you may steer N. by E. 3 or 4 leagues, when you may haul up N. E., or continue to steer North without fear. Having run 10 or 12 leagues on this course, you will be out of the passage.

If, when you are 2 leagues S. W. of the Little Cayco, the winds do not permit you to steer N. by E., or to make a good North course, after having run 13 leagues, without getting sight of Mayaguana, the best way, if night comes on, is to tack and stand to the S. E., 3 or 4 leagues; then tack again to the North, and you will weather by 3 or 4 leagues, the breakers off the East point of Mayaguana.

If, when you are to the S. W. of the Little Cayco 2 or 3 leagues, and the wind does not suffer you to lay North, you must not attempt to go to windward of Mayaguana, but must fetch the channel between it and the French Keys. You steer for it N. W. by N. Having run 18 leagues, you will come in sight of the S. W. point of Mayaguana, which ought to be North of you, 2 leagues distant; you do not run any risk in approaching this point, which is safe. A small white shoal extends from it, with 3 fathoms water on it, almost close to the shore.

When you have doubled the West end of Mayaguana, so as to bring it to bear East, you may, if the wind permits, steer N. In that case you will pass 4 or 5 leagues to the windward of Atwood's Key; but if your course is not better than N. by W., after having run on 12 or 13 leagues, and the night comes on before you can see that island, tack and stand on for 5 or 6 leagues. Then, if you can make a good N. by W. course on the other tack, you will weather the Eastern breakers of Atwood's Key, at about 3 leagues. Should you be 2 leagues from the West point of Mayaguana, and the wind will permit you to make a course only N.N.W., after having run thus 6 leagues, you will see the French Keys, bearing nearly W.N.W., 2 leagues. You may pass to windward or to leeward of them, as the wind may admit. When you are 2 leagues N.N.W., or N.W. by N. from them, upon running in that direction 12 or 13 leagues, you will be out of the passage. You must not go in the least to the Northward of this course, as the breakers off the West point of Atwood's Key bear nearly N.N.W. from the Westernmost of the French Keys.

The French Keys are very low; they bear from the S.W. point of Mayaguana N. W. by N., 8 leagues. You may go pretty close on the East, North, and South sides, the white bottom which incloses them being pretty steep. On the N.W. of the large island, the reef running out some distance, it is necessary to give it a good berth. You may anchor in the S.W. part on the white bottom, but very close to the shore. There is a small lagoon of fresh water supplied entirely by the rain. The isles have been previously described.

On leaving Cape Haytien you will generally find the wind at S.E. or E.S.E., and near the shore the current runs to windward; these are two powerful inducements to urge you to steer N.E., or N.N.E., for the Turk's Island Passage; but, at about 10 or 11 o'clock, the wind generally chops round to the E.N.E., or N.E. Being then 2 or 6 leagues from the coast, and the current no longer felt, you would necessarily make the white grounds to the Southward of the Caycos. This circumstance has caused many shipwrecks, merely from the eagerness of going 20 leagues to windward, in a voyage of perhaps 1,500 leagues. On this account, mariners from the cape should steer at once for the Little Cayco.

Remarks on the Coasts, Isles, &c., which form the Windward Passages, by several French and English Navigators.

CAYCOS PASSAGE, &c., by Captain Hester.—After having cleared the East Caycos Pass of Jamaica, I would endeavor to get to the Eastward as fast as possible, taking every advantage of wind. In so doing, when advanced to Cape Nicolas, I would prefer beating up as high as the Island of Tortue, (or Tortuga, or Turtle Island,) and take my departure for the Caycos Passage, thinking it less tedious and difficult than the passage by Crooked Island.

From the Mole to the West end of Tortue, in latitude $20^{\circ} 5' 20''$, the course is N. by E., about 11 leagues. It is all a bold clear shore, giving it 2 or 3 miles berth. The N.E. part is foul 3 or 4 miles, but from that part down to the West end it is bold; and the West end is as steep as a house-side. When the high hill which is seen near Point Paix bears S.W. by S., then the East end of the island is between you and it.

From off the middle of the Island Tortue, to go between Heneguana and the Caycos, take your departure in the evening, steering North by compass, taking care not to run more than 18 leagues at the most before daylight, with the distance off from it at making your departure included; when, if you see nothing of the East end of Great Heneguana continue your course for 7 or 8 leagues, and you will not fail of seeing the Little Caycos, or Little Heneguana.

You may keep near to the Caycos, and haul your wind to N.E., which will clear you Mayaguana and its reef, the outer point of which lies in latitude $22^{\circ} 20'$; then you are in the open ocean, clear of everything.

If you find a leeward current or a scant wind, between Heneguana and the West Cayco, so that you cannot weather Mayaguana and its reef, you may bear up and run under the lee or West end of Mayaguana, there being no danger but what you may see, the channel between Mayaguana and the French Keys, which is a wide and fair channel. When you haul your wind to windward of Atwood's Key, which lies in latitude $23^{\circ} 20'$. In going through either of these passages, there is a greater advantage gained, with less trouble, and sooner, than by Crooked Island Passage.

CAYCOS, from the French.—The Little Cayco extends N.N.E. and S.S.W., about 3 miles, being its whole length. You may anchor all along the Western side, there being 4 or 5 fathoms water close to the land; but it is hard bottom, and too near the shore. At the N.E. point is a bank of rocks, extending to the N.E. near a mile, on which the sea breaks; there are 2 and 3 fathoms close to it.

There are some ponds with brackish water—and, as rain is not uncommon here, people who have the misfortune to be cast away on this side, may obtain fresh water.

The latitude of the S. W. point is $24^{\circ} 30'$, longitude $72^{\circ} 30'$; you may run along the South side, very close to it, upon the White Bank, in 5 or 6 fathoms, and more if you please. When that point bears North, you will have a full view of all the Caycos Bank. This elbow is a shelter against the North, for there are 5 or 6 fathoms of water close to the breakers, which are very near the land.

Although the West side of the Little Cayco is quite clear of rocks, and there are 6 or 7 fathoms within musket shot of the shore, so that you may anchor there, yet the best place to anchor (and which is most known) is under the N. W. point, (going without it, in 8 fathoms, sandy bottom), there you are sheltered from Easterly breezes. It is prudent, however, to have another anchor S. by W., in 14 fathoms, etc., in case this precaution will secure you against a sudden Westerly wind; and by that means, if it should continue, you get easier under way.

The North side of the Little Cayco is covered by a reef, beginning off the N. W. point, and stretching as far as the Great Cayco. This reef is the only channel of the passage between. It is nearly 4 leagues from the N. W. point of the Little Cayco to the N. W. point of the Great Cayco, and the reef extends along that space, and is, as far as the Western point of the Great Cayco, which is about 24 miles, distant from the N. W. point of the island. To the Southward of the last point is Cape Cayco (Le'Anse au Canon,) the only good anchorage in this Western part, of which we will speak hereafter.

On the West side of the reef there is a little key, called Sandy Key, being North-westerly from the East part of the Little Cayco. It is very low, and has a reef on its North part. Many ships have been lost on it, by its not having been laid down in the charts; for, after their running along the West side of the West Cayco they have landed to the Eastward for the Providence Cayco; whereas, when you run along the former about a league, you should make a N. by W. course, to go North to the Little Key, and the reef which stretches to the Northward of it.

To the Southward of the islet, between that and the reef, is a passage of about a mile to the bank. Without the islets are 40, 5, and 6 fathoms; in the middle 10 fathoms, and without it, 3; but then you immediately come into 2 fathoms.

From Sandy Key the reef runs N. N. E., 2 leagues, being bordered with white sand, on which you have 10 fathoms, within musket shot of the reef that joins the N. W. part of the Great Cayco, a little to the Southward of Cape Cayco.

It has happened that ships intending to go through the Caycos Passage have run to the Little Henaguia, either by muttonen or from the currents. To make sure of it, run far enough to the windward, when bound from Cape Hayen, you should make a N. course, good N., or N. by E., 25 or 26 leagues, and you will see the white water of the banks, which you may run along the distance of a league, without fear; the Western edge of the bank is the islet called Sandy Key, which you may see within that distance; then make a N. W. course, and 4 leagues from Sandy Key you will see French Key; when the latter is North from you, then steer W. by N. 4 leagues, which will bring you South from the Little Cayco; and being past it, you are to make a N., or N. by E. course, as before directed.

The white bank and the reef continue between the French Key and the Little Cayco. You may run along them very near, in 10 fathoms, and you will see the reef in the reef, through which small vessels go in upon the bank.

The reef which borders the White Bank from the Little Cayco to French Key, runs one league East from the former, and it always breaks. You may stand very near it coming from sea; but if you are upon the bank, you must take great care, half a mile within you will find but 3 fathoms water, and in getting nearer, shoals very quickly. Here is a great deal of swell, it being open to the breeze. The bottom is sand, and good holding ground.

The Little Cayco, &c. from the Journal of the Emerald

"Being at noon, with the Hope, a small vessel, off the S. W. point of the Little West Cayco, a mile from it, we ran along the West side at that distance, and made the Hope anchor in 7 fathoms, hard sand, within half a cable's length of the N. W. point. Seeing that the vessel drove, the bank being very steep and narrow, and the weather inclined to be squally, we preferred keeping under sail, and made some traps, keeping well in with the land, at one mile distance. Along the reef on the West side, we landed very easily in some hollow places, filled with sand, and made by the sea in the sandy stones which compose the island. Opposite these holes, about three quarters of a mile from the N. W. point, is the best anchorage.

"The West side of the Little Cayco runs N. by E., and S. by W., about 5 miles. On this side is the anchorage, sheltered from the trade winds, nearer the North part

which is nothing but a steep border of sand, a cable's length, you anchor at about a pistol shot from the shore, in 2 fathoms; at two ship's length there are 15 fathoms, and at half a cable's length further, there was no ground under the ship. If you want to pass there, the best way will be to have the outer anchor in 15 fathoms water, and to cast another on shore. There is no swell with the E. N. E. and E. S. E. breezes, but however hard they may blow.

CANOE COVE.—A little bay is on the West side of Providence Cay, and may be of great use, as it is water enough for all sorts of ships, sheltered from the Norths, which you shall always guard against in this passage. The deepest chips may anchor in it or 7 fathoms, on a sandy bottom, looking out for a clear ground, and here and there you will find it rocky. You are sheltered from the N. to the E., and to the S. E. by S. The anchorage is within the West point, which you bring to bear N., taking care not to come near the reef, which runs round this point for a quarter of a league. The reef ends there, and does not begin again till near 2 miles further to leeward; then it must bear S. by W. from you.

From the N. W. point of the Little Cayen to this cove is N. N. W., 3/4 leagues; but you must make a more Westerly course, in order to avoid the reef and the Little Key, a sandy spit of

WATERING BAY and PINES KEY. To the N. E. of the N. W. point of Providence Cay the coast forms a bight, the two points of which are 5 leagues asunder, between them is Watering Bay and Pine's Key.

At this anchorage you are sheltered from the N. E. to the S. S. W., passing by the E.

The greatest advantage of Pine's Key is a great lagoon of fresh water, sufficient for 50 ships; it is very drinkable, and not far from the beach.

The bottom is too white near the land and in the cove for you to catch large fish with a seine; but you must go in a boat on the edge of the reef without, and you succeed still better, if you sail over with your line's end.

From the East part of Pine's Key you may discover all the islands and keys, which are scattered within the Cayen, from N. to S. E.

The following remarks on the Cayens, &c. have been written by Captain Livingston.

The whole of the North side of the Cayens is bounded by a reef, through which there are various openings, though they ought not to be attempted by a steamer with out a pilot. Vessels ought not to near the land within a league and a half, running down to the Northward of the Cayens. Watering Bay is extremely dangerous, and is most necessarily laid down in every chart which I have seen. The Providence Cayens are bounded to the Eastward, and Northward, and Westward, by as deep passages as I ever saw, among which, if a vessel once gets embayed, it is next to impossible that she can escape. The American sloop of war Chippewa, the ship Annwell, of London, and brig Messenger, Cumbley, were all lost upon these reefs in 1746, within a few weeks of each other; and two days after the Annwell was lost, another vessel narrowly escaped the same fate; to this I was an eye witness, so I observed the Annwell on shore before dark, and land for a night, with the view of repairing her masts, and when daylight came, I perceived a lugger quite completely embayed, and those on board of her seemed to discover their error, and, profiting by the wind's being at the time off shore, escaped.

After rounding the N. W. point of the Cayens, and bound to the Southward through the passage, having brought the N. W. point to bear E. or E. by N., you may sail safely even in the darkest night, steering at first S. W. 3/4 W. by compass, a league, and then S. by W. till daylight. By these courses you will clear the elbow reef off and key, between the Providenciers and Little Cayens, and, at the same time, keep efficiently to windward of the Henegans and Bishop's Shoal.

The Cayens are connected by a reef of coral rocks, and there is no danger of them in the day, as the white water shows itself. Vessels must not the land about dark, could never attempt to run through this passage in the night, unless sure of their situation.

EAST or COCKBURN HARBOR is in latitude 21° 29' 32" N., longitude 71° 31' *East or Cockburn Harbor*

The harbor is one mile in depth, and the course is N. W., when the harbor is open. High water at 7 o'clock. Tide rises 3 feet. Depth of water about 11 feet. *High water*

TURK'S ISLAND LIGHT. A variable light, revolving every 27 seconds, with a light in light between the intervals, has been placed on the North point of the Grand Turk.

The tower, which is painted white, and 60 feet high, is situated 100 yards S. W. W. of the extremity of the point in

Caution to avoid danger off Cape Comete, East Caycos.—Vessels running for the Turk's Island Passage from the Northward must endeavor to make the light on a bearing to the Westward of South, as its range does not extend sufficiently far to guard against the dangers lying off Cape Comete, East Caycos.

Caution to avoid N.E. Reef, Grand Turk, Turk's Islands.—A reef runs off from the North point of Grand Turk, its extreme bears from the light N.E., distant 3 miles, and from thence extends Southerly and runs parallel with the East side of the Key, at the distance of 2 miles; consequently, vessels, on making the light between the bearings of S.W. and West, should (if intending to take the Turk's Island Passage) be careful to avoid this danger.

On the bearing of South the light may be safely approached to within 2 miles, and have the passage open.

This light cannot be seen from the dangers at the Southern entrance of Turk's Island Passage.

Turk's Island Passage. TURK'S ISLAND PASSAGE.—There are three principal islands, Grand Turk, Salt Key, and Sandy Key, which should always be made in going through the passage.

The Western side of these islands is bold, and they may be approached very near, although there is a white shoal, with many rocky spots, which extends about a quarter of a league from the shore.

You may anchor in two places off the Grand Turk; one towards the middle of the island, opposite the huts, the other off the South part of the island; but neither of them can be considered as good. You let go your anchor as soon as you are on the white ground, and take care to find out a clear bottom, as, in some places, the points of rocks rise to within 8 or 10 feet. After you have let go your anchor, and veered to half a cable under your stern, you will not get any ground. Off the South part of the island the anchorage is of more extent, and you will find, on the point near which you anchor, a lagoon of water that may serve for cattle. The white shoal S.W. of Sandy Key decreases gradually to 5 fathoms, half a league from the shore.

East of these islands are several islets, which are connected by white grounds with very little water on them; they are bold on the East side, and surrounded with a white ground that extends to the Southward and S.W.

TURK'S ISLAND PASSAGE.—This passage is very short and good; but you cannot always be sure of fetching it from Cape Haytien. You ought to steer N. 4° E., and the wind often will not admit running so much to the Eastward; it is, therefore, recommended, in leaving the cape, to keep the wind as close as you can with the early breeze, and tack so as to fetch the Grange before night. You will generally bring it to bear S.E., or S.S.E. If the ship sails well, or has been favored by the breeze, you may bring it to bear S., whence, making good a N.N.E. course, you need not tack until you have run 18 or 19 leagues. If your last course should not have been better than N. by E. or N., you must be particularly cautious not to pass the latitude of 21°. In the night, when you think you are near that latitude, be sure to sound; and the moment you have bottom, about ship and stand the other way till morning, when you may again tack and fetch to the windward of the white shoal of the Caycos.

The white bottom is very readily seen; you may run on the edge of the bank to the Southward of the Southern Keys for a league, or perhaps a league and a half, from 7 to 11 fathoms; but further on there are rocks, with 3 fathoms, at most, between them. In the day-time you may stand on to the Northward, (supposing that you have not seen the land,) and you will desery the Southern Keys of the Caycos; or, if you go further to the windward, Sandy Key. You must be careful not to go to leeward

of the white shoals which extend South of a small sandy islet, which is entirely
drowned at high-water. It is very difficult to be seen, and your lead even cannot
give you warning, as you fall suddenly into 3 fathoms.

To the South-westward of Sand Key, lies the Endymion Reef or Shoal, which is
described below.

When you have Sand Key bearing E., at the distance of 2, 3, or 4 leagues, steering
N. by E., or N.N.E., 8 or 10 leagues, will entirely clear you of the passage. In going
through, keep the Turk's Island side on board, in order to avoid the Reefs of St.
Philip, which extend from the N.E. point of the Grand Cayco.

Sand Key is one mile long, and, in fine weather, may be seen 3 leagues off; when
you are to the Southward of it you would take it for two islands, its middle part
being a low drowned land. On the West side are 7 or 8 fathoms, upon the bank
which borders the key, at the distance of 3 leagues, and joins a reef that extends a
mile from the North point of it.

The South point has, at about 2 cables' length, three rocks close to each other, by
which it may be known; but, to have them open and clear of the land, you must not
be far off, nor bring them to the Eastward of N.E.

The most certain mark by which you may know Sand Key, is that from the N.E.
and the W.N.W., you will see no other island, and the sand upon it is quite white in
the sun. The anchorage is only known by the white water, from 6 to 4 fathoms,
within swivel-shot of it; but ships which draw much water must anchor about half a
mile off, bringing the South point to bear S.E., and the middle of it from E. to E. by
N.; the North rocks there cover you as far as N.N.E., and you may easily get under
way with any wind, as the Norths, which are most to be feared, blow only along the
coast, so that the West side may be reckoned a good roadstead. A ship which, by
accident, has been prevented from sailing through the passage, may find a good shel-
ter here, and wait for a favorable wind. The reef on the North part of the key
stretches from it North a little Westerly, a long mile, when it makes a little hook to
the S.W., but breaks everywhere, and within pistol-shot there are 8 fathoms; though
you must not come so near on the other parts of the island, for here and there are
some rocks which have only 2 fathoms water upon them. The East side has high
breakers quite to the shore.

Sand Key is low and barren, being burnt by the sun, and continually beaten by the
winds and the sea: it produces some small bushes only.

SAND KEY.—Sand Key may be seen about 3 leagues off: it makes at first like *Sand Key*.
three islands, being formed of two little hillocks and a rock, known by the name of
Split Rock, though there is water knee-deep between it and the key. This rock
serves to distinguish Sand Key, over which it is probable that the sea breaks in all the
Norths, and other impetuous winds, for it is very low; you may easily land upon it
under the hillock, where there was formerly a pyramid.

This key is scarcely more than 1300 geometrical paces (of 5 feet each) long. From
the South end the reef runs off three-quarters of a mile S. and S. by W., at the end
of which are three rocks, which always break and show themselves. The hillock on
the South part is joined to that of the middle part by a low land, which looks like
savannah; and from that to the West point the land is also very low and even; you
cannot land here, nor must you anchor near this part, but towards the South, where
all the dangers show themselves. From the N.W. point is a reef to the N. by W.
North N.W., more than 2 miles, and about a swivel-shot from the end of this reef, is
a large rock, always above water; three-quarters of a mile from which you have 6
fathoms, rocky ground. You cannot land at the East side, which is surrounded with
rocks. The anchorage may be made very convenient, by carrying an anchor, with
two or three hawsers, to the Westward, and then you would clear the island with
every wind. But in the months of May and June, you had better anchor about a mile,
or a mile and a half off, to be less exposed to the swell sent in by the S.E. breeze,
which is generally violent.

THE ENDYMION SHOAL has on it 4 feet water, and bears S.S.W. $\frac{1}{2}$ W., 5 $\frac{1}{2}$ *Endymion*
miles, from Great Sand Key. *Shoal.*

THE SWIMMER, on the S.E. elbow of the Caycos Bank, has but 7 feet water on
it, and bears from the Endymion Shoal W. $\frac{3}{4}$ S., 14 miles distant. *The Swimmer.*

South-west of Sand Key is a white shoal, extending about 2 $\frac{1}{2}$ miles from shore, on
which may be found from 7 to 9 fathoms.

SALT KEY, or the **LITTLE TURK**.—When you leave Sand Key, and steer for *Salt Key, or*
Salt Key, you must take a North course along the reef, which runs off more than one *the Little*
mile; as these bearings from you, you come almost within a stone's throw of it; for *Turk.*
at that distance there are 8 fathoms. Having got round the head of it, you are to
take a N.N.E. course to the Little Turk, which you may then see; and you will
be the soundings as soon as you have brought the reef to the Southward of you. It
is 2 leagues from the reef to the N.W. point of the Salt Key, near which you may

anchor; but the bank is very steep; for, when your anchor has gone in 5 fathoms, within musket shot of the shore, you will find the ship in 20 fathoms, and no ground a very little way astern. You bring one point N. N. E., or N. E. by N., and the other point S. by W., or S. S. W.; you must look for clear ground, or you will have your cable cut with the rocks. These places are fit only when the trade-wind is settled; for you must not be caught here with any other.

Salt Key is N. by E. from Sand Key, and lies N. by E. like the two others; it is of a triangular form, its length something more than 3 miles; it is higher than Sand Key, and you will see here and there some little risings or hillocks, and a great many bushes and small trees, fit only for fire-wood.

*Grand Key,
or Grand
Tark.*

GRAND KEY, or GRAND TARK. — Having advanced to the North point of Salt Key, you will see the Great Key bearing N. N. E., 23 leagues; so soon as you are clear of the reefs, which stretch off from the Little Tark 2 cables' length, it will be found that the bank continues from this N. E. by N., to the South point of the Great Key, for which you should make a N. N. E. course, though you might run along the West edge of the bank in 4 fathoms, or might indeed anchor upon it, as you would be sheltered from the trade-wind by the bank and its keys. You must, however, be cautious in steering N. E. of a reef that runs off from Cotton Key W. by N., seldom showing itself in moderate weather, and stretching as far as the South point of the Great Key.

If you mean to anchor on the West side, which is much like the Salt Key, (though not so good as the Sand Key,) you had better keep along the bank, lest you get too far to the leeward, and haul in West from a hillock, which may be plainly distinguished when nearly in; the bank is very steep, and looks shoal; but you will find 4 or 5 fathoms water very close to the land. You must, however, stand in only upon white water, till you bring English Point E. by N.; off that point are some Breakers quite close to the shore, and there is shoal water. When the before-mentioned hillocks bear E. by S., you may anchor within half a cable's length of the island, looking out for clear ground; English Point will then bear North, and the South Point S. E.; your anchor will be in 4 or 5 fathoms, the ship in 9 or 10, and the stern in 20, 25, or perhaps no ground to be found. It will be prudent in staying here to observe when the trade-wind dies, for you have very little room to turn; you should always buoy your cables, for the sandy bottom is full of large stones, among which cables and anchors have often been lost.

The vessels which load salt generally anchor to the Northward of English Point, that being nearer to the Salt Pond, but neither the shelter nor the ground are so good as at the other place. No passage is to be found to the Southward of this island, except for boats, as there is a reef, which is a branch of that surrounding the weather side of these keys and banks. The Great Key has the best ground of the three islands.

Of the two salt ponds which are on the key, one only furnishes salt; it is about 4,200 yards wide, and its moulding breadth above 200; it produces three times so much as the pond of Salt Key; but the grain of the salt is coarser, and not so bright as that of the latter.

The latitude of the North point of the Grand Tark is $21^{\circ} 30' N.$

*Square
Handker
chief, or
Mushcore
Quarre
Shoal.*

SQUARE HANDKERCHIEF, or MOUCHOIR QUARRE SHOAL. — This is a bank of 31 miles in extent, in an East and West direction; the Eastern end is 21 miles wide, running nearly North and South. On the N. E. point of the bank, in lat. $21^{\circ} 06' N.$, long. $70^{\circ} 30' W.$, there is a shoal that breaks; and on the Northern edge of the bank there are two large shoals, each of 6 miles in extent. The S. W. end of the bank is in lat. $20^{\circ} 56' N.$, long. $71^{\circ} W.$ The S. E. end is clean, having on it from 9 to 15 fathoms.

Ships ought never to venture within any part of the white grounds, because they may often fall from 14 fathoms to 10 feet; if, by accident, they find themselves in the middle of them, the best way is to tack, and go out the same way they came in, ranging along the grounds.

*Silver Key
Bank.*

SILVER KEY BANK. — This bank is of great extent; the N. W. point being in lat. $20^{\circ} 51' N.$, long. $69^{\circ} 56' W.$, running South easterly 39 miles; thence South westerly 24 miles; thence West, a little North, to lat. $20^{\circ} 48' N.$, long. $70^{\circ} 02' W.$ On the Northern eastern edge of the bank there is a shoal of coral rocks a-wash, of 17 miles in extent, in a South-easterly direction, and of a triangular form. The Western edge of the bank, with the exception of the N. W. point, and a reef in lat. $20^{\circ} 27' N.$, long. $70^{\circ} 06' W.$, is clear.

Your experience on the edges of the shoals weak currents, which generally follow the directions of those edges. On the Square Handkerchief they are scarcely felt; on the S. E. part of the Silver Keys you find them setting to the West and N. W.; but a short league from the grounds their effect is not perceivable.

In general you ought not to mind, in your reckoning, the weak currents which exist in these passages, they being nowhere to be feared.

SILVER KEY PASSAGE.—Should you, by any circumstance, be forced to go *Silver Key* from Cape Haytien through the Square Handkerchief, you must at the departure *Passage* make your course good N. E. by E. and E. N. E. If the wind suffer you to steer that course, you would pass in the mid channel; but if you are forced to turn, and should not get sight of the Haytien shore, after you have once got into the longitude of $70^{\circ} 20'$, you must not pass the latitude of $20^{\circ} 25'$ without frequently heaving the lead. If you come as far as $20^{\circ} 35'$ without getting ground, you have nothing to fear from the Silver Keys, and must only look out for the Square Handkerchief, which is not dangerous on the South, the bottom giving you notice in 10 and 15 fathoms. In the latter case, continue to get to the North eastward, and when you come into the latitude of $21^{\circ} 20'$ N., you will be entirely out of the passage. A very strong current is found to set to the S. W. through the Silver and Handkerchief Passages, after strong breezes from the N. E., particularly on the decrease of the moon.

BAJO NAVIDAD.—The North point of this bank lies in long. $68^{\circ} 46'$ W., and lat. *Bajo Navo* $20^{\circ} 42'$ N., and extends in a Southerly direction about 25 miles; it is 12 miles wide in *Jad* the centre, and has on it from 14 to 26 fathoms water, and is perfectly free of danger. Vessels bound to the North side of St. Domingo, can have an excellent opportunity of correcting their longitude by running for this bank, which is laid down from the surveys of Capt. R. Owen, R. N., and published by E. and G. W. Blunt.

In passing to the Northward of Porto Rico, a lookout should be kept for a rock or shoal (not more than one) which certainly exists there, although its exact situation is not yet known. This danger has been noticed, where it is stated that an American schooner struck upon it in 1817, in latitude about 20° N.; and we have since met with another notice which states that, "at 50 miles North from Porto Rico, Captain Baxter, in the brig Robert, struck on a rock, and remained several hours."

General Directions for the Coast of Cuba.

In the rainy season, or season of the Southerly winds, vessels bound from Europe to Cuba ought to pass to the Northward of Porto Rico and Hayti or St. Domingo; and during the season of the Norths, they should pass to the Southward of these islands, unless their port of destination requires them to do otherwise. There are other reasons for adhering to this mode of navigating. In Cuba the ports to which vessels are bound from Europe may be reduced to two; these are the St. Jago de Cuba and the Havana. If bound to the first, it is necessary, in every season, to direct your course directly to it; that is, in the season of the Norths to steer from Cape Tiburon, the S. W. point of Hayti, in order to make some point on the South side of Cuba, to windward of the intended port, or even to windward of Guantanamo; and, in the season of the Souths, to steer from Cape Nicholas' Mole, on the N. W. coast of Hayti, almost West for the port, making, in the first place, the various points of the coast of Cuba, which are after described. But if bound to Havana, attention should always be paid to the season; that is, if your passage is made in the time of the Norths, you should go to the South of Cuba, although you have to return the distance between Cape Antonio and Havana; because this inconvenience is not comparable to that which might be occasioned on the North side by a hard North, which would not only expose a vessel to heavy risks, but might retard the voyage much longer than the time required to reach Havana from Cape Antonio; for this distance may be worked up in a short time, as you may have the assistance of the current to the Eastward, as more particularly described in the directions for the Strait of Florida.

Those navigating on the South of Cuba, who have no occasion to touch at Trinidad, or any part of that coast, should give it a good offing, and proceed to the West from Cape de Cruz. Here it may be observed, that at the distance of 35 leagues from that cape is the Western end of the low island called the Caymanbrack, the N. E. end of which is surrounded by an extensive reef, the making of which is dangerous by night, because a reef extends from it 4 miles out to sea; and allowance must always be made for the current, which, although variable, is generally prevalent here. The safest course appears to be to the Northward of the Caymans.

The navigation on the North of Cuba is that of the Bahama or Old Channel. For this channel it is customary to take a pilot, who may be engaged at Aguadilla, on the N. W. coast of Porto Rico, or at Gibara in Cuba, but it is very uncertain. If approaching Baracoa, it will be requisite to determine the ship's place in the vicinity of Cape Maysi; for otherwise you may happen to fall in to leeward of Baracoa; it will, at all times, be proper to make the land in the neighborhood of the cape, for the sake of a departure hence to the Westward, and for correcting any error produced by current. The remarkable points of all this coast will be described. These descriptions must, of course, be especially regarded and strictly attended to.

We have already noticed that in this channel, *independent of any current*, there is a regular tide. The current itself is very uncertain, and no doubt fluctuates according

to the variations of the Gulf Stream, winds, &c. It sometimes sets E.S.E., at other times W.N.W., and again ceases. With every precaution, a vessel ought not to cross the meridian of Point Maternillo, without having made and remarked it well; as all the care of the most zealous and attentive navigator may otherwise be of no avail to keep him clear of the Mucaras Shoal, on the North side, which shows no sign of its existence until a vessel is aground upon it. If obliged to beat up at night, it ought to be done so as not to prolong the tack more than will completely and certainly clear the Mucaras. Having passed over the night in this manner, so soon as it is clear day, steer so as to make the coast and recognize it well. If it be not in sight, steer to the South until you make it.

Having once recognized Maternillo Point, direct your course so as to pass Güitelo, or Ginger Key, at the distance of 2 leagues, if by night; or make it by day, and thence keep over towards the edges of the Great Bank and Salt Key Bank, rather than to the keys of the coast of Cuba, which offer few marks that can be depended upon; and an approach to which is therefore dangerous. You will have passed all these keys when abreast of Point Yeacos, and may thence proceed. But the safest way, as before noticed, is towards the Southern edge of the Salt Key Bank, passing thence to the Westward, according to judgment, the state of the current, &c.

ISLAND OF CUBA.

Cuba

CUBA.—This is the largest island in the West Indies, and is situated at the Western extremity of the multitude of islands, keys, and banks, which separate the Caribbean Sea from the Atlantic Ocean. Its length, from Cape Maysi, on the East, to Cape San Antonio, on the West, is about 208 leagues; its breadth is unequal, being from 12 to 21 leagues.

Cape Maysi, the most Easterly point of the South part of Cuba, is situated in or near latitude $20^{\circ} 15'$ N. and longitude $74^{\circ} 5' 30''$ W. The point itself is a low beach, and cannot be clearly seen until you are nearly up with it. Landing on it is extremely dangerous, for a reef extends from it nearly a mile to the Eastward; and advancing towards it during the night is very unsafe, unless you have previously, in daylight, marked the highlands of the interior country, either of Cuba or of Hayti. From this point the coast trends to the N.W., and rounds to River Maysi, at a mile from the cape. From this river to Point Azules, which is another mile, nearly in the same direction, the coast is bounded by a reef, which extends out about a cable's length, and has a break at the mouth of the Maysi. From Point Azules the land begins to rise and the coast is clean and trends about W.N.W. for 5 miles to Punta Frayle, or Frayle's Point; whence it extends West 6 miles to the River Yamuri, and continues in the same direction 2 miles more, to the harbor of Mata. All this coast is very clean, and you may run along it within half a mile.

The harbor of Mata is very small, and too shallow to admit vessels drawing more than 12 feet. To enter it you have only to keep in mid-channel, and anchor in from 14 to 18 feet water, almost in the middle of the bay. All the shores have shoal water from them, so that there is a space of only 2 cables' length in diameter, in which there is sufficient depth for anchoring.

From Puerto de Mata the coast trends nearly N.W., 6 miles, to Port Majana, and at 2 short miles from it is the mouth of the River Bonni. This piece of coast, as well as the preceding, is very clean.

Point Majana and Baracoa Point, which lie nearly East and West, 2 miles distant from each other, form a bay, in the East part of which is the anchorage of Playa de Miel, (Molasses Beach) and in the West, the mouth of the port of Baracoa; in the middle, between these two anchorages, is the town of Baracoa, standing on the S.E. point of the harbor of the same name.

The anchorage of Playa de Miel is very open to the North. To anchor in it, you have only to approach Point Majana, and anchor something to the South of it, in from 10 to 30 fathoms, on a sandy bottom, taking care not to get to the East of that point, where you would be immediately in 4, or even in less than 4 fathoms water. As the Playa de Miel is entirely open to the North, in the season of them it is much exposed; and, therefore, any vessel under the necessity of anchoring, should steer at once

for Baracoa, to the entrance of which there is no obstacle, as it is completely clean, having no danger but what may be seen; and consulting the plan of it, you may choose the spot to anchor in which best suits the draught of water of your vessel.

BARACOA HARBOR, though secure and sheltered, has the great inconvenience of presenting its mouth to the breeze, and a great swell consequently sets in; and being able to get out of it with the land breeze only, vessels are often detained much time in it during the Norths, when the land breeze is not frequent; but in the rainy season, you may almost reckon on having it every night. The Anvil Hill of Baracoa, (El Yunque de Baracoa,) which is a little mountain about 5 miles to the Westward of the harbor, is an excellent mark to recognize it by, as, in clear days, it may be discovered at a distance of more than 12 leagues, and appears, over the other high land, like the flat top of an anvil.

Baracoa Harbor

From the Harbor of Baracoa the coast trends almost true North, 3 miles, to Point Canas, which, although very clean, ought not to be approached, because, being completely open to the breeze, there is always a heavy swell setting upon it. From Point Canas to the Harbor Maravi is 2 miles; the coast trends nearly West, and is very clean.

PORT MARAVI, though small, is well sheltered from the Norths. Its entrance is not difficult, for you have only to keep in mid-channel, which is less than a cable's length in width; and running in for the middle of the bay, anchor as soon as an islet which is on its Western side bears in the same direction.

Port Maravi

From Maravi the coast trends nearly North, making a bend (or bight) to Point Ynn, and from thence it runs to the N.W., forming another bend to Port Navas, which is an opening of about 2 cables' length in extent, in all directions, with its mouth to the North; therefore, useful only as a shelter from the breezes. To enter it, no more is necessary than an inspection of the plan.

From Port Navas to Port Cayaguaneque, the distance is only 2 short miles. Cayaguaneque is fit for very small vessels only, and its entrance is only 40 yards wide. The plan will give a perfect knowledge of it, and of the difficulties which present themselves in taking it.

TACO.—Three and a half miles from Cayaguaneque is the harbor of Taco. It is well sheltered; but though, in its interior, there is a depth for any class of vessels, yet its entrance has a bar with only from 13 to 18 feet on it, and it is also obstructed by rocky shoals with little water on them, which stretch out from both shores; but as, on account of the bar, only vessels drawing 10 or 12 feet water, or less, should go in; those will run no risk in running over the shoals, and therefore may enter this harbor by keeping in mid-channel; and when once past the entrance, they may steer to that part of the harbor which suits them best.

Taco

From the harbor of Taco to Point Jaragua is 2½ miles; and the coast, which is a sandy beach, is clean. At Point Jaragua it ceases to be so, though all between it and Cape Maysi may be run along at a mile's distance. Point Jaragua has a reef stretching to the N.W. of it; it is the Eastern point of the anchorage of the same name, which is only an opening in the reef, by which a vessel may enter upon the bank or shoal, and find shelter from the sea behind the reef. The break or mouth is only two-thirds of a cable's length wide; and from it to some islets which are to the S.W. of it, the distance is 2 cables' length. The islets are three in number: the Southern one is the largest; the anchorage for large vessels extends only until you are E. and W., true, with the South part of the middle islet, as further in there are only 12 to 18 feet of water. To enter this anchorage it is necessary to sail outside the reef, which extends out from Point Jaragua, until the East part of the great islet bears nearly S. W., then steer directly for it; and if the vessel be large, anchor as soon as you are E. and W. with the middle islet, in 6 fathoms, on a sandy bottom; but if the vessel draw not more than 14 feet, you may run further in, keeping, if you choose, within a quarter of a cable of the great islet, and about a cable's length from the middle of it, you may anchor in 19 feet, on clay. You may also enter the mouth without attending to the given bearing of S.W., because the reef itself shows the opening. This harbor is never entered except in a case of necessity, as there is no other motive for vessels coming to it.

From Point Jaragua the coast trends, first to the N.W., and afterwards to the North, forming a great bay to Point Guarico, which is 7 miles distant from the former. The reef which extends from Point Jaragua rounds the whole of it, and stretches out about 2 miles from Point Guarico. In approaching this side of Cuba, be careful not to mistake Guarico Point for Cape Maysi, it being dangerous at night and in thick weather, when you cannot recognize and use as marks the Eastern lands of the island, and particularly when you are uncertain of your latitude.

From Point Guarico the coast trends nearly N.W., 8 miles, to the River Moa; it is all bordered by a reef, which extends about 2 miles out to sea. Almost N. by W. from

the mouth of that river, and between the reef and the shore, is an islet named Cayo Moa, which offers an excellent anchorage, sheltered from all sea. It is entered by an opening in the reef, almost due North from the mouth of the river. This opening is about 2 cables' length in width, and continues W. by S., forming the channel and anchorage, until the East part of Cayo Moa bears North. To enter it, run along the East side of the reef until up with the opening, which will be when the Eastern part of Cayo Moa bears W. by S., and then steer S.W. until the South part of Cayo Moa bears W.N.W. & W.; then steer W. & S., and continue so until you anchor to the Southward of the Eastern part of Cayo Moa, in 6½ or 7 fathoms, clay. The plan of the port will give a perfect idea of this anchorage; for recognizing or finding which some mountains about 4 leagues inland, named the Sierras de Moa, may serve as landmarks.

From the anchorage of Moa, the coast trends about West; it is all bounded by a reef which extends 2 or 3 miles from it, as far as Port Yaguaneque, which is 11 miles distant from the former. On this part of the coast, and between it and the reef, are two keys, the Eastern one named Burros, (Asses,) and the Western Arena, (Sand;) these keys may serve as marks for knowing this part of the coast. The harbor of Yaguaneque is fit for small vessels only, because its bottom is shallow and unequal, and its entrance narrow and difficult, for the mouth is formed merely by a break in the reef. To enter this port, it is necessary to follow the edge of the reef to windward, until you come to the opening, which lies N.W., two-thirds of a mile, from Arena Key; then steer to the Southward, keeping along the edge of the weather-reef, because the lee-reef, which commences when you are West from Arena Key, narrows the entrance so much, that there is scarcely a cable's length of width in the channel.

Cananova.

CANANOVA.—A mile and a half from Yaguaneque is the port of Cananova, which is properly an opening of the coast only, and must be entered by another opening through the reef.

Three miles to the Westward of Cananova harbor is that of Cebollas, which is alike difficult to enter, or to get out of, and therefore unfit for large vessels.

Tanamo.

TANAMO.—Ten miles West from Cebollas is Port Tanamo; and the intermediate coast is foul, with a reef which extends out about 2 miles from it. Tanamo is a large harbor, and fit for vessels of any size. To enter it you must run along the edge of the windward reef until you find the opening in it; then steer S. & E. until you have passed the leeward point, when you may keep away up the elbow which the channel makes, in the middle of which you ought to keep; but no more is necessary than to give a berth of a third of a cable to all that is visible. With the plan and your eye, no further directions are needed.

Cabonico and Livisa.

CABONICO AND LIVISA.—From Tanamo the coast trends West, 10 miles, to the entrance of the harbors of Cabonico and Livisa; a reef extends also 2 miles from this piece of coast. These two harbors have one common entrance, which divides within into two branches; one to the Eastward, leading to Cabonico, and the other to the Westward, leading to Livisa. To enter these harbors you must go in by the opening in the reef, and then steer for the windward point until it bears S. & E., and then being near it, keep mid-channel, avoiding a reef which runs out from the windward shore, and which lies out about a cable's length from the interior point. You may approach within a third of a cable of the leeward shore; once abreast of the interior points, steer for the channel of the harbor you wish to take, without any other care than to keep mid-channel.

Nipe.

NIPE.—From these ports the coast continues foul, having a reef about W.N.W., 3 miles, to the harbor of Nipe. This bay is very extensive, and has a spacious entrance. The harbor is always accessible, for with either the breeze or the Norths, you will run in free; coming out is quite the reverse, for this requires the land breezes, which, as we have said before, are often very rare in the season of the Norths.

To distinguish this part of the coast, the mountains of Cristal may serve as marks; these are a continuation of the Cordillera, (or range,) which comes from Baracon, and extends to the South from Port Livisa, at about 13 miles inland. The Pan of Sama to the West, is also another excellent mark; its figure being such that it cannot be mistaken, because the summit of it forms a table. It rises on the land to the North of Nipe and Banes, and is almost N. and S., true, with the harbor of Sama; and as the mountains of Cristal terminate to the East, and the Pan of Sama, which begins to rise gradually almost from Point Mulas, forms an opening or break in the chain of hills or mountains, it is almost impossible for any one to mistake the place. The Pan of Sama may be seen 20 miles off.

Banes.

BANES.—From the harbor of Nipe the coast trends N.W., 11 miles, to the Port of Banes; it is all clean, and may be run along at half a mile's distance. The harbor of Banes has its entrance in the middle of a bay formed by the coast, and which has 2½ miles of opening, whence it narrows into the entrance of the port, which is only a cable and a half in width, so that it resembles a funnel. The shores of both the bay

The shores of both the bay

and the channel are uncommonly clear and deep to, and you have to fear nothing but what is seen. Only thus could this port be entered with facility, and its entrance is so tortuous, and with such elbows and turnings, that you must alter your course, almost in an instant, from S. to N. It is excellent, as a place of shelter, for any class of vessels. It is extremely difficult, however, to get out of; because its mouth stands open to the trade-wind, and it is necessary to avail yourself of the land breeze to get out clear, at any rate as far as the middle of the bay, that you may have room to tack and clear yourself from the rest of it, as well as of the coast, which there trends about N. by E., 10 miles, to Point Mulas, and which is foul, with a reef that stretches a mile from it.

POINT MULAS.—To enable any one to recognize Point Mulas, which, on account of its being very foul, and lying further to the Northward than any of the anterior coast, may be very suspicious, the marks already given may suffice; these being the mountains of Cristal and Pan of Sama.

About 5 miles N.W. from Point Mulas is Point Lucretia, which is clear and high; the coast thence continues to the West, with some inclination to the South, for 13 miles, to the Port of Sama, forming a bay named Rio Seco (Dry River.) All this coast is very clear and scarped, excepting the bay, which has a beach.

THE PORT OF SAMA is only fit for vessels which do not draw more than 12 feet of water; and as the shores, both of its entrance and the interior, are very clean, the inspection of the plan will afford all the necessary instruction for taking it. You may know this part of the coast and harbor by the Pan of Sama, and a hill or mountain near its Western part, which is pretty long, and lies N.W. and S.E., and the top of it seems to be plain and equal, and at its West end are scarped rocks which seem white. From this slope a sandy beach, named Gaurdalaboca, continues to the West; to the South of it may be seen a detached hill, in the form of a sugar-loaf, and to the S.W. a small mountain covered with trees, the top of which forms a table, and which is named Mesata de Naranjo, (Little Orange Table.) Between the hill and the mountain is Port Naranjo, which is 5 miles distant from Sama.

PORT NARANJO is a good harbor for vessels of every class. Its windward point may easily be known by being high and scarped, while the rest is of beach. To enter the harbor you must sail without the reef, until the windward point bears S. $\frac{1}{2}$ E., when you may steer towards it, taking care to give it a cable's length berth, to keep clear of a shoal which surrounds it and stretches out about two-thirds of a cable from it. It is also necessary to be cautious of another shoal which stretches out from the leeward coast, and which sallies out to the North of the exterior sloping point, about 1 $\frac{1}{2}$ cable. You should run in mid-channel until you are past the two points of the entrance; and as soon as you are well past that to windward, you may luff up and anchor in a bight formed by the East coast, at about two-thirds of a cable from it, and in 10 fathoms water, opposite the spot where the mangroves come down so as to be bathed with the water.

This harbor has the peculiar advantage that a vessel may sail either in or out with the breeze.
From Port Naranjo the coast, which is a foul beach, trends W., 2 $\frac{1}{2}$ miles, to Point Presquera Nuevo, which is sloping and clean; thence it descends W.S.W., 3 miles, to Port Vita, and is very clean. This little port is very good for vessels which do not draw more than 18 feet, and the inspection of the chart of it will be a sufficient guide. Three miles to the West of Vita is another small harbor, named Bariay, at the mouth of which there is shelter from the breezes, but only in the interior from the Norths. Very small vessels only can get up there. The coast between Vita and Bariay is very clean. A mile to leeward of Bariay there is another port named Jururu, the entrance to which is very difficult, being very narrow; and although vessels drawing 20 feet may enter it, only small vessels ought to do so.

GIBARA, OR XIBERA.—Five miles West from Jururu is the harbor of Gibara, its entrance is 5 cables in breadth, and completely open to the North. The coast between it and Jururu is very clean. To find the port, three hills, or mounts, which are to be seen to the South of it, and which, at a great distance, appear to be islands, are excellent marks. The first and most Easterly of these is named Silla de Gibara (Saddle of Gibara); the middle one resembles the shape of a sugar-boiler; and to the West of the third are some hills of a regular height. Pilots for the Old Bahama Channel may sometimes be obtained here, but it is uncertain.

From Port Gibara the coast, which is clean and sloping, trends to the North, 2 miles, to Point Brava, from which follows N.W. 10 miles of the same kind of coast, to Punta Mangle, (Mangrove Point,) and from it continues 6 miles in the same direction, but it is a sandy beach, and clean. From this point it trends West, but is foul, with a reef of 6 miles, to Puerto del Padre. All this land is low, and on the coast may be seen some small palm-trees, called Miraguanas. At the West side of Port Padre there are two little mounds, very close together.

Gibara, or Xibera

Point Mu- las.

The port of Sama.

Port Na- ranjo.

Gibara, or Xibera

Puerto del Padre

PUERTO DEL PADRE. The harbor of Padre is excellent, and fit for any class and number of vessels. Its entrance is long, and only 2 cables in width; its shores are very clean, and have deep water. To enter this harbor it is necessary to navigate outside the reefs, until the East point, named Jarro, bears S. by E. 3/4 E., when you may steer for the outer leeward point of the entrance channel, and it is necessary not to confound this point with another which is to the N. E., upon the same coast, and which, for distinction, is named Gamachos. The last has an islet of the same name very close to it, and it may assist much in finding the mouth of this harbor. Running for the before mentioned point to leeward, and then close past the S. E. part of Gamachos, no more remains than to steer for the channel, without its being necessary to beware of any more than what is visible.

From Port Padre the coast follows to the West, 5 miles, to Point Prednis, or Rock Point. Here is the entrance of the great bay of Malaguetta, which is no more than a lagoon formed in the interior, in consequence of the land being low and wet. The coast then trends N. N. W., 5 miles, to the Point of Covarobus, from which it trends W. N. W., 10 miles, to the harbor of Manati. All this coast is foul, with a reef which stretches out from it about 2 miles.

Puerto de Manati

PUERTO DE MANATI. The harbor of Manati may be known by a mount, which may be discovered inland from it, shaped like a sugar loaf. It is called the Manuco, and may be seen at the distance of 15 or 20 miles. Close to the West of this may be seen another hill, not quite so high as it, which is called Fardo, or the Table of Manati, which, when shut in with the Manuco, looks like one hill, and presents to the view the appearance of the Saddle of Gibara, which appearance has deceived many, and is dangerous to navigation.

This harbor of Manati may be considered as a lagoon, formed in low wet land, with a long, narrow, and crooked channel in it, and in which there is depth of water for small vessels only; as this channel, throughout its extent, is bordered with shoals of 6 and 8 feet of water, it is running much risk to enter it with middling sized vessels.

Three miles N. N. W. from Point Manati is Point Brava, which is foul, with a reef. The coast thence, which is also foul, with a reef, trends about West, for 5 miles, to the port of Nuevas Grandes, (Great News). To enter this port, which is fit only for vessels of 12 feet draught, it is necessary to go in at the break in the reef, (the reef lies out 6 cables, or two thirds of a mile from the coast,) and follow in afterwards all that distance by a channel which the reef forms, and which in some places is only half a cable's length in breadth. This channel is very crooked, and therefore any one who is not well acquainted runs much risk. As soon as you are abreast of the points of the harbor, you may run along the coast at the distance of one quarter of a cable without fear.

ISLETAS DEL PRINCIPE. From Nuevas Grandes the coast trends about N. W., 11 miles, to the harbor of Nuevitas. It is all foul, with a reef, and may, as well as the harbor, be recognized by three mounts of short extent, which rise within the harbor. There are also three islets in the harbor, named Ballanates. These seem high to the East, and diminish towards the West. Nuevitas harbor is a large bay, with many shoals, but fit for any number and class of vessels. To enter, it is necessary to avoid its windward or East point, to which you ought not to approach nearer than a cable's length; approaching, if you choose, within half a cable's length to the leeward point; but the best way is to keep in the middle of the channel, which is very long and crooked.

From and length of the channel, going in, the coast is lined with shoals, to keep clear of which requires good practice, which practice is equally necessary in the interior of the bay.

POINT MATERNILLOS LIGHT (Colon) is situated on the Point, in lat 21° 39' 10" N., long 77° 10' 55" W. It is about 110 feet South of the Point. It is a revolving light of the first order, time of revolution one minute, height of the light above the sea 176 feet.

From Nuevitas the coast trends about N. N. W. to the Point of Maternillos, and is very clean. From Point Maternillos it trends about W. N. W., and is bordered with a reef which stretches out a mile and a half. All the coast from Maternillos rises a little; and nearly at the end of it, about 11 miles from Maternillos, there is a little mount called Juan Dame, which forms a kind of Table. At this point commences a great white shoal or bank, which extends far to the West, and upon which are many keys and reefs. Here we cease from describing the coast, as being of no use to navigation, and begin to describe the edge of the white ground or shoal, with islets and keys upon it.

About W. N. W. from the Point of Juan Dame, but almost joined to it, there is a small islet, and in the same direction, and at the distance of 6 miles, is the island Guajaba. This island may be known by four little mounts, which lie almost in a line, East and West. The first three may readily be seen, but it is not so with the fourth

which being of less elevation than the third, remains hidden by it; but as you advance to the Westward it opens out, and the whole four may be perceived. At about 4 or 5 leagues beyond these are hillocks appearing like many islets, caused by the lower lands of the coast being invisible above the horizon.

KEY ROMANO, &c. To the West from Guapaba, at the distance of 8 miles, lies *Key Ro* Key Romano, an island stretching N. W. and S. E., in which direction it is 16 leagues *mano, &c* in extent. This land properly consists of two islands, separated by a channel half a mile wide. The Eastern isle has some heights, which, in the middle of it, form a kind of saddle. The Western isle is of low wet mangrove land. Key Romano lies considerably within the white grounds, and two small keys, called Key Verde and Key Confitas, lie nearly N. W. from its Easternmost height, the first at the distance of 7, and the second at 12 miles. Key Verde lies N. W. 1/4 W. from the West part of Guapaba, and Key Confitas N. W. by N. Between these two keys is an anchorage, which may be taken in case of necessity.

The Key Verde, or Green Key, lies 13 miles S. by E. from Key Confitas, and a reef extends from it Northward to the distance of a mile and a half. From Key Confitas a reef likewise extends to the Southward one mile, and there is a clear passage of more than 2 miles within these reefs.

On Key Confitas a light house will probably be shortly erected. It is also proposed *Lights* to erect one on the Northern part of Key Paredon Grande.

In order to gain this anchorage, when coming from the Eastward, you must stand in for the passage formed by these reefs, keeping a little nearer to Confitas than to Key Verde; and when the middle of Confitas bears due N. W. by N., and the middle of Key Verde S. by W., you will be on, or nearly on the edge of the bank. Then lay the ship's head W. N. W., and stand on until the Southernmost part of Key Confitas bears N., when you will stand N. N. W., or a little more to the Northward. Having at length brought the South end of Confitas N. N. E., half a mile distant, you may anchor in 30 or 4 fathoms, on sandy ground.

In getting under weigh from this anchorage, should the wind not allow you to stand to the S. E., you must bear away to the N. W. by N., until you have cleared a reef of rocks extending three quarters of a mile to the N. W. from Confitas Key; after which you may stand to the North, in order the sooner to gain the main channel.

West from Key Verde there is a round key, named Palomas, (pigeon's,) with various other small ones in its neighborhood. To the Northward is the island named Key de Cruz, (key of the Cross,) which is about 13 miles in extent, N. by W. and S. by E. To the N. E. of this isle, at the distance of 3 miles, there is, on the very edge of the grounds, a shoal, named Tributaria de Minerva, which lies N. 1/4 W. from Key Confitas, at 12 miles distance.

The edge of the grounds, which is reef, stretches out a mile and a half from Juan Dama, 23 miles from Guapaba, and from the E. N. E. to N. E., from the high part of the Key Romano, forms an opening, by which, according to report, a vessel may enter, and anchor in 6 fathoms, upon sand, but good holding ground; but as we cannot guarantee that any one who makes the attempt ought to exert great caution.

From this opening the reef rises again, but makes the opening already described between the Key Verde and Key Confitas; and thence the edge of the ground continues, sometimes foul and at others without reef, to the Tributario Shoal. This shoal breaks with a fresh breeze, and shows above the surface at low water. Six miles W. by N. from it is Key Baril, (Barrel Key,) and further to the West is Great Paredon Key. The edge of the grounds, which is sometimes foul and sometimes clean, lies at 2 miles from Key Baril, and 13 miles from the North part of the Great Paredon. The latter key affords good anchorage, for either the time of breezes or land winds. To ascertain and take it, remember that, at a cable's length to the North of its North point, there is a small round key, which you ought to leave on the port hand when going in, and pass within from half a cable to a cable's length from it. You anchor as soon as you are sheltered from the land of the Great Paredon, in the depth of water that suits the vessel's draught. On entering, you will leave to starboard another key, rather larger than the one you leave to port; it is called the Middle Paredon, and lies about 24 miles from the first.

From the Middle Paredon to the West, there is another large key, called Coco, from the middle of which to the West end there is anchorage on its North side.

To the West of Coco follow the groups of trees called St. Phillip's, Guidermos, and Santa Mari's. To the West of these, at the distance of 16 leagues from Coco Key, lies Key Francis. Key Francis may be known by a white flagstaff with a pale top, *Key Fran* and a half barrel on the top, painted red, and two pilot houses near. The flag *cis.* is on a low point of rocks at the West point. If the pilots are there they will hoist the Spanish flag near one of the houses, but will not come outside of the point, so may stand in, giving the point 3 1/2 miles berth, and if there is no pilot there, run in until a square white spot at the head of the bay bears E. N. E., and then run for it

until the day-staff bears N. or N. N. W., and anchor in 30 or 4 fathoms, good holding ground. Do not anchor off the point, (the point bearing East,) there being 5 fathoms and rocky bottom, and danger of losing anchors; or you may anchor, the point bearing N. E., but run into 3 or 4 fathoms as outside of 4 fathoms it is rocky bottom. The land to the Westward of Key Francis trends to the S. E. and N. W., to the Eastward of the key E. by N. and W. by S. The Arredinos Shoal bears N. W. $\frac{1}{2}$ W. from Key Francis, about 10 miles, and always breaks, and is about 3 miles from the land. Westward from this key is another portion of keys, one of which cannot be distinguished from another without difficulty, as they are so much alike.

Signal Grande.

SIGNAL GRANDE. This port has been recently opened, and a chart of it published. There are 9 feet water at the anchorage. There are three entrances, the Easternmost one is in long. 80°, and the Western one is in 80° 08'. An inspection of the chart is necessary to safe navigation.

The edge of the ground from Key Francis, and even something before that, is clean, and the lead will there warn you before you are in any danger upon it. Nevertheless, there is a considerable risk from the Bayo Nicolao, or Nicholas Shoal, which is a spot of sand, lying at a considerable distance to the Northward of the other keys, and is 16 fathoms long, and 5 fathoms wide. It is surrounded by a reef to the N. E., N., and N. W., to the distance of a cable and a half. Two miles to the West from another shoal breaks, which is named the Alcatrazes, and as these shoals present great dangers to the navigator, it is necessary to give some marks to recognize them by, and which will indicate the position of the vessel in respect to the shoals.

Among other mountains which are on the land of Cuba, and about S. S. E. and S. from these shoals, the Sierra Morena (Black Mountain) is the best known. It is long, and lies N. W. and S. E. The S. E. head of it is moderately high, and upon its extremities are various points or peaks (picachos). Of these peaks the two which are on the N. W. extremity of the Sierra (mountain) are high, and lie N. and S., true, with Nicolao Shoal. A little more to the West of the Sierra Morena rises another mountain, with three heights upon it, of which the middle one is the highest, it lies S. by W., true, from the Nicolao Shoal. These heights are named the Tetras de la Bella, (Bella's Paps,) and being N. and S., true, with the middle one of them, you will be also N. and S. with the bay of Cadiz Key, and past both the Nicolao and Alcatrazes Shoals.

To the West of the Tetras de la Bella, two mountains are seen. The first of regular extent, the second, or Westernmost, very long, and at the end of it are two hills, named Sierra de Llanos (Lame Mountain), which runs S. by W., true, with the Western extremity of the bay of Cadiz Key. Further to the West lies another mountain, of proportional extent, named Santa Clara, and something to the West of it may be seen the Paps of Camaraco, of which there are four, though in some positions there do not appear to be so many. The middle one is the largest, and lies S. W., with the Westernmost part of Key Cruz del Padre (Key of the Father's Cross). These mountains are the highest which are to the North coast of Cuba, but it may be remarked that those which are on the East and West of them are little less elevated than these mountains. Such are the lands that are seen in the interior of the island from the proximities of the Nicolao Shoal. A light house is being erected on Cruz del Padre Key. It will be a revolving light.

The White Ground still trends to the West. There are many keys upon the edge or border of it, and the edge is dangerous, having some reefs on it. The ground keys terminate at Point Jacos. The keys named Mono, Piedras, and Manilla are the Westernmost on the reef. These afford good anchorage, where shelter from the swell of the Norths may be found.

Light

The Yucos Keys.

THE YUCOS KEYS.—North eastward from Port Yucos, at the distance about a mile from the edge of the bank, lie the three islands called by the Spaniards Cayo Mono.

Piedras and Monillo.

PIEDRAS AND MONILLO.—These keys afford convenient anchorage to vessels which cannot advantageously use the harbor of Matanzas. The Southernmost and smallest is the Monillo, which lies at the distance of 3 miles from Point Yucos. From Monillo to Cayo de Piedras (Rocky Key), the distance is only half a mile, and from the latter to Mono Key it is 2 miles. At a mile and a quarter N. E. by N. from Mono there is a dangerous reef.

Cardenas.

Light-house.

CARDENAS.—On Cayo Piedras or Stone Key, there is a light-house 96 feet high; it is a revolving light; time of revolution one minute; fifty seconds of light and ten darkness.

Light.

On Cayo Diana, which is about 4 miles S. of Cayo Piedras, there is a light 48 feet high; it is a fixed light, red and white.

Bring the light on Piedras or Stone Key to bear South, distant 5 miles, then S. E. $\frac{1}{2}$ E. for a small round island, distant about 2 miles. When you are within a quarter of a mile of this island, you will perceive two islands to the Eastward.

bearing S S E, and the other S 4 E. Steer for the most Western extremity of the one bearing S S E, until within half a mile of it, and then take the middle channel between them.

There are two spar buoys on each side of this channel, painted white, with a stop of white hunting bent on to their tops. There is also a lookout station erected upon the island, on the port hand going in. It is a great clumsy log house, with a high platform upon it, and it is said a light is sometimes carried upon it, but this is doubtful.

Upon the island, on the starboard side, is a large fishing house, built of logs, with the gable end towards the water. When you have reached the centre of the channel, so that the spar buoys are upon either beam, steer S W, 4 W, for the centre of the three hills, and the town of Cardenas will soon open on your port bow, and when it bears S W, by S, haul up for it, and come to in from 9 to 11 feet water.

Plots can always be obtained in pleasant weather, by making the proper signals. In heavy weather, however, they are unable to board you, their light skills being entirely unfit for a heavy sea. If you make the harbor in heavy weather, you will have to take your vessel in without a pilot. The channel is an intricate one, abounding in shoals and reefs, which put out from the numerous islets that fill the harbor, and by observing the above directions, vessels of 10 feet draught and under will be brought in safely.

Jaceno lies to the East of Cardenas, distant about 6 miles. It is nothing but a collection of warehouses for the storage of molasses and sugar, and has not depth of water sufficient even for the small schooners that ply along the coast.

The anchorage, in regular soundings, of 5 to 7 fathoms, bottom of sand, is to the Southward of Mono, and on the East and South of Piedras, where ships may be disembarked from any sea coming from the Northward. The ground is sandy and clean, with from 5 to 6 fathoms, and vessels here may at all times get under sail. To make the anchorage so soon as you discover the keys, stand for the middle of either passage, and let go the anchor at pleasure. It is only necessary that in approaching from the N E you must take care to avoid the reef above mentioned lying to the North eastward of Mono.

MATANZAS.—From Point Yucos the coast trends to the S W, and W S W, 11 leagues, to the Point of Maya, which is the Eastern point of the great Bay of Matanzas. You may run along this coast at the distance of a league. The Pan of Matanzas, which distinguishes the bay, appears from this direction like an insulated mountain, having a round surface, and without peaks, water courses, precipices, or other inequalities, excepting a small fissure near the S E part of the summit, which can hardly be noticed at a distance, being of so little depth. When bearing from S S W to S, it appears like one round hill, but on any other bearing, another appears on each side of it adjoining, and not so high. The land to the Eastward is even though not very low; but it begins to rise at Matanzas with a gradual slope, and to the West the coast may be seen at the distance of 2 leagues, but it is alike even or level, without any remarkable height, other than the pan, which appears over it.

The harbor of Matanzas, which is at the bottom of the bay, is well sheltered from the North, but it has several reefs. The Derrotero says it is difficult to get out of this place; for, as there is not room to be it out, it is necessary to get clear of it with the land breeze, which, during the season of the Norths, occurs but seldom. The harbor is of easy entrance, but it is necessary to avoid some shoals which lie almost in the very anchorage. To accomplish this, it is advisable to keep along the leeward coast, at the distance of 2 or 3 cables' length, passing Point Maya at the distance of a mile and a half, while it bears to the Southward. With the vessel's head nearly to the bank, you pass the Western shore at the distance above mentioned; and so soon as you see the castle of St. Severino bearing W, 3 S, steer in that direction, until the houses, which will be seen in the S.W. corner of the bay, bear S, 35° W, when you must steer towards them, and anchor so soon as the Castle of St. Severino bears between N.W. 3 W, and N.W. 4 N, where you will have 5 or 6 fathoms of water, of loose clay or ooze.

To get out of this harbor, it is best to clear yourself by towing, or by the aid of the land breeze, if you have any, at a time when you consider the weather as settled, and there is no appearance of Norths coming on. If agreeable, you may cross over, and run to an anchor on the bank or shoal point of Maya, which will be a proper situation to make sail from, when convenient.

Remarks on the Harbor of Matanzas, by Mr. Bellamy.—"This harbor is easy of access, and capable of holding a great number of shipping of different sizes, completely sheltered from all winds, except those from the N.E. quarter, which send in a heavy sea. The anchorage is partly protected on the N.E. by two shoals, named Buxo Viejo, or New Shoal, and La Laja. On the shallowest part of the New Shoal, which is also the Northernmost, is a buoy, with a pole and a white flag, in 2 fathoms water, and on the Southernmost (La Laja) is a pole with a white flag, in 2 feet: the

principal entrance is between the two flags, and the channel is about 2 cables' length wide. These flags are very small, and at times cannot be seen at more than half a mile distant; and as they are badly fixed, very often break adrift. Therefore a stranger ought to pay strict attention to the leading-mark, and keep a good lookout for the shallow water.

"The leading-mark is the South side, or notch in the gun, on with a large white house, standing on a hill at the back of the town, and is the Westernmost house visible, bearing W.S.W. $\frac{1}{2}$ W., by compass. This mark will carry a vessel in mid-channel between the shoals; and when the castle of St. Severino bears from N.W. $\frac{1}{2}$ W. to N.W. $\frac{1}{2}$ N., you may, if in a large ship, anchor in from 5 to 10 fathoms, and at the distance of a mile from the town. Small vessels may anchor further up, within one-third of a mile from the town, according to their draught of water.

"There are also two other good channels into Matanzas: one between the North Shoal and the castle of St. Severino, having 8 or 9 fathoms in it; and the other to the Southward of the South Bank; but the middle channel is that preferred.

"The Spanish plan, in the *Portulano de la America Septentrional*, published at Madrid, in 1809, is very incorrect, with respect to both distance and soundings, and should not be relied on. The tides rise and fall at times between 2 and 3 feet; but they are influenced by the winds, and very irregular. It is not so difficult to get on at this place as has been described. During the 19 days that we lay here, the sea and land breezes were regular; and in the event of their not being so, vessels may be out at almost any time, if acquainted with the place."

The *Derrotero* continues: From the harbor of Matanzas the coast runs to the N.W., to the Punta de Guanos, which is the most projecting point to the Northward, and is distant from the mouth of the harbor or bay about 4 miles. From Point Guanos the coast runs almost (West) W. $\frac{1}{2}$ N., a distance of 40 miles, to the Morro of the Havana: it is all clean and bold to, and may be run along at the distance of a league, or less if required; inasmuch as there is no other risk than a rocky shoal 14 feet, extending 2 miles from the land, 19 miles from Point Guanos, which stretches off from the coast between the Rincon, or Corner, and the Punta de Tarara, or Cabece. Along this coast are soundings on sand, which extend more or less from shore, and of which the edges are steep and clear, so that you suddenly pass from 100 fathoms to 20. With the lead going there is no risk running along, because the soundings will warn you of the limits into which you stand without danger; and in good weather you may pass the night by dropping a kedge upon these soundings, which manœuvre may sometimes be convenient, either to avoid passing your port if the wind blows fresh at night, or that you may not lose ground, if the land breeze is light or calm, as the current constantly runs Eastward at the mean rate of one mile per hour. The hills or mountains of Jaruco, which rise nearly in the middle of this coast, are a point which serves to recognize it by, and ascertain your situation.

Havana.

HAVANA.—This, as noticed, is in point of importance the principal harbor of Cuba, and has been described as one of the best in the world, being deep enough for vessels of the largest class, sufficiently capacious to receive a thousand ships at war, and so safe that vessels ride securely without cable or anchor. The entrance is by a channel half a mile long, so narrow that only a single vessel can enter at once, and fortified through the whole distance with platforms, works, and batteries. The mouth of this channel is secured by two strong castles, as exhibited in the figure beneath. That on the Eastern side, called Morro Castle, is built in the form of a triangle, fortified with bastions, and mounted with 40 pieces of cannon, most level with the water. On the opposite side of the channel is another strong castle called the Punta Castle, connected with the castle town on the North. The Punta is situated on the Western side of the harbor, and is surrounded by ramparts, bastions, and ditches.

s surrounded by ramparts, h-

MORRO LIGHT is upon Morro Castle, and is 100 feet high; it is a fixed flashing *Morro light*,
light, showing a bright flash every half minute.

The entrance to Havana is between the Morro Castle and Fort Punta here it is
about one-fourth of a mile wide, and the direction is S. E. by E.; the channel narrows
so much, that, when you are one half of a mile from the Morro, it is only 600 feet
wide. The best water is nearest to the Morro side.

In passing the first castle, (Morro,) you must not come to anchor, as a reef lies off
the starboard hand as you enter, which is dangerous.

The harbor of Havana may be distinguished at a distance by the Paps of Managua,
which, as already stated, lie on the meridian of the entrance; while the land, both to
the Eastward and Westward, is low and equal, with the exception only of the Morro,
a little hill, surmounted by the fortifications and light-house. At 6 leagues to the
Eastward, the hills of Jaruco, or iron hills, may be seen; these are of moderate
height, and detached. The Tables of Mariel are about 6 leagues to the Westward;
and in advancing, not only these, but the hill of Cavanas may at times be seen. [The
plan of the harbor can be best understood by reference to the particular plan of it,
from the survey of Don Jose Del Rio, by whom the position of the Morro Castle has
been determined and delineated on a chart, published by E. & G. W. BLUNT.] The
entrance lies nearly S. E. by E. and N. W. by W., and is, therefore, very difficult
when the breeze is not to the Northward of E. N. E. The breeze enters at about 10h.
A. M., and blows until sunset: and therefore it is only between these hours that you
can sail into the port. It is very difficult, if not impossible, to sail in when the breeze
is from E. N. E. to S. E., which it often is in the rainy season, and sometimes even in
the dry season. Under such circumstances, the only resource is to anchor in the
Morro Shoal, or bank, and enter by towing or warping, when the breeze takes off,
which, as already stated, is at night. As, on entering, these difficulties are to be en-
countered; so, on going out, you will not be quite free: for when the breeze comes to
the N. E., which it often does in the dry season, or that of the Norths, it is not only
inconvenient, from the wind's being scant, but also because a swell sets into the mouth
of the harbor, which renders this operation much exposed to danger. Generally
speaking, it is best to enter about mid-day, and to go out at the dawn of the day.
Should the wind be scant for setting in, it is advisable to anchor outside the Morro,
and tow or warp in at night.

In approaching Havana from the Eastward, care should be taken to avoid a shoal
not more than a quarter of a mile from the shore, the shoal of Morro Castle bearing
out N. N. E., distant one mile. This notice is given from the information of Mr.
Cope, who was mate of the ship Jane, of Glasgow, then in company with the
writer.

The Morro Bank affords anchorage safe enough in the time of the ordinary winds
and breezes, but is much exposed in the season of the Norths, and in the hurri-
cane months. It is, therefore, advisable to anchor so as to have the mouth of the
harbor open, and to be extremely vigilant, lest you should be surprised. To direct
yourself into the harbor, the eye may suffice, for in the channel there is no other
danger than the shallows, which stretch out from each side. That on the Morro side
does not extend one-third of a cable from the shore. To avoid the leeward shoal, it
is requisite not to go farther from the Eastern shore than a cable's length; working
your vessel so as to run along half a cable's length from the coast on the N. E. side,
the mid-channel being at about three-quarters of a cable's length. When once abreast
the middle of Castle Blanca on the N. E., which will be when you are abreast of
the N. E. or front side of the city, you may keep away, and anchor opposite to the
western part of the city, at what distance you choose. The largest ships may ap-
proach near enough to lay a plank on shore.

At a short distance without the Morro Castle, to the S. W., is a very small shoal,
15 fathoms over it. This bank is to be feared only when there is much swell on,
at other times the largest ships may pass over it without touching. Even when
the water begins to shoalen, you need not be afraid of it, as at half a cable's length
from the Morro you will be perfectly clear. Finally, if you wish to pass in without
risk, send a boat to place herself on the Capstan Shoal,* which will serve you
as a mark; then steer so as to pass outside of her, and you will be free from all
danger.

An English navigator, in giving directions for Havana, has said, "On going in, with
the wind from the Eastward, keep as close to the Morro as possible. As soon as you

*The Capstan is the projecting edge of the shelf within the Morro at about a cable's length
from the light-house. A similar projection further in, on the same side, is the Pastora or Shep-

Entrance to Havana.

are within it, you may meet with flaws and variable winds; and should you be obliged to let go an anchor, great care should be taken to shorten sail and veer cable quickly, as the ground at the entrance of the harbor is not very good for holding. All ships lying in the channel of the lagoon, moor head and stern. There are two wrecks lying rather more than 2 cables' length within the entrance of the harbor, and denoted by buoys with small flags; the channel lies between them."

Ships-of-war and large merchant-vessels generally wurp up the harbor, and anchor off the sheers or arsenal, where there is sufficient room for a great number of ships to moor, in from 7 to 5 fathoms.

From the Morro, or Castle of Havana, to Punta de Ycaos, (or Ycaos,) the distance is 20 leagues, and the course is nearly E. $\frac{1}{2}$ N. From this point may be seen the Loaf or Pan of Matanzas, to the W. S. W. This hill, which is the Northernmost that you will descry to the Eastward of the Havana, lies over the bay of Matanzas, and constitutes the grand point of departure for ships bound hence to the Northward through the Strait of Florida.

Pan of Matanzas to the E. S. E.

ISLAND OF CUBA.

SOUTH COAST.

We now commence with the South coast of Cuba from Cape Maysi, proceeding regularly Westward to Cape Antonio, including the Isle of Pines, &c. From Cape Antonio we continue to describe the coast Eastward along the North side to Havana.

The greater portion of the coasts of Cuba are extremely foul. Those most dangerous are the Southern coasts, from Cape Maysi to Cape Cruz, the N. E. coast from Cape Maysi to Punta [Point] Maternillo, and the N. W. coast, from the port of Matanzas. On the other parts are many shallows, keys, and reefs, so thickly placed and so numerous, that in many places they form barriers which prevent access to the coast of the island.

The land to the South-westward of Cape Maysi, at about half a mile from it, is to be high and clean, and it trends about S. W. $\frac{1}{2}$ W., $6\frac{1}{2}$ miles, forming a small bay with a sandy beach, named Cala de Ovarado. From this cove, the coast trends about S. S. W., 4 miles, to Punta Negra, or Point Negra, whence it winds to the W. S. W., about 4 miles more, to Punta Caleta; 28 miles W. $\frac{1}{2}$ S. from which lies Point Savana-la-Mar, and 4 miles to the Westward from the latter is the port of Baitiqueri.

The Derrotero says that, "From Cape Maysi to Point Negra the shore ought not to be approached nearer than 2 leagues; for, as there is no inducement to approach it, surely it would be foolish to run in upon a coast which lies completely open to breezes, and along which there is no anchorage, although it is clear, and has no seen danger. From Point Negra to Baitiqueri, there is no risk in running along the coast at the distance of a mile; and along this part, and to the leeward of the various points thereof, you may anchor in the depth of water which suits you, from 35 fathoms; but the best bottom is in 16 fathoms, where you will be at a good distance off shore. In this place, several rivers discharge, from which you may provide yourself with excellent water, and plenty of firewood may be procured.

The Cape Bueno, or Ocoa Point of the English charts, lies to the Eastward of Punta de la Caletas of the Spanish: a British navigator remarks, "Within this cape the Bay of Ocoa, in which there is anchorage. The marks for anchoring are the Easternmost point bearing E. S. E., about $1\frac{1}{2}$ mile, when the table-land of St. Xosé's Mole will be in a line with the point. You may anchor in any water, the depth being from 35 to 7 fathoms, but 16 and 18 are the best; and plenty of fish may

OT.

and should you be obliged to anchor, you will find the ground good for holding. All ships here are two weeks lying in the harbor, and denoted by

up the harbor, and anchor for a great number of ships

ss, (or Yacos,) the distance from this point may be seen that it is the Northernmost that the bay of Matanzas, and hence to the Northward

E.

A.

from Cape Maysi, proceeding along the North side to Havana, is extremely foul. Those most dangerous are the N.E. coast from the point of Manzanillo, and reefs, so thickly planted with rocks which prevent access to

about half a mile from it. It is 6½ miles, forming a small bay in this cove, the shore of Point Negra, whence it winds N. by E. 28 miles W. ½ S. from the latter is the point

Point Negra the shore on the west is no inducement to approach, which lies completely open to the wind, though it is clear, and has no danger in running along the coast to the leeward of the rocks which suits you, from 33 to 35 fathoms you will be at a good distance from which you may provide yourself with provisions. The harbor, lies to the Eastward of the point, and is very clean. Within this cove are marks for anchoring, when the table-land of St. Nicholas is visible in any water, the depth is best; and plenty of fish may

caught with hook and line. Two fresh-water rivulets run into this bay: the one named Rio du Miel, or Honey River, lying 2 or 3 miles to the Westward of the anchorage; the other, which lies nearer, is to the Eastward, and at the bottom of the Eastermost gully, but it is generally dry, from the infrequency of rain."

The harbor of Baitiqueri, already mentioned, is very small, and has a very narrow entrance; it has only from 15 to 20 feet of water, and therefore is fit for small vessels only; it is well sheltered from all winds, and the rivulet of the same name, which runs into the interior of the harbor, affords an opportunity of watering. There is rather more than a cable's length between the two other points of the entrance; but a rocky reef, with from 10 to 17 feet on the edge of it, runs out from the windward point; and there is, also, a reef running out about a quarter of a cable from the leeward point. Between these two reefs lies the entrance-channel, which is only 50 yards wide, and continues thus narrow for about a cable's length, after which it widens as you approach the two interior points; and the depth of water admits of approaching the shore.

From Baitiqueri the coast trends about W.S.W., true, for 5 miles, to Point Tortuguilla, from which it follows W., true, 3 miles, to the river Yateras; S.W., 4 miles, to Point Mal-Año; and at 3 miles West from the latter, lies Puerto Escondido, (Hidden Port.) All the coast between Baitiqueri and Port Escondido is clean, and may be safely sailed along at the distance of a mile.

Port Escondido forms an anchorage sheltered from all winds: in the interior of it are various bays fit for all classes of vessels, but its entrance is very narrow, for between the outer points there is only one cable's length; and as each of them has a reef, of which the windward one lies out a third of a cable, the channel is only 90 yards wide; it, however, has no windings, and the whole length of the strait is not more than a cable and a half; and as to enter it, you must steer N. 43° W., it may always be done with a free wind, even if the breeze is at N.E. The most prudent mode of entering this harbor, is to order a boat to be placed on the outer point of the windward reef, which is nearly in mid-length of the channel, and which will serve as a mark to sail in by. You have then only to bring the vessel's head in the direction above given, and run on in that direction, passing close to the boat, until you have passed the inner point to leeward, where you may anchor in 5 or 6½ fathoms, clay ground.

As there is no town on this harbor, nor any proper leading-marks for running in, it is proper to allow the vessel sufficient room to alter her course from windward to N. 43° W., the course for entering the harbor. We therefore recommend, although the windward coast of the entrance may be passed at half a cable's length, that it should not be passed at less than 3 or 4; because thus, although in luffing to, the vessel may pass the demarkation given, (N. 43° W.,) yet there will be room to rectify this, by luffing to windward before you are between the points, so as to gain the proper bearing, which is absolutely necessary, as the channel cannot otherwise be passed without danger. Any one wishing to run further up the harbor, instead of bringing to in the anchorage we have mentioned, may easily do so by the eye, by towing, or even under sail; but for this it is necessary to consult a plan of the harbor.

Puerto Escondido* having no commerce, it is seldom that any vessel is bound into it; and if in any storm or hurricane, one is obliged to seek anchorage, we would rather advise every exertion to be made in order to reach the next harbor to the West, named Guantanamo; because, if it be difficult to enter Port Escondido in good weather, it must be much more so in storms and obscure weather; and it will be by no means strange if, without a pilot, or even with one, a vessel might be driven on one of the reefs of the entrance; or, what is still worse, might get on the rocks at some point of the coast, which might be mistaken for the entrance of this harbor.

GUANTANAMO, or CUMBERLAND HARBOR, a very extensive and excellent harbor, lies more than 2½ leagues to the Westward of Cape Maysi, and 4 leagues from Puerto Escondido. The coast, in the latter distance, forms some very small saw'y points, and it is very clean. The entrance of Guantanamo, between the two outer points, is more than a mile broad. The Derretoro says—"The East point may be approached without fear, as there is no danger but what is visible. The coast trends nearly North, about a mile and a quarter, whence it changes to the N.E. to form the harbor. On the windward side of the entrance, and at about three-quarters of a mile within the outer point, a rocky shoal stretches from the shore, upon the edge of which are from 4 to 5 fathoms of water; this shoal is rather more than a cable's length broad, and may be easily avoided by attending to the subsequent directions. On the western side there is also a reef of rocks, but it is narrower than that on the East. To enter this harbor, it is necessary only to place your vessel so as to pass its windward point at the distance of one or two cables' length, and thence luff up to N.W. by

Guanta-
namo, or
Cumber-
land
Harbor

* Puerto Escondido, or Hidden Port, is well termed so, as I have been within less than a mile of the entrance of it, and could not make it out distinctly —A. L.

N., on which course you must continue until the North point of the River Guantamano, or Augusta River, bears West; you may then change your course to N. by W., until you have the interior point of the windward shore bearing East, when you will be clear of the reef which stretches from it. You may next haul by the wind, and anchor where it may suit you best; or, if you wish to run into the interior of the harbor, and the breeze will not allow you to lay through, you may beat in with the assistance of the lead only."

The following remarks on the harbor of Guantamano were made by an officer on the Jamaica station, in 1809:

"The appearance of a remarkable spot of land on the side of a hill, at a distance inshore, determines the situation of Cumberland Harbor, which if you fall in to the Westward, exactly resembles a kite, and is totally open when it bears N.E. $\frac{1}{2}$ E.; but if you are far to the Southward, it will either be partly or entirely hid, unless you are far enough to the Westward to bring it over the hills on that side of it."

The following directions for sailing in, have been given by Mr. J. Town, from observations made by him in 1817:

"On coming in, you will observe in the middle of the bay a remarkable light yellow (or brown and white) cliff; bring this cliff to bear about N. by W. or N. by W. $\frac{1}{2}$ W., run in with that bearing until you open, on the Eastern side, a small sandy point with two huts on it. This point, called Fisherman's Point, cannot be mistaken, as there is no other sandy point on the East side of the harbor. After you have opened Fisherman's Point, with the bearing above described, you may steer N.N.E. and when Fisherman's Point bears E. by S., haul up N.E. or N.E. by E. and anchor in 6 or 7 fathoms, muddy bottom. The best marks for anchoring are—Fisherman's Point S. by E. or S.S.E., the West head of the harbor S.W. $\frac{1}{2}$ W., and the light yellow cliff W. $\frac{1}{2}$ S., in 7 fathoms.

"On coming in from the Eastward, you may keep in as near to the East head of the entrance as you please, there being 10 fathoms close to it; after passing, run to the Westward, and bring the before-mentioned bearings on, which will clear the reef that lies off the point a little to the S.W. of Fisherman's Point. The marks for the South end of this reef, which has heretofore been described as a single rock, are the two huts on Fisherman's Point on with each other, bearing N.E. by E., and the point within the East Head S. by E., West Head S.W. by W. $\frac{1}{2}$ W., entrance of Augusta River W. $\frac{1}{2}$ S., the yellow cliff N.W. by N. The marks for the North end of the reef are—the N.E. hut about its breadth open to the Northward of the S.W. hut, bearing N.E. by E. $\frac{3}{4}$ E., the point within the East Head S. $\frac{1}{2}$ E., the entrance of Augusta River W.S.W. The reef lies N. by W. and S. by E. about $1\frac{1}{2}$ cable's length, and 50 fathoms in breadth. It has 17 feet water on its shallowest part, 31 fathoms within it, and 5 fathoms close to the outer edge, which is about 2 $\frac{1}{2}$ cable's length from shore.

"On coming in from the Westward, you may approach the point to a cable's length as it is steep to; but, from the appearance of the point at a distance, a stranger would suppose there was a reef extending from it; at least, when you are within a quarter of a mile. After you are within this point, haul more to the Eastward, as there is a flat that extends from the entrance of Augusta River in a straight direction for a yellow cliff; this flat extends nearly one-third of the distance across the harbor towards Fisherman's Point; but the soundings to and along it are very regular.

"If the wind is off the land, and you have to work in, your lead will be the pilot when standing to the Westward; but in standing to the Eastward, be careful not to approach the land nearer than 3 cable's length, as the reef already described is steep to.

"In running in, with the marks described, you will be within the points before you get soundings: after which the soundings are very regular, from 18 to 6 fathoms.

Augusta River is narrow at the entrance, and has only 12 or 11 feet water at about one-quarter of a mile up. You may go up the river by keeping the starboard side on board; or go into a large lagoon on the port side.

When the entrance of the harbor bears nearly North, 5 or 6 miles distant, the line to the Westward of the harbor and the Morro Castle of St. Jago de Cuba will be in line, bearing W. $\frac{1}{2}$ N., and the outermost land to the Eastward E.N.E.

From Guantamano to Point Barracos, the coast trends nearly true West, and it is generally clean, and you may run along it at a mile from the shore. Point Barracos may be known by a morro or hill which rises on it. From this point the coast bends to the North-westward, and forms the Bay of Cabo Baxa (Low Cape), where it trends West to the River Juragua. The space between Cape Baxa and Juragua is named los Altares, or the Altars, because the coast forms three beachy bays, separated from each other by high scarped mounts. The River Juragua is 10 miles distant from Point Barracos.

From the River Juragua the coast continues nearly West, 12 miles, to the entrance

of the Port of St. Jago de Cuba; it is all clean, and may be run along at the distance of a mile. The rivers De Sardinero and De Aquadores disembogue upon it; and near this last may be seen some small houses, inhabited by water-carriers.

ST. JAGO DE CUBA LIGHT is a revolving light, 226 feet above the level of the sea; time of revolution 7° 20'. Lat. 19° 48', long. 75° 58'.

The HARBOR of ST. JAGO DE CUBA is very good; but the entrance being narrow and crooked, is difficult. On the East point stands the Morro castle, and a little further in Estrella (Star) castle, which is separated from the Morro by a bay, at the end of which is another small fort or battery. A rocky shoal runs out from the windward, which extends out about 2½ cables' length from the Morro Point; and, on the leeward side, another shoal runs out, about a cable's length South of the point. The channel lies between these two shoals. At its entrance it is a cable's length in width, and further in is reduced by about a third of a cable; so that, when abreast of the bay, which is between the Morro and Estrella castles, which is the narrowest part, it is only two-thirds of a cable in width; and from this it continues, with the same width, until you pass Cape Smith, when the harbor begins to open.

To make this port you ought to sail half a league or 2 miles off the shore, until the Estrella castle bears N.E., when, steering in that direction, you will enter the channel formed by the reefs; but, as soon as you are abreast of the Morro Point, within a quarter of a cable's length of which you may pass, you may begin to keep away; so that, when up with the battery, which is at the bottom of the bay, between the Morro and Estrella castles, the vessel's head shall be N. ¼ W., which course it is necessary to follow until you are past Cape Smith, when you may anchor.

The necessity you are under (from the crookedness of the entrance) of keeping away four points, viz.: from N.E. to N., renders it almost needful that a large vessel should have sufficient space to make the turn in. To this end we advise that, so soon as you are abreast of the Morro Point, you ought to begin to keep away; for without this, you may very easily get ashore at the Estrella castle. It must here be remarked, that it would be improper to keep away to the North at once, though it may sometimes be done under favorable circumstances; for, by doing this, you incur a risk of getting ashore on the corner of the leeward reef.

The distance between the Morro Point and abreast of the battery, at the bottom of the bay, on the East, is one cable's length; with the knowledge of this, the pilot will know how to regulate the steerage, and trim the sails, &c., as may be necessary to gain his purpose, and according to the facility with which the vessel can be worked.

At the bottom of this harbor, on the N.E., is the city of St. Jago, de Cuba, which is the most ancient city in the island.

From St. Jago de Cuba the coast continues to the West, forming various bays, with embayments of little importance, the knowledge of which is alone useful to coasters. Upon this coast are the high Copper Mountains (Sierras del Cobre), which are about 11 miles distant from St. Jago. In clear weather these mountains have been seen 33 leagues off.

Forty miles W. by S from St. Jago de Cuba rises another very high mountain, named the Peak of Tarquina, which is an excellent landmark. Cape Cruz is the last place on this part of the island where the coast is clean. It lies more than 30 leagues from St. Jago, and you may run along the whole intermediate coast at the distance of a league or even less; but, as there is no motive to induce one to approach it so near, it is more advisable for those bound to the Westward, to run along at 2 or 3 leagues distance from the shore. At Cape de Cruz commences a white bank, which extends 20 leagues to the North-westward, and terminates at Trinidad. Upon this bank are keys and reefs without number, which form channels of more or less width. Of the keys on the edge of the bank, the principal are those called the Cayos de las Doce Leguas, or the Twelve-league Keys, the whole range of which extends not less than 20 leagues in a N. N. W. direction.

SANTA CRUZ.—The proper channel through the keys to Santa Cruz is the channel of Cuatro Reales. Steering up N. by W., by compass, from Cape Cruz, will reach a chain of keys stretching East and West, nearly, eleven in number. The entrance of the channel is between the two Westernmost keys, which are large, and extend from each other 6 miles, and is about 2 miles to the Westward of the Easternmost one, immediately to the Eastward of which is a small sandy key, unlike any other about here, which serves as an excellent mark for the channel. There is commonly one pilot, (perhaps more now,) on one of the keys near the sandy key, who stops here one month and then is relieved by another. The entrance of the channel bears from Cape Cruz N. W. by N. A knowledge of these facts will save much uneasiness; and, on referring to the chart, an unacquainted person would directly decide that the best channel was the one named the Este Channel on the charts. The marks to be observed are as follows: it is bounded on the West side by the Eastern head of the Twelve-league keys, and on the East side by three keys, and a bank runs off from either side,

leaving the channel very narrow and nearly in the middle; bring three keys, which are inside, (and form a triangular figure,) to bear North-east by North, and then haul up North, when you will have a small round key directly ahead, for which you may steer until quite over the shoal water, and which makes an excellent mark to steer by. This will carry you over in about 3 fathoms. When the Eastern head of the Twelve-league keys bears N.N.W., and the flattest keys on the Eastern side of the channel, East by North, there will be the shallowest water, from which the course up is N.E. by N. $\frac{1}{2}$ N., passing between the keys that form a triangle, leaving one on the port hand and two on the starboard; the depth of water between which will be from 10 to 13 fathoms. When the Eastern head bears W. by N., and the flattest key to the Eastward E. $\frac{1}{2}$ S., the depth of water will be from 6 to 7 fathoms, and quite clear of the shoal water. It is high-water, full and change, at 12 o'clock; the water rises about 4 feet, but the tides are not regular about the keys, sometimes earlier and sometimes later, and appear to be very much influenced by the wind. Near to the main-land, in the first of the morning, the wind is more Northerly than in any other part of the day, and draws round gradually after the sun frequently going so far as West. After the sun sets there is an interval of calm which is succeeded by the land wind.

High-water.

To coast along the Doce Leguas Keys, being 3 miles to the Southward of Cape de Cruz, steer W.N.W. $\frac{1}{2}$ W., with which course you will run along the edge of the bank; and, having run 12 $\frac{1}{2}$ miles in this direction, alter your course to N.W. $\frac{1}{2}$ N., with which you will enter upon the bank in 40 fathoms, on sand and rocks; keep this course for 23 miles, when, with the edge in sight, you will leave it in nearly 50 fathoms. Continuing the same course 17 miles more, you will again find 40 fathoms, or less, and soon afterwards will see Livisa Key to the N.N.E., and ahead will be seen the Eastern end of the Doce Leguas Keys.

Having recognized these two points, you must run along on the bank, but without getting along into less than 4 fathoms, until you find yourself 3 miles to the South of the Eastern head, and in 7 fathoms water, over a bottom of sand; you must then run W. by N. With this course you will shortly run off the bank, and may coast along the Doce Leguas Keys, at the distance of a league, without any fear; and having run 21 $\frac{1}{2}$ miles, steer W.N.W. 18 $\frac{1}{2}$ miles, and you will then have the Boea de Caballones (or mouth of the Caballones Channel) open; and it may be easily known, as it is broader than any other to the Eastward, and because the S. and E. points of its entrance are very low, and the edges at the water of soberneo rock.

Having ascertained your situation from seeing this Boea or Channel, you may continue coasting along the keys, at the distance of 3 miles, continuing on the present course; and having run 21 miles, you will see to the Northward a great opening formed by the keys, which is the Boea Grande; passing by it, pursue the same course, keeping the Cinco Balas, or Five Balls Keys, in sight, at the distance of 2 leagues, and noting that a reef extends 3 miles to the S.W. of Key Breton. The latter is the Westernmost of the Doce Leguas Keys, nearly in a line between Key Breton and Puerto Casilda. On the main of Cuba, is the Placer de la Paz, a sand-bank, having on its Eastern part good anchorage, and nowhere less than 14 fathoms, on sand and shells.

If night comes on, when you are in the vicinity of Cape de Cruz, or to the South of it, as assumed in the preceding directions, you must steer W. $\frac{1}{2}$ S., for 14 miles, and thence N.W. $\frac{1}{2}$ W., to keep completely free of the Doce Leguas Keys; continue this course till daylight, changing it afterwards so as to make and recognize the keys, and thus include yourself in the route already recommended.

Should night overtake you in the traverse between Cape de Cruz and the Eastern Head, when it might suit you to anchor on the bank, you may do so on any part of the observing only that the edges of the banks are rocky, and that to get clean ground you ought to run in upon it into 20 or even 10 fathoms, on sand.

If night falls when you are coasting along the Doce Leguas Keys, as already directed, steer true West, until you consider yourself from 3 to 3 $\frac{1}{2}$ leagues from them, and even then continue the same course, considering that hereabout the current sets N.E. and S.W., and, if the tide happens to set in, it is very possible to get aground on the reef; hence no precaution ought to be omitted which similar cases require.

If, when in sight of the Canal de Caballones, you wish to anchor in its mouth, in case of emergency, you can do so without getting into less than 3 fathoms, on sand, in case of being unable to continue your course to the South of the keys. You can shape your course so as to desery the land of Cuba, passing between the Breton and Manuel Gomez Keys, in 12 fathoms, on clay; following afterwards to the North, to make the Anna Maria Keys, and giving a berth to the shoal of Yaguajay, which you leave to port, and to some heads which are to the East of it, and which

MANZANILLA.—The reef which extends 2 miles off Cape Cruz, can be passed *Manzanilla* within 50 yards, in 3 fathoms water. This reef is very steep. As soon as you have passed the reef, haul in for the land: you will then have 24 fathoms water within one-half a mile of the beach. The first point from the cape is called Point Calrado; this cape lies N.E., 6 miles, from Cape Cruz. The anchorage is good from the Cape to Manzanilla in the sloop-channel. In passing Point Calrado, you will have 3 fathoms; as soon as you have passed the point, you will have from 8 to 10. This point should be passed within one-half a mile. Three-fourths of a mile from Point Calrado, in a N.W. direction, lies a shoal; it extends about 3 miles in the same direction. Six miles from Point Calrado, in a N.E. by E. direction, is Point Balona; this point has a shoal extending off from it, in a N.W. direction, $\frac{1}{2}$ mile. Three miles N.W. from Point Balona, lies what the pilots call the Balona Shoal; the shoal extends N.W., $2\frac{1}{2}$ miles. Three miles from Point Balona, in a N.E. direction, lies a small key, called by the pilots Mona Key; this key lies close to the main-land, and cannot be seen as a key in passing along in the channel. The shoal water extends off this key about a mile. Two miles distant, in a N.W. direction, is what the pilots call the Mona Shoal; between there are 6 fathoms. Back of the Mona Key is Lime River, being the first fresh-water about the cape. N. by E., 7 miles, as estimated by the pilots, lie two small keys, called by the pilots Swago. N., 4 miles from Swago, lies a group of keys, trending E. by N. and W. by S., 4 miles, called Sloop-channel Keys. There are two shoals lying W. by N. of the Swago Keys. From Sloop-channel Keys the passage is clear to Manzanilla.

N.W. by W., 7 miles from Point Balona, commences the Great Bank, which extends 75 miles. Between this and the reef before mentioned, lies the main channel to Manzanilla.

A pilot can most always be found at Cape Cruz. There are but four pilots at Manzanilla, and in some cases a vessel might be detained for want of one.

Directions for sailing from Cape de Cruz to the neighborhood of these ports have already been given. We have only to repeat that it is always advisable to keep a good lookout, and the lead going, especially by night. Having recognized Key Grande, continue the N.W. course until Key Breton bears N.E., bringing it the distance of 9 miles. From this spot a N.N.W. $\frac{1}{2}$ W. course, 38 miles, will bring you to another, from which the Pan de Azucar, or Sugar-loaf Hill, will appear on with the most Eastern of the hills of Bonao, which are some high ridges immediately to the Westward of it. In this navigation the keys called the Zarza and Machos will be seen from without; and when the leading mark above given is on, you will still be in sight of the Machos, and of another very small key, named Puga; the latter is rendered remarkable by the breaking of the sea upon it, and it will bear about N. $\frac{1}{2}$ W., a mile distant. From the same spot the Key Blanco will be seen, bearing about N.N.W. $\frac{1}{2}$ W. This key is remarkable, both as the Westernmost key on the bank, and because its shore is bordered with white rocks.

The place where you ought to enter upon the White Ground is between the Keys Puga and Blanco; to do which you must steer so as to pass about half a mile, or rather less, from the reef of the Puga, which reef always shows; and in the passage you will always have 6 fathoms water. Having passed Puga, you must steer N. $\frac{1}{2}$ W., in order to anchor in 4 fathoms, sand and weed, with the South part of Key Blanco W. $\frac{1}{2}$ S.; that is, if the approach of night, or waiting for a pilot, render it necessary.

On the route between Key Grande and Key Blanco, no one need be at any loss, who has the particular chart of the navigation between the Rio Guanabo and the Boca Grande. By it may be seen that any one who wishes to enter upon the bank by the Boca Grande may always do so, provided his vessel does not draw more than 14 feet of water; and it may even sometimes be convenient to run in here to anchor, under the shelter of Key Grande or those of Cinco Bahus, in case of bad weather coming on, which will frequently happen, and which is much to be feared in August, September, and October; or, if he does not choose to anchor in the shelter of these keys, he may run in until he recognizes the key called Rabi-horeudo, which he will leave on the port hand, and will afterwards see Cayo Bargayo; having passed to the Eastward of the latter, he may run N.N.W. without fear, being guided in running by the vessel's sight of water; and entering by the Machos Channel, he may run for Masio or Punta Casilda, as he sees proper.

The key called Blanco de Zarza lies N. by W., 8 miles, from Cayo Zarza de Fuera, and half a league to the Southward of Punta del Caney. Between this key and the coast there is anchorage, as there also is in various other places hereabout, which will be found more or less commodious, according to the winds and draught of the

vessel. The keys, in general, are but little above the surface of the water, and their low shores have no extent of beach; but rocky banks stretch out to a short distance from their points: excepting, however, those which form the Machos Channel, which, within the strait, are very clean.

The Coast from the River Jatibonico, Westward to Port Casilda, Trinidad, &c

The coast between Point Jatibonico and Point Passabano, in a distance of two leagues, forms a bay with 2½ and 3 fathoms. The shore is drowned and covered with mangroves. At Point Jatibonico the river of the same name enters the sea. To water in it, you must ascend the river for a league. Many cedar and mahogany trees are brought down this river, and many vessels take in cargoes here. Three miles to the West of Passabano is the Estero de las Caovas, (Mahogany Creek,) in which small craft not drawing above 6 feet may find shelter from the South-east winds. At the Estero de las Caovas, at 3 miles, follows Point Manati, on which there are some wells of tolerable sweet water. Point Manati, with Point Tolete, which lies two leagues to the West of it, form a small bay, in the middle of which is the mouth of the Estero Nuevo, (New Creek.) Point Tolete and Point Zarza, ¼ miles distant, form another bay, in which is the Estero de San Marcos, with very little water at its entrance. On the Eastern part of Point Zarza, the river disembogues itself. By the river there is much traffic carried on with the town of Sancti Espiritu, which is two leagues inland. West of Zarza point is the creek of the same name, with 7 fathoms water, where small vessels may find shelter from the South easterly, as they may sail to the Westward of Point Zarza, under the lee of a reef, which runs out from the W. S.W. of it for nearly a mile, and which forms a bay, with a clayey bottom, of 3 and 3½ fathoms.

A league to the West of Point Zarza is Point Caney; between is a small bay, with 3 and 5 fathoms, clay and grass bottom. On the West of Point Caney is the Estero (creek) of the same name, with 7 feet of water. To the South of this point is Cayo Blanco de Zarza, (the white key of Zarza,) and between the reef which runs out from it and the point there is a good channel, navigable for any vessel, which, as before said, may find good shelter to the West of the key. Beyond Point Caney, on the West, is the Desembareadero de Mangle (Mangrove Mouth;) two leagues West of Point Caney is Point Ciego; between is a bay with from 3 to 5 fathoms; in the middle of it is the River Tallabacoa, which has very little water in the dry season; and that brook, at a very short distance to the Westward of Point Ciego, is always preferable. After Point Ciego comes that of Yguanojo, at which is the river of the same name, the water of which is excellent, but to procure it, it is necessary to ascend the river for a league. One league and a half West from Point Yguanojo is that of Agabama to the Eastward of which run out the Cayeos de Tierra, (Keys of the Land) which with Point Yguanojo, form a bay called St. Pedro, having from 3½ to 6 fathoms, clay.

The Cayeos de Tierra, with Point Agabama, form another small bay, having 7, 5, and 4 fathoms, on clay and sand. At Point Agabama is the river of the same name.

The shores from Agabama to Point Casilda, are drowned, and covered with mangroves, (literally, watery mangrove land,) and from Casilda to Point Guanarabo, are of sand and scraped rock. Relative to the interior of the land, we shall only mention that the Potrellillo, which is the highest point of the mountains above Trinidad, may be seen in clear days at 2½ leagues off, and the Sugar-loaf (Pan de Azúcar) are excellent marks for accurately ascertaining your position.

From Boca Grande the reef forbids entering on the bank as far as the outer Zorras, between which and the Outer Machos there is a spacious entrance, with depth for large vessels. Nevertheless, if when in sight of Key Breton, and to leeward of Boca Grande you wish to anchor upon the bank, in order to regulate the time for making Point Cayo Blanco, or for any other course, it may be done by steering towards Key Breton, until the N.W. part of that key bears E. ½ N.; but in running thus, sound frequently, until you have from 4 to 3 fathoms, on sand, when you may anchor. If the wind will not allow you to steer in for the anchorage directly East, and you are obliged to beat to windward, observe not to prolong the tacks to the Northward longer than until the N.W. part of the key bears E.S.E., or the South tack further than the same point of the key bears N.E. by E. Between these bearings you may work tuck and tack, till you reach the anchorage, in which there is a shelter from the wind from N. by E. to S.W., caused by the cordon of reefs and keys which lies in these directions. All these reefs show above water, and the outer part of them lies about 3 miles S.W. from the West part of Key Breton.

Any large vessel seeking shelter from the weather, or any other cause, upon the bank, may enter between the outer Zarza and outer Machos, and run over the

face of the water, and then

outer part of them lies

er, or any other cause, upon
Machos, and run over the

of the interior of the bank, there being sufficient depth for vessels of any class, and for this the chart is the best guide.

Tides.—We shall now terminate this part of the subject by remarking that the tides produce streams more or less rapid, and in various directions, according to the channels which the reefs form; but they are of very little importance, because the greatest rise of water, which is at the time of the new moon, is not more than a foot and a half, except with S.E. winds, when it sometimes rises 3 feet.

MASIO.—To enter Port Masio, being within the bank, steer N. ½ W., until the South part of Key Blanco bears W. ½ S., in which situation you will find 4 fathoms, on clay and weeds, or grass, (yerba.) From thence run N. 50° W., with which course you will run along the middle of the channel of Masio, which is formed by a shoal extending N.W. by W. from Key Blanco, and a shoal, with some heads nearly even with the water, on the land side; and you must continue thus till you have Point Jobabo N. ½ W. This point may easily be known by a sandy beach. You must then haul up with the prow to the West point of the harbor; and steering N.N.W., take care to keep a very little away until you are past the Guard-house point, that you may keep clear of the reef which runs out from it. Being past this, keep the prow as before directed to the West point, until near the entrance, when you may run up the middle of it by the eye, because the edges of the shoals show distinctly, and the eye and lead are the best guides. Having run up the middle of the entrance, haul up N. by E. until having passed the points, and being in 4 or 3½ fathoms, you may anchor where it suits you, being cautious solely of a clay bank which runs out from the landing place on the West shore, and the extremity of which is in one with the West point of the port, at South.

Passing in for Masio, you leave the Bay of Caballones to the starboard; and if you wish to anchor in it, for shelter from the N. and S.E. winds, you may do so by keeping in the middle between the two points which form it, and directing yourself mid-trait, and with the prow N.E. by E., anchor when you are in 2½ fathoms, clay or

CASILDA, TRINIDAD DE CUBA.—When up with Cape Cruz, say it bears N.E., distant 3 miles or so, steer (if you have daylight enough to run it, say 60 miles) N.W. by W. 55 miles, and you will be up with the Eastern heads or keys of the Twelve-league Range. If night is coming on steer N.W. by W., 30 miles, or less, which will run you off the bank of white water: then steer W.N.W. until daylight, and then haul your ship to the Northward, and make the keys if they are not in sight, and coast

along them at 3 or 4 miles distance, bearing in mind that Key Breton has a reef running east some 2 or 3 miles S.W., and very dangerous. This coast along these keys is not clear, and too near a proximity is very dangerous, as strong sets of current are felt here, setting on and off, as the tide may be. When you have doubled Cape Breton, your course to Zarza Fuera Key will be N.N.W. ½ W., distant about 6½ leagues. By steering this course you will leave Key Zarza about 5 miles on your starboard hand, and when it is abeam, you steer a half point more Westerly, (or say N.W. by N.) until you raise Key Blanco, which will be nearly ahead, and you will not mistake it, as its base is covered with white sand, (from which it derives its name.) You will in this course have some keys on your starboard hand, called the Machos. When up with Key Zarza, if night is coming on and you have not daylight enough to reach Key Blanco, you can bring your ship to anchor by running on the bank, giving the N.W. end of Key Zarza a berth of about a mile, and keeping the lead going until you get 6, 5, or 4 fathoms water, sandy bottom. There is good anchorage anywhere on the bank between Zarza and the Machos Keys, taking care not to approach too near the Machos in the night, say 2 miles or more distant, as its vicinity is bordered with reefs, all danger of which is plainly visible by daylight. Also observe there is a strong set of flow on the bank here and its vicinity, setting E.N.E. and W.S.W. From Zarza Key to the Machos the bearing by compass is N.W. by W. ½ W., not in sight from each other.

The vicinity of the Machos is dangerous to approach in the night—by daylight all danger is plainly visible. They are connected by reefs extending to the Punta Keys, which are low drowned keys or rocky heads, on which the sea continually swashes, and lie nearly West from the Machos. There is also a reef runs out about East from the Machos, on the bank between the Machos and Key Blanco not clear, as it is from Zarza to within 2 miles or less of the Machos. Key Blanco bears W. by N. (by compass) from the Machos. Nearly on a line, say about half way or a little more of the distance from the Machos to Key Blanco, is a dangerous reef, nearly drowned, a little above the water's edge, and extending to within about one mile of Key Blanco. Between said reef and Key Blanco is a good entrance to the bank, as also between the Machos and said reef. You are now up with Key Masio, where you will get or ought to get a pilot, as it is the pilots' station by law, but they are very negligent, as their pay is arbitrary whether services are rendered or not.

Tides.

Masio

Casilda,
Trinidad de
Cuba.

Here you may wish to anchor, from many causes, viz., no pilot on board, night coming on, weather bad, and the danger of drifting about in such near proximity to so many shoals, &c. Follow these directions, and you may safely come to anchor, viz.: Having Key Blanco in sight, steer for it till you have it well aboard, say 2 cables' length or less, you may then leave it on your port hand, and steer N.E. or N.E. by E. until it bears West, then let go your anchor in 3 or 4 fathoms water. There is a spit makes out from Key Blanco about N.E., say one cable's length, which you will avoid in your N.E. course, and the reef on your starboard hand. This is the entrance to the deep-water channel, say 16 feet. With the wind to the Eastward or off the land, you will, when well up with Key Blanco, steer for it till within one cable's length, leaving it on your starboard hand, giving the West Spit a berth, haul around it, lull up, and let go your anchor in 3 fathoms water. This is the common entrance to the port with vessels not drawing over 13 feet, viz., when you have Key Blanco well aboard, then steer (if not wishing to come to anchor under Key Blanco, as above directed, to wait for a pilot) N.W. by W., which course will bring you into a ridge of white water or shoal-looking bank, and inside of a reef on your port hand; and if you do not draw over 11 or 12 feet water, choose the narrowest part of the white ridge to cross over; you will also see on this course some 2 stakes with tufts of Palmetto leaves tied to their tops—you may leave them on your port hand—you will then, on your course N.W. by N. or N.W. $\frac{1}{2}$ N., raise more stakes, which leave on your starboard hand, as also all the others as you proceed down. The stakes denote the best water, you will therefore keep near to them. If you draw over 12 feet water, you had better come to anchor as directed, under the West side of Key Blanco, and wait a pile.

A good mark is now to place your ship's head on for the South end of the town of Trinidad, which will bring you along the range of stakes, and will save them on the starboard hand until you open the shipping in the harbor. Then steer for the fort on the point, or for the shipping; your eye will now be your guide; only avoiding the white shoal or spit running out from the fort, and leaving Rat Island or Key on your starboard hand. Enter the harbor, choose your position, and let go your anchor.

NOTE.—If you should fall to leeward of Key Blanco, bring the town of Trinidad (on the hill side) and the fort on the point or entrance to the harbor in one, until you see a large red building or house on the East end of the town, then place the fort and the house in one, you will be then on a line with the West end of the reef; you can now bring said red house on with the Lookout House on the top of the hill back of or above Trinidad, or steer North till you see some stakes inside the reef, or which are a part of the before-described stakes, run for them, or steer N.E. till the fort bears N.W., and if no pilot, and you are a stranger, come to anchor. You are now inside the reef which extends from Key Blanco nearly down to the fort, and which has some 2 or 3 openings for light vessels. In lying off and on, off the last-mentioned channel, do not stand inshore with the fort bearing to the East of N.N.E., as there is a dangerous reef on shore, Westward of the fort, called the Mulattos.

NOTE 2d.—The weather channels are always to be preferred, and the leeward one to be avoided, except in extreme cases, &c.

From the River Guanabo the coast Westward is very clean, and you may run along it at the distance of a league. For 8 long miles it trends W. $\frac{1}{2}$ N., as far as the West point of the River Honda; from this it continues N.W. by W. $\frac{1}{2}$ W., 9 miles, to the point of San Juan, which is well marked, as the coast afterwards trends N. by W. $\frac{1}{2}$ W. for a long mile, to the River Guagimico.

Between the River Guanabo and the Point of San Juan, the Rivers Guanyara, Cagan, Honda, Yaguanabo, and San Juan, run into the sea. In all these, coasting vessels, which do not draw more than 6 feet sometimes anchor. To get fresh water from any of them, it is necessary to proceed a league up from their mouths.

Along this part of the coast the water is deep, and the bottom clean, excepting a small reef, which stretches out between the River Yaguanabo and San Juan, and which does not extend from the coast so much as half a mile. The shore is scarp and of soboruco rock. The land is mountainous or hilly for a little to the West of San Juan's Point, and at it commences the mountains of San Juan, or of Trinidad.

From the River Guagimico the coast trends 14 miles N.W. by W. to the Colorado Point, which is the East point of Port Xagna, and is so clean that it may be run along at less than half a cable's length. The land is level without mountains, and in it the Rivers Gavilan, Gavilancito, and Aramao, are met with; but they are of little importance.

Cienfuegos light.

CENFUEGOS LIGHT is a flashing light, 82 feet high, with "Villa Nueva" painted on the tower. It is on Point Colorados, and is in lat. $22^{\circ} 2' N.$, long. $80^{\circ} 28' W.$

NOTE.—The longitudes of the keys and the coast adjacent of the South side of Cuba between Cape Cruz and the S.E. point of the Jardillos, are from 10 to 14 miles far to the Westward on the charts.

LOT.

lot on board, night coming near proximity to so many up to anchor, viz.: Having rd, say 2 cables' length or N.E. or N.E. by E. until ter. The port or harbor of Xagua, or Jagua, is very spacious, secure at all times, and has deep water, but its entrance is very narrow and crooked. The East point, named Colorados, and the West, Sabanilla, or de la Vigna, are the exterior points of this port, and the distance between them is a large mile. The windward shore, from Point Colorados, trends N.W. 4 N., 2 miles, to Point Pasa Caballos, whence it sweeps to the N. by E., about two-thirds of a mile, to Point Milpa, which is the interior Eastern point of the strait. The leeward shore of the entrance follows nearly the same direction as the windward, and narrows the channel so much, that opposite Point Pasa Caballos it is only a cable and a third in width, and thus it continues to Point Milpa.

To enter Port Xagua, pass Point Colorados, at the fourth of a cable's length; but shun the exterior coast to windward, as a reef stretches from it, and it cannot be approached nearer than a mile; you run on, inward, preserving the same distance of a cable, until you arrive at Point Pasa Caballos, when you must luff, for the purpose of keeping in mid-channel, or rather nearer to the leeward side; and so soon as abreast of the interior points, steer towards the S.E. point of Cayo de Caremas, in order to avoid a shoal which lies to the Northward of Point Milpa, and of which you will be clear when the Northern point of the Key Alcatraz bears East. When once the interior points are passed, you may anchor where you please, a chart of the harbor being a sufficient guide.

The town of Fernandina, or Cienfuegos, is in the harbor of Xagua. You can carry in 18 feet water, and it is the third town in importance on the South side of the island. Rise of tide 2 feet.

The coast West of Xagua, or Jagua, is all of soboruco rock, and without any bank or shoal, for nearly 21 miles, to the point of Caleta Buena, (Good Cove;) it thence trends W.N.W. 4 W., 6½ miles, to the East point of Cochinos, or Swine's Bay.

There is a shoal S. by W., true, 30 miles from Cienfuegos; it is nearly circular, the least water on it being 10 feet on the N.E. part. It is coral in formation, and is rising gradually. It is called Placer de Jagua.

COCHINOS BAY is formed by the point above mentioned, and another point which lies W. by N. from it. The last is named Punta del Padre, (Father's Point.) The bay extends 13 miles to the N.N.W. The edge of its Eastern coast is of soboruco rock, without a bank, until at about a mile from the shore, when bottom is found in 15 fathoms, on sand and rock, diminishing the depth rapidly towards the coast. The Western coast is a sandy beach, and sends out a bank to a short distance, but all of it is rocky bottom. In the Northern part of the bay is a landing-place, which leads to the stock farms, (Haciendas de Ganado,) but it is little frequented on account of its having so little bank, and the little there is having generally a bottom of sharp rocks.

Point Padre is very low, with a sandy beach. S.E. from it, at the distance of 6½ miles, lies Piedras Key, which is low, and of small extent. A little to the East of the point the bank which borders the West coast of the bay continues towards the South, and along the edge of it is a reef, which almost joins the North part of Piedras Key. The Eastern side of this reef is very steep to, and has some openings, of 3 and 4 fathoms, which allow a passage on the bank. The most frequented one is that formed by the Southern extremity of the reef and Piedras Key, both because the key serves as a mark for it, and because it has a greater depth of water than any of the others. The break which terminates this reef ends to the Westward at the Lavendera (Wash-broom) Rocks, which lie about 4 leagues W. 4 N. from Piedras Key.

From Padre Point to that of Don Christoval, all the coast is broken with lagoons, containing many keys with groups of mangroves, having their roots growing in the water, or so close to it that the water washes in among them, and having no navigable channels. In this large space is comprehended Cayo Blanco, the South side of which is a sandy beach; and there is fresh water in holes at its Eastern part. On that side, at the distance of a mile and a half from the shore, is the Lavendera Reef, which extends 2 miles East and West. The West point of it lies West 15½ miles from Point Padre, and with another key which lies to the N.W., forms the Bouqueron (Little South) of Calvario, which has little depth.

The Bouqueron of Calvario, with the Southern extremity of Diego Perez Key, which is 6 miles distant from it S.W. by W., forms the Bay of Cazones, which extends inland, N.W. by W., for about 7 miles. At the bottom of this is Masio Key. There are various small channels at the bottom of the bay, formed by Masio Key, which are connected with lagoons, lying along its sides, and at the North end of it. To the South of this key is a bank of 3 or 4 fathoms, sand and rock; but it is of no use, there being no communication thence to the main-land of Cuba. At the distance of more than a mile and a half to the East from the South point of Diego Perez Key, a reef begins, which, stretching out with a turn to the S.E., unites in the Eastern part of the Jardnellos, and is steep to. Between the same point of Diego Perez and the commencement of the reef, there is a passage on the Western Bank, which begins

Tide.

Cienfuegos Shoal.

Cochinos Bay.

with 7 fathoms, but in a short distance has only 14 feet. Four miles to the S.E. of the same point there is another channel, with first 3 fathoms, and very soon after only 2. There is no good mark for it, and the former is most frequented.

S.W. by W., a mile and nine-tenths from the Point of Diego Perez, lies the Southernmost part of Palanca Key, after which follow in order to the N.W. by W., true, the chain of keys named Sal and Fabrica, and which, connecting with the main land of Cuba, at Don Christoval's Point, form innumerable passages, but with very little water. The Southernmost keys of this chain, named Bointo, Cueno, and Palanca, are the marks for vessels sailing along the bank, which has no more in many places than 11 feet of water, and its bottom of fine white sand, is studded with heads of rocks, with only 6 feet over them, but their color indicates what they are. This passage is bounded by the keys above mentioned, another key, Rabihoreado, to the South, and the edge of the Jardine's Bank.

From Palanca Key, which lies 13½ miles W.N.W., true, from Flamenco Key, the Western Fabrica Keys take a turn to the N.E. by N., true, towards the main land, and they form a passage or channel with another chain of keys, to the West of them, called Don Christoval's.

Don Christoval's Point lies N.N.W., 2 miles, from Palanca Key; and from it the coast, which is low and swampy, trends W.N.W., for 18½ miles, to a little key which lies at the entrance of a small bay called Matahambre. The interior of the country along this part of the coast is firm land, and is called the Savannas of Juan Luis. To the South of it extend a chain of keys which are also called Juan Luis' Keys. There is a passage between them and the coast, as there is also between the East part of them and the West part of Don Christoval's; not, however, in any of the channels, for vessels which draw more than 10 feet.

N.W., at the distance of 3½ miles from the little key which lies in the mouth of Matahambre, the Great Mangrove Point and the swampy land ceases. From this point the coast trends to the N.N.E. and N.E. for a short distance, and then to the East, to form the Ensenada, or Bay of Broa, which extends inland in that direction about 7 leagues. On the North it is bounded by the Point of Mayabeque, which lies N. by W., 15½ miles distant from the Punta Gorda. The shores of this bay are all of mangrove and swampy land; and on its North side are the branches of the Cienega, or Shallow Lake, which the natives of the country call the Rivers Guines, Guanamon, Mora, Nueva, and Belen, as far as Mayabeque Point. In this bay, as well as in the whole space of sea comprehended between the coast of Batavano and the keys in front of it as far as the Cayamas Channel, the depth is from 3 to 4 fathoms, clay.

To the N.W., and about a mile distant from the Point of Mayabeque, is the river of that name, in which vessels trading to Batavano can easily provide themselves with water. From this river the coast trends W. 4 S. to the anchorage of Batavano, which is 8½ miles distant from it.

From this place the coast trends to the West, 13 miles to Point Cayamas; but in the intermediate space lies the Point of Cazio, and the river of the same name, in which the Batavano vessels sometimes also procure water.

The River Cazio, formed by the branches of the Cienega, runs into the anchorage of that name, in which at a moderate distance from the coast, from 2½ to 3 fathoms water are found, sheltered from all winds by the chain of keys which lies in front of it. The bight of the Cienega comprehended between its mouth and the main land, is more extensive than that of Batavano or Mayabeque, and the lands around it are well cultivated.

Cayamas Point, and the chain of keys to the South of it, form the channel of the same name, which has 7 feet of water; this chain of keys extends, with a bend to the S.E. by S., about 11 miles, when it forms the channel of La Hacha, which divides it from another chain of keys, which extends from this place as far as Cruz Key, lying 13 miles S. by E. 4 E. from Batavano. The Canal de la Hacha has 11 feet of water, and is much frequented by vessels trading to Batavano, when they either enter or sail out to the Westward of the Isle of Pines and Cayos de San Felipe, (St. Philip's Keys.)

At a short distance to the Westward of Cruz Key lies another, called Redondo, under which the vessels belonging to Batavano secure themselves in the season when the fresh (or stormy) S.E. winds blow: that is, in the months from July to October, (hurricane months,) which are much to be feared on all this coast.

At Batavano is a fixed light, 31 feet above the sea. It is a lantern hoisted upon a mast.

To the Southward of Cruz Key, at the distance of 2 leagues, lies Monte Rey Key, and between is a channel with 2½ fathoms, clay. This channel is the largest of those leading to Batavano, although care must be taken to keep clear of a spit which runs out about 7 miles to the S.W. of the key, and to the heads, which are to the South of those keys, forming the North side of the channel.

Light

From Cayamas Point, the coast of Cuba trends W. by N. $\frac{1}{2}$ N., forming a regular bay, called *Ensenada de Majana*, which terminates to the South, at Point Salinas, 10 $\frac{1}{2}$ miles to the W.S.W. from the former. In the intermediate space, and near Cayamas Point, is the mouth of the river Guanima, at which the Cienegu ends.

S.W. $\frac{1}{2}$ W., 12 $\frac{1}{2}$ miles, from Salinas Point, a small point stretches outward. At a short distance to the North of it is the Creek of *Savana-la-Mar*, which is much frequented by trading-vessels. From the same point the coast continues, forming a bay with *Medinensa Point*, which lies 15 $\frac{1}{2}$ miles to the S.W. of the former.

Between this coast and the Bank, or Middle Ground, on which stand the keys to the Northward of the *Iste of Pines*, the depth of water is from 3 to 4 fathoms, clay, except a spit with 1 $\frac{1}{2}$ and 2 fathoms, which stretches out from the Southernmost key about 2 leagues, to the S.W. $\frac{1}{2}$ W. of the Guanima Keys. The extremity of the spit lies S. $\frac{1}{2}$ E., 5 $\frac{1}{2}$ miles from Salinas Point.

The Guanima Keys are included in the group which, to the Westward, forms the Channel of *La Hacha*, and are situated to the Southward of the River of Guanima and of Point Cayamas.

S. $\frac{1}{2}$ E., 12 miles from *Medinensa Point*, lies *Dios Key*, between which and that point is the passage for vessels trading from this quarter to *Batavano*. *Dios Key* is low, and of small extent; it is detached, and the bank on which it stands turns to the Eastward, and unites with that which surrounds the keys to the North and East of the *Iste of Pines*. It also forms a channel with the Indian Keys, and those of *St. Philip*, with from 3 to 4 fathoms depth of water.

From *Medinensa Point* the coast trends W. by S., true, for about 2 leagues, after which, following S. and S.W., it terminates at *Fisga Point*, forming the Bay of *Ayaniguen*; this point lies S.W. $\frac{1}{2}$ S., distant 10 $\frac{1}{2}$ miles from the former.

About S. $\frac{1}{2}$ E., 10 $\frac{1}{2}$ miles from *Fisga Point*, lies the Easternmost of the keys of *San Felipe*, from which this chain of keys continues in a Westerly direction as far as the meridian of *Guanma Point*; between these keys and the Indian Keys, there is a passage with 2 fathoms of water; and the depth in the space of sea comprehended between the coast and the North part of them, is generally from 4 to 5 fathoms, on clay and weeds.

From *Guanma Point* the coast follows to the West, for about 2 $\frac{1}{2}$ leagues, to the Point and Creek of *Gunno*, where the Bay of *Cortez* begins. From this place the coast runs W. by N., true, for about 2 leagues, to the bottom of the said bay; and the inconsiderable rivers of *San Juan*, *Martinez*, and *Galafré*, disembogue in it.

About W.S.W., true, at the distance of 3 leagues from the Point of *Gnano*, disembogues the River *Cynjuateje*; to the S.E. of which, at the distance of about a mile, begin three small keys, which, extending themselves in the turn more to the East, for about a league, form, with the main-land of Cuba, the Lagoon of *Cortez*, which has about 3 fathoms of water; but the small passes formed by the keys have not more than 7 feet. Some huts have been established on them by persons who fish for hawksbill turtle, or the turtle which produces the tortoise-shell.

The Southern extremity of this lagoon, which is on a parallel with the keys of *San Felipe*, and about 5 leagues distant from them, is the termination of the Bay of *Cortez*, in which there are 3 and 4 fathoms water, on a grassy bottom. About 2 miles to the East of the South end of said lagoon, begins the deep water; the edge is very steep; it begins with 7 and 8 fathoms on a rocky bottom, and continues on so as to join the coast close to the Northward of *Point Piedras*.

Point Piedras lies about S. by W. from the Lagoon of *Cortez*, 7 miles distant: the coast, which is low, but of firm land and rocky, with spaces of sandy beach at the shore, running nearly in the same direction.

From *Point Piedras* the coast, which has no bank, runs nearly S.W. by S. to the *Point Llana*, distant about 5 miles. This point is low, and has no other marks to distinguish it than the different directions of the coast, and some huts near it, and to the West of it there is a small sandy beach. To the S.E. a reef, which is very steep to, extends out about 2 cables' length.

From *Llana Point* the coast trends W.S.W. $\frac{1}{2}$ W., and more Southerly to *Point or Cape Leones*, and then again follows the first of these directions as far as *Cape Corrientes*. All this piece of coast is of high soboruco rock, and without danger at a stone's throw distance.

CAPE CORRIENTES ends in a low point, with a sandy beach; and to the S.W. *Cape Corrientes* a short bank stretches off, on the edge of which are 15 fathoms; and close to the shore there are some rocks on which the sea breaks.

From the cape the coast trends, without any bank, N. 3° E., true, for about a league, to *Cape Cayman*, or the *Point of Maria Gorda*, and from it to the bottom of the bay, N. 40° E. The place called *Maria Gorda* is remarkable, being of soboruco rock, scarped, and higher than any other part of the bay; from it the bank again begins to run off with bad holding-ground, the bottom being rocky; although further to

the North, and from the inflection which the coast makes, the bottom is sand; and very near the beach an anchor may be let go in 5 fathoms, with the precaution of having a cable on shore, as the edge of the bank is very steep. This is the only anchorage in this bay, and affords shelter from the strong trade-winds and S.E. winds, none of the rest of the bay has any bank. The water met with in the lagoons of Maria Gorda is brackish; but the fresh may be perceived rising in bubbles in the middle of the salt, and near the bottom of the bay, and about 6 yards distant from the water's edge. With industry, and in case of necessity, it may be obtained in a drinkable state.

From the bottom of Corrientes Bay the coast trends West, true, to the Balcones, which is a short piece of coast of high soborno rock. From this place it continues W.S.W. to Holandes or Olandes Point. This point, which bears nearly West, 54 leagues, from Cape Corrientes, terminates to the Westward of the bay of that name. Near and to the East of it begins a reef, which extends in that direction about half a mile, but offers no danger, as it lies very close along the coast, and is very steep to Point Holandes has an agreeable appearance, having a resemblance to the curtains of a wall, and extending with this figure about 2 miles, beyond which it descends in a kind of falls or steps, and the shore continues woody after passing it.

From Point Holandes, or Olandes, the coast trends nearly West to the point of Caynelos, which is the Southernmost point of the front of Cape San Antonio, or Cape Antonio.

Cape Antonio light.

CAPE ANTONIO LIGHT is a revolving light, 108 feet above the sea; time of revolution one minute.

The Westernmost point of the cape is called Pocillos, or Little Wells Point; and from this the coast trends N. 9° E., true, three-tenths of a mile, or thereabout, to Sorda or Deaf Point, whence the coast inclines more to the North eastward.

To the Eastward of, and near Caynelos Point, extends the bank, which thence surrounds the cape half a mile from shore, and continues on to the Northward, where it forms the Colorados Bank. Its depth begins with from 20 to 25 fathoms, on a rocky bottom, and diminishes regularly towards the coast, with some spots which have a sandy bottom.

The front of Cape Antonio is of low land, very rocky, and its shore appears with mixed streaks of soborno rock and sandy beach. In its wells, called those of Cuera de la Sorda, (Deaf Woman's Cave,) and the Pocillos, (Little Wells,) water is abundant and of good quality.

Cape Antonio (A) bearing N.W. $\frac{1}{4}$ N., true, dist. 5 miles.

Cape Corrientes looks very much like Cape Antonio; and in order to ascertain it, observe it is rather level land, of moderate height; but being near or off it, in clear weather, some hills in Cuba, named the Cerros del Rosario, which stand toward the North coast, may be seen, bearing nearly true North. They are the only hills that can be seen from a similar situation, and present two summits only to the view.

Cape Corrientes (A) bearing N. 35° E., true, distant 4 miles.

The Isle of Pines, Jardines, and Jardinillos.

The form of the bank and reef which surround the isles or keys called the Jaclines, &c., can be best understood by reference to the chart. Towards the N.E., on this bank, is Diego Perez Key, already noticed, and the edge of the bank thence extends to the S.E., forming a bight at the Megano or Sand Islet of Bisenyno, whence it extends to the Easternmost key of the Jardines. From the North end of the latter a reef stretches out to the Eastward about a mile, and the bank extends in the same direction about 3 leagues, and nearly 2 North and South, with a depth of 15 fathoms at the edges, and 7 or 8 on the whole of it, excepting the proximity of the key, where

4 fathoms are found, on sand and rocks. This key, as well as all those which follow to the Westward, under the name of Jardinitillos, extending as far as Key Largo, are regularly high, and scarp'd at the shores.

To the S.W., about 2 leagues from the Easternmost key, follows the edge of the shoal water, thence West for 4 leagues. It is studded or streaked with reefs, as far as a key which lies a league to the West of Trabuco. For about 5½ miles the same edge forms a bend, as it approximates the East end of Key Largo.

Largo Key, which extends W.S.W. and E.N.E., 13½ miles, is the Easternmost of the Jardines, under which name are comprehended all of those which follow it to the West as far as the Isle of Pines. The South side of Key Largo is a sandy beach, bordered with a reef, which runs out about a mile from the East end, and afterwards approaches nearer, so as almost to join the West end of the key, whence the same reef continues, without any break. W. by S. and W. by N., true, to the Rosario Channel, which is 5 leagues distant from Key Largo. On the very reef, and near the West point of Largo Key, there are two rocky keys, named the Ballemates, distant a league from each other, and they are of moderate height. In all the space comprehended between the Eastern head of the Jardinitillos and the Rosario Channel, the bank which extends along the South side of the keys does not reach further out than one or two miles. Its edge begins with 15 and 18 fathoms of water, on a rocky bottom, and the depth diminishes rapidly to the very reef itself.

JACK TAYLOR'S REEF.—This dangerous reef, on which there is less than 2 fathoms water, lies South, 9 miles distant from Largo Key, between which and the shoal there is deep water; it is placed on the charts on the authority of Lt. Holland, H.M.S. Pickle.

Rosario Key, the West end of which bears North, true, from the channel to which it gives name, forms a channel of 3 and 4 fathoms of water, with another key to the Westward of it, named Canities; but its outlet on to the interior bank, to the Westward of the Passage Keys, has not more than 10 feet of water. The opening or channel through the reef is a third of a mile in width, with a depth of 3 fathoms in the middle. It is steep at the sides, and at half a mile from its North part there is a rock, which shows above water. Vessels smuggling into Cuba generally enter and sail out by this passage.

From the Rosario Channel the reef trends S.W. 4 W., 10 miles; then W.N.W. ¾ W., 19 miles, to join the East point of the Isle of Pines. In this space are included the keys named Abalo, the Aguardientes, Campos, Matias, and many others which have no names. The outer edge of the bank is parallel to the reef, and generally extends out about 2 miles, excepting opposite of Abalo Key, where it runs out almost 3 miles, at about 7 miles to the South of the key. The least water on all this bank is 5 fathoms, on a rocky bottom, with some scattered spots of sand.

THE ISLE OF PINES, when first seen, appears mountainous or hilly, of a moderate height, and the tops of its mountains very sharp. From its East point the South coast trends S.W. ¼ S., for 5½ miles, with sandy beach, as far as a point, which may be easily known, being of high soborno rock, and having a detached rock (Farallon) very near it. From this point the coast continues, without any bank along it, for 7 miles, to another small point, which, with the former point, are the boundaries of the piece of coast denominated Playa Larga (or Long Beach.)

From the Western point of Playa Larga the coast continues W. and W. 5° N., true, for 8 leagues, to Cocodrillo, (or Crocodile Point,) which is the S.W. point of the island; and from the latter to the cove of the same name, is 3½ miles N.W. by W. In this cove fishing-vessels sometimes take shelter. The coast continues N.W. for 5½ miles, to Point Pedernales. All the ground between this and the West of Playa Larga is low and rocky, with shores of soborno rock, and may be coasted along at less than half a mile. From Pedernales Point the coast bends (forming a bay) N.W. by N., 2½ miles, to Key Frances, which is the Westernmost point of the island. Near the point is found the anchorage and watering-place of Puerto Frances. This small roadstead, the bank of which extends about half a mile, with a depth of 5 fathoms, sand, (and the shore is also a sandy beach,) is much frequented by vessels coming for timber, and affords shelter from winds of the N.E. and S.W. quarters.

Key Frances is separated from the coast by a small channel, and forms the West point of the deep Bay of Siguanea. From that point the coast trends to the S.E., for 5 leagues, all watery or swampy, and broken into keys; thence it turns to the N.E., up to the Lagoon of Siguanea, which lies at the foot of the hills of the same name, and has from 4 to 6 fathoms of water, but its entrance has not more than 9 feet; from it branches off a strip of water, which, in nearly an E. and W. direction, divides the island into two parts. At the foot of the hills of Siguanea there are two filters of excellent water, which, at a short distance from the beach, rise out of the land.

From the Lagoon of Siguanea, the coast trends N.W. by W. $\frac{1}{2}$ W., for 10 miles, to a small point which forms, to the West, the mouth of the Rio de los Indios, (Indian River,) whence the coast continues N.W. $7\frac{1}{2}$ miles, to Buenavista Point, which is the Northernmost point of the Bay of Siguanea, and is $10\frac{1}{2}$ miles N.N.E. from Key Frances. Siguanea Bay extends $17\frac{1}{2}$ miles N.W. and S.E., and has from 2 to $4\frac{1}{2}$ fathoms water, grassy bottom; but the passage between Key Frances and the Southernmost of the Indian Keys has not more than $3\frac{1}{2}$ fathoms, sandy and grassy bottom.

The Indian Keys, separated by small channels, extend themselves to the N.W. by W., 8 miles, from the Southernmost of them. The Southern extremity lies N. $\frac{1}{2}$ W. from the point of Key Frances, $9\frac{1}{2}$ miles distant, and $4\frac{1}{2}$ miles W. $\frac{1}{2}$ S. from Buenavista Point; in the channel between them and the latter, there are from 4 to 5 fathoms water, clay and grassy bottom.

From the Point of Buenavista the coast inclines to the Eastward as far as the Core of Barcos and the point of that name, which terminates it to the North, and lies 4 leagues N.E. by E. from the former. From the last point the coast trends N.N.E. $\frac{1}{2}$ E., to a short distance, and afterwards E.N.E., true, to the Northernmost part of the island, which lies $3\frac{1}{2}$ miles distant from Barcos Point. From the Northernmost point the coast continues E. $\frac{1}{2}$ N., $5\frac{1}{2}$ miles, to a small point which lies to the N.E. of, and close to, Nuevas River; thence it follows E. by S., true, about 5 miles, to the high hill, called Ojos del Agua. This hill or mountain is one of the highest in the island, scarped or precipitous on the North side; and close to are 3 fathoms water. Nearly in the middle, between this point and the former, is the mouth of the river of Casas, which rises at the foot of the hills of the same name; and which, together with Nuevas River, are the most frequented in the Isle of Pines by those carrying on traffic with Cuba.

In the same direction, from the mountain of Ojos de Agua, at the distance of 5 miles, is the hill of Vivigagua, also precipitous and of moderate height: from this hill the coast runs S.E. by E., $4\frac{1}{2}$ miles, to Salinas Point, and thence continues S.E. by E., $7\frac{1}{2}$ miles, to another point, to the North of the River Guayabo, and between the two disembogues the River of Santa Fe, which has excellent water. From the first a spit runs out, which, separating about 2 miles from the coast, joins it again at the river.

From the last point the coast winds to the Southward as far as the Eastern mouth of the Cienega. This part is named San Juan; and in the space is comprehended Mulatas Point and the River Guayabo, which disembogue close to the North of it. From the Eastern mouth of the Cienega, (which divides the island in two,) the coast trends S.E. to Piedra Point, which lies N. by W., true, from the East point of the Isle of Pines, distant 2 miles.

From the Bay of Siguanea to Nuevas River, the shore is all watery and covered with mangroves; and from this river to that of Santa Fe, it is firm land, continuing generally so, though with some watery places, as far as the East head of the island.

From the Bay of Siguanea, as far as the River Guayabo, the coast may be run along at 2 miles distance, in 3 and $3\frac{1}{2}$ fathoms water, on a clay and grassy bottom; but a passage further to the Eastward is prevented by the shallow bank which surrounds the Jardine Keys, and is here connected with the Isle of Pines.

Indian Keys,
&c.

INDIAN KEYS, &c.—From Key Frances the edge of the deep water follows nearly N.W., 11 miles, as far as the parallel of the Southernmost Indian Keys, and at 7 miles to the West of it; and continuing from thence to the Northward and N.W., so as to approximate the most Northerly of the Indian Keys, it then extends so as to pass about a league to the Southward of the Easternmost of the Keys of San Felipe, running parallel to those keys, as far as the middle of the chain; whence it turns them to within a mile, and continues along them at that distance, as far as the Westernmost key, on the parallel of which it runs off to join the main-land of Cuba, near Point Piedras. Generally, from Frances Key to the parallel of the Southernmost Indian Key, from 13 to 25 fathoms are found at the edge of the bank; from the last-named key to the meridian of the Easternmost of the San Felipe Keys, from 20 to 50 fathoms; to the Southward of these keys, as far as the Westernmost, 9 to 10 fathoms;

and forms the West trends to the S.E., for it turns to the N.E., all of the same name, not more than 9 feet; W. direction, divides Guana there are two beach, rise out of the

of the deep water follows hermost Indian Keys, and o the Northward and N.W. ys, it then extends so as to of the Keys of San Felipe, he chain; whence it nears istance, as far as the West- e main-land of Cuba, near el of the Southernmost In- of the bank; from the last- n Felipe Keys, from 30 to 30 eterminost, 9 to 10 fathoms;

and between it and the main-land of Cuba, about 26 fathoms, except in the proximity of the latter, where it shoalens to 7 or 8 fathoms. The bottom of the whole is rocky; and very soon after entering on the bank, the depth diminishes to 5, 4, and 3 fathoms, on sand. All these keys have sandy beaches towards the South.

This great bank, which we have now described from East to West, is studded with keys, which, with the coast, and among themselves, form the outer channels of Diego Perez, of the Rosari, of Siguanaca, and of Cortez; which afford a passage to Batavano, by the inner narrows of Don Christoval, Las Gordas, Monte Rey, and of La Hacha, all with a depth of 11 feet, except Monte Rey or Redonda Key Passage, which has 2 $\frac{1}{2}$ fathoms, on clay.

Remarks on Cape Antonio, the S.W. of Cuba, and the Isle of Pines.

At about 2 cables' length to the Northward of the pitch of the cape, you may, when the weather is moderate, land with your boats, picking out by the eye the best place among the rocks. At about 50 yards within the first trees or bushes, you will perceive a space of about 2 acres in extent, clear of wood. On the opposite side of that opening, where the wood again commences, and at about 10 or 15 yards into the wood, you will meet with very sharp coral rocks, among which are two wells, in cavities of the rocks, of about 7 feet deep. The water of the Northernmost well is excellent, that of the Southernmost not so good, but yet very palatable. There is a good rolling-way from them to the beach, but boating large casks off is attended with difficulty, from sharp rocks which lie under water.

There are plenty of excellent gray land-crabs at Cape Antonio, which are quite safe to eat, there being no manchineal trees hereabout; also plenty of pigeons and other birds, some of which are likewise excellent.

There is a fisherman's hut and a turtle crawl on the Southernmost part of the cape, at which you may, in the fishing-season, generally find a person to point out the wells; but what has been said will enable any person who looks carefully to find them, though you may be within 8 or 10 yards of them and not perceive them, without a good look-out. Men sent for water should always have their shoes on to protect their feet from the sharp rocks. There is abundance of sponge to be found at the cape, although it is by no means of first-rate quality. The fisherman's hut is one of the best marks for Cape Antonio, when coming from the Eastward. Off the cape, about 2 miles out, the current often sets very strong to the S.E. When the current sets thus, it is advisable for handy working vessels to keep pretty close inshore, by doing which they will avoid the strength of the current; this, however, is to be understood as applying only to vessels coming from the Eastward.

JARDINES.—In all the Jardines excellent fresh-water may be found by digging a few inches deep in the sand, at a very short distance from the sea, while in the Caycos de San Felipe, to the Westward of the Isle of Pines, no fresh water can be procured. On the Jardines are also plenty of thatch-trees. Some of the Spanish fishermen have remained six or seven days at a time on one of the Jardines, living upon the heart of the thatch-tree, and upon the water got by digging as before described.

Jardines.

The North-west Coast of Cuba, from Cape Antonio to Point Ycaeos and Mitancas.

Having already given the description of Cape Antonio, &c., from the Derrotero and the notes of Captain Livingston, we shall here only notice that the cape has since been described as a low sandy point, with a flag-staff upon it, and several hmts. From Cape Antonio the coast sweeps to the N.E., and thence to the E. and E.N.E., in a broken and variegated form, which can be best understood by reference to the chart. Without this coast, to the W., W.N.W., and N., is the extensive bank and reef called the Colorados, after described, which are naturally divided, and ought, therefore, to be distinguished by different names, that is to say, the Antonio Bank and Colorados.

Following the Colorados, to the East, are the banks and reefs of Isabella, which terminate at the entrance of the harbor called Bahia Honda, in longitude 83° 7'. A too near approach here is very dangerous, as the reefs are generally very steep, and the current from the gulf sets along them mostly from the N.W. to W. and S. W., whence it sweeps along the edge of the bank, near the shore, round Cape Antonio, and thence Eastward towards Cape Corrientes, &c.

The Derrotero says, that "between the bank (that of San Antonio) and the reefs and keys of the Colorados there is an interior passage for vessels of 11 or 12 feet draught, but much experience is required for taking it; and all vessels are recommended to pass outside, keeping well away from the edge of the reef, which is very steep to;

and near it a vessel may be entangled by eddies proceeding from the general current of the strait."

When you are abreast of Cape Antonio, you will perceive the discolored water on the bank, and should take care not to approach too near, particularly in light winds, the edge being steep to, with generally a current setting over it.

High-water.

It is high-water at Cape Antonio, on the full and change, about 9h. 33m., and the vertical rise is 18 inches. The flood sets to the Southward, (the flood, therefore, bends with a Southerly current; and thus it appears to continue Eastward, within the Isle of Pines, &c.) and the ebb Northward. The velocity is about three-quarters of a mile an hour.

From Cape Antonio, the bank, which appears of a whitish color, with only 10 or 12 feet water on it, trends North, by compass, about 8 miles, whence the edge turns gradually round to N. E. by N., and North-eastward, to lat. $22^{\circ} 8'$, with very uneven soundings, from 6 to 3 fathoms, rocks and sand. To the Eastward and Southward the soundings decrease from 6 fathoms very gradually to the shore, all fine sandy ground. The edge of the bank is clean all along, and steep to.

In proceeding from Cape Antonio to the Northward, there is a bank of 10 and 15 fathoms, and which is 12 miles N. N. W. $\frac{1}{2}$ W. from the cape. In the day-time you may safely take the passage between this shoal and the edge of the bank; but in the night, or in thick weather, it is better to make sure of passing outside of it.

It, when at Cape Antonio, the wind comes to the North, it will be best to maintain yourself to leeward of the cape, either on short boards, or by coming to anchor; because, with such a wind, in place of advancing on your passage, you would probably be caught in a gale or storm.

The Colorado Reefs and Keys are very extensive. The S. W. extremity lies in about $22^{\circ} 07' N.$, and $81^{\circ} 47' W.$ The whole are, in general, steep to. Of the principal rocks or keys, the Westernmost, or Black Key, shows itself above water like the hull of a ship, and may be seen 4 miles off; the other two, Colorados, or Red Keys, are not seen unless the weather be quite calm; they have not above 2 feet of water on them; and to the Westward no ground is to be found at a short distance, or less than a mile. The channel between is a half a mile wide. Between the Black and Red Keys is a depth of 4 fathoms, but very foul ground. Capt. Street, in his account of these rocks, gives the following detail: "We took our departure from 4 or 5 leagues, abreast of Cape Antonio, and made our way good N. E. by N., 15 leagues, and then fell upon the Colorados in 3 feet water. They were about me dry in several places, without any distinction of swells and breakers: we saw flocks of pelicans sitting upon the reddish white sand. In this place we could see no dry land from the topmast head, though very clear weather, but we saw to the East of us three hummocks on Cuba; the innermost, or biggest, bearing E. by N., so near us, that we could see other hummocks within and without these three, and low land trending away from the innermost hummocks to the Southward, and likewise the hummocks almost join with the low land between them. All this we could see on deck, or but two or three rattlings up; but the three aforesaid hummocks we raised upon deck, when we were about 10 or 11 leagues off our aforesaid station of 5 leagues to the Westward of Cape Antonio."

The highlands of Cuba are in many places particularly marked. The principal lands thus remarkable, in a regular succession from West to East, have been enumerated as follows: the Highlands of Buenavista, the Coxcomb,* the Saddle Hill, Dolphin Hill, Tables of Mariel, Maiden's Paps, to the Southward of the Havana, Iron Hills, to the Eastward of the Havana, and the Pan, or Loaf, or Hill of Matanzas, to the S. W. of the port of that name. Those noticed in the Derretero, are the Hills of Rosario,† the Gap of Yoldal, (we presume, the notch in the Coxcomb,) the Pan of Cayanas, or Dolphin Hill, the Tables of Mariel, the Tetras de Managua, or Maiden's Paps, the Sierra de Jarneo, or Western part of the Iron Hills, and the Pan of Matanzas. These are all points from which a ship's situation may be ascertained in clear weather: but it frequently happens, in hazy weather, that they cannot be seen from sea at 5 leagues off.

Bahia Honda.

Bahia Honda, &c.—The harbor called Bahia Honda, or Deep Bay, is situated at the Eastern end of that range of islands and reefs distinguished by the name of Isabella. Its entrance, according to the Spanish officers, is in latitude 23° , longitude $83^{\circ} 15'$. When you are before that entrance, it bears nearly South, but you cannot get in till the sea-breeze comes on, at about ten in the morning.

Bahia Honda is a spacious and well-sheltered harbor, but the points which form the entrance, as well as its interior points, are bordered with a reef and edge of shallow

* Mr. Finlaison says, "With the Coxcomb Mountain bearing S. $\frac{1}{2}$ E., you will be in longitude $84^{\circ} W.$ "

† Probably the highlands of Buenavista; for the charts of this port are yet inaccurate and contradictory.

water. The outer point, on the East or windward side, is named El Morillo, (Little Morro,) from its presenting a rising ground. From this a shoal extends two-thirds of a mile to the N.W., having, however, at its extremity, a depth of 5 fathoms. The outer point on the West, is Punta Pescadores, (Fisherman's Point,) from which a reef extends to the N.N.E. about one-third of a mile. The distance between the two points, which are nearly East and West, true, from each other, is about two-thirds of a mile; but the channel formed by the edges of the shoals is only a cable and a half in width.*

At a third of a mile within the exterior points are two others, Punta del Cayman, on the West, and Punta del Real, on the East; and between these the breadth of the channel does not exceed 2 cables' length. From Point Real the edge of the bank extends at the distance of two-thirds of a cable; but from Point Cayman not more than half a cable's length. At half a mile further in, the harbor opens, and you arrive off Punta del Carenero, which is on the Eastern side. At a third of a mile to the Southward of Point Carenero is an island, Key Larga, or Long Key, † the West point of which (Punta di Difuntos) lies a little more to the West than Point Carenero, and it may therefore be seen from the sea.

To enter this port it is requisite to keep at some distance from the coast, and outside the edges of the reefs, till you are N. $\frac{1}{2}$ W., from the mouth, when you may run for it. When near it, or at about the distance of a mile, you may perceive Point Difuntos; and placing your vessel most carefully to S. $\frac{1}{2}$ E., you may steer in that direction; as with that course, keeping Point Difuntos open, in the mid-channel, you will run in with sufficient water, 18 to 6 fathoms. When abreast of Point Carenero, you will see to the W.S.W. a long point on the West side of the harbor, named Punta de Mangles, or Mangrove Point. ‡ With this in sight, you may steer to the S.W., and when you have arrived on a line between it and Point Difuntos, you may anchor in 7 fathoms, clay; or, if more convenient, you may luff up to the South-eastward of Point Difuntos, and anchor in 6 fathoms, same ground. There is also anchorage to the Northward of Key Larga, between it and Punta del Carenero, in 6 or 7 fathoms, which may be found, after sailing in by the lead, along the reef on the Eastern side.

THE BAHIA BANK does not exist.

PUERTO DE CAVANAS.—This harbor lies rather more than 4 leagues to the Eastward of Bahia Honda. It has an extensive reef on each side of its entrance; yet it is a fine bay to sail into, having 5 and 6 fathoms at the entrance, deepening to 8 and 10 within, with room enough for several hundred sail of ships. The Derretero says, you may run along the coasts, between Bahia Honda and this place, at the distance of 2 miles. Puerto Cavanás is a good anchorage, sheltered from all winds, and fit for any class of vessels. It may be known by a round hill, which forms a gap or break, and upon the summit of which there is a grove of trees, and by another hill, named the Pan of Cavanás, (Dolphin Hill.) The latter descends gradually towards the East, until it ends in low level land, which continues for a long league, until it meets the table-land of Mariel. In addition to these marks you may see upon the coast two rows of hillocks, which resemble shepherds' huts, and from which the place has derived its name. These hillocks lie to the Eastward of Bahia Honda, and the Pan of Cavanás appears as if in the middle of them.

To enter this harbor, you ought to open the mouth well out, until you are on its meridian, and that of the East part of an island, (Isl. Larga,) which is within the harbor, on its West. Steer S. $\frac{1}{2}$ E. until past the reef of Punta Longa, on the East side, when you may luff up and anchor in from 7 to 9 fathoms. Be cautious, in advancing, not to touch on the reefs on either side; that to windward extends out more than half a mile, and that to leeward, about 2 cables' length. At the extremity of Punta Longa, the reef extends out only two-thirds of a cable; but the channel here is only 2 cables in breadth. Another reef extends the same distance, Northward from the Eastern point of Larga Island.

PUERTO DEL MARIEL, or PORT MARIEL, which is 4 $\frac{1}{2}$ leagues to the Eastward of Port Cavanás, is large, well sheltered, and fit for any class of vessels. You may know when you are to the North of it by the Tables of Mariel, which are moderately high, and form very broad table-lands or hills. On approaching these you will perceive various white patches. The coast hence trends to the Eastward towards Havana, and is very low. In proceeding towards the latter, you may desery the Paps of Managua, commonly called the Maiden's Paps, which are two round hillocks, lying on the meridian of the port. To the West of Mariel the coast is likewise low, for a long league, until it rises and forms the Hill of Cavanás. Further to the West

*Bahia Bank.
Puerto de
Cavanás.*

*Puerto del
Mariel.*

* In a late description of Bahia Honda, by a British officer, it is said that it may be known by a remarkable tower and a small hut on the Eastern side of the entrance, and a large plantation on a round hill just on the back of it, and two small hills about $\frac{1}{2}$ mile to the Westward of the West point of the entrance. † Wood Island of the Old English Charts.

‡ Long Point of the old charts.

may be distinguished other highlands in the vicinity of Bahu Honda, and which seem to rise from, or to be surrounded by the water.

To enter *Port Mariel*, you leave only to steer towards the Western extremity of the tables, and having recognized it, may run in, along the windward shore, at the distance of a cable's length. This will lead clear of the reef which borders the coast, and on which the sea breaks. Having the mouth of the harbor well open, steer towards a small rocky key, off the leeward point, and as soon as you are within two-thirds of a cable from it, steer S. 4 E., when the leeward point of the interior part of the entrance has the same bearing. Continue this course until you pass the round tower, which you will see on the windward side. You may then huff to port, so as to maintain yourself at a cable's length from the Eastern shore, and you may anchor upon it where you please, in 8 or 10 fathoms water. If more agreeable, you may run into the interior of the harbor, for which a reference to the plan of the harbor will be a sufficient guide. We only add, that as the narrowest part of the entrance is only 50 yards wide, it is requisite to be very cautious on entering with a large vessel.

It sometimes happens that strangers mistake the land to the Westward, and about Bahu Honda, for the table land of Mariel; but it is to be observed that the latter is not so high, and is more regular than any land near, or to the Westward of Bahu Honda.

The Mona Passage

THE MONA PASSAGE.—The channel called the Mona Passage, between Porto Rico and Hayti, is 28 leagues in breadth, and generally clear and safe, with the exception of shoals in the vicinity of the coasts of the two islands. On the N. E. side, the land of Porto Rico is low, to the Westward of the harbor of Arreebo, until it reaches Punta de Pena Aguerenda, (or Point of the Holled Rock,) where a kind of cherty high land begins, which trends S. W. rather more than a mile, to Point Benguen, the North westernmost point of Porto Rico. The coast again declines in height, and forms a convex bow to Punta de Penas Blancas, (Whitestone Point,) the North point of Aguadilla Bay.

The winds are generally light in this passage, and but little current. The Island of Zacheo, bearing W. by N. 4 N., 11 miles, from Aguadilla Bay, may be seen on a clear day from any part of it. It is high and very bold. Off the North and South ends there are a few rocks, but close to the shore it is covered with small brushwood, and the landing place is on the South side.

Zacheo or Zacheo

DESECHO, or ZACHEO.—This little island, nearly covered with trees, stands like a beacon in the ocean, at the distance of 114 miles W. 1 N. from Point St. Francisco, or Porto Rico. It appears like a green mountain, 800 or 1000 yards broad at the base, and is so high as to be seen at 12 leagues off. The coast is generally clean, and there is no danger but what may be seen.

Report of the *Master of the U. S. Ship Macedonian, for the month of April, 1845*—In the Mona Passage met with a current of 1 knot, setting nearly North; about lat. 28° N., long. 71° W., a current of 4 mile, running W. 23d instant, lat. 35° 15' N., long. 72° W., entered the Gulf Stream; left it in lat. 37° 32' N., long. 72° 05' W., 4 found the direction of this current to be about N. E. by N., 2 knots per hour; the highest temperature of which was 77°, the mean 76°, being 1° warmer than the water immediately bordering it.

Mona and Monto and

MONA AND MONTO.—These isles lie nearly in the middle of the Mona Passage towards the South.

MONA ISLAND.—This island is nearly level, and of moderate height. We could not see it further than 18 miles on a clear day. Its North east, South east, and South west sides are bounded by a reef a quarter of a mile off shore. At the distance of 13 miles, we ran along these sides, but saw no other danger than a reef which extends 13 mile off the South point.

The S. W. point (to the Northward of which is the anchorage) is sand, long and low with brushwood and small trees on it. There is a reef off this point, about a quarter of a mile in length, to the Westward.

There is anchorage here with the sandy point bearing S. by W. one mile and a half. Island of Monto, N. 4 E.; N. W. Point of Mona, (high, and bluff) N. E. 4 N.

We came to our anchorage from the Northward, passing Monto to the Westward within 6 miles, but had no soundings; neither could we see broken water, or any danger between it and Mona. This island is the resort of innumerable quantities of boobies; its sides are very white, and are inaccessible. Our anchorage was off the sandy bay formed by the S. W. point, (bearing as above mentioned,) sandy bottom; thus, the N. W. side, is also bounded by a reef, about 3 cables' length from shore; the passage through it is nearly in the centre of the bay, but it is narrow, and a boat must pick her way through. The soundings are very regular; we found 1 fathom close to the reef; and there would be no danger in anchoring within a quarter of a mile of it, bearing in mind it is open to all Westerly and from South to South-east winds.

HAYTI, OR SAINT DOMINGO.

The principal towns are, the city of Cape Haytien, formerly Cape François, in the N.W., the city of St. Domingo, in the S.E., Port au Prince, Leoganne, and the Isle of St. Nicholas, in the West.

Hayti, or Saint Domingo, from Punta Espada to Petit Trou.

PUNTA ESPADA is too remarkable in its outlines to be mistaken. It lies about 10 miles from the East point of the island of Saona. Punta Enguano, the true East point of the island of Hayti, is a low point stretching shapely to the Eastward.

PUNTA CANA. The first anchoring place to the South of Cape Enguano, is Punta Punta Cana, in lat. 18° 30' N., and long. 68° 23' W. The shore is skirted by a reef, which obliges the vessels that have to take in cargo at this place to lie according to size from one to one and a half sea miles from the shore. The reef affords passages for the boats to take off the cargo from the beach, which is sandy.

The tides are not always of equal strength, running sometimes 6 hours to the S.W. and 6 hours to the N.E.; at other periods the ebb tides are stronger than the flood tides, and if such a case occurs, the North easterly tide runs even with greater velocity than the South westerly.

Vessels, excepting small ships that draw no more than 6 feet are obliged to come to an anchor outside of the reef. A vessel of from 300 to 400 tons, would not be safe closer than a mile and a half from the land. There are two breaks in the reef, which are used for taking the wood from the shore on board. They have 6 and 6½ feet water; it is, however, requisite to use caution with the launch, as the passages are narrow, and much impeded inside by beds of coral rocks. The swell or ground sea is sometimes very severe along this coast, and a stiff Northerly wind renders all communication with the shore impossible. The months from May to October are the best qualified for loading here. The breeze is generally at that time to the South of East, and calms prevail more than at any other period.

PUNFAXAI, and GUAYACANES. These landing places are a few leagues further North than Punta Espada, and the remarks made with regard to Punta Cana apply equally to Punfaxai and Guayacanes. There are some ranchos or huts on the beach, inhabited by the laborers of the adjacent mahogany cuts. Punfaxai is about 3 sea miles South of Punta Cana.

BOCA YUMA, or HIGUEY. The anchorage is good but exposed to the breezes, near the windward point of the river, in 12 fathoms water. A bar, which affords only from 8½ to 9 feet water, prevents large vessels from entering the river. Within the bar there are 12 feet water. The anchorage is well protected, but small in extent. Fresh water may be procured by ascending the river to the Derumbadero. This can only be done in a small boat.

CABO FALSO. The anchorage between Cabo Falso and Punta Yuma is good, but vessels may lie close in, in from 9 to 12 fathoms. The ship is, however, exposed to the North easterly winds. It must likewise be observed, that the tides run with great velocity, chiefly near Punta Cheyita, where it races with a velocity of from 1 to 2 knots.

Punta Yuma lies in lat. 18° 22' 16" N., and long. 68° 37' 36" W. From this determination I have deduced the position of Cabo Falso as in lat. 18° 20' 16" N., and long. 68° 35' 21" W.

The land of Cabo Falso rises in mural precipices of coralline limestone from 150 to 20 feet. The false cape is the projecting Southern point of this elevation, and presents, as seen from the North, the profile of a grotesque head.

GRANCHERA. This landing place ought never to be included in a charter party, as situated about 3 miles to the S.W. of Cabo Falso. The vessel cannot approach within several miles, and has to anchor to the lee of the reef that stretches from Granchera towards that islet. Such a heavy sea prevails usually along the shore, that weeks may elapse before the launch can take off a boat.

PUNTA MARTEL. The same remarks refer to Punta Martel.

SAONA. This small island extends from its Eastern point about 16 miles N. 70° S. It has a projecting Southern point, and is at its widest part from South to North about 5 miles across. Between it and the main lies the islet of Catalinita, bearing on the rocky North eastern point of Saona N. 50° W., distant 5½ miles. A large horse-shoe reef extends from Catalinita towards Saona, affording, however, between the North coast of the latter, and the South eastern extent of the reef, a fine channel, with

6 fathoms water. When the reef has been cleared, the vessel ought to keep North-westerly, to avoid a shallow that runs from Saona, and anchor in 5 fathoms water, Catalinita bearing N. by E.

Small vessels may pass through the channel between Saona and the main coast of Saint Domingo; at its Eastern outlet, however, are mud-banks, with only 7 feet water over them.

Catalinita.

CATALINITA.—When keeping for the anchorage of Catalinita, you may make bold with the Northern shore of Saona until the Horse-shoe is cleared. The anchorage is well protected, and the bottom clear and sandy. The currents sweep with great force towards the N.W.

The North-eastern point of Saona is bold, consisting of high cliffs; but its South-eastern point is low; and there is a reef to the South-eastward which breaks near the shore, and extends nearly 3 miles, with only 4 and 5 fathoms over it. The reef keeps this depth until within a mile of the low South-eastern point of Saona. Large vessels coming from the East, ought not to approach the shore within 4 miles, until the extreme Southern point is cleared.

There is a good anchorage about 3 miles to the West of the South-eastern point, in front of a sandy beach, called Bahia Cabello; but at about 1½ to 2 miles to the South of the bay, where the sandy beach ends and the shore becomes rocky, lies a dangerous shoal.* The shallowest part has only 6 feet, with the water breaking upon it during a heavy sea. A quarter of a mile to the N.N.W. of it, is another dangerous shoal, with from 9 feet to 3 fathoms water. There is a good pass between it and the Eastern shoal. Vessels frequent occasionally Bahia Cabello for the sake of fire-wood and fresh water.

The opening or Western entrance to the channel of Catalinita, between Saona and the main coast, is called Boca del Catujano. As already observed, it has only 7 feet water at its shallowest part, being narrowed in by mud-banks and coral rocks.

It ought likewise to be noted, that a reef stretches from the Western point of Saona towards the main shore, which must be guarded against should a vessel on bearing up keep the shore. The late Captain Lawrence, of H. M.'s surveying vessel Scorpion, determined the position of the sandy beach (Cascon) a little to the South of the two Western points, as in latitude $18^{\circ} 10' 18''$ N., and long. $68^{\circ} 46' 53''$ W., the latter relative to St. Thomas, taken as in long. $64^{\circ} 55' 40.5''$ W.

Boca de Quiabon.

BOCA DE QUIABON.—This is an open roadstead with good anchoring ground. Large vessels anchor in from 8 to 9 fathoms water; the mark for the anchorage is, to keep the point Las Minas in one with Point Aguila, that forms the Eastern point of La Romana, and to bring the two cocoa-nut trees on the shore, in front of the largest house in the small village, to bear North. The bottom shallows very gradually, and at the distance of 3 cables' length from the shore, there is still a depth of 3 fathoms. The ground to the windward of the mark just given is rocky, and there is likewise said to be a shoal with only 13 feet water on it.

The mouth of the River Quiabon is impeded by a bar, which affords only from 2½ to 3 feet water; and that small depth is sometimes reduced to half a foot during dry weather, while freshes, on the other hand, deepen and widen the entrance. The mouth of the river is sometimes entirely blocked up by sand-banks. Formerly, vessels that drew 12 feet could go up the river as far as the Malena, at that period a well-cultivated estate, for the purpose of loading wood or produce. The river is now much impeded; boats nevertheless manage to ascend the Quiabon to the small village Gavi, which may be called the port of the town of Higüey. It lies on the left bank, and is following the course of the river, 5 miles from the mouth.

The village of Quiabon consists merely of a number of huios or small bars, built of wood and covered with palm-leaves. It suffers from want of fresh water. At present the inhabitants either use brackish water, or they send up the river. The tide rises seldom more than 22 inches or 2 feet, hence the sea does not extend far up the river. The weather point or Punta Barlovento is in lat. $18^{\circ} 24' 26''$ N., and long. $65^{\circ} 23' 11''$ W.

Bayahibe.

BAYAHIBE.—Two miles and a half E.S.E. from Punta Barlovento, near Quiabon lies Bayahibe, where recently vessels have commenced to load wood. It is considered a better anchorage than Quiabon. The sea is smoother, as Saona and the projecting point of Las Palmillas protect the anchorage. Vessels lie in from 6 to 7 fathoms, distant about one mile from the shore, sandy bottom.

