Danton, Lacroix, Philippeaux, and Camille Desmoulines were arrested on the 31st of March; the real crime of the last was a satirical parallel between the revolutionary government of France and the tyranny of the Roman emperors, which he published in a periodical paper, of which he was the editor, termed the "Old Cordelier." Philippeaux, it is said, had mortally offended by exposing the horrors and cruelties he had witnessed in La Vendée. Together with them, Hérault Sechelles, Simon, Chaumette the procureur of the commune of Paris, and Gobelet the ex-bishop, who had disgraced himself and his profession by the public renunciation of his functions, had been arrested a few days before, all as accomplices with Fabre d'Eglantine. On the morning of the 2nd of April, they were brought before the revolutionary tribunal. They all evinced much firmness except Fabre d'Eglantine, who was greatly agitated. The prisoners demanded to be confronted with Roberfpierre and Barrere; this being refused, they would not answer any interrogatories, as they insisted that the proceedings were unfair. The public accuser immediately dispatched a letter to the convention, informing them that the prisoners were in a state of revolt against the tribunal; and on the motion of St. Just, a decree was passed, "that whoever insults the national justice shall not be heard, but tried immediately." This decree was read to the deputies upon trial on the 5th, but they still persisted in their refusal to answer interrogatories. The jury, therefore, without hesitation found them guilty of corrupt practices. At two o'clock on the same day sentence was passed upon the prisoners; and at five in the afternoon, they were conveyed in three carts from the Conciergerie to the place de la Revolution, where the state prisoners were executed.

While the scaffold was thus streaming with blood, the convention decreed, on the motion of Couthon, "that all aliens belonging to the countries at war with the republic, and all ex-nobles, should be ordered to depart from Paris, and from all fortresses and maritime towns." Several other measures of severity were adopted to prevent counter-revolutionary conspiracies.

To enter on a particular detail of the multitudes, who at this period were murdered by the revolutionary tribunal, would be to incumber our narrative with a long catalogue of names only rendered interesting by the melancholy fate of the innocent sufferers. One illustrious victim it is however necessary to notice, one not less eminent for her purity and virtues than for her rank and family. On the 10th of May Fouquier L'intrépide, the public accuser, made a formal demand to the commune of Paris, that the sister of Louis XVI. should be immediately delivered up to the Revolutionary tribunal. On the same day the unfortunate princess was conveyed to the Conciergerie, and on the 12th was brought before her inflexible judges. The trial was conducted in their usual summary way, and consisted only of a series of interrogatories which were

put to the prisoner. Disdaining any concession, which might soften their cruelty, and despising the wrath which she knew her answer would excite, to the first interrogatory of the court, What is your name? she magnanimously replied, "My name is Elizabeth of France, sister to the monarch you murdered, and aunt to your present king." When charged with having encouraged her nephew in the hopes of succeeding to his father's throne, she replied—"I have conversed familiarly with that unfortunate child, who was dear to me on more than one account; and I gave him all those consolations which appeared to me likely to reconcile him to the loss of those who had given him birth." This reply was construed into a confession that she had encouraged the child in these fallacious hopes and without further interrogatory she was condemned. The unfortunate princess was nobly supported in the last scene by the consolations of religion. She betrayed some emotion at the sight of the guillotine, but she presently resumed a look of pious resignation, and was executed the last of 26 persons, who were carried to the scaffold the same day.

On the 30th. of May Barrere, pretending, that several attempts at assassination which his own unexampled tyranny, and that of his bloody gang had provoked, were set on foot by the English, after a great deal of foolish rant and declamation against England, proposed that all the Englishmen and Hanoverians who should fall into their hands, should be put to death. This horrid proposal was, however, never put into execution; the French officers and soldiers on the contrary, frequently behaved with singular humanity to the British soldiers. A decree was afterwards passed, that if the garrisons left by the allies in Valenciennes, Condé, and Quefnoy did not surrender within 24 hours after being summoned, they should not be spared, but this decree was also never put into execution.

The prisons of Paris at this period were crowded with victims from all parts of the country, in consequence of a decree which ordered all of a certain class of state prisoners to be tried only by the revolutionary tribunal of Paris. At one period the prisoners amounted to between seven and eight thousand. Of the number of those who have been tried and executed, we have no precise return but the number must have been enormous*. To enter into a recital of particular facts would be a most irksome and melancholy task. Yet in perusing this black and dismal catalogue, the eye of humanity will be arrested by the fate of the venerable and intrepid defender of the unfortunate king of France, Lamoignon Malcèherbes, who died a martyr in the cause of virtue. Some were evidently put to death for their wealth, and others fell the victims of private resentment. A correspondence with relations who had emigrated brought many to the scaffold; but where this plea was wanting an imputed conspiracy in the prisons always served as a pretext for the ruin of those who were obnoxious. The judges and jurors were hardened beyond example. The viscountess de Noailles, sister to Madame La Fayette, maintained in her defence, that she was not in the prison where the conspiracy of which she was accused took place: "No matter, exclaimed one of these assassins, you would have been concerned had you been there."

At this moment Robespierre had reached the summit of his popularity;

* It is computed that in the year, 1795, 2,000,000 of persons had been massacred in France during the revolution: of those 250,000 were women, 230,000 children, and 24,000 ministers of the gospel. This computation which amounts to nearly one tenth of the whole population of France, does not include any who were killed in arms. See a work called "The cruelties of the Jacobins" published in Paris in 1795.

and the baseless fabric of his usurped authority, began to totter. The debates had been for some time before the fall of the tyrant most tumultuous and disorderly. On the 27 Billaud Varennes, after a violent speech, observed that "Men who are always speaking of their own probity and virtue, are those who trample those qualities under foot. A secretary of the committee of public safety, had robbed the public of 114,000 livres. I demanded his arrest, but Robespierre screened him." (Murmurs.) "I could recount to you, citizens, a thousand other similar facts of this man; and yet it is he who dares to accuse us; we who spend our nights and days in the committee of public safety, in organizing our victories. We must not hesitate either to fall on him with our bodies, or to suffer tyrants to triumph. It was his wish to mutilate the convention, and to murder the representatives of the nation." Robespierre here darted toward the tribunal while a number of voices exclaimed, "Down with the tyrant, down with the tyrant."

A decree of arrest was now passed against Robespierre in which Couthon and Le Bas were likewise included, and the president ordered one of the ushers of the hall to take into custody one of the triumvirs, the elder Robespierre. In the mean time Henriot had also been arrested, but had found means to escape. With the alacrity of desperation he rallied his adherents. The convention were not, however, inactive. No sooner were they apprized that Robespierre and his companions were in a state of insurrection, than they proceeded to declare them traitors and outlaws, and a deputation of their members was appointed to lead the people against their revolters. Between 2 and 3 o'clock in the morning the deputies found themselves in sufficient force to attack the insurgents at the Hotel de Ville. At that time Bourdon de L'Oise appeared at the place de Grave, and read the proclamation of the convention. He then rushed into the hall of the commune, armed with a sabre and pistols; the insurgents were now completely deserted, and endeavoured to turn their arms against themselves. Robespierre the elder discharged a pistol in his mouth; which only wounded him in the jaw, while he received a wound from a gens d'arme in the side. The younger Robespierre threw himself out of a window and broke a leg and an arm. Le Bas shot himself upon the spot, and Couthon stabbed himself twice with a knife. They were all conveyed before the revolutionary tribunal, and there condemned to suffer death. Couthon was executed first and then the younger Robespierre and Henriot. Robespierre was executed the last but one. He stood two minutes on the scaffold, while the executioner removed the cloth which covered his face; but he did not utter a word.

Having now overturned the tyranny of Robespierre, the tyrants who succeeded him, began to contend with one another for the chief power. A decree was passed for enquiring into the conduct of Barrere, Billaud Varennes, Collot d'Herbois and Vadier. They were formally tried before the convention and condemned to be transported some to Guiana, and others to be confined in the castle of Ham in Picardy. Two of them however Cambon and Thuriot, had found means to escape and concealed themselves in the faubourg of St. Antoine, and resolved to embrace the opportunity of a scarcity which existed at that time to excite an insurrection. After surrounding the convention with armed men, they awed them so much by their threats, that they were obliged to temporise, and sent a deputation of ten of their members to fraternize with them. This compliance of the assembly with so much of their demands, led them to insist on sending a deputation in return, to which the convention assented; and immediately a troop was introduced with an orator at their head, who concluded his speech with

“Vive la convention ! The deputation was invited to the honours of the sitting ; and to shew the perfect good disposition of the convention, the president was ordered to give the fraternal kiss to these representatives of the sovereign people. The sovereign people, however, notwithstanding the honour of the fraternal kiss, assembled next day, and the convention were obliged to call in the assistance of military force, by which the insurrection was at last quelled, and temporary tranquillity restored in Paris.

While these events took place the Convention were sedulously employed in discussing a plan for a new constitution. On the 23d. of August these notable constitution-makers had completed their work, and it was referred to the primary assemblies for their confirmation and acceptance. By this constitution the legislative body is composed of what they call in their ludicrous jargon a *council of ancients* and a *council of five hundred*. The executive power is entrusted to a directory of five members, nominated by the legislative body*. The forty-eight sections of Paris, while they accepted their newly made constitution, as firmly rejected the law for the re-election of two thirds of the convention into the legislature, and, as usual, had recourse to the “holy right of insurrection” to enforce their reasons. They assembled at noon the 5th. Oct. and a desperate battle took place near the convention ; the sectionaries repeatedly possessed themselves of the cannon which were as often retaken. There fell in this engagement about 2000 men.

Whatever were the political contests of the French they proceeded with the most astonishing rapidity in their career on the Continent. They had subjected Holland, the whole of the Netherlands was in their possession except Mentz, which in a short time was completely blockaded. But they were now weakened by the vast track of country they had overrun. Jourdan was obliged to retreat ; prince Charles hung on his rear, and the peasants irritated by the extortions and robberies committed by those protectors of the rights of man, took the present opportunity of revenging themselves upon their rapacious oppressors. The garrison of Mentz, likewise being strongly reinforced, two divisions of the Austrian army crossed the river at different points, and attacked the remains of the French, who had entrenched before that place, and who had, during so many months, watted their strength in vain. The Austrians after an obstinate resistance drove them from all their posts, destroyed their works and took possession of all their artillery. The campaign was shortly after concluded by common consent of the hostile generals.

As the French had now completely subdued that party of royalists, who for a long time had resisted their oppression, they were enabled to begin the succeeding campaign with renewed vigour. Such were their successes in Italy, that the king of Sardinia was compelled to sue for peace, and to submit to whatever conditions were imposed upon him, and he was shortly followed by the dukes of Modena and Ferrara. The object of the army in Germany under Jourdan was to gain possession of Mentz ; that of the troops under Moreau was to effect a passage across the Rhine, and possess themselves of Kehl. By a well concerted motion of the archduke, they were compelled to retire from before Mentz with great loss ; but general Moreau was successful in passing the Rhine and taking the fortrefs of Kehl. In Italy the enemy were still more successful ; the dispersion of the Austrian army there gave the French general leisure to carry on his various

* Rewbell, La Revellere Lepaux, Carnot, Barras, and Letourneur de la Manche were chosen directors.

enterprises against the respective states of that country. A detachment took possession of Leghorn on the 28th. of June, though belonging to a neutral power, on the pretext of dislodging the English, who were despoiled of their property by these robbers. The main army entered the territory of the pope, and without resistance took possession of the cities Bologna, Ferrara, and Urbino. This expedition, which gave the French the command of the holy see, alarmed in so great a degree the king of Naples, that he requested an armistice, which was granted to him as well as the pope, upon such conditions as the French were pleased to dictate.

