Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

- Coloured covers/  
Couverture de couleur
- Covers damaged/  
Couverture endommagée
- Covers restored and/or laminated/  
Couverture restaurée et/ou pelliculée
- Cover title missing/  
Le titre de couverture manque
- Coloured maps/  
Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black)/  
Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations/  
Planches et/ou illustrations en couleur
- Bound with other material/  
Relié avec d'autres documents
- Tight binding may cause shadows or distortion  
along interior margin/  
La reliure serrée peut causer de l'ombre ou de la  
distortion le long de la marge intérieure  
*Il se peut que certaines pages blanches ajoutées  
lors d'une restauration apparaissent dans le texte,  
mais, lorsque cela était possible, ces pages n'ont  
pas été filmées.*
- Blank leaves added during restoration may  
appear within the text. Whenever possible, these  
have been omitted from filming/  
*Il se peut que certaines pages blanches ajoutées  
lors d'une restauration apparaissent dans le texte,  
mais, lorsque cela était possible, ces pages n'ont  
pas été filmées.*
- Additional comments:/  
Commentaires supplémentaires:

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured pages/  
Pages de couleur
- Pages damaged/  
Pages endommagées
- Pages restored and/or laminated/  
Pages restaurées et/ou pelliculées
- Pages discoloured, stained or foxed/  
Pages décolorées, tachetées ou piquées
- Pages detached/  
Pages détachées
- Showthrough/  
Transparence
- Quality of print varies/  
Qualité inégale de l'impression
- Includes supplementary material/  
Comprend du matériel supplémentaire
- Only edition available/  
Seule édition disponible
- Pages wholly or partially obscured by errata  
slips, tissues, etc., have been refilmed to  
ensure the best possible image/  
Les pages totalement ou partiellement  
obscures par un feuillett d'errata, une pelure,  
etc., ont été filmées à nouveau de façon à  
obtenir la meilleure image possible.

This item is filmed at the reduction ratio checked below/  
Ce document est filmé au taux de réduction indiqué ci-dessous.

10X	14X	18X	22X	26X	30X
			/		
12X	16X	20X		24X	28X
					32X

The copy filmed here has been reproduced thanks to the generosity of:

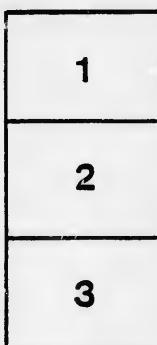

Library,  
Geological Survey of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol → (meaning "CONTINUED"), or the symbol ▽ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Bibliothèque,  
Commission Géologique du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole → signifie "A SUIVRE", le symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

NOTE  
ON  
THE COMPOSITION OF DAWSONITE.

---

BY B. J. HARRINGTON, B.A., PH.D.

---

(From the Canadian Naturalist, Vol. X, No. 2—1881.)

## NOTE ON THE COMPOSITION OF DAWSONITE.

By B. J. HARRINGTON, B.A., PH.D.

McGILL COLLEGE, MONTREAL.

In connection with the discoveries of Dawsonite which have been made at Pian Castagnaio in Tuscany,\* a few remarks on the composition of this curious mineral may be deemed of interest. It will be remembered that the specimens originally described in 1874 were from joints in a white feldspathic dyke cutting the Trenton limestone near McGill College.† Since 1874 small quantities of the mineral have been observed in the joints of several other dykes in the same neighbourhood, and beautiful specimens have been obtained at the Montreal reservoir, in what is probably a continuation of the dyke near the college. In the latter instance the Dawsonite is associated with calcite, dolomite, pyrite, minute quantities of galena and occasionally of a black substance rich in manganese. In all cases the mineral occurs in more or less fibrous blades, which are often arranged in a radiated manner. It reminds one of tremolite, and in the collection of minerals acquired by McGill College from the late Dr. Holmes of Montreal, there are several specimens of it which he had so marked.