* I have already drawn attention to the strong currents to the South of Porto R. and St. Domingo. The master of the bark Alert considered himself, on the 6th of August 1825, at 6h. p. m., about 35 miles to the S.S.W. of the East end of Saona. Shortly after 10 o'clock in the evening, the vessel struck on the above shoal.

na. Shortly after 10 o'clock

GUARAGUAO and LAS PALMILLAS.—S. E. ½ E., nearly 8 miles from the Punta *Guaraguao*
Barlovento, near Quiabon, lies the anchoring-place of Guaraguao; and some miles *and Las*
further to the East, is Point Las Palmillas, from whence to the North-western shore *Palmillas*,
of Saona it is only 3 miles. The reefs that extend from the North-western point of
Saona, have already been mentioned, and may prove dangerous to a vessel that has to
proceed from Las Palmillas to a port or anchorage to the East of it. Guaraguao and
Las Palmillas are seldom included in a charter-party.

LAS MINAS and BURGADO.—About half a mile to the West of the anchorage *Las Minas*
at Quiabon, is the loading-place of Las Minas; and somewhat further downwards, El *and Burgado*
Burgado. Las Minas is a sheltered place for small vessels; but those of larger bur-
den must lie in 20 fathoms, and masters frequently prefer to remain with their vessel
at the anchorage of Quiabon, and to send the launch for the wood to Las Minas and
Burgado.

CALETON.—This loading-place, to the East of Punta Agnila, offers scarcely a *Caleton*.
good anchorage. The tides sweep with great strength, and render it laborious, when
wind and tides are contrary, to reach the ship at anchor.

BOCA DE LA ROMANA.—The River Romana affords within a short distance *Boca de la*
from its mouth one of the best sheltered ports on the South coast of the island. The *Romana*.
entrance is narrow, (it being not quite a cable's length from point to point.) and 31
fathoms from the lee point there is a small shoal, with only 3½ to 4 feet water on its
shallowest part.

On entering the river, which must be with a leading breeze, and having reduced
your soundings to 9 or 10 fathoms, keep the two *inner* points of the river (the first or
Western of which is then about 600 fathoms, the second or Eastern 800 fathoms dis-
tant, bearing N. 17½° W.) about 14 degree open of each other; the two inner points
being *in one* is a mark for the shoal. Continue that course until you are abreast of
the weather point, remembering that there is a reef a little to the East of that point.
Having entered the river, you will observe two rocks, from 6 to 10 feet above water,
on your starboard. Keep the lee bank a little closer than the weather bank, and pro-
ceed up the river until you near the inner lee-point. Keeping now the Northern rock
you noticed on entering the river on your starboard, looking over your stern in one
with the weather point at the mouth, come to anchor in 5 fathoms. You will then
notice two rocks a little South of the inner lee-point, around one of which you may
make fast,* and if you do not wish the vessel to swing to the tides, do the same round
a rock on the Eastern bank. Small vessels anchor round the inner lee-point in 10 or
11 feet water. A short distance to the North of this anchorage is a shallow with only
6 feet water.

I need scarcely observe, the river being so narrow, and not permitting any room for
working a ship, the vessel ought to take her departure only with a land breeze suffi-
ciently strong to give her headway. The two dangers against which she has to guard,
are the sunken rock off the lee point, and the weather reef. The River Romana has
broken through the hills of coralline limestone; they frequently approach the shore
in perpendicular walls. Small sailing-vessels may ascend for nearly 2 miles from the
mouth, but they require a pilot. Boats frequently get as high up as the Derumbade-
nos, and even to the rapid, for fresh water. There are no difficulties for boats until
coming to the little island, where a shelf of rocks shallows the river to 2½ feet during
its mean stand, and to only one foot on approaching the rapid. The river falls here
over a shelf of rocks, so that the boat may almost lie under it and permit the water
to run into the casks.

The small village La Romana lies on the hills above the river on its right or West-
ern bank; the ascent is steep, and very inconvenient. The commandant has his
residence on the left bank, opposite the village. The position of this place was, ac-
cording to my observations, in lat. 18° 27' 32" N., and long. 68° 58' 37" W. † from
which determination I have deduced the position of the left or weather point of the
mouth of the river La Romana, as in lat. 18° 25' 10" N., and long. 68° 58' 20" W.,
but as the distance from any point of observation to the mouth of the river has not
been trigonometrically ascertained, this determination may deviate somewhat from
the truth.

SANTA CATALINA.—The island of Santa Catalina, or merely Catalina, lies *Santa Ca-*
about 2 miles off the Southern coast, between the mouths of the rivers Cumayasa *alina*.
and La Romana. The channel between the main of the principal island and the islet
trends East and West, and affords a passage to the largest vessel by keeping the
main-lead close on board. There is a good anchorage in 3½ fathoms on the North-

* I have given to these rocks the name of the Mooring Rocks.

† The Astronid gave for the height of the place above the river 180 feet.

western part of Catalina, near a bay where the vessel is protected by the two jutting points of the island. The North-western point has a reef, on which the water breaks to warn against the danger.

Boya de Cumaysa.

BOYA DE CUMAYSA.—I have not examined the mouth of this river, which it is well known affords us good anchorage as La Romana, with the preference that the entrance is not endangered by a shoal. Mr. Lundstrom, master of the Swedish bark *Jenny Lind*, has communicated to me the sketch of the entrance, with the following particulars:—"The anchorage for vessels that require more than 18 feet, is about $1\frac{1}{2}$ cable's length from the entrance, on the river's Eastern bank. There is a rock above water, near which the vessel may anchor. The bank of the river forms on the left, or Eastern side, two small coves, and has much more the appearance of an inlet of the sea than the mouth of the river.* Large vessels may anchor in 4 fathoms, a little South of the small cove.

"On ascending the river, a large mud-flat extends from the first point on its left or Eastern bank. There is a channel close on the right bank, with only from 6 to 8 feet water. Small craft that draw no more than 6 feet pass over it, and may ascend to the rocks of San Pedro, about $1\frac{1}{2}$ mile from the entrance. Higher up there are three islands, beyond which the river gets quite narrow, and is only passable for boats up to the Derimbadero of San Juan, $3\frac{1}{2}$ miles from the entrance."

Fresh water is somewhat higher up than San Juan, where the river forms a basin called Agua Dulce, but the boats cannot approach within a couple of hundred yards.

The River Soco.

THE RIVER SOCO, although one of the largest that flows from the mountains to the Eastern part Southward to the sea, is unfortunately impeded by a bar and surrounded in by sand-banks, covered with drift wood, so that only boats can enter the fine basin that extends beyond the bar. Vessels of 300 tons have to anchor in 5 fathoms, distant about 3 miles from the shore, the mouth of the river bearing N. by E. or N.N.E.; smaller ones may lie in 3 or 4 fathoms. The anchorage is naturally open to the winds, and receives scarcely any protection from Point Mortero, which bears from the mouth of the river S. by E.

The embarcadero or loading-place is about a cable's length from the mouth, on the river's right or Western bank, and has deep water close in. According to my observations the house of Dona Felipe Morales is in lat. $18^{\circ} 27' 46''$ N., and long. $69^{\circ} 12' 41''$ W. The mouth of the river bears from here S. by E., distant about 2 cable's length.

The Port of Macoris.

THE PORT OF MACORIS.—The bay, with the exception of the channel which the river has pathed itself, is a mud-flat. An islet, with a reef extending North-eastward, protects the anchorage. The channel affords here only 18 feet water, and shoals to 15 and 14 feet as soon as the South passage point is abreast. Between this point and the North passage point, lies, about half a cable's length from the former, a dangerous shoal, with only from 6 to 7 feet water on it. The mark for this shoal is the North passage point on with the second cocoa-nut tree, near the commandant's house.

If the draught of your vessel permits it, and you have cleared the outer reef on entering the harbor, keep your course for Mr. Peek's house at the North-western light of the bay, until you have fairly opened the small sandy beach Playa Peter. The soundings give you then 12 feet. Steer for the Playa until you are abreast of the North passage point, keeping the shore on board, and go in $11\frac{1}{2}$ feet water. This anchorage can only be used by small vessels, as at a short distance to the North-west from the North passage point the water shoals to $7\frac{1}{2}$ and 6 feet. The rise of tide is scarcely 4 feet. Schooners and sloops requiring no more than 10 feet water, may anchor in front of the village, and ascend the river for some distance. The anchorage can only be left with a good land-breeze, and it ought to be noted that the current sets towards the shoal. The South passage point and Playa Muerto being in one, it is a mistake, on leaving the bay, that you are free of the Edward's Shoal, and you may then take a South-eastern course until the reef of the Isleta is astern.

There are two small villages on the shores of the bay. The larger lies on the left or Eastern shore, and bears in common parlance the name of Mosquito y Sol. The village belongs to the district of Seybo, and surpasses in the number of houses and inhabitants La Punta, the village on the projecting right or Western point of the bay, which belongs to the jurisdiction of Los Llanos. The situation of the latter is much healthier, and the prospect more open, but even small sloops cannot come close to it in consequence of the mud-flat. My observations give me for the projecting point of La Punta, lat. $18^{\circ} 27' 0''$ N., long. $69^{\circ} 19' 17''$ W.; according to which Punta Muerto would be in lat. $18^{\circ} 25' 50''$ N., and long. $69^{\circ} 19' 25''$ W. There is no fresh water to either village that can be recommended, except it be procured by ascending the river for about 2 miles.

* This supposition is perfectly correct, from what I have seen of Cumaysa at a distance of 2 miles from its mouth.

GUAYACANES.—About 8 or 9 miles to the West of Macoris is the anchorage of *Guayacanes*; it is an open roadstead, with a reef inside of it. The anchorage is from 1 mile to 1½ mile off the land, in 8 to 9 fathoms, entirely exposed, but the bottom is sandy and holds well. The boats, in order to take off the cargo, have to pass the reef. There are a few inhabitants settled at the beach.

JUAN D'OLIO is equally exposed as the preceding, and the anchorage is about the same distance from the land. There are likewise some houses on the shore.

MAGDALENA forms the Easternmost, and Caucedo the Westernmost point of the Bay of Andres. It is an open and bad anchorage, and vessels prefer to lie in *Agua del Rey*, 4 miles further inside the bay, sending their boats to Magdalena for the wood they have to take off there.

AGUA DEL REY, on the Eastern shore of the Bay of Andres, affords the best anchorage within that expanse of water. Vessels of 300 tons may lie in 5 fathoms, being protected against the East and South-east wind by Magdalena Point. The beach is good for loading; it must, however, be noted that the swell sets in with great force, in consequence of the bay being so large and open to the sea.

PLAYA DE ANDRES.—The anchorage is from 2 to 3 miles from the land; there is a large reef, with breakers inside, which affords a passage 9 feet in depth. The Playa de Andres is famed for the prodigious and almost incredible number of pigeons that between the months of May and October come to roost there; their numbers are so large that they may be knocked down with sticks.

PUNTA CAUCEDO.—There is a Derumbadero near Punta Caucedo, only approachable for boats; large vessels must lie off and on to take in cargo from here.

LA CALETA, to the North-west of Punta Caucedo, though small is a very good port, where the vessel at anchor is protected against South-easterly winds. There are no dangers, and the vessel may select her anchorage from 3 to 7 fathoms. The expanse of the bay is small, and affords only place to a few ships; the landing is good.

ST. DOMINGO LIGHT is on the West side of the entrance S. 41° W., 617 yards distant from the signal-tower of the Fort. It is a fixed light, 113 feet above the sea, lat. 18° 28' 05" N., long. 69° 52' 30" W.

In running for this light from the Eastward, after doubling Punta Caucedo, give Punta Toreillo a berth, as there is a reef running from it to the S.W., on which, when there is any sea, it breaks.

The port is formed by the River Ozamo, where it enters the sea. There is a bar at its mouth with only 13 feet water. After passing the same, there are from 16 to 19 feet water for more than 3 miles up the river. Large vessels are therefore prevented from entering this port, otherwise so commodious and secure; for a vessel can lie so close to the shore, that she discharges her cargo by means of planks.

The bar extends from East to West; it is larger on the left than on the right bank, and ends in a narrow strip close to the rocky point, on the right or Western bank, somewhat South of the signal-tower.

The tide rises seldom to more than 20 inches, and the current sweeps with great strength through the mouth. It prevents the vessel from obeying the helm when not covered by a fair land-breeze, and has in several instances caused the ship to touch. The same danger threatens vessels on entering the river. It should not be attempted, under any circumstances, to enter the port without a pilot on board, and a good breeze to fill the sails.

Large vessels anchor in the roads, in from 8 to 12 fathoms water, distant about a mile from the shore. They are here exposed to the South wind, and the heavy swell of the sea. The anchorage consists of good holding ground; but should a misfortune befall the vessel, she would be sure to be smashed to pieces against the steep rocks that form the shore at this part of the coast. If the weather has a threatening appearance, chiefly during the hurricane months, all preparations should be made to be able to slip and stand out to sea.

The bank of anchoring-ground off St. Domingo is very steep, and for the first few fathoms irregular, 10, 15, 10, 8. After that, the soundings decrease gradually towards the shore. In coming in, give the East point a berth of two cables' length, to avoid a rocky reef with 2½ fathoms on it, which stretches off to that distance. This danger will show itself by the breakers when there is any swell.

If bound inside, keep a square white house, on the East bank of the river, twice its breadth open of the West point, on which stands the signal-tower. Keep this mark till you are within 2 cables' length of the West point; you will then discern a low sandy spit,* running off from the Eastern side; steer directly for it and pass it close; there is no danger, as there are 16 feet at a distance of 10 feet from it; but on the

* This spit has greatly changed in appearance since the severe gale in August, 1851, when it was nearly swept away. There is still the depth of water above expressed.

other side is a sunken rock with only 2 feet on it. With the marks given above, you will carry 13 feet over the bar, and after passing the sandy spit you will have from 16 to 19 feet 3 miles up the river.

If intending to anchor outside, do not shut in the houses on the East side of the river at all, but anchor with them rather open; the East point bearing N. E. by E. in 8 fathoms, sand and mud. With the houses open, the bank extends off rather more than one nautic mile from the shore, narrowing considerably to the Westward. The bottom also becomes rocky and uneven, when the houses on the Eastern bank become shut in by the West point. The best anchorage is decidedly when they are well open.

The Port Regulations are as follows:—

Art. 1. Every master of a vessel entering from abroad shall remit to the pilot who comes on board all the letters and newspapers intended for this port, excepting the consignee's letters. It remains at the option of the master to take the pilot or not, in order to anchor his vessel in the roadstead, or to bring her into port.

Art. 2. When the health officer visits the vessel, the master will deliver the requisite bill of health, and will muster the whole of his crew and passengers.

Art. 3. After the vessel has anchored, the officers of the custom-house will come on board, to whom the master shall give up the register of the vessel and the manifest of his whole cargo; he shall afford them every facility to affix the seals, and shall allow one of their number to remain on board until the vessel has finished discharging.

Art. 4. The pilot will bring the vessel, whether with cargo or in ballast, to anchor at the proper place for its discharge, and in no instance can the vessel change place without the previous authorization of the commandant of the port.

Art. 5. The throwing overboard of ballast is prohibited to all masters of vessels, as well in the port as in the roadstead; they have to address themselves to the captain of the port in case of such a necessity, who will assign to them the proper place for its discharge.

Art. 6. In order to obtain a coast-pilot, and the necessary laborers for a vessel which is to load on the coast, the master, accompanied by his consignee, will address himself to the commandant of the port to assign them to him, and to see that a contract and advances may be made to them in his presence.

Art. 7. When the commandant of the port passes his visit, previous to the departure of the vessel, the master shall produce the passports of such passengers as might be on board, and he shall likewise deliver the fort-pass to the guard-ship before it makes sail.

To the West of the city is

Boca de Zaina.

BOCA DE ZAÏNA.—The anchorage is entirely exposed and foul; vessels are obliged to lie off at a great distance, and the swell being at all times very heavy, and Northerly winds are the only period that loads can be taken off. It ought not to be included in charter-parties.

Boca Nigua.

BOCA NIGUA.—Although vessels take frequently a part of their cargo in this place, it is considered to be one of the most difficult loading-places on the South coast of Saint Domingo. The anchorage seems to be merely on a bank, with a difference in soundings of 12 to 13 fathoms by the vessel swinging to the tides or currents. A strong breeze and current forces the sea with such violence into the anchorage, that it rises from 12 to 15 feet. It is only safe to load here when the wind is from the North. The banks on shore are so steep, that such wood as lignumvite can be taken at once in the boat from the rocks above. A gale from any other point than North would inevitably cause the loss of a vessel lying at anchor at Boca Nigua. The climate of the river is considered very unhealthy; indeed it is only with reluctance resorted to as a loading-place. There is a small village a short distance from the mouth, and fresh water may be procured a quarter of a mile up the river; the water is not considered healthy.

Boca de Najallo.

BOCA DE NAJALLO.—The bight which the river forms at its mouth is somewhat more than a mile in extent, but the anchorage is as objectionable as that of the Nigua, with the difference that the landing is better than the former. The vessel lies about three-quarters of a mile from the land.

Palenque.

PALENQUE.—This is the next port to the West. It would be a most desirable anchorage did the port afford more space; the vessels lie in 4 fathoms water, great bottom, and well sheltered; the water is so deep, that close to the beach there are 6 fathoms. A South wind would prevent a vessel from leaving the port, but she escapes out with the usual trade-winds. A reef which stretches from the windward point S. and N.W., ought to be guarded against.

Boca de Nizao.

BOCA DE NIZAO.—To the West of Puerto Nizao is an open roadstead where vessels frequently take wood on board. The ground shallows gradually, and vessels of from 250 to 300 tons have to lie in from 7 to 9 fathoms water, at a distance

of 14 to 2 miles from the mouth of the river. Smaller vessels may anchor in 4 fathoms, but it must be recollected that the sea breaks often a great distance from the shore.

This anchorage is no more dangerous than other open roadsteads along the coast; indeed more vessels load here than at Bani and the other Southern anchoring places.

The tide runs frequently with a strength of from 4 to 5 knots, and renders the loading of the vessels somewhat tedious. It is next to an impossibility for a boat to enter the river; the current sweeps out with a very great force. On proceeding, therefore, from on board to the place where the rafts of wood are to be made up, it is better to land the people at Palenque, and to let them walk over land to Nizao. With regard to these local arrangements, however, and the manner in which the raft of wood is to be got on board, it is best to trust to the orders of the pilot, and to the laborers acquainted with the management.

The water of the river is good, and may be procured fresh a quarter of a mile from the mouth. There is at a short distance from the shore a small village.

PUERTO VIEJO.—On entering from leeward keep close to a remarkable white cliff, which forms the South western point of the great entrance, and where there are 9, 8, 7, 5 fathoms water, until you have passed that point. The passage to the inner port or Boca Corillo is between this point and a reef which lies nearly West from the great entrance. Keep the mid channel between the Northern lofty shore and the South side of this reef. The water shallows gradually to 3 fathoms. Let go your anchor at 4 fathoms, the reef bearing North.

The Eastern anchorage is exposed to the South east wind. You may anchor in 3 fathoms, South of the loading place, the high mountain Martin Garcia bearing South west.

PUNTA CATALINA is not much frequented as a loading place. There is no anchorage on the East part, but on the Western small vessels may anchor in 3 fathoms. To the South of Punta Catalina, distant one mile, is a shoal, with only 12 feet water over it, which ought to be guarded against when beating up the coast. Punta Palenque forms the Eastern point, and Punta Catalina the Western, of a large bight which contains Boca Nizao and Puerto Viejo as loading places in that extent of the coast.

SAVANA.—About 3 or 4 miles West of Punta Catalina is Savana, where large vessels may anchor with safety in from 5 to 6 fathoms; the anchorage is good, but to the windward only protected by Punta Catalina, which bears about E. S. E.

PAYA is an open roadstead, shallowing very gradually, so that a vessel of 200 to 300 tons has to lie at a distance of from 2½ to 3 miles. It is much frequented as a loading place.

AQUA DE LA ESTANCIA.—It is the anchoring place of the village Bani, and is, like the former, an open roadstead. The vessels have to lie at anchor at the same distance, but it is good holding ground, consisting of mud and weeds, with sand.

ESTANCIA COLORADA.—Somewhat further to the Westward is La Estancia, to which the same remarks refer that have been made with regard to the previous place.

LA SALINA.—The soundings are from 15 to 18 fathoms, at a distance of a cable's length from the shore. Two mountain cabbage trees kept in a line with a large sea-side grape-tree, bearing then between E. and E. by N., are a mark for a good anchorage. Small vessels anchor in 5 fathoms, with a lawser ashore, for fear the anchors might not hold. The depth increases so suddenly, that with 5 fathoms forward, the vessel will probably have from 18 to 20 fathoms over the stern.

LA CALDERA.—This is one of the finest ports on the South coast; a vessel may here anchor in from 15 to 3 fathoms water, as it best may suit her.

PLAYA VIEJA.—Outside of La Caldera, about N. by E. from La Salina, is Playa Vieja, affording a good anchorage under the hills of Ocoa. The bottom is so clear that it may be seen in 6 fathoms water. Three or four hedges of mango-trees, that are visible at a great distance, are a good mark for this anchorage.

OCOA.—This beautiful bay affords an excellent and well protected port near the mouth of the river of that name. You may anchor close in on either side of the river, but the Northern is preferable. A whole fleet may anchor here in safety.

CARACOLAS.—At the bight of the bay of Ocoa, you have to anchor at the distance of ½ mile from the shore, in 5 or 6 fathoms of water. The landing is good, but the large bay is sometimes subjected to a heavy swell when the breeze is Southerly.

AZUA, OR TORTUGUERO.—The sea sets into this anchorage with great force. When the breeze rises, the vessels labor much, and the boats seldom can go off with wood to the ship after 11 o'clock in the morning. There is no room for working a vessel in the bay. On the Western point is a reef, and near the East point is broken

Caracolas

Azua, or Tortuguero

Puerto Viejo de Azua, The Bay of Neyba, or Juliana.

ground. Vessels leave the bay with the land breeze. Tortuguero is the port of Azua, and is considered to be a tolerable good anchoring-place.

PUERTO VIEJO DE AZUA.—This is an excellent port for small vessels, where they lie quite land-locked. It is only 12 to 15 feet water at the entrance, but for such vessels as require no greater depth, it is one of the safest ports in the republic.

THE BAY OF NEYBA, or JULIANA, extends from Punta Martin Garcia to Punta Truxillo, 9½ miles, and has a depth of 8½ miles; the largest vessels of war may anchor in the bay, along its Eastern coast. It contains the anchorages of Rancho del Cura and Bahía Alejandro on the Eastern, and the port of Baraona on the Western coast. The river Neyba, or Yaque, enters the bay N. 84½° W., 10 miles from Punta Martin Garcia. The ground shallows to 11 feet, and has a bar with less water, which prevents small sailing-vessels entering the river. Its course has been very changeable, and formerly it entered the bay further Southward, in several arms.

Rancho del Cura.

RANCHO DEL CURA.—At the distance of one mile from Punta Martin Garcia, in the fine bay of Neyba, and a little to the North of some red cliffs, is a very good anchorage under the above name. You lie 2 cables' length from the shore in 5 fathoms, protected by Punta Martin Garcia from the East winds. To the North of the anchorage are some white cliffs, almost equidistant from the anchorage and the red cliffs.

Bahia Alejandro, Baraona, or Barahona.

BAHIA ALEJANDRO.—The anchorage is very exposed, and there is a reef inside. It is not a desirable place for loading vessels.

BARAONA, or BARAHONA.—This harbor offers a very good anchorage, but the vessels ought to await a pilot to lead them through the passage between the reefs. On entering the bay of Neyba, and being abreast of the red cliffs, hold a W. S. W. course for the entrance; the water is bold close in to the reef. At four cables' length from the reef you have no bottom with 120 fathoms, and it suddenly shallows to 5 fathoms and 10 feet. When you are within 2 miles of the reef, you will discern the village very plainly, and you will note above it two ridges of hills, one overlapping the other; each ridge has a saddle or hummock, in a direction of nearly W. S. W. with the village; keep these two saddles in one. Coming close to the entrance, your soundings being probably 10 fathoms, you will note on the square of the little village a house, larger and more prominent than the others, with a palm-tree before it, standing likewise in the square. Bring that palm-tree on a line with the Northern gable end of the house, or with the gate that leads to the yard, bearing then S. 69° W., and let go your anchor. After having cleared the weather reef in 5 or 4 fathoms, there is a good anchorage in 7 to 8 fathoms, the little islet bearing West; and sometimes vessels anchor much closer inshore, in 22 feet, but some sunken rocks, called the fishing-rocks, may prove of danger in getting the vessel under way. The reefs possess several passages for schooners and smaller vessels. The village of Baraona is in lat. 18° 12' 2" N., and long. 71° 5' 15" W.

Baburuco.

BABURUCO.—This place ought to be avoided, although vessels have loaded there at various times. Baburuco is not a proper shipping-place for large vessels, and masters should be careful in accepting any charter in which this place is included. There is scarcely sufficient room for a vessel to lie at anchor, and with the wind blowing on shore, there is not sufficient opening to tack out. Moreover a very heavy sea sets into the anchorage. The vessels are anchored in from 12 to 17 fathoms, at a distance of one mile and a half from the shore, with a reef towards the South of the anchorage, and one to the north. The shore is uninhabited.

Mala Pasa.

MALA PASA.—About 3 miles S. W. of Baburuco is Mala Pasa. It may be easily recognized by its steep white cliffs. It is less qualified for an anchorage than Baburuco; the same refers to Paradise and Petite Banane.

Riocito.

RIOCITO is about 5 miles from Mala Pasa. The water is so deep that the vessel is obliged to anchor close in, which renders her situation dangerous; the anchorage is moreover exposed to every wind, and all the sweepings of the sea. Vessels have loaded here to my knowledge, during fair weather, but it cannot be recommended as a loading-place. After Riocito follows

P. de Carlos, Petit Trou, or Ajugero Chico.

PUNTA DE CARLOS, and PETIT TROU, or AJUGERO CHICO.—A long reef, about 3 miles in extent, encompasses this anchorage. This barrier has two passages; the windward passage is about 2 cables' length in width, with several sunken rocks, one of which has only 10½ feet water, but there is deeper water on both sides; this entrance is called the reef passage. The lower entrance, or sea passage, has 18 to 20 feet, but the room within, having once cleared the passage, is so narrow and impeded by sunken rocks, that no vessel could beat up to the proper anchorage; it is therefore only of use for vessels that stand out to sea. A vessel bound for Petit Trou, ought not to draw more than 10 feet and a half. In approaching the reef you should shorten sail, to prevent the vessel going too quick through the water. The time for passing through the passage ought to be between 11 o'clock in the morning and 1 o'clock in the afternoon, when

guero is the port of Azua.

for small vessels, where the entrance, but for such ports in the republic.

Punta Martin Garcia to largest vessels of war may anchorages of Rancho de Barnona on the Western W., 10 miles from Punta Bar with less water, which rise has been very change- several arms.

from Punta Martin Garcia, a red cliff, is a very good anchorage from the shore in 5 fathoms. To the North of the anchorage and the reef

is, and there is a reef in-

ry good anchorage, but the passage between the reef and the red cliffs, hold a W.S.W. the reef. At four cables' distance, and it suddenly shallows

of the reef, you will discern ridges of hills, one overtopping the other in a direction of nearly W.S. coming close to the entrance,

on the square of the little hills, with a palm-tree before them on a line with the Northern yard, bearing then S. 69. W., their reef in 5 or 4 fathoms, bearing West; and some- some sunken rocks, called vessel under way. The reefs sets. The village of Barnona

small vessels have loaded there for large vessels, and this place is included. There and with the wind blowing on cover a very heavy sea sets to 17 fathoms, at a distance the South of the anchorage.

cala Pasa. It may be easily for an anchorage than Babu-

er is so deep that the vessel is dangerous; the anchorage is of the sea. Vessels have cannot be recommended as

ef, about 3 miles in extent, ages; the windward passage rocks, one of which has only its entrance is called the reef 20 feet, but the room within, led by sunken rocks, that no before only of use for vessels might not to draw more than shorten sail, to prevent the passing through the passage lock in the afternoon, when

the sun is high, and shows the rocks under the water more clearly. The pilot stands in the bowsprit, and gives directions how to steer the vessel through the rocks (some of which are only covered with 6 and 7 feet water) to the anchorage. It is therefore requisite to have a clever and quick person at the helm.

The ground for anchoring is not very good. There is scarcely a berth to be found where the vessel with 70 fathoms chain can swing round, without striking a rock; it is therefore advisable to moor the craft. The bottom shallows gradually, and at a distance of 1½ mile from the land there are only 3 fathoms water. The breeze blows fresh from the North-east, and the weather is uncertain and squally. The North-easterly breeze sets in about 2 o'clock in the morning, and continues to blow from that quarter until half past 7 or 8 p. m., when it veers more to the Eastward, and blows from E. by S. until midnight. During increasing moon the current sets regularly for 12 hours with the ebb to the East, with a velocity from three-quarters to one knot per hour. The flood rises at Petit Trou above 3 feet. During a decreasing moon the flood sets uninterruptedly towards the West, and there is no ebb at all. It runs then with a velocity of from one to one and a quarter knot.

In spite of these drawbacks, vessels load frequently at Petit Trou, and a person acquainted with the dangers he has to meet, will take accordingly the requisite precautions, if that place should be included in his charter party. A careful master will lie to when he has the slightest mistrust in his pilot, and sound the passage, placing moreover a buoy on the 10½ feet rock, which presents the greatest danger to a vessel on entering. I have already observed that the sea passage affords more water and less danger. It is nevertheless necessary to be cautious when standing out to sea, as there are sunken rocks in the course before the reef is cleared.

Petit Trou is the most Western landing-place that, on the South coast of the republic, is at present resorted to.

From Petit Trou to Cape Tiburon.

BEATA POINT, or LITTLE CAPE MONGON, is the Southernmost point of *Beata Vela* Hayti. Its bearing and distance from Punta de Salinas are about S.W. ½ W., 16 leagues. Of the coast between we have no particular description. Eight miles to the North-eastward of Beata Point is Cape Mongon, and between these points appears the high mountainous land of Barnona.

ISLE OF BEATA.—This island lies to the South of Beata Point; and is 1½ league *Isle of Beata* in length from N. to S., and about 2 miles broad from E. to W. It is low and covered with bushes. There is a breaker off the N. by E. side of it, stretching towards Cape Mongon, at the extremity of which is a white shoal, that very much narrows the passage between Beata and the shore. In the passage are but 3 fathoms water. There is anchorage to the Westward of Beata, between it and the shore, in 7, 8, and 10 fathoms, sandy and weedy bottom, with the N.W. end bearing about N. by E., or N.N.E. one mile, and the S.W. end S. by W., 4 miles.

East of the isle the water is deep, and there is no ground at a short distance from it with 50 fathoms of line. There is, nevertheless, a shoal stretching from the S.W. point, to which a small berth should be given, as there are no more than 4 fathoms of water West, 3 cables' length from the point. When the latter bears E.S.E. you may haul up from the N.W. end. In the anchorage there is good fishing.

The Frayles, or Friars, a number of steep rocks above water, lie West 3 leagues from Beata. The sea breaks over part of them, and they are so bold to that vessels may sail within a quarter of a mile round; but it will be prudent not to approach within a mile.

Near all the isles off the main coast the bottom may generally be seen; but near the shore of Hayti the water is very deep. The coast hereabouts is a flat of white and hard rocks, about 40 feet high, in which appear large holes and breakings, with some prickly shrubs.

ALTAVELA, or the Little Mount, a high rocky islet, lies at the distance of 5 *Altavela* leagues South from Beata Point, in lat. 17° 28', and long. about 71° 38'. The islet is peaked, but its summit has a rotundity resembling the upper part of a bell. It is generally seen before any other land in the vicinity, particularly from the Southward, and appears like a dome emerging above a mist or fog. Being very bold, it may be approached with safety.

At the distance of 2½ leagues N.N.E. from Altavela lies the South end of Beata Island. Between is a good and very deep channel. There cannot, however, be any motive for preferring a passage between these islands to passing Southward of Altavela; and therefore vessels bound to the Westward from Ocoa Bay, may steer S.S.W. 22 leagues, and a West course will then lead well to the Southward of Altavela; a more Southerly course is, however, to be preferred, in order to avoid danger

should the wind become scant, with a Westerly or W. by N. current, which has often been found to prevail here with considerable strength.

*Point Agu-
jas.*

POINT AGUJAS, or the False Cape, bears from Beata Point W.N.W. $\frac{1}{2}$ W., 6 leagues, and from the Frayles N.W. by N., 3 leagues. Cape Lopez bears N., true, 5 miles from Point Agujas. The coast between forms a bay, affording good anchorage. From Cape Lopez, Cape Roxo bears N. by W., 2 $\frac{1}{2}$ leagues, and between is the Enseñada sin Fondo, or Bottomless Bay: from this bay the coast trends to the N.W., and at 5 leagues from Cape Roxo is the mouth of the Rio de Pedernales, or Pitre Cove, which constituted the old limit between Hispaniola and Hayti. At this place is a good anchorage, which it is easy to make, a bank here extending along shore, and there is no risk in nearing the coast.

From Cape Lopez, the promontory called Morne Rouge, or Red Hill, bears N.W., 12 leagues. A league and a half to the Eastward of Morne Rouge, is the village of Sale Tron, or Foul Hole, where there is a good anchorage for vessels drawing less than 16 feet: larger ships may anchor there, but they must lie further out, where the ground is not so good.

From Morne Rouge the coast trenches in a little to the Northward, then out again E.S.E. to the Anses à Pitres, or Pitre Cove. All the coast is clear, and may be approached with great safety, as noticed above.

There is good anchorage at the Anses à Pitres, and of very easy access. At 2 miles from the shore the water is very deep. All the coast hereabout appears white, being chalky. You may anchor either before the plain of Anses à Pitres, or Southward of a small cape before the mouth of a river, which is considerable enough to be easily distinguished. The water is smooth, and you will be well sheltered in 6 or 8 fathoms, good ground, or in 4 fathoms and better ground nearer shore.

From Morne Rouge the coast rounds to Cape Jaquemel, or Jacmel, which bears from the former W.S.W. $\frac{1}{2}$ W., 29 miles. From Cape Jaquemel Cape Marechal bears N. by E. $\frac{1}{2}$ E., distant rather less than 2 miles.

In approaching Morne Rouge from Cape Jaquemel, it may be known by its white hummocks. The coast in the space between forms several little creeks, wherein small vessels may anchor; but in none of them will they be sheltered.

*Jaquemel, or
Jacmel.*

JAQUEMEL, or JACMEL.—Between Cape Jaquemel and Cape Marechal lies the bay of Jaquemel, in the upper part of which there is anchorage for shipping of every class. The town of Jaquemel stands at the head of the bay, to the East of the River Guachee, which has several mouths in the beach. In the middle of the bay no bottom is to be found at 70 and 80 fathoms; but the bank around the coast, which is about 3 cables in breadth, has from 20 to 3 fathoms, shoaling to the land. On this bank, upon the N.E. side of the bay, is a dangerous reef, nearly half a mile long, the outer edge of which is 3 cables' length from the shore. To the Westward of this reef, and opposite the town, is the anchorage, having from 5 and 7 to 3, and in one spot 2 $\frac{1}{2}$ fathoms. You may sail in with a remarkable white cliff, the last cliff on the Western side, bearing from W. $\frac{1}{2}$ N. to N.W. $\frac{1}{2}$ N., until the wharf near the middle of the town comes on with the Eastern side of an old battery, bearing N. by E. $\frac{1}{2}$ E.; and with this mark on, you huff up to the anchorage, which, at half a mile to the Southward of the town, has the depths above mentioned.

Jaquemel Harbor may be distinguished, at a distance, by the sudden cut off or drop of a hill, seen over another long hill at the upper part of the harbor. Running in towards that drop will lead directly to the entrance.

Bayenette.

BAYENETTE.—From Cape Jaquemel Cape Bayenette lies nearly W. $\frac{1}{2}$ S., distant 5 leagues. The latter may be known by the white hummocks and cliffs on its extremity. This cape forms the South side of a bay of the same name, which is open to the S.E. Its name, Bayenette, signifies clear bay, and is supposed to have been given from its great depth of water, and being entirely clear of shoals. This bay is unsheltered, but there is anchorage on the North side near the shore.

*Leighton
Rock.*

LEIGHTON ROCK, of 3 feet water, is in lat. 17° 45' 9" N., long. 73° 21' W. South 28° 06' E., 19 miles distant from South end of Isle Vache.

La Vache.

LA VACHE.—From Cape Bayenette to the East point of La Vache, the bearing and distance are W.S.W. $\frac{1}{2}$ W., 13 $\frac{1}{2}$ leagues. The isle is 3 leagues long and about one broad: it is hilly, and at the distance of 6 or 7 leagues, appears like an assemblage of small islands. The South side is bold, and along the North a reef extends to the distance of a cable's length. From off the East point is a white shoal, connected with the reef, extending from an islet to the N.W., called La Folle, or the Fool's Rock.

From the Fool's Rock to the N.W. end of La Vache, there is a range of islets and shoals, among which are some narrow passages. On the North side of La Vache is a bay, called the Baie de Feret, where there is good anchorage, but it is accessible only to those who are well acquainted. The Northernmost of the islets above mentioned, is Grosse Caye, called also Caye de l'Eau, or Water Key, which is readily

current, which has often

known by a great tuft of large trees. It is bold to, and at some distance from its North side there is good anchorage, in from 15 to 30 fathoms.

The Western end of La Vache forms the East side of the entrance of the great bay, called Bay of the Cayes; and from its S.W. Point, called Point Diamant, Point Abacon bears nearly W. by S., 5 miles. In mid-channel between, there is a depth of 25 fathoms, thence decreasing towards the island. From the S.W. point of the isle a white rocky spit extends to the South, having from 7 to 5 fathoms over it, at about 2 miles from there.

Remarks on the Anchorages within La Vache.

"The N.W. point of La Vache is in latitude 18° 6' N., longitude by chronometer, &c., 73° 43' 15" W. Variation 6° 20' E. Ships coming from the Westward, and intending to anchor here, ought to round Abacon Point, at a good mile off, as a reef stretches to the S.E. to nearly that distance from it. Having rounded this reef, there is nothing in the way, and you may steer for the N.W. point of La Vache. At half way between it and Abacon Point there are soundings in 15 fathoms, and the bottom thence shoalens gradually to the island. The best anchorage here is with the N.W. part of the island bearing E.N.E., in 5 fathoms; you will then be about three-quarters of a mile from the shore, on a white sandy bottom. The soundings all over this part are so very regular, that you can hardly err in anchoring anywhere, so long as you keep the N.W. point of the island bearing to the Northward of East. From the N.W. point to the S.W. point of the island the soundings are not so regular, and strangers ought not to come nearer than in 7 fathoms, especially near the S.W. point, for a reef stretches from it to the Southward not less than 2 miles, having very foul ground with irregular soundings to upwards of a mile or more. Therefore, ships coming from the Eastward and intending to anchor, ought to keep Abacon Point bearing West until the West point of La Vache bears N. They may then haul in to the Northward and steer for the anchorage.

"About a mile to the Eastward of the town of Aux Cayes, which stands to the North, there are three small white cliffs close to the seaside; and the mark I have generally run in and out by, is the Easternmost cliff bearing North, and in a line with a small round hill on the highest land behind it; and anchoring with this mark nearly on the N.W. point of La Vache, bearing E.N.E. or N.E. by E.

"The whole of this large bay to the Westward of La Vache is clear, and the soundings very regular, while you keep the West end of the island bearing to the Northward of East, between La Vache and Aux Cayes, the bay is covered with large reefs, and several are above water."

THE CAYES, ST. LOUIS, &c.—Point Abacon is composed of two points or *The Cayes*. reefs, which stretch three-quarters of a mile to seaward; but you may pass without fear, at the distance of half a league, and will find no ground with a line of 40 fathoms. *St. Louis.* The town of the Cayes bears from Abacon Point nearly North, 4 leagues. In sailing towards this place and approaching Point Diamant, before noticed, you will not find the white ground for more than a quarter of a league from it; and the ground is good in 6 or 7 fathoms. With Point Diamant bearing East, there are soundings all across. There is good anchorage to the West of Diamant Point, and further to the Northward, opposite a sandy cove, in from 6 to 7 fathoms, mud and sand.

To go into Aux Cayes you range along the N.W. point of La Vache, in 6 fathoms water, and you steer nearly N. by E. to make, on your starboard hand the white hummocks of Cavillon. You will then leave on the port hand a large reef, surrounded with a white shoal, which takes up almost all the middle of the bay. When you have brought the town to bear N.W. $\frac{1}{2}$ W., you must haul up two points to windward of the town, standing towards the Company's Islet, where you may anchor, if you do not mean to go into the road; if you do, you shorten sail a mile from the shore, and wait for a pilot. The channel is two-thirds of a cable in breadth. Ships drawing more than 13 feet water cannot go in; those of 15 and 17 feet water always anchor at Chateaudin, half a league to the Westward, and which is separated by shoals from the port.

To anchor in the road of Chateaudin, (coming from the mooring of La Vache.) W. or W.N.W. off Diamant Point, in 8 or 11 fathoms, you must steer directly for Torbee, which is a small town very easily distinguished, in the road of the bay; this tack will be about N.W. When you are within about 2 miles of the shore, you will discover a little white flag, which is on a shoal; you double it to the Westward at about half a cable's length, leaving it on the starboard hand. When you have brought it to bear South, you steer along the coast for the road of Chateaudin, and anchor in 6 or 7 fathoms, mud. In all this passage, if you keep the proper channel, you cannot have less than from 7 to 9 fathoms, and often 12 and 16, muddy ground.

In advancing towards the Tapion of Cavaillon, you must not approach too near its S. E. side, as a shoal of only 6 feet water, called *Le Mouton*, or the *Sheep*, lies S. E. from the Eastern point, at the distance of about half a mile. There is a depth of 5 fathoms between it and the coast.

Cavaillon Bay.

CAVAILLON BAY is spacious, although its anchorage is of small extent. The coast on the Western side is very steep, and the bottom full of rocks; but there is anchoring-ground on the Eastern side, opposite a coast covered with mangroves, which may be approached without fear, the bottom being clean, with 5 fathoms close to the shore.

This bay affords shelter from the sea-breezes, by the Eastern point of an island, which leaves a passage into the *Baie des Flamands*, next described.

Baie des Flamands.

BAIE DES FLAMANDS, or Flamingo Bay, lies a quarter of a league from Cavaillon Bay, and extends upwards towards the N. E. Its entrance and shores are clear and bold, and it is the place where ships lie up the hurricane months. There is a good careening-place, and anchorage in every part.

Baie du Mesle.

BAIE DU MESLE.—From Flamingo Bay the coast extends E. by N., 2 miles, to the Grande Baie du Mesle, all over which the anchorage is good; but as the entrance is broad and open to the Southward, there is no shelter from Southerly winds. The coast hence continues its direction to Point Pascal, half-way towards which is the Petite Baie du Mesle, in which a vessel may anchor, but it will not be sheltered even from the sea-breeze.

Of the Great Bay du Mesle is a shoal, lying like a bar across the bay, and extending opposite the point, which is to the Westward of the Little Bay du Mesle. This bank has not, in some places, more than from 15 to 18 feet water. It is very narrow, and leaves a passage of three-quarters of a mile only between it and the coast. To the Southward it extends about half a league from the shore.

To go into the Great Bay, with a ship drawing more than 15 feet, you must keep close to the shore on the Western side, steering by Point Pauline, which forms that side of the entrance.

Bay of St. Louis.

BAY OF ST. LOUIS.—The great entrance of the bay of St. Louis lies between Point Pascal, which is steep and wide, and a little isle called Orange Key; the bearing and distance from one to the other being E. 3 N., rather more than half a league. This isle may be seen from the entrance of the Cayes 13 miles distant, whence it appears nearly in a line with the Southern extremities of the intermediate coast.

About two thirds of a mile N. E. by N. from Pascal Point is the Vigie or Old Look-out Point; between is a cove called the Baie du Paradis. When off the Vigie Point, you will have the whole of the bay of St. Louis in sight. The bay is shut in on the Eastern side by Cape Bonite, which bears from the Vigie Point N. E. 3 E., distant 14 miles.

In proceeding to the anchorage of the Bay of St. Louis, run along past Point Pascal and Point Vigie, and thence along the Western coast of the bay, in 8 or 10 fathoms. The anchorage is West of the Old Fort, about a quarter of a mile from the Western shore, and the town may be seen from it, between the Old Fort and shore, in the bottom of the bay. The Old Fort is on an island of rocks towards the middle of the bay, half a mile to the Southward of the town. In the passage between it and the shore there is a depth of 6 fathoms.

In the anchorage before the town, called the Little Anchorage, the greatest depth is 5 fathoms.

S. S. E. three-quarters of a mile from the Old Fort, and West of Cape Bonite, at nearly the same distance, is a shoal called *Le Mouton*, (The Sheep). There is a good passage between it and the shore, as well as between it and the Old Fort; but the depth of water is less on the Eastern than on the Western side of the bay.

Between Orange Key and the shore, in a N. E. direction, there are two islets and some shoal-ground; the first of which, next to Orange Key, is called *Rat's Key*. You may pass into the Bay of St. Louis through a small passage immediately on the North side of this key.

Aquin Bay.

AQUIN BAY.—One mile and a half E. by N. from Orange Key is Moustique Key, a little island clear of shoals, unless very close inshore. You may pass without or within it, at the distance of one-eighth of a league, in 10 fathoms. Cape St. George is North of Moustique Key, and N. W. of a key called *Caye à Ramiers*, (or Pigeon's Key,) which bears E. by N., 2 miles from Moustique Key, and is known by a white hummock, rather steep, and seen at some distance. There is a deep passage between it and Moustique Bay, by which ships pass into the great Bay of Aquin.

South of *Caye à Ramiers* is a shoal, extending half a league, which has, on its middle part, only 3 fathoms. East of the same key is a small isle, called *L'Anguille*, or the *Eel*, and to the N. E. is another, called *La Regale*; the three form an equilateral triangle, having each side half a league in length.

N.E. three-quarters of a league from Caye à Ramiers, lies the West end of the Great Key of Aquin, which is 2 miles in length, and distinguished by two very remarkable white hummocks. It extends E. and E. by N., true, and its South side is bold to; but the white shoals of L'Anguille extend to its Western point, so as to prevent a passage between it and Caye à Ramiers, for ships that draw more than 12 or 11 feet.

East of Aquin Key, at the distance of a short quarter of a league, is a white insulated rock, called Le Diamant, or the Diamond; to the Eastward of this, at the distance of 2 cables' length, is the Point of Morne Rouge, or Red Hill. Thus the Eastern end of Aquin, the Diamond Rock, and the Point of Morne Rouge, form the two passages into the bay. All the islands and shores are bold. In the Morne Rouge passage are 5 and 6 fathoms water, and in that between Aquin Key and the Diamond, 6, 7, and 8. The bay is extensive, and trenches considerably inland, but the water is shallow, and there are only 3 fathoms at a distance from shore.

The Point of Morne Rouge may be readily known at a distance, by three very high white hummocks, called the Tapisons of Aquin, which together form a great cape, under which is an anchorage, in 10 and 12 fathoms, at a distance from land. This bottom continues as far as the Petite Baie des Flamands, or Little Flamingo Bay, which is W.N.W., 14 league from the Tapisons of Aquin.

To enter the passage into Aquin Bay, between Caye à Ramiers and Moustique Key, before-mentioned, steer N.N.E., so as to get into the mid-channel between the shore and the island. Having doubled Caye à Ramiers, you will see La Regale, which is a very low isle of sand; leave this on the starboard side, keeping in mid-channel between it and the shore; then haul up for Aquin Key as much as the wind will permit, and anchor to the Northward of it in 6 or 7 fathoms, or further in, at pleasure.

GENERAL REMARKS.—Observe that from Point Pascal all the capes are broken and steep, and from the S. and S.E.; and as, on all this coast, the land is white, many white hummocks will be seen. Aquin has two, above mentioned; but the Easternmost and highest are those of Morne Rouge; and, with attention, it will be impossible to mistake them. From the point of Morne Rouge, or the hummocks of Aquin, the true direction of the coast, after having trenced in to form the Petite Baie des Flamands, is East, Southerly, 10 leagues, to Cape Bayenette. The whole of this coast is free from danger and bold to, but has no bay or anchorage, or shelter from the common breeze. Two leagues and a half Westward of Bayenette the coast is iron-bound, and the water near it of great depth.

POINT ABACOU TO CAPE TIBURON.—From Point Abacou to Point Gravois, the bearing and distance are West, Southerly, 23 leagues. The latter is low, not easily distinguishable, and has frequently been mistaken for the land of Port Salut, a small cove lying a league further to the N.N.W.

From Point Gravois, N.W. by N., 4 leagues, there is a bight of half a league, in which anchorage may be found. This bight lies about 2 miles to the Southward of Les Coteaux. From this spot to a large hummock, called Les Chardoniers, which is very remarkable at a distance, the bearing and distance are nearly W.N.W. 10 miles.

From Les Chardoniers to the Fond des Anglais, or English bottom, the coast extends W. by N., 4 miles, and a bay thence rounds to within a league and a half of Pointe des Vieux Boueans, or Boucan Point. All this part is safe, but it has no anchorage. A ship may, indeed, anchor very near the land, but it is everywhere exposed to the sea-breeze.

From Boucan Point to Point Burgos, which is a low point, the coast trends Westward, 4 miles. Between these places, off a point called Aigrettes Point, there are some white shoals, rocks, and breakers; but their extent is not more than half a league.

Ports and anchoring-places to the North of Punta Engaño.

The following anchoring-places, Cabeza de Toro, Babaro, Los Ranchitos, and Arena Gordó, come nearly all under one and the same category with regard to their practicability as loading-places. During the summer months, when the trade-wind is to the South of East, and calms are prevailing, there is no danger to be apprehended, and vessels load in as short a time as anywhere on the coast; but during the winter months, when North-easterly winds are frequent, the vessel is not only endangered, but the loading is rendered difficult, as days and days may elapse before a boat can pass from the anchorage to the land. Nevertheless, a vast deal of wood is loaded at the North-eastern anchoring places, and the master who has accepted a charter-party in which one or the other of the above-named places is included, ought to be provided with good chains.

Los Algodones.
Cabeza de Toro.

LOS ALGODONES.—The first rocky point to the North of Punta Engaño, is Los Algodones, which does not afford any anchorage.

CABEZA DE TORO.—The quantities of wood in the neighborhood of this anchoring-place cause it to be frequently visited by vessels. The reef affords two passages; the one to the leeward, called La Naybe, is even passable for schooners that draw no more than 10 or 12 feet. Large vessels anchor outside the reef, in from 10 to 12 fathoms water, sandy and rocky bottom.

Babaro.

BABARO, about 6 miles from Cabeza de Toro, is considered a better anchoring-place than the former; the sea is somewhat calmer and the reef approaches more the land. Vessels lie in 10 to 12 fathoms, distant $1\frac{1}{2}$ to 2 miles from the land. The beach is sandy, and the loading may be effected rapidly when there is no North-easterly breeze or heavy ground-swell.

Los Ranchitos.

About nine miles North-easterly from Babaro are:
LOS RANCHITOS.—The reef has two passages with about 4 to 5 feet water. Vessels lie outside in 11 or 12 fathoms of water, distant $1\frac{1}{2}$ to 2 miles from the land. It is a sandy beach and a good loading-place.

Arena Gorda.

ARENA GORDA, about 2 miles from the former, has three passages through the reef, which a small sloop with 5 feet water can safely pass, to the anchorage within; vessels of large burden lie from $1\frac{1}{2}$ to 2 miles, according to their size, in 10 or 12 fathoms water.

Macao.

MACAO.—All the remarks respecting Babaro, Cabeza de Toro, &c., refer equally to Macao. The anchorage is here still further off the shore than at Babaro, and the place is much more exposed to the winds and sweepings of the sea. The vessels anchor about half a mile North of the reef, which stretches from Cabezote Barlovento in a line towards El Infiernito, and send their boats for the wood to the bight of the bay and to the mouth of the Anamuya. The two rocks high out of the water, called the Cabezotes, are excellent landmarks, and afford along them good landing-places. The passage for the bight of the bay, where there are some ranchos for the shelter of the laborers, is between Punta Macao and the Cabezote Barlovento; and that for the mouth of the Anamuya close to the Cabezote Sotavento, likewise called El Infiernito. At the mouth of the Anamuya is a bed of excellent oysters.

The position of Punta Macao, deduced from observations taken near the ranchos, is in lat. $18^{\circ} 48' 0''$ N., and long. $68^{\circ} 29' 50''$ W.

There is an anchoring-place between Punta Macao and Cape San Rafael.* The latter cannot be mistaken. Nearly 2 miles inland from the cape is a round hill, which, at the distance, has the appearance of being isolated; it is, however, connected with the Southern shore of the bay of Samana by low land.

Port Jicaco or English Harbor.

PORT JICACO or **ENGLISH HARBOR.**—Port Jicaco or English Harbor, (Puerto de los Ingleses,) lies about 11 miles W. by S. from Cape San Rafael. A rock, which rises above the reef stretching from Punta Jicaco towards the Keys, is seen at a distance of 2 leagues, and serves as a mark to point out the passages Barlo and Sotavento. At the same time a high double-peaked mountain will be observed inland, bearing S. by W.; keep the hummock between the two peaks as your mark, and come to anchor in $5\frac{1}{2}$ and 6 fathoms, distant a quarter of a mile from the land. The anchorage within the reef is safe, and has the advantage that the vessel can leave with the trade-wind, selecting the lee pass for her passage when standing out to sea.

Cape Samana.

CAPE SAMANA is a broken rugged point of land, which appears, from a great distance, like a ship with her topsails down, and seems not to join the main, but on a nearer approach this shape changes. The cape makes with two points, both alike, blunt and steep, about the height of Beechy Head in the English Channel, but not so white. They are 4 or 5 miles asunder, with a small bay and harbor between them. At 2 or 3 miles to the Westward of the Westernmost point, there is very high land, which falls down to the water-side, and is twice as high as Cape Samana.

Samana Bay.

SAMANA BAY.—There is good anchorage in Banistre, or Lavantados Road, on the South side of the peninsula of Samana. In advancing for this place, observe that when Cape Samana bears N.W. by W., about a league, it appears like two points, the Westernmost of which, as you come further in, you should bring open with a white spot of sandy ground, which may, at first, be mistaken for one of the sand-keys, although it is connected with the main shore. In order to ascertain the true point, observe that in coming about it, it will appear as if a small rock were lying off it, which, on a nearer approach, will be found to join to the land. The soundings are uncertain. Having well shot into the bay, you may have 10 fathoms, and then no ground in 20.

Or, being off Cape Samana, and bound for this port, sail S.S.W. 3 or 4 miles, along shore, (you may go within a mile, for it is bold to,) to Point Valudras, or Blue Point, which has two or three black rocks lying near it. When at the length of this point steer thence West about half a mile, and you will leave three keys, which are

* Lieut. Raper, R.N., gives, in his table of Maritime Positions, (1849,) for Cape San Rafael, lat. $19^{\circ} 1' 0''$ N., long. $68^{\circ} 55' 0''$ W.

high and woody, a mile from you on your port side. With the Westernmost of the three keys bearing S.S.W., you may anchor in 15 fathoms, half a mile from shore, and have good water. Then Lavantados, or Banistre Key, will bear W. by N., one mile off.

There is good easy riding in this harbor, in from 7 to 3 fathoms. You may also find good fresh-water in many places, with plenty of fish and fowl. Here is commonly a fresh breeze from the Eastward all day, and open to the North.

The preceding paragraphs are from the French of the Count Chastenet de Puysegur, &c., the following from the Spanish Derrotero:—

SAMANA BAY.—From Cape Rafael the coast trends nearly West, and forms a gulf, shut in to the N.W. by the peninsula of Samana. The East point of this peninsula, named Cape Samana, lies 7 leagues N.W. by W. $\frac{1}{2}$ W. from Cape Rafael. This bay, which is more than 11 leagues in extent from East to West, and 4 from North to South, is obstructed and almost shut up by a great reef, which extends from the South coast, and so far to the North, that a channel of only 3 miles in width remains between it and the peninsula of Samana. The Northern extremity of this reef is marked by some keys or islets, the largest of which, called Key Lavantados, must be left on the port hand on going into the bay. Within there are several anchorages, but little frequented, as there is scarcely any commerce here. The first anchorage is on the coast of the peninsula, and near the entrance of the bay, it is named the Carenera Chico, (or Little Carenage;) to enter and anchor here, it is necessary to approach within half a mile of Point Valadras, which is the S.E. point of the peninsula, and to keep along the edge of the coast at this distance, until sheltered by Vinas Point, when you may anchor in 6 fathoms, taking care to keep half a mile from a key, named the key of the Carenero Chico, which is at the West part of the road, and has, to the South of it, either four or five small islets. Behind this key, and between it and the coast, is the proper anchorage; but it is much narrowed by shoals, and must be entered by warping. Point Vinas is easily known, as it bears true North from the West part of Lavantados Key. In the entrance there is nothing to be feared, because there is no danger but what may be well seen; and only inward from Point Vinas is there a shoal, having on it 2 feet of water: to keep clear of this shoal, bear in mind that it bears East, a long mile from Vinas Point. By following the coast, as we have directed, at the distance of half a mile, you will go safe from it; but, for greater certainty, keep something to starboard, when you will sound in 5 fathoms water; for in the channel, between it and the coast, there are 6 and 7 fathoms.

A league and a half to the West of the Carenero Chico, is the Puerto de Santa Barbara, or of Samana: the anchorage here is very narrow at the entrance, which is formed by a great reef, that runs out to the East from Point Escondido, the S.W. point of the harbor; and on this reef are several keys or islets, of which the outermost is named Tropezon; the second is the Greater Carenero; and the third, Cayo Escondido, is very near the Point Escondido, on the West. There is not only this reef at the entrance, for there are two off the North coast, which stretch far to the South, and form two bays: of these the first is called Aguada, or Watering Bay, and it has Point Gomero for the N.E. point of its entrance. The second roadstead lies between the two reefs. In Aguada Bay there is good anchorage, in 6 fathoms, clay; the second anchorage is very narrow, but has 7 fathoms water. To the West of these two reefs and roadsteads, lies the principal harbor and anchorage of Samana, with a depth of 5 and 6 fathoms, on clay, which is found to the South of the town. To enter this harbor it is necessary to run along the North coast, at half a cable's distance, and steer to the West, taking care neither to get nearer to, nor farther from Point Gomero, than half a cable; for you will thus run in mid-strait; and, keeping further off, you would incur the risk of getting on the Southern reefs, or, by coming nearer, get on those of Point Gomero, which lie out one-third of a cable. So soon as past Point Gomero, you may see a little rivulet in Aguada Bay; and then you ought to head direct for the Western extremity of Carenero Key, until Point Escondido, or its key, bears W. $\frac{1}{2}$ S., when you may run about W. by N., towards the bottom of the harbor, and perfectly free from the Northern reefs, and may anchor to the South of the town, in 5 or 6 fathoms water, upon clay. If you wish to anchor in Aguada Bay, you must run in, luffing up to the Northward, so soon as past Point Gomero, in order to anchor in the middle of it, and about S. E. from the rivulet of Aguada.

From this anchorage the coast of the peninsula continues bold, and with roadsteads, in which there is nothing to fear, except the South winds, which, in their season, are often violent. Two leagues to the West of Samana lies Point Espanola, with an islet; and thence, in the interior of the bay, there is no establishment whatever. A large clay bank, in the interior of the bay, runs out more than 2 leagues.

From Espanola Point, in which you will be well to the West of the reef at the entrance of the bay, you should steer to the South for the Bay of Perlas, or of St. Lorenzo, in which there is no necessity to run far in; and it may suffice to anchor at its

Samana Bay.

entrance, and about South of Arenas Point, which is the North point of this bay; for, although further in there is sufficient depth, yet there are sand-banks, on which you might easily get aground. To find this bay, it is better to make the land to the East than to the West; for the South coast of Samana, from Perlas Bay to the West, is very wild and unsafe, on account of the many islets along it. Steering from Point Espanola, to the S. $\frac{1}{2}$ E., you will fall to the East of the bay, and make a little town, named Savanna de la Mar, which affords anchorage for very small vessels; and thus, as soon as you discover Arenas Point, when crossing over, steer towards it, and you may approach within a cable's length of it.

The entrance of Samana Bay is effected with the regular breezes; but you can get out with the land-breezes only, which blow by night.

Cape Samana is of considerable height, and steep down to the water's edge; on nearing it you may also discover Cape Cabron, which is N.W. from it, nearly 3 leagues: this is even more high and scarp'd, or steeper, than the former, and the coast between is green, and covered with large trees; on it there are some islets, and as it is foul, it should not be approached nearer than one league. From Cape Cabron the coast takes to the West, and forms a great bay, called Escroesa Bay: the coasts of this bay are low, and very foul, from which reason, as there is neither town nor establishment in it to induce vessels to visit it, they ought to proceed direct from Cape Cabron to Cape Viejo Francois, or Old Cape Francois, which lies 15 leagues from it W.N.W. $\frac{1}{2}$ W. Old Cape Francois may be seen, in clear weather, at the distance of 10 leagues. It is known by a mountain inland, which may be seen at the distance of 15 leagues.

Ships coming from the Eastward, towards the N.E. coast of Hayti, should, previous to their making the island, run down between the latitudes of $19^{\circ} 20'$ and $19^{\circ} 50'$, taking particular care not to pass either to the Northward or Southward of these latitudes. In this track they will make the land, either by Cape Cabron, or Old Cape Francois, and they will pass clear of the Silver Key Bank on the one side, and the current commonly setting towards Samana Bay on the other.

*Old Cape
Francois.*

OLD CAPE FRANCOIS.—The point of the Old Cape is rather low, and stretches out in the form of the snout of a porpoise; at 5 or 6 leagues distant, to the N.N.W. of Cape Cabron, in a clear day, the Old Cape is seen making like an island, whose ends slope gradually into the sea. When you have made Cape Cabron, being 4 or 5 leagues to the North-westward of it, you must sail 13 or 14 leagues N.W. $\frac{1}{2}$ W., and you will pass 5 leagues to the Northward of the Old Cape: then steer W. by N. when, having run 15 leagues, you will see Point Casroque at about 3 leagues distant from you: continue on for 5 leagues, when Ysabella or Isabella Point will bear S. W. $\frac{1}{2}$ W., distant 4 leagues; having advanced thus far, you have nothing to fear, and, if necessary, you may keep within half a league of the shore, the coasts being very clear.

At about 4 leagues off to the Northward of Old Cape Francois its point appears like a porpoise snout, projecting to the Eastward; and 3 leagues further West is a point named Cabo de la Roca, or Rocky Cape, very much resembling it, and projecting to the Westward. The coast between lies W. $\frac{1}{2}$ N. and E. $\frac{1}{2}$ S.; it is low, rather steep to the seaside, and covered with trees remarkably green.

Towards the point of the Old Cape a mountain is perceived inland, which, in clear weather, can be seen 15 leagues off, and is a good mark to point it out.

There is some foul ground lying off the pitch of the cape, and a harbor a little to the Westward of it for small vessels. When sailing from Cape Samana to Old Cape Francois, which is about 6 or 7 hours' sail, you see a point of land on the East side of the cape, which oftentimes, at first sight, you suppose to be the cape, but coming nearer, you will see your mistake. And when you are due North of Old Cape Francois, you will perceive to the Eastward of the cape a very steep point, which seems to be divided from the main, and running off the land, rises higher and higher in such a manner that the highest part of it lies open to the sea, so high that you cannot see the land within.

When from Old Cape Francois you sail for Monte Christi, observe to steer a more Northerly course in hauling off, giving a good distance between you and the shore, because the currents always set upon it; and unless you do this you will run the hazard of being ashore.

From Cape de la Roca, the land trenches in to the distance of 2 leagues, and forms a bay pretty deep, which is sheltered by reefs. This coast trends to the W.N.W., and rising in height to the Northward, comes to Punta Macuris, or Point Mascurey, which bears W. $\frac{1}{2}$ N. from Cape de la Roca. This point is high, and its shore bold; it serves as a mark for the small harbor of St. Jago, which is 3 leagues distant from, and to the Eastward of, Puerto de Plata.

*Puerto de
Plata.*

PUERTO DE PLATA, or Port Plata, lies 17 leagues from the point of the Old Cape, and bears from it West. It is known by a mountain at some distance inland.

point of this bay; for, banks, on which you see the land to the East Bay to the West, is Steering from Point and make a little town, small vessels; and thus, steer towards it, and you

reezes; but you can get to the water's edge; on N.W. from it, nearly 3 miles the former, and there are some islets, and one. From Cape Cabron to the coast of Coecesa Bay; the coast here is neither town nor proceeded direct from Cape Cabron lies 15 leagues from it, rather, at the distance of 10 leagues seen at the distance of

ance of 2 leagues, and forms East trends to the W.N.W., Macaris, or Point Macaris, is high, and its shore bold; which is 3 leagues distant from

s from the point of the Old in at some distance inland.

which appears insulated like the Grange, although not in so precise a manner. This mountain, which is called Isabella de Torre, has a large white place on it, caused by a slide, in the great rains of 1837 and 1838. This is a good mark for the port, and you must run for it, until you discover the fort at the foot of the mountain. In running in, keep midway between the points; and as soon as round the point, on the port hand, let go your anchor, in $3\frac{1}{2}$ fathoms. There are not now any mangrove bushes.

On approaching the coast, you will discover to the Westward a great cape, very high and steep; the extremity of this is Punta del Algarroba, or Point Casrogue which is readily known by its magnitude.

The bight from Port Plata to Point Casrogue, is bordered with reefs close to the shore, and does not admit of any anchorage.

Old Cape Francois and the great Point Algarroba, or Casrogue, bear from each other W. $\frac{1}{2}$ N. and E. $\frac{1}{2}$ S., 19 $\frac{1}{2}$ leagues. When at the distance of about 3 leagues to the Northward of Casrogue, you will see a low point projecting out to the Westward, which is remarkable by its having the appearance of being detached from the coast like an island: it is Ysabella, or Isabella Point, the Northernmost point of Hayti.

YSABELLA, or ISABELLA POINT, according to late observations, lies in latitude 19° 59', longitude 71° 10' 30", and at the distance of 44 leagues W.N.W. $\frac{1}{2}$ W. from Algarroba, or Casrogue Point. To the Eastward of it lies the deep bight, called Puerto Caballo, or Port Cavallo. In the bight between these is an anchorage for vessels drawing 12 or 13 feet water, and sheltered by the reefs: the entrance is readily known by running to it along the reefs.

On the Western side of Isabella Point is a more extensive anchorage, and easier to gain than that of the East, but the ground in many places is foul; there is a depth of from 5 to 7 fathoms water.

From Isabella Point to the Grange, the bearing and distance are W.S.W. $\frac{1}{2}$ W., 10 leagues. The coast between is bordered with reefs, among which the entrances are narrow and dangerous.

West of Isabella Point is Punta Roca, or Rocky Point, to the Westward of which is an anchorage for large vessels, which being very bad, ought to be used only in case of necessity.

To gain this anchorage, you must haul very close to Rocky Point, and anchor so soon as you are in 12 fathoms, white bottom.

This anchorage, which is sheltered by the reefs that stretch N.N.W. from Punta Roca, lies about 4 leagues from Isabella Point.

THE GRANGE.—The Grange Point is known by the mountain of that name, and is seen at a great distance before you perceive the coast. This mountain, which is insulated, and stands upon a low peninsula, has very much the appearance of the roof of a barn, from which it takes its name. The North-west part of it is bold, and you may approach it within a quarter of a league, or even less. Close to the West part of the Grange Point is a rocky islet, named the Frayle, or Friar; and from its S.W. part, at 3 cables' length, is another, somewhat larger, and named Cabras, or Goat's Islet. These are the islets of Monte Christi.

HAUT-FOND.—Two leagues to the N.N.E. of the Grange Point lies a white shoal, of not more than 2 cables' length each way, called the Haut-fond; there is a small spot on the shoal, with only 25 feet of water. Close to it is a depth of 6 fathoms, then 10 and 15, and suddenly no ground. The white ground has generally scattered rocks, so that it cannot be ascertained whether there may not be some spots on it even with less than 25 feet. When you are on this shoal, the Grange bears S. by W. $\frac{1}{2}$ W.; you will then have the islets of Monte Christi open of each other, the Westernmost of them bearing S.S.W. $\frac{1}{2}$ W.

MONTE CHRISTI REEF.—About 3 leagues to the Westward of Haut-fond lies another reef. It extends nearly N.E. and S.W., is about three-quarters of a mile in length, and half a mile broad. On the shoalest part the points of rocks stand up like sharp spires. On other parts are white patches of sand. The shoalest water 3 fathoms; thence 3 to 4, 5, 6, and 7 fathoms. It is steep to, and has from 15 to 17 fathoms close to it, and 20 to 25 all around. The bottom is soft in 20 fathoms; and in some places you will have coarse sand. The water, when smooth, is very clear, so that you may see the pinnacles of the rocks as you pass over them in a boat. From the shoal, in 3 fathoms, the Eastern end of a grove of trees open to the South-westward of Monte Christi (and between it and the key) bore S.E., and the mount of Cape Francois (now Cape Haytien) S.W. by W. The variation was 6° 20' E.

With Isabella Point bearing S.W., distant 4 leagues, the course and distance, to pass without the shoals called the Haut-fond and Monte Christi Reef, will be a few leagues to the Northward of West, 17 leagues; and then the latter will bear about S. E. But should you be up with Isabella Point, and prefer the mid-channel between these shoals and the coast, a W. by S. course, 16 leagues, will clear the shoals and

Ysabella, or Isabella Point

The Grange.

Haut-fond

Monte Christi Reef.

bring you in sight of the high land of Cape Hayden, (formerly Cape Francois) at an distance of about 5 leagues.

In sailing between Old Cape Francois and the Grange, be careful to keep sufficiently to the Northward in hauling off, that you may not be driven ashore by the current, which always sets upon the coast.

There is anchorage under the Grange to the West. To take it you must range along the Frigate, or islet of Monte Christo, and let go your anchor so soon as you have 6 fathoms; but under the South side of Calvary, the Westernmost islet, you may anchor further in with 4 fathoms. From the Grange you may see the mountains above Cape Hayden.

In approaching this anchorage you must be cautious of a shoal, which lies W. by S. from Calvary Isle, at the distance of a long mile, to keep clear of it, on entering and leaving the anchorage, take care not to bring Calvary Isle to bear anything to the Northward of E. & N., but, on the contrary, keep it rather to the Southward of the bearing.

The shoal or bank of Monte Christo extends 11 miles to the West, and to the South as far as Manzanilla, or Manchoual Point, and it thence continues to border the coast at the distance of half a mile, more or less, according to its sinuities. On this bank rise the islets named the Seven Brothers, which are low, and covered with mangroves. The islet named Monte Grande is the most remarkable of all of them. It is the second from the Eastward, and has high trees upon it. This bank, as well as many others in these seas, has a very white bottom, and is very dangerous, because the bottom is very irregular in its depth, with stones and rocks; you may have 8, and sometimes butly after 3 fathoms. You should therefore avoid sailing on this or similar banks, unless they have been well examined and sounded.

See also
Vol. 1. p. 101.

MANZANILLA BAY, &c. To the East of Manzanilla Point there is an excellent anchorage in Manzanilla Bay. From this bay the coast trends in to the S. E., and then runs to the West, in which direction it continues to a distance of 8 leagues, when it ascends to the North, and terminates with Point Piedrot. The Grange Point with Point Piedrot form a great bay, in which, besides Manzanilla Bay, there are two other harbors, the first of these, named Bayaha, or Port Dauphin, is to the S. W. of Manzanilla Point, and about 2 leagues from it, and the second, at the Western extremity of the bay, is known as Guasco, or the City of Cape Hayden, or City of the Cape.

The coast from Bayaha to the West is bounded by a white bank and reef, on the edge of which there are from 50 to 80 fathoms; between the reef and the coast is a channel, with 2 or 3 fathoms of water, to which there are various passages in the reef known to the coasters and pilots only.

The navigation from Grange Point to Manzanilla Point should be made on the white bank of the Seven Brothers; it is, therefore, very necessary to know the channel, and though you may proceed on the outside of the islets and the bank, extending to the Westward, it follows that, in doing this, vessels must get much to leeward and are then obliged to beat up to the anchorage. The delay in following this route is not so great when bound to Bayaha, or Port Dauphin; but the channel for crossing the bank, which we are about to describe, being very safe, it does not seem requisite that any one should go round about, but that all should proceed as follows.

Having passed near the Grange Point, steer W. & S., without going to the Southward of that bearing until you are to the North, or on the meridian of Yuna Point, which is low, and bears S. W., true, 5 miles, from Grange Point; the vessel, having arrived at this situation, should now steer towards Yuna Point, until the riet named Monte Chico, which is the Easternmost of the Seven Brothers bears West, whence you must steer S. W., leaving to starboard the Islet or Key Toron, which is the Southernmost of the Seven Brothers, and when you mark it at about 4 by F., you must steer S. & E. until you have Manzanilla Point E. & N., when you must haul to the wind on the port tack to take the anchorage, if you can, and if not you must prolong the stretch to the Southward as far as necessary to enable you to get into the bay upon the other tack, in the understanding that you may run along the whole of the South shore at half a mile, or even less. In running by the way we have pointed out, you will find upon the bank 7 to 8 fathoms of water, or sandy clay, and you may anchor on any part of it immediately, especially to the S. W. of the Eastern Keys, Monte Chico and Toron; and it may even be convenient to anchor in case of night coming on, by which the inconveniences arising from darkness may be avoided.

The edge of this bank is so steep, that from 12 to 20 fathoms you rapidly pass into 100 fathoms; and of the same nature is Manzanilla Bay, for from 7 fathoms you pass to 100 in the short distance of 5 cables' length; from which reason an anchor should never be let go until the depth has been previously ascertained by the lead, keeping in mind, that the best anchorage is in from 6 to 10

by Cape Francisco, at an

a mile from the shore.

In the River Papou, (E. S. E. of Manzanilla Bay,) and also in that of Axolom, to
the S. E., water may be conveniently got, and you may cut wood on any part of the
coast that is desert and uncultivated. In this bay there are always fresh land Creeper,
which facilitate much the communication between Bayaha and Monte Christy. For
those to whom the breeze is contrary, may go at night by aid of the land breeze
in Manzanilla Bay, no hurricanes are felt, which is an advantage of great con-
sideration.

THE HARBOR OF BAYAHA, or PORT DAUPHIN, is one of the finest ports *The Harbor*
in Hayti, for to its great extent it will shelter equal to a dock, with an excellent clay *et Paraha*
bottom, and the depth does not exceed 12 fathoms, nor is it less than 2 fathoms, which *or Port*
are found at half a cable from the shore, but notwithstanding these singular qualities, *Dauphin*
of the difficulty of entering and getting out of it, in consequence of the narrowness and
crookedness of the channel or mouth, is considered, it will be seen that it would not answer
for any vessel on actual service to enter and be shut up in a harbor from which she could
not sail, unless at night with the land breeze, and thus exposing herself not only to
the danger of getting aground on the shoals of the entrance, but also, in case of the
land breeze failing, she may both lose the time for getting out and the object for do-
ing so. The entrance of this harbor needs no description more than the chart, by which
it may be seen that its entrance is only a cable and two thirds in width, and this nar-
row breadth continues onwards to the distance of a short mile. The several points
which are in this passage render the entry still more difficult. The risk of this entrance
is a shallow ridge which borders both sides of the channel, and which, at the points,
strikes out more than half a cable, and reduces the channel to one cable's length in
width. Again, this channel being serpentine, it is necessary that a vessel, in running
in, should take the turns with much dexterity and promptitude, in order to avoid
getting aground. It is, therefore, necessary to enter this harbor when the breeze
is to the Northward of E. N. E.; for, if more seaward, an attempt to take the entrance
will be unprofitable. Keeping well in the middle of the channel, you pass close to
the White Shoal, which runs out from the windward point of it, and, when abreast
of it, you must haul up so as to place the prow towards the second point on the wind-
ward side, so as to free yourself from the ledge which lies off the second point to leeward,
and so soon as you have this abeam on the port side, you must haul up for the
last point to windward, till you have passed the third leeward point, when you may run
round anchor between Port Dauphin and the little isle called Toumou Island, with-
out approaching near the N. E. part of the latter, because a shallow bank stretches off
it. From what has been said, it may be seen that the harbor requires no other direc-
tion than that of an eye accustomed to run in and channel through a devious passage,
and he who knows how to do this, need never get ashore here, for his eyes will
direct him when to haul and when to be a way, without particular leading marks.
From the mouth to the third leeward point you cannot anchor, from want of space to
turn the vessel, and because the bottom is of sharp rocks. The tide, at full and change
of the moon, flows here at 7 1/2 a w., and spring tides are 3 1/2 feet, but neaps only
2 1/2 feet.

THE HARBOR GUARICO, or CAPE HAYTIEN, is no more than a bay formed *The Harbor*
by the coast, and shut to the East and North by a group of reefs which rise upon the *Guarico, or*
white bank, extending outward, at this place, more than a league. Those bound *Cape Hay*
to this port ought to run from the Grange Point towards Praelot Point, outside the *ti-en*
Seven Brothers, and to place themselves so as that they may run down towards Point
Praelot, with a vessel's head to the S. or S. S. W. In this direction they may ap-
proach without fear, within the distance of a nautical day, and may wait for a pilot,
if convenient, but, if obliged to take the anchorage without one, they must steer
from Point Praelot S. E. and S. E. by E., leaving a white flag (if there) on the port
head, and which, placed upon the Northern extremity of a reef serves for a beacon,
taking care to carry plenty of sail to clear a red flag, which they will see a little after-
wards, and which must be left half a cable's length to the starboard, and so soon as
they have this flag on their beam, they may steer for the reef, and anchor in from 7
to 8 fathoms.

Those who go out from Manzanilla, or Bayaha, (Port Dauphin,) to the cape, ought
to steer to the Northward until Praelot Point bears to the Southward of the true
West, and then direct their course to the West, as convenient, for they will be clear
of the White Point off Point Praelot, but if bound to the East, they must run to the
Northward until the Grange Point bears to the Southward of the true East, in order
to clear the Seven Brothers' Bank.

The Count Chastenet de Puységur, in his directions for the coast of Hayti gives
the following for Cape Haytien, &c. These were written in 1787, but they include

some descriptions not given in the *Perrotero*, and we therefore insert them here, with a trifling correction.

"Ships bound from the Eastward to Cape François, always make the *Günge*, for the coast, in the environs of the cape, offers nothing remarkable, unless they be near enough to distinguish the hummock of *Picolet*, and the rock of that name, lying to the North, and very near the hummock. Having brought *Monte Christo* to the South, distant about a league and a half, the proper course, in order to fall a little to the Northward of *Picolet Point*, is between the W. S. W. and S. W. by W., distant a league.

"The mark is better when you approach the cape from the *Günge*, in steering W. S. W. and S. W. by W., for in this best position the hummock of *Picolet* must appear to project in the sea more than the rest of the coast. The best mark that can be given is, that the hummocks which are to the West of the road to the cape, are the highest of all this part; besides, you can distinguish in them large white spots. With some attention you will discover *Point Picolet*, which is lower than the said hummocks, and seems to lose itself among them. This point terminates the road of the cape on the West side, in coming near you desery *Fort Picolet* itself, built upon the point, at whose end lies the rock of the same name, which is not discernible at a greater distance than a league.

"So soon as you have deserted *Fort Picolet*, you steer directly against it, being you must sail very near that fort to enter the road, whose opening is bordered with dangers or keys, which you leave on the port hand in coming in. We would advise no stranger to attempt the channel without a pilot, for whom he must wait in the offing.

"At half past 10 the wind comes to the E. S. E., but it must blow from the N. E. to carry you into the harbor, for you are obliged to steer S. E., and even E. S. E. The breeze is very regular. The land wind blows in the evening, and often during the night; but, about 10 or 11 in the morning, after an interval or calm, it turns to the E. N. E. or N. E. So that at 1 o'clock, ships are able to enter the harbor.

"The city of *Cape Haytien* is under *Picolet Mount*. There is no danger in running in for *Picolet Point*, if you keep it bearing from S. S. W. to S. S. E. Should you have time to wait for a pilot, you must range along *Picolet Point*, having it about S. or S. S. W. at the distance of a short musket shot.

"*Point Picolet*, being *Point Picolet* to bear S. by W. W., and steer S. W. A remarkable mountain called the *Bishop's Cap* will then be seen directly above, being this mountain, which appears in three points, in a line with a remarkable hummock, by the water side, in the harbor, which will bear S. by W. Steering in this direction will lead to the Westward of the outer reef, named *Le Coque Aille*. The water generally breaks on this reef, which has (you had) a buoy, or white flag, upon it. Continue in the same direction, leaving the buoy at a distance of about 100 yards on the port side, until a small rock, standing detached a little to the *Picolet Point*, appears just open of that point. Now haul to the S. E. or S. E. by S., keeping the rock just open, and you will pass between the *Coque Aille* and *Le Grand Mouton Bank*, a bank having a buoy, or flag, on its Eastern edge, which is left on the starboard side. The *Point Mouton*, a danger that always breaks, and a small named *Trompense* with a buoy or white flag on it, are to be left on the port side. You must, therefore, have sufficient sail to outweather round the *Grand Mouton Bank*, giving a buoy, or flag upon it, a berth or half or two third of a cable's length, and having passed, steer for the town, and you may anchor where you please, in 8 or 9 fathoms, good ground.

"A ship cannot enter the harbor unless the wind be at N. E., as she is obliged to steer S. E. by S., and even S. S. E. The breezes are very regular, they come from the land in the evening, and very often during the night; but, at about 10 or 11 in the morning, after an interval of calm, they chip about E. N. E., or S. E. Strong North winds heave a great swell into the bay.

"The town is on the Western side, about 2 miles from *Point Picolet*, in lat. 19° 20', long. 72° 14'.

Port François
178

PORT FRANÇOIS. From *Point Picolet* the coast trends West to *Honorat Bank*, which is the North point of *Port François*, whence a reef stretches out a cable's length to the N. W. At its extremity are 3 fathoms of water. The anchorage of *Port François* is a small bay, and about 2 cables in extent. Between the points of the bay there is good shelter from the breezes. To enter you must run along the edge of the reef of *Honorat*, which is on the North side, and after having gone about 2 cables to the S. S. E., you may anchor in 8 or 10 fathoms, on a playey sand, about S. W. by W. from the fort.

Bay of Acul

BAY OF ACUL. From the South point of *Port François* a reef extends to the entrance of the *Bay of Acul*, without leaving any practicable pass. The *Bay of Acul* is extensive. It has three entrances, but the Western is the best, the Eastern

, and after having gone about
ons, an clayey sand, about S

aneous a reef extends as far
practicable pass. The Bay of
stern is the best, the Eastern

being narrow and devious. The first entrance is between Rat Islet and Sandy Islet, situated on the reefs extending from Port-Francois, and which shut in the entrance to the N and N E. That to the N W is shut in by other reefs and shoals, which, though among themselves they have only difficult and narrow passages, form an excellent channel with the West coast of the bay. The three channels into the harbor are called the East, the Middle, and the West, or Lambé Channels. To enter any one of them, it is necessary to approach on the outside of the white bank, extending along shore between Port-Francois and the Bay of Anel, until Rat Islet bears S by W by W, and as soon as you are a league from the sandy islet, you will plainly see Trois Maries Point, which is the Eastern point of the bay, and approaching nearer, you will also see a low point on the Western side, in the interior of the bay, named Point Belie, which is known by a clump of trees that is upon it. Having recognized these points, bring them in a line, and steer in with this mark, keeping by small variations at course the depth of 10 fathoms. Thus, you will run in and channel, which is not more than a cable's length wide, and the bottom of clay. On both sides of it there are white banks, with 4 fathoms of water on their edges. It is necessary to notice that you must have recognized the two points which serve for the leading mark, at 3 miles from Trois Maries Point, for, from that distance, it is necessary to come in by the mark described. In thick or hazy weather, when these objects cannot be seen at the proper distance, you must not attempt to enter by this channel. At about 1/2 cable's length within, the channel begins to widen, so that when Rat Islet, which you bore to the starboard, bears N W, you may anchor in from 14 to 16 fathoms. All the reefs which lie within Rat Island are visible.

To enter the Middle Channel, you must run outside the bank until Rat Islet bears S by E by E, and steering that course, and keeping in 9 fathoms of water, you will pass very near to some reefs which are about one quarter of a league to the Northward of Rat Islet. These are easily seen, and it is necessary to approach them within a cable's length on the port hand, and to haul up to S E, or S E by E, to pass along the North side of that which stretches to the East from Rat Islet, and which must be left to starboard. Having once got to the S E of Rat Islet, you may anchor as above stated. All the reefs show clearly, and therefore there is no danger in entering by this channel when the winds allow you to shape the proper courses, but if you cannot do this, you ought not to attempt it, as there is not room to work in. In case the wind becomes scant in the channel, you must anchor in a moment, and you will be free from danger, for the holding ground is very good, being hard clay, and you are sheltered from the S W of the sea.

The West, or Lambé Channel, is the best and widest, for you may work in it, if requisite. To enter by this channel, run outside the banks or shoals, until Point Leanne, on the West side, bears South. This point lies between Lambé and Grand Bourcaud Points. That of Lambé is the North westernmost, and has an islet at its base.

Point Leanne is easily known by the scarp of bluff rocks which form it, and from its being the only one of any elevation lying to the South of Lambé. So soon as Point Leanne bears South, steer towards it, and as you get near it you will see, to port, the breaking of a reef of considerable extent, named Copeyville, on the edge of which there are 5 fathoms of water, having recognized this reef, taking care to pass in and channel between it and Point Leanne, in 10 or 15 fathoms of water, and with nearly a S E course, with which you must run in, amending successively a little to the East to pass about 1/2 or 1 cable's length from Grand Bourcaud Point. You may then anchor in the West of Trois Maries Point. If obliged to tack, you must prolong the tacks until very near the reefs, on the supposition that their breakers afford the best marks for guiding them; and that, at the very edge of them, there are 5 and 6 fathoms of water. You may also prolong the tacks to a cable from the coast, without any risk, for, though Grand Point is foul, the reefs show above water, and have 6 and 10 fathoms up and down at their edge. The anchorage, or place which we have assigned for anchoring, between Rat Islet, Trois Maries Point, and Bourcaud Point, is not properly that which is called the Bay of Anel, but, as there is good shelter in it, those who have no occasion to make a long delay, or to discharge, may avoid entering the bay.

To enter the Bay of Anel, you must not approach Trois Maries Point nearer than 3 cable's length, for it is foul and shallow, and as soon as you are past it, steer towards the point of Morne Rouge, (Red Hill) on the East, which you may pass at about half a cable's length, in order to give a berth to a shoal which lies off Belie Point, opposite. Having passed Morne Rouge Point, you will see a fine cove, on the same side, called Lambert Cove, in which you may anchor in 7 fathoms water, at about a cable's length from the shore. From this cove, Southward, into the interior of the bay, there are many shoals; and no one should pass the cove who has not a practical knowledge of them. In the route above described, you will always find from 10 to 15 fathoms of water, on clay.

Between Trois Maries Point and that of Morne Rouge, in a line with them, and

about half a mile from the first, there is a shoal of small extent, which you will see by taking care to go on not less than 10 cables length from Point Maria. From the inner to the outer shoal, the slope is from east to west. From Point Maria you may anchor in a bay between the two points. The anchorage at the Lombard Cove is a natural one. In Vent Bay it is difficult to get a way, the best is on the Eastern side of the cove, between Point Maria and Marie Ramp Point.

POINT VENTURE (POINT VENTURE) or **POINT VENTURE BAY**. Four leagues from Point Maria, follows the Bay of Venture, which has a round bottom, lying rather further out than that of Point Maria. It is very useful to make the bay in order to direct yourself to Choucheon Bay, which is 2 miles Westward. In this bay, there is a good depth of water, 10 fathoms, in case if you must keep towards the East point, which has 8 fathoms close to it, and as soon as you have passed it, and the vessel begins to lose headway, you may anchor. At the moment you enter under the point, the breeze ceases, and the little you have come ahead. This happens even when the wind is very fresh without the bay. In the West of this bay there is a small one, called La Riviere, where, on South layer Cays, which has both depth and room for small craft only.

POINT LA GRANGE. Four miles Westward from the Bay of Choucheon, about Four leagues, on the former Bottom 100 fathoms broad, and the West point, which is named Palmarie, is distinguished by a chain of rocks extending nearly a league to the West, and thence to Point La Grange. Land by Grange is a good roadstead, and in case, not necessary, a stop of the line may take in it, for throughout it there is not less than 10 fathoms water, and at least a cable's length from the shore. To come in it, you may pass in at the East point, and anchor in about the middle of the bay, on a clayey sand. At a short league Westward from Palmarie Point lies that of Longe. The cove between is a shoal, with sunken reefs, which extend half a league out to sea.

PORT PAIX. Eight miles from Point La Grange is that of the Couronne, which the N. with a wind, be all end of this part of the coast, and which, from a distance, may be mistaken for Point La Grange. The coast between is very clean. From this point the coast trends S. W. by S. to form the cove of Port Paix. To enter here you must avoid the East shore, because from a point which has a little to the N. E. of the town a reef stretches out about a cable's length, and runs directly without it there is a depth of 12 fathoms, with very sand. To avoid this reef, keep in the middle of the entrance, which has only 4 cables length in breadth, and anchor to the N. W. from the town, in 14 or 15 fathoms, on a clayey sand, about a cable and a half from the shore.

CHANNEL OF PORT PAIX. Nearly North from Point La Grange is the East point of Point de l'Empereur, which extends nearly East and West, and in that direction, about a league in extent, but only one from N. to S. All the North side is irregular, and steep, and the South side is, for the most part bounded by a shallow shoal and reefs. The only good anchorage in Point Paix is that of Basseterre, on the South side, at a league and a half from the East point. It is formed by the shore and the reefs which run out from it, and no vessel drawing more than 10 or 12 feet can come in. The passage is narrow, but easy to fetch. You must clear the weather reefs as you enter, leaving them on the starboard hand, and stand N. N. W. and N. to double the reef, you leave on the port hand. Do not be afraid of coming near the land, and anchor in good ground, so soon as you have brought the fore foot to bear S. W. Every breeze may come to anchor outside of the reef, upon white ground a mile to the west of Basseterre.

To go Eastward at Basseterre, towards Portugal (or the East Point), there are several bays or coves, in which boats or schooners may anchor, but nothing of consequence.

The channel which the Isle of Fortune forms with Hyatt, is 6 miles wide, and fit for every class of vessels which may commodiously beat in it, and often with great advantage, for getting to windward, when the currents are at run to the Eastward, which they do for the greater part of the year. For rarely, and only during the months, do they change their direction to West. In the latter case, it is necessary to beat round Northward, and get it in 7 leagues from the Fortune, to beat to windward. When beating in the Fortune Channel, you ought to stand on within less than a mile of the coast on every tack, for to go to the east the current is stronger, and the wind more favourable, than in and around. As there are several bays on each side, the setting of the current is neither in them, nor in the same direction. You will sometimes see it run in numerous directions, and some times, in the middle of the channel, it will run contrary to the current inshore.

PORT PAIX (PORT SAINT NICOLAS' MOLE). Four leagues from Port Paix, or Port Mouton. The coast between is clean, and full or scarp'd. Port Mouton has severely an opening of 1 cable's length, its bottom is no good, and much to be desired, which render it necessary to examine it with the lead before you let go your anchor, for between the two outer points you cannot find bottom with 10 fathoms of line.

Port Paix

Directions for ships bound to Cape Hayton, &c. from the Westward

In advancing from the Westward towards Cape Hayton, pass the N. E. part of Tatum Island a good berth, and after you get to windward of the East end of the Island you will describe the cape.

The land to the West of Point Park shuts to the Northward, a low point, and rises gradually towards the South to a high mountain, with a sugar loaf top, and then it

declines on the same side to a large valley, whence it rises quickly to a prodigious high mountain, smooth at the top, and the highest land in this part of Hayti. The high land after this, to the Southward, is of sugar-loaf form, with a little one to the South of it, which are both 10 or 12 miles in the country. The next high land, or point, which is seen by the water-side, is Cape Haytien. The land, at first, makes like a saddle; but on nearer approach, a low point will appear, which shuts from the Eastward the Eastern part of the saddle land. This is Point Pirolet, or the Cape Land, the extremity of the cape already described.

The Western coasts of Hayti or St. Domingo, between St. Nicolas' Mole and Cape Tiburon.

In proceeding from St. Nicolas' Mole, as already observed, you will descend to the Southward the Pointe du Cap au-Foux, or Fools' Cape, which lies 5 $\frac{1}{2}$ miles to the Southward of St. Nicolas' Point; and the coast thence trends 2 $\frac{1}{2}$ leagues more, nearly in the same direction, to the Pointe de la Perle, or Pearl Point.

This part of the coast is steep, without any shelter; but here it is generally a calm. The currents inshore set to the Northward, and 2 leagues in the offing, to the W and W.S.W.

*Platte-
forme, or
Platform
&c.*

PLATTE-FORME, or PLATFORM, &c.—From Point de la Perle, the coast rounds to the South eastward and East, to the Point of the Platform, which is at the distance of 3 leagues from the former. This point is easily distinguished, as well by its flat form as by its being the Southernmost of this part of the island. The anchorage is before a small sandy cove, at the bottom of which some houses are seen. You anchor near the shore in 8 or 10 fathoms, weedy bottom. At this place water may be obtained after rains, but there is none to be had at other times.

To anchor under the Platform, bring its Southernmost point E. by S., the Westernmost point in sight W.N.W., the watering-place N.N.E. Then come to in about 9 fathoms. In deeper water the ground is foul; and the nearer the shore the clearer the bottom. The bank is very steep for 2 cables' length. Without, 10 fathoms soundings will not be found. The bay is very convenient for cruising ships to heave and boom to in, &c.

From the Platform Point to Point Pierre, on the South side of the entrance of the Port of Gonaïves, the bearing and distance are E. 18° S., 10 leagues. The point is high and steep, and all the coast between is safe, and may be ranged very near. There is anchorage, even for large ships, at Henne Bay and at Port Piment, but it ought to be used only in case of necessity. In the winter months there are tempests or gales of wind almost every night, coming from the S.E., some of which are violent; and unless you have business on this part of the coast, it is best to stand off 2 or 3 leagues, so that you may, with any wind, keep to the Westward.

Gonaïves

GONAÏVES.—The bay of Gonaïves is very large and fine, the anchorage excellent, and the entrance very easy. You range along the shore, at half a league or 2 miles distance, steering nearly East, and let go your anchor in from 10 to 6 fathoms, *ooze*. You will find from the entrance under Gonaïves Point, which is low, and one mile East of Point Pierre, 15 and 12 fathoms; the water decreases as you get into the bay. When you are a good half league from the land, and 2 miles from the Debarcadere, (or landing place,) you will have 6 fathoms. After you have doubled the point, leaving it on your port hand, you will see Fort Castres on a point of land, which you must not approach too near, as there is a key that lies about a mile South of the point.

Observe that from the South point of the entrance, a reef extends to the N.E. to the distance of a quarter of a mile. It is nearly steep to from 6 fathoms.

The harbor of Gonaïves is an excellent one, and capable of containing any number of ships of the largest size completely shut from all winds; it is of very easy access, and generally clear, excepting a small reef that extends about 2 cables' length from Fort Castres, on the North side. The latitude of the town is 19° 26' 41", and its longitude 72° 11' 7" W. Var. 5° 50' E., 1817.

Ships intending to anchor at Gonaïves, and having advanced to Point Pevis, on the North side of the entrance, will gain soundings in 15 or 16 fathoms, and have the town in sight, bearing about E. by N.; they may proceed for the town on that bearing, keeping in mid-channel or any way near it; then soundings will be very regular. When well up the harbor, you will see Fort Castres, which stands on the North side, on the top of a small hill, about one mile without the town. When this fort bears N. by E. & E., you will have 7 fathoms in mid-channel, fine soft mud. When it bears N. by W. & W., in 5 or 6 fathoms, this seems to be the best anchorage, and as close in as a ship-of-war ought to go. You may go so far up the harbor as to have Fort Castres bearing N.W. in 4 fathoms; but the best anchorage is with it bearing N. by W. & W., and the middle of the town E. & N., nearly in mid-channel.

The soundings all over the harbor are so very regular, that it is not necessary to

, that it is not necessary to

have marks for running in and out by; but in the event of having to bent with the sea-breeze, you must not stand too near Fort Castres, as there is a small reef extending from it to the Southward: the mark for keeping clear of this reef is a large tree behind the town on with the Northernmost houses, bearing E. by N.; but this reef stretches to so short a distance that a ship will scarcely stand so near the shore as to touch it. In standing to the South side of the harbor, give the shore a good berth until without the inner point, and after that you may stand from shore to shore, by your lead, with safety.

ST. MARK.—From Point Pierre, without the entrance of the bay of Gonaives, *St. Mark* the distance to Cape St. Mark, in a direction nearly South, is nearly 7 leagues. A league and a half to the Northward of St. Mark's Bay is a low point, which appears at a distance like an island, and forms a cape that is called La Pointe du Morne au Diable, or the Devil's Bluff Point: it points out the mouth of the River Artibonite, which falls into the sea 2 miles Northward of the point. There is an anchorage the whole length of this coast for small vessels only.

Cape St. Mark is high, and of a round form: you will desery at a great distance the hillock which forms it, and stands only one mile from the seashore.

The opening of the Bay of St. Mark lies to the North of the cape: it extends one league within the land, and the water in it has a great depth. Ships anchor in the bottom of the bay under the town, in 15 or 18 fathoms of water; small vessels may come into less water, but they will be very near the shore. In the South side of the bay is a piece of foul ground, extending 2 miles from a bluff point to the S. E., and on which a reef stretches out about 2 cables' length from the coast.

The following Description of the Navigation between the Platform and St. Mark, is given by Capt. Hester, an English navigator.

"About 9 leagues Eastward of the Platform is the fine bay in the harbor of Gonaives. All along this coast you are sure, about 10 o'clock in the forenoon, to have the sea-breeze, which lasts till night, and then you have the wind off shore; therefore you may stay till that time, before which there is little or no wind at all. If you intend to go into Gonaives, you must keep a good distance off the South point, which is that for a considerable distance. When you are about the point open with the bay you will desery a small island, which you must leave on your port side, and run in with your lead in 10 or 12 fathoms of water. You may also run along close by the island, if you choose, in 4 or 5 fathoms.

"About 2 leagues to the Southward of Gonaives is Artibonite Point, and 2 leagues further South, Artibonite River. In sailing from Gonaives to the latter place, it is good to keep your lead; for, as you come near the river, you will find the water shoalen to about 4 fathoms, and after that deepening again to 7 or 8 fathoms.

"This place is very remarkable, the land being high and uneven, and a bold clear shore all along to the Northward, from the Platform to Gonaives. When you have run 8 or 9 leagues E.S.E. } E., you will see the land ahead, or Eastward, very low by the water-side, and prodigious mountains over it; this low land reaches from Gonaives to the Southward of Artibonite River, about a mile; and its South end, somewhat higher than the rest, appears like a table-land, overgrown with weeds and green trees; this is the Devil's Bluff: round its South end is the Bay of St. Mark, the other part of which you can see to the S.W. of the Devil's Bluff. To anchor off the river, bring the South end of the low land to bear South, 3 miles distant; and, as you run in, you will see five or six small houses by the water-side; bring them to bear E.S.E., 2 miles; then the river will bear S.E. On the starboard side, or the South side of the entrance of the river, there is, likewise, a small hole, which you may see. Be sure to keep these bearings, and you will be upon a fine level bank, where you may anchor in what water you please, from 20 to 6 fathoms. But if you go within 2 miles of the shore, you will drop off that bank from 6 fathoms to 20 the next east, then 50 or 60, and then 90 or 100 fathoms, w. In less than half a mile of the shore, and from that to 5, at once. When you are at anchor at Artibonite, you may see the Platform, bearing W.N.W., about 10 leagues.

"Artibonite River is not a place of great note, because it ebbs almost dry at low-water; neither is there any town in this place, but only some plantations, 5 or 6 miles up the river; there you can have good water, but no wood. The sea-wind comes on at noon, at N.W., until 10 at night, and the land-wind at E. by S., until 8 in the morning."

From St. Mark's Point the coast of Hayti trends nearly S.E., true, 6 leagues, to La Soufriere, or Vases Point; and thence E.S.E., 5 leagues, to Port au Prince. The coast is generally even and bold, and you may run along it at the distance of a mile, in 10, 15, and 20 fathoms water. In proceeding thus, you will first perceive the magazine of Moutroun, and afterwards the villages of Arcubais, or Arcubaye, and

Boncasin; and finally the city of Port au Prince. Off the coast, at about half way between St. Mark's Point and Port au Prince, are three small islets, called the Areadins, which are situated at nearly a league from the shore, and separated by channels about half a mile in breadth. Near these islets, on every side, the depths are 5 and 6 fathoms.

To the E. by S. of Boncasin, and very near the coast, is Montou, or Sheep Key. A passage ought never to be attempted within this key; near it, on the outside, the coast is clear, and water deep. About 2 leagues to the Southward of this island is the roadstead.

Foso: this to the N. E., and Laurentin Point to the S. W., form the entrance of the bay of Port au Prince. To the Westward of this roadstead is an extensive bank, with a cluster of islets, of which the Easternmost is distant about 2 miles from Foso Roadstead, and the Southernmost 3 miles from Laurentin Point. There are, besides, two other islets, which lie almost in the direction of the two points of the bay, and which are 4 miles from Foso Road, and 2 from Laurentin Point.

Port au Prince

PORT AU PRINCE.*—The shore at the bottom of Port au Prince is very foul, and has a large group of islets. These form the inner anchorage; and to go in this, the aid of a pilot is indispensable; but the Grand Road is without the reefs, and may be entered without a pilot.

Those bound to Port au Prince from the N. W., after having made St. Mark's Point, may slope their course, either to pass between the Areadins and the coast, or between them and the island Gonaive: the first appears to be the best route, for thus the foul grounds on the S. E. side of Gonaive must be avoided: it is also to be observed that the wind in the channel is generally from the N. E.; the nearer, therefore, you pass to the main land, the more free will you run to the Eastward.

Again, almost every afternoon in the rainy season there are torridoes in the channel, which compel vessels to lie to, and to keep on boards or racks, that they may not fall upon the reefs of Gonaive. If you can foresee the gale, it will be best to gain an anchorage near Arcahais Point, and there ride it out; or, you may anchor to the Northward of Leogane, on the South side of the channel, upon the ground extending from Gonaive Island, as shown in the chart.

When past the Areadins, your course will be about S. E. by S. to get near Laurentin Point. If caught by night to the Eastward of this point, here you may anchor. From the point to the anchorage of Port au Prince the distance is 4 miles, and to make it you must steer towards the city, and anchor about half a mile outside the islets in 10 or 15 fathoms.

The channel between the Areadins and coast is 2 miles wide, and in the middle of it you will never have more than 28, nor less than 10 fathoms. The water deepens towards the Areadins to 6 or 8 fathoms, corally ground; at the same distance from the opposite shore is the like depth, with muddy bottom.

From Pearl Point the entrance of St. Mark's Channel, midway between Cape St. Mark and the island of Gonaive, the course and distance are S. E. 4 E., 16 leagues. This will bring you to the Westward of Cape St. Mark, for which you may steer, or, you may continue the same course 6 leagues further, which will lead clear of the Areadins.

Should it be night when you enter the channel of St. Mark, you should steer S. S. E. 4 E., in order to clear the Areadins and the Eastern end of Gonaive Island. Having run about 4 leagues on this track, the course will be about S. E. by E. 3 leagues, to make Point Laurentin, which is on the South side, to the Westward of Port au Prince. You may range along this coast without fear, only avoiding the shoals of the sandy key, which lie at a short league Northward of the point. Should you pass this point in the night, you would do right, after you have run a mile, or a mile and a half, to anchor; you will find 12 or 18 fathoms water, the ground good, and the water always smooth.

You may be forced to turn in this channel, but you must not go so near to the Gonaive as to the St. Domingo side: the latter being safe, may be approached anywhere, within half a league.

The Areadins, as before noticed, are not to be feared; a short stretch is on from them a mile, or half a league at most, with 5 or 6 fathoms of it; on the edge of the West and S. W. sides you will have from 12 to 15 fathoms, corally ground. The latter is good ground to be found in 8, 12, and 13 fathoms, coarse sand and shells.

Gonaive Island.

GONAIVE ISLAND.—The greatest length of Gonaive Island is 10 leagues E. S. E. and W. N. W.—its breadth, which is very regular, is nearly 2 leagues.

This island was surveyed in 1787, by M. de Lieude de Sepinauville, who has given the following description of its coasts and the adjacent dangers:

* See Plan by Com. R. Owen, published by E. & G. W. Blunt, 1833.

Seymourville, who has given
ngers:

The most dangerous reefs are those which lie to the S. E. of Petite, or Little Go-
nave, which is situate near the S. E. point of the great island. These seem to be
joined with the land of the Little Gonave, and stretch more than a league into the
offing, being at about 800 fathoms, or nearly a common English mile from the shore.
A vessel may pass, in an urgent case, between them and the Little Gonave, but the
attempt would be imprudent, especially if the wind be not well set in, as the currents
are very strong and irregular. I have observed, however, that in this part they run
more generally to the N. N. E., and between the two Gonaves.

Small vessels, drawing 8 or 9 feet water, may find a good anchorage to the West of
the Little Gonave, which may be best entered from the Southward.

The N. E. point of Gonave, called Gallet Point, is low, and bordered with a reef,
which stretches along the East coast, towards the South, and extends 1,100 toises,
(617½ English fathoms,) opposite the place called Trou a Feu, or Water Hole—
within is a wide ground, where there are from 4 to 6 fathoms of water.

To sail near this reef, which every vessel can do that draws 9 or 10 feet, you must,
mening from the East, take a channel which is opposite to a fisherman's hut.
There are several other channels, which are easily known by the non appearance of
white ground. About 88 fathoms within the reef, you may range along the coast as
far as Anse a Gallet, or Gallet Cove, in case the wind should fail. There is anchorage
everywhere; but the places to be preferred are Byron Cove, Cosentin's Hole, and
especially Gallet Cove, which are very convenient; the hold is good, and the reefs
shelter you from the swell of the sea.

The several anchorages on the North coast, for boats or schooners, are L'Isle a
Mare, Grand Lagoon, and Bohem's Channel, where you are equally sheltered; the re-
minder of the coast is likewise bordered with reefs, but they are very near the shore,
and you find there no anchorage.

The Western part is an iron bound coast, along which you may range pretty near;
but it is not so from the S. W. point of Pointe a Retomes, where you may find a num-
ber of small detached reefs, almost even with the water. Several small vessels may
anchor in that part, on the spot named Les Baleines, or the Whales, but not without
a pilot well acquainted.

The only place where two or three large ships, such as frigates, can anchor, is La
Baie du Parc, or Park Bay, which lies to the N. W. of Pointe Fantastique, the South
point of the island; but coming into it is dangerous, on account of several detached
reefs, which are never seen.

ROCHELOIS.—The reef called Rochelois had been fatal to many ships, its true
situation having never been well ascertained; it lies in the channel which separates
the South coast of the Gonave from that of Hayti. M. Le Compte de La Luzerne
ordered me to survey, and determine the position of that reef. I went and anchored
within a cable's length of the rocks, which are above water; I hauled on these rocks,
where I took four observations of Latitude, as well as the bearing of all the objects in
sight; and having measured the whole extent of the shoal, I found its breadth to be
2000 toises, (2130 fathoms,) in a direction N. and S., nearly, and its length 3155 toises,
(3350 fathoms,) from E. to W.

The rocks, called Progues, which are towards the middle of this reef, were already
known; I found their extent to be 125 toises, (133 fathoms;) they are quite uncovered
at low-tide, but three heads only are perceived at high-water. M. Le Compte de
Chastenet Puysegur, who had occasion to explore the extent of this reef, says, in his
account of the navigation along the coast of St. Domingo, that the rocks which show
themselves at low-water, are the only things to be feared on the Rochelois—but I have
found two other shoals of very small extent, which are very dangerous, since they have
only 2 fathoms water. They lie to the N. W. of the rocks in the middle, one at 800
toises distance, and the other at 300. There may be some other dangers on the
Rochelois, but I could not make myself sure of it, having been only four days on that
expedition. Prudence requires that, with a large ship, you should avoid it entirely—
there is more room for tacking to the North of that reef than to the Southward of it—
you are only to keep at the distance of one mile, at least, from Gonave, if you pass by
the North; whereas, in passing by the South, you may range along the Haytien coast,
which is clear and safe.

The latitude of the middle of the Rochelois, deduced from four observations, is 18°
37' 20" N.

PORT AU PRINCE, to the WESTWARD.—On leaving Port au Prince, when *Port au*
bound to Petite Gonave, you may range along the South coast, at the distance of one *Prince*
or two miles, all the shores being bold and safe, as far as Point Leoganne.

From Point Lamentin to Leoganne Point, there is no anchorage; but you will find a
good bottom for anchoring between the latter point and the anchorage off the town of
Leoganne.

From Leoganne, the coast trends to the South, and forms the bays of Grand Gonave

Rochelois

Port au
Prince

and Petite Gonaive, which are separated by a point and a hill, named the Tapion, or Hummock of Gonaive. You enter into Petite Gonaive Bay, by leaving on the port hand an islet which is very near the coast, and which lies to the North of the town; to the Westward of this islet you may anchor in 9, 12, and 15 fathoms. Petite Gonaive is 10 leagues from Port au Prince; but, as you are forced to double Point L'Ange, the run is longer.

Miragoane

MIRAGOANE.—From the Hummock of Petite Gonaive to the Tapion du Trou Chouehou, or Hummock of Miragoane, the coast runs West, 8 miles; thence W. 4 S., 6½ miles, to the careening island, or Miragoane Bay.

Bound to Miragoane, and off the West end of Gonaive, give it a berth of 3 or 4 miles, and steer E.S.E. or S.E. by E.; or keep the Gonaive side of the channel best on board to clear Rochelois. Steer up in the same way until the highest hummock on Gonaive bears North. This hummock is the Western part of the table-land, so called, and from the West end of Gonaive appears like a high mountain. When this highest land bears North, steer S. or S. 4 E. for Miragoane. The land about Miragoane may be known by a remarkable clearing up and down the side of the mountain, presenting the appearance of a long narrow grass field scorched by the sun. This is 6 or 7 miles to the East of the town. Continue standing in for this mark until near the land, when the town of Miragoane may be seen to the Westward.

To anchor at Miragoane, you come within a mile of the careening island, when you perceive a small town at the foot of a mountain, and some mangrove islands to the Westward. You keep the mid channel between the first islet and the shore, where the village is situated, and come to an anchor within, in from 18 to 8 fathoms, sandy bottom. This anchorage ought not to be taken without a pilot; the channel is not more than a cable's length in width, and you must anchor so soon as you are within.

From Miragoane Careening Island, the coast bends in, and forms the Bay of that name. It is shut in on the North by Frigate Island, a small islet, from which a white shoal extends half a league to the Eastward, and nearly North, to the anchorage at Miragoane; which obliges you, in coming in or going out, to keep the island shore very close aboard. From this place the coast trends West, to the village of Rochelois, which is situated at the foot of a large hummock.

From Miragoane, the coast to the Westward is clear and deep; and beyond Rochelois, are seen the towns of L'Anse-a-Veau and Petit Trou. From the last, the coast forms a large bay, Baradaïres.

Baradaïres Bay.

BARADAÏRES BAY.—From the village of Rochelois to the entrance of the Bay of Baradaïres, the coast runs W. 5 leagues. Baradaïres Bay is formed on the S.E. by Rôtelets Point, and on the N.W. by the Bee du Marsonin, or the Porpoise Snout, these points bear from each other nearly N.W. and S.E., 4 miles. Near the East coast of the bay there is an island, with several islets, which send out a reef and shallow, that almost join the Western coast, leaving a pass, or channel, of only 5 or 6 cables' length in breadth. To proceed into the bay, you keep along the peninsula of the Bee, and come into from 8 to 10 fathoms. There is a good depth of water in the middle of the bay, which is of great extent; but there are several weedy shoals, which prevent you going in without a pilot, well acquainted.

The Caymites.

THE CAYMITES, &c.—The Northern extremity of the Bee du Marsonin, and the North part of Grand Caymite Island, bear nearly W.N.W. and E.S.E., 4 leagues.

The coast West of the peninsula of the Bee bends in to the Southward, and forms a bight; thence, rounding out a little, it trends W. by N., as far as Point Jeremie. This bight and Grand Caymite Island, form a large bay, called Caymite Bay, where there is very good anchorage for all sorts of vessels. You may come to it without a pilot, and anchor under the island, in what depth you choose. You may also proceed to Planard's Bay, near the peninsula, ranging along the peninsula side, and anchor opposite a sandy beach, in what depth you please.

The Bay of Caymites presents several very fine anchorages, very easy to come at with the assistance of the lead alone; but there is not a good passage between the Grand Caymite and the shore; and you will not find more than 13 feet water upon the white shoals of the Little Caymite, or of Fougard Islet; and then there are several coral rocks, which rise within 2 or 3 feet of the surface of the water, so that no vessels but very small ones, ever attempt it without a pilot. These white shoals extend 3 leagues W.S.W. from the Grand Caymite.

Jeremie.

JEREMIE.—From the North point of the Grand Caymite to the Point Riviere Salée; or Cape Rosa, which is 1½ league W.N.W. of Point Jeremie, is 9½ leagues, this Salt River Point is the Northernmost point Westward from Port au Prince. Under Point Jeremie is the village of that name, whose anchorage is very small, and not proper for large ships; schooners and small vessels may anchor within the reef, but no ships which draw upwards of 12 or 14 feet should ever anchor here, except in case of necessity, there being no shelter for them; in short, it is a bad anchorage, which must be avoided during the Norths.

From Cape Rosa, or Salt River Point, to Cape Dame Marie, or Donna Maria, the coast trends W. S. W., 13 miles.

All this shore is safe and bold within a quarter of a league; it does not present any shelter, although, in case of necessity, you might anchor in the Anse a Claire, or Clair Bay, which is 1 league from Salt River. This bay, or rather cove, is so very small, that two ships, 100 feet long, would be embarrassed by each other: it can only serve as a shelter to very small vessels, and is easily discovered by keeping along shore.

CAPE DAME MARIE, or DONNA MARIA.—So soon as you desery Cape Dame Marie, by the false cape of that name, and are half a league distant from it, you will strike soundings of from 15 to 18 fathoms, and may range along this cape at the distance of a quarter of a league, in from 8 to 10 fathoms, weedy bottom.

To anchor in the Bay of Dame Marie, you must keep the shore on board, steering about S. E., the wind being generally adverse; and with your lead you come to an anchor W. N. W. of a large white tapion, or hummock, on which stands a battery, and within a musket shot of which you will find 5 fathoms. There is anchoring bottom all over this bay; a mile from the shore you will have from 1 to 6 fathoms, and at 2 miles, from 6 to 10. You will be sheltered from the winds between the North and South, passing by the East; notwithstanding which, ships that lie in 8 or 10 fathoms will feel the swell, if there is a fresh breeze without. In entering, keep about half a mile off, but not less, in order to keep clear of a reef which extends to the length of a cable and a half to the West from the cape. Preserve this distance from the coast until past the False Cape, to the Southward of Cape Dame Marie, and which is also foul. When once past False Cape, you may haul to the wind, which is generally sent in the bay, to get the vessel's head to S. E., with which course, and keeping the lead going, you may gain the anchorage as above.

From Cape Dame Marie the coast runs S. by W., 5 leagues, to Pointe des Trois, and forms, at that distance, several bays and coves, where vessels may anchor. In general, a frigate may run in along this coast with her lead, and anchor in any part, there being no shoals, or any danger under water, the ground gradually increasing towards the shore.

To the S. by W. of Cape Dame Marie, 2½ leagues distant, and about half a league off Point Ministre or Minister Point, are some rocks, called Les Balenes, or the Whales. These rocks are above water and surrounded with a white shoal, which does not extend more than half a cable's length from them, and on which are 4 fathoms. A ship can sail between it and the shore. In the mid channel she will have 6 fathoms, and may go as close as she pleases to take them on the off side. The sea always breaks on this shoal.

One league to the S. S. E. from the Whales lies Pierre Joseph's Islet, where a cove may anchor. The anchorage is very good and easy, and large ships anchor to the S. W. of the islet.

All along this Western coast you have ground at 2 leagues from the shore, the depth gradually increasing as you leave the land; so that, in general, you will find 4 and 5 fathoms, at one mile distant; 10 or 12, at 2 miles, and regularly from 15 to 17, at 3 miles. When you get into 30 fathoms, you will lose soundings suddenly.

POINTE DES TROIS, or IRISH POINT, as the English sailors call it, is the Westernmost point of Hayti. It is not very high, though remarkable from a small hummock on its extremity, which appears detached from the coast, and makes like an island. This point forms the North part of the Baie des Trois, or Irish Bay. You may range very close to the land on the North side of the bay, there being from 9 to 18 fathoms touching the shore.

The anchorage is to the N. W. of a black rock, which is seen a little way to the Southward of the town. It is in from 9 to 10 fathoms, shelly ground. You may anchor likewise to the Southward of the rocky islet, N. N. W. of a small hummock, towards the middle of the bay. The depth is here from 8 to 9 fathoms, sandy and muddy ground.

The bay is exposed to Southerly winds. There is always a great sea within, and the Barbadaire, or landing-place, is of course a bad one. It is situated in the eddy of the currents, which set to the Northward on the West side, and to the S. E. on the East coast. Besides, the sea in the eddy is alternately agitated with violence by the N. E. and East breezes, which prevail on the West coast, and by the S. E. winds that blow on the South coast. Trois Bay is terminated to the South by Cape Carresse, which, with Cap-an-Foux, or Fools' Cape, forms a large roundish point, whose end is at Cape Tiburon.

CAPE TIBURON.—These three capes, seen at a distance, form but one, which is called Cape Tiburon, and is very easily known by its form and height. It is a large mountain, very lofty, whose top is rounded like the back of a dosser, or French hand basket, and comes gradually down towards the sea.

*Pointe de
Trois, or
Irish Point.*

*Cape Tibu-
ron.*

Cape Tiburon, properly speaking, is 5 miles S. 25° E. of Irish Point, and forms the entrance of Tiburon Bay, which is to the Eastward of it. Its situation is Lat. 18° 19' 25", long. 71° 27' 32". You will get no ground at 50 fathoms, 2 cables' length from the coast, between Cape Curasse and very near Cape Tiburon; but off the latter, at that distance, you will have from 24 to 30 fathoms, and a little further out, quickly lose soundings.

On the North shore of Tiburon Bay, the water is deep to within 2 or 3 cables' length of the rocks, and within half a cable's length you have 6 and 7 fathoms, stiff clayish ground. On the East and S. E. shores you have 4 and 1½ fathoms, fine muddy ground, within a cable's length all round. The edge of soundings runs as the bay forms, half a mile from its head. You may anchor anywhere in the bay; but bring Point Bargas, the South point, (which is foully S. by E., and the pitch of Cape Tiburon W. N. W., in 4 or 5 fathoms. From that to 8 or 9 is very good ground. Wooding and watering in plenty. You may either land your casks, and roll them over a narrow neck of land into the river, or fill them in your boats with buckets.

The Windward Channel between Hayti and Jamaica.

By the Windward Channel is meant that channel which lies between Hayti on the one side, and Cuba and Jamaica on the other. The coasts which form it on the East and North have already been described, and the coasts of Jamaica are described hereafter. The breadth of the channel between Cape Tiburon, in Hayti, and Morant Point, the Eastern end of Jamaica, is 31 leagues, in a W. S. W. direction; and to the Northward of this line is the little isle called Navaza, and a dangerous shoal bank, called that of the Formigas; to the Southward is a bank of soundings, but clear of dangers, and the Morant Keys, with their surrounding bank. These we shall describe in order.

Navaza.

NAVAZA is about 2 miles in length, E. S. E. and W. N. W., and about 1½ mile broad at its widest part. Lat. 18° 25' N., long. 75° 2'. It was surveyed in 1803 by Mr. Francis Owen, Master, R. N., who says, "This island is a flat level rock, apparently of volcanic origin, is above 300 feet in height, and covered with small shrubs. It may be seen on a clear day from the deck of a line-of-battle ship, about 7 leagues. Every part thereof shows a rocky perpendicular cliff, except a small space on the Northern side, which is but little above the surface of the sea. From the Western extremity of the island, a coral reef stretches to the Westward about 100 fathoms, on which are only 27 feet, with 15 fathoms all round it. In every other part there are 12 fathoms water close to the shore. On the Western and Southern sides, soundings from 16 to 40 fathoms, sand, extend to the distance of three-fourths of a mile, on which you may anchor and be smooth in a strong sea-breeze. On the North side the bottom is rocky, and the bank does not extend beyond half a mile. In crossing this island, on its Eastern side, at the distance of about one-third of a mile, you will have 34, 25, and 18 fathoms; and at half a mile, 38, and soon after no ground with 75 fathoms. At the distance of 13 mile from the East end, no bottom will be found with 230 fathoms. The N. W. end bearing N. or N. by E., and the S. E. point E. S. E., or a little more Southerly, you may anchor in 16 fathoms, fine sand, about half a mile from the shore. There are great quantities of sea-fowls on the island; and round the rocks, cod and red-snappers in abundance. Between Navaza and Cape Tiburon there is a small bank of fine white sand, with plenty of fish thereon. The depth is from 14 to 16 fathoms, with the following bearings: Navaza, W. ½ S.; Cape Tiburon, E. S. E. ½ E.; and Cape Dame Marie, N. E. ½ E., by compass.

From Navaza to Cape Dame Marie, the bearing and distance are N. E. by E. ½ E., 11 leagues.

From Cape Tiburon to Morant Point, which is the East end of Jamaica, the bearing and distance are W. S. W. ½ W., 31½ leagues; and from Navaza to the same point, S. W. by W. ½ W., 23 leagues.

The Formigas, or Ants.

THE FORMIGAS, or ANTS, are some dangerous coral spots upon a sand-bank, nearly 9 miles in length, extending in a N. E. and S. W. direction, about 10 leagues to the Westward from Navaza. Its Eastern part bears N. E. by N., 40 miles from Morant Point, Jamaica; and from the body of the shoal, the N. E. end of Jamaica bears S. W. by W., 38 miles. The Eastern part is the shoalest, not having in some places more than 13 or 14 feet of water. The edge here is nearly steep to, and there is generally a great swell upon it. In standing over the bank, when the depth increases to 7 or 7½ fathoms, there will be a sudden increase to 13 and 15 fathoms, and thence no bottom at 20. On the Eastern edge the bottom is dark, and not easily seen in hazy weather; but to the Westward the water is discolored, and appears lighter.

The centre of the bank is about 18° 30' N., and 75° 40' W. The fall of the high land over Plantain Garden River, which is the Easternmost high land on Jamaica, bearing S. W. by S., leads directly on the bank.

THE MORANT KEYS.—These keys, which lie at the distance of 32 miles S.S. *The Morant Keys*
E. from the East end of Jamaica, consist of four low islets or keys, situate in form of
a crescent, and are surrounded by a dangerous reef. They are named N.E. Key, Sand
Key, Savanna or Bird Key, and S.W. Key. You may approach within 21 miles of
any of them. The reef on the Eastern side is a most dangerous ledge of coral. The
keys lie between lat. 17° 21' and 17° 28', long 75° 55'. To the N.W. of them is good
anchoring ground, in 5 or 6 fathoms, white sand and shells. To anchor, give the N.E.
Key a berth of 14 or 2 miles; and when the S.W. Key bears S. by E., steer directly
for it, and you will pass close to Westward of the rocky spit that extends to the
Westward from the N.E. Key, and has but little more than 3 fathoms over it. When
the N.E. Key bears E. by N., or E.N.E., you may haul more to the Eastward, and an-
chor with the S.W. Key bearing S., or S. by W., and Savanna Key, the next to it, S.
E., in from 5 to 6 fathoms, sandy bottom. As there are some spots of coral, it is re-
quisite to ascertain that the bottom be clear.

These keys are only 7 or 9 feet above the water. The body of them lies from
Port Morant, Jamaica, S.S. E. $\frac{1}{2}$ E., about 14 leagues. With the keys bearing S.W.,
nearly 4 miles, there are about 18 fathoms water, stony ground, mixed with fine red
speckled gravel. With them S.W. by S., about 4 miles, there are 16 fathoms; and
when S.S.W. $\frac{1}{2}$ W., 6 miles, there are 23 fathoms, with ground as above.

In order to ascertain when you are to the Eastward of the keys, observe that Mo-
rant Point, or the East end of Jamaica and the N.E. end of the same, bear from each
other N.W. $\frac{1}{2}$ N., and S.E. $\frac{1}{2}$ S., so that when the North-east end, which is high and
bluff, is to be seen on that bearing, or to the Westward of it, you will be to the East-
ward of the keys.

Also, when coming in from the Southward for Jamaica, by keeping Vallah's Hill,
hereafter noticed, to the Northward of N.W. $\frac{1}{2}$ N., you will pass clear of the keys to
the Westward.

Be very cautious on approaching the keys in the night, lest you be driven on them
by the current.

In turning between the Morant Keys and the East end of Jamaica, there is a good
league of turning ground; and as it seldom happens that the land is not discovered
before night, its bearing may direct in turning or sailing.

The coconut trees formerly on Morant Keys have been cut down, and there is
not a shrub of any kind to be seen, except a few small coconut bushes on the N.E.
key. Very great care should be taken in approaching the N.E. Key, on either side,
as it is foal to a great distance off; and vessels intending to anchor at the keys
ought not to come on the white water at all, that is, to the Westward of the N.E.
key, until they are far enough to the Southward to have the South part of the N.E.
key bearing E. by N.; they may then haul up to the Eastward of Savanna, or
Bird Key, and when it bears S.E., and the S.W. Key S., or S. $\frac{1}{2}$ W., anchor in 5 or
6 fathoms. If it is necessary to work up to this anchorage, with the wind East, you
may stand to the S.W. Key by your lead, not going nearer than 5 or 6 fathoms; but
the reef off the N.E. Key is steep to, and you will have 6 fathoms at one end, and
the next 3, or perhaps less; therefore, in working up, keep the point of the N.E. Key
always to the Northward of E. by N., after you are in the white water.

Directions for the Windward Passages, including those for sailing to and from Jamaica, and thence to New Providence, Havana, Europe, &c.

Ships from Europe, when bound to Jamaica, generally take the broad and safe
channel between the islands and Guadaloupe, but they may pass it with equal
safety between St. Bartholomew's and Saba, or St. Eustatius, and thence make the
parallel of 17° 20' to the Southward of Hayti, or on the meridian of 70° W. When
thus far advanced, they may continue W. $\frac{1}{2}$ S., until they make Altavella, or the Little
Mount, which lies off the Southern point of Hayti, as already described. They will
thus avoid the dangers in the vicinity of Neiva Bay, towards which there is frequently
an undercurrent, as before noticed.

Should you happen to miss Altavella, you may probably make the land of Jacquemel,
or Jacmel, before described; or, if not, with the next great promontory, of which
Point Abacon and Point a Gravois are the extremities. Jacquemel may, as already
shown, be distinguished from sea by the sudden cut-off or drop of a hill, seen over
another long hill at the upper part of the harbor. This mark leads directly to the
harbor's mouth.

The Isle a Vache lies to the Eastward of Point Abacon, and forms the channel to
Aux Cayes, &c. From Altavella to the East end of the Isle a Vache, the bearing and
distance are W. by N., 12 leagues. From the East end of the Isle a Vache to Point
Abacon, W. by S., 14 miles; thence to Point a Gravois, W. $\frac{1}{2}$ S., 24 leagues.

When off at sea, abreast of the Isle à Vache, the middle of a saddle mountain over Port St. Louis bears nearly N. by E., and then the Eastern end of Isle à Vache is between it and the ship. The island is low, though hilly, and lies so under the land of the main, that is not distinguishable from it at any considerable distance. At 6 leagues off it appears, as already said, like an assemblage of small islands. The water towards it shoals gradually.

The saddle mountains over St. Louis, which are called the Grand Anse Mountains, are the second high range from the West end of Hayti. The Westernmost, which is highest, may be seen in clear weather 30 or 40 leagues off, on both sides of the island. Observe, however, that after noon the exhalation of vapor is sometimes so great as to render them invisible. Be cautious, at such times, of making the land, lest you run on the dangers of the Isle à Vache.

From Point à Gravois to Cape Tiburon, the bearing and distance are N.W. by W. $\frac{1}{2}$ W., 43 leagues. The land about Cape Tiburon is so high as often to be seen at more than 20 leagues off.

Morant Point, the Easternmost extremity of Jamaica, already noticed, bears from Point à Gravois W. $\frac{1}{2}$ S., 42 leagues; and from Cape Tiburon W.S.W., 31 leagues.

In running for Jamaica from the West end of Hayti, or the Isle of Albavilla, be cautious of running too far North, lest you should get on Morant Point, this point being very low. In thick hazy weather it may possibly be approached so near as to be difficult to weather; the wind setting right on, and the current always going to the East. By keeping the proper parallel, ($17^{\circ} 45'$) you will run down without danger, and close to Yallah's Point, off which you are sure to meet with pilots, who will conduct you to Port Royal Harbor, if required.

Sailing Directions for the Coast and Harbors of Jamaica.

Morant Point Light.

MORANT POINT.—On this point there is a revolving light, 113 feet above the level of the sea, which can be seen in clear weather 24 miles. Yallah's Hill bears from the light-house W. $\frac{1}{2}$ S.; North-east Point, N.W. $\frac{1}{2}$ N.; and the Morant Keys, S.S.E. $\frac{1}{2}$ E., 33 miles distant. Latitude, $17^{\circ} 56'$ N. Longitude, $76^{\circ} 41'$ W.

Morant Point to Kingston.

MORANT POINT TO KINGSTON.—The Southernmost high land of Jamaica to the Eastward of Port Royal, is Yallah's Hill, which is very remarkable. The middle of this hill is 20 miles to the Eastward of Port Royal Point. When the full of this hill bears W. $\frac{1}{2}$ N., a W. by S. course will carry a vessel a league or more to the Southward of the East end of the island, which is very low. The latitude at noon will be a guide; for when Yallah's Hill bears W. $\frac{1}{2}$ N., 11 or 12 leagues distant, the ship will be in lat. $17^{\circ} 50'$ or $17^{\circ} 54'$.

Should you make the Southernmost high land, bearing W.S.W., 9 or 10 leagues distant, when bound to the South side of the island, you must haul up S.W., to clear the East end, which will not be in sight at a greater distance than 4 leagues; and observe, also, that a current frequently sets to the Northward around this end of the island.

From off Morant Point, or the East end of Jamaica, when bound to Port Royal, ships should keep at a distance of 4 miles from shore, until past Morant Bay, as the coast from the East end to the Southward of Rocky Point is lined with a reef that stretches nearly 2 miles outward, and over a part of which the sea generally breaks.

To the Westward from Rocky Point the coast continues rocky to about one mile from the shore, as far as Morant Bay; it is then clear to the white cliffs called the White Horses, off which there are some rocks, at about half a mile from shore.

From the White Horses to Yallah's Point, the distance is one league. In running down, when the former bear North, and Yallah's Point West, you will have soundings, and frequently see the bottom in 7 $\frac{1}{2}$, 8, 9, and 10 fathoms; and on approaching Yallah's Point, the water will be found to deepen until you lose soundings.

From Yallah's Point to Cow Bay Point there is no danger; the latter is bold to, as well as all the coast to the Westward, as far as Plum Point. The course and distance between the two points are W. by N., 8 miles; but should you be 3 or 4 miles from Cow Bay Point, you must steer more to the Northward.

Plum Point is the S.E. point of the Palisadoes; you may run in boldly for it, and approach its extremity within half a cable's length, having nothing to fear until abreast of it, or between it and the Middle Ground, in the entrance of the Eastern channel to Port Royal.

When you have brought Rock Fort N. by E., you will come on a cross ledge without the entrance of the channel, and must then bring the leading-mark on, which is the North part of the Apostle's Battery and the magazine of Port Charles in a line.

This mark is to be kept on until you are abreast of Lime Key. When thus far advanced, steer a little to the Southward towards Raekham Key, giving Lime Key a good berth, until Port Royal Point comes open between Gun Key and Raekham Key. Now steer in mid-channel between these keys, and immediately after passing them proceed directly towards Port Royal Point, till you bring the fall of Yallah's Hill on the centre of Gun Key, which will bring you between the Knoll and Port Royal Point; you may approach the point within half a cable's length, and by sailing close to it you will also pass between it and the Harbor Knoll, which lies to the Westward about the length of $1\frac{1}{2}$ cable, with 19 feet on it.

Having passed the point, steer to the Northward till the Admiral's Penn comes to the North of Gallows Point. This mark leads you clear of Old Port Royal, where you may anchor abreast of the dock-yard, or even before you come to it. With a land or North wind, the channel between Gun Key and Port Royal is to be preferred: then the Twelve Apostles' Battery on the South angle of Fort Charles leads you clear of Gun Key Reef.

Strangers, in case of necessity, may pilot their ships down to the anchorage in the channel, even when the marks are not to be seen, as nothing is to be feared on the side of the Palisadoes, which is low and bushy. They must only keep within half or three-quarters of a mile from Plum Point, and steer down by the Palisadoes, till they bring Lime Key to bear S.S.E., or S.E. by S., then they anchor in 15, 16, or 17 fathoms, near the middle of the channel.

SHOALS IN THE EASTERN CHANNEL OF PORT ROYAL.—The most remarkable shoal in the Eastern Channel is the Middle Ground, or Eastern Middle Ground, which lies $1\frac{1}{2}$ mile S.S.W. from Plum Point; it consists of two patches, the rocky bottom: the East patch having 12 feet, and the West patch (about 70 fathoms to the W.N.W. of the other) having 9 feet; they are divided by a narrow wash, 10 fathoms deep, and both break with strong sea-breezes.

A beacon with a small triangle, about 50 feet above the level of the sea, has been erected on the Palisadoes, between Great and Little Plum Points. A light bearing N. by W., by compass, or in one with Kingston church, it will lead clear of the Eastward of the East Middle Ground.

You may sail within the Middle Ground, or without it to the Southward, as necessity requires; but to the Northward is the best and safest channel. The soundings in that channel are uneven, from 7 to 19 or 20 fathoms; but when you are past the Middle Ground they are regular, from 19 to 13 fathoms, between Raekham and Gun Keys.

The first key you meet with, in steering from the Middle Ground towards Port Royal, is Lime Key, from the North end of which a reef stretches about a cable's length; your eye is the best mark for it, as it is generally seen; to the Westward of the key lies another shoal, with 8 or 10 feet upon it.

The Knoll of Port Royal Point is the third shoal; it is a small hard coral bank to the Southward of the point, with only 16 feet water upon it. If your ship draw 12 or 13 feet water, you must be careful to keep clear of it.

To go within the Knoll, the leading-mark is to bring the highest bush on Gun Key (which is near the middle of it) in one with Yallah's Point; you have then 10 fathoms water, and the channel is 70 fathoms wide. The mark to strike the Knoll is the South point of Gun Key, on the high hill of Yallah's, or a ship's length open of Yallah's Point; the best mark is the church on the seventh or eighth embrasure of the fort, Sandy Key just open with Lime Key, and you will have 16 or 17 feet of water.

To go between the Knoll and the Western Middle Ground, which lies about 300 fathoms to the South-westward of it, the leading-mark is True Land's Hummock within Yallah's, on the Southernmost part of Gun Key, or Yallah's Point well open to the Northward of the North point of Raekham's Key. This channel, which is the widest, and has 12 fathoms of water, is mostly used when taken with the land-breeze.

The anchorage is good all over Port Royal Harbor; but the best anchoring for ships that are bound for sea, is in 9 fathoms, with a notch on the East side of a high mountain, called the Leading Notch, a little open to the Eastward of Fort Augusta, and Raekham Key in one with Port Royal Point.

SOUTH CHANNEL OF PORT ROYAL.—To go to sea from Port Royal, you may make use of the South, or the New Channel; the small craft generally go through the East Channel, but it is to be avoided by large vessels, unless they are privateers, and have a strong land-breeze or North, with an appearance of its lasting long enough to carry them through.

When bound through the South Channel, you should get under way with the land-wind, as soon in the morning as you can see the marks, observing that the current then sets most commonly to the Westward. The general leading-mark is the Leading Notch in one with the magazine of Fort Augusta, which is the Easternmost building of the fort. This mark leads ships of 16 or 17 feet water clear through; but

for heavy ships, the notch should be kept very little to the Eastward of the magazine until Hellshire Hummock comes open with Fort Small.

To keep well to the Westward of the Middle Ground, be careful not to bring the church steeple upon the corner of the wall with embrasures, until Yallah's Hill is brought in one with Lime Key. In case you should not see Yallah's Point, look out for a hummock on Hellshire, and when it is open of Salt Pan Hill, you will be to the Southward of the Middle Ground.

The Middle Ground is a large coral bank, which often breaks, with only 3 feet on it in the middle; the North and West sides are almost steep. On its N.W. edge lies a buoy, whose marks are, Port Royal tower on the fourth embrasure of Fort Charles, counting from the Westward, and Hellshire Hummock on the flag-staff of Fort Small.

When you have opened Hellshire Hummock with Fort Small, you steer out with the Leading Notch a little to the Eastward of the magazine, which carries you between the Drunken Man's Key, the Turtle Heads, and the South Knoll; or, to avoid these heads, you are to haul up so as to bring the church steeple to the Easternmost part of the fort, and continue to keep that mark until the South Key is brought on with Yallah's Point. Then you may haul to the Westward, if the wind will permit. But if you should not keep up the leading-mark, and the church steeple should come near the corner of the fort, you must then come to, or tack and stand in. The mark, when ashore on the Turtle Heads, is the church steeple upon the magazine of the fort, and Spanish Town land just open.

When Maiden Key is open a ship's length to the Southward of Drunken Man's Key, you will be to the Southward of the South Knolls, and should bring the Leading Notch in a line with the magazine, which will bring you close to the Westward of the Little Portuguese, in 8 or 9 fathoms: when Yallah's Hill comes to the Southward of South Key, you are clear of the Portuguese, and may haul to the S.E., giving South Key a berth of about a mile.

Drunken Man's Key is a narrow ledge of rocks just above water, covered with some loose sand, that gives it the appearance of a sand-bank. To the Southward of it, about half a mile, there is a shoal which breaks with strong sea-breezes; and between it and Drunken Man's Key is a channel, having 6 or 7 fathoms of water.

The Turtle Heads are three dangerous spots, with 10 or 11 feet of water on their shoalest part, and deep water close to them. The South Knolls, to the S.E. of these heads, are two small patches, about 70 fathoms asunder, with 23 feet water on them. And to the S. by W. of these lies One-bush Reef, which always breaks, and is almost steep to. The Three-fathom Bank is a large coral shoal, with 19 or 20 feet of water, which breaks with strong sea-breezes. A small patch, about a quarter of a mile to the S.S.E. of it, has 20 feet of water; it is called the Warrior's Bank.

The Little Portuguese is the Southernmost shoal on the Eastern side of the South channel. It has from 22 to 39 feet water over it, and in general a great swell.

When Portland makes an island open about three-quarters of a point, or a point, with Hellshire, you will be to the Southward of the Three-fathom Bank and Warrior's Bank.

It frequently happens that the land-breeze fails before a ship can get clear of the channel; and there is sometimes a long interval of calm between the land and sea breezes. Should this occur, it will be requisite to anchor so soon as the breeze fails, or there will be danger of being set, by the swell, on the Three-fathom Bank or One-bush Reef. By inattention to this precaution, there have been instances of ships slipping or cutting their cables, when the sea-breeze has come on, and running into Port Royal for safety.

The best anchorage is within the length of the Little Portuguese, with the Leading Notch a little open to the Eastward of the magazine of Fort Augusta. Then, if the wind changes Southerly, a ship may easily return to Port Royal, or, with the common sea-breeze, may proceed to sea.

When clear of the channel, if bound to leeward, you may steer S. by W., or not further than half a point more Westerly, in order to avoid some shoal spots that lie to the South-eastward of Wreck Reef.

Wreck Reef always breaks. This danger lies about a mile, or little more, to the S.E. from Hellshire Point, and is about a mile in length from N.E. to S.W. There is a channel for small craft between it and Hellshire Point. About a mile to the S.W. of the reef there is a shoal spot of 34 fathoms, with 7 fathoms around it.

To sail through with the sea-breeze.—Ships of war, or those that sail well, may safely proceed to sea from Port Royal, if they can lie S. by E., or a little to the Eastward of it, if the foregoing precautions be strictly attended to. When through the channel, soundings will be found of 10 and 11 fathoms, if steering S. by W., until Portland bears W.N.W.

The shoals in general, when the sea-breeze prevails, may be distinctly seen from the mast-head. They appear of a brownish color, being covered with large branches of coral. The greatest part of them are very steep, having a depth of several fathoms close to them. The bottom of the channels between is mostly soft mud or clay.

Ships bound to windward from Port Royal, if they can weather the Middle Ground
or the time the sea-breeze comes on, may pass through the Eastern or Windward
Channel, and thus they may gain 6 or 7 miles more to windward than by going through
the South Channel. Small sloop-rigged vessels generally pass this way; but to
others it is hazardous; because, if the land-breeze fails, with an interval of calm, a
swell may come on ahead, and be extremely dangerous.

NEW CHANNEL OF PORT ROYAL.—The New Channel lies to the East-*New Chan-*
ward of the South Channel, and almost parallel to it; it is preferable, on many ac-*nel of Port*
counts, to the South Channel; it has smooth water till you come to South Key, with
Royal
good anchoring-ground, easy riding, and a facility of going to sea to the Southward
with the sea-breeze as far as S. E., &c.

The leading-mark to enter this channel, is a remarkable flat hummock on the moun-
tain to the N.N.W. of Port Royal. When the middle of this hummock is in a direct
line with the white house standing to the N.W. of Fort Augusta, it leads to the
Westward of the harbor and Point Knolls, as well as between the East edge of the
Western Middle Ground and the West end of Bachelman's Key Shoal. Steer with
these marks on until a remarkable round billock, to the Westward of Stony Hill bar-
racks, comes open to the Eastward of Gun Key.

After you have opened this hummock, you steer away to the Southward, keeping it
open until a saddle in the mountains to the N.W. comes in a line with Fort Small.
Then you bring the same hummock on the centre, or West edge, of Gun Key; which
marks carry you to the Westward of the shoals on the East side of the channel, and
about a quarter of a mile to the Eastward of the Great Portuguese. As soon as Port-
land appears like an island, you may haul to the Eastward, being clear of the reef and
shoals of South Key.

The shoals in this channel are: 1. The Western Middle Ground, (on the East side
of which there is a buoy,) and the small shoals to the Southward of this ground.

2. The Great Bay Shoal, which has 16 feet least water, and a floating beacon, in 18
feet.

3. The Four-fathom Knoll is a very small spot, with no less than 24 feet water on
it, and deep water all around. Ships of 20 feet draught may sail over it, as the water
is smooth.

Between Great Bay Shoal and South Key Breakers there are two shoals: the
Northernmost, at about half a mile S. by W. from the former is steep, and a small
part of it appears just above the surface of the water. This shoal always shows
itself by the rippling on it. About half-way between this and the breakers lies the
second shoal, having only 16 feet of water.

The South Key Breakers have a buoy upon them. The marks for the West edge
of this reef are, the Leading Notch open a little to the Eastward of the capstan-house,
and a saddle-mountain to the N.W. and Fort Small in one.

Half a mile to the Southward of these breakers is the Eighteen-feet Reef, remark-
able by the great swell upon it. To the Westward of that reef lies the Great Portu-
guese, which is the Southernmost shoal on the West side of the channel.

The preceding description of, and directions for, the South Channels, may be con-
sidered as more for the use of the pilot, than of the general navigator. Captain Liv-
ingston remarks, "I think the Derrotero is right in omitting directions for any of the
channels at Port Royal, Jamaica, excepting the Eastern one, as directions for the
Southern channels are absolutely useless; because no one who is unacquainted
ought to be fool hardy enough to attempt carrying any vessel in or out, except by the
Eastern channel, even with the most correct instructions an almost accurate chart."

OLD HARBOR, LONG'S WHARF, &c.—Mr. Leard's directions for these har-
bors are as follows: Being clear of the South or New Channels, steer to the South-
ward, or S. by W., and give Wreck Reef a berth of 2 miles; and then edge away, and
along the fall of Braziletto Hill to bear W. 4 N., or W. by N., and steer for it; this
will lead you to the Southward of the foul ground off the Pelican Keys; and as you
approach them you will see Pigeon Island, which is low and bushy, in a direction
of the fall of Braziletto Hill; keep it so, and pass the Pelican Keys in 7, 7, and 6
fathoms; and, as you steer down with those marks on, you will see a remarkable hum-
mock on the mountain to the Northward, called Cudjoe Hill; it is like a jockey's cap.
When this hummock comes on the West extremity of the slant fall of Goat Island,
and will bear N. 4 W., then haul to the N.W. by N. for Old Harbor. This last mark
leads you clear to Westward of Dry Shoal, part of which is even with the surface of
the water, and you will see it.

You will have from 63 to 6, or 54 fathoms; and, after you have passed Dry Shoal,
continue steering N.W. by N., and you will deepen your water to 8 fathoms; and
as you approach Careening Key will shadden it to 7 and 6 fathoms. You must
give Careening Key a berth of nearly half a mile, to avoid a reef that runs from it to
the South-east; and steer direct for the wharfs at Old Harbor, and anchor in 14

*Old Harbor,
Long's
Wharf, &c.*

or 4 fathoms, keeping clear of the reef on the South side of the harbor, which generally shows itself.

The most frequented and best channel for entering into this great bay, is between Pelican and Bare-bush keys, and to enter it, those who come from Cow Point must steer W S W $\frac{1}{2}$ W, 9 leagues, until the slope of the Braziletto mountain bears W by N. With this mark and bearing you proceed to Pigeon Island, &c. The Braziletto mountain cannot be mistaken, it being the Northernmost of the two which are seen to the West, and the Southern is of a round shape. The opening which these mountains form, is the point to be used as the leading mark, bearing W by N, as above. *Derrotiro, &c.*

*Buoy
Long's
Wharf and
Salt River.*

There is a black buoy on the S W, Pelican spot. *Long's Wharf and Salt River.* If you are bound to Long's Wharf, in sailing to the Northward of Pigeon Island, there is a small white shoal of only 18 feet; it shoals gradually on the East end, and bears North from Pigeon Island, distant one mile. The South edge of Round Hill just open with the Braziletto Hill leads on it. You may sail between this shoal and Pigeon Island, in 8, 7, 6, or 5 fathoms, but to the Northward is the straightest course. After passing Pigeon Island steer to the North west and bring the top house about one third from the North side of the large opening or gap in the mountains; this mark leads between the reefs to the anchorage at Long's Wharf, in 4 or 33 fathoms.

*Salt River
Anchorage*

Salt River Anchorage. If you are bound to Salt River, after passing Pigeon Island, keep the South part of Braziletto Hill open a little on your port bow, which will lead you close to Salt Island; you may go either to the Northward or Southward of Salt Island, but the North passage is the best. You may pass within a cable and a half's distance of Salt Island, on the North and West part, on the South part is a reef which shows itself, and is steep close to. There is a reef extending along on the East side of Long Island, which you see, and also a reef extending from the Salt River shore to the Eastward, which sometimes breaks. Therefore, steer round the North end of Salt Island, at about 3 or 23 cables' distance from it, and then steer towards the entrance of Salt River, until you bring the South edge of Pigeon Island almost in a line with the South edge of Salt Island. Keep them in that direction, and when you are in 14, 1, or 3 fathoms, anchor, according to the size of your ship. If you are in a low vessel, it will be necessary to go a little up the stream to see Pigeon Island over Salt Island. The South end of Pigeon Island, a little way to the Southward of Salt Island, leads on the edge of the Salt River Reef. There is good anchorage under the West part of Salt Island, in 5 fathoms, good holding ground.

Peake Bay.

Peake Bay. To sail into this bay, give the reef that runs off Rocky Point a head of a cable's length, or more, and steer towards the North part of the sandy beach, and anchor in 1, 4, or 33 fathoms, good holding ground. The reef off Rocky Point, and the reef on the South side of the bay, are nearly even with the surface of the water, so that you generally see them. There is a great sea in this bay with strong sea breezes.

*West Har-
bor.*

West Harbor. The entrance into this harbor is between two coral reefs, that are nearly even with the surface of the water, and the heads of coral frequently show above water. The channel between the reefs is above half a mile wide, with 6 fathoms in it. There is very good anchorage, with smooth water, just to the Westward of the North reef, in 3, 5, or 1 fathoms, good holding ground. The lead to the Westward does not show any mark to guide you into this anchorage, but it is not difficult. As you go to the Westward in the West harbor, the water shoals to 2 or 9 feet. It is also shoal on the South side, towards the mangroves, and smooth water.

*Going to
sea.*

Going to Sea from Old Harbor, Long's Wharf, &c.—Ships generally get under way with the land wind, so as to get clear of the reefs near the anchorage before the sea breeze comes on. Being clear of the reefs, you may turn out with the sea breeze, and may go on either side of Pigeon Island. The channel between Pigeon Island and the reef of the Half moon keys is 2 miles wide, with deep water; but the smooth water is to the Northward of Pigeon Island. You may stand towards Goat Island or Cabarita Point, by your lead, (the soundings are gradual,) and tack when you come to 5 or 13 fathoms. If the sea breeze should be very strong, you may anchor near the Shoal, and wait for the land wind. But with moderate sea breezes, any ship may turn out between the keys and reefs. Being as far to the Eastward as Dry Shoal, and standing to the Southward, your leading mark for the channel between the bare-bush key and Morris' Shoal, is Cuploe Hill, on the blunt fall of Goat Island, the best mark us for Dry Shoal; keep it so until the Half moon keys come in one; then stand to the Eastward of Morris' Shoal, and may edge away a little, keeping the Cuploe Hill about a large sail's breadth on the lower part from the blunt of Goat Island, and your mark will lead you along the white water on Bare-bush side to sea. But if the

ing to the Southward from Dry Shoal, you find that you cannot weather Morris' Shoal, which you will know by the fall of Cudjoe Hill not being within a sail's breadth of the fall of Goat Island; in this case you must tack to the Northward when Bare-bush Key bears E. S. E., or when a saddle hill to the North, west of Pigeon Island is just coming on the North end of Pigeon Island. And in standing to the Northward, tack when the fall of Braziletto Hill comes on the centre, or near the North end of Pigeon Island; you may approach the white water on the side of Bare-bush to 5 fathoms. There is a good channel between Morris' Shoal and Hill moon keys; but it is dangerous to approach the latter on the South east side, for you will have from 6 to 7 fathoms to 12 feet, in one or two casts of the lead. To the E. S. E. and S. E. of Bare-bush Key, distant about one mile, are some spots of coral, with from 3 to 5 fathoms on them, and 7 fathoms close to them. And to the Southward and S. S. E. of the Portland Keys, distant about 2 miles, are some spots of 3 and 4 fathoms on them. After you have passed those keys in sailing to the Westward, come to anchor Portland than 2 or 2½ miles, or 7 or 8 fathoms; for the reef off Rocky Point, which is the West part of Portland, extends nearly 2 miles from the point to the southward.

It is said, that about thirty years ago ships sailed over Morris' Shoal; if so, it must have grown fast, for there is not at present more than 9 or 10 feet on the North edge of it, and a great swell in general. Marks for the East end of it—Cudjoe Hill, about half way from the fall of Goat Island, upon the low and bushy land towards the rising to the Westward, (this rising is commonly called Little Goat Island,) and the Hill moon keys about 1 open, and North part of Bare-bush Key bearing E. 4 S. Marks for the West end are, Cudjoe Hill, on the before mentioned rising of Little Goat Island, and Bare-bush Key bearing E. 1 S. It is in length little more than a quarter of a mile, and in breadth about one sixth of a mile, and shoals too suddenly for your lead to be a guide in standing towards it.

PORT ROYAL, TO PORTLAND. In proceeding towards Portland, observe that *Port Royal*
Wreck Reef, which is a large shoal composed of dry rocks and breakers, lies about *to Portland*
half way between Port Royal and Old harbor, at the distance of more than a mile from the shore. This danger, which appears in the day, consists of two parts, lying between them a channel of 4 fathoms water. Ships passing in the night should approach no nearer than 12 fathoms, nor come to an anchorage until morning. Within the reef there is good shelter, and tolerable anchorage, in 4 and 5 fathoms, bottom of sand, with shells and mud. Here vessels occasionally ride during the prevalence of a breeze, &c.

From Port Royal to Portland, the distance, on a circuitous course, is 9 leagues. In this track, when clear of the South Channel, give Wreck Reef a berth of 2 miles.

There are soundings outward as far as with the Easternmost end of Hell-hole bearing N 4 E., and Rocky Point, or the Southernmost land of Portland, N. W. 3 N. With these bearings, soundings have been found of from 17 to 23 fathoms, and the nearest no ground at 20 fathoms, although not a ship's length from the bottom.

The Pedro Keys.

THE PORTLAND ROCK is elevated from 15 to 20 feet above the level of the *The Port*
sea. H. M. S. Winchester rounded it on the South side, and brought it to bear East, *land Rock*
carrying from 10 to 11 fathoms water, on a sandy bottom, with pieces of coral. In this
being a vessel might anchor with safety in moderate weather.

We made the latitude 17° 7' 23" N
— — — — — longitude 77° 25' 20" W.

which is only 20' difference from De Mayne's meridian distance reduced, he having considered Port Royal in 76° 52' 28" W., whilst we use 76° 49' W.

We stood from the Portland Rock to the S. W., carrying from 12 to 15 fathoms, and making these soundings further to the Southward than had been by the chart. We saw the Eastern Breakers, so called by De Mayne; they appeared to have an extent of about 2 cables' length, with two small rocks above water, and were breaking in mild quarters.

Near these the water shoaled to 8 fathoms and a half; and when they (the rocks) bore N. E. distant 1 mile, we had only 7 fathoms, the Pedro Keys just then coming in sight. Steering W. by S., we soon after had no bottom, having got into the shoal, as shown in De Mayne's chart, so that the shallowest water we had must have been very near the edge of the bank.

We did not go nearer than a mile and a half to the Eastward of Pedro Keys, and had no soundings with the land lead; but the chronometers gave the centre of the middle of 77° 47' 13" W., or 58° 13' West of Port Royal.

The South-west breakers.

THE SOUTH WEST BREAKERS.—They are dangerous, and require a strict lookout. The sea breaks over two small rocks, not more than 3 feet above the level of the sea, constantly, but so irregularly, that from the deck of a vessel, and in a moderate breeze, a high breaker might not be distinguishable oftener than once in 5 minutes, and the ordinary ones would be taken for waves. In the *Wmchester*, with a good mast head lookout, we passed within 3 miles of these, without their being discovered.

On the West side they are bold to. Having stood to the Northward on the bank, passing them at the above named distance, we carried 11, 12, and 10 fathoms for 6 miles. When the breaker bore S. S. W. about that distance, we tacked, and stood for it; and when about 3 miles distant, the soundings became irregular, varying from 11 to 84 fathoms.

We were at noon as near to it as one mile, bearing East, and we had not less than 9 fathoms.

The whole breaking part does not extend more than 1 or 1½ cable's length; but it is to be supposed there is foul ground to the Eastward of it for a mile or so. The ocean color of the water above it is remarkable even in soundings, and I should befor this reason cautious in approaching it to the Eastward.

Latitude of South-west Breaker 16° 47' 56" N.
Longitude of do. 78° 40' 32" W.

or 1° 21' 32" West of meridian of Port Royal, which is nearly a mile to the Eastward of De Mayne's reduced.

The Pedro Shoals (Byora Bank of the Spaniards) have been regularly surveyed, and the representation of them in the chart is to be relied on. Of the Cascahel, or Rattlesnake, which is supposed to distinguish the N. W. end of the Pedro Bank, it does not exist, as there has been an accurate survey of the bank, and it was not to be found.

Carlisle, or Wither-wood Bay.

CARLISLE, or WITHER WOOD BAY, to the West of Portland, is an open bay, winds from W. to S. E. Its S. E. extremity is the rocky point of Portland, from which a spit of 12 feet water, extends about three quarters of a mile to the S. W. Westward of Rocky Point is a bank, called Robertson's Shoal, on some part of which there are only 6 feet at low water. The outer edge of this shoal is one mile and a half West from Rocky Point. The form of the shoal is nearly oval, from E. to W. Its breadth N. and S. is three quarters of a mile.

To sail into the bay, bring a remarkable round hill to bear nearly North, and steer for it until Rocky Point comes almost on with the East point of Portland. Here, rounding Robertson's Shoal, you may come to an anchor in from 5 to 4 fathoms. With the hill above mentioned N. by E., there is a spot of 3½ fathoms at about 2 miles from the beach. With the fort N. E., or N. N. E., is the best place to anchor in for loading, because your boats can sail both ashore and aboard with the sea winds. No tides here, but a strong Westerly current generally runs in the offing. Air 65 to 80 E.

Along the coast to the Westward, to the distance of nearly 20 miles from Carlisle Bay, at a mile or a mile and a half from the shore, there is a regular depth of 13 or 14 fathoms.

Alligator Pond Key.

ALLIGATOR POND KEY—Alligator Pond Key is a key just above the surface of the water, with a reef all round it. Its distance from the shore is about 1 mile, and vessels may approach it by the lead, or on seeing the breakers. There is good anchorage for small vessels along shore, between it and the main, in 3 and 4 fathoms.

Briene Bank.

BRIENE BANK, a small bank, having on it a little more than 4 fathoms, with 12 or 13 close to it, lies 6 miles S. E., by compass, from Alligator Pond Key. The shoal is about a mile and three quarters in extent, from East to West, and one mile and a half in breadth. It has from 4 to 6 fathoms water on it, and the outer edge is about 5 miles from the shore.

Pedro Bay.

PEDRO BAY, &c.—In Pedro Bay, to the Westward of Pedro Bluff, there is good anchorage for any vessels, but it is open to Southerly winds. The lead is here the best guide for anchoring. The coast hence to the Westward, nearly to Parrot Point, is bold to. Off Parrot Point is a small reef; and to the N. W. of this point a Black River, which is formed by extensive reefs. To clear these reefs, keep Pedro Bluff open with Parrot Point.

Entrance of Black River.

The entrance of Black River is between two reefs, and has not more than 8 feet water. To sail into the river, when advancing from the Eastward, keep Pedro Bluff open of Parrot Point, till you bring the church on with a gap in the high land, or to bear N. E.; then steer directly for the church, which will carry you into the best of the channel. It is full of heads of coral rocks.

PORT ROYAL TO BLACK RIVER.—On leaving the South Channel of Port Royal, when bound to the Westward, you may clear Wreck Reef by keeping the muzzle of Port Johnson open of St. George's Rocks, until Portland bears West; thence you may alter your course along the land, as there are no dangers to be apprehended until you approach Alligator Key, about 4 miles S. E. & E. from which is the Brine Reef, already described.

Pedro Bluff is very remarkable, and may be known from any other land on the coast. At 4 or 5 miles to the Eastward of the bluff, there is a remarkable white spot on the cliff, called the White Horses, which, when you first make it from the Eastward, appears like a schooner under sail, close to the land.

From Parratee Point to Larina Point, the bearing and distance are N. W. by W. 4 W., 9 miles. The coast between forms the bay of Black River, which is obstructed by a number of reefs, all of which lie within the line of the two exterior points, and a course N. W. by W. & W. will therefore lead clear of them. The bay does not appear to have been regularly surveyed. The main channel, which is between two reefs, has only 18 feet of water.

If going to Black River, or its bay, when advancing towards Parratee Point, take care not to approach the point nearer than one mile, as there is a reef extending off to the S. W. nearly a mile. Your leading marks into this bay, to the anchorage where merchant ships land, will be the church just open to the Eastward of a large cotton tree; run in with this mark, until you are within half a mile of the town, and anchor in about 18 feet. Large ships, that cannot approach so near the town, should anchor under the Eastern shore, in 8 or 9 fathoms. Your best mark for anchoring, is Pedro Bluff shut in about a cable's length of Parratee Point, in 9 fathoms, with the town bearing about N. E. by E. & E. There is a very dangerous reef lying on the Western side of this bay, with only 4 feet of water on the shoalest part. There is also a coral bank nearly in the middle of the bay, with only 2 fathoms over the shoalest part.

From Larina Point the coast continues clear for a league and a half to the N. W., but it thence becomes foul, and so continues to Bluefield's Bay, &c. The direct course and distance, clear of danger, from Larina Point to South Negril, the S. W. end of Jamaica, are W. N. W. 1/2 W., nearly 10 leagues.

South 4 leagues from Bluefield's, lies a rocky bank, discovered in 1821, with from 13 to 20 fathoms on it.

BLUEFIELD'S BAY.—This part of the coast is environed by reefs, and the anchorage here for large ships is without a rocky ledge which stretches from Crab Pond Point to the West of Bluefield's, and joins the reef of Savanna la Mar. Vessels coming from the Eastward to anchor in the bay, must keep down by the outside of the reef, or keep the land to the Eastward open of the point, until the leading mark is brought on, which is the overseer's house a little open to the Eastward of the tavern, bearing N. E. by E. & E. For anchoring, bring the overseer's house and tavern in a line, N. E. by E. & E., and the Easternmost point E. S. E. Ships drawing 16 or 17 feet water, may sail over the rocky ledge, in 34 or 4 fathoms, with the overseer's house and tavern as above, until over the ledge, which may be known by finding a sandy bottom, and a depth of 54 or 6 fathoms. The watering-place is to the Northward of the Bluff Point, on the lee side of the bay. Water may also be obtained at a stream off Bluefield's River, near the tavern.

In steering in, keep the lead going, and be ready to anchor, as the water shoalens rather suddenly.

SAVANNA LA MAR.—The coast from Bluefield's to Savanna la Mar is rocky, in some places, to the distance of 2 miles from the shore. The entrance to Savanna la Mar is very narrow, and lies between a small reef called the Middle Ground, (on which there is a depth of only 4 feet,) and another reef having 7 or 8 feet over it. In the channel there is a depth of 19 or 20 feet. The leading-mark in is a large gap on the highland, called the Dolphin Head, in a line with a remarkable large tree on the lowland to the Eastward of the town, and bearing N. 4 W. This mark leads close to the Middle Ground, which will be seen. After passing the latter, haul to the Eastward, and anchor in 7, 16, or 15 feet water. This channel should never be attempted without a pilot.

A mile and a half to the Westward of the former channel, is the Great Channel of Savanna la Mar, which is a mile in breadth, and has a depth of 24 to 19 and 13 feet towards the shore. To sail through, in mid-channel, it is only requisite to bring the fort on, bearing N. N. E.

On the Southern extremity of the bank extending from shore, between Savanna la Mar and John's Point, the British ship Monarch struck, in 1782, upon a bottom of coral. This extremity lies with John's Point bearing N. W. by W. 3/4 W., and will be avoided by keeping one-half of the highland of South Negril open to the Southward of John's Point.

In traversing hereabout, it is necessary to be very particular in the use of the lead, for the bank which extends along the front of Bluefield's, and thence to opposite Savanna la Mar, &c., is rocky, and has on its edge from 20 to 21 feet of water; and on it, as on the White Banks, there are many shoals with little water on them, some of which uncover, and many have breakers. Without the edge of the reef, and very near to it, are 5 fathoms of water, which deepens to 13 fathoms at three-quarters of a mile from the edge of the bank: the depth therefore is the best guide, for, when you get from 8 to 10 fathoms, you will be from one-third to half a mile from the edge of the reef; and when you get 13 fathoms you will be three-quarters of a mile from it; and, pursuing your route, you should not keep in the depth of 8 or 10 fathoms, but in that of 13 to 15, for only in the vicinity of the anchorage they wish to make, should vessels get into the first of these depths. The anchorage of Savanna la Mar is of the same nature as that of Bluefield's: large ships must anchor outside of the reef, and, in such a situation, they will not be sheltered from the sea from East round to S. by W. It seems probable that such will very seldom come to this place, because they here run much risk of losing their anchors; as the instant there is the least appearance of the wind freshening they must make sail. Such vessels as do not draw more than 12 or 13 feet water may anchor upon the bank, and behind, (or in the lee of the reefs,) in 15 or 16 feet of water, with the town bearing N. N. W. $\frac{1}{2}$ W., nearly three-quarters of a mile distant. You may cross over the edge of the bank as soon as the wharves at Savanna la Mar bear N. W. by W., which will be three-quarters of a mile to windward of the Eastern Channel, (that is, if the vessel is on the edge of the reef, or near it,) and sending a boat to be placed to the Westward of the Middle Ground; it will serve for a guide and buoy; and then you have only to shave close to the boat, as the mean to keep clear of the reef to leeward. The boat may proceed with the leading-mark as above, or may steer Northerly until she comes to the edge of the reef which runs along to the East of the anchorage; and, keeping along the Southern edge of this reef, she must thence steer N. W. $\frac{1}{2}$ N., so soon as the wharf of Savanna la Mar bears on that rhumb, with this course she will pass over the rock.