Meanwhile the emperor had sent fresh troops into Italy under the command of general Wurmsler to oppose the farther progress of the French. The first operations of this army were successful, but they soon experienced a sad reverse; on the 15th. of August a most obstinate engagement took place which ended in a total defeat of the Austrians; they were compelled to repass the Adige, leaving the enemy in possession of the whole country round Mantua; the siege of which place they were obliged to turn into a blockade from the loss of their heavy artillery. The successes of the French on the Rhine corresponded with those in Italy. They had possessed themselves of the country lying on each side of the Mein and of Franconia and were advancing towards Ratisbon; during this period the Austrian army having received reinforcements, attacked them with such vigour that they were compelled to retreat with precipitation; the French generals found it impossible to rally them, as they were more anxious to escape the vengeance of the peasantry whom they had plundered and oppressed; than incur the risk of losing their treasure together with their lives. Moreau meanwhile conceiving hopes that either Jourdan's army would resume the attack, or that the advances of his own army towards Vienna would force the archduke to return, had marched along the Danube, and had taken possession of Ulm, Donawerth, and several other towns on its banks, triumphantly entered the circle of Bavaria, and on the 27th. August took quiet possession of its capital. But the defeat of Jourdan's army was so complete that all hopes of their further resistance were relinquished, and Moreau, finding himself in imminent peril, was finally obliged to effect a retreat, and recross the Rhine at Brisach, leaving a strong garrison in the fortress of Kehl, from whence he had commenced his irruption into Germany. This fortress was soon after attacked by prince Charles and obliged to surrender.

Meanwhile those who had usurped the government of France found themselves perplexed with those tumults and insurrections which the tyrants, whom they had displaced, might naturally be expected to excite. These however being quelled by military force, the directory began to turn their attention to the enacting of such laws as they deemed necessary in the present situation of the country, or such as gratified the malignity of their vitiated, perverted minds. The non-juring clergymen, whose unmerited and inconceivable sufferings since the commencement of this accursed revolution, might have softened the bitterest enmity into compassion, were at present the objects of Jacobinical malignity. They decreed that all nonjuring priests should be banished from the republic, and this persecuting decree was sanctioned by the council of five hundred, but was rejected by the council of elders. They likewise shewed about this period their malignity against England by a law which they enacted, prohibiting the importation of English manufactures into France, and they obliged Holland and Spain to adopt the same resolution. Genoa was likewise compelled to shut up her ports against the

British.

British. This pitiful effort of malice cannot materially affect the commerce of Great Britain, which, since the passing of this law has become more flourishing than ever.

The negotiation which had been carrying on during the summer between the republic and Naples was brought to a termination on the 25th. of October by a definitive treaty of peace. The conditions were such as the French were pleased to prescribe, which were not so rigorous as what had been granted to several other powers. A negotiation which the ministry in Britain entered into this season failed of success, and the English minister was ordered to depart within 24 hours. The conditions of peace which were offered to the pope about this period being incompatible with his dignity as a sovereign power, that prince determined again to have recourse to arms in defence of his crown. The army in Italy had received very considerable reinforcements that they might be able to effectuate the release of general Wurmsler who was shut up in Mantua. The command of this army was entrusted to general Alvinzi, who was entirely defeated in the dreadful battle of Arcole after having most gallantly and obstinately disputed the field. He was compelled to retire behind the Brenta with his army and leave Mantua to its fate. This city though long and obstinately defended by the gallant and experienced veteran Wurmsler, was at last obliged to surrender, as every attempt to relieve it had proved abortive. Discouraged by the successes of the enemy the pope was obliged to submit to whatever conditions they thought proper to prescribe, which were sufficiently humiliating. Meanwhile the emperor had levied a fresh army which he sent to Italy in order to stop the progress of the victorious enemy. This army, however was not able to stand before them and their operations were a series of victories. In this perilous situation, a correspondence was commenced between the two generals which ended at first in an armistice, and finally in adjusting preliminaries of peace between the court of Vienna and the French republic, and by the Neapolitan minister on the part of the emperor.

Meanwhile the violence of the different factions was producing new commotions in France. On the 5th of March the two councils drew the important lots, which were to deprive a third of their members of their seats in the legislature. As the period of the general election approached, the ardour of party zeal became every where apparent; and the whole nation was in some measure agitated by the efforts of contending factions. The new third had scarcely taken their seats, before they shewed their disapprobation of the conduct of the agents of the Directory. They proposed several resolutions of expence among the civil and military agents. Their treatment of the United States was severely reprobated; and a decree was proposed for appointing a committee to inquire into the internal resolutions of the directory on that subject, which was adopted. The interference of the French general in the internal government of Venice was severely censured; and the disturbance which was given by the faction of the directory to the Genoese and Helvetic republics. The abominable laws authorising polygamy were likewise ordered to be revised. The cruel laws against the priests and emigrants were somewhat softened, and all political meetings and societies were abolished. The discontent excited by these measures soon reached the armies. The directors were of necessity connected with them, and there is little doubt but every step would be taken to fan the rising flame among the military. The army led the way in addressing the directory in the most violent manner, and their example was followed by

the other armies of the republic. To check this spirit in the army, Thebadeau presented the plan of two resolutions, the last of which declared every "assemblage of soldiers for the purpose of deliberating in other circumstances than those determined by the law, a crime; that any communication under the title of addresses from one armed body to another, or to the civil authorities, should be punished as a seditious act." Though the opposition party were not without their preparations, their measures were tardy, and pursued with less energy than those of their opponents. An address from the Fauxbourg of St. Antoine confirmed the directory in the violent measure it was about to adopt. On the morning of the 4th of September, at the early hour of 3 o'clock, the majority of the directory ordered the alarm guns to be fired, and the halls of the council to be surrounded by military force. General Augereau, who was charged with the execution of this bold measure, entered the hall, where he found Bovere, Pichegri, Willot, Bouchon de Loise, and several others. He seized Pichegri with his own hands, and ordered about 18 others of the most conspicuous characters to be arrested. They were committed to the temple; the halls were shut up, and the members of both councils were summoned to meet, the ancient at the school of Surgery, and the council of 500 at the Odéon, formerly the theatre in the Fauxbourg St. Germain. The minority of the directory Carnot and Barthelemi were implicated in the fate of their friends in the councils; Carnot took advantage of the tumult and fled; Barthelemi was put under arrest. The directory announced their victory to the public by a proclamation, in which they exhorted the citizens to peace and harmony; promised that life and property should be protected; and that every act of plunder and outrage should meet with exemplary punishment. This change in the French government appears to have been very unfavourable to a treaty with England; and shortly after they had got possession of power, Lord Malmesbury, who was then at Lisle, was ordered to depart from the dominions of France in 48 hours.

Having now humbled all their enemies at home, and ruling with triumphant sway, the directory began to indulge themselves in new plans of ambition and conquest; Italy by its weakness and the degeneracy of its inhabitants, presented a tempting object to these rapacious oppressors. Having pretended that their ambassador at Rome was insulted; they prepared to take vengeance by arms, and, far from being appeased by the humble apologies of the sovereign Pontiff, their troops were ordered to commence their march; they never met with the smallest opposition, and in a short time they placed their standard with triumph on the Capitol. The first act they made of their power was to overturn the papal government, and to remove oppressive institutions. The fine statues, and all those monuments of the arts which had long adorned Rome, were transported to Paris. Many other acts of tyranny and oppression were committed by the commanders of the French armies. Switzerland was next obliged to submit to the galling yoke of republican tyranny. After having beyond endurance insulted them, the directory at last ordered their troops to invade that country, which after a desperate resistance was finally subdued. For an account of which, we must refer our readers to Switzerland where we have given a full relation of all the misfortunes which befel that unhappy country.

Against no country in the world was the malignity of the directory so apparent as against Great Britain. They demanded the expulsion of the English from Hamburgh, and seized and confiscated English merchandise, where

ever they could find it, in the shops or warehouses of the French merchants, or in the ships of neutral nations. They appeared for many months to connive at a trade with England and even to encourage it; thus their own merchants were led into a snare; when their warehouses were full, the directory seized their prey.

A more extensive plan of vengeance, however, was in agitation against England, which was at once to overturn her government, to destroy her commerce, and to reduce the people to the degrading servitude in which the directory held the people of France. To execute the proud and empty boasts of an invasion, they were to build immense rafts or rather floating islands of wood to transport their troops into England. This ridiculous enterprise was not however attempted, they had been probably intimidated by the ardour and alacrity of the British nation in defence of their country.

The complicated baseness, meanness, and duplicity of the Gallic tyrants was likewise very conspicuous in their transactions with America. For the purpose of terminating all differences between America and the French republic, three envoys were appointed, to whom full powers were granted to settle all disputes between France and the United Provinces. The envoys, on their arrival, sent a letter to Talleyrand minister for foreign affairs; to which they never received an answer. The apostate bishop did, however, send his agents to talk with them, and from them they received the following overtures, which it was proposed to them to accede to, as preliminaries to negotiation, and even to their reception.

The agents did not assign any other reason for the innumerable injuries which America had suffered, than merely the offence which the directory had taken at the President's speech at the opening of the Congress, although by far the greater part of their depredations on the American trade were committed before that time, and that very session of the Congress was occasioned by nothing else. Yet for this speech some atonement was demanded worthy the acceptance of the directory. It is astonishing, that on a subject like this the envoys should condescend to talk to them a single moment. They did however. They justified the conduct of the president, insisted upon his right to deliver to the Congress what sentiments he pleased, and declared that they had neither authority nor inclination to offer any disavowal of them. This brought on a conversation, which led the agents to the point, and they soon found that the wrath of the directory was only to be appeased with money. They condescended to name the sums which they wanted.

I. Fifty thousand pounds was to be paid to Talleyrand, to be shared by him and certain of the directory, as the price of an interview without any promise of its producing a reconciliation.

II. America was to purchase of them for cash and at par millions of Batavian Florins, which were then selling at fifty per cent. *à* par, and put up with the loss. And this transaction was to make an article to be kept a secret from Great Britain.

III. America was immediately to advance them a loan, double in amount to what they had been robbed of by the French already; but in order to avoid all delay with respect to their touching the cash, and to simplify the amount by adhering to round numbers, 15 millions of dollars were to be sent over immediately; and that France would repay this loan, when convenient.