The first specimens of Dawsonite analysed were found to contain between five and six per cent. of lime, and there was no evidence to prove that this was not one of the proper constituents of the mineral. Subsequently, however, it was found that the proportion of lime differed widely in different cases, while the ratio between the other constituents was constant. From this it

---

\* Two papers on the subject have appeared within the last few months in the Bulletin of the Mineralogical Society of France (IV., 28 and 155), the first, entitled "Sur un nouveau gisement de Dawsonite (hydrocarbonate d'aluminium et de sodium) et sur la formule de ce minéral," by C. Friedel; the second, "Sur le gisement de la Dawsonite de Toscanie," by Maurice Chaper.

† *Can. Nat.* II. vii. 305. "Notes on Dawsonite, a new Carbonate."

was inferred that the lime really belonged to intermixed calcite which could not be completely separated. This view is fully confirmed by Friedel's examination of the Dawsonite discovered by M. Mauriee Chaper in Tuscany, and the right of the mineral to rank as a good species may now be considered as fully established. Its special interest of course depends upon the fact that it is the only well defined carbonate containing aluminium which has yet been met with in nature.

The Tuscany Dawsonite is stated to occur in minute crevices, both in marl and sandstone, the latter being impregnated with dolomite. Among the minerals associated with it are calcite, dolomite, pyrite, fiorite and cinnabar; and it is said that the miners of the region look upon Dawsonite as a favourable indication in their search for cinnabar. The Tuscany mineral is evidently obtained in a purer condition than ours, and from his analyses Friedel concludes that the composition of the species is represented by  $\text{Al}_2\text{O}_3$ ,  $\text{Na}_2\text{O}$ ,  $2\text{CO}_2$ ,  $2\text{H}_2\text{O}$  or, as he also puts it,  $\text{Al}_2(\text{CO}_2\text{Na})_2(\text{OH})_4$ .

The following table gives under I. the results of Friedel's analyses; under II and III the original analyses of the mineral from McGill College; and under IV a recent one of that found at the Montreal reservoir. The last, it will be seen, indicates the presence of a large proportion of calcite:—

	I	II	III	IV
Carbon dioxide.....	29.59	29.88	30.72	32.23
Alumina.....	35.89	32.84	32.68	24.71
Soda .....	19.13	20.20	20.17	15.64
Water .....	12.00	11.91	(10.33)	9.06
Lime.....	0.42	5.95	5.65	16.85
Magnesia .....	1.39	tr.	0.45	tr.
Potash .....	....	0.38	....	....
Manganese dioxide...	....	....	....	0.23
Silica .....	....	0.40	....	0.84
	98.42	101.56	100.90	99.56

If from the above analyses we deduct the substances which may justly be regarded as impurities, including lime and magnesia in the form of carbonates, and then calculate the normal constituents for one hundred parts, it will be seen that the results agree well with the formula  $\text{Na}_2[\text{Al}_2]\text{C}_2\text{O}_8 + 2\text{H}_2\text{O}$ :

VIAARILLI

LIBRARY

	I	II	III	IV	FORMULA.
Carbon dioxide* ....	29.27	27.96	29.06	27.78	30.49
Alumina.....	37.88	36.42	36.70	36.12	35.55
Soda.....	20.19	22.41	22.65	22.86	21.48
Water .....	12.66	13.21	11.59	13.24	12.47

It has also been suggested that the formula may be written  
 $3(\text{Na}_2\text{CO}_3) + (\text{Al}_2\text{C}_3\text{O}_9) + 2(\text{H}_6[\text{Al}_2]\text{O}_6)$ .†

According to Friedel, the Tuscany Dawsonite when heated to 180° C. loses nothing but a little hygrometric water. Like the Canadian mineral it gives up both its "carbonic acid" and water at a red heat. The calcined residue also dissolves easily in hydrochloric acid. Neither the hardness nor the specific gravity of the European variety has been ascertained. For the Canadian mineral the original determinations were, H = 3, G = 2.40.

---

\* The atomic ratios for I and II are as follows:

C .....	.665	.636	2
[Al <sub>2</sub> ] .....	.369	.355	1
Na.....	.651	.723	2
O .....	2.764	2.696	8
H <sub>2</sub> } .....	.703	.734	2
O }			

† Am. Jour. Sci. III. xxii. 157.