Western end of Jamaica.

WESTERN END OF JAMAICA.—From St. John's Point to South Negril the coast is bold to, or high and steep. The inlet between South and North Negril is called Negril, or Long Bay, and affords tolerable anchorage. Close to the South side of North Negril is Negril Harbor, a small harbor with good anchoring-ground for small vessels; and to the North are Orange Bay and Half-moon Bay, places fit for droghers, &c. Six miles to the N.E. from North Negril is Green Island Harbor, and about 2½ miles from the latter is Davis Cove. These are places seldom resorted to but by those who go thither on purpose to load, and have pilots.

A rock, with 24 feet water on it, was seen some years since by one of the ships in a convoy lying to, about (as well as I can recollect) 10 miles West of Negril Point, Jamaica; and I am pretty certain it was in lat. 18° 21'.

Between Negril and North Pedro the coast is bold, excepting at Green Island, which is low, and environed by a reef, nearly even with the water. From Pedro Point to the harbor of Lucea, vessels may stand within a mile of the shore.

Mr. Town says, a ship being off the West end of Jamaica, and bound to any port on the North side, should endeavor to round the points called South and North Negril, as close as she can: for the current, in general, sets to the N.E. If proceeding for the Harbor of Lucea, you may know its entrance by a remarkable notch in the mountain, called the Dolphin Head. At a little to the Westward of the harbor there is, also, a remarkable white spot in the land, which may be seen 8 or 10 miles off.

Harbor of Lucea.

HARBOR OF LUCEA.—This harbor is one of the best on the North side of the island. It is safe, there being little danger in sailing in or out. The N.E. point is called Lucea Point, and on the Western point stands the fort. Vessels, having opened the harbor, stand directly in, only giving the Fort Point, on the Western side, a berth, as a reef stretches from it, on the extremity of which there is generally a buoy. To sail in, bring the remarkable mountain called the Dolphin Head open to the Westward of Barbara Hill, which has a house on the top of it, and is on the East side of the harbor, bearing nearly S. by E. Continue on in this direction, until the fort bears West, when you will be within the Fort Reef. Hence proceed towards the town on the West, and anchor in 5 or 6 fathoms, muddy bottom, with the fort bearing from N. by W. to N. N. W., and Lucea Point, at the Eastern side of the entrance, from N. N. E. to N. E. $\frac{1}{2}$ E.

Those approaching this place from the Eastward, must observe to keep at least 3 miles from the shore, until past Buckner's Reef, which lies off Mosquito Cove, and sometimes breaks. It is also to be observed that around Lucea Point, and to the North-eastward, there is a rocky flat extending out to a considerable distance.

in the use of the lead, and thence to opposite to 21 feet of water; and the water on them, some of the reef, and very much at three-quarters of best gulle, for, when you are a mile from the edge of waters of a mile from it: 8 or 10 fathoms, but in they wish to make, should of Savanna la Mar is of labor outside of the reef, a sea from East round to come to this place, because tant there is the least aply vessels as do not draw and behind, (or in the lee ing N.N.W. ½ W., nearly edge of the bank as soon a will be three-quarters of the vessel is on the edge of Westward of the Middle ave only to shave close to l. The boat may proceed until she comes to the edge range; and, keeping along W. ¼ N., so soon as the course she will pass over

Point to South Negrit the South and North Negrit is ge. Close to the South sea good anchoring ground for moon Bay, places fit for Green Island Harbor, and places seldom resorted to pilots.

Since by one of the ships in des West of Negrit Point.

excepting at Green Island, h the water. From Pedro mile of the shore.

rien, and bound to any port alled South and North Vesets to the N.E. If proce by a remarkable notice the Westward of the har- hich may be seen 8 or 10

st on the North side of the r out. The N.E. point is rt. Vessels, having opened the Western side, a berth, re is generally a buoy. In n Head open to the West- and is on the East side of rection, until the fort be s proceed towards the townon th the fort bearing from N the entrance, from N.E.

observe to keep at least 3 es off Mosquito Cove, and nd Lucea Point, and to the onsiderable distance.

Within the point the reef extends to a cable's length from the shore. It is nearly steep to, and the heads of coral sometimes appear above water.

For passing clear of the edge of the Eastern bank, the mark for the Malcolm House, which stands on a small hill or rising at the East end of Lucea Town, brought on the East end of the fort, and kept so until you bring the Dolphin Head, as already mentioned, to the Westward of Barbara Hill. This mark leads through 8, 7, and 6 fathoms, then deepening to 13, and shoaling again into the harbor.

MOSQUITO COVE, an excellent harbor, lies 3½ miles to the Eastward of the *Mosquito* harbor of Lucea. Here a hundred sail of merchant-ships may lie secure from all *Cove*. winds. The channel, at the entrance, is little more than a cable's length in breadth, but widens inward to where the harbor has from 7 to 4½ fathoms. The bottom in general is muddy. To sail in, you may pass to the Eastward of Buckner's Reef, or over its Eastern end, in 5 or 6 fathoms. The course into Mosquito Cove is nearly S.E. by S., but it should not be attempted by a stranger without great caution, as the entrance is much contracted by a reef from the Eastern side.

MONTEGO BAY.—The Northern point of Montego Bay lies in lat. 18° 32'. This *Montego* is a good bay with the wind from N.N.E. to the Eastward and Southward: but it is *Bay* open to the North and West; and the Northerly wind in December and January has frequently driven vessels on shore.

To sail in from the Eastward, give the point, on coming down, a berth of 2 miles, in order to avoid a reef which extends from it, and which may be distinctly seen from the bows, when in 4 or 5 fathoms. When you open the town you may approach the reef, which is pretty steep, into 10, 9, or 8 fathoms, and will see the bottom. You now haul round towards the town, but must not venture to anchor until you have well shut in Sandy Point. (without the bay on the North,) with Old Fort Point. For, with Sandy Point in sight, there are from 35 to 30 fathoms, and the bank is so steep that the anchor will not hold. If a ship drives off, she will, with a sea-breeze, be in danger of grounding on the lee reefs. The mark for the best anchorage, is the barracks upon the mill in a line, or nearly so, with Redwick's stone wharf, on the N.E. side of the bay. The ground here is good in 11, 10, and 9 fathoms. On entering from the Westward with a fair wind, the church bearing East leads directly to the anchorage.

The following descriptions and directions are those of Mr. Town: Montego Bay affords good anchorage for 20 or 30 vessels, except during the prevalence of strong North winds, which generally commence in the beginning of November, and end in the latter end of February. With the general trade-wind, which is from the N.E. to the E.N.E., ships will ride here with perfect safety. There is a small harbor or cove, in the N.E. part of the bay, which will hold from 10 to 12 vessels. This is the only safe place for ships during the strong North winds.

On coming into this bay with the sea-breeze, which is from N.E. to E.N.E., you should endeavor to get well to the Eastward before you attempt to run in.

The leading-mark for clearing the Old Fort Reef, which extends from the anchorage in the bay to the Northward of the Northernmost point, is the Boge Road end on, bearing South, or South a little Westerly. Proceed with this mark until Montego church comes open of Old Fort Point; then haul in for the S.E. part of the town, and when Sandy Point is shut in with Old Fort Point, you may anchor in from 17 to 19 fathoms, fine sand and mud. The reef off and to the Northward of Old Fort Point, lies nearly ¼ mile from the shore: advance, therefore, no nearer to the point Northward of Old Fort Point than 2 miles.

About 5 miles to the Westward of Montego Bay is a small creek, a bay without, which is called Great Roads. In this bay merchant-vessels lie to load; a shoal extending nearly the whole of the way across, which affords a good shelter for ships lying here during the North winds.

All ships lying either in Montego Bay or at Great Roads, pay harbor dues, at the rate of one shilling per ton, register tonnage; and in the event of any ship's going into the inner harbor, at Montego Bay, she is charged one-halfpenny per ton for every day that she may lie in this harbor, in addition to the fee that is paid for anchoring in the bay.

If bound from Montego Bay to the Eastward, it is best to leave the bay in the evening, as soon as the land-breeze comes off, which will generally run you clear of the bay, and in a good offing for the sea-breeze. It is generally best to beat to windward close to the land, in order to have the advantage of the Eastern currents; but I am of opinion that the only advantage you have by keeping inshore is that you meet the land-wind, which sometimes will carry you well to the Eastward during the night, for the current sets to the Westward as often as to the Eastward. If your destination be Falmouth Harbor, endeavor, if by night, to keep the shore close aboard, and the land-breeze will lead you to the Eastward.

*Peak of
Tarquino.*

PEAK OF TARQUINO.—In working hence to windward, in clear weather, when Cuba is visible, a remarkable hill will be discerned. This is the Pico de Tarquino, the highest land on this side of Cuba, which bears from Montego Point N. E. 4° N., distant 35 leagues; from St. Anne's Bay, N. by E., 28 $\frac{1}{2}$ leagues; and from the East end of Jamaica, N. N. W., 10 leagues, by which you may judge how far you are to windward on any other bearings. The Peak of Tarquino, &c., have already been described.

*Falmouth
Harbor, or
Martha
Brae.*

FALMOUTH HARBOR, or MARTHA BRAE.—This harbor, which lies 6 leagues to the Eastward of Montego Bay, is a bar-harbor. Its channel, or entrance, is very narrow, not more than 16 or 17 feet in depth, and too intricate to be attempted without a pilot. The town of Falmouth is on the Western side of the harbor, throughout the greatest part of which there is a regular depth of from 5 to 10 fathoms.

*Marabona
Bay.*

MARABONA BAY.—At about 3 leagues to the Eastward of Falmouth is Marabona Bay, which is very remarkable. It has a low pleasant plantation close to it; and on the hill over it is a large house or castle. Within a league to the Eastward of this is the small harbor of Rio Bueno.

*Rio Bueno
and Dry
Harbor.*

RIO BUENO AND DRY HARBOR.—Rio Bueno, which lies nearly 4 leagues to the Eastward of Falmouth, is a bay exposed to all winds between N. and W. N. W. and has but indifferent anchorage, the bank being steep. It is seldom visited by other than merchant-vessels, which go there to load. From the entrance to the place of anchorage, the distance is about 2 miles. The harbor is formed by two reefs. A ship may lie, with the point N. N. W. $\frac{1}{2}$ W., in 9, 8, or 7 fathoms. Dry Harbor, which lies 3 miles more to the Eastward, is a good harbor for small vessels, although its channel be narrow, and has a depth of only 16 feet.

*St. Anne's
Bay.*

ST. ANNE'S BAY.—The entrance of this bay lies in lat. 18° 31', long. 77° 15'. It is narrow, and lies between two reefs, which have on their edges 3 and 3 $\frac{1}{2}$ fathoms, deepening abruptly in the channel to 10 and 11 fathoms. The entrance is less than half a cable's length in breadth, and lies with the barracks on the rise of the hill bearing nearly S. $\frac{1}{2}$ E., but it is not to be attempted without a pilot. With a Northerly wind, a stream of considerable strength sets outwards through the channel; this is occasioned by the great quantity of water thrown over the reefs by the swell. In passing in, as the water is clear, vessels generally pass close to the Western reef, on the starboard side.

Mr. Town says, St. Anne's Bay lies about 12 miles to the Eastward of Dry Harbor. This bay may be known by its having a very regular row of coconut-trees around it close to the water's edge, and the town of St. Anne, which stands on the side of the hill on the S. E. side of the bay. The houses stand close to the water's edge on the Western side, and the plantations are, in appearance, in a state of cultivation much superior to any Westward of this place. The harbor of St. Anne is small, and is close to the town. You may anchor here in from 6 to 9 fathoms, good ground.

Deho Rios.

DEHO RIOS, which lies 7 miles to the Eastward of St. Anne's, is an anchorage open to the North and N. W. winds. To enter, you sail by a reef which spits off from the Eastern side of the bay, bearing up and bringing the Westernmost part of it N. W. $\frac{1}{2}$ W. to N. W., in 7 fathoms. There is another reef to the Southward, but, as the water is very clear, it will be seen. This is a small harbor frequented by merchant-vessels only, which go there to load.

Oru Cabeca.

ORU CABECA, 10 miles to the Eastward of Deho Rios, is another anchorage, exposed, like the former, to North and North-west winds. To sail in here when advancing from the Eastward, first make Galina Point; in order to do which, when off at sea, bring the Westernmost highland of the Blue Mountains S. S. E., which, thus kept on, will lead to the point. To anchor, give the small reef on the East side a berth, and when the Westernmost bluff point bears W. or W. by N., anchor in 3, 4, or 7 fathoms.

In Allan's Hole, which is formed by reefs level with the water on the one side, and the Eastern shore of the bay on the other side, vessels drawing from 10 to 12 feet may lie as secure as in any harbor in Jamaica. When once inside the reefs the bottom is quite clear, and the reefs completely break the sea off. Vessels drawing not more than 12 feet of water may warp into this place. At the North end of the reef is an islet, with bushes on it, divided from the main-land by a narrow and shallow channel. Allan's Hole has two entrances; one through the reef, which is extremely narrow, and one by the point of the reef; but neither ought to be attempted without a pilot.

GALINA POINT lies 4 miles to the Eastward of Oru Cabeca. This point is low, but the land to the Southward of it is high; and in making it from the Westward, a remarkable round hill that stands within the point will, on its first appearance, be

in clear weather, when the Pico de Tarquino, Stego Point N. E. 1 N. 4 S.; and from the East how far you are to &c., have already been

Cabeen. This point is low- ing it from the Westward, on its first appearance, from

the point; but, on a nearer approach, the land slopes off to the Northward to a low point.

PORT MARIE.—The entrance of this harbor lies in lat. 18° 27', and long. 76° 23'. Its anchorage is open to N. N. E., N., and N. W. winds. In coming in, the high island, named Cabarita Island, must be seen, and its Northern point should have a berth of 2 cables' length. You may haul into the bay, and anchor with the N. W. point of the island N. E., or N. E. by N., at the distance of about a cable or a cable and a half's length. Small vessels drawing 10 feet of water may anchor between the island and the main. The bottom is foul in the outer part of the bay, and ships have injured it by heaving over their ballast. There is not room for more than ten or twelve vessels to lie here, as the foul ground extends nearly over the whole harbor.

From Port Marie the coast trends E. S. E., 6 miles, to Blowing Point; thence it continues S. S. E. 1 E., about 5 miles, to Anotta Bay.

ANOTTA BAY, which lies about 11 miles to the S. E. of Port Marie, has its anchorage open to N. and N. W. winds. To sail in, give the reef on the Eastern side, which is called the Schoolmaster, a sufficient berth; then steer down until you bring the tavern, a building easily known, S. by W. or S. When advanced within the Schoolmaster, haul a little to the Eastward, and have the anchor clear, the bank being steep and narrow. The first sounding will be 10 or 9 fathoms. Let go in 7 fathoms, which is about a quarter of a mile from shore, with good holding-ground. Be cautious of anchoring on the Western edge of the bank, as it will not hold, and you may be in danger of getting on shore to the Westward.

Anotta Bay is an extremely unhealthy place; so is Port Maria; but Ora Cabeen is a tolerably healthy situation.

Of Anotta Bay, Captain Livingston says, "This is the wildest road I ever saw. No vessel ought to enter it, without being uncommonly well found in ground-tackle. They ought, by all means, to have chain-cables. The following is from memory only: The reef off Gibraltar Point, the Schoolmaster, is much more dangerous than is generally supposed. It extends fully 1 1/2 miles out; and some places have only from 6 to 9 feet of water, while there are gulps or gateways through them with as many fathoms."

PORT ANTONIO, which lies about 8 miles from the N. E. end of Jamaica, was formerly a king's port, where there are still to be seen the remains of a careening wharf, &c. It is formed by nature into two harbors, divided by a peninsula, on which stands the town of Titchfield, to the N. and N. W. of which lies the island called Navy Island, extending E. and W., and about half a mile in length.

To sail into the Eastern harbor, first bring the Eastern part of the Blue Mountains to bear about S. S. W., and steer in that direction until you approach near Folly Point, the East point of the Eastern harbor. Next bring the church (which is a large square building, on the side of the hill in the S. W. part of the bay) on with the second wharf from the Westward, bearing S. by W. 1/2 W., and you will thus pass safely into the harbor. But observe that on approaching the fort, (which stands on the Western side, upon the point of Titchfield peninsula,) to open the church to the Eastward of the wharf. When the fort bears N. W., you may anchor in 8, 9, 10, or 11 fathoms, good holding ground. The bottom is, indeed, so stiff, that it is rather difficult to get up the anchors.

The preceding directions must be particularly attended to, in order to avoid a reef which stretches from the Eastern end of Navy Island, as well as from the point of the peninsula. The Eastern side of the harbor is shoal, and there is a reef nearly in the middle, having over it only 8 or 10 feet of water.

To sail into the Western harbor, after having brought the church west open to the Eastward of the fort, proceed, under easy sail, into the entrance of the channel between Navy Island and Titchfield, bringing a long building, which is a store house, standing on a hill to the Westward, open of the South-western point of Navy Island. This mark is to be kept on until the church appears open to the Westward of the peninsula; then haul round to the S. W., and anchor in from 7 to 4 fathoms, where there is good ground.

A channel, called the Hog Channel, leads directly from sea into the Western harbor, from the West end of a long reef that extends from Navy Island; but it is crooked and narrow, has only 13 or 14 feet of water on the Western part of it, and is therefore used only by small vessels.

The tides here are not regular, being influenced by the winds. The variation in 1771 was 7° 15' E., and it is still nearly the same.

The Western harbor is the best, the Eastern being open to the North winds. When entering the port with the sea-breeze, keep as nearly in mid-channel between Navy Island and the main as you can. Run in with the leading-mark (c), and anchor in about 6 or 7 fathoms. If in a small ship, anchor in 4 or 5 fathoms, as the ground without the latter depth is foul.

Port Marie.

Anotta Bay.

Port Antonio.

Tides.

Port Morant.

PORT MORANT.—This is a good harbor, but the reefs extend to the distance of half a mile from shore on each side of the entrance, and the breadth of the channel between is only a cable's length and a half. As the direction of the entrance is N. by W., it can be attempted only with the sea breeze, or between the hours of 10 and 2 in the day. To sail in, a ship must lay N. by N. by E., until the leading mark is on. This mark is a remarkable house, which stands upon a hill, in a line with the East end of the Easternmost reef chuff, bearing N. 3 W. With this mark you may sail into the bay with safety. Take care not to approach too near the reefs, but bring the marks exactly as described. You will thus have 9, 8, 7 1/2, 7, 6 1/2, 6, 5, and a quarter less 5 to 4 fathoms of water. There is anchorage in 6 1/2 and 7 fathoms, with the leading mark on, and Pero Battery, which is on the Eastern side, bearing E. S. E.

The Caymans.

The CAYMANS are three islands lying between the meridians of 79° 30', and 81° 35' W., and parallels of 19° 10', and 19° 45' N. The larger and Westernmost is named the Grand Cayman, the second, the Little Cayman, and the Easternmost the Cayman Brack.

The Grand Cayman.

The GRAND CAYMAN is about 8 leagues long, and 2 1/2 broad. The S. E. end lies in latitude 19° 46' N., and the N. E. point in latitude 19° 22'. The Eastern end is surrounded by a reef, extending 1 1/2 mile from shore, which thence extends along the North and South coasts. Off the S. W. point there is also a key and reefs, to which a good berth must be given. The N. W. or W. point is 3 leagues from the S. W. point, and between is the spot called the Hogsties, where there is a small village, of which you may anchor in from 12 to 7 fathoms, by bringing the Southernmost house to bear E. by S., at half a mile from shore. The bottom is rocky, but you may see the ground where you let go, as the water is very clear; it will, however, be proper to buoy up the cables, and steady the ship with a small anchor.

Captain Dalzel, in some observations on passing the Grand Cayman, has said, "The island is low, covered with cocoanut and other trees, and of greater extent than is generally imagined. The North side forms a bay, across the mouth of which runs a reef of snaken rocks, which may be readily seen in the daytime, before you are near enough to run any kind of risk. It is impossible for anything but small craft to anchor on this side, for there are no soundings close to the reef, and the deepest water over it is 6 feet, though there are 2 or 3 fathoms within it. The small vessels of the island go in here; as they do, likewise, on the South side, which is also foul and not to be approached by strangers.

"The West end of Grand Cayman, which is best inhabited and mostly resorted to, is the only place large vessels can come to, though even here it is but indifferent anchorage. For, without the utmost care, you are in danger of getting your cables cut by the rocks, or may, perhaps, let go your anchor in a place where it cannot be purchased. Our anchor got under the shelf of a rock, and we had two days' hard work to purchase it; nor could we have weighed it at all, if we had not borrowed a small anchor, (we rode by our only anchor,) and bucked with a swivel. This luckily hooked another shelf; we hoove upon the cable that was fast to it, and then with much difficulty purchased our own anchor from under the rock. We came to in 14 fathoms, but most of the inhabitants say that 8 fathoms is the anchorage.

"Your first soundings going in are about 17 fathoms, three quarters of a mile off shore; after which you shallow your water 2 or 3 fathoms every ship's length, till you get into 8 fathoms, where you may come to in one of the white holes. These holes are patches of sand among the rocks, which you can easily see when looking over the side. Let a careful person look out forward, to pick a large hole, and be sure you let go your anchor well towards the weather side of it, that when you wear away, cable it may not come upon the rocks. If it should come to blow, and you are in danger of dragging your anchor towards any of the shelves, you must have it up again. You can plainly see your anchor as often as you please, and you can easily distinguish the rocky bottom from the white holes, by its blackness. Observing the above directions, you cannot get amiss; perhaps you do best not to take a pilot, as they are not over careful.

"The West end forms a kind of double bay; the Southernmost is the road for the middle point a good berth, as some rocks lie off it; you need not leave the lead until you see the bottom, for you will get no ground until then."

The Grand Cayman is inhabited by many persons, descended from the old buccanniers, exclusive of negroes. The climate and soil are singularly salubrious; the people are vigorous, and commonly live to a great age. They raise various produce for their own use, and have some to spare. As navigators, their chief employment is to fish for turtle, and to pilot vessels to the adjacent parts.

Refreshments may be obtained here, as fowls, turtle, yams, plantains, coconuts, &c., but no beef nor mutton. Water is procured by filling a bucket about 20 yards from the beach, the well bearing S. N. E., or N. by E., from the anchoring place.

From the S.W. end of the Grand Cayman to Cape Corrientes, the true bearing and distance are N. 17° W., 71 leagues; and to Cape Antonio N. 51° W., 81 leagues.

THE CAYMAN BRACK is very level land, covered with small trees, and at a *Cayman Brack* short distance presents a smooth, unbroken surface, very like Nuyza, except towards the S.W. point, where there is a small bunch of trees, a little higher than the rest, apparently logwood trees, as they are small leaved. The S.E. point appears very high, and the South side also very bold—we ran down it at less than a mile distant, and saw no danger of any kind, except the breakers on the shore. From off the S.W. point, which is low and sandy, a reef runs off an eighth of a mile, but you can easily see the breakers, and even the colored water, 13 mile distant. We were not far enough to the Eastward to ascertain whether any reef extended from the East end or not; but, from the bold appearance of the S.E. point, I should think that if there are any reefs, they do not extend to the Southward of the East point. The East end of the Cayman Brack is the highest, and with a slight but even declination towards the West end. The Cayman Brack is considerably higher than the Little Cayman, and before leaving the Cayman Brack you will raise the Little Cayman, of which you will at first discern scarce anything, except three large cocoonut trees on the East end, and which, at a distance, appear like two vessels at anchor. These cocoonut trees are the only ones I saw on this island. These islands are separated by a deep channel, and are resorted to by the turtles.

CAYMAN BANK—A bank was discovered in July, 1839, having on it from 15 to *Cayman Bank* 15 fathoms water.

It is about 13 miles long, in an E.N.E. and S.W. direction, and from a mile to 14 mile in width.

The North eastern end is in long 81° 32' W., lat. 19° 20' N.; the South western point, long 81° 36' W., lat. 19° 18' N.

PICKLE BANK—On this bank there are from 11 to 17 fathoms water. It runs *Pickle Bank* about W. by N. 3° N. It lies in lat. 20° 18' N., long 80° 23' W.

THE ISLAND OF PORTO RICO.

This island is 30 leagues in length, and throughout this extent, from East to West, is a chain of mountains, with branches diverging to the North and South, and extending to the coasts. The whole are covered with wood, and in the intervals are fertile valleys and plains, watered by more than fifty rivulets, in the sands of which gold dust has been found. The highest summits of the mountains are called the Peaks of Layaanita. They are often covered with snow, and may be seen from a great distance.

The capital, St. Juan, stands on the Western part of an island on the North side, which forms a good harbor, defended by a citadel, called the Morro Castle, and other works. The town is populous and well built; the residence of the governor.

The Northern coast, which extends like the Southern coast, nearly East and West, is but imperfectly known. It is rugged and uneven, having many rocks and islets on which the sea breaks heavily. The town of St. Juan, which stands at the distance of 3 leagues from Cape St. Juan, is the N.E. point of Porto Rico.

There are no large bays, either on the Northern or Southern coast, and a vessel may generally run along the former without any risk, at the distance of 3 miles, and along the South coast at 5. Fully observing, in the latter case, to give sufficient birth to the small isle, called Dead Chest, which lies about half way between the S.E. and S.W. points of Porto Rico.

On the Morro there is a light, 154 feet above the sea. It is a revolving light, show- *light* ing eight seconds of light every two minutes.

The harbor of St. Juan is very capacious, and the largest ships may lie there with the utmost safety, in 3, 6, and 7 fathoms. The entrance is along the island on which the town is erected, and between the Morro Point and three islets, called the Cabans, or Goat Islands. South of the latter is a small islet, occupied by a little square fort, or castle, called the Cannelo, which defends the Western side of the harbor. The channel is generally buoyed.

The Western and Southern sides of the harbor are flat and shoal. The Western side of the entrance is rocky, but in the channel the ground is generally of gravel and sand, with a depth of 5, 6, 7, and 8 fathoms. From the South side of the town a low point of land extends to the Southward, and is surrounded by a shoal. Ships

generally ride to the Eastward of this flat, and out of the wash of the sea, occasioned by the trade-wind, which commonly sets directly into the harbor.

If you make the harbor with the wind Southerly, you must run into the channel with all the upper sails well set, in order to preserve your way, when you come under the lee of the Morro, and have a boat out for towing, or to carry out a warp, both of which are frequently necessary. It is high-water in the harbor at 8h 21m, on the full and change; and the greatest rise is about 13 foot.

Off the Eastern coast of Porto Rico are numerous keys and rocks, which cannot be approached by large vessels, and therefore serve as a rendezvous for smugglers, &c. Before these are the Isles Culebra and Vieque, or Snake and Crab Islands. The passages among these isles and rocks are generally deep; but no one should venture in who is not intimately acquainted with the place.

Passages between St. Thomas' Island and Culebra and Crab Islands.

In this channel there are soundings, with 20 fathoms, on the West side of it; and approaching either the island of Culebra or Vieque, it is shoaler. We had 10 fathoms, with the following bearings:—East end of Crab Island, S. by W. 4 W.; East end of Culebra, N. by W. 4 W.; and Sail Rock, E. by N. 4 N. The currents set through this channel strong to the Westward, which would render it necessary, in case of being becalmed, to anchor before you are drifted on the Western shore.

*Vieque, or
Crab Island.*

VIEQUE, or CRAB ISLAND.—It is of moderate height, and well wooded. The S.W. end is hilly, and to the Westward it is low and uneven. On the West end is a low and sandy point; and with it bearing N. by E., about 13 mile, is the anchorage. In working in, do not bring this point to the Southward of East, as there are numerous shoals between it and the East side of Porto Rico. We found the soundings regular, and 1 mile from shore you will have 6 fathoms. The shore should not be approached nearer, as the soundings there are irregular, and the ground rocky. There are a few settlers, principally on the North end. There are two sandy bays on the West side: the Northernmost is bold, and the bottom of sand. You may approach it to within three fourths of a mile, with 4 fathoms. The Southern one has a rocky bottom; soundings irregular.

*Carlit, or
Serpent's
Island*

CARLIT, or SERPENT'S ISLAND, sometimes called the Great Passage Island is more than 6 miles in length. It has numerous reefs and keys about it, which require a large berth when passing. Off its Eastern side is Culebra, or Little Passage Island, from the South end of which a dangerous reef extends to the S.S.W. and S.W. 3 miles. To the West of the Southern part of this reef is the harbor of Culebra, which is 2 miles in extent from the entrance. There are 2 channels into this harbor, which are divided by a bed of rocks, and bordered with reefs, but the interior is clear and secure. Great caution is required when entering, but a pilot lives in the port. Plenty of wood, water, and fish may be obtained. The neighboring keys are famous for the great number of tropical birds which breed here.

The course through the Virgin's Passage, on the East of Vieque and Carlit, is N. W. by N., or rather N. N.W., in case of a calm and lee current; the Western side being foul and without wind, it is dangerous. Continue on this course until the St. Jago, the N.E. point of Porto Rico, bears W. by S., or W. S.W., and you will be clear of all danger.

If you are bound down the South Side of Porto Rico, you will see the S.E. part of that island when lying at anchor off Crab Island; it bears from thence S.W. by W. 4 W. or W. S.W., about 13 leagues, and is called Pasqui, or S.E. Cape. You must run down until you come abreast of that cape, within 3 or 4 miles of it, and then steer West; and by the time you have run 3 leagues down past the cape, and it bears N. E., you will see a large breach, or shoal, 2 or 3 miles in length, which lies 3 or 4 miles from the coast. By keeping a mile or two without the breach, in running down, you will desery a small building by the water side, which is a guard house, and by running down as directed until the guard house bears N., or a little to the weatherward of that bearing, you may haul in N., or N. by E., for it, and anchor 4 fathoms, with the house bearing N., or N. by E., one mile distant, and the West end of the beach S. by E. This place is called Guayama, or Yama, Bay, which may be known by a windmill on a hill, one mile to the Westward of the anchorage, and is much frequented, though there is no shelter from the effects of the sea breezes than the reef. In going in, although you give the West end a good berth, you must keep the lead going. The soundings are irregular, from 20 to 8 fathoms, whence it shoalens gradually inshore. The land by the water side is low, but up in the country, high and uneven, as before explained. In going out of Guayama Bay, run S. S.W., or S. W.

From Guayama Bay the next trading-place is Salinas, a good place to lie in. The *Caxa de Muertos*, or *Dead Chest*, may be seen from, and is a guide to it. When at the distance of from 2 to 3 leagues from Guayama Bay, you may steer W. $\frac{1}{2}$ S., passing several keys to the Northward which lie near the shore; then, having run to a sufficient distance, haul in for the Western end of the outermost of these keys, and about a mile or a mile and a half off that end is a reef, or sunken key, which cannot be seen, but the sea breaks over it; leave this to the Westward, and run with the Westernmost key on board, within a cable's length. This key is bold to, but shoaler to leeward towards the bench. The guard-house is 3 or 4 miles from this key, and may be seen before you get within. You may run in boldly for 2 miles towards the guard-house, and anchor within a mile of the same, in 4 or 5 fathoms, good ground, and moor to the North-west.

When at anchor at Salinas, with the guard-house bearing N. $\frac{1}{2}$ E., there is a good watering-place close to the water-side, a kind of lagoon, which will be about N. by W. from the ship, and half a mile to Westward of the guard-house. The water appears white to nearly a league without the key. The soundings are from 12 to 7 fathoms, very gradual, and there is no danger.

Within the key above mentioned, there are several other keys a little to the Eastward of it; and in running in you will see, at about 3 leagues to Westward, two small keys at a little distance from each other, one appearing double, the other single; you leave them to windward.

In quitting Salinas, steer outward in the same way as you entered. When without the key steer S.S.W., until the *Dead Chest* bears West; you may then run down boldly, giving that isle a berth of a mile. There is a small key about a cable's length from the S.W. end of the *Dead Chest*, to which a berth of a mile and a half should be given. You may then haul in, and anchor under the lee of the isle, at pleasure, in from 7 to 12 fathoms. With the West point of the small key S. by E. $\frac{1}{2}$ E., 14 mile distant, and the North end of the *Dead Chest* N.E. $\frac{1}{2}$ E., there are 10 fathoms of water, at a mile from shore.

CAXA DE MUERTOS, or DEAD MAN'S CHEST.—This island is on the South *Caxa de* side of Porto Rico, and bears E. $\frac{1}{2}$ S., 36 miles, from Cape Roxo. When made, it ap- *Muertos,* pears in the form of a wedge. The North end is high, the centre low, and the South *or Dead* end has a sugar-loaf mountain, which at a distance appears a detached island. The *Man's Chest.* anchorage is on the West side, off the low land, half a mile off shore, in 8 fathoms, in the following bearings.—South east point of the small island, connected to Caxa by a reef above water, S.W.; the only sandy bay S. by E.; the North west point and Northern peak in one, East. There is no danger on the West side of this island, and off the low land the soundings are regular; but to the Northward of it the water is deeper, and you will have 17 fathoms close to the shore. Off the Southward of the island there is a shoal, which breaks, about half a mile off shore.

PONCE.—The town and harbor of Ponce, lie about 5 leagues to the East of Guan- *Ponce.*ico. To run for this port keep a mile off the small key off the S.W. end of the *Dead Man's Chest*, and run N.W. $\frac{1}{2}$ N., or N.W. by N. The land is low near the water, covered with mangrove bushes and some coconut-trees; but the houses are also low, so you will not see them until you open the harbor. In running over, you will see a low sandy island, which you leave on the port hand. If it blows fresh, the reef which you turn round on the starboard hand, will appear as though there were breakers across the mouth of the harbor; but, as you approach, you will find the breakers do not make off far from the bushes. You may pass them within 2 cables' length, and keep nearest the shore on the South or side of the harbor.

In proceeding on a West course towards Cape Roxo, that cape, when first seen, appears low, gray, and like two keys. A shoal, called the *White Grounds*, encompasses the cape, and extends to the S.W. At 2 or 3 leagues to the Eastward and Westward of this cape there are 10, 12, and 15 fathoms. It is a coral bank, and close to the outer edge no bottom is to be found. The Southern extremity bears from the cape S.W. $\frac{1}{2}$ W., 8 or 9 miles.

GUANICO.—On this coast the best anchorage is in the harbor of Guanico, 5 leagues *Guanico* to the Eastward of the *Morillos*—it is fit for vessels of all classes, with from 63 to 3 fathoms of water, which latter depth is found in its interior. The bottom is of sand and gravel. The mouth of the harbor is in the middle of the bay, formed by the point and cliff of *Brea* (*Pitch Point*) on the West, and that of *Puena* on the East. In the neighborhood of this last are two islets, and from them to *Punta de la Meseta*, which is the East point of the entrance of the harbor, there is a reef, which reaches out from the coast about a mile, and nearly forms a circle, uniting at one end with the islets, and at the other with *Punta de la Meseta*.

Between *Punta de Brea* and *Punta de los Pescadores*, (*Fisherman's Point*), which is the West point of the mouth of the port, the coast forms another bay, of which the mouth is shut by a reef that, running out from *Punta de Pescadores*, ends on the

South side of the bay, about a mile within the point and cliff of Brea. It is necessary not only to give a berth to the reef which runs from Punta de Piedra to Punta de la Meseta, but also to a rocky shoal which stretches out a short half mile from it.

To enter this harbor you must steer on the outside of these banks or reefs. To do this bring the Punta de la Meseta exactly in one with one of the Paps of Cerro Guada, which are at some distance inland. If you run in with the point in one with the Western Pap, you will have the bank very close, but will have 10 fathoms of water; but if you run in with Punta de la Meseta in one with the Eastern Pap, you will pass without any risk whatever. You will have passed the shoal when the islets at Punta Piedra bear E. 1 N., or perhaps a little sooner.

If you advance to the harbor by Punta de Brea, or Pitch Point, you may pass this point or bluff at a cable's length, and thence steer to within the Punta de la Meseta, passing it, if necessary, at a quarter of a cable's length, and thence proceeding for the interior of the harbor, only observing that you may make bold with the South than with the North side of the entrance. You may anchor where you please, in 1 or 3 fathoms of water.

Mayaguez.

MAYAGUEZ.—The best leading-mark in, is a hill, about 10 miles inland, with a double summit called Montoso, in range with the custom-house, (which has one side, ple.) bearing E. by S. 1 S.

In beating in, stand to the N. until the custom-house and church (which has two steeples) come in range, sounding for the Manchac, and to S. tack, before Montoso ranges with the church, until you have over 5 fathoms inside the bar when the land S. of Guanagiva shuts in behind it you are inside all the reefs South of Algarroba.

The Manchac extend about 3 miles W.N. Westward from Algarroba Point the soundings upon them are very irregular; the least water found was 2½ fathoms, the bottom shows very plain, the brown spots being generally shoalest; they break sometimes in rough weather. There is a good channel inside from Anasco Bay, giving Algarroba Reef a small berth, and taking care not to haul round it until Montoso opens to the South of a white sugar-house chimney, (Vico's,) which stands conspicuously near the shore, N. of Puntilla.

Algarroba Reef is nearly bare, and is bold to the South-westward. Vico's white chimney, on with Montoso, is the mark for it. They intend to erect a light-house at the point.

The Puntilla Reefs are nearly dry, and bold to the South-westward.

The church and Montoso in range, lead into 12 feet water on the bar.

Montoso shut in with a hill South of the church, having a remarkable red mark upon the side of it, is the range for Piedra Blanca, which has only 8 feet water in one spot.

The Rodríguez Reef is dry in several spots, and always shows itself. There is a passage through the midst of it, about N.E. by E.; least depth 12 feet, green water. To the N. and N.N.W., for nearly 2 miles, the soundings are irregular, and there are probably spots having less water than what is marked.

Zachco Island is 22 miles N. 50° W. (true) from Guanagiva, and 2½ miles N. 60° W. from Algarroba.

Lat. of custom-house, N.	18° 43' 00"
Long. of do. (by French survey) W. from Greenwich	67° 12' 45"
Do. do. (English charts) W. do.	67° 08' 00"

Tides.

Tides rise and fall 2 to 4 feet; time irregular.

Description of Porto Rico, from the "Derrotero de las Antillas," &c.

This island is 31 leagues in length from East to West, and 11 leagues in breadth in the broadest part. The N.E. point of it is named Juan, (St. John's Head,) where the range of mountains, called Luquillas, commences. The highest part of these, Yunque, or the Auyil, may be seen at the distance of 68 miles. The range continues to the Westward with many intervals or openings, until it ends at the hill named Silla de Caballo, (Horse's Saddle,) which is to the Southward of Arrecibo.

The harbor of San Juan requires a pilot. The harbor of Arrecibo is about 90 leagues more to the West; it has a small town on its Western side, and a good river, but little frequented, being open to the North winds. From Arrecibo the coast runs nearly true West to the N.W. end of the island. The land here is generally low, until it reaches Punta de Peñon Agujerado, (or Point of the Holed Rock,) where a range of cliffs highland begins, which trends S.W., rather more than a mile, to Point de Guen, the North-westernmost point of Porto Rico. The coast again declines in height.

cliff of Brea. It is ne-

AGUADILLA BAY, called Aguada on some charts.—From the Point Penas Blancas, *Aguadilla*
the little town of Aguada bears S. S. E., 2 miles. In the bay before the town, or *Bay*
rather village, is anchorage for the largest ships, with shelter from the sea breeze.
This bay may be entered at any hour of the day, with facility and safety; but not at
night, as the breeze then dies away, and a calm ensues. There is excellent water to
be obtained at a rivulet which passes through the middle of the village. The situation
of the latter, as given by the Spanish officers, is lat. 18° 25' 53", long. 67° 0' 20".

This bay is much frequented by vessels bound from Europe to Cuba, both on ac-
count of the facility with which they can procure refreshments, and because pilots for
the Bahama, or Old Channel, may always be found here. If intending to anchor in
Aguada Bay, after rounding Point Braguén, keep about 3 cables' length from the
shore, in order to avoid a shoal which spits out from Punta de las Palmas; whence
to that of Penas Blancas you may approach the coast nearer, as it is very clean; and
at half a cable's length from the shore you may find 4 fathoms of water.

To anchor, bring Point Aguada N. N. W., 2 or 3 miles, the church tower E. N. E.,
the Island of Zacheo W. by S., when you will be in 10 fathoms water, about 3 cables'
length from the shore. There is a good river of fresh-water; the sea in general
smooth, with usual trade-wind; but should the wind incline to the Northward, avoid
anchoring, or weigh as soon as it sets in.

At S. W. by W. 7½ miles from the village of Aguada, is Point St. Francisco, with
various rocks about it. All the coast between has a beach, with many shoals, formed
by the rivers that empty themselves into the sea. At 2 cables' length from the coast
are 4 fathoms of water, with bottom of rocks and sand; but there is no anchorage.
At S. W. by S., 7 less than half a mile from Point St. Francisco, is Point Guigero,
the Westernmost point of Porto Rico, otherwise called El Rincon. About it the ground
is shoal, with many rocks.

Remarks on Aguadilla Bay, &c.

The town is in lat. 18° 24' 57", and long. 67° 8' 15". In proceeding for the an-
chorage from the Northward, you may run round the N. W. point of the island, about
S. W. or S. S. W., within a mile of the shore; your depth of water will be 20 or 25
fathoms. Point Braguén, the N. W. point, is a high steep cliff; about a mile to the
Southward of it is Point Palmas, a low sandy point, covered with trees. The latter
forms the North side of the bay; and in rounding you must give it a berth of a mile, as
a reef stretches off at that distance. Having rounded this reef, with the bay fairly
open, you will see the town, lying on the N. E. side of the bay, with straggling houses
to the S. W. for 2 miles. The anchorage is before the town and near the shore. The
water of the bay is perfectly clear, with the exception of the white reef, (Penas
Blancas,) extending from Point Palmas; and you may stand to a quarter of a mile
from shore anywhere, for the depth of water will not be less than 7 or 8 fathoms. The
marks for anchoring are, a large house standing by itself, about a cable's length from
the North end of the town. Between it and the town is a small battery of three guns.
Bring this house to bear N. E. 4 N., the church steeple E. 4 S., and the North point
of the bay N. by W. Here you will have 18 fathoms, and very good bottom, at about
half a mile from shore. The anchorage is very good further inshore, in from 10 to 15
fathoms. If you moor, lay your anchor in 10 fathoms, and under one from 15 to 18.
There is also good anchorage in from 20 to 24 fathoms, but there you are more liable
to drive of the hulk. Inshore the anchorage is so extensive that you can hardly err
in anchoring any way before the town. The winds are frequently variable, and render
it difficult to get up to the anchorage. At times the sea-breeze blows fresh over
the land from the N. E.; then you may beat in with ease.

In the winter months, when the North wind blows strongly, there is a heavy swell
into the bay, and great surf on the beach. Large ships ought not then to anchor fur-
ther in than from 23 to 25 fathoms; they will thus have room to get under way and
work out, in event of its coming on to blow; and as the West point of the bay bears
from the anchorage S. W. ½ W., a ship will lie out with the wind at N. W., and may run
through between Zacheo and the S. W. point of the island.

Ships coming from the Southward for Aguada, may also pass between Zacheo and
the island; and when Zacheo bears W. by S. they will have the bay fairly open, and
may work up as above; taking care to keep the West point of the island bearing to
the Southward of East; for off it there is foul ground all the way to the Southward,
as far as Cape Roxo, but all clear to the Northward.

From Point Guigera (says the Derrotero) the coast trends S. E. by S. 3½ miles,
to Punta de la Cadená, having one small bay, named Del Rincon, which, although well
sheltered from the sea-breeze, has a very unequal bottom, and is full of rocks. After

Punta de la Cadena follows that of Algarroba, which lies S.E. $\frac{1}{2}$ S. from the former. Between these points lies the bay of Anasco, fit for vessels of any size, in which they will be completely sheltered from the North winds. The coast is all beach, and the bank, or shallow water, which extends from it about half a mile, is probably formed by the River Anasco, which disembogues at this place.

"The Punta de Algarroba is the North point of the Bay of Mayaguez, and lies nearly N. by E. and S. by W. with the South point, named Punta de Guanagiva; the distance between them being about 4 miles.

"The anchorage of Mayaguez is well sheltered from the Norths, and fit for briggs and ships, provided they are not very large; but a good knowledge of its entrance is necessary, in order to avoid a shoal which stretches out about half a mile from Punta del Algarroba. It is necessary, also, to give a berth to the Pantilla, or Little Point, for a reef stretches out about 2 cables' length from it.

"To the Westward of Punta del Algarroba, and about a large mile from the coast, there is a rocky shoal, named Las Mauchas, with 4 fathoms water on it; but vessels may pass very well between it and the shore.

"A little without the line of the two points, and about half-way between them, is a rocky shoal, stretching nearly North and South. Its length is about half a mile, and its greatest breadth not much less; it is named Baxo de Rodriguez, (Rodrigo's Shoal.)

"To anchor in the part of the bay which is best sheltered, having rounded the Little Point, (Pantilla,) place yourself in such a situation that, when the island Desecheo is directly astern, you will have the highway of the town of San German exactly ahead. San German is upon a hill, which is pretty high and pointed. The highway is of red earth, and winding like a snake; and there can be no danger of mistaking it, as there is no other. Run thus until being something to the Southward of the Little Point, you may huff up and anchor within it, in either 3 or 4 fathoms, as you may think proper. The River of Mayaguez runs into the sea at the bottom of this bay; and in it the schooners and sloops for the most part winter, as it is the best anchorage on the West coast of the island.

"South from Punta de Guanagiva, about $5\frac{1}{2}$ miles, is Puerto Real de Calo Roxo, its figure is almost circular, and the extent from West to East is about three-quarters of a mile. At its entrance are 3 fathoms of water, and in its middle 16 feet. The entrance is by a very narrow channel, near the South point of the harbor, and from the North point a great reef stretches out, which, doubling Cayo Fandueo, ends at Puerto de Veras.

"S.S.W. from this, at the distance of 2 miles, is the Punta de Guaniguilla, which is the North point of a bay named Del Boqueron; this is so full of reefs as not to allow anchorage. Punta de Melones, (Melon Point,) which is the South point of the bay, is distant from the first (Guaniguilla) about $2\frac{1}{2}$ miles, or a little more; and nearly West from this point, at about 6 miles distant, is the Baxo de Gallardo, (Gillard's Shoal,) of which we shall speak hereafter. Along the whole of the West coast the Monte (or Hill) de la Ataylaya may be seen. It is the highest and most Northerly peak of the two, which are seen on the highest part of the mountain range, and which stands S.E. by E., true, from the Punta de San Francisco, and does not alter the appearance of its shape, even when you are to the Southward of the Isle Desecheo."

*Shoals off
the West
Coast.*

SHOALS OFF THE WEST COAST.—Besides the shoals on this coast already noticed, there are several others, which we shall now describe:

"Baxo Negro (Black Shoal) is a reef of very small extent, and upon it the sea always breaks. It is distant from the nearest coast about $3\frac{1}{2}$ miles, and lies W.S.W. $\frac{1}{2}$ W. from Punta Guanagiva, and S. $\frac{1}{2}$ E. from Punta de Guiguera.

"Media Luna (Half-moon) is a reef of about two-thirds of a mile in length, North and South, and about $2\frac{1}{2}$ cables in breadth. The sea always breaks upon it. It is about 5 miles from the coast. Half a mile from it, about E.N.E., there are three reefs which show above water, and on which the sea always breaks. The Northern extremity of the reef is nearly S.W. by W. from Punta de Guanagiva, and South from Punta de Guiguera.

"Las Coronas (the Crowns) are shoals of sand, on which at times the sea breaks, and its extent in all directions is scarcely a mile. It is about $3\frac{1}{2}$ miles distant from the coast, and bears nearly S.W. by S. from Punta de Guanagiva, S. $\frac{1}{2}$ E. from Punta de Guiguera.

"A shoal lies to the Westward from Punta de Guaniguilla, at the distance of 2 miles. It may be about 2 cables' length in extent, and there are 3 fathoms of water upon it; the bottom is rocky. It bears S. by W. $\frac{3}{4}$ W. from the Punta de Guanagiva, and S. $\frac{1}{2}$ E. from Punta de Guiguera.

"Baxo de Gallardo is almost due West from Punta de Melones, and 6 miles distant from it. Its extent is about 3 cables length, and the least depth of water on it is 3 fathoms, with rocky bottom. It lies in the Isle Desecheo, bearing N. by W. $\frac{1}{2}$ W.

Monte de Atalaya, S. by W. $\frac{3}{4}$ W.; and the Southern extremity of the Morillos E.S.E."

The South Coast, from West to East.

From the Morillos, or Little Hills, in the S.W., to Cape Malapasqua, which is the S.E. extremity of the island, the coast is of double land, and is very foul, with reefs, islets and shoals, which stretch out from it. In the middle of it is the Island Caja de Muertos, or Coffin Island, distant from the Coast 4 miles, and foul on both its N.E. and on its S.W. sides.

Directions for making Porto Rico, &c.

By those advancing from the Eastward, and bound to Porto Rico, every precaution must be taken, so as to avoid the dangers of Aneгада. This island, the last of the Virgins to the N.E., is so low, that it may be considered rather as a dangerous shoal than as an island. If navigating with care, and with certainty of the situation of the vessel, nothing is easier than to cross the meridian of Aneгада on a parallel above 19°, and so to run down afterwards on Porto Rico, as to make the land to windward of your destined port: thus you will not be obliged to beat up again for a distance over-run, at the expense of both time and labor. But as it may happen, that some one may be misled by an erroneous reckoning, and find himself in this predicament, we recommend such, in order that they may avoid the dangers of Aneгада, and also avoid overrunning Porto Rico, that they, at all times, shape a course to make the islands of St. Bartholemew and St. Martin's, (or the parallel of 18°,) because these islands are high and clean, and there is no danger of being wrecked on them, although sailing by night, or in thick weather, so that you have a league of horizon; for that distance here affords time, either to steer so as to take some of the channels, or, in case you prefer it, to haul by the wind, and wait for daylight, or for clear weather. Neither is there a risk of passing them without seeing them; and even if by a combination of circumstances, which will be very strange, this should happen, they could not fail on the following day to see some of the Virgin islands, by which the situation of the vessel might be rectified. In choosing either of the channels between St. Bartholemew and St. Martin's, or between the latter and A-guilla, we should prefer the latter, because it has no detached islets lying off from the principal lands; and, therefore, running through it, even at night, it is not so unsafe. Having run through any of these channels, the course must be made to the South of the Virgins, and thence to the N.W., so as to make the Cape of St. Juan of Porto Rico, and having recognized this, you have only to run afterwards as may best answer for your port of destination.

From the island of Porto Rico you may escape from the region of the general or trade-winds, into that of the variables, merely by steering to the North; and as this island is so far to windward, it is easy to gain all the Easting that is necessary for going to the lesser Antillas, or Carribee Islands. You may gain this to windward, and heave with the breeze without being under the necessity of running into high latitudes to catch the variables. On Porto Rico you cannot count on land-breezes to facilitate the getting to windward, for on the next coast the utmost is that the breeze calms at night, but no land-breeze proceeds. Lastly, from this island you may, on one stretch, catch any point of the Colombian main, from Laguyra to leeward.

General Directions for making and navigating among the Carribee Islands.

[From the Derrotero de las Antillas.]

As to choosing the North or South part of any of these isles for making your land-fall, you ought to consider, firstly, which point is nearest to the port or road to which you are destined; and secondly, the season in which you go. In the dry season, it is to be remembered that the winds are generally from the North eastward, and in the rainy season they are often from the South-eastward. Thus, in the dry season, it is best to make the North side, and the wet season, the South, but without losing sight of the first consideration.

There can be no mistake in recognizing any of the Artilles; and, in making St. Bartholemew's and St. Martin's alone, can there be any doubt on seeing at once the eminences or heights of various islands. That this may not mislead any one, they must remember the following instructions:—

When in the parallel of St. Bartholemew's at less than 4 leagues off, if there be no fog or haze, the islands of St. Eustanias, Saba, St. Kitt's, Nevis, and St. Martin's appear plainly.

The mountain of St. Eustatius forms a kind of table, with uniform declivities to the East and West. The top is level, and at the East part of this plain a peak rises, which makes it very remarkable. To the West of the mountains seems to be a great strait, (in consequence of the lands near it being under the horizon, or seeming drowned,) and to the West of that there then appears, as it were, another long low island, the N.W. part of which is highest; but it is necessary not to be deceived, for all that land is part of the land of St. Eustatius. From this station Saba appears to the N.W.; it is not so high as St. Eustatius, and apparently of less extent than the Western part of St. Eustatius, which is seen insulated.

The N.W. part of St. Kitt's is also seen, formed by great mountains, in appearance as elevated as St. Eustatius, with low land at the East; to the Eastward of this low land, Nevis will be seen, apparently higher than all the others.

The lands of St. Martin's are notably higher than those of St. Bartholomew's, and this island appears also when you are some leagues further distant from it than from St. Bartholomew's.

When there are any clouds that hinder St. Martin's from being seen, there may be some hesitation in recognizing St. Bartholomew's; and thus it is proper to notice that the latter, seen upon its own parallel, appears small, and with four peaks, trending North and South, and occupying almost its whole extent; and if you are not more than 8 leagues from it, you will see, also, the appearance of an islet to the North, and another to the South, at a very short distance. As this island has neither trees, high mountains, nor thickets, it is not subject to fogs; and it may, therefore, be seen oftener than St. Martin's, St. Kitt's, Nevis, St. Eustatius, and Saba; it is, therefore, advisable to keep its appearance in mind.

At 8 leagues to the East of St. Bartholomew's you may see Nevis, very high; from it to the West the strait called the Narrows, and then the lands of St. Kitt's, appearing to rise out of the water, and which continue increasing in height to the Westward, so that the Westernmost of two mountains, which are at the West part of it, is the highest. This mountain, which is higher than that called Mount Misery, has to the West of it a gentle declivity, terminating in low land; and it cannot be mistaken for any other. To the West of this you may also see the large strait towards St. Eustatius; but from this situation you will see only the high S.E. part of that island, or rather its mountain, in consequence of which it appears like a very small island, while its mountain seems to be lower than Mount Misery; but it is easily known from the table which its top forms, by the uniform declivities to the East and West, and by the peak on the S.E. part of it. Saba seems, from this situation, equal in size to the visible part of St. Eustatius; but it shows only an eminence without peaks, with uniform declivities, and almost round.

If a small islet appears to the West of, and very near to St. Eustatius, that must not confuse you; for it is the N.W. extremity of that island; and on getting nearer, you will perceive the land which connects it with the S.E. part. Mount Misery, on St. Kitt's, which has a very high and sharp peak on the Eastern part of its summit, seems at a distance to be the summit of Mount Eustatius; but it cannot be mistaken for such, if you attend to its surface, being more unequal than the table-land at the top of St. Eustatius, and that there is another less elevated mountain to the East, and with gentle declivities, which show much land to the East and West of the high peak.

When you are 6 leagues to the Eastward of Bartholomew's, its N.W. extremity appears insulated, and has the appearance of a pretty large island, on the top of which there are four small steps, (like steps of stairs, Escalones,) with a considerable strait to the South, between it and the principal island. In the middle of this strait you may also see a smaller islet. This is one of the islets which surround the island; but the first is only the N.W. point, to the North of which you will also see some islets; all these are much nearer St. Bartholomew's than St. Martin's.

Finally, to navigate from one of the Antillas to another of them, there is no more trouble than what a simple navigation requires; but it is something greater when you have to get from leeward to windward; yet this will be reduced to a trifling consideration, if the navigation is made by the straits which are to the North of Martinique, and in which the currents are weakest; but the same does not follow in the Southerly straits, in which the waters set with more vivacity towards the West; and it would be impracticable by the straits of Tobago, Grenada, and St. Vincent, in which the waters run at the rate of not less than 2 miles an hour.

WINDWARD AND LEEWARD ISLANDS.

UNDER the denomination of Windward Islands, we include the whole range from the Virgins to Trinidad; and under that of Leeward Islands, the range which exists between Trinidad and the Gulf of Maracaybo.

The Windward Islands appear at a distance as if united together: but there are many deep channels between them, through which those acquainted sail with safety.

The Passage Isles, which are dependencies of Porto Rico, and the Isles of St. Croix, or Santa Cruz, which lie to the Southward, were originally included under the general name of the Virgin Islands.

The Western division (Danish) includes the islands of St. Thomas and St. John, with the numerous islets, as those of St. James, Montalvan, or Little Saba, Savanna, or Green Island, the Brass Isles, Hansatic, and others. The Eastern division (British) includes Tortola, Virgin Gorda, Anegada, Jost Van Dyke's isles, the Thatch isles, Norman's, Peter's, Salt, Cooper's, Ginger, Beef, Camanoa, Scrub, and Guana isles, with a number of islets in their vicinity. The whole group, Anegada excepted, is high, craggy, and mostly bold to.

Tortola, a few miles to the N.E. of St. John, is the principal of the English Virgin Islands. It is nearly 5 leagues long, and 2 broad, but badly watered, and has the name of being unhealthy. The entrance is wide, with plenty of water.

The town is situated on the South side, at the bottom of a bay 2 miles deep, with a pretty good road at the entrance, with 12 fathoms water, good ground.

Virgin Gorda, that is, the Great Virgin, or Penniston, more commonly Spanish-town Island, lying to the Eastward of Tortola, is formed of elevated land, and is watered even worse than Tortola. The island has two good harbors, the largest of which is that called East Bay, on the Northern side, where you may anchor safely in from 5 to 12 fathoms, to leeward of the island called the Prickly Pear; but the entrance is narrow, being obstructed by a reef on each side. The next harbor is that called the Great or West Bay, which is in some degree sheltered to the West by the islets called the Dogs. The roadstead here has very good holding-ground, of sand and ooze, in 8 to 10 fathoms of water. In the smaller bay, called Thomas Bay, more to the S.W., vessels may anchor before the town, in 6 to 8 fathoms: but there is a reef in the middle of the bay, which stretches North and South; and there are likewise many rocks in the bottom, which chafe the cables.

The course from Saba to Virgin Gorda is N.W. by W. Northerly, above 26 leagues. When Virgin Gorda bears from you N.W. by N., 7 leagues off, the Virgins appear like three islands, with a great many small ones about them; the middle one is the longest, and when you come within 3 leagues, they seem as if they were joined together.

The best mark for Virgin Gorda is an insulated hill, of moderate height, standing near the middle of it, and which is easily known by its being alone. This hill, in clear weather, may be seen at the distance of 7 leagues.

Under the lee of Virgin Gorda, the ground is so clear that 300 sail may anchor in the space between the Dogs and the Valley. The North Sound is a perfectly secure port, and of great capacity. The entrance between the two reefs is not difficult to discover.

ANEGADA, or ANAGADA, is the most Northern of the Virgin Islands, and is *Anegada, or Anagada.* about the size of Virgin Gorda, but so low that its coasts are inundated at high tides, and it has not even the smallest hummock on its surface. You may discern over it two high hills on Virgin Gorda, which appear like a great hummock. There is good water on the low part, near the South point.

Many have been lost on this dangerous island and the reefs surrounding it, which has been caused by the strong North-westerly current which prevails there most of the time; its average set being about one knot per hour in that direction.

Those bound to St. Thomas, or any of the islands in that parallel, will find it necessary to take every opportunity of ascertaining their latitude at night, as from the causes above stated, there will always be a great uncertainty in their position.

The whole of the windward side of Anegada is bordered with a dangerous reef, which thence continues under the name of the Horse-shoe, about 4 leagues to the S.E., and terminates at E.N.E., 7 miles from Point Pejaro, the East end of Virgin Gorda. There are swashes in the reef, but on many parts only 2 to 6 feet of water. On approaching the isle from the North-eastward, the hill on Virgin Gorda will appear over it like a great hummock, and by this mark the relative situation of a vessel may be known.

From the observation of R. H. Schomburgh, who has made a plan of this dangerous island, it appears that the greatest number of wrecks on Anegada occurs in the months from March to June, and that vessels of large burden strike usually on the reefs to the South east, while smaller ones generally go on shore further West, which he imputes to the wind which blows frequently from S. and S.E. from March to June, thereby increasing the North westerly current, in consequence of which vessels bound during that time for these islands, are more subject to error than at any other period, and that light bodies being more influenced by the current than heavy ones, is the cause of the small vessels going on shore further to the Westward.

Fallen City, or Old Jerusalem. FALLEN CITY, or OLD JERUSALEM.—A very remarkable cluster of broken rocks, to the Southward of Virgin Gorda, bears this name. They appear to have been thus left by some great convulsion of nature. To the Southward of these is a large bluff rock, called Round Rock, next to which follows Ginger Island. Between the two latter is the general entrance into Sir Francis Drake's Channel, which is called the King's Channel, it being the best passage inward for those bound to the road of Tortola.

Tortola. TORTOLA.—To run through Sir Francis Drake's, or the King's Channel, between the Round Rock and Ginger Island, towards Tortola, as soon as you make the land of Virgin Gorda, steer for the S.W. end of it, W.N.W. Northerly; and when you are within 6 or 7 leagues of it, you will raise the high land of Tortola, and also the highest keys and islands to the Eastward and Southward of it; that is, beginning with the Easternmost, or Round Rock, Ginger Island, Cooper's Island, Salt Island, Dead Chest, Peter's Island, and Norman's Island.

Having these keys in sight, steer for the South end of Round Rock, which you cannot mistake, for within 3 or 4 leagues of Round Rock you will raise the low keys called the Broken City, or Old Jerusalem, which extend from the S.W. end of Virgin Gorda, in a S.S.W. direction, to within 2 cables' length of the North side of Round Rock: these keys are the more remarkable, not having the least earth or verdure on them, but are merely heaps of large stones, resembling the ruins of a city or island.

When 2 or 3 leagues to the Eastward of these keys, having the Round Rock N.W. Westery, steer for the South side of the rock, keeping it on board as you run through, that is, keep about one-third of the breadth of the channel from it towards Ginger Island: this caution is necessary in case of light winds, when strong leeward currents may hurry you close to Ginger Island. The course through is nearest N.W. by W. by compass. The Round Rock is a barren slate rock, and the Eastern cliffs of Ginger Island are also full of slate. The channel is about half a mile over you may pass safely within a cable's length of Round Rock, at which distance we sounded 11 and 15 fathoms, no ground.

Having passed Round Rock to the W.N.W. of you, on the Island of Tortola, you will see a negro town, a white dwelling-house, and a fort. Keep to the Westward of this mark, steering W. by N. and W. As you run down towards Tortola, the Easternmost point of Tortola Road bears nearest West, by compass, from the Round Rock. You may see with a glass, at the same time, the fort and flagstaff on the West point of the harbor, from which extends a dangerous reef: the Eastern point is a craggy bluff, with a footpath or road winding around it. The first soundings in running down (with the lead line) are found abreast of the East end of Ginger Island 15, 13, and 12 fathoms; the course from W. to W. by S.; which soundings continue nearly to the East point of the road.

It is particularly to be observed, that there is a bay to the Westward of Road Harbor, called Sea Cow, or Rogue's Bay, which, by strangers, may be mistaken for the road, as the points make alike. Therefore, when drawing near the Eastern side of Road Harbor, if you have any doubt, look to the S.W. quarter, and you will see four remarkable perpendicular rocks, called the Indians, off the N.W. end of Norman's Island, and bearing S.W. by S. At this time the Easternmost point of Tortola Road will bear nearest to W.N.W. $\frac{1}{2}$ W. With this bearing on we sounded, and had 8 fathoms about half a mile from Tortola. Come no nearer. We found no ground, after 8 fathoms, on the next east with 14 fathoms of line; and, thinking it bold, we neared the shore, having the point N.N.W., but again found that it suddenly shoaled to 4 fathoms, then at 3 cable's length from the shore, hauled off W.S.W., and deepened in two or three casts to 7 fathoms; and, at the fifth cast, no ground at 15 fathoms. Be cautious to keep at least half a mile from the point.

You now open the road of Tortola, and keep your eye on the Easternmost or weather-shore of the bay. On the third bluff point in you will descrie a battery, (Fort Shirley,) abreast of which ships-of-war anchor. Keep to the Westward, until you open the next point to the Northward of this, on which stands Fort George, of

the Citadel, with a flagstaff; bring this citadel North westerly, then haul in, and steer for it.

As you steer in for the citadel on the above bearing, keep in 10 fathoms of water; indeed, the mark will lead you in 11, 12, and 10 fathoms. You anchor abreast the point of the first battery, the battery bearing N. E., but the mark for letting go the anchor is the flagstaff of the battery on the West point of the bay in one with the South end of the guard house, which is close behind the battery, depth 10 fathoms, and about one cable's length from the shore. The Western battery will bear nearest S. W. by W. Westerly. Moor with your stream to the N. N. E., because the ground is foul; and should you part your bower, your stream will check you into the bay, and clear the reef of the Western point of the road.

The merchants' anchorage is in from 10 to 13 fathoms, on the Western side.

In proceeding outward, from Tortola, you sail through the Southern channel, between the West end of Norman's Island and the East side of Flanagan, or between the latter and the East end of St. John's Island.

Mr. Lockwood says, "In the passages, and also in Drake's Channel, the current, running quick over the foul ground, causes a ripple, which wears the appearance of danger. The anchorage at Tortola is not good, and experienced masters usually anchor under Peter's or Norman's Islands, both of which have good bays."

Current, &c. — About Virgin Gorda, and the passage of the Virgin Islands, the current runs regularly, setting Eastward during the moon's passage from the horizon to her zenith, and from her setting till she arrives at Nadir, and to the Westward while the moon passes from zenith to the horizon, and from Nadir until her rising. The rate varies, according to the breadth of the channels, from 2 to 53 knots, and the rise is from 20 to 40 inches.

ISLAND OF ST. JOHN.—This island is 2 leagues broad and 4 in length, and has no heights or eminences of importance. The North and South coasts are chilly, and the former rather foul; as is also the East coast. The island is said to be the best watered of any of the Virgin islands, and its harbor, called Coral Bay, to afford as good shelter as any harbor in the West Indies. An inlet on the West, having 4 fathoms within it, is a complete natural dock, where a frigate may careen or refit, lashed to the shore on each side.

The East point of the harbor is called Moor's or North Point. The walls of the fortress upon it, which are white, may be seen from the distance of 7 or 8 leagues. From a little without Moor's Point quite into the harbor, there are regular soundings, with from 10 to 5 fathoms of water.

With the wind any degree to the Northward of East, you may lie into the entrance of the harbor; but if it be to the Southward of E. S. E., you must anchor without the point, and warp in. The Governor's house and part of the town are not above half a mile within the point on the East side; but there is a large harbor, with lagoons, &c. above that; though ships seldom go higher than the Governor's house. You anchor within a quarter of a mile from the weather shore, in 5 fathoms of water, good ground, and run a stream anchor to the S. W. by reason of the land breeze, which is, at most times, betwixt the S. S. E., South, and S. S. W. You moor N. E. and S. W.

Observe, in coming in, to leave one-third of the channel to windward from Moor's Point, and two-thirds to leeward towards the key called Duck Island, and you will not have less than 5 fathoms of water.

There is a small bank, which does not show itself, directly off from the gate, at a cable's length from the shore, with only 10 feet over it. The watering place is at the South side of the town, just without the South gate, but it is brackish.

If you are bound to Porto Rico from the Eastward, night coming on, and you off the E. N. E. part of St. John's, you will take notice of the Easternmost high land; it is inland a little from the East end of the island, which is low. You may run to the Westward till you bring that high land to bear S. by E., then bring to till morning, but take great care that this high land does not deceive you, for it lies a long way in the country, and it is all low land by the water-side. In the morning make sail; you may see the walls and works all white about Moor's Point.

From the South point of St. John's Island, called Run's Head, to the entrance of St. Thomas' Harbor, the course is about W., 53 leagues; from the North side of Santa Cruz, N. N. W. $\frac{1}{2}$ N., 10 leagues. The latitude of St. Thomas' town is $18^{\circ} 22' N.$

ISLAND OF ST. THOMAS.—The eminences of this island are almost like those of St. John's, and descend gently towards the shore. The entrance into the harbor is very easy and commodious; the town has more commerce than any other of the Virgin Islands, and is always well supplied with every requisite, being a kind of warehouse or depot of rich merchandise; it has a regular careening place, and is defended by a fort and several batteries.

In running down from St. John's to St. Thomas' Harbor, you leave Bird Key to the Southward of you, and you continue your W.N.W. course until you come down to Buck Keys: they are much lower and longer than Bird Key, before mentioned, and there is a small opening of no consequence between them. You leave these keys to the Southward of you about one mile, and then steer N.W., when you bring them S. E., and continue your N.W. course about 2 or 3 miles until you bring the harbor open; then haul in for the town N. by W. or N.N.W., giving the East shore all along a good berth, and run within half a mile of the fort, which is white, and plainly seen at the East of the town. You anchor in 5 fathoms water, fine clear ground; it is a fine harbor, where you are landlocked from all winds, but from the S. by W. to the S.E. by S., which part lies open to the sea; but the wind seldom blows in unless it is in the hurricane months. There is a rock above water in the harbor's mouth, (called Prince Rupert's Cliff,) which you leave to the Eastward of you; you may make bold with the West side of it, but there is no passage within.

The channel between the main island and Buck Island is but $1\frac{1}{2}$ mile broad, and at the entrance, in the fairway, lies a rock, called Packet Rock, which is a hard, whitish, rocky shoal, the S.W. point of which is from the flag-staff on Mühlenfeldt's Battery, (the Eastern battery at the entrance of the harbor,) S. 57° E., 2180 fathoms, and from the Northern, or nearest point of Buck Island, N. 4° E., 1050 fathoms distance.

This sunken rock or shoal extends from its S.W. point on which are 6 feet water, E.N.E., upwards of 15 fathoms to $5\frac{1}{2}$ feet—in the centre are 9 feet. From $5\frac{1}{2}$ feet water it inclines a half point to the North, upwards of a quarter cable's length, with a depth of 12 and 9 feet water.

The whole shoal is consequently little above 40 fathoms in length, and has a direction of nearly E.N.E. and W.S.W.; its position being one-third the distance from St. Thomas' to Buck Island. The passage between this sunken rock and Buck Island is perfectly free, with good soundings from 10 to 14 $\frac{1}{2}$ fathoms. The way to clear this shoal is to keep Buck Island close on board.

Light.

Entrance of the Harbor of St. Thomas.—There is a fixed light on Mühlenfeldt's battery, at the East side of the entrance of the port of St. Thomas, lat. 18° 19' 29", long. 61° 55' 8". The elevation of this light is 95 feet above the level of the sea, and is visible at the distance of 5 leagues. The light is red, in the S.E., S., and S.W., and can thus be distinguished from those of the city and neighborhood.

To avoid the hidden rocks, called the Triangles, lying outside to the Eastward.—To clear these rocks in passing to the Westward, the Eastern angle of the light must be brought to bear N. by W. $\frac{1}{2}$ W., in a line with the S.W. corner of an out-building, painted white, and (standing to the Northward) this range carries you within a cable's length of the Triangles, and is the least distance at which it will bring you; and the more you keep the building covered by the light-house, the greater will be your distance from these rocks. The outbuilding is about 65 feet to the Northward of the light-house, and will be lighted during the night, and visible in clear weather.

Prince Rupert's Rock, which is nearly in the middle of the entrance of the harbor, will be always white-washed, and visible at night.

Scorpion Rocks lie about midway between Mühlenfeldt's Point and Cowell Point, and have on them 20 feet at low-water. You are on them when Frederick Point is in range with the house on French Hill, (Western part of the town,) and Cowell Point in one with the South point of Sandy Bay, on Water Island.

Kiaer Rock has on its shoalest part 17 $\frac{1}{2}$ feet. The marks for it are, Content House in one with the N.E. end of Gallows Hill, and the Castle Telegraph in one with Kiaer Tower.

From St. Thomas' Harbor, if bound to Porto Rico, being in the offing, steer W. by N. until you come down the length of the West end of the island, which is about 3 leagues from the harbor. You will see a small island called Little Passage, about 4 or 5 miles to the Westward of the West end of Little St. Thomas. Little St. Thomas is a small island, that almost joins with the West end of the great island: there is a small opening between them, but of no note. There is likewise a channel of small importance between Little Passage and Little St. Thomas; but there are two other islands before you come down to the West end of that island. The Easternmost, just to the leeward of the harbor, is called Water Island, and almost joins with the main land; about 2 or 3 miles to leeward of that, is a rocky island, about half a mile round, which lies a mile from the shore, and is called Little Saba; it is foul all round, and must have a good berth. All the shore along these islands must be left on your starboard hand. In running down, till you pass Little Passage, you have soundings all the way, but deep in some places.

W.S.W. $\frac{1}{2}$ S. from the mouth of St. Thomas' Harbor, above 4 leagues, and S.W. by S. 7 miles from the West point of the island, lies a remarkable rock in the middle of the channel. It is round, rugged, and double pointed, as high as Beachy Head.

and may be seen 5 or 6 leagues off, being all white; it appears at some distance like a sail, whence it has been called St. Thomas' Carvel, or St. Thomas' Hoy. This rock is bold to all round, and may be seen 5 or 6 leagues off.

Remarks on the passages in general, from the "Derrotero de las Antillas."

The straits between the Dog's Isles and Virgin Gorda are all excellent, and are those by which the entrance into Drake's Channel is made from the Northward. The channels to the Southward are, that between Salt Island and the Dead Chest, or Peter's Island; that between Peter's and Norman's islands; and that between Norman's Isle and Flanagan Key. The pass between the Dead Chest and Salt Island, when used for going out of Drake's Channel, requires the breeze to be steady, that it does not pass from E.S.E. towards S.; for otherwise you will be apt to get entangled with Peter's Island, as the water sets strongly towards the strait which it forms with the Dead Chest, and the swell also aids, as it diminishes the vessel's way, and increases her lee-way.

It is to be noted that, at about half a mile to the E.N.E. of the Dead Chest, is a rock, having over it only 12 feet.

Vessels which navigate by the South of the Virgins, commonly pass between Bird's Key or Frenchman's Cap and Buck Island; and all those which run for the Southward of the Virgins from St. Juan's Head, in Porto Rico, pass through the channel between the Sail Rock and Savanna, or Green Island.

The sea along the whole of the West coast of Virgin Gorda is tranquil during the time of the breezes, and you may anchor along the whole length of it, in the certainty of not having more than 16 fathoms, nor less than 8 fathoms at a mile from the shore, and the quality of the bottom is commonly sandy.

On the West coast of Norman's Island there is a harbor, Man-of-war Bay, which is much better sheltered and more secure than that of Virgin Gorda; for in it, and as far as Flanagan Islet, the sea, during the breezes, is as calm as a bath. Within this harbor they do not experience gusts of wind, and it also appears that the breeze in it is light when it is fresh outside. As the interior of the harbor is to windward of its points, and it is not more than half a mile wide, large vessels cannot beat up into it, and, therefore, when these come from the North, it is necessary that they should shave the point, and luff up and anchor in about the middle of the harbor's mouth, warping or towing in afterwards, if they have to make a long stay; for if not, they will lie very well at the very mouth, if it be not in the hurricane season. On coming in from the South, they must prolong the tack to the North, in the certainty that they will find no unseen danger; and when far enough they must heave about to manœuvre, on the South tack, as already directed. If the wind with which you run to take this harbor should be from the North, you may run further in, and lie as if in a dock; but it is necessary to furl your sails smartly; for with Norths there are flaws of wind which might cause you to drive, and there is no room for manœuvring. Keep in mind that about a league to the S.S.E. of the S.W. point of Norman's Islands, there is a rock of small extent, which has not more than 9 feet water on it. The situation of this rock is not well ascertained; for, though the brigantines under the command of Don Cosme Churrua made every exertion to find it, they never could succeed.

ST. CROIX, or SANTA CRUZ, is the Southernmost of the Virgin Islands, and *St. Croix, or Santa Cruz*, lies W. by N. from Sandy Point, in St. Kitt's, 33 leagues. It is not very high, though full of hummocks, two of which, on the Eastern side, are higher than the rest. At the S.W. end of the island, there is a flat extending outwards to the distance of a mile; and the whole of the South side is bordered with reefs, which render an approach dangerous to a stranger. The island is scantily watered; and wood can be procured only at a high price.

There are two towns, one on the North and the other on the West side. The first is Christiansted, the capital of the Danish West India islands, lying on the South side of a harbor, protected to seaward by extensive reefs, and on the land by a fortress.

Christiansted is situated at the bottom of a bay on the North coast, under the cannon of a fortress, which defends the principal harbor. The other town, named Frederiksted, lies on the West side, about half-way up on the middle of a spacious bay, wherein ships may anchor at pleasure, in from 3 to 10 fathoms.

From the town of Christiansted to the S.W. point of St. John's Island the course is N. by E., about 10 leagues. In the channel, about 6 miles S. by W. of this point, lies a remarkable round rock, called Bird Key, which is about one quarter as large as Reclondo, near Montserrat.

The harbor of Christiansted is difficult of access, and shoal in several places. It is defended by the fort of Louisa Augusta, situated on a neck of land which trends from the Eastward, and by that of Sophia Frederica, situate on Loot's Key, an inlet

North of the town, under the guns of both of which vessels must pass to the anchor-
age. This is one of the handsomest towns in the West Indies; its principal streets
being wide, long, and straight, and intersect each other at right angles.

To enter the port of Christiansted much practice is required, and therefore a pilot
must be taken.

FREDERICKSTÆD.—The roadstead of Frederickstæd, or as it is called the
West End, is free from rocks or shoal places. The ground shelves gradually off,
with clean bottom of white sand, with here and there a patch of dark color. It is not
very good holding-ground, and you want both anchors down. The wind most gene-
rally comes off the land, which is the trade-wind, but occasionally, say once in two or
three years, during the hurricane season, the wind for a few hours will blow from the
West right on the land, when the only safety is to up anchor and put to sea.

Vessels drawing 12 feet can anchor two stone throws from the beach, in front of the
fort or custom-house, and vessels drawing 15 to 18 feet from 300 to 400 yards off.
This is well to know, for in coming in you have to make two or three tacks, and wish
to get as near as possible to the landing-place, which is just South of the fort. All
goods are landed and loaded by small lighters, that hold about ten hog-heads of
sugar, from staves or small wharves of wood that project some 30 feet into the water.
There are three of them. At night there is an ordinary sized glass lantern South of
the fort. There is more commerce at this place than at Christianstad, the other town
of the island.

The greatest length of St. Croix from E. to W. is 20 miles. On advancing, its
North side presents a chain of embayments almost like those of the Virgin Islands. At
about a league to the W.N.W. of the East point, and half a league from the North
coast, there is an island named Bokken, or Goat Island, which appears at a distance
like a part of the coast. Between this island and St. Croix there is a passage, but it
is bad and little frequented. From the East point of Goat Island a reef extends $\frac{1}{2}$
mile to the E.S.E.; there are others stretching to the N. and N.W.

The West coast of St. Croix is clean; the South coast is very foul, and requires
much practice, either to navigate near it, or enter into its bays, of which there are
two.

The Eastern point of St. Croix is in lat. $17^{\circ} 45' 30''$ N. lon. $64^{\circ} 34'$ W.

The Eastern point of Buck Island, lat. $17^{\circ} 47' 18''$ N., lon. $64^{\circ} 36' 10''$ W.

A. Lang's observatory, (elevation 400 feet.) lat. $17^{\circ} 41' 32''$ N., lon. $64^{\circ} 41'$ W.

Full 9 nautical miles N.E. by E. $\frac{1}{2}$ E. from the East end of St. Croix, and about 11
nautical miles E. by N. from the E. point of Buck Island, commences the Eastern ex-
tremity of an extensive bank or shoal, the Northern limits of which round off thence
to the N.W., soon afterwards stretch Westery, inclining at last to the Southward of a
Westerly direction, towards Buck Island Eastern shoals, with which it may be con-
sidered as connected. The Northern edge of this shoal is a narrow coral ledge, of
several miles in length, on which $5\frac{1}{2}$ fathoms of water is the least depth yet found,
the more common depth being 6, $6\frac{1}{2}$ and 7 fathoms.

Along the whole line of the Northern edge, and to the very Eastern extremity of
the bank, where there are not less than 7 fathoms water, the sea breaks in an awful
manner, during severe gales of wind, and sometimes, also, in moderate weather
during the great Northerly ground-swell, which occasionally sets in during the win-
ter months.

A line of direction, drawn from the observatory E. $24^{\circ} 15' 30''$ N., passes through
the shortest part of the Northern edge of this coral ledge, through its whole length,
until it approaches the Eastern limits of the shoal, where it rounds off to the S.E. and
S. as far as the bearing E. $15^{\circ} 50'$ N., from the observatory. Its most Eastern part
bears from the observatory E. $17^{\circ} 20'$ N., which will place it in lat. $17^{\circ} 49' 25''$ N.,
lon. $64^{\circ} 24' 40''$ W. from Greenwich, having there 7 $\frac{1}{2}$ fathoms, which, in coming from
the Eastward, you at once strike from an ocean depth. At this spot the East end of
St. Croix is distant $9\frac{1}{2}$ nautical miles. In approaching the Northern edge of the
shoal from the Northward, you at once get from an ocean depth upon its shallowest
part, passing which, and standing to the South, the water gradually deepens, on a
clean sand bottom, during the short time taken in crossing the bank when standing
in this direction.

The bank is the resort of many whales during spring and summer.

*Island of
Sombbrero.*

ISLAND OF SOMBRERO.—Between the Virgin Islands and that of Anguilla, lies
a small rocky island, about 2 miles in length; it consists of a very flat embayment,
without any hummock upon it, covered with birds from the Southward. You can-
not descry this island further off than 5 or 6 leagues at most.

This island is rugged, steep, and barren; a little camphor and grass are the only
vegetable productions which appear on its surface; the little water that lodges in the
cavities of rocks during rains soon evaporates. You may anchor on the West side
of it. The cliffs are steep to, and are from 40 to 15 feet high.

t high.

The latitude of Sombrero is 18° 38' N., and its longitude is 63° 30' W. Two leagues off Sombrero, when it bears from E. N. E. to E. by S., is found from 25 to 22 fathoms, uneven ground and rocky bottom. It lies about 14 leagues E. by S. from the island of Anegada, and 12 leagues due East from the reef lying off the S. E. end of it. In going between the two you have 5, 6, 7, 8, and 10 fathoms of water. The course from Saba to Sombrero is N. W. by N. $\frac{1}{2}$ N., distant 20 leagues.

The passage to leeward or windward of Sombrero is very clear and safe; there is no swell. The winds are generally favorable for going out, and when once you are past Sombrero, all obstacles are at an end.

Anguilla, and the islets in its vicinity.

Anguilla lies E. by N. $\frac{1}{2}$ N. and W. by S. $\frac{1}{2}$ S., above 2 leagues to the North of St. Martin's; it is a low, flat and withered island, without any mountains, so that it cannot be seen further off than 4 or 5 leagues. The anchoring-ground is good on the South side, because the current there has no force, on account of a long ledge which stretches off S. E. from the East point. On the South part of the West point there lies, about one mile from the shore, a small island, not above 100 fathoms in length. To the N. W. by W. of the West point of Anguilla, distant about 4 leagues, lie several small islands, the principal of which are Dog and Prickly Pear islands, between which is a good channel. The first is the Easternmost; the second, which is the largest of all, lies further than any of them to the West, save a little rock that is almost joined with it on the West side. It is about one mile in length, and has a few inhabitants. All these islands are very low, and cannot be seen further off than 4 or 5 leagues.

Remarks by an experienced navigator.

"When we came to sail so far out, I found that the highest top of St. Eustatia came *Bearings.* even with the top of Brimstone Hill, and that the two Southernmost points of St. Kitt's and St. Eustatia were in one, and bore N. W. by N. At the same time Fort Tison bore N. E. Easterly, when Sandy Point, and Tumble-down-dick, or the Northernmost part of St. Eustatia, came in one, and bore W. N. W.

"The direct course from the West end of St. Kitt's is N. N. W. to St. Martin's West end, and so through between the Dog and Prickly Pear. For when you are within half a mile of the West end of St. Martin's, the Southernmost part of St. Bartholomew comes in one with the Southernmost land in sight of St. Martin's, and they bear S. E. by E., and then Saba will bear S. by W., Westerly. By the aforesaid bearings of St. Bartholomew and Saba, if you see either of them, you may by them know how to direct your course for the West part of St. Martin's.

"The west part of St. Martin's and the West end of Anguilla bear N. N. W., North-erly. When the N. E. part of Anguilla, the North side of Prickly Pear, and the middle of Dog Island bear all in one, it is East and West. Three miles N. of Dog Island, I observed at noon, and found the latitude 18° 26' N., and the variation 2° 30' E. At the same time St. Martin's showed itself beyond Anguilla from E. S. E. to S. by W."

Dog Island N. N. E., distant one league.

The following particulars of Anguilla, &c., are from the Derrotero de las Antillas, &c. Anguilla is situated to the North of St. Martin's, and separated from it by a channel, of which the least width is 4 miles. It is extremely low, and has neither the smallest hill nor prominence. Its soil is very sandy and sterile, and both fresh-water and wood are very scarce. The town is on the East side, near the N. E. end. It is very small, and has no commerce. The bay is shut almost entirely with reefs, and is therefore of very little value. To the N. E. of the East end, there is an islet, Anguillita, which is still much lower. It is very clean on its South side, and has 12 fathoms water on the side of the channel which separates it from Anguilla, which channel is nearly half a mile in width. On passing here, when running from windward to leeward, Anguillita seems part of Anguilla, and the strait between them cannot be seen until you are to the Westward of the meridian of the former. Off the East end of Anguillita are four rocks, on which the sea breaks with violence, but they do not

lie further out than 2 cables' length, and at less than a mile there are 24 fathoms, sand, gradually increasing to 30 fathoms at 4 miles.

The channel between St. Martin's and Anguilla is excellent, and fit for any class or number of vessels; for it has not less than 13 fathoms of water, and the depth is in general from 13 to 20 fathoms, sand and gravel; and near both coasts it does not decrease to less than 7 fathoms. The only thing which is to be avoided is the Spanish Rock, lying within a mile from the N.E. end of St. Martin's, on the South side.

St. Martin's.

ST. MARTIN'S is divided from Anguilla by the channel above described. It is divided between the Dutch and the French, and contains a great number of hills, or rather huge rocks, covered with heath, which may be seen above 10 leagues off. The shape is very irregular, and the Western coast is comparatively low. Rains very seldom fall here, and as the soil of the plains and valleys is sandy, they are unfruitful. The island, destitute of rivers, has fountains and cisterns, which afford good and drinkable water for the planters. The air is very healthy, the shore full of fish, the sea rarely disturbed, and the anchorage safe everywhere about the island, especially with a N.E. wind. Wood is scarce and dear.

The principal town, Phillipsburgh, lies on the S.W. side, in a harbor called Great Bay, which has 8, 9 and 10 fathoms, good sandy ground. Near it are three salt ponds, where a great quantity of salt is made. This is the chief place of the Dutch quarter, the French quarter being to the North.

The Derrotero says, St. Martin's has many heights and hollows, but no mountain of consequence. On the S.W. side, in Phillipsburgh Bay, vessels anchor more commodiously than in any other in the island. The town, the capital of the Dutch part, extends in the direction of the shore. On the South side of this harbor stands an eight gun fort, called St. Peter's, and on the N.W. point is Amsterdam fort. These two forts defend the entrance. The harbor has from 3 to 1 fathoms of water, on fine sand; but on the line between the two exterior points, are from 6 to 9 fathoms, and vessels of a large draft go no further inward than this line. About a mile to the S.W. of this bay is a rock named the Man-of-war, which has only 10 feet of water on it, and is about 2½ cables' length in circumference. The point of it on which there is the least water may be found by bringing the S.E. point of Simson's Bay, which is to the N.W. of Phillipsburgh Bay, on with the high point of the Westernmost mountain in St. Martin's; and on the opposite direction, by bringing the flagstaff at the governor's house, which is at the Eastern end of the town, on with another large house which stands on the top of the hills to the North of the bay. The last house may be known by its standing to the East of a great tamarind tree, which is insulated and separated from the other trees. In addition to these marks, it may be kept in mind that the shoal is exactly S. 38° W., true, from the White Point, which is the Western point of the bay, and S. 6° 30' E., true, from Port Amsterdam. At a third of a cable's length around this rock, or shoal, 6, 7, and 8 fathoms, rocky bottom, are found.

On the N.W. coast there is a bay named Marigot Bay, open to N.W. winds, and having a depth of from 4 to 7 fathoms on sand: at the bottom of it stands the town of Marigot which belongs to the French, and which is defended by a fort to the North of it.

To the East of the N.E. end of St. Martin's is an islet, named Hat Island, which is very bare, and surrounded by reefs close round it. The channel between it and St. Martin's is a mile broad and passable. The shoal named the Spanish Rock lies nearly 2 miles W.N.W. of Hat Island. This is a very small rock, the least water on which is 3 feet. When passing to the North of Hat Island, and near to it, in order to steer to the N.W., be careful to give a sufficient berth to the rock. The strait between this island and St. Bartholomew's is 10 miles wide. It is without shoals, sunken rocks, or any other invisible dangers; but those bound through it, and not destined for any of these islands, ought to leave to the South all the islets to the N.W. of St. Bartholomew's, and to the North all those of St. Martin's. The navigable channel is thus reduced to a league and a half in width. The ordinary depth, until touching the islets, is from 13 to 20 fathoms, but almost always upon rocks, and you may safely run within half a mile of the islets. The navigation of this channel is excellent, not only for those going from windward to leeward, but also for those bound from leeward to windward; but attention must be paid to keep clear of the rock called the Man-of-war, before described.

St. Bartholomew's.

ST. BARTHOLOMEW'S.—St. Bartholomew's S.W. end bears from Sandy Point, in St. Christopher's, N. 4 E., distant 10 leagues. It lies E. and W., and is 5 or 6 leagues long. The middle part is very high land. Its shores are extremely dangerous, chiefly on the North part where there are many rocks above and under water, and the approaching them requires an experienced pilot; but it enjoys the advantage of having a very good harbor of an excellent hold, in which ships of any size are perfectly sheltered from all winds. The island of St. Bartholomew's appears at first almost round, and can be seen 9 or 10 leagues off. E. ½ N., 14 leagues distant from

there are 21 fathoms.

and fit for any class of vessel, and the depth is in all parts it does not decrease. The Spanish side of the South side.

above described. It is a great number of hills, or more than 10 leagues off. The wind is low. Rains very seldom. The hills which afford good and the shore full of fish, the South side of the island, especially

in a harbor called Great Bay, and three salt ponds, and the Dutch quarter.

follows, but no mountain. Vessels anchor more commodious in the Dutch part. This harbor stands an eight steradian fort. These two islands of water, on fine sand, 6 to 9 fathoms, and vessels a mile to the S.W. of this island, 3 feet of water on it, and is on which there is the least water, which is to the N. The easternmost mountain in St. Gustavia, the governor's flagstaff at the governor's another large house which is the last house may be known. It is insulated and separated. It is kept in mind that the island is the Western point of the island, a third of a cable's length from the shore, are found.

open to N.W. winds, and the bottom of it stands the town enclosed by a fort to the North

named Hat Island, which is the channel between it and St. John's. The Spanish Rock lies nearly a mile to the N.W. of St. John's, the least water on which is 10 fathoms, in order to steer to the N.W. of St. Bartholomew. The strait between this island and the Dutch coast, out shoals, sunken rocks, and is not destined for any of the N.W. of St. Bartholomew. A navigable channel is thus formed, until touching the islets, and you may safely run within 10 fathoms. The channel is excellent, not only for vessels bound from leeward to windward, but also for the Man-of-war.

and bears from Sandy Point, S. E. and W., and is 5 or 6 miles above and under water, and it enjoys the advantage of being a safe harbor for ships of any size are frequented. St. Bartholomew's appears at first N., 14 leagues distant from

the island, lies a large bed of rocks, about 20 yards square. On the West side of it is a swell. The rock is sharp-pointed, and sometimes covered. When the sea falls, it is about 4 feet dry.

Vessels bound for this island from the Eastward, should endeavor to run down the South side, and keep as near the shore as possible. There are several rocks on the South side, but all above water, and hold to, the largest of which is a long flat key, called Turtleback. From Turtleback round Point Negro the coast is clear and bold.

Vessels bound in harbor should keep about 200 fathoms from the shore, and when abreast of the first battery, lay off and on, and wait for the pilot. A stranger should not enter the harbor without a pilot, as the channels are narrow, and the winds often baffling.

There are three channels by which vessels enter the harbor, according to the winds viz.: South, South-west, and North-west channels.

The South Channel has a good depth, but it is dangerous for a stranger to attempt, as a rocky reef extends from the middle key, called the Saints, two-thirds across the channel; but should a vessel be compelled to run in without a pilot, keep the main shore close aboard, and anchor when within the second battery, in 4 fathoms. With the wind at East, the South west channel is the best, and with a N.E. wind the North-west channel is the best, as it is the broadest of the three.

The North side of the island is perfectly safe; there are several keys and small islands, but the channels between them are all bold and free from danger with the wind at N.E.

I would recommend to those bound in to run down the North side of the island, double the West point and stand in for the harbor. The Baleine, or Whale, is a rock 150 fathoms West from the key called the Islets, in front of the harbor, is even with the water, and has a point standing up like the fin of a whale. Vessels can pass all around, within 10 fathoms of the rock.

On the West side of the island is the town of Gustavia, pleasantly situated at the foot of a hill, forming three different sections, and in the centre is the carenage, with wharves all around. On the South-west side of the water are several ship-wharves, with conveniences for careening, caulking, and carpenters' work well executed, and at a moderate expense. The carenage can contain 60 sail, and the road from 300 to 400 shipping, good holding-ground, from 1, 2, 3, 4, 5 and 6 fathoms, sandy bottom.

About the island of St. Bartholomew, the day after the full moon, runs S.E., and it is then high-water at 10h. and 3m. p.m., while the sun is furthest to the North of the equator, but comes about two hours sooner in the following months, until the sun gets furthest to the South, when it is high-water at 10h. 30. a.m., and it runs afterwards in the same proportion back again. The winds which are of long continuance sometimes make a trifling difference. The horizon is also lowest at the time when the sun is furthest to the North of the line; and so to the contrary. The greatest difference in the ebbing and flowing is 18 inches; but, in general, only 10 inches.

DANGEROUS ROCK.—S. 51 E., 12 miles from the S.E. point of St. Bartholomew's, lies a dangerous rock, nearly even with the water's edge.

SABA.—The island called Saba belongs to the Dutch. It is very high, and its shores bluff and clean. On the S.W. part is a small town built in a plain, but hid from the sea by very high hills, except to the Southward. A very high mountain constitutes the centre of the island. The island appears like a steep rock, of a round form; it is about 9 miles in circumference, accessible only on the South side, on which there is an intricate and artificial path leading to the summit, which admits only one man at a time.

It is said that the bottom may be seen all round. On the N.W. side there is a rock, called the Diamond, standing at about a musket-shot from the shore, and which appears afar off like a sail. There is an extensive bank of soundings, extending 7 leagues to the Southward and S.S.W. of the island, having on it within that distance from 12 to 17 fathoms. Beyond these soundings, to the South, no bottom is to be found. At 4 miles to the Southward of the island there is a shoal spot of 3 or 4 fathoms, on which the sea breaks, during gales of wind, but the exact spot has not been ascertained.

THE ISLAND OF ST. EUSTATIUS makes, at a distance, like a steep rock, *The Island* rising out of the sea, and in a sugar-loaf form, ascending upwards in a round hill, but, on a nearer approach, its figure changes, and it appears longer. The rock is composed of two mountains, whose middle land is pretty even. The Eastern mountain is much higher than that to the N.W.; it is hollow in the middle, the excavation being the crater of an exhausted volcano, which has probably constituted the island; the bottom is pretty nearly on a level with the town, and is frequented by sportsmen in pursuit of game.

The town stands on the South side, and is divided into two parts, called the Upper and Lower Towns. The latter is on the shore; it consists of shops and warehouses,

High-water.
Dangerous rock.
Saba.

and is inhabited in the day only, as the inhabitants pass their nights and holidays in the upper town, 50 or 60 feet above the level of the sea, to which they ascend by means of steps cut in the rock. The lower town consists of a single street, and is very indifferently built.

Light.

There is a revolving light on the centre of the island in the upper town: time of revolution, one minute.

The anchorage, which is off the town, is not of the best; there is a swell when the wind blows from the S.E. quarter, and landing is rendered very difficult by the great and continual breaking of the waves against the shore. If bound into the road, give the Eastern point a small berth, and anchor in 12 fathoms before the town. The ground is mostly coarse sand and coral, and merchantmen buoy up their cables. The anchoring-marks are, the church bearing E.N.E., or N.E. by E., about three-quarters of a mile from shore; and the West end of the bay, called Interloper's Cape, N. W. by N. Vessels may even anchor further in the offing, in 11 or 15 fathoms, similar ground. The road is much frequented, and ships are often there, even in the hurricane months; but in this season, the wind must be attentively observed, as, on the smallest indication of a squall from the Southward, they should immediately proceed to sea.

The Derrotero says, "This island shows itself from the S.W. The only hill which it has, is situated near the S.E. extremity, and extends to the West, descending tolerably gently, and comes down to the shore at the place where the town and anchorage is situated. The latter is so bad that, being open to the S. and S.W. winds, (when the breeze even comes to the Southward and Eastward,) so much swell comes in as to incommode the vessels much, and prevent landing on the shore conveniently; the depth in this roadstead is from 7 to 12 fathoms, sand, and vessels in it must remain at single anchor, ready to make sail the moment the wind comes on shore, which, however, does not frequently occur. The channel between it and St. Christopher's is excellent, and without any danger whatever."

Nevis and St. Kitt's.

NEVIS AND ST. KITTS are high, and their eminences may be descried at the distance of 18 leagues; they are separated by the Narrows, a channel of half a league wide, but which, though there is depth enough in it for every class of vessels, ought not to be attempted by a stranger without a pilot, as it is obstructed by several shoals.

Nevis

NEVIS is a small island, which may be readily known, being low on both sides, and very high in the middle. The top of the high land, which to those situated at N. or S., makes like a saddle, reaches far above the clouds. The plantations are on the sides of it, near the bottom. On the Western side are two brooks of fresh water, and three tolerable roadsteads, on the principal of which, near the S.W. end, is Charleston, the principal town of the island.

As the shores of the Southern and Western sides are very low, ships must not approach near to them in the night, as they are not to be distinguished from the high land behind them. From the S. and S.W. points there are reefs stretching off to the distance of nearly half a mile, which must also be carefully avoided.

The Derrotero reports that there is a shoal off the windward coast of Nevis, the situation of which has not been made known; all that is known of it being, that an English sloop touched on it at 2 leagues from the shore. It is added that an English ship of the line also touched upon a rock nearly 2 miles S.S.E. from Nevis. This may probably be the same.

The narrows, or straits, between St. Kitt's and Nevis, is rather more than half a league broad, and lies N.E. and S.W. Nearly in mid-channel, at the Eastern end, there is a remarkable high rock, called Booby's Island; and nearly one mile and a half to the S.W. of this island are two others, called the Cows. The channel, which has a depth of from 3 to 12 fathoms, is between these rocks and St. Kitt's; for on the Southern side there are several shoals.

An extensive shoal, from a mile to a mile and a half in breadth, and 5 miles long, from N.W. to S.E., lies without the Eastern end of the Narrows. The passages in are, therefore, between its North end and St. Kitt's, and between its South end and Nevis. The Southern half of the shoal, which is the broadest, is rocky, and has, in some parts, a greater depth than 10 feet. There is also a dangerous patch of 15 feet of water near the North end.

In sailing up to the Narrows, between this bank and the Isle of Nevis, bring Booby Island W.N.W., and keep it so until the Cows bear S.W. by W. This leads clear of the reef, whence you may proceed as shown hereafter. In sailing in from the Northward, before arriving at the narrows, Booby Island will be seen nearly in mid-way of the channel. In sailing downwards, that isle is to be kept on the port side, keeping over towards the shore of St. Kitt's. The South part of Nevis, kept open to the Westward of Booby Island, will clear the reef. The Cows are also to be left on the port side, keeping over to the shore of St. Kitt's, in 4, 5, or 6 fathoms, good ground.

The Road of Nevis is on the West side of the island. In approaching it from the Southward, give the Fort Point, near Charleston, a berth of a mile, to avoid a shoal which lies to the Southward of that point; then luff up, and anchor in from 10 to 7 fathoms, good ground, with the fore bearing S.E., the S.E. part of St. Kitt's N. 4 E.; distance off-shore about one mile.

On the beach at Bassaterre there is a fixed red light, 37 feet above the sea.

Light-house.

In running from Nevis to Bassaterre, you will cross a bank, on the shoalest part of which there are 4 fathoms, or quarter less 5. It is not quite a mile over, and its middle lies S. by W., Westerly, from the Nag's Head, or the South end of St. Kitt's, two miles.

ST. CHRISTOPHER'S, or ST. KITTS.—The centre of this island is occupied by *St. Christopher's, or St. Kitt's.* a great number of high and barren mountains, intersected by rocky precipices, almost impassable, and among which there are several hot springs. Mount Misery, which is an exhausted volcano, whose head is hidden in the clouds, is the highest of all these mountains, its perpendicular height being 3711 feet. The assemblage of hills makes the island appear, on an approach from the sea, like a huge mountain covered with wood; but advancing nearer, the coast becomes less abrupt, and the ascent of the mountains, rising one above another, will be seen cultivated as high as possible. The S.E. side, on sailing along at 2 leagues distance, appears like several detached islands. The N.W. part is the highest, but declines gradually to the sea.

The bottom of the great crater of Mount Misery is a level of fifty acres, of which seven are covered with a lake, and the rest with grass and trees; amongst the latter is mountain-cabbage. Streams of hot water, impregnated with sulphur, still issue from the fissures.

The principal town is that of Bassaterre, on the South coast, situate at the mouth of a river, which opens into a bay called Bassaterre Road. Sandy Point Town, towards the N.W., is also a town of consequence. There is no harbor whatever, and, on the contrary, a surf continually beats on the shore, which is sandy, and prevents any tree or wharf being erected upon it, and also makes landing always inconvenient; sometimes dangerous. Owing to this, the inhabitants are under the necessity of landing and shipping heavy goods in the manner practised at Montserrat.

SOUTHERN SIDE OF ST. KITTS.—In sailing off the Southern coast of St. Kitt's, the following lands are to be particularly noticed, namely, the Nag's Head, South end of St. Kitt's, on which there is a high hummock; the high-lands on each side of Frigate Bay, the bay at the North end of the isthmus which connects the Northern and Southern parts of St. Kitt's; Monkey Hill, a high mountain to the Northward of the town of Bassaterre; and Brimstone Hill, another high mountain, with a square fort on it, to the Eastward of Sandy Point Town in the West.

In proceeding from the Southern side of Nevis towards Bassaterre, you may cross a bank lying off the Narrows, on which the least depth is about 4 fathoms. It is rather more than a mile in breadth, and its middle part lies nearly 2 miles S.S.W., Westerly, from the Nag's Head, above mentioned. Advancing towards Bassaterre, and having passed the South end of Nevis, the course will be N.W. by N. When off Frigate Bay, run in until the Nag's Head appears to the Southward of the mountain in Nevis, or until the hummock on the Nag's Head appears on with the Southern part of the top of the same mountain; keep this mark on until a single tree on the green ridge behind the town of Bassaterre comes on with the edge of Monkey Hill, or begins to shut in behind it; you may then anchor in 10 or 9 fathoms, mud or clay, with the fort on the East side of the town bearing North, about half a mile distant, and the West point of the bay W. by N. Vessels from the Westward, when bound for the road, may run in with the single tree above mentioned just open to the Eastward of Monkey Hill; and, when the points of high land on each side of Frigate Bay begin to shut in on each other, the water will be found to deepen from 7 to 10 fathoms, after having passed over a rocky ridge into clean ground.

The following remarks on sailing from Nevis to Bassaterre, have been made by Mr. Backhouse: "In sailing past the island of Nevis from Bassaterre Bay, give the S.W. point a berth of 13 mile, and steer N.N.W. and N.W. by N., and there is no danger. You may anchor in 7, 8, or 9 fathoms of water, coarse sandy bottom, with Fashion Fort bearing N.E., the Half-moon Battery N.W. by W., and the town N. by W. You cannot wood nor water here."

Old Road lies 5 miles to the Westward of Bassaterre. In sailing close along shore to this place, the embrasures of the low battery on Stony Point (the Eastern point of the bay) will first appear. The town on low ground will then come in sight, with its houses intermixed with trees. The anchoring-place is nearly midway between Stony Point and the town. In sailing to this spot, run first so far to leeward as to fetch it upon a wind, or nearly so; and then stand in under easy sail, directly for the gully to the Eastward of the town; and when the church of St. Thomas, standing nearly a mile to the Westward, is brought on with the flagstaff on

Brimstone Hill, you may anchor, at about a cable's length from the beach, in 9 or 10 fathoms, stony, but good ground. Fresh water here is obtained by the casks being landed and rolled about 100 yards, then filled at the running gully, and floated off to the boat. There is a great surf on the rocky shore.

Give the Eastern point a small berth, and anchor a little to the Eastward of a red house, abreast of a large gully, in 10, 11, or 12 fathoms of water. If you go abreast of the town, you will soon be off the bank. The mark for anchoring is Old Road Fort by the Red House N. by W. half a mile, and the extreme points S.E. and W.N.W. You cannot wood here, but watering is extremely convenient.

Sandy Point Town lies a mile to the Westward of Brimstone Hill. Off this town, and to the Eastward of it, the bank is narrow, and the ground rocky: the anchoring-place is consequently to the Westward, at about a cable's length from shore, in from 9 to 13 fathoms, and the mark for anchoring is, the street extending from the landing-place, through the middle of the town, end on. In running along shore to the anchorage, you must cautiously avoid a reef stretching half a mile from Charles Fort Point.

Remarks made in Bassaterre Road and Old Road.

In Bassaterre, which is a large open bay, the marks of the anchorage are as follow: The long point of Nevis S.S.E., Nag's Head S.E., Bluff Point W. $\frac{1}{2}$ N., the town of Bassaterre North, distance off shore half a mile, depth of water 7 fathoms; wood purchased, water better and easier got at Old Road, about $1\frac{1}{2}$ league from hence; tides none.

In the Old Road the following are the marks of the anchorage, viz.: the long point of Nevis S.E., Southerly; Stony Fort E.S.E., the Westernmost point of Old Road N.W. by N., Stony Point, S.E. $\frac{1}{2}$ E. Depth of water where the anchor lay, 10 fathoms, one-third of a cable out—wind off the land; 13 fathoms under the stern—West distance off shore two-thirds of a mile. You land your casks, roll them about 100 yards, and fill them at a running gully; then float them off to the boat. A great surf and a rocky shore.

Barbuda.

BARBUDA.—The greatest extent of Barbuda, from S.E. to N.W., is 15 miles. Its highest land cannot be discerned at more than 6 leagues off. The greater part of the coasts of this island are very foul and dangerous. In its proximities, it is not uncommon to sound with 50 or 60 fathoms at the bow, and have only 4 or 5 fathoms at the stern; the reef extends several miles to the S.E. from the island, and the rocky soundings continue to the South as far as mid-strait between it and Antigua, where 9 fathoms, on the same kind of bottom, have been found. To the N. and N.W., the reef extends outward to the distance of 5 miles.

There is anchorage in a well-sheltered road on the Western side, where ships may ride in 9, 12, or 14 fathoms of water; or within the reef in 31 fathoms, 1 mile above Palmetto, on the S.W. point. There is also anchorage off the S.W. coast, in 51 fathoms, sandy bottom, with Palmetto point N.W. by W., 3 miles, and Cocoa Point, the South point of the Island, E. by S., 4 miles distant.

Antigua.

ANTIGUA has, in general, a rocky shore, and is surrounded by many dangerous reefs. The climate of this island is commonly hotter, less healthy, and the hurricanes more frequent than those of Barbadoes. There being no rivers, and but few springs, and those brackish, the inhabitants are obliged to preserve the rain-water in cisterns. Excessive droughts frequently impede and destroy vegetation.

Antigua however, derives considerably by advantage from the circumstance of having several excellent harbors, particularly English Harbor, on the South side, which is capable of receiving the largest ships-of-war in the navy; here also is a dock-yard, with stores and all materials and conveniences for repairing, heaving down and careening ships. To the Westward of English Harbor is the Harbor of Falmouth, and to windward is Willoughby Bay. At the Eastern end of the island is Nonsuch Harbor; and on the North side is the town and harbor of Parham, &c. The coasts are, in general, very foul, especially on the N. and N.E., whence many reefs extend out to the distance of more than a league.

The town of St. John, on the N.W. side, is the capital. This town is situated on the harbor of the same name, in which there is a sufficient depth for merchant vessels, and perfect security in all winds. Ships from the Eastward generally make for the S.E. coast of the island.

Willoughby Bay.

WILLOUGHBY BAY.—The first harbor on the S.E. side is that called Willoughby Bay, on the Western side of which is a little island, called Sandy Island, environed to a short distance by sunken rocks. From the Eastern side of the bay a long narrow reef extends more than two-thirds over the entrance, and to within half a mile of Sandy Island. The passage is therefore between the island and the reef; and even in mid-channel between, there is a shoal having only 9 feet over it, called the

the beach, in 9 or 10 fathoms, and floated off to

the Eastward of a red buoy. If you go abreast anchoring is Old Road point S.E. and W.N. convenient.

Off this town, the anchorage is rocky; the anchorage is from the shore, in from the anchorage along shore to the mile from Charles Fort

Road.

anchorage are as follows: the town of Old Road, in 7 fathoms; wood pier anchorage from hence; tides

anchorage, viz.: the long point of Old Road, where the anchor lay, 10 fathoms under the stern—four casks, roll them about off to the boat. A great

S.E. to N.W., is 15 miles off. The greater part of its proximities, it is not more than 4 or 5 fathoms at the island, and the rocky point of Antigua, where 9 to the N. and N.W., the reef

on the stern side, where ships may anchor in 31 fathoms, 1 mile above the S.W. coast, in 51 fathoms, 3 miles, and Cocoa Point,

is surrounded by many dangerous rocks, healthy, and the hurricanes are few, and but few springs, and the rain-water in cisterns is pure.

The circumference of having on the South side, which is very deep; here also is a dock-yard, for repairing, heaving down and building the Harbor of Falmouth, the end of the island is Nonsuch Point, &c. The coast is very dangerous, whence many reefs extend

to the sea. This town is situated on a shallow depth for merchant vessels, and generally make for the

S.E. side is that called Wilkeson Island, called Sandy Island, on the Eastern side of the bay a long narrow entrance, and to within half a mile on the island and the reef, and only 9 feet over it, called the

Weymouth, which lies only half a mile from Sandy Island. Between Sandy Island and this shoal there is a depth of 4 fathoms; between it and the West end of the reef there are 7 fathoms, and the channel is wider. At a mile within the entrance there is good anchorage, in 4 and 5 fathoms; in going up, it is recommended to near the port shore.

ENGLISH HARBOR.—This harbor is perfectly safe, and lies close under the West part of the Easternmost high land, so as to afford a shelter in all winds; and ships-of-war commonly lie here during the hurricanes. In the bay without the harbor, ships may anchor in 5, 6, or 7 fathoms. They must warp in, and cannot lie excepting N.N.E. There are, generally, flatterings of wind from the highland.

Three fixed lights on a staff are shown on Fort Berkeley when the mail-steamers are expected. The upper light is red; the others of the natural color.

The lights are in lat. $17^{\circ} 10'$, long. $61^{\circ} 45' 12''$ W.

In entering the harbor give the Old Horse-shoe, or low battery point, on the starboard side, a good berth, and keep as nearly as possible in mid-channel, between that and the opposite point, on which stands Fort Berkeley, until you get into the bay on the Eastern side, called Freeman's Bay. In this bay there are moorings for shipping, and good anchorage hence up to the storehouses on the Western side, in 3, 4, and 5 fathoms. The water is generally smooth. It is not safe for a stranger to enter, as the entrance is narrow and rather shoal. When you are off the harbor, a pilot, or the master-attendant, will come on board.

Large ships lie at proper moorings, but small ones lie with one anchor to the E.S.E., and the other made astern on shore. There are four moorings for ships in Freeman's Bay, just within the harbor's mouth, the best bower to the Westward, and the moorings on shore to the Eastward.

Wood and water are not to be obtained here. You may, however, obtain the latter at Falmouth, about $1\frac{1}{2}$ mile to leeward. It is not very good, being soft, muddy and brackish.

FALMOUTH HARBOR.—To sail into this harbor, run close in towards the Western point, called Proctor's Point, and you will pass clear of a ledge of snaken rocks called the Bishops, which lie towards the middle, just within the entrance, and terminate a shoal extending from the Eastern point, on which there is a redoubt for the protection of the harbor; beyond these rocks there is good anchorage in from 3 to 6 fathoms water. There is a battery on an islet within for the defence of the town, on the Western side of the harbor; beyond which there is a spring of fresh water.

Vessels bound to St. John's harbor, from the South side of the island, on approaching Westward, must give the coast a berth of 3 or 4 miles, until they come abreast of Johnson's Point, (the S.W. point of the island,) in order to avoid the dangerous reefs which lie about 2 miles from shore, Eastward and North-westward of the point. If bound to the North-westward from English Harbor, the course to abreast of Johnson's Point is first W. by S., or W.S.W., about 8 miles; then hauling towards the N.N.W., and keeping the lead going, still keeping at the above-mentioned distance from the island, steer for Sandy Island, the little island lying to the Westward of St. John's Road, and about 7 miles N. by W. from Johnson's Point.

Or, in sailing from off English Harbor to the Westward, when to leeward of Falmouth Harbor, keep the small battery on the Eastern side of the entrance of that harbor open with the Western point of the same, until you are off Carlisle Bay, or Old Road. The bluff land of English Harbor being then kept open without that of Old Road, will lead clear of Johnson's Reef, in a depth of about 18 fathoms.

On the Western side of Antigua, at about half-way up, and nearly a league to the Northward of Sandy Island, is a large harbor, called Five Islands Harbor, from a cluster of five remarkable small islands, which lie nearly in a line, about half a mile East and West, off the point on its South side. About three-quarters of a mile to the Northward of the harbor, and close inshore, is another conspicuous little island, called the Hawk's Bill. When you have approached so far to leeward with the mark above mentioned, (namely, the bluff of English Harbor kept open without that of Old Road,) you may have the Hawk's Bill open to the Westward of the Five Islands, you will be clear of the reefs, and may tack up towards Sandy Island. In approaching this island, keep it on your starboard bow, in order to avoid several shoals extending to the distance of a mile from shore, to the N.W. of Five Islands Harbor.

Should the wind permit, you may run within Sandy Island; but it is better for strangers to go to leeward of it, at the distance of not less than 2 cables, so as to avoid a reef which stretches from its Southern side to the S.W. Be careful not to stand above 3 miles to the Northward of this island, lest you be caught by a lee current, or run on the shoals which lie to the Northward. By keeping in 15 fathoms, you may pass clear of the island in the night.

ROAD OF ST. JOHN'S.—This roadstead lies about 13 mile East, a little North-ward, from Sandy Island. It lies in lat. $17^{\circ} 10'$, or very nearly so. The Western point *John's*.

on the South side, which forms the bay, is called the Ship's Stern, at about a mile North of which there is a dangerous ledge of rocks, with not more than 3 feet water over them, called the Warrington. Here are breakers in a wind.

The road lies to the Southward of the Warrington Rocks, and has a depth of from 6 to 10 fathoms. The anchorage, which is 2 or 3 cables' length within the rocks, lies with the Ship's Stern, S.W. by W.; Fort James on the North point of the entrance of the harbor, E.S.E.; and the Warrington N. by W., or with the flagstaff of Fort James on with the North side of the island in the harbor, called Rat Island, where there are from 5 to 7 fathoms water, and good holding-ground.

The middle of the Warrington Rocks lies with the Northern part of the buildings on Fort James on with Rat Island above mentioned. Close to the Westward of them, in the depth of 9 fathoms, the largest of the Five Islands appears open to the Westward of the Hawk's Bill. The Western part shoalens about a cable's length from the breakers, but the Eastern part is bold to.

Ships bound to the road stand on upon a wind for half a mile above Sandy Island, then tack, and run close in to the Ship's Stern; but be sure not to get further to windward than to open the Hawk's Bill without the land, or to bring it in a line with the Easternmost of the Five Islands. When thus far in, if standing to the Northward towards the Warrington, you must tack so soon as the flagstaff of Fort James appears on with the middle of Rat Island.

To sail up within Sandy Island, bring the Westernmost of the Five Islands N. by E. $\frac{1}{2}$ E., and keep them open on the starboard bow, which will lead clear of danger.

At the distance of a mile from the Westernmost of the Five Islands, you will be in the channel; keep Sandy Island, as before mentioned, on the starboard bow, until you open the Hawk's Bill, and then luff. The Eastern side of Sandy Island is nearly bold to, and in the day the shoaling may be seen. The Ship's Stern is bold to. After the Hawk's Bill bears E. by S. you may haul up as near to it as you choose, there being 11 fathoms of water close to it. In steering for the harbor, keep along the South shore, which is all clear.

There is a bar at the entrance of the harbor, which stretches from the North side S.W. to the land on the South side. The deepest water, 14 feet, is on the Southernmost part of the bar. The depth on the Northern part is about 12 feet.

NORTHERN SIDE OF THE ISLAND.—The Northern and Western coasts of Antigua are environed by numerous reefs, between which and the land there is a good channel for shipping. At the N.E. part there are also a number of small islands, of which two or three of the outermost are called the Bird Islands. The whole are encompassed by reefs, which render them inaccessible to shipping. Of the latter the Northernmost is a narrow ledge, part of which is sometimes dry. This ledge stretches N.E. about a mile from the Northernmost Bird Island. A shoal of 3 fathoms lies about three-quarters of a mile to the Northward of the end of the ledge, between which and the Bird Islands Reef there is a clear channel of 8 and 6 fathoms. The white water from the shoal may frequently be seen at the distance of a mile and a half.

THE HARBOR OF PARHAM lies at the distance of 2 miles Westward of the Bird Islands Ledge. This harbor, though large, will admit small vessels only. The town is situated on the South side of the harbor.

A little island called the Prickly Pear, lies off the West point of the entrance of Parham Harbor, and about 4 miles due West from the North end of the Bird Islands Ledge. In advancing towards this island, and thence to Boon's Point, 2 miles to the Westward of it, be sure not to get over to the Northward, as the reefs on that side are extremely dangerous, and in some parts not more than a mile from the coast.

From Boon's Point, to go clear of the Warrington Rocks, on the Northern side of St. John's Road, the course and distance are W.S.W., Southerly, 4 miles.

THE NORTHERN LEDGES off the North coast of Antigua, commence with the rock called Addison's Rock on the East, and terminate with the reef called the Diamond Reef on the West. Addison's Rock is a shoal, having on some parts only 2 feet of water, and lying nearly North of the Fort on Barvaile Point, upon the Western side of the entrance to Parham Harbor. It has a depth of about 3 fathoms around it. Within a short distance, N. by W., Westerly, from Addison's Rock, there are two other shoals of about 3 fathoms; and half a mile thence, West, is a reef, sometimes above water, and called the Horse-shoe. This reef bears North, $\frac{1}{2}$ mile distant from the Prickly Pear, close to the Westward of the Horse-shoe, and between and the great cluster of reefs which stretch to the Westward, there is a channel of 4 fathoms.

At a short distance to the Westward of Beggar's Point (the point to the Southward of the Prickly Pear) there is a windmill; and at the distance of one-third of a mile to the S.W. there is another. These mills form the mark for sailing through the channel.

Northern side of the island.

The Harbor of Parham.

The Northern Ledges.

NOT.

Stern, at about a mile more than 3 feet water and has a depth of from 15 to 20 fathoms within the rocks, lies at the entrance of the channel with the flagstaff of Fort called Rat Island, where the buildings of the fort appear open to the Westward a cable's length from the Westward of them.

ern part of the buildings to the Westward of them, appears open to the Westward a cable's length from the Westward of them.

mile above Sandy Island, not to get further to windward in a line with the standing to the Northward of the flagstaff of Fort James appears

of the Five Islands N. by W. will lead clear of danger.

Five Islands, you will be in on the starboard bow, until the end of Sandy Island is nearly abreast of the Ship's Stern is held to. After that it as you choose, there is a small shoal in the harbor, keep along the

stretches from the North side of the island, 14 feet, is on the Southern side about 12 feet.

Eastern and Western coasts of the island and the land there is a good number of small islands, of which the largest is called Bird Islands. The whole area is very fertile and well adapted to shipping. Of the latter, the largest is called Bird Islands, sometimes dry. This ledge is about 3 fathoms deep at the end of the ledge, between the channel of 8 and 6 fathoms, at the distance of a mile and

2 miles Westward of the Bird Islands, small vessels only. The town of St. John is situated on the West point of the entrance of the harbor, 2 miles to the North end of the Bird Islands, and 2 miles to the East of Poon's Point, 2 miles to the East, as the reefs on that side are a mile from the coast.

Reefs, on the Northern side of St. John, 4 miles.

of Antigua, commence with the reef called the Diamond, having on some parts only a depth of about 3 fathoms around the point, upon the Westward of about 3 fathoms around Addison's Rock, there are two more reefs, the first of which bears North, 1 1/2 mile distance from the Horse-shoe, and between it and the second, there is a channel of

10 fathoms, the point to the Southward, at a distance of one-third of a mile from the mark for sailing through the channel

pel on the Western side of the Horse-shoe; and steering S. by W. between them will lead a vessel through.

A small shoal of only 5 feet water lies S.W. by W., at the distance of nearly 1 1/2 mile from the Horse-shoe, and nearly at the same distance N.W. by W. from the Prickly Pear. There is also a shoal stretching half a mile from the Western side of the Prickly Pear, which may be seen during the day.

There are so many shoals and rocky spots without the great reefs above mentioned, that it is dangerous to come too near. That, in particular, called the Diamond, lies a mile to the West of the reef, and in the channel between you have 6 and 5 1/2 fathoms. You will be in this channel whilst you keep the Western side of the leeward Sister in a line with the flagstaff of James Fort. The Diamond is of a circular form, and one mile in extent; the depth of water over it is from 1 to 9 feet. To avoid it, when coming in from the N.W., bring the Ship's Stern to bear S. by E. before you haul up with the fore, and then look out for the Warrington Reefs. If the wind will serve, you may pass close to the Westward of the Westernmost Sister, and you will thus weather the Warrington, which bears North, above a mile from the Ship's Stern. The Westernmost part shoals from the breakers a full cable's length, but to the Eastward it is held to.

Remarks on the Coast of Antigua.

[From the Derrotero de las Antillas.]

On approaching Willoughby's Bay, upon the S.E. coast, great caution is required, in order to avoid its rocky shoals, and a pilot will be requisite for strangers who enter here.

From this bay the coast continues to the Westward very clear, and in it you will soon find ENGLISH HARBOR, which is an excellent port, having dock-yard and *English Harbor.* careening-place for vessels of any size. The strait of this harbor is about a cable's length in width, and in the middle of it there are from 4 to 5 fathoms, and 3 fathoms at a quarter of a cable from the points. After English Harbor that of PALMOUTH *Falmouth* follows, and thence the coast begins to be foul, having for more than 2 cables' length from it, very dangerous rocky reefs. Thus it continues to CARLISLE BAY, or the *Carlisle Bay* Old Road. From Carlisle Bay to Johnson's Point, the South-west point of the island, the coast extends to the North, but has a rocky shoal, of the length of 2 1/2 miles, which lies at a mile and a half from the coast. Between this shoal and the coast there is a passage fit for any vessel, but it ought not to be attempted without a pilot.

From Johnson's Point the coast continues to the North, to the FIVE ISLANDS, on *Five Islands* the South side of the harbor of that name; and another shoal of rocks and sand extends between these points, which lies about a mile and a half from the coast. The depth between is very unequal, and the navigation therefore dangerous.

From the Five Isles the coast forms a great bay, named Five Islands Harbor, of which the North point is called Pelican Point. At about 2 miles from the N.N.E. of this point, is the point called the Ship's Stern, which is the S.W. point of St. John's Bay. Between the two points is a sand-bank, which extends out above a mile from the coast, and its edge is nearly on the meridian or South of Sandy Island, an islet 2 miles to the West of the Ship's Stern. A reef surrounds Sandy Island, and is three-quarters of a mile in extent from N.E. to the S.W.

Two miles to the N.E. by N. of the Ship's Stern are two islets, named the Sisters, which are three-quarters of a mile N.W. by W. from Caribon's Point, on which there is a fort.

Between the Two Sisters and Sandy Island, and just within this line of direction, is the rocky shoal called the Warrington, which has, in its shoaler part, not more than 3 feet of water.

The town of St. John, situated at the bottom of a bay of the same name, is the capital of the island and centre of its commerce. We therefore give directions which may guide any one to the anchorage. The North coast of this island is very foul, as already noticed: it is, therefore, more advisable, on advancing, to make the island on the South side, and direct your course so as to pass about 2 miles to the South of its Southernmost points, and continue steering true West, but nothing to the North, until the Westernmost part of the Five Islands bears North, when you may hull up to N.N.W.; with which course you will pass about a mile from the outermost part of the Fish Bank, a shoal of sand and rock, and you will follow it until the Five Islands bear East; when, if the wind allows, you will steer so as to pass about 2 cables' length from the S.E. side of Sandy Island, taking care not to pass to the Eastward of N.E. by N., that you may keep clear of the sand-bank, which extends from the coast between Pelican Point and the Ship's Stern, until Sandy Island bears North, when you may hull to the wind all you can; and if you can, place the vessel's head towards

the Ship's Stern Point, which is very clean, and follow on towards the road within and anchor in 5 or 6 fathoms water, nearly South from the Warrington Shoal. If, when passing between Sandy Island and the coast, the wind will not permit your approach to the Ship's Stern Point, you may follow the tack until Fort Hamilton, which is the middle one of the three standing on the coast to the North of the town, bears East; then go about on the other tack, and continue beating, taking care not to prolong the North tack more than until Hamilton Fort bears East; or go about even sooner; but the South tack you may follow until you are within a cable's length of the shore of Ship's Stern Point, for it is very clean.

If, when to the West of the Five Islands, the wind will not permit you to pass to the S.E. of Sandy Island, you must steer to the North until the North point of Sandy Island bears East, South-erly, and then you will haul by the wind, and prolong the stretch until you can weather Sandy Island on the other tack; and having weathered it, you will beat in as above stated: that is, on the North tack until you are nearly West of Fort Hamilton; and on the South tack to within a cable's length of the coast near the Ship's Stern.

To proceed to the Northward from the road of St. John, it is necessary to give a berth to the rocky shoal called the Diamond, and others, which extend West almost to the meridian of the Warrington; and the Northernmost part of which is nearly 5 miles distant from the Ship's Stern Point. To effect this you must steer from the anchorage about N.W. by N., but nothing to the North of that, until Sandy Island bears from South towards East, and then you may steer North, which you will continue until the Sisters bear S.E. by S., when you may haul to the wind, and pursue your route, according to destination.

If, having made the North part of Antigua, you wish to anchor at St. John's, you ought to steer true West, passing outside of all the shoals; that is, avoiding the North coast by about 4 miles, until Sand Island bears South, a little Easterly, when you may steer towards it, until you are due West from the Northernmost land of Antigua; thence steer for Ship's Stern Point, and so run until being something to the South of Fort Hamilton, you may haul by the wind, or shape the most convenient course to gain the anchorage.

The channel between Guadaloupe and Antigua is most excellent, and does not offer the least danger.

The channel between Antigua and Barbuda, on the contrary, is at times dangerous, particularly between May and November, during which season no one should pass through it, because there are many calms in it, alternating with very heavy squalls of wind; and, as the depth of the channel is so unequal, and the bottom frequently rocky, an anchor cannot be let go when the calms come on, and the risk is incurred of being driven upon the rocks, either on one side or the other, by currents that may occasionally prevail here.

MONTSERRAT AND REDONDO.—There is no harbor in the Island of Montserrat, and the greater part of the coast is so encompassed with rocks as to render it riding dangerous, in case of a hurricane or tornado. The principal roadstead is off the town, and there are two others, namely: Old Road and Ker's Bay; but in all these a surf beats continually on the shore. Large heavy goods are therefore landed and shipped by means of a boat, called a Moses, manned by expert rowers; who, when they see what is termed a lull, or abatement of the surge, push ashore and lay the broadside of the Moses on the beach, so as to roll out or admit the hogheads, kegs, Cotton, rum, and other commodities, which will bear the water, are generally floated off or ashore.

Two fixed lights are shown on the beach at Plymouth, on the expected arrival of the mail steamers.

It has been recommended to those who lie near this island, when the state of the atmosphere indicates an approaching tornado, to get under way for Antigua, or St. Christopher's, according to the wind and other circumstances.

The Spanish description says: "Montserrat, which lies nearly S.S.E. and N.N.W., is a great rock, formed by two mountains. The N.E. part is remarkably high, scarped, or cliffy and clean. The island has not the smallest bay, nor any breakers, except they break upon the very shore, which you may come so near as almost to touch it, without the least risk. The N.W. point is also high and scarped, (or ruffly) and bluff. The highest parts of the island may, in clear weather, be seen at the distance of 15 leagues.

"The S.E. part is higher than the N.W., but it has a gentler declivity, and when it joins the sea is rather low; the South part is also very clean; but, when the trade South-easts, the sea breaks upon it with much force. The road is an opening of some depth, which affords shelter only when the breeze is N.E. This renders it impossible for large vessels to anchor in it, and none frequent it but some small ones, which carry away the produce of the island, which they take to Antigua."

REDONDO, which lies 3 leagues to the N.W. from the North end of Montserrat, *Redondo*
is a very high, round, barren, and uninhabited rock, having the appearance of a hay-
cock, and may be seen from the distance of 9 or 10 leagues. There is anchorage on
the West side of it, in the depth of 11 fathoms. You may approach the isle on either
side, it being steep to. On the S. E. side is a little islet called the Pinnacle, which
is nearly joined to the land.

AVES, or BIRDS' ISLAND.—This little solitary isle, which takes its name from *Aves, or*
the multitude of sea-fowl with which it is always covered, lies, according to the *Birds' Isl.*
Spanish chart, in lat. $15^{\circ} 50'$ and long. $63^{\circ} 43'$. It is extremely low, and surrounded by *and*
a sandy beach. In the middle it is somewhat higher than at its extremities, and has
some trees. There are reefs on its S. E. and N. W. sides, which extend out to
a short distance, and on which the sea always breaks. The length is about 3 cables,
from N. to S., and nearly the same from E. to W. The height is about 12 or 15 feet
above the level of the sea. At the Western part of it there is good shelter from the
sea, where a vessel may anchor in 10 or 12 fathoms water, on a sandy bottom. This
island may be seen, in a clear day, at 3 or 4 leagues off, but the flight of birds, at the
setting of the sun, will always point out its situation.

Fisher Loyal says, that there is anchorage on the S. W. side, at half a pistol-shot
from shore, in 31 fathoms, white sand. He adds, there is neither pond nor spring of
fresh water on the island; but, it is supposed, that by digging at the distance of 150
or 200 paces from the shore water might be found.

On the West and N. W. sides are two islets, or barren rocks, white with the dung
of birds who resort there. These islands are connected to Aves by shoals and break-
ers, which may be seen.

Mr James Finlaison, (M. R. N.) describes the Isle of Aves as follows.—The
Island of Aves lies in lat. $15^{\circ} 40' N.$, long. $63^{\circ} 33' W.$, variation $4^{\circ} 20' E.$; it is a
low small island, about three-quarters of a mile in length; you will not see it further
off than 6 or 8 miles; broken water extends from both ends of the island, about half
a mile from it. Ships must be careful that they keep near the parallel, in the night-
time, as it is impossible to see it, being so very low; there is a slight covering of grass
on the top."

The position of Aves, as given in the French tables, is $15^{\circ} 30' 18'' N.$, and $63^{\circ} 38'$
 $17'' W.$ The mean of the three statements is $15^{\circ} 40' N.$, and long. $63^{\circ} 38' W.$

GUADALOUPE.—The form of Guadeloupe is very irregular, and the land is *Guadeloupe.*
divided into two parts by an arm of the sea, called the Rivière Salée, or Salt River,
a stream diminishing in width from 50 to 15 fathoms, and of which the soundings are
in some places deep enough for a ship of 500 tons, whilst in others there is scarcely
water enough for a bark of 50. The length of this strait is about 2 leagues, and no
scene can be more pleasant than the passage; the water being clear and still, and the
banks on each side lined with mangroves and palmettos, which afford excellent re-
freshment and shelter from the heat.

The Western division of the island, which is the most important, is divided into
two parts by a ridge of very high rugged mountains, extending North and South;
so high, indeed, that the continual cold suffers nothing to grow but fern and some
useless trees covered with moss. Towards the South point there appears in the
middle region of the air a mountain called La Soufrière, or the Sulphur Hill, which
is about 5500 feet above the level of the sea. This mountain exhales a thick black
smoke, mixed with sparks, visible in the night.

Its principal town, Port au Petre, or St. Louis, is a place of considerable trade.

The chief town of Guadeloupe is that named Bassaterre, situated on the West side,
near the South end of the island.

Lying at anchor at Bassaterre Road, you have the Westernmost part of the Saintes
and some part of the Western side of Dominica in one, bearing S. E. by S.; Montserrat
at the same time bearing N. W.; Northerly, and the Westernmost part of Bassaterre
Bay N. W. by N., distant one mile.

There is also good anchorage in this road in 7 fathoms, sandy ground, with the
small anchor in 37 fathoms, similar ground, on the following bearings; by compass:
the fort to the S. W. of the town, S. E. by E.; the church N. E.; the N. W. end of the
town N. by W.; Point Troiz, N. N. W.; and the Southernmost point of Dominica S.
E. by S.

Should you be bound from the road of Bassaterre to Antigua, the best way is to
weigh at night, and sail at such a distance from the shore as to keep the land-wind,
that it may carry you to the Northern part of the island by morning, where you will
have the sea-wind to carry you across. Should you act otherwise, you may be
caught by the baffling winds from under the highlands. Off the N. W. point of
Guadeloupe there is a small but remarkable high rock, called Tête à la Anglais, or
Englishman's Head; it appears gray, and particularly distinguishes this coast, and
there is no passage within it.

Remarks on Guadaloupe.

[From the Derrotero de las Antillas, &c.]

*Grande
Terre*

This island, the mountains of which may be seen in clear weather at the distance of 20 leagues, is divided into two almost equal parts, by a channel navigable solely for boats and canoes. The Eastern part is named GRANDE TERRE, and the Western part is subdivided into two by the mountains: the East being named Cabes Terre, and the West Bassaterre. The capital of this island is St. Louis, or Point à Petre, on the Western part of Grande Terre, at the South entrance of the Rivière Sable, or channel, which separates it from Cabes Terre. The anchorage of Point Petre is sheltered, and vessels which have to remain at Guadaloupe winter in it. In the hurricane season it is necessary to have a pilot for this anchorage. If bound to it, you proceed towards the town of St. Louis, taking care not to get to the West of it, but keeping to the Southward and Eastward, that is, you must make it to the N.W. of you.

On the S.W. of Point Bassaterre stands the town of the same name, which is the most considerable in the island, and the centre of its commerce. This is the reason why it is generally resorted to. The anchorage here is a very inconveniently unsheltered roadstead, where there is a constant swell: its bottom, at the edge, is so steep, that at 2 cables' length from the shore there are 80 and 100 fathoms. The ground is not good, and these circumstances make it necessary to keep close to the shore, and let go one anchor in 20 or 30 fathoms, on clay, and hang to it without letting go another, that you may be ready to sail the moment that winds from the S.E. quarter come on.

From the anchorage of Bassaterre you may approach as near to the West coast as you choose, as far to the Northward as the hill named Gros Morne, which is the N.W. extremity of this part of the island.

Every one bound to Guadaloupe ought to take the South part of it, for the principal commercial ports are on it. If bound to Point à Petre, you ought to approach within 2 miles of the South coast, or Grande Terre, and continue at that distance to the East and Bay of Fergeant, on which is the town of St. Louis, whence you ought to take a pilot to carry you into Point à Petre.

On this coast there are two roadsteads, with towns at them, the first called St. François, and the second St. Anne's. Between the last and Fort Louis there is another town, a little island, named Le Gosier, which is nearly North from an island of the same name. From this island to the West, in about 2 miles of the coast, are 6 or 8 fathoms of water.

If bound to Port Royal or Bassaterre, direct your course so as to approach Cabes Terre about Point St. Sauveur; then follow the coast at the distance of a mile, or thereabouts, and pass about half a cable's length from Point du Vieux Fort, or Old Fort Point, which is the Southermost point of Petite Terre, and luff up immediately when round it, in order to keep at the same distance, of half a cable's length from the coast, until you are opposite the town, where you must anchor.

It ought to be observed that, when sailing either to the Northward or Southward to leeward of Guadaloupe, you ought to keep within 2 miles of the shore, as by doing so you may have the advantage of a light land-breeze, which will be almost always sufficient to pass it before day; but, getting further off the coast, it is no uncommon thing to be 4 or 5 days absolutely becalmed. Any one who is not able to get near the land of Guadaloupe, that is, within the distance of 2 miles, must positively pass at 7 or 8 leagues from it to avoid the calms.

Lighthouse.

There is a fixed light, 108 feet above the sea, on the Eastern end of Terre-de-haut one of the islets of Petite Terre, near Guadaloupe. It is in lat. N. 16° 10' 29" and long. W. from Greenwich, 61° 01' 51", and is visible in fine weather 5 marine leagues.

The light bears S. 36° 45' E. from the extremity of Point des Chateaux, the Eastern point of Guadaloupe; from the Western point of Descada, it bears S. 5° W. and from the Eastern point of the same island S. 32° 15' W.

The reef, called Baleine du Sud, which is the most Southerly, and the most distant one from Petite Terre, bears from the light S. 19° W., distant half a mile.

The soundings to the Eastward of the light are from 13 to 20 fathoms, at the distance of 2 miles; nearer than which it should not be approached.

Petite Terre

PETITE TERRE is a small sandy island divided into two parts by a shallow channel. It lies directly in the fairway, or in a line between the Eastern coast of Marie-Galante and the Isle Desirade. There is pretty good anchorage by Petite Terre, to the Westward, at 2 miles from shore, in 7 fathoms water.

POINT PETRE.—Point Chateau, the Easternmost land of Guadaloupe, is composed of irregularly-shaped rocks, some of which appear ready to tumble over into the water. From this point you may keep down the South side of the island, within about 2 miles of the shore, until you pass an island called Le Grosier, which is the first island you come to, and between which and the main island there is no passage, and only a small opening. From this island to near the harbor, you may go along in the edge of the white water. When up with Isle Le Grosier, you will discover a building on a hill near the water, which is called the fort, although it has not much the appearance of one. About a mile or a mile and a half from the fort, is the entrance to the harbor of Point Petre. In sailing along here, you will, if not too far off shore, observe an island so low that the mangrove bushes appear to stand in the water, from which a reef extends off some distance to the Westward. A little to the Westward of the last is another island, larger and higher, with coconut-trees and some houses on it, where the pilots stop, from which a large reef extends off in an Easterly direction. Between these two reefs is the entrance to the harbor. A little inside the low island are several large square buoys, near which you pass, leaving them all on the starboard hand. There are several islands to the Westward of those already mentioned, among and around which the ground is foul, so that vessels lying off and on should keep to windward.

There are 3 fathoms on a small piece of shoal ground, nearly S. by E. from the entrance to the harbor. Point Petre is one of the best in the West Indies, and pilots are readily obtained.

THE SAINTES, MARIE-GALANTE, DESIRADE, &c.—These islands are dependencies of Guadaloupe, from which island Marie-Galante, the principal, is 11 miles distant. The channels between them are generally clear and deep.

THE SAINTES.—The assemblage of little islands, called the Saintes, or All Saints, were so denominated from having been discovered by the Spaniards on All Saints' Day. They are bold to, and so arranged as to form as fine a road for shipping as any in the neighborhood.

The two largest islands are called Terre d'en Haut, or the Upper Land, and Terre d'en Bas, or the Lower Land. The first is the Easternmost, and contains the town, or rather village, which is situated about half-way down, on its Western side. Between this town and a small island to the N.W. is the anchorage, which is nearly half a mile broad, and has a depth of 16 to 14, 10, and 6 fathoms. On the Terre d'en Bas is a neat wooden church, with two convenient creeks for anchorage and landing.

The islands have constantly a fresh breeze, let the wind blow from what quarter it may.

On the S.W. side of the upper island is a mountain, called Mont de Filles, the summit of which is 813 feet above the level of the sea. To the N.W. of this mountain, on the North coast of this island, is a remarkable promontory, called the Sugar-loaf, which serves as a guide to ships coming in from the Northward; for bearing S.W. by W., it leads between a rock called the Whale, and a bank lying more to the North-westward, at the entrance of the channel, within which ships may haul round to the road.

In passing out hence to the Westward, keep over towards the South shore, in order to avoid a shoal which lies at the distance of a cable's length from the South point of the island to the North-westward.

It is said that there is a sunken rock lying a mile and a half to the Northward of these islands, of which the particulars are unknown.

MARIE-GALANTE.—The land of Marie-Galante is of moderate height, and it rises gradually towards the North. On the South and Eastern sides are several sunken rocks and dangerous reefs, some of which extend nearly a league to sea; but the Western side is a fair shore, with good anchorage in several places. The town Bas-saterre, which is protected by a fort, stands on the S.W. point of the island.

Along the Eastern shore are lofty perpendicular rocks, that shelter vast numbers of tropical birds. The Western shore is flat, and the ground, in general, is proper for cultivation. It has several large caverns, where crabs are found, with many little streams and ponds of fresh water.

DESIRADE, or DESEADA.—This is a small rocky island, destitute both of wood and fresh water, but whereon some cotton is cultivated. The island lies nearly E.N. E. and W.S.W., shaped like a galley, the Eastern end making like the head or prow, and the Western end like the tilt. But on advancing towards the North side, some white broken patches will appear, like heaps of sand with red streaks in them. On this side there are some rocks under water.

There is anchorage off the S.W. part, at a mile and a half from some houses standing near the shore. You may anchor in from 5 to 7 fathoms water, taking care to look out for a clear spot, as the ground is rocky. When at anchor, Petite Ferre will bear South, Easterly, and Point Chateau W. by S. The latter is the Easternmost

Point Petre.

The Saintes Marie-Galante, Desirade, &c.

Marie-Galante.

Desirade, or Descada.

point of Guadeloupe, and may be known by a hummock on it. Between it and Desade there are 22 and 23 fathoms of water.

Moaal Guadeloupe.

MOAAL, GUADALOUPE.—This port, which is often visited by vessels from the United States, and also from other ports, is W. N. W. 44 miles from Point Chateaux, and 18 miles W. from the North east end of the Island of Pescadore. The entrance to it is between two reefs, which protect it, but when the sea is heavy, which is often the case, it breaks entirely across the channel, which prevents vessels from passing in or out, and causes such a sea in the harbor that it is difficult to land or take in cargo.

When once in, you moor head and stern with your bower chains to anchors secured in the rocks on each side of the harbor. With the wind from S. E. by E. and to the Southward of it, vessels cannot enter, and when it blows from N. E. by E. and to the northward of it, they cannot leave this place. It is not uncommon for vessels to wait from six to twelve days for a chance to get in, and a like time for an opportunity to get out after they are ready for sea. Vessels drawing over 13 feet of water should not visit this place. The hire of a launch is from twenty to twenty five dollars per day, and should you damage one, which is sometimes the case, will have a pretty round sum to pay for the repairs of it. Sand ballast can be had for the trouble of taking it from the beach. Stone ballast costs \$1 per ton, put on board. Water costs \$1 per 100 gallons.

The town contains about 1000 inhabitants, and is 18 miles from Point a Pitre, over a good road, and through a well cultivated part of the island.

Dominica.

DOMINICA has, properly speaking, no harbours; but there are good and safe anchorages along the Western side, all of which is held. Ships are, however, exposed to Westerly winds, as in the other islands, but those winds prevail only in the winter months.

The chief town is that called Roseau, or Charlotte Town, on the S. W. side of the island. There is no danger in going in, and there are 6 and 7 fathoms at half a cable's length from shore. You lay one anchor in 7 or 8 fathoms, the other in 10 fathoms, a very bad ground. The anchoring mark is to bring the fort N. E.

Between 3 and 4 miles from the North end lies a noble bay, called Prince Rupert's Bay, which, besides its safety, its magnitude, the depth of water, and the goodness of the anchorage, has the advantage of three fresh rivulets running into it. Fleets destined to other parts of the West Indies commonly come to anchor in this bay, for the purpose of supplying themselves with wood and water, for which there are excellent conveniences.

Scott's Head, or Point Caibaeron, the South point of Dominica, is a high rock having a flag-staff on it, and from a distance appears like an island.

The town of Roseau, is about 6 miles to the Northward of Scott's Head, and will be readily discerned when sailing along shore. Merchant ships generally anchor in the bay off the South end of the town, but ships of war in the smaller bay to the Northward, called Woodbridge Bay, abreast of a gibbet erected near the beach, and appearing on with the middle of a large cane field. To come to an anchor here, run in under easy sail, nearly opposite to the gibbet, and let go the moment you get proper soundings. A light is usually shown from the flagstaff on Fort Young.

Light.

The course and distance from Roseau to Prince Rupert's Bay, are nearly N. W. 17 miles. The coast between is generally bold and steep.

Barbadoes to Dominica, &c.

BARBADOES TO DOMINICA, &c.—If you are bound to Dominica from Barbadoes, you must steer N. N. W. until you have passed Martinique, and a S. W. course will then carry you to the Northward of Dominica. Leaving Marie Galante on the starboard side, haul up close in with the North point of Dominica, (Cape Melville) you will see a round bluff making like an island (Prince Rupert's Head) at some distance; go round that bluff, and you open the bay; turn into the North part, and anchor in 7, 8, or 9 fathoms. You will see the mouth of a large river, which anchor to the Northward of half a mile, and you will be opposite a small river, which you water at, the best in the bay; the great river is brackish. There is another river to the Southward, where you may anchor in 6 fathoms, clear ground; but in 10 fathoms you will have coral rocks.

When turning into the bay, its Southern side will be in sight; which is a low point with a remarkable high hill over it, called Rollin's Head and Hill. Prince Rupert's Head, on the North side, is distinguished by two fortified hills, called the Cabris, which are connected to the main by a low marshy neck. At the bottom of the bay, which is a mile deep, is the town of Portsmouth, consisting of houses irregularly placed. Westward of Portsmouth, on a rising ground at the inner part of the marsh which connects the Cabris to the main, there is a small plantation, called Cotton Hill, with a few small houses. Over the town appear two high sugar loaf hills, to the Southward of which is a high mountain whose summit is involved in clouds. To the Southward of Portsmouth, at the distance of nearly a mile and a half, and on low

a mile and a half, and on low

ground near the beach, is a plantation, called Pierre Estate, and nearly midway
between Pierre Estate and Rolla's Head, is a fine plantation, called that of Mount
Allen.

Nearly midway between Portsmouth and Pierre Estate, in the valley on the
Southern side of the two sugar loaf hills that appear over the town, is the river called
Indian River, which falls into the bay.

When working into the bay, you may stand boldly over from side to side, which is
a distance of nearly 3 miles. The bay is rather more than a mile deep. Prince Ru-
pert's Head and Rolla's Head are both so steep that either may be approached to the
distance of a ship's length. When off Mount Allen, you may stand towards it so as
to bring a single tumour tree, which stands to the Northward of the middle of
Portsmouth, on with the highest land behind it. You may stand towards Pierre
Estate into a little hill to the West begins to open with the cultivated part of Mount
Allen Estate, without the Western edge of Rolla's Hill. When standing towards the
marsh, between the Cabrits and Cotton Hill, you should tack in 9 or 7 fathoms, ac-
cording to the ship's draft.

From the inner part of the Cabrits, round the bay to the Western side of the cul-
tivated part of Mount Allen Estate, a shelf stretches from the beach, which is, in gene-
ral, a cable's length broad; off Indian River it is a cable's length and a half, at about
that distance there are 3 fathoms of water; thence it gradually deepens to 5, 7, and 10
fathoms, and then suddenly to 15, 20, and 25 fathoms. The shallowest ground is in the
shall water; for without the depth of 10 fathoms it is rocky. The best anchorage is
off the tumour tree above mentioned, and the coast seen over the low land within
the Cabrits, or on with the Western part of Cotton Hill, or on with the dean at the
Western end of it. Should you be to the Southward of the tumour tree, you must
run in until the highest ground on the Western side of the cultivated part of Mount
Allen Plantation is open without the Western side of Rolla's Hill. With either of
these marks the ground is muddy, and the depth is from 9 to 7 fathoms. There is an
anchorage farther out, in from 12 to 20 fathoms, fine dark sandy bottom, at from 4 to
3 cables' length from shore, with the tumour tree E. N. E.

There is good fishing and good hunting for the same throughout the bay. The
water of the small rivers is to be preferred, that of the larger being brackish.

Remarks from the Derradero, &c

The Derradero says that Dominica is the highest of all the Antilles; it has much
wood and is very fertile. All its coasts are clean, and you may approach within less
than a mile of them. On the West coast they experience great calms, which extend
fades out at sea; and here it is necessary to navigate under moderate sail, and with
much caution, on account of the heavy gusts that abruptly proceed from the openings
and valleys of the mountains; for, if caught, you may sustain serious damage from
them. This island has neither harbor nor secure anchorages, the best are those of
Rosenau, on the South part of the West coast, and Rupert's Bay, in the North in part
of the same coast; in both roadsteads they anchor at less than 2 cables' length from
the shore, and in front of the towns; there is no need of instruction for going to them,
for there is no hidden danger.

After what has been said of the calms and gusts of wind on the West side, it
seems that the best way to avoid them will be, for those bound to Rupert's Bay, to
make the North part of the island; and for those bound to Rosenau, to make the South.
The channel between Martinique and this island offers no danger whatever, and the
current sets to the N. W., but they are of little importance.

ST. ESPRIT REEF, reported in lat. 14° 37' N., long. 58° 59' W., does not exist. *St. Esprit Reef.*

MARTINIQUE is about 12 leagues in length, and lies N. W. by N., and S. E. by S.
Its breadth is extremely unequal, and scarcely anywhere more than 1 or 2 leagues,
and if you include the promontories, which project in many places 1 or 2 leagues be-
yond the rest of the island, its circumference will include above 30 leagues. The
land is very uneven, and everywhere intersected with large hummocks, in the form of
sugar loaves. Three mountains rise above these innumerable hummocks, the highest
of which has been a volcano; it appears like the crown of a hat, and may be plainly
seen from every side of the island.

The principal towns are those named St. Pierre (St. Peter) and Port Royal, both on
the Western side of the island. The latter, which is very advantageously situated
near an excellent harbor, and under cover of a peninsula entirely occupied by a fort,
is the residence of the governor. It stands on the North side of a deep bay, called
Cul de Sac, or Royal Bay, and is situated to the N. W. of the fort. A little harbor
on the East of it is called the Carénage. Here are all the conveniences for refitting
ships-of-war.

On every side of the island are large bays containing good harbors and sandy coves; but some of them do not afford protection during the hurricanes.

The DIRECT and TRUE course from the North end of Barbadoes to Point Salines, the South point of Martinique, is N.W., distant 31 leagues; but the course to be taken should be N.W. by N., to allow for a lee current. Point Salines is low, and has off it three rocky islets; when these bear West, you may see between them and the point. To the Westward of the islets there are several dangers.

The Diamond Rock, which lies off the S.W. point, is, according to the description of Captain Hester, about twice the size of the cupola of St. Paul's in London, and nearly as high. To the N.E. of it is Great Diamond Cove. There is no sailing within the rock, but on the South side it is bold.

Martinique: the Diamond bearing W. by N., and Point Salines distant 2 or 3 leagues.

Having made the Diamond, the course thence to Fort Royal Bay is N.N.W., 3 leagues. The track is free from danger, and the shores bold. When you see the bay open, haul up, and the fort will be in sight; turn up towards it until it bears N. by E., or N., when you may anchor on a bank in 8 fathoms, or off the bank in from 14 to 17 fathoms, which is the best ground. The bank has coral on it, but is not rocky.

Fort Royal Bay.

FORT ROYAL BAY.—The Bay of Fort Royal, by its position on the West side of Martinique, affords a shelter from the reigning winds. During the whole of the dry season, its different anchorages offer all the same degree of safety during this part of the year, and we have no other motive in preferring one place to the other for anchoring, than the superior facility of entering or leaving which some places afford over others, and their neighborhood to places with which we wish to communicate. It is different during the rainy season, when we have to fear gusts of wind and sudden changes in the atmosphere. At this season we must renounce the advantage of coming to anchor in favorable situations for getting a ship under sail, and must seek a refuge in a situation sheltered by surrounding land, secure from accidents to which we might otherwise be exposed. We shall point out, among these anchorages, the most secure ones, and the means of entering them.

The Bay of Fort Royal is nearly 54 miles wide between Point Negro and Cape Solomon, which we shall regard as its Western limits. It narrows so, that as we reach the middle of its length, it is reduced to 2 miles in width, and preserves about this mean breadth. Its greatest depth is nearly 7 miles, in an E.S.E. and W.N.W. direction. This great bay of water incloses a multitude of banks of gravel and coral, which encumber it, and greatly diminish the navigable part. These banks produce a change in the color of the sea, by which they are easily known, and serve as a guide through the passes, which they limit. They are generally very perpendicular, and form irregular curves.

Fort Royal, the capital of the island, and the seat of government of the colony, is situated on the North side of the bay, and 14 mile E.N.E. of Point Negro. This city, of which the population is nearly 4,000, without including the garrison of Fort Bourbon, is built on a low flat piece of ground, formed probably by the alluvial deposits of the River Madame, which forms its Western boundary. It is bounded South by the sea, East by the careening-place, North by a canal which serves to communicate with the careening-place, the stores of the port, and the River Madame. At its Eastern extremity, near the careening-place, there is a fine parade called the Savanna, which forms the glacis of Fort St. Louis, elevated, like the rest of the ground, only 3 or 4 feet above the surface of the sea.

Lights.

Fort St. Louis (on which there are two fixed horizontal lights, 131 feet above the sea) is built on a peninsula, terminated on all sides by steep rocks of a considerable height, especially on the Western part. This peninsula extends 660 yards South of the parade, and separates the careening-place from the German Anchorage, which is situated between the city and Point Negro. It is not accessible from the land, except by a narrow isthmus, which joins it to the savanna. On the East side it is defended by a bank of gravel and madrepore rocks, which stretches S. and S.W. about half a mile.

Light.

On the fort on Point Negro there is a red light elevated upon a red mast.

The German Anchorage has for its limits to the North, after leaving Point Negro, a coast of middling elevation, whose almost perpendicular shores terminate before reaching Madame River, by a little wharf built for a landing-place. Further to the East, near the peninsula of Fort St. Louis, and on the site of the city of Fort Royal, we find the soil composed of gray sand, which is terminated by a handsome beach, where you can land with great facility at all times.

The anchorage extends Westward as far as the Virgin Banks, situated 6 cables' length S. S. E. from Point Negro. It is bounded South by the Mitau Bank, and near Fort St. Louis, by the banks from this fort. On the Western extremity of these banks is a pier, anchored in 19 feet water, and 6 cables' length S. 35° W. from the flagstaff of the fort.

From Virgin's Bank to the Southward of the church of Fort Royal, the soundings decrease gradually from 154 to 41 feet, on a line on which the flagstaff of Fort St. Louis bears N. 51° E. This line indicates the best place to come to anchor. If you quit this line, either to the N. or S., you will find at different distances the madreporic rocks, which are dangerous to come to anchor on, as they will cut your cable. Some of them rise suddenly 50 feet above the bottom of mud by which they are surrounded.

It is on this line of bearing relative to the flagstaff of the fort, and nearly S. | W. of Madame River, in from 90 to 110 feet water, that government vessels usually anchor. Merchant vessels usually approach nearer the fort and the savanna.

You can, if necessary, anchor on the Mitau Bank, the length of which, in an E. and W. direction, is half a mile, and the mean width 3 cable's length; but you should anchor about the centre of the bank, in from 8 to 9 fathoms, as this part offers few irregularities, and where the risk of damaging your anchor and cable is less. In anchoring too near the edge of this bank you will expose your cables to be cut, and your anchors to be caught in the crevices of the rocks. For greater security, however, we advise you not to anchor on this bank, except with a chain cable.

The highest part of this bank is covered with 21 feet water, and is situated one mile S. 36° W. from the South extremity of Fort St. Louis.

We are not certain that Virgin's Bank is composed of madreporic rocks. The highest part of this bank has 51 feet water.

With the winds from E. to E. N. E., which almost always blow here, you cannot reach German Anchorage without making several tacks; but this offers no difficulty, for there is only one dangerous bank at the entrance of Fort Royal Bay, which is the Bank of Gros Islet, on the shoalest part of which are 21 feet water. This bank is situated $1\frac{1}{4}$ mile North of Islet Ramers, and about the same distance from Point Negro.

The permanency of the winds from the East, from November to July, makes the German Anchorage perfectly safe. It is only in the months of August, September, and October that it is necessary to quit it and seek refuge in the careening, at the Three Islets, or at the Colic du Lamentin, which we shall presently describe.

The port of the Careenage, by its situation East of Fort St. Louis, affords a shelter from all winds which would endanger a vessel at the German Anchorage. It is a little bay, four-tenths of a mile wide, bounded West by the peninsula of Fort St. Louis, and East by Point Carriere. A point of small height divides this bay, near the marine establishment, into two parts, one of which communicates with the canal which surrounds the city, and the other, which is more spacious, is encumbered with banks of gravel and madreporic rocks. The port of the Careenage extends from the mouth of the canal to the North and South extremity of Fort St. Louis. Its width is scarcely a cable's length at its entrance and diminishes gradually, so that vessels stationed there, the number of which is oftentimes very great, have not sufficient room, and are obliged to preserve their respective situations, to moor to anchors, secured to the foot of the walls of the fort.

There is, at the entrance of the Careenage, a little to the North of a line from Point Carriere, to the extremity of Fort St. Louis, a coral bank, which narrows very much the anchoring-place. This bank is situated East of the barracks of the fort; is near a cable and a half's length from N. N. E. to S. S. W., and has only from 8 to 9 feet water on its shoalest part. Its North point is marked by a pier.

The channel of the Careenage is between banks of gravel and madreporic rocks, which extend on one side 4 cables' length South of Fort St. Louis, and on the other side 3 cables' length S. S. W. from Point Carriere. Small vessels find here space enough for beating in, but others should not attempt it, except with a leading wind.

We advise you not to pass the Grand Seche Shoal. It is probable, however, that the shoalest part has not less than 20 feet water.

ed upon a red mast.

South of the mouth of Monsieur River, and in a bend of the Grand Seebe Shoal, is an excellent anchorage, where you can anchor in 70 to 80 feet of water, with a bottom of clayey mud. This anchorage is bounded North by the banks extending from Point Carriere, at the entrance of the Careenage, and South by the Southern part of the Grand Seebe Shoal.

Near Point Salle is the entrance to the Cobe du Lamentin, a bay extending 4 of a mile N. N. W. and S. S. E. Its greatest width perpendicular to its length is 1 mile, and the entrance seven-tenths of a mile wide. The River Lamentin winds through drained lands, and enters the bottom of this bay.

One-quarter of a mile S. S. W. from the entrance of the River Lamentin, is Point Mill, remarkable for a handsome building situated on the highest point.

Many banks of gravel and rocks occupy a considerable space in the Cobe du Lamentin: the largest extends from Point Mill W. S. W., 4 cables' length, dividing the bay into two parts, where you can anchor on a bottom of mud, with excellent holding-ground.

The next anchorage, that of the Three Islands, is one of the most important in the bay of Fort Royal. This anchorage is easily known from the appearance of the surrounding land, and particularly by a small island called the Great Islet, which is situated half a mile from the South side of the bay, and South from Red Hill, 2 miles distant. Great Islet is composed of two distinct parts: the first part has a round summit, and descends gradually to the sea; the second part, on the contrary, has an abrupt rise of 70 yards from the bed of the sea, and is terminated on the top by a little rocky plateau, covered by a slight vegetation, composed of small bushes and herbs, dried up for the most of the time by the sun. The anchorage, as well as the village of the Three Islands, takes its name from three small islands situated near the coast, forming a triangle. By its position, defended by banks which break off the sea, caused by Westerly winds, this anchorage is a very safe one during the rainy season, but it contains a number of banks, which diminish the space of the anchorage. The place for anchoring to which we give the preference, is on the middle of a line drawn from the Eastern of the three small islands to the top of Great Islet. In going further South, we meet with banks reaching almost to Great Islet.

A bank of gravel and madreporic rocks, covered with but 2 to 3 feet of water, surrounds almost entirely the Western part of Great Islet, and extends to within 5 cables' length of Point Rose. This bank limits to the N. and E. the anchorage of the Three Islets.

From Point du Bout, S. 56° W., is the Isle Ramieres, a rock elevated 25 yards above the sea. It is separated from the coast by a channel about 4½ cables' length wide, and in depth 8 to 9 feet. A fort, built on the highest part, defends the entrance to the bay.

Between the Diamond Rock and Fort Royal Harbor there are three small coves, the Southernmost of which is called Little Diamond Cove, and the others Grand and Petite Ance d'Arlet, or Arlet Coves. At the S. W. corner of the harbor there is a small green islet, strongly fortified, called Islet Aux Ramieres, or Pigeon Island, from which the fort bears nearly N. by E. In working into the harbor, by keeping the lead going, and having weathered Pigeon Island, you may anchor at pleasure.

On the South side of Pigeon Island there is a little rockstead for small vessels. In order to gain this place, those who are well-acquainted go round the N. E. point of the islet and turn in. The South shore is steep. The anchorage lies with the Western part of the isle bearing N., N. by W., or N. N. W., in 7, 8, and 9 fathoms, clear ground. Be cautious of approaching too near the Eastern shore, as a bank stretches from it, which breaks with a great swell.

Description of the Bay and Harbor of Trinity, by Monsieur Monier.

Leaving the island of St. Mary, the coast trends about E. 60° S., to the bottom of the harbor of Trinity, which is distant from this island 3½ miles, and is defended by a border of reefs which surround it in almost every direction. It forms little bays of small depth separated from each other in many places by high steep points, in other places of but middling elevation; among others we distinguish Fort Point, situated towards the North part of the City of Trinity.

You will remark, before arriving at the bottom of the harbor, an islet, distant from the preceding coast three-quarters of a mile, lying near a mile and a half North of Fort Point, and a little more than that distance from the Islet of St. Mary, from which it bears S. 58° E. This islet, known by the name of St. Aubin, indicates the entrance of the harbor of Trinity to vessels coming by the Dominica Channel. Its appearance and position make it easily distinguished. It appears high and steep in all parts.

Mary, situated N.N.E. of St. Mary's Islet, a mile distant. The shoal occupies a space of 3 cables in length by one in width, and the shoalest water we found on it was 32 feet. It is best, however, not to pass over it, notwithstanding the great quantity of water by which it is covered; for the sea there is always heavy, and oftentimes breaks, particularly when the winds blow from the E.N.E. to the N.E. strongly from these points: the soundings are at the least 25 fathoms, less than a cable's length from the Loup St. Mary; and in the channel which separates it from the islet, the depth of water varies from 18 fathoms to 9.

The passage between the Loup Ministre, the Loup St. Mary, and the Islet of St. Aubin, is at least a mile wide, and is frequented by vessels bound to Trinity; but it is very important not to get in with the chain of the Loup Ministre, for you would expose yourself in passing over the shoals, where the soundings are scarcely $4\frac{1}{2}$ fathoms, to very great danger from the sea. You will take the precaution to keep your distance until the Islet St. Aubin bears S. $4\frac{1}{2}$ E., true, at the distance of nearly 2 miles, the directions given for this course being very near by the West part of the banks of which we have just spoken. You should not deviate from this course to the Eastward, (whether you have a fair wind or must beat in,) till you open the Island of St. Aubin to bear S. $4\frac{1}{2}$ E., at 6 or 7 cables' length distance. You may then stretch towards the Southern limits of the madreporic rocks, and when you are W.N.W. of the Loup Ministre, and you have got sufficiently to windward to be N.E. $4\frac{1}{2}$ E. of the small island of St. Aubin, and W. of the Loup Ministre, you must steer S. $4\frac{1}{2}$ W. for this anchorage, guiding yourself, however, through the passing by the sight of the reefs which lie at East and West. You may come to anchor East of Fort Point, between the two chains of reefs, and in the whole space comprised between this position and the bottom of the harbor the anchorage is excellent. It is sheltered from the prevailing winds, which generally vary only from the N.E. to the S.E., passing Easterly. The winds from the N. and N. $4\frac{1}{2}$ E., are the only ones which cause any swell, because their direction is the same as that of the entrance; but these winds blow very rarely, and are not to be feared except in the winter season.