The envoys stated (which is but too true) that the people of America had been warmly concerned for the liberties of France; that when all the

powers of Europe united against her, America alone stood her friend; that notwithstanding the spoliations which had been committed upon their trade, the government of America, had the most ardent disposition to reconcile all existing differences. To all this they replied that nothing could be done here without money; that Hamburg and other states had been obliged to purchase a peace, and that it would be prudent for America to imitate their example. They said that some of the directors were not so well supplied with cash as others of them. Merlin, they said, received a part of the prizes from the masters and owners of privateers; but others had no such perquisites. When an objection was stated to the demand, and its unreasonableness insisted on. "What," said they, "you pay for your treaties with the Indians, and shall you not pay for them with us also?" Perceiving that good words had no effect they began to threaten. They desired the envoys to look at Genoa, Holland, Geneva, and Venice; to take a timely warning from their fate, and to avoid it by the only possible mode, that of tribute and submission. England, they said, was upon the eve of her ruin; that she was just about to fall, and that, when she was overthrown, the terms to be imposed on America would be ten times more severe. "Perhaps," said he, "you believe that in returning and exposing the unreasonableness of the demands of this government, you will persuade your fellow citizens to resist those demands; you are mistaken—you ought to know, that the means which France possesses in your country are sufficient to enable her, with the French party in America, to throw the blame which will attend the rupture of the negotiation on the Federalists, as you term yourselves, but on the British Party, as France terms you; and you may assure yourselves this will be done."

After all this conference with the agents, Mr. Gerry obtained an audience of Talleyrand; informed him of the conversation, of the persons with whom it was held, and asked him if these men really possessed his confidence, to which Talleyrand unequivocally replied, "They did."

Such are the particulars of this infamous transaction, which along with other innumerable crimes, fix indelible infamy on the tyrannic faction, which oppress France. As they are not vague reports, but are supported by the clearest evidence, as they are related officially by the American envoys to the American government, it would be vain to address any arguments to those who shut their eyes against this instance of Gallic baseness; their minds must be corrupted by the infectious poison of Jacobinical principles. We cannot refrain from transcribing the address of an American journal to his readers after a short summary of these dispatches.

"They speak in a language that needs neither preface nor commentary—Whoever reads must understand them, and whoever understands must hate, detest, abhor, and execrate, the base, insolent, and perfidious nation, whose power they develope.

"Read, if you are an American, never lose, nor for a moment mislay, this paper. Meditate on it through the labours of the day and let it be the first thing that revisits your mind when you awake from your nightly slumbers. Guard it as you would the apple of your eye—Preserve it amongst the hallowed gifts of your parents; and, when you die leave it as the first, most valuable, and most precious legacy, to your children. So shall they learn to shun the blindness of their fathers; so shall they learn to distinguish their friends from their foes; so shall the name of a Frenchman become a bye-word, a reproach and a curse amongst them, from generation to generation!"

their preparations; the French directory seem to have relinquished their visionary scheme of invading England. The fleet which they had equipped, set sail from Toulon May 19. under the command of admiral Bruyès. It consisted of fifteen ships of the line and eighteen frigates. An immense number of infantry, with artillery, vast quantities of mortars, howitzers, furnaces, bombs, grape, and cannon shot with ammunition have been put on board. Men of letters, geometricians and artists of every sort accompany them. Various conjectures were formed throughout all Europe concerning the destination of this fleet, which was very uncertain. The first certain account of them was, that they had taken possession of Malta, which they plundered. After collecting and sending away the booty which they found there, they set sail for Egypt and arrived safely in the harbour of Alexandria. Their subsequent transactions in that country together with their memorable defeat by admiral Nelson, have been related in the histories of England and Egypt.

The joy which that defeat diffused through all Europe has produced the happiest effects; it infused spirit into the council of Rastadt, and, instead of that timid, irresolute policy which the emperor had invariably pursued, he began to shew some faint appearances of courage and resolution, and being assured of the assistance of Russia, he at last determined to take the field, and to make one last attempt to check that inordinate ambition of France, and to maintain his rank as a sovereign prince among the states of Europe. The most brilliant victories have attended his arms. The French have been driven from most of their conquests, and the Austrians have entered Switzerland; while Suwarrow in Italy has met with the most complete success, and cleared great part of that country of the enemy.

To trace, with precision, the military operations of the Russians and Austrians, under the command of Suwarrow, whose conduct in Italy has fully answered the high character which Europe entertained of his talents, and the full confidence which the two emperors have reposed in him, would require a much greater portion of room than our narrow limits will allow. All that military knowledge, personal courage, vigilance, activity, perseverance, and address could effect, has been achieved by this celebrated general. Before his arrival, the Austrian general Kray, expelled the French from the Milanese, and compelled them, after having sustained considerable losses, to relinquish their strong holds on the Mincio and the Adige, and to retreat to the Adda. On the banks of this river, the French general Morsau, prepared for a vigorous defence. Nothing that could give courage and confidence to his troops was neglected. Entrenchments were thrown up wherever the river was considered as passable; and a situation remarkably strong by nature, was strengthened by every means which art could supply. In this position, however, Suwarrow, after having driven in all his out posts, resolved to attack him. Accordingly, on the morning of the 27th of April he forced the passage of the river, at different points, attacked the French in their entrenchment, and, after a most desperate action, obtained a complete victory. The French left six thousand men on the field; and upwards of five thousand prisoners, including four generals, fell into the hands of the allies, together with eighty pieces of cannon. The consequence of this action was the total expulsion of the French from the Milanese.

A dreadful battle was fought on the 19th of June which ended in the complete defeat, and almost total dispersion of General Macdonald's army. The engagement continued for three days, when the enemy were obliged to fly. They left 3000 men dead upon the field of battle, and 10000 prisoners.

FRANCE.

The army have never been able to make resistance against the Russians, except a memorable defeat, but continue flying before them. Tuzin has been joined with a number of other fortresses; the enraged peasants rose everywhere against the French, and received the Austrians as their protectors and friends. In several places, all those symbols of liberty which the French had been so careful to erect, have been destroyed by the enraged populace.

In Egypt they seem to have no better success; Buonaparte has been repulsed with great loss in several desperate attacks, which he made on St. John d'Acro, and has been obliged to fall back with great loss, so that his destruction does not seem to be far distant.

In the interior of France nothing appears friendly to the genuine principles of liberty; the directory appear to possess the same unlimited power over a ruined, distressed people, whom they oppress without mercy. At present they seem to be at variance with the councils, who are supported by the people. Which of these two contending parties will gain the ascendancy, is doubtful, and indeed immaterial. For you will look in vain for the smallest spark of honour or virtue from the collision of Jacobinical factions.

Lewis XVI. the late unfortunate king of the French, was born August 23, 1754; married April 9, 1770, to Maria Antoinetta, archduchess of Austria, born November 2, 1755; succeeded his grandfather, Lewis XV. May 10, 1774; crowned at Rheims June, 11, 1775; beheaded Jan. 21, 1793. The issue of Lewis XVI. and Marie Antoinetta are,

1. Madame Maria-Theresa-Charlotta, born December 19, 1778.
2. Lewis-Charles, born March 27, 1785.
Brothers and sisters to his late Majesty.

1. Lewis Stanislaus Xavier, count de Provence, born November, 17, 1755; married May, 15, 1774, Maria-Josepha-Louisa, daughter of the king of Sardinia, born September 2, 1753.

2. Charles-Philip, count d'Artois, born October, 9, 1757, married, November, 6, 1773, to Maria-Theresa, daughter of the king of Sardinia, born Jan. 31, 1766, by whom he has issue

1. Louis-Antoine, born Jan. 24, 1778.
A princess born August 5, 1780.
Another princess born Jan. 8, 1783.
3. Maria-Adelaide-Clotilda-Xaveria, born Sept. 23, 1759.
4. Madame Elizabeth-Philippa-Maria-Helena, born May 3, 1764.

Issue of Lewis XV. now living are,

1. Maria-Adelaide, duchess of Lorraine and Bar, born 1733.
2. Victoria-Louisa-Maria-Theresa, born 1733.
3. Sophia-Philippina-Elizabeth-Justinia, born 1734.
4. Louisa Maria, born 1737, who went into a convent of Carmelites, and took the veil in 1770.

 ...for miles together with elegant, neat country houses, seated in the midst of
 ...gardens and pleasure grounds intermixed with figures, busts, statues, temples,
 ...&c. to the very water's edge. Having no objects of amusement beyond the
 ...limits of their own gardens, the families in fine weather spend much of their
 ...time in these little temples, smoking, reading, or viewing the passengers,
 ...to whom they appear complaisant and polite.

COMMERCE AND MANUFACTURES.] The commerce of the Dutch previous
 to their falling under the dominion of France, and the consequent revolution
 of their government, might be said to be almost unlimited; for there
 is scarcely a manufacture they did not carry on, or a state to which they did
 not trade. In this, they were assisted by the populousness of their country,
 the cheapness of their labour, and above all, by the water-carriage, which,
 by means of their canals, gives them advantages beyond all other nations.
 The United Provinces were the grand magazine of Europe; and goods were
 purchased here sometimes cheaper than in the countries where they were
 produced. Their East India company had the monopoly of the trade
 for more than a hundred years, and was extremely opulent and powerful.
 Their capital city in India is Batavia, which is said to exceed in magnificence,
 opulence, and commerce, all the cities of Asia. Here the viceroys appear
 ed in greater splendour than the stadtholder; and some of the Dutch
 subjects in Batavia scarcely acknowledged any dependence on the mo
 ther-country. They had other settlements in India, but none more
 pleasant, healthful, or useful, than that on the Cape of Good Hope, the
 grand rendezvous of the ships of all nations, outward or homeward bound.
 Not to mention their herring and whale fisheries, which they had carried
 from the native proprietors, they excelled at home in numberless branches
 of trade, such as their pottery, tobacco-pipes, delf-ware, finely refined
 oil; their oil-mills, and starch manufactures; their hemp, and fine
 paper.

PUBLIC TRADING COMPANIES.] Of these, the capital is
India, incorporated in 1602, by which formerly the Dutch ac
men's wealth, divided forty per cent. and sometimes sixty, about the
year 1660; at present the dividends are much reduced; but in a hundred
and twenty-four years, the proprietors on an average, one year with another,
divided somewhat above twenty-four per-cent. But the Dutch West India
company, the same year divided no more than two and a half per-cent. This
company was incorporated in 1621. The bank of Amsterdam is thought to
be inexhaustibly rich, and is under an excellent direction; it is said by Sir
William Temple, to contain the greatest treasure, either real or imaginary,
that is known any where in the world. What may seem a paradox is, that
this bank is so far from paying any interest, that the money in it is worth some-
what more than the current cash is, in common payments. Mr. Anderfon
supposes, that the cash, bullion, and pawned jewels in this bank, which are
kept in the vaults of the stadthouse, amount to thirty-six (though others say
only to thirty) millions sterling.

CONSTITUTION AND GOVERNMENT.] France like another destroying
angel has so disjointed and broken the whole system of Europe, and over-
thrown so many of its ancient governments, that it may seem preposterous
to spend time in describing what no longer exists; but as it is impossible to
understand the history of Europe without a previous knowledge of its ancient
governments and laws, and as the erections made upon the ruins of its former
establishments, are built upon a system which is absurd, and destructive
of every principle that gives coherence and firmness to society; the
horrors of war, moreover, still continuing to rage and rendering the state of
Europe every day more unsettled and disastrous; we shall continue to de-
scribe the constitutions of the different kingdoms of Europe such as they
were before the revolution in France, leaving it to the future historian who
shall have the good fortune to see a period put to the calamities of Europe
to describe that state of tranquility and permanent security upon which it
may ultimately settle.

The constitution of the United Provinces is very intricate; for though
they subsist in a common confederacy, yet each province has an inde-
pendent government or constitution independent of the others: this govern-

While the States of that province and the deputies from them formed the *states-general*, in which the sovereignty of the whole confederacy was vested, but though a province should send two or more deputies, yet such province had no more than one voice in every resolution; and as that resolution could have the force of a law, it was in fact a law of the province, and for every city and republic in that province. In case of great danger and emergency had been let the States-general of the United Netherlands particular province was carried un-

The *council of state* consisted likewise of deputies from each province, but its constitution was different from that of the *states-general*, composed of twelve persons, whereof Gelderland sent two; Friesland, two; Zealand, two; Utrecht, two; Friesland, one; Overysel, one; and Groningen, one. These deputies, however, did not vote provincially, but personally. Their business was to prepare estimates, and ways and means for raising the revenue, as well as other matters that were to be laid before the *states-general*. The states of the provinces were stiled "Noble and Mighty Lords," but those of Holland, "Noble and Most Mighty Lords," and the *states-general*, "High and Mighty Lords," or, "The Lords the States general of the United Netherlands;" or, "Their High Mightinesses." Subordinate to these two bodies, was the chamber of accounts, which was likewise composed of provincial deputies, who audit all public accounts. The admiralty formed a separate board, and the executive part of it was committed to five colleges in the three maritime provinces of Holland, Zealand, and Friesland. In Holland the people had nothing to do either in choosing their representatives or their magistrates. In Amsterdam, which took the lead in all public deliberations, the magistracy was lodged in thirty six senators, who were chosen for life; and every vacancy among them was filled up by the survivors. The same senate also elected the deputies to represent the cities in the province of Holland.

In the year 1747, the stadtholdership of the United provinces was made hereditary in the male and female representatives of the family of Orange. This office in a manner superseded the constitution already described. The stadtholder was president of the states of every province and city. By this he had the moulding of the assembly of the *states-general*, though he had no voice in it; in short, though he had not the title, he had more real power and authority than some kings; for besides the influence and revenue he derived from the stadtholdership, he had several principalities and large estates of his own. The present stadtholder is William V. prince of Orange and Nassau, son of the late stadtholder William Charles, who married Anne, princess royal of Great Britain, and died 1751. After the French entered Holland, and it was evident that the whole country must fall under their power, he, on the 19 Janry. 1795 embarked from Scheveling in an open boat with only three men to navigate her and arrived safe at Harwich.

Though Holland was a republic, yet its government was far from being of the popular kind; nor did the people enjoy that degree of liberty which might at first view be apprehended. It was, indeed, rather an oligarchy than a commonwealth; for the bulk of the people were not suffered to have the least share in any part of the government, not even in the choice of the deputies. It may also be observed, that very few persons in this state dared to speak their sentiments freely; and they were generally educated in principles so extremely cautious, that they could not relinquish them when they entered more into public life.

NETHERLANDS

With respect to the administration of justice in this country, every province had its tribunal, to which, except in criminal causes, appeals lay from the petty and county courts; and it is said that justice was no where distributed with more impartiality.

REVENUES.] The government of the United Provinces proportioned their taxes according to the abilities of each province or city. Those taxes consisted of an almost general excise, a land tax, poll-tax, and hearth-money; so that the public revenue amounted annually to about two millions and a half sterling. The province of Holland payed nearly half of this revenue. The following is the rate at which each of the Seven United Provinces was said to contribute towards the public expence:

Of every million of ducats the Province of Holland contributes	420,000
Zealand	130,000
Friesland	170,000
Utrecht	85,000
Groningen	75,000
Gelderland	70,000
Overijssel	50,000

Of the 420,000 ducates paid by the province of Holland, the city of Amsterdam furnished upwards of 320,000. The taxes in these provinces were so heavy, and so many, that it is not without reason a certain author asserts, that the only thing which had escaped taxation there, was the air they breathed. But for the encouragement of trade, the duties on goods and merchandize were exceedingly low. Holland, before the breach with England, was in a very flourishing condition. The immense sums in the British funds have given reason for some people to imagine that Holland laboured under heavy debts; but the chief reason was, the states only paid two and a half per cent. interest for money.

MILITARY AND MARINE STRENGTH.] The number of land forces in the United Provinces in time of peace, commonly amounted to about forty thousand; twenty-five thousand of whom served in garrisons; many of them were Scots and Swiss; and, in time of war, they hired whole regiments of Germans. The chief command of the army was vested in the stadtholder, under whom was the field-marshal general. The marine force of the United provinces used to be very great, and they formerly fitted out very formidable fleets: but since that period their navy has been much neglected. In the present war since they made a common-cause with France, the capture of one fleet at the Cape of Good Hope and of another on their own coast by Admiral Duncan has almost annihilated their naval power.

ORDER OF TEUTONIC KNIGHTS.] This was one of the most powerful as well as ancient orders in Europe, now divided into two branches; the first for papists, and the second branch for protestants. This branch has a house at Utrecht, where they transact their business. The nobles of Holland, if they propose a son to be a knight, enter his name in the register, and pay a large sum of money to the use of the poor maintained by the order, and the candidate succeeds in rotation, if he brings with him proof of his nobility for four generations on the father's and mother's side. The ensign is a cross pattie, enamelled white, surmounted with another, black above the cross is a ball twisted, white and black. It is worn pendant to a broad black watered riband, which is worn about the neck. The

Arms.] The ensigns armorial of the Seven United Provinces, or the States of Holland; are, *Or*, a lion, gules, holding with one paw a cutlass, and with the other a bundle of seven arrows close bound together, in allusion to the seven confederate provinces, with the following motto, *Concordia res parva crescut.*

HISTORY.] See the Austrian Netherlands.

William V. prince of Orange and Nassau, Hereditary Stadtholder, Captain-general and Admiral of the Seven United Provinces, and knight of the Garter, was born March 10th, 1748, married in 1767, the princess Frederica Sophia Wilhelmina of Prussia, born in 1751; by whom he has three.

1. Frederica-Louisa-Wilhelmina, born Nov. 28, 1770; married to the hereditary Prince of Brunswick.

2. William-Frederic, hereditary Prince, born Aug. 2, 1772; married Oct. 1, 1791, to Princess Frederica-Sophia-Wilhelmina of Prussia.

3. William-George-Frederic, born Feb. 15, 1774.

The Stadtholder hath one sister, Wilhelmina-Carolina, born 1743, and married to the Prince of Nassau Wieburch.

AIR, SOIL, AND PRODUCE.] The air of Brabant, and upon the coast of Flanders, is bad; that in the interior parts is more healthful, and the seasons more settled, both in winter and summer, than they are in England. The soil and its produce are rich, especially in corn and fruits. They have abundance of pasture; and Flanders itself has been reckoned the granary of France and Germany, and sometimes of England. The most barren parts for corn rear far more profitable crops of flax, which is here cultivated to great perfection. Upon the whole, the Austrian Netherlands, by the culture, commerce, and industry of the inhabitants, was formerly the richest and most beautiful spot in Europe, whether we regard the variety of its manufactures, the magnificence and riches of its cities, the pleasantness of its roads and villages, or the fertility of its land. If it has fallen off in later times, it is owing partly to the neglect of its government, but chiefly to its vicinity to England and Holland; but it is still a most desirable and agreeable country. There are few or no mountains in the Netherlands; Flanders is a flat country, scarcely a single hill in it. Brabant, and the rest of the provinces, consist of little hills and valleys, woods, inclosed grounds, and Champaign fields.

RIVERS AND CANALS.] The chief rivers are the Maeſe, Sambre, Demer, Dyle, Nethe, Geet, Sanne, Ruppel, Scheldt, Lis Scarpe, Deule, and Dender. The principal canals are those of Brussels, Ghent and Ostend.

METALS AND MINERALS.] Mines of iron, copper, lead and brass, are found in Luxemburg, and Limburg, as are some marble quarries; and in the province of Namur there are coal-pits, and a species of bituminous fat earth proper for fuel, with great plenty of fossile nitre.

INHABITANTS, POPULATION, MANNERS, CUSTOMS, AND DIVERSIONS.] The Flemings (so the inhabitants of Flanders and the Austrian Low Countries are generally called) are thought to be a heavy blunt, honest people; but their manners are somewhat indelicate. Formerly they were known to fight desperately in defence of their country; at present they make no great figure. The Austrian Netherlands are extremely populous; but authors differ as to their numbers. Perhaps we may fix them at a medium at a million and a half. They are ignorant, and fond of religious exhibitions and pageants. Their other diversions are the same with those of the peasants of the neighbouring countries.

DRESS AND LANGUAGE.] The inhabitants of the French Flanders are mere French men and women in both these particulars. The Flemings, on the frontiers of Holland, dress like the Dutch boors, and their language is the same; but the better sort of the people speak French, and dress in the same taste.

RELIGION.] The established religion here is the Roman catholic but Protestants, and other sects, are not molested.

BISHOPRICS AND BISHOPS.] The archbishoprics are Cambray, Malines or Mechlin; the bishoprics, Ghent, Bruges, Antwerp, Arras, Tournay, St. Omer, Namur, and Ruremonds.

LEARNING, LEARNED MEN, } AND ARTISTS. The societies of Jesuits formerly produced the most learned men in the Austrian Low Countries, in which they had many comfortable settlements. Works of theology, and the civil and canon law, Latin poems and plays, were their chief productions. Strada is an elegant historian and poet. The Flemish painters and sculptors have great merit, and form a school by themselves. The works of Rubens and Vandyke cannot be sufficiently admired. Fiamingo, or the Flemings models for heads, particularly those of children, have never yet been equalled; and the Flemings formerly engrossed tapestry-weaving to themselves.

UNIVERSITIES.] Louvain, Douay, Tournay, and St. Omer. The first was founded in 1426, by John IV. duke of Brabant, and enjoys great privileges. By a grant of pope Sixtus IV. this university has the privilege of presenting to all the livings in the Netherlands, which right they enjoy, except in Holland.

ANTIQUITIES AND CURIOSITIES, } NATURAL AND ARTIFICIAL. Some Roman monuments of temples and other buildings are to be found in these provinces. Many curious bells, churches, and the like, ancient and modern, are also found here; and the magnificent old edifices of every kind, seen through all their cities, give evidences of their former grandeur. In 1607, some labourers found 1600 gold coins, and ancient medals of Antoninus Pius, Aurelius, and Lucius Verus.