It is oftentimes more difficult to get out of the harbor of Trinity than to enter, particularly when the winds are E.N.E.; taking care, however, to tow your vessel so as to approach as near as possible to the banks which limit the anchorage to the East, which may be done without inconvenience, as these banks are to windward; you will then be able to double a little rock detached from the reef which surrounds Fort Point, and on which there are but 7 fathoms of water. After having passed to the North of this danger, which is about 2 cables' length E.N.E. from the Fort, the passage will present much less difficulty, as the pass widens much, and is marked through the greatest part of its extent by lines of breakers, which border it almost without interruption. The Mitau Bank, covered with 11 feet of water only, and the banks to the E.S.E. of the Islet of St. Aubin, are the only dangers which the breakers do not render always apparent; but it is not necessary to prolong your distance as far as the Mitau Bank to pass clear of the banks of the Islet of St. Aubin.

Once outside of the Islet of St. Aubin, you will make your course Westward of the Loup Ministre; and in case you want to go towards the entrance of the Dominica Channel, you may pass inside of Loup St. Mary, or outside, opening the wind-mill of Beau Sejour a little to the East of the Islet of St. Aubin to avoid this bank.

The reef to the South of the Islet of St. Aubin does not extend to the shore. Between it and the border of breakers which surrounds the coast, there is a channel about a cable's length or more wide, and in which the soundings are from 5 to 6 fathoms, with a bottom of white sand. This narrow passage is frequented by boats; as for vessels, they should not attempt it.

The Carvel Channel, which we have before mentioned, is used by vessels of a great draught of water, but as it does not shorten the route to the Harbor of Trinity, or the other anchorages on the East coast, and as there are great inequalities in the soundings, and the violent currents oftentimes cause a heavy sea, it is but rarely used. The least soundings we ever found there are 40 feet.

Trinity, next to Saint Pierres and Fort Royal, is the most commercial place in the colony. The city extends along a beach of sand, which terminates to the North at Fort Point. Its length is about 300 feet, its breadth is very small. There is no remarkable edifice. It is a watering-place which may answer for vessels anchored in the road: but to have pure and limpid water, it is necessary to go to the interior a considerable distance. Good water may be had from a spring at the plantation of Beau Sejour.

*Fort Royal
to St. Pierre.*

FORT ROYAL to ST. PIERRE.—The N.W. point of the Fort Royal Harbor is low, though bold, and has a masked battery on it. To the N.W. of this point, about 2 miles distant, there is a rivulet of fresh water, and a village called Case des Navires, off which there is excellent anchorage, from abreast its Westernmost houses to abreast of a battery East of it. The anchoring-ground, or bank, reaches only to the distance

of a cable's length and a half from the shore. Within half a cable's length of the beach the water is shoal, deepening thence to 3 fathoms on the outer part, and to 5, 7, 10, 15, 18, and 25 fathoms, at a cable's length distance: off the battery the ground is clean, softening to soft mud abreast of the Westernmost houses. Without the depth of 24 fathoms the ground is hard and gravelly.

In order to anchor in this road, you must turn to windward before you stand in, until the Easternmost cluster of houses in the village appears on with the middle of the valley behind them; then steer in with this mark. When the point between Case des Navires and the next village, called Case Pilote, opens without the land to the N.W., you will be entering on the bank in 43 fathoms; then steer so as to have the Westernmost house of the cluster above mentioned on with the middle of the valley; and with Le Gross Pointe, on the South side of Port Royal Harbor, shut in behind Point Negro, you may anchor a large ship in 18 or 20 fathoms. Small vessels may stand further in, with the same mark, to the depth of 9 or 7 fathoms.

ST. PIERRE, (St. Peter,) the trading-town of Martinique, lies about 4 leagues to the N.W. of Fort Royal. It is built partly upon the rising grounds at the foot of a ridge of hills, and partly along the shore of a spacious circular bay, which forms an open road to the Southward and Westward.

The best anchoring-place, called the Frigate's Anchorage, lies in the Southernmost part of the road, (when you see some steep hills and rocks,) in 7 fathoms, gravelly ground. If you bring the highest steeple of the town N. $\frac{1}{4}$ E., and Point Carbet (on the South side of the road) South, you will have 7 fathoms, oozy ground.

Lying moored in this road, with one anchor in 25 fathoms, fine sand, and the other in 14 fathoms, same ground, the following bearings by compass were taken—the variation was $3^{\circ} 52'$ E.:

Point Precheur N.W. by N. 3° N., the Galley's End N. 9° W., the Black Friar's Tower N. 3° W., the Negro's Chapel E. 2° N., Point Carbet S. 4° W.

If you intend to stay some time in this road, it is proper you should lie with one anchor close to the shore, to the S.E. or E.N.E., (or even on shore,) and the other to the N.W.

In the hurricane months, that is, from the 15th of July to the 15th of October, ships cannot lie with safety in this road, and the French ships are generally obliged to leave it on the 15th of July at furthest. If they are to remain for a longer time at Martinique they retire into Fort Royal Bay, where they lie secure against the hurricanes; they may also find shelter in Trinity Bay to the windward, and on the North side of the island.

Mr. Backhouse, in his description of the Road of St Pierre, observes:—"there are 30 and 10 fathoms, at 2 cables' length from the shore; but further off than that you will be off the bank. They generally lay one anchor in 25 or 30 fathoms, and the other in 12. The marks with which we anchored were the fort S. by E.; the great church N. off shore one cable's length, in 24 fathoms."

In sailing from Case Navires to St. Pierre, you will pass the village and battery of Case Pilote, and those of Fort Capet and Carbet. Between the latter is the promontory called Morne aux Bœufs, which bears N.N.W. $\frac{1}{4}$ W., distant $5\frac{1}{2}$ leagues, nearly, from the Diamond Rock.

The anchorage in this bay is far from offering adequate security to the many vessels that frequent it from Europe, West Indies, the United States and Gulf of Mexico. Its being exposed to all winds from S.S.W. to N.W. by W., renders it particularly dangerous during the winter months, as well as towards the commencement and at the end of that season, by reason of sudden squalls of wind then frequent. The ground-swell is then often experienced with a violence that afterwards causes great damage. In the other parts of the year, the road of St. Peter's is almost entirely exempt from these dangers, and it is a shelter from the reigning winds, which blow from the E. to the E.N.E., and the phenomenon of the ground-swell is much nearer and less dangerous; the only inconvenience it occasions is to impede considerably the communications to the city, and sometimes to render them impracticable.

Vessels surprised at the anchorage by strong winds from the open sea, or from a heavy ground-swell, find themselves in a critical situation. If they cannot tow out, or beat out, they are oftentimes thrown ashore by the enormous surges; if instead of attempting to go to sea they remain at anchor, their loss is almost certain, particularly if they have not chain cables: for the continual shocks of the sea cause them to drag their anchors, or if they hold, the agitation of the sea causes the cables to part, and in either case they drive on shore and soon go to pieces. With the intention of preventing such shipwrecks, the colonial government orders all French vessels to quit the road of St. Peter at the commencement of the winter, and obliges them to depart for Europe, or pass this season in the bay of Fort Royal, either at the Carénage or at the port of the Three Islets.

The best anchorage in St. Peter's Road extends from Point St. Martha to the South extremity of Thurin's Bay. The soundings in this part have less declivity than in the other part of the road. They form relative to the depth which exists before the city a flat space of less depth, called the Plateau of Carbet. You may anchor on this plateau in 21 fathoms, 2 cables' length from the shore, but you must not anchor further off, particularly if you are West of a little ravine where the steepness in the rocks round the bay of Thurin is interrupted, as at this place are 150 to 180 feet of water, and a bottom of irregular rocks, on which many anchors have been lost.

The anchorage for merchantmen extends from Point St. Martha to the river des Peres, which bounds the city to the North. French vessels occupy the space South of the Place Bertin, and foreign vessels North of this place. In these two parts of the road, the soundings having a very rapid increase towards the sea, you are obliged to come to anchor at a cable and a half's length from the shore, and to moor by the head to an anchor carried on shore. It is important to bury your anchors very deep in the sand, that they may resist the violent shock to which vessels are exposed from the ground-swell. It is also necessary to take the precaution to have your cables tight to prevent your vessel changing her position, and avoid falling on board other vessels.

A little distant from the Place Bertin, W.N.W. from the marine hospital, and at a cable's length from the shore, is a bottom of rock called Hospital Key, on which foreign vessels are obliged to anchor. Its breadth gradually diminishes in approaching the shore, but on the Western side it terminates abruptly by an almost perpendicular wall, so that from 50 to 96 feet, the soundings found off the key, you suddenly have from 166 feet to 213 feet, which are immediately outside its Western limits. It is necessary to sound before anchoring on this key, and let go your anchor in 50 feet water, as in going further off, at a cable and a half's length for example, you expose your cables to be cut by the rocks which form the limits of this key.

North of this key, and in approaching it from the river Des Peres, the anchorage becomes more and more difficult, by reason of the declivity of the soundings. At less than 2 cables' length from the mouth of this river, the depth is 550 feet, and further off you will find no bottom with 600 feet.

Variation at Port Royal Bay, 1821, 2° 47' N. E.

North-eastern side of the Island to St. Pierre.

NORTH-EASTERN SIDE OF THE ISLAND TO ST. PIERRE.—Ships advancing from the Eastward, off the North side of Martinique, generally take their departure from La Carvaille, or the Carvel, a remarkable rocky islet, lying about 1½ mile off the N. E. point. In running thence along the coast, you must cautiously avoid the effect of eddies, or sudden and partial gusts of wind, which frequently proceed from the narrow openings of the mountains; and if the top-gallants are up you must keep a good look-out after the halliards. For it is to be observed, generally, that the mountains intercept the course of the trade-wind, and consequently occasion calms and variable winds to leeward.

This side of the island is well cultivated. You will distinguish the plantations to the very summit of the hills, which are themselves covered with trees and grass, excepting only the Mount Pelee, or Bald Mountain, the highest of those hills, and the only one that is barren.

Point Macouba, the Northernmost point of the island, is distinguished by a waterfall, or kind of torrent, falling into the sea from the top of a high rocky coast. About 5 miles to the W.S.W. from Point Macouba lies a round rock detached from the land, called the Pearl, to the Southward of which are the little islets, called those of Preecheur, or Precher. Next follows the point of the same name. Soon after Point Preecheur presents itself, which ends in a flat hummock, with a plantation on it, then the town of Le Preecheur. Beyond Preecheur Point, you will discern two others in a line, namely, the Morne aux Beaufs, before mentioned, to the Southward of the road of St. Pierre, and the Diamond Rock to the Southward of Port Royal.

Between the North end of the island and St. Pierre there are several villages, protected by batteries. The coast is very steep and clear of danger.

Having doubled Point Preecheur, you will descry the ships which lie at anchor in the road of St. Pierre, as they all have awnings to protect them from the intense heat of the sun. You would take them at first sight for so many white houses, whose roofs are built like a terrace; you cannot come to anchor close-hauled; for the winds, which always prevail from the E. and E.N.E., will compel you to traverse up to the road.

Remarks on the Navigation about Martinique, from the Derrotero de las Antillas, &c.

The land of this island is high and rocky, and may be discerned at about 15 leagues off. Its Eastern part is full of bays, but they afford little shelter, and are frequented by coasters only. From the South Point, or Point Salines, along the Western coast, to the North Point, Point Macouba, you may approach within a mile of the coast without any danger.

The principal anchorages of Martinique are those of Port Royal and St. Pierre. That of St. Pierre is an open roadstead, which affords shelter from the general breezes only: and vessels that are obliged to remain in Martinique during the hurricane season, go to Fort Royal to pass it over. The fortress, called Fort Royal, is on a tongue of land, which runs nearly half a mile to the South into the sea; from the S.W. part of this tongue, a shoal of sand and rock stretches out, but it may easily be discovered by the color of the water. By the Eastern side of this point is the harbor and arsenal, where vessels anchor in the greatest safety; but they enter into it only in the season of hurricanes, or for the purpose of careening; its bottom is excellent, with a depth of from 6 to 10 fathoms. The city is about one-fourth of a mile to the North of this point, and at the seaside on the West part, in Flamingo Bay, which is, therefore, the anchorage for merchant-vessels; and indeed, generally, for all vessels which are not to remain long at Martinique.

If you approach Martinique on the North side, and mean to anchor in the road of St. Pierre, you may haul in as close as you choose for Macouba Point, and should run along the coast afterwards so as to pass the outside of the Islets du Seron, which lie on the N.W. point of the island; and from these you may shave the Pointe du Precheur (Preacher's Point) within half a cable's length, in order to run and anchor in front of the town of St. Pierre, or a little to the South of it; keeping in mind that the coast is so steep, that half a cable's length from it you will have 4 or 5 fathoms water, and 35 or 40 fathoms at 3 cables' length. Vessels moor with two anchors, one to the West in 35 or 40 fathoms, and one to the East in 4 or 5 fathoms; it is, however, better to have a cable on shore, in place of the anchor to the East, that you may not drag with the strong gusts of wind which come over the land.

If you are bound to Fort Royal, you will steer from Pointe Precheur to Morne aux Beaux, which is the South point of the Bay of St. Pierre; and from it you will sweep along the coast to shave Pointe des Nègres, (Negro Point,) from which you must haul to wind all you can, in the understanding that, from the said point to Flamingo Bay, you may shave the coast without any risk.

As it is necessary to beat up from Negro Point to the anchorage, keep in mind that the shoal which runs out from Fort Royal Point, extends to the West as far as the meridian of a brook which runs into the sea, to the Westward of the city; and thus, when you mark the said brook at North, you must not prolong the South tack further than to bring Fort Royal Point a little to the Northward of East, but ought rather to go about before you bring it to bear East, and anchor on the other tack, opposite the city. If you have to enter the harbor, it is advisable to take a pilot.

Those approaching Martinique from the Southward, must steer so as to pass close to the Diamond Rock and Point, and shave Cape Solomon, where the course is nearly North, but nothing to the East of it, until Point Noire bears East; from this situation you will haul by the wind to take Flamingo Bay, or enter into the harbor, as may be requisite, it being well understood that you can anchor in any part of the Great Bay.

If coming from the South, and bound to St. Pierre, you must steer from Solomon's Cape to Morne aux Beaux, hauling in to anchor to the S.W. of the town, as already directed.

It is almost a matter of indifference what part of Martinique you make: only in case of the wind's being free from the N.E., you may consider it preferable to make the North side.

The strait between St. Lucia and Martinique is clear of all danger; the breeze is always steady in it, and its current is scarcely perceptible.

The Island of St. Lucia.

St. Lucia bearing N.W. by W., 3 or 4 leagues.

About $\frac{1}{2}$ mile to the West of the Sulphur Hill, on the sea-shore, stand two high peaks, called by the French Les Pitons, and by the English the Sugar-loaves; they lie very near each other, but between them there is opening enough to distinguish both on coming from the Southward.

On the Western side of the island, at the distance of about 3 leagues from its Northern cape, is Port Castries, or the Careenage, one of the harbors in the Windward Islands, having deep water and good ground all over it. These careening-places have been formed by nature, require no wharfs, and only a capstan to turn the keel ashore ground. Thirty line-of-battle ships might lie securely here unmoored, during the hurricanes. No ships can enter without warping in; but there is always a breeze to carry them out; and in less than an hour the largest squadron may be in the offing. The shores are so bold that a first-rate man-of-war may approach within 6 yards of them.

Lights.

Two lights are shown from Tampion Battery on the expected arrival of the mail-steamers.

Nearly a league to the Southward of the Careenage lies the Grand Cul de Sac, or Grand Bay; and nearly 2 leagues to the Northward of the same, is the Bay of Gros Islet; these places form excellent roads for ships of war.

When bound from the Northward to the Careenage, you will see a bluff 2 leagues to the leeward, which may be approached boldly; you must haul close in to see the harbor, then run into it as far as you can fetch, and warp in. When the sun shines, all the dangers may be seen.

Should you have occasion to anchor off the South coast, you may do so in Old Fort Bay, (Anse de Vieux Fort.) under the S.E. bluff, unto which you may turn until you bring Point Moulacique, the Southern point, to bear S.S.W., and then anchor in 7, 8, or 10 fathoms, good ground. At the North part of this bay there is a river, which runs into the sea. If you water here, it must be by proceeding half a mile up with the boat; unless after great rains, when you may fill at the entrance.

Remarks on St. Lucia.

[From the Derrotero, &c.]

The Island of Santa Lucia shows high, and in detached hills, with various peaks sufficiently visible; in particular, two, at its extreme S.W. part, called the Pitons, which may be seen at the distance of 16 leagues; they are black, and covered with wood.

At the N.W. part of this island there is an islet named the Gros Islet, which is rather more than a mile distant from Point Salines, to the S.W. Between Salines Point and the Gros Islet there is a rock named Burgaux. To the South of the islet is the Bay of Gros Islet, or roadstead of St. Croix, with excellent anchorage for every class of vessels, having a depth of from 17 fathoms down to 5 fathoms, which are found at half a mile from the coast; between the coast and the Gros Islet there is a passage for small vessels only, it being impeded by a shoal, on which there are only 2 fathoms of water. The Gros Islet is foul, and you ought not to approach nearer to it than 2 cables' length.

Near Brelotte Point, to the South of Gros Islet Bay, there is an islet which forms a strait, practicable for any vessel, it having 7 fathoms of water in it. This islet, like the Gros Islet, is foul, and you must not approach nearer to it than 2 cables' length; the coast, on the contrary, is clean, and a rock which is also clean, lies about a cable's length out from it. On all this coast there are from 8 to 10 fathoms, at half a mile from it, and you may anchor in any part, though the safest anchorage is in the road of St. Croix, where there is good shelter from the sea.

About $\frac{1}{4}$ mile to the S. by E. of Brelotte Point, there is a rocky shoal extending nearly in that direction, which is a mile in length, and about 2 cables in breadth; its distance from the coast is more than half a mile. This is the only danger on all the Western side of St. Lucia, on which there are excellent anchorages, but principally in the Careenage, which is 2 leagues to the S. by W. of the great islet, and the best harbor in the Lesser Antillas, with excellent anchorage, very clean, and three natural coves in the interior, and such steep shores that they might serve as wharves, or moles, at which the largest men-of-war may be hove down. This harbor has, however, the disadvantage that you cannot enter it except by towing or warping, it being impossible to beat in, on account of its narrowness; but, in exchange, it is easy to get out of it, even with a large squadron: as you must enter either towing or warping, it is sufficient to say that the South point sends out a very shallow tongue of sand to the N.W., and that the North point is deep and clean, and you may approach within a quarter of a cable's length of it, without giving a berth to more than the rocks which are seen

The strait between this island and St. Vincent's is subject to tornadoes, and strong currents to the W.N.W.; and as Port Castries and the bay of St. Croix are towards the Northern extremity of the island, it is advisable to make the land, when bound to them, from the Northward.

The Island of St. Vincent's.

St. Vincent bearing S. by W., about 4 miles.

From Bequia to St. Vincent's the course is North about 2 leagues. The channel between these two islands is very good to come through, if bound from Barbadoes to the Salt Tortuga, or the Spanish Main; and there are small trading-vessels which work up through it. St. Vincent's is about 5 leagues long, and lies nearly N. and S. and E. and W. The North end, which is much higher than the South part, is inhabited by about 2,000 natives, or Caribs. On the North end there is a volcano, called La Soufriere, or Sulphur Hill, near Spanish Point. On the West side of the island, which is bold, are several bays, having all of them fresh-water rivers; and on the S.W. side you have good anchorage, as near or as far off as you please, especially in Kingston Bay, where the chief town is situated. But the best bay of the island is Balair Bay. When you turn up between St. Vincent's and Bequia, you will see a large bluff of land, and just to the windward of that is Balair Bay, or Calliaqua. The shore is bold on each side. Run in to 19, 20, or 15 fathoms, and anchor. There are two rivers which run into the sea.

The course from Carlisle Bay to the South end of St. Vincent's is W., Northerly, 33 leagues. If you intend to anchor in Kingston Bay, you will see a small high-peaked island, called Young's Island; pass the bay to leeward of this island, and go round a long sloping point; you may go within pistol-shot, but if the wind takes you short, you may anchor in 35 fathoms, and warp in. There is a small ledge of rocks close on the weather shore, within 6 fathoms.

Kingston Bay is completely open to the S.W., and is more than a mile in breadth. The town is at the head of the bay, close to the water-side; the anchorage good, the soundings regular, with a bottom of dark sand, apparently clear, and forming a good holding-ground. The water is deep on each side of the bay, and you may round the Eastern head, called the Old Woman's Point, as close as you please, there being 20 fathoms at no more than 200 feet from the shore. The best anchorage for a frigate is with the court-house bearing North, in 19 or 20 fathoms, not more than a quarter of a mile from the beach. There is a light current setting along the bay, but it is not regular. The tide rises about 4 feet. Fresh water is good, and easily obtained.

PRINCESS, or BARAWALLY BAY.—This little bay lies $5\frac{1}{2}$ miles to the Princess, or Barawally Bay. North-westward of Kingston, and its North side is formed by rocks, called the Bottle and Glass, between which and the main there is a passage for boats. There is no danger in going in; and, in coming from the Northward, you may haul close round the Bottle and Glass. When round this point, luff up as much as possible, and you will open the town barracks, bearing N.E. by E. $\frac{1}{2}$ E., which may be kept thus until the Bottle and Glass Point bears N.W.; you will then be in about 22 fathoms, with sandy ground.

All along the Bottle and Glass side is rocky, but the bottom of the bay all sandy and good ground. If you moor in and out, which is used for ships-of-war, you may warp in, and lay your inner anchor in 12 or 13 fathoms of water, and your outer anchor will be in 32 fathoms. Moor a cable each way.

THE GRENADINES, or GRANADILLOS.—The Grenadines form a chain of The Grenadines, or Granadillos. innumerable rocks and barren spots, which extend N.E. by N., for about 16 or 18 leagues. Some, however, are of considerable size and value, particularly Cariacou and Bequia, both inhabited, and producing good coffee and cotton. Cariacou lies about 6 leagues N. by E. $\frac{1}{2}$ E. from the N.W. of Grenada. It is of a circular form, of about 6 miles in length and breadth, and has a commodious harbor.

Bequia, called also Little Martinique, is the Northernmost of the Grenadines, and lies about 2 leagues South from St. Vincent's. On the West side it has a very

good sandy bay, where you may ride occasionally; and wood is to be got there, with plenty of fish, but no water. The little islands to the Southward of Bequia are very fair, and near them you may stand boldly, having neither rocks nor dangers to fear.

A N. by E. course from Point Laurent, or the N.W. point of Grenada, will carry you clear along the Grenadines.

Observe that towards the South part it is rather dangerous to come near in the night.

Island of Grenada.

ISLAND OF GRENADA.—There is good anchoring-ground along the coasts, and on the Eastern and Western sides are several small bays and creeks, commodious for vessels, as well as for the landing and shipping of goods.

St. George.

The principal town is that of **ST. GEORGE**, in the S.W. quarter of the island, which is situated on a bay of the same name, formerly called La Grande Bay. This bay is formed by a point called Molenier's Point, on the North, and Cabrit, or Goat Point, on the South. The distance between these points is $3\frac{1}{2}$ miles. The space between is not entirely clear, as a coral reef extends out to a considerable distance from Point St. Eloi, which lies a mile to the South-eastward of Molenier's Point; and there is a sand-bank, of only 17 or 18 feet water, on which coral is beginning to grow, at some little distance off the fort point, on the North side of the entrance to the harbor.

Greenville.

The chief bay on the Eastern side of the island is that called Greenville Bay, which is open and protected by extensive reefs.

The town of **GREENVILLE** is a port of entry, having its distinct custom-house establishment. The villages are generally on the shipping bays round the island.

On the South side of the island, immediately on the Western side of the point of Fort Jedy, and 2 leagues to the Eastward of Salines Point, lies the harbor called Calavine, or Egmont harbor, which is very deep, and where, it is said, sixty men-of-war could ride in safety without anchors. The entrance is nearly half a mile in breadth. Within, its peculiar conformation is such, that it may be considered as forming two harbors, namely, the Outer and Inner Ports. The entrance into the latter is narrow, and its length rather more than half a mile. The depth in the greater part is 7 fathoms, with excellent holding-ground, being everywhere a soft, oozy bottom. The ships may here lie alongside of the warehouses, and take in their lading with great ease and convenience; after which they may, with very little trouble, be towed into the outer harbor, which enjoys this peculiar advantage, that ships can sail in or out with the common trade-wind.

In sailing off the South side of the island, there is little danger until you get to the Westward of Fort Jedy's Point. But thence to the rocks named the Grampuses, it is necessary to keep a good offing, as the ground inshore is very foul, and full of reefs. The Grampuses lie about three-quarters of a mile off the land, with the point called Pirogue Point bearing N. $\frac{1}{2}$ W. They appear just above the surface, and there is a passage within them, but it is not deemed safe.

On the North side of the island, in the channel between it and Redonda, or Round Island, there stands a remarkable rock, called London Bridge, (from its having a natural arch in it,) and from the South side of which extends a reef. This rock may be easily avoided by keeping over to the North side of the channel. Hence, and along the West coast of the island, the shore is bold, all along to the point of St. Eloi, whence a coral reef extends, as before explained.

Islets off the North end of Grenada.

St. George's Bay

ST. GEORGE'S BAY.—When sailing into St. George's Bay from the Northward, give Molenier's Point a small berth. You may run within half a cable's length of it, in 8 or 9 fathoms. The point is low, with some straggling trees on it, and makes like an island. When near the point you will see St. George's Fort bearing S.S.W. Keep your hull for the fort, and when you cannot fetch near enough to anchor, with the fort bearing East, tack, or you will be in danger of running on the Three-fathom Bank, before noticed. The soundings are very irregular from Molenier's Point—some casts 20, 13, 9, and 12 fathoms; and inshore, towards the fort, from 9 to 5 fathoms the bottom is foul.

To sail within the Three-fathom Bank, or Middle Ground, you may be directed by two white houses over the town, about half-way up the hill. Keep them open with the North end of the fort, and run directly in, until you see a single tree to the Southward, upon a little hill, open a good sail's breadth to the Northward of a large tree close to the shore; you will then be within the bank, and may pass the fort point at a distance of half a cable's length, in 4 and 5 fathoms. In the mouth of the harbor there are 15 fathoms of water, but it shoalens very fast to the Southward.

The best anchoring-ground in St. George's Bay is off the mouth of the harbor, at about a cable's length from the fort, with the two white houses, above mentioned, open to the Southward of the fort: but, if you anchor in the bay off the town, the houses must be open to the Northward of the fort, and bear E.S.E.

In advancing towards St. George's Harbor from the Southward, it must be observed that after passing Point de Salines, there is a very dangerous coral reef lying between that point and Goat Point, with only 2 or 3 feet over it in the shallowest part. This bank lies with the signal-staff of Fort St. George in one with the house that has two little turrets, or pavilions, situated on the top of a hill a little to the Eastward of the redoubts on Hospital Hill. With this mark you will be in a line with the reef, and must give it an offing. The bank is about a mile in length, lying parallel with the shore. Within it there is a narrow channel, through which small craft frequently pass.

In running from the Eastward towards Point de Salines, you will see Islet Rameur, a very small island, lying rather more than half a mile from the nearest shore, and nearly a mile from the point. Give that islet a berth of a mile, and do not attempt to pass within it, as the passage is shoal. To Point de Salines it is sufficient to give a berth of half a mile, as at that distance there are 7 fathoms water. So soon as you pass the point, the bay will be open. You must now carefully avoid the bank above described, which you will have passed, when a remarkable house, like a summer-house, upon a high point close to the end of the reef, bears S.E. On the bank the sea frequently breaks.

To sail into the harbor, you leave the Three-fathom Shoal, as before directed, on the starboard hand, and run in close under the fort, and then warp up. The ground is all clear, and the harbor capable of containing, with the utmost safety, a large fleet of ships of the line.

You will generally be obliged to work up into the bay, as it lies open to the Westward, and the trade-wind blows directly outward. The true entrance of the port is from W.S.W.

GREENVILLE BAY.—This port lies about half-way down the island, on the Eastern side, and all those bound for it must be very cautious, and not go too leeward of it; for, if they do, they must pass round Point de Salines, and turn to windward, on the other side of the island, as the current sets so strongly to the Southward that, with the prevailing winds, the fastest sailing-vessel cannot lead up. They should veer to a little to windward of the Greenville Rock, which lies to the North-eastward, (off Telescope Point,) and is round, pretty high, and steep on all sides. Upon firing a signal, a pilot will come off, and take charge of the ship.

The marks for going in are two white beacons, formed at the head in the shape of a diamond. One stands at the head of the bay, and South end of the town, at high-water mark; the other a little inland, on the side of the road leading over the mountains. They bear, when in a line, N. 71° W. By keeping them thus you may run directly in, under easy sail. Be careful to steer very small, as the channel between the rocks is very narrow, not being a ship's length across. After you are through the narrows, if your ship draws more than 13 feet, you must come to at the mooring chain, and lighten.

This harbor, to those acquainted with it, is safe and commodious, being sheltered from all winds. Yet it is impracticable to a stranger, the lead being no guide; and, if you once get too near the rocks, the current sets so strongly that you cannot get off again.

Remarks on Grenada.

[From the Derrotero de las Antillas.]

Any part of Grenada may be safely approached to within less than 2 miles. On its Western coast are many bays fit for anchoring in, but the principal is that in which stands the town and harbor of ST. GEORGE, or Fort Royal. This bay is about one league from the Salines, or the S.W. point. Between that point and Fort St. George, there is a rocky shoal and banks of sand, with coral. The rocky shoal is half a mile in extent from N.E. to S.W., and its greatest breadth is 2 cables' length. On all its edges there are 6 and 7 fathoms. It bears N. 25° E., true, three-quarters of a mile

Pt. David.

Pierced Rock.

e's Bay from the North within half a cable's length, and makes St. George's Fort bearing S.S.E. or enough to anchor, with a line on the Three-fathom bank, from 9 to 5 fathoms

distant from Point de Salines, and the Northernmost part of it lies nearly W., or W. by N., from Goat Point, at about 3 cables' length. Goat Point is the Southernmost point of St. George's Bay. The first sand-bank is a mile in extent, N. by E. and S. by W., and its greatest breadth is 3 cables' length. The least water on it is 3½ fathoms, and close to it are 6½ and 7 fathoms. Between it and the coast the depth increases to 10 fathoms. The Western extremity lies nearly North from Goat Point, and at the distance of half a mile. The second bank, on which there are not more than 3 fathoms of water, lies S. 59° W., true, from the fort, at the distance of half a mile. The greatest extent of this bank is 3 cables' length.

Behind the point on which the fort stands is the harbor, which is only 3 cables' length in depth, and into which vessels go to load and unload, or to be careened. This place is well sheltered as the best harbor can be, and vessels of the greatest burden can haul alongside the shore, in a depth of 8 or 10 fathoms.

Grenada may be seen at the distance of 7 or 8 leagues; and, as the principal harbor is by the S.W. point, the best way is to make and haul in for its South side.

To the South of Point Pirogue, on the South coast, there are some rocks even with the water's surface, which are called the Grampuses, and which lie out about two-thirds of a mile from the point. At night it is necessary to be certain how you run, that you may keep clear of them. To the Westward of Pirogue Point, nearly half a league, there is an islet named Glover's Island, which is very clean, and has 1½ fathoms of water at a cable's length from it. To take St. George's Bay, you ought to pass about a mile without Glover's Island, and at half a mile with Point de Salines, steering to the North so soon as you have passed the latter, until Goat Point bears East; then haul to the Eastward, and steer towards Point St. Eloi, which is about a mile to the Northward of the Fort St. George. Thus you will pass safely outside of the shoals. So soon as the point on which the fort stands bears East, you will have passed the last shoal, and may beat up between it and Point St. Eloi, taking care neither to prolong the tacks to the South of the fort, nor within less than 2 cables' length of St. Eloi's Point, which sends out some rocks to the West.

The anchorage is to the West of the town, at a quarter of a mile from the coast, in 6 or 9 fathoms. The bottom is very various, for you may equally find clay, sand, or rocks. Vessels intending to make a short stay only, bring to in this place, with only one anchor; but those which have to make a stay and unload, go into the harbor, where they moor with four.

There is said to be a bank and a shoal to the S.W. of Point de Salines, with 13 and 45 fathoms. In the strait between Grenada and Tobago, the water has been found to set S. 70° W., with the velocity of 1½ mile an hour.

The Island of Barbadoes.

Barbadoes bearing W.N.W., about 6 leagues.

Barbadoes. BARBADOES, which lies out of the line and to windward of the Carribee Islands, is of moderate height, and generally level, although there are a few hills of easy ascent. The island may be seen, in fine clear weather, 10 or 11 leagues off. The East end is much lower than the other parts; but on coming from the Eastward, or when the North end of the island bears W. by N. and the S.W. point about W.S.W., then the Eastern part appears the highest. From the Eastern part to the Southward the land is even, and declines towards the sea; but, between the Eastern and Northern points, it is uneven, rugged, and broken.

The S.E. coast, from South Point to Kitriages on the Eastern point, is inclosed by a ledge of rocks, called the Cobblers, from one of the most remarkable among them. They extend about a mile from the shore, and you must be careful to avoid them in the night. At South Point where the rocks terminate, there is a flat spit, which must have a berth, as it runs off above a mile to the W.S.W. In the day-time you may see how far it extends by the white water.

The principal town of Barbadoes is that called Bridgetown, situated at the mouth of a little rivulet on the North side of Carlisle Bay, upon the S.W. side of the island.

There is a revolving light on the South point of the Island of Barbadoes, 145 feet above the level of the sea, from which it is 200 yards distant, and stands in lat.

Light.

it lies nearly W., or W. by N. The Southernmost extent, N. by E. and S. by E. the depth in the North from Goat Point, which there are not more than 2 miles at the distance of half a

which is only 3 cables' load, or to be careened. 1 vessels of the greatest tonnage.

and, as the principal harbor for its South side, there are some rocks even with the surface, which lie out about two miles to be certain how you run, the Cape Point, nearly half a mile from the shore, is very clean, and has 14 fathoms water in George's Bay, you ought to be careful to sail with Point de Salines, or the Cape Point bears N. by E. until Goat Point bears N. by E. St. Eloi, which is about a mile from the shore, you will pass safely outside the Cape Point bears East, you will pass Point St. Eloi, taking care to be within less than 2 cables' length of the West.

at a distance of a mile from the coast, you may equally find clay, sand, and shells, and in this place, with care, and unload, go into the harbor.

Point de Salines, with 13 and 14 fathoms, the water has been found

leagues.

ward of the Carribee Islands, there are a few hills of easy access, 10 or 11 leagues off. The distance from the Eastward, or the S.W. point about W.S.W. by S. to the Southernmost point, is enclosed by a reef, most remarkable among them. You must be careful to avoid them in the day-time you may

Speightstown, situated at the mouth of the S.W. side of the island, is about 15 leagues distant, and stands in lat.

$13^{\circ} 27' 45''$ N., and long. $59^{\circ} 33' 30''$ W. The tower is painted in alternate red and white bands.

From the light Seawell Point bears about N.E. by E. $\frac{1}{2}$ E., and Needham Point W.N.W. $\frac{1}{4}$ W.; and, except from between the opposite bearings, the light is visible in all directions from the deck of a vessel, within the distance of 18 miles.

Vessels approaching the island from the Eastward are recommended not to run down their longitude to the Northward of $12^{\circ} 55'$ N.; and as soon as the light is discovered, to bring it to bear West; steering from thence W. by S., and not passing it at a less distance than 2 miles.

If coming from the North-eastward the light will not be visible until it bears to the Westward of S.W. by W., being concealed by the high land forming Seawell Point; and if kept in sight well open to that point, it will lead clear of the Cobblers. Mariners are advised to give them a wide berth, on account of the prevailing current to the Westward.

When the light is brought to bear N.E., a course may be shaped for Needham Point; but in hauling up in Carlisle Bay, that point should be kept at the distance of a third of a mile.

Those bound to Bridgetown should always endeavor to make the South side of the island, by sailing on or near the parallel of 13° . In the latitude of Barbadoes, at about 70 or 80 leagues to the Eastward, you will find the water discolored and thick, as if there were soundings, though there are none; by this indication, if met with, your situation will be nearly ascertained. When you approach the island, you may run along within 3 miles of the shore, until you advance towards Needham's Point, which forms the South side of Carlisle Bay. You may haul up and anchor in Osten's Bay to the Westward of South Point, by avoiding the spit above described, where you will find ground in 7, 8, 9, or 10 fathoms water. This bay is rocky; but the best ground, which is tolerably good, lies with a mill close by the water-side, at the head of the bay, bearing E. by N., or E.N.E.

In Carlisle Bay, also, the ground is foul, and apt to chafe the cables. In hauling in for this place, give Needham's Point a berth of a quarter of a mile, to avoid a reef which stretches from it, and always breaks. You may then run in until you bring Charles Fort, on Needham's Point, to bear S.E., and the steeple N.N.E.

There is also anchorage in this bay in 25 fathoms, fine sandy bottom, with Needham's Point S.E. $\frac{1}{4}$ S., the church N.N.E., and the N.W. point of the bay N.W. by North.

The Needham Point light (Carlisle Bay) will show red to the Southward of West, and as a bright light to the Northward of West. The bright light may be seen in clear weather 8 to 10 miles, and the red one about 3 miles. Vessels approaching from the Southward, after passing the revolving light on the South point of the island (giving the point a berth of at least 2 miles) may haul up W. by N. $\frac{1}{2}$ N. for Carlisle Bay, when they will soon make the red light. Gradually nearing it, (the lead kept going) as soon as the light shows bright, they may haul into the bay and bring up. Needham Point may be rounded within about a quarter of a mile in 5 fathoms water. Vessels approaching from the Northward, as soon as they see the light on Needham Point, must bring it on an E.S.E. $\frac{1}{4}$ S. bearing, which will clear the Pelican and Kettle-bottom shoals.

The long mark for the reef of Needham's Point, is a house standing upon the hill above the North end of the town, open with the outermost or Southernmost flagstaff on Needham's Point; and the thwart mark is the three flagstaves in one. With the above-mentioned house on the hill open to the Northward of the church, the ground is foul, but to the Southward it is more clear; and with the house just open to the Southward of the church, there is an anchorage in about 12 fathoms: the other marks for which are, a road to the Eastward of the town directly open, the fort S.S.E. $\frac{1}{4}$ E., and Pelican Point N.W. by N. The tide is almost imperceptible.

On the leeward side of the island, N.N.W. from the Northern part of Carlisle Bay, are several shoals, called the Pelican and Half-acre Shoals, the outermost of which lies about three-quarters of a mile off.

Before Speightstown, which lies between 8 and 9 miles to the Northward of Bridgetown, and which is defended by three forts, vessels occasionally ride.

There is a bank lying about 300 miles to the windward of Barbadoes, called Glass-ionieres, from the name of the French admiral who first reported it, but subsequent information confirms it.

TOBAGO, like Barbadoes, lies out of the line, and to windward of the Carribee Islands. The land in the Northern part is so high as to be seen, in clear weather, at the distance of 15 leagues.

Though Tobago does not possess any harbors, properly so called, yet it has several good bays, which, considering that from their Southern latitude they are never exposed to dangerous gales of wind, are equally convenient and secure to shipping. For

this reason the men-of-war stationed at the Carribee Islands, frequently repair hither for safety in the hurricane months.

The principal towns are Scarborough and Georgetown, situated on the South side of the island, and its roadstead is in Man-of-war Bay, on the North side. The vertical rise of the tide, on the full and change, is only 4 feet. The currents near the island are very strong and uncertain, especially between it and Trinidad. The N.E. trade-wind prevails all the year round.

The course usually taken from the island of Barbadoes to the S.E. side of Tobago, is South rather Easterly, so as to allow for the current, which sets most frequently to the N.W., and so as to get several leagues to windward of the island.

If you make Tobago towards the evening, and are afraid of running in with it, you must not, by any means, lie to, but stand to the Southward under easy sail, otherwise the current, which always sets either to the N.W. or N.E., may occasion your losing sight of the island; and it is possible that a N.W. current may carry you so far to leeward as to render it difficult to regain it.

Ships bound to the bays on the N.W. side, should always endeavor to make the North end of the island, which is bold and clear. A cluster of large bold rocks, called Melville's Rocks, lies off the N.E. point. Of these the Westernmost is very remarkable, having a large hole in it, from North to South. You may run as near to these rocks as you choose, and along the coast hence to Man-of-war Bay.

Port Scarborough Light.

PORT SCARBOROUGH LIGHT is upon Point Bacolet. The light is a bright white one, and is elevated 128 feet above the level of the sea. Vessels approaching Scarborough from the windward, and coursing down the coast, steering S.W., will not discern the light until it bears W. 1 S.; when it is brought to bear W.N.W., the Minister Rock must be looked out for; it bears E.S.E. from the light, distant half a mile. Continue to steer W.S.W. until the light bears S.W., then steer W.N.W. until the light bears N., then you will have passed the light, and must steer N.W. for the harbor, giving attention to a proper distance from the land. When you are well inside of the light-house, and have lost sight of the light, be guided by the soundings, as the depth decreases gradually. Anchor when you are in from 6 to 6½ fathoms.

Man-of-war Bay.

MAN-OF-WAR BAY.—This bay is not only the best in Tobago, but is one of the best harbors in the West Indies, having sufficient depth for the largest ships close to the shore. The distance from Melville's Rocks to North Point, on the N.E. side of this bay, is about 3 miles. In sailing in, haul round this point, when you will have the bay open, and you must be careful not to be taken aback, the wind being very fluttering under the high land.

You will find no soundings until close up in the bay, and then from 10 to 16 fathoms.

Having entered, turn in and anchor as far to windward as you can. After you are shut in, you will see the little bay, on the Eastern side, called Pirate's Bay; get as near to that bay as you can; you will find all clear ground, and may anchor in from 12 to 14, 16, or 17 fathoms. If you cannot turn in, you may anchor in 35 or 40 fathoms, and warp up. In Pirate's Bay is the watering-place in the rainy season.

On the South shore of the bay you may anchor in 16 or 18 fathoms, at a quarter of a mile from shore, and have good water at all times, half a mile from the anchorage; but there is a great surf which makes watering hazardous.

The western side of the bay is a good place for fishing; but there is a small shoal called the Cardinal, lying within half a mile from the shore, on that side, about half-way down the bay.

Nearly 2 miles to the Westward of Point Corvo, the Western point of Man-of-war Bay, are some bold rocks, called the Brothers; and in the same direction, at a league and a half from that point, are some others of the same description, called the Sisters, close to which there is a depth of 40 fathoms. All the coast hereabout is bold to. From abreast of the rocks, the South-west end of the island, which is low and sandy, may be seen.

Courtland Bays.

COURTLAND BAYS.—The first bay from the Northward, on the Western side of the island, excepting a few for small vessels, is that called Great Courtland Bay, the Northern point of which, called Guana Point, lies 13 miles to the South-westward of the Sisters. To this point a berth must be given, as a rock, called the Beef Barrel, which breaks at low-water, lies just off it. There is anchorage in 6 fathoms, but good fishing in 9 or 10 fathoms, either with the seine or with the hook and line. The ground is clear, only that there are a few stumps of trees close up to the mouth of the river. If the wind hangs to the Southward of East, you will ride very roughly, and if at N.E., will roll very much. In the bay you will have the common trade-wind all day, and an offshore breeze during the night. If you arrive in the night, and do not care to push for the bay, you may find very good anchorage to windward of the cliff, in from 6 to 20 fathoms, regular soundings.

To the Southward of Great Courland Bay is Little Courland Bay, having very good anchorage within the windward point, which is pretty bold. Vessels ride more safe and smoothly here than in the former.

Between Man-of-war Bay and Courland Bay are the bays called Bloody bay, Penetuyver's Bay, Englishman's Bay, and Castum Bay, which have safe anchorage for vessels of 150 tons.

At the S.W. end of Tobago is Sandy Point Bay, in the bottom of which ships may anchor in 6 fathoms. When you weigh for this place, be sure of a breeze to carry you without the reef, called the Buckoo, which extends from Little Courland Bay to Brown's Point, and is dry, in some places, at the distance of 2 miles from shore. If it be calm, the current may set you on this reef. At the distance of 2 cables' length from the breakers, you will be safe to enter Brown's Point Bay; haul close round the reef, and having passed the point, anchor as above.

EASTERN COAST.—About 3½ miles S.S.E. from Melville's Rocks lies the *Eastern Coast*, small island called Little Tobago, near which there are several islets and rocks. Within these is the bay called Tyrrel's Bay, in the bottom of which vessels of 150 tons may anchor, in 7 fathoms. The ground between Little Tobago and the main is very foul, and the currents very strong and uncertain. In sailing off this part of the coast ships must, therefore, keep well to the Southward, allowing for a N.W. current, which almost constantly prevails about Little Tobago.

At the distance of 3½ miles to the Southward of Little Tobago is Pedro Point, and rather less than 2 miles from Pedro Point lies a high rocky islet, called Queen's Island. Between these points is the bay called King's Bay, which has good anchoring-ground in every part within the windward point, in from 6 to 20 fathoms of water. The land on the Eastern side being high, intercepts the trade-wind, and the swell from the Eastward is apt to set a vessel down to the leeward point; the best time to sail out is early in the morning, about daybreak, when the wind blows fresh from the land on the Northward.

South-westward from Queen's Island, at the distance of a league, lies a similar islet, called Richmond Island; and 1½ league from the latter, in the same direction, is a lesser islet called Smith's Island. These islets being situated off projecting points of the coast, are conspicuous. Nearly a mile West of Queen's Island is a large dry rock, called the Roxburg, and between lies the bay named Queen's Bay. Between the Roxburg Rock and Richmond Island is Hog Bay, in which the ground is foul. To the N.W. of Richmond Island is the little bay called Halifax Bay, which is noticed hereafter. From Halifax Bay, extending nearly to Smith's Island, there is a dangerous bank and reef half a league broad, called the Great River Shoal, on which the depth, in several places, is only 3 fathoms.

In running down for Queen's Bay, which lies within Queen's Island, as above mentioned, give the latter a good berth, until you open a large house, having a gallery, on a rising ground, fronting the quay, which is the only one of that description in the bay. Continue on this, without nearing the shore, until you bring this house in a line with one on the hill above; and keep this mark on, if the wind permits, until you are 2 cables' length from the shore; then haul your wind, and anchor about 150 fathoms from shore, in 5 fathoms, fine ground, abreast of the watch-house on the beach. Should the wind be adverse, you must let go an anchor and warp up. In sailing outward attend to the same mark as in sailing in, without getting over to windward.

The dangers are so numerous, from Queen's Bay to the West end of the island, that no stranger should venture without a pilot. The most accessible bays are those described as follow:

Halifax Bay, to the N.W. of Richmond Island, as before mentioned, is a good bay for vessels of 150 tons, but a shoal lies in the middle of the entrance. The next is called Barbadoes Bay, and lies to the leeward of Smith's Island. To avoid Great River Shoal, in sailing for Barbadoes Bay, or to the Westward of it, keep Little Tobago open without Richmond Island, with Smith's Island bearing N.W., you may haul up for the bay, cautiously avoiding a reef of coral rocks, which stretches to the distance of a cable's length from Granby Fort Point, on the windward side. Within this reef, before Georgetown, there is good ground, in from 12 to 7 fathoms; particularly with a silk cotton-tree on the beach in a line with the flagstaff on the top of the hill.

Rocky Bay, on which the town of Scarborough is situated, is a deep bay, generally safe; but a heavy swell rolls in with the breeze, especially when it is to the South of East. It lies 5½ miles to the Westward of Barbadoes Bay. In sailing towards this place, keep Little Tobago open of Richmond Island, as above directed, to avoid Great River Shoal; and next observe that the Chesterfield Rock is a danger which must, also, be cautiously avoided. This is a sunken rock, having only 7 feet over it, and on which the sea frequently breaks. It lies at half a mile from shore, about 2½ miles

to the Southward of Granby Fort Point, and at the same distance to windward of the East side of Rocky Bay. You may sail clear within it, with Richmond Island open between Smith's Island and the main; and without it, by keeping Richmond Island open without Smith's Island; for Richmond and Smith's Islands in a line, lead directly on it.

When past the Chesterfield Rock, you haul in for Scarborough Point, which is a bold bluff point, with a fort on the hill. There is no danger provided you keep the weather shore well on board until you open the main street, which extends directly up the hill. With this mark you may anchor in from 7 to 9 fathoms, being the only clear part of the bay. It is requisite, even here, to buoy up the cables. No stranger should attempt to leave the harbor without a pilot, as it would be extremely hazardous. The channel between Scarborough Point and the reefs is less than three-quarters of a mile in breadth, and the dangers extend thence to the end of the island.

In the channel between Tobago and Trinidad there is a dangerous shoal, having only from 17 to 24 feet water upon a considerable portion of it, and lies directly in the channel of vessels going from Tobago to Trinidad, as also of vessels coming from Demerara and rounding the Southern extremity of Tobago on their voyage home. The shoalest part lies S. 20° W. from Brow's or Crown Point, distant about 2½ miles, and from Point Columbus, Island of Tobago, S. 67° W., distant 3½ miles, and upon the ebb-tide there is generally a current of 3 miles an hour, setting about N.W. by W., probably caused by the outlet of the waters of the river Oronooka. In this channel, or strait, the current runs to the Westward at the rate of 2 miles per hour; but so that when approaching Trinidad, the direction of the current is towards the N.W., and near Tobago towards the S.W. On the N.E. part of Tobago the current sets to the North-westward with more velocity than is stated above.

THE ISLAND OF TRINIDAD AND GULF OF PARIA.

Chiefly from the Directions and Survey of Captain Columbine.

All the bearings given, whether points or degrees, are true bearings, unless otherwise expressed.

*Island of
Trinidad.*

THE ISLAND OF TRINIDAD is of considerable magnitude, containing, according to computation, 2,012 square British statute miles. It presents a front to the Eastward of nearly 12 geographic miles, from Point Galere to Point Galeota, its N.E. and S.E. extremes; the latter bearing from the former S. 74° W. From Point Galeota the South Coast extends 56 miles Westward to Point le veque, or le veos; and from the latter to Mona Point, which is the N.W. extremity of the island, it is 43 miles in a N.N.E. direction. The North Coast extends Eastward from Mona Point, about 46 miles, to that of Galere. A range of high mountains extends all along the North Coast, which may be seen at the distance of 11 or 12 leagues; and thence stretch to the Southward above 3 leagues on the East Coast. The South side is also bordered by a range of mountains, but considerably inferior in height to those on the North side; and near the middle of the East Coast is another range, extending to the W.S.W. The other parts of the island are principally low and level land, with some savannas.

*Gulf of
Paria.*

GULF OF PARIA.—Between the Island of Trinidad and the main land, there is a large space, or opening, called the Gulf of Paria, affording secure shelter to ships of all classes, as they may anchor in any part of it without the smallest risk, and in any convenient depth of water. This great Gulf may be entered by two channels, one to the North, the other to the South; that to the North is divided into several small channels by some islands; and that to the South has an islet in it surrounded by rocky shoals, which are dangerous.

*North Coast
of Trinidad.*

NORTH COAST OF TRINIDAD.—From Point Galere, the North Coast of Trinidad stretches first S. 85½° W., 29 miles, to Point Chipara, and thence S. 76° W., 11½ miles, to point Corozal; whence it bends to S. 58½° W., about 4 miles, to Point Mona. All this coast is bounded by rocky shores; and, with the exception of a small part, with steep mountains, thickly covered with wood, close down to the sea, which breaks in a heavy surf along the whole extent, and renders landing impossible, except at a very few places. The land immediately about Point Galere is not above 50 feet high; it rises towards the West, and about Poco begins to connect itself with

out Point Galere is not above
o begins to connect itself with

the chain of mountains which extend along the whole North coast, from Rio Grande to the Bocas. Of these, that of Maraceas, called by the Spaniards Cerro de las Cuevas, is the highest, being 2,917 feet above the surface of the sea, and not 2 miles from the sea-coast; those to the Eastward are estimated from 2,000 to 2,500 feet high, and those to the Westward at less than 2,000.

Between Mona Point and that of Chupara, there are some bays; but so much swell sets into them, and the wind is so uncertain and light else to the shore, that it is dangerous to anchor a ship in any of them, except Escouvas and Maraceas. Of these, the first from the Westward is Macaripe, a cove in which there are from 7 to 3½ fathoms water, sheltered from the N. E. winds, and defended by two batteries; this lies about 3 miles to the Eastward of Mona Point, and one mile to the Westward of Point Corozal. The next is Chute d'Eau, at the distance of 5 miles to the Eastward of Point Corozal; this is also a small sandy cove, deriving its name from some rills of water, which, as they descend from the hills, are projected over the rocks in various directions. Off the East point of this cove is an islet of the same name; and about 1½ mile to the Eastward of it is Isle aux Vaches, an islet lying close to the East point of another cove or bay, in which there is anchorage in from 12 to 8 fathoms, sheltered from N. N. E. winds. About E., 1½ mile from Isle aux Vaches, is the West point of Maraceas Bay, having to the Eastward of it a small bay, called Mal d'Estomac, in which there is no shelter; this point lies 9 miles to the Eastward of Point Corozal.

MARACAS BAY.—This bay is a mile wide, and about the same depth, having from 16 to 10 fathoms, on mud, at its entrance, decreasing gradually to 8 and 7 fathoms, on sand, near the middle. It is open to the North, but is capable of affording more shelter than any other on this part of the coast; the land about it is level for a considerable space. Two miles further North-eastward is Escouvas Bay, five-sixths of a mile wide, and about half that in depth, with from 10 to 5 or 4 fathoms water in it. The East point of this bay, on which there is a battery to defend it, is 1½ mile S. W. from the West part of Point Chupara. Here is anchorage at about one-third of a mile from the East point, in 9 fathoms of water, sand and mud, with the fort. (Abercrombie,) bearing E. N. E., and the large house on the South side of the bay S. by W. Escouvas is a better anchorage than Maraceas Bay; the latter, although much larger, being more subject to calms and sudden shiftings of the wind.

Maraceas Bay.

POINT CHUPARA.—Point Chupara is scarped and cliffy, and extends about a mile nearly East and West. At the distance of 700 feet to the Westward of its West extremity, is a rock, on which the sea generally breaks; and the reef extends about half a mile Eastward from its East extremity. From this point the coast inclines to the East South-eastward, being a sandy beach; and at the distance of three-quarters of a mile is the entrance of the little river Chupara, fit only for boats. Here the coast again trends Eastward; is partly composed of cliffs, and at the distance of 3½ miles is the mouth of the little river Macapon, similar to that of Chupara. Nearly 3 miles further, in the same direction, in the East part of a small sandy cove, is the little river Paria, of the same description as the former; a small islet lies off the East side of the cove, close to the shore, called Paria Islet; 2½ miles to the Westward of this islet, and about one-third of a mile off from the rocky points on the East side of the River Macapon, there is a reef of rocks; there are also several other rocks lying at a short distance from shore, between Chupara and Paria, but none so far off as the reef just mentioned. About 2 miles Eastward of Paria Islet is Trou Bouille Rio; the shore between being chiefly rocky cliffs with two islets lying near it. Nearly 1½ mile farther, in the same direction, and at the East end of a sandy beach, is the mouth of the little river Mandamus, having between a projecting rocky point; this, like the former, will admit nothing but boats. Hence the coast trends to East North-eastward 3 miles, to Point Matelot, which lies 11 miles N. 87° E. from Point Chupara.

Point Chupara.

From Matelot Point to Rio Grande Point, the bearing and distance are N. 80° E., 7½ miles; at about a mile to the Eastward of the former is Le Petit Matelot; and between these, close to the Eastward of a rocky spot, is the entrance of Shuck's River, similar to those already described. The coast thence, to within half a mile of Rio Grande, is chiefly rocky and high, with a few sandy bays. Rio Grande, contrary to its appellation, is a small river, like those before mentioned; it lies about S. W. by S., three-quarters of a mile from the point of that name, the shore between being scarped; from the entrance of the river a sandy beach extends Westward about half a mile, having off its West extremity two islets, or rocks, the outermost of which lies nearly one-third of a mile from shore. A vessel may anchor in 9 fathoms water at one-third or two-fifths of a mile W. by N. from Rio Grande Point, (off which is an islet or rock,) with the East end of the sandy beach bearing about S. by E. 4 E.

The coast from hence trends nearly E. 2½ miles, to Point Sans Souci; the shore being chiefly scarped.

From Point Sans Souci to Reefs Point, (called by the Spaniards Toco Point,) the bearing and distance are S. 87° E., 4½ miles. Here the coast bends in a little to the Southward, and is of the same description as the anterior. About E. by S. 23 miles from Sans Souci Point is Toco Point, with some islets or rocks, lying close to it; and between it and Reefs Point, to the West South-westward of the latter, is Toco Bay, where a ship may anchor at about three-quarters of a mile from the land, in 12 fathoms water, muddy ground, with Reefs Point bearing E. by S., Harris' house (at the S.E. side of the bay, and easily distinguished, being the largest in that neighbourhood,) S. S. E. ½ E.; or further Southward, in 12 or 14 fathoms, with Reefs Point E. by N., and Harris' house as before; but this is not a good place to lie at, as a great swell sets in.

From Reefs Point the coast trends S. 61° E. nearly 1½ mile, to Point Galere, which, as before noticed, is the N.E. point of the island. The land between is of a moderate height. A reef extends about one-third of a mile from shore along all this space, and should not be approached nearer than the depth of 12 fathoms. There is also a rock to the Eastward of Point Galere, about three-fourths of a mile, often visible, but on which the sea always breaks; and there is reason to suspect that some sunken ones lie still further out, and also within it.

The whole of the North coast is bold, with the exception of the places already mentioned; and the soundings extend several miles off, and are almost regular. Four miles N. by W. from Point Galere there are 22 fathoms; half a mile further off, 40 fathoms, sand and mud. Three and a half miles North from Point Sans Souci there are 23 fathoms; at the same distance N. by W. from Rio Grande, 20 fathoms; and at a similar distance N. N. W. from Point Matelet, 17 fathoms. N. by E., 5½ miles from Paria, there are 13 fathoms; N. by W., 2½ miles from the River Macapou, 21; and N., three-fourths of a mile from Chupara Point, 16 fathoms. There are 78 fathoms 5 leagues N. by W. from Escouvas; and 43 fathoms 5½ miles North from Maracaes Bay. North 6½ miles from Point Corozal, there are 60 fathoms; and at 7 leagues N. by E. from Boca Mona, 93 fathoms. These depths decrease gradually towards the shore, very close to which are 8, 7, and 6 fathoms.

The bottom being everywhere good, sand and mud, a vessel having occasion to anchor, may choose her anchorage on any part of this coast, with the precaution not to go into any of the bays to leeward of Maracaes; as the high mountains there prevent the wind from blowing home, and the swell, in such a case, renders it difficult to manage a ship.

High-water. At Rio Grande, on the full and change days of the moon, it is high-water at the 30m.; and between this and Point Chupara, the last 2 hours of the ebb, and sometimes the whole of it, set to the Eastward along the shore.

East Coast of Trinidad. EAST COAST OF TRINIDAD.—The range of high mountains extending along the North coast of this island from West to East, continues on the East coast as far as Point Salibia. The highest part of the range, as before said, is near the meridian of Escouvas; on the East, the most elevated part is near Point Salibia.

The general bearing of the East side of the island, from Point Galere to Point Galcota, is S. 74° W., about 41½ miles. Cape Galere, as before said, is comparatively low and rocky, with a heavy sea constantly breaking on it; and S. 71° W. from it, 1½ mile, is Point la Forest, having between a rocky bay, in which there is no landing. From Point la Forest, S. 40° W., 4½ miles, lies Point Guayaman. Between these the coast forms a bay, on the shore of which, and nearly midway, is the little settlement of Cumana. From Point Galere to Cumana the coast is very rocky. Cumana consists of 3 or 4 plantations, situated on land tolerably even, and rising with gentle ascent from a sandy bay, which always affords good landing, although quite unsheltered, and as much exposed to the East, and to the consequent violence of the ocean, as the rest of the coast, along whose whole extent, except at this spot, a tremendous surf breaks. At three-fourths of a mile off there are 9 fathoms of water, whence the depth decreases gradually to the shore. From Cumana to Point Guayaman, a distance of 2½ miles, the shore consists of some points of rocks and sandy beaches. From the latter point it becomes cliffy to within three-fourths of a mile of Balandra Point, and then a sandy beach almost to the point itself, which terminates in a scarped rock, and bears from Guayaman Point S. 40° W., at the distance of 4 miles. Balandra Bay is to the Westward of the point; it is not large or deep enough to shelter any vessel larger than a trading schooner, in from 2 to 4 fathoms. The North part of this bay is a sandy beach, and at its West end a mountain torrent discharges; the shore there is cliffy as far as Salibia Point, which is nearly a mile S. 48° W. from that of Balandra. The coast now bends more to the Westward; and at the distance of nearly 2 miles W. S. W. ½ W., is Patura Point, to the N.E. of which is Salibia Bay, where a small vessel, drawing 8 feet water, may find tolerable shelter within a small rocky

Sans Souci; the shore be-

Spaniards (Toco Point) the coast bends in a little to the prior. About E. by S. 25° islets or rocks, lying close westward of the latter, isers of a mile from the land, ring E. by S., Harris' house ng the largest in that neigh- fathoms, with Reefs Point ool place to lie at, as a great

The North part of this bay t discharges; the shore there S. 48° W. from that of Bal- and at the distance of nearly which is Salibia Bay, where a shelter within a small rocky

islet on the North side. There is also anchorage about a quarter or a third of a mile to the Southward of the islet, in 5 or 6 fathoms water, but more exposed. This islet lies four-fifths of a mile from Salibia Point; the rocky shore extends nearly as far, and thence to Patura Point is a sandy beach. About W. by N., half a mile from the islet, is the entrance of Salibia River, fit only for boats; and a little to the Westward of it is a tolerably good landing-place. Patura Point has a small islet, or rock, near it, and the coast is somewhat cliffy, though somewhat lower than before, for about two-fifths of a mile, whence it turns abruptly to the Southward. Salibia is at the foot of the range of mountains which extends along the Northern coast; and here ends the rocky quarter of Point Galere. From hence to the Southward is a long sandy shore, the interior being a vast extent of land, apparently level, and of a moderate height, with a few distant insulated hills arising out of the plain; the whole covered with a continued forest.

We have just said that the coast turns abruptly to the Southward, and is a sandy shore. It continues of the same description so far as Manzanilla Point, which is 9¼ miles S. 8° E. from Patura Point, with a surf breaking along its whole extent, so heavily as to render landing on any part of it totally impracticable. This is called Patura Bay; near the middle of it the River Oropuche discharges itself through the surf, and over a very bad bar.

At Manzanilla Point the coast turns suddenly to S.W. by W. and W.S.W., for about 1½ mile, chiefly rocky, but forming a small sandy bay, or harbor, of the same name, sheltered by some rocky islets lying near its East point. This bay has a depth of water sufficient for any vessel not drawing more than 9 feet; and, although very small, it is the best on all the East coast of the island. A reef of rocks stretches from Manzanilla Point Eastward, rather more than half a mile; and nearly 2 miles S. 49° E. from the same point are three rocks, above water, over which the sea always breaks. Half a mile S. 71° W. from these rocks is another, so small that it scarcely makes the sea break, and is not to be seen until you are close to it. Vessels from the North may run with great safety between the reef which stretches off from the point and these rocks; but the wind will scarcely permit a square-rigged vessel to lay her course through this channel to the Southward. There is also some foul ground about two-fifths of a mile E.N.E. from the three rocks, on and near which the sea breaks in very bad weather. It shoals suddenly from 9 to 4½ fathoms. A ship may anchor off Manzanilla Bay, in 5 fathoms water, with the leewardmost of the rocky islets at the entrance of the bay bearing N.W. about the distance of 3 cables' length, and Manzanilla Point N.N.E. This is by far the best anchorage on the coast, as a ship from hence will always have plenty of room to make sail in case of necessity. Here the flood and ebb streams both set North-eastward. Nearly W.S.W., about 3½ miles from Manzanilla Point, is the East end of Lebranche Mountains, which thence extend West South-westward. This, by estimation, is about 1,000 feet above the level of the sea, and forms a conspicuous mark to know this part of the coast by.

COCOS BAY.—Close to the Westward of the cliffy shore, on the West side of Manzanilla Bay, is the mouth of the little River Lebranche; and hence the coast again turns abruptly to the Southward as far as the River Orotoire, a distance of 10½ miles; the shore being all a sandy beach, nearly straight, with the surf breaking heavily on it. This is called Cocos Bay, from its shore being bordered by a narrow grove of cocconut-trees 7 or 8 miles long. Near the middle of the bay the River Mitau discharges its waters. About half a mile Eastward of the mouth of the Orotoire River is a landing-place behind a rocky point, on the North side of a scarped promontory, which advances 1½ mile into the sea, and presents a front of high cliff to the Eastward of about a mile in length, N.N.E. and S.S.W. This is called Mayero Point, (but by the Spaniards Cape Guataro.) Several rocks and reefs lie off its N.E. part to a considerable distance; and it should not be approached from the East nearer than a mile, as there are only 3 fathoms at the distance of four-fifths of a mile from it, in that direction; but a vessel may anchor, at nearly a mile to the Northward of this promontory, in 5 fathoms, good ground, having the N.E. part of the point bearing S.E. ½ S., and the Westmost rocky bluff, which is near the mouth of the Orotoire, S.W. ½ S. Mayero Point is remarkable at the distance of 5 or 6 leagues, from advancing into the sea, and also from the almost equal elevation of the whole tongue of land that forms it. It lies nearly 11 miles S. 13° W. from Manzanilla Point.

MAYERO BAY.—From the South part of Mayero Point, the land continues high and scarped for about two-thirds of a mile to the W.N.W., whence a low sandy beach begins, turning to S. by W. and S., and continues of the same description, with low land in the interior, as far as Point Galeota, which is 12¼ miles S. 8° W. from Mayero Point. The space between these points is called Mayero Bay; and at its Northern part the water is sufficiently smooth to afford good landing for 2 or 3 miles, although it is as much exposed to the East as the middle and Southern parts,

Cocos Bay

Mayero Bay.

where a heavy surf breaks; and off this part, also, a vessel may anchor, as there are about 6 fathoms at $\frac{1}{2}$ mile off, and it shoals gradually to the shore. To the Southward of Mayero Point are some plantations, and at the distance of 3 miles, a church.

Point Galeota

POINT GALEOTA, as we have before said, is the S. E. point of the island. Several rocks lie off it, but they are all above water; and at the distance of three-quarters of a mile to the E. and S. E. of it, is a depth of 10 fathoms. This promontory is of moderate elevation, and may be discovered from the North-eastward at the distance of 6 or 7 leagues. The soundings extend to a considerable distance off to the Eastward, and shoal gradually to the land; these will be best understood by inspecting the chart.

Sunken rock.

SUNKEN ROCK.—Before we quit this part we ought not to omit mentioning a dangerous rock that lies 6 or 7 leagues from the land, although we are not acquainted with its precise situation. The surveyor, (Capt. E. H. Columbine,) when searching for it in the direction that was pointed out to him, found a bank of 16 fathoms, with deep water all around it, on which it is supposed to exist. This bank lies 7 leagues S. 37° E. from Point Galere, and N. 82° E. from the mountain at Lebranche, distant 6 $\frac{1}{2}$ leagues from Manzanilla Point. There is no doubt of its existence, a vessel having been wrecked upon it; and it has been seen by several persons at very low spring-tides; it is a very small rock, and steep close to.

South Coast of Trinidad.

SOUTH COAST OF TRINIDAD.—From Point Galeota to the Point de la Grande Calle, it is 3 miles S. 75° W. The coast between forms Guaya-Guayara Bay, which is spacious, with a sandy shore, but so shoal that nothing can be sheltered in it, except very small vessels, there being only 3 fathoms water a mile from the land. A rocky shoal lies nearly in the middle of it, and there are several rocks near Galeota Point, but they are all above water. From Point de la Grande Calle the coast trends S. by W. $\frac{1}{2}$ W., all scarped and rocky, to Point Casa Cruz, a distance of 5 $\frac{1}{2}$ miles. All along this part there are 5 fathoms water at $\frac{1}{2}$ mile from the land. From Point Casa Cruz the coast runs nearly West, with several inflections, about 32 miles to Point Tabaro, the shore being chiefly scarped, with two or three spots of sandy beach, and a few rocks at the projecting points. From Point Tabaro the coast trends W. by N., about 2 $\frac{1}{2}$ miles, to Point Herin, a projecting point of sand, with some rocks lying off it. Nearly 5 miles W. by N. from the latter lies Islet Point. The coast between is sandy and forms a small bay, called Herin Bay, in which there are 3 or 4 fathoms water. The coast from hence trends W. S. W., nearly 6 miles, to Point Quemada, the shore being all sandy. About midway lies Point Chaguaramas. About 3 miles to the Westward of Point Quemada is Point Icaeos, or Icaque, the South-western extremity of the island. We have already said that Point Galeota may be distinctly made out at the distance of 6 or 7 leagues. From this point the land begins to be more elevated, and continues so along the South coast. No part of this coast can properly be called mountainous, although it is very hilly; but these gradually diminish from the vicinity of Point Herin towards Point Icaeos, which is quite low and flat. The hill of Guaya-Guayara, at the Eastern extremity of this range, and about $\frac{1}{2}$ mile N. W. by W. from Point de la Grande Calle, is 760 feet high by admeasurement. This may serve as a guide whereby to estimate the height of the others. There is a watering-place about a mile to the Westward of Point Casa Cruz, where, with a little trouble, water may be obtained from a mountain-stream that falls into a well on the beach. Five fathoms will be found at $\frac{1}{2}$ mile from the shore, in which depth you may run along the coast; but it is more advisable to keep at 2 miles from the land. You will then be in 8 or 10 fathoms, and clear of all risk. At the distance of 3 or 4 leagues to the Eastward of Point Icaeos, a reef of rocks lies upwards of a mile from the land. It does not show itself, but some red cliffs on the shore will nearly point out its situation. After passing Point Quemada, you may approach the shore to a quarter of a mile without the least risk.

Point Icaeos, or Icaque.

POINT ICACOS, or ICACQUE, is a sandy promontory advancing into the sea in a circular form, but so steep that at half a cable's length there are 8 or 9 fathoms water. From its S. W. part it first runs Northward about $\frac{1}{2}$ mile, to Point Coral, and thence North-eastward, $\frac{1}{2}$ mile, to Point Gallos, which has two or three islets lying off its West side.

West Coast of Trinidad.

WEST COAST OF TRINIDAD.—From Point Icaeos to Port d'Espagne, the bearing and distance are N. 36° E., 43 miles. All this part is low, excepting Mount Naparima, which is round, and 602 feet high. In clear weather, it may be seen at 5 leagues distance, and is a good mark within the Gulf of Paria.

From Point Gallos, before mentioned, to Point Cedro, it is 5 $\frac{1}{2}$ miles N. 61° E. the coast between forming a bay of the same name, the N. E. part of which is flat at a considerable distance off. From the point a spit projects Westward, and at its extremity, two-thirds of a mile from the point, is a rock called the Barrel of Beef. A shoal of 9 feet lies also about 3 miles N. E. $\frac{1}{2}$ E. from the same point. N. 67° E.

the same point. N. 62° E.,

at the distance of 14 miles from Point Cedro, is the N.W. extremity of Cape, or Point Brea, or Pitch Point. Between these the shore forms two shallow bays, separated by Gnape Point. Cape Brea presents a front of 2 or 3 miles in extent, projecting to the N.W., and within it is a wonderful lake of pitch or bituminous matter. In the bay to the Southward about a mile from Point Brea, there are two small rivers of excellent fresh water close to the beach.

From the North part of Point Brea to Mount Naparima, the bearing and distance are N. 59° E. 9¼ miles, and from the latter to Point Caseaal, the coast trends N. 6° W., 11 miles. The shore between Cape Brea and Point Caseaal forms a deep bay, with shallow water, into which several rivers discharge; of these the first is the Sibaira, at about 1¼ mile to the S.W. of Mount Naparima. Between this river and the mount, at two-thirds of a mile from shore, lies a farallon, or rock, and to the W.N.W. of it, till 2 miles, the water is shallow. At the foot of the mount, on its West side, is Petit Bourg, and to the Northward of it are the little rivers Tarouga and Guaraerao. About 2½ miles to the Northward of Petit Bourg is Stony Point, at the Western end of the middle range of hills. The coast thence trends about N. ½ W., 8½ miles, to Caseaal Point, bordered with shallow water to the distance of 4 miles off. About S. E. by S. 1¼ mile from Caseaal Point, is the mouth of the little river Coura, and 17 mile N. E. ½ E. from the same point, is that of Carapielima, of a similar description. From hence it is N. 134° W., 9 miles, to Port d'Espagne; the land between is low and swampy, through which the little rivers Chagouane, Aripo, and Arouca, discharge their waters. On the Jetty at Port d'Espagne there is a fixed light 50 feet

Light.

above the sea.

Here we discontinue the description of this coast from the South, resume it again at the Rocas, and conclude at Port d'Espagne.

Mona Point, as we have before said, is the N.W. extremity of the island. From thence to Taitron's Point, or Punta del Diablo, it is little more than 1¼ mile S. 8° E. At three-quarters of a mile from the former lies the North point of an inlet, called the Careenage of Mona, which runs in North-eastward more than half a mile, and has from 17 fathoms, at the entrance, to 4 and 3 at the extremity. At the head of this inlet, or bay, a ship of the line might lie secure to the shore, land-locked. Off the sandy shore which forms the East side of it, there is a bank which shoals suddenly: it will therefore be necessary to keep on the opposite shore, if you should have occasion to work up so far. Taitron's Bay, called also Ensenada del Infante, lies to the Northward of Taitron's Point, is about one-third of a mile wide, and of nearly the same depth, having a sandy beach at its head, and a depth of 15 fathoms at the entrance. The high land between these bays is 100 feet above the surface of the sea, Westward from these points lie the three islands, Mona, Huevo, and Chaca-chacare, which form the Bocas, and which will be described hereafter.

GASPAR GRANDE.—S. 4° W., one mile from Taitron's Point, lies the West *Gaspar Grande.*
point of Gaspar Grande, named Espolon (Cock-spur.) This island extends Eastward nearly 1½ mile to Punta de la Reyna, the East point, and is about half a mile broad. Its elevation is considerable, the highest part being 337 feet; and its coasts form some coves, or little bays, in which small vessels may anchor.

From Taitron's Point the coast of Trinidad runs S. 73° E., four fifths of a mile, to Punta de San Jose, whence it bends in to the N. E. and E., 1¼ mile, and thence to the S. S. W., about two-thirds of a mile, to Punta San Carlos, being the West part of Chagouanous Peninsula. This point lies almost 2 miles S. 65° E. from Taitron's Point, one and one-tenth mile S. 60° E. from Punta de San Jose, and 740 yards to the Eastward of Gaspar Grande. Gasparilla Island lies to the Southward of Punta de San Jose, and has an islet on its North side. This island forms two passages: that on the North is 250 yards wide, with 5 to 15 fathoms water; and that on the South, between it and Gaspar Grande, is 740 yards wide, with from 9 to 14 fathoms water.

CHAGUARAMUS BAY is comprised between Gaspar Grande, on the S.W., the *Chaguaramus Bay.*
West side of the peninsula on the East, and the land on the North. It is spacious, and

affords good anchorage. The shores are bold, except off the large plantation, which is situated in the principal valley on the North side, whence a shoal of 1 to 3 fathoms extends 600 yards off. Its outer edge trends to W. N. W., and is very steep. Vessels may anchor in this bay anywhere; but the most convenient spot for watering, is in 12 fathoms, with the East end of Gaspar Grande bearing S. by E., and Taitron's Point in a line with Punta de San Jose. There is a wreck of one of the Spanish ships-of-the-line that were burnt here at the taking of the island. It lies in 17 fathoms water, bearing the Western Diego Island open 1° 10' of Punta San Carlos, and the North extreme of Gaspar Grande W. by S. Avoiding this wreck, a ship or two may water very well here.

At full and change of the moon, it is high-water by the shore at 3 o'clock, and it
ges about 5 feet; but at the anchorage the flood-stream runs until half-past 3 o'clock.
The flood runs to the Eastward, and continues only 5¼ hours; the ebb runs to the
Westward.

High-water.

Escondido Harbor.

ESCONDIDO HARBOR.—To the Northward of Punta San Carlos, or Escondido, is a little harbor, named Escondido. From this point S. S. E. $\frac{1}{2}$ E., four-tenths of a mile, is Prince's Point; and thence to the East end of Chagarramus Peninsula, it is about E. N. E. $1\frac{1}{2}$ mile. From this latter point to another point at the West side of Lynch's Bay, it is N. 53° E., $1\frac{1}{2}$ mile. To the N. W. of the East point of the peninsula, nearly half a mile, is an inlet, or bay, called the Careenage, an excellent harbor for merchant-ships, but too shoal for men-of-war, there being only from 10 to 23 feet water. North-eastward from this bay is another, with 2 $\frac{1}{2}$ to 4 fathoms in it.

Diego's Islands

DIEGO'S ISLANDS.—To the S. and S. E. of Prince's Point, about one-third of a mile, lie Diego's Islands, two in number, of about a quarter of a mile in extent each, and the same distance asunder, N. E. by E. $\frac{1}{2}$ E., and S. W. by W. $\frac{1}{2}$ W. There is a good passage between them of 9 to 12 fathoms water, and also between them and Prince's Point, of 20 to 25 fathoms.

Coloras.

COLORAS.—The Coloras are a cluster of small islands, five in number, occupying a space of four-tenths of a mile. They lie $1\frac{1}{2}$ mile E. $\frac{1}{2}$ S. from the Easternmost of Diego's Isles, and $1\frac{1}{2}$ mile S. E. from the East point of the peninsula. There appears to be a passage between the two Southernmost and the others.

Port d'Espagne.

PORT D'ESPAGNE.—From the point on the West side of Lynch's Bay, the coast, with some inflections, trends E. S. E., a distance of 5 $\frac{1}{2}$ miles, to Port d'Espagne, and there turns about S. S. E. $1\frac{1}{2}$ mile to the River Caroni, which in the rainy season pours on a furious stream. The water in the road of Port d'Espagne is very shallow, there being only 3 fathoms at a mile and a half off. It is extremely foul and muddy there, and nearer to the shore it is proportionably more so. At about $1\frac{1}{2}$ mile off from the shore, with the round white tower on a hill near the town bearing N. E. by E., there are 3 fathoms, very soft mud, but ships may anchor anywhere. The ship will turn the soft mud up long before she gets into a good anchoring-place, which should be in about 3 feet more water than she draws. The water is always perfectly smooth.

Light.

On the Jetty Port d'Espagne, there is a square tower, 50 feet above high water, containing a fixed light, which can be seen 5 miles.

Tide.

The tide flows here, on full and change days of the moon, at half past 5 o'clock; the flood comes from the West, and the ebb from the S. E.; and the water is slack about 1 hour, both at high and low water. The course of the tides, both ebb and flood, being checked by an opposing shore in the corner where the town is situated, they naturally deposite there much of the mud which they carry along with them; hence the quantity of mud in the anchorage.

The coast of the main-land is low and swampy, opened by a great number of rivers and channels falling into the gulf; of these the deepest and most frequented is the Guarapiche, by which a trade is carried on with the interior of Cumana; it is navigable for schooners and large balaxies.

Description of the Islands which form the Bocas.

The Northern passages into the Gulf of Paria, between the N. W. end of Trinidad, three islands lying off it, and the coast of Paria, were by Columbus called Bocas de Bragos, from the velocity of the current which he found setting through them. This, however, is very various in its strength, though constant in its direction to the Northward.

Mona Island.

MONA ISLAND.—The three islands which form the passage are Mona, or Ape's Island, Huevo, or Egg Island, and Chaca chacare. The first is about 2 $\frac{1}{2}$ miles in length from N. E. to S. W., and $1\frac{1}{2}$ mile in breadth; it consists of two lofty hills, from which the land in the South side shelves down to the sea, in ridges singularly sharp; the highest of these hills, at the North part, is 1013 feet above the surface of the sea. On the East side of the island are two bays; the Northernmost named Moris's Bay, the other Deheri's, besides some coves; to the Westward of these, on the South side, are some others. The N. E. point of this island bears about S. W. by W., distant half a mile from Mona Point, and the S. E. point W. N. W. $\frac{1}{2}$ W., 1330 yards from Taitron's Point; but in the narrowest part, the channel is not quite one-third of a mile wide. This is called Boca Mona; it lies nearly North and South, and has from 23 to 17 fathoms water in it. A cluster of rocks lies about 300 yards E. N. E. from the N. E. point of Mona Island; these have 8 fathoms close to them.

Huevo, or Egg Island.

HUEVO, or EGG ISLAND, is the next; this is of a semi-circular shape, forming a bay on its S. W. side. Its N. E. point, near to which lies the Umbrella Rock, is distant one and one-tenth mile, W. by S. from the N. W. part of Mona Island, and thence extends $1\frac{1}{2}$ mile about N. W. by W. $\frac{1}{2}$ W. Its South point lies one mile W. N. W. $\frac{1}{2}$ W. from the S. W. point of Mona. Huevo, near its N. E. point, is 655 feet above the surface of the sea. The channel between it and Mona is called Boca Huevo, or more commonly the Umbrella Passage, from the rock of that name; the course through is about S. W. by S. and N. E. by N.; and its narrowest part, which is near the S. W.

entrance, is about three-quarters of a mile wide, with a depth of more than 100 fathoms.

CHACHA-CHACARE is the Westernmost of the three islands; Point St. Jago, *Chacha chacare* the East point of this island, lies three quarters of a mile nearly W.S.W. from the South point of Huevo; and thence extends about N.W. $\frac{1}{4}$ N. one and four fifths mile to the North point, near which is an islet; and thence turns about S. by W. $\frac{1}{4}$ W., nearly the same distance, to its S.W. point. From the latter to Point Antoine, the S.E. point, the coast runs about E. $\frac{1}{4}$ N. $\frac{1}{4}$ mile; and from this point to that of St. Jago, N.E. by E. about three-quarters of a mile. Between the latter points a deep bay is formed North-westward, with safe anchorage, but difficult to get into or out of, except by warping. At the further end of the bay of Chacha-chacare, which nearly divides the island into two parts, is a low sandy neck or isthmus. To the Southward of this beach, and on the West side of the island, are some scattered rocks, at about a cable's length from the shore; and there is a small rock, with 2 $\frac{1}{2}$ fathoms on it, lying one-third of a mile West from the S.W. point of the island, and S. 25 $^{\circ}$ W. from its N.W. extremity. The whole of the high land of the peninsula of Chaguaramus open to the Southward of the rock at the S.W. point of Chacha-chacare, clears it on the South side; the altitude of the hill on that point, from the top to the sea at its foot, from an angle taken in a boat anchored on the rock, is 7 $^{\circ}$ 50'. This hill is 126 feet above the surface of the sea; the North part of the island has an elevation of 840 feet. Here it is high water, full and change, at 30 minutes after 2 o'clock. *High water*

There is another rock lying off the S.W. point of Chacha-chacare, with only 9 feet water on the shoalest part of it, at low-water, with very deep water all round; it is about 16 yards in circumference.

The bearings by compass from the Chacha-chacare rock are, S.W. point, E.N.E.; El Plata, or Goose Island, S.W. by W. $\frac{1}{4}$ W.; and the S.E. end of Cumana, or Paria, W. by S.

The channel formed by Chacha-chacare and Huevo, is called Boca Navios, or Ship Passage; it lies S.E. by S. and N.W. by N., and is, at the narrowest point, the S.W. entrance, two thirds of a mile wide. To the Westward of this island is Boca Grande, of great extent, and almost free from danger.

Description of the Bocas.

The great depth of water in the three largest of the Bocas, namely, Nuevo, Navios, and Boca Grande, prevents anchoring in any part of them, except in case of absolute necessity, very close to the shore. A ship may anchor anywhere in Boca Mona, but in 20 or 30 fathoms, in mid-channel. The beds of these channels are much deeper than the bottom either within or without them; as if they had been thus worn away by the constant operation of the Northern current, which runs through them. An opinion its rapidity at times is so great, that ships are frequently driven out again, after having entered one of the passages with a good breeze; during the rest of the year its rate may commonly be estimated to be about 2 or 3 knots; but close to the S.W. point of Chacha-chacare, it runs much stronger. Except in autumn, the tide of flood, which sets through them into the Gulf of Paria, has a considerable power towards the top of high water in checking this current; and at spring tides, the water is frequently perfectly slack in Boca Mona for an hour; and very nearly so in Boca Huevo.

BOCA MONA.—In the Boca Mona, (the Eastern mouth,) at ebb tide, the current runs outward with a velocity of 1 $\frac{1}{2}$ or 2 miles an hour, and somewhat less at ordinary flood; so that, with the exception of about an hour near the top of a spring flood, it always runs outward. For this reason, and because it is subject to calm and eddy winds, occasioned by the great elevation of the coast, from being very narrow, (not exceeding one-third of a mile in width,) long and winding, and consequently full of eddies, it should not be attempted by a ship except in a case of necessity, although it is the windward one; but either of the others should be preferred. It is high water here, *High-water* full and change, at 50 minutes after 3 o'clock.

A ship may anchor anywhere in the South part of this passage, and all along the South side of Mona. Deheri's Bay affords excellent anchorage, and there is deep water far into it; a ship anchored off the mouth of it in 15 fathoms, clay, with the South point bearing S.W. by S., and found the ground so tough that it was with great difficulty the anchor was weighed.

BOCA HUEVO, EGG PASSAGE, (or, as it is now more commonly called the *Boca Huevo*, Parosol, or Umbrella Passage,) is safe to attempt to run in at, if the wind hangs to the N.E., as it will then, probably, blow quite through the passage; but, at any rate, if the ship cannot stem the current, there is ample room to back and fill her out again. The shores are bold, but care must be taken to avoid a rock at the S.W. point of

Mona: although it is not above a ship's length from the point, the eddy of the flood-tide at the springs sets directly over it. At ebb-tide the current sets through with rather less velocity in the former; and during the last two hours of flood, it is nearly slack water: on this account, it being the shortest, being to the windward of the other two, and being entirely clean, it is considered the best for entering the Gulf. It is advisable to keep closer to the island of Huevo than to that of Mona, to avoid being becalmed by the high land of Mona, and also because the current inclines to the N.E.

Boca Navios, or Ship Passage. BOCA NAVIOS, or SHIP PASSAGE, may be safely entered, if, when a ship hauls round the N.W. end of Huevo at a quarter or one-third of a mile distance, she can lie up high enough to bring the South end of the island on her starboard bow, so as to have the current under her lee; otherwise it will be improper to attempt it, as the current does not run fairly out, but rather inclines down on Chachu-chuacare.

High-water. With a flowing tide, it runs with a velocity of 1½ mile per hour; but at the ebb, frequently at the rate of 3; or 4 miles. It is high-water, full and change, at 30 minutes after 3 o'clock. Although the entrance by this channel is practicable only under the above circumstances, with a flood-tide; yet, on the other hand, it is far superior to the Boca Huevo for getting out of the Gulf; but it is necessary, in so doing, to pay attention to the set of the current, as we have just mentioned, and also to the following:

On June 5, 1801, at 7 P.M., His Majesty's ship *Ulysses* weighed from Chaguarama Bay; but, falling calm, it was 10 o'clock on the following morning before she reached the South point of Huevo, with an intention of going through Boca Navios. Here was found such a strong current setting round that point to the E.S.E., that, being unable to stem it, she was let drive out through the Umbrella Passage, which took two hours to perform, owing to a number of eddies and opposite currents, from the tide of flood setting into the Gulf and contending against the usual stream running outward. It was high-water in the Bocas that day at about half-past 12 o'clock, being three days before the new moon.

Boca Grande. BOCA GRANDE.—In this channel, at ebb-tide, the current runs with less velocity than through either of the others, and at flood there is scarcely any. It is also very clean, with the exception of the sunken rocks lying off the S.W. point of Chachu-chuacare, and of sufficient breadth to tack at pleasure; but, being the leewardward, it is only resorted to in case of having failed to effect a passage by either of the preceding.

Remarks on the Currents on the Coasts of Trinidad and in the Gulf of Paria.

Currents. CURRENTS IN THE VICINITY OF TRINIDAD.—We have already seen that the Western Equinoctial, or Tropical current, occasioned by the trade-wind, being confined by the trending of the coast of South America, is thrown in a collection upon Trinidad, and runs there with great strength; we have now further to observe that the force of this current is still further increased along its shores by the obstruction which the island itself presents against the free course of the stream; and by the waters of the Orinoco, which, flowing through vast plains, subject to periodical inundations, and discharging itself into the ocean near this island, greatly increases the current in its vicinity, particularly about the months of August and September, when that river is at its greatest height. The River Amazon, also, collecting the waters almost half the Southern continent, may, perhaps, though at the remote distance of 280 leagues, contribute somewhat to its strength.

These currents vary much in their velocity at different times, without any apparent cause. It is said they run strongest in the declining quarters of the moon; but this no satisfactory proof has hitherto been obtained. Adapting itself to the current, the vessel runs to the Northward along the East side of Trinidad, and takes the Western direction between the Island Tobago and Point Galere, round which it runs with such accumulated strength, that it is scarcely possible for a square-rigged vessel to beat against it, round that point, although there are instances of its having been effected.

Passing Point Galere, it runs along the North coast, close to the shore, for a few leagues, as far as Rio Grande; but there it often quits the shore, and takes a W. or W. direction, increasing its distance from the land until it gets to the Northward of the Bocas, where it seldom prevails within 5 or 6 leagues, being repelled by the current which runs out of these passages; there the two streams blend and run to the Westward.

Along the South coast it always runs to the Westward, seldom less than 1 or 2 knots, near Point Galeota, but often more; and as the opposite shore of South America contracts the channel towards Point Leaque, or Leacos, its velocity is much accelerated.

point, the eddy of the flood current sets through within a few hours of flood, it is nearly always to the windward of the Gulf of Paria, the best for entering the Gulf is to that of Mona, to avoid the cause the current inclines to

ely entered, if, when a ship is within a third of a mile distance, she is on her starboard bow, so that it is improper to attempt it, she comes down on Chacha-chacare, one hour; but at the ebb, the flood and change, at 30 minutes, is practicable only under the other hand, it is far superior to the necessary, in so doing, to pay attention, and also to the al-

s weighed from Chaguarama, being morning before she reached the Gulf through Boca Navios. Her best point to the E.S.E., that being the abella Passage, which took her to the opposite currents, from the usual stream setting against the usual stream setting at about half-past 12 o'clock

the current runs with less velocity, scarcely any. It is also to be off the S.W. point of Chacha-chacare; but, being the leewardmost, it is a passage by either of the

and in the Gulf of Paria.

AD.—We have already stated that the trade-wind, being a S.W. breeze, is thrown in a collection of eddies, which have now further to be observed along its shores by the observed course of the stream; and by the eddies, which explain, subject to periodical changes, the great increase of the current in August and September, when, also, collecting the waters together at the remote distance,

at certain times, without any apparent cause, the quarters of the moon; but it is a safe method of rectifying the course of a ship arriving from the Eastward, and under circumstances of night, or cloudy weather, will save much time; for, being in the parallel of the island, it is necessary to try for soundings, which may be done without more delay or inconvenience than that of trying at about every 20 miles, when the ship is supposed to be nearing the land. The depth of water and latitude will give the situation of the ship with tolerable precision. Knowing this, no more is requisite than to steer for the Points Galere or Galeota, according to the season of the year, for entering the Gulf either by the North or South passage. It is necessary, however, to be cautious of the smoken rock that lies about 7 leagues S.E. $\frac{1}{2}$ S. from Point Galere. But, as it frequently happens that 2 or 3 days elapse without obtaining a meridian altitude, it is very possible that the mariner supposing himself to be in the parallel of Trinidad, may actually be in that of Tobago, or even of Grenada, as the current sets with such violence to the N.W.; for this reason no opportunity of observing the latitude either by the moon, a star, or by altitudes of the sun, before and after he has passed the meridian, should be neglected. It is also advisable to make the

rated there, and may be estimated generally at 3 knots, but it frequently runs still stronger.

The channel between the coast of America and the S.W. point of Trinidad, is called the Serpent's Mouth, through which the current enters the Gulf of Paria, dispersing itself over it. Near the shore of the Gulf, it is subject to the influence of the tides; but, in the middle, it always runs to the Northward towards the Bocas; where, its channel being again contracted, its velocity is proportionally increased. Having passed these straits, the body of this water preserves its Northerly direction for 5 or 6 leagues, before it falls into the common course of the stream of the ocean, which is there W.N.W. But it is to be observed that so soon as it has passed the Bocas, a considerable part diverges to the E.N.E., and either runs with some rapidity to the windward, or so thoroughly destroys the effect of the Western current that a ship will seldom fail of working up, at least to Point Chuparra, with ease, by keeping within a moderate distance of the shore. This Easterly current frequently extends to a considerable distance further along the North coast.

That part of the stream which goes out of the Boca Grande on the West side, turns round the N.E. point of Paria, and runs down that coast with such velocity, that if a ship bound to Trinidad should fall in with the land to leeward of this point, though ever so little, she must immediately stand to the Northward again, at least so far as 13° of lat., out of the great force of the current, and work up to Grenada before she again attempts the Bocas. Even then, if she cannot lie S.E. by S. at least, her reaching them will be very doubtful; and her best mode of proceeding will be to go through the passage between Kick-em-Jenny and Carrimou, in order to weather Grenada, before she gets into the strong lee-current that prevails between that island and Trinidad. This current renders it very difficult for ships to fetch Point Saline, in Grenada, from the Bocas; they generally only run about 4 or 5 leagues to leeward of that island; hence the necessity of working to windward on the North coast of Trinidad.

Practical Directions for making the Island of Trinidad, and for entering the Gulf of Paria.

[From the Derrotero de las Antillas]

It has been already observed, that from July to November is called the rainy season in this country, in which the general trade-wind is very light, and veering to E.S.E. and S.E.; and that, in the other months, it blows fresh from N.E. or E.N.E.; this circumstance, and the two channels by which the Gulf of Paria may be entered, occasions the preference to be given to the South entrance during the rains, and to the other during the dry season. It is, therefore, obvious that Trinidad should be approached with due regard to the season; from December to June the object is to make it about Point Galere; and from July to December, about Point Galeota. These two points being the N.E. and S.E. extremities of the island, cannot fail of being known. A ship coming from the Eastward, and making the body of the island, will see the mountain of Lebranche ahead of her, and a flat low shore extending from thence about 4 leagues to the Northward, where it is bounded by the Northern range of high mountains. To the Southward of Lebranche will be seen another, and more extensive low shore, at the extremity of which are the hills of Guaya-guayrare. The range of high mountains which extends along the Northern coast may be seen, in clear weather, at the distance of 11 leagues, but Point Galere cannot be distinguished at more than 3 leagues, from being low.

The soundings off the Eastern coast of the island, to the distance of 17 leagues, furnish a safe method of rectifying the place of a ship arriving from the Eastward, and under circumstances of night, or cloudy weather, will save much time; for, being in the parallel of the island, it is necessary to try for soundings, which may be done without more delay or inconvenience than that of trying at about every 20 miles, when the ship is supposed to be nearing the land. The depth of water and latitude will give the situation of the ship with tolerable precision. Knowing this, no more is requisite than to steer for the Points Galere or Galeota, according to the season of the year, for entering the Gulf either by the North or South passage. It is necessary, however, to be cautious of the smoken rock that lies about 7 leagues S.E. $\frac{1}{2}$ S. from Point Galere. But, as it frequently happens that 2 or 3 days elapse without obtaining a meridian altitude, it is very possible that the mariner supposing himself to be in the parallel of Trinidad, may actually be in that of Tobago, or even of Grenada, as the current sets with such violence to the N.W.; for this reason no opportunity of observing the latitude either by the moon, a star, or by altitudes of the sun, before and after he has passed the meridian, should be neglected. It is also advisable to make the

land rather to the South than to the North of either of the points, as the currents always favor working to the Northward. The facility is still greater in times of N.E. winds for getting up from Point Galeota to Point Galere. The passage may also be made from the latter to the former, but not with so much ease. As soon as one of the points or capes has been made out distinctly, the route to the mouths of the Gulf is as follows:

From Point Galere a ship may run along the coast at the distance of 2 miles, with an understanding of its being quite clear, as before described.

Point Corozal may be approached to half a mile. It will then be better to close in upon the land, to reach the mouths with great facility.

Directions for the Bocas.

From the description already given of the islands which form the Bocas, and also of the Bocas, it is evident that the Boca Huevo, or Umbrella Passage, should be chosen for entering the Gulf; and that the best time is with a flowing tide, and with a wind that will insure the ready working of the ship; but, if there be a four knot breeze there is no necessity to wait for the tide. At night, if the weather be clear, there is no inconvenience in entering the Huevo Channel, as the only risk is of getting too close to one of the little islets, which is almost impossible to happen; but if calms, scant winds, want of tide, darkness, or excess of caution, should determine the mariner to wait for a more favorable opportunity, he may anchor about two thirds of a mile from the coast, in 18 or 20 fathoms, except the wind be N. E., which raises a heavy sea; in such a case he will do better by keeping under sail, and making short tacks on and off shore. Along the coast, from Point Toco to Point Chupara, the bottom is soft mud; on the meridian of the latter point it is coarse sand and fine gravel, and to the West of it, so far as the mouths, it is mud of a greenish color. The differences in the bottom will point out with sufficient accuracy what part of the coast the ship is on.

When a ship has passed through either of the channels, she should be kept close to the wind on the port tack, in order to get away from the mouths, and near the coast of Trinidad; and she should, in general, be continued on this tack so long as the flood tide lasts, that she may go on the starboard tack so soon as the ebb begins, with a certainty of reaching the anchorage, or at least within a very little of it. It may probably appear, to some persons, more eligible to make several tacks, after entering the Gulf, and particularly so if the port tack is not the most advantageous; but it must be remembered that the strongest currents are in the narrows; and, therefore, from remaining near the mouths, in consequence of having made several tacks, it would not be extraordinary if the ebb-tide should force them through the channels again, or compel them to anchor to prevent it; and even if neither of these circumstances should take place, the ebb will be found unfavorable for gaining the Boca d'Espagne. On the other hand, by having stood on the port tack within the Gulf, if necessary, as far as the parallel of Mount Naparima, the ebb-tide will then favorably assist the ship on the starboard tack, perhaps, so much as to reach the anchorage, or it will be gained by another short board. If calms or very light winds prevent gaining ground by keeping under sail, the kedge-anchor may be let go; but anchors should be avoided as much as possible; because, as they bury themselves deep in the soft mud, there is considerable trouble in weighing them. In Boca d'Espagne ships may anchor in the S.W. part, in 4 or 5 fathoms, according to the ship's draught; moor N.W. and S.E.

At about 4 miles within the Bocas, soundings may be got with the hand-line, in fathoms; from whence, in standing Southward, the water soon shoals to 14, 13, and 12 fathoms, which depths will continue several miles; but the soundings are not quite regular, though nearly so, there being some small banks with 6 or 7 fathoms on the 5 or 6 leagues from the shore. When about 6 or 7 miles from Point Brea, the depth will increase suddenly to 17 and 18 fathoms; the latter will continue until about 10 miles from the shore; the water then shoals gradually to 3 fathoms, about the length of $1\frac{1}{2}$ cable from the beach. The best anchorage off this part of the island is within the town of Brea, which consists of 5 or 6 old houses near the beach, bearing about S. or S. by E., one mile off the shore, in 6 or 7 fathoms.

Running down the coast to the Southward from Port d'Espagne, observe that about 8 miles from it, and off a point of mangroves, there are only 2 fathoms, at 14 miles from the shore. To the North-westward from Naparima Hill, about 7 miles, there are 2 fathoms 2 miles distant from the land, and this bank is steep, with 10 fathoms not far without it. Go into no less than 4 fathoms between Point Brea and Point Cedro; from the latter to Point los Gallos, the shore is flat, and a ship may be guided by the lead.

The following remarks on Boca Huevo are by Captain Samuel Chambers, of H. M. S. *Druid*. He says

"As had been recommended, we tried the second passage two different evenings, approaching it with a fine breeze; but when almost through, both times, the current forced her on; and the second night, had not the boats been ready down, and she a quick ship, she must have gone on shore. According to calculation, this was at flood tide. We immediately bore up for the Great Bocas, where we soon got through: (the reason, I by no means recommend any passage but the large one, as the advantage is trifling comparative with the safety of your ship. For, when through either, in less than an hour, with a moderate breeze, you come in 13 fathoms water, when you may anchor."

In going through the Great Bocas, be careful of the rock that lies W. S. W. from the S. W. point of Chacha Chacare, as well as that which lies one-third of a mile due West from it.

Description of and Directions for the South Channel.

So soon as the ship has reached Point Galeofa, she should be kept along the shore of the island at the distance of 2 miles or less; at the distance of 2 miles she will be in from 7 to 9 fathoms, clear of all risk; and although it may be perceived that the water is of different colors, particularly to the Eastward of Point Hern and about it, there is no reason to be suspicious of shoals, as the variety of colors is occasioned by the current. On clearing Point Quemeda, she may near the shore to a quarter of a mile, without the least risk, to gain that channel which, under the existing circumstances, may be most convenient.

The First Channel is formed by Point Icaeos, or Icaque, and a shoal lying to the West of it, distant about half a mile, and which is from East to West about 2 cables' length, with 13 fathoms, rocky bottom. In the channel there are 9 fathoms water. Point Icaeos, as before said, is a sandy promontory, advancing into the sea in a circular form, but so steep, that, at half a cable's length from it, there are 7 or 8 fathoms. The current in this channel sets to the S. W., at the flood, with a velocity of 23 miles per hour, and N. W., with the ebb, at the rate of 3 and 3½ miles.

The Second Channel is formed by the rocky shoal and a bank of rock and gravel lying to the N. W., upon which there are 4 fathoms. This point bears from Point Gallos S. 60° W., distant 3 miles, and from Icaeos N. 73° W., distant 2 miles. The greatest extent of it is three-quarters of a mile, N. W., and S. E. The current in this channel sets in nearly the same direction as in the preceding one. Its breadth is about a mile.

The Third Channel lies between the bank last mentioned and the Isote del Soldado, (Soldier's Islet,) with the reefs and shoals on the S. and S. E. of it. This channel is about 2 short miles from East to West. About 2½ cables from the reef off the East part of Soldado, there are 6 fathoms water, in mid channel, and near the bank.

At flood-tide the current sets W. by S., with a velocity of 3½ miles; and with the ebb N. W., and W. N. W., at the rate of 4 and 4½ miles per hour.

The Fourth Channel is formed by the Soldado with the reefs and shoals on the South of it and the main-land. The breadth of it is about 1 mile. The current always sets to the N. W., and W. N. W., with a velocity of 4 or 5 miles per hour in mid-channel, and near Soldado; but at half a mile from the main it runs only from 1½ to 2 miles.

To enter the First Channel, it is only necessary to near Point Icaeos at about a cable's length, huffing up, by degrees as it is passed, and then steering North, to pass at convenient distance from the Points Corral and Gallos. This passage can never be attended with difficulty, either by day or night, especially at ebb-tide, as the current will keep the ship clear of the shoals; and if it should be necessary to anchor, there will be no risk of getting aground, as the shoal will be at least 3 cables' length distant from the ship.

To enter the Second Channel, it will be necessary, after having passed Point Quemeda, and approached the coast to a quarter of a mile, to steer towards Soldado, until Point Gallos comes open of Point Corral, and then huff, but without going to the N. E., until Point Corral bears East; she may then be kept along the coast of Trinidad.

To pass through the Third Channel, the course is towards the Soldado, in the same manner as for the second, until Point Gallos bears N. 67° E.; then huff up to N., until the South front of Point Icaeos bears S. E. by E., and Point Gallos N. 83° E.; then run along the coast of the island.

To pass through the Fourth Channel, you have only to pass at 2 miles S. of the Soldado, and when it bears N. E. huff up to N., and keep huffing by little and little to East along the island of Trinidad. Care must be taken not to get within 2 miles of the Soldado, observing that the current will set the ship strongly to the N. W.

A ship may enter the gulf by the South Channels, even by night, if not very dark, the First Channel is the best, not only because it is the windward one, but by keeping the luff, every danger will be avoided, especially with the ebb-tide. In fact, there can be no danger whatever, if an anchor be ready to let go in case of a sudden calm, or other cause, that might carry the ship towards the shoal. In the night-time either of the channels can be more easy to enter than the first; for as the point must necessarily be passed within a cable's length, every impediment from darkness will be avoided, because at so short a distance it can be very distinctly seen.

But, if any circumstance, either of calm or want of daylight, render it advisable to wait sometime before attempting to enter the channels, the ship should be anchored on the South Coast of Trinidad; for if kept under way and tacking, as the current always sets inward, it will be very difficult to maintain a determinate position.

On getting through the channels into the Gulf, steer for the West coast of Trinidad, and keep along it, at 2½ or 3 miles distant, as far as Brea Point. Port d'Espagne is not above 8½ leagues from this point, and steering N. by E. ½ E., the buildings in it will soon be discovered. If this course cannot be made good, recourse must be had to tacking; but the boards must not be stretched within 4 miles of the shore, on account of the shoal that lies off it; and if standing into the Bay of Naparima, it will be necessary to be careful of two shoals: one West of the mouth, distant about 2 miles; and the other S. 75° W. of it, distant 4 miles. In proceeding from Brea Point to Port d'Espagne, the depths are from 7 to 12 fathoms, at the distance of 3 miles from the point; then 14 fathoms for about a mile; after which, 18 or 19 fathoms for nearly 10 miles; and then a gradual decrease to 5 fathoms, at the distance of 2½ miles S.W. from the town.

Good fresh water may be obtained from two small rivers in the bay, about a mile to the Southward of Point Brea; at high-water a boat may land close to it. Wood can be procured in abundance with little trouble, as the trees are very large, and close to the water side.

In September, 1821, his Majesty's ship *Forte*, Capt. Sir T. J. Cochrane, passed over a bank with only 4 fathoms water on it, at about 4 or 5 miles Northward of the Soldado, and the same distance from the shore. The Captain says, "I felt a very strong smell of tar, or pitch, and observed some of the former floating on the surface, which no doubt oozed from the bank below. I have since learned it is composed of pitch, and that there is a spot on it with only 3 fathoms water; but being suddenly called from the station, I had no time to ascertain that fact."

THE COAST OF COLOMBIA, FROM THE GULF OF PARIA TO CARTHAGENA.*

IN the description of the Island of Trinidad and the Dragon's Mouth, (Isla de Dragos,) it was said that the fourth, or Boea Grande, is formed by the Island of Chachacare and the main-land. The most projecting, or N.E. point of the coast forms a lofty steep islet, called the Morro. This lies about 4 leagues N. 78° W. from Point Moun, in Trinidad. From the Morro the coast runs Westward, with a little indention to the South, for the distance of 19 miles, to the Bay of Mexillones, whence it trends a little Northward to Cape Tres Puntas, (Three Points,) which is distant from the Morro 50 miles, due West. The whole of the land along this space is high and mountainous, and the shore perfectly clean, so that it may be run along at half a mile distant. At the distance of a mile there are from 20 to 40 fathoms, on a bottom of muddy sand.

Cape Tres Puntas is the most Northerly cape of all this part of the coast, and it continues to be equally as clean and deep as the preceding part of the Bay of Unare, a distance of 2 miles.

Unare Bay presents a good anchorage, sheltered from the trade-wind. To enter it it is necessary to keep about a mile from the N.E. point, which is fronted by a rock shoal extending half a mile out; then stand in and anchor in 5, or 4½ fathoms, sand bottom, immediately on getting round within the point. A little river falls into this bay, and on the hill to the East of it, there is an Indian town named San Juan de Unare. Off the S.W. point of the bay extends a reef, with several islets upon it.

the distance of half a mile. Passing outside of them, at about 2 cables' length from the most Northerly one, will clear every danger.

From Unare Bay the coast continues to run West, with some inflections to the south, for the space of 10 miles, whence it turns gradually to the Northward of West for 9 miles further, to Cape Mala Pasera, between which and Cape Three Points all the shore is clean, and may be coasted at a mile's distance, in 8 fathoms, sandy bottom. The bearing and distance from Cape Three Points to that of Mala Pasera, are S. 83° W., 20 miles.

TESTIGOS ISLANDS.—Nearly N. $\frac{1}{2}$ W. from this cape, at the distance of 10 miles, lie the little islands called the Testigos. These consist of seven principal islands, besides several furallones, or high rocks. The passages between the islands are free and clean, and may be run through without any risk whatever; but the contrary is the case with those between the rocks, for they are very narrow. All those islands may be approached to the distance of 2 cables' length, or even nearer if necessary, excepting that which lies most to the North-eastward. This is surrounded by a reef extending half a mile from it. Between the islands the bottom is sandy, and will admit of anchoring in case of necessity. The principal island, called Testigo Grande, (Great Testigo,) lies N. W. and S. E., about 2 $\frac{1}{2}$ miles in length. The S. W. part affords good anchorage, sheltered from the trade-wind, with a depth of 8 to 15 fathoms, coarse sand. It may be approached either by the N. W. or S. E. side. If by the former, it must be on the outside of the reef that lies off it; if by the latter, the passage is between the great island and another lying S. W. of it. The channel is sufficiently spacious; for, at the narrowest part, between the reef and the East side of the little island, and another about a cable's length from the S. W. coast of the large island, it is half a mile wide, with a depth of 8 $\frac{1}{2}$ to 9 fathoms, red gravel.

The Testigos may be seen at the distance of 5 leagues. The Great Testigo, called Great Island, abounds with land-tortoises. It is not inhabited, except in the season, by turtles. It appears a bold shore, and has a sandy beach near its North end. Anchorage may be had here in 16 fathoms, sandy bottom, about $\frac{1}{2}$ mile from shore, the North end of the island bearing N. $\frac{1}{2}$ E., and the South end E. S. E. $\frac{1}{2}$ E.; the current sets West North-westward, $\frac{1}{2}$ mile per hour. No fresh water to be had.

Between these islands and the coast, there are soundings. About 5 miles to the S. S. E. of them lies a large bank of sand, with 4 $\frac{1}{2}$ and 5 $\frac{1}{2}$ fathoms water on it, which should be avoided by large ships.

From Cape Mala Pasera the coast runs nearly West 7 or 8 miles to the Morro of Porto Santo. This Morro is joined to the shore by a little low sandy tongue; and very near to the Morro on the West, lies an islet called Porto Santo. To the Westward of the Sandy Tongue is an anchorage sheltered from the trade-wind, in 4 $\frac{1}{2}$ to 5 $\frac{1}{2}$ fathoms water, sand and mud. The North side of the Morro and island may be approached to 2 cables' length if necessary. To gain the anchorage immediately after passing the island, steer S., or S. by W., and anchor in 4 $\frac{1}{2}$ or 5 $\frac{1}{2}$ fathoms, as soon as shelter from the wind is obtained; but taking care not to get to the Eastward of the Western part of the islet, because there lies a bank in that direction with only 3 fathoms water on it. Southward from the Morro, and about 2 leagues inland, stands the mountain of Porto Santo.

From this bay the coast inclines to W. S. W. for the space of 3 $\frac{1}{2}$ miles, and sends off a bank with little water on it, about half a mile, and extending all the way to the Point of Hernan Vasquez, which forms another little bay, with an anchorage of 5 $\frac{1}{2}$ to 6 fathoms water, sheltered from the trade-wind. From a river that disembogues into the Bay of Hernan Vasquez, fresh water may be obtained; and to the Southward of its Western point, off which is a small islet, stands the town of Carupano; 2 miles West of Carupano are the Point and Morro of Salines, or of Jarro, with an islet near it, which, with the Point of Hernan Vasquez, form the Bay of Carupano, including that of Hernan Vasquez. There are two shoals at the entrance of this bay, lying a little to the Northward of the parallel of Point Hernan Vasquez, and Westward of the meridian of Carupano: of these the first has 2 $\frac{1}{2}$ fathoms on it, with 5 $\frac{1}{2}$ fathoms close to, and lies one mile W. N. W. from the point; the other lies $\frac{1}{2}$ mile W. $\frac{1}{2}$ N. from the same point, and $\frac{1}{2}$ mile N. E. from Point Salines; this has 1 fathom on it, with $\frac{1}{2}$ close to it. A third shoal, of 3 $\frac{1}{2}$ fathoms, with 5 close to it, lies within the bay, at three-quarters of a mile W. S. W. from Point Hernan Vasquez, and the same distance North from the town of Carupano; and Westward of the town there is a bank, with little water on it, extending from the shore Northward nearly three-quarters of a mile, and one mile E. N. E. from the islet of Point Salines.

MORRO BLANCO.—From the Point and Morro of Salines to Morro Blanco, a distance of 3 miles, nearly West, the coast is clean, with several patches of small rocks lying close to the shore; nearly South of this Morro, and about 3 leagues inland, the mountain of San Jose, or St. Joseph, may be seen.

*Testigos
Islands.*

*Morro Blan-
co.*

From Morro Blanco to the Westward, a bank runs off, with little water on it, that does not permit the coast to be approached nearer than 2 miles; on this part of it, there are, 1st, the Point and Morro of Padilla, known by an islet and several rocks extending to a little distance from it; 2d, the Point and Morro of Taquien which projects further Northward than the preceding, and is also surrounded by several islets; 3d, the Morro of Lebranche, which is joined to the main by a low sandy and swampy tongue of land; and 4th, the Morro de la Esmeralda, or Emerald Morro, which is an islet separated from the coast by a channel of about half a cable's length wide. Between Lebranche and the Emerald Morro, at a moderate distance from the land, lie the Garrapotas Islets; but from rocks and shoals there is no passage between them; there is, however, between the most Southerly islet and the main-land, a good passage; but the better way, always, is to go on the outside of them, especially with large ships. From Morro Blanco to the point of Taquien, the distance is $3\frac{1}{2}$ miles, N. $83\frac{1}{2}$ W., and thence to the Emerald Morro, $8\frac{1}{2}$ miles, S. $7\frac{1}{2}$ W. Southward of the latter, and about 13 miles inland, will be seen Mount Redondo.

*Esmeralda
Bay*

ESMERALDA BAY.—To the Westward of the Emerald Morro there is formed a large bay, but it is obstructed by a bank, with very irregular soundings, which extends from the middle of the Morro about S. and S.W., nearly a mile, then S.W. by S. to within one-third of a mile of the coast, whence it turns to the Eastward, and runs parallel to the shore, at about that distance from it. In the bay and on the bank, there are three islets, called the Casabells, lying nearly East and West. On going to anchor in this bay, ships may pass as close as may be necessary to the North and West of Emerald Island, and anchor under shelter of it, at the distance of 2 cables' length, in $5\frac{1}{2}$ to $6\frac{1}{2}$ fathoms water, sandy mud.

From this bay the coast runs West about 5 miles to the Point and Morro of Manzanilla, all the way bounded, at the distance of one-third of a mile, by a bank which extends from Emerald Island. The Point of Manzanilla forms a bay; but it is obstructed by the same bank of which we have spoken, and which terminates at the first steep point, about two-thirds of a mile to leeward of the bay; it not only impedes the entrance into the bay, but also prevents steering to the Southward before getting to the Westward of the said steep point. From this situation, West of the point, the coast is quite clear for the space of 8 miles, to Point Guarapoturo, where another bank begins, and extends two-thirds of a mile from the coast. About one mile N.E. of Point Guarapoturo lies a sunken rock that must be carefully avoided. A little Eastward of this point, and about a league inland, will be seen the peak of a mountain, called Pico del Este, Peak of the East.

Three miles Westward from Guarapoturo Point, is that of Eseudo Blanco, or White Shield Point, the coast being steep and high; but from that the coast runs out about N.W., very low and swampy, for the space of $2\frac{1}{2}$ miles, where there rises a Morro called Chacopata, which forms a point projecting into the sea almost 2 miles. From this point the coast takes a Southerly direction and forms a great bay, in which, at $1\frac{1}{2}$ mile West from the middle of the said Morro, there is a little island called Caribes, at about a mile West of Caribes Island is an island called De Lobos, or the Wolf, with a rock close to the East part of it. The shoal bank that begins at Guarapoturo Point, also borders this part of the coast, and reaches about one-third of a mile from the Morro point; it hence continues to Caribes Island, whence it turns to the South, bearing so close upon the shore, that at Cayman Point, the Southermost and Westernmost of the bay, it does not extend more than half a mile.

N. $8\frac{1}{2}$ E. from Chacopata, at the distance of 17 miles, lies the Eastern point of the Island Margarita, forming with the main-land a channel, $1\frac{1}{2}$ miles wide. In the middle of this channel are the Coche or Coach, and Cagua or Cubago Islands; and, as a description of the coasts on both sides of this channel will be necessary, we will first proceed along that of the main, as far as Araya, and then return to Margarita and the other islands.

From the Point and Morro Cayman, the coast is level towards the West, the only salient points being those of Tuma, a mile and a half from the preceding, and the Point and Morro del Castillo, 2 miles beyond Tuma. From Castillo Point, the coast inclines somewhat to the North, as far as the Point and Morro of La Pena, a distance of 1 mile; this point lies S. $77\frac{1}{2}$ W., $11\frac{1}{2}$ miles, from the Morro of Chacopata. From the Point of La Pena, the coast descends somewhat to the Southward of West to Point Gorda, a distance of $3\frac{1}{2}$ miles, from which it forms a bay with a very flat shore and beach to Point Guachin, or Guaranahe, forming a piece of steep and high land, which rises above the low land, and seems insulated by it; along the shore of the bay, there is a steep point of little extent, called Minas. From Point Gorda to that of Guachin, it is $6\frac{1}{2}$ miles.

From Point Guachin the shore continues low and flat as far as Punta del Escarreo, or Eddy Point, where it rises a little; the distance from one to the other is $3\frac{1}{2}$ miles;

with little water on it, and 2 miles; on this part by an islet and seven-point and Morro of Tag, and is also surrounded joined to the main by a rea de la Esmeralda, or est by a channel of about e Emerald Morro, at a ts; but from rocks and ever, between the most e better way, always is ss. From Morro Blanco W., and thence to the utter, and about 13 miles

at Morro there is formed regular soundings, which early a mile, then S.W. by it turns to the Eastward, from it. In the bay and ls, lying nearly East and s as close as may be neel anchor under shelter of ons water, sandy mud.

the Point and Morro of one-third of a mile, by a it of Manzanilla forms a e have spoken, and which a mile to leeward of the ont also prevents steering mid steep point. From this e space of 8 miles, to Point o-thirds of a mile from the a sunken rock that must be ont a league inland, will be of the East.

of Escudo Blanco, or White at the coast runs out about where there rises a Morro sea almost 2 miles. From a great bay, in which, at 1/2 little island called Caribes; De Lobos, or the Wolf, with egin at Guaraputuro Point, e-third of a mile from the nce it turns to the South, e Southernmost and West-ile.

ies the Eastern point of the 1 miles wide. In the middle Cubago Islands; and, as a ll be necessary, we will first return to Margarita and the

towards the West, the only om the preceding, and the in Castillo Point, the coast Morro of La Pena, a distance Morro of Chacopata. From Southward of West to Point with a very flat shore and f steep and high land, which g the shore of the bay, there at Gordal to that of Guacilin,

as far as Punta del Escareco, one to the other is 3 1/2 miles;

the latter bears from the Point La Pena N. 85° W., 12 1/2 miles. Point Escareco presents a front extending half a mile, the Western extremity of which is called Point Cardon, whence the coast bends to S. 49° W., a distance of 2 1/2 miles, to Point Araya, the whole space being a very low sandy beach. About half a mile from Araya Point is another, called Point Chica. On Araya Point there are a few small houses, inhabited by people employed in the salt-works. All the coast, from Point Cayman to that of Escareco, has a bank about half a mile from shore, which from the latter point extends 1 mile Westward, forming what is called the Araya Shoal, the South edge of which terminates at Point Chica, to the Southward of Point Araya. This will be cleared on the South side by bringing the most Southerly of the houses on the point to bear East. Thence Southward the coast may be approached at 2 cables' length; for although the sandy beach is very flat, at that distance there are 5 or 6 fathoms of water. The beach continues for 2 miles about S.S.E. to Punta de Piedras, formed by the Western extremity of the ridge of Guaranache; this point shows a front of about half a mile, and immediately within it the land rises to a lofty hill; on the South part of it stands a chapel, or sanctuary. The coast continues in the same direction, S.S.E., to Point Barragon; at first it is low and sandy, and afterwards steep, but all of it is so clean that it may be coasted at a cable's length. On the South Point of the little Bay of Araya, where the high land of Point Barragon begins, there is a castle in a ruinous state. From Point Barragon the coast continues high and very clean, about S.E. by S., a distance of 2 miles, to Point Caney, from whence it changes its direction to S.E. by E., and continues for rather more than a mile to Punta de Arenas, or Sandy Point, which is the Southernmost part of this coast, and Northernmost of the Gulf of Cariaco. From Point Caney there is a bank extending along the coast as far as half a mile South of Point Arenas.

Here we suspend our description of the coast and return to

THE ISLAND OF MARGARITA.—The greatest length of this island is, from *The Islands of Margarita.* East to West, about 37 1/2 miles; it is mountainous, and, when seen at a short distance from the North, it appears like two islands, from a space of low swampy land in the middle of it. On the Eastern part there are several heights, that may be seen in clear weather from Cape Three Points, a distance of 24 leagues; and on the West part, a ridge of heights called Macanao. The Eastern point is named Ballena, and, as before stated, lies N. 8° E. from Chacopata Morro; the coast runs thence N.N.W. 1/4 W. to Cape La Isla, a distance of 13 miles, forming the N.E. side of the island. The whole of it is clean, only sending off a bank of about 3 cables in breadth; two islets named Isles of the Cape, lie about 1 1/2 mile South-eastward of the cape, and about half a mile from shore. From Cape La Isla the coast runs S.W. by W. to Point La Galera, a space of 7 miles, all clean; there is also an islet lying 1 1/2 mile N.E. by N. from the point, named La Galera, having between them 11 fathoms water, on sand and shells. From Point La Galera to Point Maria Libre, it is S.W. 1/4 S. 3 1/2 miles; between these points there is a large bay with a bank edging the shores of it, which in the centre runs off nearly a mile. On the shore opposite to the widest part of the bank, stands an Indian village. In approaching this bay from the Northward and Westward the soundings will be regular, from 30 fathoms at the distance of 4 leagues to 6 fathoms. Pass the islet of Galera at a discretionary distance, and in hauling round Point La Galera, which is high and bluff, you will see a fine open bay, where you may ride at anchor in safety, in from 10 to 11 fathoms, with Point La Galera bearing N.E. 1/4 E., distant about 2 miles.

Point del Tunar bears from that of Maria Libre N. 83° W., at the distance of 11 1/2 miles; in the intermediate space there is a very large bay, running about 5 miles inland. The whole of this bay is very clean, and presents no other danger than the bank which borders it, which, at the widest part, extends only about half a mile from the land: the shore at the extremity of the bay is a low swampy beach. A reef of considerable extent runs off in a N.N.E. direction from Point del Tunar. From this point the coast trends about W. by S. for 8 miles, to Point del Tigre, the whole very clean, and may be coasted within half a mile; from the latter point the land bends to S. 72° W. for 2 1/2 miles, to the Morro of Robledar, and thence S.S.W. a distance of 13 miles, to the Punta de Arenas, which is the Western extremity of the island. The bank of shallow water which surrounds the coast, extends about 1 1/2 mile from the Western part of the island, between the Morro of Robledar and Point Arenas. About N.W. 1/4 N., 14 miles from Point Arenas, and W. 1/4 S. 4 miles from the Morro of Robledar, lies the Eastern edge of a rocky shoal, named the Ostial, having on its shoalest part 1 1/2 fathoms; it thence extends about N.W. by W. 3 miles, and is nearly a mile wide. Between it and the Morro of Robledar, there are from 5 to 7 fathoms, on sand and mud; to the Northward and Westward, the soundings extend to a considerable distance; but on the S.W. side, at a short distance, the water is very deep.

Three miles and a half about S.W. from Balena Point, are Points Moreno and Morro: the intermediate coast forms a spacious bay, on the North side of which stands the town of Paupatar. Nearly in a line between the two points, and about midway, lies the little islet called Blanco, which is very clean; the passage between it and the land is very safe. All parts of this bay afford anchorage in 7 and 8 fathoms water, at two-thirds of a mile from the beach: with the trade-wind blowing fresh, it is rather exposed, as there is no shelter; and although such a wind does not send in much sea, it will be advisable to anchor in such a position that, in case of necessity, there may be room to run freely for the Morro Moreno, which, if occasion require, may be passed on the East side, at the distance of a cable's length.

Ships from the Eastward having approached Ballena Point to about a mile, should edge away to the S.W., sounding in 12 and 10 fathoms water, until Fort La Carranta comes open: this fort is on a point of land over the sea, about half a mile to the East South-eastward of Fort St. Carlos, which is situated in the middle of the town. With Fort La Carranta bearing N.W. $\frac{1}{2}$ N., by compass, distant one mile, there is good anchorage in 8 fathoms water; there is little shelter against any weather, and a great scarcity of water and every species of provision.

In sailing out of Paupatar Bay and bound to the Westward, pass to the Westward of Blanco Islet, on account of a reef lying off its S.E. side, which makes it dangerous to near it in that direction.

From the Morro Moreno the direction of the coast is S.W. $\frac{1}{2}$ W. for a space of 6 miles to Mosquito Point: the land between forming a great bay, on the North part of which stands the town, so called, of La Mar, but more correctly, a cluster of straw huts. The coast from Moreno Point to that of Mosquito is so foul, that it would be hazardous to get within 2 miles of it: the same character may be given to that further Westward. From Mosquito Point to Punta de Mangles, or Mangrove Point, the bearing and distance are S. 83° W. $10\frac{1}{2}$ miles; the coast between is very foul, from a rocky shoal that extends off about a mile. From Mangles Point the shore turns to the Northward, forming a bay between it and Point Piedras, a distance of 3 $\frac{1}{2}$ miles; from the latter point it runs further Northward, forming another bay with Point del Pozo, which is distant 6 $\frac{1}{2}$ miles from the preceding. Point del Pozo lies 10 miles N.W. by W. $\frac{1}{2}$ W. from Point Mangles; and from the former to Point Arenas, the bearing and distance are W. by N., 12 miles. All that part of the coast from Mangles Point to Arenas Point is like the preceding, foul, and should not be approached to less than 2 miles.

The Frayles. THE FRAYLES.—Nine miles E.N. Eastward from Cape La Isla, in Margarita, lie a group of islets, called the Frayles, or the Friars, of which the Southernmost is the largest. They are all very clean, except the Northernmost, which is surrounded by a reef extending about 2 cables' length from it.

Sola Islet. SOLA ISLET.—About 12 miles N.E. $\frac{1}{2}$ E. from the largest of the Frayles, lies the little islet called Sola, which is very clean. From Sola to the Testigos, the distance is 27 miles. The passages between the Testigos and Sola, Sola and the Frayles, the Frayles and Margarita, are all so clear that ships of all sizes may use them in any kind of weather.

Channel between Margarita and the Main. Channel between Margarita and the Main.—In this channel there are two large islands: the Easternmost one is called El Coche, or the Coach; and that on the West, Cubagua, or Cuagna. Coche Island is low, lying W. N.W. and E. S. E., about 6 miles in length, and 2 $\frac{1}{2}$ miles wide. It is surrounded by a rocky shoal and reef, which extend from the N.W. and S.E. points about 14 miles, and form two channels: the one to the North, with the island of Margarita, which in its narrowest part, is 2 miles across, and that on the South, with the main-land, of nearly similar breadth in its most confined part. In both of them the passages are clear, the bottom very good, and a vessel may ride at anchor in either of them as securely as in a harbor.

Cubagua is smaller than Coche Island, and lies nearly East and West; it is about 5 miles long and 2 miles wide. From the East point there are a shoal and a reef, extending out about a mile. The North and South sides are very clean; but on the West side, a rocky shoal extends about one-third of a mile from the shore. This, like Coche Island, forms two channels,—one on the North with Margarita, and the other on the South with the main-land—both very clear. In the narrowest part, which is between the shoal and reef which stretches out from the East end of Cubagua, and the bank that extends off from Mangles Point in Margarita, the width is 34 miles.

In navigating the North Channel of these islands, no other care is necessary than that of keeping in the middle of the passage: for, by so doing, the banks of Margarita, that from the N.W. of Coche Island, and that from the East end of Cubagua, will all be cleared; but for greater certainty, the most Northerly little point of Cubagua may be brought to bear West; which course may then be kept on to past Mangles Point, and then edging a little to the Northward, so as to pass a cable's

length to the Northward of the said North point of Cubagua, every danger will be avoided.

To navigate the South Channel, you ought to pass near to the Caribes and Lobos Islands, by which you will clear the bank that extends to the S.E. from Coche Island, and thence shape a Westerly course without fear, as the three Tuna Islets, lying off Tuna Point, are very clean, and may be passed between, if necessary. From these islets, Westward, the channel widens considerably, and consequently requires less care. In all these channels it is advisable to anchor at night, in any part of them, when the ship is bound to Araya or Cumana, lest the current should carry her to leeward; and also because these ports should always be entered in the day-time, that the shoal off Point Araya, and the shallow bank of Cumana, may be avoided.

To sail to the ANCHORAGE of ARAYA, the only danger to be avoided is the shoal off Point Araya, which, as before observed, extends 2½ miles to the N.W. of it.

Anchorage of Araya.

This may be effected by standing on about 3 miles from the point before the course is altered to the Southward; or, what is nearly the same thing, to make no Southing until out of soundings. But if thought preferable to use landmarks, be careful not to cross the parallel of Point Escaereo until the Westernmost peak of four, on the height of Macanao, in Margarita, bears North, a little Easterly; for when it bears N. 5° E. it will clear the West extremity of the shoal about half a mile. The island of Cubagua will also afford a mark; for, by bringing the West point of it to bear N.E., the Western edge of the shoal will be cleared 2 miles. Hence a ship bound to Araya, having run down the South Channel between Coche and Cubagua on the North and the main-land on the South, should pass about a mile to the Northward of Point Escaereo, and steer West until the West point of Cubagua bears N.E., when, by altering the course to the Southward, she will pass 2 miles distant from the West edge of the shoal; and if it be desirous to keep closer to it, to avoid getting so much to leeward, it may be done by steering West, until the Westernmost peak of Macanao bears N. 5° E., or rather more Easterly; then bring her head to the Southward, and she will pass at the distance of one mile from it. Keep on the South course until abreast of the Southernmost house on Point Araya, then haul to the wind, in order to fetch into the little Bay of Araya, which will be known by the fort on the South side, and the Sanctuary of Our Lady of Agua Santa on the North side, and on the South slope of Guaranelie. In this bay, and also on every part of this coast, as far as Point Arenas, a ship may be anchored in any convenient depth; and, if desirable, at a cable's length from the shore.

In like manner, in doubling Point Araya, from the Northward, that is from Cubagua or Margarita, the parallel of Point Escaereo should not be crossed to the Eastward of the bearings before given; and if by any accident you happen to do so, you should immediately steer in an opposite direction, until you are due West from Point Escaereo; and then West, until the proper bearings come on—namely, the Westernmost peak of Macanao N. 5° E., or rather more Easterly; when you should steer South, so as to be able to haul to the wind on getting abreast of the Southernmost house on Point Araya. On coming from the North, the soundings will also be a good guide, either by keeping out of them altogether, or, at least, by not getting into less than 35 fathoms, until after crossing the parallel before mentioned.

There are a shallow bank and reef stretching about half a mile South from Point Arenas, which have been already spoken of as the North point of the Gulf Cariacou, which runs 3½ miles inland to the Eastward; at the broadest part it is 8 miles across, and may be considered as a spacious, well-sheltered harbor, there being good anchorage in every part of it; but the best is in 36 fathoms. The shores are very clean, and may be approached to half a mile, or even a less distance, except in the vicinity of Cumana, where a shallow bank extends about two-thirds of a mile from the shore. On the North side there are two harbors, called the Little and the Great, or Bishop's Lagoon: the former is very small, but the latter is spacious; and, besides having from 8 to 15 fathoms water, is so clean that there is no danger except what is visible. Its entrance is 12 miles from Point Arenas. Within the gulf there is no town of consequence, or other inducement for ships from Europe to visit it; the main object of attraction for all is Cumana, which is situated on the South point of the entrance into the gulf. This point is low and sandy, with a bank running from it to the West and South, so steep, that from 10 fathoms there are almost immediately 5; and from 5, a ship would be aground before getting another cast of the lead. The edge of the bank running Eastward, lies nearly East from the point, about 1 mile, to Punta Baja or Low Point, whence it turns to South-eastward with the coast, narrowing by degrees to the vicinity of Mount Blanco, where it terminates on a clean shore.

The edge of the bank that runs Southward from the point is very close to the shore, forming with it the mouth of the River Manzanares, or Cumana, whence it increases in breadth to the S.W. so much that, N.W. of the Escarpado Roxo, a little mount with a red cliff South of the town, it reaches about a mile from the shore; from this point it narrows again, and terminates at Point Piedras.

The Town of Cumana

The *POWA* and *FORP* of *CU MANA* stand on the high land of the point, on the banks of the Manzanares, or Cumana River, on the low land, and near to the beach, stands in Indian town, separated from Cumana by the river. The anchorage is nearly in front of, or to the Westward of, the river's mouth, on the South point of which is another fort. In order to fetch this anchorage, ships should steer from Point Cana toward Escopido Roxo, but not more to windward, until the bank of Punta de Ar was as cleared. Having passed it, they should keep to the wind, and steer direct for the mouth of the river, which will be known by the fort already spoken of. Keep the lead going, and on getting a depth of water suitable for the size of the vessel, let go an anchor, with which, and a stream anchor towards the shore, the ship will be secured. The bank shelves off very suddenly, which occasions vessels to anchor near the beach, in 11, 8, and 6 fathoms, on good ground. To the Northward, and at the foot of the beach, it shelves off quicker still, but to the Southward, the shoal water extends further off shore. The rise and fall of the tide is from 6 to 5 feet. Good water may be obtained in a little river to the Northward of the fort on the beach. The wind always blows off the shore.

Tide

If from a severe wind, or from the current having set the vessel to leeward, it should be necessary to work to windward to gain the anchorage, when standing to the Southward, she should tack before Fort St. Antonio, which is situated on the most elevated part of the town of Cumana, bears to the Northward of the fort, in order to keep clear of the projecting point of the bank of Escopido Roxo. To the Northward there is no danger, and the bay may be prolonged according to pilotage.

To the S.W. of the Escopido Roxo, and a little to the Eastward of Punta de Piedras, the River Barahona discharges its waters, and from this latter point the coast lies nearly West for the distance of 3 miles, in some parts scarp'd, and in others a sandy beach, to Port Escudido, which is a bay running about half a mile inland, and 3 cables' length wide at the entrance. In the middle of it the depth is 10 fathoms, on sand, but nearer to the shore, only 3 and 4. On the West Point there are some rocks, which may be avoided by passing a little more than a cable's length from it.

From the West point of Port Escudido, the coast trends about West for the distance of 11 miles, to Punta de Campanario, all of which is scarp'd, and very clean, except one sunken rock, about half a cable's length from the coast, and 2 or 3 cables' length to the Westward of the West point of Port Escudido.

From Point Campanario to the Motro and Vigna, or Signal tower, of Mochnua, the distance is three quarters of a mile, between them is a very fine bay, varying in depth of water, from 10 fathoms to 3, which will be found within a cable's length of the shore. Every part of the bay is clean, and only off the North and West sides of Point Campanario there are a few rocks, extending somewhat less than half a cable's length from it, but nevertheless, it might not to be passed nearer than one.

About W.S.W. from the Signal tower of Mochnua, a little town of land projects, and forms the East point of the Harbor of Mochnua, which is spacious, beautiful, and well sheltered. The shores are indented with several coves, or little bays, which are so many natural docks. The depth of water is very regular, nowhere exceeding 11 fathoms, or being less than 4, the latter from one to 11 cable's length from the shores, which are generally very clean. In keeping at the distance of 11 cable's length from every visible obstruction, all danger will be avoided. To these good qualities may be added that of sailing in and out with trade wind, altho' the making it the best harbor in this part of America, indeed it may be reckoned one of the best in the world.

About a mile to the Westward is the harbor of Manare, which is also an excellent port. The depth of water is from 11 to 13 fathoms, the latter at half a cable's length from the shore. It is very clean, and as the entrance is spacious, it may be entered with the trade wind at any time, and quitted with equal facility. The West point of the harbor is called Point Manare.

From Point Manare, the coast runs about W.S.W. for the distance of 13 miles, to Punta de Fegullo, which has a reef on every side, to the distance of half a cable's length from it. The coast thence trends to the Southward and Eastward, a distance of 21 miles, whence it returns to W. by S. for 3 miles, to Punta Gorda, forming what is called Fegullo Bay, at the further extremity of which there is a canal communicating with the Harbor of Mochnua. In the entrance of this bay there are three islands, the first, or Eastermost, is named Venados, the second, or middle one, the East Caraca, and the third, the West Caraca. The shores of the bay, as well as those of the islands, are very clean, there being only off the North point of Venados, called Point Campanario, a rock which extends about a cable's length from it, and from the S.W. part of the same island, a small shallow bank running off a considerable distance. All the passages or straits between these islands, and also between

at the point, on the land near to the beach, an anchorage is nearly north point of which is east from Point Guaya bank off Punta de Arica, and stores direct for y spoken of. Keep the size of the vessel, for on here, the ship will be able vessels to anchor the Northward, and off the Southward, the shoal is from 1 to 3 fathoms of the fact on the beach

ed to leeward of, should a standing to the south of the anchorage, in order to keep clear Northward there is no

ward of Punta de Pium this latter point the e parts scarp'd, and running about half a mile middle of it the depths of the West Point there are than a cable's length

about West for the dis scarp'd, and very clean coast, and it is a cable's

to tower, of Machuca, the fine bay, very fine, in depth cable's length of the shore of the West Point is about a cable's length from

to be forming of land projects by is capacious, in small coves, or little bays, which peninsular, much have exceed to a cable's length from at the distance of 1/2 cable will be rounded. To these the trade wind, when the it may be reckoned one or

which is also an excellent for at half a cable's length venous, it may be entered safely. The West point of

the distance of 1/2 mile, to distance of half a cable's and Eastward, a distance Punta Garda, forming which there is a canal common to this bay there are three second, or middle one, the use of the bay, as well as a North point of Venados, cable's length from it, and ink running off a consider islands, and also between

them and the main land, are free and available for ships of any class, and although some of them are narrow, there is sufficient room for anchoring, in case of necessity.

The only danger to be avoided is a rocky shoal, called the *Cuacua*, which lies about N.W. at the distance of rather more than a mile from the First *Cuacua*. It is about half a mile in extent from East to West. There is not, however, much risk, for in passing between it and the *Cuacua*, it will be avoided by keeping near to the latter, and in going outside of it, keeping to the Northward of Point Muro will clear it in that direction.

To the Southward of Punta Garda, distant 1/2 miles, lies Punta del Encapado Roxo, (Red slope Point.) These form the entrance of the Gulf of Santa Fe, which runs about 6 miles inland to the Eastward. All its shores are very clean, but at the entrance, at about one third of a mile from the North coast, there is a foul rock, that should not be approached within 2 cable's length. The depth of water in this gulf is from 27 to 36 fathoms, on mud bottom.

From the Point of Encapado Roxo the coast inclines to the Southward, and then to the Westward, for 1/2 miles, to Punta de Cruz, forming a bay that is very clean, and without any great anchorage, called the Bay of Santa Cruz. About W. 1/2 W. one mile from the latter point, lies the Easternmost of the little islands called the *Arquip*, extending all together to the Westward about half a mile. They are very clean, except in the strait between them, which is impassable on account of a bank and reef that unites them together. The passage between the Easternmost one and the next is deep, and without danger. Off the Western part of the Westernmost land there are two rocks, but they are very clean.

From Punta de Cruz the coast continues Westward, including a little to the Southward, nearly 1/2 miles, to Punta Comuna, the whole of it clean, and available without a cable's length of the shore, without the least risk. Westward from Punta Comuna, almost 1/2 miles, is Punta de Portugete, in which space there is a fine bay, with 12 fathoms water within a cable's length of the shore. In the further part of this bay there is a sandy beach, where two small rivers discharge their waters. It is all very clean, except on the Eastern part, from which extends a reef about a cable's length from the shore.

MODOC ISLAND. In front of this bay, and about 1 cable's length to the Southward of Portugete Point lies the South coast of the Island *Momod*, or *Temeraria*, the shores of which are steep and clean. About 2 cable's length from the North side there is a rock and a foul reef, which should not be approached nearer than half a cable's length; the channel between *Momod* and the rock is very clean, with 12 fathoms water, and in sailing through it will be best to keep closer to the land than to the rock. The channel between *Momod* and the coast is also very clean, with 12 to 15 fathoms water in the middle of it, and nearly the same depth near to the land, which should be kept close on board, if anything prevents running through and channel.

Momod Isd and

The inlet and a half to the Westward of Punta de Comuna is Point Guaya, and between the two formed the Bay of Portugete, within which there is a small inlet, and a little river empties into it. In case of anchorage here, it will be necessary to keep clear of the West side of Portugete Point, passing at it a cable's length at least, to avoid a reef, which runs out from that part. It is also necessary to avoid the reef and shoal from the centre of the bay, which will be cleared by not getting too close to the Westward of the most Easterly part of the reef, but to the South. With this attention a ship may be anchored nearly north from the mouth of the little river, in 12 fathoms water, at about 1/2 cable's length from the beach on the East side.

Point Guaya

To the Westward of Punta de Guaya, and 1 mile distant, is Punta de Berantun, between the two, and about 1/2 mile from the first, is the little bay of Guaya, in the mouth of which lie several foul rocks, with very narrow channels between them, though very clean and navigable. Within the bay there is a reef from E. to N. 1/2 N. for, at half a cable's length from the base of the West front of the bay a reef runs all about 2 cable's length, but, by keeping over to the Eastern side, which is very clean, every difficulty will be avoided.

THE PENINSA DEL BERGANTIN has a foul reef, which runs all about a cable's length, and extends about a mile to the Southward. On the S.W. side of the point there is an inlet, so very foul all round as not to leave a clear passage, but even if and the point, from which the coast continues West, forming *Berantun Bay*, the Southern side of which has a foul reef that borders the coast Westward to *Las Barras*, the *Morro of Berantun*. This *Morro* has high land, lying nearly north and south one mile in extent, and joined to the main land by a very narrow isthmus, or *tongue* of sand, rather more than a mile in length.

The Punta del Bergantin

The distance between Punta del Bergantin and the *Morro of Berantun* is 1/2 miles, and the coast inclines to the Southward, forming a large bay called *Pozo de Bay*, all

this track of shore, which is a sandy beach and very low land, sends off a shallow bank a mile into the sea. Therefore, in navigating on this part of the coast, it is not advisable to steer directly from Bergantin Point to the North point of the Morro, which is steep and clean, and may be passed within a cable's length; or, should it be thought preferable to go into the bay, the lead must be kept going, to avoid getting into less than 7½ fathoms water, sandy bottom.

Barcelona.

The Western side of the Morro of Barcelona is foul, and ought not to be approached nearer than 2 cable's length, from its North point to Punta Maurea, which is to the Southward of it, the distance is about 4 miles; the coast, a low sandy beach, rounds in to the Eastward, and in this part the river of Barcelona, discharging itself into the sea, forms a large bank of sandy mud. About 1 mile inland, on the left bank of the river, stands the city of Barcelona. To anchor in the bay, the lead will prove the best guide, for being very shoal, each ship may take a berth suitable to its draught of water.

On the coast from Cape Manare, besides the Caraca Islands, already noticed, there are several others, called the Piendas, the Chumana, and the Borracha. The Great Pienda lies to the Westward of the West Caraca, with which it forms a channel rather more than a mile wide, free from all danger, except a sunken rock that lies about 2 cable's length to the Eastward of the East point of Pienda. This island lies about S.W. and N.E., and is little more than a mile in length; its shores are very clean; to the Northward of its East extremity there are two rocks. The first of about a mile, is the East Chumana, another islet less than the preceding, and equally clean. Two miles further West is the East point of the second Chumana, which lies East and West, about 4 mile in length, and also very clean; to the Eastward of it are two little islets, the nearest being about one cable's length off, and the other 5 cables, and on the West side is another little islet about a cable's length distant. About S.W. 2 cable's length from the West point of the second Chumana, lies the East point of the Great Chumana, which island is of a very irregular figure, and in its greatest extent about E. by S. and W. by N., 3 miles. To the Westward of it, about one third of a mile, lies the West Chumana, joined to the Great Chumana by a shoal of rocks and sand, extending a full half mile to the Northward of the North extremity of the Great Chumana. On this shoal, and midway between the two islands, there is an islet, also another at a short distance from the West extremity of the West Chumana, and, finally, to the Southward of the East part of the Great Chumana lies the South Chumana, that, in its greatest extent from N.E. to S.W., measures 2 miles. This island forms two channels: one on the North with the Great Chumana, about 1½ cable wide, and very clean, with a depth of 20 fathoms, or a mud; and the other to the South, between the island and Punta del Bergantin, half a mile wide, and very clean, in passing through it, the reef, which extends about a cable's length from Bergantin Point, is the only danger to be avoided. Between the Great and the South Chumana, there are several islets, all very clean.

From a recapitulation of what has been said of the Piendas and Chumana, it appears that these islands and their islets are clean and steep to; the only dangers being the rock on the East of the Great Pienda, and the shoal in the channel between the Great and West Chumana; consequently, all the channels or passages between these islands and their islets are navigable, although some of them, from being very narrow, are not so eligible for large ships; this circumstance, however, is a matter of choice for the navigator, in other respects he has no hidden danger to guard against.

Borracha Island.

BORRACHA ISLAND (Drunken Woman's Island) is about 3 miles to the Westward of the West Chumana: it lies nearly North and South, in which direction it is rather more than 2 miles in length, and 1 at its greatest breadth. All the East and North sides of it are clean; but on the N.W. a very foul rocky bank, with very little water on it, extends to a considerable distance, having on it several little islets, all of which should be passed on the outside, at 2 cable's length distance from the most Westerly. From the South extremity of the island a large sand bank runs off about S.S.W., on which is situated an islet, called Borracha; near the island two small islets, called the Borrachitos, at the distance of 2 large miles from the Borracha. They should always be passed on the South side, at the distance of 3 cable's length from the Southernmost of them; for, between them and the Borracha, as well as between it and the principal island, the water is very shallow.

From the anchorage of Barcelona the coast trends to the S.W. and Westward, 32 miles, to the Morro of Pnare, which lies about W.S.W. 4 W., 41 miles, from the Morro of Barcelona. It thence inclines to the Northward of West, then N.W., and

lastly, North to Cape Codera, distant from the Morro of Unare 57 miles N.W. by W. *Cape Codera*
 4 W., and from that of Barcelona, 85 miles N. 76° W.

The whole of this coast is low land, on which are seen the Morros of Paritu and of Unare, distant 7 miles from each other. The water is shallow along it, but it is very clean, and in approaching it the lead will be a sufficient guide. The two islands of Paritu lie nearly 12 miles to the Westward of the anchorage of Barcelona, and about 31 miles from the shore; they lie nearly E.S.E. and W.N.W., are low like the coast, and have a reef extending 1½ cable's length from them. There is a passage between the two islands, but it is hazardous to attempt, on account of the reefs on each side, which leave a channel of only 2 cable's length wide, with 53 fathoms water. The passage between the islands and the main land is free for ships of any size; and in going through it there is no necessity for any other guide than the lead.

About due North from the Morro of Roldan, at the N.W. point of Margarita, about *Hermanos*
 40 miles, lies the Southernmost of seven islets, called the Hermanos, or Brothers, *Islets*
 which Southernmost, at the distance of 2 miles therefrom, is called Pico, and from it to the next, which is the largest, and called Orquilla, the distance is 3 miles; the others lie to the North and N.N.W. of it; they are all very clean and steep to, so that there are no soundings in the passages between them.

BLANCA. - To the Westward of the Northernmost of the Hermanos, at the dis- *Blanca Isl*
 tance of 73 miles, lies the Island Blanca, or Blanquilla, about 6 miles in extent from *and*
 North to South, and 3 from East to West. It is very flat and sterile, and the coasts are very clean, except the S.W. point, where there are several ridges of rocks extending about 3 cable's length from the shore; and some parts of the West side, and off the North point, where there are some foul rocks extending 2 cables from the shore. On the N.W. part there is an anchorage in from 18 fathoms, at a mile from the shore, in 6 or 7 at 3 cable's length from it, all the bottom being sand. On the West side, about half way, at a cove in the beach, there is a Cazumba, spring or well, where fresh water may be obtained.

TORTUGA. - Westward from Margarita, at the distance of 47 miles, lies the *Tortuga*
 East end of the Island Tortuga, (Turtle Island,) which thence extends about 12 miles to the Westward, and is about 5 miles at its greatest breadth. All the East and N.E. sides are very clean, except at Punta Delgada, the N.E. extremity, where a reef extends off about 2 cable's length; the South side is also clean, but at the S.E. part are several islets. The West point of the island is named Punta de Arenas, from which to the North point, called Punta Noire, there are so many banks, that it will be necessary to keep the lead going while passing that space. On this side there is, first, Angulla Key, lying about half a mile from the shore, the intermediate channel being very foul with reefs; second, Cayo Herradura, or Horse shoe Key, forming, with the coast, a channel of one mile wide, but too dangerous to be attempted by large ships; from the N.E. point of this key, a ridge of rocks extends about 2½ cable's length Eastward; thirdly, the Tortuguillos Keys, two in number, entirely surrounded by a bank, with little water on it. The anchorage at this island is between the Tortuguillos and the coast; it may be entered from the S.W., or from the North, through the channel formed by the Tortuguillos and Herradura Key. At the anchorage, and in all the channels, the greatest depth of water is from 64 to 74 fathoms, with sandy bottom in the middle. In going in, the only care required is not to go into a less depth than 64 fathoms.

Description of the Coast of Caracas and the Frontier Islands, from Cape Codera to Cape St. Roman.

CAPE CODERA, a place well known on this coast, is a very round hill, to the *Cape Codera*
 North of which, about a mile, a tongue of low land projects, and is so clean that at half a cable's length from it there are 9 fathoms water, on sandy bottom. On the West side this tongue forms a very fine anchorage, named Puerto Casarros, or Privateer's Bay; to enter which it is only necessary to double the West point of the tongue, close to which there is a Fallon, or rock, and anchor as soon as there is shelter from the wind, wherever the depth of water may be suitable; with an understanding, that at 2 cable's length from the shore there are 7 fathoms water, on sandy bottom. At the South extremity of the bay, the coast, for a space of about 3 cable's length, is a low swampy beach, to the Westward of which it is foul, with a reef stretching about half a cable's length from the shore. The West point of the bay, named Caracoles, has on the North side a rock close to it, from which a reef extends about a cable's length.

From Cape Codera the high mountains of Caracas are visible, extending East and West many leagues. Nearly 1½ miles N. 4 W. from the cape lies an islet, which appears like a ship under sail; it is very clean, except about a musket-shot to the

North, where there are two sunken rocks, leaving between them and the islet a channel of great depth.

Point Caracoles

From Point Caracoles the coast runs in the direction of W. N. W., a distance of 10 miles, to Point Maspa, whence it trends W. by S., 9° miles, to Point Chuspa, which is the Eastern extremity of an anchorage of the same name. All this space is bordered by a reef, which extends one mile Northward from Point Maspa, and terminates at Point Chuspa, for this reason it should not be coasted at a less distance than 2 miles.

Chuspa

The anchorage of Chuspa is excellent. From the Point Chuspa, which is the N. E. point of the bay, the coast runs about S. W. for 1½ mile, to the mouth of the River Chuspa, on the East bank of which stands the town of Chuspa, about 2 cables' length from the bank.

From the mouth of the river the coast rounds to the Westward for the distance of 1½ mile, to Point Curum, to the Southward of which, at about one third of a cable island, stands the town of Curum. From Point Chuspa to that of Curum the shore is very clear, and the only guide required for entering the anchorage will be the lead, but from Point Curum the coast is very foul, with a reef extending 2 cables' off, and continuing so to La Punta del Frayle, (Fra's Point,) with a cañon, or rock, of the same name, about a cable's length from it. This point is nearly 4 miles from Point Curum; between the two points there is a projection to the North, called the Sabana, and to the North of it lies a bank, the South edge of which is about 2 miles from the shore; its greatest extent is about a mile from S. E. to N. W., on rocky bottom, and although the general depth on it is from 8 to 14 fathoms, in some places there are only 33, and even less than 3, for which reason it should be carefully avoided. It lies 3 miles from the anchorage of Chuspa, and, as in making this place it will be necessary to pass near to Point Chuspa, there can be but little room in approaching it, it will, however, be entirely cleared, by taking care to be to the Northward of the parallel of Point Chuspa, before crossing the meridian of Curum.

From Point del Frayle the direction of the coast is S. 86° W., 20½ miles, to the anchorage of Lagunera, on every part of which a ship may be anchored at half a mile, or even at a musket shot from the shore.

About 3 miles to the Eastward of Lagunera is the little village of Maento, situated in a small bay of that name, and is an excellent place for watering. The water is procured from three iron pipes, or spouts, distant about 84 feet from the beach. There is good anchorage all over the bay, and the soundings are very regular in approaching the watering place. On going in towards the village keep the watering place on a line with the N. W. corner of the chapel, and the highest coconut tree over the East angle of the fort, West of the village.

There is a depth of 20 fathoms at about three quarters of a mile from the shore, with a street of the village, close by the watering place, open, or cut out, and the Easternmost point about a sail's breadth open to the point to the Westward of it.

The Port of Lagunera

THE PORT OF LAGUNERA, with respect to its commerce, is the principal one on this coast; it cannot properly be called either a harbor or a roadstead, but a restricted coast, with a little shooshy between Point Carabellera on the East, and Cape Blanco on the West; consequently, it affords no shelter from winds in the N. E. and N. W. quarters, and the trade wind from the Eastward, which constantly produces a heavy sea. To prevent ships from dowering the sea when the winds on the sides, or falls calm, they are generally moored with a cable a tern to the Westward, at a cable's length from the shore there are nearly 3 fathoms water. In this anchorage it is seldom that any other wind than the trade is experienced, which, however, some times, for short intervals, veers to the West, in which case, the position of the ship should be changed, and her head placed to the Westward; there are seldom any fresh winds, but there are squalls from the S. E. during the rainy season. Lagunera cannot be called anything else than a dangerous roadstead; but as the trade wind blows along shore, by being prepared a ship may always clear the land. There is good anchorage, the town bearing S. by E., in a depth of 10 fathoms, at 1½ mile from the shore. The rollers are very heavy. The ground is very bad for holding.

Ships from sea bound to the anchorage of Lagunera, will have a good mark in a high and steep peak, called the Peak of Cares, situated about 9 miles inland, and 3 miles to the Eastward of the anchorage. At about 10 miles to the Westward of the peak is another, called the Peak of Nguatar; and thence a range of mountains extending towards Lagunera, among which the Silla de Caranus, (Saddle of Caranus,) and Mount Avila, may be very well distinguished; the latter being about 2 miles inland, and nearly on the meridian of the anchorage. It is advisable to make the land well to windward; there will then be no danger in running down to the anchorage. Cables are sometimes injured here by some anchors lost by the English in one of their expeditions against this place. There is a fixed light on the pier at Lagunera, in lat. 10° 57' N., long. 66° 56' 30" W.

From the anchorage of Lagunera the coast first runs West for the distance of 6 miles, and thence W. by S., 90½ miles, to the little harbor of Cruz, and is sufficiently clean to be run down at the distance of a mile. This part is a small indent in the coast, with an entrance about 1½ cables' length wide, and 2 cables in extent inward, very clean, for at half a ship's length from the coast, all round, there are 12 fathoms water. At its South extremity a little river discharges its waters, and at its Eastern point, called Point la Cruz, there is a rock close to it. Were it of greater capacity, this anchorage would be excellent, but it is so small as to be eligible for small vessels only.

From Point la Cruz the coast trends N. 83° W., a distance of 3½ miles, to the bay of Cota. It is all very clean, and may be approached with safety within a mile, or less. About 2 leagues to the Eastward of this bay, and 2 miles inland, will be seen Monte de Maseta, (Pable Manatru), and at about the same distance inland, on the meridian of Cota, another, called Mount Oemure. These will serve as marks for taking Point Bay, or the anchorage of Oemure, which is farther to the Westward.

Cota Bay is half a mile wide at the entrance, and about as much in depth. At the Eastern point there is an islet lying almost close to it, and from this point the shore runs to the South to the extremity of the bay, where a river falls into it, throwing up a bank, with little water on it, which extends almost a cable's length from the shore. Every other part of the bay is clean, with a depth of water from 7 to 12 fathoms, about 1½ cable's length from the beach.

Two thirds of a mile Westward from the West point of Cota Bay, or the Eastern point of the bay of Oemure, is in which there is a very good anchorage. An islet lies at the East point, in a N. W. direction, forming with it a strait, or channel, of about half a cable's length wide, very clean, and with a depth not less than 6 fathoms. In taking the anchorage in this bay, pass close to the islet, and steer to the South until shelter is obtained from the wind, then anchor in 6 or 6½ fathoms, sand, at about a cable's length, in a little more Southward of the islet. The bay has many banks on it, but the E. has a good guide. Care must however be taken, for as the current narrows in the Southward, a large ship may possibly touch the ground, unless attention be paid to the islet, and stop her headway in time. A river falls into this bay to the Southward of the islet, leaving on its banks a few fishermen's huts.

Two miles and a half Westward from the islet of Oemure, is the East point of a bay, called Chenga de Oemure, (the Bog of Oemure), which, in fact, is no more than a swampy opening in the land, and which, between shoals of a rock, has a channel of 12 to 14 fathoms water. The West point of this bay is formed by an island near to that rises on the low land. The anchorage is very bad, and fit only for small coasting vessels.

One mile and a half to the Westward of the Mouth of Chuspa, is the harbor of Turano, which is excellent, and capable of receiving every class of ships. At the entrance it is about a mile broad, but decreases inward to two thirds of a mile. From the entrance to its South extremity is about 2 miles, and the general depth, in mid channel, is from 5 to 15 fathoms, on mud and sand. All its shores are low, and very clean, extending all about one third of a cable. Therefore, by not approaching nearer than half a cable's length, all danger will be avoided. At the further extremity of the harbor, the River Turano discharges itself on a sandy beach. Off the East point, at a cable's length in a N. W. direction, lies Turano Islet.

From the harbor of Turano, Westward, at the distance of 9 miles, is Porto Caballo. This part of the shore is very clean, and may be coasted at the distance of a mile. There are various detached islands lying off it to the Eastward of Porto Caballo, and for sailing by or between them, sufficient information will be obtained by inspecting the plan of the port.

There is a very good and spacious anchorage between Isla Larga, or Long Island, and the main, about 3½ miles to windward of Porto Caballo. There is plenty of room in 10 or 12 fathoms water. You may sail into, or out from, this anchorage, between any of the islands, but the best passage is round the East end of Long Island, between it and the main, in order to take a berth well to windward.

It is necessary to be cautious of a shoal that lies about a cable's length to the Southward of the West end of Long Island.

Porto Caballo is a channel formed by several islets and tongues of low land, covered with mangroves. Ships desirous of entering must be warped into it, and those of the largest size may be made fast to the mole, not requiring even the use of a plank to land from them. The mouth of this channel opens into a spacious bay, with excellent anchorage, in 10 to 12 fathoms, sandy mud, and well sheltered from the trade wind. Being in 13 fathoms, will be near enough to the beach, which is rocky, and good. The best berth is about West from the harbor's mouth, at the distance of 3 or 4 cables' length, in 11 to 12 fathoms. In this harbor, all Spanish merchant ships that come to Lagunera, are careened, and winter. Each ship, as soon as she has delivered

her cargo at Lagunayra, proceeds to Porto Cabello for greater security, to receive and repairs as may be necessary, and take in part of the homeward bound cargo. She then returns to Lagunayra to complete her lading. At Porto Cabello there is always a body of good shipwrights, &c., although it is not very numerous. Ships of war should only enter the harbor when it may be necessary to enter them; for other purposes it is not only useless, but prejudicial. They should, therefore, always remain in the bay; for the excessive heat in the harbor, the mangroves with which it is surrounded, added to any degree of intemperance, occasion almost immediate attacks of putrid fevers and the black vomit, both of which are very fatal to Europeans. A fixed light is proposed to be placed at the entrance of Porto Cabello.

Light

The coast to leeward, or to the Westward of Porto Cabello, forms a great bay called Tucacas, or the Gulf of Triste, in which there are several islets. With the trade winds it is a lee shore, and rather dangerous. Ships from Europe should keep clear of it, as there can be no inducement to enter. Point Tucacas, the North point of this gulf, bears N. 28° W., 25 miles from the mouth of Porto Cabello; therefore vessels bound Westward from that port should steer about N. by W., until they are abreast of Point Tucacas, or N. N. W., if they intend to keep close in with the point in order to take the anchorage at it, called Chichiriviche.

Light

There is a fixed light, 30 feet above the sea, on Brava Point. It is in lat. 10° 47' N., long. 68° 48' 30" W., and may be seen 9 miles.

Point Tucacas.

Point Tucacas, is formed by a low swampy land, covered with mangroves, which projects out from the high land about a mile. On the East side of it there is a key, about a mile in length from S. E. to N. W., called Sombrero, between which and the coast there is a channel barely half a mile wide; and although there are 14 fathoms water in it, it is dangerous from shoals and the reefs extending from the coast. A key on the N. E. side of it is also surrounded by a reef of 2 cables' breadth, which should not be approached at less than a mile. From Point Tucacas, which is to Westward of the most Northerly part of Sombrero Key, the coast runs about N. W. It is low and foul, with a reef half a mile broad, which extends as far as the mouth of the harbor of Chichiriviche, distant 3 miles from the point. This harbor is formed by low lands covered with mangroves; and although well sheltered from all winds with 63 fathoms, good holding ground, the entrance to it is a little difficult on account of shoals and reefs.

Chichiriviche harbor.

The East point, called Chichiriviche, presents a front of rather more than a mile in length, from which a reef runs off about 3 cables' length, having on it several islets that must be passed on the outside. To the North of these there is a key, called Peraza, with a foul reef all round it, half a cable broad. This key, and the islands off the point, form a channel 2 cables' length wide, with upwards of 7 fathoms water. To the Westward of Peraza Key lies another, called Chichiriviche Key, larger than the former, and also surrounded by a reef a cable's length broad. Between these two there is a channel rather more than 2 cables' length wide, with 6 and 7 fathoms water in it. To the West of Chichiriviche Key lies the West point of the harbor, forming between them a channel of 2 cables' length wide, with 5, 6, and 7 fathoms. There are, however, two shoals in it, with only 2 fathoms water over them. Half a mile North from Chichiriviche Key, there is a large one, called Salt Key, from the salters in it. This key is also surrounded by a reef, nearly a cable's length broad, except on the S. W. part. Finally, about N. by E., at the distance of 4 miles from Salt Key lies Borracho Key, which is very foul, with a reef extending half a mile from the N. E. and S. points of it. All this part of the sea just described is of so regular a bottom, that at somewhat more than one half a mile from the coast there are 63 fathoms, which depth continues so far as 2 miles North of Borracho Key, where there are 14 fathoms, on sandy mud. To enter this harbor, observe that on getting abreast of the Northernmost part of Sombrero Key, which should always be passed on its outside, steer towards Peraza Key, and on approaching it steer West, so as to pass in the middle of the strait between it and the islets off the point, and Peraza Key bears N. E. by E., and then S. W. by W., edging towards the South, so soon as the largest islet off Point Chichiriviche bears East; thence run under shelter of the point, holding up to S. S. E., and there anchor in 63 fathoms, mud. The plan of this harbor will show all that is necessary to be done, either in going in or coming out.

From the harbor of Chichiriviche the direction of the coast is N. N. W. 3 W., for the distance of 18 miles, to Point St. Juan; the ground in all that track is so regular, that at the distance of 4 miles there are only 14 fathoms water; the only danger is a small shoal, called La Piragua, lying off a little point, named Manatic, about 4 miles before arriving at Point St. Juan; it does not, however, extend more than a mile from the shore.