CITIES.] This article has employed several large volumes published by different authors, but in times when the Austrian Netherlands were far more flourishing than now. The walls of Ghent, formerly the capital of Flanders, and celebrated for its linen and woollen manufactures, contained the circuit of ten miles; but now unoccupied, and great part of it in a manner a void. Bruges, formerly so noted for its trade and manufactures, but above all for its fine canals, is now dwindled to an inconsiderable place. Ostend is a tolerable convenient harbour for traders; and soon after the last rupture between Great Britain and Holland, became more opulent and populous. In 1781 it was visited by the emperor, who granted to it many privileges and franchises, and the free exercise of the protestant religion. As to Ypres, it is only a strong garrison town. The same may be said of Charleroy and Namur.

Louvain, the capital of the Austrian Brabant, instead of its flourishing manufactures and places of trade, now contains pretty gardens, walks, and harbours. Brussels retains somewhat of its ancient manufactures; and being the residence of the governor or viceroy of the Austrian Netherlands, it is a populous, lively place. Antwerp, once the emporium of the European continent, is now reduced to be a tapestry and thread lace-shop, with the houses of some bankers, jewellers, and painters adjoining. One of the first exploits of the Dutch, soon after they threw off the Spanish yoke, was to ruin at once the commerce of Antwerp, by sinking vessels, loaded with stone, in the mouth of the Scheldt; thus shutting up the entrance of that river to ships of large burden. This was the more cruel, as the people of Antwerp had been their friends and fellow sufferers in the cause of liberty, but they foresaw that the prosperity of their own commerce was at stake.

It may be observed here, that every gentleman's house is a castle or *chateau*; and that there are more strong towns in the Netherlands than in the rest of Europe; but since the decline of their trade, by the rise of English and Dutch, these towns are considerably diminished in size, and the whole streets, particularly in Antwerp, are in appearance uninhabited.

the

the Netherlands, provisions are extremely good and cheap. A stranger may dine in a *caf *, on seven or eight dishes of meat, for less than a shilling English. Travelling is safe, reasonable and delightful in this luxurious country. The roads are generally a broad causeway and run for some miles in a straight line, till they terminate with the view of some noble buildings. At Cassel, in the French Netherlands, may be seen thirty-two towns, itself being on a hill.

COMMERCE AND MANUFACTURES.] The chief manufactures of the French and Austrian Netherlands, are their beautiful linens and laces; in which, notwithstanding the boasted improvements of their neighbours, they are yet unrivalled; particularly in that species called cambrics, from Cambray, the chief place of its manufacture. These manufactures form the principal article of their commerce.

CONSTITUTION AND GOVERNMENT.] The Austrian Netherlands are still considered as a circle of the empire, of which the Archducal house, as being sovereign of the whole, is the sole director and summoning prince. This circle contributes its share to the imposts of the empire, and sends an envoy to the diet, but is not subject to the judicatories of the empire. It is under a governor general, appointed by the court of Vienna, who is at present the archduchess Christiana, sister to the late emperor Joseph II. and her husband the duke of Saxe Tefchen. The face of an assembly, or parliament, for each province, is still kept up, and consists of the clergy, nobility, and deputies of towns, who meet at Brussels. Each province claims particular privileges, but they are of very little effect; and the governor seldom or never finds any resistance to the will of his court. Every province has a particular governor, subject to the regent: and causes are here decided according to the civil and canon law.

After what we have already premised, *page*, 520. it may be reckoned almost needless to remind the reader that this description of the constitution and government of the Austrian Netherlands is only applicable to their situation when subject to the emperor, at present they are annexed to France, and make a part of her territories.

REVENUES.] These rise from the demesne lands and customs: but so much is the trade of the Austrian Flanders now reduced, that they are said not to defray the expence of their government; but by the late reduction of the garrison, this is now altered. The French Netherlands bring in a considerable revenue to the nation.

MILITARY STRENGTH.] The troops maintained here by the emperor are chiefly employed in the frontier garrisons. Though, by the barrier treaty, the Austrians were obliged to maintain three fifths of those garrisons, and the Dutch two; yet both of them were miserably deficient in their quotas, the whole requiring at least 30,000 men, and in time of war above 10,000 more. But the emperor Joseph II. demolished the fortifications of most of the places, and rendered the garrisons useless.

ARMS.] The arms of Flanders are, or, a lion sable, langued gules.

HISTORY.] The seventeen provinces, and that part of Germany which lies west of the Rhine, was called Belgica Gallia by the Romans. About a century before the Christian  ra, the Batt  removed from Hesse to the marshy country bounded by the Rhine and the Maese. They gave the name of Batavia to their new country. Generous and brave, the Batavians were esteemed by the Romans with great respect, being exempted from tribute, and governed by their own laws, and obliged only to perform military services. Upon the decline of that empire, the Goths, and other northern people, pos-

essed

selfed themselves of these provinces first, as they passed through them in their way to France, and other parts of the Roman empire; and afterwards being erected into small governments, the heads of which were despotic within their own dominions. Batavia and Holland became independent on Germany, to which it had been united under one of the grandsons of Charlemagne, in the beginning of the 10th century, when the supreme authority was lodged in the three united powers, of a Count, the Nobles, and the Towns. At last they were swallowed up by the house of Burgundy, anno, 1433.

The emperor Charles V, the heir of that family, transferred them, in the year 1477, to the house of Austria, and ranked them as part of the empire, under the title of the Circle of Burgundy. The tyranny of his son Philip II. who succeeded to the throne of Spain, made the inhabitants attempt to throw off his yoke, which occasioned a general insurrection. The counts Hoorn, and Egmont, and the prince of Orange, appearing at the head of it, and Luther's reformation gaining ground about the same time in the Netherlands, his disciples were forced by persecution to join the malecontents. Whereupon king Philip introduced a kind of inquisition, which from the inhumanity of its proceedings, was called the "Council of blood;" in order to suppress them; and many thousands were put to death by that court, besides those that perished by the sword. Count Hoorn and count Egmont were taken and beheaded; but the prince of Orange, whom they elected to be their Stadtholder, retiring into Holland, that and the adjacent provinces entered into treaty for their mutual defence, at Utrecht, in the year 1579. And though these revoltors at first were thought so despicable as to be termed *Beggars* by their tyrants, their perseverance and courage were such, under the prince of Orange, and the assistance afforded them by queen Elizabeth, both in troops and money, that they forced the crown of Spain to declare them a free people, in the year 1609; and afterwards they were acknowledged by all Europe to be an independent state, under the title of THE UNITED PROVINCES. By their sea wars with England, under the Commonwealth, Cromwell, and Charles II. they justly acquired the reputation of a formidable naval power. When the house of Austria, which for some ages ruled over Germany, Spain, and part of Italy, with which they afterwards continued to carry on bloody wars, was become no longer formidable; and when the public jealousy was directed against that of Bourbon, which was favoured by the government of Holland; who had dispossessed the prince of Orange of the stadtholdership; the spirit of the people was such, that they revived it in the person of the prince, who was afterwards William III. king of Great Britain; and during his reign, and that of queen Anne, they were principals in the grand confederacy against Lewis XIV. king of France.

Their conduct towards England in the wars of 1742 and 1756 hath been discussed in the history of that country, as also the occurrences which led to a rupture between them and the English in the year 1780. As it was urged, that they refused to fulfil the treaties which subsisted between them and Great Britain, so all the treaties which bound Great Britain to them were declared null and void, as if none had ever existed. By the war, their trade suffered considerably, but Negapatnam, in the East Indies, is the only place not restored to them by the late peace.

Probably, to their separation from Great Britain, may be attributed the late differences between the States General and the late emperor Joseph II. who, from the exhausted state of several of the European powers, seemed to have a favourable opportunity of accomplishing his ambitious designs. In the year 1781, he had been allowed to demolish the Dutch barrier in

dominions, for which they had contended so desperately in the time of queen Anne, and he now seemed willing to encroach upon their territories. A conference concerning the boundaries of their respective nations was proposed to the states; but before this could take place, he began to commit some acts of hostility, and extend his dominions a little by way of preliminary. Two small forts, St. Donat, and St. Paul, were seized upon, as well as some part of the marshes in the neighbourhood of Sluys. A formal demand was then made of a free navigation beyond fort Lillo, as far as the land of Saftingen, some miles up the Scheldt; and it was insisted as a preliminary to the ensuing conferences, that the guard-ship, which had usually been stationed at fort Lillo should be immediately withdrawn. A list of his demands was delivered in to the plenipotentiaries at Brussels on the fourth of May 1784: of these the most important seems to have been, the claim upon the town of Maastricht and the territory of Outre Meuse, a country disjoined from the rest of the Dutch possessions on the side of Flanders.

The claims of the emperor were little relished on the part of the republic, and the states were extremely urgent to obtain the mediation of the court of Versailles. In his ultimatum which was delivered on the 23d. of August, under the pretence of amity and a desire of conciliating all differences, he offered to relinquish his claim upon Maastricht, and to moderate his other requisitions, in consequence of the free and unlimited navigation of the Scheldt in both its branches to the sea, expressing at the same time his confidence, that the states would with eagerness, accept so decided a mark of his good will; and that he had therefore thought proper to regard the Scheldt as open, and to declare its navigation free from the date of this paper, and finally he further declared that should the imperial flag in the execution of these views, suffer any insult, he would be under the necessity of regarding such insult as an act of direct hostility, and a formal declaration of war on the part of the republic.

The answer of the Dutch to this memorial of the Emperor was decisive and peremptory. They regarded the restrained navigation of the Scheldt as the most valuable of their possessions; they declared it was a pretension from which they could never depart; and they protested against any step they might be obliged to take in vindication of their rights, being construed as a violation of those pacific dispositions they wished always to preserve towards his imperial majesty. The Emperor though not hasty in the execution of his design, appeared notwithstanding to be resolute. Early in October a small vessel sailed from Antwerp; on arriving before Lillo and Saftingen, it was stopped by the Dutch naval officer, and after pressing and amicable solicitations were in vain made use of to prevail on the commander to desist from his purpose, he discharged his whole broad side into the imperial vessel, in consequence of which she surrendered. A few days after this transaction, another Austrian vessel advanced on the side of the sea, and was detained by the Dutch admiral at the mouth of the Scheldt. This conduct on the part of the Dutch was perhaps unexpected by the Emperor; but having advanced so far, it was impossible that he should immediately retreat. He recalled his ambassador from the Hague, he ordered his plenipotentiary at Brussels to break up the conferences, and he wrote circular letters to the courts of Europe stating the unjustifiable and hostile proceedings of the provinces. The Dutch were no less active in their own vindication; a circular letter is dated on the third, as the Austrian is dated on the 10th of November. They insist upon their rights as unquestionable, and their proceedings as moderate beyond all example, and they farther declare

that so far from meriting to be considered as a power that had acted offensively, they still persisted in their peaceable dispositions, but if unfortunately such dispositions can have no influence on the mind of his Imperial Majesty, though the States still preserved some hopes to the contrary, the Republic will find itself in the disagreeable necessity of having recourse to such means as the rights of nature and nations entitled them to; hoping that Divine Providence, and the applauding voice of the neutral powers, will assist in maintaining the Republic in the just defence of its dearest rights."