Point St. Juan forms, on its West side, a large bay, but so shallow, that at a mile from the beach there are no more than 3½ fathoms water. N. W. of the point there

security, to receive mail and found cargo. Sta. Cabello there is always numerous. Ships of war are seen there; for other purposes, always numerous vessels with which it is sur-
 most immediate attacks of all to Europeans. A fixed

lo, forms a great bay several islets. With the from Europe should keep Tucacas, the North point Porto Cabello, therefore N by W, until they are close in with the point

out so shallow, that at a mile r. N.W. of the point there

are two keys; the first, half a mile distant, called St. Juan's Key, and the second, nearly 2 miles further, named the N.W. Key. On the N.W. side of Point St. Juan a reef stretches off about 2 cables' length, and the Key of St. Juan is surrounded by another about half that breadth. The N.W. Key is also surrounded by a reef that extends out about half a mile from its S.E. point, having on it several keys and islets. The anchorage is to the S.W. of St. Juan's Key, in order to take it, it will be necessary to pass to Northward and Westward of that key, and anchor in any depth of water suitable to the ship's draught. It is directed to pass outside of St. Juan's Key, because the channel formed between it and the point is eligible for small vessels only; not alone for its narrowness and the foulness of the reef, but because the greatest depth of water is only 34 fathoms.

From Point St. Juan the direction of the coast is about N. 60° W., 19 miles, to Point Ubero, the whole space being clean, and the depths regular, but there is a farallon, or rock, lying near a rocky or cherty part of the shore, about 8 miles from Point St. Juan, called Pezon del Soldado. On the West side of Point Ubero there is a bay, but being very shallow, it scarcely affords any shelter for large ships from the trade wind. About N.N.W., 13 miles from this point, there is a bank, over which the least depth is 13 fathoms; on it there are some loose rocks.

From Point Ubero to that of Zamuro the distance is 12 miles N.W. by W., and from Point Zamuro the coast runs N. 77° W., forming various sinuosities, for the distance of 25 1/2 miles, to Point Manzanilla, and thence S. 83° W., 14 miles, to Point Taymatayma. All this coast is clean, and the soundings regular, requiring no other guide than the lead to run along it at half a league distance, and in the interior are several heights that may be seen far at sea. Between the Points Manzanilla and Taymatayma the coast bends in to the Southward, and at the distance of 5 miles S. 62° W. from the former, is the bay of Cumurebo, being a sandy beach, so called; the town of the same name standing on a hill at the distance of 3 miles S.E. from it. N.N.W., 6 1/2 miles from the sandy beach, and N. 65° W., 7 1/2 miles from Point Manzanilla, lies the rocky bank of Cumurebo, with 5 fathoms water on it, and from 14 to 15 fathoms very near it. From Point Taymatayma the coast trends S.W. by W., about 1 mile, to Point des Frailes; on the East side of the bay of La Vela de Coro. This bay has an anchorage, and, in proceeding to it, no other guide than the lead is required, as the bottom is regular and clean. At the S.E. part of the bay stands the town of La Vela de Coro, and about 2 miles inland to the Eastward of it, an Indian village, called Currazal. The River Coro falls into the sea 1/2 mile West of the town.

From the River Coro the coast turns abruptly to N.W. 1/4 N., forming a chain of sand hills about 19 miles in length, uniting the peninsula of Paraguana with the coast; these sand hills are called the Isthmus of Medanos, or Sand hills. The Eastern coast of this peninsula trends true North for 15 miles, to Point Auricula, which bears N. 24° W. from the bay of Coro, and distant 33 miles; all the coast has very regular soundings, there being 18 fathoms at the distance of 10 miles from it.

From Point Auricula the coast trends from N. by W. to N.W. 1/4 N., a distance of 16 1/2 miles, to Point Tamatey; and thence about W.N.W., 3 1/2 miles, to Cape San Roman, the Northernmost land of the peninsula. The mountain of Santa Anna, on the peninsula of Paraguana, may be seen from the sea at the distance of many leagues.

One North from Cape Codera, at the distance of 23 leagues, lies the island of Or- *Orechila Is-* elchila, rather flat; its greatest extent is from East to West. On its North coast are *and* some peaks, the highest of which is at its Western extremity. Off the East end a key runs to the Northward about 3 miles, and to the Westward of it, a great reef extends in that direction, nearly half the length of the island; there are several keys on the reef. All the rest of the coast is clean, and may be approached to a cable's length. On the S.W. part, near the Western extremity, there is a very clean sandy beach, in front of which there is good anchorage, well sheltered from the trade wind, in 6 or 17 fathoms water, within 1/2 cable of the beach. Half a mile W.N.W. from the West point of the island, there is a high rock, very clean and steep, forming a passage eligible for ships of any burden.

S.W. 1/4 W. from Orchila, and S.E. by E. 1/4 E. from the East end of the Roccos, there is a shoal with 3 fathoms water; the form of the shoal is nearly circular and is about 1 1/2 mile round. Longitude corrected by the Roccos, 66° 27', latitude 11° 12'.

The ROCCOS.—Twenty two miles to the Westward of Orchila is the Roccos, an *The Roccos.* assemblage of low keys raised on a very dangerous reef. This group occupies a space of 12 miles from North to South, and 2 1/2 from East to West; of which the S.E. Key, named Grande, is 6 miles from East to West, and nearly the same in breadth. To the Westward of it is Key Sal, upwards of 7 miles in length, nearly East and West, very narrow; and to the Northward and Westward of Key Sal, there lie a great num-

ber of smaller ones, without any passage between them. The Northernmost group consists of El Roque, nearly 2 miles in length, E. by S. and W. by N.; the French Keys, four in number; the N.E. Key, Naman's Key, and Pirate Key. All the exterior keys on the edge of the reef may be passed at a mile distance, except on the Eastern side, where the reef extends upwards of 3 miles beyond them. The passage between the keys must not be attempted, as most of them are barred by the reef, except on the West side of El Roque Key, where there is an entrance into a very fine bay, formed by the other keys and reefs, in which there are from 13 to 20 fathoms water, but a foul rocky bottom frequently does great damage to the cables. The anchorage is on the West side of the key, in 17 or 18 fathoms water, on sand and mud, and about 3 cables' length from the beach. The Roque Key may be easily distinguished by several peaks on it, that may be seen at a moderate distance. It will be most prudent to give all these keys a wide berth, as the vicinity of them will be perilous to a ship, particularly at night.

Light-house. There is a light house building on Cayo Grande.

Port of Roque.

PORT EL ROQUE.—There is a fine harbor to the Eastward of El Roque—it is sheltered on the North by the French Keys, from the East by the N.E. Key and the reef, and on the South by Pirate and Naman's Keys, and their reefs. There is a space of about 2 miles in length, and half a mile wide at the narrowest part between the reefs, where ships may anchor in from 12 to 14 fathoms, and five entrances, or outlets quite clean.

Port El Roque presents considerable advantages, as a safe and convenient anchorage, as from whatever quarter of the compass the wind may blow, a vessel can scarce find a difficulty in getting to sea. Nor, from the manner in which it is locked in, by the keys and reefs, is it probable she would receive any injury, should her commander deem it necessary to ride out a gale at her anchors.

Beside which, a ship will find another important advantage over the old anchorage—that of having, almost invariably, a clear unobstructed trade breeze across the reef, which can bring with it no decaying vegetable, or other impure effluvia, to render the place unwholesome.

The channels are clean, and, without exception, steep to the reefs on either side, which are of coral, and have scarcely sufficient water on their edges for a four oared gig: thus displaying by the contrast between the shades of deep and shallow soundings, a secure guide to a stranger on entering. The bottom is mostly of a hard sandy nature, though there is a patch of stiff clay off the N.E. point of Pirate Key, in 13 fathoms.

Fish of excellent quality may be caught in plenty, either with seine, or by anchoring in a boat near the reefs, and employing a hook and line for that purpose. Turtle are met with, but not numerous.

Ships requiring small plank, firewood, boats' knees, and breast hooks, can be well supplied for the labor of cutting them, though it is recommended, should time admit of it, to have it always barked, split, or sawed up, before embarkation, as, should the sap lodge upon decks or anything else, the stains would be found difficult to eradicate. There is a well of water upon the S.W. end of El Roque. The supply is uncertain, never, however, exceeding 80 gallons a day. The lime-burners obtain what they make use of by digging wells in the sand.

A stranger, in running for the harbor, is recommended to pass to the Westward of the peaks, and then stretch across towards Blackman's Key, which may be easily known as appearing, without the use of a glass, like a single large rock, (though actually a low islet with bushes on it,) until he can fetch through the South channel, which will open clearly to sea, at the bearing of N. 16° E., per compass, when he can pass with safety between Pirate Key on the port, and a small dry sand bank on the starboard side, both of which are bold within the channel; but a reef extends 233 fathoms off the S.S.W. end of the former, which, like all others, is easily traced from a vessel's deck by the eye.

High-water. On the full and change of the moon, it is high-water at 4h. 30m. p.m. Spring tides rise 3 feet perpendicular.

Isles de Aves.

ISLAS DE AVES.—Thirty miles to the Westward of the Roques are the Islas de Aves, (Bird Islands,) which are two groups of keys, rising upon two distinct reefs, and forming between them a channel of 9 miles in breadth. These keys are very low and flat: and as the East group has a reef extending 4 miles to the North from it, and the Western another, extending 6 miles in the same direction, it results that an approach to them, especially from the North, is extremely dangerous; and therefore they ought to be given as wide a berth as any other dangerous shoal.

Buen Ayre light.

B. EN AYRE LIGHT.—On Point Rasa del Euen there is a fixed light, 50 feet above the sea, in lat 12° 12' N., long. 68° 17' W. This light cannot be seen to the Northward.

Buen Ayre Island. To the Westward of Ayres, and at the distance of 33 miles, is the island of Buen Ayre. It is of moderate height, with several mountains and peaks on it, the most elevated of which is close to the North point. The South point of the island is rather low and flat, and called Point Rasa del Luere. About the middle of the West shore there is a town and small fort. There also is the anchorage, which is so steep that at 13 cable's length from the shore is a depth of 17 fathoms, and it increases so rapidly, that at a cable's length further out there are 60 fathoms. For this reason it is necessary to run out and make fast a cable to the shore. Small ships should always be prepared, in order to prevent the anchor from dragging, for should she be driven from the anchorage, it will cost much trouble to regain it. From the West part of the anchorage, at the distance of a mile, lies an island named Little Buen Ayre; and although the passage formed by it on the N. E. will admit ships of any size, yet it will be preferable to use the S. W. channel, as being more free, both inward and outward. There is no danger whatever to be apprehended at the distance of a cable's length from all the coast of Buen Ayre, except on the East side, where a reef runs out in some places more than half a mile; but the N. E. and S. E. points are very clean.

Curazao Island. Twenty seven miles Westward from the South point of Buen Ayre lies the S. E. point of the Island Curazao. It thence extends about N. W. 1/4 W. 35 miles, but the greatest breadth does not exceed 6 miles. It is moderately high, with some mountains, that may be seen from a considerable distance at sea. All its coasts are very clean, and may be passed at the distance of a cable's length without risk. S. E. by E. from the S. E. point, named Canon, at the distance of 4 miles, there is a little low sandy island, named Little Curazao, which, although very clean, is from its lowness dangerous at night and in thick weather. No part of this island appears elevated more than 6 or 8 feet above the level of the sea, except that on the West end there are two small clumps of mangrove bushes, showing higher than the rest of this land. On the East end there is a large cairn of stones, having on its top an old tree, and bearing at a distance a great resemblance to a martello tower. It bears from the mountain of Sta. Barbara, on the S. E. side of Curazao, E. by S., by compass.

On Little Curazao there is a light house containing a red fixed light, 10 feet high.

The island of Curazao has many bays and harbors, the principal of which, where the whole commerce of the island is carried on, is St. Ann's, on the West coast, situated at the distance of 10 miles from Point Canon. To the Eastward of this, about 6 miles, is another bay, named Sta. Barbara. In proceeding to the harbor of St. Ann, it will be proper to make Point Canon, so as to run down the coast at one or two miles' distance, taking care not to get to leeward of the harbor's mouth, as the current sets with considerable strength to the Westward. The entrance is very narrow, and formed by tongues of low land. That in the inner part, also, forms large lagoons. On the Eastern point stands Fort Amsterdam and the principal town of the island, inhabited by Protestants and Jews. On an islet close to the West point there is a battery, which, with Fort Amsterdam, defends the mouth of the harbor; and on the Western shore stands the town inhabited by the Catholics. The channel leading into the bay runs in about N. E. by N., is three quarters of a mile long, and a cable's length broad, except between the forts at the entrance, where it is barely half that breadth. The towns, wharfs, and magazines, are on the banks of this channel, where also ships anchor and are careened. To enter the channel it is necessary to keep the windward coast close on board, but not within half a cable's length, as there are rocks, and also a reef, extending about one third of a cable from it; and on getting abreast of the batteries on the point of Fort Amsterdam, luff enough to bring the ship's head towards the battery on the islet at the West point, and then stand inward through the middle of the channel. The Dutch always have a launch ready to assist in towing ships into the harbor.

There is a six light on the South side of St. Ann's Harbor.

Oruba Island. At the distance of 13 miles to the Westward of the most Northern part of Curazao, lies the S. E. point of the island of Oruba, which extends thence nearly N. W., 17 miles, and 4 miles wide. Although low, there are some heights upon it that may be seen at a moderate distance off, particularly one, which is called the Sugar-loaf. All the Eastern coast is very clean, and has islets close to it. On the Western coast there is a chain of keys extending almost as far as the West point. These may be crested on the outside, at the distance of 2 cable's length, if necessary. This island lies to the Northward of Cape St. Roman, the intermediate channel being 13 miles wide, and very clear.

The island is moderately high; the East part even, and gradually lowering to a point. The West end, at a distance, appears like broken hummocks. The Sugar-loaf Hill, which is about 7 miles from the N. W. point, is the highest in the island, and

may be seen at the distance of 18 or 20 miles. A chain of low bushy keys stretches along the South shore, bold to, having, at a cable's length off, no soundings with the haul lead. These keys terminate in a rocky islet, considerably higher than the rest, about 3 miles to the Westward of the East point, and 2 cables' length off shore. About 3 miles to the Westward of the Sugar loaf there is a projecting point, having an opening between the keys to leeward of it. To take the shelter afforded by this point, it is necessary to get close in with the land as far to windward as the Sugar loaf and run along shore until the port bears N. N. W., when the flagstaff will come on with a small sea house standing by itself on a hill behind. These marks kept in a line will lead clear of a rocky ledge at the extremity of the point. To leeward it is all clear. When far enough in to be sheltered from the breeze, you may anchor in 4 to 5 fathoms, on sandy bottom. There are, however, some rocky patches to be carefully avoided. It is particularly necessary for a stranger to get close in with the keys well to windward, otherwise the current will sweep him so far past the opening as will require half a day to beat up again. There is also good anchorage in from 5 to 12 fathoms under the West end of the island; but as procuring provisions, or temporary refit, can be the only inducements for visiting Oruba, it is advisable to go into the harbor, which is distinguished by the town along the beach, close to leeward of the sandy point, and named Port Caballos. The pilots are skilful and attentive, and the anchorage, within the reefs and close to the town, in 3 fathoms water, sandy bottom, is very good. Fresh water is scarce, there being no spring. It is collected in tanks in the months of September and October, but is good and wholesome; it may also be procured by digging a few feet in the sand, at a short distance from the beach.

The Gulf of Venezuela, or of Maracaibo.

From Cape St. Roman the coast runs S. 62° W., 13 miles, to Point Macolla. It is shallow and clean, and may be safely approached by the lead. St. Roman bearing E. N. E. 3 E., distant from 12 to 15 miles, and off shore about 3 miles, there is a shoal on which the water breaks, having close to it 15 fathoms. The land being very low about this part of the coast, it would be dangerous to beat up along shore during night; although with the Westerly current running through the channel, a strong counter-current will be found along shore and with the very strong breezes if at you frequently get in this channel, it is difficult to get up, except by beating inshore. You will, however, find good anchorage all along this part of the coast, in from 5 to 10 fathoms; and during the day you may see all your danger. This point, and Point Espada, (Sword Point) which lies nearly West from it, at the distance of 50 miles, form the entrance of the Gulf of Venezuela, or of Maracaibo. The South extremity of this gulf opens into the Great Lagoon of Maracaibo, by a delta that has but one month navigable, and that only for vessels drawing no more than 12 feet water, as there is a bar, upon which there is no more than 11 feet. As the water is shallow, but without banks, or detached islands, the lead is the best guide that can be recommended. The same may be recommended for the West coast, which may be safely approached to the depth of 6 or 5 fathoms, in every part. Those who enter this gulf proceed to the lagoon, for the purpose of loading with cocoa, tobacco, and other produce. We shall, therefore, now proceed to give some instructions for navigating it with certainty.

Being 4 leagues to the Westward of Cape St. Roman, a S. W. by S., course will take a ship in sight of the Mesas of Borojo, which are some level hills, or sand-hills, situated to the East of the bar. From this situation steer about West, keeping at the distance of 2 leagues from the coast, and in from 43 to 53 fathoms water, until the castles of Zapara and San Carlos appear in sight; these defend the entrance of the lagoon, and are placed, the first on the Eastern point, and the second on the Western. They are not, however, on the bar, but rather to the Southward of it; the bar itself being formed by the shoals, which extend out W. N. W., to the distance of 2½ or 3 miles from the Bajo Seco, or Dry Shoal. The sea breaks on all these shoals, and the deeper water is easily distinguished by its having no breakers. This will be found by keeping at 13 cable's length from the outermost breakers off Bajo Seco. This Bajo Seco is an islet of sand, which is about 13 cable over in every direction; it lies N. N. E., at the distance of 13 mile from San Carlos castle, and at about East from it will be seen the other. The island of Zapara has some very high mangroves; and outside of it, in 53 or 63 fathoms, the bottom is hard mud mixed with sand; and this is where ships ought to anchor, in case of necessity; observing that the ground-tackle ought to be good, as the prevailing wind blows very fresh at the place.

Being off Point Espada, at the distance of 2 leagues, and bound to the bar, a S. S. W. 4 W. course will take a ship to the N. E. of the islet named Bajo Seco.

d bound to the bar, a S.W.
 ed Bajo Seco.

On this course, as well as the former, the depth diminishes very gradually as you advance Southward; and it will be advisable not to approach the bar in the night, but to run out aground, or make short boards about 4 leagues from it, until daylight comes on. The breezes in this gulf are fresh, and from N. N. E., which cause a heavy sea on the bar and all the South shore, so that there is great risk of getting aground, which must be guarded against.

High-water on this bar takes place, on full and change of the moon, at a quarter *Tides* after 5 o'clock, afternoon; on spring tides, the water rises from 2 to 2½ feet. The least water on the bar, at high water, in the season of the breezes, is 11 feet 8 inches; and 16½ feet in the rainy season, which is August, September, October, and November.

The bar cannot be crossed without a pilot, and therefore as soon as the ship is nearly North and South with the castle of San Carlos, and in 5½ fathoms water, the course should be altered to the West, until in the depth of 13 fathoms, when the breakers on the shoals will be seen in a line about W. N. W. Continue steering to the Westward, keeping the same depth, until abreast of the last breakers, which will be near the mouth, heave to on the starboard tack, or, what is better, make short tacks off and on, until the pilot gets on board.

Steering for the bar, the first object that comes in sight, as being the highest there, about, is the island of Todus, or Todus, which lies about 3 miles to the Southward of the castle of San Carlos; shape a course towards this island, until the castles and the Bajo Seco can be seen, and then proceed as before directed.

A knowledge of the exact situation of the mouth of the bar is very essential; that is, to the Westward of the meridian of the castle of San Carlos; because, without this information, every person would suppose it to be between the Bajo Seco and the Eastern coast, where Zapara castle stands. By such a mistake, the ship might be cast away on the shoals.

Vessels drawing from 9 to 12 feet water, should endeavor to be at the entrance at high water, to avoid all danger of even touching; for if she would not answer the helm immediately, from the narrowness of the channel, shipwreck would be inevitable.

A pilot is also requisite for getting over the bar outward, and clearing the shoals, after which, particular instructions for sailing out of the gulf are necessary, for although it must be done by working out, yet every navigator knows how to regulate his tacks, so that they may be more or less favorable; and here he may prolong either tack without any other guide than the lead. It is, however, necessary to remark, that in the gulf the wind generally shifts to the North, or nearly so, at 4 or 5 o'clock, p.m.; therefore endeavors should be made to get near the Western coast about that time, in order to take advantage of it for a long board to the E. N. E., and to go on the other tack again so soon as the wind rounds back again to the Eastward, not only to gain Northing by it, but also to get again over the West coast, to make the best use of the next shift of wind to the North.

Directions for navigating from Santa Martha to the Bar of Maracaibo.

In sailing from Santa Martha to Maracaibo, round Cape Aguja quit close, and by keeping within 5 miles of the foot of the Snow Mountains, you may carry the Easterly set of the Magdalena up to Cape la Vela.

On entering Rio de la Hacha, you must keep the lead going, as you will be in 5 and 7 fathoms water the whole night. After passing Cape la Vela, the best plan is to make one good stretch to sea, and the next morning you will in all probability weather Cape Chichibacoa, in which case you will weather Punta Espada, and be able to stand for the bar of Maracaibo. You will run the greater distance from Punta Espada in 9 and 10 fathoms, and the shoaling of the water will be a guide to shorten sail for daylight.

The best anchorage is with the castle of the Bajo Seco in a line with that of St. Carlos, and distant from the latter about 7 miles, in about 6 fathoms water.

The entrance of the bar is in lat. 11° 2' long. by chronometer, 71° 13' W.

The bar of Maracaibo is a shifting bar; formerly the entrance was by the island of Zapara, on the West end of which stands the old fort. It then formed its channel to the Southward of Bajo Seco, (which at that time was not above water, although now an island of some magnitude,) but now it seems to have settled into a permanent channel of 13 feet depth, to the N.W. of the Bajo Seco. The whole bar is a quick sand.

To pass the bar, a pilot should always be taken.

The town of Maracaibo stands 21 miles up the lake, and you have to pass over the Tablizo, shoals of soft mud, with about 10 feet, in some places, which you may drag through with ease.

You may cross the bar with 11 feet.

Water can be procured, if you are outside of the bar, from the main-land, exactly opposite the fort of the Bajo Seco: and, if inside, the lake is fresh water, 10 miles above the bar.

Although the Derrotero de las Antillas mentions the depth of water on the bar in the rainy season, from August to November, to be 16½ feet, it is stated by others to be but 11 feet at most. The tides are very strong.

Continuation of the Coast from Point Espada to Carthagena.

It has been already said that Point Espada is the West point of the entrance to the Gulf of Venezuela, or of Maracaybo: from it the coast trends about N.W. by N., a distance of 13 miles, to Cape Chichibacoa, and is all so clean and shallow, that the lead is a sufficient guide: and, although the coast is low, there are several peaks which rise inland, the highest of which are named Sierras de Arica, &c.

From Cape Chichibacoa, N. 75° E., at the distance of 10 miles, are the Monges del Sur, or Southern Monks, which are two very small and perfectly clean islets, and may be passed at the distance of half a cable's length, without any fear. About N.E. by E. from them, at the distance of 2 miles, there is another named Monge del Este, or East Monk, which is also very clean; and at the distance of 8 miles N. ½ W. from the first is another group of seven islets, named Monges del Norte, or Northern Monks; these are foul with a reef, and ought not to be approached at less than a mile. The channels which the Northern Monks form with the East and with the Southern Monks, as well as between them and the coast, are very free and clean; therefore there is not the least risk in navigating them.

From Cape Chichibacoa the coast bends nearly W.N.W., 25 miles, to Point Gallinas, which is the most Northerly part of all this coast. From Point Gallinas the coast bends to W.S.W. a distance of 5 miles to Point Aguja, from which a shoal bank extends a mile out to sea. At Point Aguja the coast turns to the Southward, and forms a bay of small extent, named Bahía Honda Chica, or Little Bay Honda, which has very shallow water and affords no shelter: next to this is the harbor of Bahía Honda, the Eastern point of which is 4 miles from Point Aguja.

There is a shoal with only 2 fathoms on it, in latitude 12° 30' N., longitude 71° 46' 30" W. Point Gallinas bears from it S.S.E. distant 5 miles, and Bahía Honda S.S.W. 4 W. Ships of a large draught of water should not go nearer than to bring the low sandy hills on the shore in sight. If clear weather, the high land of Chimane will be seen.

Bahía Honda.

BAHÍA HONDA is a bay of great extent, and its mouth is 3 miles wide. In entering this bay you have only to be careful to avoid a shoal which lies in the mouth of it, and in a line with the two points of the entrance, and which is distant from the West point three-quarters of a mile, and from the East point a mile and two-thirds. This bank, whose greatest extension is nearly E. and W., is about one-third of a mile in length, or a little more; and the least depth of water on it is at the East end, where there is only one foot: upon which, with the slightest wind, the sea breaks. In other respects the bay is shallow and clean, so that no other guide than the lead is required for choosing an anchoring-place in it, the depths being from 4 to 8 fathoms. The coast from Cape Chichibacoa to this bay is low and level, but clean and shallow, so that no other guide than the lead will be required.

From the West point of Bahía Honda the coast runs about S.W. for the distance of 11 miles, to a large bay, named El Portete, the entrance of which is very narrow, and the depth of water in the interior will admit none but small vessels. From El Portete the coast trends about West, 14 miles, to Cape la Vela: the coast is clean, and from Bahía Honda the land begins to rise higher. One league before arriving at Cape la Vela, there is a small hill, in form of a sugar-loaf, against which the sea breaks, and which projects about half a mile to the Northward of the rest of the shore. From this hill the land continues of a good height, rounding Southward so far as the West point, which is that properly named Cape la Vela: about 2½ cables' length to the Westward of this point, there is an islet, or rock, very clean and steep to, which may be passed at a ship's length. The channel between it and the cape is quite clear, and may be run through without danger, there being 5½ fathoms in the middle of it; but it is better to keep nearer the islet than the cape, because there are 5½ fathoms water close to the former, and only 4, or even less than 3, near the latter. The land about Cape la Vela is very sterile, and S.E. from it, about 7 miles inland, there rises a mountain named Sierra del Carpintero, the Carpenter's Mountain.

Cape la Vela

ANCHORAGE OF CAPE LA VELA.—From the cape the shore trends to the Southward, forming a large bay, where there is shelter from the trade-wind to enter it no other guide than the lead is necessary, for all the bottom is clean, and so shallow, that at 2 miles from the coast there are 5½ fathoms, and from that the depth gradually diminishes towards the shore.

CAPE LA VELA TO POINT MANARE.—From Cape la Vela the coast runs *Cape la Vela*
about South, with some inclination Westward, 23 miles, to Castilletis Point, where *la to Point*
there is a grove or group of mangroves, from which the cape bears N. 21° E. From *Manare*.
this point it trends S. 71° W. 11 miles, to Manare Point, and between the two bends
a little to the Southward, with some projecting points. S. 72° W., at the distance of
13½ miles from Manare Point, is that of La Cruz, the intermediate coast being nearly
straight, although the points of Almidones, Pajaro, and the Fonton de Jorote, project
out a little. Between the two latter, at a mile and a half to seaward, lies the Pajaro,
or Birds' Shoal, with 2 fathoms water on it, sandy bottom.

From Point de la Cruz, at the distance of 4 miles S. 51° W., is Point Vela; and at
7 miles from it S. 42° W., are the city and river of La Hacha. The coast thence
trends S. 61° W. and S. 53° W., to Punta Dibulle, which is 31½ miles distant from
the city of La Hacha. From Dibulle Point the coast runs West, and N. 75° W., to
Cape San Juan de Guia, which is distant 38½ miles from Dibulle Point. All this coast,
from Cape la Vela to 12 miles East of San Juan de Guia, sends out a bank of sound-
ings, more or less projecting into the sea, but it is dangerous on account of several
shoals on it, which extend a considerable way off to sea. The first shoal, which is
already noticed, is that named Pajaro; and the second, named Navio Quebrado, or
Wrecked Ship, is situated at 24 miles from the coast, between the Laguna Grande
and the Laguna Navio Quebrado, in latitude 11° 26' 15", and longitude 73° 14' 30"
W.; therefore ships should not approach the coast nearer than 4 leagues; and care
should be taken not to get into a less depth than 20 fathoms. The shore is generally
low; but somewhat to the Westward of the city of La Hacha, the celebrated Sierras
Nevadas, or Snowy Mountains, begin to rise inland, well known, not only for the great
elevation, but also because the summit terminates in two peaks like sugar-loaves,
which are always covered with snow. These mountains extend to the Westward, and
terminate under the meridian of Cape Aguja.

Instructions for the anchorage off the CITY OF LA HACHA.—Although we have *La Hacha*.
said it is not advisable to approach this coast, but to steer a direct course from Cape
la Vela to Cape Aguja, and take care to get into no less depth than 20 fathoms;
nevertheless, as vessels bound to La Hacha must of necessity stand in for the shore,
it is requisite to give some rule by which they may do it without risk. To make the
anchorage off the city of La Hacha, which can be known by a new white cathedral,
visible nearly 15 miles, and which can be seen before you see the land, and being near
the rock or farallon of Cape Vela, it will be necessary to steer S. 53° W., or 55° W.,
with which course run in sight of that coast; and having run 51 miles they will be
on the meridian of the city of La Hacha, in 5½ to 6½ fathoms water, on sandy bottom,
and may then direct themselves to the anchorage without more attention than by the
chart appears necessary, observing that large vessels ought to steer for the anchorage
N.N.W. of the city, in 5 or 6 fathoms; and when they sail from it, they ought to fol-
low this course until they are 3 leagues out.

This anchorage, as well as all others which have no secure distinguishing marks,
demands some vigilance; and as a case may happen in which a vessel may pass it,
the bank of 4 and 5 fathoms, on gravel, sand, and rock, which lies 15½ miles to the
Westward of the city of La Hacha, may serve as a mark for ascertaining her situation.
The snowy mountains of Santa Martha may also serve as good marks for the same
purpose.

From Cape San Juan de Guia the coast runs W.N.W., W., and W.S.W., 124 miles,
to the North part of the islet of Cape Aguja, which forms a prominent or projecting
front of high hills scarped, with deep water close to, with several covers or small bays,
and good anchorages. The islet of Cape Aguja forms, with the cape, a channel of
three-tenths of a mile in breadth; but the passage is very narrow, on account of the
reefs which extend out both from the cape and the South part of the islet; so that,
although there is water enough for any vessel, yet none should attempt it, as by so
doing they run great risk.

To the N.W. of the islet of Cape Aguja there are three rocks, or farallones, very
near each other; and the one which extends furthest out, which is also the largest, is
at the distance of 3 cables' length. There is another, to the Westward of the West
point, which is higher than either of the former, and is also at a short distance; they
are all clean and steep to. From Cape Aguja the coast trends S. 31° W., 3½ miles,
to Betin Point, which is the North point of the bay of Santa Martha, and the South
point of the Bight or Ancon of Tagango; the coast is high and scarped, with some
beaches and indents.

SANTA MARTHA.—The harbor of Santa Martha may be considered as one of the *Santa Mar-*
best on this coast. To the Westward of its Northern point, called Point Betin, at the *tha*.
distance of half a cable, there is a farallon, or rock, named El Morrochica, which is very
clean, so that it may be passed at half a ship's length, if necessary; between it and the
point there are from 5 to 8 fathoms water; but we advise that no one should attempt

this passage, which is very narrow, as there is nothing to be gained by it. About 4 cables' length to the Westward of the same point lies an islet, called the Morro, also very clean, so that it may be passed on either side at the distance of half a cable's length. There is a fortification on this island. The channel between the morro and the rock off the point is very open and clean, with a depth of water from 13 to 27 fathoms. The bay is also very clean, and the bottom good; there is nothing in it to avoid, or give a berth to, but a bank before the city, which extends out about half a mile from the beach; but as the depth diminishes gradually from the edge, the use of the lead will be sufficient to avoid all risk from it. The best anchorage is to the Northward of the city, as much as possible within the cove, or basin: to enter it, pass at about half a cable's length outside of the Morrochica, steering thence so as to pass at about the same distance from some rocks which extend Southward from the point; having passed them, huff as much as possible, and anchor where most convenient, with the precaution of being guarded against the edges which extend from the coast and the points, exhibited in the particular plan of the harbor. On entering into this anchorage, be particularly attentive to the sails, &c., for the gusts of wind come off the land very heavy. The river Manzanares disembogues a little to the South of the city, which, although not large, has very good water.

Light.

A fixed light is proposed, and will probably be shortly erected on Betin Point. There is a rock off Point Betin. It bears from the East end of El Morrochica S. 55° E.; from the S. E. of Point Betin, S. 46° W.; and from the West point, S. 10° W., all true bearings. On its inside it is quite perpendicular, with 5 fathoms, decreasing gradually to the shore: its outside is a quick descent to 9, 12, and 15 fathoms; and on the top of it are exactly 12 feet.

FROM SANTA MARTHA TO THE RIVER MAGDALENA.—From Gaira Point, which is the South point of Santa Martha, the coast trends nearly South, 13 miles, to the Cienega, which is a lagoon, formed by some of the branches of the river Magdalena. From the Cienega it bends to the West, and W. N. W., a distance of 34 miles, to the Western mouth of this celebrated river, named Boca de Ceniza, leaving at 8 miles to the Eastward another, named Boca de Rio Viejo, or Old River. These streams form an island in form of a delta, named Isla de los Gomez, which is 6 miles from North to South, and 8 from East to West. By the two directions which the coast takes from Santa Martha, it forms a very large bay, in the bottom of which is the Cienega. All this coast is low and shallow; and from the Cienega towards the West it forms the Isla de Salamanca, the West point of which is formed by the Boca de Rio Viejo. The waters of the Cienega, and those which form this island, communicate with the Magdalena by several small channels. The current of this great river is so powerful, that at more than 5 leagues out at sea it gives a greenish color to the water, resembling that over a shallow bank. All the bay may be coasted by a hand-lead, for it is all clean. The West part of Isla de los Gomez, and the East part of Isla Verde, or Green Island, form the Boca de Ceniza of the River Magdalena; and in the middle of this mouth there are two keys.

The Isla Verde stretches from East to West a distance of 5 miles, and to the Southward of it is another, of greater extent, called Sabanilla, at the S. W. end of which is a harbor of the same name, with 4, 5, and 6 fathoms water, on sand and mud.

Sabanilla Harbor.

The harbor of Sabanilla is situated about 7 or 8 miles to the South-westward of the Boca Ceniza of the Magdalena River, and is formed by the main-land on the South side, and by the islands Sabanilla, Verde, and others, on the North side. Its entrance is between the point of Morro Hermoso and a shoal bank that extends about 4 miles South-westward from the Isla Verde, and nearly 2 miles from the West end of Sabanilla Island. The extremity of this bank has about 7 feet water on it, and lies about 3 miles North-eastward from Morro Hermoso point.

The land to the Eastward of the anchorage is quite low, and full of trees. It consists of small islands lying about the mouth of the River Magdalena. The shore on the North side of them is safe, by attending to the lead; but should not be approached nearer than 2½ miles.

Coming from the Eastward, and having a distinct view of the S. W. part of the low islands, and the high land to the Southward of them, go no nearer than 2 miles, but continue steering Westward, until the point of Morro Hermoso bears about S by W., and then steer directly towards it, until you bring a small hummock upon the table land to the Southward to bear about S. E., (some yellow-faced cliffs close to the water will then be seen, and nearly on with the said hummock.) You may then with safety haul up for it, and it will lead you clear to the S. W. of the shoal that stretches off 2½ miles S. S. W. from the low islands, with only 5 feet water on it. Keep this latter mark on, and run S. E., until you get a small whitish-looking house to the right of the fort, and close to the water, a little to the Eastward of the highest part of the highest of three hills at the back of the fort, bearing E. N. E.

then haul up for it, which is about as high as a ship will lie, as the wind is generally at N.N.E.

But if, in going in, you should happen to get into 7 fathoms water, before you have the latter mark on, bear up to S.W. immediately, until you deepen to 9 or 10 fathoms, which you will soon do. The reason for this precaution is, that if you are without the bark, you may have 6 fathoms, and before another cast of the lead can be had, the ship be on shore.

On a line with the S.W. part of the shoal and the main-land, there are not more than 6½ fathoms water. Ships of a small draught may anchor close to the fort, in 3 fathoms.

There are good turning-marks for working up to the fort, but rather difficult for strangers to understand. In standing South-eastward, be careful to keep a good look-out for a small red or yellow spot in the land to the N.E. of the custom-house, and keep it open of the fort. In standing Northward, keep a very small hillock on the land, a considerable distance off, just open of the South easternmost low land, though this will not be known unless pointed out. Large vessels may work in by standing no further to the S.E. than the depth of 5 fathoms, nor to the Northward than 5½ fathoms. In mid-channel, above the line of the S.S.W. part of the reef, there are no more than 6½ fathoms, on muddy bottom. The soundings are very regular, but in standing towards the reef it is steep to.

The fort is not very conspicuous, but may be seen 8 or 9 miles. It has 6 guns, which cannot be seen one mile off, and a small howitzer. It is situated on a rising bluff under the high land.

About 34 miles from the nearest shore, with Morro Hermoso bearing between E. N.E. and N.E., distant 5 or 6 miles, there is a rock, with 11 feet water on it, and 6 fathoms all round it.

A frigate might work up half or three-quarters of a mile nearer the fort, and anchor in 5 fathoms, to windward of all the red-faced land. About 3 cables' length off lies a rock just above water, with two others close to its North side, with 2 feet on them; and another 20 yards N.E., with 4 feet on it. There are 4 fathoms close to their N.W. side, and 2½ fathoms between them and the shore. The custom-house kept open of the fort clears them. Although these rocks are out of the track of vessels working up, it has been thought proper to notice them, as they are dangerous for boats.

COAST BETWEEN ISLA VERDE AND GALERA POINT OF ZAMBA.—From the Isla Verde the coast trends S. 53° W., for a distance of 33 miles, to Galera Point of the island of Zamba, or Zamba Point: the shore between forms a bay of 5 or 6 miles in depth, all of it being shallow: for, at 3 leagues from the shore, there are only 26 fathoms of water, on muddy bottom. The Caseabel and Palmarito Shoals are in it; the first, very near the coast, in the middle of a little bay formed by the morros, or hills of Darias and of Inasco: the second is more dangerous, for it lies at a league off shore, N. 26° W. from Morro Pelado, or Bald Hill.

ANCHORAGE OF GALERA DE ZAMBA.—The Galera Point of Zamba is so *Galera de Zamba*. low that, when there is a fresh breeze, the sea washes over the greater part of it. To the West, W.N.W., and N.W. of its Western extremity, and at the distance of 2 miles from its most projecting part, there are four small banks, of different sizes, with 5 fathoms water, on black sand. Between these banks, and between them and the coast, the depths are 7, 8, 9, and 10 fathoms, black sand. This Galera Point of Zamba projects into the sea about 8 miles, and forms on its South part an anchorage, sheltered from the breezes: but in taking it, great care is necessary, on account of the banks in it, and of the Isla de Arenas, or Sandy Island, which lies in the middle of the bay of Galera de Zamba: therefore, every one intending to enter into this anchorage must pay great attention to the hand-lead.

At S. 20° W., distant 11½ miles, from Point Galera of Zamba, is the Point of Canoas, which is low at the water's edge, but hilly very close to it. Between these two points the coast is of moderate height; and at about one-third from Point Canoas there rises a hill forming table-land at its top, with several barrancas, or reddish-colored ravines, upon it, called *Bujio del Gato*. On the intermediate coast there are several dangerous spots. Of these, the first is the islet *Caseajal*, which lies from the Point Galera of Zamba S. 6° E., at the distance of 6 miles, and from the coast a long ¼ mile. North, and N. 6° E., from this islet, at the distance of one mile and three-tenths, and eight-tenths of a mile, are two little banks, with 2 and 4 fathoms water on them; and there is another of equal depth, lying N. 58° W., at the distance of 2 short miles from the *Caseajal*. S. 14° W. from the Point Galera of Zamba, and at the distance of 7 short miles, is the West rock of *Bujio del Gato* Shoal, which extends a long half mile from North to South. At about N.N.E. from its North extremity, distant half a mile, there is another rock, called the N.E. Rock, or *Uña de Gato*, Cat's Claw. The depth on the outside of this shoal is 7, 8, 9, and up to 11 fath-

oms, at the distance of $2\frac{1}{2}$ miles. There is also, at the distance of $3\frac{1}{2}$ miles N. 31° E. from Point Canoas, a rocky bank, of 3 fathoms water. This lies in the middle of the bay of Bajío del Gato. We ought to warn the navigator that going into this bay is dangerous, especially by night, and if he is compelled to do so, he ought not to go into a less depth than 20 fathoms.

Negrillo Shoal.

NEGRILLO SHOAL.—The point of Canoas has lying off it, at the distance of one long mile and a quarter, S. 49° W., a shoal, called the Negrillo, of one-quarter of a mile extent. It is composed of three rocks, at a short distance from each other, in a triangular form, with from 2 to 5 feet on them. All round these rocks, and very near to them, there are 6, 8, and 9 fathoms water, on a bottom of rocks, small gravel, and sand; and the channel between them and the coast would be practicable, were it not for three sunken rocks, which make it difficult to pass. From the Negrillo shoal, the hill of La Popa, at Cartthagena, bears S. 44° W., distant $7\frac{1}{2}$ miles; and this bearing may, if necessary, serve to guide the navigator clear of it. At S. 50° W., a short mile from the Southernmost morrito, is the Cabeza Shoal, with 2 feet of water on its shoalest part.

There is a reef of rocks, Canoas Point bearing N.E. $\frac{1}{2}$ N., distant about 3 miles, consisting of several heads of rocks, about 100 yards in length, with 3 to 5 fathoms between them, 7 fathoms all round them, and on the tops, which are sharp pointed, from 4 to 5 feet.

Cartthagena.

CARTHAGENA.—From Canoas Point the coast trends to the Eastward a long mile; and thence it bends round to the Southward 3 miles, where rise some little hills, called Los Morritos. From these, the coast, which is low, and covered with mangroves, trends S. 33° W., $5\frac{1}{2}$ miles, to the city of Cartthagena, which is built upon the Western part of this swampy land. About $1\frac{1}{2}$ mile to the East of the city, rises the hill of La Popa, on the summit of which there is a convent of Augustine monks, and a chapel or sanctuary, dedicated to the Virgin of La Popa. In clear weather, this hill may be seen, from the quarter-deck of a line-of-battle ship, at the distance of 10 leagues.

Harbor of Cartthagena.

HARBOR OF CARTHAGENA.—The little tongue of land on which the city is built, extends S.S.W., 2 short miles from it; then turning round to the East, it forms with the main-land, a basin, which is the anchorage or harbor, and which is as well sheltered as the best arsenal. One mile to the Southward of the exterior point of the little tongue, of which we have just spoken, is the North Point of the island called Tierra Bomba, and the passage which is formed between the two is called Boca Grande, and is artificially closed in such a manner, that only boats, and vessels drawing very little water, can enter by it. Tierra Bomba Island is about 4 miles from North to South, and its South point is the North point of Boca Chica, which is the only entrance to the harbor of Cartthagena. The South point of this entrance is the North point of another large island, named Barn, which is separated from the main, and by a creek named Passa Caballos, navigable by canoes only. On both points of the Boca Chica there are castles to defend the entrance. This boca, or entrance, is rather more than 2 cables' length in width; but there are parts of it where the bank of shallow water which extends off from the Southern castle (San Josef's) narrows it one half.

This entrance opens first into a large and well-sheltered bay, where there is a depth of 13 and 15 fathoms. To the North of this the Eastern coast of Tierra Bomba inclines towards the main-land, leaving a channel of a mile in width, at the entrance of which and in its middle, are some shoals, which lie to the Westward of an islet called Brujas, and which is very near to the main land. Through this strait is the entrance into a second bay which corresponds with, or is opposite to, the Boca Grande, and in which there are also 14 and 15 fathoms. To the North of this second bay there is an entrance less than half a mile wide, defended by other castles, and which conducts into the harbor. This channel or entrance has a shoal in the middle, which forms it into two very narrow channels, but with 6 to 12 fathoms water; and the depth in the anchorage nowhere exceeds 14 fathoms.

Having given an idea of the harbor, we shall now speak of the exterior coast and the shoals.

Bank of Boca Grande.

BANK OF BOCA GRANDE.—From Point Canoas to Boca Grande there is a large bank, on which the depth of water diminishes gradually; and there are 9 fathoms at 4 miles, or somewhat less, from the land. This bank is named the Playa Grande, and ships may anchor on it, in 7 or 8 fathoms water, on a bottom of gray sand, in front of the city. After passing the most Northerly part of Tierra Bomba, the depth increases to 20, 30, and 40 fathoms; and at 2 cables' length from the shore there are 6. To the Westward of Tierra Bomba, at the distance of 4 miles, there is a shoal, called the Salmolina, which has been much spoken of an account of the great loss of ships which, it has caused. This shoal, which is a little more than a mile in

extent from North to South, and a little less from East to West, lies with the following bearings:

The Head or North Edge of it.

The Castle del Angel.....	S. 61° E.
Hill of La Popa.....	N. 68 E.
N.W. point of Tierra Bomba.....	N. 80 E.
Point Canoas.....	N. 35 E.

The South Head, or Edge, on which the sea generally breaks.

The Tower of the Cathedral.....	N. 55° E.
Hill of La Popa.....	N. 62 E.
N.W. point of Tierra Bomba.....	N. 70 E.
Point Canoas.....	N. 33½ E.

In addition to these marks, by which it may with certainty be avoided, in running from Playa Grande for Boca Chica, ships ought to get into from 6 to 8 fathoms, to the West of the city, and at the distance of 3 short miles from it, and then steer South, without inclining anything to the Westward; and so soon as the depth increases keep more to the port hand, in order to close in with Tierra Bomba to the distance of half a mile; and run along thus, closing to within a pistol-shot of the North shore, at the entrance of Boca Chica, avoiding the South shore, which is foul. To enter Boca Chica, and navigate within the bays, up to the harbor, requires a pilot, and one may always be obtained at Boca Chica.

Ships having occasion to anchor and stop in Boca Chica, should haul round the S.W. point of Tierra Bomba, at the distance of half a cable's length, and run along by the beach, until the centre of San Fernando castle bears N.E., true, and then drop an anchor in 13 fathoms, at about 100 yards from the beach. They may then drop with two-thirds of a cable on the N.E. anchor, and half a cable on the S.W., in 16 fathoms, which ought to be the bearings of the anchors. When moored, the centre of San Fernando castle will bear N.E., as before, the centre of San Josef castle, E.S.E., and the extremity of Tierra Bomba, W.N.W.

As the harbor of Carthagena may be made by ships from the Southward, it is necessary to give some description of the South coast, as far as the islands of Rosario, in order to connect all the information required for making the land with correctness and safety.

We have already said that the South coast of Boca Chica is the North coast of the Island Baru. The exterior coast of this island, from the point forming the entrance of Boca Chica, trends S. 35½° W., for 13 miles, to Baru Point. This coast is sufficiently clean as far as an islet, named the Farallon of Perico, from which to the South is very foul, with a reef. To the Westward of this latter part of the coast, that is from the Farallon of Perico Southward, are the islands of Rosario, of which there are four principal ones, with several small islets. The Eastermost and Southermost of these, which is also the smallest, is named Isla de Arenas, and it is distant from the shore of Baru scarcely ¼ mile; but the channel between them is reduced to three-quarters of a mile, by the reefs and shoals which extend from both sides. W.N.W. ¼ W., at the distance of 3½ long miles from Arenas Island, is the Island of Rosario; and to the Northward of these two, is that named Isla Larga, or Long Island, which is the largest, and which, with its banks, shoals, and islets, extends out to the Westward further than the Rosario Island. To the Northward of the middle of Isla Larga, at a little more than 3 miles distant, lies the Islet Tesoro, with a reef to the Westward. The channel between them has from 17 to 25 fathoms water, on a bottom of sand and rocks, from which Boca Chica bears N. 63° E., distant 10½ miles. By the chart it bears N. 57 E.

The Rosario Islands are very foul, and no one should sail among them unless well acquainted; but always keep at a sufficient distance to the Westward, in order to avoid the shallows which extend out from them. About S.S.W., distant 7 miles from Rosario Island, there is a shoal called the Tortuga. These islands are fertile in trees, and to the Southward of them there is good shelter from the trade-wind. Between the bank of Rosario Island, there are two others, one 3½ miles to the W.N.W., and the other 2½ miles S.W. by S. Both are rocks and sand, with 6 and 7 fathoms water on them.

Observations on Navigating on the Coast of Colombia, from the Dragon's Mouth to Carthagena.

Reflecting on what has been stated respecting the winds that are experienced on this coast, it would appear that nothing further need be added to the description already given, to enable the navigator to prosecute his voyage with the greatest safety. In fact, as there is on this coast only the general breeze, or trade-wind, neither hurricanes nor hard Norths are to be feared, the first being absolutely unknown, and the second, if they do at any time occur, never exceed the strength of the ordinary breeze. If in the rainy season, that is, from May to November, there are sometimes strong Southerly winds, they must be considered rather as squalls with heavy rain, of short duration; and as they blow off shore, do but little injury. This coast, therefore, especially as far as Cape La Vela, may be considered as a continued harbor, as far as climate is concerned; and no more is necessary to enable us to avoid every danger upon it than a reference to the description given; for we are sure that the loss of a vessel upon it has been very rarely the effect of a storm.

From Cape La Vela Westward, it is proper to give some notices; for as the breezes, especially from Cape Aguja, or rather from Point San Juan de Guia, are exceedingly strong, so much so that they may be considered as real gales, it becomes necessary to present some rules for making the different harbors, to prevent as much as possible those accidents that, during such unmanageable winds, might prove of the most serious consequences. The shifting of the wind, which we have before said sometimes changes from the W., from June to November, raises some doubt with respect to the navigation; and therefore the following reflections will not be considered irrelevant, for though they may not be necessary for those who are acquainted, they cannot fail of being beneficial to those who are not so.

The principal commercial establishments on this coast are Cumana, Barcelona, Laguayra, Porto Cabello, Maracaibo, Santa Martha, and Carthagena; Pampatar, in the island of Margarita, and Santa Ana, in the island of Curazao. It being a general rule on this coast, as well as in the whole sea of the Antillas, or Caribbean sea, to make the land to windward of the port of destination, as a matter of necessity, to prevent the trouble consequent upon getting to leeward of it, we may say with safety, that being once within the sea of the Antillas, all those who intend to anchor at either Margarita or Cumana, should close with the coast about Cape Mala Pasque, or Cape Three Points, passing in preference through the channel which Margarita forms with the main-land, as we have before stated in the description. This route also appears preferable for those who are bound to Barcelona, although there certainly can be no inconvenience in their going to the Northward of Margarita.

Those who are bound to Laguayra from Cumana or Barcelona, should shape a direct course from Cape Codera, passing always between the Island Tortuga and the coast; but those who, from windward, are bound to that port, should navigate to the Northward of Tortuga, to approach the coast about the same cape, or a little to leeward of it, taking care, if they choose, to make the rock called the Sentinel, which lies to the Northward of the cape. For those bound to Porto Cabello, it will not be so necessary to make Cape Codera, as any other point on the coast will answer the same purpose, provided it be sufficiently to windward of their port.

To make Cape Codera, or any harbor upon the coast to leeward of it, every one may do it in the manner that is easiest, or that he considers best; that is, he may just through any of the straits or passages that are formed by the islands to the Northward of the coast; in doing which, nothing more is necessary than to attend to the description of the one that he takes.

Those bound to Maracaibo from the East, should get sight of Cape St. Roman, and those from the Westward should make Point Espada. In running for Cape St. Roman, they may pass either to the Northward or Southward of Curazao; and from that cape they may run along by the coast, until they get about 2 miles to the Westward of Point Macolla, which is the situation from which the course to the bar is certain, as has already been stated in the description.

Should the navigation to Cape St. Roman be made outside the islands, it should be recollected that the Roques and the Islas de Aves are extremely dangerous on their North sides; and to the end that they may be careful to keep themselves at a sufficient distance from them, especially by night, they must not forget to apply to their reckoning for the night, a correction for currents which they experience during the day, as deduced from the comparison of the dead reckoning with the points of departure and landfalls. The due observation of this remark is very important, as from what has been before stated relative to the currents, they in this place require particular attention.

Those bound direct for Santa Martha, or Carthagena, ought unquestionably to navigate outside all the islands, so as to make that of Oruba and the land about Cape La Vela: for, having obtained a sight of the latter, they may with safety shape a direct course for Cape Aguja, in order to reach the anchorage of Santa Martha, as before directed. We speak of the propriety of navigating to the Northward of all the islands, because by so doing a more direct course may be shaped, and the distance be thereby shortened, which is well known to every skilful navigator.

Those who, without touching at Santa Martha, go on to Carthagena, will shape a direct course from Cape Aguja for the mouths of the River Magdalena, whence, by passing about 2 leagues to the Westward of Point Zamba, and 13 from Point Canoas, they may proceed direct to Boca Chica, or else anchor off Point Canoas, or on the bank of Playa Grande, if they should not be able to effect an entrance into Boca Chica with daylight. Calculation ought to be made, in order that the distance may be proportioned at the rate the vessel sails at, or the sailing of the vessel to the distance to be run, so as to reach Point Zamba, and thence take the Boca Chica by day; or anchor off Point Canoas, or on Playa Grande, in order, if possible, to avoid the necessity of hauling the wind for the night, which will be troublesome and injurious to the ship and her rigging, in the time of the hard breezes; but if there be no means of avoiding it, the situation must be maintained by short tacks off and on; or, if the wind and sea will permit, let go an anchor.

When we advise a direct course to be shaped from point to point on the coast, as Aguja, Zamba, and Canoas, it is not only on account of distance, which would be greatly lengthened by following every turn of the coast, but also for the purpose of avoiding the various shoals and dangers which lie between Cape La Vela and Point Aguja, as noticed in the description of the anchorage of the city of La Hacha, as well as those lying between Point Zamba and Point Canoas, among which we recommend no one to go with a large vessel.

If, during the season of the breezes, it is necessary to follow the route which we have described to Carthagena, from any place situated to the Eastward of, you ought, in the season of the rains, or during the vendavales, to steer true West from Cape La Vela, in the parallel of 12° , or somewhat more, in order to reach the breeze, until you get so far as $75^{\circ} 15'$ or $76^{\circ} 15'$ West longitude; and from that station to steer South, coming up by degrees to S. E., on getting into the limits of the rains; observing, also, that it is better to make the land to the Southward of Boca Chica than to the Northward of it, because in this season the currents set to the N. E., though in the season of the breezes they run to the S. W. Particular care should likewise be taken, not to run in upon the land by night, but only by day; for at such times the land is very hazy.

In working to windward on this coast, from Carthagena to Margarita, or Trinidad, haul close by the wind, and make the boards as long as convenient. The proper time of tacking ought to be decided by the daily variation of the trade-wind, which, at about 12 at night, or somewhat sooner, comes off the shore from about E. S. E., or even S. E., if it has been raining before, and the ground is soaked; and from 9 to 11 in the forenoon, the sea-breeze, or that from E. N. E., comes on. At all distances from the shore these variations take place; and the navigator may, and ought, to take advantage of them in working from leeward to windward; therefore when at night the breeze gets to the S. E., it will be proper to tack, and stretch off from the land until the morning; and when the wind gets to the Northward of East, he ought to tack and stand in towards the land again. And if, on account of hearing the land he cannot continue on the same tack until the breeze changes, he ought to make short tacks along shore until the breeze again changes to E. S. E., and then again stand out to sea. By these means two long stretches may always be made, one to the N. E., the other to the S. E.; that is to say, both of them within eight points of the compass. By working to windward on short tacks along shore, this advantage cannot be obtained, because the breeze always blows along the coast, unless sometimes there may be a light land-wind in the night, and before the sun rises during the season of the rains; but they do not last, and such variations afford but little assistance.

Very small vessels cannot proceed upon this system when the breezes are very fresh, which, from Point Aguja to the Isla Fuerta are like storms, with a rough sea, so that they cannot make any way; in these cases, it is most advisable for them to keep in near the coast where the water is smoother. But large vessels, well equipped, and capable of resisting these gales, or when the breezes are moderate, ought to make long stretches when the wind will admit of it, in the manner already describe.

Observations by Capt. Don Tarquato Peñola.

On the coast of Cartagena de Indias, of which I can speak with certainty, the breezes do not begin until the end of November, and generally with little strength until the middle or end of December, from which time they are powerful both day and night; only they frequently, but not always, moderate a little between sunrise and 9 or 10 in the morning, when they recover their ordinary force. When you are very near the coast, especially if it be high, you may often find them moderate at the dawn of day, and at sunrise veer to E. N. E., until 9 or 10 o'clock, when they again blow in their usual direction, which, on this coast, is from N. N. E. to N. E. Of these variations, those who are acquainted with the coast, and sail near it, may take advantage; and it may be better, at nightfall, to anchor at the various points which offer, even for large vessels. In the season which is not of the breezes, that is, from April or May until December, they experience the wet season, but not in the other seasons, as has been made manifest; adding, that a vessel which attempts to get to windward on-side will not accomplish it without great difficulty and damage, as much from the strength of the breeze, because the sea is very rough and short, as far as 30 or 40 leagues from the coast, when it becomes longer; and because being forced in the night to take in the reefs, and that the current draws towards the N. W. quarter, it results that the little gained by tacking is lost by these causes. These facts have been proved by continued experience.

COAST OF COLOMBIA, MOSQUITO, HONDURAS, AND YUCATAN.

From Cartagena to Cape Catache.

[From the *Derradero de las Antillas, &c.* &c.]

*The Rosario
Islands and
Island of
Baru.*

THE ROSARIO ISLANDS and ISLAND OF BARU have been described in the preceding section, and it has also been noticed that the latter is separated from the main-land by a narrow channel, named the Paso Caballos (Horse Pass). The North end of the channel opens into the first bay of Cartagena; the South end of it into the N. E. part of a great bay between the island of Baru and the coast, which extends inward, North-easterly, nearly 12 miles: the points which form its entrance are, the S. W. end of the Island Baru on the West, and Barbaecos Point on the main-land, on the East. This bay is named Barbaecos, or the Little Gulf of Baru: it has several shoal spots in it, but is generally clean, with a depth of 3 to 9 and 10 fathoms, on fine sand and ooze; the most general depth being from 4 to 5 fathoms. In it there is very good shelter from the breeze: and, in entering, care must be taken to avoid the edges of the shoal ground that extends from the Rosario Isles, and not to forget the Tortuga Bank, which lies at the distance of 10 miles, S. 42° W., from Rosario Island, with 7½ fathoms water, on sand and rock.

At one mile N. 41° W. from Barbaecos Point, is a shoal, the least water on which is 2 fathoms; and there is another, lying S. 82° W., 2½ miles from the same point, with from 1½ to 2 fathoms on it; these are named the Barbaecos Shoals. Besides these, there are two others, named Atillo and Matunilla; the first lies N. 25° W., distant 3½ miles from Barbaecos Point, with the depth of one foot, on rock; and the second lies N. E. by N., nearly 5 miles from the same point, and has very little water on it.

From Barbaecos Point the coast runs about S. 8° W., 15½ miles, to the Fronton, or Bluff of Tigua; this is easily known, because a cerro or hill rises on it, which is the highest of any on this part of the coast. From this Fronton, a bank, with little water on it, extends to the North a little West-ly, about 1 mile, the extremity of which, opposite to Point Comisario, (the first projecting point to the North) extends 2½ miles from shore. From the Fronton or Bluff of Tigua, to the Boqueron or Point San Bernardo, it is 12 miles S. 25° W. To the North-eastward of Point San Bernardo, and in the direction of the coast, are two islets; the Northernmost, named Isleta de Jesus, and the Southern one, Cabrana; they lie respectively at 4 and 3 miles from the point.

DT.

Trola.

peak with certainty, the rally with little strength are powerful both day and night, and the wind is little between sunrise and sunset. When you are very near moderate at the dawn when they again blow in to N.E. Of these varieties, it may take advantage; points which offer, even for that is, from April or May to the other seasons, as his is to get to windward our advantage, as much from the N. short, as far as 30 or 40 miles, being forced in towards the N.W. quarter, it causes. These facts have

TO, HONDURAS.

che.

e., &c.]

RU have been described in the latter is separated from the Bahías (Horse Pass) The Bahía; the South end of Barú and the coast, which forms which form its entrance and Barbacoas Point on the north, or the Little Gulf of Barú, with a depth of 3 to 9, and 10 fathoms, being from 4 to 5 fathoms, entering, care must be taken to clear the Rosario Isles, and not to pass within 10 miles, S. 42° W., from the coast, the least water on which is 10 miles from the same point, Barbacoas Shoals. Besides these, the first lies N. 25° W., with a depth of one foot, on rocks; and the second point, and has very little

15½ miles, to the Fronton, or the hill rises on it, which is the Fronton, a bank, with little or no depth, the extremity of the point to the North, extends to the Boqueron or Point San Bernardo, the Northernmost, named Isla de San Bernardo, respectively at 4 and 3 miles from

The point of San Bernardo is the S.W. point of a drowned mangrove key; between it and the coast there is a narrow channel, called the Boqueron, frequented by canoes and pirogues. S. 20° E. from the Point San Bernardo, nearly 2 miles, lies a rocky bank, called the Pajirito, (Little Bird Rock,) the least water on which is 3½ fathoms, and the most 4½ fathoms.

To the Westward of San Bernardo Point lie the islands of the same name, which are eleven in number, including those of Jesus and Cabrera, already mentioned, but without including some other small islets of little consideration. The edge of the banks on which these islands are situated extends to the Westward 15 miles, and nearly 10 from North to South. Various little channels are formed between them. The depth on the bank to the West and South of these islands is very unequal; for you may suddenly pass from shallow into deep water. All the islands are low, and covered with trees.

SALAMANQUILLA CHANNEL.—The Salamanquilla Channel lies to the Eastward of the San Bernardo Islands, or rather between the bank on the E. and S.E. side of the Island Salamanquilla, and that on the West side of the Islet Cabrera. Its direction is N. 17° E., and contrary, and in the narrowest part is only three-tenths of a mile wide; but the depth is from 9 to 12½ fathoms, clay, with 5 fathoms at the edges of the banks. The banks have but little water on them, and therefore, unless precisely in the middle of the passage, there is great danger of grounding. The channel is nearer to Salamanquilla than to Cabrera; therefore it is necessary to pass nearest to the former; and if the weather be clear, the banks may be seen, by which ships may sail through with less risk; but, in thick cloudy weather, the lead is the only guide.

SAILING THROUGH THE SALAMANQUILLA CHANNEL.—To sail through this channel from the North, as soon as you have passed to the Westward of the Rosario Islands, steer toward the Cerro, or Hill of Tigua, bearing in mind that the shallow bank, called the Tortuga, lies N. 63° W. from that hill, which will be a sufficient guide for giving it a suitable berth; that is, you must not steer towards Tigua Hill when in that direction, but either to the Southward or Eastward of that bearing. Stand on until the Easternmost of the Rosario Islands, named Salamanquilla, bears South, from which situation you may steer S.S.E., until the Hill of Tigua bears N.E.; and then steer S.W., keeping the same bearing on; and keeping in mind what has been previously said of this channel, have persons on the lookout for the banks which stretch off from both sides, and which, as we have before said, show plainly.

GULF OF MORROSQUILLO.—Having passed through Salamanquilla Channel, and being opposite to San Bernardo Point, you will discover the great bay of Tolu, called also the Gulf of Morrosquillo, which is formed by the islands of San Bernardo Point on the North, and the Island Fuerte on the South. The latter lies with the Southernmost key of the former bearing N. 16° E., distant 26 miles. All this gulf has a good depth of water, there being from 9 to 23 fathoms, green ooze; therefore a ship may anchor in any part of it during the season of light breezes, calms, and variable winds.

TOLU.—Thirteen miles S. 33½° E. from Point San Bernardo, in the bottom of the gulf, is the town of Santiago de Tolu, situated close to the sea; this town lies 13 miles N. 63° E. from the mouth of the harbor of Cispata, and is in lat. 9° 30' 56". The land in the vicinity of this town is plain, with savannas, which extend to the North, East, and South, terminated on the East by a chain of mountains, over which here rises one mount forming two round hummocks, named the Tetras de Tolu; these lie 12 miles to the Eastward of the town, and are useful marks for recognizing the coast.

In order to pass to the Westward of the islands of San Bernardo, it is necessary to keep at about 6 miles from the Northernmost of them, named Tintipan; and then not steer to the Eastward of South, until the point of San Bernardo bears E. by N., in which direction you may steer towards it if you choose. It is very convenient for those bound to Santiago de Tolu, to enter by the Salamanquilla Channel; and as soon as they are advanced to abreast of San Bernardo Point, they will see the Tetras de Tolu, which mark they can direct themselves to that town. Of other hills, which are seen to the Southward, the Easternmost is called Santero; it bears from the point of San Bernardo S. 5° W., distant 21 miles; and the Westernmost, named Cispata, bears S. 29° W., distant 25 miles from the same point. Neither the North side of this hill is the harbor of Cispata. Cispata Hill is not so high as that of Santero; steering directly between the two, will lead direct to the entrance of this harbor, bearing in mind what was before said.

PUERTA DE CISPATA.—The mouth of Cispata Harbor lies S. 16° W., at the distance of 17½ miles from the point of San Bernardo; and the point of Zapote, which is the Eastern point of the harbor, is in latitude 9° 24' 19", and longitude 75° 51'; the Western points are Terraplen and Balandra, distant from each other one mile,

Salamanquilla Channel.

Gulf of Morrosquillo.

Tolu.

Puerta de Cispata.

and covered with high mangroves, extending into the water. From its mouth the harbor runs in S. 64° W., to the distance of 7 miles. This harbor is well sheltered from seas and winds, and the best anchorage is on the Northern shore, between Habandra and Navios Points; the latter being very remarkable from its projecting out to the Southward. The hills of Santero and Cisputa will serve to find this harbor exactly; the middle and highest part of the former lies S. 18° E., distant above 4 miles from the Fronton, or Point of Zapote; near this hill, and to the Westward of its North part, is the village of Santero, at the distance of 2 miles from the little bay of Zapote. The highest points of Cisputa Hill lie S. 27° 30' W., 8 long miles from the said Fronton, or Point of Zapote.

The River Sanu disembogues into the interior of Cisputa Harbor: it forms almost a semicircle towards the West and South, passing by the Southern slope of Cisputa Hill, including to this point the village of San Bernardo del Viento on the left bank, and the villages of San Nicolas and Santa Cruz de Lorien on the right.

From the Mezizos Point, which is the Northernmost point of Cisputa Harbor, the coast runs S. 81° W., S. 70° W., and S. 63° W., to Point Piedras, a distance of 17½ miles: in the intermediate space, and on the bearings mentioned, are found the Ciénaga de Venidos and Punta del Viento, (Wind Point,) between which is the part where the bank extends furthest from the coast; for there it extends 3½ miles Northward, and 6½ miles Westward, with a depth of 3, 4, and 5 fathoms, sand and rock, and also sand and ooze.

Punta de Piedras forms a front in the direction of S. 40° W., for 3 miles; it is of moderate height, scarped, and foul at the water's edge; at its N.E. end a small bay is formed, and to the Northward of it, at the distance of 2 cables' length, lies a little high rock, with some shoals half a mile to the N.W. of it. These shoals extend nearly a mile from N.E. to S.W. and have some rocks above water, and others which appear only at low water; the depth on them is from 1½ to 2 fathoms. Those who run along near this coast ought to take care and keep the lead constantly going.

The S.W. extremity of the front or bluff of Point Piedras is called Point Rada, and at the distance of 5 long miles S. 39° W. from it, is Punta Broqueles, low and rocky, with a reef which extends out Northward 2 cables' length. At a short distance from this reef lies the Toro, or Bull Shoal. Between Broqueles Point and Rada Point is the bay named Elsenada de la Rada, which has a low bencheshore; it is shallow, with 3½ fathoms, on oozy bottom, at the distance of 8 to 9 of a mile. S. E. from this bay a ridge of hills may be seen, extending N.E. and S.W., having three remarkable peaks, the highest and largest of which lies about 5 miles South-eastward from Point Broqueles.

la Fuerte.

ISLA FUERTE.—The N.E. end of Fuerte Island lies S. 84½° W., 21½ miles from Point Mezizos, and from the N.E. part of Point Piedras S. 57° W., 6½ miles. The island is one mile and a quarter in length from North to South, and somewhat less from East to West: it is high in the middle, and covered with trees and royal palms, which appear above the others. It can be approached at the South point, named Arenas Point, only; because it is surrounded by reefs, with various scattered rocks, some of which appear above water, and others do not. On the back, on the outside of the reef, and even on them, there are from 2 to 4 fathoms water, on rock and coarse sand. Besides these banks, which surround the island, there are two other small ones; the one with 1½ fathoms, sand, lies S.S.W. from the island, distant one mile; and the other, with 5½ fathoms water, sand, and gravel, lies S. 28° E., distant a long mile from Arenas Point. In the channel between the island and the main-land, there are from 6 to 11 fathoms water. The island may be seen from the deck of a brig or schooner at the distance of 20 miles.

S. 19° W. from Broqueles Point, at the distance of about 56 miles, is the point Caribana, which is the Northernmost point of the Gulf of Uraba, or of North America.

The intermediate coast forms bays, trending inward 6 miles, or somewhat less, and in this space is the fronton and hill of Tortugon, which is remarkable; the point of Arboletes, or Little Trees, San Juan and Savanilla: that of San Juan is high and scarped, the others are low to the water's edge, with benches from one point to the other. The interior is a low range of hills, terminating near the cerros, or hills of Savanilla, which are about 4 miles S.S.E. from the point of that name. All this coast has a bank lying along it; so that, during the season of light breezes, or of variable winds and calms, ships may anchor on it, at any convenient distance from the coast according to the size of the vessel. There are no other obstructions on it than farallon, which lies S. 39° W., a long mile and a half from Broqueles Point; the Island Tortuguilla, which lies 16 miles S. 37° W. from the same point, and nearly 10 miles from the fronton and hill of Tortugon, rather more than 4 miles; and the Gigantones Shoal, which lies S.W. from Savanilla Point, at the distance of a long mile; this, lying near the shore, presents no danger, except to those who run near the coast, or Gigantones Point. Tortuguilla Island is low, and covered with trees; a small reef extends from it Northward, with very little water on it.

er. From its mouth the harbor is well sheltered on the eastern shore, between a headland from its projecting out to sea to find this harbor extends 18° E., distant above 1 mile, and to the Westward of 2 miles from the little bay 30° W., 8 long miles from

Harbor: it forms almost a Southern slope of Cispata del Viento on the left bank, on the right. The point of Cispata Harbor, the Piedras, a distance of 17 miles, is the part where the bay extends 33 miles Northward, and is composed of mud and rocks, and also

40° W., for 3 miles: it is of a small bay of 2 cables' length, lies a little above water, and others which extend to 2 fathoms. These will lead constantly going.

The point is called Point Rada, is Punta Broqueles, low and of a small length. At a short distance between Broqueles Point and the main land has a low benchy shore of a distance of 8 to 9 miles, of a mile. S. 10° E., and S.W., having there about 5 miles South-eastward

lies S. 84° W., 214 miles from the main land, N. 57° W., 62 miles. The bottom is South, and somewhat less for the trees and royal palms, which are the South point, named Arenas, various scattered rocks, some on the back, on the outside of the reef, and on rock and coarse sand, are two other small ones, the first, distant one mile; and the second, distant a long mile from the main-land, there are from the deck of a brig or schooner

about 56 miles, is the point of Uraba, or of North Darien, and 6 miles, or somewhat less, which is remarkable: the point is that of San Juan is high, and benches from one point to the other near the cerros, or hills, of that name. All this coast is of light breezes, or of variable distant from the coast, and other obstructions on it than the Gulf from Broqueles Point, at the same point, and nearly Westward, than 4 miles; and the bay at the distance of a long mile to those who run near the coast, covered with trees; a small bay in it.

CARIBANA POINT.—*Gulf of Uraba or Darien.*—Point Caribana, as we have already said, is the Northernmost point of the Gulf of Uraba: it is low, with trees on it, and surrounded by rocks close to it. It is readily known, because from it the coast trends to the South to form the said gulf, and also by the Cerro de Aguila, or Eagle Hill, which is near it: this hill is in latitude 8° 37' 50" N., and longitude 76° 56' 30" W.; and from it, Cape Tiburoo, which is the Western point that forms the Gulf of Darien, bears N. 84° W., 29 miles distant.

Aguila Hill, although of moderate height, is remarkable from being insulated in the middle of low land.

SHOALS OFF CARIBANA POINT.—The shoals off Caribana Point are at the S.W. end of the bank, already described as generally extending along the coast; the outer corner of which, with 4½ fathoms water, is 4 miles N.W. by N. from the point.

In this extent, and nearly in that direction, there are two rocks; one at a little distance from the point, partly shows itself; and the other, farther separated from it, with very little water on it. From the edge of the bank, in 5 fathoms, the depth increases onwards to 6 and 7 fathoms, on sandy bottom, and successively to more; so that 6 miles N.W. from Caribana Point, there are 9 and 10 fathoms, oozy sand; at 11 miles, 24 fathoms, ooze; and, lastly, at 14 miles, 32 fathoms, ooze. These soundings, with the bearings of Aguila Hill, may serve to direct those who are bound to the gulf; observing that as soon as Aguila Hill bears East, they will be entirely free from the shoals of Caribana Point, and may steer freely for the Gulf of Darien, nearly to Arenas Point, which lies 5½ miles S. 35° W. from that of Caribana; all this part having a good depth of water.

GULF OF URABA, or of NORTH DARIEN.—This gulf, as above stated, has an entrance between Caribana Point on the East, and Cape Tiburoo on the West. All the Eastern and Southern coasts of it, to the bay of Candelaria, offer secure anchorage at every season of the year; but the other parts to Cape Tiburoo are very bad in the season of the breezes, and without any shelter, except for small vessels; but in the season of the ventayales, when there are light breezes, variable winds, and calms, you may anchor in any part of the gulf, without either wind or sea to incommodo you.

ARENAS POINT.—The North and South points of Arenas form a low front of 2 miles extent, and they bear from each other S. 19° E., and N. 19° W. These two points form the Eastern dyke of Aguila Lagoon, which extends from thence Eastward 5½ miles, and is 3 miles from North to South, with various low islets in it; this lagoon commences at the Southern extremity of Aguila Hill, heretofore described.

RIO SALADO.—From Arenas Point Southward, the coast trends Eastward a distance of 5½ miles, to the Rio Salado, and thus forms a tongue of sand, projecting into the sea, and which, although it is low, has a sufficient depth of water near it, and may be crossed at less than a mile.

From the Rio Salado the coast takes a Southerly direction, with some inclination Eastward; it is all low land, with hillocks at intervals; and the depth on the bank along it is so regular, and the bottom so clean, that it may be coasted without any other care than due attention to the lead. From the point and hill of Cayman, which are distant from Rio Salado 14 miles, S. 44° E., the shores to the Southward on both sides of the gulf, so far as the principal mouth of the Rio Atrato, are swampy, without even one hill on it; and, from the Rio Suriguilla, which is in the Southernmost part of the gulf, to the North and West, may be considered as the Delta, where the great river Atrato, or Darien, disembogues. The bay of Candelaria, which is formed by the swampy land at the mouths of the river, bears from the hill of Cayman about S. 19° W., at the distance of 12 miles. For navigating all along this coast of the bottom of the gulf, from Cayman Point on the East to the bay of Candelaria on the West, there needs no other direction than that of attending to the lead; nor is there any danger, for a ship may be anchored wherever it may be convenient, or necessity may require.

The principal, indeed the sole object for entering into the Gulf of Darien, can only be to avail yourself of the facilities which the River Atrato affords for conducting into the interior the imports, and withdrawing therefrom the exports: thus, notwithstanding this river branches into the sea by many mouths, extending over a great distance, and forming the swampy and inundated lands just spoken of, yet only eight of them are navigable for boats and launches; and of the whole of them, not one of them offers the same advantage as the Little Faysan, or Pheasant, which discharges into the Southern part of the bay of Candelaria: inasmuch, as ships anchoring there, will be sheltered from the sea, and be near to the channel by which their freights are to be conveyed inland.

BAY OF CANDELARIA.—The coasts of the bay of Candelaria are so very low, and the greater part of them are inundated, even at low-water, and bordered with

Shoals.

Gulf of Uraba, or of N. Darien.

Arenas Point.

Rio Salado.

Bay of Candelaria.

mangroves, reeds, and rushes, so that only the N.W. point of the bay appears dry. The mouth, or entrance of the bay, from the N.W. point to the S.E., where the branch called the Little Faysan falls into it, is about 2 miles in width; but there is a sand-bank which borders the whole circuit of it, and extends out a mile to the S.E., from the N.W. point, which reduces the entrance to scarcely a mile in breadth. This shoal also stretches off from the S.E. point, but only to a cable's length and a half; within the bay it narrows on the South shore, but widens considerably on the N.W. side. The clear space of good anchorage is about a mile and a third each way.

Instructions for entering CANDELARIA BAY.—To enter this bay, caution and a careful use of the lead are necessary, taking care not to get into less depth than 17½ or 17 fathoms in its entrance, nor 12 within it. This caution is very necessary, because the sand-bank that surrounds it is so steep, that it shoals immediately from 13 to 5 fathoms, and from 5 to getting aground. By taking care to preserve the proper depth, you will go in mid-channel, at about 4 cables' length from the S.E. point. It will also be advisable to have a man upon the lookout on one of the yard-arms, as the color of the water indicates the channel and the shoals. On the bar of the Little Faysan branch, there are 3 feet water, and the tides rise 2 feet throughout the whole of the Gulf of Darien.

Tide.

Choco Anchorage.

CHOCO POINT AND ANCHORAGE.—From the N.W. point of Candelaria Bay the coast continues low, and covered with mangroves, in the direction of N. 10° W., nearly 5 miles, to Reyesa Point: thence W. N.W. 7 miles, to the Tarena Keys; on all this coast the shallow bank, thrown up by the waters from the mouths of the river, extends outward. The principal mouth of the Atrato lies at about one-third of the distance from Reyesa Point towards Tarena Keys; and it is necessary to keep at 2 miles distance from the coast. Reyesa Point, which is also called Choco Point, forms a curve that presents a fine anchorage, well sheltered from the North winds and breezes; to enter it you have only to keep about 14 cable's length distant from the South side of the point; and when you are abreast of it, or to the Westward of it somewhat further into the bay, you may anchor in 13 or 14 fathoms.

Peaks.

PEAKS OF TARENA, CANDELARIA, DE CABO, AND GANDI.—On this coast, and to the Southward of the Tarena Keys, will be seen a mount, or hill, called the Peak of Tarena, whence lies a very lofty ridge, extending to the N.W. of the various peaks of these heights: the Southernmost is called Candelaria, and the Northernmost, which is over Cape Tiburon, is called Pico de Cabo, or Peak of the Cape; the peak next to it Southward is named Gandi.

Islets.

ISLETS TUTUMATES, TAMBOR, AND BOLANDEROS.—From Tarena Keys the coast runs about N. 28° W., a distance of 10 miles, to the Bolanderos: it is all high, and there are various islets lying along it. The first of these, named Tutumates, is a group of three islets, very clean, and lying about half a mile from the coast. To these follow another named Tambor, which is separated from the coast rather more than half a mile. Although this is clean, it must be borne in mind, that at the distance of half a mile N. N.E. from it there is a rocky shoal which shows itself, between which and the islet there is a passage; but it is always better to pass outside. To the West of this islet the coast forms a bay called Puerto Escondido, or Hidden Harbor, which, on account of its small capacity, admits small vessels only. To Tambor follow the Bolanderos, consisting of a larger islet, with other small ones at its South part: all these are clean, with deep water around them, and do not lie further than three-quarters of a mile from the coast.

Three miles N. 35° W. from the Great Bolandero, and at the distance of half a mile from the coast, lies the Piton Islet, which is very clean; from thence N. 65° W. 5 miles, lies Gandi Point forming a beachy bay named Tripo Gandi. From Gandi Point the coast follows about N. N.W. for the distance of 15 miles, to the point of the River Gandi, with which Gandi Point forms the bay of Estola, or Gandi, where the rivers of these names disengage; this bay is of little importance.

At N. 16° W., 6 miles from Gandi Point, lies the Tonel Islet, very clean, with deep water, especially on its Eastern side; it is rather more than a mile from the coast. From this islet to Cape Tiburon it is 6½ miles N. 42° W. All this coast from the Tarena Keys to Cape Tiburon, is high and steep, with deep water, but it is very wild in the season of the breezes; for which reason it is most prudent to avoid it during these seasons, and to keep on the Eastern side of the gulf, as it not only affords security and the accommodation of anchorage in every part, but, as there is no inconvenience arising from the sea, it is much more easy for working to windward and much time may be saved by it.

Cape Tiburon.

CAPE TIBURON.—This cape, as before said, is the N.W. boundary of the gulf; it is rocky, high, and scarp'd, and projects out in a N.E. direction, forming an isthmus, on the South and West sides of which are two little harbors. The first of these is so narrow as to be of little importance, the second is larger, and called Mel

of the bay appears dry to the S.E., where the width is only a mile; but there is a narrow channel about a mile to the S.E., which is only a mile in breadth, and widens considerably on the N.W. side, to about a mile and a third.

After this bay, caution and care to get into less depth than the shoals immediately from the S.E. point, and to preserve the length from the S.E. point, on one of the yard-arms, as the bar of the latitude 2 feet throughout the

N.W. point of Candelaria, in the direction of N. 40° W., to the Parena Keys; the distance from the mouth of the bay to the N.W. point is about one-third of a mile, and it is necessary to keep at least a cable's length distant from the N.W. point, or 14 fathoms.

O. AND GANDI.—Out lies seen a mountain, or hill, called Gandi, extending to the N.W. of the Cape, and the North Cape, or Peak of the Cape.

DEROS.—From Parena Keys to the Bolanderos; it is called the first of these, named Tuna, about half a mile from the Cape, and is separated from the Cape by a rocky shoal which shows out at low water, but it is always better to pass by the N.W. point, called Puerto Escondido, or the N.W. point, with other small rocks around them, and do not lie

at the distance of half a mile; from thence N. 65° W. to Tripo Gandi. From Tripo Gandi, the distance is 15 miles, to the point of Estora, or Gandi, where the importance.

Tonel Islet, very clean, with a depth of more than a mile from the N.W. point. All this coast is with deep water, but it is very prudent to avoid the gulfs, as it not only adds to the danger, but, as there is no anchorage or working to windward, and

the N.W. boundary of the gulfs, in the E. direction, forming an island, the harbors. The first of these is larger, and called Mel

hor, in which there is good holding-ground, and the greatest depth is from 11 to 12 fathoms, on sand and clay.

POINT AND PEAK OF CARRETO.—Thirteen miles North 62° W. from Cape Tiburo are the Point and Peak of Carreto, which is the Eastern point of a little harbor of that name. Between the two points a bay is formed of about 2½ miles in depth, which is called the Bay of Anachucma; all its shore is beachy to the foot of the high mountains, without any remarkable point. In the N.W. part of this bay, and at the distance of 2 miles to the Southward of Point Carreto, is a little harbor, called Puerto Escondido, fit for smugglers only.

CARRETO HARBOR.—The Point and Peak of Carreto are, as before stated, at the Eastern part of the harbor of that name, the Western part being formed by a cluster of islets of various sizes; and between these points the greatest distance is 14 miles, but the narrowest part of the mouth is only a mile. This harbor is of a semi-circular form, and extends inward about a mile; the depth of water in it is not less than 34 fathoms, nor more than 8 fathoms. Notwithstanding these good qualities, it is, on the contrary, open to the N.E. breezes and the seas they raise, and has little shelter from the N.W.; it is, therefore, only of use during the season of the calms and variable winds.

CARRETO SHOALS.—To the North of this harbor, at the distance of a long mile, there are two small shoals near each other, bearing N.E. and S.W., with 54 fathoms over them, rocky bottom, and near them from 20 to 25 fathoms; with fresh breezes the sea breaks over them.

Seven miles N. 48° W. from the Point and Peak of Carreto is Punta Escoeces, or Seal's Point; on this bearing there are clusters of islets of different sizes, extending out to N.N.E., a long mile, from Punta de los Isletes; to this point which is 3 miles South-eastward from Punta Escoeces, the coast is high and scarped; but from thence to Punta Escoeces, it is lower, with a beach.

CAROLINE BAY.—Punta Escoeces is the S.E. point of a bay named Caroline Bay, the former islet of Oro, or Santa Catalina, being the N.W. point bearing from the former N. 40° W., distant 4 miles; and from this line of direction, the bay falls inward about one mile and two thirds. In the S.E. part of this bay is Puerto Escoeces or Escondido, (Scottish or Hidden Harbor,) which extends inward in that direction nearly 3 miles, and forms good shelter. There are some shoals in it, which are represented in the particular plan of the harbor, by which any vessel may run in for the anchorage where they will find 43, 50, 6, and 7 fathoms water, sandy bottom.

GRANDE DEL ORO, SAN AUGUSTIN, AND PIEDRAS ISLET.—The Isla Grande del Oro is high; and at one mile and eight tenths to the South of it, there is a smaller island, called San Augustin; and on the same bearing, a little more than a cable's length from San Augustin, is Piedras Islet, which doubtless takes its name from the many rocks with which it is surrounded.

Between Piedras Islet on the North, the West point of Aglatomense River on the South, and that of San Fulgencia on the S.W., is formed the Estanada, or Bay of Caroline, or Caledonia, and the channel of Sasardi.

CALEDONIA BAY.—The Bay of Caledonia is, strictly speaking, formed by the points already mentioned, which bear from each other N. 25° W., and contrary, distant one mile. This bay is clean, and has a good depth of water; the greatest part of its shore is beach, and near the middle of it disembogues the River Aglateniqua. The front or point of San Fulgencia is salient, scarped, and clean; and it also has a little bight at its Western part, with little depth of water, bordered by mangroves and various keys.

SASARDI CHANNEL, S.E. ENTRANCE.—Between San Fulgencia Point, the Great Oro Island, Piedras Islet, and the Mangrove Keys which lie to the West of them, the Channel of Sasardi is formed; whose S.E. entrance, from edge to edge, is about 4 cables' length wide, with a depth of 8 to 11 fathoms, ooze; and further in, from 7 to 9 fathoms; as also between the edge of the bank of Piedras Islet, and the Bay of Caledonia, the depth is from 6 to 11 fathoms; and the space of sea between the Bay and Puerto Escoeces, is of a good depth; but at S. 55° E., a short mile from Piedras Islet, the sea breaks when the breeze is fresh.

These harbors are equally sheltered from the winds and seas of both seasons, and have a good depth of water; but the Channel of Sasardi and Bay of Caledonia are preferable, because you can either enter or sail out from them with all winds, with more facility and less risk than you can either into or out of Puerto Escoeces.

SASARDI CHANNEL, N.W. ENTRANCE.—At the distance of 15 miles N. 20° W. from the East end of the Great Oro Island, is the West extremity of two larger islands, which, with the reefs, shoals, and multitude of smaller islets extending thence to the N.W., form with the coast the channel of Sasardi. The N.W. mouth of this channel is formed by the said Western point of the two large

islands and the fronton of Sasardi with an opening of three-quarters of a mile; this channel has many shoals in it, and is, therefore, of no utility; neither is there any population near it. Those who wish to enter it must have a free wind for that purpose.

Between the Eastern point of Great Oro Island and the N.W. mouth of the channel of Sasardi some reefs project out, with two islets at the extremity, which bear from the said Eastern point of Great Oro, N. 25° W., 2 miles distant, and from the S.E. extremity of the two large islands already mentioned, about N.E. Also, at the distance of 1½ mile to the Westward of the fronton or point of Sasardi, there is a bank with little water on it.

The fronton of Sasardi is projecting, round, scarped, and surrounded by reefs close to the shore. From the most salient part of this fronton, the S.E. part of the Isla de Pinos bears N. 59° W., distant 2 miles; and in the intermediate space the coast forms various open bays, of little importance, the points of which are scarped and surrounded by reefs. Off the West part of the said island is the Cienaga of Navagandi, with its mouth shut by reefs; which, with the island, form a channel of 2 cables' length wide in the narrowest part, with a depth of from 1½ to 5 fathoms water.

The Isla de Pinos is high, with a hill extending along it, on which rise two remarkable points, covered with wood; its greatest extent is N.E. by N. and S.W. by S., rather more than a mile, and its greatest breadth is scarcely a mile; its N.E. and South sides are scarped, and bordered by reefs, very near the shore. The N.E. point of this island is in latitude 9° 1' 30", and longitude 77° 50' 10". At the distance of 2 miles N. by W. from the North end of the Isle of Pinos, is the Isla de Pajaros, or Birds' Island, which is low, narrow, covered with brushwood, and surrounded by reefs, which have a depth of 7 or 8 fathoms close to their edges, on rocky bottom. From this point commences the immense archipelago of the Mulatas, composed of islands, keys, shoals, and reefs, forming between them and the main-land many anchorages and well-sheltered channels, secure in all weathers, and terminating at Punta de San Blas. The interior of the coast is a high mountain range, with notable peaks, whose situations are exhibited in the chart of the coast, and may serve as marks to direct the various anchorages, &c., which it comprises.

The channels which are formed in this space, are those of Pinos, Mosquitos, Caba, Zambogandi, Punta Brava, Coeos, Rio de Monos, Ratonos, Playon Grande, Puyado, Arevalo, Mangles, Moron, Caobos, Holandes, Chichime, and San Blas. These are more or less free, as may be seen by inspection on the chart.

A ship at the distance of one league to the Northward of Pajaros Islet, and steering N.W., 25 miles, and N. 65° W., 38½ miles, will pass clear of all these dangers, and will be to the North of the Easternmost keys of the Holandes Group, at the distance of 1½ or 5 miles. With these courses you will, in the beginning, pass at 1½ or 2 miles outside the reefs, and afterwards at 1 and 5½ miles; but it remains at the option of the navigator to pass at a greater distance, if more convenient.

GULF OF SAN BLAS.—Seventeen miles to the Westward of the Easternmost keys of the Holandes Group lies Point San Blas, in lat. 9° 31' 30", and long. 76° 21". It is low, and forms the N.E. boundary of the Gulf of San Blas, the mouth of which extends N. and S. to the anchorage of Mandinga, 6 miles, and from thence an equal distance to the Westward. Its coasts are low, with mangroves, which advance into the sea.

From Point San Blas Eastward, to the distance of 1½ mile, extend some reefs with various keys, the Easternmost of which is called Cayo Frances. From the extending to the S.W. and Westward, there are twelve other keys; and to the Eastward of them are many banks and islands, which make part of the archipelago of the Mulatas, and form various channels.

To run into and anchor in the Gulf of San Blas, whether it be in Bahía Inglesa, which is to the S.W. of Point San Blas, or at Mandinga, which, as before said, is to the South of it, the most commodious passage is by the channel of Chichime and the Gulf of San Blas.

THE CHICHIME CHANNEL is formed to the West by the keys off Point San Blas, to the East by the reef and group of keys of Chichime, and to the South by another group surrounded by reefs, which some call Cayos de Limon, or Lemon Keys.

THE CHANNEL OF SAN BLAS is formed by the Cayos de Limon to the S.E. and those of San Blas to the N.W. The first is 3 miles in extent between the outer edges of the reefs; and the second 1½ mile.

Directions for entering the Gulf of San Blas.

To enter this gulf it is necessary to open the mouth of the channel of Chichime until you are on the true meridian of the second islet, counting from the Westward.

th of the channel of Chichime
 et, counting from the West-

to Cayos de Limon; from which situation steer South towards it, until abreast of, or
 rather before you get so far to the South as Cayo Frances; then steer South 50° W.,
 through the middle of San Blas Channel, which, as already noticed, is 13 mile wide
 between the reefs of the West South-westermost islet of the Lemou Keys, called
 Gallo, or the Cock, and the reef which extends to the Southward from Cayo Frances;
 thus directing yourself to the anchorage, whether it be to that on the North side of
 the gulf, or in Mandinga Bay. To proceed to the latter, the keys which lie to the
 North of Mandinga Point will serve for a mark. Of these, the outermost, called
 Cabras, lies a mile from the point; and it should be noticed, that at nearly a mile
 N. 10° W. from Cabras, there is a little sandy key, to which a berth must be given,
 and there is a bank, with 4 and 14 fathoms on it, lying N. 69° W., distant a long mile
 and a half from Cabras Islet. The passage is between this bank and the little
 sandy key. The anchorage of Mandinga is sheltered, and has depth sufficient for
 any class of vessels. In the gulf, and extending out from the bottom of it to the dis-
 tance of 34 miles, there are various islets, keys, and banks, the Easternmost of which
 is called Cayo Maeceta. To all of these a berth must be given, if desirous of going
 far into the gulf.

HOLANDES CHANNEL.—This is the largest of all the channels that are formed
 by the Mulatas Islands. Its mouth is formed on the East by the Western extremity of
 the reefs of the Holandes Group, and on the S.W. by Itecos Key. The distance
 from one key to the other is 24 miles N. 55° E., and S. 55° W., and the least depth in
 the channel is 14 fathoms, on a bottom of sand; but W.N.W. from Holandes Key, at
 the distance of a little more than 13 mile, there is a shoal, which extends half a mile
 N. and S., with 6 and 64 fathoms on it, over rocks. The sea breaks over it when
 there is but little swell. It may be passed either on the East or West side, but it will
 be always best to pass to the Eastward of it, and near to the reefs of the Holandes
 Group, the breakers on which will serve as marks. Proceed afterwards towards the
 East part of Itecos Key, and give it a berth in passing. This key or island is of
 firm land, covered with high wood, and named from the abundance of Itecos-trees
 growing on it. From the meridian of Itecos Key, or its South side, the direction of
 the Holandes Channel is about S. 75° W., to the bottom of the Gulf of San Blas. It
 is clean, and has a depth of 24 to 25 fathoms, oozy bottom, with a breadth of 2 to 3
 miles, between groups, detached keys, and reefs, but free and commodious to turn in,
 in case of necessity, towards the anchorages already described.

FROM THE POINT OF SAN BLAS WESTWARD.—At N. 49° W., rather
 more than half a mile from Point San Blas, is the North part of its front, low and
 covered with mangroves; and in the intermediate space is a little key, called Piedras,
 and other shoals connected with Cayo Frances. At the distance of a quarter of a
 mile, N. 34° W., from the North point of San Blas, is a key named Cayo Perro, also
 united to the reefs extending Westward from Cayo Frances, and which terminate at
 an island lying in front of Cocoga, a mile and a quarter further West.

From Perro Key the coast continues nearly 10 miles S. 88° W. to Coeos Point, on
 the East side of the mouth of Escribanos Harbor. The intermediate coast continues
 low, with reefs along shore, and somewhat of a bay. The most visible objects on it
 are Magote Point, which is small, a little salient, and has a hillock on it; that of Cerro
 Colorado, which is round, scarp'd, and projects out but a little; and that of Playa
 Colorado, which is round and surrounded by reefs which extend out to a cable's length.

POINT ESCRIBANOS.—Coeos Point advances into the sea, and from it the
 point of Escribanos bears S. 80° W., 13 mile, and in this space a bay is formed, in
 the middle of which is Escribanos Harbor, extending inward to the South, from its
 mouth, half a mile. This harbor is very shallow, having no more than one and one
 and a half fathoms water. Without, on both sides, there are reefs with very little
 water on them; and in the channel, which is formed by them, there are from 34 to 6
 fathoms.

ESCRIBANOS SHOALS.—To the North-eastward of the mouth of this harbor
 are the shoals named the Escribanos. They are two in number, and are composed of
 reefs with very little water on them, and lying near each other. On the reef nearest
 to the coast is an islet lying rather less than 2 miles from Coeos Point. This reef
 extends a mile from W.S.W. to E.N.E. The other lies about W.N.W. from the
 said islet or rock, and extends nearly a mile from E to W. Both are steep to, with 3
 and 4 fathoms water; and on the bank are from 8 to 12 fathoms, on gravel and coarse
 sand. In the channel formed by the South-easternmost shoal and Coeos Point, there
 are from 9 to 12 fathoms, diminishing to 6 and 5 fathoms on each side.

Escribanos Bank lies nearly N.W. by W. from the shoal of that name, distant 54
 miles. This extends N. 56° W., and S. 56° E., nearly 2 miles, and has from 5 to 8
 fathoms water, on rocky bottom. To the Northward of its edge, about 2 cables' length,
 from 8 to 34 fathoms are found. In heavy seas, the water breaks on this bank, which
 may serve as a guide; and when it does not, a lookout must be kept at the must-

head. In the channel between this bank and the Escribanos Shoal, there are from 8 to 17 fathoms water, on sand, gravel, and rocks. The N.W. part of it lies N. 32° W., distant 8½ miles from Escribanos Point.

TERRIN POINT.—Nineteen and one-third miles N. 81° W. from Cocos Point, lies Terrin Point and Pescador Islet. Between the former and Quingongo Point, which are distant from each other 8½ miles, and on the meridian of Escribanos Bank, is Culebra Islet, distant from Culebra Point two-thirds of a mile, about N.N.W. Following on to the Westward, the point and islet of Quengo are met with. Port Escudido, which is somewhat to the Westward of this point, is only a little cienaga or lagoon. Point Chaguachagua, and that of Macolla, are the most remarkable points on this part.

The range of mountains which extends along this coast, from those of Darien to those of Porto Bello, are sufficiently remarkable; that called Cerro de la Gran Loma, or Gordo, being rather more so than the others. It lies S. 121° W. from Culebra Islet, distant full 7 miles, and may serve as a mark for keeping clear of the Escribanos Shoals and Bank. This hill is a little higher than the Cordillera, in which it is situated. Its top is large, and of some extent.

Pescador Islet lies about 2 cables' length, N. 43° W., from Terrin Point, and the point is surrounded by reefs, which extend a cable's length to the North, and half a mile to the West, continuing to S.S.W., so as to surround three islets, which lie between that point and the N.E. point of the harbor of Nombre de Dios.

Between Point Terrin, on the East, and the Islet Martin Pescador and Manzanilla Point, on the West, the first of which bears from Terrin Point N. 64° W., at the distance of 4 long miles, and the second, N. 73° W., 5 miles, a great bay is formed, which extends in nearly 3 miles to the S.W., and to the W. and N.W., 2 miles; to the bottom of the bay of San Cristoval. At 1½ mile, S. 49° W., from the Eastern extremity of this bay, lies the Western point of the harbor of Nombre de Dios, surrounded with reefs, as is also the Eastern point, although at this part they extend but furthest off. This harbor is small, and the greatest part of its shores are bordered with reefs and shallows. Its clear depth is 3, 4, and 5 fathoms in the month. The other parts of the great bay of San Cristoval are useless in the season of the breezes, and the reefs from the bottom of it extend out nearly a mile towards Point San Cristoval.

From point San Cristoval, distant 2 long cables' length to the N.E., lies an islet, called Juan del Pozo, surrounded with rocks; and about 8 E. from it, at the distance of half a mile, is a bank named Vibora. Between this bank and the Islet Juan del Pozo, and between the latter and Point San Cristoval, there is a depth of 9, 10, and 13 fathoms, on gravel and coarse sand.

Point San Cristoval lies S. 88° W., 3½ miles from Terrin Point; also from this point the Buoy shoal bears N. 60° W., distant nine-tenths of a mile. Between this shoal and the reefs of Terrin Point there are from 9 to 12 fathoms water, on rock, sand, and clay; and 9, 12, and 14 fathoms, on ground of the same quality, between the Buoy and Vibora Shoals. The coast between Point San Cristoval and that of Manzanilla is high and scarped.

The Point of Manzanilla is the Northernmost of all the coast of Porto Bello. It is also high, scarped, and projecting out, with two hummocks on it. Near this point are several islets and a shoal. The greatest of these, named Manzanilla Islet, is high and scarped, and lies four-fifths of a mile to the East. It has three firrallons to the North, of which the furthest out is distant a long cable's length. At S. 30° W. from the same islet, there are three small islets surrounded with reefs, which extend N.E. and S.W., and also to the East there is another small one, distant about 1½ cable; and, lastly, to the N.N.E. of the said Manzanilla Islet, at the distance of four-tenths of a mile, lies the islet of Martin Pescador, extending about a cable's length N. and S. All these islets are high and scarped, and between those of Manzanilla and Martin Pescador there are from 10 to 14 fathoms water.

Manzanilla Shoal lies N.W. of the point of the same name, at the distance of four-tenths of a mile. It has very little water on it, and 5 and 6 fathoms close to it; and in the strait between it and the point, there are 13 fathoms water.

Among the mountains on this coast two are remarkable, named Saxino and Nombre de Dios, which may serve as marks for recognizing the harbor of the last name. The first, which is high, terminates in two peaks, near each other, and the North-easternmost of them is about S. 22° E. from Terrin Point, distant nearly 7 miles. That of Nombre de Dios, which is to the South of the harbor, terminates in one peak, and is distant from Terrin Point 8 miles S.S.W.

N. 65° W., at the distance of a mile and a half from Manzanilla Point, is the highest part of Tambor Islet, which is high, round, and scarped, and which is connected by a reef of 2 cables' length, with the Northernmost part of Venados or Bastimentos Island. This island is nearly a mile in length, N.E. and S.W., and forms, with the main-land,

ent nearly 7 miles. That of
erminates in one peak, and is

manzanilla Point, is the highest
and which is connected by a
ndos or Bastimentos Island,
nd forms, with the main-land,

the N. E. channel of Bastimentos Harbor, the greatest extent of which, between the reefs, is $\frac{1}{2}$ of a mile, with 5 and 5 $\frac{1}{2}$ fathoms water, sand. This island of Bastimentos is foul on its S. E., S., and S. W. sides; and the latter, with Cabre Islet, which lies somewhat to the Southward of West, forms the N. W. channel, the narrowest part of which, between the reefs, is three-tenths of a mile wide, with from 3 to 9 fathoms, mud. The harbor of Bastimentos is of little importance, although sheltered, with a depth of 3 $\frac{1}{2}$ to 7 fathoms. All its shores are bounded by reefs; and the customary anchorage is to the S. W., S., and S. E. of the South or sandy point of Bastimentos Island.

GARROTE HARBOR.—At S. 51° W. from the highest part of Tambor Islet, at the distance of 2 $\frac{1}{2}$ miles, lies the mouth of Garrote Harbor, formed by the main-land, to the South, by Great Garrote Island in the East, and by Pelado Island, and other islets which follow, to the Westward, $\frac{1}{2}$ mile, to the mouth of the Boquerones. The mouth of Garrote Harbor is scarcely three-tenths of a mile wide between the reefs to the West of Great Garrote Island and Pelado Islet. Its first direction is from North to South, and afterwards to S. E., with a depth of from 6 $\frac{1}{2}$ fathoms in the interior of the harbor, to 12 and 18 in the mouth, mud. Between this harbor and that of Bastimentos, rises the hill of Garrote. It is of middling height, and its top terminates in a peak, at the distance of seven-tenths of a mile from the coast.

At the distance of 3 $\frac{1}{2}$ miles S. by E. from the little bay of Garrote, is the mountain of Capiro, or Capira, high, and almost always covered with clouds. This mountain is situated nearly East from the city of San Felipe of Porto Bello.

At a short distance to the Southward of Capira is the Sierra or Mountain Ridge of Llorona, extending nearly East and West. It is the highest of all on the coast of Porto Bello. On the Eastern part of its top it appears as if cut down vertically, forming a peak called the Campana, or the Bell. From this peak the ridge descends gradually to the West, to near the peak of Gunche. The appearance of this ridge is such, that it cannot be mistaken for any other. In clear weather it may be seen at the distance of 15 miles; but in the season of the fresh breezes it is generally covered with haze; and in the season of the vendavales and variable winds it may often be seen between 8 and 9 in the morning, and 4 and 5 in the afternoon; but in the rest of the day it is covered with clouds.

The Lavandera Shoal lies N. 6° E., seven-tenths of a mile from the North extremity of Pelado Islet, and N. 85° W., distant one mile from Cabra Islet, at the mouth of Bastimentos Harbor. This shoal is of rock, with very little water on it, and steep to, with 7 $\frac{1}{2}$ and 9 fathoms close to the rock, on which the sea breaks. The channels between it and Cabra and Pelado Islets have a depth of from 14 to 17 fathoms, mud.

BOQUERONES POINT AND ISLETS.—S. 64° W. from the highest part of *Boquerones Point and Islet.* Tambor Islet, at the distance of 3 $\frac{1}{2}$ miles, lies the point of Boquerones, which is salient, high, and scarped; and from it, almost on the opposite bearing, that is, N. 64° E., there are 5 islets, called the Boquerones, which extend out about 3 cables' length. Here terminate the reefs and islets which extend Westward from Pelado.

CASIQUE HILL.—Boquerones Point has to the South, at a long mile's distance, *Casique Hill.* a hill named Casique, which terminates in a point, and is of middling height. It may serve as a mark for keeping clear of the Farallon Sucio, or Foul Rock, which lies N. 33° W., nearly 2 miles from Boquerones Point. The Foul Farallon is at the West end of two groups of islets and shoals, which, from S. W. to N. E., extend $\frac{1}{2}$ of a mile, forming a channel between both, with 4 to 7 fathoms water. The North-easternmost islet, or farallon, bears N. 88° W. from the highest part of Tambor Islet, at the distance of nearly 1 mile; and in this space there are from 16 to 20 fathoms water, clay, and sand; and 16, 21, 22, and 25 fathoms, between the said farallon, the islets of the coast, and the Lavandera Shoal.

DUARTE ISLETS.—Three miles S. 69° W. from Boquerones Point, lies the *Duarte Islets.* North end of the Duarte Islets, which are 4 in number, and extend S. 25° E., and N. 25° W., six-tenths of a mile. From the North-easternmost one a reef extends a cable's length in the same direction. The Southernmost of these islets are separated a little more than 2 cables' length from the point of Duarte on the main-land to the Southward of it; and from that of Sabanilla, which bears N. 64° E., nearly half a mile. Between the two straits there is a depth of from 3 $\frac{1}{2}$ fathoms, close to the islet, to 15. The intermediate coast is high and scarped, with some bays. The point of Josef Pobre extends furthest out, and is surrounded with rocks and reefs. Sabanilla Point has also a reef, and some rocks.

At the distance of 2 long miles S. 24° W. from the Northernmost part of Duarte Islets, is Drake's Point, which is the N. W. point of Porto Bello. The intermediate coast is high and scarped, with a little harbor, called Leon, of very little importance,

Garrote Harbor.

Casique Hill.

Duarte Islets.

*Porto Bello,
or Porto
Velo.*

and bordered with reefs, which terminate to the N.N.W., at a little farallon, distant four-tenths of a mile from its mouth.

PORTO BELLO, or PORTO VELO.—This port is capable of receiving and accommodating ships of every class. The widest part of its entrance, which is between Drake's Point on the North, and the islet of Buenaventura on the South, is $1\frac{1}{2}$ mile; and these bear from each other S. by E. and N. by W. The narrowest part between Todo Fierro Point and that of Farnesio, is rather more than half a mile wide, and these lie in the direction of S. 2° E., and N. 2° W. From the last-mentioned points the harbor extends inward E.N.E., $1\frac{1}{2}$ mile, to the mangroves at its bottom. The North shore is clean; but from the South shore some reefs and rocks, with very little water on them, stretch off to between 1 and $1\frac{1}{2}$ cable's length; and in the bottom, or East part of the harbor, there is a sand-bank, which advances $2\frac{1}{2}$ cables' length from the mangroves towards the West; and also at N. 26° W. from the city mole, one and a half-tenth of a mile, there is a very little sand-bank, with 1 and $1\frac{1}{2}$ fathoms water on it. The rest of the harbor is clean, and sufficiently deep, diminishing regularly from 16 to 8 fathoms. Ships of the line ought to enter this harbor by warping or towing, because there are regularly either head-winds or calms. The best anchorage is to the N.W. of the battery of Santiago de la Gloria, in 9 or 10 fathoms on clay and sand; but smaller vessels may go nearer to the city, taking care to avoid the little shoal already spoken of.

The reefs on the South shore continue to the W.S.W. and W., to the Islet Buenaventura, the N.W. point of which bears S. 55° W., 3 long cables' length from the point of the same name; and between this islet and the point there are two smaller ones, all connected by reefs. S. 37° W. from Drake's Point, at the distance of one-fifth of a mile, lies the middle of Drake's Islet, which is clean all round, and has a break in the middle that appears to divide it into two parts. From this break to the West, and N. 65° W., at the distance of three-fifths of a mile, lie the South and North ends of the Salmedina Shoal. The South part consists of rocks above water, over which the sea breaks; and the other parts have from 2 to $3\frac{1}{2}$ fathoms water, on rocks. There is deep water all round it, and in the channel between it and the islet there are from 11 to 26 fathoms water, clay.

At three-fifths of a mile South from Drake's Islet, and $\frac{7}{8}$ of a mile West from Point Farnesio, lies the Farnesio Shoal, of a triangular form, with $3\frac{1}{2}$ to 5 fathoms water on it, on a bottom of rock. There is no passage between it and the coast, but, in the channel between it and the Salmedina Shoal, there are from 16 to 21 fathoms water, clay.

*Fresh
Water*

Fresh Water.—This harbor is surrounded by high hills, from which some rills, or rivulets, descend on both coasts, and from whence vessels may procure water, particularly from that which runs into the bay to the Westward of the fort of San Fernando. The battery of San Gerommo, at the city, is in lat. $9^{\circ} 21' 22''$ N., and long $79^{\circ} 13' W.$

To the Southward of Porto Bello, at the distance of a long half-mile, is the Ensenada, or Cove of Buenaventura, much bordered with reefs, and consequently of little use.

To enter Porto Bello when approaching it from the North-eastward, it is advisable to approach the Farallons of Duarte, and from them to steer so as to pass at about a cable's length to the N.W. of Drake's Islet, by which the Salmedina Shoal will be avoided; but never attempt to pass between Drake's Islet and the Shoal. Having passed the Drake, steer to the South and East, to gain the middle of the harbor, and proceed inward in that direction, or rather nearest to the North shore.

If bound into this harbor from the Southward, pass at about half a mile from the Islet Buenaventura, and thence towards Drake's Islet, to clear the Farnesio Shoal, then steer N.E., and more Easterly as the harbor opens; and lastly, run in mid-channel, or rather nearer the North side, as before directed.

*From Porto
Bello to
Chagres.*

FROM PORTO BELLO TO CHAGRÉS.—About S. 50° W., at the distance of nearly 15 miles from Drake's Point, is the Western extremity of the fronton of Longarremos, which, with the North-eastermost of the Islas de Naraujos, or Orange Isles, form a bay, in which are two creeks, called those of Minas; the Orange Isles lie N. 66° E., at the distance of $4\frac{1}{2}$ miles, from Longarremos Point. The Minas Creeks are formed among mangroves, and the Eastermost one extends inward 3 miles to the S. S.E., is of various breadths, and its shores are bordered with reefs. The Western creek is narrower and shorter; it extends inward to the South rather more than a mile. At the S.E. part of the Orange Isles, which are low, covered with trees, and surrounded with reefs, there is an anchorage, with $4\frac{1}{2}$, 6 , and 7 fathoms water, sand.

In the intermediate part of this coast, Point Gorda is the most projecting, and there are several coves of little consideration. To this point the coast is high, with basins

or ridges; and between it and Buenaventura Cove, the River Guanche disembogues: Guanche Hill bears from Point Gorda N. 82° E., distant 3½ miles. From Point Gorda to the S.W. the coast gradually diminishes in height, and the remainder from the point of Rio Grande and the creeks of Mimms, is a low coast with mangroves. The fronton of Longarremos is likewise low, with mangroves, and bordered with reefs, as are also the points which form the Mimms Creeks; these reefs extend somewhat more than a cable's length off, are steep to, and at the distance of one-third of a mile there are 11 fathoms water, clay.

There is a reef off Manzanilla Point, with the island of Bastimentos bearing S.W. by W. by compass, distant 3 miles, and Monkey Island S.E. There are 3 fathoms water on it, and 7 or 8 fathoms round it.

There is also a shoal of 6 fathoms, with 20 fathoms round it, 4 miles W. ½ S. of Tambor Island, Manzanilla Point bearing S.W. by compass. The bottom is rocky.

MANZANILLA POINT.—From the fronton of Longarremos, the mangroves extend to the S.W., nearly 1½ miles, to the point of Manzanilla, which is also of mangroves, round, and bordered with reefs, to the distance of a long cable, with a small shoal, that is distant 3 cables from it, N.W. by N.

MANZANILLA HARBOR is formed between the islet of that name to the West, and the main-land to the East, extending in nearly 2 miles S.S.E. from Manzanilla Point: this harbor is clean, from 2½ to 6 fathoms water. The best anchorage for every class of vessels is a little to the South of its mouth, and on the East coast, in 5 fathoms water, on sand and clay.

Five miles S. 68° W. from the fronton of Longarremos is Toro Point, which is the Western point of Naos Harbor, the Eastern one being the North end of Manzanilla Island, which is distant from Toro Point 2½ miles. Toro Point is salient, high, scarped, and bordered with reefs, extending out 2 cables' length, or more, with an islet near them. Naos, or Navy Harbor, extends inward nearly 1 mile to the South from the middle of its mouth; its breadth is nearly equal, narrowing somewhat from two-thirds of the said distance: it is clean to the parallel of Point Limon, with a depth from 3½ to 6 fathoms water, sand and clay; from Point Limon to the South it is shallow. As this harbor is open to winds from N.E. to N.W., round by North, it can be of use in the season of the variable winds and calms only.

From Toro Point the coast trends S. 67° W., nearly 2½ miles, to Brujas Point, which is of moderate height, and, like the intermediate coast, bordered with reefs, which extend only a short distance out, but surround an islet, named Magote de Brujas, which lies to the N.E. of the point of the same name, about 2 cables' length.

From Brujas Point the coast that follows is lower than before, and in the direction of S. 35° W., for 2 miles, to Butata, or Vigia Point, so named from having a guard-house on it: from this point that of Chagres is a cable's length distant, and is lower than the former, bordered with low rocks, which show above water, and reefs which extend out to a short distance.

NAVY BAY.—Navy Bay is 2½ miles wide and 3½ deep, open to the Northward. Four fathoms of water can be carried 2 miles within the bay, with bold shores on either side. Under Point Limon is a three-fathom anchorage, but all the rest of the bottom of the bay is shoal water.

Point Toro to the West, and Manzanilla Island to the East, are the extreme points of land forming Navy Bay. A reef extends from Point Toro N.E. half a mile, upon which the sea always breaks: beyond this, a cable's length, are a few detached rocks, upon which breakers are visible during the ordinary "trades." Manzanilla Island, which forms the East side of Navy Bay, is one mile N. and S. by half a mile E. and W. This island is owned by the Panama Railroad Company, and is made the terminus of the railroad, connecting the Pacific with the Atlantic. Several wharves have been run out to 26 feet of water, and others are in course of construction. The place is called Aspinwall. On the extreme N.W. point of Manzanilla Island, is a fixed white light, on a frame-work of timber, elevated 50 feet above high-water, visible 10 miles at sea, at the ordinary elevation of the eye.

ASPINWALL.—Bound to Aspinwall, or any of the ports in the Caribbean Sea, through any of the windward passages, the course should be steered so as to allow 20 miles Westerly drift in the 24 hours.

In running down for Aspinwall near a S.S.W. course, the high land of Porto Bello is first made, bearing near S.E. by S., some 50 miles. This high land slopes away to the S.W. and disappears; immediately to the right the woody high land about Chagres becomes visible. The gap between these highlands is Aspinwall harbor.

When off Porto Bello, and within 5 miles of the islands off the port, steer S.W. for Aspinwall. Should the weather be thick, and it very frequently is so, and you fall in with Point Longarremos, you will know it by the mangrove keys and the breakers about them. Do not go closer than 12 fathoms water.

Shoals.

Manzanilla Point.

Manzanilla Harbor.

Navy Bay, or Aspinwall.

Light.

The land to the Westward of the harbor makes like main-land. It is low, but entirely unlike the keys about Langarremos. At the termination of Point Toro, when at the distance of 5 to 10 miles, it makes as if there was a small round island near the point.

In clear weather the town can be seen, and at night, the light. The bay is wide and clear. Steer for the town, or light, from S. E. to S., or any point between them. Run up off the town, and anchor in 6 or 7 fathoms water, at a distance of a quarter of a mile, or closer.

A coral reef makes out one cable's length distant from the light-house. Just beyond its limits, in 36 feet water, is a large iron can buoy, painted white, with an imitation flag on top. South of this, 100 feet clear of the Western limit of the reef, is placed, in 34 feet of water, a barrel buoy. Outside of these buoys, and in front of the town in any direction, there are no dangers whatever. The U. S. Mail Steam-ship Company have several large buoys placed off their wharf for the purpose of securing their steamers. The Panama Railroad Company has placed three mooring buoys of the best description, at such points in the bay as render them very convenient and useful, and contemplate building a breakwater from the light-house, 1500 feet in a South-westerly direction. This will protect the wharves from every wind. Now the front of the town is exposed to the N. W. gales, which may be expected during December and January. They are, however, of rare occurrence, and seldom violent. From May to December is the wet season. The winds prevail during this period from S. E. to S. W. and W., light airs and frequent calms, with heavy showers of rain. From December to May is the dry season. The N. E. trades then blow home a steady fresh breeze. As the shore line of Aspinwall inclines half a point to the West, the wharves and anchorage immediately in front of the town are completely sheltered, the slightest swell scarcely ever being felt there during these winds.

Mean rise and fall of the tide, 14 inches. Mean range of the thermometer (yearly) 72 to 88.

Chagres

CHAGRES.—From Chagres Point to the West point of the Peñon, or rock, on which stands the castle of San Lorenzo, is about 14 cable's length S. by E. The Peñon is scarped to the N. W. and South, and the castle of San Lorenzo, as we have said, is situated on it. This Peñon to the North, with Point Arenas to the South, form the mouth of Chagres River, which, at the widest part, is 2 cable's length across, and is where narrowest.

To the E. S. E., at a short distance from the castle of San Lorenzo, is the little town or village of Chagres, consisting of huts, covered with thatch. The mouth of the river narrows between the Peñon and bank, which extends out from Arenas Point in a N. W. direction, to the distance of a cable's length. In the mouth, and to the South of the Peñon, there are 2 and 3 fathoms water; and the same depth continues, a little more or less, to the distance of half a mile up the river. To the West of the castle of San Lorenzo, at the distance of 92 English fathoms, is a shoal, named Laja, which extends from North to South 70 fathoms, and is of rock, with very little water over. To enter and to sail out of this river is very dangerous, and can only be effected by very manageable vessels, which do not draw more than 12 feet. Both operations must be performed with a fair wind, for otherwise the current of the river, and the various eddies it forms, from the opposition of the Peñon, Laja, and the West shore, will carry vessels on either one or the other of these dangers.

From Point Arenas of the River Chagres, the direction of the coast is S. 65° W. one mile, to the Point of Morrito, or Little Hill Point; and from thence S. 28° W. nearly 2 miles, to the Point of Animas; all the shore being low with a bench.

Directions for sailing from Jamaica, to and upon the Coast of Colombia between Escudo Island and Cartagena, including Chagres and Porto Bello.

Jamaica to Escudo Island and Chagres.

JAMAICA TO ESCUDO ISLAND AND CHAGRES.—The current between the island of Jamaica and the Spanish Main, or Coast of Colombia, is not always to be depended upon as setting to the Westward, as is generally supposed; for in crossing from Jamaica to the Main, ships have been known to be driven to the Eastward by the current 50 or 60 miles, in 4 or 5 days; which can only be guarded against by lunar observations, or good chronometers. From the month of May until the middle or end of November, the E. and N. E. trade-winds seldom blow home to the Main, therefore, ships should never go to the Southward of the parallel of 11° until they are 40 or 50 miles to the Westward of their intended port; after which they may make a South course good, allowing half a point Easterly variation, and with the winds, which in the afore-mentioned months blow from S. W. to W., and sometimes in the morning, after daylight, till 8 o'clock, even at South, together with the current, will set them to the Eastward, and thereby gain the anchorage. If, however, not making the land, they should find that the current has set them to the Eastward.

the intended port, and light winds prevail, they should immediately stand to the Northward, so far as $10^{\circ} 30'$, or even 11° , of latitude, in order to meet the N. E. trade-wind, and with it to make good the necessary Westing again.

The land to the Westward of the River Chagres, within the Island Escudo, is high, and unless you are close inshore, it is impossible to discover that island; but in a clear day, a remarkable high hill will be seen to the Eastward of it, which makes like a sugar-loaf. Steer in towards that hill, until you are within 3 miles of the shore, and then run to the Eastward, at about that distance from it, free from danger, until you see a fort on a small bluff, which is the entrance of the river, bearing about E. by S. or E., according to your distance from the land. The mouth of the River Chagres is strongly marked, by the land to the Westward forming a bluff, and the fort on the Eastern side; the latter, however, cannot be seen at a greater distance than 10 or 12 miles. You have good anchorage by bringing the fort to bear E. S. E., or E. S. E. $\frac{1}{2}$ E., in from 10 to 6 fathoms, sand and mud: the sugar-loaf, to the Westward, will appear about one-third above the low land between Chagres and Escudo and the two high hills of Porto Bello open Point Brujas. In mooring, lay your small bower to the Westward, and the best to the Eastward, as the offset of the river will generally keep the bawse clear during the prevalence of Westerly winds. Variation 7° E.

CHAGRES TO PORTO BELLO.—From the road of the River Chagres to Porto Bello, the course, by compass, is N. E. $\frac{1}{2}$ N.; but if you run 3 or 4 miles to the Northward, then a N. E. course will take you into the harbor—the distance is about 28 or 30 miles. Should light winds prevail, which is generally the case from May to the end of November, ships bound to the Eastward should get a good offing, as the current runs at the rate of from 1 to 2½ miles an hour, to the Northward and Eastward, and sets right on the rocks to the N. E. of Porto Bello, particularly in the rainy months, that is, as above stated, from May to November. In this season the River Chagres has a discharge which discolors the sea 6, 7, and 8 miles off; and this water, meeting the sea-current, raises a strong set to the Eastward.

If you intend going into Porto Bello, the entrance of the harbor may be known by two remarkable trees on the top of the hill, on the starboard or South side, and on a hill, on the port side, is a small signal-post. In coming from the Westward, keep within 3 miles of the shore, until you open the town of Porto Bello, on the starboard or South side of the harbor, which will lead you in; but observe, should you have light winds, to keep well up, on account of the Salmédina Shoal, which lies in a line with Drake's Islet, on the port hand, when going in, as the current may set you down upon it. Take care, however, that you do not shut the town of Porto Bello in with the land on the South side, as a shoal extends off from the Islet Buenaventura, on that side. You may anchor in from 10 to 18 fathoms, on soft mud. There are no other dangers in going into the harbor, besides those stated. The Salmédina is frequently visible, and generally breaks; it is from 50 to 60 fathoms in extent, N. N. E. and S. S. W., and 50 fathoms in breadth, with 6 fathoms all round it, at 25 fathoms distance from the breakers. It bears from Drake's Islet, on the North side of the entrance, W. $\frac{1}{2}$ S. by compass, distant about 300 fathoms; and between is the passage generally taken by ships coming from the Eastward for Porto Bello.

During the N. E. trades blowing home, that is, from December to May, there is no danger to be apprehended in going through this passage, as you may keep within a cable's length of the islet, and within half a cable's length of the Salmédina; between which are from 7 to 14, and 22 fathoms of water. In turning up to Porto Bello, great care must be taken, when within 3 or 4 miles of the harbor's mouth, that you do not shut the town in with the land on the South or starboard side of the harbor, in order to avoid the sunken rocks off Buenaventura Islet.

There are no particular marks for anchoring; but when ships require refreshment, and supplies of water and wood, they should anchor about a quarter of a mile below Fort Fernando, which stands on the North shore, and is easily seen; then they will be nearest of the only watering place in the harbor. In going in with a leading wind, keep the town well open on the starboard bow, and anchor in from 30 to 15 fathoms, or even in 12 or 10, according to the size of your ship.

During the months of May, June, &c., to November, light airs prevail in the harbor, from the S. W. and W., and early in the morning, light winds from the N. E., down the harbor; therefore, be prepared with boats ahead, to be under way by the dawn of day. In mooring, let the small bower be to the Northward, and the best to the Southward.

CHAGRES TO CARTHAGENA.—When at the River Chagres, during the months of the rainy season, or from May to the end of November, stand out to the Northward, for 5 leagues, as soon as you can; because the winds during these months are a general light, and the current very strong, setting directly on the rocks which are off Porto Bello, and thence along the line of coast from E. by N. to E. N. E. and E. S. E., and seldom less than at the rate of 1½ to 3 miles an hour. Should you, how-

Chagres to Porto Bello

Salmédina Shoal

Chagres to Carthagena

ever, be unavoidably drawn in near the land of Porto Bello, be constantly on your guard, but particularly in the evening and at night, against squalls, which frequently shift from the land, round the compass, with torrents of rain and gusts of wind so as to oblige you to clew all up.

When you get to the Eastward of Point St. Blas, and open the Gulf of Darien, the current appears to have less effect, and generally draws in to the South, S. by W., and S. by E.; but it is much influenced by the prevailing wind at the different periods of the seasons. After passing the gulf, you may see the islands of San Bernardo, which lie to the Eastward and form a cluster, the centre of which is in latitude $9^{\circ} 45' N.$, longitude, by chronometer, $75^{\circ} 57' W.$ These islands are low, but very remarkable; when at the distance of 10 or 12 miles, and bearing from E. to E. by S. & S., several parts of them will appear like small rocks between the islands; but at the South end of the Northernmost island there are two remarkable trees which may be mistaken for a vessel at anchor. These islands, like the whole of the coast, are covered with wood, and may be seen about 5 leagues off.

As you proceed further to the Eastward, you will make the islands of Rosario, which may always be known from those of San Bernardo, as they lie in a triangular form, and are long and low. Having passed these islands, if the weather be fine, you will see the hill over Carthagena, called Popa, on which a convent and castle with a signal-staff stands, and forms not unlike a gunner's quoin. After you get to the Eastward of the Rosario Islands, you will find a current setting to the N.W. and N.N.W., at the rate of from 1 to 2½ miles in an hour.

In proceeding to your anchorage you must steer to the Northward, until you open the town of Carthagena to the Southward of the Popa, which may be seen at the distance of 10 or 12 leagues off. In running in from sea, you must never bring the Popa to bear to the Northward of East; either of the above marks or bearings will lead clear of the Sabuedra Shoal, which has only 8 feet water on it, and bears from the Popa S.W. by W., about 8 miles.

The anchorage of Carthagena is very good, sand and mud, and from 8 to 6 fathoms of water. Here you are about 3½ or 4 miles from the city, and may see a gateway on the face of the bay, named the St. Domingo Gate, where you may land, keeping a little to the Westward, where there is a good sandy beach. In the fine season the winds generally blow along shore, and seldom bring in much sea. The marks for anchoring are: the citadel on with the lower or South part of the Popa, or the Popa, E. by S., and the Boea Chica S. ½ E.

The Coast from Chagres to Boca del Toro of the Chiriqui Lagoon.

Escudo Island.

ESCUDO ISLAND.—The course from Chagres to the Island Escudo is W. by S. by compass, about 75 miles. The island lies 9 miles from the main-land, and its East end is in $81^{\circ} 33' W.$ longitude. It is low, and covered with cocoanut-trees, and is about 1½ mile in length, with a reef of rocks extending from each end.

Point Valiente bears from this island W. by S., 22 miles, and may be seen in clear weather. To the Eastward of the point there are two small keys, named the Plantain keys, and are covered with trees. To the Westward, about 3 miles, are the three Tiger keys, between which and the main is a passage about a mile in breadth, having from 7 to 16 fathoms water. Here the current sets strong to the Westward.

Green Bay

GREEN BAY.—Six or seven miles to the Westward of the Tiger keys is the entrance of the Chiriqui Lagoon; and 8 miles S.E. of this entrance is Green Bay, where you may anchor in 10 fathoms, about a mile from the shore, abreast of an old hut in the middle of the bay. At about half a mile from the shore, the water shoals suddenly. Fresh water may be procured in abundance; it runs out of a hollow rock nearly 500 yards to the Westward of the hut. There is also a pool of water close to the hut, but it is not so good as that obtained from the rock. Wood is plentiful. There are no inhabitants within 7 or 8 miles.

In working out of Green Bay, two small keys will be observed; they are named the Zapadillas, and bear W.N.W. from Point Valiente. To these a berth must be given, on account of a reef which stretches to the South-eastward from them about 2 miles, on which the water breaks in most parts.

Boca del Toro, another passage into the lagoon, is about 10 miles W. by S. from the Zapadilla keys. This may be known by a remarkable rock, standing near the middle of the entrance. Ships going into the lagoon should keep the rock open at about a cable's length on the starboard side, until a reef appears on the port side, which must not be approached to a less depth than 4 fathoms, it being very steep. Pass the end of the reef in 7 fathoms, and haul up for the bay, where you may choose your anchorage in from 8 to 4 fathoms, well sheltered.

The only supplies to be obtained here, are turtle, fish, and wood.

Chiriqui Lagoon is about 26 miles long, and in some places 12 or 13 miles wide, with several rivers falling into it. The principal entrance into this lagoon is called the Valiente Channel, which is about 2 miles wide, lying North and South, with from 23 to 11 fathoms water. Point Valiente is in lat. 9° 41' N., long. 81° 53' W. The Western side of this channel is formed by the Zapadillas and Water Keys; the former having a reef on the North side of them, from the S.E. end of Provision Island to about 2 miles S.E. of the Easternmost Zapadilla Key. Off the East end of Water Key, a reef extends about half a mile. The Eastern side of the channel is formed by the Tiger Keys and Valiente Point. The Tiger Keys lie 13 mile from Valiente Point, and are four in number, three having trees on them, and the fourth perfectly bare, to the S.W. of which is a rock just even with the surface of the water. On this the sea always breaks, and there are 17 fathoms within half a mile of it. There is little or no danger in going into this channel, by keeping a good look-out from the mast-head, until you get within Water Key; then there is a rocky bank with 11 feet on some parts of it. The mark to avoid this bank, is to keep the two Zapadilla Keys open of the East end of Water Key, N.N.W. 4 W. In going across to the South side of the lagoon to Chirico Mola River, the soundings are very irregular, there being in some places not more than 3 fathoms. By observing the following directions, you will not have less than that depth:

When abreast of Water Key, steer to the Southward until you bring the two Zapadilla Keys just open of the East end of Water Key, bearing N.W. by N.; keep them on that bearing until the small keys which are off Valiente South Point come on with the North Valiente Point, and you will have from 18 to 5 and 6 fathoms; then steer to the W.S.W., until the Eastern Zapadilla Key comes within half its breadth of the East end of Water Key, bearing N.N.W. 4 W., and keep it thus open, or in that direction, until the North and South Valiente Points appear in a line. You will then be on a bank of 3 fathoms, which is about half a mile wide; and when over it, the water will deepen fast to 10 and 12 fathoms. When you are on the bank of three fathoms, Chirico Mola River will bear about S.E. 4 or 5 miles distant. It is not perceptible until you are within 2 or 3 miles. Nine fathoms is near enough to approach on the river side. It has, however, two entrances. The best anchorage is off the Northernmost, in 9 or 10 fathoms, muddy bottom, with Valiente Point bearing N. by W.; W., and the East end of Water Key N.W. 4 N., or you may go further Eastward, in 9 fathoms.

At the head of the river a tribe of Indians live, from whom you may purchase hogs, fowls, and plantains, by going up to their village, about 25 miles. The water is perfectly fresh at a quarter of a mile from the sea.

There is a very good anchorage on the South side of the Zapadilla Keys, in 12 or 13 fathoms water, about one mile off either of them, and little danger in going in there, by giving the reef off the S.E. key a berth of about a mile. Your eye will be the best guide for you here.

Remarks on the Coast of Nicaragua.

Near the River Tortuga is the most remarkable land on the coast. It is a high hammock, shaped at the West end like a gun boom, and called the Turtle Bogue. The land to the Eastward is very low, and perfectly level. To the Westward it is the same for about 10 miles, where there are three hills rising inland near the River Colorado. From this to Point San Juan, it is uniformly level, very low, and covered with trees. There are 50 fathoms blue mud and small shells, at about 10 or 11 miles off shore. The wind variable from N. to N.E., a current running to the S.W., about one mile an hour. Off this part of the coast, particularly after rain, the water will be much discolored for a considerable distance from the land; and if the wind blows on shore, you will often observe a ripple that has the appearance of broken water, which is occasioned by the outsets from the many rivers on the coast; but the soundings are very regular, there being 9 and 10 fathoms from 3 to 4 miles off shore. Nevertheless, at night it would not be prudent to go into less than 7 fathoms, as the currents are constantly varying, but mostly set on shore. The anchorage is good all along this part of the coast, generally blue mud and clay.

SAN JUAN DE NICARAGUA, OR GREY TOWN.—Bring a remarkable tree *San Juan de Nicaragua* on the main-land opposite Point Arenas, and bearing from it West, Northerly, to bear S.W. and steer for it; or bring the beacon on Point Arenas open to Eastward of a remarkable white house to the Westward of the town, and steer for it, giving it a berth of one-fourth of a mile until the centre of the town bears S.E. by E., when you may run in on this course and anchor, off the town, in 4 fathoms, with Point Arenas N.W. by N. During the Northerly, haul up rather sooner, and anchor off Point Mandeville, in 5 fathoms. In going out, beware of the current, which sets on the spit.

From Chagres to Cape Catoche.

*The coast
between
Porto Bello
and Valiente
Point.*

THE COAST BETWEEN PORTO BELLO AND VALIENTE POINT.—From the last low point without a name, the coast trends about S. 70° W., a distance of 53 miles, to the River Bolen, from whence it bends N. 55° W., 8 leagues, to Point Escudo; and thence it runs West another 8 leagues, to Valiente Point. All this coast is generally low, excepting some parts which rise a little; and the water is deep, so that at the distance of 3 or 4 miles off there are from 20 to 40 fathoms, the bottom being chiefly mud and sand. Several rivers disembogue upon it, two of which, besides Chagres, namely, that of Indios and that of Coelet, are navigable, and have communication with the interior. The River Coelet is 42 miles to the Westward of Chagres; and between them are four remarkable mountains, two of them inland, and the other two on the coast; and as they may serve for recognizing the land by, we give a description of them.

1. The Caladeros Altos of Chagres, are two mountains situated on the River Chagres, and some distance inland. They lie North-west and South-east, and appear separate from each other, as you come from Porto Bello. They seem only as one when they bear S.E., and thus apparently united, they have the same bearing from the castle of San Lorenzo, at Chagres; therefore, those bound to Chagres, from sea, have only to bring these two mountains in one, and steer S.E. for the port.

2. The Pilon of Miguel de la Borda is a single mountain, so named from its resemblance to a sugar-loaf, which is seen inland, at about 9 leagues to the S.W. by S. from Chagres. When this mountain bears S. by W., it will be in a line with the River Indios, which is 5 leagues to the Westward of Chagres.

3. The Sierra of Miguel de la Borda is 1552 feet high, and rises upon the same coast. It extends North and South, and is 13 leagues to the Westward of Porto Bello.

4. The Sierra of Coelet, which is 1432 feet high, lies to the S.S.W. of the River Coelet.

The Cordillera of Veragua and Serrania of Salamanca.—Besides the mountains above described, there are others about 7 leagues inland, very well known, and celebrated for their great elevation, named the Cordillera de Veragua, which commence nearly to the South of the River Coelet, and unite with the Serrania of Salamanca, nearly on the meridian of Boca de Toro, which ends a little to the Westward of the meridian of the River Matina. Both are so elevated as to be seen 36 leagues out to sea, in clear weather. At the East end of the mountains of Veragua, there is a gap resembling a riding-saddle, and is called the Silla, or Saddle of Veragua, and which lies South from the River Coelet. Therefore, to find that river from sea, you have only to bring the Silla to bear due South, and steer in for the shore. To the Westward of the Silla there is a mount on the highest top of the same cordillera, of the figure of a house or castle, and is called the Castle of Choco, from which the island named Escudo de Veragua, (Shield of Veragua) bears N 38° W. Therefore, when the mount bears S. 38° E., the island will be found by steering in that direction. Upon the West end of the same mountain, may be seen a remarkable peak, called Pan de Suerre, so called from the village at its base. This may serve as a mark for finding Matina.

The island of Escudo is low, covered with cocoa and other trees, and surrounded on the East and North parts with various keys of a chalky clay, also covered with trees. From the East side a reef extends off about half a league, on which the sea generally breaks. All the island and its keys are surrounded by a bank of sand and gravel, which extends out about 5 miles, on which, and very near to the land, there are 43 fathoms, and the depth gradually increases outward. The island is situated about 3 leagues from the main-land, and in case of emergency, water may be procured from its various rivulets, but not without considerable trouble, from the scantiness of the streams, and from their distance above the beach. On the S. and S.W. sides of this island there is good anchorage, sheltered from the Norths and the breezes. There is also anchorage on the bank to the Eastward, but this is not so commodious as the other, not only because it is not sheltered from the breeze, but also because the bottom is rocky, and may chafe the cables.

From Point Valiente, already noticed, and which is situated in 9° 11' of North lat. the coast forms a great bay, shut in by various keys and islets, which extend from that point W.N.W., a distance of 14 leagues, to Punta Gorda de Tirbi. This great bay is separated into two parts, by several interior keys. The Eastern part is called the Lagoon of Chiriqui, and the Western part, Almirante Bay. They are connected by various arms and creeks, of little depth of water. The lagoon of Chiriqui may be entered through the channel which is formed by Point Valiente and the Eastern-

most keys of the group; and, according to our information, although shallow, there is depth of water sufficient, both in the channel and within the lagoon, for vessels of all burdens. Almirante Bay must be entered exclusively by the channel which is formed by Punta Gorda de Tirbi and the Westernmost key. In this mouth, and within the bay, there is, from the same authority, depth of water sufficient for all classes of vessels. This channel is called the Dragon's Mouth, Boca del Dragon, to distinguish it from another mere to the Eastward, called Boca del Toro, by which only small vessels can enter. Within both bays the anchorage is as well sheltered and secure as the best harbors; but as we possess no information respecting them, we shall say no more than that to enter in or go out by the Dragon's Mouth, you should give a good berth to the Western coast, or that of Punta Gorda de Tirbi, on account of a rocky reef that runs out from it to mid-channel.

COAST BETWEEN PUNTA GORDA AND SAN JUAN DE NICARAGUA.—Coast between Punta Gorda de Tirbi the coast trends about N. 56° W., a distance of 14 miles, to Punta Carreta, which is the Eastern point of a bay that falls into the S.W., *Gorda and W., and N.W.,* a distance of 13 miles, to Blanca, or White Point, which has an islet near it. Thence the coast trends N. 3° W., 26 miles, to the point of Arenas, which forms the harbor of San Juan. All this coast is clean, and the water deep, and several rivers disembogue in it, of which the principal is that of Martina, or Port Cartayo, or Cartago, and that of San Juan. The last discharges its water by several mouths, one of which enters the very harbor.

From the harbor of San Juan de Nicaragua, the coast trends to the North a little Westward, a distance of 80 leagues, to Cape Gracias á Dios, and what is properly called Mosquito Shore. It is all low land, for the high lands terminate at San Juan; and in this extent there are numerous rivers and lagoons. A bank of soundings extends all along it, being about 8 miles from the shore, at Point Arenas, and running off, in a North-easterly direction, into latitude 16° 33' N., and longitude 84° W.

Upon this bank there are a number of keys and reefs, and those of Cape Gracias á Dios are very dangerous.

COAST BETWEEN ARENAS POINT AND THE PIGEON KEYS.—North of Point Arenas, 30 miles distant, is Point Gorda; the coast between forms an extensive bay, called the Gulf of Matina. About Point Gorda, and near it, are several islets, which, with the coast, are clean; and the soundings are so regular that no other guide is necessary than the use of the lead.

From Point Gorda the coast trends to N., about 3 leagues to Point Monkey, S. E. of which there are several keys very clean; and between them and the coast there is an anchorage in 3 fathoms water: this anchorage ought to be entered from the Southward of the islets. To the North of the point there are others, which rise upon the bank and reef, called the Pigeons, extending about 12 miles from North to South. To the Eastward of all these, and without the bank, lies a key, which, with the Pigeons, forms a channel; but it is best to avoid it, by sailing on the outside, as the Pigeon's Reef will thereby be entirely cleared, although it extends about 2 miles North from the islands.

BLEWFIELD'S LAGOON.—Aforeast of the Pigeon Keys, on the coast, is the Southern point of Blewfield's Lagoon, which is a bay extending inland to the Westward about 10 miles, and receiving in its Northern part a considerable river, called Rio Escondido. From the Southern point of the bay, or lagoon, to the Northern one, called Blewfield's Point, the distance is 12 miles N.; the latitude of this point is 11° 59' N., it being the mean of several observations. Nearly on the line between the two points is a key 7 miles in length, which forms, with the points, two channels: of these the Northern is the principal one, and has, in the season of the breezes, about 2 fathoms water; but at that season it is dangerous, because there is a fall of 3 feet. In the time of the vendavales, or rainy season, there are 2½ fathoms, without any fall.

Having passed the bar, or channel, there are within the bay 5 and 6 fathoms water, clay; the anchorage is near the town, on the N. E. side. To enter the lagoon you have only to keep along by Blewfield's Point, at the distance of a stone's throw, for it is very clean; and the point may be known from its being the highest land on this part of the coast. When within, continue on near the North shore, for the South is very foul, and requires the utmost caution; it will be indispensably necessary in going up to have anchors and cables all clear, to let go at an instant when the current, which is moderately strong, may render such an expedient necessary.

PEARL LAGOON.—From Blewfield's Point the coast trends North, inclining a little to the West, for the distance of 21 miles, to the entrance of the Pearl Lagoon. Of this part of the coast is a key, called the Cayman, lying at the distance of 7 miles from Blewfield's Point, and somewhat more than half a league from the shore. A reef extends from the North part of this key to the distance of 1 mile; but as every vessel ought to pass to the Eastward of it, there can be no danger if the lead be kept

going. The entrance of Pearl Lagoon has deeper water than that of Blewfield's: there is also anchorage on the outside of it, under shelter of the North coast, which rounds to the E.N.E., a distance of 8 miles, to Pearl Key Point.

Pearl Key Point.

PEARL KEY POINT—A reef runs off E.S.E., 1 mile distant, from Pearl Key Point. From that point to Man-of-war Keys, in lat. 13°, there are also a number of keys and reefs, some 14 miles from the main-land. From lat. 13° to Fox Reef, lat. 15° 30', the coast is clean up to Blackman's Bluff, lat. 14° 4'.

Between Blackman's Bluff and Morrison's Keys, there is a good channel of 8 miles in the narrowest part, up to Cape Gracias.

From lat. 11° 5' to lat. 16° 7', the Northern point of the Cuxones, or Hobbies, and long. 82° 22' to 83° 21', the bank is full of keys and reefs, with channels between them, and which can only be used in daylight with the charts as guides.

Island of St. Andrew.

ISLAND OF ST. ANDREW.—There is a fine bay on the West coast of this island. The bay is spacious and clean, sheltered from N. by E. round by E. to S. by E., and it appeared that a S.W. wind would not send in much sea. The bottom is rocky without the depth of 7 fathoms; so that you must run in until you get upon the white bottom, which consists of white sand, and bounds the bay, stretching off a long mile, having good anchorage on every part of it. The anchorage is with a small inlet lying nearly East, three-quarters of a mile off shore: the North point of the bay bearing N. by W., and the South point S. by W. $\frac{1}{2}$ W., in 6 $\frac{1}{2}$ fathoms.

No other directions are necessary for entering this bay than to steer directly in, and anchor where convenient. To find the situation of the bay from the offing, look out for the highest part of the island, near the South end, on which are two coconut-trees, very conspicuous by their overtopping the other trees, and by being the only coconut-trees that show themselves on the high land: bring them to bear N.E. or N. E. by N., and you will find the bay by steering in that direction.

It is flat to the distance of 2 cables' length from the North point, with no more than 2 and 3 fathoms, deepening suddenly to 8 fathoms; but this lying so near the shore, is out of the way of sailing in from the Southward. But if from the Northward, running along shore, with a scant N.E. wind, it will be necessary to give it a berth, going no nearer to the shore than 8 fathoms; and keeping the South side of the point a little open of the port bow, bearing nearly South; and when the two coconut-trees come over a remarkable withered tree which stands near a sandy place on the point, bearing about N.E., you will have passed the point of the flat, and may haul in S.E. for the anchorage.

The island in general presents a level fertile appearance: it is of moderate height, and may be seen 18 or 20 miles off: when seen from the Eastward, it makes in two hummocks, of which the North one is the highest. The East coast is bounded by a reef, which extends off 4 or 5 miles: the South point of this reef, with the shore inside of it, forms what is called the Eastern Harbor, the entrance of which is from the Southward. The North end is very dangerous, having a low key with a reef off it, on which the sea breaks as far as can be seen from the deck, probably 7 miles; it joins with the Eastern reef, and they together encompass all the North end and two-thirds of the East side of the island, ending a mile or so South of the entrance to the Eastern harbor.

The South end is bold, as is the West side: you may anchor in a bight near the shore to the Northward of the cove, near some chalky cliffs. There are no soundings until you come very near the shore.

From the hills you can see the E.S.E. keys, which lie 7 leagues from St. Andrew's; the S.S.W. keys 10, and Old Providence 18 leagues.

Currents.

The currents about these islands are very irregular, setting occasionally in every direction, but generally to the Northward and Southward.

The S.S.W. Keys.

THE S.S.W. KEYS are the Southernmost and Westernmost of the keys around St. Andrew's Island, being S. by W. 20 miles from the South point of St. Andrew's Island. These are three islets, which afford good anchoring-ground, and so clean that there is nothing to be guarded against, except what is in sight; for although there are a few rocks round them, they are too near to be any interruption.

The E.S.E. Keys.

THE E.S.E. KEYS.—About E. $\frac{1}{2}$ S. from St. Andrew's Island, at the distance of 5 leagues from the South end of it, there are three keys, called the E.S.E. Keys. They are surrounded by a reef and a bank of 7 miles in extent, which is very dangerous, and although there is anchorage for small vessels on it, it is necessary to have a pilot.

Little Corn Island.

LITTLE CORN ISLAND lies about 20 leagues W.S.W. $\frac{1}{2}$ W. from St. Andrew's, and has a reef round the East side of it, about a mile from the shore. The island appears to be all savanna, bordered round the beach with trees: all around the East side there are a great number of coconut-trees. There is good anchorage in a bay on the S.W. side of the island, where you may lie sheltered from North winds; from the North and South points of the bay there are reefs running off to the distance of 2 cables'

han that of Blewfield's: of the North coast, which point.

distant, from Pearl Key here are also a number of lat. 13° to Fox Reef, lat.

a good channel of 8 miles

Caxones, or Hobbies, and with channels between s as guides.

ting occasionally in every rmmost of the keys around south point of St. Andrew's ng-ground, and so clean that ight; for although there are rption.

y's Island, at the distance of s, called the E.S.E. Keys. extent, which is very dan- on it, it is necessary to have

W. ½ W. from St. Andrew's, the shore. The island ap- trees: all around the East good anchorage in a bay on from North winds; from the f to the distance of 2 cables'

length, but there is good room to work in, and regular soundings. You may anchor in 3 or 4 fathoms, sandy ground, at about a mile from the shore. In approaching this bay from the Northward, it is necessary to give the North point of the island a berth of a mile, in order to clear the reef. The tide rises and falls about 3 feet. Latitude of the bay by observation is 12° 17' N. Variation of the compass 7° 20' E.

GREAT CORN ISLAND.—This island lies S.S.W., 10 or 11 miles, from Little *Great Corn Island.*

Corn Island: it has a reef off the N.E. end of it that runs along the East side, about a mile and a half from the shore. The N.W. part of the island is pretty bold: in the N.W. bay, called the Brigantine Bay, there is good anchorage with the sea-breeze, but no shelter from Norths. There is another called the S.W. Bay, where we anchored in 3 fathoms. Off the point between the two bays lies a very dangerous ledge of rocks, stretching from the point to sea, nearly East and West, about 2 or 2½ miles, and having from 10 to 13 feet water on it: it does not appear to be more than 2 cables' length across in any part, and on the outer end there is a spot with only 9 feet on it, where the sea breaks when it blows strong. This ledge breaks off the sea from the bay, when the wind is to the Westward of North. In going down the West side of the island for the bay, it is necessary to give these rocks a good berth, and not haul up for the bay till the S.W. point of the island bears about E.S.E.: but, by keeping a lookout from the mast-head, you may see the rocks and round them, taking care to go no nearer to them than 6 fathoms: you may then work up into the bay, the soundings being regular, from 6 to 24 fathoms, on fine sandy bottom. You may sail along on the outside of the reef to the Eastward of the island, and go round the S.E. point, which is pretty bold; then haul into the bay, and fetch further to windward than by going to the Westward round the ledge. The latitude observed at the anchorage is 12° 13' N., and the longitude 83° 3' W.

This island is very conveniently situated for those bound to the harbor of Blewfields, which bears from it W. by S., distant 11 leagues, and which it is very dangerous attempting, in blowing weather, with the wind on shore, as there are only 12 or 13 feet water on the bar; but here they may stay in safety until the weather settles, that they can get in.

BLOWING ROCK.—S. 7° E., 7 miles distant from Great Corn Island, there is a *Blowing Rock.*

THE ISLANDS OF SANTA CATALINA AND PROVIDENCE, separated *Santa Catalina & Providence.*

only by a narrow channel, may be considered as one island. They are situated about 15 leagues N. 23° E. from St. Andrew's. Catalina is scarcely anything more than a rock, extremely craggy, and mostly covered with stones. The highest parts of it are exceedingly irregular, so that it is of no value, and is therefore uninhabited. Providence is about 4 miles in length from North to South, and 2 from East to West. From the level of the sea, at the most salient points, it begins to rise with a very gentle declivity towards the centre, where, resembling an amphitheatre, it forms four hills, crowned by a high mountain. From the summit, or cusp of the Easternmost hill, four streams descend from the same source, and run down to the shore in different directions, subdividing in their course into smaller rivulets of most excellent water. The most abundant of these streams in the dry season, is that which runs down on the West side, into what is called Freshwater Bay. In clear weather the island may be seen from 10 to 12 leagues off. It is, as well as Catalina, surrounded by a reef, that will not admit of coming within a league of it, and on the North side, not nearer than 4 miles. It is inhabited by three or four families, who cultivate some portions of it. Vessels not drawing more than 10 or 11 feet, may get in between the reefs, but it is necessary to have a pilot for the purpose.

MUSKETEERS.—This shoal, of which we have no written description, is dangerous, and has an extent of 8 miles, in a North-westerly direction. The centre lies in 13° 31' N. lat., and 80° 3' W. long. *Musketeers.*

QUITA SUENO.—This is an extensive bank, of 35 miles in length from North to South, and 13 miles in width from East to West, having on it from 7 to 20 fathoms *Quita Sueno.* water, excepting on the Eastern edge, which is dangerous, being a range of shoals and reefs for an extent of 23 miles, ranging nearly North and South.

South point of the bank is in.....	14° 2' N. lat.,	81° 15' W. long.
North point.....	14 37 "	81 7 "
South point of the shoal ground.....	11 7 "	81 7 "
North do. do. do.	11 30 "	81 7 "

SARRANA.—East, 52 miles from the Eastern edge of Quita Sueno, is the Sarrana *Sarrana.* Bank. It is of a triangular shape, longest from N.E. to S.W., being 20 miles long. On the S.W. point there is a key. The N.E. and South sides are bounded by reefs.

North point.....	14° 28' N. lat.,	80° 17' W. long
East point.....	14 21 " 80 8 "	
S. W. point.....	14 16 " 80 23 "	

Serranilla. SERRANILLA—This is a bank of 25 miles in extent from East to West, and 20 miles from North to South, of different depths, from 3 to 30 fathoms. The S. E. side is a range of keys and breakers; the Western side is clean and clear, with the exception of one small spot, called the Western Breaker.

The N. E. Breaker, which may be called
the N. E. point of the bank, lies in.....15° 47' N. lat., 79° 42' W. long
The West point of the bank, in.....15 45 " 80 7 "

The New Shoal. THE NEW SHOAL is a bank extending about 13 miles from N. E. to S. W., and 7 from East to West. All the Eastern part is a reef, very steep to; but on the West side the depth diminishes gradually. On the bank, at 13 mile from its Northern extremity, there is a sandy key, situated in latitude 15° 52' 20" N., and longitude, 78° 33' W. Three or four miles W. N. W. from this key you may anchor; but take care not to get into less than 9 fathoms water, because, at 2½ miles W. N. W. from it, a rock has been found with only 7 feet water on it; and S. by E. from it, at the distance of a mile, there is another, with no more than 4 feet water on it. Both of them stand in 5 fathoms. They are very steep, and not larger than a boat.

The Baxo del Comboy. THE BAXO DEL COMBOY does not exist; particular search has been made for it, but it could not be found.

Great River. GREAT RIVER.—From Pearl Key Point, already mentioned, the coast trends about N. 7° W., a distance of 30 miles, to the Rio Grande or Great River. This part of the coast is very foul, with a reef, which stretches off from it about 6 miles. On the Southern edge of the reef, and East from the point, there are two keys, the Easternmost of which is called Seal Key. To the North, a little Westerly from this key, and at the distance of 9 miles, there is another, which is outside the reef. Without these two keys there are others, of which the Southernmost are called the Pearl Keys. To these follow three others, called the King's Keys, which lie S. E. by E. from the mouth of the Great River, at the distance of about 14 miles. Next to these follow the Tyra and Man-of-war Keys. The Northernmost of the Man-of-war Keys lies about 11 miles distant from the Great River. Between all these keys there are good channels, with from 5½ to 9 fathoms water, on clean mud; but to enter them it is necessary to have a pilot, and if you have not one, you ought to go outside the whole of them. To enter the anchorage of Great River, you should pass between the Man-of-war Keys and the coast, in which channel, until you arrive at Great River, there is nothing to fear or attend to but the lead.

Prince Apulca River. PRINCE APULCA RIVER.—To the N. by W. from Great River, at the distance of 31 miles, there is another, called Prince Apulca, from which, in the same direction, at the distance of 25 miles, is the River Wava.

The coast to Blackman Bluff. THE COAST TO BLACKMAN BLUFF.—From the River Wava the coast continues to the N. E. for 13 miles, to Blackman Bluff. This last part of the coast forms a bay, sheltered from the North and Westerly winds, and in it you may anchor to any depth that suits you, understanding that at 2 miles from the land there are 4 fathoms, upon coarse gray sand and small shells. Great care should be taken in landing from this beach, as there is a bank before it, on which, with ever so little wind from the East, the sea breaks with great force.

The coast to Gracias a Dios. THE COAST TO GRACIAS A DIOS.—From Blackman Bluff the coast trends about N. N. W., a distance of 6 miles, to the River Hueson, which is known by a town situated about three-quarters of a league from the beach, and discernible at a good offing, as the ground is level and bare. From there the shore runs about N. N. E. 15 miles, to the Gordo Point, which is known by being more salient Eastward than any other on this coast, and thickly covered with trees. From this point the coast trends to the N. N. W., a distance of 7 miles, to the mouth of Arenas, or Sandy Bay, in which there is so little water that, in the time of the breezes, launches pass with difficulty; but within there is a deep and spacious bay.

From Sandy Bay the coast trends to the North 24 miles, to the Wano Lagoon, and thence to the bay of Gracias a Dios it is 7 miles in the same direction.

The Bay of Gracias a Dios. THE BAY OF GRACIAS A DIOS is formed by a tongue of land, extending to the Eastward more than 4 miles, which affords a good roadstead, with winds from S. S. W., round by W. and N., to S. S. E. The Easternmost and Southernmost point of this tongue of land is that which is called Cape Gracias a Dios; and from it to the South there are several keys, of which the last or Southernmost is called San Pio; and the South point of it, called Arenas Point, is also the East point of the bay. The

to go W.N.W. from it, a rock
lies from it, at the distance of
1/2 mile. Both of them stand
on a boat.
A regular search has been made

mentioned, the coast trends
about N.E. or Great River. This part
of the coast is about 6 miles. On
this part there are two keys, the East-
ern, a little Westerly from this
point, is outside the reef. With-
in the reef are called the Pearl
and Keys, which lie S.E. by E.
about 1-1/2 miles. Next to these
keys, most of the Man-of-war keys
between all these keys there are
shoals and mud; but to enter them it
is necessary you ought to go outside the
reef, you should pass between
the keys, until you arrive at Great

the Great River, at the distance
of 1/2 mile, which, in the same direction,

the River Wava the coast con-
tinues its last part of the coast forms

a tongue of land, extending to
the roadstead, with winds from
the East and Southernmost point of
the coast is called San Pio
and from it to the
Southernmost is called San Pio
the East point of the bay. The

depth of water in the bay is 20 feet, which is found at the entrance, to 16, which is
found well within it; and in all parts of it the bottom is soft, slaty clay.

ANCHORAGE OF GRACIAS A DIOS.—To anchor in this bay, if approaching *Anchorage*
it from the North and West, you have only to pass the sandy point of Key San Pio, *of Gracias*
and then run into the bay, and anchor in the number of feet suitable to the vessel's *à Dios.*
draught of water, for all of which you have only to attend to the lead. The only
thing which demands a little care, is not to mistake for the Key San Pio, that which
comes before it, called Troncoso; for having a strait of a mile in breadth between
them, and the Key San Pio being very low, any one coming from sea may be de-
ceived, and take the strait between the keys for the entrance; but this mistake may
be avoided, if you bear in mind that Key Troncoso is very small, and on the contrary,
that Key San Pio is a mile in extent from N.E. to S.W.; and further, in this strait
there is so little water that scarcely a canoe can pass, which is the cause of the sea
generally breaking in it. To those coming from the Southward, in order to enter this
bay, we have nothing further to recommend.

The canal made by the English from the Great River Segovia, across the tongue
of land that forms the bay, for the purpose of conveying into it the timber which they
bring down that river, has increased so much in width that from a narrow canal, it
has become a branch of the river, and brings with it so much soil and so many trunks
of trees, that the depth of water is gradually diminishing, and particular attention
should on that account be paid to the lead.

All the coast from the River Tongula is clean, without any other keys or reefs on
the bank than those already described; and those which are between the parallels
of Governor's Point and Cape Gracias à Dios, which are named the Mosquitos and
Thomas' Keys. These keys, with their reefs, form, with the coast, a channel 1
league in breadth where narrowest; and although between them there are passes
with the depth of 6 fathoms or more water, yet it is not advisable to attempt them,
but always run to the Westward, between them and the coast; for there can be no
risk in this channel, as the lead will give timely warning, either in sailing with the
wind large or working to windward; as at half a league from the coast there are
4 fathoms, and 9 in the vicinity of the keys; therefore, by not getting into less than
11 when standing Westward, or into more than 8 fathoms to the Eastward, there will
not be the least risk or cause of anxiety.

From the bay of Gracias à Dios you may steer S.S.E., which will take you in
sight of the Westernmost key of this group, which is a dark brown rock, that may
be seen at the distance of 5 or 6 miles. On this route you will have from 7 to 8 1/2
fathoms, and the course must be kept without going anything to the Eastward of it,
until you are West, clear of the Southernmost keys; the surest indication for which
will be your getting the depth of 11 fathoms, and thence you may shape a course for
your voyage.

FROM CAPE GRACIAS A DIOS WESTWARD.—From Cape Gracias à Dios *From Cape*
the coast runs about N.W., for the distance of 10 leagues, to Cape False, which may *Gracias à*
be known from being the highest land on this part of the coast. From the False *Dios West-*
Cape a bank, with very little water on it, projects out to the N.E. 6 miles; but the *ward.*
coast bank preserves its regular soundings, and it even seems as if they extended to
the Sarranilla; but however that may be, it is so little known, that 9 fathoms is the
greatest depth that you ought to navigate in, because there are various shoals, of
which the positions are very doubtful; and, therefore, to navigate with safety, you
ought not to get into deeper water than 9 fathoms, nor into a less depth than 5 1/2
fathoms; and this rule will hold good, either in steering a direct course, or working
to windward; for you will thus be sure of navigating in a clean channel of 20 miles
breadth.

From False Cape the coast trends about W.N.W., for a distance of about 35 miles,
to the lagoon of Cartago or Caratasa, which is easily known by its wide mouth. All
this coast, like the preceding, is clean, with regular soundings along it; and to nav-
igate on it the lead is a sufficient guide, so that you may not get into less than 5 1/2 fath-
oms when standing towards the shore, or into more than 9 when standing off; by doing
which you will evade falling on the Vivorilla, &c., as they lie about 8 leagues off the
coast Northward.

From Cartago Lagoon the coast trends about W.N.W., for a distance of about
20 leagues, to Brewer's Lagoon; and thence, almost on the same bearing, a distance
of 84 leagues, to the Rio Tinto, or Black River.

BLACK RIVER, AND METHOD OF ANCHORING OFF IT.—Black River *Black River,*
is distinguished by the mountains of La Cruz, which are very lofty, and are the first *and method*
to be seen on all the coast, after passing Nicaragua. These mountains are a little to *of anchoring*
the Eastward of the river's mouth; on the same river there is a peak, named the *off it.*
Sugar-loaf, because it is of that shape. To anchor off this river, bring the mouth of
it to bear South, and Cape Cameron West, taking care not to get into less than 11

fathoms; because in less depth there are many lost anchors, left by ships obliged precipitately to make sail when the Norths have set in.

This anchorage is an open roadstead, where, even with an ordinary breeze, it is necessary to ride with two thirds of a cable out, and as soon as the wind falls, to heave in to nearly a peak, in order to avoid fouling the anchor. When lying in this anchorage during the season of the gales, which, as we have said, is from October to February, the utmost attention must be paid to the state of the weather—and when you see the wind gets to the South east, and then veers to South and South west you ought immediately to weigh the anchor, and make sail off shore, well clear of the land, for a gale will surely succeed. Cloudiness, or a foul appearance on the N.W. quarter during these months, is an almost infallible sign of an approaching gale—a swell from the North is an indication equally certain, that precedes the gale at a moderate interval. In any of these gales, the loss of a ship remaining at anchor is inevitable—frequently the wind will not give time to weigh the anchor; in which case the cable must be slipped, with a buoy upon it, or even cut, that you may immediately make sail, and get clear from the land, in order to encounter the gale under sail. These gales are very violent, and raise a heavy sea, and therefore, if a ship is very much distressed, she has the resource of running to the bay of Gracias a Dios for shelter, and riding out the gale at anchor; and it has been already observed, that the lead is a guide which there will carry you clear of all danger. As these gales occur more frequently from the N.W. and W. than from the North, the result is, that ordinarily the anchorage of Gracias a Dios may be considered as a port to leeward, to which you can bear away; in which resource there will be found the advantage of being to windward of the Black River, when the land weather ceases; because then the breeze blows from the East, and, therefore, in a short time, and almost without trouble, you can return to your former anchorage.

Black River Bar.

BLACK RIVER BAR.—The bar of Black River is extremely dangerous, and boats run great risk of being upset on it, and the crews on board of them of perishing, from the very heavy sea there is generally upon it. Therefore, either to enter or come out of it, it is necessary that it should be done in the calm of the morning before the sea-breeze sets in, and after the land-breeze has blown the preceding night. If the breeze has been tolerably fresh, neither going in nor coming out can be effected, so that communication from the shore is far from frequent, and is always very troublesome and dangerous.

Coast to Cape Cameron and Punta Castilla.

COAST TO CAPE CAMERON AND PUNTA CASTILLA.—From Black River the coast trends West, with some inclination to the North, for a distance of 9 miles, to Cape Cameron, which is formed by a low tongue of land projecting into the sea. From this cape the coast trends W. 3° S., a distance of 20 leagues, to Punta Castilla, or Cape Honduras; it is all clean, and also deeper than the anterior coast, so that it should not be approached into less than 7½ fathoms water.

Punta Castilla is low; and a small sand bank, with very little water on it, extends from it one quarter of a mile to the Westward. Castilla is the North point of the bay of Truxillo, which at the entrance is about 7 miles wide. This bay is easily entered, as there is nothing to be guarded against except the little bank off Punta Castilla. On the South coast of the bay there is a high mountain, called Guaimoreto, which may be seen at the distance of 24 leagues. In making the bay from the offing, this mountain is a good mark for running in by; for, by bringing it to bear about S. E., or S. E. by S., it will lead clear of Punta Castilla, and up to the anchorage off the mouth of the River Cristales, which falls into the South side of the bay. This anchorage seems preferable, not only because its contiguity to the river affords the opportunity of procuring water conveniently, but also because from this spot Punta Castilla may be easily cleared, in case of being obliged to get under way by a gale from W. S. W., W., or W. N. W.; whence it blows most frequently from October or November until February. With such winds, a simple inspection of the plan of the bay will show that there must be a heavy sea in it.

To enter in or sail out of this bay no particular instructions are necessary, as there is plenty of room for working, without the smallest risk, observing only not to approach Blanquilla or St. Lucas Key nearer than half a mile; this key is off the South coast, about 2 miles outside the bay, and is surrounded by a bank, with little water on it, the best guide towards which is the lead. Take care not to get into less than 3½ fathoms in its vicinity, and you will avoid every danger. Blanquilla lies about a mile from the coast, and you may run through the channel between, without any other guide than the lead. It was heretofore believed that this bay was well sheltered, and a good place of refuge during the storms of winter; but this is not the fact, and any vessel stationed on the coast at that season, ought to prefer Port Royal, to it.

Guanaja, or Bonacca.

GUANAJA, or BONACCA.—North from Point Castilla, at the distance of 8 leagues, is the island of Guanaja, about 3 leagues in length, N. E. and S. W. It is a

 this bay was well sheltered,
 but this is not the fact, and
 ight to prefer Port Royal, in

estilla, at the distance of 8
 gth, N.E. and S.W. It is co-

rely surrounded by keys and reefs, which extend a league off from it. On the East side of the island there is a very good anchorage, particularly during the North winds, but it will be necessary to pass between the keys and reefs to enter it. The best passage is to the Southward, leaving the Southernmost key on the port, and another key, lying N. by E., half a mile from it, on the starboard. Endeavor to pass in mid-channel, and steer towards another key that lies two thirds of a mile West from the Northernmost of those you have passed. It will bear from you about N 71 W. You ought always to pass between the two last mentioned keys, and then nothing remains but to coast along the island to the N.E., and anchor at any convenient place, after getting under shelter of the land; observing to keep about the middle of the channel, between the island and the keys, in 7, 8, and 9 fathoms water, on muddy sand. It may be necessary sometimes to run for this anchorage in blowing weather from N., N.W., or W., which will not permit of entering it on one stretch. In such a case, however, it may be observed that you may work between the three keys before mentioned, on the supposition that it will be sufficient to give them a berth of a cable's length. The plan of the harbor will clearly illustrate what has been said of it.

RATTAN.—Westward of Guinap is the Island Rattan, about 10 leagues in length, from E.N.E. to W.S.W. A reef runs off Eastward from the East point, to the distance of 12 miles, on which there are several keys and islands; of these, the Easternmost is called Barburet. The distance from Barburet to Guinap, is about 10 miles; but the channel is reduced to 5 miles only, by the reefs which extend from both islands. Without great experience, the passage through it will be attended with great danger. All the North coast of Rattan is bordered by reefs that prevent its being safely approached nearer than a league; and those not well acquainted with the coast should keep at a still greater distance. On the South coast there are several good roadsteads, but most of them are difficult of access from the foul reefs at the entrances. Of all these harbors, that called Port Royal, on the Eastern part of the island, is the principal; and of which mention was made when describing the bay of Truxillo, as being well adapted for affording shelter during the season of the Norths. It is formed by the coasts of the island on the North and West, and by some reefs and keys on the South and East: the entrance to it is by a narrow channel, scarcely half a cable's length wide between the reefs; but, fortunately, this narrowness is not more than 1 cable's length. The East side of this channel is formed by a reef extending from the West side of the island called Leon, which is easily distinguishable from its size, and cannot be mistaken for the other keys, which are very small. In attempting to enter this harbor without a pilot, it will be necessary to mark the entrance by boats or otherwise; and it ought always to be done with the wind from N.E., Easterly, or from West, Southerly, in order to get clear within the reef; we refer to the Plan of the Harbor, but we cannot guarantee the correctness of it. In approaching the island from the Southward, great caution is required, to avoid a rocky shoal nearly opposite the Western extremity of it, at the distance of more than 4 miles from the coast; the channel between it and the coast is also obstructed by several other shoals; and although there is a passage for large ships, yet without an experienced pilot, they should always pass on the outside of it.

Rattan.

FROM TRUXILLO, WESTWARD.—From the River Cristales, in the bay of Truxillo, the coast trends about S. 75° W., a distance of 32 leagues, to Triunfo de la Cruz, or Triumph of the Cross. This coast is dangerous on account of several reefs and shoals which extend from the South side of Utila; for which reason, if there is no cause for keeping near the shore, or you have not the requisite experience for making the passage without risk, we strongly recommend a course always to the Northward of both the Cochinos and the Island Utila.

From Truxillo, Westward.

THE COCHINOS are two rather large islands, clean on the North side, but with various foul keys and reefs on the South; between these islands and the keys there is a regular anchorage.

The Cochinos.

UTILA ISLAND lies about N. 75° W. from the Cochinos, at the distance of 23 miles: the North, South, and West coasts of it are foul, but the East coast has a good anchorage, to enter which safely, much experience is requisite. To the S.W. of this island lies a shoal, called the Salmedina, of more than 5 miles extent; on account of which, when going to the Northward of Utila, observe to approach it no nearer than 2 leagues, until you are abreast of its Western points; you may then run down for the coast about Punta Sal; in doing which, a S.W. by W. course will counteract the effect of the current, that hereabout sets N.W., and might otherwise drift the ship into some difficulty with Long Reef.

Utila Island.

THE TRIUNFO DE LA CRUZ is a point whence the coast rounds to S.S.W. and S., about 7 miles, and then bends to the N.W. for the space of 22 miles further to Punta San, forming a great bay, sheltered from the breezes, and with good anchorage for ships of every denomination. To the North of Cape Triunfo, at the distance of half a mile, there are some islets, two of which are tolerably large, and may be

Triunfo de la Cruz.

seen at the distance of 2 leagues; they are clean, and by passing at half a mile from all that is visible, you may proceed direct to the anchorage in the Eastern part of the bay, a little to the Southward of the point, in 5½ to 8 fathoms water, on sand.

Punta Sal.

PUNTA SAL.—The point at which the bay terminates is called Punta Sal, or Salt Point; and at about half a mile to the Northward of it lie some high rocks, called the Fishops, forming a channel unvailable for boats only. The point appears with some hillocks and broken ground, and to the Southward of it there is a little harbor, called Puerto Sal, but of which we have no details; however, off the mouth of this harbor, and at the round of Punta de Sal, you may anchor, under shelter from the breezes; but it will be necessary not to come to in more than 12 fathoms, because in 17, 16, 15, and 14, the bottom is rocky: while, on the contrary, in less than 12, it is clean clay.

From Puerto Sal the coast lies about W.S.W., a distance of 8 miles, to the River Lúa, which is large and deep: in front of this river there is anchorage on excellent holding-ground, of clay, but without the least shelter from the Norths.

Port Caballos, or Cavallos.

About 8 miles, W. & S., from the River Lúa, is that of Chamalceon, off which there is also anchorage on good holding-ground, but also unsheltered from the Norths.

PORT CABALLOS, or CAVALLIOS, lies about W.S.W. from the River Chamalceon, and at the distance of 4 leagues. This harbor is formed by a low point of sand to seaward, on the West side of which there is an anchorage in 5½ to 11 fathoms, on sand. The harbor may be known by a high round hill, which is situated close to the sea, on the Eastern coast, and at about 2 leagues to the Eastward of the port. To enter this port, you have only to keep clear of what is visible.

From Porto Caballos to Omoa the distance is 7 miles, S.W. by W. Within this space there is a small bank, with little water on it, lying North of some red gullies or broken ground, which are seen on the coast, and at the distance of about a league and a half from them. To keep clear of this bank, take care not to get into less than 8 fathoms, until you have passed the red gullies; you may then steer direct for Omoa.

Omoa.

OMOA.—The harbor of Omoa is formed by a low point of land, covered with mangroves, which projects out to sea. It is now fit for vessels drawing 12 feet water only. It may also be known by the high land rising from Omoa, and running Westward, because from Omoa Eastward it is all low. To enter into Omoa, you may pass at a cable's length from the mangrove point, which forms the harbor; and on getting to the Westward of it, you ought to luff as much as possible to the South and East, to fetch the South part of the point, with the object of trying whether you can enter into the basin, or caldera, under sail; but, as it will be necessary to steer North for this purpose, the best way will be to get as much to the Eastward as possible, until you are abreast of the mouth of the basin, and anchor there for warping in.

Light.

On the fort at Omoa, there is a fixed light, 60 feet above the sea, in lat. 15° 47' 10" N., long. 88° 03' 45" W.

From the anchorage of Omoa, in clear weather, Cape Three Points may be seen bearing about W. by N. ½ N. All the land to the Westward of Omoa is very high, and upon it rise three or four summits, resembling sugar-loaves; but the coast is very low, and continues so to the gulf of Honduras. From Omoa to Cape Three Points, the distance is about 11 leagues, the intermediate coast trending a little to the Southward, so that it forms a bight, in which there is generally a confused sea: and therefore, it is advisable not to go too near to it, but rather to steer W.N.W., or N.W. by W., to pass well clear of Cape Three Points. After running a short distance on these courses, you will see at the N.W. the Southernmost keys, which lie off the coast of Bacalar, and which are about 5 leagues distant from Cape Three Points. In all the channel leading into the gulf of Honduras, and as far as Point Manabique, the greatest depth of water is 23 fathoms. Point Manabique is about 3 leagues W. by N. from Cape Three Points; and West from it, at the distance of a league and a half, there is a bank, with little water over it, called the Buey, or Ox, to which a berth must be given.

Gulf of Honduras.

GULF OF HONDURAS.—Point Manabique and the Southernmost keys of the coast of Bacalar form the entrance of the Gulf of Honduras, within which, and at S. or S. by E. from Manabique Point, is the bay of St. Thomas de Castilla; and S.W. by S. or S.W., from the same point, lies the mouth of Rio Dulce. All this gulf is shoal, but with depth sufficient for ships of every class; but in navigating in it, you ought to keep the lead going, and have the anchors ready to let go, if necessary, or if you wish to anchor. The mouth of the River Dulce may be known by a little insulated hill which is somewhat to the Westward of it. The anchorage is N.N.E. from the mouth of the river, in any convenient depth of water, and the anchors must lie N.W. and S.E.

From the River Dulce the coast rounds to the N. and E., to Point Tapet, which is about 18 miles N.W. from Manabique; and thence North-easterly to Cape Catoche, which, with Cape San Antonio, in the island of Cuba, forms the South channel into the Gulf of Mexico. On this coast there is a reef extending to the 19th degree of latitude, on which there rise almost innumerable keys, with various openings or passages through them, by which the coast may be approached. The Southernmost keys on this reef are the Zapadillos, which are about 5 leagues distant from the coast. Between this reef and the coast there is a channel, with a good depth of water in it, but it is full of dangers; and speaking generally, it may be said that all this part of the coast is so foul, and so little known, that it cannot be navigated near without great risk. There are not only the reef and chain of keys already mentioned, but other foul reefs also; namely, Long or Glover's Reef, Four Keys Reef, and Chinchorro.

Some of these lie more than 20 leagues from the coast, and with it form channels free and navigable.

The Mosquito Coast, from Black River to Blackman's Bluff.

Black River is known by the land over it, which is the Easternmost high land on the Mosquito shore, and very remarkable, called Poyer Hills; to the Westward it is all high land. Therefore, if when steering in for Black River, you fall in with high land to the Eastward of you, you will be certain of being to the Westward of it. It is quite an open road, the shore lying nearly East and West; you must, therefore, lie at a single anchor, and be ready to put to sea the instant the North comes on, even if you are obliged to leave your anchor; as the swell sets in so violently, there would be little chance of riding it out and in case of parting, in all probability you will be driven on shore.

The number of anchors left here makes the road very bad, as your cables are liable to be cut by them, or in heaving up, to hook one; in which case you seldom fail losing your own, as it is good holding-ground. For the above reason, it is advisable to lie somewhat to the Eastward of the usual anchoring-place, where you will have clear ground. Should the wind come to the Westward of North, you must run to Cape Gracias á Dios; but if it should be to the Eastward, you may go either to Truxillo or Bonacca. The North prevails from October to February.

We anchored in 12 fathoms, directly off the river, with the Sugar-loaf of Poyer Hills bearing South, and Cape Cameron West; but with the Sugar-loaf bearing S. ½ W., there is less risk of getting foul of anchors. When the trees on the low land are seen from the deck, you will have 80 or 90 fathoms, from which it shoals regularly to 9 fathoms, muddy bottom. The entrance into the river is narrow, and distinguishable from the other land; it has a dangerous bar across it, which can very seldom be passed, except in the morning before the sea breeze sets in; and then only in their craft; though it is sometimes smooth enough for a ship's boat to go over in safety. Being over the bar, and in the entrance of the river, you must proceed up a lagoon on the right hand, about 1½ mile to the town, or bank, as they call it, which is the principal settlement, and is very pleasantly situated on the left side of the lagoon, going up. The town is about a mile long, and consists of only one street; at the East end of it there is a battery of 12 guns *en barbette*.

Good water may be obtained a little way up the river, and plenty of wood; but both must be got off in the country craft, on account of the bar.

Off Patook River, which lies at a considerable distance to the Eastward of Black River, the fresh water, where it joins the sea, forms a distinct line, being very brown and muddy, and has the appearance of a shoal.

Off the Caratasca Lagoon it is shoal to some distance. On passing the False Cape, be careful to give it a good berth, keeping in 5 fathoms, as a dangerous shoal runs off from it; then keep along the shore in 5 fathoms for the cape, which appears like a bluff point, with level low land to the Westward of it. As you proceed to the Southward, keeping in 4½ or 5 fathoms, you will see near the cape three small islands, with moderately high trees on them; but they all join the land by a narrow beach; beyond them is a low sandy key, connected with the other by a reef, and forming the entrance of the harbor, it appears to lie across the mouth of it. As a spit runs from this key, you must give the point a berth of about 2 cables' length. There is good anchorage within the spit point in 4 fathoms, the said point bearing S. E. distant three-quarters of a mile. You may bring the Southernmost point of the Spit Key to bear S., and the Northernmost point S.E. by E., distant three-quarters of a mile, and anchor in 4 fathoms.

In working up the harbor the soundings are regular, from 4 to 3 fathoms, muddy bottom. The town, which is only a few huts built for the convenience of the woodcutters, is situated on both sides of the Haulover, which is a cut they have made from

the River Wanks across into the harbor, the river running into the sea by the gap. Through this cut, great trees and logs have been drove, which have lodged round it, and formed a bar about 2 cables' length off, over which there is barely water for a boat; and it is increasing, so that it is very probable it will in time spoil the harbor. Latitude observed, $11^{\circ} 59' N.$

Sandy Bay. SANDY BAY lies about 9 leagues from Cape Gracias á Dios, to the Southward, it is low level land, and only to be distinguished by a gap among the bushes near the beach, which the Indians have cut through for nearly a mile, to open a passage into a spacious lagoon for their craft, directly across which is their town, very near the water side. The coast here trends nearly North and South. The bar, which is off the creek, is not above a cable's length from the shore, and has a continual breach over it, without any very heavy surf. Neither wood nor water can be procured, except from the Indians, and brought off in their craft, for the ship's boats cannot go over the bar. Latitude observed, $11^{\circ} 30'.$

You anchor to the Southward, off the creek, bringing it to bear W. by S., or W. S. W., for the convenience of getting off from the shore. The water rises and falls here a little, but there is no regular tide.

Trebuppy. TREBUPPY is about 7 leagues to the Southward of Sandy Bay. On running down you will see houses a considerable way inland, which is the Governor's Town, off which we anchored. The land is not high, but has the appearance from the ship of being cultivated. The bar is at the entrance of a small river that runs winding up to the town, and is only safe to be passed in the country craft. It is no better lying here than at Sandy Bay, as it is a straight shore. The bearings at the anchorage are, Blackman's Bluff, S.W. $\frac{1}{2}$ W., the river's mouth West, and the Northernmost land N. by E. Latitude observed, $11^{\circ} 8' N.$ The current sets to the Southward.

Neither wood nor water to be had here, except procured from the Indians, and brought off in their craft.

Blackman's Bluff. BLACKMAN'S BLUFF makes off in a point from Trebuppy, about 5 miles, and has somewhat of a bay to the Southward of it. You may run in until the bluff bears N.N.E. $\frac{1}{2}$ E., and anchor in 11 fathoms, about 2 miles from the shore, with the river's mouth bearing N.W., and the Southernmost land S.W. by S. At about half a mile within this anchorage there are only 3 fathoms. The appearance of the land is much the same as at Trebuppy; there is a bar at the river's mouth; and at about 2 miles up the river are the few houses of the inhabitants, who have a number of cattle and good pasturage. There are no Indians living here. There is a considerable rise and fall of the tide in the river, but at the anchorage there is only a small southerly current. Latitude observed, $11^{\circ} 3' N.$

Tide. Wood and water may be got here, but they must be brought off by the inhabitants in their craft.

Description of the Swan Islands, &c., with directions for navigating from Half-moon Key to Balize; and from English Key Northward past Manger Key, Turnoff.

The Swan Islands, two in number, are low, but may be distinguished from the mast-head in clear weather at a distance of 5 leagues. They are in extent about $1\frac{1}{2}$ miles, in an E.N.E. and W.S.W. bearing, and have a passage between them, in which there is only sufficient water for a boat: they may be approached on either side with safety to a distance of three-quarters of a mile; and at the S.W. end of the Western island there is a fine sandy bay, and clean bottom, where a ship may anchor in safety in from 7 to 10 fathoms, at half a mile off shore. Further West, at from $1\frac{1}{2}$ to 2 miles distant, the bottom becomes foul, with very irregular soundings, from 10 to $4\frac{1}{2}$ fathoms. The Easternmost island is infested with innumerable boobies, its shores not accessible without great danger, or injury to the boat. The Western island, on the contrary, is well wooded, with several good landing-places in small sandy bays, which abound in turtle. Coconuts are in great numbers on the North side. Water cannot be had, though it probably may be found by digging.

Observed latitude of the West island, $17^{\circ} 24' N.$; longitude, by chronometer, $83^{\circ} 53' W.$

Misteriosa Bank. MISTERIOSA BANK.—North, 90 miles distant from the Swan Islands, is the Misteriosa Bank, in lat. $18^{\circ} 52' 42'' N.$, long. $83^{\circ} 51' 37'' W.$

Albion and Maud's Bank. THE ALBION AND MAUD'S BANK, described in a former edition of this work, are without doubt the Misteriosa Bank.

Glover's Reef. GLOVER'S REEF.—The bank is in general very dangerous. With the common trade-wind the current sets strongly over it to the Westward.

It has two sand-spots on the North end, and lies nearly south from Hat Key, distant 15 miles, trending thence S.S.W. $\frac{1}{2}$ W. to the South end of the reef, on which there are five islands or keys. These may easily be known from the Southern Keys, as they are quite bold on the South side. The keys are very little detached, and nearly

into the sea by the cape which have lodged round it, there is barely water for a in time spoil the harbor.

Dios, to the Southward, among the bushes near the e, to open a passage into a town, very near the water. The bar, which is off the as a continual breach over can be procured, except ship's boats cannot go over

dangerous. With the common vard.

ly south from Hat Key, dis- n end of the reef, on which n from the Southern Keys, ery little detached, and nearly

all of the same height, with numerous cocoonut-trees on them. If, from want of ob- sertation and strong current, you may have gotten to the Southward of Glover's Reef, and the wind be so far to the Northward that you cannot sail North for Key Bokel, might coming o. r, you should anchor to leeward of the key, where there is good ground, in from 7 to 17 fathoms, within half a mile of the keys, and there either wait for a wind, or till you send into English Key for a pilot.

BALIZE, or BELIZE. For Balize are always in readiness at Half-moon *Balize, or Belize, or Light.* Key, (the S. E. key,) on the E. end of which is a fixed light, elevated about 50 feet above the sea, which may be seen in clear weather when 4 leagues distant—a circumstance that causes this route to Balize to be generally preferred—though in the season of the North winds, that is, from October to March, it is considered by some, and with apparent justice, best to make Manger Key, the Northern key on the Turnell, from which you may run with a fair wind S. S. W., 6 leagues, to English Key: whereas by approaching Half-moon Key at this season, the prevailing winds will not allow you to fetch Key Bokel from Hat Key Reef, and also gives you a dead bent to English Key. It has been recommended by some to make Bonacca, in lat. 16° 35' N.; but this island is surrounded by reefs, which circumstance combined with the strong Southerly currents, at the season alluded to, when gales from the N. and N. W., may be frequently expected, renders it a coast rather to be avoided, particularly as the only port under your lee would be New Port Royal, in the South side of Rattan—a most desirable port for persons acquainted—but the entrance lies between reefs, and is intricate, and pilots are seldom to be obtained.

Distance from the light-house on Half-moon Key, 17° 4' 30"; longitude, by chronometer, 87° 27' 40" W.

HAT KEY AND REEF.—W. S. W. of Half-moon Key lies Hat Key, which is *Hat Key and Reef.* wooded and resembles, in form, a coronet. A dangerous reef extends from this key S. 8 by E., 3 miles, to clear which, when 2 miles South of Half-moon Key, they steer S. S. W. $\frac{1}{2}$ W., 10 miles. From the edge of the reef to Key Bokel the course is W., or W. $\frac{1}{2}$ N., according to the wind, 7 leagues.

KEY BOKEL AND ANCHORAGE.—Key Bokel may be known by its fine sandy *Key Bokel* beach and three or four cocoonut-trees, and may be rounded at half a mile distant, *and An-* but not nearer. Should you wish to anchor, a clear sandy bottom will be found with *chorage.* from 10 to 1 fathoms, the centre of the key bearing from E. by S. to S. E.; the E. S. E. bearing is preferred. It is advisable to give a good scope of cable at once, as from the edge of the bank being very steep, you are liable, in case of squalls or fresh breezes from the Eastward, to drive off it before you could have time to veer.

ENGLISH KEY.—The course and distance from hence to English Key is N. W. *English Key.* by S., 4 leagues. It has three cocoonut-trees on its centre, is sandy on the N. E. side, and bushy to the water's edge on its S. and S. W. sides, lying at the South side of the entrance to the channel to Balize. God's Key is situated on the North side of the channel, is very small and bushy, with one cocoonut-tree in the centre, and surrounded by a sandy beach. To the Eastward about half a mile is a sand-patch, called by the pilots "Sand Bore," nearly even with the water's edge, and requires a good berth in rounding. The anchorage is in from 8 to 4 fathoms, with God's Key bearing from N. by W. to N. by E., or the keys to the Northward of God's Key in one. From this place, unless perfectly acquainted, you cannot proceed without a pilot.

There are three lights on English Key similar to those on Manger Key, described *Lights* below, lat. 17° 49' 35" N., long. 88° 01' W.

There is also anchorage in 4 fathoms at "Joe's Hole," under Turnell, as far North from Key Bokel as to have English Key bearing N. W. by W. The depth of water between English and God's Keys is 20 fathoms. Pilots are generally found on the former of those keys waiting the arrival of vessels coming in from the Northward.

The course in mid-channel from English Key to Balize is about W. N. W., till the West end of Water Key bears North; then haul up to N. by W., or N. N. W., till God's Key is on with Water Key, which is the mark to run over the narrows in 2¹/₂ fathoms; then N. W. and N. W. by W., hauling to the Northward after passing the middle-ground, which has only 10 feet water on it, and lies from 2 to 2¹/₂ miles from Balize. From the narrows you will find 7 fathoms, decreasing gradually as you approach the anchorage. The marks for anchoring off Balize are the steeple of the church on with the centre of Government House, and the South end of Fort George, situated on a low flat island, bearing N. W. $\frac{1}{2}$ W., where you will have 2¹/₂ fathoms, on muddy bottom. Ships of greater draught of water lie at a considerable distance from the town, and proceed to it through a wider and deeper channel than the one described, having in it 3 fathoms and upwards.

The current in the anchorage sets to the Southward, at the rate of one mile per hour, with a rise and fall of 2 feet.

Supplies of all sorts are of a very inferior description. Vegetables are seldom to be procured, and never but in very small quantities. Beef is also inferior, and very scarce. Turtle alone is abundant. The water is not good for a voyage, unless taken from about 11 miles up the river, except during the rainy season, when it may be had perfectly fresh 2 miles from its mouth.

Mauger Key.

MAUGER KEY.—The course from English Key to Mauger Key is N.E. by N., 6 or 7 leagues. It is the Northernmost key on Turneff, with a reef extending from it N.N.W., 2 miles. To the S.S.W. is Crawl Key, at the S.W. end of which there is anchorage during the regular trade-winds, in 4 or 5 fathoms. To the Eastward of Crawl Key lies Three-cornered Key, all having a great resemblance to each other, Mauger Key being the smallest, and, as before stated, the Northernmost.

Lights.

On Mauger Key there is a triangular light, formed by three lanterns hoisted on a flagstaff. The lights are on the North-west point of the key, and bear from the N.W. point of the reef E.S.E., so that a vessel by bringing the two lower lights in one, at a distance of 4 miles from the key, may safely shape her course S.S.W. for English Key, distant from Mauger Key about 7 leagues, where, if no pilot offer, by keeping the English Key lights well on board, and a good lookout, a small sandy spot will be clearly seen, and anchorage can be had on the edge of the bank.

The latitude of the lights is $17^{\circ} 36' N.$, longitude $87^{\circ} 46' W.$ The upper light is 95 feet above the level of the sea, and the two lower lights 75 feet. The lights can be seen distinctly, in clear weather, at a distance of from 14 to 15 miles.

Swan Islands.

SWAN ISLANDS.—The courses and bearings are magnetic. The North side is bold, and may be approached with safety to the distance of half a mile, until within three-quarters of a mile of the West end, where shoal water and dangerous rocks lie off full 1½ mile. The Easternmost of these islands is not low, and may be seen in clear weather 18 or 20 miles off. The discolored water extends a full mile off from the E.S.E. part along the South side to the West end, where it extends off full 1½ mile. They are two distinct islands, connected by a reef of rocks, and well wooded, the trees on the Easternmost being moderately high. The latitude of the Eastern end is $17^{\circ} 22' 30'' N.$; the longitude, by chronometer, $83^{\circ} 48' W.$

From Swan Island towards Balize, it is necessary to guard most particularly against the influence of the currents in running down to the shores of Honduras. They are entirely influenced by the winds, and change their direction when the wind changes; but on approaching the shoals, reefs, and keys South of Balize, you will generally find a strong current setting to the Northward, which must be guarded against by frequent observations during the night. The South-eastermost of the Southern four keys is Half-moon Key, so called from the form of the sandy shoal projecting from it. On this key the light-house is placed, in lat. $17^{\circ} 42' 30'' N.$, and long. $87^{\circ} 27' 10'' W.$, by chronometer. Here the pilots for Balize reside.

Light.

The approach to Balize from the Outer Keys is too difficult to be attempted by any one not having a thorough and practical knowledge of it.

When about 12 miles to the Southward of Mauger Key, you will see two or three remarkable hillocks on Turneff; from these hillocks English Key will bear about W. by S. From hence you may steer across to English Key, with less chance of mistaking it, attending to the lights seen in the space between the coconut-trees. The course from Mauger Key to English Key is S.S.W., 20 miles; but there is a great risk of a stranger's being bewildered, from the similarity of the keys near English Key, by steering directly for it; and therefore recommend running along the Turneff shore, as above, in preference.

Anchorage at English Key.

ANCHORAGE AT ENGLISH KEY.—In anchoring at English Key, take your soundings from Goff's Key, and round towards English Key, as there is a dangerous spit off the latter, called by the pilots the Sand Bore. With English Key bearing S. W. ½ S., and Goff's Key N. by W., there are 5 fathoms.

Between the anchorage and Mauger Key there is always a Southerly set; it is, however, influenced by an ebb and flow of the water, but not very strong. The edge of the reef of Mauger Key is about 2 miles off. Unless very dark, by keeping a good lookout, you may see it in time to avoid danger.

Current.

Navigators should guard against a strong current, which almost always sets between Mauger Key and the opposite keys, about N. W. This current sometimes sets Westerly, and then to the Southward.

The coast of Bacalar is bold, and may be approached in some places within one mile; there is a reef all along it, which, both by the color and breaking, plainly indicates itself; and off some of the projecting points they are plainly seen breaking at a considerable distance off. You have no soundings outside the reef, nor any means of ascertaining your approach to it in the night.

Ambergris Key.

AMBERGRIS KEY.—The long isle, called Ambergris Key, to the Northward of Balize, is said to abound with extensive fresh-water lakes; to produce logwood, and the valuable kind of dye-wood, named Brazilletto. In most seasons it is plentifully stocked with many kinds of game.

Vegetables are seldom to be had, and is also inferior, and very scarce for a voyage, unless taken in the winter season, when it may be had in great quantities.

Mauger Key is N. E. by N. 6 miles, and has a reef extending from it to the S. W. end of which there is a shoal. To the Eastward of Mauger Key is a shoal of resemblance to each other, and is the Northernmost.

Three lanterns hoisted on a high point, and bear from the N. W. end of the reef two lower lights in one, at a distance of 2 miles, for English Key, and a small sandy spot will be seen on the bank.

46' W. The upper light is 75 feet high. The lights can be seen at a distance of 14 to 15 miles.

Magnetic. The North side is of half a mile, until within 1/2 mile of the shore, where the rocks are not low, and may be seen in the distance. It extends a full mile off from where it extends off full 1/2 mile of rocks, and well wooded. The latitude of the Eastern end is 17° 48' W.

To guard most particularly to the shores of Honduras, their direction when the wind blows South of Balize, you will find that the South-easterly wind, which must be guarded against, extends a full mile off from where it extends off full 1/2 mile of rocks, and well wooded. The latitude of the Eastern end is 17° 48' W.

To guard most particularly to the shores of Honduras, their direction when the wind blows South of Balize, you will find that the South-easterly wind, which must be guarded against, extends a full mile off from where it extends off full 1/2 mile of rocks, and well wooded. The latitude of the Eastern end is 17° 48' W.

At English Key, take your bearings, as there is a dangerous shoal with English Key bearing S.

Always a Southerly set; it is not very strong. The edge is very dark, by keeping a good look out.

Which almost always sets here. This current sometimes sets in some places within one mile; it breaking, plainly indicates a shoal, and is chiefly seen breaking at a considerable distance from the reef, nor any means of ascertaining its depth.

At Ambergris Key, to the Northward of the reef, to produce logwood, and most seasons it is plentifully

The whole of the shore of Ambergris Key has a reef about a quarter of a mile, or a little more off, in many places dry, and the sea breaking on all of it.

EL CHINCIONO.—The shoal called the Northern Triangle lies at the distance *El Chincion* of 13 leagues to the Northward of Mauger Key. When the trade-wind prevails, a *chono* current, often very strong, sets down between Mauger Key and Triangle; there dividing itself, it sets to the Southward, between Turnell and the main reef, and, to the Northward, between the Triangle Reef and Ambergris Key. With a wind from E. to E. S. E., as you sail to leeward of the Triangle, you will have a strong current in your favor.

The South end of the Triangle Reef is from 1 to 5 miles broad: it makes in two points, between which there is a sandy spot. From the S. W. point, the reef trends N. by W. 1/2 W. to the great key on the centre of the reef; from thence N. by E. to the two keys on the North end. The course along shore to Cozumel is N. by E. 1/2 E., and the shore pretty bold.

COZUMEL ISLAND is of moderate height, extending N. E. and S. W., upwards *Cozumel Island* of 7 leagues, and is about 2 leagues in breadth. Its East side is free from danger; but off the N. E. point a reef runs out in a N. E. by N. direction, upwards of 3 miles; this reef is steep to in every part; and there are 10 and 11 fathoms close to the breakers, on the N. E. extremity. Passing the North-easterly breakers at a distance of half a mile, having 12 fathoms, and rounding them gradually, you may stand into a bay on the West side of the island, and anchor in 6 fathoms, on rocky bottom, at about 2 1/2 miles from the beach, with the N. E. point bearing East, distant 5 miles. From this spot you can plainly see the main-land of Bacalar to the Westward, which is rather low, with a number of large trees along the shore.

The N. E. point of Cozumel is situated in latitude 20° 32' N., and longitude 86° 41' 52" W. The North part of the island is low and swampy, covered with thick underwood; on the South part the trees appear much larger, but of the rustic or logwood kind.

Off the North part, or end, the soundings extend to a considerable distance Northward from the reef before mentioned. You will have 13, 11, 20, and 16 fathoms, on rocky bottom. In lat. 20° 50', and long. 76° 40' you have 16 fathoms, on rocky bottom, with strong rippling, similar to the Gulf Stream, the set being N. by E. 2 1/2 knots; at this point the bank appears to terminate.

The current to the Eastward of Cozumel sets N. by E., at the rate of 2 knots; but to the Westward, between the island and the main, it runs South-westward, at the rate of 2 1/2 knots.

The variation of the compass is 7 1/2°, Easterly.

The main-land opposite to Cozumel, trends about N. N. E. 1/2 E., to the Island Mauger Key, and is all low and woody.

On first making the Island Cozumel, from the North-west end being much higher than the Southern, you are inclined to think the island lies nearly East and West; but, on a nearer approach, it will be found to lie nearly in a N. E. and S. W. direction. There is good anchorage all along the West side of the island, at about three-quarters of 1/2 mile from the shore, on stiff sand and clay; the anchor may be seen. The bank running all along the Western side is free from danger, and very steep to, having from 13 to 10 fathoms at one east of the lead. On approaching the shore you plainly see the edge of the bank, which shows itself by the discolored water, and a very strong and turbulent motion, caused by the stream of current which sets very strong to the Northward outside, at one mile from the shore, coming in contact with the eddy current, which sets in a contrary direction along from the edge of the bank.

ANCHORAGE.—There is good anchorage in the first bend of the coast to the Southward of the N. W. point, having that point bearing N. by E., and the Southern extreme S. S. W., distant off shore about half a mile. It is necessary to remark, that the land from the N. W. to the North point, falls in to the Eastward, forming a long deep bight of 8 miles. About 8 miles to the Southward of the N. W. point, there is a small lagoon, the entrance to which is not discernible till very near it, having about 5 or 6 feet of water at the mouth; there are many small islets all about it, and an abundance of fish of the finest quality. All along the coast there is an abundance of wood, and fish may be caught; in some places the seine may be hauled, but generally speaking, the beach is lined with small rocks near the water's edge. The South end of the island is low, and has a long sandy spit projecting from it. It is stated that fresh water is to be found.

THE COAST AND RIVERS OF GUYANA, FROM THE EQUATOR AND THE AMAZON, WESTWARD TO THE GULF OF PARIA, OR TRINIDAD.

THE COAST OF GUYANA, IN GENERAL.—The country comprehended under the name of Guyana, extends Southward from the River Orinoco to the River Amazon. The coasts of it are generally low; as the numerous rivers bring down vast quantities of alluvial matter, which accumulating on the shores, has formed a border of low ground. This ground, between the high and low water marks, is commonly covered with mangroves: at low-water, it appears like an inaccessible bank; but with the rising tide it is inundated.

Portuguese Guyana.

PORTUGUESE GUYANA.—The Amazon is considered the first or largest river in the world. The sources of this river are within 2 degrees of the Pacific Ocean, about the parallel of 11° S., and several great rivers fall into it; these again having innumerable branches. The course of its grand stream is nearly East, across the continent, until it falls into the Atlantic, under the equinoctial line. The river is said to be navigable through nearly its whole length, though impeded by many banks of sand, some of which extend 30 or 40 leagues. Below its confluence with the River Xingu, at 40 leagues from the sea, its opposite banks are invisible from each other. At Ovidos, more than 140 leagues from the sea, its breadth is about 1600 fathoms. The tide is perceptible to the distance of 150 leagues.

Tide.

The declivity of the bed of the river, from Ovidos, has been computed at only 4 feet; yet the immense body of interior water gives it an astonishing impetus; so that it rushes into the sea with amazing velocity, and is said to freshen the ocean, at times, to the distance of nearly 80 leagues from the shore. This rapidity, on the return of tide, occasions a bore, called by the Indians *pororooca*, which is chiefly observable towards Cape North, and which surpasses those of other great rivers. This phenomenon always occurs two days before and after the full and change of the moon; when, at the commencement of the flood, the sea rushes into the river, forming three or four successive waves, that break mountain high on the bar, and raise the tide within its greatest elevation in one or two minutes. It has been said that the elevation of these ridges of water has amounted to not less than 200 feet; but the ordinary rise over the bar is from 12 to 15 feet. The noise of the irruption may be heard at the distance of 2 leagues.

French Guyana.

FRENCH GUYANA.—The coasts of French Guyana are much like those of the Portuguese or Brazilian territory, and present nothing remarkable to the navigator; the whole being lined by drowned mangrove isles and mud-banks, which bar the mouths of the numerous rivers. The rains on this coast prevail from January to June, and form stagnant ponds and marshes, which render the climate very unhealthy. The currents along the coast are strong and irregular.

Dutch and British Guyana.

DUTCH AND BRITISH GUYANA.—Dutch Guyana, or Surinam, extends from the Marowyne to the Corantine, an extent of 170 miles; and British Guyana, from the Corantine to Essequeibo, an extent of about 120 miles.

General directions for the coasts of Dutch and British Guyana.

Ships bound from the windward, or Caribbee islands, to these coasts, should steer as far to the Eastward as S.E., if the wind will permit, on account of the strong draught, or current, setting all times of the year to the Westward, into and through the Gulf of Paria. The moment you come on to the outward edge of the ground, you will perceive the color of the water change to a light green, and will have from 35 to 45 fathoms. If in that depth you should be so far to the Southward as 7° 25', or 7° 30' North latitude, you may steer in S.W., and make the land; but if more to the Northward, keep your wind till you attain that latitude, you will have very gradual soundings quite to the shore, but very shallow; you will be in 9 fathoms when you first get sight of the land about Demarara; but you may run in, without fear in 1 fathoms, being attentive to your lead. As it is the general opinion that there are many unexplored sand-banks on this coast, a great attention to the lead and the quality of the ground will be necessary, as by that only you will be apprised of the danger: for on most parts of this coast, to the Eastward of the River Orinoco, the bottom is of very soft mud; if, on a sudden, you find hard sandy ground, be assured some danger is near, and immediately haul off, till you again find soft ground, as before.

The making of the land all the way from the Orinoco, as far to the Eastward as Cayenne, is very low and woody, and therefore appears in all parts so much alike.

that the most experienced pilots are frequently deceived. Your chief dependence, therefore, is in a true altitude; if that, by reason of thick weather, cannot be obtained, it will be advisable to anchor in about 6 fathoms, which you may do with great safety, having good ground, and in general, moderate gales and smooth water.

The making of the land about Demarara is the most remarkable of any part of the coast: the woods in many places being burnt down, and cleared for cultivation, makes the land appear in large gaps, where the houses, &c., are plainly to be seen; and if there are many ships lying at the lower part of the river, their mast-heads may be plainly seen above the trees for some distance at sea.

If bound into Demarara, you must run to the Westward till you bring the entrance of the river S.S.W., or S. by W., and either lie to or anchor for the tide, in 4 fathoms water; but be very cautious not to be hauled further to the Westward than these bearings, for the flood runs very strongly into the River Essequibo, at the mouth of which, and at a great distance from the land, lie many very dangerous sand-banks, on some of which there are not more than 9 or 10 feet of water, and the flood-tide sets directly on them.

On many parts of this coast, particularly off Point Spirit, a league to the Eastward of Demarara, the flood-tide sets directly on the shore, and the ebb sets off to the N. E. It will be advisable, when calm and near the land, to anchor there.

In the month of December, there is at times, particularly in shoal water, on the coming in of the flood, a great sea, called the rollers, and by the Indians, porooca. It is often fatal to vessels at anchor.

At the distance of between 12 and 40 leagues from the coast, the wind generally prevails from the E.S.E., but within 12 leagues the wind is variable; in the morning S.E. and E.S.E. towards noon, drawing round to the East; and between 2 and 8 it is generally to the N.E. and N.N.E., or North. In the night it varies from E. by N. to E. by S.

To get to the windward on this coast, care must be taken not to suffer the Southerly winds to take you more than 10 leagues from the land, at which distance you should be about noon; for by two hours after, the wind may prevail so far to the North as to lay you along shore. By 8 in the evening the North wind has gradually subsided, and the wind then blows along shore from the Eastward; therefore, with a whole ebb before you, it may be best to anchor and stop for a tide. By daylight the wind will be found to have changed to West, Southerly; hence the advantage of being near shore. Thus proceeding, and taking advantage of the tides, a ship may beat from Demarara to Surinam in the space of 3 or 4 days.

SURINAM RIVER.—It is advisable for ships bound for Surinam, when coming from the Eastward, or long voyages, to get into latitude $5^{\circ} 55'$ in the longitude of 59° , unless they have a time-keeper, or lunar observation, to depend on, as they will have an opportunity, from observation to observation, of ascertaining the current, which almost constantly, off the Marowynne, runs to the N.W.; and you are also to observe that, during the rainy season, you cannot always depend on a meridional observation.

When arrived in the above latitude, and having found no bottom with 60 fathoms, you ought to keep directly to the South-west, because it is certain you are then about the meridian of Cape North, or perhaps still more to the Eastward, where the current, with uncommon velocity, sweeps to the North and North-west, by which one may be prevented from gaining Southing. With a South-west course you may the sooner be able to pass through the current, and enter the boundary of the tides, which should be your principal aim.

Having gained ground in the latitude $5^{\circ} 55'$, already quoted, and a depth of 60 fathoms, fine sand with mud, you may be certain of having arrived nearly to the meridian of Cayenne, at least not more to the Westward.

To the North and N.E., from 20 to 30 leagues off the Marowynne shoals, are the depths of 30 to 45 fathoms of water, the bottom soft mud with fine sand and broken shells. To the Marowynne shoals you should not, in the night, approach nearer than 10 fathoms, when the soundings will be gradually coarser; in hauling to the Northward, you will have deeper water and finer sand; and in 10 fathoms of water, heaving-to with your lead to the Northward, you will drive clear enough of the shoals to the North-west. You may always know whether you are to the Eastward, and consequently to the windward, by the soundings; for the ground, 6 leagues to leeward of the Marowynne, all the way to Bram's Point, is soft mud. Your best landfall will be between Post Orange and the Marowynne; indeed, it is absolutely necessary that you should make the land thereabout. The Marowynne is known, not only by the high land lying at a great distance inland, but best of all by the appearance of its mouth, opening towards the N.E., in which this stream differs with nearly all the other rivers on this coast, as no one of them shows its entrance open in that direction. Its sand and clay banks also lie dispersed to the N.E. and N.N.E.

The coast between the Marowynne and Surinam River lies still uncultivated, with the exception of Mr. Cameron's plantation; and nothing but thick wood, of an almost uninterrupted uniformity, presents itself to the view, without the smallest emerged object; from this reason ships ought to run as near the land as their draught of water will permit, which they may do with perfect safety, there being no known danger; to this they are the more compelled as the espying the few existing marks requires the utmost attention, from their being projected against a wood, the trees and leaves of which are of different hues.

In making Post Orange, (which is in longitude $54^{\circ} 36'$) you will see the Dutch flag hoisted there, and a few houses, of a dark brown aspect, lying nearly hidden in the forest. This post lies nearly 13 leagues to the Westward of the Marowynne, and at about the same distance from Bram's Point.

It ought to be remarked that, although in former times there may have existed some likeness between Post Orange and Bram's Point, at present none such is to be found; the large tree at Post Orange, mentioned in former descriptions, is probably fallen or dead, and the flag only may serve to distinguish the spot. At Bram's Point, however, no flag is now to be seen.

About 5 miles to the West of Post Orange is the Motkreek, where also the Dutch flag is displayed as a mark for ships; a few houses, in a similar manner, lie scattered among the trees.

The next mark you have (for you must be very attentive in keeping a good lookout) is a break in the land, through which appear the houses and buildings of a plantation called Cameron's Castle. The mansion, a large structure, painted white, has a steeple upon its roof, which makes it the best mark on this part of the coast.

From here the mud-bank begins to spread further off shore; the lead is your best guide; and by keeping all along its edge, you will discover, in due time, the buoys, placed along the channel which leads over the bank into the river. When seeing the land leading inward to the S.W., and marking the trees opposite the ship, you may perceive a row of trees along the forest bank without leaves, and of a singular brown, burnt aspect; these trees have been known, during at least half a century, by the name of Krabbewoesh or Crab-wood.

As Surinam River disembogues towards the West, you may not see its Western bank before you have discovered the outer vessel, which serves as a mark to lead over the bank.

In 1717 a beacon was erected on Bram's Point, but since 1832 it has broken down, together with the houses, flagstuffs, and every other object previously existing; so that, at present, not the smallest trace of human habitation is to be seen there. Instead of the beacon, there have been placed four marks along the windward side of the channel, leading over the bank towards the river, which consists of two iron vessels with masts, and two copper buoys, placed in the following order:

No. 1—The outermost vessel with Bram's Point South 19° East; and No. 2, the other vessel, South 10° West, in latitude observed $6^{\circ} 1' 30''$, and has $2\frac{1}{2}$ or $2\frac{3}{4}$ fathoms around it.

No. 2 has Bram's Point South 37° East, and No. 3, being one of the buoys, South 11° East: it lies in $2\frac{1}{2}$ fathoms of water. N.B. These bearings are true.

No. 3 lies in $2\frac{1}{2}$ fathoms of water, to the Westward of the sand-banks which extend from Bram's Point, with the Easternmost point of land bearing North 74° East; Bram's Point, South 61° East; and No. 4, South 50° East. (You must keep a sharp lookout in going from the one to the other, in order to find out their place.)

No. 4 lies to the Southward, and close to the edge of the sand-banks, in 3 fathoms of water, with Bram's Point North 45° East. To the West of this buoy is a pit or hole with $3\frac{1}{2}$ fathoms of water, and which affords a good anchorage for ships waiting for wind or tide. N.B. These bearings are by compass.

Every depth above given is at low-water, full and change of the moon, when the water rises 9 or 10 feet; but at the intervals only $5\frac{1}{2}$ or 6 feet. It is high-water 4h. 30m.

Light-house. A light-house is building on Bram's Point, in lat. $5^{\circ} 56' N.$, lon. $55^{\circ} 9' 30'' W.$

Regarding the marks as above, the only additional caution necessary is against the setting of the tides; the flood sets with force upon the lee shore, and the ebb rushes straight over the sand-banks; the former is of some importance to ships working in, especially when the wind is not sufficient to keep the ship in restraint; for here the bottom, of a soft mud, has now and then, by suction, prevented the effect of the rudder; and as, in such cases, a ship may not always let go an anchor, they have been pressed deep in the mud, before they could do anything to prevent it. This has happened, even in 1833, with one of the returning merchant-ships, which, passing the bank against the flood, touched but lightly; after which she ran till in 4 feet of water alongside, and although fortunately got off she lost her rudder, besides a great lapse of time, together with hard working and expenses. As vessels, small craft excepted,

es still uncultivated, with thick wood, of an almost out the smallest emerged as their draught of water being no known danger; to existing marks requires the d, the trees and leaves of

56° N., lon. 55° 9' 30" W. caution necessary is against the lee shore, and the ebb rushing importance to ships working the ship in restraint; for here the prevented the effect of the rudder to go an anchor, they have been hant-ships, which, passing the ch she ran till in 4 feet of water er rudder, besides a great loss. As vessels, small craft excepted

always enter the river with the flood-tide, the effects of the ebb are to be shunned by those who come driving down the river; because the tide will throw them upon the sun-bank which juts out from Bram's Point. This bank, called Schulpe Rif (Shell-shoal) is of a tenacious substance, and nearly as hard as solid ground; therefore care should be taken not to be driven upon it.

Finally, no vessel of any considerable draught should enter the channel of Surinam without the certainty of going in at once, at least so far as to reach the anchorage West of the buoy No. 4; for getting aground here is always attended with some fatal consequence, during the following ebb-tide, which causes the ship to plough the soft ground till she is fairly driven ashore. If it be evening, or ebb-tide, you had better haul to the Northward, and must anchor when you have 3½ or 4 fathoms of water, with the outer vessel, (No. 1,) bearing S. by E. or S.S.E., as, should you lie to, the current would, during the night, drift you as far to the Westward as the River Saranacca; and many ships have been three to four weeks beating back to Bram's Point, although the distance is only 7 or 8 leagues. (It must however be remarked, they were probably unacquainted with the mode of working up along this coast.)

Having passed the buoy No. 4, you have only to keep in mid-channel with the lead going. A mile inward from Bram's Point stands a flagstaff, with a few houses, destined for a lazaret; here you may anchor in 3½ and 4 fathoms of water. Between this place and Jaglust plantation, you will find the deepest water by keeping three-quarters over to the Eastern shore. After passing the first plantation called Resolutie, you will find only 2 fathoms at low-water, and from thence to within a mile of the entrance of the Comowinie may not be improperly termed the Lower Bar.

Having reached nearly to the entrance of the Comowinie, which branches from the Surinam, you must be very particular in guarding against the flood, which sets strongly into the Comowinie, and which, without great precaution, would set you on a spit of sand, which extends from Fort Amsterdam almost across the Comowinie. On the other hand, you must guard against some sunken rocks, which lie a little below Fort Amsterdam, on the Western shore, so as to keep between the two. Having passed the flagstaff, you will have 18 feet at low-water; and from thence to the edge of the bar, the deepest water in the river. It is here that those ships complete their lading which draw too much water to pass over the bar.

At Tiger's Hole there are 6 fathoms of water, which is just above Governor Frederic's plantation, called Voorburg. Here you will then have a leading wind up; and by keeping three-quarters over the Eastern shore you will have the deepest water, 11 feet at low, and 18 feet at high water. You may anchor abreast of Paramaribo, in 4 fathoms, observing that the deepest water is close to the town.

It is high-water, at full and change, at Bram's Point, at 4½ o'clock. The flood sets High-water. to the Westward, ebb to the Eastward.

DEMERARA.—In sailing for the coast of Demerara from the Northward, you must keep well to windward, as the general set of the current along the coast is W. or W. N.W., about 2 miles an hour. Demerara.

At the distance of 20 miles off shore the currents vary according to the wind, and it may be observed, as a general rule, that when there is any Westing in the wind, a strong Easterly set will be found along the whole coast; and that when the wind inclines to the Eastward, the set will then be Westerly.

The trade-wind, blowing between N.N.E. and S.E., causes the Westerly set usually found; but as the wind occasionally veers to the Northward, and even so far as N.N.W., particularly in the winter months, the Easterly current above alluded to sometimes exists.

The flood-tide sets along the coast S.W., and the ebb N.E. Their influence is not felt beyond 8 miles off shore.

As the passage from Demerara to Berbice, or other ports to windward, exposes you to the general Westerly current, it is well to keep close inshore, and take advantage of the inshore tides; and should the winds be light it will be necessary to anchor with the flood.

Appearance of the land on the Demerara coast.—Nine miles to the Eastward of Cocobano Point are five or six single cocoanut-trees; 10 miles further to the Eastward are two rows of the same trees, appearing like white cliffs.

Twenty-six miles to the Eastward of the river there is a hillock, formed by a large cotton-tree. This towers above the low land, and forms like a sugar-loaf: it is called General Murray's tree.

Forty-six miles to the Eastward of the river General Murray's Tree, S.W. by S. 12°.

are two hillocks close together. They also form like sugar-loaves, and show themselves above the land.

Vessels on the coast of British Guyana, and bound to Demerara, will clearly make these objects, as they alone alter the appearance of the low land.

Two Cotton Trees S.S.W. 11.

Crab Island, at the entrance of the River Berbice, will point this part of the coast out, there being no other island between Demerara and Surinam.

Fourteen miles to the Eastward of Berbice, there is a building close down to the water; its sides and top are white, and a little to the Westward is a deep gap in the land.

Fifty miles to the Eastward of Berbice there is a patch of burnt trees, having the appearance of vessels at anchor.

The intermediate coast between these objects is low; patches of trees, and a few dispersed houses, alone altering its appearance.

There is no danger if the lead is kept well going.

Unless standing in for a harbor or river, do not go into less than 5 fathoms, as there are many banks but little known inside these soundings. There is anchorage along the whole coast, but be careful, if you anchor off Berbice, to have sufficiently deep water to prevent touching the bottom between the hollows of the rollers, which break.

Berbice.

High-water.

Light.

BERBICE.—Latitude and longitude of the light-vessel $6^{\circ} 19' 18''$ N., $57^{\circ} 22' 30''$ W.; high-water, full and change, 4h. 0m.

There is a fixed light at New Amsterdam, near the Palace of Justice, in lat. $6^{\circ} 11' 11''$ N., long. $57^{\circ} 22' 40''$ W.

Berbice light-vessel carries one fixed light by night, and a black ball at the foremast head by day, painted black outside and roofed over; she has a small jiggermast abaft, and lies in a quarter less than 3 fathoms, at low-water.

From the light-vessel to the entrance of the river the course is S.S.W., 10 miles. To enter the river all vessels have to pass over a bar or flat of 6 miles in extent, having 16 feet at high-water, and only 7 feet at low water, spring tides.

All vessels drawing from 11 to 15 feet, going up the river, should leave the light-vessel about an hour before high-water, and steer S.S.W. When about 2 miles from the light-vessel the water will shoal to 15 feet, until a tree on the low point to the Eastward, is shut in by a bluff point, bearing E. by S. $\frac{1}{2}$ S. They will then be about 2 miles from the entrance of the river. The water will then deepen from 15 to 20 feet, and they will be over the bar. The channel narrows in approaching the river, there being a long mud-flat, extending about 6 miles to the Northward, on the Western side, which is sometimes dry at low water; and a hard shell-bank to the Eastward, on which the sea breaks at low-water, and which is steep close to. The channel lies between these two banks, and a vessel may keep so far to the Eastward as to shut in Crab Island half-way with the Eastern point of the river, and to the Westward, so as to open Crab Island from the Eastern point. When about three-quarters of a mile from the Eastern point, open the shipping between Crab Island and the Eastern point; and when off the East point, which is 5 miles from the town, steer South, or S. by W., in 3½ fathoms, keeping close to the Eastern shore, and about three-quarters of a cable's length off shore.

To avoid a shoal off the S.E. point of Crab Island, keep the steeples of the two churches touching each other, or about half a cable's length off the bushes on the Eastern shore.

Off Point Canje there is a mud-bank lying N. and S., of 30 fathoms in extent, having only 9 feet water on it, at low-water. It is half a cable's length off shore, and the mud on it is very soft.

After passing Canje Creek haul out a little to the Westward, in order to anchor with a flood-tide, and in 17 to 21 feet at high-water. Vessels drawing 12 feet generally lie aground here at low-water.

BERBICE TO DEMERARA.—The true course and distance from Berbice light-vessel to Demerara light-vessel is N. 49° W. 51 miles; the magnetic course N. 34° W.

Leaving Berbice with an ebb-tide, steer N.W. by N., by compass, 20 miles, and then N.W. by W., with which courses Demerara light-vessel will be seen ahead. The N.W. by N. course is to avoid the long mud-flat lying N.W. by W. from Berbice light-vessel, having at high-water only from 12 to 6 feet water on it; whereas this track will give from 16 to 20 feet, muddy bottom. To know when the vessel is to the Westward of this flat, two groups of trees, called the Eighteen and the Nineteen, will be touching each other, bearing S. by E. by compass. Alter the course then to N.W. by W. by compass, and in approaching the Demerara light-vessel there will

be from 18 to 26 and 30 feet water, muddy bottom. Twenty miles to the Eastward of Point Corrobana (the Eastern point of Demerara River) the coast assumes a more lively appearance, the mangrove-trees having frequent gaps in them, through which the smoke is seen rising from the different factories. There is also seen a very long remarkable group of trees, with large tops and small stems, called Paradise Plantations, with a white factory building half a mile to the Westward of it; and as there are no other trees on this coast having the same appearance, it will be a very good guide to know if a vessel is to the Eastward of Demerara, which frequently happens during the rainy seasons, when the current, which usually sets W.N.W., alters to N. by E. and N.N.E.

Ships coming from the Windward Islands and bound to Demerara, making these trees, and being in 5 or 6 fathoms water, by steering W.S.W., will make Demerara light vessel; but they should not shoal the water to less than 3 fathoms.

DEMERARA.—Demerara light-vessel is in latitude 6° 59' 30" N., longitude 58° 5 W. Time of high-water, at full and change, 4h. 30m. The light-vessel is painted red, has two masts, and carries a fixed light by night, and a broad red pendant by day, and lies in 4 fathoms at low-water, N.N.E. ½ E., 12 miles, from the light-house on Corrobana point.

The light-house is striped red and white perpendicularly, and has a signal-post on the top of it.

It is a fixed light, 103 feet above the sea, latitude 6° 49' 20" N., longitude 58° 11' 20" W.

Ships bound into the river have to pass over a bar, one mile in length and 1½ mile across, having 13, 12, and 8 feet on it at low-water. On leaving the light-vessel steer S.W. by S., or S.S.W. ½ W., allowing for the tide, keeping the light-house a little on the port bow, just over the cathead, for 8 miles. In this track there will be from 21 to 11 feet. When a single large tree, (the high cabbage-tree) on the Western shore of the river bears S.W. ½ W., or the Northernmost large factory chimney on the same side of the river bears S.W. ½ S., steer S.W. ½ S., passing to the Northward of a black buoy and a staff, with a small cask on it, called the Tub Beacon; this track will afford 16, 18, and 20 feet water. It is not safe to shoal to less than 16 feet in passing the beacon, as the ground is very hard there. About W.S.W. of this beacon there is a white buoy in 16 feet, lying off the N.E. point of the river. Pass to the Northward of it, and between it and the red buoy, which lies N.W. from it about 1½ mile.

When the light-house bears S. by E. haul into the river, and moor off the town as most convenient.

In coming from the Northward, it should be carefully remembered, that the light in the light-house can be seen before that of the light-vessel. By bringing the former to bear S.W. by S. it will lead to the light-vessel; but if anything should have happened to the latter, and the light of the light-house be mistaken for it, when bearing anything to the Southward of S. by W., or Eastward of South, it would lead to a very hard sand-bank, having only 8 feet on it, lying W. and W.N.W. from the light-vessel.

The pilots for this harbor are very good, and keep a sharp lookout for vessels coming down, picking vessels up 15 and 20 miles to the windward of the river.

It is high-water (spring tides) at George Town at 4h. 45m p. m. Rise at ordinary springs, 9 feet; at neaps, 8 feet. The tide continues to flow on the surface 1h. 10m. after high-water, and during spring-tides runs about three knots per hour at the anchorage, in the dry season, from July to November. Variation 5° 43 East.

The distance from George Town to the sand-hills up the river is about 25½ miles. In going up to the sand-hills keep the Eastern shore close on board, after passing the flats of Providence, until abreast of Howeroenie Creek; then haul over towards the point on the West shore above Glasgow.

SPANISH, or COLOMBIAN GUYANA.—The most remarkable feature of Spanish or Colombian Guyana is the course of the River Orinoco. A great part of the upper portion of this river was explored in the year 1800, by the celebrated Humboldt, who proved its communication with the Rio Negro, and consequently, with the Amazon. The mouths of the Orinoco are of dangerous navigation, and require an expert pilot. Seven of them are navigable; but the chief is the Great Mouth, (Boea Grande, or Boea de Navios,) which is about 6 miles in width. This is most to the Southward, and in the direct course of the river. The isles of the Orinoco, or rather its Delta, which is of prodigious extent, are possessed by the Guarannas and the Marians, two independent tribes of Indians. The Northern part, opposite to Trinidad, is overflowed from the middle of January to the middle of June; and, during this season, the Guarannas dwell upon the palm-trees with which it is covered.

The seven navigable channels into the river, already mentioned, are as follow, commencing Northward:

Demerara. High-water.

Light.

High-water.

Spanish or Colombian Guyana.

The first of the navigable mouths is the Grand Mamano, in the gulf of Paria; the second is the Cano, or Canal of Perdernales, 3 leagues South of the Soldier's Island at the entrance of the gulf; it is fit for long boats only; the third mouth, named Capura, is 7 leagues to the Eastward of Perdernales, and likewise is fit only for boats; the fourth, named Macareo, is 6 leagues Eastward of Capura, and is navigable by small craft; Marimus, the fifth, is 12 leagues to the South eastward of the fourth, but between are many mouths navigable when the river is high; the sixth mouth is 18 leagues to the Southward of Marimus, and is navigable for small vessels; the seventh, Boca Grande, or Great Mouth, is 8 leagues S. E. from the sixth; its breadth is 6 miles between the islands, Congrejo (Crab Isles) on the N. W. and Point Barma on the S. E., but the navigable channel is not above 3 miles, and is crossed by a bar, with 17 feet at low water; the approach to this entrance is dangerous, from the shoals running off 7 miles Eastward from Congrejo Island, and 2 miles Northward from Point Barma.

The flux and reflux of the tide are felt in the mouth of April, when the river is lowest, beyond Angostura, at a distance of more than 85 leagues inland. At the confluence of the Carony, 80 leagues from the coast, the water rises 1 foot 3 inches. These oscillations of the surface of the river, this suspension of its course, must not be confounded with a tide that flows up. At the Great Mouth, near Cape Barma, the tide rises to a height of 2 or 3 feet; but further to the N. W., towards and in the gulf of Paria, the tide rises 7, 8, and even 10 feet. Such is the effect of the configuration of the coast, and of the obstacles presented by the Boca del Dragon, &c.

Currents.

The currents on the whole of this coast run from Cape Orange towards the North-west, and the variations which the fresh waters of the Orinoco produce in the force of the general current, and in the transparency and the reflected color of the sea, rarely extend further than 3 or 4 leagues E. N. E. of Congrejo, or Crab Island. The waters in the gulf of Paria are salt, though in a less degree than in the rest of the Caribbean Sea, attributed to the small mouth (Bocas Chicas) of the Orinoco, and the mass of water furnished by the River Guarapiche. From these reasons there are no salt-pits on this coast.

The navigation of the river, whether vessels enter by the Great Mouth, or by the labyrinth of the Bocas Chicas, requires various precautions, according as the bed may be full or the waters very low. The regularity of these periodical risings of the Orinoco has long been an object of admiration to travellers, as the overflowsings of the Nile furnished the philosophers of antiquity with a problem difficult to solve. The cause is similar, and acts equally on all the rivers that take their rise in the torrid zone. After the vernal equinox, the cessation of the breezes announce the season of rains. The increase of the rivers is in proportion to the quantity of water that falls in the different regions. This quantity, in the centre of the forests of the upper Orinoco, and the Rio Negro, appeared to me to extend 90 or 100 inches annually. The following is the usual progress of the oscillations of the Orinoco. Immediately after the vernal equinox, (the people say on the 25th of March,) the commencement of the rising is perceived. It is, at first, only an inch in 24 hours, (sometimes the river again sinks in April;) it attains its maximum, or greatest height, in July; remains full, at the same level,) from the end of July until the 25th of August, and then decreases progressively, but more slowly than it increased. It is at its minimum, or least depth, in January and February.

The River Amazon, according to information obtained on its banks, is much less regular in the periods of its oscillations than the Orinoco; it generally begins, however, to increase in December, and attains its greatest height in March. It sinks from the month of May, and is at the lowest height in the months of July and August at the time when the lower Orinoco inundates all the surrounding land. As no river in America can cross the equator from South to North, on account of the general configuration of the ground, the risings of the Orinoco have an influence on the Amazon; but those of the Amazon do not alter the progress of the oscillations of the Orinoco. It results from these data that, in the two basins of the Amazon and the Orinoco, the concave and convex summits of the curve of progressive increase and decrease correspond very regularly with each other, since they exhibit the difference of six months, which results from the situation of the rivers in opposite hemispheres. The commencement of the risings only is less tardy in the Orinoco. This river increases sensibly as soon as the sun has crossed the equator in the Amazon, on the contrary, the risings do not commence till two months after the equinox.

Foreign pilots admit 90 feet for the ordinary rise of the lower Orinoco. M. de Pons, who has, in general, collected very accurate notions during his stay at Caracas, fixes it at 13 fathoms. The heights naturally vary, according to the breadth of the

bed, and the number of tributary streams which the principal trunk receives. It appears that the mean rise of Angostura does not exceed 24 or 25 feet.

When vessels that draw much water sail up towards Angostura, in the months of January and February, by reason of the sea breeze and the tide, they run the risk of taking the ground. The navigable channel often changes its breadth and direction; and no buoy has yet been laid down to indicate any deposit of earth formed in the bed of the river, where the waters have lost their original velocity.

General Description of, and Directions for, the Coast of Guyana.

[From the "Derrotero de las Antillas," &c., &c.]

The coast which extends from Cape North to the Great Mouth of the Orinoco, which is in latitude 8° 41' N., is very low, and soundings off it reach out a great way to sea. This circumstance is the only means of ascertaining with certainty the proximity. Any other mode of recognizing the coast is very difficult: for, in the clearest day, it is not possible to discern the land at 5 leagues off; and the nature of the coast itself impedes a nearer approach than 2 leagues, on account of the shallowness of the water, and the banks of sand and mud of great extent with which it is obstructed.

The harbors on this coast are the mouths of rivers only, all of which have bars, more or less navigable: and to enter, a practical knowledge is necessary.

From North Cape to Cape Cassapama, the land is very low and wet, and covered with a thick wood, without any other mark to recognize it by than the Hill or Mount of Mayes—a kind of platform, insulated and lilly, which may be seen, in clear weather, at the distance of 5 or 6 leagues. Its latitude is 3° 5' N. The soundings hereabout extend far out to sea. You may sail along the coast at 3 leagues from it, and at that distance have from 8 to 10 fathoms. At 10 leagues from land, the depth increases to 15 and 20 fathoms; and, at 15 and 20 leagues distance there are from 25 to 30 fathoms, with bottom of soft clay, or fine sand of various colors. The current runs N. N. W., but, close to the shore, varies according to the tide, of which the flood runs W. N. W., and the ebb N. E., at the rate of about 3 miles an hour. It flows at 6 o'clock on full and change days, and rises from 12 to 15 feet.

The general velocity of the current, outside the influence of the tides, may be estimated at 2 miles an hour. On this account, in making this coast, it is always necessary to make it in less latitude (i. e. more to the Southward) than that of your port of destination. It is the custom of those bound to Cayenne, to endeavor to strike soundings about N. E. from Cape North, and 20 or 30 leagues from it, at which distance they find from 10 to 50 fathoms of water.

Cape Cachipour lies in latitude 3° 50': near it there is a great bank of clay, which extends 5 or 6 leagues out to sea; its extent from N. to S. is about 4 leagues, with 4 and 5 fathoms of water upon it. On account of this, vessels from the Southward, making this cape, ought not to run along the shore nearer than 5 or 6 leagues. After having passed this bank, Cape Orange bears W. by N., distant from 6 to 7 leagues; and although from this place it cannot be discovered, yet its proximity may be ascertained without any doubt; for, steering North, you will deepen the water from 5 to 10 fathoms, in running less than a mile; when you find this latter depth, you ought to steer W. N. W., (or even West, if necessary,) to preserve the same depth. It is to be remarked, that when a vessel is near Cape Cachipour, and in 5 fathoms of water, she ought not to be steered so as to maintain that depth; but that it is necessary to steer North, or even N. by E., until you get 7 fathoms of water, when you will no longer be able to see the land from the deck, as it is very low. After steering the same course for a short time, in 7 fathoms, you may steer N. N. W. and N. W., with the same depth; with these courses you will near Cape Orange, insensibly, and make it at the distance of 2 or 3 leagues, when in 8 or 9 fathoms of water. Between this cape and Cape Cachipour, the river of that name disembogues itself.

Cape Orange may be known by a point (Punta Cortado,) which seems to have been cut or shortened, which is on the side next to the sea, and is the highest land to the S. E. of the same cape; and also by the Silver Mountains, which form various penes, appearing insulated and detached the one from the other, and which are the more remarkable, as they are the first high land discovered in coming from Cape North. Approaching Cape Orange, you may discover various remarkable hills over the point which forms the entrance of the River Oyapoc.

Beyond Cape Orange the coast forms a bay, of 4 leagues in breadth, in which the great River Oyapoc disembogues, and into which also two other rivers of small consideration discharge their waters: the one to the Eastward is named Coripe, and that to the Westward is called Warnari. The Silver Mountains serve not only as a

Tide

Cape Orange

River Oyapoc.

mark for Cape Orange, but also for this bay, because, beginning to rise on the West coast, in a swampy country, they come down almost to the edge of the sea.

*River
Oyapoc*

The River Oyapoc is 2 leagues wide at its entrance, and you may anchor in it in 4 fathoms, clayey bottom, keeping Warari West, at the distance of three quarters of a league. Mount Jary is a small, but tolerably high, hill on the point which divides the Rivers Warari and Oyapoc. One league to the river, (Oyapoc) there is a low island, named Isla de Venados, which is covered by very high tides. You may pass to the Westward of it, where you will have 4 fathoms water close to the shore. After the Isla de Venados, there are some other small islands, which do not embarrass navigation of the river. After sailing up the river 5 or 6 leagues, there is a fine bay, which serves as a harbor, and in which you may anchor in 4, 5, or 6 fathoms of water, and as near the shore as you please. At this place there is a small fort and a country house.

*Apronague
River.*

About 12 leagues to the N. W., from the River Oyapoc, is the River Apronague. Its entrance is 2 leagues wide, and it has from 3 to 4 fathoms of water. The lands which form it are very low, marshy, and covered with mangroves. Two leagues up the river, and in the middle of it, there is a low and very narrow island, about half a mile in length, covered with wood, and named Fisherman's Island. To the North of it a bank of sand stretches out more than 2 miles, to which it is necessary to give a berth when you enter into the river. There is a channel on each side of the island. The one to the Eastward has 3 fathoms water, but that to the Westward not more than 2 fathoms.

Five leagues North of the mouth of this river there is a tolerably high bare island, in shape resembling a half orange. It is called the Great Constable, to distinguish it from a smaller island, which lies half a league from it, nearer the coast, almost level with the water, and which is called the Little Constable. The Great Constable, (or Gunner,) may be discovered 8 or 10 leagues out to sea. Vessels bound to Cayenne direct their course to these islands from Cape Orange, from off which they bear N. N. W., distant 18 leagues. In this passage it is necessary to keep in 8 or 9 fathoms. The Great Constable has 3 fathoms of water all round it, and is very clean. The little one lies E. N. E. and W. S. W. with the great one. You may pass between them in 8 or 9 fathoms of water, observing to keep within two market shots of the great one, and to leave the little one on the port hand.

N. N. W. from the Great Constable, there is a rocky shoal, which some place at 2, others at 3, and others even at 4 miles distant from it. To avoid this shoal is the principal reason for passing between the Constables; it lies N. 39° W., true, from the Great Constable, at the distance of 4 miles. Its extent may be about a cable's length, and it lies N. W. and S. E.

The course from the Great Constable, to pass outside the Mother and Daughters, which lie about 6 leagues distant from it, is N. W. by W.; with this course you will shorten the water, and will not have more than 6 fathoms near the Milingre, (one of the Mother and Daughters,) near the N. N. E. part of which you may anchor in 3 fathoms, at low water.

Four leagues N. W. from the Apronague is Kay River, and from it to the River Mahury is reckoned 4 leagues more. The River Mahury separates Cayenne on the East from the main land. It has 3 fathoms, at low-water. The banks are pretty high, and covered with large trees.

Cayenne.

CAYENNE. — The city and fortress of Cayenne are situated on the N. W. point of the island, the North part of which has various hills and eminences, but the South part is low and wet, in the season of the rains. The harbor is to the Westward of the city, in the mouth of the River Cayenne.

Light.

There is a fire light, 64 feet above the sea, on the infantry barracks at Cayenne, lat. 4° 56' 12" N., lon. 52° 13' 4" W.

At about 14 leagues, or something more, from the island of Cayenne, are the islets of Reunira; they are five in number, viz., the Child, the Father, the Mother, and the two Daughters. The last are two little rocks, very close together, and about a mile distant from the Mother, to the E. S. E. The Father is the largest of all these islets, and bears E. N. E., true, from Mount Joly, on the Eastern coast of Cayenne Island, 4 miles distant. It may be about half a mile long, E. S. E. and W. N. W.

The Child is very small, and lies about a league E. N. E. from Mount Reunirah, and 4 miles from the Father. You may pass without them at 3 miles, or a little less, with out any risk, and with a certainty of not having less than 5 or 6 fathoms of water. Between these islets and the coast there are about 15 feet of water, at low ebb, but the passage is dangerous on account of a rocky shoal which lies in mid channel, almost even with the surface of the water. There is also a shoal, which extends between the Father and the Child; this shoal lies N. N. W. from Mount Joly, and nearly East from Mount Reunirah. Round the Milingre, the bottom is very shallow, and it is

LOT.

ing to rise on the V edge of the sea.

You may anchor in it in a distance of three quarters of a mile on the point which is the river. (Gyproc.) there is very high tides. You may anchor close to the shore is, which do not embarrass you. There is a fine bay, in 4, 5, or 6 fathoms at there is a small fort and a

is the River Apronague, a fine bay of water. The lands are very fertile. Two leagues up the river is a narrow island, about half a mile long. To the North of it is necessary to give on each side of the island to the Westward not more

a tolerably high head of water. Great Constable, to distinguish from it, nearer the coast, the Constable. The Great Constable is to sea. Vessels from Cape Orange, from this passage it is necessary to have 3 fathoms of water. E. N. E. and W. S. W. with 5 fathoms of water, observing to leave the little one on the

shoot, which some place at. To avoid this shoal is the of the N. 30° W. true, from the point may be about 5 cables.

the Mother and Daughters, with this course you will be near the Milagre, one of which you may anchor in 3

er, and from it to the River separates Cayenne on the water. The banks are pretty

situated on the N. W. point of the bay, but the South harbor is to the Westward of the infant barracks at Cayenne,

and of Cayenne, are the islets of the Father, the Mother, and the Child, which are all together, and about a mile from the coast of all these isles, from the coast of Cayenne Island, 4 or 5 leagues N. W.

from Mount Remontado, and at 3 miles, or a little less, with 5 or 6 fathoms of water. Besides this, at low ebb, but the channel, which extends between Mount Joly, and nearly East of it, is very shallow, and it is

and that a reef stretches out about 2 cables' length N. N. W. from its Western extremity.

It is for these isles there is another, at about 3 leagues to the W. N. W. of the Child, called the Forlorn Hope, or the Last Child, which lies nearly on the meridian of the town of Cayenne, at the distance of 7 miles.

To enter to enter Cayenne, it is first absolutely necessary to anchor between Milagre and the Forlorn Hope, both for the purpose of receiving a pilot, and to wait for the tide, so as to pass the shoals at the entrance of the harbor. Between the Child and the Father, the anchorage is very inconvenient, for the N. E. winds raise much sea on it, which, catching vessels on the beam, makes them roll as if in a storm. An anchor is very apt to drag, and it is necessary to have another all ready to let go; and after three or four days' elapse, in which no communication can be had with the shore. In this anchorage there are from 20 to 25 feet at low water, clay bottom.

In general, vessels anchor to the E. N. E., N. E., or North of the Child, at the distance of 2 miles; but some anchor to the E. N. E. or N. E. of the Forlorn Hope, about 2 miles distant from it. From the East to the South of the latter, the depth of water diminishes to 15, 12, or even 10 feet, and you must take good care not to place your self between it and the coast, because there it has even less depth. In this place the tides rise 7 or 8 feet; and at high water, full and change, at the 30m

High water.

N. W. by N. from the Forlorn Hope, at the distance of 8 or 9 leagues, are three small islets, which are so placed as to form a triangle. They are called the Devil's Islets. They form a fine and well sheltered harbor. The best anchorage of them is E. S. E. of the most Southerly islet, in 5 or 6 fathoms of water, with a hard clay bottom, at about a musket shot from the islet. In this islet there is a reservoir of fresh water; but it is necessary to get the water with small kegs which can be carried, as the roughness and steepness of the ground render it impossible to get it with large casks.

Fresh water.

Between these islets and the Forlorn Hope, there are 5, 6, and 7 fathoms of water, at 3 or 4 leagues from the land; near the Devil's Islets are 9, and leaving them to the S. or S. E., you will have 20, 30, and 40 fathoms, increasing your depth as you increase your distance from the islets.

Five leagues N. W. from Cayenne is the River Marouma. The coast between is low level, and has many handsome houses. At 10 leagues N. W. from Marouma is the River Surinam. This river affords excellent anchorage at 2 or 3 leagues from its mouth, in which vessels are not incommoded by the sea, because the bottom is of very soft clay.

Marouma River.

Twenty-two leagues N. W. by W. from Surinam is the River Marom, which is very considerable. Its entrance is about 2 leagues wide, but is difficult of access, on account of the shoals of sand and clay which are in it. In this space of coast the rivers Surinam, Tracoubo, and Orinima disembogue themselves, and shoals and banks of dirt stretch out about 3 leagues to sea along the whole of it; so that it is necessary to keep at least 4 leagues from the land, in 5 or 6 fathoms of water. Between Cayenne and Marom there are many single or detached rocks, some of which are 2 leagues from the shore.

River Marouma.

From the River Marom to Surinam River, the distance is about 24 leagues. The coast trends W. by N.; it is all so much alike, and so low, that it is totally impossible to distinguish one part from another, so as to rectify the position of any vessel, hence it is absolutely necessary to make the Marom, in order to be sure of falling in correctly with Surinam. This coast, also, has various banks of clay stretching from it, which render it necessary to keep 4 leagues off it. The entrance of the River Surinam, when coming from the Eastward, may be known by its crow's bill point, which may be seen at 4 or 5 leagues off, and is the only land which, under these circumstances, can be discerned. It has a beacon on it, as before mentioned. The East shore is that which is first seen; the opposite cannot be discerned until you are in the entrance of the river, it being remarkably low land, which, as it were, hides itself to the West.

Beacon.

To anchor in the entrance it is necessary to bring the East point, of which we have spoken, to bear S. E., or S. E. by S., at the distance of 3 leagues, and to anchor then in 10 fathoms at low water. The tides flow at six o'clock, on full and change days; and at the anchorage, at the entrance of the river, the flood tide sets from S. to S. S. E., and the ebb from N. to N. N. W. The least water is 24 fathoms. When the wind is favorable for entering the river, steer S. E. or S. E. by E., until the East point bears East; then steer E. S. E. to anchor in 5 fathoms, on a clay bottom, at a quarter of a league from the East point, which is named Bram's Point, with that point bearing N. 9° W.

At one league up the River Surinam the River Comowinie discharges its waters into it. A little farther up is the bar, upon which there are not more than two fathoms.

River Surinam.

oms at low-water. After passing this, you find, on the West shore, the town of Paramaribo.

River Surama. Four leagues West of the River Surinam the Rivers Suramaen and Copename enter the sea by the same mouth. Their banks are uninhabited, and in their mouths are 2 fathoms at low-water.

River Corentine. Ten leagues West from these rivers, the River Corentine disembogues. Its entrance is about a league in width, but of difficult access, on account of the sand-banks off it, which extend 3 leagues out to sea. Within the river are three islands, which are very clean, running North and South; between you may anchor in 5 fathoms of water. The entrance and anchorage are on the West side. The small River Nikesa also discharges its waters by the same mouth as the Corentine.

River Berbice. Five leagues West from the Corentine is the river of Berbice. Its mouth is about a league in width. Its banks are very low, and covered with trees. In the very mouth lies Crab Island, which divides the entrance into two channels. This island is low and bushy, and is surrounded by a bank of sand and clay, which prevents a nearer approach to it than at least a long musket-shot. It is in length about a mile, and half a mile in breadth. The bank which surrounds it stretches about a league to the Northward of it. A rocky shoal extends from its East point, to which it is necessary to give much attention, as you must enter by the East channel, on the bar of which there are not more than two fathoms at low-water.

[Directions for the Demerara have already been fully given.]

River Essequibo. The River Essequibo is very large. Its mouth is 3 miles wide, but full of islands and shoals which render it difficult to enter; and although the islands and shoals form channels deep enough for all classes of vessels, yet it requires much care and practical knowledge to enter them. The islands are numerous, low, and bushy. The greater part of them are a league or 2 leagues in length, but very narrow, and run North and South. There are two principal channels for entering the river, viz. the East and West channels. The Eastern is the best; there are in it from 15 to 35 fathoms. After having passed the islands at the entrance, you will see another cluster of them, which it is proper to pass on the East side, where they form so deep a channel that there are from 10 to 70 fathoms in it.

At 10 leagues from the entrance the fort is situated, upon an island in the middle of the river. The town, or rather village, is situated on the West side, in front of the fort.

River Pauroma. At 15 or 16 leagues from the Essequibo, is the mouth of the River Pauroma, which is about half a league in width; its shores are low, and covered with trees. The East point of the entrance is named Cape Nassau. Six leagues up the river, on the Eastern side, is the town or village, named Middleburgh.

Coco Point. From the River Pauroma the coast trends, without varying its appearance, to Coco Point, which forms a bay to the South, and to the Westward has some very high coconut-trees, which are the only ones on all this coast, on which, in general, there is nothing but mangroves.

From Coco Point you steer N.W. and N.N.W., with the precaution of keeping in 5 or 6 fathoms of water, in order to avoid a bank of mud, which lies about 2½ leagues N.N.W. from it. Having run 12 leagues on these courses, you will see the mouth of the Guayana, situate in 8° 25' N. latitude. The making of this mouth is very necessary for those who seek the great entrance of the Orinoco, as there is no other point which can be used with certainty as a mark, and it cannot be mistaken; not only because it is the sole entrance or opening which can be seen, but also on account of three little hills, or hillocks, which may be seen, if the day be clear, bearing about S.W., at some distance inland.

N.E. from this mouth, about 3 leagues distant, there is a shoal of fine sand, with 2½ fathoms of water on it; and to avoid it, you must take good care not to shoal the water more than to 5 fathoms, muddy bottom.

From the mouth of the Guayana the coast is woody, level, and low, and trends for 8 leagues about N.W. to the point of Mocomoco; after which comes the coast named Sabaneta, which trends West about 4 leagues; it also is covered with wood, level, and lower, and the water on it shallower, than the former. All this coast is bounded by a shallow bank of soft clay and shells, and sand with clay and shells.

River Orinoco. RIVER ORINOCO.—The Isle Congrejo, (Crab Island,) of which the N.E. point is in lat. 8° 51' N., has a shoal of hard sand, of the color of ground coffee, which extends 6 leagues from its Eastern part, and about 2 leagues from the Northern part of the island; and this renders the entrance of the river dangerous: for between it and the coast of Sabaneta is formed the bar of the Grand Entrance of the River Orinoco, the depth of which, at low-water, is 15 feet, and at high-water, only 16 feet; the bottom soft clay. The bar is about 3 leagues in extent from N. to S., and a little less from E. to W.

The coast, which is rather higher than the former, though still woody, trends S.W. from Point Sabaneta, about 3 leagues, and ends at Cape Barma, which forms the boundary of this line of coast; as after this it forms a great bay, into which the river empties itself.

The coast which follows from Isla de Congrejo to leeward, is very indistinct from the former; low and all broken, forming different mouths, by which the small branches of the Orinoco discharge their waters. They are fit for small vessels only, which have pilots, because they are full of dangerous sand-banks.

North of Point Barma, in 18 feet water, there is a light-vessel, on board of which pilots are stationed for the river; the light can be seen 9 or 10 miles in clear weather, lat. 8° 37' N., long. 60° 40' W. *Light-vessel*

GRAND MOUTH OF THE RIVER ORINOCO.—Having recognized the Boca de Grand Guyana, you may run along the coast at the distance of 5 or 6 leagues, in 4 or 5 fathoms, in soft clayey bottom, until Cape Barma bears S. by W., when you may shape your course for the bar; keeping the lead going, in order to preserve the soft clayey bottom, although even in shallow water; as it is better to get ashore on the clayey mud than to run the risk of falling on the shoal of hard sand off Isla Congrejo. If you catch that quality of soundings, (hard sand-like ground coffee,) you must immediately steer South, to recover the soft bottom. Following these directions, you will near Cape Barma; and when about 2 leagues from it, you will see a large island covered with trees, which is that called Isla de Congrejo; and having passed the bar, you will begin to increase the depth of water until you find 5 fathoms, when it is proper to steer from S.W. by S. to S.W. by W., to keep mid channel, understanding that, if you are in less than 5 fathoms, soft bottom, you are too much on the main-land side of the channel, and must steer more to the Westward to recover the mid-channel; but if you find less than 5 fathoms water, with a sand bottom, you are getting upon the shoal off the Isla de Congrejo; and, in this case, must steer more to the Southward to recover the mid-channel. With these directions, and attention to the soundings, you may run in, until the S. E. point of Isla de Congrejo covers some woody islets which lie off the N. E. point of it; you may then run close to the island, and anchor in 5 or 6 fathoms of water, the bottom soft clayey mud, Moor with a cable ashore, and in this situation every vessel will be secure and well sheltered; and it is necessary at this place to wait for a pilot to conduct you up the river. A pilot may be engaged from any of the small vessels of the country.

On all this coast the tides are rapid and irregular. They are said to be felt as high up the river as Imatua, a village of the Guaraunas Indians. At one-third ebb, at the rising of the moon, the water of the Orinoco increases from April to September, and decreases during the other months of the year. It is navigable for large vessels up to the capital, only between the months of May and December; during the rest of the year they must stop 16 leagues further down, not being able to ascend higher, in consequence of a bar or pass, named Del Mamo, which at that time has not more than 4 or 5 feet of water on it; and large merchant-vessels, therefore, must employ lighters to load and unload them.

The magnetic variation at the mouth of the river, is 4° E.

The termination of this coast may be fixed at the Grand Mouth of the Orinoco, which we have described; and we now proceed to make some general remarks which follow:

GENERAL REMARKS ON THE COAST OF GUYANA.—It is necessary to remark, that on a coast of which there is scarcely a possibility of recognizing the different places except by the latitudes, it is very easy to make a mistake, and get to leeward of your port of destination. For this reason it is proper to run down the coast from windward to leeward, taking good care to make the various places out distinctly. It is also proper to examine the mouths of the rivers; and what renders this more necessary is, that in the season of the rains there are often days on which the latitude cannot be observed.

If such is the uncertainty as to recognizing the points, it is no less in respect of the soundings at the entrances of the rivers. All these rivers form bars, and the bars generally have very little water on them. The best way for those who have not a practical knowledge of these entrances, is either to obtain such by means of their boats, or not to enter a river without a pilot.

The wind, which from E. N. E. to N. E., or E. S. E. and S. E., always prevails upon this coast, and the current, which always runs W. N. W., make the lesser latitude to windward, and hence on all this coast it is very easy to increase your North latitude, but almost impossible to decrease it.

The general current of which we have spoken, must not be confounded with that which is produced by the tides, the influence of which is principally felt near the coast; and 12 leagues out at sea, or 9 fathoms of water, may be considered as their limit, as at that distance out at sea no other current than the general one is felt, but

Tides.

between that and the land no other currents than those caused by the tides are felt. It is high-water, full and change, at Cayenne and at Surinam, at 4h. 30m.

In addition to what has already been said, it is advisable for vessels bound to Guyana, to make the land about the coast of Mayez; shunning the vicinity of the River Amazon, because it produces vast swellings, which are felt a great distance out at sea; and which, near the mouth of the river, might prove fatal to the vessel. This phenomenon, which is known in the Ganges, and other great rivers, by the name of a bore, is here called the porroco, as already noticed.

Having made and recognized the coast, it is necessary to run along it, keeping the lead constantly going, so as to keep in 7, 8, or 9 fathoms, taking care not to get into less water, from fear of striking on some of the shoals which stretch out from the coast; and although with that depth, in some places, the land cannot be seen from the vessel, even in clear weather, this can occasion little or no inconvenience; as when near the latitude of your place of destination, it is easy to put the vessel on the port tack, and run in to sight the land. Nor is there any difficulty in examining it, when necessary, as you have only to keep more away on the port tack; but in such cases it is very necessary to be extremely careful with the lead. When night comes on, and you are near your destination, it is proper to anchor; as also when it is calm, within the limits of the tides, (described before,) as the current, or set of the flood-tide, carries a vessel towards the coast.

Getting aground on this coast is not generally attended with much danger, as the bottom is always of clay, more or less soft. Notwithstanding this, no one ought to navigate without due care, as getting ashore not only causes loss of time, but occasions much work in carrying out anchors, &c., to get a vessel off. We notice here that, even when a vessel is in the regular track, although in 9 fathoms of water, she will raise the mud as if ploughing it with her keel. This may cause uneasiness to those who witness such a thing for the first time, though it is the consequence of a very natural cause.

The islands of Ramire, the Constables, and the Health Islands, are the only points of this coast which are likely to cause the loss of a vessel, if she gets ashore on them. In order to avoid this, it is needful to pay attention to the currents, that they do not drive you upon them; and not to attempt to pass between the Constables, unless with a free wind; with the contrary, it is better to anchor at 3 leagues from them, or to pass outside of them, taking care to give the shoal, of which we have already spoken, a sufficient berth.

On the whole of this coast there are no other harbors than those formed by the mouths of the rivers, the greater part of which require practical knowledge to enter them, on account of the bars and shallows which run out from all of them; but, as on all this coast storms are unknown, and there is not the smallest risk in anchoring where one deems it to be necessary, there can be no necessity to run rashly for one of these anchorages, but rather wait at anchor outside for a pilot, or till such time as you obtain a sufficient practical knowledge of the place by means of your boats, so as to be able to take the vessel in safely yourself.

When any one wants to beat to windward on this coast, or what is the same, wishes to go from the Orinoco, or Surinam, to Cayenne, he must work along the coast with the ebb-tide, in from 3½ or 4 fathoms water, out to 8 or 9 fathoms; for though you may be shouldered away by the current to the N.E., you will gain very well on the tack to the S.E., or E.S.E., but with the flood it is necessary to anchor; for then both wind and current being against you, you will irremediably be driven upon the coast.

Those who, from the Antillas, are bound to any port in Guyana, ought to keep their port tacks on board, until in a convenient latitude to make the land to the Southward of their port of destination, which ought to be more or less to the Southward, according to the practice and knowledge of the navigator who directs the vessel; but upon all this coast, especially from Cayenne to the Orinoco, even the most experienced are unable to ascertain the places where they find themselves; and without the assistance of observation for latitude, and of prudent conjectures on the different appearances to windward and leeward, they would often commit very serious mistakes.

The environs of Demerara are the parts of the coast easiest known, on account of the trees being burnt and cut down to clear the land for cultivation; and where these trees have been cleared away, there are clear spots, or gnps, in which (as already stated) houses, &c., may be plainly seen. When at a loss, it is best to anchor until you can clear up your doubts; as, although you lose time, yet you keep still to windward, which is what interests you most; and which, if lost, it would cost you much time and labor to recover.

Dead Reckoning.

DEAD RECKONING in shoal water on the coast of Guyana, &c. — As the greatest uncertainty in the situation of a vessel arises from the errors in the dead reckoning, caused by currents; to diminish such errors, and render the computation more correct, it is advisable to take off the log-chip from the log-line, and to substitute a lead

weight, weighing 4, 6, or 8 pounds, as may be judged necessary: this, taking the bot- ton, (when the log is hove with it, in place of a log-chip,) will not so easily follow the vessel, or be influenced by currents. By this mode it is clear that the log will show the whole distance which the vessel runs, whether caused by winds or by currents. Then having made fast the log-line, before you haul it in, mark the bearing of it, and the opposite point or direction will be the course which the vessel makes good. It is clear that, by this mode, the course and distance ought to be as exactly found as if no current existed. If you heave the log with a chip, in the usual manner, as well as a log with a lead attached to it, and compare the distance by it, and the course which the vessel appears to make by compass, with the distance and course found by the proposed method, you will be able to ascertain the direction and velocity of the current.

SOUTH AMERICA, SOUTH OF THE EQUATOR.

VESSELS bound to the coast of South America, South of Cape St. Roque, should endeavor to cross the equator as near the long. of 30° W. as may be, as experience has shown that that is about the best point to avoid falling to leeward. The island of St. Paul's, being near that route, we give its position and description.

ST. PAUL'S ISLETS are in lat. 0° 55' 30" N., long. 29° 22' 30" W. They appear extremely small at the distance of 8 miles, and are covered with multitudes of birds. Numbers of fine fish, like the groupas of the Bermuda Islands, may be caught with hook and line. The highest point is 64 feet above the sea. The variation, in 1832, was 91° W.

FERNANDO NORONHA consists of one large and several smaller islands. At Fernando is hilly and uneven land, and may be seen 10 leagues in clear weather. The principal island has on it a high rocky peak, called the Pyramid, which is very remarkable, and seems to lean to the Eastward when it bears S.S.W. The S.W. point has off it a sunken rock at a considerable distance, which renders it dangerous to approach. A reef and some sunken rocks extend off the S.E. part, at about 3 miles from the shore. There is a reef, on which the sea breaks, about 3 miles off the East part of the island, with a channel of 10 to 15 fathoms inside. The Pyramid shut in with the highest hill leads directly upon it.

The group lies N.E. and S.W., about 7 miles, and is nearly 2 miles broad. Wood and water may be obtained here, (the latter not at all times,) but are difficult to get off, on account of the heavy surf. It is high-tide, at full and change, at 1 o'clock. Rise of tides 8 feet. Variation 7° W. The Pyramid is in latitude 3° 55' 8", long. 32° 25" W.

The current here commonly sets strongly to the Westward, for which due allowance must be made in rounding the islands to the N.E.

THE ROCCAS.—These are dangerous low keys to the Westward of Fernando Noronha. The keys or islets are sandy, with shrubs upon them; they cannot be seen from the mast-head in the clearest weather at the distance of more than 3 leagues. At their N.E. end there is a high rock, and the sea breaks exceedingly high all around them. At 2 miles to the Westward of the reef there is bottom at 25 fathoms, coral rock. The current here sets 2 1/2 miles hourly to the Westward. Rise and fall of tide 6 feet. Latitude 3° 50' 51" S., and longitude 33° 48' 39" W; variation, 10° 56' W.

COAST OF BRAZIL.—The appearance of the coast of Brazil is very various. From the island of Santa Catharina up to Olinda Point, (60 leagues North of Cape Frio,) the land is very high and woody, and can be discovered in fine weather from 50 to 60 miles distant, and, consequently, with little care a vessel can make land without danger. North of this, in many places, the land is very low and not to be perceived from that distance: as, for example, between Espirito Santo and Mount Pascal; between the bay of Porto Seguro and the bay of All Saints; between the Torre de Gracia de Avila and Cape St. Augustine; in short, everywhere between Olinda and the island of Maranhau: in all these places the land is more or less low, few mountains can be perceived, being too far in the interior.

Sounding in general is of very little service to indicate the distance from the land, particularly from Santa Catharina Island up to Olinda Point, on account of the great depth even at a short distance from the shore, except in the neighborhood of the Abrolhos. It may be generally stated that the depth under the following parallels is nearly this: 70 fathoms at 18 leagues distant from the land of Santa Catharina; 40

Depth of the Sea.

fathoms at 12 leagues from the Paranagua; 50 fathoms at 12 leagues East from the island of San Sebastian; 35 fathoms at 5 leagues South-east of Tinga Point; 77 fathoms at 18 leagues South-east of Rio Janeiro entrance; more than 60 fathoms at 7 leagues only from Cape Frio. The depth of the sea is very great N.E. of Cape Frio, for at 30 leagues distant, in a direction E. & S. of Cape St. Thomas, you cannot find bottom with 100 fathoms. Soundings increase again E. and S.E. of Abrolhos; generally speaking, (it is in a few instances not to be depended on,) a less depth than 100 fathoms is not to be had at 30 leagues from the coast.

No bottom is to be had with 200 fathoms 8 leagues S.E. of St. Salvador, nor at 12 miles South of this, although at a distance of 4 miles there are but 20 fathoms; and finally, E. from Cape Morro San Palo there is no bottom with 120 fathoms, at 9 leagues distant. From Bahia de Olinda the coast is not less bold, for at 9 leagues East of Torre de Graçia de Avila there are over 180 fathoms; at the same distance 9 leagues East of the bar of Bapieracu, over 200 fathoms; the soundings are over 190 fathoms 20 leagues from Rio Real, and 15 fathoms are found 10 leagues East of Rio San Francisco. Finally, everywhere up to Pernambuco, there are not less than 30 to 40 fathoms at 9 or 10 leagues distant from the shore, and between Olinda and Pernambuco, from 18 to 20 leagues distant from the shore, the bottom is not met with over 120 fathoms. Though the soundings are less North of Olinda, they are too great at a small distance to be of service.

North of Cape St. Roque, the land being more low and extending into the sea, the soundings decrease gradually towards the shore.

From Monte Malancia up to the village of Amufadas, there are but 15 fathoms at 16 leagues distant, and further North the soundings increase, but it may be taken as a general rule, that 10 fathoms are to be met with at the distance of 10 or 12 miles, between Amufadas, and Jericacoara. Opposite the village of Caraca there is a spot where 2 to 25 feet only of water are to be met with, over an extent of 3 leagues, but it is the only place up to Maranham.

The coast of Brazil has this peculiarity, viz., that there are two banks or shoals at no great distance from the shore, the first of which is not far distant from the land, and in many places rises over the level of the sea, and in others forms breakers or shallow waters. The other bank, further distant from the shore, is not equally distant anywhere. It cannot be stated as forming shallow water, but between this bank and the former there is a deep channel, separated from the main sea by this bank and the small islands of Figuera, Castillo, Guemado, los Aleatroces, los Abrolhos, Manuel Luis Shoal may be considered as the prominent point of this second bank.

The dry season is from September to February; the rainy season from March to September, but the only months in fact which may be considered as rainy, are May, June, and July.

On the Brazil coast the South monsoon is from March to September; the Northern one, from September to March. The prevalent winds according to the saying of the natives, during the South monsoon, are from E.S.E., and S.S.E., and during the Northern monsoon are from E.N.E. and N.N.E.; this may be the case at sea; but at a short distance from the shore the monsoon is not so regular; in fact, the most prevalent wind at all times is from the Eastern part of the compass. The ribajos are very strong winds, blowing from the S.W. during the rainy season. They last three or four days with great force, not so great when it rains, but very heavy in dry weather. This begins at the change of the moon. The grains are squalls, and are met more frequently in the neighborhood of Abrolhos islands, and called for this reason Abrolhos squalls. They are more frequent in the months of May, June, July, and August, and in very rainy seasons they blow from E.S.E. They are said to arise from a white cloud of a round shape, and of a little appearance at first, increasing to such a force as to be dreadful.

Land-breezes are very regular on the whole extent of Brazil coast, but not equally so, being more so as you approach the equator. At Rio Janeiro they are not very regular, and very often not at all felt. The land-breezes are more powerful in the Northern monsoon, and in the Southern monsoon very often the land-breeze has quite the same direction as the sea-breeze, this part coming from the S.W.

As a general rule the land-breeze will be more powerful in proportion as the sea-breeze is so.

Generally, the more you proceed South along the coast, the more you must expect to find the winds coming from the South and West, in the rainy season. In this time of the year, from Abagoados Patos up to Cape Frio, they blow with great violence from S.E. to S.W., and even N.W. In this case they turn into hurricanes, and are called *pampeiros*. In the River Plata they are very dangerous. If, at sunset, foggy clouds, and the land appears more distinct at a small distance, it is an omen the wind will blow from the S. or S.W., and will be powerful in general. They last in proportion to their strength; the stronger the shorter. When they turn into a hurricane,

they will never last over 24 hours. When the wind hauls towards the East, you may expect fine clear weather. It is to the contrary when it nears towards the West: Easterly winds bring clear weather; Westerly winds bring fogs.

Nothing positive can be said respecting the regularity of the currents: they generally follow the direction of the wind, for there is no river of a sufficient magnitude on the whole extent of the Brazilian coast capable of causing a current, according to numerous observations. The average running of the currents is at the rate of six-tenths of a mile an hour; in the monsoon time, never over that rate, and in many instances below it, even no current at all. It is only North of Pernambuco that the current can be considered as permanent, and capable of causing errors in the day's work of a ship; and, even in this case, it is only when you go along the coast at no great distance, for if distant at sea, no current exists. From what has been said respecting winds and currents, we may infer that no impediment exists in navigating the Brazilian sea from Santa Catharina to Olinda Point, and it is unnecessary to make land more South than the place bound to, as formerly prescribed. If going to Olinda, or any other place more North, up to Maranhim, it is better to keep East of the place bound to, in order to counteract the effects of the currents, which run generally W.N.W., as will be more particularly stated when describing the several harbors, and the manner to reach them.

A revolving light, twice white and once red every 3 minutes, has been erected at the entrance of Pernambuco, on the reef, by which that part of the coast may be recognized. *Light-house.*

THE CAPE AND BANKS OF ST. ROQUE.—The Cape of St. Roque admits *The Cape and Banks of St. Roque* hardly any description, for nothing particular exists by which this cape may be distinguished from the sandy beach. The color of the sand is white, but in some places appears of a reddish tinge, owing to the reflection of the light, and for this reason is not a very certain guide. From place to place bushes are to be seen on the top of the beach, and some trees can be discovered far in the interior, which is not the case in coming from the South. Cape St. Roque is not, in fact, the most extreme end of this great elbow of the South American land, for the direction of the shore remains nearly the same 20 miles further, and it is only at Calcanar Point that it changes its course to N.N.W.

From St. Roque the land lowers more and more, and 8 miles distant it forms Cape Petefinga, which cape offers no more particulars than St. Roque, and the beach is of the same white sand.

The Portuguese cosmographer, Pimentel, states that near Cape Petefinga there is a good watering-place for ships, but we had no chance to ascertain that fact.

Near Cape Petefinga the soundings begin to indicate the shallow water of the Banks of St. Roque. This shoal runs in a direction parallel with the shore, nearly 60 miles, and the average breadth may be considered 6 miles. The channel between them and the main-land is from 5 to 6 miles wide, and it is reported that vessels of a less draught of water than 7 or 8 feet, can pass without the least danger. The greatest distance from the Northern shoal to St. Roque is 20 miles.

Notwithstanding the small height of the shore near these shoals, in fine and clear weather, it may be discovered before you reach them.

The whole extent we ascribe to the shallow water is not equally dangerous, and it is reported that places exist where large ships may cross them. As the whole coast is of very little interest, one will do well to keep at a distance from it.

The Eastern breaker lies 12 miles distant from Calcanar Point. The sea seldom breaks over it. The next West of the former, and 8 miles distant from Dos Tres Irmaos Point, is called the Lavandera; and the third one, called the Ureas, is 12 miles N.E. 4 N. from Tubarao Point, and opposite St. Alberto Bay. The sea breaks coastwise with great force on these two last, particularly when the wind blows from the sea.

By keeping at a reasonable distance, there is not the least danger to be apprehended. We found the soundings increasing regularly and very fast towards the sea, the surest proof that no more shallow water is to be met, though in many charts another shoal is marked E. 20° N. of this place. This we consider as an error, for the reasons previously stated.

The soundings are of no service to indicate the approach of this place. The nature of the bottom seems to be the same everywhere, and we found it always a mixture of white madrepores and sand, and in some instances gravel.

The green color of the water, like every shallow water, deserves more notice, and you may consider yourself safe as long as you have not reached this green water.

The current runs N.N.W. and N.W., at the rate of nearly 2 miles an hour; and the tide rises from 6 to 10 feet, according to the new or full moon.

From Cape St. Roque to Ponta Petefinga, is 5 leagues to the N.W. and N.W. by *Cape Petefinga*. At the foot of this hill, or eminence, is a stream, where you may obtain water: *Tide.*

and at about a musket-shot from shore is a high reef, near which you may anchor in 3 or 4 fathoms, sand and mud. The coast, in general, is flat and barren.

At 3 leagues from Petatinga, Westward, are some rocks on the shore called Pedra de Gira, near which any ship may anchor; and at about 15 leagues to the West, is the Ponta das Pedras, or Point of Rocks, with the rocks called the Three Brothers. Of all the coast between, the country is bare and black, its surface covered with sand, and it appears like small islands.

*Point of
Rocks.*

Of the Ponta das Pedras are three shoals of rocks, having a channel between them and the main of 3 and 4 fathoms. At 3 leagues outward are reefs above water.

*River Gua-
mare.*

Of the River Guamare to the S.W., the distinguishing marks are two inland sugar-loaf mountains of unequal heights. To the West is the Island Tubarao; then follow the Rivers Amargos, Cavallos, and Conchas; of these rivers the first two lead to the Salines, or Salt Pools of Assu; whence many parts of Brazil have been supplied. The coast hence trends to the Ponta do Mel, or Honey Point. The point may be known by its high red cliffs; and hereabout were, and probably still are, some palm or cocoa-trees.

Salt Ponds.

*River Upa-
neva.*

At the River Upanema are natural salinas, which, like those of Assu, require no artificial means for crystallization. Its entrance has a bar of little more than one fathom at high water, although within there is a depth of 8 fathoms. Here the land is very level; and on the West of the river there are red cliffs. Further inland is Monte Vecanhos, a sugar-loaf hill. Ships, however, should not advance into the bay, as it is full of shallows.

*River Lagua-
ripe.*

From the River Upanema to the N.W., the next river of consequence is the Laguaripe, which may be known by a round bare hill of sand on the N.W. terminating in a rock below, and by a mountain inland having seven sugar-loaf points.

Five leagues inland from the Laguaripe rises the range of the Guama Mountains, which extend ten leagues in the direction of East and West.

Commencing at about 3 leagues from the River Laguaripe, the land for nearly 1 league, close to the sea, appears dark and full, with several openings like bays. At about half a league from the commencement of these openings are some white cliffs, in shape like a schooner with all sails set, and head at East. So soon as this full land terminates, the coast assumes a more flat and level appearance.

Upon the South bank of the River Laguaripe, at the distance of about 9 miles from the entrance, is the town of Araçati. At the entrance is a bar, narrow and dangerous, owing to sand-banks on each side; and upon these the surf is very violent. The sand is so loose at the mouth of the river, that, even with the coasting vessels of the country, every precaution is required. The river widens immediately within the bar, and forms rather a spacious bay; but the port cannot, from the uncertainty of its depth, ever become important, and it has, at times, been nearly choked up.

The bay of Laguaripe to the South eastward of Crira, forms a small harbor to the Westward of some low level land. The bay is surrounded by very high perpendicular cliffs, against which the sea breaks at half tide. It has a high round rock, behind or within which is shelter and anchorage in 2½ or 3 fathoms. On the N.W. of this bluff rock you may anchor in the very roll of the sea, as it has 4 and 5 fathoms; and on the strand are pits for watering. Along side of the rock of Laguaripe, on the East, the River Xiro falls into the sea; and on its West side, 3 leagues out to sea, is a shallow of green water, of 5 to 7 fathoms, with bottom of mixed sand, and, in some places, small shells.

River Xiro.

*Crira,
Light.*

CIARA is the most important town upon this part of the coast. The bay on which it stands is formed by Point Macoripe (on which there is a fixed light, 37 feet above the surface of the sea, in lat. 3° 41' S., and long. 38° 29' W.) to the Eastward, and by the River Papiua to the Westward, an extent of about 4 leagues. It is extremely open; its greatest depth being 3 miles.

Directions for good anchorage off Crira.

Get the light-house on Macoripe Point to bear S.E. by E., and stand on this course until the church steeple is in one with a notch in the West end of the ridge of the mountain in the interior, at which time it will bear S.W. by S. Keeping this bearing, run in on this course, until in 6 or 5 fathoms water, where anchor, and wait for the pilot to take the vessel inside the reef. The anchorage outside is good holding ground, and perfectly safe, in as much as there seldom or never occurs a gale here. Should this port be visited at night, there will be no difficulty in anchoring in perfect safety with the light-house on the above bearing, in from 8 to 5 fathoms. The light is a very inferior one. Inside the reefs, 3½ fathoms; between them, is the least water at high-tide. Ordinary rise 3 feet.

Tide.

All communication with the shore is had by means of *jangadas*.

HOPE.

which you may anchor in 3 fathoms on the shore called Pedra.

15 leagues to the West, is called the Three Brothers; its surface covered with sand.

A channel between them is above water.

Two islands, Tabarao, then follow; the first two lead to the Bay of Brazil, have been supplied by Point. The point may be probably still are, some palm

jangadas.

Abrast of the town, and at the distance of half a mile from the shore, extends a ridge of rocks, level with the water's edge, and within which small craft generally anchor, the entrance to the anchorage being around the Eastern end of the reef.

The land within Point Macoripe is a high and irregular sand hill, terminating in a point which has a tower near the extremity. Ships advancing from the N.E. should not approach the point nearer than 3 miles, and should choose a berth without the points which form the bay. Tolerable anchorage may be obtained by bringing the point to bear S.E. by E., and the town of Ciara S., about 4 miles distant from shore, in 5 fathoms, sand and mud.

The reef forms a complete ridge, at a considerable distance from the shore, and is to be seen at low-water. It extends parallel with the shore for about one quarter of a mile, with two openings, one above and the other below the town. A small vessel may come to anchor between it and the shore; but a ship can bring up only in one of the openings of the ridge, or on the outside of it. A vessel coming in from the Northward should make Point Macoripe, which is a league to the Eastward of the town, with a small fort on it, and may thence bring up in 6 or 5 fathoms. On the appearance of a ship, the town fort displays a white flag upon a tall flagstaff.

North eastward of Ciara, between the reef and shore, is a rock, called Pedra da Velha, or the Old Woman's Rock, which may be known by the breakers over it. When a vessel leaves the port she may pass between this rock and the shore, giving berth to a shoal which lies about 100 yards to the Northward, or she may run out between the rock and the principal ridge or reef.

The inner anchorage, above mentioned, is between the reef and the shore. You enter by the Eastern channel and go out by the Western, when you cannot fetch out by the Eastern one. Here a vessel lies at low-water surrounded by breakers, except in the channels; and, as the pilots are very inattentive, it is, altogether, very dangerous. This is, nevertheless, becoming a place of very considerable trade.

From Ciara the coast trends N.W. by W., to Jericoacoara, the depth gradually increasing off shore; but a N.W. course should be pursued, to avoid a spit, the base of which extends from Mount Melanetas to Jericoacoara, and terminates in a N.E. direction from the latter at the distance of 6 or 7 leagues off shore. Having run 100 miles upon the above N.W. course, including a mile and a half per hour for the current's assistance, in soundings varying from 11 to 20 fathoms, change the course to W. ½ N., which is nearly the direction of the coast from Jericoacoara to Mangues Point, and it will give you a sight of the land as far as the island of St. Anna.

When ships are bound to Maranhão, from seaward, it is absolutely necessary to make the land considerably to the Eastward, as the currents, in general, set very strongly between W. ½ S. and W. N.W. If, in endeavoring to make the land, you should be in lat. about 3° S., on discovering it you will be off Mount Melanetas, or between it and Ciara; if the latter, three other mountains will be observed to the S. S.E., lying nearly S.E. and N.W. of each other, which mountains are about 7 leagues to the Westward of Ciara, and are easily seen from that place. About this part of the coast you will have a bottom of fine sand and shells.

If you should make land when you consider yourself in from lat. 2° 15' S. to 2° 30' S., and have a bottom of small red and white stones, you will be off Jericoacoara; if the bottom consists of yellow, blue, and red stones, you will be off Parnahiba or Tamoma, and three mountains lying nearly in the meridian of each other, in the neighborhood of the latter, will be seen.

The whole coast, from Point Macoripe to Parnahiba, is sandy to about half a league inland, whence it appears well cultivated; so that it is easy distinguishable from the coast between Parnahiba and Green Mangues (Mangrove) Point, which consists of nothing but sand, without the least sign of vegetation.

The bar of Tutuia is between 7 and 8 miles wide, and may be crossed at all times Tutuia, with 15 feet water.

The bars of Igarrassu and Barra Velha are not navigable. Tutuia, above mentioned, is the only port accessible, and is highly important in a commercial point of view.

Inclining to the shore, and observing the sand banks well as you pass along, the entrance of the River Perguicas will easily be distinguished. The land will now begin to assume a higher and more irregular appearance: this height and irregularity does not, however, deserve the appellation of hills. When the Perguicas bears S.S.E. you will begin to shoalen your water to 8 or 9 fathoms, but a steady course should be pursued, as you will presently pass the spit formed by the sand washed from the river, and which, meeting the natural course of the current in the offing, inclines it to the N.W.

If the day should be far advanced when you are off this part of the coast, haul to the wind under topsails and foresails for the night; standing off into 22 or 24 fathoms,

River Perguicas.

and on into 12 or 14. It would not be advisable to haul the wind before you are past the Pergnieas, as, otherwise, you may be short of daylight for the operations of the ensuing day. At daylight you may bear up under all sail, pursuing the former course and distance from the shore, and towards the conclusion of the sand-banks the land will begin to appear a little more fertile, and Green Mangues Point will easily be distinguished.

*Angerstein
Rocks.*

ANGERSTEIN ROCKS.—Lat. $4^{\circ} 28' S.$, long. $37^{\circ} 6' W.$, sounding 11 feet. They are not dangerous by day, being of a dark brown color, so that they show themselves sufficiently for a vessel to pass clear of them; and before the second cast of the lead can be got, you are in 10 fathoms water. They lie in a triangular form, about 11 miles from the land, with Ponto do Mel S.S.E. $\frac{1}{2}$ E., the Red Mount on the Return W. by N. $\frac{1}{2}$ N., 7 or 8 leagues.

*St. Marco
Bay.*

ST. MARCO BAY.—St. Marco Bay is that part of the sea comprised between the Western coast of Maranham and the main-land; its entrance lies N.N.E. and S.S.W.; its length is over 72 miles, and its width 6 miles; everywhere the depth of water is sufficient for large vessels, even frigates, which may cast anchor near the harbor of St. Louis, situated on the Western coast of the island of Maranham.

The prevalent winds being from the East, vessels bound to Maranham must endeavor to make the first land East of the island, except in case of a fair and favorable wind from North to West.

*Lancoe
Grandes.*

The white sandy beach, called Lancoe Grandes, is the first land a vessel bound to Maranham must endeavor to make; but it is proper to observe, that, by an error in the day's work, you may be deceived, and mistake the Lancoe Pequenas for the Lancoe Grandes, and in such case consider yourself West of the Pergnieas, when in fact you will be on the East of this shallow water. To prevent such an error, the surest way will be to keep at 10 or 12 miles distant from the shore, with from 6 to 10 fathoms water, and sail along the coast until you reach the green mangle shore; from this point you must steer West, and very soon after you will discover the breakers of St. Ann Island, and the island itself. Now you must direct your course round the breakers of St. Ann at 2 or 3 miles distance, until North of them, and you will be certain to have passed them when St. Ann Island will stand South a few degrees East of you.

Having passed the Northern breakers of St. Ann, you must steer again West, a few degrees North, until you discover the breakers of Corao Grande, which you may approach as near as the former. From this point you may proceed to the harbor by two different courses: if you intend to follow the first course, then you must steer round Corao Grande, keeping at a regular distance, with 10 or 12 fathoms of water; if the second, you coast along the Western shore of Maranham Island. Maranham Island is easily distinguished from Santa Anna Island by its greater height, and its white shore towards the North.

The first point to be discovered, when keeping close to the Maranham Island, is Cape St. Marcos, from which the bay derives its name. It is a high land of very great declivity, on the top of which a house is to be discovered, with a mast for a signal. This cape and the land project into the sea, and 300 yards from the sea-shore there are many rocks and sandy breakers, which you must not approach, being very dangerous.

Keeping always the same course, S.W. and S.W. $\frac{1}{2}$ S., you will reach the parallel of the small fort of San Antoni de la Barra, situated at the point of Arcas, which forms the Northern point of St. Luis harbor. That point being part of the rocks and sandy bank, above stated, it will be dangerous to approach too near, as long as you stand West of it, but when you are beyond this cape you may cast anchor.

*Maranhm
Beacon
Light.*

MARANHAM BEACON is a fixed light on Fort St. Marcos, which can be seen 15 miles. It is placed to avoid the dangerous bank Do Meyo. From it the West edge of the bank bears N. $27^{\circ} 30' E.$, and the East edge N. $63^{\circ} E.$ The light should not be run for between the opposite of these bearings.

*Shoal of
Manoel
Luiz.*

SHOAL OF MANOEL LUIZ.—At the distance of 77 miles N. $8^{\circ} E.$ from Itacolomi, you will find one of the most dangerous shoals that you can possibly meet with at sea; this is called the Shoal of Manoel Luiz, and was only known by the number of wrecks that happened before we were able to discover or assign its true position. It consists of many groups of conical rocks, nearly even with the water's edge, separated by intervals, irregular both in distance and in depth.

This shoal being situated in a sea rarely exposed to violent winds, breaks only for an instant, and that when the tide is quite low, so that it is almost impossible to perceive it even when passing very near. Nevertheless, the rocks on the surface which we have explored, are not more than from 5 to 15 feet under water at low tide, while there are 8, 12, and 10 fathoms close to them.

The instantaneous breakings rise in appearance like the back of a whale, when the sea is calm; and when these disappear, they leave masses of white foam which

are visible for some time. When the sky is clear you may discover the rocks under water, which appear in large black patches; but as these patches are not perceptible until you are too near, you must not wait for such indications. After two hours of flood, and at the distance of half a mile, it is probable you will not see one trace of this danger, if the sea is calm.

The survey made of this shoal has enabled us to be well acquainted with its approaches from the East, the South, and from the West, so as to be certain that nothing dangerous exists in these directions. I wish I could state the same with confidence respecting the approach from the North; but we had not the opportunity of making the examination. These rocks are in latitude $0^{\circ} 54' 25''$ S., longitude $41^{\circ} 14' 45''$ W., and the variation was $0^{\circ} 57'$ E. The rise of the tide was 12 feet, and it was high-water at 5 o'clock; the flood ran for 6 hours at the rate of six-tenths of a mile per hour to the S.W., and the ebb ran N.E. for the same period, and with the same velocity.

We were told that another group of rocks had been discovered nearly 7 leagues more to the Northward, and almost in the same meridian. The position given to this new danger is latitude $0^{\circ} 32'$ S., longitude $41^{\circ} 17' 21''$ W., and there does not appear to be any doubt at least of their latitude.

It is difficult to determine, from the soundings, your distance from the shoal of Manoel Luiz; the depth and the nature of the ground being so variable, at a certain distance from the danger, that you can deduce from them only very uncertain conclusions. The soundings of white sand, speckled black and red, as before mentioned, being the most common in that part of the sea, between the meridian of the Coroa Grande and that of the Eastern coast of the adjacent continent, extend 10 or 15 leagues to the Northward of the entrance of the bay of St. Marcos; but these are not without exceptions, as you will often find soundings of a very different appearance.

Beyond this limit, as well as to the Eastward of Coroa Grande, sand and broken madrepora are the most commonly met with. These are nearly the same which you so constantly meet with all along the coast of Brazil from the Abrolhos. We found them at the extremity of all our routes to the Eastward, and on the parallel of this shoal; and it is probable they extend much further to the Northward and Eastward.

In fact, broken madrepora are most common in the vicinity of this danger, to the East, South, and West of it; but they are mixed sometimes, though rarely, with coarse gravel, broken shells and rocks, but varying in depth so much, that you cannot by the soundings determine your distance from the shoal to within 5 or 6 leagues.

MARANHAM.—A light is erected on Mount Itacolomi, on the Western side of the bay of Maranhão, 117 feet above high-water. It is a revolving light of two distinct colors, white and red every minute, and lies in latitude $2^{\circ} 10'$ S., longitude $41^{\circ} 21'$ W. of Greenwich. *Maranhão Light.*

Vessels bound to Maranhão may cross the equator in longitude 40° W., which will enable them to fetch the Lancoes Grandes. It has been customary to make the light-house on the island of Santa Anna, but an error in the longitude will be of less importance by making the Lancoes Grandes.

A vessel arriving off Santa Anna light, and not having sufficient daylight to find her way into the bay of St. Mark, may lie to for the night, keeping the light as near South of her as possible, distant 6 and 7 miles. The light is revolving, time of revolution 40 seconds, and can be seen about 15 miles. *Light-house.*

As there is constantly a heavy swell on the coast, anchorage should be avoided if possible, as it is both difficult and dangerous to recover the anchor.

From Santa Anna, a vessel should steer $W. \frac{1}{2} N.$, by doing which she will pass the breakers off Coroa Grande, at the distance of about 3 miles, and Mount Itacolomi will be discovered bearing about West. When distant about 10 or 11 miles from the point, alter course to $S. \frac{1}{2} W.$, till the fort and flag-staff of St. Mark's are made out nearly ahead. St. Mark's Point should not be passed at a greater distance than $1\frac{1}{2}$ mile, that the bank of De Cere (on the starboard hand going in) may be avoided; a reef of rocks runs off from the point; and to avoid these, it should not be approached within three-quarters of a mile. Within these limits a vessel may coast along until Fort Antonio bears $E.$, or $E. by S.$, when she should anchor and wait for a pilot.

A vessel, by following the above route to Maranhão, will avoid getting entangled among the swash-ways on the Coroa Grande shoals, so very dangerous to strangers.

Vessels should be careful not to anchor off St. Mark's Point, as the ground is foul, and many anchors have been lost there.

ROUTE FROM MARANHÃO TO PARA.—A vessel bound from Maranhão to Para, during the rainy season, should get to the Northward of the equator as soon as possible. She will thus avoid the light baffling winds and calms that prevail in this season; and also the current, which sets from $E. N. E.$ to $S. E.$, about 2 or 3 *Route from Maranhão to Para.*

miles per hour, occasioned by the waters from the various rivers and bays of the coast.

To the Westward of the island of Salina there are some white cliffs so nearly resembling those to the Eastward of that island, that they have been frequently mistaken for each other. Vessels mistaking the Western cliffs for those East of Salina, have stood on until they have become lost on the Braganza Shoal, or in that equally dangerous place called the Well. The utmost caution therefore is necessary, to attend to the following directions for anchoring at Salina:

Bring the town of Salinas to bear S. by E., and anchor in 9 fathoms. The whole coast from Turnivissa is woody, and the white sand-hills are very remarkable.

A flag hoisted on the flagstaff at Salinas village, is the day-signal that a pilot may be obtained.

If the pilot should not, however, come off during the day, and at night there be shown two lights, the pilot may be expected off the following morning.

If there be three lights shown, the pilot has no boat, and must have one from the vessel to bring him off; in which case the vessel must bring the village of Salinas to bear S.S.W., in soundings of 5 or 6 fathoms water, when Point Atalaia will be distant about 5 miles. You may dispatch a boat well-manned, which must be kept close in with the shore at Atalaia, clear of the surf, until it meets with an opening in the reef which lines the coast in front of the village, through which it must pass. Inside the reef, the water is quite smooth, and you may land anywhere upon the beach.

High-water. The boat should be sent at half-flood, in order that it may return the same tide. It is high-water, full and change, at 7 o'clock, and off shore at 8.

Light. On Point Atalaia there is a revolving light, (Fresnel,) of 70 seconds of light and an eclipse of 16 seconds, then 12 seconds of very brilliant light succeeded by an eclipse of 22 seconds; this is repeated every 2 minutes.

Accidents have frequently happened, and lives have been lost, by boats going for the pilots being swamped in the surf. They have frequently landed immediately under the town, which is very wrong. They should pass to the Westward of the island; by doing this a river will be observed, which leads up to the town, where boats may land in safety, and thereby avoid the surf outside.

Maranhão to Para.

MARANHAM TO PARA.—Para, or Grand Para, is the Northernmost province of Brazil, and is celebrated for its cotton, sugar, vanilla, chocolate, and coffee. The coast from the bay of Maranhão to Para is generally low and sandy, and has many little isles of the same description, with numerous coves and rivulets. A vessel bound from Maranhão to Para, should take her departure in the morning, run to the anchorage off the Aracaji, or cliff, already described, thence stand out to sea, beyond the shoals of Cuna, (or Carnaveros Banks,) which may be effected in a run of 8 leagues. Having passed these, you approach the sand-bank stretching from the Western shore, and over which there are 6, 10, 7, 6, 5, 7, and 8 fathoms. Thus you may proceed to the N.N.W., or N.W. by N., to the distance of 22 leagues, when the ground of the bank, white sand with black specks, will be succeeded by coarse sand and stones, or brown sand and broken shells, with 13 to 17 and 20 fathoms water. Here you will be off the island of St. João, or St. John, and near the parallel one degree South.

The island of St. João is nearly level with the sea, and about 3 leagues from E.N.E. to W.S.W. Between the N.E. end of this island and Point Tamandua, to the W.N.W., the distance is about 9 leagues. The bay between affords shelter, and vessels may anchor at the N.W. side of St. John's Island, in from 6 to 1 fathoms, sandy ground.

At the distance of 18 leagues W.N.W. from Tamandua Point is Cape Gurupi, over which is a mountain, insulated, and therefore remarkable. This mount is several leagues inland, and near it is another, somewhat smaller and rounder. The coast here, as in other parts, is, however, low, level, and sandy, covered with a dark brush-wood, and from the point a shoal, with breakers, extends 3 miles out to sea.

From Cape Gurupi to the River Cayte, on the Western bank of which is a small town of the same name, the distance is 24 leagues, on a course nearly West. At the entrance of this river, on the Eastern side, are several low islets of the same name. Off the shore, throughout this extent, the bottom is generally flat, and there is commonly 7 and 8 fathoms at 3 leagues off, with clear ground.

From the Cayte to the inlet of Maracão, the distance W. by N. is 124 leagues. In sailing along, it is proper to keep 2 or 3 leagues off shore, in soundings of 7 and 6 fathoms.

The coast here is distinguished by a range or chain of white sand-hills, the highest of which, Pirassu Hill, is about 31 leagues Westward of Cayte Point, the Western point of the mouth of the Cayte. Pirassu Hill appears like a high bluff, and perpendicular point, close to the sea, with red cliffs on its Eastern side.

is rivers and bays of the white cliffs so nearly receive been frequently mistaken for those East of Salina. Shoal, or in that equally therefore is necessary, to not

t white sand-hills, the highest of Cayte Point, the Western s like a high bluff, and perpen- stern side.

At 5½ leagues W. by N. from Piraussu Hill is Point Atulain, distinguished by a *Point Atulain* watch-tower, having a gun which is occasionally fired when a vessel is approaching. *Point Atulain* On making this, and keeping a good lookout, the smoke may be seen. At this place are two eminences of white sand, and immediately West of the point is the inlet, or bay of Maracuno, having 5 or 6 fathoms water, and good ground.

RIO PARA.—Point Tijoca, the Eastern point of the mouth of the Para, is 9 leagues *Rio Para*. West from Atulain Point; and within this, at the distance of 7 miles to the S.W., is Point Tapua. Here an extensive bank extends 2 leagues from the shore between the two points, and to the Northward are the Tijoca shoals and breakers, the positions and nature of which can be understood only by reference to the charts. The passage in is between these shoals, in a depth of 12, 11, and 15 fathoms, at about 11 miles from the Southern shore, in lat. 0° 23' S. There is also a channel for small vessels, at 5 miles from shore, and along the edge of the Baxo de Boronoco, the bank which extends from Point Tijoca, as already noticed.

DIRECTIONS FOR PARA.—Vessels bound to Para should endeavor to make *Directions for Para* the land about Salina or Cayte, which lies to the Eastward of Salina, and is remarkable for its white sand-hills. Steering to the Westward, keeping the land in sight 6 or 7 miles distant, you will make the Point Atalain, which has a house near its extreme point, and immediately after will be seen the village of Salinas, which faces the sea, and easily perceived in clear weather by its white buildings. Here vessels take a pilot for Para, and if one should not come off by making a signal, you will have to send a boat on shore for one.

Should you not see Salinas, or find any difficulty in procuring a pilot, by attending to the following directions you will find no difficulty in passing the shoals, or getting up the river.

The land between Salinas and Tijoca runs about W. by N., about 4 leagues. To the Westward of Salinas you will see a point of land, S.W. of which are two remarkable white sand-hills, and by keeping a good lookout at the mast-head, you cannot pass them without seeing them, they being the only thing remarkable between Salinas and Tijoca, and a good departure to run between the shoals. Tijoca lies about 17 miles to the Westward of this land, and is a low point. You will have running along, 11, 12, 11, and 15 fathoms water, channel-way, and be careful in sounding; come no nearer the land than 9 or 10 miles, as you approach Tijoca, for fear of getting into the Well, which is a dangerous place, and oftentimes deceives strangers by supposing it to be a good channel inside, but should never be attempted by any. The Well (or entrance of do.) is about 5 or 6 miles to the North and Eastward of Point Tijoca, and has from 20 to 2½ fathoms water; by getting that soundings you may judge immediately you are in the Well, for there are no such soundings anywhere about that part of the coast. Haul off as soon as possible to the South and East, to avoid the Braganza Bank, for in that soundings you are not far off danger; perhaps the next soundings you may not have more than 2 or 3 fathoms.

A flag-staff 10 feet in height has been placed 58 fathoms E.N.E. of the light-house, where the signals will be made with seven different flags, as follows:

No. 1. A red flag, with white swallow-tail, signifies to vessels arriving at Salinas that a pilot is there, and a boat to take him on board.

No. 2. A white flag, with a blue cross through it, signifies that the pilot goes on board immediately.

No. 3. A flag, upper half red, lower half white, signifies that the tide will not allow the pilot to embark.

No. 4. A flag, all blue, signifies that the pilot will go on board before noon.

No. 5. A flag, inner half white, outer half red, signifies that the pilot will go after noon.

No. 6. A flag, blue and white chekered, signifies that the pilot will go on board before midnight.

No. 7. A flag, red and white chekered, signifies that the pilot will go on board after midnight.

When a bonfire is seen in the village of Salinas, it signifies that there is a pilot, and a boat to take him on board as soon as the tide will allow. When two bonfires are seen, it is a signal that there is a pilot but no boat to take him on board. When no bonfire is seen during the night in the village, the vessel having appeared during the day, it signifies that there is no pilot at the station.

Vessels wishing a pilot, should hoist a red flag at either the fore or mainmast head, but never at the peak.

When it is known by the signals made on shore that the tide will not allow the pilot to go off, vessels not wishing to anchor in 6 or 7 fathoms, keeping the light-house bearing South-east, should lie off and on, standing out during the flood and in shore during the ebb tide.

Signals

Vessels being North-west from the light can receive pilots more promptly than in any other position. The pilots embark at high-water, which, at the full and change of the moon, is, on the coast, at 30 minutes past 7, (7h. 30m.) and at the place where the vessel should anchor, 15 minutes past 8 o'clock, (8h. 15m.)

Masters of vessels need pay no attention to signals hoisted at Salinas, as they are merely made for the information of the keeper of the light, who also has charge of the signals.

Channel between Tijoca and Braganza Banks.

THE CHANNEL BETWEEN TIJOCA AND BRAGANZA BANKS.—When you make Tijoca Point from the mast-head, and running along the land so that you can see it plain from the deck, (say 9 or 10 miles,) you will soon discover the Braganza breakers from aloft, which break very high on the port hand going in, and is the best mark to run in by. The tide runs very rapid in this channel, and the sea at times. The ripple caused by the tide appears to a stranger like shoal-water, where there are probably from 14 to 15 fathoms water; and while the Braganza is in sight, you need not be apprehensive of any danger, for the bank is steep close to the breakers, and you should pass within 2 miles of them, or even less, and when Tijoca Point bears about S. E. by S., Braganza distant about 2 or 3 miles, you may haul up about S. W. to avoid Tijoca Shoal, which lies outside of you, and stretches to the South and West, and breaks heavy at the East part, but seldom seen going through this channel; and should your water shoalen, approaching said shoal, (which will not be the case while the land is in sight plain from the deck,) haul more to the South, and your water will deepen immediately; you may then proceed up the river by keeping the Braganza in sight, which will always be a sure guide for going in, keeping them at a distance of about 2 miles, more or less, as the courses given may be affected more or less by the tides.

The land between Tijoca and Point Taiper is broken, appearing in spots of small islands, which makes them more remarkable; and near to Taiper is a dry sand-bank, about 5 miles from the land, to the South of which, abreast of Point Taiper, is good anchorage, in about 7 or 8 fathoms water. This is where pilots come to anchor, outward bound, to wait an opportunity of running out between the shoals, on account of being less exposed to the heavy sea which sets in with the flood-tide.

Point Taiper is about 11 miles from Tijoca Point. The land between Taiper and Vigia lies about S. W. by W. and N. E. by E., distant about 17 miles, between which, keeping at a distance from 5 to 4 miles, you will have 9 to 10 fathoms water; and as you approach Vigia, your water will shoalen gradually to 8 and 7 fathoms. The point of Vigia is remarkable in coming from the Northward, and as you draw to the Southward, another point will open, which shows the entrance of Vigia. Be careful not to approach too near Vigia, as a shoal stretches off about N. W. by N., 2 miles, from the Northern part of the land which forms the entrance; and North from the Southern part, which forms the entrance to Vigia, $2\frac{1}{2}$ or nearly 3 miles, hard sand. Vigia is a small fishing-town, and cannot be seen in passing, as there is an island in front of it, which stands some distance from the entrance.

Running along the land, at the distance of 4 miles, you will have 7, 8, and 9 fathoms towards Colares, a small village which faces the water, and is very easily distinguished by its white buildings, distant from the South point of the land 5 or 7 miles. Off this village, or between it and Vigia, is good anchorage about 3 miles from the land, sticky bottom. Be careful not to come too close to Colares, as there is a reef of rocks that stretches off nearly 2 miles.

If night is coming on, it is advisable not to pass Colares, but come to an anchor and wait until morning. When you pass Colares, your water will deepen very soon after as you approach the Bay de Sol, which will open to your view. Bay de Sol is a large deep bay, being about 5 miles wide at the entrance.

Bay de Sol.

Be careful not to get into this bay, as it is dangerous, being full of rocks, and no safe anchorage, and has sometimes been taken for Bay St. Anthony. Between Bay St. Anthony and Colares there is no good anchorage that can be recommended with safety, the water being very deep, particularly abreast the Bay de Sol, where you will have from 16 to 18 and 20 fathoms water, which is not the case anywhere else in the river. Colares bearing East about 5 miles, steer from S. S. W. to S. S. W. $\frac{1}{2}$ W. You will then pass two small islands on your port hand, one abreast of the land, which forms the Bay de Sol, (S. part,) the other about 3 miles to the S. and W. In approaching these islands your course will draw you towards the land, but come no nearer than 2 miles, as there are rocks which stretch off about $1\frac{1}{2}$ mile, with 7 fathoms close to them; therefore 8 or 9 fathoms is near enough. As you draw up with the South island, you make the island of Tatuoek, nearly ahead. Be careful in drawing up to this island, not to come too close to it, as there are rocks stretching off it to North Tatuoek, between 2 and 3 miles. Leave this island on your starboard hand, after passing the small island previously mentioned, 4 or 5 miles; you may then haul in for the land which forms the Bay St. Anthony. The shore becomes bold and without danger.

The Bay St. Anthony is a fine clear bay, good anchorage all through, from 5 to 7 and 8 fathoms, and by hauling into the bay, if you want to anchor, particularly the Southern part close in, which forms a lee, you will have the sea perfectly smooth, good shelter from the wind, and out of the strength of the tide; but if you want to proceed to town, steer across the bay, the wind being always fair for going up; you will then see several islands; keep between them and the point which forms the South part of the bay, (or Point Penheiro,) which is close to. When you pass Point Penheiro steer directly for the fort, which stands on a small island, giving it a berth of half a cable's length on the port hand, where you must send the boat on shore with your papers, or come to anchor; the latter is preferable for a stranger, as the channel is very narrow. When you weigh anchor, steer for Para, or city of Belem, which will be open and plain to your view, distant about 5 miles from the fort, keeping the land distant about one mile on your port hand, and as you approach the town, haul in for the shipping, or custom-house, the next large building to St. Anthony's church, which is the first or nearest church in coming up the river; then you may anchor abreast the custom-house, where you will have to land your cargo.

N.B.—There is a shoal of considerable length runs between the island of Marajo and the main land that runs nearly North and South, which the sea constantly breaks on. Nearest distance of said shoal from the main-land being abreast of Colares, or that part of the land which forms the Bay de Sol, distant 7 or 8 miles.

High-water, full and change, at Para, 12 o'clock.

Do. entrance between the shoals, 10 do.

High-water.

From the mouth of the river, within Point Tijoen, the distance to the basin or anchorage of Para, is 20 leagues. All the Western side of the river is shoal, but on the Eastern side are even soundings of 8, 7, 8, 9, 10, 7, 10, 12, 9, 7, and 6 fathoms. In the basin itself are from 5 to 3 fathoms.

A vessel direct from sea, with good observations, may cross the equator on the meridian of 45°, where soundings, from 50 to 40 fathoms, may be found. A course hence W. by S. will lead towards Maracumo Inlet, on the East of which a pilot may be obtained. The soundings over the bank decrease gradually, from 40 to 15 fathoms; and it is to be observed that the flood-tide sets strongly to the West, while the winds are from the East.

The flood sets into the Rio Para at the rate of 4 miles an hour. The beginning from the Eastward is very rapid, and it veers gradually to the N.E. and N. The vertical rise is 10 feet.

Vessels outward bound, from Point Tapua, steer according to the tide, keeping that point S.E. to the distance of 15 or 16 miles. With Cape Magouri then in sight, haul up N.E. or N.N.E., taking care to avoid the banks of St. Rosa on the West. The wind here being generally from the Eastward, with frequent squalls, great caution is required. In thick weather, when Cape Magouri cannot be seen, the approach to St. Rosa's Bank may be known by the soundings becoming irregular, which is not the case to the Eastward of the channel. The weather shoals should be kept on board as much as possible.

PERNAMBUCO BAY.—Cape St. Antonio is the land which vessels bound to Pernambuco must endeavor to make first. The coast North of Cape Antonio forms a bay, in the centre of which lies Pernambuco. At the extreme end of this coast, N. 17° E. stands Olinda Point; half-way from Olinda Point to Semambius, the church of Nossa Senhora Da Rosario is built on a height; its two towers are easily distinguished when coming from the main sea; going along the coast at 2 to 4 miles distance, there are 12 to 19 fathoms water.

PERNAMBUCO LIGHT is a revolving light, on the reef forming the South point of the entrance of the port. It is composed of three lights, two white and one red, which show alternately, and revolve once in three minutes. It is visible 18 miles.

When you have made Cape St. Antonio, you must keep at 2 or 3 miles from the shore, until you bring the fort of Picao to bear between N.W. and W.N.W., and then run for the fort built on the breakers, until the cocoa-tree of Olinda (which stands between the two highest buildings of the city) bears N. ½ E.; keep on this course to within two or three thousand yards of the breakers, which form a key. The anchorage is not very good, large ships ought never to go nearer, and it is prudent never to anchor, in bad weather, West of the meridian of the cocoa-tree of Olinda. Going to Pernambuco during the Northern monsoon, it is best to make land on Olinda Point. From Olinda Point up to the fort of Picao, there is a shoal extending 2 miles from the shore towards the sea, which makes it necessary to keep at 3 miles distance, and in from 8 to 10 fathoms, until Fort Picao stands West, a few degrees towards the North, by which you will avoid the English Bank, which is formed by sandy rocks lying at the Southern end of Olinda Bank. That does not extend further East than the meridian of Olinda city, nor further South than the parallel of Fort Ciesco. The sea breaks there with great violence in heavy winds, though there are 2 fathoms of

water. Small vessels may avoid it to the West and North, keeping at half a mile from the main-land from Pernambuco up to Olinda Point, but such vessels should not draw over 5 feet, and a pilot is indispensable.

The white con Olinda buoy is moored in 5 fathoms at low-water, at about 2 miles E.S.E. of Olinda Point, with the following approximate bearings:—Se church tower, W.N.W. $\frac{1}{2}$ N.; the flagstaff of Fort Braco, W. by S. $\frac{1}{2}$ S.; and the tower of the naval arsenal in Pernambuco, S.W. by W. In clear weather it may be seen at from 5 to 6 miles distance.

Buoys

On the English Bank there are two buoys, a red one on the Southern end and a black one on the Northern end.

South of the red buoy there is plenty of water for any vessel. North of the black buoy should not be attempted without a pilot.

The harbor of Pernambuco is not a very safe one, for the swell of the sea is very great outside, and if too near the shore there will be great danger, should the anchor drag or the ship fall to the leeward, when getting under sail, which may become indispensable should the wind turn S.S.E. or E.N.E., as is the case in the months of March and September. During the Northern monsoon the prevalent winds are from the East, particularly at the time of new or full moon, and though the weather is clear and fine generally, yet it requires to be careful in the anchorage, and the surest will be not to cast anchor too near the shore, the bottom being very rocky, and it is requisite to make use of chain-cables in this place more than in any other. Large vessels will do well to be at all times in readiness to get under sail, and prudence requires a second anchor for safety during the night.

If there is any necessity to remain a long time at Pernambuco, the best way will be to moor with two anchors to the Eastward, and another toward the W.N.W., over the stern, in order to prevent the ship from swinging during the calm which comes after every squall of wind.

The harbor of Pernambuco is sufficiently spacious and deep for vessels from 10 to 12 feet draught of water; it is divided into two parts: the interior part, which is called the Poco, (the Well,) is situated on the Northern end. The entrance is formed by several rocks or banks of small stones. There are from 17 to 30 feet water on the bar, as well as inside. The shore is sandy, and the water decreases in depth, in proportion as you go toward the land. The only guard vessels have from the winds coming from the sea, are the rocks, or breakers, before stated; but they are insufficient for that purpose, and during the Southern monsoon this place is not at all safe. The second part is called Recife Port; it is comprised between the natural quay of rocks and the city; it is also called Mosqueirao. This harbor is better guarded than the former, by the quay of rocks, but the bar has but 7 feet at low-water.

If you wish to enter the Poco Harbor, you must proceed as follows: being inside of the English Bank, the cocoa-tree of Olinda N. $\frac{1}{2}$ E. of you, you will have a small pyramid on the shore, in range with the church of San Amarao, which is surrounded with cocoa-trees, and you must run for them until Fort Picao bears South. If you wish to go into Mosqueirao you must steer S. $\frac{1}{2}$ W. from that place.

Small vessels sometimes pass through the South entrance to Mosqueirao, which is at the Northern end of the quay of rocks whereon Fort Picao is built. The mark is, to keep the two corner-towers of the Southern end of Fort Bruin in range, and run for them, true West, until Fort Picao bears South; then steer along the Western side of the breakers into the harbor. There is no great danger in going near the breakers; it is customary with pilots, when called, to come to vessels lying in the bay. Vessels trading with Pernambuco must not draw over from 10 to 12 feet water.

The two harbors of Pernambuco are safer than the bay, ships being sheltered from the swell of the sea by the breakers, or quay of rocks.

The prevalent winds are from S.S.E. to N.N.E.; from March to September, they are more towards the South, and sometimes S.W.; during the other six months they stand E.N.E. and N.N.E.

Bahia to St. Augustine.

THE COAST FROM BAHIA TO ST. AUGUSTINE.—From Itapuanzinho Point up to Itapan, the shore is sandy and low; a few trees are to be perceived at a distance, and from place to place some cocoa-trees. All along shore are ridges of rocks, and in many instances they rise above the level of the sea; the one at the Itapan Point, particularly, seems like small islands. Thirty-eight miles further N. 15° E. of Itapan Point, you are opposite the Torre de Garcia of Avila, a kind of fort built on the top of the coast, among the trees, and which is now used as a house for signals. The coast, from 9 to 10 miles distant, appears like a wall of great magnitude and equal height, except where the two rivers, San Joannes and Jacuhype, discharge into the sea, where a large cut appears in this wall. The depth of the sea is very great opposite this place. From Torre of Avila up to Oiteras of San Miguel, the shore is higher, but with small hills.

All the coast from Rio Real up to Rio St. Francisco is low and sandy, with small brown bushes, and small hills at no great distance in the interior. A vessel may approach very near the land: the bottom is sandy, with gravel and broken rocks. The next after Rio Real is Rio Sergipe, which is 21 miles distant from Vassa Barris. The mouth of this river, when viewed at a small distance, is distinguished by the three small hills of equal height, covered with briars, lying 9 miles S.W. of the bar. These hills are called the *Ostres Irmãos*, (or *Three Brothers*.)

At the mouth of the Sergipe River a very white sand-bench is to be seen, presenting a marked contrast with the green coast all around. At the bar the sea breaks with great force, from which we infer there is shallow water. The rivers next in succession are: Colindiba River, near the Misericórdia Point and Japuratuba Points, south of the mountains of Pacatuba. There are but 7 feet of water at the bar. When the bar bears W., the Mount Aracajou bears a few leagues N.W., and in the West Marro Pelha is discovered. The Mount Aracajou runs parallel with the coast, and in its Northern extremity there is a deep cut. The second mount has the shape of a Quaker's hat.

COLINDIBA RIVER.—Vessels bound to the Colindiba River during the North-*Colindiba*
erly monsoon, viz., from March to September, should make the land in the latitude *River.*
10° 50'.

Mount Aracajou will be about West, and will appear near the shore. Steer S.W. along the shore in no less than 5 fathoms, and the Atalaia will soon be seen, and if the flag is set, it will be a proper time to pass the bar; and a flag will be put out North or South as it may be necessary to steer. Sometimes the pilots come outside the bar, but not at all times. When the flag is set on the Atalaia, the pilots will be in readiness on or within the bar.

The Atalaia on with Mount Cajuiba will lead to the channel over the bar. Course N.W. by W., W., or W.N.W.

If in the Southerly monsoon, it will be well to make the land in latitude 11° 2'; the Three Brothers will then be seen thus , and Mount Aracajou to the Northward, like a promontory; no land to be seen beyond it. Steer along shore North-easterly, in not less than 4 or 5 fathoms, and the Atalaia will soon be seen, when you can steer in as directed above.

The Atalaia has the appearance of a tower with a flat top and flagstaff in the centre, but is nothing more than four large spars put upright, and secured with rafters or beams, some 10 or 15 feet apart; some boards are nailed at the top, which makes it look white when the sun is on it. Steer direct for the flags.

If clear, Mount Itabayama can be seen 30 miles, and Aracajou 12 or 15, the Atalaia 3 to 5 miles. There is usually a small nun buoy on the South sand-head.

The coast from Rio Idaparutuba up to St. Francisco River, is very dangerous in a strong S.E. wind, for vessels going near the land, they having no good chance to escape the wind, and the bottom being too hard for the anchor to hold.

Near St. Francisco River the land is very low, and cannot be seen even at a short distance, for which reason great care is required in making the land here. The only mountains to be discovered at a distance are the Itabayama and Pacatuba, but only in the clear weather, and when exactly opposite the River St. Francisco. The entrance of this river lies South of Mangualha Point, which is very low, and all covered with mangel-trees. It projects E.S.E., and at 11 mile distant from it, in that direction, there are dangerous breakers. The North point of the entrance is much lower than the former, of white sand, and there are extending from it dangerous breakers. Between these breakers you must anchor until a pilot comes on the bar. There are from 12 to 13 feet water; the land from St. Francisco River up to Alagous is low and sandy, and a ridge of rocks, at a short distance from the shore, is to be seen. Many small rivers discharge into the sea, but none of a sufficient depth to be navigated; they may be approached very near without danger.

Opposite Oururippe, 3 miles distant from the shore, stands the rock of Don Rodrigo. All around this place there is a great depth of water, and the shallow water does not extend over 3 miles. As there is no reason to keep near the land, one will do better to remain at a greater distance than 4 miles. The land-breeze, during the night-time, is hardly perceived when 4 or 5 miles from the land, but at daylight it begins to reach that distance, and seems to attract the Eastern wind towards the North until 12 in the morning; and afterwards the Eastern wind returns gradually towards the East; from that fact vessels may derive some benefit on either course, when obliged to beat. Near San Miguel the shore is very bold, and nearly 80 feet high, and the top perfectly even and horizontal for an open space of 15 miles. When coming from the South, the village of Macayo will be seen on the top of a highland. The church is easily distinguished, and for this reason the place deserves notice. The Jaraguá River empties below Macayo, and the point which forms the Northern land of the month is covered with cocoa-trees, and breakers are to be seen at some distance in its direction. North of Macayo, and from the interior, the mount of Marambaya may be seen at 45 mile

distance. The country on which it stands, though high, is very level on every side of its base. The shore North of Macayo is sandy, and from place to place of a reddish color; low trees are seen not far distant from the shore. The port of Tamandare though not very important, deserves some notice, being the only place affording a safe shelter between Bahia and Pernambuco. This anchorage is formed by a deep cut into a bold shore, and is sufficiently large and deep for large vessels.

Nine miles N. $\frac{1}{2}$ E. of Tamandare Harbor, lies the small island, or rocks of Alexo, situated at the mouth of the small river Serehen. Previous to your arrival there, the bar of Rio Ferno is discovered. When two rocks, Alexo, are in range, they bear N. 6° W. North of these two rocks, Monte Do Sella is seen in the interior, which derives its name from its shape, (Little Saddle.)

Being a few miles East of the rocks of St. Alexo, you will distinctly perceive the cape of St. Augustine, lying 16 miles N. 18° E. This cape is hardly covered with wood and not very thick; it is of a moderate height, which decreases gradually towards the sea. A steep beach of a red yellow color, is to be seen in many places upon it; on its top there is a church; towards the North side, a little below the church, fortifications are to be seen.

*The Bay of
All Saints,
or Bahia.*

THE BAY OF ALL SAINTS, OR BAHIA.—Vessels bound to Bahia during the Southern monsoon, should make land near San Paulo. If during the Northern monsoon, they will do better to make land North of Itapiun, which is a little further North than Cape St. Antonio. Upon the whole, this will depend on the accuracy of the day's work, the actual situation of the vessel, and the wind to be met with when near the coast. The main entrance of Bahia, called likewise St. Salvador, is formed by the cape, or promontory, of St. Antonio on the East, and by the island of Itaparica on the West. The distance from Cape St. Antonio to Itaparica Island is not less than 4 miles; but one-half only of this channel, which is towards the main-land, is safe for navigation of large ships. If from the Morro San Paulo, you steer N. 46° E., with a favorable wind, you will pass at the proper distance of the bold shore of Itaparica Island and the breakers of St. Antonio; but if you are obliged to beat, it requires care to avoid both places.

Nothing is to be feared by keeping parallel with the main-land, on which stand San Paulo, Mount Arod, Itaparica, until you discover towards the North, the Jaburu Point, which is the Eastern end of Itaparica Island. Arrived opposite Point Aratuba, you are 7 miles from Jaburu, and 5 miles S. 41° W. of Cape St. Antonio, and nearly 3 miles W. of the Southern extremity of the breakers of St. Antonio. From that situation you must steer towards Cape St. Antonio until 2 miles only from the shore; from thence steer for the church of Bom Fim (situated on the point of Monteferrate) until up with the Fort Do Mars, or Sant Marcello, near which is the usual anchorage.

The flat of St. Antonio, lying 4 miles S. $\frac{1}{2}$ W. of Cape St. Antonio, is easily avoided, and is not very dangerous. It is a sandy bank of a reddish color; no rocks are to be met there, and 4 fathoms of water are to be found everywhere according to the statements of the natives; but as in some places the sea breaks on this bank during strong wind, large ships should keep at a distance, which is the case when following the course we have described. The anchorage for merchant-vessels is inside of the line drawn from the fort of Marto Monteferrate Point. It is necessary when going to this anchorage to avoid the sandy bank of Panella, which has on it 3 to 3 $\frac{1}{2}$ fathoms only, lying W. $\frac{1}{2}$ N. from Fort Do Mar.

Generally the wind permits you to come to anchor in front of St. Salvador, the most prevalent wind being from E. and from S. E., and vessels can generally go in by making short tacks. During the night-time, the breeze comes from several points of the compass, but more generally from the land side. The tides are perfectly regular from St. Salvador, and the flood and low water have equal times. The harbor is very safe, and there are only a few instances, when a strong wind from the S. W. blows, that the water is much swelled, and ships do not ride easy.

The course out of St. Salvador is very near the reverse to the one in. When one mile distant West of Cape St. Antonio, by steering 43 miles S. S. W., the shallow water will be avoided, and afterwards you may go round the cape into the open sea. All the lands near Cape St. Antonio are tolerably high, compared to those on the opposite side. They are of a pleasing appearance, being covered with trees, and a luxurious vegetation of a green color. This shore, in fine weather, can be discovered 30 miles distant. On the end of Cape St. Antonio stands a light-house, containing a brilliant revolving light, showing two white sides and one red, the latter to be seen once in every 4 minutes, situate on Fort Santo Antonio da Barra, 140 feet above the level of the sea, and visible at a distance of about 25 miles. In the day-time, when the light-house bears W., the fort of St. Antonio appears as separated at a small distance from the main-land. Two and a half miles East, a few degrees South of the light-house, there is another point, on the top of which stand the poles for sig-

nals. This last point forms, with the Hapuanzinho Point, which stands one mile East, a small bay. Many houses are to be seen along the sea-coast.

MARTIN VAS' ROCKS are high and barren; the central one is the largest, and may be seen from a ship's deck at 3 leagues distance: this is a little more Easterly than the other two, although they are nearly on the same meridian, as they are in range when bearing S. Between the central and Southern rocks there is a channel. With the largest rocks E.N.E., about one mile distant, you will have 12 fathoms. Plenty of rock-cod and other fish may be caught here. N.E. from the largest rock, about 2½ miles distant, there is a sunken rock, on which it usually breaks. Their extent from North to South is 3 miles. They are all steep and inaccessible. The channel between them and the island of Trinidad is about 25 miles wide. The largest rock is in lat. 20° 29' S., long. 28° 54' W.

TRINIDAD ISLAND is about 6 miles in circumference, and lies N.W. and S.E., nearly. The S.E. point is in lat. 20° 31' S., long. 29° 21' W. The island is high and uneven, and may be seen from a ship's deck about 17 leagues. In some parts, particularly the Southern part, there are trees from 12 to 18 inches in diameter, but it is mostly barren. The surf continually breaks upon it, rendering landing difficult and dangerous. On the West side there is a rock with a stupendous arch, like that of Fernando Noronha, and a very remarkable rock called the Monument, or Ninepin which is 850 feet high, and almost detached from the island, with large trees on its top. At the S.E. end of the island is the Sugar-loaf, a large conical rock, 1160 feet high, with trees on its summit.

The Coast between Rio Janeiro and the Bay of All Saints, the Harbor of Espirito Santo, Porto Seguro, &c., &c.

Leaving the bay of Rio Janeiro to proceed Eastward, 11 miles distant, E. 15° S. of the Sugar-loaf, you will find the two islands of Marice, situated nearly one league from the shore; they are not very high, their Southern shore is quite perpendicular, and there is no danger in going near them.

At 11 miles further, N. 77° E. of these islands, you meet Cape Negro, which is formed by a hill not very high, adjoining the highest mountains between Rio Janeiro and Cape Frio, which, with its dark green tinge, are quite sufficient to distinguish it. There is not the least danger in nearing it, for even at the distance of 3 miles, the soundings are from 30 to 40 fathoms, muddy bottom.

The sea-shore from Rio Janeiro to Cape Frio is low and sandy; the mountains which surround that bay run first E.N.E. until you reach the meridian of Cape Negro, and afterwards N.E., leaving an empty flat between, over 10 leagues in extent, which is to be seen from the sea in fine weather only.

Between Cape Negro and Cape Frio the land is low, and a few small hills may be seen at some distance from the shore, which is there sandy and bushy. On the top of one of these small hills, 9 miles E.N.E. from Cape Negro, stands a church. At no great distance from the shore a ridge of rocks and sand are to be seen at low-water, with 30 and 40 fathoms water, 6 miles distant, muddy bottom, the depth increasing very fast towards the sea, and at 10 leagues distant, from 70 to 90 fathoms, bottom sandy, rocky, and muddy.

Though of little importance, it is proper to state that inside the beach a flat of water can be seen. The depth of the sea near Rio Janeiro is very great, varying from 76 to 90 fathoms, at the distance of 10 or 15 leagues, diminishing gradually towards the land. The bottom is a mixture of coarse sand, gravel, broken shells, rocks, and mud.

CAPE FRIO (on which there is a light-house, with a revolving light, 1000 feet above the sea, which is visible 2 minutes and eclipsed 2 minutes, and can be seen 10 miles in clear weather) is the Southern side of an island lying on the Eastern end of the beach of Maranhaya. This island is rocky; there are trees only in some places, and green grass is nowhere to be seen. In fine weather it may be discovered 15 leagues distant. Viewed from E. and N., two hills are visible on Cape Frio, the Northern one of which is the largest and highest, and on the Southern one a kind of rock seems to project and hang over. Viewed from N.N.E. and S.S.E., those two hills appear to be but one with two tops; and at a small distance from the Cape, in an E.S.E. direction, lies a small island of a conical shape. All this shore is so bold, that 30 and even 40 fathoms are to be met in every direction, even at one mile distance, bottom almost everywhere mud.

Between the island of Frio and the main-land there is a good channel for small vessels, and a good anchorage for others of any size. The channel runs N.E. and S. W. It is not frequently used, on account of its narrowness at the Southern part, but the depth of water is everywhere more than sufficient. The Northern passage is very spacious and safe against any wind except N.E.: but by anchoring more North

Trinidad Island.

Cape Frio. Light-house

towards the Island Dos Porcos, you will be perfectly safe, the anchorage being firm, and often resorted to by coasting-traders. Variation $2^{\circ} 3'$ E.

The Northern part of the coast of Cape Frio, together with the islands, runs N. 35° E. up to the Anchor Islands, and forms a deep bay, in the inside of which stand the numerous islands of Papagoros: several of them afford very safe anchorage in case of contrary wind.

The islands of Anchoros are 4 miles E. $\frac{1}{2}$ S. from Cape Busios; the Eastern one has the appearance of a Quaker's hat.

North of Cape Busios lies the small island of Branoa, from whence another beach extends to the Morro San Joa, or San Joam, and at no great distance the island of Feno. The land now runs Easterly up to Cape St. Thomas. This gulf, formed by the coast between the Capes Busios and St. Thomas, is very near 30 leagues in extent, and in the middle of it, at 3 leagues distant from the shore, lies the island of Santa Anna.

The Morro San Joam is easily distinguished, being entirely separated from the chain of mountains lying in its rear.

At 20 miles N. $\frac{1}{2}$ W. of Morro San Joam is another hill, the Northern side of which is quite perpendicularly cut, and its top ends in a sharp point. It is known by the name of Father de Macaya, or Macahe.

The islands of St. Ann are three in number. Viewed from the S.S.W. and N.N.E., they appear as one only. The Southern one is the highest. The anchorage in the channel is one of the safest and most convenient for any kind of repairs, and to refit vessels of any description. Good water and timber are to be found; and at the distance of 4 to 5 miles from the shore, there is, in every direction, from 19 to 30 fathoms of water, and a good mud bottom.

From the parallel of the islands of St. Ann up to Benevente, which lies in latitude $20^{\circ} 53' 50''$ S., a flat land projects considerably into the sea, and is known by the name of Granes.

*Cape
Thomas.*

CAPE THOMAS.—From the island of St. Ann to Benevente End, the land extends more and more to the sea; and at Cape Thomas the mountains appear to be 13 leagues from the sea-shore. This part of the Brazilian coast is very low; a few trees and small sand-hills seem as buried in the sea-water. This beach extends far into the sea, and forms what are called the Banks of Cape Thomas. At the distance of 5 miles are from 10 to 21 fathoms, increasing regularly towards the sea. By keeping 15 miles from the shore there is not the least danger.

Some coasting-traders state that places on the banks are to be met with having 2 or 3 fathoms of water only, but the pilot thinks differently.

The bottom near Cape Thomas is not mud, but white sand and broken shells. It should here be observed, that this white sand, which extends so far North, appears to begin only there, and is never met with further South.

At a short distance from Benevente you meet, in succession, the Barra Guarapaya, (Bald Island,) La Rosa, and the small islands of Guarapari.

The River Guarapari enters into the sea between two hills covered with trees. On the top of the Southern hill there is a church with a steeple, many houses and cocoa-trees. The other hill is called Perro de Cao. To proceed up the river, it is necessary to keep Guarapari Hill N.W.

The surrounding coast is tolerably high, and everywhere covered with small trees, and in several places a yellow steep beach not perceived to the Southward of Benevente. The mountains in the interior deserve particular notice, being of a conical shape, and appearing to incline on one side, which is not to be observed to the South or North.

*Espirito
Santo.*

ESPIRITO SANTO.—The Island Calvada lies 4 miles distant from the shore. There is no danger passing in the channel, being from 12 to 20 fathoms water. Outside this island, and off the Island Rosa, the depth varies from 12 to 20 fathoms up to Espirito Santo Bay. Keeping at the distance of 2 to 7 miles from the shore, at nearly two-thirds the distance from Guarapari Santo, you meet the rocky Island Juen and a little further distant the Pocotes Rocks, which indicate the entrance of the bay of Espirito Santo. The particulars which distinguish Espirito Santo Bay, are Monte Moreno and Mertue Alvara. Monte Moreno is a mountain on the Southern end of the bay, its Northern base forming the Southern entrance of the river of Espirito, and is of a conical shape, covered in part with wood; no green grass to be seen on its Eastern side; it may be discovered 10 leagues distant. Vessels going up the river must range along it at no great distance. The two Pocotes Rocks lie 24 miles off, and are of unequal size. The inside channel is used only by small vessels.

Nearly one mile distant from Monte Moreno, S. 60° W., stands the Morro de Nozza, (Sembora de Porã) a rocky hill with little wood. The church which is built on its top, can be discovered 5 leagues distant. The hill called Mastre Alvaro, is distin-

stands the Morro de Nozza,
e church which is built on
ed Mastre Alvaro, is distin-

guished by its great height on a low ground, appearing entirely separated from the other mountains.

The greatest part of the bay of Espirito Santo is occupied by two islands in a direction N.N.W. of Monte Moreno. Through the space between this island and the mountain, a vessel not drawing over 16 feet water may easily pass without danger, as you will not have less than 18 feet water.

Espirito Santo is of some importance to navigators. At one league's distance from the city of Victorin, there is good water. Wood and cattle can be had in plenty and cheap. The climate is unhealthy, being extremely damp. There is a rock called the Pao de Haunar, (Sugar-loaf,) about 2000 yards from the city: you steer in its direction after weathering Monte Moreno, if you intend to get into the river. The tides are not more than 4 feet, and are regular except inside the bay.

The coast North of Espirito Santo is low and covered with trees; and the shore which runs N. 32° E. from the Tuberon, (the Shark,) up to the bar of Rio Doce, nearly 16 leagues distant, is of a yellow red color.

From Rio Doce (Soft River) the coast runs North and South up to the bar of San Matheo, a distance of 20 leagues. The country in the interior does not appear so low as the sea-shore, but from Rio Doce to Mount Pascoal the country is very flat. There is consequently no difficulty in recognizing Espirito Santo Bay when coming from the South or from the North, as in the first instance Mount Mastre Alvaro comes next to the flat land, and in the second instance it ends a land tolerably high.

The shore from Tabarao End up to San Matheo, may be approached everywhere at the distance of 2 or 3 miles. From 9 to 10 fathoms water are to be found at that distance, sandy bottom, sometimes muddy and with broken shells.

It is reported Rio Doce runs far in the interior, but its mouth does not admit of large vessels.

The bar of Rio Seea lies 10 leagues North of Rio Doce. Rio Seea is a stream only in the rainy season.

The bar of San Matheo is 10 leagues distant from Rio Seea. This bar may be distinguished at a great distance by the breakers, which are greater than on the surrounding places. The shallowness of the water, the impossibility of crossing over the bar, and above all, the little benefit to be derived from this place, are more than sufficient reasons to keep at a distance from it.

ABROLHOS.—At a distance of 4 to 5 leagues from San Matheo, in a Northern *Abrolhos* direction, and at 3 to 4 leagues from the land, the soundings begin to indicate the shallow water of the Abrolhos. This shallow place may be considered to extend North and South 18 to 20 leagues, and East and West not less than 20 leagues; and though the whole extent is not equally dangerous, yet a vessel not bound to this place, will do well to keep away from it.

The Abrolhos Islands, or Santa Barbara Islands, are four in number, not including two or three flat rocks. The two Northern islands are the highest. The Western one is nearly 130 feet above the sea: the other 115. They may be perceived from the top of a frigate, in fine weather, 20 miles.

Nothing is to be found on these islands except some reeds and cactus. Numerous tribes of birds inhabit them. A few turtles are to be met with. Fishes are plenty, and the fishermen of Porto Seguro repair there to fish, and dry what they call garoujas. This is consequently the only thing a vessel can expect.

We have already stated that the extent assigned to the shallow water is not everywhere dangerous. In the same extent, it appears that from the E.S.E. up to S. by N., and W., large ships may approach from one to eight miles, in fine weather. The only part we had no chance of sounding, and which remains consequently doubtful, is that part comprised between the S. and S.S.E.