Such conduct seemed to prognosticate an immediate war, and we may almost venture to say that hostilities commenced on the seventh of November, when the garrisons of Lillo, Frederic-Henry and Cruickshank, fearing a sudden attack on the part of the Austrians, cut their dykes, opened their sluices and inundated the flat country for many miles around the Scheldt, and great preparations were made on both sides for opening the campaign early next spring; but by the mediation of France and Russia, Europe was prevented from being again involved in the calamities and horrors of war, from which she had but lately been freed.

During the progress of these contentions with the emperor, the united States were harassed and torn with dissensions and animosities among themselves. The late war with Great Britain had originally been brought on by the French or patriotic party in Holland, as it was called, and had never been acceptable to the mass of the people; the conduct of the war had moreover been spiritless, injudicious and unsuccessful; all their settlements in the West Indies fell into the hands of the British without resistance; their ships were captured and their trade ruined; the patriotic party were indutrious to throw the blame of all their miscarriages on the Stadtholder, and they succeeded in raising a violent spirit of animosity against the House of Orange.

The Stadtholder was accused of not having exerted the force with which he was entrusted by the state, with that energy, which he ought to have done, and which would have been most effectual for counteracting the designs, and frustrating the efforts of the enemy; that the naval department had been shamefully neglected; its force misapplied and withheld; and that to these causes alone was to be imputed the ruin of their commerce and the loss of their colonies. The Stadtholder's known averseness to any political connection with France, and above all to entering into any treaty with, or affording any support to the American colonies, then in open rebellion against the mother country, afforded such a plausible foundation for these accusations as sufficiently answered the purposes of the party. The prince represented to his adversaries that the weak and bad condition of their navy had rendered it totally incapable of performing the services expected from it; and that the blame of this negligence and the consequent misfortunes rested solely with the states themselves, to whom he had often remonstrated for their inattention to this department, frequently warned them, since they were pursuing measures tending to a war, to be in due preparation to withstand its consequences; but these representations were all in vain, the ferment was such as neither reason nor conciliatory measures could allay. On the other hand the monarchical party accused the patriots of having involved their country in a war, when they were totally unprepared for it.

During these mutual recriminations the republic was torn to pieces and convulsed in all its parts and members. Nothing could be more deplorable than the face of tumult, riot and confusion which was every where extant.

The Stadtholder was treated with public indignity and insult; the acting committee of the States of Holland issued a decree by which they deprived him of his government and command, forbidding the troops to obey his orders in any manner, or even to pay him the customary military honours; these with other marks of disgrace and degradation put upon the first magistrate of the republic seemed to announce their near approach to some violent crisis. — This however was not silently acquiesced in by the stadtholder. He transmitted a strong letter to the states of Holland, in which, after taking notice that he could consider this resolution as nothing less than a violent outrage upon his dignity and authority, and an usurpation upon a right which did not admit of being doubted; after observing the defect of unanimity among themselves, and the closeness of the division upon which a question of such importance was carried; he denies the legality of any one member of the confederacy depriving him of rights which had been unanimously conferred upon him by the whole nation. While the tide of affairs seemed to be setting so strong against the Stadtholder, his brother in law, the new king of Prussia, was unceasing in his endeavours to promote every measure that seemed to have the most distant tendency to effect a reconciliation. The offer of his joint mediation with that of Great Britain having been rejected by the adverse party, he proposed that France along with himself should undertake the kind office, which being agreed to, the negotiation commenced, but under such doubtful and indeed inauspicious circumstances, as gave but little room to hope for a favourable termination; the event soon justified these fears; the correspondence betwixt Nimeguen, where the Stadtholder kept his court, and the Hague, was continued for some weeks; but was at last abruptly broken off by M. de Rayneval, the representative of the French king, who set out on his return to Paris about the middle of January 1787. The failure of this negotiation, was followed by the most bitter recriminations on both sides; but our limits will not permit us to enter into a particular account of the various movements of the different parties.

Towards the end of the year 1786 the republican cause sustained almost a mortal blow from the defection of the senate of Amsterdam. Soon after they experienced a shock, no less important in the revolution of sentiment and conduct of the states of Holland. The city of Utrecht was the centre and spring of democratic principles, there the ancient government was entirely overthrown, and the democratical established; and things were arrived at such a crisis as to preclude all hope of success from negotiation; the provincial states therefore resolved to proceed to the last extremities to restore the government of their turbulent capital; they determined therefore to possess themselves of Vreeswick near Utrecht, a post of the utmost importance to both parties. Here a skirmish took place which terminated in favour of the Burghers. Soon after a violent commotion took place in the city of Amsterdam betwixt the adverse parties, the scenes of rapine and destruction which ensued, filled the peaceable inhabitants with confusion and terror.

This was followed by the revolt of most of the regular troops of Holland, who went over to the stadtholder; but notwithstanding these advantages the disputes were still carried on with extreme violence. Our limits do not permit us to enter in a particular description of all the unimportant hostilities which took place; we shall therefore only add that on the 13th. Sept. 1787, a Russian army entered the province of Guelderland under the command of the duke of Brunswick, the progress of this army was rapid; it spread itself

on all sides and every thing fell before it; the fortified towns and garrisons surrendered without resistance, and last of all Amsterdam opened its gates to the conquerors. The assembly of the states at the Hague, at which all the deputies attended, except those of Amsterdam, restored the stadtholder to all those offices and rights from which he had been suspended. The deputies from Amsterdam after the surrender of that city joined the assembly of the states of Holland, and assented to all the resolutions that had been passed during their absence; and thus the differences which threatened such dreadful consequences were happily terminated and tranquillity completely restored. Treaties of defensive alliance were negotiated between Holland and Great Britain, and Holland and Prussia; by which all attempts to disturb the domestic tranquillity of the republic, by means of any foreign interference, appeared at that time to be effectually guarded by the close union that subsisted between those two important powers.

Nothing very remarkable occurs in the history of the United Provinces till the breaking out of the French revolution which has been attended with circumstances very important to that nation.

After the French armies had over-run the Netherlands and persisted in opening the navigation of the Scheldt, contrary to existing treaties, a correspondence on this subject took place betwixt the courts of Great Britain and France, which issued in the latter country declaring war against Great Britain and the United Provinces. We have given in our histories of France and England, such a detail of the operations of the French and allied armies as our limits permitted us, and to these we refer our readers, only observing that the unparalleled successes of the French armies and the deplorable misfortunes attending the allies enabled them in the winter of 1794. to enter and make themselves masters of Holland, which tho' allowed to retain the shadow of an independent government, can now only be considered as an appendage to France. By the retreat of the allies the most important places in the United Provinces were left open to the conquerors. Utrecht, Rotterdam, and Dort successively surrendered to the enemy, and on the 20th of January, Pichegru entered Amsterdam; at the head of 5000 men. The ancient government was immediately overturned and a new one established after the model and under the protection of France, and soon after, they declared war against their old friends; they have however dearly paid for that total want of spirit and principle which suffered them ignominiously to bow their necks under the yoke of an insulting and desolating foe; their country has been impoverished by requisitions, the new name for plunder, their trade has been ruined, their navy destroyed and their colonies lost; such are the happy effects of French principles and French connections. Before taking leave of this subject we cannot help dropping a tear over the melancholy fate of this once industrious brave and virtuous people, who by a long and noble struggle, having rescued themselves from the galling fetters of a barbarous and unfeeling tyrant, have now tamely submitted themselves to a slavery the most ignominious and degrading.

After the independency of the Seven United Provinces was acknowledged, the Spaniards remained possessed of the other ten provinces, or, as they are termed, the Low Countries, until the duke of Marlborough, general of the allies, gained the memorable victory of Ramillies, in the year 1706. After which Brussels, the capital, and great part of these provinces, were acknowledged Charles VI. afterwards emperor of Germany, for their sove-

reign; and his daughter, the late empress-queen, remained possessed of them until the war of 1741, when the French reduced them, except part of the province of Luxemburg; and would have still possessed them, but for the exertions of the Dutch, and chiefly of the English, in favour of the house of Austria. The places retained by the French, by the peace of Aix-la-Chapelle in the year 1748, may be seen in the preceding general table of divisions.

It was not long after the settlement of the disturbances in Holland, that an insurrection broke out in the provinces of the Netherlands, belonging to the emperor. The quarrel originated, like those in other countries, about the prerogatives assumed by the emperor, and which were more extensive than his subjects were willing to submit to; and the emperor making use of force to assert his claims, the discontented Brabanters sought refuge in the territories of the United Provinces.

On the part of his imperial majesty, the insurgents were not treated with lenity. A proclamation was issued by count Trautmansdorff, governor of Brussels, intimating, that no quarter should be given them, and that the villages, in which they concealed themselves should be set on fire. A general Dalton marched with 1000 men to retake the forts, proclaiming that he meant to become master of them by assault, and would put every soul he found in them to the sword.

In opposition to this sanguinary proclamation, the patriots issued a manifesto, in which they declared the emperor to have forfeited his authority by reason of his various oppressions and cruelties, his annulling his oath, and infringing the constitution. Banishment was threatened to such as took part with him; and all were exhorted to take up arms in defence of their country, though strict orders were given that no crowds or mobs should be allowed to pillage; and whoever was found doing so, should be treated as an enemy to his country.

This was dated at Hoogstraten, in Brabant, October the 24th, 1789. Almost every town in Austrian Flanders shewed its determination to oppose the emperor, and the most enthusiastic attachment to military affairs displayed itself in all ranks of men. Even the ecclesiastics manifested their valour on this occasion; which perhaps was naturally to be expected, as the emperor had been very active in depriving them of their revenues. A formidable army was soon raised, which after some successful skirmishes, made themselves masters of Ghent, Bruges, Tournay, Malines, and Ostend: so that general Dalton was obliged to retire to Brussels. A battle was fought before the city of Ghent, in which the patriots were victorious, though with the loss of 1000 men, besides women and children. It reflects indelible disgrace on the imperial character, as well as on the commanders of the troops, that they committed the most dreadful acts of cruelty on the unhappy objects who fell into their hands. By such barbarous conduct they ensured success to their adversaries; for the whole countries of Brabant, Flanders, and Maes, almost instantly declared in their favour. They published a memorial for their justification, in which they gave, as reasons for their conduct, the many oppressive edicts with which they had been harassed since the death of the empress-queen; the unwarrantable extension of the imperial prerogatives, contrary to his coronation oath, and which could not be done without perjury on his part; the violence committed on his subjects by forcibly entering their houses at midnight, and sending them prisoners to Vienna to perish in a dungeon, or on the banks of the Danube. Not content with this, he had openly massacred his subjects; he had consigned towns and villages;

villages to the flames, and entered into a design of exterminating people who contended only for their rights. These things, they owned, might be terrible at the time, and easily impose upon weak minds, but "the natural courage of a nation roused by repeated injuries, and animated by despair, would rise superior to those last efforts of vindictive tyranny, and render them as impotent and abortive, as they were wicked and unexampled." For all which reasons they declared themselves **INDEPENDENT**, and for ever released from the house of **AUSTRIA**.