West of this island there is a channel of nearly 3 leagues wide, where the soundings show from 10 to 15 fathoms, except in a few places where it shows only 8 fathoms. The Western side of this channel is formed by more shallow water, called the Paredes, (or Walls,) which is very dangerous. According to the report of the native mariners, the tides are irregular on the Abrolhos; the current runs according to the wind, and not over three-tenths of a mile an hour. The soundings show no mud over the whole extent of the shallow water of Abrolhos, and if any is to be perceived, it is a certain sign you are no longer there. The nature of the bottom in the Abrolhos is white sandy stone, mixed with broken madrepora, in a powdered state. Sometimes that sandy gravel is very firm and combined with sand and rock, particularly in a N. E. direction. In the direction of S.S.W. or N.E. by N., the bottom is very firm and like tough mortar, in which the anchors have a good hold, though they enter very little into it. We have no certain information respecting the Paredes, which are placed in the chart according to the statements of the native mariners, beginning at the bar of Portalegra, and ending at Aleobaca.

Capt. Fitzroy, of H. M. sloop Beagle, on the Abrolhos Banks.

"On the 18th of March we sailed from Bahia, and worked our way slowly towards the Eastern limit of the Abrolhos banks. The winds being light and Easterly, favored our sounding frequently, and taking good observations.

"Having reached the parallel of the islands, to the Eastward of the Easternmost soundings laid down in the charts, and finding no ground with 300 fathoms of line, I began to steer Westward, sounding continually, and keeping a sharp lookout at the mast-head. At 2 p. m. on the 26th, we had no bottom with 230 fathoms, and at 4 p. m. we found only 30 fathoms, without the slightest change either in the color of the water or in its temperature, or any indication of so sudden a change in its depth.

"I directly hauled to the wind, and worked back again to the Eastward, to have another opportunity of confirming the place of the edge of the bank. We lost soundings as suddenly as we found them; and in standing to the Westward a second time, with a grapnel towing astern with 200 fathoms of line, we hooked the rocky bottom and straightened the grapnel, but my object in ascertaining the exact beginning of the bank was gained.

"From that spot we had soundings in less than 40 fathoms, until we anchored near the Abrolhos islands.

"I passed to the Southward and Eastward of them, because that side had not been examined; but time would not allow of my doing what I wished while so favorable an opportunity offered.

"At least a fortnight would be necessary to complete the survey of Baron Ronisim, which appears, so far as we have examined, to be extremely correct. The soundings are so irregular, that little dependence can be placed on the lead. It is only by a multitude of soundings, by watching the sea when there is much swell, and traversing every part with a sharp lookout at the mast-head, that the neighborhood of the Abrolhos, particularly to the South-east, can be thoroughly examined.

"More than once we had 4 or 5 fathoms under one side of the vessel, and from 15 to 20 under the other side. The *sauts de sonde*, as the French express it, are surprising.

"The tide, or rather current, which we experienced, was continually to the Southward for the three days we were near these islands, varying from half a mile to 1½ mile an hour.

"I supposed that the bottom was chiefly composed of coral rock, but was surprised to find no coral excepting small fragments growing on the solid rock, which is chiefly gneiss and sandstones. As the charts say, 'coral rock,' I have sent a few of the soundings for your inspection; and you will see by them that what has here been called coral, is the coating of a solid rock, formed by the deposit of the sea-water, mixed with coralline substances, and what a sailor generally calls 'barnacles.'

"My meridian distance of the Abrolhos Rocks from Bahia, their latitude and their size, agree precisely with those given in the French survey; but between Bahia and Rio de Janeiro, and consequently between the Abrolhos and Rio de Janeiro, there exists a difference of from 4 to 5 miles between us, this being the only point on which I have found any such difference either on this or on the Beagle's former voyage.

"Having made both passages, I venture to observe, that going within Abrolhos certainly shortens that between Rio and Bahia very much; but yet I should not recommend it to any vessel unless she has reason to make unusual haste. The soundings are very irregular, varying suddenly from 20 to 6 fathoms; and there are both reefs and currents."

*Hotspur and
Victoria
Banks.*

HOTSPUR AND VICTORIA BANKS.—The Hotspur is about 15 by 10 miles across, in lat. 17° 51' S., long. 36° 53' W., variation 6° 33' W.; and the other 72 miles by 12, the middle of which is situated in lat. 20° 46' S., long. 37° 47' W.

No bottom at 200 fathoms has been found between them, nor between them and the coast, from which the nearest is 180 miles.

*Montague
Shoal.*

THE MONTAGUE SHOAL is in lat. 20° 45' 8" S., long. 37° 47' 23" W., with one spot at its N.E. extreme of only 19 fathoms; the current sets to the S.W. three-quarters of a mile per hour. The same description of fish as on the Hotspur may be found on it in abundance. The variation is 3° 42' W.

The little city of Prado lies on the mouth of the river Incruen, a very deep cut amongst the trees, which are numerous on the shore, at the place where the river discharges into the sea. There is no danger near the mouth; even at 3 miles there are from 10 to 14 fathoms of water. This depth remains the same as far as the village of Columbiana, situated E.S.E. of Mount Pascal. Mount Pascal is to be perceived even from the Abrolhos.

E. by S., 28 miles from Mount Pascal, in a direction North and South, and at 12 miles distant from the coast, the water is very shallow, intermixed with rocks. This dangerous place is called the Itacolomis, and runs E.S.E. and S. by W. There is not the least danger by keeping away 13 miles from the shore, and when North of Mount Pascal the lead may be heared to 3 miles, the depth being from 11 to 24 fathoms.

Mount Pascal, as we stated before, is the highest of the mountains perceived from the Abrolhos. The chain it belongs to runs nearly S.E. and N.W. The Southern part of this mountain seems as if a large square tower had been built on its top. Viewed from the East, Mount Pascal appears of a conical shape, and being the highest of the whole, it cannot be mistaken.

The shore from Villa Prado up to Mount Pascal runs N. 10° E. It is low, woody, and its general appearance is very much like the shore between Itacolomis and Mount Pascal; it differs only in its yellow red colors. This red color increases towards Porto Seguro, the shore is more high and steep, and the cow-tree is more numerous amongst the trees which cover the land. In going along the coast you will pass in succession the bars of Gramminnan, of Josium, of Frade, the small bay of Trancoso, and the church of Mossa, in Senhorada Judea, distant only 2 miles from Porto Seguro; the walls of that church being perfectly white, it is perceived among the trees at some distance. There is a small river that empties into the harbor of Porto Seguro; on the bar there are 18 feet at high-water, and only 11 inside; moreover, there are many banks extending very far; taking the whole together, Porto Seguro is not a good place for vessels of small size, and of no use for large ones.

From Porto Seguro to Rio Grande is 12 leagues; the coast runs N. 14° E., very woody; sandy banks and shallow water are to be found at 3 miles distance.

From Belmonte to Fort St. George dos Ilheos is 20 leagues, steep shore and equally woody; depth of water from 7 to 20 fathoms; and at 5 miles distance, muddy bottom and broken madrepore. At half the distance from Belmonte to Fort St. George, you will see the Seras de Itaraca, a group of mountains on which terminates the flat country beginning after Mount Pascal; the Southern mountain is named Commandatuba.

From Fort St. George, up the two Castelbanos Ends, 19 leagues distance, the coast is perfectly safe; the largest ships may approach it within 2 miles.

The Dos Castellhanos Ends belong to a high land joining to Ponta de Muta, at the extremity of which stands the small island of Quipe. The Muta Point and the island of Quipe form a kind of basin, into which empties the small river Acaacui. The breakers which obstruct the bay do not permit vessels to go into it.

Beginning at this place the coast seems divided into two, and appears like two islands. This appearance is produced by the low land existing between the two hilly parts, and remains the same until you arrive at Cape or Morro San Paulo.

Morro San Paulo, from the East end of the bar of Uha's River, may be easily distinguished, though not very high; there are on its top two separate groups of cow-trees. When near it, the green verdant color of its top seems spotted on the Northern side with large white stains, which, in fine weather, may be seen 54 miles. Two miles East of Morro San Paulo there are 17 fathoms, muddy bottom. North of San Paulo the coast is low, sandy, and a reef of rocks runs along within a short distance of it. This coast appears at first connected with the island of Tamarica; but the fall on this island is higher; the space between the Western side of Itaporica Island and the main-land forms what is called the false entrance of Bahia. This channel is very crooked, narrow, and difficult.

A vessel may steer direct from Morro San Paulo to Cape St. Antonio; but if the wind blows strong towards the land, it is better to keep a little more to the N.W., until the Eastern point of Tamarica Island stands North of you.

Description of the Mountains and other objects which show your approach to Rio Janeiro

At the Eastern end of the bench of Maranhaya stands the large point of Guaratiba, where begin the high mountains which surround the bay of Rio Janeiro. From this point, in clear weather, the Island Redonda (Round Island) can be seen, 8 leagues distant. It stands at the entrance of the bay of Rio Janeiro, and is distinguished by its round shape, and the green and white color of its shores. From the same point is seen the mountain called Gabia, or Main-top, which by its peculiar shape cannot be confounded with any other. When near Round Island, there is no difficulty in reaching Rio Janeiro. It is necessary to reach it before night-time, and for that to wait for the sea-breeze, which generally begins at 12 or 1 o'clock.

Some say that it is better to make the land near Cape Frio, when bound for Rio Janeiro; this may do for vessels coming from the North or East, but in every other instance it will be wasting time.

When coming from the E.S.E. up to the S.W., the tops of the mountains resemble a man lying on his back, in a direction W.S.W. and E. N.E., the Main-top seeming to form the head, and Sugar-loaf the extremities of the feet.

The Main-top Mount is flat on its top, and seems not so large at its base as at its top, from whence it derives its name. Eight miles distant from the mountain lies the Paofasucar (Sugar-loaf) Mount, a large rock, not so high, so distinct, or so near the shore, as the Main-top Mount. Its shape is very conical, and it appears above all the other mountains of a like shape around it, and seems to incline a little towards the N.W.

It is very prudent to keep at some distance from the shore, between Rio Janeiro and Cape Frio, because the sea-breeze blows towards the shore, and the waves generate a current, having the same tendency, particularly when it blows from S.W., and in case of a sudden storm there will be some danger in the anchorage.

It is prudent not to approach too near the islands which stand at the entrance of the bay of Rio Janeiro, except in case you are certain to reach the harbor during the daytime; for if engaged amongst them you may be dangerously situated, in case of a squall of wind: if not enabled to reach the harbor in daylight, it is better to put to sea again.

Rio Janeiro. RIO JANEIRO.—To enter the harbor of Rio Janeiro, pass between the Island Rasa, (Bare Island,) on which there is a revolving light 150 feet high, and showing a bright and red light alternately, and the Islands of Para, (Father and Mother,) the first one nearly 7 miles from the Sugar-loaf, the two last 5½ miles N. 41° E. of Bare Island. They have bold shores, and may be approached very near; and even if necessary a vessel can pass between them and the shore. The depth of water between these islands is from 13 to 23 fathoms. Standing one mile abreast of Bare Island, you must perceive the Western end of the most Western Island (Paya) N. 47° E. from this point. Steer 7½ miles N. 5° E., until 800 yards West of the fortress of Santa Cruz, on which is a fixed light, at the Eastern extremity of the entrance. On that course you will pass on your port hand several small rocks and small islands, which lie between the Round Island and the land on the Main-top Mount side, and you will pass at one half mile distance the small island Toncinho. (Ham Island,) which is not far distant from the Sugar-loaf Mount. There is no danger. You have only to keep at a proper distance from the rocks which are visible. The least depth of water is 7 fathoms at the entrance; but when in the harbor it increases very fast, and at a few yards from the Santa Cruz Battery there are over 12 and 16 fathoms.

Light.

The passage between Fort Santa Cruz and Fort Lage is the only one used in passing—the one formed by San Joao Point is never used; not on account of deficiency of water, but because it is narrower, more crooked, the bottom rocky.

When 600 yards West from Fort Santa Cruz, the course to the best anchorage is N. 35° W., until you arrive E.N.E. of Fort Villegagnon, which you may pass at 600 yards distance. Then steer towards the Island dos Ratos, (Rat Island,) and, being in sight of the city, you may choose your anchorage in from 10 to 20 fathoms.

If you draw a line from the flag of Fort Villegagnon to the Cobras (Snake) Island, that line will separate the anchorage for vessels-of-war from that of the merchant-vessels. The best for vessels-of-war is towards the E.N.E. of the palace, and South of a line drawn from Rat Island to the main church in the city, and the best for the merchant-vessels is near the city. The largest reach that place by passing North of Snake Island, and they are separated from the vessels-of-war by a bank, or shallow water, where boats only can pass, and over which the sea is constantly breaking at low-water.

The sea and land breezes are regular, and each lasts one half of the day. The land breeze begins in the evening, continues during the night, and stops at 9 or 10 in the morning; a calm of one hour generally succeeds it, and at about 11 the sea-breeze commences.

Vessels going to sea will follow the course opposite to that pursued when going in. It is best to take your departure in the morning, in order to take advantage of the land-breeze, which, lasting three or four hours during daylight, enables you to clear all the small islands and reach the open sea. Vessels used sometimes to go at some distance from the city the day previous to their departure, in order to have a better chance of getting to sea the day after, with the land-breeze. In case the breeze should subside, it would be better to anchor.

Description of the Coast between the Island of St. Catharina and the Bay of Rio Janeiro.

Volage Bank

VOLAGE BANK, on the coast of Brazil, lat. 26° 44' S., long. 48° 15' W. Soundings 12½ to 14 fathoms.

His Majesty's ship Volage, on her way to St. Catharine's on the coast of Brazil, in September, 1832, struck soundings in 14 fathoms, mud. From thence, while the ship

was sailing 2 miles West by South, bottom was found with 14 to 12½ fathoms; after which, on steering W. and W.S.W., the water deepened suddenly to 23 and 29 fathoms; and these depths were preserved until the island of Arboredo, at the North end of St. Catharine's Island, was passed.

The above position of the shoal depends on that of Fort San Jose, which was considered to be in lat. 27° 26' 30" S., and long. 48° 39' W. The variation was found to be 7° Easterly.

FROM RIO JANEIRO TO THE RIVER PLATE.—On quitting Rio Janeiro, *From Rio* the shore bends W. by S. towards the great point of Guaratiba, where the range of *Janeiro to* mountains terminates which surrounds the bay of Rio Janeiro. From this point you *the River* may, in fine weather, clearly perceive Redonda, or Round Island, distant 8 leagues, *Plate.* which island is distinguished by its form, and the deep streaks of white and dark green which slope down on every side. You will also discern La Gabia at the distance of 6 leagues, bearing E.N.E., which is a remarkably formed mountain, as already described, and cannot well be confounded with any other, when coming from the Southward.

From the point of Guaratiba, a W.S.W. course will lead along the low land of Maranhaya, the Western point of which terminates in a little hill, called the Morro de Maranhaya, at the entrance of the bay of Ilha Grande. The Eastern point of Maranhaya Island, is separated from the land of Guaratiba by a small channel, which boats only can enter. This island extends 8 leagues E. and W. It is very low, and must be approached with great caution, especially when the weather is not clear. This circumspection is necessary on account of a rock, surrounded with shallow ground, which projects 3 miles to the Southward from the coast, about midway. By keeping about 4 miles from the coast at this part, you will have from 22 to 30 fathoms of water, with a bottom of sand and gravel.

BAY OF ILHA GRANDE.—The great bay of Ilha Grande has two entrances. *Bay of Ilha* The Western one is bounded by the point of Joatinga and the island of Grande; *Grande* the Eastern one by the same island and the promontory or low land of Maranhaya. The bay is calculated to receive the largest vessels. The pilots say "whole fleets may enter there, and find shelter from every wind. The soundings vary from 30 to 7 fathoms in the greatest part of the bay, and you may readily procure wood and water from many parts of the coast."

At the distance of 2 miles from the South part of Ilha Grande is the little island of Georgi Greco, which has a barren appearance, but supplies both wood and water. The largest vessels may find anchorage on its Northern side, and supplies procured at the little village of d'Angra dos Reos, which is there situated.

This bay is bounded on the N.E., and also on the S.W., by the main-land, comprehending a length of full 60 miles, and is studded with numerous islands and places of anchorage, having many villages on the Northern shore. The Eastern, or Maranhaya Channel, is 8 miles wide, and may be known by the single bold mountain about 700 feet high, which stands on the low point of Maranhaya. The sandy flat, or island of Maranhaya, is about 20 feet above the level of the sea. In most parts, especially near the middle of the island, it is quite barren; in others it is covered with various creeping plants. It exhibits on its summit a little brushwood, and at its Northern extremity some mangroves. Towards the sea it is steep, and the surf breaks with violence against it; but towards the bay it is level and smooth. This latter side abounds with shell-fish and sand-larks. The herbage shelters many armadillos, and there are numerous deer and other animals of chase. There is a church, and some few springs of good water.

The Island Grande, which bounds the Western side of the channel, is 14 or 15 miles in length, and lies in the centre between the two channels. The Western or Gairoso Channel, is 3 leagues wide, and both channels have deep water within them. On entering this passage there are said to be several small bays at the Western shore; and in entering the Eastern channel there are also the bays of Palmas, Albro, and Eschella, all situated on the Eastern side of the Isla Grande. Palmas Bay is reported to have good anchorage, inasmuch as a vessel may lie land-locked within it, and ride in 6 or 8 fathoms water. The other two are smaller, and have a depth of 5, 6, and 7 fathoms.

The Western channel between the Ilha Grande and Joatinga Point, may readily be known by a remarkable hill inland, called the Friar's Hood; this you should bring N. by E. ½ E., and steer towards it until you get within 2½ miles of the point. Keep at this distance from the island, in order to avoid the sunken rock about mid-channel. After passing Starling Point, you will see a low and barren island, lying about 1½ mile from Ilha Grande, having 9 and 10 fathoms close to it. You then discover Ter-ville Island, and also the town of Villa Grande; steer for the Island Terville, and you will have nowhere less than 6½ and 7 fathoms. Green Island lies so very close to Villa Grande, that, until you get close to it, it cannot be distinguished as an island.

You leave this on the starboard side, and Teryillo Island on the port, having 9 and 8 fathoms between them; keep close to Ilha Grande, until Gabia Grande is distinctly perceived; then steer towards it, and you will gradually deepen your water to 12 and 13 fathoms. Round close to the Island Gabia Grande, in 9, 10, and 11 fathoms, and then steer for the cluster of islands which lie round Jagenos's, or Jagenos Island, and come to in 11 fathoms, sandy ground; the extremes of the islands bearing S.E. and N.E. by E., distant 13 mile from the shore. There is a passage between the Islands Fortada and a small low, round, and well-wooded one, which lies nearly West, distant 2 miles from the former, in 16 and 17 fathoms water. This is a very safe passage with a leading wind; but due East from the woody island a dangerous reef runs off about the length of 3 cables, upon which are only 12 feet water; this, therefore, must always be carefully guarded against.

The best, most common, and by far the safest passage to Sapatiba, is by keeping the main-land on board, leaving the whole of the islands of Theurecu and Madeira on the port side, and those of Jagenos on the starboard; you will then have 10 and 9 fathoms of water, until you get abreast of Madeira; it then gradually shoalens towards the anchorage of Santa Cruz.

In sailing from hence, we kept the main-land on board, and when we were between the islands of Gabia Grande and Fortada, caught a Westerly wind. You may stand towards Gabia Grande into any depth you choose; but you must be cautious in approaching the shores of Marabuya. Run into no less than 10 fathoms to avoid the reefs on that side; you will have 15, 17, 10, and in two casts only 5 fathoms, and before you can get the ship round, you will be in 4 fathoms; with the above soundings, Gabia Grande bears N.N.W., and Point Marabuya S. by E. It appears by the water having shoaled gradually when standing towards the reef, from 15 to 10, 10 and 7 fathoms, that the Western edge of it lies with Point Marabuya S.E. 4 E., and Gabia Grande N.E. 1 N.

The Marabuya, or Eastern, Channel is upon the whole safe, and may be navigated, with common prudence, with very little danger. Should the winds be light when you get within Point Marabuya, and the flood or Easterly current is making, you should not bring Gabia Grande to the Northward of N.E. or N.E. 1 N., for the tides set strongly over Marabuya Reefs, and there are plenty of places for anchorage.

Point Joatinga, which is the Western point of the Gairaso Channel, has a small islet before it. This island lies in latitude $23^{\circ} 18' 30''$ S., and longitude $14^{\circ} 39'$ W. This point, with that of Cariocu, terminates the Southern part of the high land which forms the vast bay of Ilha Grande; both are very lofty and may be approached with safety by all kinds of vessels.

From Point Cariocu the land runs W. 23° S., about 9 leagues, towards the islands of Porcos: this group comprehends an island somewhat high, and is accompanied by three other smaller ones: one of these lies to the Southward, the others to the Eastward. The pilots assert that between this island and the continent there is a very fine channel, through which large vessels may pass, and anchor in perfect safety. You may, at many parts of the coast, procure wood and water, also cattle and other necessaries; but you should not attempt this passage without having the advantage of a fair wind.

Mr. Bruce says, "When I was near the shore about the island of Porcos, I took the following bearings of a very interesting cluster of islands; between the whole of which there appear to be good and safe passages, with excellent anchorages inside, sheltered from all winds. The island of Porcos bore S.W. 4 W., distant 12 miles; the first, or inshore island, about half a mile from the main, and situated abreast of a very fine sandy beach, N. by E., distant three-quarters of a mile; second island, N.E. by E., distant one mile; a rock, which is 10 feet above the level of the sea, E.N.E., distant 13 mile; and an island, which appeared to be $2\frac{1}{2}$ miles in length, and forming a sort of cape to this little bay, E. by S., distant 3 miles, with 6 smaller islets inside of it, running to the North-eastward in a semicircular form.

Mr. I. Engledue, of H.M. ship Bedford, observes, "The bay in Porcos Island shows a good roadshead, being sheltered from all winds, except those from the N.E. to the E. by N., which seldom continue long enough to occasion a sea of any consequence; it may, therefore, be considered the best and safest of any on this part of the coast. There is no regular tide, and the water does not rise or fall above one foot. Shark's Road also has good anchorage with all winds, except those from the Southward, which occasion a heavy tumbling sea, and render large vessels unsafe."

St. Sebastian's Island.

SAINTE SEBASTIAN'S ISLAND.—Point Pirasonungo, which is the South-eastern point of the island of St. Sebastian, bears from Redondo Island W.S.W. 1 S., distant 10 leagues, and from the Point Cariocu, S.W. 4 S., distant 19 miles. This point, according to Baron Ronnison, is in lat. $23^{\circ} 57' 32''$, and longitude $15^{\circ} 20' 15''$ W., but Lt. Heywood, in 1810, made it only in longitude $15^{\circ} 9' 30''$. It is about 4 leagues in diameter, and the mountains are as lofty as those upon the main-land, from

the port, having 9 and 8 fathoms. Grande is distinctly open your water to 12 and 10, and 11 fathoms, and 8, or Jagenos Island, and islands bearing S. E. and S. W. between the Islands lies nearly West, distant is a very safe passage in dangerous reef runs off water; this, therefore, must

ungo, which is the South- Redondo Island W. S. W. 1/2 S., distant 49 miles. This 2', and longitude 45 20' 15" de 45 9 30". It is about 4 those upon the main-land, from

which it is separated by a narrow channel. This island is visible 15 leagues off in clear weather: the shores are very steep, the South point projects sensibly, and the coast runs directly to the E. S. E. as far as the S. S. E. point of the island. The Eastern coast runs nearly in the direction of the meridian. The whole island is in the form of a triangle, and the coast opposite to the continent forms with it a strait, or channel, with deep bays, where you will find excellent anchorage on a bottom of mud, having from 25 to 8 fathoms.

Many islands or groups of islets, situated to the Northward of the island of St. Sebastian, contribute to shelter the vast basin which the island forms with the continent. The most contiguous is the island of Victoria. Six miles E. 28° N. of Victoria, are the three little islets of Buzios; and 11 miles N. 15° W. of these lie the Porcos Islands, already noticed. The passages between these islands have water sufficient for the largest vessels, like that between the island of St. Sebastian and the main; however, the passage between Victoria and St. Sebastian being contracted by a reef, which stretches 2 miles to the S. S. W. of the former, it is hazardous for large vessels.

THE STRAIT OF ST. SEBASTIAN, between the island and the continent, offers a safe and commodious port for the largest vessels; its general direction is N. 30° E., and S. 30° W., but this course cannot be followed exactly throughout the strait, on account of the banks which run out from the continent two-thirds of its length from North to South. Vessels coming from the Northward, and leaving a point situated half a mile from L'Armenio, which is built at the head of the North-west side of the island, should first proceed South 16° W., for about 5 miles, and then S. 45° W., until they get out of the strait. In this passage which is about 11 miles in length, the least water will be 10 fathoms, but more frequently from 15 to 20 fathoms, the ground being always mud. The greatest breadth between the island and the main is about 3 miles, and this is at the Northern entrance; but two-thirds of this space is occupied by the banks just mentioned, over which there are not above 3 fathoms water; so that you must range along the shore of St. Sebastian's Island, at the distance of 500 or 600 fathoms.

The Southern entrance is much narrower; nevertheless, all the natives assure you that the largest ships may navigate it, by only following the direction of the channel. You could not wish for a harbor more tranquil than this of St. Sebastian, for, environed by high land, the vessel rides on water which is as smooth as though it were in a basin.

You will find at St. Sebastian the advantages of a good supply of cattle, poultry, and other provisions customary to the countries situated within the tropics. You may obtain these very easily, and at moderate prices, either at the two principal establishments, or at the habitations of the natives. Fish are seldom very plentiful, but they are of a good quality.

There are a great many watering-places on the island of St. Sebastian; one of the best is situated at the N. W. point of the island, where water is good and easily obtained. Wood for fuel may also be had on all parts of the adjacent continent.

The winds of St. Sebastian follow, almost always, the direction of the strait, except at night, when the land-breezes blow alternately from many points, without following any regular law. During the day the winds generally come from the N. N. E. and the S. S. W., following the direction of the land; but are frequently interrupted by intervals of calm.

The currents follow the same directions as the winds, and their velocity is proportionate to the force of the latter; the most common in the straits is from 1/10 of a mile per hour, to 1/5 of a mile.

The tides have no regularity within the strait; nevertheless, we thought we could reckon that it is high-water, on the days of new and full moon, at 2 o'clock. The rise of the tide has been estimated at 4 feet.

The anchorage is situated in latitude 23° 17' 26" S., and in longitude 45° 27' W.; the variation 3° 25' E. We have observed that the land of St. Sebastian's Island, and that of the neighboring parts, is much elevated; the hills are covered with wood up to their summit, and have a most agreeable aspect. The coasts are steep, and you may anchor anywhere at a little distance from them, on a good bottom; and there is, in general, no danger but what appears above water.

About W. S. W. 1/2 W., 50 miles from the Southern entrance of the strait of St. Sebastian, is that of Santos. Between them you will perceive the deep bay which forms the coast, and also a number of islands near the shore, of which the Monte de Trigo, (Stack of Corn), is the most considerable. The Monte de Trigo is nearly conical, high, and woody to its very summit. At 2 or 3 miles from it, as well as at the same distance along the neighboring coast, you will find a good passage, with from 12 to 15 fathoms, on an excellent bottom of mud. Due East from this island, at about 14 miles distance, is a small rocky islet, called Toquetoque; it lies just off the Western entrance of the strait of St. Sebastian; and in coming out or going in, should always

Strait of St. Sebastian.

High-water.

be left to the Northward. Some small rocky islands also lie close to the shore, and to the N.E. of Monte de Trigo.

Les Alcatrazes.

LES ALCATRAZES.—The group of Alcatrazes is composed of several barren rocks above water, the largest of which may be seen 7 leagues off. Viewed from the E.S.E. it has the appearance which painters commonly give to the dolphin; whose head, joined to two little rocks, is turned to the W.S.W.; another rock, larger than the two latter, lies at the distance of 2 miles to the W.N.W., while 2 or 3 others are situated about a similar distance to the North-eastward. The pilots say the bottom is not safe in the parts adjacent to this group of rocks, and that it will be prudent not to approach them nearer than 4 or 5 miles, and that with a fair wind. This precaution may be rendered necessary by the vicinity of the strait and island of St. Sebastian, which cause the currents to be very considerable at this part. Vessels beating to windward from Santos may pass close to the Alcatrazes, which are steep to, and visible 10 or 12 leagues off in clear weather.

The summit of the principal island of the Alcatrazes is in latitude $24^{\circ} 6' 5''$ S., longitude $45^{\circ} 46' 32''$ W.; the variation is 5° E.

It will here be proper to mention a rock first seen by Manoel Madeiros, a Portuguese commander, who sounded round it at 100 fathoms' distance, and was unable to reach bottom. He described it as a round naked rock, sometimes above water, and often covered by the swell of the sea. The mariners of Brazil allow the existence of this danger, which is said to lie 35 leagues S. by E. from the S.E. point of St. Sebastian, and 72 leagues E. $29'$ N. from the N.E. point of St. Catharine's Island; or in lat. $25^{\circ} 41' 20''$ S., long. $44^{\circ} 59'$ W. of Greenwich.

$W. \frac{1}{4}$ N., distant 11 leagues from the Alcatrazes, is the island of Moela, upon which a light-house is erected, which shows a fixed light, 100 feet above the sea. The island is situated off the Eastern point of the harbor of Santos.

Light-house.

Santos.

SANTOS.—The port of Santos was formerly much frequented by Portuguese vessels. This port is formed by the continent and the Island St. Anuro, being only separated from the former by the little river Bertioaga. There are two entrances, but only that of the South is navigable by large vessels. The harbor of Santos will admit large ships, which may ride sheltered from all winds, except those from S.S.W. to S.E.

The point of Tavpu, which forms the Western point of the entrance, is in lat. $24^{\circ} 11''$ S., long. $46^{\circ} 30' 20''$ W. The point of Manduba is to the Eastward, and on the same parallel, about a mile to the South-eastward of which is the little island Moela, which may be approached without danger.

In steering for Santos from the Southward, you may pass close to the Island Redonda, bearing N.E. $\frac{1}{4}$ N., distant one mile; it is 2 miles long, and narrow, and lies about N. N.E. and S.S.W.; the highest part is to the S.W., which appears lofty and bluff, and with the above bearings, seems to be round. N.W. from this island is another, distant nearly 6 miles; this is small and quite round, being thickly wooded, and visible 20 miles off. After passing between these islands, you will see a rock 12 or 15 feet high, and a little larger than a line-of-battle ship's launch. The following are their bearings and estimated distances: small round Woody Island, S.W., 24 miles; and the Rock, N.E. $\frac{3}{4}$ N., about 6 miles; the Rock in one with Redonda, S. $\frac{1}{2}$ E.; Rock and Woody Island in one, S.W. by S.

In advancing into the River Santos you will have 10, 9, 8, and 7 fathoms water, until you near the bar, upon which there are 44 and 5 fathoms; the entrance is narrow, but the starboard side is much the boldest, and has 19 fathoms water close to the shore. After passing the first Barra Grande, the water deepens to 15 and 16 fathoms within 12 fathoms of the shore. Keep the starboard land close on board until you get abreast of a few huts; then steer mid-channel, keeping gradually on towards the highest, or Northernmost hill, there being two on the Westernmost bank of the river, and these are the only ones, therefore you cannot be mistaken. Steer from the huts before mentioned, towards these two hills. The reach is shallow, with not more than 3 fathoms on it; the starboard side is the shallowest; keep close to the hills, and your water will deepen to 6 fathoms; but having passed the hills, you may again run toward the starboard shore, and when you have passed about 2 cables' length, steer for the fort on the starboard bank of the river. This is erected upon a perpendicular rock close to which are 20 fathoms water; and when you arrive abreast of this fort, you will see the town of Santos nearly open of the point on the port side. Steer toward it, keeping about 2 or 3 cables' length from the shore, and you will then avoid the shoal which runs from it, and be perfectly clear also of the bank, which runs off the fort in the direction of the town, on the starboard hand; and when almost up with the town, you can anchor. The best anchorage will be abreast nearly of the centre of the town, in 7 fathoms, on a bottom of mud. Provisions are abundant, and good water may be obtained by sending a boat about 7 or 8 miles further up the river.

lie close to the shore, and

will see a 2 cables' length, steer for the
entrance upon a perpendicular rock
arrange abreast of this fort, you
to the port side. Steer toward
the fort, and you will then avoid the
entrance of the bank, which runs off the
entrance nearly of the centre of the
entrance are abundant, and good water
further up the river.

To enter this port, a pilot is not absolutely necessary; for the above directions, if well attended to, will be fully sufficient to carry you in, clear of every danger. When you get abreast of the town, you will observe the high land opposite, on the Northern side of the river. You may pull towards this, and round Curvallo Point, pretty close by which you will open the Lago de St. Rita. This lake is about 4 miles in circumference. Steer right up it for the distance of a quarter of a mile, and stretch directly over for a low round island, thickly covered with brushwood: and when you get near to this, you will perceive another island, somewhat similar in appearance. Keep nearer to the first island, and pass between them; when you will open the entrance of the river, and also will observe another branch or opening on the starboard side. Keep the port shore on board, and pull up about 3 or 4 miles. You will then find the water fresher. A boat may with ease make two trips a day; but as the atmosphere is hot and sultry, all boats should endeavor to get on board before half after 3 o'clock; for at this time it commonly begins to rain, and continues to do so until 10 at night. Wood is in abundance.

The Lago, or Rock of Santos, lies $16\frac{1}{2}$ miles S. 14° E. from the island of Moela: it is a smooth white stone, elevated about 6 or 8 feet above the surface of the sea; it lies in latitude $24^{\circ} 18'$ S., and in longitude $46^{\circ} 17'$ W. Midway between this danger and the port of Santos, there are 19 and 20 fathoms, with a bottom of sand and mud, which is the usual quality of the ground hereabout.

Leaving the port of Santos, the coast runs S.W. towards the village of Conceicao, a distance of 8 leagues. The land is generally low at the water's edge, but high in the interior; for a chain of mountains runs along 4 or 5 leagues inland, and the shore is intersected and broken by several rivulets, which, in sailing along at a distance, give to it the appearance of islands. This chain of mountains is broken by the harbor of Santos, but continues to run E. by N. as far as the harbor of Sebastian.

The village of Conceicao is situated on a little mountain near the shore, 4 miles off, where you may anchor in 10 or 12 fathoms water. To the S.W. of Point Tappu, distant 20 miles, is an isolated rock, elevated about 10 or 12 feet above the surface of the sea, which the Portuguese call Lago de Conceicao, at a pistol-shot from which are from 12 to 14 fathoms, sand and mud. Off this part you may distinctly perceive the port of Santos. This rock lies 7 miles E. 31° S. from the village of Conceicao, and 15 miles N. 4° W. from Queimada Grande.

The islands of Queimada are two masses of rocks, nearly barren, and distant from each other 10 miles, in a S.E. and N.W. direction: the largest, which is furthest to the S.E., and may be seen 7 or 8 leagues off, has a little rock lying to the Northward of it; you may, without danger, go between the two Queimadas, or pass between them and the land.

In sailing along the shore to the South-westward, you will recognize successively the river and hill of Piruibe, the two isles of Queimada, the isles of Guarahu, the Barra de Unha, the Point da Jurca, and the River Iguaque. At the distance of from 3 to 10 miles off the land, you will have a depth of from 8 to 15 fathoms. The coast near the shore becomes rather high, and runs S. 50° W., and the soundings of the increase in proportion to the elevation of the adjacent coast.

IGUAQUE AND CANANEA.—The coast from the entrance of the River Iguaque to the River Cananea, is called the Playa de Iguaque: it is a low sandy flat, except about the middle, and cannot be seen unless you are a very little distance off: therefore, in sailing along it, you ought never to come nearer the land than 2 leagues; nor into less than 10 or 12 fathoms water, with a bottom of sand. It is separated from the continent by a lake, or natural canal, which communicates with the bar of Cananea, and is called by the Portuguese, Mar Pequena, or the little sea. This lake has depth sufficient for large vessels, but the bar of Iguaque will only admit of boats. You must not confound this opening with the bar of the River Iguaque, which is situated 3 leagues further to the North-eastward, in lat. $24^{\circ} 35'$ S.

You may anchor all along this coast at the distance of 2 or 3 miles off the Playa, on excellent muddy ground, with from 6 to 10 fathoms water: but there are no ports on this coast accessible to large ships, and there can be no necessity to anchor here, unless in a calm, when you have no occasion to expose yourself to danger.

After passing along the Playa de Iguaque, you will arrive at the bar of Cananea, and at the island of Bom Abrigo, which lies to the Southward of the bar of Cananea, within which the Brazilians construct their large vessels; and the natives say that to enter the river "you may pass with a pilot to the Southward of the island of Bom Abrigo; but the common channel is to the Northward, although it is encumbered with many shoals." The Island Bom Abrigo is very high, and covered with trees; vessels may anchor at a little distance off to the Eastward. There is a small island lying to the Southward of it, about 2 miles to the Eastward from which there are 11 and 12 fathoms of water, on a bottom of sand.

*Iguaque and
Cananea.*

The bar of Cananea may be known from seaward by two objects, both equally conspicuous: one is the mountain of Carдоз, situated inland, about 5 leagues W.N.W. from Bom Ambrigo; the other is the Playa de Iguaque, or flat, consisting of little downs of white sand, interspersed with brushwood, which extends all the way from the bar of Iguaque, a distance of 10 leagues. Notwithstanding the short distance, and the height of the chain of mountains, of which Mount Carдоз constitutes a part and predominates so remarkably, the fogs that prevail throughout this part of the coast in the South monsoon will prevent your discovering the land, and large vessels should therefore approach the low coast with the greatest precaution. Mount Carдоз is the highest mountain upon this part, and is situated in lat. $21^{\circ} 54' 45''$ S., and in long. $4^{\circ} 42' 26''$ W. The variation, 6 leagues off the land, is 7° E.

Pimentel, in describing this part, proceeds thus:—"From the Barra de Iguaque to the Barra de Cananea the distance is about 30 miles, the shores being low and flat. Opposite to the entrance to the latter, lies the island of Abrigo, dividing it into two channels, both of which are dangerous, on account of the breakers and shoals thereabout. The Northern entrance, called Barra Falsa, is narrow and shallow. Corvettes and small boats only enter there. The Southern entrance is wider and deeper, and in this channel ships of burden find a passage. Sail in towards the Southern shore, keeping close in 3 and 4 fathoms water; but observe the bar is shifting, and consequently dangerous to all strangers. The bar is about a mile in breadth. When you are within, you will deepen your water to 5, 6, and 7 fathoms, and may anchor as most convenient for your purpose.

"From Cananea Southward, you will fall in with a small island, called Castillo. This is nearly opposite to the River Arrepirá, which is not navigable. Further on is Figuera, another small island; and, coasting along, you will reach the Barra de Superaguí, admitting canoes only. This creek is divided from the main entrance to the bay of Paranaguá by the island of Peers, nearly a mile from the Southern part of which are some rocks. These rocks form the Northern boundary of the channel, while the island do Mel lies to the South. The passage between is near a mile in width. A league off at sea are only 3, 4, and 5 fathoms; but as you approach the bar, it deepens to 5, 6, 7, and 8 fathoms; in the channel are 4 and 5 fathoms; and when within you will have 5, 6, and 7 fathoms. There is another entrance to the Southward of Mel Island, called Barra do Sul; but, like the Barra do Superaguí, it is fit only for boats. The course to Paranaguá town and the Villa Antonina is due West. The former is on the port side, almost 4 leagues from the bar, while the latter is rather to the Northward, and about 6 leagues up the river. There are several islands scattered about, but the channel is generally clear, and every known danger is visible."

In following the land to the South-westward of Bom Abrigo, to the distance of 10 miles, you will meet the little island Castillo; and $8\frac{1}{2}$ miles beyond that, in the same direction, the Island of Figo, or Figuera. The former is somewhat less elevated than the latter, but broader, and has a ridge rising up in the middle, which may be mistaken for a castle—the latter resembles a fig. They are both nearly barren, and bear from each other S. 35° W., and N. 35° E. In drawing near to them, you will have, at the distance of one mile, from 15 to 10 fathoms, fine sandy ground.

Paranaguá. PARANAGUÁ.—Having passed to the Southward of Figuera, about 8 or 9 miles, you will open the bay of Paranaguá. This is a bay of 3 or 4 leagues diameter, receiving many brooks and little rivers; the entrance is sheltered, and at the same time divided into two channels by a low island, upon which are many little hills, appearing when seen at a distance, like several islands. This island, named Isle do Mel, has, on its North-eastern side, three little islets, Das Palmas. The Southern entrance is encumbered with breakers, and not navigable. The Northern channel will admit of brigs, and many are built in the bay, which is surrounded by forests. In navigating the Northern passage, the pilots say you ought to leave the islands of Palma to the starboard: these you will recognize by the palm-trees with which they are covered, but a pilot must always be employed for the interior navigation.

The water which runs out of the bay of Paranaguá constantly carries with it the alluvial soil of the country, which sensibly is diminishing its depth, but there is otherwise nothing material to obstruct its navigation; and 2 leagues from the two entrances there are from 5 to 9 fathoms water, the bottom being gray sand and mud. The coast from hence to the island of St. Catharine, generally speaking, runs South.

The summit of the Southern hills on the island of Mel is in lat. $25^{\circ} 32' 13''$ S., and in long. $48^{\circ} 25' 40''$ W. The variation is $6^{\circ} 1'$ E.

Guaratuba. GUARATUBA.—S.S.W. from the Barra do Sul de Paranaguá is the point of João Diaz, the Eastern point of the entrance of Rio San Francisco; 16 miles N. by W. from which is the entrance to the River Guaratuba, from the Northern point of which a shoal runs up the Barra do Sul; this shoal extends 4 or 5 miles from the shore, and is bounded to the Eastward by the little islets of coral, and by two great

n Francisco; 16 miles N. by
from the Northern point of
xtends 4 or 5 miles from the
ets of coral, and by two great

rocks, 20 feet high, called the Itacelomis. The shoal is not navigable except by boats; but you may approach the rocks. Eastward to the distance of one or two miles, where you will have from 10 to 12 fathoms water, sand and mud.

This river is remarkably rapid, and famed for its fisheries. Whoever runs for the harbor from the Northward, should keep close to the land, make for the point of the rock above mentioned, and, when about to enter, keep the small flat island astern; this island lies about 1½ mile to sea, and your anchorage will be immediately behind the hill to the Northward, or opposite to the hill on the South side. This river is supplied by several others, of which Rio St. Joao is the most considerable, and is said to be navigable for upwards of 12 leagues.

RIO SAN FRANCISCO.—About 16 miles South from Guaratuba is the North-
Rio San Francisco.
ern entrance to the Rio San Francisco, capable of accommodating any vessel, and having from 6 to 13 fathoms in its channel. To sail in, it is advisable to coast up the land which lies to the Southward, in 6, 7, and 8 fathoms; and when you arrive at the headland where this coast ends, you should make for the Northern point, taking care to avoid a bank running to the N.E., which is shoal, having not more than one fathom at low-water; and as soon as this North point comes abreast, stand S. by W. for the town, or for the church of St. Joze, built on an eminence, opposite to which you may anchor in clear ground. This entrance may be known by the high woody land of San Francisco, which terminates at the hill; and also by the three islets lying 2 or 3 miles to the Westward of this hill. The other entrance to the river, called the Aracary, is 6 leagues to the Southward, and fit only for canoes; but opposite are some islands with anchorage and shelter from the sea, in 4 and 5 fathoms water, on a bottom of whitish sand.

The islands of Garcia lie on the parallel of the point of Jono Diaz, which forms the Eastern extremity of the bay of San Francisco, and are situated about 2½ miles from the point. Fourteen miles to the Southward of this group are the Tamboretos islands, from abreast of which the coast turns more to the Westward, so far as the River Aracary; near the bar, or entrance of which, is another group, called the Remedios; all these islands lie at the distance of 2, 3, or 4 miles from the coast, and are said to have passages between them. The islands are covered with trees; but between the Remedios and the mouth of the River Aracary, the passage is said to admit of small vessels only, and is not to be depended on.

The River Aracary, after running a considerable way up, and separating the island of San Francisco from the main, turns N.E. Easterly, and runs into the sea at a spacious bay of the same name, where you may anchor in several places. At 2 leagues from the shore, N.N.E. from the entrance of Rio San Francisco, you will not find more than 6 fathoms water, on a bottom of fine sand. The coast is flat, the land adjacent but little elevated, but interspersed with desolate spots, which are rather remarkable. A few leagues in the interior are the Sierras of Maratuba, a chain of very high mountains.

Directly South of the Remedios Islands, distant 6 leagues, is Point Itapacoroia, the Eastern extremity of a bay, rather deep and sheltered by the winds from the South and West; here are an armacao, or oil-house, and two little rocky islands, near which you may anchor in sufficient depth of water. At the bottom of this bay the land runs N. 4 E., so far as the Islands Garcia, where you may see another armacao, the whole distance being 13 leagues.

S.S.E., 7½ leagues from Point Itapacoroia is the point of Bombas, and between them are the points of Cambecudo, Camborin, Ytapeba, and Garopas, forming several bays. You may safely sail along these points at the distance of 2 or 3 miles. The entrance to Garopas Bay is 8 or 9 miles broad, and well sheltered from all winds, with depth of water enough for any ship. Two rivers discharge themselves into it over beds of white rocks, and the surrounding land is covered with thick woods. To the Southward is Point Manduri, from whence you proceed on Southerly to the island of St. Catharine.

THE ISLAND OF ST. CATHARINE is situated at a little distance from the *Island of* continent, upon the parallel of 28° S.; it is visible 15 leagues off, in fine weather. *St. Catha-*
At the above distance you will find 70 fathoms; thence the depth diminishes gradu-
ally to within 4 cables' length of the coast, where there are 4 fathoms. *-rine.*

In approaching from the Eastward, this island appears very uneven, being inter-
sected with mountains and deep valleys: its elevation is greater at the Southward
than at the Northward. Across it the mountains on the continent are a little more
elevated than those on the island; and you will distinguish among these principally
the Morro de Camborella, which is a branch of the Eastern Cordilleras, which extend
from Rio Janeiro to this island.

About the middle of the island, and near the edge of the sea, is a large lake which
presents an opening that may serve to distinguish it as a landfall. At 3 leagues from
the Eastern coast, if you bring this opening to bear West, the N.E. point of the isl-

and will be about 3 leagues to the N.W. All the Eastern side of this island is safe, and rather steep to, and you may run alongside many large rocks on the coast without danger.

The island of St. Catharine may be entirely circumnavigated, and many anchorages will be found between the Western coast and the continent; but the Northern part of the channel is the only one fitted to receive vessels which draw much water, and it is to this part we shall limit our description.

*North
Channel*

To enter by the North Channel into the Gulf or Bay of St. Catharine's.—The passage most frequented, leading to the anchorage, is between the North point of St. Catharine's and the Arvoredo, a woody island situated N.N.E. from the Northern point, called Point Rapa. This passage is rather less than 2 leagues in extent, and does not contain any danger. You may approach it on either side, observing only to keep clear of the Moleques, which you will leave to the Southward: these are large rocks, and lie near the shore. All the points which surround this passage you may sail close to, and beat up to them without the least risk or danger. There are 26 feet water at 600 fathoms distance from the N.W. coast of St. Catharine's, which is the deepest water in this part of the channel.

*Anchorage
for large
vessels*

When you are within the bay, you may anchor anywhere, agreeably to the size of your vessel; by keeping in the middle of the channel, the depth will be sufficient for the largest ships, to 1000 fathoms S. by E. of the little island Anhatomirim. Having passed this point, in advancing to the Southward, the depth gradually decreases; and S. of the Raton Islands there are not more than 10 or 12 feet water. There is little more depth West of these islands, in the large bay, called by the natives Saeco Grande: it is a quiet place to ride in, and principally frequented by vessels in the whale fisheries; but ships drawing any great quantity of water could not have access to it.

There is plenty of water in all the anchorages in the bay of St. Catharine's. In that which vessels of war most commonly frequent, you will have the following bearings:—North point of St. Catharine's, N. 69° 30' E.; middle of the Port of Santa Cruz, S. 63° 30' W.; the Fortress St. Joseph, S. 55° 30' E.; and the point of the Armaenco, on the continent, N. 16° 50' E.

The depth of the above anchorage is 30 feet; and the bottom is mud, of a greenish cast, and holds well.

Here you enjoy almost always a perfectly tranquil sea, under shelter of the highlands with which it is surrounded, the only exposed part being to the N. Eastward; but the winds from this part are seldom dangerous.

Many places for obtaining water are in the vicinity of this anchorage: the best is about 2 miles North of the Island Anhatomirim, upon the continent, which is supplied day and night with excellent water, of which you can obtain an ample quantity. You may get permission, at a cheap rate, to take fire-wood, either on the continent or on one of the isles of Raton, and also for repairing your vessel, if needful. In short, the principal town of the island, and the habitations near this anchorage, furnish at moderate prices, all kinds of supplies, &c., which the country produces. The provisions consist of bullocks, pigs, fowls, maize, rice, spirits, farina, dried meats, sugar, coffee, all tropical fruits, &c. The island of St. Catharine's is, therefore, one of the best ports at which a vessel can be supplied with necessaries.

The anchorages of this island are sometimes plentifully supplied with fish. Most of the shores are covered with the bones of whales, which it is difficult to avoid in hauling the seine.

When you provide yourself with fire-wood from the country, it is better to prefer the young trees; for the old trunks are commonly hollow and filled with insects and the eggs of reptiles, which are very often venomous, and might be highly dangerous on board your vessel. It will, therefore, always be prudent to throw the wood into the sea before you take it on board.

The winds most frequent in the gulf of St. Catharine's follow the direction of the channel, whether inwards or outwards, but these are seldom violent; and the storms are not dangerous to vessels well moored.

From March to September—that is, during the time called winter, or the Southern monsoon—the winds in the neighborhood of the islands blow generally from the S. or S.S.W. Sometimes they come on with very great violence, and are accompanied with rain; but these gales seldom last more than 18 hours. Towards the month of October, the winds approach towards the E. and N.; the six following months form the summer, and are the hottest throughout the year. There are frequently storms, which come from the N. and S.E. round by the West; and if in this season the winds blow from the S.E., they are accompanied with considerable rain; but in general, the greatest quantity of rain falls during the months of August and September. The tides are regular at the anchorage: and it may be remarked, that as they flow into the North and South entrances of the strait at the same time, meeting at the

anchorage near the town, they turn in a similar manner, with more or less velocity, according as they are accelerated or retarded by the prevailing winds.

The common rapidity of the current seldom exceeds three-tenths of a mile an hour at half-tide, and the rise of the water does not in general exceed 3 feet; but at the springs the currents run sometimes $1\frac{1}{2}$ mile per hour, and then the water rises 6 feet. It is high-water at the above anchorage at 40 minutes after 2, full and change.

The position of the flagstaff of Fort Santa Cruz, on the island of Anhatomirim is $27^{\circ} 25' 32''$ S., and the longitude $48^{\circ} 41'$ W. Point Rapa, the North point of St. Catharine's, is in lat. $27^{\circ} 22' 31''$ S., and in long. $48^{\circ} 32' 7''$ W. The variation at the anchorage is $7^{\circ} 29' 26''$ E.

The island of St. Catharine's may be made indifferently upon all parts of the island, and it rarely happens that either the winds or the currents are strong enough to occasion any difficulty in correcting your route; however, you ought to prefer making the Southern part of the island in the South monsoon, and the Northern part in the contrary monsoon.

Many little isles are visible to the Northward of St. Catharine's: the largest of these is Arvoredo, which has been already described. Its distance from Points Ganzos and Zombo on the continent, and from the Isle Pedra de Galle, is nearly the same as from the Point Rapa in St. Catharine's; and you may pass through, in great safety, all the channels formed between these islands and the continent. The depth varies from 21 to 12 fathoms, on a bottom of mud and gray sand; you have only to avoid the rocks and breakers of San Pedro, situated rather less than 3000 fathoms (about 3 miles) W.N.W from Arvoredo.

Directly to the Northward of the entrance to the harbor of St. Catharine's is the bay of Tijoucas, where there is good anchorage. Three leagues to the Eastward of all the islands, the depths are from 27 to 31 fathoms.

There are no particular dangers in going to the anchorage of Santa Cruz; and in entering you will carry regular soundings, 13, 12, and 9 fathoms, gradually shoaling towards St. Catharine's Island until you get abreast of Papagaios Island. It then shoals abruptly from $7\frac{1}{2}$ to 5 and $4\frac{1}{2}$ fathoms. The best leading-mark for a large ship to enter, when she is abreast of the above islands, is to haul over to the Westward until Great and Little Raion Islands are in one; then steer for them until you are nearly abreast, or a mile from Santa Cruz, when you may haul over to the Eastward, until you get the Southernmost Raion Island, which is the smaller of the two, open of the great island. Keep it just open, and you may anchor within a mile of them in 6 or 7 fathoms, good holding ground and well-sheltered. In working out from this anchorage, when you are standing to the Westward, do not stand into less than 5 fathoms, for there is a bank of 1 fathoms on its Eastern edge, and only $3\frac{1}{2}$ and 3 fathoms on its inner part. It lies rather less than 2 miles to the Southward of Santa Cruz. Standing to the Eastward, you may bring the island of Arvoredo on with Point Groca, (St. Jose,) and when you get nearly as far as the points of Groca and Santa Cruz, you may stand into any depth you please. There is good anchorage under Santa Cruz, where ships commonly touch for water; but the best anchorage is with the small island Ratonas just open to the Eastward of the larger one, in 54 fathoms. The deeper water will be found on the Eastern side; but when off Santa Cruz, the Western side will be the holdest. There is but a scanty supply of water inside of Santa Cruz, which comes from a small rivulet close to the beach. Here you may fill your casks in the boat, by bailing with buckets; but this supply in dry weather sometimes fails. Wood may be either cut or purchased.

The island of Santa Catharina is of such height as to be discovered in fine weather from 15 miles distant, at which distance there are 70 fathoms water, diminishing gradually towards the shore. Nearing it from the East, it appears with high mountains and deep valleys. Taking the whole together, the Southern part appears higher than the Northern side. The Morro Camborello is a mountain which appears above every other. Vessels may go round this island with safety. The channel between the main-land affords good anchorage, but the best place to cast anchor is on the Northern part.

Santa Catharina affords the best place to refit a vessel. There is an inexhaustible quantity of good water, to be got without any expense; fuel and provisions of every kind at a cheap rate—such as beef, pork, poultry, corn, sugar, ried beef, arrack, &c., &c. It is then the most convenient place for a ship to stop, in case of want, and for repairs. When taking on board wood for fuel, it is necessary to take young branches only, and even to let them float in the sea-water, in order to destroy the numerous worms, as their eggs are very dangerous on board of a ship.

The coast North of Santa Catharina is everywhere very high. Woody mountains and deep valleys are to be discovered all round. From Santa Catharina to the bay of San Francisco, you meet several small islands and rocks, and the last are the small

High-water.

Garcia Islands, 2 miles distant from Joao Diaz Point, which point forms the Eastern extremity of the River San Francisco. San Francisco River is not very deep. Its mouth is turned N.N.E., and empties in a large bay, in which you may anchor any where. The shore of this bay is flat, the surrounding land not very high, but from place to place small hillocks are to be seen, which render that place remarkable, particularly by the chain of very high mountains to be seen nearly at 9 miles in the interior. The island of San Sebastian is to be seen 45 miles distant. The shores are very bold. The whole island taken together seems of a triangular shape. The channel affords good anchorage, but is not to be followed in a straight line from end to end. Banks connected with the main-land exist nearly two-thirds of the whole extent, in the direction of N. to S., and consequently, when coming from the North, and starting from a point situated one-half mile from the armacao, or oil house, which is constructed at the head of the island, it is necessary to steer first 5 miles S. 16° W., and from thence S. 45° W., until you are out. This route is nearly 11 miles, and the depth of water from 10 to 20 fathoms. The greatest distance between the opposite lands is nearly 3 miles, but two-thirds of that space is not safe for navigating. Go no nearer the shore of Sebastian Island than from ten to twelve hundred yards. The Southern entrance is more narrow. The natives say that very large ships may pass through. San Sebastian Harbor is one of the safest in the world, and offers the same facilities as Santa Catharina for provision of any kind.

St. Catharine to Cape St. Martha Grande. FROM THE NORTH POINT OF ST. CATHARINE TO CAPE ST. MARTHA GRANDE.—The land of the isle of St. Catharine, and the neighboring continent to Cape St. Martha Grande, is very high and woody. The highest mountains perceived from this island are of the Cubatao chain, covered with clouds when the winds from the South prevail, and clear in N.E. winds. At sea, with a clear horizon, the coasts can be easily perceived at 12 leagues distance. The soundings are from 70 to 80 fathoms, muddy bottom. In approaching the coast, the soundings diminish gradually. At 3 leagues distant the soundings are still from 37 to 40 fathoms, and 20 to 30 at 4 miles distant.

The whole coast is safe, and may be coasted at 3 or 4 miles off, passing between the Irmaos Islands and Moleques do Sul, in 17 fathoms water. The only dangers to be avoided are the islands and islets, which can be perceived at 3 leagues off, and round which there are 15 fathoms water.

The usual anchorages are at Isle de Campexe, Point Pinheira, and La Laguna.

The two first form shelters from Southerly winds; the third is only practicable for small vessels, drawing at the most from 7 to 8 feet of water, by reason of a bar at the entrance of the Lagune, near the borders of the lake where the city of Laguna is built.

The island of St. Catharine is about 9 leagues long, and its greatest width does not exceed 10 miles. It forms, with the continent, a strait in which vessels find excellent anchorages.

The points to distinguish the entrances into the strait are the following:

The North entrance.

THE NORTH ENTRANCE.—The island of Arvoredo, which rises in the form of a sugar-loaf, with two summits, (seen at a distance.)

The islet Budejo, which is in the form of a tiller, and without vegetation.

The South entrance.

THE SOUTH ENTRANCE.—The islet of the Great Moleque do Sul, which resembles a steep bench when seen from the S.E., and for this reason is perfectly delineated on the coast, which is woody.

The Isle Coral stretching from North to South, and round when perceived in this direction. It is covered with trees, and is about 1½ mile long.

If you wish to come to anchor North of St. Catharine's, where large ships ought to anchor, you must follow the directions given by Admiral Roussin; but if you wish to come by the South bar to the city of Nostra Senhora do Desterro, the capital of the island, you cannot do it with a vessel drawing over 13 feet water. You may govern yourself by the following directions:

Steer for Cape Quebra Cabaco, leaving the two Raton Islands on your port hand, not less than 1½ mile distant; when you bring the small Ratone Island to bear East, 2 miles distant, steer S.E. until the two rocks of Itapitinga do Norte are in a line with Cape Quebra Cabaco. You will then have on your starboard hand a flat rock, on which, at low-water, there are about 4 or 5 feet. As soon as you open this cape to the South of the rocks of Itapitinga do Norte, steer S.W., and proceed on this course until the rocks bear N.N.W.

From thence steer so as to pass within 4 or 5 cables' length East of the rock of Cape Tres Henriques, a wooded cape, and more apparent than Cape Quebra Cabaco. Then steer direct for the little strait of the city, taking care to pass 3 or 4 cables' length from the islet of Point do Lial. From this islet you will enter the little strait defended by Fort Santa Anna on your left, and by the battery of San Jono on your

care to pass 3 or 4 cables'
ou will enter the little strait
buttery of San Joao on your

right. You will find there a bottom of 12 to 18 fathoms, and you will perceive, in approaching, the islet of Gato and the islet of Vinhas, situated before the city. You will leave the first on your port, and come to an anchor in 19 to 20 feet water, the island of Gato bearing, by compass, N.N.E., the islet of Vinhas, S.S.E., and the steeple on the cathedral, N.E.

The city of Nostra Senhora do Desterro is situated in 27° 35' 25" S. latitude, and in 48° 34' 9" W. long.; the variation is 5° 29' E.

In coming from the North bar to the city, we frequently found but 7 feet water, and a muddy bottom; but the mud is at least 5 feet deep, and a vessel lies easy; at high-water the passage is made. The Emulation, which drew 13 feet 4 inches, was 3 days coming up to the city. She was dragged through the mud by her anchors, when the water was low or the tide weak.

In coming in by the South Bar, you must have a fair wind, high-water, smooth sea, and fine weather, without which the currents may throw you on Fort Isle, or on the Point dos Naufragodos, distant from each other only 280 fathoms. The vessel should draw less than 15 feet. The following is the route to take: steer on a line drawn from Coral Island to Fort Island, towards the last island; when you are abreast of the two islands Dos Papigios, (they are on your left,) you will have the three Irmaos islands, and the Moleques do Sul on your right, and you will bring the cape to the N. E. to open the passage; arrived at this point, you will steer directly in the middle, until you find yourself South of the Isle dos Cardos, remarkable by a single tree, elevated on the summit. Steer then so as to pass East of the Isle dos Cardos one or two cables' length distant, and from thence continue until you find yourself E. or W. with the South point of Encendo do Brito, half a mile distant. Follow the coast of the continent, until you come up to Cape Pesqueiro Fundo, at 4 cables' length distant. You will pass the village of Encendo do Brito, and at a little distance forward is a group of houses or cabins, forming the little village Dos Cedros. On your right, at a great distance, you will perceive the village of Robeirão, situated on the island of St. Catharine's, and almost before you Isle Largo.

Before arriving to this last, you will have to avoid a reef of rocks always under water. You are on this reef when the towers of the cathedral in the city are W. of the Isle Largo, and those of Cardos by the fort of the South bar.

From the Isle Largo steer N. until you are off the Isle das Caseas, and then steer for the steeples of the city, till you come to the anchorage indicated between Isles Gato and Vinhas.

There are on the coast of the island of St. Catharine, from Point Rupa, the North extremity, the following islands and islets: the North Molequez, the Isle Badejo, (the outward one,) the two Aranhas Islands, Pavier Island, (of a middling height, and without trees,) Campexe Island, the three Irmaos Islands, the South Moleques, (three large white rocks which touch each other, composing the Grand Moleque.) On the coast of the continent, commencing at the South bar, are the following islands and islets: Coral Island, (S.E. of Point Pinheira;) Araras Islands, (S.E. of Point Bituba;) Tocoromi Islet, (an elevated and perpendicular rock, S.E. of Araras Island;) Lobos de La Laguna, (S.W. of Araras and Tocoromi.)

In passing along the coast, we find the following points and capes: Point Pinheira, Cape Guaratuba, Cape Cirmi, Cape Uvidoa, Point Viraquera, Point Bituba, or Embituba, Morro-da-Barra, Morro-da-Forro, Cape Santa-Marta-Pequeno, and Cape Santa-Marta-Grande.

At Point Bituba commences the beach, behind which is a lake and the cities of Villa Nova, Santa Anna, and Laguna. This last is situated on the South side of the lake, at one mile from the bar within, in latitude 28° 28' 23" S., and 48° 50' 17" W. longitude. This position has been determined on shore.

CAPE SANTA MARTA GRANDE is remarkable on account of several large *Cape Santa* white rocks situated on the summit of the cape, which may be taken at a distance for *Marta* a number of houses. The latitude is 28° 39' S., and the longitude 48° 49' 49" W.; *Grande*. the variation is 7° 20' E.

FROM CAPE SANTA MARTA GRANDE TO RIO GRANDE DE SAN *From Cape* PEDRO.—This space of land, about 95 leagues in extent, has a coast extremely low, *Santa Mar-* having, at intervals, little sand-hills and brambles. The land can hardly be perceived *ta Grande* in clear weather, from the mast-head, at the short distance of 7 or 8 miles, and from *to Rio* the deck at 3 miles distance the furthest. It may be divided into three parts. The *Grande de* first runs N.E. and S.W. true, and is called the Beach of Torres. The Easterly *San Pedro*, part is in 48° 49' 49" W. longitude, and the situation of the Westernmost part is in 49° 54' 45" W. longitude.

The second part runs N. 4 E., and S. 4 W., true, and is called the Beach of Fernambuco. The Easterly part is in 29° 52' S. latitude, and 49° 58' 45" W. longitude.

The third part runs N.E. and S.W., true, and is known by the name of the Beach of Destretto. The Easternmost part is in 31° 12' S. latitude, and 50° 39' 45" W. longitude.

Beach of Torres.

BEACH OF TORRES.—A chain of mountains, distant about 15 leagues from the sea, stretches along in the interior, and ends abruptly at Torres, 25 leagues from Cape Santa Marta Grande. This beach may be approached within 3 or 4 miles.

We found 30 fathoms of water, bottom of sand, mud, and shells, 4 miles South of Cape Santa Marta Grande, and from thence to Torres, the soundings decrease to 5 fathoms, almost to touching the shore at this last place. You can judge of the decrease of the soundings, as the distance between the first soundings in 30 fathoms, and the soundings at 5 fathoms, was 25 leagues.

Beach of Fernambuco.

BEACH OF FERNAMBUCO.—This is more perpendicular than the first, especially in the latitude of 30 and 31 degrees. There are 40 fathoms water, with a bottom of sand, mud, and shells, 4 to 5 miles from the shore.

In steering off shore to the distance of 15 leagues, the soundings augment progressively to 95 fathoms, with a bottom of muddy sand: at a greater distance, no bottom is found with 100 fathoms; at 10 leagues distance, the soundings are about 83 fathoms.

Beach of Destretto.

BEACH OF DESTRETTO.—It terminates at Rio Grande de San Pedro. You will find 10 to 15 fathoms in coasting along, at the distance of 3 or 4 miles. It is not higher than the beach of Fernambuco, but there are hills of sand and less vegetation. Twenty to 21 leagues S.E. of this beach are 38 and 39 fathoms water, bottom of mud and sand, and in sailing towards the land, these soundings gradually decrease.

We will also remark, that of the three beaches that of Fernambuco, the Easternmost, has more water towards the shore, and also at a distance; on the contrary, that of Destretto has the least.

Rio Grande light.

RIO GRANDE LIGHT is an iron structure, 114 feet above the level of the sea. It is a revolving light, making its revolutions in 3 minutes, presenting three views of bright light, three darker, and three eclipses. It can be seen from 25 to 30 miles. Lat. $32^{\circ} 7' 15''$ S., long. $52^{\circ} 4' 25''$ W.

Rio Grande de San Pedro.

RIO GRANDE DE SAN PEDRO.—The approach to Rio Grande de San Pedro is difficult on account of the want of elevation of the neighboring land, it being low for a distance of 95 leagues North, and 40 leagues South. You should not attempt the bar except when the wind is N.E., the weather very fine, and appearing as though it would last several days. You should coast along the beach of Destretto at a small distance, until you perceive the light-house, which is situated at the North point of the bar, 2 miles inside. You must not, if possible to avoid it, get embayed or wind-bound on the South side, because the sea breaks in the shoal water.

When you make the tower, endeavor to get it to bear North 5 or 6 miles, then steer direct for it, but be particular to observe if a red flag be hoisted on the tower. If so, it signifies you must approach and continue to advance (as long as the flag is up) direct for the tower, until you see a boat, which will be at anchor on the bar, in which a pilot will be situated, showing flags which represent the depth of water on the bar as follows:

A blue flag over a red flag, 10 feet.

A red flag over a blue flag, 10 feet 6 inches.

A blue pendant over a white flag, 10 feet 10 inches.

A white flag over a blue pendant, 11 feet 3 inches.

A blue pendant over a blue flag, 11 feet 7½ inches.

A blue flag over a blue pendant, 12 feet.

A blue pendant over a red flag, 12 feet 4½ inches.

A red flag over a blue pendant, 12 feet 9 inches.

Steer for the boat, guiding yourself by a staff with a flag, which is inclined by the man in the boat as follows: If the staff is held upright, it denotes you are steering correctly; if the staff be inclined to port, or starboard, you must haul or keep off accordingly; if the flag on the tower is hauled down, you must not approach. From the tower they also throw out lateral flags, particularly in rough weather, to guide vessels keeping off or luffing, according as the flags are shown to North and South.

There is good anchorage 6 miles from the tower, which bears North, 6 miles distant; but as a general rule it is best to avoid anchoring. At night keep in 10 fathoms water, or over, and be very careful to sound frequently when your head is to shore. The soundings diminish regularly to 5 fathoms, which is close to the breakers. On the beach to the South of the bar the water decreases gradually, but to the Northward it shelves more suddenly.

The bar changes every year, during the winter; and, as soon as the pilots have well ascertained the channel, the president of the province notifies the government at Rio Janeiro. It sometimes happens that it is impossible to cross the bar for a long time, after a great S.E. gale.

The geographical position of the tower is $32^{\circ} 07' 20''$ South latitude, and $52^{\circ} 09' 45''$ W. longitude. The variation is $8^{\circ} 30'$ E.

E. by N., 12 miles from the light, there is a rock of 8½ and 9 fathoms, with 14 fathoms inside of it.

FROM RIO GRANDE DE SAN PEDRO TO CAPE ST. MARY.—In this *Cape St.*
part of the coast the soundings are very shallow and variable, you are therefore obliged *Mary.*
to keep off. The Emulation, in 33° 30' 30" S. latitude, and 52° 19' 45" W. longitude,
passed at once from 22 fathoms, sand and mud, to 18 fathoms, sand and shells; she
soon ascertained the edges of a great bank, extending from the coast 7 or 8 leagues,
and extending to the Castillos.

The Castillos are black and scarped rocks, situated at a very small distance from
the land, in 34° 21' S. latitude, and 53° 40' 45" W. longitude. At the North is found
an immense bay, in which you find shelter from S.W. winds, but you should quit this
anchorage as soon as the winds vary to the E. and N.E.

South of the Castillos is Bahin Falsa, of which we shall speak hereafter.

Some time before arriving at the these rocks, if you coast along the land 11 to 12
miles in coming from the North, the soundings show 11 to 12 fathoms water, with a
bottom of sand; when shells are mixed with sand, you are still on the Great Bank,
and you steer a little more to the port; you will then perceive two hills having the
form of teats, the only ones which can be seen to Cape St. Mary.

WINDS, TIDES, AND CURRENTS.—At the island of St. Catharine's, the pre- *Winds,*
ailing winds are N.E., N.W., S.W., and S.E. The winds from N.W. bring fine *Tides, and*
weather, and the winds from S.E., in the winter, are extremely rainy. *Currents.*

The tides are not regular in the strait, until the approach of new and full moon. The
difference between high and low water is, there, scarce above 5 feet.

The sea rises in the South basin from the South to the North, and it rises in the
North basin from the North to the South, in such a manner, that the waters meeting
from two sides accumulate towards the city, built near the little strait, which serves
as a limit for the whole strait, of which the two basins are composed. It falls also
in a contrary manner from which it rises.

About the beach of Rio Grande de San Pedro, the winds from the S.W., N.E., N.
W., and S.E., are usually the most frequent, and those from the S.E. the most vio-
lent and dangerous. A vessel surprised by a sudden squall from this quarter, on the
coast, cannot get away from it. During these winds from the S.E., the sea runs ex-
traordinarily high, and the currents run rapidly towards the shore.

The winds blow usually from the S.E. after having blown from the S.W. These
last winds do not usually blow until after the N.E. winds have varied to N.W. and
W.N.W.

RIO DE LA PLATA.—The River Plate is 55 leagues wide at its mouth, and runs *Rio de la*
nearly W.N.W. and E.S.E., true. It is formed by the waters of the Uruguay and *Plata*
the Parana, two great rivers which receive the waters of an immense number of other
rivers, among which may be mentioned the Paraguay, the Pileomnya, and Rio Grande
de Curitiba.

The capes which mark the entrance are those of St. Maria and St. Anthony; the
first is situated on the Northern side, and the second on the Southern.

The coast on the Northern side, comprised between St. Maria and the mouth of the
Uruguay, is in general high.

The coast on the Southern side comprised between Cape St. Anthony and the
mouth of the Parana, is, on the contrary, very low; it is on this side that those im-
mense plains, known under the name of Pampas, are found.

The river sensibly diminishes in width from its mouth to the confluence of the
Rivers Uruguay and Parana. It may be divided into two parts, nearly equal in length.

The first extends from Cape St. Maria and St. Anthony on the North, to the river
of Santa Lucia, and South to Point das Piedras de San Borrombon; the water of the
river is brackish. The second part extends from these points to the confluence of
the Uruguay and the Parana; the water is here generally sweet.

The depth of water in the River Plate increases in going from this confluence to
the sea, and the bottom between the banks is generally composed of mud, and fre-
quently of soft sandstone, to the meridian of Monte Video: from this place it is of oozy
sand, sand only, sand and shells, and sand and gravel, as far as Cape St. Anthony, ex-
cept towards the North side, and towards Ensenada de San Borrombon, where it is
formed of mud. The South side, from near the River Salado to near the borders, the
Ensenada de Borrombon has a border of soft sandstone 2 to 3 leagues wide, on which
it is very shallow.

The Point das Piedras de San Borrombon forms with Cape St. Anthony a great
bar, called the Ensenada de San Borrombon, in which two small rivers discharge
themselves, the San Borrombon and the Salado; this last is the largest. It is difficult
to discover its mouth, the following, however, serves as an indication of it: the
South side is covered with bushes, which terminate at two brick towers, used for-
merly as lime-kilns, and at the North part of the entrance are two banks of sandy
land, on which two batteries are built.

We may consider the bottom of sand, sand and shells, and sand and gravel, situated East of the meridian of Monte Video, as forming an immense bank, the highest part of which is known by the name of the English Bank.

The bottom of hard sand, found West of the same meridian forms sundry banks, on which the depth of water is from one to one and a half fathom at the most.

Three cities are built on the North bank: the first, after leaving Cape St. Mary, is Maldonado; the second, Monte Video; and the third, the colony of San Sacramento; they belong to the republic of Banda Oriental, or Uruguay, the chief of which is Monte Video; from Monte Video to the colony of Uruguay is 10 leagues.

The city of Buenos Ayres is the only one situated on the South side of the river; it is the chief city of the United Provinces of La Plata; the distance to Parana is 5 leagues.

From Cape St. Maria to Maldonado, is 26 leagues; from Maldonado to Monte Video, 21 leagues; and from this last city to Colonia, 28 leagues; the distance from Cape St. Maria to the Uruguay is thus 75 leagues.

From Cape St. Anthony to Buenos Ayres is 45 leagues, and from thence to Parana 5 leagues; the South side of the river is thus 25 leagues less in extent than the North side.

On the North side there are many islands, and a number of rocks, above and under water; there are none on the opposite side as far as Buenos Ayres. These islands are Lobos, 8 miles S.S.E. of Maldonado; Goritti, in the bay of Maldonado Flores, E. of Monte Video, 15 miles; San Gabriel, Farallon, and Lopez, before Colonia; and Hornos, 5 and 6 miles West of the city. The rocks are all a short distance from the shore.

The islands situated at the point of Santiago of Eusebada, being very small, we do not mention.

Banks.

BANKS.—The first we meet with coming from the sea is the English Bank, which breaks in $35^{\circ} 11'$ S. latitude, and $55^{\circ} 54' 45''$ W. longitude; it is 11 miles South of the island of Flores.

The second is Archimedes Bank. It is very small, and is situated S. 4 E., (true,) from Monte Video, at 19 miles distance.

The third is New Bank, formed within a few years, very probably by the sand drifted from the little bank of Ortiz. It is situated on the Southern side of the river.

The fourth, and the largest of the whole, is the Ortiz; its Eastern extremity is only half a mile wide, and is North of New Bank; its Western extremity stretches to within a very short distance of Colonia; it is nearer the mouth than the South side of the river. Its greatest width is 11 to 12 miles.

The fifth is the Chico Bank, a dangerous bank, by reason of the irregularity of the soundings on the edges. It is placed between the Ortiz Bank and the South side.

The sixth and seventh are the Banks of Santiago and of Larn; and the eighth, ninth, and tenth, those of Ciudad, Camerones, and the Palmas, all situated on the same side, except the Palmas, which is between the confluence of the Uruguay and Parana, on the way from Buenos Ayres to Colonia.

In going to Maldonado, there is no bank to fear, but in going to Monte Video, you must avoid English and Archimedes Banks; in going to Buenos Ayres you have to pass all the banks. Vessels do not generally take a pilot in going to Monte Video, but they rarely omit to take one in going to Buenos Ayres.

The pilots who conduct vessels to Buenos Ayres live at Monte Video or Point Indio. They keep under sail, or at anchor, near the coast, in schooners or cutters.

The government of the United Provinces of La Plata caused to be placed, several years since, large buoys on the edges of most of the banks, but bad weather and the strong currents have caused them to disappear. The government of Monte Video have erected a tower containing a revolving light on the isle of Flores, elevated 99 feet above the level of the sea: it can be perceived in the night at 15 or 16 miles distance, and serves to avoid the English and Archimedes Banks. It is badly attended, and frequently not lighted.

Light.

WINDS, TIDES, AND CURRENTS.—At the entrance of the river, and at Monte Video, the prevailing winds are the N.E. and S.W.

At Buenos Ayres and at Colonia, they are N.N.W., S.E. and S.W.

During the summer, and in fine weather, the winds blow in the whole river, with considerable regularity, from the E. to the S.E. from 10 o'clock in the morning, until sunset. In the night the winds vary to the North.

The winds from S.W. and S.S.W. are known about the River Plate, by the name of the Pamperos, from the Paupus, from which they come.

The Pampero lights up the sky, the same as the N.W. winds in Provence, and the N.E. on the coasts of Brittany; it blows usually after rain, or when the wind has varied from the N. to N.W., and to W.N.W., and in summer after a calm and very hot day. Oftentimes it comes all at once, with a strong wind from the N.E., when the

nd from the N.E., when the

sky is covered with clouds; the explosion is then sudden and very dangerous; and it is best for vessels in the River Plate, or the entrance, to get under easy sail, as soon as there are any indications of a Pampero. The barometer falls previous to the Pampero, and rises afterwards.

As it rains oftener in winter than in summer, this wind is more frequently in the winter, and lasts each time from two to three days. In summer it blows with more violence and ceases sooner; and it is then called in the country the *Turbonada* (Torment.)

When the weather is fair, and the wind light and constant, the tides on t. is coast are regular; on the contrary, in bad weather and strong winds, the tides are irregular, and form currents which oftentimes run from 4 to 5 miles per hour.

At Buenos Ayres the sea is high with t. winds from the S.E., and low with the winds N.W. and S.W. At Monte Video and the remainder of the Northern side, the river rises with the winds from the S.E. and S.W., and falls with those from the North. The difference between high and low water on the borders of the river rarely exceeds 4 or 5 feet; but in strong gales from the S.W. they sometimes rise 10 feet. Tide.

In the months of March, April, and a part of May, the River Plate is higher than in the other months of the year, occasioned by the Rivers Parana and Uruguay. It then brings down trees and shrubs, which form little islands of verdure sufficiently remarkable. This is the epoch of the finest season in this interesting part of South America, of moderate breezes and a mean temperature. During the spring, summer, and winter, the winds are very strong, and the temperature of the atmosphere very variable.

ANCHORAGES.—Whenever the lead shows mud, you can anchor; having care, *Anchorages.* however, to anchor far enough from the banks not to be driven on them.

With the winds from the S., the anchorages on the South side are best; with the winds from the N., the opposite side is preferable.

Large vessels and frigates may go up to Monte Video; vessels drawing less than 17 feet may go up to Buenos Ayres, and the Hornos Islands.

The anchorages which shelter from the N.W., N.E., E., and S.E., are Maldonado, Monte Video, and Hornos. Those which give shelter from S.W. winds are Enseada de Borrombon and Buenos Ayres.

Small vessels may anchor at Cape St. Mary, at the entrance of the River Santa Lucia, and at Colonia on the North side; at Rio Salado within Enseada de Borrombon, and at Riachuelo, near Buenos Ayres, on the South side.

You can come to anchor at Maldonado in 6 to 8 fathoms water; at Monte Video, in the road in 5 to 6 fathoms; in the port, in 3 to 3½; at the Hornos Islands, in 3½ to 4½ fathoms; in the road of Enseada de Borrombon, in about 5 fathoms; at Buenos Ayres, in the road, in 3½ to 4½ fathoms; and near the city, in 2 to 3 fathoms.

In the anchorage, on the North side, you should moor for the S.W. winds; in the others for the S.E. winds.

Of all these ports and roads, the best holding-ground is at Maldonado. It is much covered with sand. In the other places the bottom is of soft mud, through which the anchors drag in sudden blasts of wind. During the Pamperos, the Hornos Islands offer an excellent anchorage, because the sea is broken off by the Palmas Bank.

DEPTH OF THE RIVER AT THE ENTRANCE AND OFF THE *Depth of the River.* **MOUTH.**—When in the parallel of Cape St. Mary, and in the longitude of 52° 8'

45', which is that of Rio Grande de San Pedro, the soundings at the distance of 33 leagues from the cape are 90 fathoms, mud; at 25 leagues the bottom is sand or mud mixed with shells, and show 40 to 28 fathoms only. In going towards the cape, the soundings decrease irregularly.

On the parallel of Castillos, at 33 leagues distance, the depth of the water is 58 fathoms, and the prevailing quality of the bottom is sandy.

In sailing on parallels further South than Cape St. Mary, you will find less water in the same longitude, and the depth diminishes more regularly. At 15 leagues from Cape St. Antonio the depth is 17 fathoms, bottom of sand. At 28 leagues S.E. from the same cape, you will have 15 fathoms, same quality of bottom. North of the cape, and 5 leagues from the land, you will have 7 to 8 fathoms water.

If you shape your course for the English Bank, that is to say in the parallel of 35° 11' S., you will find 6 to 7 fathoms, and a sandy bottom, 5 leagues before arriving there. You are then nearly in 55° 39' 45' longitude.

On the parallel of 35° 30', when you reach the longitude of 50° 39' 45' W., the bottom is of fine sand, and the depth 8 fathoms. On the parallel of 35° 35', and to the parallel of Cape St. Antonio, the bottom is sand mixed with shells and gravel.

In the latitude of 35° 20' S., when you have passed the longitude of the English Bank, the soundings do not reach above 8 fathoms; on the parallel of 36° it reaches to 11 and 12 fathoms; West of the bank, on the same parallel, there are 5 and 6 fathoms only.

At 20 leagues distance from the entrance to the river, the water loses its blue color, and becomes green, tinged with yellow.

In coasting along the North side, in sight or near the land, you will have no soundings; running on a parallel greater than that of Lobos Island, you have no soundings of mud except in the neighborhood of the meridian of this island; at 2 miles South, you have 16 and 17 fathoms of water; and at 6 miles, 23 and 24 fathoms, mud bottom. In going from Lobos to Monte Video, the depth diminishes gradually, but irregularly. In the passages formed by the hard sand-banks situated between Monte Video and Buenos Ayres, there are from $3\frac{1}{2}$ to $5\frac{1}{2}$ fathoms of water.

*Points to Recognize.
Cape St. Mary.*

POINTS TO RECOGNIZE IN MAKING THE LAND.—There are three, Cape St. Mary, Lobos Island, and Cape St. Antonio.

CAPE ST. MARY.—Its position, determined on shore, is $34^{\circ} 39' 1''$ S. latitude, and $51^{\circ} 9' 45''$ W. longitude. The variation of the needle is $10^{\circ} 7' E.$

Although of but little elevation, the cape is distinguished by the neighborhood of two little islands named Tuna and Palomma, distant from each other only 260 feet. The separation forms a passage for small vessels drawing less than 10 feet water, and is the entrance of a bay which is sheltered by the cape and the two islands. You find there from 11 to 12 feet of water. It will contain perhaps 7 or 8 vessels.

The island of Tuna, the smallest and the nearest to the cape, is covered with the cactus, which is peculiar to the sandy coast. You will remark also, in coming from sea, a large sand-hill with a double peak, S.W. of the cape, near a very flat beach. At the North, on a hill, is seen an establishment consisting of a group of houses called an Estancia, for raising cattle. Near to these houses are many trees, and all about them many inclosures.

The coast to the North forms a large bay, 11 miles in extent, with a point surrounded by the Palmarone and Castillos Islands. The island of Palmarone, the nearest to the point, is verdant; the Castillos are barren. Otherwise, this resemblance to Cape St. Mary has caused sometimes one to be taken for the other. It is named False Bay.

At 2 miles East of the Castillos, are found 16 fathoms of water, bottom of sand. From these islands to Cape St. Mary, at the same distance, are found 11 to 11 fathoms, same kind of bottom. At the East of the cape, 11 fathoms, a bottom of sand, or sand and gravel; S., 13 miles distant, 20 fathoms, sand; and S.W., from 15 to 22 fathoms, bottom of mud.

Isle of Lobos.

ISLE OF LOBOS.—It is situated in $35^{\circ} 1' 00''$ S. latitude, and $54^{\circ} 52'$ W. longitude, and is only a mile in extent. It can be seen 15 to 16 miles off. It is inhabited by a great number of seals. The Eastern part ought to be avoided, as a chain of reefs extends 3 miles off. A light-house is proposed to be built here.

This island is without vegetation. In the strait between it and the main-land, there are 17 fathoms of water.

The variation of the needle is the same as at Cape St. Mary.

Cape St. Antonio.

CAPE ST. ANTONIO.—We comprehend under this name a large collection of little mountains or hills composed of sand, which stretch to the E. and S., and which are terminated in the West by a low coast covered with bushes.

Its position, determined at the anchorage, is $36^{\circ} 19' 36''$ S. latitude, $56^{\circ} 47' 15''$ W. longitude. The variation of the needle is $13^{\circ} 30' E.$ The point determined is that where the separation takes place between the sand-hills and the low verdant coast.

This cape is surrounded by a bank of sand, which breaks oftentimes at a considerable distance from the land, extending N. and E., and ought to be carefully avoided.

Navigation of the river.

NAVIGATION AT THE ENTRANCE AND IN THE RIVER PLATE.—The description that we have given of this river naturally indicates the precautions necessary to take to ascertain the points of the entrance. We think it preferable to make the North side, as the land is the highest.

You cannot depend upon the soundings, as they are on all the coast nearly at the same depth and quality as towards the entrance of the river. Besides the Great Bank between the Rio Grande de San Pedro and the Castillos has the same sort of soundings we met with West of Cape St. Mary, and this resemblance causes numerous errors.

We advise mariners bound to the River Plate, to be well assured of their position by frequent observations of latitude and longitude, and to take them with the greatest precaution, as the currents may deceive them between the hours of observation.

If the winds are well established from the N.E., by making the land about Cape St. Mary, you can recognize a larger extent of land before entering the river. But in all other circumstances Lobos Island offers more chances of success, by the position of the island, to avoid being wind-bound on the North coast, and to beat up

water loses its blue color.

land, you will have mud. Lobos Island, you have no. dian of this island: at 2 at 6 miles, 23 and 24 fathoms, the depth diminishes gradually sand-banks situated between 5 1/2 fathoms of water.

AND.—There are three,

aking the land about Cape re entering the river. But ces of success, by the posi- orth coast, and to beat up

with greater advantage. Making the land at Cape St. Antonio should be considered the most difficult and dangerous.

COURSE TO MONTE VIDEO.—Being South of Lobos Island, at 2 or 3 miles distant, the direct course for Flores Island is W. 7° N., true, or W. 4 S. by compass. *Monte* But the River Plate is subject to very variable currents; and you should steer in *Video*. such a manner as to approach the North border of the river, rather than the South side, on account of the English Bank. You will perceive in good season the tower of Maldonado, and the elevated land to the East. In sailing along at a distance of 5 or 6 miles, you will distinguish a point formed of black rocks, on both sides of which, to the right and the left, are sand-beaches. This is Black Point, or Point Negro, situated 14 miles from Maldonado, near a vast sandy bay. The high lands on the city side are remarkable for a great white band, which shows itself on both sides of Whale Point, which is the West extremity of the bay of Maldonado. It is very near the same parallel as the tower of the city.

When Point Negro bears N., 6 miles distant, the island of Flores bears W. 7° N., true. The island of Lobos is then on the same bearing, about 37 miles distant, and the soundings are from 13 to 14 fathoms, with a muddy bottom.

The land North of Point Negro makes a deep bend, and becomes lower. In steering along in sight of land, you can distinguish the hills of Afilar, situated in 31° 47' 15' S. lat., and 55° 31' 8' W. long. When they bear by compass N. by W., and the nearest hill bears E. 45° N., you are 27 miles distant from Flores. The soundings are then 12 to 13 fathoms, mud, and still on the same rhumb with Lobos. The hills of Afilar are isolated, and resemble two teats.

In running W. 1/2 S., by compass, you have to run only 12 to 13 miles to perceive from mast-head the tower built on Flores. This island at first resembles three islands, then the lower part gradually shows itself, and at the distance of 5 miles, if the sea is low, the whole island is seen. If the sea is high, the island at the same distance appears in two parts.

If it be night, as soon as you perceive the light on the tower, steer direct until within 4 miles distance.

From thence keep on the port side, leaving the island on the starboard hand, and passing within 2 or 3 miles South of it: or you can pass North of Flores, taking the precaution to pass at a good distance from the Eastern point, to avoid a bank of rocks under water, which extends 1 1/2 mile North. You can anchor only North of the tower, one or two miles distant.

Between Flores and English Bank, the bottom is mud, and the depth of water 7 to 8 fathoms.

From Flores to Monte Video is 16 miles in a straight line, and you must steer by compass W. by S.: avoid Point Brava.

Point Brava, situated East of the city, is formed by a long line of rocks stretching off from the land. You must give a good berth to a rock detached from the rest. A large white house is built North of Brava, and another smaller one, is situated towards the middle of the rocks. In quitting Flores, you can, at the same time, if the weather be clear, perceive the cerro, or hill of Monte Video, and soon after the steeples of the cathedral in the city.

If the wind is from the N., or N.E., you ought to steer in the night W. by S., to double Point Brava. But if the wind is from S.E., or E.S.E., it is prudent to steer W.S.W. You should, by way of precaution, in either case, bring the light of Flores to bear E. by N., or E.N.E., to be assured that the currents have not set you towards Point Brava.

When the hill of Monte Video bears N.W. by compass, the point is doubled, and you steer gradually towards the starboard hand, if you would anchor in the harbor. A large vessel, which can only anchor in the open road, should steer W. by S. from Brava, and anchor in 5 fathoms.

South of Brava, one mile distant, there are from 5 to 6 fathoms of water.

On the passage from Lobos to Monte Video, and also in the navigation of any part of the river, you must estimate the distances run by a ground log, that is to say, by a log of which the "chip" has been replaced by a piece of lead. If you throw the common log immediately after the deep log, the difference given by the two logs shows if the currents are in favor of, or against the vessel.

As any part of the coast between Point Negro and Flores may be approached within 5 or 6 miles, it may be well, in the night-time, to steer wide to the starboard. The revolving light on the island, in this case, may be perceived on the port side, but it will be easy to rectify the vessel's course in steering directly for it, and then leaving it on the starboard hand, when you estimate yourselves 4 or 5 miles distant. You will by this means certainly go clear of the English Bank.

MONTE VIDEO LIGHT is a revolving light on the Cerro, 486 feet above the *Monte Video* level of the sea. It has a flash of 30 seconds every 3 minutes, and can be seen 30 *light* miles. Lat. 31° 53' 15" S., long. 56° 14' 45" W.

If you wish to go to Monte Video South of the English Bank, you must enter the river on the parallel of $35^{\circ} 30'$, and steer W. by S. with Northerly winds, and W. S. W. with Southerly winds.

The soundings are at first fine sand, then sand of the usual kind, further on muddy sand, and again mud. You will be in this last case on the meridian of Monte Video, and ought to see the hill of Monte Video, which can be seen in the day-time, in clear weather, 9 leagues distant. The position of this hill is $34^{\circ} 53' 2''$ S. lat., $56^{\circ} 16' 30''$ W. long.

If in spite of your precautions you should get in 5 or 6 fathoms of water in passing S. of English Bank, it will be necessary to steer more to port, and keep in from 7 to 9 fathoms.

Monte Video is in $31^{\circ} 51' 11''$ S. latitude, and $56^{\circ} 13' 18''$ W. longitude. The variation of the needle is $1^{\circ} 42' 21''$ E.

In a thick fog, or in the case of uncertainty of the true position of the ship, it is best to anchor, rather than pursue your course up the River Plate.

Course to Buenos Ayres.

COURSE TO BUENOS AYRES.—Vessels that do not wish to take the passage by the island of Flores, must run on the parallel of Point Piedras de San Borromben, and steer true W. until they make it. Its position is $35^{\circ} 27' 40''$ S. lat., $57^{\circ} 0' W.$ long. This point is very low, and can only be perceived in clear weather. You will remark on the right many woody hills, among which the highest bears nearly N. W., and is called Salvador Grande. It is situated between Point Piedras de San Borromben and Point Indio; the hill situated E. of Salvador Grande, is called Salvador Chico. The pilots confound Indian Point with these hills.

From Point Piedras de San Borromben the course is the same as when the vessel has passed Monte Video.

Vessels that draw less than 9 feet of water, pass generally over all the banks between Monte Video and Buenos Ayres.

Those drawing 13 feet, may pass between Chico Bank and the South side.

Those drawing 15 feet may pass between the channel formed by Ortiz Bank and the North side.

Those drawing 15 to 17 feet, should choose the passage between the Ortiz Bank and Chico Bank.

Passage between Chico Bank & the land. Light-ship.

PASSAGE BETWEEN CHICO BANK AND THE LAND.—On leaving Monte Video, steer S. W., by compass, 30 miles, to avoid being drifted on the Ortiz by the currents. You must then head W. S. W., until you make Point Indio, or rather Salvador Grande.

There is a light-ship, with a red flag in the day-time, between Point Indio and Ortiz Bank. From it Indio Point bears S. W. $\frac{1}{2}$ S., 9 miles distant; and the S. E. point of Ortiz Bank N. E. $\frac{1}{2}$ N., 7 miles distant. Pilots can be obtained on board.

Point Indio is in $35^{\circ} 15' 20''$ South lat., $57^{\circ} 11' 42''$ W. long., and 52 miles from Monte Video; it is very low, and can only be known by the woody hills in the East part, while the coast to the West has no hills. When you reckon yourself 9 to 10 miles from Point Salvador Grande, head W. N. W., along the land. You will soon perceive the three ombu-trees of the Magdalena, and then the church of the same name. When the first ombu-tree bears S. by E., by compass, you are then N. and S., true, from the East point of the Chico Bank; when the church is on the same rumb, you are in the middle of the channel. You will distinguish in a short time a large single ombu-tree on a hill, and, more distant, three other ombu-trees, forming a single group.

In sailing along with the land in sight, it is better to steer first one side and then the other, to ascertain the limits of the border of soft sandstone, which we have said exists in this part of the river, and not to quit it more than 2 or 3 cables' length, in obtaining with the lead alternately soft sandstone and mud; by this means you will avoid the Chico Bank.

When you distinguish two small elevations covered with bushes and trees, and an ombu-tree by the side of two low houses, you have passed the narrowest part of the channel. When you are N. and S., true, with these elevations, you are entirely clear. From thence you may follow the coast, or steer N. W., until you make the edges of the Ortiz.

In the first case it is necessary to steer at a distance from the land, twice as great as before to avoid the banks of Santiago, Lara, and Ciudad. In the second case, which is the most prudent, you must pay great attention to the soundings. The depth increases at first to 5 fathoms, at the least, and then diminishes gradually to 3 $\frac{1}{2}$ and 3 fathoms. As soon as you have these last soundings, you are on the edge of Ortiz, and you must then head to the West.

This course will bring you towards the South side. You will soon see the village of Quilmes, situated on a little hill, on which there are many ombu-trees, and the towers of Buenos Ayres, and the vessels anchored in the open road. When these

different objects are well distinguished, steer W.N.W., to avoid the Ciudad Bank. As soon as the towers of the cathedral bear S.W., you are in the outward road of the city.

The city of Buenos Ayres is in $31^{\circ} 36' 18''$ S. latitude, and $58^{\circ} 23' 57''$ W. longitude. The variation of the needle is $12^{\circ} 30' 59''$ E.

PASSAGE BETWEEN ORTIZ AND THE NORTH SIDE.—In leaving Monte Video, you may follow the land along 6 miles distant, taking care to avoid the Panella Rocks, near which is a large iron buoy, secured by means of a strong anchor and chain.

Passage between Ortiz and the North side.

The Panella Rocks are situated in $31^{\circ} 51' 15''$ S. lat., and $56^{\circ} 26'$ W. long. You are on them when you see Point das Yeguas of the hill of Monte Video, with the steeples of the city, and Point Espinito bears N. by E., by compass, distant 5 miles. These rocks are never uncovered, but when the water of the river is very low, it occasions a long eddy, which may be easily distinguished.

Point Espinillo, though low, is apparent; because it terminates the coast of the hill of Monte Video, and it forms the entrance of the river of Santa Lucia, 11 miles from Monte Video.

Being N. and S., true, with Point Espinillo, you must steer W. by N. by compass, and follow the land always at the distance of 6 or 7 miles, to avoid the little banks of sand on the borders of the river. You will soon perceive the high scarped mountains, called Barrancas de San Gregorio, or Santa Lucia. When you are N. and S. with their East extremity, called Point de Jesus Maria, steer W.N.W., until you bring this point to bear E. $\frac{1}{2}$ N. by compass. You must then head to the W., until you make Point Sauce, the only part of the coast which is woody. The lat. is $24^{\circ} 25' 20''$ S., and the long. $57^{\circ} 26' 21''$ W.

From thence you may coast along at a short distance, until you pass North of you a great bank of rocks, of which some are out of water, and are known by the name of the Pupas, which will bring you off Point Colonia, with a considerable depth of water, but in a very narrow channel between this part of the coast and the Ortiz Bank.

COLONIA BEACON is a fixed light on the S.W. angle of the Plaza, which can be seen 6 miles.

Colonia Beacon.

When you are before the city of Colonia, and have on your right the San Gabriel Islands, Farallon and Leper, steer S.W. for Buenos Ayres.

The navigation South of the Chico Bank, and North of the Ortiz Bank, is not practicable, except with a fair wind and a favorable current.

POINT JESUS MARIA.—S.E. true, from Point Jesus Maria, and S.W., true, Point Jesus from St. Gregory and Santa Lucia, is a shoal of light-colored quicksand, having on it 12 feet.

PASSAGE BETWEEN THE CHICO BANK AND THE ORTIZ BANK.—You may leave Monte Video until within 9 or 10 miles of Salvador Grande, then you bring the vessel's head W.N.W., to bring the first ombu-tree of the Magdalena S.E., and avoid by this course the new bank. From this the course is N.W. $\frac{1}{2}$ N.

Passage between the Chico Bank and the Ortiz Bank.

This course leads directly to the edges of the Ortiz Bank: as soon as you come up to this bank, and have $3\frac{1}{2}$ to $3\frac{3}{4}$ fathoms, steer W., until you perceive the village of Quilmes and Buenos Ayres.

If the winds are ahead and the currents favorable, you may beat between Chico and Ortiz Bank, but the tacks should be short, and you should prefer the neighborhood of the Ortiz, because this bank is announced by the progressive and regular diminution of the soundings. If the currents are contrary, you should anchor between the banks, taking care to avoid the soft sand-bottom which you often meet in the River Plate.

COURSE FOR THE HORNOS ISLANDS.—If you are before Colonia, going from Monte Video to the North of the Ortiz, leave the islands on the right; and when you bring the island of Farallon to the North, steer N.N.W., and then N. by W.; you will soon see the Hornos Islands on the same line, the last islands after leaving Colonia, covered with small trees, and very bushy.

Course for the Hornos Islands.

You will anchor N.W. from the outer one, and at from one to one and one-third mile off.

In going from Buenos Ayres, you must steer so as to bring Farallon North of you, and then steer as in the preceding case.

Colonia is situated in $31^{\circ} 28' 11''$ S. latitude, and $57^{\circ} 50' 37''$ W. longitude. The variation of the needle is $11^{\circ} 8'$ E.

Additional Remarks.

A shoal is said to exist in latitude $36^{\circ} 28' S.$, long. $51^{\circ} 30' W.$, about a mile long, and the same in breadth, with a sea breaking very high over it: it has the appearance of sand, and a little water on it.

At the entrance of the Plata, the prevailing winds, during the summer months, from September to March, are North-easterly, with tolerably clear weather overhead, but a dense atmosphere near the horizon. These winds haul generally to the Eastward as you advance up the river, and, about the full and change of the moon, strong breezes from the South-eastward are common at this season, accompanied with rain and foul weather. At Buenos Ayres, during the summer months, the S. E. winds are generally fresh in the day-time, hauling round to the Northward in the night.

During the winter months, from March to September, the prevailing winds, at the entrance of the Plata, are S. W., or more Westerly; but up the river, more generally from the Northward than the Southward of West.

The winter season is the best, in point of weather, at Buenos Ayres; for, the winds being chiefly from the N. W., to S. W., the water is smooth, and the communication can be kept up between the shore and the shipping with more facility. The weather is sometimes, but not frequently, foggy. Fogs are most common in the months of July, August, and September, and prevail more at the entrance of the river, as far up as the S. E. tail of the Ortiz, than above the banks.

As it cannot be said that there are regular tides in the Plata, but currents, as uncertain in their duration as they are irregular in their rate and direction, no certain allowance can be made for them; therefore, a ground-log should always be used, to know the course made good and distance run.

The tides, generally speaking, when the weather is fine and settled, and the winds moderate, do not, in any part of this river, rise or fall more than 5 or 6 feet; though at Buenos Ayres, at the distance of 8 miles from the city, when the winds are strong at N. W., there is so little, sometimes, as 15 feet water; while with strong breezes from E. S. E. to S. S. W., the depth is upwards of 5 fathoms; but except on such extraordinary occasions, there are between 17 and 22 feet water. It is said that the river has been almost dried up across from Buenos Ayres to Colonia, during heavy West-erly gales.

The River Plata has many singularities. Its entrance being very wide and very shallow, it is affected by every change of wind in a most extraordinary manner; so much so, that a shift of wind may be predicted to a certainty, by observing carefully the state of the mercury in a barometer, and the set of the currents, which usually shift before the wind. In calm weather the currents are generally very slack; and then as regular, almost, as tides: setting up and down the river alternately. When the winds are variable, the currents are equally so. When the current comes in from the Eastward, along the North bank of the Plata, a North-easterly wind may generally be expected to follow; and at the same time, (should the wind have been previously to the S. E.,) the mercury in the barometer will fall a little; but much more if the transition be quick from the South-west, without stopping in the South-eastern quarter.

When the wind continues in the North-east quarter, the mercury is more depressed (according to its strength) than with any other wind; and there is usually, then, a set into the river on the North bank, and out on the opposite. Indeed, whilst the winds are between N. E. and S. S. E., the current generally runs to the Westward past Monte Video, though without much augmenting the depth of water off that place, but filling the river above the banks.

The winds between N. N. E. and W. N. W. make the water lowest: the out-set being then strongest along the South bank of the river, past the Points del Indio and Menaria; but very inconsiderable along the North bank.

Before the setting in of a S. W. gale, or pampero, the weather is usually very unsettled, and the winds unsteady and variable in the Northern and North-western boards, preceded by a considerable fall in the mercury, though it usually rises a little again before the wind shifts to the South-west, and often continues to rise, even though the wind may increase from that quarter.

Before these winds set in at Buenos Ayres, the current runs up, and fills the river unusually high; at the same time as strong an out-set is experienced along the North bank, which continues whilst the winds are strongest from W. S. W. to S., seeming to prove that these winds force up from the Southward a large accumulated body of water past Cape St. Antonio, which can only find a passage out again by the North shore, where they increase the depth of water, as well as up the river, and particularly in the shallow harbor of Monte Video. Whilst these S. W. winds blow, the air is cold, and the atmosphere clear and elastic, in a degree rarely to be met with in any other part of the world. They are generally succeeded by some days of fine serene

weather, the wind continuing moderate from the Southward, or varying to the Eastward.

The velocity of the tide or current, in the River Plata, seldom exceeds 3 knots per hour; although some have found it to run at the rate of 6 or 7 miles an hour.

As the winds outside the River Plata, and particularly about Cape St. Mary, are most frequently from the North-eastward and Northward, except when the S.E. summer and S.W. winter gales blow, about the times of new and full moon, it is on the whole, most advisable for ships bound in the river to get in with the land about the latitude of that cape.

In latitude 33° S. the bank of soundings extends off the land full 36 leagues, where the depth of water, in longitude $50^{\circ} 20'$ W., is 34 fathoms, and the quality of the bottom dark olive-colored mud, or ooze, as it is all along the outermost verge of the bank.

In latitude 34° S. and 30 leagues from the land, the bank is steep, and the soundings decrease quickly, in standing to the Westward, to 25 fathoms, 20 leagues from land.

Latitude $34^{\circ} 20'$ S., and longitude $51^{\circ} 50'$ W., or about 30 leagues East of the Great Castellus Rock, the depth is 63 or 64 fathoms, dark mud. In standing in for the land, between the Great Castellus and Cape St. Mary, the water shoals, in a short distance, from 60 to 25 fathoms; and the quality of the bottom changes to sand, which grows coarser as you approach the coast; and, as far as 7 leagues off shore, is intermixed with shells. This bottom is found only in, and to the Northward of, the latitude of Cape St. Mary, except very close in with it.

To the Southward of $34^{\circ} 40'$ S., the bottom is chiefly mud, intermixed with fine sand or gravel; and if a ship happen to be set to the Southward of Cape St. Mary, as she hauls in for the land, yet keeps to the Northward of Lobos, she will get out of fine sand into dark mud, which is the quality of the bottom, chiefly, between Cape St. Mary and Lobos, as well as 8 or 9 leagues to the Eastward of that island; and the depth of water between them is generally 26 to 30 fathoms.

In latitude 35° S., and longitude 52° W., or 42 leagues true East of Lobos, there are about 30 fathoms water, dark sandy bottom; from whence the bank of soundings takes a S.W. direction. East of Lobos, 27 leagues, the depth is 25 fathoms; and, in steering in, on its parallel, the same depth nearly continues until very near that island. But, if set a little to the Southward of Lobos, the water will shoal even to 10 fathoms, perhaps on a hard sandy or gravelly ridge, that extends all the way from the English Bank, in its parallel, as far as longitude $52^{\circ} 30'$ W.; or full 18 leagues to the Eastward of the meridian of Lobos.

Thus the approach to this river cannot be considered dangerous, if proper care be taken in navigating, and due attention paid to the lead, and to the course steered.

THE COAST FROM THE RIVER PLATA TO THE RIVER NEGRO.

PIEDRAS POINT should be approached with more caution than any other land near the entrance of the Plata, excepting the North-east part of Cape San Antonio.

The point is low and ill defined. A few trees of stunted growth show themselves at a small distance from the shore; but as the land is almost flat, and not 20 feet above the level of the river, it is difficult for a stranger to recognize the spot, either by description or by a drawing.

Very near the point, about half a mile inshore, is a single tree; 2 miles South-west of the point is another tree, rather larger. Six miles to the South-west is a clump of trees; 4 miles beyond which is another clump; all easily distinguishable by those who are accustomed to low land, but appearing like bushes to eyes familiar with such noble scenery as that of the coast of Brazil.

Northward, and to the North-west of Piedras Point there are no distinct trees; although straggling bushes are sometimes altered in their appearance, by refraction, so much as to deceive a practised eye.

Towards the East and South, extends a dangerous bank, to the distance of 7 miles in an Easterly direction, and 15 towards the South. The North part is hard clay, with many patches of Tosea, (clay hardened to the consistence of half-baked bricks,) almost as injurious to a vessel as actual rock.

Within the limits of the bank, the bottom is uneven, and the lead cannot be trusted. Outside of the limits a vessel may go by the lead, with confidence, accord-

Piedras Point.

Piedras Bank.

ing to her draught of water. But in estimating distance from this low land by the eye, one may be very much deceived, so much is it at times either elevated or apparently depressed by refraction. In approaching the banks from the Northward or Eastward, the ground hardens, and the water decreases gradually in depth; from the Southward the decrease of depth is somewhat quicker, though the bottom is not nearly so hard.

Salado River.

From Piedras Point to the River Salado, the land is uniformly low and level. Besides the clumps already mentioned, there are but a few straggling trees. Having given a wide berth to the South-east part of the Piedras bank, and being to the Southward of it, a vessel may close the land, from 5 to 8 miles, according to her size, off the mouth of the Salado.

Mount Rosas.

Brick-kiln.

Northward the land is, as has been said, uniformly low, not exceeding 20 feet above the level of the water, in many places much lower; but to the Southward of the river, distant 5 miles from its mouth, is a rising ground covered with trees, called Mount Rosas. The highest part of this mount may be 30 feet above the water. Being covered with trees, and higher than the adjoining land, it affords a good mark for the entrance of the Salado. Another remarkable object is a red brick-kiln, 20 feet in height, upon the shore, 2 miles S.S.W. of the mouth of the river. When within 4 miles distance from the shore, the entrance of the river is distinguishable. Two wrecks now lie near, but they will of course soon perish. The Salado is a very shallow bar-river, unfit for anything but the smallest vessels. At times, when the Plata is high, there are 6, 8, or 10 feet water on the bar. But at other times the smallest boat cannot even approach the mouth of the river; and the mud is so soft that one cannot walk from the boat, lying aground, to the firm land. There are a few houses near the Salado, and on Mount Rosas.

Sanborombon River.

Tuyu Bank.

The San Borrombon River is frequently dry, and is not navigable.

From Mount Rosas to Cape St. Antonio the land is very low, and quite flat. Trees occasionally show themselves. The great extent of the Tuyu bank prevents even the smallest vessel from approaching this half-drowned land. The ground near, and even on the bank, is extremely soft; the depth decreases gradually, and with the lead going there is no danger. This bank is also called Arenas Gordas.

In San Borrombon Bay, particularly within 5 miles from the land, the bottom is so soft that the lead sinks 1, 2, or 3 feet into the mud, if suffered to lie on the ground. In the bay there is but little current at any time.

Rasa Point.

Rasa Point, the Northern extremity of Cape San Antonio, is a low sandy spit, extending to the Northward, and under water towards some breakers, near the Northern limit of the Tuyu bank.

Close behind Rasa Point, to the West, is the little river Tuyu, communicating with several lakes, with 2 fathoms water at its entrance. There is a small creek winding through the Tuyu bank, by which a very small vessel can approach and enter that river. The creek is extremely difficult to find, and at present of no consequence.

At Rasa Point the almost united land and water of the coast of Sanborombon Bay is succeeded by a well defined, though low, extent of sand and shingle. The Tuyu bank gradually diminishes, and a few miles South of Rasa Point vessels may approach the land as near as 2 or 3 miles.

From Cape St. Antonio, Southward, the coast is of a light color, low and sandy. Occasionally straggling bushes, or patches of rough grass, are seen. Sand-hills between 20 and 40 feet in height begin to show themselves 10 miles to the Southward of Rasa Point, gradually increasing in number and height as they approach Medano Point, rising near that point to 100 feet above the sea. Two of these sand-hills, near one another in latitude 36° 27', remind one of a Spanish saddle; they are rather higher than their neighbors.

Currents.

Off Cape St. Antonio there are currents setting into or out of the Plata, varying in their strength and duration as the winds vary, by which they are principally governed. Generally speaking, the current sets to the Northward before and during the commencement of Southerly winds, from 1 to 3 knots; and to the Southward before and during the beginning of Northerly winds, with about the same strength.

Medano Bank.

Off Medano Point is the Medano Bank, an extensive and dangerous shoal stretching 6 miles to seaward. Generally the water upon it is much discolored, and the lead will give warning; but at any time, even in fine weather, it is more prudent to give this shoal a wide berth. In crossing it, irregular and shoal soundings are obtained; and at 3 or 4 miles from the shore there are places over which are not more than 2 fathoms water.

About Medano Point the land is higher than to the Northward or to the Southward. A range of hills between 100 and 200 feet in height, appears to stretch to the N. W., or more Westerly. The Medano shoal seems to be a continuation of that range; irregular soundings, with many shoal spots, may therefore be expected.

From Medano Point to the narrow isthmus between the sea and the lagoon, called Mar Chiquito, the coast is lower than near Medano Point; but it has a similar appearance, sand-hills, with a few patches of verdure, being the only objects visible. These sand-hills, and the coast near them, have a whiter look than those to the Northward of the point.

In approaching this part, there is no danger while at a reasonable distance from the shore—from 1 to 3 miles, according to the weather; but as in some places, especially to the Northward, near Medano Point, the soundings are irregular, shoaling suddenly, a fathom or two at a time, and then deepening again, it is as well not to go nearer than 3 miles.

Mar Chiquito is a lagoon of salt water (visible from the mast-head of a passing *Mar* ship) into which flow the Tandil, and other small rivers. At times it overflows and runs into the sea, but generally there is a dry bank of shingle between the two. From the spot where the Mar Chiquito overflows, the land rises and is no longer sandy. A low range of cliffs, from 20 to 30 feet in height, is surmounted by a rising ground, of which the highest part is about 80 feet above the sea. Pasture land now meets the eye. On that high ground near which is the Estancia de la Loberia Chica, (Seal Farm,) thousands of fine cattle may sometimes be seen feeding.

Cape Corrientes is a high and rather a bold headland; the South-eastern extremity of a range of hills running nearly East and West. The Sierra Tandil and Sierra Vulcates. can form part of this range. In clear weather three ranges of the latter are visible from a vessel at sea, and have a singular wedge-like form, somewhat resembling the Bill of Portland. These ranges of high land are like the downs on the English coast, but they do not end so abruptly, nor with such imposing cliffs. Near the sea they slope away gradually, and are ended by broken rocky shore.

Half a mile to the Northward of the cape is a little bay, where a boat may land in fine weather. The Southern side of the bay is bounded by the rising ground of the cape; the Northern by the cliffy shore under the Estancia. A vessel may anchor in this bay during off-shore winds, in from 5 to 10 fathoms water, over a clean sandy bottom; but with Easterly winds of any strength a heavy swell would set in, and render the anchorage unsafe.

There is a bare sandy place on the East side of Cape Corrientes, around the upper part of which the green turf has so regular an edge that it appears artificially cut; and all the higher part of the cape is covered by smooth green turf, without either trees or bushes. The highest part is 120 feet above the level of the sea.

Five miles Southward is Mogotes Point; high, bare, and sandy; ending towards the sea in a low projecting spit, which requires a berth of 2 miles in rounding the point. The summit is 104 feet above the sea.

When near the point you can distinguish several sand-hills, some of which are peaked and higher than others. Behind the sand-hills, the down-like hills, described above, extend to the Westward.

Off Mogotes Point it has been said that there is a shoal; but no less water than 7 fathoms near the shore, and 9 fathoms at 5 miles distance, was found by the *Beagle* when seeking expressly for the reported shoal, excepting on the ridge which continues under water one mile from the spit off the point.

Andres Head is the South-west extremity of a range of high bold cliffs, which extend from the North-east half-way between that Head and Mogotes Point. From the place where they end the shore is low, sandy, and rocky.

The bay, or rather bight, between Mogotes Point and Andres Head should not be entered by ship or boat. Many sunken rocks lie near the shore, causing blind breakers at sudden intervals.

The highest part of the cliffs, near Andres Head, is 70 feet above the sea. A short distance inshore of those cliffs is the Estancia de la Sociedad (Society Farm), formerly the Estancia de la Loberia Grande (Great Seal Farm.)

Off the projecting land, which extends from Andres Head to Cape San Antonio, the current sets strongly to the Northward previous to and during Southerly winds; and as strongly in the opposite direction under contrary circumstances. From 1 to 3 knots are usually the limits of strength, although there are intervals when no current is perceptible.

From Andres Head to Hermeneg Point the coast is rugged, not high, nor yet very low, from 30 to 80 feet being the usual height. There are a few detached irregular cliffs, and some gaps, or creeks, which might afford a landing-place for a fine weather; but there is neither shelter nor anchorage for a ship.

Close to Hermeneg Point is a little bight, into which runs a small stream of fresh water.

Very few bushes appear on this part of the coast, and scarcely a tree, excepting a few near the Estancia de la Sociedad. Sometimes a considerable extent of grass land

appears, but in most places near the sea the ground appears sandy and barren, thinly covered here and there by coarse grass, or by low prickly shrubs.

Black Point. From Herneneg Point to Black Point, and thence onwards to Asuncion Point and Mount Heraoso, the coast has a similar appearance, and is equally unfit to approach. Occasionally the sand-hills rise higher, to 100 or 130 feet above the sea, and some are more than usually barren, or there are a few more bushes, and rather more grass, to vary the view; but there is no other variety.

Gueguen River. About 5 miles to the Eastward of Black Point the River Gueguen, or Josef, runs into the sea. Its entrance is accessible to boats during moderate weather, when there is not much swell; but it is inaccessible to small vessels. A large swell is generally rolling towards this shore, so fully exposed to the Southern Ocean.

If a vessel should anchor near any part of this coast, it is probable that she will lose or break her anchor in endeavoring to weigh. Hard tosea, full of holes, receives the anchor in most places. On the lead line brown sand and broken shells always come up, indicating a clean bottom; but the sand lies thinly over the treacherous tosea.

There is sufficient depth of water for the largest ships near all the coast between Cape San Antonio and Asuncion Point, excepting near the Medano bank and Mogotes spit.

As you approach the land the soundings decrease gradually. They extend to a great distance. When 50 miles off shore you will find between 30 and 60 fathoms. At 100 miles distance there are between 50 and 80 fathoms. The bank of soundings may be traced to an average distance of 150 miles from the land.

Ariel Rocks. Some rocks, or a shoal, said to have been discovered by the Ariel, of Whitehaven, Dixon master, have been sought for repeatedly, without the least success. Their alleged situation is in the track of vessels trading between the Rivers Plata and Negro.

El Rincon. The deep bight, formed by the sudden change in the direction of the coast on each side of Bahía Blanca, or Blanca Bay, is called the Rincon (corner.) Generally speaking it is shallow.

Inside of an imaginary line drawn across this deep bight from the River Gueguen to the River Colorado, more than 20 fathoms water will not be found. Between that and 10 fathoms will be the depth until you approach either shore near enough to see the highest parts in clear weather, with the eye 20 feet above the water; and throughout the space thus described there is anchorage during North or West winds. South or East winds send a swell into the Rincon which obliges vessels to keep under sail. But it should be remembered that winds prevail from North and West during at least four days out of five.

In the Rincon, and along the coasts to the Eastward and Southward, the lead will invariably bring up sand, or sand mixed with broken shells, and perhaps some gravel, but the quality and color of the sand is very different in different situations, and should be carefully noticed, whether with a view to anchoring in good ground, or avoiding any of the numerous and very dangerous sand-banks which throng the coasts between Bahía Blanca and the River Negro. On and near the banks the sand is always of a dark brown color, very fine, and generally unmix'd with other substances; sometimes bits of shell come up on the lead; seldom anything else. If an anchor is let go upon this sort of ground, its recovery is doubtful. There may be soft ground underneath, but rarely; most of the banks are formed of tosea, and this very fine dark brown sand is simply the tosea pulverized. In the offing, over soft ground, the sand is speckled, or black or white, rather fine generally; when coarse it is mixed with gravel; broken shells are frequent, though not so regular in their location as to assist in ascertaining a ship's place.

Having such soundings as those last described, the seaman may be certain that his ship is out of danger from a shoal; and that if necessary an anchor may be dropped with confidence. At night, if the weather is moderately fine and the wind off shore, it is better to anchor than to keep under sail.

Tides. The tides set strongly, the flood to the North, the ebb in a contrary direction, nearly six hours each way. They are much influenced by the winds, their strength varying from 1 to 4 knots when within 10 miles of the banks or land; and from half a knot to 2 knots when between 10 and 20 miles from the outer limit of the dangers.

If the weather threatens, or the wind is Southerly or Easterly, it is more prudent to stand directly off shore during the greater part of the night. Heaving-to, or making free with the land, is not to be recommended on any coast, much less on this, which is considered by those who have frequented it during many years to be most intricate and dangerous.

The land is extremely low, almost flat, in most places. The banks are very extensive, and suddenly steep. A vessel may shoal her water from 10 to 2 fathoms in 2 cables' length, even while out of sight of land from the deck. To this unwe-

niences should also be added strong tides, and gales from the South-east, which bring thick weather and a heavy sea, overfalling and breaking as it approaches the banks.

When entering the Rincon, if the object be to anchor in or near Bahía Blanca, the Northern shore between Black Point and Asuncion Point should be kept in sight from the main-top; or the ship should be kept between the parallels of $39^{\circ} 5'$ and $39^{\circ} 15'$.

Eastward of Asuncion Point, the land may be approached as near as may be thought proper, but from that point to the Westward more caution must be used, particularly when about 10 miles West of Asuncion Point, as well as in the immediate vicinity of Bahía Blanca.

To the Westward of Asuncion Point, and thence along shore, the soundings are irregular, within 8 miles of the land. Ridges of tinea run out in a South-east direction, from 5 to 10 miles from the shore. These ridges are so frequent, and so regular, that crossing them from North-east to South-west gives one the idea of a vast land-swell, the hollows of which are 6 fathoms lower than the risings, and about 2 cables' length from one hollow to another. In crossing those spaces the lead shows from 10 to 1 fathoms; and the water deepens again as quickly as it shoals. From 8 to 6 fathoms is the usual change; 10 to 4 is the extreme.

At a less distance than 5 miles from the land, near Asuncion Point, these ridges have not 4 fathoms water over them; and by keeping within the limits above mentioned they will be avoided.

When to the Westward of the meridian of Asuncion Point, and between the parallels of $39^{\circ} 10'$ and $39^{\circ} 20'$, the Sierra Ventana will be seen if the weather is clear.

The Sierra Ventana is a high mountain 3,500 feet above the sea, a considerable height anywhere, but in this low country extraordinary. When seen from the South-east the summit is peaked; seen from the South it appears rather square, with a notch in the middle.

A good bearing of this mountain (astronomical if possible) and the latitude of the ship will fix her position with certainty.

Supposing that the weather is thick, or that the Sierra Ventana is not seen, the distance of the vessel from the North shore should first be ascertained, either by latitude or by steering due North, with attention to the lead and the lookout, until the water shoals to 8 or 7 fathoms, if the land is not seen previously to obtaining that depth. Reference to the chart and the ship's reckoning will show the position. By distance from the land, which runs nearly East and West from 10 miles West of Asuncion Point, the latitude will be known.

Being about 10 miles West of Asuncion Point, (which is a projecting sand-hill 120 feet above the sea, difficult to distinguish with certainty, yet the most marked feature of this unvaried coast,) and 8 or 9 miles from the North shores, in latitude $39^{\circ} 10'$, steer so as to make good a true W.S.W. $\frac{1}{2}$ W. course, and a distance (by ground log) of 30 miles. The vessel should be kept as nearly as possible in the parallel of $39^{\circ} 10'$, not going to the Northward of it, when between 40 and 10 miles East of the meridian of Mount Hermoso, nor to the Southward of it when less than 10 miles from that meridian.

Excepting the Sierra Ventana and the Northern shore, no land will be seen. The Northern shore will appear low, just topping above the horizon of an eye 20 feet above the water.

Monte Hermoso is a little round hill, higher than those around it (excepting one little hillock, which is rather more inland). It is close to the sea, and forms, when seen from the Eastward, a distinct finish to the sea-coast; Westward of it the land is lower, and is not at first visible. Upon it there is a pile of tinea, 10 feet square, raised by the Beagle's crew. Below the mount a low cliff of about 12 feet in height will be seen; it is the only one hereabouts, and is called Papagayo cliff.

Between Monte Hermoso and Bahía Blanca the North Bank, which shoals very gradually, projects S.S.E. from the shore; and which, with the two Toro Banks, nearly block up the entrance into Port Belgrano.

Between Bahía Blanca and Falsa Bay lies the Lower Toro Bank and the Horn Spit, which is very suddenly steep at its North-east side; and then the Lobos Bank, which extends nearly North and South to the parallel of $39^{\circ} 20'$. To the Westward of these banks the land is so low that it is visible only from aloft.

Next to Falsa Bay is Green Bay, and between them are some large banks. Westward of Green Bay is Green Island, with banks lying off its South-east end. Between Green Island and Laberinto Head is Brightman Inlet.

From 3 miles South of Laberinto Head, or from latitude $39^{\circ} 30'$ to the mouth of the Colorado River, in latitude $39^{\circ} 51'$, the coast runs directly South, and is quite free from obstructions, or dangers of any description. The water shoals gradually, and regularly, therefore a vessel may go by her lead and close the land as much as she thinks proper. The land is low. A range of sand-hills, between 30 and 10 feet in height, extend parallel to the high-water mark. The beach is sandy, and in some

places runs off more than a mile at low-water. It has neither opening nor break of any kind.

At the entrance of the Colorado River the sand-hills end abruptly, forming a low but distinct headland. The *Sauci* (a kind of willow) trees show themselves as you open the river. They are the only trees of this or any other kind on this part of the coast. From the Colorado the land is very low until near Indian Head.

Indian Head.

Indian Head cannot be mistaken, being a bluff 25 feet high, rising from very low land, which nowhere exceeds 20 feet in height above the sea, and is in many places almost level with the water at ordinary spring-tides.

Starve Island.

From seaward Starve Island, and perhaps a part of the South-west side of Union Bay, may be seen at the same time as, or soon after, Indian Head.

Serpent Bank.

Off Indian Head is the Serpent Bank, extending 4 miles to the Eastward, and with more water over it to a greater distance. Between Indian Head and Starve Island is Union Bay, a good harbor for vessels drawing less than 17 feet water. The Serpent is the first of the extensive flats and shoals lying between the Colorado and San Blas Bay. They extend to the Eastward and Southward, from 10 to 15 miles from the land.

Anegada Bay.

This portion of coast, lying between Indian Head and Rubia Head, is appropriately named *Anegada* (lowland overflown) Bay.

Prodigious sand-banks, as level as the water, extend beyond eyesight soon after the first quarter ebb. At high-water very little dry land can be distinguished, even from the mast-head. Every vessel, large or small, should give these shoals a wide berth; more particularly when going Northward. They extend to the South-east Southerly, the flood-tide sets up between them to the North-west Northerly. In steering to the Northward during the flood, a vessel will probably be set towards or amongst the banks; and if so hampered she will have great difficulty in extricating herself.

Shoal water probably on each side, the tide setting 1, 2, or 3 knots towards the danger, and with a Southerly wind, no resource left but anchoring.

In this case it is probable that she will not be able to haul off to seaward, because banks extend in parallel ridges on each side. These ridges are very numerous, all lying North-west Northerly and South-east Southerly; upon them from 2 to 6, and between them from 8 to 12 fathoms water.

Between the parallels of $40^{\circ} 5'$ and $40^{\circ} 35'$, a vessel might run aground so far from the land that it could hardly be seen from the mast-head in the clearest weather. Between those parallels the banks extend from 10 to 15 miles to the Eastward. Their length North-west and South-east is much greater. Some parts are more suddenly steep than others. The water over them is always more or less discolored. When there is a swell the breakers are high and the ground-swell on the banks is sufficiently distinct to show their position. There are no rocks.

Viper Bank.

The Viper Bank, and the tail of the Snake, with their accompaniment of parallel ridges, are extremely dangerous. In going towards the South there is less danger if the lead is carefully attended, because you will naturally find the water shoaling upon an outside bank first, and may haul off to seaward when you please; besides the dangerous tide, that of flood will probably be a weather-tide, while it is running. The quality of the soundings, as before mentioned, must be strictly watched, and the time of tide borne in mind.

Southerly winds, particularly if strong, raise the flood-tide, causing it to run half an hour or an hour longer, and with more strength. Strong Northerly winds have a diminishing effect upon the flood, but they make the ebb run stronger, and cause the water to fall unusually.

Creek and Deer islands.

While passing these banks, Creek Island and Deer Island may be seen from the mast-head if the weather is clear, but it is better to keep so far off as not to see land at all.

If the land is seen between the parallels of $40^{\circ} 5'$ and $40^{\circ} 35'$ the vessel is in a more or less dangerous situation. There are always breakers near the edges of the banks even in a calm; but on the dangerous ridges, where are only 2 or 3 fathoms, there are no breakers in fine weather. A slight rippling, or an unusual smoothness, and some difference in the color of the water, are, with the soundings, the only warnings of these dangers. When there is much swell the whole extent of the banks is shown, even where there are 4 or 5 fathoms water over them.

Between the North-east sands of San Blas and Rubia Head are small banks, narrow channels, and strong tides.

Rubia Head.

Rubia Head is the North end of the land which now takes the place of the low islands and extensive sand-banks in *Anegada Bay*. It is still low, only 30 feet above the sea.

Rubia Point.

Rubia Point is a little higher, 40 feet. The coast between and on each side of them, and Southward to the River Negro, is a line of sand-hills, few as high as Rubia Point, here and there partly covered by rough grass, and by low prickly shrubs. No hills appear inland, until you approach the River Negro.

Raza Point will be recognized by the trend of the coast, as well as by three or four *Raza Point* flat-topped sand-hills.

From Rubia Point to the bar of the River Negro the coast may be more closely approached. There are neither shoals nor rocks when one mile from the beach. The lead may be trusted.

The tide sets strongly from 2 to 5 knots, following the coast's line nearly six hours *Tides*. each way.

As the River Negro is approached, the sand-hills are lower; some hills of a different character just show themselves inland.

At Main Point, on the North side of the river, the land rises a little, to 40 feet. The *Main Point*. point makes in three hummocks, tolerably covered with verdure; on one of them is a flagstaff.

Around Main Point, to seaward, are the breakers on the bar; beyond it to the Southward, is lower land, on the further side of the river, which extends about a mile, to the comparatively high and extensive range of cliffs called the South Barranca.

The River Negro separates the provinces of La Plata and Patagonia.

THE COAST FROM THE RIVER NEGRO TO THE STRAIT OF MAGELLAN.

THE South Barranca range of hills extends from the River Negro to Belen Bluff, in the Gulf of San Matias, with only a slight interval that of Rosas Bay. Their utmost height (near Belen Bluff) is 300 feet. At their beginning, near the River Negro, they are 200 feet above the sea. Thence, nearly to Bermeja (red) Head, erroneously called by many Cape Two Sisters, the low land above and inshore of the cliffs is so extremely level as to appear parallel to the water-line when seen from the South-eastward. *Bermeja Head.*

Near Bermeja Head there are hummocks and irregular hills, nearly covered with tough verdure. At the North-eastern part of these heights are two peaks, very small, yet showing distinctly when seen from the Eastward.

They stand nearly over two peculiar cliffs, which so much resemble one another that they have obtained the name of the Two Sisters (or *Dos Hermanas*).

The bar of the River Negro is the only outlying danger on this part of the coast, or, between San Blas Bay and Port San Antonio. The banks off each of those places excepted, the intervening coast is quite clear.

As far as Belen Bluff, soundings in from 10 to 20 or 25 fathoms will be found from 10 to 20 miles from the land. Everywhere there is a clean sandy or gravelly bottom. Bermeja Head is an excellent point to make when approaching the River Negro, the Bay of San Blas, Port San Josef, or Port San Antonio. It will keep a vessel clear of numerous dangers which attend the approach to either of those places on a parallel, as is the frequent but, on the coast, dangerous practice. It is dangerous on account of the tides, the lowness of the land, and the extensive banks. *Belen Bluff*

Thirty miles to the Eastward of Bermeja Head, you will have only 20 fathoms water (a fathom more or less.) Twenty miles to the Southward, the same bank extends.

Westward and Southward of Belen Bluff, there is a ledge of rocks with less than 13 fathoms over them. The water appears light-colored.

In all other parts of the Gulf of San Matias there is deep water; from 30 fathoms when a mile or two from the shore, to 80 fathoms in the offing.

West of the meridian of Norte Point, and Northward of latitude $41^{\circ} 50'$, but little stream of tide is felt; though the water rises 1 fathoms perpendicularly. Round Norte Point and thence to the bay of San Josef, the tide sets strongly, with ripples and eddies, dangerous for boats, or very small vessels. From Belen Bluff it sets strongly to the Eastward along shore with the flood and but faintly to the South or South-eastward during the ebb. Westward of Belen Bluff the flood-tide sets to the North-west, the ebb to the South-east. *Tides.*

The tide-wave, coming up the coast from the Southward, rushes round the projecting land of San Josef with much strength, causing violent and dangerous overfalls off Valles Creek, and off Norte Point. Part of the body of water goes round Norte Point. The main body continues Northward, inclining to the West, until near Belen Bluff, when it divides: one stream running to the North-west, the other to the Eastward along the land. With the wind against the tide, there is a very cross short sea in the entrance of the gulf.

Tide Creek. Ten miles West of Belen Bluff, there is a tide creek in which there are 3 or 4 fathoms at high-water, but at low-water it is dry.

West of that creek, another range of cliffs begins. This range, which is about 100 feet in height, and with one break, extends about 18 miles. To the cliffs succeed low land, with a shingle beach. Near and inshore of the cliffs, to the Westward of Bermeja Head, are irregular ranges of hills, tolerably covered with rough verdure. Where there are no cliffs, the land is low and without hills. Rosas Bay and Tide Creek appear, when first made from seaward, like openings in the land. The hills and cliffs on each side show like islands or headlands.

Lobos Bank. In the North-west bight of the gulf there is no danger, either near the shore, or outlying, except the Lobos Bank. Deep soundings may be had anywhere, and when only a few miles from the land, soundings will be obtained with the hand-lead.

From Cliff End to Villarino Point the land is low, a few banks, partially covered with grass and stunted bushes, or low sand-hills, alone rise above the shingle beach. At high-water mark, the beach is either shingle, or coarse sand. At half-tide it is composed of large shingle stone; at low-water tosea and rock are mixed with large stones.

Villarino Point. Villarino Point is low and sandy. Some little hummocks upon it are covered with rough grass and straggling bushes. Before seeing Villarino Point, the land to the Westward of Port San Antonio, and perhaps the range of hills lying to the Northward of it, will be distinctly made out. Direction hill, or the Fort, will first appear according as you are more to the East or to the South.

Direction Hill. Continuing along the coast Southward from the fort, the Sierras de San Antonio attract notice. The highest part of this range of hills may be about 1700 feet above the sea. It is peaked, and visible from a ship's deck when 20 or 30 miles from the land. There are several ranges of hills in irregular succession. Amongst these hills are ponds and streams of fresh water; but the steep and exposed nature of the shore renders it impracticable to use them for ship purposes.

All this West coast of San Matias is bold and steep to. From the point of the Sierra, to the Southward, the coast is chiefly cliffy, but with intervals of low land. The cliffs are moderately high, from 100 to 200 feet nearly perpendicular. They are composed of loose earth, or diluvium, but mixed with shingle and vast quantities of fossil shells. At high tide the shore is sandy; at low-water it is rocky.

Port San Josef. On each side of Port San Josef are bold, cliffy headlands, with deep water to seaward; but a shoal ledge runs from one to the other under water. From the East side of Port San Josef to Norte Point, there is a continued cliff from 60 to 100 feet in height. No high land appears inshore; all looks low, bare, and sun-burnt. No danger lies under water; to small vessels the races of tide which are sometimes met between San Josef and Norte Point, are rather troublesome, if not dangerous.

Tide Race. The races to the Eastward of Norte Point and Valdes Creek are yet worse. But the height and violence of these overfalls, races, or rippings, vary as much as the winds and tides by which they are occasioned. Norte Point (by some called Lobos Point) is lower than the adjacent cliffs, and a reef extends under water about a mile. It is rocky and unfit to approach nearer than that distance. In the offing is deep water.

From Norte Point to Valdes Creek the land is low, mostly a shingle beach, and off this piece of coast are the worst tide-races; being occasioned by the rush of water across shoals, and rocky patches lying from 2 to 10 miles off shore to the South-eastward of Norte Point, and to the N.N. Eastward of Valdes Creek.

There are no marks on the land by which the shoals can be avoided. The strength of tide is so great as to render the sails of doubtful effect. It is, at least, prudent to avoid going nearer to this shore than 15 or 20 miles. Sometimes the overfalls extend 15 miles from the land; sometimes they are hardly 5 miles distant; their locality depending upon wind and tide.

Valdes Creek. The entrance of Valdes Creek may be known by the shingle beach ending, and by a line of cliffs commencing at Cantor Point, on the South side of the creek, and continuing to Ereules Point.

Cantor Point. At Cantor Point the cliffs are low, but they increase in height to 220 feet at Ereules Point. There are no heights inland which can assist in showing a ship's place.

Ereules Point. Ereules Point is a high white cliff: when first seen it appears to be perpendicular, or rather overhauling. When near, the upper and lower parts of the face of the cliff meet at an angle near the middle, resembling the back of the letter K. Close to the Northward of it are two perpendicular cliffs of the same height, off which a shoal ledge of tosea extends 2 miles to seaward, and 3 miles along shore.

Delgada Point. Delgada Point is sloping and green, and is 200 feet above the water. A tosea ledge runs to the Eastward $\frac{1}{2}$ mile.

Lobo Peak rises only 15 or 20 feet above the table range. It appears from the Northward like a small peaked sand-hill; but from the Southward it appears double; a smooth round-topped sand-hill to the Northward, with a peaked one close to the Southward of it. A rocky ledge off this point extends about a mile to the South-east.

Near all the clifly points between Valdes Creek and Nuevo Gulf, there are rocky ledges extending nearly a mile from the high-water mark. In some places they extend still further, and should be allowed a berth of 2 miles. On the outer part of some of these rocky places there are not more than 2 fathoms water.

The upper outline of the portion of coast between Cantor Point and Nuevo Head is nearly horizontal.

Nuevo Head is bold. Its vicinity is free from danger, a few tosea ledges close to the shore excepted.

Ninfas Point is bold to the eye, but there are some rocks and tosea ledges extending towards the East and North-east. At the North side of the point there is a reef running to the North-east nearly 2 miles. One mile and a half from the shore there are rocks, dry at low-water, with 7 fathoms close to them. The tide rushes over these rocks at the rate of 5 or 6 knots, causing heavy and, for a small vessel or for an open boat, very dangerous ripplings or races.

There are good anchorages, wood, and water in Nuevo Gulf.

From Ninfas Point the coast runs nearly straight to Engaño Bay. This straight shore is clifly, and similar to the coast Eastward of the gulf. There is no outlying danger. The tide runs North-east and South-west, nearly in the direction of the shore, from 1 to 2 knots.

In Engaño Bay the water is shoaler than near the higher land. Around this bay, between North and South Cliffs, the land is low and sandy. Many small sand-hills or hummocks appear near the beach. At the South-west corner of the bay, where the low and sandy hummocks end and the clifly shore again begins, is the little river

Chupat. Southward to the mouth of the river is a range of table-land, from 50 to 60 feet in height, ending in very white chalky-looking cliffs.

Castro Point is the North-east termination of this table-land. The entrance of the river is partly concealed by a ledge of rocks which crosses and, at low-water, quite hides it from view.

From Castro Point to Delfin Point, and thence to Lobos Head and Union Point, the coast is high and bold. The water near it is deep and free from danger. The cliffs hereabout have a chalky appearance. They consist of very light-colored sand and clayey earth, with horizontal strata of a dark color.

At Delfin Point a small conical hummock is seen above the table-land. This hummock appears double, saddle-shaped, and rugged, when seen from the Northward.

Eight miles South of Delfin Point is Hidden Islet, and so much like the cliffs near it that one might easily run past, even if looking out, and only a mile or two distant, without seeing it.

Union Point is rather low and rocky. Here the character of the coast changes. Bold cliffs and extensive ranges of table-land no longer meet the eye, the shore becomes lower and more uneven.

Tambo Point is low and rocky. Its outline is very rugged. For a quarter of a mile from the sea it is quite bare, rocky, and dark-colored. There are some rocks and a rocky ledge extending half a mile to the North-eastward.

On the North side of the point, inside the reef, there is an anchorage where small craft might find shelter from South-east winds. Sealers anchor there at times.

Atlas Point, the Northern head of the bay of Vera, shows a smooth slope, terminating in a low rocky point, when seen from the Northward or Southward, but in a ragged ridge of rocks, if seen from the Eastward. There are rocks under water near, within 2 cables' length of the extreme point.

One mile South-west of Atlas Point is an anchorage fit for small craft drawing less than 12 feet. It is formed by a reef of rocks lying South-west and North-east nearly a mile in length, and half a cable's length broad. You may enter in a vessel drawing less than 12 feet from the North-east or from the South-West. In each entrance the bottom is rocky and uneven, and there are only 12 feet at low-water in them. Inside, opposite the shingle beach, is a good berth in 15 feet at low-water, over a bottom of coarse sand, shells, and sandy mud.

The tide sets through, between the reef and the shore, about a mile an hour.

The land is low, close around the bay of Vera; but rather high ground is seen in-shore. Two islets with rocks near them lie nearly in the middle of the bay.

Cape Raso is level and rather low. There are few rocks close to its extreme point. Two miles North-west of Cape Raso is Raso Cove, a good anchorage with all winds, excepting those between N. by W. and N.E. The cove is free from impediment of any kind; but on the East side the ground is hard and stony. In the middle, and near

*Lobo Peak.**Ninfas Point and Reef.**Nuevo Gulf.**Engaño Bay.**River Chupat.**Castro Point.**Delfin Point.**Hidden Islet.**Union Point.**Tambo Point.**Atlas Point. Vera Bay.**Tides.**Cape Raso. Raso Cove.*

the West side, there is good holding-ground, a stiff yellow clay. Sand is shown by the hand-lead, but underneath is clay. There is neither fresh water nor any fire-wood, excepting a few straggling bushes.

Salaberría Reef.
Cruz Bay.

South-eastward of Cape Raso is the reef of Salaberría, extending 8 miles North-eastward from Cape San Josef.

Westward of the rocks of Salaberría is the bay of Cruz, in which there may be good and well-sheltered anchorage.

New Cove, close to the Northward of Cape San Josef, is small and exposed to East winds. West Cove has not been examined.

Camarones Bay.
Tides.

The shore of Camarones Bay is rocky as far as Fabian Point, where it changes to shingle, and so continues as far as Cape Dos Bahías. Along this shore, and especially along the headland, the tide runs strongly from one to three knots, nearly N. N. E. and S. S. W. It rises from 8 to 12, sometimes even to 15 feet.

Cape Dos Bahías.
Moreno Islet.

A ledge of rocks extends a mile to the N. E. of Cape Dos Bahías. It should be carefully avoided.

Moreno Islet, 2 miles North-west of Cape Dos Bahías, and a third of a mile off shore, is high and rocky. It is of a dark color. In the depth of Camarones Bay, 11 miles from Cape Dos Bahías, there is a high rocky islet, with two lower and smaller ones to the Northward, all of which are perfectly white. Their whiteness is caused by numerous sea-birds.

Gregorio Cove.

From Cape Dos Bahías to Gregorio Cove the coast is bold and steep to, without an anchorage. Excepting Raso, the islets in the offing are not dangerous, being rather high, from 20 to 100 feet, with deep water near them.

Gregorio Cove is exposed to South-east winds. It is somewhat difficult to enter, because of the strong tides setting past. From the prevailing winds there is good shelter.

Rasa Islet.

Rasa Islet is dangerous because it is so low and so far from the land: the water round it is deep, excepting at the South side, where there are some rocks near the islet. They extend rather more than a mile.

Leones Isle.

Leones, or Ship Island is high and bold. It is about 100 feet above the sea. There

Leones Cove.

is a snug anchorage at the West side, between it and Harbor Island. The entrance to this cove, called Leones Cove, is from the Northward, midway between the islands. The tide sets directly through, causing eddies, which are strong enough to turn a ship round at her anchors against a strong breeze. This and the strength of the tide setting between the isles and the main-land are objections to anchoring here; yet the bottom is good, and there is generally a small stream of fresh water upon Leones Isle.

San Roque Point.

San Roque Point is low and rocky with a hummock upon it. While the flood-tide is running, a vessel ought to give it a good berth, as the tide sets rather towards it. There is no other danger in the passage between Leones and the main.

Tides.

The flood-tide sets to the N. E. Easterly, 3, 4, or 5 knots.

Cape del Sur.

From San Roque Point to Cape del Sur, or South Cape, the tide sets to the Eastward during the flood, passing the latter at the rate of 3 knots, and causing much rippling. In the bight to the Northward of Cape Sur is the Oven, a concealed dock-like cove.

Port San Antonio.
Gill Bay.

At the West side of that cape, between Valdes Island and the main, is the little port of San Antonio.

Gill Bay is formed by Cape del Sur and the North shore. There is anchorage in the bight to the South-west, in 8 fathoms at low-water. Southerly gales send a heavy swell into Gill Bay, as well as into Port San Antonio. Cape Sur makes an island when seen from the Eastward, the isthmus being very low.

Cayetano Islands.
Frayles.

Between Cayetano Islands and the main-land is a bight which appears to offer anchorage and shelter; but it is unfit for any vessel.

Pan de Azucar.

At low-water the Frayles show as three distinct rocks. At high-water there are always breakers upon them. They may be closely approached on either side.

The isle called Pan de Azucar does not resemble a sugar-loaf; its summit is uneven and rocky, rising to 190 feet above the sea. There are rocks close around, and dangerous ones between it and the reef of San Pasqual. To the Northward of the West-ermmost of these out-lying rocks, off its Eastern and Western extremities, there is anchorage under the island in 7 or 8 fathoms over a muddy bottom. This anchorage might answer for a vessel wishing to enter Port Melo and waiting for the tide.

Tides.

The tides here are strong, running along the land 2 or 3 knots. Off the projecting points and in confined passages their strength is of course increased, and causes heavy ripplings, when opposing the wind.

Port Melo.

Port Melo is too rocky, and too much exposed to Southerly winds to be valuable as a port. Off it are several rocks, lying in a direct line between San Pasqual or Molino Reef, and Pan de Azucar.

From Point Castillos to Cape Aristazabal, are several bights and coves, though none of them are worth notice as fit places for anything larger than a decked boat.

Tova Island is large and bold at the North-east side of it is Tova Cove, a good anchorage for vessels drawing less than 15 feet. In entering, avoid the reef on the starboard hand, and close the opposite shore, which is steep to. You may anchor in 5 fathoms, muddy bottom, sheltered from all winds excepting Northerly, which cannot raise much sea, as the main-land to the Northward is so near, and a strong tide is always setting through, between the island and the main. On Tova there is abundance of excellent fire-wood, and, in general, water may be procured.

The Robledo Rocks, and Medrano Shoal, lie South-eastward of Tova, and must be carefully avoided. The Medrano is a mere reef, but so far outlying, is very dangerous. At most times, the sea breaks upon it with violence.

The Lobos and Galiano Isles are beset with rocks. The Viana Isles have a reef 1½ mile to the Eastward of the largest, on which the sea generally breaks. In other directions they may be approached with safety.

Instamante Bay is very open, and exposed to the South-east winds; several rocks lie near the middle.

Port Malaspina is a mere rocky inlet, unfit for anything except a boat. Upon this coast, which forms the North side of the bay of St. George, a Southerly gale drives a very heavy sea. The land has everywhere a barren desert appearance, destitute of trees or any verdure. In height it is generally between 100 and 300 feet. No mountains are visible.

Off Cape Aristazabal the flood-tide sets to the North-eastward about 2 knots; with the ebb it runs to the Southward. There is deep water close to the cape, excepting at three-quarters of a mile to the South-east, where there is a rocky place which causes breakers at half-tide.

From Cape Aristazabal to Cordova Cove, the land gradually rises. A range of table-land is seen increasing in height, as it extends Southward. There is no danger of any kind between these places, excepting a rock off the Quintano Isles. The soundings are regular, the tides scarcely felt, the coast steep to, and bold.

After passing the Quintano Isles, high light-colored cliffs bound the coast; they continue nearly as far as Cordova Cove.

Salamanca Peak is remarkable. It is visible 40 or 50 miles distant. It is a regular cone-shaped cone, and shows itself distinctly above the high ranges of table-land.

Cordova Cove is rocky and shallow, almost unfit for the reception of any vessel. From the Northern point of the cove, a reef extends half a mile. To the N.E. of the point lies the Novales Shoal, a small rocky ledge under water. There is also a ledge of rocks directly East of the cove, and to the South-east of the North point. Five miles Southward of Cordova Cove, and one mile off shore, are the Ali Rocks; they are at low-water, and having breakers on them when covered. There is no other outlying danger between Cordova Cove and Cape Tres Puntas.

Tilli Road is a tolerably good anchorage during Westerly winds. The beach is level and sandy, but so much swell generally breaks upon it that landing is difficult. There is plenty of small fire-wood near the shore, and a *salina* of fine white salt. From North to South, by the East, Tilli Road is quite open. The anchorage is in 5 or 6 fathoms water, over a clean sandy bottom. The heights near this shore are composed of a sandy light-colored diluvial earth, and great quantities of fossil shells, principally oyster-shells of a very large size. The position of Tilli Road may be recognized by its lying between the second and third prominent bluffs, which are seen to the Southward of the lower land about Cordova Cove.

In the depth of the Gulf of St. George, from Tilli Road to Cape Murphy, the shore is low; generally a shingle or sandy beach, without cliffs or rocks. The soundings are the offing are regular. Cape Murphy is a cliffy bluff. Thence to Casamayor Point, the shore is rugged and broken.

Very little cliff is seen until you reach Casamayor, where the land again rises into a high ridge, fronted towards the sea by precipitous cliffs. This ridge is called the heights of Espinosa. Thence to Cape Tres Puntas the coast is alternately cliff, rock, sand, or shingle, in discontinued portions.

Cape Tres Puntas may be known from seaward, by observing that it is the termination of a long level range of table-land running nearly North and South. A little to the South-east of the Northern end of that range is a remarkable conical hill, like a sugar-loaf, attached to the main range, though rather a straggler; and there is a small sharp peak rather Northward of the fall of the range.

Cape Tres Puntas shows three distinct upright heads of a light-colored earthy cliff. Off these heads are ledges of rocks, extending half a mile to seaward. Over them the tide runs and ripples with violence. One mile from the shore there is no danger whatever.

*Tova Island.**Robledo and Medrano Rocks.**Lobos, Galiano and Viana Isles.**Instamante Bay.**Port Malaspina.**Cape Aristazabal.**Quintano Isles.**Salamanca Peak.**Cordova Cove, Novales Shoal.**Ali Rocks.**Tilli Road.**Cape Murphy.**Espinosa Heights.**Cape Tres Puntas.*

From Cape Tres Puntas to Cape Blanco the coast is low and rocky, with table-land showing inshore. A thick bed of kelp lines the rocky coast. Salinas (salt lagoons or marshes) extend for many miles inshore of these points.

*Cape
Blanco.*

When at a distance, Cape Blanco appears to be an island. Three distinct masses of rugged rock 130 feet high are connected to the main-land by a narrow low isthmus. On each side of the isthmus is a small cove. That on the South side is sheltered excepting from South to East. A very small vessel might obtain tolerable shelter from all winds, by anchoring close to the end of the kelp, in the North-east corner of the cove.

A vessel intending to anchor here should make great allowance for the tide. The flood sets with great force over the bed of rocks, which lie half a mile North-eastward of the cape. They would prove extremely dangerous, if drawn in among them. The beach around the cove is rather steep, and formed of shingle, here and there mixed with dark sand. The depth is from 4 to 6 fathoms. Plenty of excellent fire-wood, of a small sort, may be cut on the South-west side of the cove, a few yards only from the beach. There is no appearance of fresh water. From the summit of the cape, patches of shoal water are seen towards the N.E. and S.E., some 10 or 12 miles off shore. On and about them are rippings and overfalls, more or less violent according to the time of tide, and the direction and strength of the wind.

Over these shoals there is but little water in many places, and the soundings are very irregular. A ship should entirely avoid them.

From Cape Blanco Southward, the land is low, and the bench regular, until near Port Desire, when it rises into a remarkable bluff.

Tides.

It should be borne in mind, when approaching any part of the coast between Union Bay and Port Desire, that there is a difference of half a tide, or three hours nearly, between the turn of tide in the offing and high-water, or the turn of tide in the harbors. Three hours after high-water in the harbors, or rather upon the shore, the tide ceases to run to the Northward, and begins to run in a contrary direction. Also 3 hours after low-water on the shore, the tide turns in the offing.

*Cape Blanco
Shoals.*

There are several shoals off this part of the coast, which, at low-water, would doubtless be dangerous. His Majesty's ship Adventure passed over two of them, and had not less than 5 fathoms, but possibly at low-water the depth may be considerably less; they are thrown up by the force of the tide, which sweeps round the cape, into and out of St. George's Gulf, with great strength.

Byron Shoal.

The North and South ends of the Byron Shoal bear respectively from Cape Tres Puntas and Cape Blanco, E. N. E. $\frac{1}{2}$ E., distant from the former 7 miles, and from the latter 5 miles; consequently it extends in a N. W. $\frac{1}{2}$ N. and S. E. $\frac{1}{2}$ S. direction for 6 miles; it is scarcely a quarter of a mile wide.

Anne Shoal.

The North end of Anne Shoal bears E. $\frac{3}{4}$ N., 7 miles from Cape Blanco, and extends in nearly a Southerly direction for 2 miles. Between these shoals there is a passage 2 miles wide, and the depth gradually increases to more than 45 fathoms.

Within these shoals are two others; a small one with 2 fathoms on it, bearing E. $\frac{1}{2}$ S. from the cape, and distant 2 miles; and another 2-fathoms bank, which has been named after the Susannah cutter which struck on it. It is 2 $\frac{1}{2}$ miles in length, and nearly a mile broad; its direction is S. S. E. and N. N. W., and its Northern end lies 33 miles S. E. by S. from Cape Blanco. There is probably more shoal ground to the N. E.; for in the year 1829, having approached the land within 14 miles of Cape Tres Puntas, bearing S. W. $\frac{1}{2}$ S., the depth rather suddenly decreased from 10 to 11 fathoms, pebbly bottom, being then about 10 miles within the 50-fathoms' edge of the bank. On approaching the land, the quality of the bottom becomes irregular, and changing from ooze to sand, with pebbly shoal patches; so that by attention to the soundings and nature of the bottom, these shoals may be easily avoided.

A good mark to avoid them is, not to approach so near to the cape as to see the rugged hillock of Cape Blanco, and to keep the high land of Cape Tres Puntas, which is visible from the deck, about 20 miles on the horizon.

Tides.

The flood or Northerly tide ceases in the offing at 4h. 15m. after the moon's passage, which agrees very well with the establishment of the tide off Penguin Island; but in the neighborhood of the cape and among the shoals, the tides may be less regular; they produce strong rippings, and set with considerable strength.

*Coast
between
Cape Blanco
and Port
Desire.*

The coast line between Cape Blanco and Port Desire was imperfectly seen; within the distance of 3 to 5 miles from the shore there are several small patches of rock, which uncover at half-tide, but beyond that belt the coast is free from any known danger, and may be approached to not less than 15 or 14 fathoms; within that limit the ground is foul. To the Northward of Port Desire the land is low, with a shingle beach, except for the first 3 miles, where it is high and lofty. The North Point of entrance of the port is a steep bluff, and is therefore remarkable as being the only point of that description along this part of the coast. At 4 miles N. by E. $\frac{1}{2}$ E. from that bluff there are some rocks, called Sorrell Ledge, a quarter of a mile without

*Sorrell
Ledge.*

and rocky, with table-land at. Salinas (salt lagoons)

which the depth is 13 fathoms. The Tower Rock, on the South side of the coast, becomes visible after passing this ledge; it opens out when the North bluff bears S. W. 4 S. A ship bound to Port Desire, or merely wishing to anchor in the bay which fronts it, may procure a good berth in 7 fathoms, at low-water, well sheltered from N.N.W. to S.E., with the North Bluff bearing N.W. 4 W., and Tower Rock W. 4 S. This situation being a little to the Southward of the fairway of the port, and about 1 mile from the nearest shore, is quite out of the strength of the tide. The bottom, however, being strewed with rounded stones, is rather foul for hemp cables, but the holding-ground, although of such suspicious quality, seemed to be good. At this place the tide rose from 6 1/2 to 9 1/2 fathoms, a difference of 16 1/2 feet.

The outer side of Penguin Island is bold, and may be passed very close without danger, for the tide rather sets off than towards the shore. The tide is very rapid, and forms, even in a calm, strong rippings, which in a breeze must be very dangerous for boats to pass through, and, indeed, not agreeable for vessels of any size. The flood sets to the Northward, and during its strength at more than 3 knots; off the island the high-water, or the termination of the Northerly stream, takes place at about 4h. or 4h. 15m. after the moon's passage; which is 3 1/2 or 4 hours at least after it is high-water at the shore.

Sea Bear Bay is one of the best anchorages on the coast, but it is difficult of access without a leading and fresh wind, on account of the strength of the tides, which set to the Northward through the narrow channels separating the rocky islets that are strewed between Penguin Island and the main-land; and the bottom there is not only 20 to 30 fathoms deep, but very foul and rocky; so that although a ship may be prevented from drifting through by dropping an anchor, yet its loss, from the foulness of the ground, would be almost certain.

The South point of Sea Bear Bay is in 47° 57' 15" S., and 65° 45' 40" W.; variation 20° Easterly; high-water, at full and change, 12h. 45m., and the tide rises 20 feet.

Spring Bay is contained between the South head of Sea Bear Bay and the point within the Shag Rock; it forms a deep bight, but is much exposed, being quite open to the South and East; and at the conclusion of a South-west gale, when the wind always veers to South and South by East, there is a considerable sea. The shore is skirted for some distance off with many rocks, and the bay altogether is quite unfit for anchorage. The land is of the same height as about Sea Bear Bay, but has more lumps or nodules of rocky hills visible on the outline of its summit.

Off this bay, in the old chart, is laid down a rock called the Eddystone; it would seem that this rock and the Bellaco Rock, discovered by Nodales in 1619, is the same danger; but the whole coast between Cape Blanco and Port San Julian is much strewed with shoals, which are the more dangerous from the strength of the tides which set between them. In navigating upon this part of the coast, the depth and quality of the soundings is a good guide, and, as a general rule, when the depth is more than 10 fathoms, there exists no known danger.

A reef of rocks is said to exist about 10 miles E.N.E. from the Southern point of Spring Bay. The position of the reef, according to the same report, is about 48° 7' S., 65° 37' W.

In directing the ship's course by night near this coast, regard should be paid to the tide, which sets with considerable strength, the current parallel with the shore.

The Shag Rock is a whitish mass of rock, perfectly bare, lying about 1 1/2 mile off Lilly Point; 2 miles to the Southward of it there are four small dark-colored rocks; and a mile further there is rather a large rocky islet.

On the land, and at a short distance from the coast, there are three hills, which appear, when a little to the Southward of Sea Bear Bay, to be round-topped, but on reaching more to the Southward, they extend in length and form into two hills, and when 3 leagues to the Southward of the Shag Rock, they appear to form one mass of table-land.

Cape Watchman is very low, but may be distinguished by its bell-shaped mount; at 2 leagues from the point there is a shoal with kelp on it, and only 3 fathoms water. There are also many other shoal patches, but all are buoyed with sea-weed; the ship passed between several in 7 and 9 fathoms.

To the Northward of Cape Watchman the shore falls back into a bight, called Desvelos Bay, which offers good shelter from Westerly winds; but in approaching or quitting it, due allowance must be made for the tides, which sweep along the shore from 2 to 3 knots.

The ground is very foul for more than 4 miles from Cape Watchman, and is so uneven that the tides ripple much. Though no positive danger has been discovered, it would always be prudent to give the cape a wide berth, and pass to the Eastward of the Bellaco. When the cape has been passed, a hill will be seen to the N.W. of it,

Port Desire.

Cape Watchman

Monte Video. somewhat resembling Monte Video, in the River Plata, both in shape and color, but not quite so high; it also is called Monte Video, and is in $48^{\circ} 13' 40''$ S., and $66^{\circ} 25' 50''$ W.

Bellaco Rack. The Bellaco Rock, or the San Estevan Shoal, is in latitude $48^{\circ} 29' 20''$, and longitude $60^{\circ} 12' 15''$. It bears 10½ miles S. 40° E. true, or nearly S. E. by E. ½ E. magnetic, from the extremity of Cape Watchman, and S. E. ¼ E. from Monte Video. The rock is a dark mass, about 6 feet above the water at high-tide, and has the appearance of a boat turned bottom up; within half a mile of its South side are 12 and 15 fathoms, rocky bottom, and on its East side, at the same distance, the depth is from 20 to 24 fathoms. The ground around it being foul and uneven, the coast in its neighborhood should be avoided.

Lookout Point. From 4 miles to the Southward of Cape Watchman to Lookout Point the land rises and the coast is safer; but 5 miles to the Eastward of Lookout Point, there is a large patch of foul ground with much kelp. The land still rises, in advancing to the Southward, till it attains the height of above 600 feet, and is then remarkable for its horizontal outline.

Flat and Bird Islets. Flat and Bird Islets, though low, are too near the land to be dangerous to vessels that keep a fair offing.

Dañoso Reef, Port San Julian. Nine miles to the Southward of Flat Islet, and off the high table-land of Cape Dañoso, a dangerous reef projects 3 miles from the shore to the South-eastward, but it does not appear to be steep to. From thence to Port San Julian, there is no known danger; and Mount Wood, and the above-mentioned long range of horizontal land, show so far out to sea, that they are unfailling guides for making that port.

When Mount Wood bears W. S. W. ½ W., it is in a line with Descargaño Head, the South point of the entrance, which may be distinguished 6 or 7 miles or more, according to the state of the weather. The North point of the entrance, Cape Curioso, is a low point jutting out to the Northward, formed of cliffs horizontally stratified, of which the upper part is white-brown, and the lower generally black, or with black streaks.

The land to the Southward of Port San Julian is uniform, flat, and low; it is covered by scrubby bushes, and fronted by a shingle beach. At 10 or 12 miles South of it, coming from the Eastward, a small flat-topped hill is seen over the low coast hills.

In latitude $49^{\circ} 29'$, the character of the coast changes to a range of steep white clay cliffs, the average height of which is about 315 feet. They rise like a wall from the sea, which, at high-water, nearly washes their base; but at low-water they are fronted by a considerable extent of bench, partly of shingle and partly of mud. Some short rocky ledges, which break at half-tide, lie off several parts of this range, but none of the ledges extend for more than a mile from the shore. This cliffy range occasionally forms projections, but so slight as not to be perceived when passing abreast of them.

Anchorage off the coast. Anchorages along the coast may be taken up with the wind off shore, at from 1 to 2 miles from the beach, and in from 9 to 14 fathoms, oozy bottom. In latitude $49^{\circ} 58'$ the range of steep white cliffs begin gradually to diminish in height, and terminate at 9 miles further to the Southward, in a low point, forming the Northern side of the entrance of Santa Cruz river. It is called in the chart North Point, and is in $50^{\circ} 3' 20''$ S., and $68^{\circ} 3' 10''$ W.

Santa Cruz. The appearance of the coast about the entrance of the river of Santa Cruz is very remarkable, and easy to be known, from the manner in which it makes, when seen from the Northward, and is even more conspicuous when seen from the Southward. From the latter direction a coast line of cliffs and downs of considerable height is seen extending to the Southward of the entrance as far as the eye can reach, and terminating abruptly to the Northward in a high, steep, flat-topped cliff, Mount Entrance, of which the upper part descends vertically, the lower slopes off, and appears to be united with some very low land, which will be seen extending (according to the distance off) two or three points of the compass to the Northward of it. Mount Entrance is at the South entrance of the river, and is 356 feet high; the low land is on the Northern side of the entrance of the river.

Tides. Well up the harbor the spring-tides rise 42 feet, and run sometimes 6 knots. The neaps rise only 18 feet, and with a much more moderate velocity. In the offing the tides flow regularly 6 hours each way, but turn 2 hours later than the time of high-water inshore. The flood, as before, runs to the Northward.

The harbor and river of Santa Cruz will be more particularly described in the following chapter.

The coast to the Southward of Santa Cruz is bounded by a ledge of rocks, which are either dry at half-tide, or are then shown by a line of breakers; they extend as far off as 3 miles.

Between Santa Cruz and Coy Inlet the coast trends in, so as to form a considerable *Coy Inlet*. It is a succession of cliffs and intervening low benches. Coy Inlet is conspicuous, as it is the only part of the coast that has the appearance of an inlet between Santa Cruz and Cape Fairweather.

When within 7 miles of its latitude, (50° 57') as well to the Northward as to the Southward, a ship should keep at the distance of 4 or 5 miles off the coast. There can be no inducement to go nearer, as it affords neither fuel nor water; and if incautiously approached, much trouble and danger may ensue, from the ledges of rocks, which project at least 3 miles, and perhaps more, from the coast.

Coy Inlet is said to be a shoal basin of some miles in breadth at high-water, terminating 19 miles from the entrance, and fronted by a bar of rocks, leaving a passage of only 6 feet water; inside there are little more than 3 feet water, and in most parts of the inlet the banks, which are of mud and sand, are dry at low-water; it seems to be useless for any other purpose than to afford shelter to a small boat. The Southern side of the inlet is cliffy, and at its termination receives the drains of an extensive flat country.

Thence to Cape Fairweather the coast is similar to that to the Northward of the inlet, but more free from rocky ledges, and good anchorage may be had from 2 to 6 miles off shore, in from 7 to 12 and 14 fathoms, muddy bottom, the water shoaling gradually to the shore. The beach is of shingle to high-water mark, and then of hard clay as far as 100 feet beyond the low-water limit, where a green muddy bottom commences, and the water gradually deepens. The outer edge of the clay is bounded by a ledge of rocks, on which the sea breaks; it extends for some distance parallel with the coast.