The emperor now perceiving the bad effects of his cruelty, published proclamations of indemnity, &c. but they were treated with the utmost contempt. The patriots made the most rapid conquests, inasmuch, that before the end of the year they were masters of every place in the Netherlands, except Antwerp and Luxemburg.

Notwithstanding they thus appeared for ever separated from the house of Austria, yet the death of Joseph, happening soon after, produced such a change in the conduct of government, as gave a very unexpected turn to the situation of affairs; and the mild and pacific disposition of Leopold; who succeeded his brother, the conciliating measures he adopted, together with the mediation of Great Britain, Prussia, and Holland, made a material alteration in the affairs of these provinces; and a convention, which was signed at Reichenbach on the 27th of July 1790, by the above mentioned high contracting powers, had for its object the re-establishment of peace and good order in the Belgic provinces of his imperial majesty.

Their majesties of Great Britain and Prussia, and the states-general of Holland, became in the most solemn manner, guarantees to the emperor and his successors for the sovereignty of the Belgic Provinces, now re-united under his dominion.

The ratification of this convention was exchanged between the contracting parties within two months from the date of signing, which was executed at the Hague on the 10th of December, 1790.

The Netherlands have since become the scene of that desolating war which has been kindled in the world, and have been over-run by the numerous armies of France, but as all these events have been detailed in the history of that country, it is unnecessary to trouble the reader with them in this place.

the North ; by Poland and Hungary, including Bohemia, on the east ; by Switzerland and the Alps, which divide it from Italy, on the South ; and by the dominions of France and the Low Countries, on the West, from which it is separated by the Rhine, Moselle, and the Maese.

GRAND DIVISIONS.] The divisions of Germany, as laid down even by modern writers, are various and uncertain. I shall therefore adhere to those that are most generally received. Germany formerly was divided into the Upper, or Southern, and the Lower, or Northern. The emperor Maximilian, predecessor and grandfather to the emperor Charles V. divided it into ten great circles ; and the division was confirmed in the diet of Nuremberg, in 1552 ; but the circle of Burgundy, or the seventeen provinces of the Low Countries, being now detached from the empire, we are to confine ourselves to nine of those divisions, as they now subsist.

Whereof three are in the north, three in the middle; and three in the south.

The northern circles	— —	{ Upper Saxony Lower Saxony Westphalia
The circles in the middle	— —	{ Upper Rhine Lower Rhine Franconia
The southern circles	— —	{ Austria Bavaria Swabia

NAME.] Great part of modern Germany lay in ancient Gaul, as I have already mentioned: and the word Germany is of itself but modern. Many fanciful derivations have been given of the word; the most probable is, that it is compounded of *Ger* or *Gar*, and *Man*; which, in the ancient Celtic, signifies a warlike man. The Germans went by various other names, such as *Allemanni*, *Teutones*; which last is said to have been their most ancient designation; and the Germans themselves call their country *Teutschland*.

CLIMATE, SEASONS, AND SOIL.] The climate of Germany, as in all large tracts of country, differs greatly, not only on account of the situation, north, east, south, and west, but according to the improvement of the soil, which has a vast effect on the climate. The most mild and settled weather is found in the middle of the country, at an equal distance from the sea and the Alps. In the north it is sharp; towards the south it is more temperate.

The soil of Germany is not improved to the full by culture; and therefore in many places it is bare and sterile, though in others it is surprisingly fruitful. Agriculture, however, is daily improving, which must necessarily change the most barren parts of Germany greatly to their advantage. The seasons vary as much as the soil. In the south and western parts, they are more regular than those that lie near the sea, or that abound with lakes and rivers. The north wind and the eastern blasts are unfavourable to vegetation. Upon the whole, there is no great difference between the seasons of Germany and those of Great Britain.

MOUNTAINS.] The chief mountains of Germany are the Alps, which divide it from Italy, and those which separate Saxony, Bavaria, and Moravia from Bohemia. But many other large tracts of mountains are found in different parts of the empire.

FORESTS.] The great passion which the Germans have for hurting the wild boar, is the reason why perhaps there are more woods and claces yet

standing in Germany than in many other countries. The Hyrcanian forest, which in Cæsar's time was nine days journey in length, and six in breadth, is now cut down in many places, or parcelled out into woods, which go by particular names. Most of the woods are pine, fir, oak, and beech. There is a vast number of forests of less note in every part of this country; almost every count, baron, or gentleman, having a chase or park adorned with pleasure-houses, and well stocked with game, viz, deer, of which there are seven or eight sorts, as roebucks, stags, &c. of all sizes and colours, and many of a vast growth; plenty of hares, conies, foxes, and boars. They abound so much also with wild fowl, that in many places the peasants have them, as well as venison, for their ordinary food.

RIVERS AND LAKES.] No country can boast a greater variety of noble large rivers than Germany. At their head stands the Danube or Donaw, so called from the swiftness of the current, and which some pretend to be naturally the finest river in the world. From Vienna to Belgrade in Hungary, it is so broad, that in the wars between the Turks and Christians, ships of war have been engaged on it; and its conveniency for carriage to all the countries through which it passes is inconceivable.—The Danube, however, contains a vast number of cataracts and whirlpools; its stream is rapid, and its course, without reckoning turnings and windings, is computed to be 1620 miles. The other principal rivers are the Rhine, Elbe, Oder, Wefer, and Moselle.

The chief lakes of Germany, not to mention many inferior ones, are those of Constance and Bregentz. Besides these are the Chiemssee, or the lake of Bavaria; and the Zirnitzer-see in the duchy of Carniola, whose waters often run off and return again in an extraordinary manner.

Besides these lakes and rivers, in some of which are found pearls, Germany contains large noxious bodies of standing water, which are next to pestilential, and afflict the neighbouring natives with many deplorable disorders.

MINERAL WATERS AND BATHS.] Germany is said to contain more of these than all Europe besides. All Europe has heard of the Spa waters and those of Pyrmont. Those of Aix la Chapelle are still more noted. They are divided into the Emperor's Bath, and the Little Bath, and the springs of both are so hot, that they let them cool ten or twelve hours before they use them. Each of those, and many other waters have their partizans in the medical faculty; and if we are to believe all they say, they cure diseases internal and cutaneous, either by drinking or bathing. The baths and medicinal waters of Embs, Wisbaden, Schwalbach, and Wildungen, are likewise reported to perform their wonders in almost all diseases. The mineral springs at the last mentioned place are said to intoxicate as soon as wine, and therefore they are inclosed. Carlsbad and Baden baths have been described and recommended by many great physicians, and used with great success by many royal personages.

After all many are of opinion, that great part of the salutary virtues ascribed to these waters is owing to the exercises and amusements of the patients. It is the interest of the proprietors to provide for both; and many of the German princes feel the benefit of the many elegant and polite institutions for the diversion of the public. The neatness, cleanliness, and conveniency of the places of public resort are inconceivable; and though at first they are attended with expence, yet they more than pay themselves in a few years, by the company which crowd to them from all parts of the world: many of whom do not repair thither for health, but for amusement and conversation.

METALS

[METALS AND MINERALS.] Germany abounds in both. Many places in the circle of Austria, and other parts of Germany, contains mines of silver, quicksilver, copper, tin, iron, lead, sulphur, nitre, and vitriol. Salt-petre, salt-mines, and salt-pits are found in Austria, Bavaria, Silesia, and the Lower Saxony; as are carbuncles, amethysts, jasper, sapphire, agate, alabaster, several sorts of pearls, turquois stones, and the finest of rubies, which adorn the cabinets of the greatest princes and virtuosi. In Bavaria, Tirol, and Liege, are quarries of curious marble, slate, chalk, ochre, red lead, alum and bitumen; besides other fossils. In several places are dug up stones, which to a strong fancy represent different animals and sometimes trees of the human form. Many of the German circles furnish coal pits; and the *terra sigillata* of Mentz, with white, yellow, and red veins, is thought to be an antidote against poison.

[VEGETABLE AND ANIMAL PRODUCTIONS.] These differ in Germany very little, if at all, from the countries already described; but naturalists are of opinion, that had the Germans, even before the middle of this century, been acquainted with agriculture, their country would have been the most fruitful of any in Europe. Even in its present, that we may call rude state, provisions are more cheap and plentiful in Germany than in any other country perhaps in the world; witness the prodigious armies which the most uncultivated part of it maintained during the late war, while many of the richest and most fertile provinces remained untouched.

The Rhenish and Moselle wines, differ from those of other countries in a peculiar lightness, and detestive qualities, more sovereign in some diseases than any medicine.

The German wild boar differs in colour from our common hog, and is four times as large. Their flesh, and the hams made of it, are preferred by many, even to those of Westmoreland, for flavour and grain. The *glutton* of Germany is said to be the most voracious of all animals. Its prey is almost every thing that has life, which it can master, especially birds, hares, rabbits, goats, and fawns; whom they surprise artfully, and devour greedily. On these the glutton feeds so ravenously, that it falls into a kind of a torpid state, and not being able to move, he is killed by the huntsmen; but though both boars and wolves will kill him in that condition, they will not eat him. His colour is a beautiful brown, with a faint tinge of red.

Germany yields abundance of excellent heavy horses; but their horses, oxen, and sheep, are not comparable to those of England, probably owing to their want of skill in feeding and rearing them. Some parts of Germany are remarkable for fine larks, and great variety of singing birds, which are sent to all parts of Europe.

POPULATION, INHABITANTS, MANNERS, } As the empire of Germany
CUSTOMS, DIVERSIONS, AND DRESS. } is a collection of separate
states, each having a different government and police, it hath been difficult to speak with precision as to the number of its inhabitants; but lately the following estimate hath been formed of them.

Moravia	1,100,000
Austrian Silesia	200,000
High and Low Lusatia	380,000
Circle of Austria	4,150,000
Bavaria	1,148,438
Archbishopric of Saltzburgh	250,000
Wurtemberg	565,899
Baden	200,000

17,166,868

This calculation extends only to the principal parts of Germany, and when the inferior parts are added, the number in all, including the kingdom of Bohemia, is now computed at twenty-six millions; and when the landholders become better acquainted with agriculture and cultivation, population must naturally increase among them.

The Germans in their persons are tall, fair, and strong built. The ladies have generally fine complexions; and some of them, especially in Saxony, have all the delicacy of features and shape that are so bewitching in some other countries

Both men and women affect rich dresses, which, in fashion, are the same as in France and England; but the better sort of men are excessively fond of gold and silver lace, especially if they are in the army. The ladies at the principal courts differ not much in their dress from the French and English, only they are not so excessively fond of paint as the former. At some courts they appear in rich furs; and all of them are loaded with jewels, if they can obtain them. The female part of the burghers families, in many of the German towns, dress in a very different manner, and some of them inconceivably fantastic, as may be seen in many prints published in books of travels; but in this respect they are gradually reforming, and many of them

make quite a different appearance in their dress from what they did thirty or forty years ago. As to the peasantry and labourers, they dress as in other parts of Europe, according to their employments, conveniency, and circumstances. The stoves made use of in Germany are the same with those already mentioned in the northern nations, and are sometimes made portable, so that the ladies carry them to church. In Westphalia, and many other parts of Germany, they sleep between two feather-beds, with sheets stitched to them, which by use becomes a very comfortable practice. The most unhappy part of the Germans are the tenants of little needy princes, who squeeze them to keep up their own grandeur; but in general, the circumstances of the common people are more comfortable than those of their neighbours.