The flood sets to the N.W. by N., and the ebb S.E. by S., 6 hours each way; high-water, at full and change, takes place between 9 and 10 o'clock, and the tide rises 21 feet. *Tides.*

About 17 miles North of the cape there is a ravine containing abundance of fresh water, which may be obtained, when the wind is off shore, without any difficulty; it is standing water, and being much grown over with plants, may not keep, but for a temporary supply it seemed to be very good. *Fresh water.*

Cape Fairweather is the Southern extremity of the long range of clay cliffs that extends from Coy Inlet, almost without a break. The cape resembles very much Cape St. Vincent on the coast of Portugal, and appears to be of the same character as Cape Virgins, for which it has frequently been mistaken, notwithstanding there is more than 45 miles' difference in the latitude of the two headlands. *Cape Fairweather.*

On the old charts of this part of the coast the shore is said to be formed of chalk-hills, "like the coast of Kent;" the resemblance certainly is very great, but instead of chalk they are of clay. They are from 300 to 400 feet high, and are horizontally stratified, the strata running for many miles without interruption.

The interior is formed by open plains of undulating country, covered with grass and plants, among which is abundance of wild thyme, but entirely destitute of trees; guanacoos may be procured by lying in wait at the water-holes.

Besides the pond above-mentioned, there is no want for fresh water; it may be seen trickling down the face of the cliffs at short intervals. *Fresh water.*

The entrance of the river and Port Gallegos is formed on the North side by the cliffy land of Cape Fairweather, and on the South by a low shore that is not visible at sea for more than 4 or 5 leagues, excepting the hills in the interior called the Friars, the Convents, and North Hill. It is fronted by extensive sand-banks, most of which may be crossed at high-water, but at half-ebb they are almost dry. The entrance is round the South extremity of the shoals, which bears from Loyala Point S. E., distant 10 miles. The passage in is parallel with the coast, taking care not to open the land to the Northward, the most Eastern trend of Cape Fairweather. The shore may then be gradually approached, but in the present state of the knowledge we possess, the ship should be anchored there in 10 fathoms, to wait low-water at 13 mile from the shore, as soon as Loyala Point begins to be observed to trend round to the Westward; the anchorage there is good, and well sheltered from the prevailing winds. *Port Gallegos.*

By anchoring, the passage in will be easily detected, and may be passed before the shoals are again covered, which will be a good guide. Anchorage may be taken up on the South side, for to the Northward the banks are extensive. *Directions for entering.*

There is also a middle channel, which, as it appears to be the widest, may be the best for crossing the bar. The outer part was not examined, but no doubt there is a sufficient depth of water at three-quarters flood for any vessel to pass it.

The water of the river is fresh at 25 miles from the mouth. In the entrance the time of high-water, at full and change, is 8h. 50m.; the rise of tide at the springs is 46 feet, and the stream runs as much as 5 knots. *Fresh water.*

*Coast to the
North of
Cape
Virgins.*

From Port Gallegos the coast, towards Cape Virgins, extends in a more Easterly direction than it does to the Northward of Cape Fairweather; and, for the first half of the distance, is formed by a low shelving coast, which, at a few leagues from the shore, is not visible, so that a stranger might readily suppose it to be the entrance of the Strait of Magellan. There are, however, some marks by which it may be known, even should the latitude not have been ascertained. In clear weather the Priars and the other hills will be visible, and in thick weather the soundings off the cape will be an infallible guide; for at the distance of 4 miles off no more than 4 fathoms will be found, whereas at that distance from Cape Virgins the depth is considerable; the bottom also to the North of Cape Fairweather is of mud, whilst that to the North of Cape Virgins is of gravel or coarse sand; and the latter cape has a long low point of shingle running off for nearly 5 miles to the S.W.; and, lastly, if the weather be clear, the distant land of Tierra del Fuego will be visible to the S.S.W.

At 18 miles to the Southward of Cape Fairweather the cliffs again commence, and continue to Cape Virgins, with only one or two breaks, in one of which, 8 miles North of the latter cape, a boat might land, if necessary. There is good anchorage along the whole coast between the Gallegos and Cape Virgins, at from 2 to 5 miles from the shore; but the bottom is rather stony, and might injure hempen cables. As the cape is approached, the ground becomes still more foul.

THE PORTS BETWEEN THE RIVER PLATA AND THE STRAIT OF MAGELLAN.

Port Belgrano.

THE first harbor after quitting the River Plata is Port Belgrano, in the Rincon, or Bahía Blanca; but it will be expedient, in order to show the way into it, to retrace a part of the coast which has been already described.

Sierra Ventana.

When to the Westward of the meridian of Asuncion Point, and between the parallels of $39^{\circ} 10'$ and $39^{\circ} 20'$, the Sierra Ventana will be seen if the weather is clear. The Sierra Ventana is a mountain 3,500 feet above the sea. Seen from the South-east, the summit appears peaked; seen from the South, rather square, with a notch in the middle. A good bearing of this mountain, (astronomical in preference to magnetic,) and the latitude of the ship, will fix her position with certainty.

Supposing that the weather is thick, that the Sierra Ventana is not seen, and that the reckoning is uncertain, the safest plan is to steer due North, with attention to the lead and the lookout, until the water shoals to 9, 8, or 7 fathoms, if the land is not seen previous to obtaining that depth. Reference to the chart and the reckoning will then show the ship's place very nearly.

Asuncion Point.

Asuncion Point is a projecting sand-hill, 120 feet above the sea, difficult to distinguish with certainty, although the most marked feature of this part of the coast. Being about 10 miles West of Asuncion Point, and 8 or 9 miles from the nearest part of the North shore, or in latitude $39^{\circ} 10'$, steer so as to make good a course between W.S.W. $\frac{1}{2}$ W. and W.S.W. $\frac{1}{4}$ W., and a distance of 20 miles by the ground log.

The nearer a ship is kept to the parallel of $39^{\circ} 10'$ the better; not going Northward of it when between 40 and 10 miles East of the meridian of Mount Hermoso, nor South of it when less than 10 miles from that meridian. Excepting the Sierra Ventana and the North shore, no land is visible in the clearest weather. The North shore will appear low, just topping above the horizon of an eye 20 feet above the water. While visible, the Sierra Ventana is an excellent mark, and becomes more useful as you approach the Bahía Blanca.

Tides.

On the days of new and full moon, it is high-water in the Rincon, or great bight outside of Bahía Blanca, at 5 o'clock. In Port Belgrano it is high-water at 6. The tide sets along the North shore about one knot; the flood to the Westward near that bay; but to the Eastward, when off Asuncion Point. In the entrance to Port Belgrano, it runs between and parallel to the banks, nearly North-west and South-east, from 1 to 3 knots. The rise of the tide in the Rincon is from 6 to 8 feet. In Port Belgrano it is from 8 to 12, and at the extremity of the inlet from 10 to 14 feet is the usual difference between high and low water.

*Toro and
North
Banks.*

In approaching Bahía Blanca, the dangers to be chiefly guarded against are the two great shoals, the Toro and the North Bank. The banks are all hard; of fine brown sand, where they are steep and dangerous; of coarser and light-colored sand, where flatter and safer to approach. The Toro and the Eastern extremity of the North Bank are instances of the different qualities.

guarded against are the two
are all hard: of fine brown
nd light-colored sand, where
eru extremity of the North

The fine brown sand, of a very dark color, generally lies upon tosea. In the chan-
nels between the banks, the bottom is everywhere soft—a dark, soft, sandy mud. On
and near the banks it is everywhere hard. In the otting, when in the fairway, the
ground will feel rather soft and sticky. Still further off, it is somewhat hard, being
clay-covered by speckled sand, with broken shells.

The Great North Bank shoals very gradually, and may be approached by the lead
in a large ship with safety. The Toro is the reverse. From the deepest water be-
tween the banks it shoals so suddenly that there is hardly time for the best leadman
to give warning. The Horn spit is particularly steep. From 7, 8, or at high-water
nearly 9 fathoms, over a soft muddy bottom, you will shoal in two casts of the lead,
or less, if going fast, to 2, 3, or 4 fathoms.

Sometimes there are breakers on the edges of these banks; sometimes only rip-
plings. The Toro is generally more marked than the North Bank. Sometimes there
is not a mark on the water by which they can be distinguished by a stranger. Gene-
rally the water in the channels is less discovered than that on the banks; but where
all the water is extremely dirty and discolored, a few shades are hardly noticed.
From the mast-head, in fine settled weather, the water in the channels will appear
bluish, while that on the banks is muddy; but in windy weather the color is every-
where alike. Generally in fine weather the water is smoother on the banks than it
is in the channels, where there is a slight tide-ripple. This is also the case with a
fresh breeze at high-water; but at low-water, particularly with a breeze, breakers
show themselves upon the banks in all directions.

With or after South-east winds, as long as the swell lasts, there are breakers on all
the banks, the highest being on the Toro.

A good azimuth compass, a sextant, the plan of the bay, and good leadsmen, should
be turned to account in entering Port Belgrano.

A vessel should not go to the Westward of the meridian of Mount Hermoso before
she sees the land, and sounds up to the edge of the North Bank. When near that
meridian, it is best to steer due North until you get between 6 and 7 fathoms water
over a rather soft clayey bottom: Mount Hermoso should then bear about North-
west.

If the weather is thick, it is prudent to anchor, or stand to the South-east, for it is
out of the question attempting to enter until you are certain of the ship's place.

Mount Hermoso bearing N.W., appears as a low rounded distinct headland. It is
higher than the surrounding hills, excepting one small one, rather inshore. It is
120 feet above the sea, and at the summit is a pile of tosea, 10 feet square, raised by
the Beagle's crew. There is a low cliff (Parrot Cliff) 12 feet in height under the
mount: the only one upon the coast hereabouts. Mount Hermoso is close to the sea,
and forms, when seen from the Eastward, a distinct finish to the Northern sea-coast.
West of it, looking from the Eastward, the land appears much lower and more distant.
When seen from the Southward, this little mount is confounded with the adjacent
land, and by a stranger would hardly be made out, unless by seeing the Beagle's
mark.

Having made out Mount Hermoso and sounded on the edge of the North Bank,
alter your course entirely, and steer between S.E. and S. by E. (according to your
position) to cross or round the North Bank. In doing this, if the water shoals, or
you wish to get into a greater depth, South-easterly is the course upon which the
depth will increase fastest. All the banks and ridges lie North-west and South-
east.

When the greater part of the land is sunken beneath the horizon of an eye 20 feet
above the water, you will have between 6 and 8 fathoms water, (according to the
time of tide,) with a soft or sticky clay bottom. No land will be seen from the deck
to the Southward or Westward. From the mast-head some bushes will be seen
nearly West, apparently rising out of the water. They are on a low, flat, marshy
island, called Zuraita Island. Those first seen are Laborde Bushes; afterwards
some, more to the Westward, called Ryan Bushes, make their appearance.

It should be remembered that the tide is always setting strongly either in or out,
excepting at the very few minutes of slack water; that the fairway is narrow; that
the deepest water is close to the most dangerous bank, the Horn Spit, and that, if in
doubt, an anchor should immediately be dropped.

Supposing that you have rounded the North bank, and have between 6 and 8
fathoms water over a sticky bottom, steer N.W. by W., or from that to N.W., ac-
cording to the wind and tide, until you again get hard casts and shoaler soundings on
the South side of the North bank. Do not go into more than 6 fathoms water, or 7
at high-water, while steering Southerly, which will keep you from crossing the fair-
way and getting too near the Horn Spit. It is safest to borrow upon the North Bank,
and not to go into the very deepest water at all.

Horn Spit.

Breakers.

*Mount
Hermoso.*

Parrot Cliff.

*Zuraita
Island.*

Horn Spit.

Near the Horn Spit there are between 7 and 9 fathoms water over a soft bottom, but unless the edge of the Horn shows by rippling or breaking, it is rather too close to the deepest water.

Having run along the South side of the North Bank, and shoaled your water a little, one bearing of Mount Hermoso will show your position. Should you shoal too soon, keep more Westerly, and deepen again. When Hermoso bears N.N.E., steer one or two points more Westerly to find the end of the East Gate Post.

East Gate

The tail of this spit shoaling very gradually, is an excellent guide to the Gateway Channel, and a far better one than the Horn Spit, which shoals so suddenly.

When near the end of the Gate Post, you will see (if the weather is clear) Mount Hermoso, Texada Point, with its low, round, bare sand-hills; the Black Spot or Medano Mark, and the Laborde Bushes. Bearings of two, or angles between three of which will show the ship's position.

*Black Spot,
or Medano
Mark.*

The Black Spot, or Medano Mark, is a very singular hillock of sand close to the water, so covered with verdure as to look quite black, and well-defined among the other bare sand-hills. Behind it the land is rather higher than on any other part of the shore.

The Sierra Ventana may occasionally be used, but it is often clouded, and for so narrow a channel, such a distant mark is of little use, excepting in a line with one nearer. Its summit in one with the Black Spot, leads to the middle of the North end of the Gateway.

From the South-east end of the East Gate Post, Mount Hermoso bears N.E. by N. ; Texada Point, N. $\frac{1}{2}$ W. ; Black Spot, N.W. $\frac{1}{2}$ N. ; and Laborde Bushes, W. $\frac{1}{2}$ N.

Having found this spot, which, if the ship anchors, may be done by a boat, pass on the South side of it in 5, 6, or 7 fathoms water, but not more, and steer along the South-west side of the East Gate Post until Mount Hermoso bears N.E. ; then steer N.W. till Laborde Bushes bear S.W. by W. $\frac{1}{2}$ W., the highest part of the dry Toro Sand, W. $\frac{1}{2}$ S. ; Anchorstock Hill, W.N.W. $\frac{1}{2}$ W. ; Black Spot, N. $\frac{1}{2}$ W. ; Texada Point, N.E. $\frac{1}{2}$ E., or Mount Hermoso, N.E. by E. $\frac{1}{2}$ E.

When either of the bearings are on, you will have passed the Gateway and be in Port Belgrano. Hence, W. by N., will lead up the harbor, and the plan will be a sufficient guide. Indeed the plan, the eye, and the lead ought to be trusted more than any written directions, for they cannot embrace all the contingencies of winds, weather, tides, and oversights.

When in the Gateway, the rippling on the East and West Gate Posts, or the smoothness of the water on them, and the rippling in the channels assist one much. At low-water many parts of both banks show by breakers, and sometimes quite uncover.

*Anchorstock
Hill.*

Anchorstock Hill is the highest (57 feet) and most peaked of the hummocks seen to the North-westward ; on it is a mark which looks at a distance like a mast.

For passing the Gateway, the best time of tide is the last-quarter ebb, or the first-quarter flood. The banks show more distinctly ; and if the vessel should touch the ground, the tide will soon lift her off. The dry part of the Toro Sand is a good mark when you are near the North end of the Gateway. The breakers upon the Toro Spit are also serviceable.

All the Northern shore from Mount Hermoso Westward is low ; a succession of sand hills, partly covered with shrubs and rough grass.

To go higher up the inlet and anchor off the Pilot's House, (or the Guardia,) it is advisable to weigh at the last-quarter ebb, and to anchor again before half flood. When the banks are covered, it is difficult to find the way, but easy when they show themselves at low-water. At high-tide an unbroken extent of water is seen ; when the tide is out, mud-banks, with narrow channels winding between them, meet the eye in every direction. Above Anchorstock Hill most of the banks are mud, mixed with fine sand ; and in the creeks so soft in most places near the water that it will not support a man's weight.

Tides.

In Port Belgrano it is necessary to moor, because the tide runs strongly and rather irregularly. From 1 to 3 knots is the usual strength. South-east gales raise the water several feet ; those from the North-west have a contrary effect.

The head of the inlet ends in a small creek. Throughout its entire extent the water is salt ; some small fresh-water rivulets run into it at and above the Guardia. A boat can go from the anchorage of Anchorstock Hill to the Guardia in one tide, if the wind is not strong against her.

*Excellent
water.
Fire-wood.*

Plenty of excellent water may be obtained from wells between Anchorstock Hill and the beach. There is but little fire wood. Bushes, the stems and branches of which burn well, grow upon Zuruta Island, and in hollows between the sand-hills on the North shore. Deer, carves, and ostriches are numerous. Fish swarm in the creeks and at the edges of the banks.

*Supplies at
Puerto Ar-
gentino.*

Fresh beef may be procured at the settlement called Fuerte Argentino, and but little else.

Falsa Bay is an extensive and dreary waste. Sand-banks surround it, and neither land nor landmarks can be seen until a vessel is within the banks, and then they are not wanted. The remarks on the precaution necessary on the nature of the banks, and on the passages between them, just given in the description of Bahía Blanca, apply equally to Falsa Bay, Green Bay, and to Brightman Inlet.

It is high-water in Falsa Bay at 5h, 30m, on the days of new and full moon.

Tides.

Between Bahía Blanca and Falsa Bay are the Horn Spit, Lower Toro Bank, and Lobos Bank. The latter does not shoal so quickly as the others, particularly the Horn; but it stretches out to the South-east as far as $39^{\circ} 24' S$. This and the other two banks should be carefully avoided, whether approaching Falsa or Bahía Blanca. A large part of Lobos Bank uncovers at half ebb.

Horn Spit,

Toro, and

Lobos

Banks.

To the South and West of Falsa Bay the Laberinto Shoals extend to the South-east, from Ariadne Island as far as the parallel of $39^{\circ} 27'$. They are nearly all under water. Here and there a patch of sand is uncovered temporarily, and affords a resting-place for seals.

Ariadne

Island

Laberinto

Shoals.

When near these Laberinto shoals you will see some rising ground upon Green Island, appearing rather high, because surrounded by a dead flat, although no more than 60 feet above the water.

Green Isl-

and

and.

The Paz Bank, at the South-east extremity of the Laberinto Shoals, is the most outlying, and very dangerous. At low-tide there are not 10 feet water on it. Its seaward side shoals gradually. As the land is in sight from the vicinity of this bank, it is not difficult to avoid it during daylight.

Paz Bank

Laberinto Head next appears. It seems to be the termination of the shore on the South side of Brightman Inlet, and makes as a perpendicular bluff 40 feet in height.

Laberinto

Head

From the Paz Bank the heights upon Green Island bear $W. N. W. \frac{1}{2} W$. Northwesterly. The nearest point of the island is distant 5 miles; the heights are distant 8 miles. Laberinto Head bears $W. \frac{1}{2} S$. Southerly from the same place.

Green Isl-

and Spit

The interior of Green Bay is beset with shoals, though the entrance appears some what tempting. If it is necessary to enter, keep close to Green Bank, taking your soundings from it, and anchor to the Northward of the narrow passage (off the East end of Green Island) with the peaked hillocks bearing $W. \frac{1}{2} S$. Southerly. Remember that the banks on the East side of the entrance shoal suddenly. Low-water should be chosen as the time to enter.

Green Bay

Off Laberinto Head, Green Island Spit extends from Green Island to latitude $39^{\circ} 29'$. Between this spit and the shore is the entrance to Brightman Inlet, a narrow bar-harbor. At a distance it looks like a large river. On the South side of the entrance, the land is level and rather low, ending in a bluff, 40 feet above the water.

Green Isl-

and Spit

Brightman

Inlet

To the Northward upon Green Island are some peaked hillocks, rising 60 feet above the sea. At the Southern extremity of Green Island is a single hillock, of use as a mark. At low-water, there are 2 fathoms on the bar, which is about 2 cables' length wide.

To pass over the bar bring Laberinto Head to bear $N. W. \frac{3}{4} W$, and when the East end of Green Island bears $N. \frac{1}{2} W$, you will be close to or upon it. Keep Laberinto Head bearing $N. W. \frac{3}{4} W$, until the water deepens to 3 or 4 fathoms, with Single Hillock bearing $N. N. W. \frac{1}{2} W$. Steer upon that line, keeping the hillock on the same bearing until Laberinto Head bears $W. S. W$, then steer $W. N. W. \frac{1}{2} W$, until you are almost in a line between Single Hillock and Laberinto Head, with about 4 fathoms water over a soft muddy bottom. There anchor.

Tides.

The flood-tide sets across the entrance, (not right into it,) therefore a vessel should keep to the Southward sufficiently to insure a proper position. It is high-water at 5h, 10m, on the days of full and change. The tide rises 12 feet at the springs, and 8 with the neap-tides. There is only half an hour's interval between high water in the harbor and in the offing. The strength of tide is between one and two knots.

A vessel approaching Brightman Inlet, with a view of anchoring, should not go to the Northward of $39^{\circ} 30'$. Further South will be still safer, because the coast between Brightman Inlet and the Colorado is quite free from outlying dangers, while to the Northward of that parallel the banks are extensive and dangerous.

There is abundance of game on the main and on Green Island. Good water may be obtained by digging wells, about 8 feet deep, on Green Island. Plenty of fuel may be cut on the main land.

Game,

Good Fresh

water.

Fuel.

It appears probable that a creek, fordable at low-water, is the only separation between Green Island and the main. The tracks of cattle and horses are too numerous to suppose that there is not an easy communication. Perhaps there is no separation at all.

The River Colorado is accessible to vessels which do not draw more than 7 feet. A bar surrounds and defends the entrance. This bar, and the banks inside the river, are continually changing their position. Floods, high-tides, and gales of wind cause frequent and material alterations. It is high-water on the bar at 1h, on the days of full and new moon. The tide rises from 6 to 9 feet.

Colorado

River.

The entrance to the Colorado may be known by the abrupt ending of the sand-hills. South of the river the land is quite flat and low. When East of the river's mouth, you will see the trees which grow on the banks, a short distance inshore. They are a kind of ash, and the only trees on the coast. The entrance to the river is not more than half a cable's length in breadth, and has only 3 feet water when the tide is out. It is difficult to enter, even with the flood-tide, unless the wind is fair, and not too strong. A strong South-east or Easterly wind, throws so much sea upon the bar that it is then impossible to make the attempt. The stream of the river makes the flood very weak. The ebb runs extremely strong.

The best passage is from the Northward; and when you have passed the point on the West side, keep over towards the banks on the East. All to the Westward is flat and low. A stranger would perhaps suppose the river lay more to the Westward, and would get rather hampered in consequence. This error must be guarded against by keeping over to the East side.

The river does not show itself distinctly until you are close upon the green banks, which are nearly a mile from the bar. It is about a cable's length wide, with 2 fathoms at low-water; the banks are steep to, consisting of clayey earth. From the appearance of the banks, and the large trees that are scattered about the low land, it is evident that the river is subject to vast floods; in two months only, the entrance had quite changed; what was the deepest part having become shallow, and the reverse.

No vessel, however small, should attempt to enter while there is a swell on the bar. It is also prudent to wait during one low-water at the entrance, in order to see which is the best channel. It is the only safe way. Sometimes the water is fresh outside the bar.

Cañada River. The Cañada is an arm of the Colorado, less navigable than the latter. Between the Cañada and the main-stream there are low marshy islets and winding streamlets, almost dry at low-water.

Union Bay. Union Bay is adapted to the use of vessels drawing less than 17 feet. In smooth water, with a fair wind, a line-of-battle-ship might enter, as there are not less than 5 fathoms in the fairway at high-water; but for general use, 15 or 16 feet is quite draught enough. At full and change, it is high-water at 3h. 10m. The rise of tide, from 6 to 12 feet. Vessels intending to enter Union Bay should make the land about the River Colorado, where the coast is clear, and the lead may be trusted.

Tides. Three-quarters of a mile North of the Colorado is a flat-topped sand-hill covered with verdure. It is 40 feet in height, the highest about that part of the coast, and may easily be recognized by a stranger. When this height bears 5. by N. and is distant 4 or 5 miles, you will have from 5 to 7 fathoms water over a dark sandy bottom, and should steer S. by E. $\frac{1}{2}$ E., or rather steer so as to make good that course, until you shoal your water upon the North side of the Serpent Bank, or until Creek Hill bears W. by S. Creek Hill is the highest of three hillocks 2 miles N.W. of Indian Head.

Flat-top Hill. Indian Head is the North point of Union Bay. It appears as an island when seen from the Northward, the land Westward of it being very low. It is 45 feet high above the sea; bluff to the South-east, composed of sand-hillocks, partly covered with bushes.

Creek Hill. In approaching and entering Union Bay, the chief dangers to be guarded against are the Serpent Bank, the Dog Bank, and the tide, which sets across those banks. The Serpent, or Northern bank, extends in a long ridge, 4 or 5 miles from the shore. As far out as 2 miles from the land it dries at low-water. It shoals gradually on the North, but rather suddenly on the South side.

Indian Head. The Dog Bank extends in a similar manner to the South-east, but it is of great extent to the Southward. The water shoals upon its edge rather quickly. The flood-tide sets to the Northward right across the banks about 2 knots, seldom more, generally less. The ebb-tide sets right out at first, and then more to the Southward as it clears the Dog Bank.

Serpent Bank. The quality of the bottom alters as you approach the banks as it does in the other inlets and harbors of this coast. In the middle of the channels, there is soft, dark-colored sandy mud. Near and upon the banks there is hard, fine, brown sand.

Dog Bank. On Starve Island there is a peaked hillock, (the middle one of three,) which may be of use when crossing the tail of the Serpent. It ought to be kept to the Westward of S.W. by W. while you are crossing, in order to insure having sufficient water. When Creek Hill bears W. by S. and Indian Head S.W. by W. $\frac{1}{2}$ W., steer S.E., 5 miles, (by ground log,) then S.S.W. until Indian Head bears W. by N. With Indian Head bearing W. by N., steer for it (allowing for tide, and keeping it on the same bearing) until you are between the Serpent and the Dog Banks, and between 2 and 3 miles from the head; then steer West and anchor with Indian Head bearing N.N.W., distant half a mile. You will then have 4 fathoms at low-water over a soft muddy bottom.

Tides. The quality of the bottom alters as you approach the banks as it does in the other inlets and harbors of this coast. In the middle of the channels, there is soft, dark-colored sandy mud. Near and upon the banks there is hard, fine, brown sand.

Starve Island. On Starve Island there is a peaked hillock, (the middle one of three,) which may be of use when crossing the tail of the Serpent. It ought to be kept to the Westward of S.W. by W. while you are crossing, in order to insure having sufficient water. When Creek Hill bears W. by S. and Indian Head S.W. by W. $\frac{1}{2}$ W., steer S.E., 5 miles, (by ground log,) then S.S.W. until Indian Head bears W. by N. With Indian Head bearing W. by N., steer for it (allowing for tide, and keeping it on the same bearing) until you are between the Serpent and the Dog Banks, and between 2 and 3 miles from the head; then steer West and anchor with Indian Head bearing N.N.W., distant half a mile. You will then have 4 fathoms at low-water over a soft muddy bottom.

Swedish bay. On Starve Island there is a peaked hillock, (the middle one of three,) which may be of use when crossing the tail of the Serpent. It ought to be kept to the Westward of S.W. by W. while you are crossing, in order to insure having sufficient water. When Creek Hill bears W. by S. and Indian Head S.W. by W. $\frac{1}{2}$ W., steer S.E., 5 miles, (by ground log,) then S.S.W. until Indian Head bears W. by N. With Indian Head bearing W. by N., steer for it (allowing for tide, and keeping it on the same bearing) until you are between the Serpent and the Dog Banks, and between 2 and 3 miles from the head; then steer West and anchor with Indian Head bearing N.N.W., distant half a mile. You will then have 4 fathoms at low-water over a soft muddy bottom.

ending of the sand-hills, of the river's mouth, you are on the shore. They are a kind of bar, and are not more than half a mile wide. It is difficult to pass them, and not too strong. A bar that it is then makes the flood very weak.

When you have passed the point on the Westward, it is more to the Westward, must be guarded against

the green banks, length wide, with 2 fathoms of earth. From the top of the low land, it is only, the entrance had a swell on the entrance, in order to see the water is fresh than the latter. Between the sand and winding streamlets,

(than 17 feet. In smooth water are not less than 5 feet, 15 or 16 feet is quite good. The rise of tide would make the land about 10 feet may be trusted.

stopped sand-hill covered that part of the coast, and it bears S. by N. and is over a dark sandy bottom. Bank, or until Creek hillocks 2 miles N.W. of

to be guarded against are across those banks. The tides from the shore. As the shoals gradually on the

east, but it is of great value quickly. The floods, seldom more, generally the Southward as it clears

banks as it does in the other channels, there is soft, dark, fine, brown sand. (one of three,) which may be kept to the Westward of a sufficient water. When W., steer S.E., 5 miles, by N. With Indian Head (it on the same bearing) between 2 and 3 miles end bearing N.N.W., dis-water over a soft muddy

This anchorage is preferable because of ready communication with the shore. Mud-flats extend so far from the land in all other parts that at low-water a boat cannot land. Good water may be obtained on Indian Head by digging only a few feet into the sand.

A little to the Westward of the Head is a creek through which boats may work their way to the Colorado at half-tide. It passes close to the Creek Hills. Fire-wood is scarce about Indian Head.

Vessels wishing to enter the harbor of San Blas ought to make the land to the Southward of Raza Point; on no account to the Northward of it, unless absolutely certain of their latitude. Even then they should not close it to the Northward of Second Barranca Point, unless the tide is ebbing.

The tides run along this coast with dangerous strength, from 3 to 5 knots. The flood is strongest by nearly a knot. As the flood sets directly towards the outlying banks you must, when near the entrance, with the flood-tide running, do one of three things: enter the channels leading to the harbor, stand to the Southward, or anchor. By standing off and on, or to the Eastward, you will be on the banks in a very short time. If you cannot stem the tide by standing to the Southward, and do not choose to enter the passage, the anchor must be dropped; and if it should come on to blow from the South-eastward, your situation will not be pleasant. With the flood-tide, weighing would be out of the question; with the ebb, you might get clear, but remember that a heavy sea tumbles in with a South-east gale.

Raza Point is low, but on it there is a bare round sand-hill, 30 feet in height. Seen from the Southward, it appears like an island, the land to the Westward being low. Five miles South-west of Raza Point are some sand-hills, rather more remarkable than their neighbors, being flat-topped, and partly covered by straggling bushes, which somewhat resemble a drove of cattle.

Second Barranca Point (so called in the old charts, though called by some near the sea is a low cliff, the only one hereabouts, and therefore remarkable. Rubia Head and Rubia Point are in their appearance similar to Second Barranca Point, excepting the cliff at the base.

Rubia Point is 40 feet, Rubia Head 35 feet above the sea. Between Raza Point and Rubia Head the coast is low, consisting of sand-hills more or less covered with verdure.

Five miles E.N.E. of Rubia Point is the Southern extremity of the San Blas Banks. Generally breakers are visible, though not always. Half-way between the shore and this extremity of the banks is the proper distance to keep while steering for Helgat entrance. There are three channels or passages lying close together, the Great Gat, the Little Gat, and the Ship Gat. These channels are formed by three banks and the shore. Between the shore and the nearest bank lies the Little Gat, a narrow passage, fit only for the smallest coasting craft, or for boats.

Between Helgat Bank and Middle Bank, is the Great Gat, the least bad of the three; and between Middle Bank and East Bank is the Ship Gat, but unfit for any vessel.

Middle Bank is a narrow ridge of shingle. Something was seen in the middle of it, which might have been a piece of wreck, but it had the appearance of a rock occasionally showing at low-water. This bank generally shows at half-tide.

The tides run with great force, particularly in the channels; 3, 4, or even 5 knots, with very short intervals of slack water. At full and change, high-water takes place at 2h. 30m. in the offing, at 1h. 30m. under Rubia Point, and at 2h. in the harbor. It rises from 8 to 12 feet.

The most simple and the surest directions appear to be: wait for the last-quarter ebb, and enter as near low-water as possible. Take your soundings from the East side of Helgat Bank, and go through the Great Gat by the lead, the eye, and the plan. But to enter at any other time, more trouble will be required. When near Rubia Point, bring it to bear West, distant about 3 miles; bring Rubia Head to bear N. by W. 3 W., and the Estancia (farm-house) on the rising ground N.W. Then steer N. 3 W. until Rubia Head bears N.N.W., and the Estancia W. 3 N. when you will be abreast of the South end of East Bank, in 44 fathoms at low-water. From this spot N. by W. ought to take you safely through the Great Gat into the broad channel.

With the Estancia bearing W.S.W. 3 W., and Rubia Head S.W. by S., you will be in the deepest water between Helgat Bank and the South east end of Middle Bank. When past the Middle Bank, the Estancia will bear S.W. 3 W. In mid-channel, between Helgat Bank and the South end of Middle Bank, when the Estancia bears W.S.W. 3 W., and Hog Island beacon is one degree open to the Eastward of Rubia Head, N. by W. 3 W. ought to carry you safely through the deepest water.

Second Barranca Point.

Rubia Head.

San Blas Banks.

Tides.

Great Gat.

This is the best course (N. by W. 4 W.) with a leading commanding breeze, as long as Hog Island beacon is visible.

Beacon. If Hog Island beacon is not seen, it will be advisable to keep towards Helgat Bank until Rubia Head bears N. N.W. 1/2 W., and then steer N. by W. 1/2 W. The lead, the breaking or rippling water upon the shoals, and the plan must assist in directing your track.

The flood-tide sets strongly towards the South-east end of the Middle Bank. The ebb sets towards the North-west extremity.

The dangerous part of this entrance is about a mile in length, after which Great Gat and Ship Gat join, making the channel comparatively wide and also deeper. While Hog Island beacon is standing, the entrance will be less difficult; but it cannot be expected to stand long in the shifting sand.

Little Gat. Little Gat is used by small fishing-vessels and by boats. Being quite close to the shore, a place of refuge is at hand if a roller should fill or capsize them. Being within three banks much sea is broken off before it reaches this passage. The eye and the lead are the only guide of those that enter by the Little Gat.

Skip Gat. Skip Gat, or Channel, has a bar across its entrance, between Middle and East Bank. It is probable that this bar and the Middle Bank, both of which are chiefly composed of loose shingle, shift occasionally. From the North-west end of Middle Bank the flood sets rather towards the North end of Helgat Bank, therefore you must be guarded in steering up N. by W. 1/2 W.

Broad Channel. When you have entered by either of the two large Gats, and have brought Rubia Head to bear W., you may steer W. N.W. to the anchorage off the watering-place. This part of the harbor is called the Broad Channel; it is about a mile wide, and the tide sets directly through. It is best to keep on board the South shore, which is steep to, and will afford some shelter from South-east winds if obliged to anchor sooner than you wish.

In working up the Broad Channel, do not stand far over to the North shore. The bank shoals very suddenly on that side. There are places where in one cast of the lead the water will change from 10 to 3 fathoms. The best anchorage is off the watering-place, within half a mile of the beach, secure from all winds, and well sheltered from the South-east. The best bower inshore is 10 or 12, the small bower to the North-east in about 14 fathoms, and open hawse to the South.

Best anchorage. The beach is steep to, having 6 fathoms a few yards from it. The bottom is still sandy mud, covered with coarse gravel and shingle. Boats may land here in any weather.

Fresh water. There is a plentiful supply of good water in the wells near the beach.
Fuel scarce. Fuel is scarce in the immediate neighborhood, but can be procured in great quantity, and of excellent quality, by sending to the inhabitants, who bring it from the interior in carts. It is called Peccolipi, and is the best fuel on this coast, and perhaps as good as any wood for burning. Iron may be brought by it to a welding heat.

Good fresh Provisions. Fresh provisions may be procured in abundance from the neighboring Estancia. Fish are plentiful.

Tides. With and after a gale from the South-eastward, both channels and banks are covered with heavy rollers and breakers. At such a time it would be highly improper attempting to enter. The usual rise of the tide is between 8 and 12 feet; but it is affected here, as elsewhere on the coast, by the wind. The last part of the flood-tide comes from the Northward, from Anegada Bay, at which time the tide is beginning to ebb at the gats.

Through Anegada Bay there are numerous creek communications by which a boat may go to Union Bay and thence to the Colorado. On Deer Island there are wild dogs, the produce of those which have been left by vessels, either accidentally or on purpose. They are very savage.

San Carmen. There is frequent intercourse with San Carmen, the town on the banks of the River Negro.

Besides the injury to shipping, which is caused by the extreme dryness of this place, their chain-cables suffer from some hidden cause. Whether there is copper or anything in the bottom of the harbor which acts chemically upon the iron is hard to say, but the fact is, that in a surprisingly short time chain-cables are considerably corroded if suffered to lie upon the ground. During most summer nights no dew falls. At no period of the year is there a rainy season. During winter there are occasional but not heavy rains.

Rio Negro. In approaching the Rio Negro, it is best to keep to the Southward, and to make the land about the Fulse Sisters, or Bermeja Head. Being certain of the latitude, and making proper allowance for the tide, may justify a direct course for the river, but on no account should a vessel incur the risk of being set to the Northward of Raza Point. The tides set so strongly along shore, from 2 to 4 knots, that a stran-

ect course for the river,
et to the Northward of
to 4 knots, that a strat-

ger, unaware of their existence, might run aground on the banks near San Blas, think-
ing himself to the Southward of Raza Point.

About Cape Bernucia the land is high, and the water free from danger. If set out
of her reckoning during the night or thick weather, a vessel will not run any risk of
getting ashore. Northward of Raza Point, the case is reversed, as the flood-tide
will sweep her strongly towards the San Blas banks. Many vessels have been wreck-
ed owing to this cause.

At the full and change of the moon, it is high-water at 2 o'clock in the offing, 3 *Tides.*
hours later than upon the bar and at the entrance of the river. The tide runs parallel
to the coast from 2 to 4 knots.

Raza Point may be known by observing the trend of the coast, and by some flat-
topped sand-hills which are a short distance to the South-westward. It is low; upon
it is a bare rounded sand-hill, 30 feet in height. Seen from the Southward it appears
like an island, the land close to the Westward of it being low. Five miles South-
west of Raza Point is a range of sand-hills, somewhat more remarkable than their
neighbors, being very flat-topped, and covered with straggling bushes, which appear
rather like a drove of cattle. *Raza Point.*
Sand-hills.

Northward of the Rio Negro, the nearest land of any height is the North Barranca, *North Bar-*
so called, though in reality a range of sand-hills 110 feet high, without any cliff. *ranca.*
From the North-eastward this ridge appears as a bluff headland, visible as soon as
Raza Point is passed. All the coast Northward and Eastward of the Rio Negro is
low, and generally shows sand-hills slightly covered with vegetation, or entirely
barren.

Main Point, or Redonda Point, is a low, rounded hummocky sand-hill. From the *Main Point.*
Eastward it appears to be formed by three hummocks, tolerably covered with verdure.
On the highest, which is 40 feet above the sea, is a small half-formed battery and a
flagstaff. The battery cannot be distinguished outside the bar. At some distance
inshore two headlands will be distinguished, one of which, Leading Hill, bearing N. *Leading*
W. from Main Point, is the mark of most use in entering the river. It is the highest *Hill.*
and the Easternmost of the two headlands: it has a small round-topped hillock at the
South-west extremity, which slopes suddenly to the South-west. It is 130 feet high,
and may be seen from 3 to 4 miles outside the bar of the river.

Medano Point is very low, bare, and sandy. In very high tides it is overflowed: *Medano*
at such a time the entrance of the river would appear three times its usual breadth. *Point.*
and it would be difficult to hit the deep-water channel. South Point rises a little: *South Point.*
it is a cluster of sand-hills.

Flat Point (within the river) is a sandy point, 25 feet high, covered with verdure. *Flat Point.*
It shows a steep side to the South-west, and is rather wedge-shaped. At present this
point is distinguished by a mark, the bowsprit of a large ship, erected by the Beagle's
officers. This mark, if distinguishable, in one with the highest part of Leading Hill,
is the best guide for crossing the bar in the deepest water.

On the beach to the Northward of the river are two wrecks; while they last they
will be excellent marks. One, a brig with her lower masts standing, her hull half
buried in the sand, lies rather more than 4 miles from Redonda or Main Point. The
other, without masts, is a mile from Main Point, and so far inside of high-water mark,
that one must suppose the land is there gaining upon the water unusually fast. They
may soon decay, or be carried away for fire-wood; and yet they may be of use longer
than these remarks, for heavy gales and heavier seas assist the torrent from the inter-
rior in altering and shifting the ground about the entrance of the river. In 1827,
there was a battery on a part of Main Point, where in 1833 we found 2 fathoms
of water.

Again, within the river, the deep-water channel has changed sides. Six years ago
there were 3 fathoms where now are 6 feet. Yet the principal entrance, the South-
east, and the marks (Leading Hill and the summit of Flat Point) have varied very
little.

From Medano Point, a low sand-hilly shore extends 2 miles to the South-west.
There the land changes its character, suddenly rising into a range of perpendicular
cliffs, from 150 to 200 feet in height. These cliffs are called the South Barrancas. *South Bar-*
Above them no land is seen; their upper outline is as horizontal as the surface of the *rancaas.*
sea when they are viewed from the South-east in the offing.

With Redonda or Main Point bearing N.N.W., or more Northerly, approach
the bar until the water shoals to 10 fathoms. The lead lines should be carefully exam-
ined, marked to feet, and well used in both chains. The edge of the bar will always
show either by breakers or by rippings; rarely does a day occur on which there are
no breakers; with any swell the breakers continue all round the bar, not excepting
the channel.

Do not bring Main Point to the Westward of N.N.W. until you mean to pass
the bar.

• If circumstances do not admit of attempting the passage at once, you should anchor, or stand directly off shore again, because of the strong tide. Good anchoring-ground, and a convenient place for awaiting a proper time for entering, is to the Southward of the bar, with Main Point bearing North, and the North-east end of the cliffs (South Barranca) bearing W. N. W., or from that to N. W. by W. The former bearing will give 8 fathoms, the latter 10, over a clean sandy bottom.

While the winds have Northing and Westing this is a good roadstead; but it must be quitted directly if the wind gets to the Southward or Eastward, threatening to blow strong. Very heavy seas are sent in by Southerly gales. The strength of tide should be remembered.

The proper time for crossing the bar is during the last quarter flood, before the time of high-water by calculation. The water does not rise during the last-quarter flood, and it is of material consequence that a vessel should enter the river before the ebb-tide makes out with strength. At this time (last-quarter flood) the tide is setting strongly to the North-eastward, along shore over the bar. The difficulty is to avoid being set to the North-eastward in crossing the bank. After high-water this difficulty is increased, because the powerful ebb-out of the river meets the tide flowing to the North-eastward, along shore, and they together sweep over the Eastern bank at the rate of 3, 4, or 5 knots.

*Rio Negro
Bar.*

The passage across the bar is very narrow, not more than a cable's length in breadth. At low-water there are only 6 feet upon it. Great attention to the marks, a commanding breeze, and smooth water, are absolutely necessary to enable a vessel drawing 12 or 14 feet to enter the river. Fourteen feet is almost too heavy a draught. Not that vessels of 15 or even 16 feet might not occasionally pass the bar, but to do so they must have perfectly smooth water, a spring tide, and a fine breeze of wind. The least swell might be fatal. Such smooth water is very rare on this exposed coast. Generally speaking, 14 feet is the utmost draught that may enter the River Negro without incurring risk.

By keeping Redonda or Main Point summit distinctly open to the Eastward of Leading Hill summit, so that a sail passing between them on the horizon would just fill the intermediate space; or, by keeping Flat Point in one with the summit of Leading Hill; or, by keeping the extreme of Main Point in one with the summit of Leading Hill, about N. W. $\frac{1}{4}$ N., you will cross the bar at the proper place.

When on the shallowest part of the bar the North-east end of the South Barranca will bear W. S. W. $\frac{1}{4}$ W. At spring tides you will have about 18 feet, at neaps about 14.

Keep the marks in one until the end of the Barranca bears W. S. W.; then steer one point more Westerly until the Barranca end bears S. W. by W. $\frac{1}{4}$ W.; then one point yet more Westerly until Main Point summit bears N. N. W. Thence steer direct for Flat Point, passing close to Main Point. Having passed Main Point, steer so as to pass close to the opposite Medano Point, and anchor in a line between Medano and Flat Points if your object is to proceed further up the river. If intending to remain at the Boea, (entrance,) a better berth is rather more to the Northward, out of the strength of the tide, in 3 fathoms (at low-water) over a muddy bottom.

In a line between Medano and Flat Points there are from 2 to 4 fathoms at low-water, with a soft, sticky, muddy bottom.

Both Main Point and Medano Point are steep to: by closing them you avoid the opposite banks, which are dangerous.

Tides.

Abreast of Main Point the channel is only 300 yards in breadth.

The tide of ebb runs through it at the rate of 2, 3, 4, 5, or 6 knots, according to the wind, the body of fresh water coming down from the interior, and the state of the outgoing-tide. The flood-tide is less strong, seldom exceeding 2 or 3 knots. When an unusually great body of fresh water is brought down, owing to floods in the interior country, the ebb is at the strongest; and, on the contrary, the flood-tide is hardly to be noticed, though the water rises as usual. Like all large rivers having their sources in mountainous countries, it is subject to periodical inundations.

Directly after high-water, the ebb-tide begins to set strongly out of the river, and over the N. E. bank. Care must be taken to avoid its effects by anchoring, if in sufficient water, or running out to sea again, if on the bank. There is no time to be lost; one or other alternative must be instantly adopted, if unable to obtain the proper anchorage before the tide makes out too strongly for the wind to enable you to overcome it. Very few vessels have escaped that have once grounded on the banks or bar of this river.

*North-east
and South-
west Banks.*

The North-east bank is hard sand and shingle. The South-west is chiefly a quick-sand. The sand composing it is very fine and dark-colored.

For boats there is a safer entrance than the South-east channel. They should pass the South Barranca in 4 or 5 fathoms water, and steer about N. by E. till some bare sand-hills, rather inland, on the North-east side of the river, are distinguished.

Bringing the second of these hills (South Channel Hill) counting from the West, to bear N. by E. $\frac{1}{2}$ E., and steering upon that bearing, will carry a boat at three-quarters flood into the river. At high-water a vessel drawing 7 feet may thus cross the South bank.

This is called the West Channel, though channel there is none; but it is safer for boats to enter by this line, because they run less risk from blind breakers, which are common in the South-east channel. Also, if any accident does occur, the shore is close at hand, and the tide sets into the river.

From the Boca to the town of Carmen, the plan and the lead will suffice. If a vessel should ground, with a flowing-tide, smooth water, and soft banks, she will not be injured; but, both for the bar and for the river, a local pilot should always be procured if possible. The banks alter more or less every year, although the main-channel is nearly stationary.

There is a pilot resident at the Boca, maintained by the Buenos Ayrean government. When vessels approach the bar, if the weather will allow of his going out in a whale-boat, he readily embarks, and remains on board until an opportunity offers for their entering. Leaving the river is rather more difficult than entering, because of meeting instead of leaving the Southerly swell. There are instances of vessels having been detained 40 days at the Boca, waiting for an opportunity to cross the bar. No vessel should make the trial without a commanding breeze. Light winds are treacherous; they blow different ways on the river. North-east winds are the best, either for entering or leaving the river.

Some say it is high-water, upon the bar at 11h. 15m.—others say 11h.—on the full and change days. It will vary much more than that quantity, even half an hour, or an hour, during gales of wind; but the usual time of high-water upon the bar, during settled weather, is 11h., or a few minutes later, on the days of new and full moon.

The tide reaches a few miles above the town of San Carmen, during the dry season. It is then high-water at the town 2 hours later than at the Boca.

Fresh provisions, in moderate quantity, some fire-wood, plenty of vegetables, and, during the season, abundance of excellent fruit, may be procured at San Carmen.

Encouragement and protection would make this a very thriving settlement. The climate is delightful, the soil on the banks extremely rich, and watered by the periodical overflow of the river.

Port San Antonio is the best place on the coast for a large ship in want of serious repair. It may, for that reason, prove very valuable, notwithstanding its remote situation and the barren nature of the surrounding country. A ship may approach as near as may be convenient without getting into shoal-water, or running any risk, until an opportunity offers favorable for running within the Lobos Bank.

In approaching Port San Antonio from the South-eastward, Direction Hill and the Fort are seen before any of the low land can be made out. If approaching from the Southward, the hill called El Fuerte, or the Fort, is seen sooner than Direction Hill. If from the Eastward, the reverse. A more singular resemblance to a regular fortification it would be difficult to find. Some call it the Castle; but its appearance is that of one side of a regular polygon, the curtain and each bastion showing distinctly.

Direction Hill is 560 feet above the sea; three small hummocks, close together, are visible on its summit.

The entrance to Port San Antonio is much exposed to South-easterly winds, and at such times it would be imprudent to approach without a probability of speedily entering, as you would be embayed, and have to contend with a heavy rolling sea.

On each side of the entrance is a bank, partly dry at low-water, and very steep at the edges. The Eastern or Lobos Bank extends 5 miles South of Villarino Point. It is very steep, shoaling suddenly from 7 to 5 fathoms.

When off the bank of shoal soundings, or in upwards of 20 fathoms water, the stream of tide is little felt, not more than, if as much, as one knot; but as you near the Lobos Bank its influence increases fast.

There is good anchorage in from 10 to 30 fathoms between the end of Lobos Bank and the Fort, as well as to the Southward and Eastward of that bank, the ground being quite clear, either fine sand or a soft, greenish, sandy mud. The shelter is good, excepting with South-east winds, which, it must be remembered, do not often blow, and still less often with violence.

For entering, keep Direction Hill bearing W. N. W. until the Fort bears S. by W., when you will see the hummock on Villarino Point bearing N. by E., and Nipple Hill showing over it on the same bearing. The Nipple Hill is the highest land hereabouts, 600 feet above the sea. It is on a range of down-like heights to the Northward of the port, and carries a small hummock upon its summit resembling a nipple. Having on those bearings, steer about North (allowing for tide,) so as to keep the

*Carmen.**Pilots.**Tides.**Supplies.**Port San Antonio.**El Fuerte.**Direction Hill.**Lobos Bank.**Good Anchorage.**Nipple Hill.*

Nipple just open of the West extremity of Villarino Point, until you are half a mile from that part of the point, when you may go, by the eye, close to the bank on the East side, round the point, and go to the berth which is most convenient.

Villarino Point.

Villarino point is low and sandy, with a few hummocks on it, nearly covered with verdure, and having, therefore, a dark appearance. The highest is 40 feet above the water.

Tides.

At full and change, high-water is at 10h. 45m. The rise of tide depends much upon the wind, being between 3 and 5 fathoms. Between Villarino Point and the Reparo Bank the tide runs from 3 to 5 knots.

For a line-of-battle-ship two-thirds flood, but for most vessels the last quarter ebb, should be chosen as the time for rounding the tail of Lobos Bank, so as, if possible, to arrive off Villarino Point at low-water. When there all is safe and easy. The water is always smooth, and the only inconvenience is the rapid tide. A sheltered berth, suited to the object in view, may be gained by warping when the tides suits.

Lobos Bank.

It must be remembered that the fairway is not sufficiently examined, particularly along the West side of Lobos Bank. Many more soundings are required on both sides, and in the bight near the West shore; although enough have been taken to ascertain and show the nature and practicability of the passage.

A large ship intending to enter this port must take the trouble of fixing two boats or two marks upon the shoal places of 2 and 3 fathoms marked in the plan. The fairway should also be partially sounded by the person who is to pilot the ship into the harbor, to insure his acquaintance with the marks, and to guard against any shifting of the banks which may occur in so rapid a tideway.

Lieutenant Wickham remarks, "That Port San Antonio is the best harbor on this coast. It is a good port in a bad situation. Should the River Negro become of importance to commerce, vessels of much draught ought to anchor here rather than in San Blas Bay. The land-carriage from each place to the town of San Carmen is about the same, (supposing that from San Antonio you take the nearest line to the river.) Fuel is abundant. Water is deficient, but may be obtained by digging wells. Dry docks might be built for vessels of any size. There are many places where vessels may be laid ashore for a tide, without the slightest risk, the harbor being perfectly sheltered from every wind."

Escondido Creek.

Tides.

In Escondido Creek the keel of a line-of-battle-ship may be examined, the rise of tide being from 24 to 32 feet. The greatest rise during our stay was 25 feet, and the least 16; but from marks on the shore it was evident that 30 feet would be too small a limit to name for a spring tide, during South-east winds.

Port San Josef.

The great basin of San Josef, though 26 miles in length and 14 wide, was called Port San Josef by the Spaniards; it is free from interior obstructions or danger, but the entrance has an unpleasant appearance owing to a rocky ledge crossing it, over which the water ripples so much that a stranger would hardly think it safe to enter. Eleven fathoms is the least depth that has yet been found in that channel, but the tide sets so strongly over the narrow ledge that soundings upon it are not easy. Many vessels have entered at various times, and as no one has yet encountered danger it may be supposed that none exists, excepting within half a mile of either point.

Both East and West heads are moderately high, and show distinctly from seaward. They are bold cliffs, rising abruptly to 100 or 150 feet above the water. Their color is the same as that of all this coast, where a yellowish, sun-burnt appearance continually meets the eye. Under water, from each head, the above-mentioned ledge of rocks extends across, causing, when the wind opposes the tide, a heavy rippling.

The best anchorage is in the bight to the Eastward of the Eastern head. Northern winds send much sea into the Southern bight.

Lieut. Wickham says, "Masters of vessels who have been some months at anchor in this gulf speak very unfavorably of it. They say that a short heavy cross sea gets up with any strong wind; although the gulf is nearly landlocked. Fuel may be cut in the South-west part of the bay, from stunted shrubby trees; but near the shore there is no appearance of fresh water." To the eye, all is barrenness and desolation. How the Spaniards could have selected such a spot for a colony, is surprising.

Tides.

Within the gulf it is high-water at 10h. 0m. full and change. The tide rises from 20 to 30 feet, and rushes between the heads 3, 4, or 5 knots.

Valdes Creek.

Valdes Creek is a dangerously deceiving inlet of a singular character. The entrance is only a third of a cable's length in breadth at most times, but sometimes it is entirely blocked up by shingle.

The tides run most rapidly through the opening, and up the long narrow passage which extends to the Northward, at the rate of 4, 5, or 6 knots. A heavy surf breaks across the entrance, when there is any swell.

The depth of water on the bar is quite an uncertainty, depending upon the length of time that has elapsed since a South-east wind has heaped up shingle at the entrance. The strong tides scour out a channel as repeatedly as the gales block it up.

It is an unfit place for any vessel unless obliged to enter from some urgent cause. Being merely in want of a port should never be a reason for attempting it. Nuevo Gulf, with every advantage, is close at hand, and always easy of access.

With the wind blowing from the South-east, no vessel, under any circumstances, should run for it; since, if the entrance is found closed, she will inevitably be lost, being then too close to get out again. The exact place of the entrance is easily known, all the land to the Northward being low, all to the Southward high and cliffy. Cantor Point, and the tides off this part of the coast, have been described in the *Cantor Point*. To avoid the races and rippings, it is absolutely necessary to keep well to the Southward, as far at least as Ereules Point, and then run to the Northward along shore. Valdes Creek should be entered with the flood-tide and the wind off shore, by backing and filling, with the vessel's head to the Southward. There is no room to wind inside, and when bringing up, headway will be necessary to lessen the strain upon the cable.

Nuevo Gulf is easily known by the two well-defined headlands at the entrance. Off *Nuevo Gulf*. Nuevo Head no danger exists. It is steep to, high, and bold. The highest part is 200 feet above the sea. Nifus Point is high also for this coast, being 210 feet above the water. It makes us a double point, the two corners lying N.N.W. and S.S.E. of each other.

It ought not to be approached nearer than $2\frac{1}{2}$ or 3 miles, as there are rocky ledges extending from it, particularly from the N.N.W. extremity, off which there are rocks, dry at low-water, distant from the land $\frac{1}{2}$ mile. Alongside of these rocks there are 7 fathoms water; over them the tide rushes into Nuevo Gulf 5 or 6 knots, causing a heavy and dangerous rippling, the swell from which is felt entirely across the gulf, and with a Westerly wind, causes a short hollow sea.

In mid channel you are out of the rippings, and the tide is sufficiently strong to carry a vessel Northward, while hove to in a fresh gale. When once well inside the heads, the swell is much less strong, and the sea longer and more regular. On the South side of the gulf there are several good anchorages, off the shingle or sandy *Anchorage*. beaches, between the different heads.

There is no danger whatever in approaching them, only taking care to avoid being too near to the projecting points, as they have, like the rest of the projections on the coast, rocky, foul ground, extending to seaward some part of a mile.

The cliffs here are like those further Northward, consisting of sandy clay, or rather diluvial earth, containing prodigious quantities of fossil shells.

The best anchorage in the gulf is in the South-west corner, lying between the first *Best anchorage*. two white cliffy points. These points are between 40 and 50 feet in height.

With the Eastern cliff bearing E.N.E., and distant about a mile, you will find a good anchorage, with 5 fathoms at low-water, over a muddy bottom. Westward of this anchorage there are many places where an anchor may be dropped with propriety, the bottom being sandy mud, or clay.

The Northern part of the gulf is lined with steep cliffs. There is a remarkable *Pyramid*. rock called the Pyramid at the North-east part.

Pyramid Road, near the Pyramid, is sheltered, and good anchorage, except with *Pyramid*. Southerly winds. No tide is felt here. The best berth is with the Pyramid bearing *Road*. West, or W. by S. Ten miles within the heads of the gulf the tide is scarcely felt.

On full and change days of the moon it is high-water at 7h. 0m., and the average *Tides*. rise is 10 feet.

There is plenty of small wood for fuel in the South-west part of the bay, and there *Fuel*. are some ponds of excellent water upon a clayey soil, which appear to last all the *Fresh water*. year round. Good water may also be procured in abundance by digging wells.

The entrance to the River Chupat is at the South-west corner of the bay of En- *Chupat*. gaño, just where the beach ends, and the rising ground begins. A reef of rocks, dry *River*. at low-water, extends across the mouth, and apparently shuts it up. At half-tide the rocks uncover.

The bar between the reef and the beach has scarcely a foot of water on it when *Chupat Bar*. the tide is out. At high-water there are from 7 to 12 feet, according to the state of *Tides*. the tide. The greatest rise of tide during the neaps was found to be $6\frac{1}{2}$ feet.

To enter, the channel must be examined at low-water, and a buoy placed at the end of the reef, because the deepest water is close to it. Within the reef the water is at all times quite smooth. Near the mouth the river is not more than 60 yards wide, and is 5 feet deep at dead low-water. Higher up it gets broader, but not deeper.

At low-tide the water is quite fresh at the bar, and at high-water 3 miles only above it.

Boats, or flat-bottomed barges, might be tracked up by men or horses to a great distance. The river is free from obstacles, and the banks are firm and level. The ebbs run 2, 3, or 4 knots; the flood is not felt more than 6 miles from the entrance.

The best time to leave the river is before high-water with the last-quarter flood, because when the ebb makes it sets directly upon the reef. At each side of the mouth are great quantities of drift-wood. Many fragments of light volcanic scoriae were picked up, possibly washed from the volcanic mountains on the Western side of the continent.

Sauci-trees (a kind of willow) grow on the banks of the river in great abundance; they are chiefly the red sauci, which is more durable than the white. It is fit for pumps, pump-boxes, boats, and many other purposes for which elm is frequently used. The very winding course of this river, and the rich soil through which it flows, affords facilities for isolating numerous peninsulas, and artificially watering a very large extent of country. No defence is so certain against the Indians as a ditch filled with water, no matter how small. They never willingly cross water in their attacks.

Had Sir John Narborough seen this part of the country, he would not have given so unpromising a report to his master. How the Spaniards could have overlooked it, having a settlement so near, upon the peninsula of San Josef, is surprising. Perhaps the Indians were numerous, and kept them within bounds.

Port Santa Elena.
Anchorage.

Santa Elena harbor may be easily known by some hummocky hills on the North-east projecting point, on the Easternmost of which there is a remarkable stone resembling a monumental record, but it is a natural production. The best anchorage is at the N.W. corner of the bay, in 6 or 7 fathoms, but not too near to the shore, for when the sea is heavy the ground-swell breaks for some distance off. In working into the bay the 2-fathoms bank must be avoided, for which the low island is a good mark.

Tides.

It is high-water, at full and change, at 4 o'clock, and the tide rises at springs 17 feet.

Bad water.
Fuel.

The water that is contained in the wells is too brackish to be worth consideration; nor is there any fresh water to be obtained from any part of the harbor. Of fuel, a temporary supply may be procured from the small shrubby tree which is described in the account of Port Desire, and which is tolerably abundant here. Guanacoës, ostriches, armadilloes, and the cavia or Patagonian hare, are to be procured, as are also wild ducks, partridges, snipes, and rails, but fish seem to be scarce. The guanaco affords an excellent food, but it is a difficult animal to approach.

Refreshments.

Reef off Cape Raso.
Salaberria Reef.

In approaching Port Santa Elena from the Northward, there are several rocks near the shore which are very little above the water, and there is a considerable reef in the offing called the Salaberria Reef, situated $1\frac{1}{2}$ miles E. by S. from Cape Raso, and N. E. $\frac{1}{2}$ E., 8 miles, from the N.E. trend of the North head of the port. It is a dry rock, and is near the extremity of a ridge which probably projects off from the latter point, for there are two dry rocks in the same line of bearing, one $1\frac{1}{2}$ mile, and the other $3\frac{1}{2}$ miles from the point, besides several patches which break. The tide sets rather strongly along the shore, which is fronted by reefs for 2 or 3 miles off. Great caution should therefore be used in approaching the coast, as the water is deep, and if becalmed it may be necessary to anchor, which will be in at least 30 fathoms water.

Cruz Bay.

Should the above reef be as continuous as it appears, there ought to be good riding in the bay between Cape Raso and Port Santa Elena.

Cape Dos Bahias.
Leones Isle.

Between the South head of Port Santa Elena and Cape Dos Bahias are two bights in the coast, the Southernmost of which is considerable, and may probably afford a good anchorage. Cape Dos Bahias is a rounded point, with a hill close to the sea on the most projecting part of the cape, and the small islet of Arce to the S.E. of it.

Between Leones Isle (sometimes called Ship Island) and Harbor Isle is an anchorage, good in point of safety, but somewhat disagreeable on account of the eddy tides. The eye is a sufficient guide in entering, as the shore is bold, and there is no hidden danger. There is generally a small stream of fresh water at the North-west part of Leones Isle, but it cannot be depended upon during the summer months. A few bushes may serve for a temporary supply of fuel, but there are not enough for a store. There is no passage between the two islands except for boats. The ground towards the narrow part of the passage is rocky and uneven. The tide sets directly through, causing eddies which will turn a ship round at her moorings against a strong breeze.

Harbor Islet.

In the best anchorage abreast of the middle of Harbor Islet there are 4 fathoms at low-water, over a clean sandy bottom.

In approaching this anchorage, the set of the tide should be considered, in order to determine whether to pass round the North or round the South side of the island. The flood-tide runs strongly to the Eastward round the Northern side, between it and the main-land.

Egg Harbor.

Egg Harbor, formerly called Port San Antonio, is one of the best ports on the coast. In entering, a vessel may pass on either side of Valdes Isle, and steer by the eye. There is no hidden danger. Southerly winds send in a good deal of swell, but

cause no further inconvenience. The best anchorage is in the North-west corner, shutting the point of the main-land in with Valdes Isle. In this spot are 5 fathoms water, over a stiff clayey bottom. The lead may show shingle or gravel, but there is stiff clay underneath.

Port Desire has rather a difficult entrance, from the strength of the tide and its narrow breadth, and it is rendered still more confined from several rocky reefs that extend off the North shore, or that lie nearly in mid-channel. There is good anchorage off the mouth. By waiting, therefore, for low-water, all the dangers that exist will be seen, and the vessel easily dropped in with the tide, should the wind be, as it generally is, Westerly. If it be fair, it will be advisable for the ship to be in the entrance at slack water; or, if the breeze be strong enough, a little before; as the water is deep on the South shore, there seems to be no real danger that may not be avoided by a careful lookout for kelp, which on that coast always grows upon, and therefore plainly indicates the existence of, rocky ground. The course in is about W.S.W., and the distance from the entrance to the anchorage is $\frac{1}{2}$ mile. The anchorage is off the ruins on the North shore, and the vessel should be moored; the tide sets in and out regularly. *Port Desire.*

Four miles above the ruins there is a small peninsula, connected by a narrow isthmus to the North shore; by sending a party up, and stationing men with guns on the isthmus, it is very likely that several guanacoos may be shot as they are driven across it; for the peninsula is their favorite feeding-place. These animals are abundant, but unless stratagem be used, they are very difficult, from their shyness, to be approached. There are some water-holes near the ruins, which generally contain water, but of so brackish a quality as scarcely to be worth notice. The wood is the same kind that was described in the account of Santa Elena, and it burns well; but on the islets further up the inlet, and in many of the valleys, fire-wood of a superior quality may be freely obtained. *Refreshments.*

Captain Fitzroy adds to the above account of Captain King's, that vessels of 300 tons will not find very easy access to Port Desire, the narrow and hooked entrance, the strong tides, the short interval of slack water, and the uncertain bottom, are sufficient obstacles to deter any large ship from making the experiment, unless urged by necessity. In the Beagle's last visit she knocked off a piece of her fore-foot against the rock, to which she has given her name, and which lies N. $\frac{1}{2}$ E., 3 cables' length, from Chaffers Point. Entering by a compass course is out of the question; for two leads, a sharp eye, the braces in hand, and moderate sail are precautions absolutely necessary, as the tide hustles a vessel through in a few minutes, even against a strong wind. With Westerly winds, good anchorage may be obtained outside the port. *Water Wood.*

Once or twice in the year, a large body of Indians visit this place as if to reconnoitre, and therefore no straggling parties from the ship, much less individuals, should venture to any distance without having ascertained that these sanguinary intruders are not in the neighborhood. "War to the knife" with all white men is now their maxim, in consequence of the treatment they have received from the Spaniards and their descendants. *Natives.*

At the entrance of Port Desire, it is high-water, at full and change, 10 minutes after 12 o'clock, and the springs rise 18 feet. *Tides.*

Sea-bear Bay is a good anchorage, but from the strength of the tides troublesome to enter. *Sea-bear Bay.*

The bottom, besides, is very foul, and 30 fathoms deep; and though an anchor might save a vessel from driving ashore, she would not be likely to regain it. In entering the bay, border pretty close to the Wells Point, the low rocky point to the Southward, in order to avoid May Reef, which lies about a quarter of a mile N. $\frac{1}{2}$ E. from it; but as the sea always breaks upon it, the eye and a due consideration of the tides are the best guides. This reef extends for some distance to the Eastward of the breakers, and therefore the tide, when within it, sets in or out of the bay, but with little strength. Should a ship not be able to enter the bay, there is anchorage off Wells Point between it and the reef, on, I believe, tolerably clear ground. You will have 12 or 13 fathoms off the reef; then the depth shoals for one or two casts of the lead to 7 fathoms, after which it deepens again; you may then haul across the bay, and anchor at about a quarter of a mile within, Wells Point bearing E. by N., in 4 fathoms at low-water, but avoiding the kelp which projects off from the sandy beaches: this is, however, sufficiently distinct. A small vessel may easily turn in, but I should hesitate in taking such a step unless I was certain of her qualities. When once in, the anchorage is good, and protected at all points, except between N. E. and E. by N.; but from the appearance of the beaches it is not probable that a heavy sea is often thrown in. There is no wood to be procured of any size, and the few gallons of water that may be collected in the wells at the point are too precarious to be worth attention. The passage to those watering-holes is over a small rocky *Anchorage.* *Wood and water.*

bar, which a boat may cross at three-quarters flood; they lie immediately within the Wells Point: there is a small spring at the North end of the third sandy beach, which a herd of guanacoos was observed to visit every morning, but as the water only trickles down in a very small quantity, it cannot afford more than a temporary supply. Two of the three of the wells at the point we found to be full of sea-water, which had breached over the rocks; the other contained about 40 gallons, which were rather brackish. In short, besides a secure anchorage, this place affords no other advantage, though convenient for sealing-vessels to anchor in while employed in their occupation upon Penguin Island.

Tides.

Wells Point is in lat. $47^{\circ} 57' 20''$ S., and long. $65^{\circ} 41' 40''$ W.; variation 20° E.; high-water, at full and change, 12h. 45m., and the tide rises 20 feet.

Port San Julian.

Mount Wood is visible from the deck for at least 11 leagues, and is a good mark for Port San Julian, being flat-topped, and much more elevated than the land about it: the trend of the coast may also be a good mark; and as the land about the port is higher than to the Southward or Northward, no mistake can be made. The North head, Cape Curioso, is a low point jutting out to the Northward, formed of cliffs horizontally stratified, of which the upper part is white brown, and the lower generally black, or with black streaks.

Keeping Mount Wood W.S.W. $\frac{1}{2}$ W. will lead you to the South head, which will be easily distinguished when at the distance of 6 or 7 miles, or more, according to the state of the weather.

Having made out the two points which form the entrance, Curioso and Desengaño, steer for the latter, and if the tide does not serve for going in, anchor in 8 or 9 fathoms about a mile N.E. of that point, till a proper opportunity offers; but if the wind be S.E., or the weather threatening, stand off and on. An extensive bar crosses the entrance, and in the middle dries at low-water, leaving a channel on either side, with something less than 2 fathoms in them, and rather intricate. But the great rise of tide (30 feet at the highest springs, and 16 in the dead neaps) makes the passing this bar comparatively easy. Great attention should be paid to the set of the tides, which run in and out sometimes at the rate of 4 knots. Half-flood is the best time for entering, as a vessel will then have depth enough on the bar, and the parts that dry at low-water will still be visible. The most convenient anchorage is off Sholl Point, in 4 fathoms.

No fresh water was found in any part of the inlet, its upper division being a chain of salinas; but wood may be procured with ease on Shag Island, and at other places. Abundance of sea-fowl may be killed, and fish of various kinds are plentiful.

Tides.

The little monument erected by his shipmates to the memory of Lieutenant Sholl, close to the point, stands in $49^{\circ} 15' 20''$ S., and $67^{\circ} 42'$ W. It is high-water, at full and change, at 10h. 45m., and rises at high springs 30 feet.

Santa Cruz.

The appearance of the coast about the entrance of the river of Santa Cruz is very remarkable, and easy to be known, from the conspicuous manner in which it makes either to the Northward or the South-eastward. From the latter direction, a coastline of cliffs and downs of considerable height is seen extending from the Southward as far as the eye can reach, and terminating abruptly in the high, steep, flat-topped cliff, Mount Entrance, of which the upper part descends vertically; the lower slopes off, and appears to be united with some low land, which will be seen (according to the distance off) two or three points of the compass to the right of it. Mount Entrance stands on the South side of the river, and is, by angular measurement, 356 feet high; the low land is on the Northern side, and outside of the river.

The outer part of the bar, on which at low spring-tide there are 14 feet, lies 4 miles outside of Mount Entrance. There are several shoal patches on it which dry, or at least break, at low-water. Weddel Bluff kept open to the North of Entrance Point, and seen over Sea-lion Island, on the bearing of N.W. by W. $\frac{3}{4}$ W., seems to offer the most direct route across the bar. This mark, however, does not agree with that given by Captain King and Lieutenant Weddel; and Captain Fitz-Roy judiciously remarks, that where the tides are rapid and a heavy sea frequent, it is not probable that a bar of sand and shingle stretching across the mouth of a large river should long retain its position. Strangers are therefore advised to remain outside the bar, either at anchor or under sail, till low-water, when its shallow parts will show themselves; and then, as the tide rises very high, to weigh at half or two-thirds flood, and steer directly in through the most convenient of the channels, of which there were three open in 1834.

Twelve miles up the river, on the South bank, is Weddel Bluff, a conspicuous headland; and 6 miles further is another, called Beagle Bluff. Weddel Bluff, kept open of the South entrance point, and in a line with the centre of Sea-lion Island, bearing N.W. by W. $\frac{3}{4}$ W., is the leading-mark for the passage over the bar; and the Beagle Bluff a little open of the low points on the North side of the river, is also a

leading-mark to cross the bar. After passing the bar, which is about a mile broad, there is no impediment to a free course up the river, keeping midway between the narrow points of entrance until reaching the shoals which project off the East point of Sea-lion Island. The best anchorage seems to be on the South side of Sea-lion Island, where the water is shoaler, and the tide not so strong.

If the object of entering this harbor be wood or water, or to refit, a good berth will be found above Sea-lion Island, and near the shore under Weddel Bluff; but strangers should first anchor in the bight near Keel Point, so that another ebb may expose to view the shoals that surround that island. If it be intended to sight the vessel's bottom, the sloping shingle beach at Keel Point offers a most convenient spot; and the prodigious rise of tide, and clean shore, renders Santa Cruz a most desirable place for that operation. The anchorage off Keel Point is easily taken or quitred, but in moving, all vessels should have their anchors ready, and a boat ahead, for the tides are sometimes furiously strong, from 3 to 6 knots, and the banks are somewhat changeable. In bringing up, they should use heavy anchors, and veer plenty of cable; they should avoid dropping them in the strength of the stream; and if near high-water, they should carefully consider the probable fall of the tide.

Fire-wood may be cut near the anchorage, but water can only be obtained by sending the boats up the river; during the last half of the ebb the river water is generally fresh above Weddel Bluff.

The position of Keel Point is 50° 6' 45" S., and 68° 23' 30" W. It is high-water, *Tides.* at full and change, 9h. 30m.; spring tides rise 40 feet, the neaps 18, and they run from 6 to 3 knots. In the offing they turn 2 hours later than in the harbor, and the flood runs to the Northward.

OF THE WINDS AND WEATHER, TIDES, AND VARIATION OF THE COMPASS, BETWEEN CAPE BLANCO AND CAPE VIRGINS.

Our knowledge of the wind and weather upon this part of the coast is not sufficient to enable us to form any judgment of the changes that are liable to occur. The prevailing winds, particularly towards the Southern portion, are from the South-west, from which quarter the gales are the strongest; but near the land, during the summer season, they veer about between South and W.N.W.; and in the winter, when the sun has Northern declination, they hang more commonly to the Northward of West. Northerly winds are accompanied by misty or foggy weather, particularly on that portion of the coast between the Rio de la Plata and Port St. Elena.

The marine barometer here is of signal advantage. It is low with a Northerly wind, but as soon as the column has fallen to 29 inches or lower, and ceases to fall, a change of wind from the S.W. may be expected; which commences with, or very soon follows, the ascent of the mercury; the wind then freshens and blows hard, and the weather clears up. The clouds are white, of large size, and of rounded form, and the air becomes elastic, dry, and cold. During the existence of, and for some days preceding, a Northerly wind, there is generally a very copious deposition of dew; indeed, the appearance of it is an infallible presage of the change. With Northerly winds, the air is mild and excessively damp, but when they blow from the opposite quarter it is cold and dry. The wind rarely blows from East, but sometimes obliquely towards the coast from N.E. or S.S.E.

The flood-tide sets to the Northward parallel with the coast. Near Cape Virgins, *Tides.* the Northerly tide ceases at about four hours before the moon's passage: in the Gallegos River it is high-water, at full and change, at 8h. 50m., and rises 46 feet; at Cape Fairweather, at 9 o'clock, and rises 28 feet; at Coy Islet, at between 9 and 10 o'clock; at Santa Cruz, about 10h. 15m., rising 38 feet, but in the offing two hours later; at Sea-bear Bay, 12h. 45m., rising 20 feet; Port Desire, 12h. 10m., rise 18½ feet; and at Port St. Elena, at 1 o'clock in the afternoon, they rise 17 feet. In the offing of Port Desire, the tides are 3½ or 4 hours later than they are inshore, which is probably owing to the eddy-tide setting out of St. George's Gulf.

The variation of the compass gradually increases from the Rio de la Plata, where it is about 14°; in lat. 36½°, long. 55½°, it is about 14½°; in lat. 41°, and long. 60°, it is 16°; in lat. 41½°, and long. 60½°, it is 17°; at Port St. Elena, 19° 10'; at Port Desire, 19° 42'; at Sea-bear Bay, 20° 47'; at Port St. Julian, 22° 18'; at Santa Cruz, 20° 51'; at the River Gallegos, 21° 47'; and at Cape Virgins, it may be considered about 22½°.

Cape Virgins.

CAPE VIRGINS.—In approaching the strait of Magellan from the Eastward, the first land usually seen, and the best to make, is Cape Virgins; it is the South eastern point of a range of steep white cliffs, about 200 feet in height: the cape itself is 160 feet high.

Dungeness Point.

Extending nearly 4 miles to the Southward is Dungeness Point, a low flat, formed entirely of shingle. On the opposite coast lies Cape Espiritu Santo, very similar to Cape Virgins; and Catharine Point, very like Dungeness. Cape Espiritu Santo is the North-west end of a high range of white cliffs. Beyond it, to the Westward, there is only one low short range of cliffs, less than half the height of Espiritu Santo. The upper outline of this cape slopes away on both sides like the roof of a house.

Between these remarkable headlands, or rather between the two shingle points, lies the entrance to the strait.

In the vicinity of Cape Virgins and Espiritu Santo, it is high-water between 8h. and 9h. in the morning, on the days of new and full moon; while the stream of flood is still running to the Westward into the strait, and to the Northward past Cape Virgins.

Tides.

Spring tides rise from 36 to 40 feet vertically; neap tides, about 30 feet.

Sarmiento Bank.

Off Cape Virgins lies the Sarmiento Bank; this shoal has been too little considered by those who have hitherto passed that cape. After half flood, or before half ebb, a ship may pass Cape Virgins at any distance not less than a mile, and may cross the Sarmiento Bank without hesitation; but when the tide is low, 10 miles is not too far for a ship to keep from the Cape, until it bears N.W. by W. A ship might often pass over this bank without touching, even at low water, because the bottom is uneven; but there are places which no vessel drawing more than 12 feet could pass at a low spring tide without injury. This bank extends about 20 miles E.S.E. from Cape Virgins, and appears to average a mile in breadth. The soundings on it are shoal and very irregular, at a less distance from the cape than 10 miles; but beyond 10 miles distance, as they increase, they become more regular.

Virgins Reef.

A reef, which at half-tide is scarcely observable, projects full a mile from Cape Virgins; this and Sarmiento Bank are the only dangers on the North side of the approach.

Soundings.

In standing Eastward from Cape Virgins, the bottom is very fine brown sand, without shells or stones. When, by standing more Southerly, the water shoals upon the Sarmiento Bank, the sand becomes much coarser, and is mixed with slate pebbles, or broken stones of all sizes; the sand is slaty.

This rule continues till the water deepens to 30 fathoms, or more, to the Southward, when shingle only is found; and when it begins to shoal in approaching Tierra del Fuego, there is coarse dark sand, mixed with stones of various sorts, chiefly slaty. Between the shoal parts of the bank and the deep water, or from 16 to 30 fathoms, the sand is coarse, particularly near the deep water. In standing to the Southward, after bringing the cape to bear West, the bottom is a very fine gray sand, until near the ridge or bank, with Cape Virgins bearing W. N.W.; with the cape in this bearing, the sand is coarser, and mixed with large and small shingle.

In crossing the Sarmiento Bank, when standing to the Southward, the fine dark grayish-brown sand changes to coarse slaty sand, with small stones and shingle; the stones chiefly slaty. Some casts after crossing the ridge were found to be entirely of coarse sand, while others were all shingle. As the water shoals, the bottom is coarser and more mixed.

When to the Northward or Eastward of the Sarmiento Bank, the lead brings up fine brown-gray sand, while near the latitude of Cape Virgins; but when N.N.E. of the cape, the sand is like steel-filings.

OUTER OR SEA-COAST OF TIERRA DEL FUEGO.

Catharine Point.

Catharine Point is the North-eastern extremity of Tierra del Fuego; it is formed of shingle, very low, and precisely similar to Dungeness upon the opposite coast of Patagonia. Between Catharine Point and Cape Orange there is a large bay, called by Sarmiento, Lomas Bay. The land around it is very low, and the space which appears to be water is chiefly occupied by extensive shoals: some of them are visible at low-water.

Cape Espiritu Santo.

Ten miles inshore there is a range of land from 200 to 600 feet in height, and extending from Cape Espiritu Santo to the Westward. From Catharine Point to Cape Espiritu Santo the shore is low. Lying 2 miles Northward of that cape, there is a reef with shoal water. Cape Espiritu Santo is a steep white cliff, 190 feet high, somewhat resembling the gable-end of a large but low barn. This cliff is the termination of a range of rather high land, lying nearly East and West, corresponding in

s: some of them are visible

o 600 feet in height, and ex-
tending from Catherine Point to Cape
ward of that cape, there is a
p white cliff, 150 feet high
urn. This cliff is the termin-
t and West, corresponding in

height and position to the opposite range, which is terminated by Cape Virgins, but not so horizontal in outline.

The Fuegian shore has many hummocks, and does not show any extent of table-land similar to the Patagonian ranges. From Cape Espiritu Santo cliffs from 100 to 300 feet in height, extend, with but few breaks, to Nombre Head: the land is 200 or 400 feet high, irregularly rounded in outline, quite destitute of wood, and, excepting *Nombre Head*, being rather greener, resembling the coast of Patagonia.

South-eastward from Nombre Head extends a low shingle beach, forming a spit, behind which is the large bay of San Sebastian—an excellent anchorage as respects shelter, good bottom, and easiness of access, but without wood, or a good watering-place, though water may be procured.

Coasting along this shingle spit, the depth is not more than 10 fathoms, but it deepens suddenly near the South-east extremity. Within the shingle point, which is steep to, or nearly so, the bottom is uniform, but the depth gradually decreases.

Between Nombre Head and a range of higher and more hilly land which is terminated by Cape San Sebastian, the land is so low as not to be visible from a ship's deck until within the horizon; hence the old supposition that a channel existed in this place. The shingle beach, or, rather, the long ridge of shingle which extends 9 miles Southward from Nombre Head, ends in a narrow steep point, which may be closely approached.

Westward of this point, called Arenas and between it and Cape San Sebastian, *Arenas* there is a spacious harbor, secure from all but Easterly winds, which seldom blow, *Point* and never with any strength. There is no hidden danger on the North side of the *San Sebastian* bay, the shingle is steep to, the shores of the bay shoal gradually, the bottom is clean, *Iron Bay*, and the soundings are regular. On the South side, off Cape San Sebastian, it is otherwise: a shoal rocky ledge extends under water to the North-eastward, and requires a berth of 3 miles; there is no kelp upon it. On its edge you shoal suddenly from 12 to 4 fathoms; the ebb-tide sets rather strongly over it, about 2 knots; the bottom is hard, and offers bad holding.

Cape San Sebastian is a bold cliffy headland, of a dark color; inshore of it the land *Cape San* rises to near 1000 feet above the sea, and becomes more irregularly hilly. From *Cape Sebastian*, San Sebastian a short range of cliff extends; then low land; and then another small cliff, off which there is a rock above water about a mile off shore.

Hence to Cape Sunday the shore is rather low, irregularly hilly, and fronted by a *Cape Sun*-shingle beach. Cape Sunday is a prominent headland, of a reddish color, rising 250 *days* feet above the sea: the shores near it are free from danger until near Cape Penas, near which are some dangerous rocks.

Cape Penas is not more than 100 feet above the sea; around it, to a distance of 2 *Cape Penas* miles, there are dangerous rocks: the sea generally, if not always, breaks upon them; but they should be carefully avoided, especially at night.

The bay lying to the Southward of Cape Penas appears to afford anchorage; but the appearance is deceitful, as it is shallow and strewed with rocks. The hills hereabout are higher and partially wooded, and the view of the country is pleasing.

Capes Santa Inez, Medio, and San Pablo are high and bold: they are fronted by *Capes Santa* steep cliffs, 200 or 300 feet in height. Hence to Cape San Diego there is no outlying *Isles*, &c. danger: the water is rather deep near the shore, but not so steep as to prevent a ship anchoring during Westerly or Southerly winds.

The Table of Oroseo is a remarkable table-topped hill, about 1000 feet above the *Table of* sea. Between it and Cape San Diego there are three remarkable hills, called the *Oroseo*, Three Brothers, and the Westernmost of these hills is very like the Table of Oroseo: they are from 1000 to 1400 feet in height.

Polcarpo Cove is a deceiving place; it looks like a harbor, but is fit only for a boat. *Polcarpo* False Cove will hardly give a boat shelter. Cape San Vincente is a dark looking low and *False* bluff point, backed by woody hills, 200 or 300 feet in height. Some rocks and foul *Coves*, ground extend half a mile from the point of the cape.

Between Cape San Vincente and Cape San Diego lies Thetis Bay, an anchorage *Cape San* which might be taken by a vessel intending to go through the Strait of Le Maire, but *Vincente*, defined by wind or tide; the bottom is mixed rocky, in some places, in others sandy, *Thetis Bay*, with mud and stones; and the tide sets strongly from 1 to 3 knots across the bay, on a line between the heads. There is much kelp in the bay, but no dangers could be discovered amongst it. When the wind opposes or crosses the tide, a great sea rolls into this bay, which can only be recommended as an anchorage fit for remaining at during a few hours. In leaving it to pass Cape San Diego, a considerable offing must be obtained in order to pass round the very heavy tide-race which extends from the cape to a distance of 3 miles into Le Maire Strait, and on no account, through it.

Cape San Diego is low, with a smooth outline ending in a small bluff. The rocky *Cape San* ledge, extending to the Eastward from this cape, is more dangerous than has been *Diego*, supposed. So violent was the race of tide upon it, as to prevent soundings being *Race*.

taken so frequently and accurately as was desirable; in the middle of the race, they were found to vary suddenly from 60 and 70 to 5 and 9 fathoms; it will be, therefore, but prudent to give this cape a berth of at least 3 miles. This race is at times very dangerous; a vessel was seen to founder in it, but whether from striking on a rock, or from being swamped, was not known.

Along this North-east coast of Tierra del Fuego the soundings are regular, and the bottom in most places clean and fit for anchorage. During Westerly and Southerly winds a vessel may lie at anchor under the lee of the land very conveniently; but a Northerly or Easterly wind sends a heavy swell upon the shore. Near the Straits of Magellan, as well as Cape San Diego, the tide is much felt, but there is very little along the intermediate coast.

Tide. From Cape San Diego to the Northward the flood-tide sets North and West along the shore from 1 to 3 knots. The ebb sets in a contrary direction, but not so strongly.

Good Success Bay. Seven miles South of Cape San Diego is the bay of Good Success. It is a good anchorage, perfectly safe, provided that a vessel does not anchor too far in towards the sandy beach at its head; for, during South-east gales, a heavy swell with dangerous rollers sets right into the bay. The best berth is shown in the plan. Heights, of about 1200 feet above the sea, surround the bay; therefore with strong winds it is

Squalls. subject to squalls, which during Westerly gales are very violent. It is an excellent unchorage for vessels of any size to stop in to get wood or water, but it would not answer if a vessel required to lie steady for repairs, as a swell frequently sets in. It is quite safe; but in the winter season, when Easterly winds are common, no vessel should anchor so near the head of the bay as she might in summer.

Cook's Broad Road. The "Broad Road," mentioned by Cook, is a good mark for the bay, if the inbend of the land does not sufficiently point out its situation. It is a barren strip of land on the height outside the harbor.

Cape Good Success. Cape Good Success is high and bluff; some rocks lie close to it above water.

Strait of Le Maire. The soundings in the Strait of Le Maire are similar near their Southern entrance. Towards the North the soundings diminish; and 2 miles from Cape San Diego, there are not more than 30 fathoms water, over a rocky bottom. The strait is clear of all obstacles, the tide excepted.

Tides. It is high-water on the shore in Good Success Bay, and slack-water in the strait, at 4 in the afternoon, on the full and change days, and low-water with slack-tide in the offing at 10 in the morning. The rise of tide is from 6 to 8 feet, according to the wind.

In the Strait of Le Maire the flood runs from 2 to 4 knots near Cape San Diego, and from 1 to 3 in mid-channel, more or less, according to the strength and direction of the wind.

Tides. The tides in the strait are as regular as in any part of the world. They will assist a vessel materially in her passage, if taken at the right time.

As the strait is very wide, perfectly free from obstacles of any kind, the soundings regular, with Good Success Bay close at hand, in case the wind or tide should change, vessels may pass through without difficulty or risk.

Valentyn Bay, &c. Neither Valentyn Bay, Aguirre Bay, nor Spaniard Harbor, is fit for more than temporary anchorage during Northerly or Westerly winds, all being much exposed to the South.

Bell Mountain. The Bell Mountain is remarkable: it is seen far at sea, from the Northward as well as from the Southward; it is high, and in shape resembles a large bell.

Lennox Island. Lennox Island, as well as New Island, and indeed any part of the coast hereabouts may be approached with confidence, using the lead and looking out for kelp. There are no shoals, but the water is not so deep as to the Westward of Cape Horn, neither is the land near so high.

At the East side of Lennox Island there is excellent anchorage; small vessels may go into a cove, but large ships must anchor in the road, which is quite secure and sheltered from all but South-east winds, with which of course a vessel would not wish to remain at anchor. To the North of Lennox Island is the Eastern opening of the Beagle Channel. It is easy of access, but useless to a ship. Boats may profit by its straight course and smooth water. It runs 120 miles, in nearly a direct line between ranges of high mountains covered always with snow. The highest are between 3000 and 4000 feet above the sea. This channel averages $1\frac{1}{2}$ mile in breadth, and in general has deep water; but there are in it many islets, and rocks near them.

Mount Sarmiento. A range of high mountains continues uninterruptedly from the Strait of Le Maire to the Barbara Channel. Mount Sarmiento, 6800 feet above the sea, is in this range. Southward of these mountains is a long extent of broken land, intersected by passages or large sounds. A boat can go from the Eastern entrance of the Beagle Channel to the Week Islands, without being once exposed to the outside coast, or to the sea, which is there found.

Some heights on New Island were noticed by Cook; they were not, however, so visible from the West as from the East side.

Good temporary anchorage during Westerly winds may be obtained under New Island, or near the shore to the Northward; but there appears to be no good harbor, between Richmond Road and Good Success Bay, in the Strait of Le Maire.

Regular soundings are found hereabouts, in all directions, and the shore is steep to. Goree Road, on the West side of Lennox Island, is an excellent place for ships; very easily entered or quitted, and able to furnish wood and water with as little trouble as any harbor on the coast. It should be particularly remarked here that the kelp in Goree Road, as well as that which extends out from Guanaco Point, partly across the entrance to the road, does not, as far as we have been able to discover, grow upon rock, but upon loose detached stones, and need not, therefore, be a subject of so much alarm.

Nassau Bay extends to the North and North-west, into the Beagle Channel, through Ponsorby Sound. It is very accessible, and free from dangers. Anchorage may be found on each coast, and the only dangers are some rocks (or islets) above water, shown in the chart, and visible at a distance by daylight. The Northern shore is low, particularly towards Guanaco Point, where the coast changes its level land, and low earthy cliffs, for rocky heights. In Nassau Bay the compasses are much affected; they become very sluggish, and might cause a serious error if not carefully attended to.

The Northern shores of the Hermite Islands afford anchorages, and are free from outlying or hidden dangers.

Middle Cove, though small, is secure, but when it blows, the squalls from the high land around are furious.

North Road is easy of access, quite sufficiently sheltered, and a very good stopping-place for a vessel working through Nassau Bay.

Franklin Sound is clear of obstruction, and has no other dangers than those which are shown in the chart.

Port Maxwell is a perfectly secure anchorage, and untroubled by mountain squalls, (or willywaws,) but it is rather out of the way. Though it has four openings, only two are fit for vessels,—those to the North and East. The best berth in it has 16 fathoms water, over a clear, sandy bottom. This harbor is decidedly good, though it requires a little more time and trouble in the approach.

The passages between these islands have deep water, and are free from dangers; what few rocks there are, show themselves above water, or are thickly covered with kelp. Some rocks lie off the South end of Chanticleer Island, but they are too close to be of much consideration.

A strong current sets, at times, along the outer coast of the Hermite Islands and through the Bay of St. Francis. It varies from half a knot to two knots, according to the wind and tide; and in the bay, changes its direction with the change of tide.

Cape Horn is the Southernmost point of the Hermite Islands. There is nothing very striking in the appearance of this promontory, as seen from a distance; but, in passing near, it is more remarkable, showing high black cliffs towards the South; it is about 500 feet above the sea.

One mile to the Westward of the cape there are three rocks, generally above water; the sea always breaks on them.

Off the East point of Horn Island, there are some small rocks and breakers; and off Cape Decoit several rocks, but all above water; and 2 miles to the South-east of the cape, there is a cluster, rising 30 or 40 feet above the sea.

West Cape, on Hermite Island, is low. The land about St. Martin Cove is high and rugged. Wollaston and Herschel Islands have also ridges of mountains. Kater Peak, the highest land (excepting Mount Hyde) on the islands, is 1740 feet above the sea.

No dangers exist to the Southward, in approaching these islands; they may be closed without hesitation.

Off Cape Horn the current is as strong as on any part of the coast; between it and Cape Pillar, it is by no means regular; sometimes with a strong wind and flowing tide it runs 2 knots, at others it is hardly worth notice. It has never been found to set to the Westward at any time of tide, or with any wind.

In the channel between False Cape Horn and the Hermite Islands, a current is found setting into Nassau Bay, and rather towards the Hermite Islands, at the rate of 2 knots, with the flood-tide, and about half a knot with the ebb. As this current sets rather towards West Cape, a good berth must be given to it in passing.

The Barnevelt Islands lie 14 miles N.E. by E. from Cape Decoit.

The Eastern side of Hardy Peninsula affords several anchorages.

Pack-saddle Bay, sheltered from N.W. winds by a curious island resembling a castle or pack-saddle, is safe and roomy, but not so convenient as Orange Bay.

Pack-saddle Bay.

Orange Bay. Orange Bay is considered the best anchorage on the coast; it is somewhat open to the East winds, but they seldom blow strong. No sea can be thrown in, because of the Hermite Islands.

Anchorage. Off Orange Bay anchor-soundings extend to 2 miles from the land. The opening of the bay is 3 miles wide, and in that part are 18 or 20 fathoms, over fine speckled sand. Two islands, the largest having a smooth, down like appearance, lie in the middle; behind them is the harbor, a square mile of excellent anchorage, without a single rock or shoal. In the two creeks at the South side is good anchorage for small vessels, on a bottom of fine speckled sand, and the depth of the water varying gradually from 5 to 20 fathoms. The land hereabouts is low, comparatively speaking, and you are not annoyed by the violent squalls which come from the heights in other places.

Wood and water. You may go close to the shore in every part, therefore no directions are necessary to point out the way to the best berth, which is marked in the plan. Wood and water are plentiful; the best watering place is in a small cove at the North side, called Water Cove. This harbor is fit for a fleet of line-of-battle ships, and could supply them with any quantity of wood and water.

Tides. Off the North point are several small islets, which must not be approached too closely; they are, however, out of the way.

Schapenham Bay. It is high-water at 3h. 30m.; rise of tide 6 feet. There is no current worthy of notice.

Schapenham Bay. Schapenham Bay is 1 mile wide; there is a small black rock, above water, rather to the Northward of its middle. A great deal of kelp, lying over a rocky bottom, is seen at the head of the bay, and a large waterfall marks the place distinctly. There is anchorage in from 10 to 15 fathoms, near its South point; but I should not recommend a vessel to use it, when by going further she may get into an unexceptionable harbor, or anchor off its entrance in perfect security.

The land behind is high and rugged; two singular peaks show themselves, which resemble sentry-boxes. Near the shore the land is low, compared with other parts of the coast, and has not the iron-bound forbidding appearance of the more Westerly shores.

From the heights sudden and very strong squalls blow during Westerly winds. Being generally a weather shore, and regular soundings extending along it, there is no difficulty in choosing or approaching an anchorage.

Lort Bay. Five miles S.S.W. of Schapenham Bay, is the Bay of Lort; about 2 miles wide. A vessel may anchor there, if necessary, in 8 or 10 fathoms, sand; but some rocks above water lie off its Northern shore.

False Cape Horn. False Cape Horn, the Southern extremity of Hardy Peninsula, is a very remarkable headland, and from the East or West resembles a large horn.

Nassau Bay. If bound to the Westward of Cape Horn, it might be preferable to work through Nassau Bay, and stand out from False Cape Horn, instead of making Westing in the open sea, as is usually done. There are no dangers but those which are shown in the chart, the water is comparatively smooth, and an anchorage may be taken at night; for this purpose Gorce Road, North Road, or Orange Bay may be chosen.

When it blows too hard to make any way to windward, it is at least some satisfaction, by lying quiet, to save wear and tear, and to maintain one's position, instead of being drifted to leeward, and perhaps damaged by the sea in the offing. There is less current through the bay than in the offing near Cape Horn.

Diego Ramirez Islands. The Diego Ramirez Islands lie nearly North and South, and extend over a space of 5 miles. The highest part of these islands is about 150 feet above the sea. There is no hidden danger near them. A ship may pass between the Northern cluster and that to the Southward. Detached rocks lie off the Southern Island; all the outer ones are above water. The Southern, or Boat Island, has a cove at its N.E. corner, in which boats may land, and where water may be procured on the point close to the Eastward of the landing-place.

Water. Between the Hermite and Diego Ramirez islands, there is no danger of any kind. In proceeding Westward New Year Sound next presents itself. It is a large tract of water studded with islands, and extending to the North-west.

New Year Sound. On Henderson Island, at the entrance of the Sound, there is a high sharp-pointed hill, visible at a great distance. From its summit the Diego Ramirez Islands may be seen, though 50 miles distant.

Henderson Island. Indian Cove, about 12 miles from the entrance of the sound, and on the Western shore, is not a place to be recommended; vessels must go far among the islands to reach it, and when there, they will find a bad rocky bottom, with deep water.

Indian Cove. Between False Cape Horn and Cape Weddell, at the Eastern side of New Year Sound, there is a tract of broken land, which has not been properly examined. It is, however, a lee shore during S.W. and Southerly winds, and therefore unfit for anchorage.

There may be good anchorage between Morton and Henderson Islands. There was *Morton Isl*
no time to examine some coves on the Eastern side of Morton Island, but their up *and*
pearance seemed to promise shelter and holding ground.

Clearbottom Bay is at the North end of Morton Island, and a good anchorage; it is *Clearbottom*
an anchorage which, by being close to the coast, is convenient for a vessel to touch *Bay*
at for wood and water. To sail into it from sea, bring the Eastern Hildefonso Island S.
4 E., and steer N 4 W for Point; about 14 mile E N E; on this point is the
anchorage, and at the distance of 3 cables' length from the shore, in 22 fathoms on a
bottom of sand and clay, is the most eligible berth.

Landing Hill on Hund Island, is a very remarkable double peaked height, and may *Hund Island*
be seen from a distance of 6 or 7 leagues. It points out the entrance of Duff Bay.

The Hildefonso's, a large group of rocks and islets, 5 leagues to the Southward *Hildefonso*
of Morton Island, next claim attention. They extend 5 miles in a N W. and S E *Islands*

direction, are very narrow, and about 100 feet above the sea. They appear to be the
remains of a mountain ridge, broken through in many places by the sea. Vessels
may pass close by them, for there is no danger. Sealers have much frequented them
for fur seals.

Neither Rous Sound nor Trefsis Bay afford anchorage.

The Wood Islands afford no good anchorage. Passages and broken land lie behind *Wood Isl*
them to the Northward *lands*

Captain Cook's description of Christmas Sound is as accurate as his accounts of *Christmas*
other places. His Great Black Rock, and Little Black Rock show the marks as *Sound*
you enter. There is no hidden danger. Adventure Cove, in which he anchored, is *Adventure*
the easiest of access, but it will only hold one vessel. *Cove*

March Harbor is large, with good holding ground, but there are many rocky *March Har*
places; and on a sunken rock marked by very thick kelp, there is only one fathom. *har*
No vessel of more than five hundred tons should attempt to enter Christmas
Sound.

Port Clerke is a bad place for any vessel, though quite secure when inside; access *Port Clerke*
is difficult, and from its situation, it is exposed to very violent squalls.

Waterman Island is known by its remarkable heights, the Southernmost of *Waterman*
which was named by Captain Cook, York Minster, from its fancied resemblance *Island*
to that building. He describes it as a "wild-boar egg rock." Close to the Eastward *York Min*

of York Minster, there are several rocks and islets; one, on which the sea breaks *Isle*
violently, lies 2 miles E. 4 N. from the extremity of the Minster. You may pass it
quite close. Off the Great Black Rock, there are two or three breakers, caused by
rocks under water. But little current sets among these islands.

Eight miles West of York Minster, and 4 miles South of the Western point of Wa-
terman Island, are the Capstan Rocks, about 20 feet above water. There are no *Capstan*
other dangers to seaward of a line from York Minster to the Phillips Rocks *Rocks*

Cook Bay is a large space between Alkhuolip and Waterman Islands. Broken *Cook Bay*
land, islets, and breakers, surround and make it unfit for the approach of vessels.

To the Eastward of Cook Bay there is an entrance to the Beagle Channel, and to
the North west a passage to Whale boat Sound, but both are unfit for sailing vessels,
excepting with a fair wind.

About 4 miles S S W 3/4 W. from Alkhuolip, are the Phillips Rocks. They are *Phillips*
dangerous, though above water, because so far from the shore, and so low. *Rocks*

The Londonderry Islands are a large group which nearly fills up the space *Londonderry*
between the two last-mentioned passages. *Islets.*

Tribble Island is remarkable, having three peaks; and is visible from a con- *Tribble Isl*
siderable distance; near it are some straggling rocks. *and*

Four miles to the Westward of the Londonderry Islands are Gilbert and Stewart *Gilbert and*
Islands. *Stewart Isl*

Between the two latter islands lies Adventure Passage, an open space, with deep *and*
water, and clear of danger. *Adventure*

At the N.E. side of the Eastern Gilbert Isle, there is a safe anchorage for a small *Passage*
vessel, called Doris Cove. There are no hidden dangers hereabouts; the eye and the *Doris Cove*
chart will guide a vessel safely.

The next promontory we meet in passing along the coast, is Cape Castleburgh, it *Cape Castle*
is high and remarkable. Under this cape is an excellent anchorage called Stewart *burgh.*
Harbor. It is not large, but for small vessels is an exceedingly good place, being *Stewart*
easy of access with any wind, having three openings. A vessel may anchor in the *Harbor*

entrance and warp in; there is nowhere more than 16 fathoms, generally from 6 to
12. The rocks just awash at high-water lie nearly in the middle of the harbor. A
rock on which the sea breaks, lies one mile nearly W.S.W. of the middle opening to
the harbor. There is no other danger.

Wood and water, as in every Fuegian harbor, are plentiful and easily obtained.

Cape Desolation. Cape Desolation, the South point of Basket Island, is a very remarkable headland; it is rugged, with many peaks.

Desolate Bay. Between Cape Castlerough and Cape Desolation is a large space of water, called Desolate Bay, leading to Courtenay Sound, Thieves Sound, and White-boat Sound.

Rocks and breakers abound, and make these sounds quite unfit for shipping; no doubt small vessels might, in clear weather, traverse any of these passages, but it would always be with much risk, and should not be attempted without an adequate object. Such an object does not now, nor is it likely to exist.

London Isle. Townshend Harbor. London Isle is one of a large group called the Camden Islands. At its East end there is a safe anchorage called Townshend Harbor. The Horace Peaks point out its position. Some rocks, on which the sea breaks violently, lie off the islands, and near the entrance of Pratt Passage. As there are no soundings in less than 50 fathoms after passing these rocks, and getting into the passage, you must depend upon the wind hasting to carry you into or out of the harbor. The holding-ground in it is excellent, and though you have tremendous squalls off the high land to the Westward, there is no fear of an anchor starting.

The lee side of high land, is not the best for anchorage in this country. When good holding can be found to windward of a height, and low land lies to windward of you, sufficient to break the sea, the anchorage is much preferable, because the wind is steady, and does not blow home to the heights. Being to leeward of them is like being on the West side of Gibraltar rock, when it blows a strong Levanter.

Between, and to the Northward of these islands, there are several passages with deep water, numbers of islets and rocks, and anchorages opposite to most of the valleys, or between the islands, in which small vessels could lie securely, if necessary.

Fury Harbor. At the South side of Fury Island, and N.W. by W. 4 W., 14 miles from the North-western point of London Isle, is Fury Harbor, a bad place, unfit for any vessel. There is little shelter, and very bad ground.

North Cove. At the North side of Fury Island a snug and perfectly safe anchorage, called North Cove, will be found. It is, however, only fit for small vessels. When there, they are in security; but there is no anchorage in the channel, nor until you get into the cove, unless you close the weather shore, and find a creek, in which the anchor will hold you temporarily. At the North side of Mount Skyring is another anchorage, Tom Harbor, fit for small vessels.

Tom Harbor. The entrance of the Barbara and Cockburn channels, lies between Fury and London Islands. Rocks show themselves in every direction, the two clusters called East and West Furies being the most remarkable. They have been much frequented by sealing vessels' boats, fur seals being numerous upon them at times.

East and West Furies. Barbara Channel. Four remarkable mountains point out the entrance to the Barbara Channel very distinctly. The Kempe Island peaks are high, and show three points. The Fury Island peaks are high and divided. Mount Skyring is high, and has a single peak. Mount St. Paul, from near Fury Island, appears very like the dome of the cathedral, the name of which it bears.

The situation of the rocks off the entrance of this channel, as laid down in the chart, is accurate: but no vessel should attempt to pass them without daylight and clear weather, so that she may steer more by a good eye at the mast-head, than by any chart.

Breakneck Passage is wide, and clear of all danger. I should prefer entering or leaving the Barbara Channel by this way to passing the Fury Rocks.

Agnes Islands. The Agnes Islands, and these in their neighborhood, do not require any description. They are so fortified by outlying rocks as not to be fit places for the approach of any vessel.

Stokes Bay. Northward of them is Stokes Bay, and to the Eastward a number of islands, between which lies the South-west entrance to the Barbara Channel.

No vessel ought to entangle herself in these labyrinths; if she does, she must sail by the eye. Neither chart, directions, nor soundings, would be of much assistance, and, in thick weather, her situation would be most precarious.

Noir Island. Noir Island is about 600 feet above the sea, and with a remarkable neck of land to the South-west, ended by a rock like a steeple or tower. One mile South of this point there is a sunken rock, over which the sea occasionally breaks: two other breakers are in the light close to the point.

Noir Road. There is an excellent roadstead under the East side of Noir Island. Several ships may lie there secure from all Westerly winds, over a clear sandy bottom. Wool and water plentiful and easily obtained. There is a cove at the South part of the island where boats would be perfectly safe in any weather, but the entrance is too narrow for larger vessels.

The large space between Noir Island and the Agnes Islands is extremely dangerous for shipping, being scattered with rocks, the Jupiters and Neptunes and many others; *Jupiter and Neptune Rocks.* some just awash, some showing themselves several feet above, and others under water. Still there is abundant room to go round the island in perfect security, therefore no ship need fear being hampered by an Easterly wind, in the event of anchoring in Noir Road. A rock lies in the road, and another, which is very dangerous, 4 miles to the Eastward.

Seven miles S.S.W. of Noir Island are the Tower Rocks; they are high and quite steep to. A ship u close to either side of them. *Tower Rocks.*

Between Cape Schonberg on London Isle and Noir Island, lie many reefs, and a great number of detached outlying rocks, which render this part of the coast extremely dangerous and unfit for vessels. No chart could guide them; they must trust to daylight and clear weather, with a good lookout, if necessary to enter or leave the Barbara Channel, which opens into this bay.

To the space between Kempe and Noir Islands, the name of the Milky Way has been given, as in every part of it rocks are seen just awash with, or a few feet above, the water. On them the sea continually breaks. *Milky Way.*

The Grafton Islands extend about 20 miles, in a North-west direction, they are high, and the remarks on the general character of the coast are applicable to them. *Grafton Islands.* Between them are several anchorages, but the best and easiest of access is Easton Bay. Behind them lies a passage, through which a sealing-vessel has passed. To the North-east of it is a mass of land, broken into islets and rocks.

Hope Harbor is one of those formerly used by sealing-vessels.

Isabella Island contains an anchorage fit for a sealing-vessel, but for no other. *Isabella Island.*

Rocks lie in the way to it. *Cape Gloucester.*

Cape Gloucester, the Western extremity of Charles Island, the largest and Westernmost of them, is a very remarkable promontory, and cannot be mistaken. At a distance it appears to be a high detached island; but, on a nearer approach, a low connecting isthmus is seen. A rock on which the sea breaks, lies nearly a mile to the North-west; there is no other danger. The cape may be passed quite close, being steep to.

Cape Gloucester is a guide to Easton Bay, one of the best anchorages on this coast, as it can be approached and left with any wind, without risk, and in which a fleet may lie in perfect security from all but the S.E. winds, the least prevalent of any on this coast. *Easton Bay.*

If coming from the Westward, on passing Cape Gloucester, a high island will be seen to the South-east, distant 7 miles; this is Ipswich Island, between which and Cape Gloucester lies Maria Bay, in which are many rocks and breakers. *Ipswich Island.*

Rounding Ipswich Island you must give a good berth to the rocks under water, which lie a mile from its South-east extremity. The sea does not always break upon them, but it does generally, and there is no other hidden danger. After clearing these rocks, pass close to Leading Island, and steer for the opening of Laura Harbor, which you will see under a high-peaked mountain. Choose your berth by the eye, if intending to anchor in Easton Bay, or work as far up the passage to the basin as you think proper, then anchor and warp to the berth marked in the plan. *Laura Harbor.*

The Bragle worked up all the way against a fresh wind blowing directly out. There is water for a frigate in the basin, but it is better suited to a small vessel. Large ships should anchor in the bay; and as the bottom is even and good, and the bay capacious, exposed only to South-east winds, which come on gradually and seldom blow hard, it may be considered a fit place for ships of any size, or for a squadron. Wood and water are plentiful, and easy to be obtained. The depth of water in the bay varies from 5 to 20 fathoms—the bottom generally fine speckled sand.

A large patch of kelp lies across the entrance of the harbor, but there is no danger beneath it, except for a line-of-battle-ship, as in one spot there are 4 fathoms only. This kelp was very closely examined, and its safety satisfactorily proved. *Kelp Patch.*

The Fincham Islands may be next noticed in passing to the North-westward. Between these islands and Cape Gloucester lies the Breaker Coast, a large wild extent, full of rocks and breakers, and exposed to all the strength of Westerly winds. I had neither time nor inclination to examine it, for I never saw a place more unfit for the approach of a vessel. The shore is broken into islands, islets, and rocks, almost innumerable. *Fincham Islands. Breaker Coast.*

Off Cape Tate, which is rather high, and rounded at the summit, are several clusters of rocks, the two Southern parcels are called the College Rocks; they are only seen when near the land. *Cape Tate. College Rocks.*

As a reference to the chart will show, there is no good anchorage hereabout, the coast is very dangerous and unfit to be approached.

Seven leagues to the N.W. of Cape Tate are the Landfall Islands, so named by Captain Cook, from seeing them first when he visited this coast. *Landfall Islands.*

At Cape Horn it is high-water, full and change, at 3h. 30m.; at York Minster, at *High-water* 3; and at Cape Pillar, at 1 o'clock. At the intermediate places the time gradually changes between those limits; and the rise varies from 4 to 8 feet.

General Observations upon the Sea-coast of Tierra del Fuego; its Seasons, Winds, and Weather.

From Cape Horn to Cape Pillar, the coast of Tierra del Fuego is very irregular and *Cape Horn to Cape Pillar.* much broken; being, in fact, composed of a prodigious number of islands. It is generally high, bold, and free from shoals or banks; but there are many rocks nearly *Nature of the level with the surface of the water, distant 2 and even 3 miles from the nearest shore, coast.* which make it very unsafe for a vessel to approach nearer than 5 miles, except in daylight and clear weather. The coast varies in height from 800 to 1,500 feet above *Height above the sea.* the sea. Further inshore there are ranges of mountains always covered with snow, their height being from 2,000 to 4,000 feet, and in one instance, Mount Sarmiento, 6,800 feet.

With daylight and clear weather a vessel may close the shore without risk, because the water is invariably deep, and no rock is found which is not so marked by *Rocks buoyed by kelp.* sea-weed, (or kelp, as it is generally called,) that by a good lookout at the mast-head, its situation is as clearly seen as if it were buoyed. By avoiding kelp you are sure of having sufficient water for the largest ships on any part of this coast. At the same time it must be remembered that kelp grows in some places from a depth of 30 *Kelp or sea-fathoms,* and that on many parts of this coast you may pass through thick beds of *weed, a sign of danger.* sea-weed without having less than 6 fathoms water; still it is always a sign of danger, and until the spot where it grows has been carefully sounded, it is not safe to pass over it with a ship.

Viewing the coast from a distance, it appears high, rugged, covered with snow, and *Appearance of the coast.* continuous, as if there were no islands; but when near, one sees many inlets which intersect the land in every direction, and open into large gulfs or sounds behind the seaward islands. The high land covered with permanent snow now disappears, and *Appearance of the land.* the hills close to the sea will be seen thickly wooded towards the East, though barren on their Western sides, owing to the prevailing wind. These hills are seldom covered with snow, because the sea-winds and the rain melt it soon after it falls.

Opposite to the Eastern valleys, where the land is covered with wood, and water *Places fit for anchorage.* is seen falling down the ravines, good anchorage is generally found. But these valleys are exposed to tremendous squalls, which come from the heights. The best of *Squalls.* all anchorages on this coast, is where you find good ground on the Western side of high land, and are protected from the sea by low islands. It never blows nearly so hard against high land as from it, but the sea on the weather side is of course too formidable, unless stopped by some barrier cape or islet.

Where the land is chiefly composed of sandstone or slate, anchorages abound; where of granite, it is difficult to strike soundings.

The difference between granite, and slate or sandstone hills, can be distinguished *Granite* by the former being very barren and rugged, and of a gray or white appearance; *sandstone* whereas the latter are generally covered with vegetation, are dark-colored, and have *and slate* smoother outlines. These slate or sandstone hills show few peaks, and the only *hills.* rugged places are those exposed to wind or sea.

Soundings extend to 30 miles from the coast. Between 10 and 20 miles from the *Soundings.* land the depth of water varies from 60 to 200 fathoms, the bottom almost everywhere a fine white or speckled sand. From 10 to 5 miles distance the average depth is 50 fathoms; though varying from 30 to 100, and in some places no ground with 200 fathoms of line. At less than 5 miles from the shore the soundings are very irregular; generally less than 40 fathoms, but in some places deepening suddenly to 100 or more; while in others a solitary rock rises nearly to the surface of the water.

After carrying 50, 40, 30, or 20 fathoms, towards an inlet, which you are desirous of entering, you will possibly find the water suddenly deepen to 60 or 100 fathoms as soon as you enter the opening; and in the large sounds, behind the seaward islands, the water is considerably deeper than on the outside.

A bank of soundings extends along the whole coast, and 20 or 30 miles in breadth, *Outer Bank.* which appears to have been formed by the continued action of the sea upon the shore, wearing it away and forming a bank with its sand.

Between the islands where there is no swell or surf worth notice, the water is deep, and the bottom very irregular.

A small vessel may run among the islands in many places, and find good anchorage; but she runs into a labyrinth, from which her escape may be difficult, and in thick weather, dangerous.

Fogs are extremely rare on this coast, but thick rainy weather prevails, and strong *Fogs.* winds. The sun shows itself but little; the sky, even in fine weather, being generally overcast and cloudy. A clear day is a very rare occurrence.

- Weather.* Gales of wind succeed each other at short intervals, and last several days. At times the weather is fine and settled for a fortnight, but those times are few.
- Winds.* Westerly winds prevail during the greater part of the year. The Easterly winds blow chiefly in the winter months, and very hard, but they seldom blow hard in summer.
- Easterly winds.* Winds from the Eastward invariably begin gently, and with fine weather:—they increase gradually,—the weather changes,—and often end in a determined heavy gale. More frequently they rise to the strength of a treble-reefed topsail-breeze, then die away gradually, or shift to another quarter.
- North and North-west winds.* From the North the wind always begins to blow moderately, but with thicker weather and more clouds than from the Eastward, and it is generally accompanied by small rain. Increasing in strength, it draws to the Westward gradually, and blows hardest between North and North-west, with heavy clouds, thick weather, and much rain.
- When the fury of the North-wester is expended, which varies from 12 to 50 hours, or even while it is blowing hard, the wind sometimes shifts suddenly into the South-west quarter, blowing harder than before. The wind soon drives away the clouds, and in a few hours you have clear weather, but with heavy occasional squalls.
- South-west wind.* In the South-west quarter the wind hangs several days, (generally speaking,) blowing strong, but moderating towards its end, and granting two or three days of fine weather.
- Summer.* Northerly winds begin generally during the summer months but change continually from North to South, by the West, during that season, which would hardly deserve the name of summer, were not the days so much longer, and the weather a little warmer. Rain and wind prevail much more during the long than the short days.
- Changes of the winds.* It should be remembered that bad weather never comes on suddenly from the Eastward, neither does a South-west or Southerly gale shift suddenly to the Northward, South-west and Southerly winds rise suddenly and violently, and must be well considered in choosing anchorages, and preparing for shifts of wind at sea.
- Usual weather.* The most usual weather in these latitudes, is a fresh wind between North-west and South-west, with a cloudy overcast sky.
- Barometer.* Much difference of opinion has prevailed as to the utility of a barometer in these latitudes: but Captain Fitz-Roy, during twelve months' constant trial, found its indications of the utmost value. Its variations do not of course correspond with those of middle latitudes, but they do correspond with those of high Northern latitudes in a remarkable manner, changing South for North.
- Currents.* There is a continual current setting along the South-west coast of Tierra del Fuego, from the North-west towards the South-east, as far as the Diego Ramirez Islands. From them the current takes a more Easterly direction, setting round Cape Horn towards Staten Island, and off to seaward about E.S.E.
- Much has been said of the strength of this current, some persons supposing that it is a serious obstacle in passing Cape Horn to the Westward, while others almost deny its existence. From the experience of the *Beagle* it appears to run at the average rate of a knot. Its strength is greatest during Westerly, and least or insensible, during Easterly winds. It is strongest near the land, particularly when close to the projecting capes or detached islands.
- This current sets rather from the land, which diminishes the danger of approaching this part of the coast.
- Coast not dangerous.* There is, in fact, much less risk in approaching this coast than is generally supposed. Being high and bold, without sand-banks or shoals, its position accurately determined, and a bank of soundings extending 20 or 30 miles from the shore, it cannot be much feared. Rocks, it is true, abound near the land, but they are very near to the shore, and out of a ship's way.
- Southerly gales.* Gales of wind from the Southward, and squalls from the South-west, are preceded and may be foretold by heavy banks of large white clouds rising in those quarters, having hard edges, and appearing very rounded and solid.
- North and North-west winds.* Winds from the Northward and North-westward are preceded and accompanied by low flying clouds, with a thickly overcast sky, in which the clouds appear to be at a great height. The sun shows dimly through them, and has a reddish appearance. For some hours, or for a whole day, before a gale from the North or West, it is not possible to take an altitude of the sun although it is visible; the haziness of the atmosphere in the upper regions causing its edges to be quite indistinct. Sometimes, but very rarely, with the wind light between N.N.W. and N.N.E., a few days of beautiful weather may occur; but they are generally succeeded by gales from the Southward, with much rain.
- Succeeded by Southerly gales.* It may be as well to say a few words respecting the seasons in the neighborhood of Cape Horn, as much question has arisen respecting the best time for making the passage around the cape—in winter or in summer.

The equinoctial months are the worst in the year, generally speaking, as in most other parts of the world. Heavy gales prevail at those times, though not, perhaps, exactly at the equinoxes. August, September, October, and November, are the worst of all. Westerly winds, rain, snow, hail, and cold weather, then prevail.

December, January, and February, are the warmest months, the days are long, and there is then some fine weather; but Westerly winds, which often produce very strong gales, with much rain, prevail even throughout that season, which carries with it less of summer there, than in almost any part of the globe.

March is the most boisterous month in the year, though not so rainy as summer.

In April, May, and June, the finest weather is experienced; and though the days are shortened, it is more like summer than any other time of the year. Bad weather often occurs even during these months, but not so much as at other times. Easterly winds are frequent, with fine clear settled weather. During this period there is some chance of obtaining a few successive and corresponding observations. To endeavor to rate chronometers, by equal altitudes, would be a fruitless waste of time at other seasons. June and July are much alike, but Easterly gales blow more during July.

The days being so short, and the weather cold, make these months very unpleasant, though they are, perhaps, the best for a ship making a passage to the Westward, as the wind is much in the Eastern quarter. Upon the whole the summer months, December and January, are the best for making a passage from the Pacific to the Atlantic, though that passage is so short and easy, that it hardly requires a choice of time. For going to the Westward, April, May, and June are preferable.

Lightning and thunder are scarcely known; violent squalls come from the South and South-west, giving warning of their approach by masses of clouds. They are rendered more formidable by snow and hail of a large size.

STATEN ISLAND AND THE ISLANDS OF CAPE HORN.

Staten Island lies off the South-eastern extreme of the American continent, and like the Falkland Islands, is so deeply indented by bays as to form nearly four different islands. It offers a good departure to ships bound into the Pacific, as well as a landfall when returning. It is composed of lofty hills, the peaked summits of which retain through most of the year the snowy covering amassed during the long and dreary winter. The harbors are merely the continuation of the valleys, and consequently all preserve nearly the same direction, and are surrounded by high land, the water in them deepening rapidly towards the centre. The coast consists everywhere of rocky cliffs elevated from 200 to 500 feet, and have generally from 15 to 20 fathoms water close to their bases.

The velocity of the tides is very great, and as they meet with constant obstacles in the manner in which the headlands jut out at right angles to their directions, there is produced, when the wind is strong and contrary, a rough cross-breaking sea which is impassable by a boat, and even dangerous to a ship of considerable size.

There is also reason to believe that the meeting of the two flood-tides coming round Cape Horn, and through the various channels of Tierra del Fuego, contributes to the unusual agitation of the sea in the vicinity of Staten Island. The flood comes from the Eastward along the Northern shores of the island, and continues its course Southward through the Strait of Le Maire, varying in velocity from 5 to 7 knots. To the Southward of the island but little amount of tide is perceptible; there is, however, a remarkable undertow, which renders it dangerous for boats to stretch across the mouths of the deep bays, as it is difficult to close again with the land; and for this reason the sailors invariably follow the circuitous route of the shores. The times of high-water, at full and change, at Cape St. Bartholomew and Cape Horn are 3h. 50m. and 4h. 30m. respectively, showing that the great tide-wave of flood comes from the South-west. This seems to point out that Staten Island, standing with its extreme length about N.E. and S.W., or nearly at right angles to its direction, receives upon its Southern shore the whole force of the flood, which having passed Cape St. John, follows the direction of the coast to the Westward, where it meets the flood coming down the Eastern side of the South American continent and also that proceeding from the Strait of Magellan, together with those streams that find their passage between the islands of Tierra del Fuego. This heaping together of the tides in one place from such a variety of directions, would be quite sufficient to account for the constant state of agitation exhibited by the surrounding sea of Staten Island, even in moderate weather, without taking into account the prevalence of Westerly gales of the most violent character.

Harbors.

The harbors of Staten Island are with one exception confined to its Northern side; they are, St. Johns Harbor, Port Cook, New Year Harbor, Port Basil Hall, Port Parry, Port Hopper, and Port Vancouver. There are also two or three small bays in the Strait of Le Maire, but they are rendered unsafe by their exposure to the prevalent Westerly winds. All these anchorages, though well protected when once gained, are more or less difficult of access from the force with which the tides set across the mouths of the inlets, the depth of water, and variability of the wind, which in every instance, except that of blowing immediately lengthways of the port, finds its way down the ravines of the mountains in various directions, according to the peculiarity of their form.

New Year Islands.

The New Year Islands afford a sort of protection from Westerly winds, and there is anchorage under the North-easternmost in 17 fathoms; but it cannot be recommended, being open to the influence of all winds between N. and E.S.E., the bottom rocky, and the tides rapid, while the eddies are so uncertain in their distance from the island, that it is by no means easy to keep a ship clear of her anchors.

St. Johns Harbor.

St. Johns Harbor is the Easternmost in the island, and may be easily recognized at a distance by Mount Richardson, at the base of which it is situated. On nearing it a remarkable cliff like a painter's muller, appears on the Eastern shore, which is high and steep. Allowance must be made in steering for the harbor for the set of the tide, which at all times runs rapidly across its mouth; it is, however, less sensible when within the headlands forming the North-west bay, in which in case of necessity, or to await the turn of the tide, an anchor may be dropped in from 20 to 30 fathoms. The mouth of the harbor is wide, having 25 fathoms in the centre, with a rock standing off at some distance from the Western point, to which a berth must be given. The shores, with this exception, are bold, and immediately within the Western point is a small bay, where anchorage may be had in 10 fathoms. The most sheltered situation is at the head of the harbor, distant from the entrance 3 miles S.S.W., where a vessel may choose any depth between 20 and 5 fathoms, with sandy bottom, and moor with an open hawse to the S.W., from whence the gusts that come from the mountains are violent. The wind, anything to the Westward of N.N.W., or even N.W. outside, will be found to draw out of the harbor on nearing its head, and if at all strong, it will be impossible to beat further, as it follows the direction imparted to it by every ravine in the hill as it passes; and therefore warping will be found the only means of advancing, taking care to have hands by a bower anchor ready to let go, and the cable stoppered at a short scope, in the event of the hawsers being carried away. A ship may readily heave down on a beach of sand at the head of this harbor. Wood and water are plentiful and easily procured.

Wood and water.

The shores of St. Johns Harbor are lined with kelp, which is an excellent indication of its navigable part, the border of it being almost invariably in 8 fathoms, and that close to the shore, the depth rapidly increasing towards the centre, until near the head of the harbor, where the depth gradually decreases to the beach.

Port Cook.

Port Cook is the most eligible harbor in Staten Island for a ship in want of shelter, from the good anchorage at its entrance in not too deep water, the greater regularity of the prevailing winds, and the facility of communication with the South side of the island, by means of the low isthmus separating it from Port Vancouver.

Port Basil Hall.

Port Basil Hall is separated by a narrow neck of elevated land from the head of New Year Harbor, though their mouths are $2\frac{1}{2}$ miles apart. This is a most convenient anchorage when once attained, and well sheltered from all winds, though the depth of water and contraction of its mouth by two detached rocks render it difficult of entrance without a commanding breeze and favorable tide. There are three rocky patches nearly in the middle of the space within the entrance, but all the danger is pointed out by the kelp and the tops of the rocks themselves, which show at half-tide: they must be passed on the Eastern side, where there is a space sufficiently wide to admit of beating in moderate weather. The best anchorage is between a small green island on the Western shore, and a fine sandy beach to the Northward of the island; it gives from 7 to 10 fathoms, and the island may be passed on either side, taking care to avoid a rocky ledge that runs off its South-east extremity. Although the whirlwinds common to all the harbors of Staten Island are found to exist here, yet the comparative lowness of the South-western shore renders them less violent than in many of the others; and the New Year Islands afford some protection to the harbor from the sea, by stretching, though at a distance, across its mouth.

Wood and water.

Wood and water are abundant, and a fine sandy beach abreast of the anchorage affords facility for a small vessel in want of repair.

There is anchorage on the Eastern side also, in a bay just within the entrance, but it cannot be compared with the other, being exposed to the swell that rolls in from seaward, and open to the influence of Westerly, the prevailing winds. The best directions for entering the port are, after having passed the rocks in its mouth, to steer for a remarkable peaked hill, the Easternmost of two near the head of the harbor,

until another peaked hill, on the Western shore, which stands by itself, comes into view, after which the course may be shaped so as to pass the island on the Northern side, where the best anchorage will be found.

The entrance of Port Parry may easily be distinguished by its being the first opening to the Westward of New Year Islands, and by Buckland Peak on its Eastern side, the quoin-shape appearance of which renders it a very remarkable object. There are detached rocky islets off both the points of entrance, but they are bold and steep, and there is no danger to be apprehended from approaching them.

Port Parry.

The harbor itself is divided into two parts by the near approach of its opposite shores, about 2½ miles from the entrance, after which they again expand, forming a well-sheltered and secure anchorage.

The depth of water in the gorge of the inner harbor is 8 fathoms, and the breadth about 150 feet; and after having passed it, the Eastern point of the outer entrance should be brought in one with the Eastern point of the gorge, in order to lead clear of two rocky patches that lie one on either side within it, and are pointed out by the kelp growing on them.

There is good anchorage in 9 or 10 fathoms to the Southward of a small grassy island on the Eastern shore of the inner harbor, with sandy bottom, after which the water again deepens to the head of the harbor, where a vessel may be moored with an open hawse to the S.S.W., opposite to a sandy beach—the place in which the observations were made.

The deepest water is on the Western shore, more particularly abreast of a perpendicular cliff opposite to the small island before mentioned. In this harbor, wood and water may be got on board with facility, and clams may be caught by a scissors-shaped rake to detach them from the sand at low-water.

There is a rocky patch having 4 fathoms on it nearly in the centre of the outer port, and as the water gradually shoals all round it, a vessel might find a temporary anchorage. The depth of water in the Western arm is an objection to it as a place of long continuance for a ship, but the bottom is good, and both wood and water may be procured, though the swell that rolls in on the rocks would be very destructive to the boats on landing; there is, however, a convenient place for the employment of a hose for watering. The hawse should be open to the Westward, in the event of mooring.

After entering the outer harbor, there is no bottom with 30 fathoms, until near the contraction; and the Western shore should be kept on board if the intention be to anchor in the Western arm of the outer harbor. If bound into the inner harbor, the Eastern shore should be hugged tolerably close until abreast of the white ravine. Unless with a leading wind, it would be impossible to sail through the contraction. If the wind is found to baffle on nearing it, the sail must be taken off the ship and preparations made for towing or warping; indeed it would be perhaps better in all cases to adopt those precautions, as the height of the surrounding land frequently causes flaws that might, in so narrow a channel, drive the ship on shore before the sails could be trimmed.

To this harbor the sealing-vessels are accustomed to resort when in want of repairs, or as a place of shelter while their boats are absent in the pursuit of furs; in this respect it is, however, very inferior in point of convenience to Port Cook, for though the distance across the island from the head of the harbor hardly exceeds the breadth of the isthmus at Port Cook, and there is a boat-harbor on the Southern shore nearly opposite, yet the elevation of the land is too great to admit of a communication being kept up without two separate establishments.

From the height of the land also the squalls are frequent and violent, though not sufficient to cause apprehension to a ship well moored.

Port Hopper is the next opening to the Eastward of Cape St. Anthony, and is divided from Port Parry by a peninsula of 2 miles between Isabella Point, the Western point of Port Parry, and Austin Point, the Easternmost of Port Hopper. Abreast of the Western arm of Port Parry, however, the distance across the neck of land does not exceed half a mile. This harbor is also divided into two parts, like Port Parry; it has a high rocky island in its mouth, by which it is protected from North-westerly winds, and which affords anchorage for the space of half a mile within it, in from 20 to 8 fathoms. To the South-east of this island, however, there is a continuation of rocky patches, and two pinnaled rocks peep above the water's edge, and are surrounded by abundance of kelp. Near the head of the outer harbor, there is also anchorage close to the shore, which on the Western side is high and precipitous. The gullet is not more than from 25 to 30 yards broad, with from 2 to 4 fathoms in it; yet the sealers sometimes haul their small schooners through into the inner basin, where they are completely secure from all winds in from 20 to 6 fathoms, and moor by hawsers to the rocks. The tide rushes through the narrow openings with great velocity; it would be prudent, therefore, not to commence warping in until the last-quarter flood.

Port Hopper.

A tolerably-sized stream falls into the head of the inner basin from the mountains by which the whole of the harbor is surrounded. In the outer harbor there are no soundings in the centre with 40 fathoms of line. Wood and water are here tolerably plentiful; but the harbor is by no means so convenient or so secure as either of those previously mentioned.

Flinders and Crossley Bays.

Port Hoppner is the Westernmost harbor in the island, but anchorage may be found in the small coves on the Eastern side of Flinders Bay, and also in Crossley Bay; they are, however, open to the prevalent winds, and unprotected from the sea, and can by no means be recommended.

Port Vancouver.

On the South side of Staten Island, the only well-sheltered harbor is Port Vancouver, immediately opposite to Port Cook, from which it is separated by a low isthmus. In it a vessel may ride in security in 16 or 17 fathoms, sandy bottom, close to a rivulet, and near a convenient wooding-place in the Western arm. There is a rocky island on the Eastern side of the entrance which is always visible, and a reef extends some distance from the South point of the Western arm, which may be avoided by not hauling in for the anchorage there until a remarkable white ravine on the South shore becomes visible. These are the only dangers; and in this harbor the same advantages of communication with the other sides of the island, by means of the isthmus, are offered as in Port Cook, while it possesses the important one of affording a place of refuge during a S.W. gale. It may easily be recognized from seaward by its being the first opening to the Eastward of Dampier Islands, from the Southernmost of which it is distant 43 miles. A ship must moor with an open bayse to West.

Back Harbor.

Back Harbor cannot be recommended, on account of the heavy rolling sea that sets into it with S.W. winds, the scarcity of wood, and difficulty of procuring water, in consequence of the surf that breaks on the beach. The holding-ground, however, is good, and small vessels have rode here occasionally in N.W. winds.

Tides.

The time of high-water, at full and change, is about 1h. 30m., and very nearly the same in all parts of the island; the rise and fall is from 7 to 9 feet.

Natural History.

The seal, the otter, the rat, and the mouse are the only quadrupeds on Staten Island. Birds are more numerous, and comprise three species of penguins, gulls, albatrosses, and shags, of which the crested shag form extensive flocks, building their nests in the loftiest trees on the hills.

THE HERMITE, OR CAPE HORN ISLANDS.—The whole of these islands are composed of greenstone, in which the hornblende and feldspar are more or less conspicuous, and the presence of iron very apparent, as already stated. Their shores are bold; and the mountains are peaked, rising with a steep ascent to an elevation of from 1000 to 1700 feet above the level of the sea; and being thickly clothed to within 200 or 300 feet of their summits with different sorts of shrubs and evergreen trees, render them difficult of access.

St. Martin Cove.

The entrance into St. Martin Cove bears from Cape Horn W.N.W. 4 W., from which it is distant about 10 miles, and is farther distinguishable by Chanticleer Island, that lies about a mile due N.E. from South Head. In this direction there are no dangers but what show themselves, and the cove is of easy access with N.E., E., or S.E. winds; but with the Westerly winds that prevail here it is quite the reverse, and ships then should anchor off the entrance in about 22 fathoms, and wrap into the cove, where there is a convenient berth in 18 fathoms, sandy bottom, midway from either side, and about half a mile from the head of the cove. This anchorage is safe, although the gusts of wind in Westerly gales (which are of frequent occurrence at all seasons of the year) rush down the sides of the mountains in various directions with impetuous violence, and may be very properly called hurricane squalls. They strike the ship aloft and have more the effect of heeling a vessel than of bringing a strain upon the anchors, which, when once imbedded in the sandy bottom, hold remarkably well, and will cost a heavy heave in weighing.

Wood and water.

Wood and water are in abundance in every part of the cove, but cannot always be procured, from the steepness of the shores and the heavy swell that sometimes sets in. The water is highly colored by the vegetable matter through which it percolates, but we found no inconvenience from its use than that of giving to our tea a deeper color, and somewhat unpleasant taste. The wood was very much twisted and stunted in growth, and did not appear fit for any other purpose than fuel.

Tides.

Time of high-water, at full and change, 3h. 50m. Rise about 8 feet; but the swell that sets into the cove rendered the observations both on the times and on the rise and fall very uncertain. There was no very decided direction observed in the stream of either tide, which was very slack; but it appeared that the flood came in from the Southward amongst these islands.

Currents.

At the distance of 3 or 4 leagues to the Southward of Cape Horn, however, there is a current running to the E.N.E., at the rate of about one mile per hour; but in what manner this current may influence the tides near the shore, or what changes may be produced in the direction and strength of the current itself by the flood and ebb tides, will require a very extensive set of observations to ascertain.

 the flood and ebb tides,

The circumstance of there being no well authenticated account of the existence of a current to the Southward of Cape Horn, induced me to throw together the following observations upon that subject, made during the passage of His Majesty's sloop Chanticleer, from Staten Island to Cape Horn, from Cape Horn to South Shetland, from South Shetland to Cape Horn, and from Cape Horn to Staten Island, during the summer and autumnal months of those regions

The ship's way through the water was measured by Massey's self registering log, and the variation of the directing compass was ascertained by actual observation on the course steered, whenever the state of the weather would permit. The local attraction of the Chanticleer did not exceed two degrees in extreme cases.

The observed places of the ship were computed with every possible care and attention.

The following tables comprise those observations —

All vessels intending to touch at this group, and coming from the Northward, should endeavor to get soundings off Cape Corrientes, in about 39° S. latitude. If their longitude is incorrect, they would thus be able to correct their position; for the edge of the bank is so steep that, in a distance of 10 miles, the depth changes from 100 fathoms to bottom to 60 fathoms sand; and by sounding every 2 or 3 miles, until the edge of the bank is hit in about 80 or 90 fathoms, a vessel might obtain her longitude within a very few miles of the truth. In the parallel of 39° S., the edge of the bank is in $55^{\circ} 15'$ W. longitude; in latitude 41° , in about $56^{\circ} 55'$ longitude; in latitude 45° , in about 60° longitude; and in latitude 46° S., in about $60^{\circ} 15'$ W. longitude.

Should a vessel be unable to get in with the coast so as to strike the edge of the bank as far North as 39° S. latitude, she should endeavor to do so as soon afterwards as possible; taking advantage of every Northerly and N.W. wind to steer about S. W., in order to make up for what she is certain to be driven to the S.E. about the wind draws to the S.W., which it does at least every second or third day. By persevering in getting to the S.W., whenever the wind will allow it, until the Westward of 60° W. longitude, there will be no fear of being driven to the N.E. of the islands; whereas, if a vessel make a straight course for the islands when the wind is fair, she will be certain of being driven to leeward by the frequent South-westerly winds, and find great difficulty in getting to windward again. Having, if possible kept as far to the Westward as 60° W. longitude, until in $49^{\circ} 30'$ S. latitude, soundings will be obtained on the bank to the Northward of the Falklands, in about 80 to 85 fathoms, fine dark sand. If the longitude can be depended on, a course may then be steered to make the land about 20 miles to the Westward of Volunteer Point; but if the position of the vessel is doubtful, or the wind drawing round from the N.W. towards the S.W., it would be better to keep to windward, so as to make the Eddystone Rock, which is seen well from a vessel's deck about 8 miles off, and exactly resembles a ship under all sail when seen at that distance. It can be seen in the darkest night (if the horizon is clear) before a ship would be in danger, as there is deep water close round it; but if the longitude is uncertain, it would be better, in the night, not to run on, after shoaling to 50 fathoms, should the wind be towards the shore, as a vessel might pass the Eddystone, and become embayed in the deep bight to the Westward of it. The same rule should apply in thick weather, which is always the case with Northerly and N.E. winds; but if a vessel has had observations shortly before, and can depend on her position, she may run for the N.E. point of the island in any weather; and if the land is not seen about Macbride Head, or Cape Carysfort, when the water shoals to 40 fathoms, her head should be put off shore until daylight, or until a break in the thick weather enables the land to be seen; but the days of thick weather are very few, and it is not often that the land cannot be seen when 20 miles off.

*Eddystone
Rock.*

*First appearance
of the
land.*

The first appearance is very unfavorable; rugged hills, the summits of which are stony and very light-colored, have made many suppose that the high land is always covered with snow, but this is rarely the case from October to April or May, except patches in the hollow of the mountains, which sometimes remain till November.

*Macbride
Head.
Cape Carys-
fort.
Cow Bay.*

In coming from the Northward, the most Eastern hills seen are those immediately over Berkeley Sound; by steering for them, when within 6 or 7 miles of the land, the cliffs of Macbride Head and Cape Carysfort will be plainly seen. Both these capes, and a projecting point between them, have small detached rocks lying off them, which show plainly in coming from the Westward. Cape Carysfort may be passed at a mile distance, and the low land and rocky islets which form Volunteer Point, will then be distinctly seen. Cow Bay lies a couple of miles to the Southward of Cape Carysfort, and affords clean sandy anchorage in 7 or 8 fathoms, but open to the Eastward. It is easily known by its white sandy beach, and the bluff land about the cape; and, at the close of the evening, vessels bound to Stanley might find it convenient to drop an anchor here for the night. A berth of 2 miles should be given to the rocky islets off

Uranie Rock.

Volunteer Point, in order to clear the Uranie Rock, on which a French frigate of that name struck. It is the more dangerous, as with Westerly winds the sea seldom breaks on it, and it is the only rock of the whole group on which no kelp grows. The best marks to clear it, particularly in the night, are the bearings of Cape Carysfort and

Mount Low.

Mount Low. By keeping Cape Carysfort to the Westward of W.N.W., until Mount Low bears S.S.W. $\frac{1}{2}$ W., a vessel will pass nearly 2 miles outside of it, and may then haul up for Mount Low, which is the most Eastern high hill on the island, and may easily be seen, in a clear night, when to the Northward of Volunteer Point; the summit, which is 840 feet high, forms two peaks, and from the Eastern one the land slopes down to the point that divides Berkeley Sound from Port William.

*Berkeley
Sound.*

The entrance to Berkeley Sound is seen opening out directly after passing Volunteer Point, and cannot be mistaken either by night or day. This capacious bay may be said to lie between Aigle Point and Kidney Island, and is therefore 4 miles wide

ctly after passing Volun-
This capacious bay may
s therefore 4 miles wide

at its entrance, and upwards of 5 leagues in length, terminating in the three excellent anchorages of Johnson Harbor, Stag Road, and Port Louis. After passing Aigle Point, from which a reef extends half a mile to the Eastward, the sound is clear of all danger up to Sea-lion Rocks. These rocks make at a distance like two or three small boats; and vessels bound to either of the above three anchorages should in the first instance steer for these rocks, the dangers round which are well marked by kelp.

The entrance to Johnson Harbor is two-thirds of a mile in breadth, from kelp to kelp, which shoots up there in 5 or 6 fathoms, and well marks the limits of the channel. Off Lamarche Point the kelp will be seen to run out a long way, with another large patch opposite to it, which together narrow the passage to a third of a mile. After clearing these, the vessel may boldly proceed up the harbor and anchor off Magellan Cove, in from 5 to 6 fathoms, mud. The Conway found the ground there so tough that in weighing the anchor the head of the capstan was wrung. The watering-place is at the N.W. corner of Magellan Cove, but it is inconvenient, as the beach shelves out a long way, so that the people are obliged to roll the casks some distance, and are therefore constantly wet. If not in want of water, a better berth may be found further to the Westward, for the sake of shelter during heavy S.W. and Southerly gales, which raise a heavy sea off Magellan Cove. The landing, also, is more sheltered on the Western shore; and that side of the harbor abounds with rabbits.

Stag Road offers a still better anchorage for large ships off Bougainville Creek; the two large kelp patches may be passed as close as possible, and the largest ship may work in, and anchor in 4½ or 5 fathoms in any part of the road. The best berth and the best ground will be found mid-channel between Hog Island and the North shore; but it is 2 miles from the watering-place, which is to the Westward of the Carenage.

Berkeley Sound is the only place, on the East coast, that can be entered by night, if the entrance has been made out before; and even worked into safely, by standing close to the shore on each tack till nearly abreast of Johnson Harbor, where a ship can anchor in from 12 to 15 fathoms, outside the kelp patches off Long Island, but rather to the Southward of mid-channel, to avoid getting too close to the Sea-lion Rocks, which cannot be seen in a dark night.

Port Louis lies in the Western extremity of the bay. The entrance is between Long Island on the South and Peat and Hog Islands on the North; but a rocky patch nearly mid-channel contracts the passage to a little more than a cable's length. After passing this narrow gullet, keep to the Northward of Round Island. This anchorage is nearly landlocked; the most convenient berths for small vessels are off the Carenage, in 3 fathoms, about a quarter of a mile from the shore, or further over to the Southward in 3½ or 4 fathoms.

The Carenage, at its entrance, is scarcely more than 100 yards across, but expands to a sheet of water of nearly a circular form, and nearly half a mile wide; from the shallowness of the water, however, it is only adapted for boats. The old settlement was on its Western side.

It is high-water at Port Louis, full and change, at 5 o'clock, and the rise of tide at springs does not appear to be more than 7 feet.

The entrance to Port William cannot be made out well till near the land. With a fair wind, after rounding Volunteer Point, Mount Low should be kept about a point on the starboard bow; some white sand-hills will then be seen ahead, and close to Kidney Island; at the same time the Seal Rocks, which form the extreme of the South entrance to Port William, will be seen on the horizon, just above Cape Pembroke, and about two points on the port bow. By continuing on this course till within a mile of Kidney Island, (which can be approached in safety to within a quarter of a mile,) the Northern point of the entrance to Port William (William Point) will be made out clearly; it is low and rocky, and has *tussac* growing on it, which has the appearance of low green bushes, and is easily distinguished from the rest of the land. This point may be passed within a cable's length, and the entrance to the harbor will be seen bearing S.W. The port is entered after passing William Point, and there is good anchorage in the bay, between it and Cape Pembroke, in from 11 to 12 fathoms, sheltered from all the prevailing winds. The next point is Charles Point, about two miles further; it has two small detached rocks at its extreme, off which there is a kelp patch, extending about one-third of a mile; there is deep water close to the edge of the kelp. Yorke Point, on the South side of the harbor, and the islets to the Eastward of it, are all steep, and may be approached within 100 yards; the entrance is wide enough for a line-of-battle ship to work in, and the edge of the kelp is a secure guide; but the white sandy bay on the South side should not be entered, as it is shallow. In standing towards it, a vessel should tack when in the line of the islets and of Yorke Point. Immediately this point is passed, Sparrow Cove will be seen open on the North side of the harbor, under Mount Low, and the entrance of Stanley Harbor (where the settlement is now) on the South side. If the wind is Southerly, the

Stanley Harbor.

passage into Stanley Harbor should not be attempted, except by a small quick-working vessel; but, with the wind to the Westward of S.W., it may be passed by the largest ships; it is little more than a cable's length broad, but both points can be passed within 30 yards. If the wind is S.W., so as to make it necessary to pass very close to the Western point (Navy Point) to fetch through, a vessel should work up well to windward of the entrance, and entering the passage under all sail and with good way on, directly the sails lift from the wind drawing out in passing the point, she should be kept a little higher, so as to shoot through with the sails shaking till she gets the steady wind inside the point. When through the Narrows, the harbor may be traversed by any vessel under the size of a line-of-battle ship; there are 3 fathoms a cable's length from the kelp on each side, and above 4 fathoms in mid-channel, close up to the site of the town, which is about 2 miles to the Westward of the entrance, on the South shore. The largest ships have plenty of room to round to and anchor in mid channel, in about 5 fathoms, as far up as they choose to fetch. After passing the Narrows, the bottom is excellent—a stiff mud, which often causes some trouble in getting the anchor up again.

Water.

The greatest drawback on Port Stanley was its want of running water near the settlement; but several wells have been recently sunk by its present active governor, and all vessels can now depend on a ready supply. Good and cheap beef may be obtained in any quantity, and wild fowl and fish are also very abundant.

Wood.

Wood cannot be had, but *peat* which is a fair substitute for it, is plentiful, and when compressed, is found to be a valuable fuel.

Above Port William anchorage, a long creek winds through the hills to the Westward, up to Murrell River; its whole extent being about 34 miles. It varies in width from one-fifth of a mile to half a cable's length for the first mile, with a depth of 3 to 2 fathoms, beyond which it shallows rapidly, so that a boat cannot get up till the tide begins to flow. The landing on all the benches is very bad in consequence of the scattered fragments of quartz rock from one to three feet long, which may greatly injure a boat if she touches them; the only safe landing is on the rocks where the shores are steep to. There is a very good watering-place on the West side of the cove on the North shore, in a bight outside the entrance to Weir Creek; but care must be taken in landing on account of the stones. Nearly every hollow has a small stream running through it, and peat may be dug in several places.

The shores of this port seem to be the favorite resort of the wild horses; but the horned cattle are never seen there, as they keep on the low grounds to the Southward of the hills.

Sparrow Cove.

Vessels that remain in Port William will find good anchorage in Sparrow Cove, and an unfailing supply of good water in its N.W. corner. In Port Harriet there is a good stream in a cove on the North shore, about a mile inside the entrance.

Ships bound round Cape Horn should not enter Stanley Harbor, as the wind which would be fair for them to sail, would be foul for getting through the Narrows; they may anchor outside the entrance about a quarter of a mile N.W. of them.

Vessels coming from Cape Horn might always go into Stanley Harbor, as any wind which would be fair for them to sail, if bound to the Northward, would also be fair to leave the harbor.

Large ships, when abreast of the entrance, in coming up Port William, not intending to enter Stanley Harbor, should stand towards the Narrows till they shut in the entrance points of Port William, when they will have from 6 to 7 fathoms, about one-third of a mile from the shore, and can easily leave with any wind.

Beauchene Island.

Vessels from the Southward, wishing to call at Port William, should make Beauchene Island, which is about 2 miles long, and half a mile wide. Its Northern point rises to a green mound about 200 feet high; the Southern end is less than half that height, and is all rocky, covered with birds and hair-seals. It is in latitude $52^{\circ} 51' 4''$ S., longitude $59^{\circ} 12'$ W.; the South and East sides form high cliffs, but the West side slopes gradually to the sea. There is no danger within a quarter of a mile of the shore, so that it may be run for in safety.

Making Port William from the Southward.

In coming from the Southward the lead will not be a guide, as Beauchene is on the Southern edge of the bank which surrounds the Falkland Islands; and within 4 miles of the South point there is not any bottom with 100 fathoms. After passing outside Beauchene, a N.N.E. course for 60 miles will clear all the islands off the S.E. coast of the East Falkland, and the depth then will be from 50 to 56 fathoms, about 15 miles to the S.E. of Lively Island. This is supposing it to be night, or thick weather; if daylight, and the weather clear, the high land in the central chain will be seen, and a course may be steered nearer the coast, passing about 6 or 7 miles outside the West Sea-lion Island, and the same distance from the Shag Rock (which shows high out of the water) and from Lively Island. In either case, after passing Lively Island, a course should be steered towards the Easternmost of the hills; if thick, or too dark to see the hills, a vessel will be in a very good position for waiting for day-

osition for waiting for day-

light, and should endeavor to keep in about from 40 to 50 fathoms, not standing inshore into less than 30, nor off into more than 60 fathoms. When the land can be made out, by bringing the Eastern hill (Mount Low) to bear North, and keeping it on that bearing, it will lead into the shore, where it can be approached in perfect safety, just outside the entrance to Port Harriet. The Wolf Rock will then be seen; and by passing a mile on either side of it, the Seal Rocks, at the entrance of Port William, will show clear of the extreme Eastern point of Cape Pembroke. If the wind is off the land, a vessel might pass inside the Wolf Rock, but not nearer to it than three-quarters of a mile, as some rocks run out nearly half a mile to the Westward of it; nor should the kelp near the main shore be approached nearer than a quarter of a mile, as there is a sunken rock at its outer edge, which breaks when there is any swell.

On the S.E. coast there is so little tide that it need not be considered, though a current will generally be found running with the wind, of from half a knot to one knot; but, after passing Port Harriet, a strong tide begins to be felt. The flood runs to the N.E., past the Wolf Rock, and becomes stronger as it approaches Cape Pembroke, round which it runs from 2 to 3 knots, according to the age of the moon. The flood runs directly to the Northward from the Seal Rocks to Volunteer Point, while very little tide is felt within the heads of Berkeley Sound or Port William. The ebb runs equally strong to the Southward; and when there is a strong breeze, a heavy tide-rip extends 2 miles off shore. With a flood tide it is necessary to guard against being swept too near Cape Pembroke or the Seal Rocks; but if there is a commanding breeze, there is a good passage for the largest ships between the rocks and the cape; with a strong tide and swell, without a good breeze, it is best to pass outside both the Wolf and Seal Rocks.

Should a vessel, in doing so, find that she is setting towards the Seal Rocks, the best way then is at once to try and pass between them and the cape, as the tide sets through strongly; but there is a rock to be avoided in this passage, and it is the only danger in the entrance to Port William. It lies in a line with William Islets and the Seal Rocks, and N. by E. $\frac{1}{2}$ E., 4 cables' length from Cape Pembroke; it always shows at half-tide, or when there is much swell, but at high-water it is covered; there is a little kelp close round, and deep water close to it on the East side. Billy Rock is more particularly to be guarded against in leaving Port William to pass round Cape Pembroke with an ebb-tide; for there is no tide felt while running down Port William till near this rock, and then the outside tide being met running strongly to the Southward, it is very likely to sweep a vessel towards the rock, unless allowance is made for it. In passing Cape Pembroke bound to the Southward, the same rule applies as when bound into Port William; that is, if a good breeze, and not much swell, you may run inside the Seal Rocks in safety, the water is deep within a cable's length of the outer rock of Cape Pembroke; but in light winds, or much swell, it is better to pass outside the Seal Rocks, and to keep well to the Northward of them, in order to allow for the tide running to the Southward.

Directions for entering Port William.—Ships from the Southward should sight Cape Pembroke, which is the Easternmost point of the Falkland Islands, and on which there is a fixed light, 58 feet above the sea. With a commanding breeze anything South of West, keep to seaward of the Wolf Rock, and pass between the Seal Rocks and Cape Pembroke, and then between the Billy Rock and Seal Rocks, where there is plenty of water and no danger that is not visible; having passed the Billy Rock, haul up, and if in doubt, or if the pilot has not come off, anchor abreast of the William Islets; but in daylight there is no danger in standing on to the entrance of Stanley Harbor. The above directions are for Westerly winds, which generally prevail; but when the wind is Easterly, keep outside of the Seal Rocks.

Coming from the Northward, with Westerly winds, make Cape Carysfort, or with Easterly winds, Volunteer Point; when they are passed, steer for Cape Pembroke, on which the beacon will be seen, until Port William opens to starboard, when run in and anchor, or wait for a pilot, according to the above directions.

In case of darkness or fog, ships may anchor in the mouth of Berkeley Sound or of Port William, or stand off and on, as may be expedient, there being no danger that is not buoyed by the kelp.

The Wolf Rock bears from Cape Pembroke S. $\frac{1}{2}$ W., by compass, distant nearly 3 miles. It is of a triangular shape, each side being about 3 cables' length.

The Seal Rocks lie about three-quarters of a mile from Cape Pembroke, and are clean on all sides. The tide runs North and South about 3 knots between Cape Pembroke and the Seal Rocks; the flood sets to the Northward, and the ebb to the Southward.

It is high-water by the shore, at about 5h. 15m. at full and change, and in Ports William and Stanley, about 5h.; the rise and fall being 4 feet at near, and 7 feet at spring tides, and about the same at all places on the S.E. coast of the East Island. It sometimes rises and falls 8 feet, but very seldom.

Remarks upon the passage round Cape Horn.

Ships bound from the Atlantic to any of the ports in the Pacific, will find it advantageous to keep within 100 miles of the coast of Eastern Patagonia, as well as to avoid the heavy sea that is raised by the Westerly gales which prevail to the Eastward, and increase in strength according to the distance from the land, as to profit by the variableness of the wind when fixed in the Western board. Near the coast, from April to September, when the sun has North declination, the winds prevail more from the W.N.W. to N.N.W., than from any other quarter. Easterly gales are of very rare occurrence, but even when they do blow, the direction being obliquely upon the coast, I do not consider it at all hazardous to keep the land on board. In the opposite season when the sun has South declination, the winds will incline from the Southward of West, and frequently blow hurl; but as the coast is a weather shore, the sea goes down immediately after the gale. In this season, although the winds are generally against a ship's making quick progress, yet as they seldom remain fixed in one point, and frequently shift backward and forward 6 or 8 points in as many hours, advantage may be taken of the change so as to keep close in with the coast.

Having once made the land, which should be done to the Southward of Cape Blanco, it will be beneficial to keep it topping on the horizon, until the entrance of the Strait of Magellan be passed.

With respect to this part of the voyage, whether to pass through the Strait le Maire, or round Staten Island, much difference of opinion exists. Prudence, I think, suggests the latter; yet I should very reluctantly give up the opportunity that might offer of clearing the strait, and therefore of being so much more to windward. With a Southerly wind, it would not be advisable to attempt the strait; for, with a weather-tide, the sea runs very cross and deep, and might severely injure and endanger the safety of a small vessel and to a large one do much damage. In calm weather it would be still more imprudent, (unless the Western side of the strait can be reached, where a ship might anchor,) on account of the tide setting over the Staten Island side, where, if it becomes necessary to anchor, it would necessarily be in very deep water, and close to the land. With a Northerly wind the route seems not only practicable, but very advantageous, and it would require some resolution to give up the opportunity so invitingly offered. I doubt whether Northerly winds, unless they are very strong, blow through the strait—if not, a ship is drifted over to the Eastern shores, where, from the force of the tides, she must be quite unmanageable.

Captain Fitz-Roy, whose authority, from his experience, must be very good, seems to think there is neither difficulty nor risk in passing the strait. The only danger that does exist, and that may be an imaginary one, is the failure of the wind. Ships passing through it from the South, are not so liable to the failure of the South-westerly wind, unless it be light, and then it will probably be from the N.W. at the Northern end of the strait. The anchorage in Good Success bay, however, is admirably situated, should the wind or tide fail.

In passing to leeward of Staten Island, the tide-race, which extends for some distance off Cape St. John, at the N.E. end of the island, must be avoided, otherwise there exist no dangers.

The anchorage under New Year's Islands, although it is a wild one, the bottom bad, and the tide very strong, yet offers good shelter from South-west winds, and might be occupied with advantage during the existence of a gale from that quarter, since it is unfavorable for ships bound round the Horn.

After passing Staten Island, if the wind be Westerly, the ship should be kept upon the starboard tack, unless it veers to the Southward of S.S.W., until she reaches the latitude of 60° South, and then upon that tack upon which most Westing may be made. In this parallel, however, the wind is thought to prevail more from the Eastward than from any other quarter. Never having passed round Cape Horn in the summer season, I may perhaps be justified in opposing my opinion to that of others; who, having tried both seasons, give the preference to the summer months. The advantage of long days is certainly very great, but from my experience of the winds and weather during these opposite seasons at Port Famine, I preferred the winter passage; and in our subsequent experience of it, found no reason to alter my opinion. Easterly and Northerly winds prevail in the winter off the cape, whilst Southerly and Westerly winds are constant during the summer months; and not only are the winds more favorable in the winter, but they are moderate in comparison to the fury of the summer gales.

Having passed the meridian of Cape Pillar, it will yet be advisable to take every opportunity of making Westing in preference to Northing, until reaching the meridian of 82° or 81° , which will enable a ship to steer through the North-westerly winds that prevail between the parallels of 50° and 51° . (See Hall's South America, Appendix.)

With respect to the utility of the barometer as an indicator of the weather that is experienced off Cape Horn, I do not think it can be considered so unfailing a guide as it is in the lower and middle latitudes. Captain Fitz-Roy, however, has a better opinion of the indications shown by this valuable instrument; my opinion is, that although the rise or fall precedes the change, yet it more frequently accompanies it. The following sketch of the movement of the barometer, and of the weather that we experienced, may not be without its use.

Being to the North of Staten Island for 3 days preceding full moon, which occurred on the 3d of April, 1829, we had very foggy weather, with light winds from the Eastward and Northward, causing a fall of the mercury from 29.90 to 29.56. On the day of full moon the column rose, and we had a beautiful morning, during which the high mountains of Staten Island were quite unclouded, as were also those of Tierra del Fuego. At noon, however, a fresh gale from the S.W. set in, and enveloped the land with a dense mist. No sooner had the wind changed, than the mercury rose to 29.95, but fell again the next morning; and with the descent the wind veered round to, and blew strong from N.W., with thick cloudy weather and rain, which continued until the following noon, when the wind veered to S.W., the barometer at 29.54, having slightly risen; but after the change it fell, and continued to descend gradually until midnight, when we had a fresh gale from the W.S.W. When this wind set in, the mercury rose, and continued to rise, as the wind veered, without decreasing in strength, to S.S.W., until it reached 29.95, when it fell again, and the weather moderated, but without any change of wind. During the descent of the mercury, the sky with us was dull and overcast, with squalls of wind and rain, but on shore it seemed to be very fine sunshiny weather.

The column now fell to 29.23, and during its descent the weather remained the same, dull and showery; but as soon as the mercury became stationary, a fresh breeze set in from the Southward, with fine weather.

After this to new moon, the weather was very unsettled, the wind veering between S. and W.S.W., the barometer rising as it veered to the former, and falling as it became more Westerly; but on no occasion did it precede the change.

The mean height of the barometer is about 29.5.

The mercury stands lowest with N.W. winds, and highest with S.E.

With the wind at N.W., or Northerly the mercury is low; if it falls to 29 inches, or 28.80, a S.W. gale may be expected, but does not commence until the column has ceased to descend. It frequently, however, falls without being followed by this change. In the month of June, at Port Famine, the barometer fell to 28.17, and afterwards gradually rose to 30.5, which was followed by cold weather, in which the thermometer stood at 129.

The following table shows the mean temperature and pressure as registered at the Observatory of Port Famine, in the strait:

1828.	Temperature.	Pressure.
February, ..	51.1	29.40
March,	49.4	29.61
April,	41.2	29.57
May,	35.5	29.50
June,	32.9	29.28
July,	33.0	29.57
August,	33.2	29.28

This Table contains the LATITUDES and LONGITUDES of the most remarkable Harbours, Islands, Shoals, Capes, &c., in this work, founded on the latest and most accurate Astronomical Observations, Surveys, and Charts.]

The Longitudes are reckoned from the Meridian of Greenwich.

The Latitudes and Longitudes in the preceding Table have been selected from the most recent and best authorities.

Those of the Coast of Newfoundland and Gulf of St. Lawrence have been altered to correspond with the recent observations, as far as received, of the officers under the direction of Sir Charles Blye, and those made by Captain Bayfield, R. N., who is surveying the St. Lawrence.

The positions of the principal points of the Coast of the United States are altered to agree with the observations made of the Eclipse of the Sun of February 12th, 1831.

August, 1857.—The positions of the Coast of the United States are those of the Coast Survey, A. D. Bache, Superintendent.

The Balize from a number of occultations by Captain A. Talcott, United States Commissioner for the Northeastern Boundary; and the Sabine by Major J. D. Graham, U. S. T. E., one of the Commissioners for determining the United States Southwestern Boundary, and now a Commissioner on the Northeastern Boundary Line.

In the above cases it will be seen that both points have been placed too far to the westward in all previous publications.

The West Indies are adapted to the most recent observations; among others, to those of Commander R. Owen, and E. Barnett, R. N.

The Coast of South America, from St. Luis, Maranhão, to St. Catharine's, from the observations of Baron Roussin, with the exception of Rio Janeiro, which is that of Capt. R. Fitzroy, R. N.; from St. Catharine's to the River Plate, by M. Barral; and from Port St. Elena to Cape Horn, by Captains P. P. King, and R. Fitzroy, R. N.

DIVIDING ENGINE.

They have just completed at their establishment, after a labor of over five years, a Dividing Engine, by which they are enabled to divide Astronomical and Nautical Instruments to a degree of precision which they will guarantee to be equal to the best of foreign make. The subscribers, therefore, ask that American ships may be navigated by American made instruments.

INSTRUMENTS.

Chronometers of the best makers, for sale and to hire.
Sextants, Quadrants, &c., of American manufacture.

Spy Glasses.

Night Glasses, new kind.

Aneroid Barometers.

Compasses, Dent's Improved, and others.

Binnacles.

Globes, Terrestrial and Celestial, 16 inch, by CHARLES COPLEY.

Massey's Patent Logs.

Ogden's, Ericsson's, and Massey's Patent Sounding Instruments.

Improved Compasses with elastic centres.

ABBOTT'S HOROMETER, a new and simple instrument for working the Longitude, either by Lunar Observations or the Chronometer.

E. & G. W. BLUNT,

170 WATER STREET.

ALL THE U. S. COAST SURVEYS AND ENGLISH ADMIRALTY SURVEYS.

NOTICE.

Ship-owners and Ship-masters are informed, that by sending their Chronometers to, and taking them away from the establishment of the subscribers, they can have them rated free of expense.

Extract of a letter from Lieut. John Rodgers, commanding U. S. Ship "Hancock," attached to the Surveying Expedition to the China Seas, North Pacific.

NEW BEDFORD, January 4th 1852.

"I had a long discussion on Charts of the extreme North Pacific, Behring's Straits, Sea of Okotsk, &c. All the Whalers say that you are right, and the English entirely wrong."

COMPASSES.—Attention is invited to the new Compasses constructed at the establishment of the subscribers. It is a fact now well understood, that most of the losses charged to Currents are due to the imperfect construction of Compasses, and to their deviation not being ascertained.

Compasses of a superior quality are manufactured by them, and are constantly on hand. Also, Dent's Patent and other approved Compasses.

E. & G. W. BLUNT,

Sept., 1857.