The Germans are naturally a frank, honest, hospitable people, free from artifice and disguise. The higher orders are ridiculously proud of titles, ancestry, and shew. The Germans in general, are thought to want animation, as their Persons promise more vigour and activity than they commonly exert, even in the field of battle. But when commanded by able generals, especially the Italians, such as Montecuculi and prince Eugene, they have done great things both against the Turks and the French. The imperial arms have seldom made any remarkable figure against either of those two nations, or against the Swedes or Spaniards, when commanded by German generals. This possibly might be owing to the arbitrary obstinacy of the court of Vienna; for in the two last wars, the Austrians exhibited prodigies of military valour and genius.

Industry, application, and perseverance, are the great characteristics of the German nation, especially the mechanical part of it. Their works of art would be incredible, were they not visible, especially in watch and clock making, jewelry, turnery, sculpture, drawing, painting, and certain kinds of architecture; some of which I shall have occasion to mention. The Germans have been charged with intemperance in eating and drinking, and perhaps not unjustly, owing to the vast plenty of their country in wine and provisions of every kind. But those practices seem now to be wearing out. At the greatest tables, though the guests drink pretty freely at dinner, yet the repast is commonly finished by coffee, after three or four public toasts have been given. But no people have more feasting at marriages, funerals, and on birth-days.

The German nobility are generally men of so much honour that a sharper in other countries, especially in Italy, meets with more credit if he pretends to be a German, rather than any other nation. All the sons of noblemen inherit their father's titles, which greatly perplexes the heralds and genealogists of that country. The German husbands are not quite so complaisant as those of some other countries to their ladies, who are not entitled to any pre-eminence at the table; nor indeed do they seem to affect it, being far from either ambition or loquacity, though they are said to be somewhat too fond of gaming. From what has been premised, it may easily be conceived, that many of the German nobility, having no other hereditary estate than a high-sounding title, easily enter into their armies, and those of other sovereigns. Their fondness for title is attended with many other inconveniencies. Their princes think that the cultivation of their lands, though it might treble their revenue, is below their attention; and that, as they are a species of beings superior to labourers of every kind, they would demean themselves in being concerned in the improvement of their grounds.

The domestic diversions of the Germans are the same as in England; billiards, cards, dice, fencing, dancing, and the like. In summer, people of fashion repair to places of public resort, and drink the waters. As to their field diversions, besides their favourite one of hunting, they have bull and bear-baiting, and the like. The inhabitants of Vienna live luxuriously, a great part of their time being spent in feasting and carousing; and in winter, when the several branches of the Danube are frozen over, and the ground covered with snow, the ladies take their recreation in sledges of different shapes, such as griffins, tygers, swans, scollop-shells, &c. Here the lady sits, dressed in velvet, lined with rich furs, and adorned with laces and jewels, having on her head a velvet cap; and the sledge is drawn by one horse, stag, or other creature, set off with plumes of feathers, ribands, and bells. As this diversion is taken chiefly in the night-time, servants ride before the sledges with torches, and a gentleman standing on the sledge behind, guides the horse.

[RELIGION.] This is a copious article, but I shall confine myself to what is most necessary to be known. Before the Reformation introduced by Luther, the German bishops were possessed (as indeed many of them are at this day) of prodigious power and revenues, and were the tyrants of the emperors as well as the people. Their ignorance was only equalled by their superstition. The Bohemians were the first who had an idea of reformation, and made so glorious a stand for many years against the errors of Rome, that they were indulged in the liberty of taking the sacrament in both kinds, and other freedoms not tolerated in the Romish church. This was in a great measure owing to the celebrated Englishman John Wickliffe, who went much farther in reforming the real errors of popery than Luther himself, though he lived about a century and a half before him. Wickliffe was seconded by John Hus, and Jerome of Prague, who, notwithstanding the emperor's false-conduct, were infamously burnt at the council of Constance.

The Reformation introduced afterwards by Luther*, of which we have spoken in the Introduction, though it struck at the chief abuses in the church of Rome, was thought in some points (particularly that of consubstantiation, by which the real body of Christ, as well as the elements of bread and wine, is supposed to be taken in the sacrament) to be imperfect. Calvinism †, therefore, or the religion of Geneva (as now practised in the church of Scotland), was introduced into Germany, and is the religion professed in the territories of the king of Prussia, the landgrave of Hesse, and some other princes, who maintain a parity of orders in the church. Some go so far as to say, that the numbers of protestants and papists in the empire are now almost equal. Germany, particularly Moravia and the Palatinate, as also Bohemia, is over-run with sectaries of all kinds; and Jews abound in the empire. At present, the modes of worship and forms of church government are by the protestant German princes considered in a civil rather than a religious light. The protestant clergy are learned and exemplary in their deportment, but the popish, ignorant and libertine.

4 B

* Born in Saxony, in the year 1483, began to dispute the doctrines of the Romish church, 1517, and died, 1546, in the 63d year of his age.

† John Calvin was born in the province of Picardy, in the north of France, anno 1506. Being obliged to fly from that kingdom, he settled at Geneva, in 1539, where he established a new form of church discipline, which was soon after embraced by several nations and states, who are now denominated Presbyterians, and, from their doctrinal articles, Calvinists. He died at Geneva, in the year 1564; and his writings make nine volumes in folio.

ARCH

[ARCHBISHOP AND BISHOP SEES.] These are differently represented by authors; some of whom represent Vienna as being a suffragan to the archiepiscopal see of Salzburg; and others, as being an archbishopric, but depending immediately upon the pope. The others are the archbishop of Mentz, who has under him twelve suffragans; but one of them, the bishop of Bamberg, is said to be exempted from its jurisdiction:—Triers has three suffragans;—Cologne has four;—Magdeburg has five;—Salzburg has nine, besides Vienna;—and Bremen three.

At different periods since the Reformation, it has been found expedient to satisfy the claims of temporal princes, to secularise the following bishop-sees, Bremen, Verden, Magdeburg, Halberstadt, Minden, Lubec, and Osnaburg, which last goes alternately to the houses of Bavaria and Hanover, and is at present held by his Britannic majesty's second son. Such of those sees as were archbishoprics are now considered as duchies, and the bishoprics as principalities.

[LANGUAGE.] The Teutonic part of the German tongue is an original language, and has no relation to the Celtic. It is called High Dutch, and is the mother tongue of all Germany; but varies so much in its dialect, that the people of one province scarcely understand those of another. Latin and French are the most useful languages in Germany, when a traveller is ignorant of High Dutch.

The German Pater Noster is as follows: *Unser Vater, der du bist im himmel. Geheiligt werd dein name. Zukomme dein reich. Dein wille geschehe, wie im himmel also auch auf erden. Unser taglich brodt gib uns heute. Und vergib uns unser schuld, als wir vergeben unsern schuldignern. Und fuhre uns nicht in versuchung. Sondern erlase uns von dem bosen. Dem dein is das reich, und die kraft, und die herr lichkeit, en ewigheit. Amen.*

[LEARNING, LEARNED MEN, &c.] No country has produced a greater variety of authors than Germany, and there is no where a more general taste for reading, especially in the protestant countries. Printing is encouraged to a fault; almost every man of letters is an author; they multiply books without number; thousands of theses and disputations are annually published; for no man can be a graduate in their universities, who has not published one disputation at least. In this country there are 36 universities, of which 17 are protestant, 17 Roman catholic, and two mixed; besides a vast number of colleges, gymnasia, pedagogies, and Latin schools. There are also many academies and societies for promoting the study of natural philosophy, the belles lettres, antiquities, painting, sculpture, architecture, &c. as the Imperial Leopoldine academy of the *nature curiosa*; the academy of sciences at Vienna, at Berlin, at Gottingen, at Erfurth, at Leipzig, at Duisburg, at Giefen, and at Hamburg. At Dresden and Nuremberg are academies for painting; at Berlin a royal military academy; and at Augsburg is the Imperial Franciscan academy of fine arts; to which we may add the Latin society at Jena. Of the public libraries the most celebrated are those of Vienna, Berlin, Halle, Wolfenbuttle, Hanover, Gottingen, Weymar, and Leipzig.

Many of the Germans have greatly distinguished themselves in various branches of learning and science. They have written largely upon the Roman and canon laws. Stahl, Van Swieten, Stork, Hoffman, and Haller, have contributed greatly to the improvement of physic; Ruvinus and Dillenius, of botany; Heister, of anatomy and surgery; and Newman, Zimmerman, Pott, and Margraff, of chemistry. In astronomy, Kepler deservedly obtained a great reputation; and Puffendorf is one of the first writers on the

the law of nature and nations, and has also merit as an historian. But at the end of the last century, and the beginning of the present, Germany, by her divines, and by her religious sects, was so much involved in disputes about systematic theology, that few comparatively paid any attention to other parts of learning, or to polite literature. The language also, and the style of writing in German books, which at the time of the Reformation was pure and original, became ridiculous, by a continual intermixture of Latin and French words; and though they were not understood by the people in general, were thought to give an air of superiority to the writers, and were therefore much affected. For an opinion prevailed among the learned in Germany, and many have not yet divested themselves of it, that compiling huge volumes, and larding them with numberless quotations from all sorts of authors, and from all languages, was the true test of great erudition. Their productions; therefore, became heavy and pedantical, and were in consequence disregarded by other nations.

It was about the year 1730, that the prospects of literature in Germany began to brighten. Leibnitz and Wolfius opened the way to a better philosophy than had hitherto prevailed. Gottsched, an author and professor at Leipzig, who has been greatly honoured by the present king of Prussia, introduced a better taste of writing, by publishing a German grammar, and by instituting a literary society, for polishing and restoring to its purity the German language, and by promoting the study of the *belles lettres*. We may consider this as the epocha, from which the Germans began to write with elegance in their own language, upon learned subjects, and to free themselves, in a considerable degree, from that verbiage and pedantry by which they had been characterised. About this time several young men in the university of Leipzig, and other parts of Lower Germany, united in publishing some periodical works, calculated for the general entertainment of persons of a literary taste. Some of these gentlemen afterwards became eminent authors; and their works are held in Germany in high estimation.

The style of preaching among the German divines also now underwent a considerable change. They began to translate the best English and French sermons, particularly those of Tillotson, Sherlock, Saurin, Bourdaloue, and others. They improved by these models: and Mosheim, Jerusalem, Spalding, Zollikofer, and others, have published sermons which would do credit to any country; though they still retain too much of that prolixity, for which German divines and commentators have been so much censured. Nor can it be denied, that great numbers of the German preachers, even in large and opulent towns, are still too much distinguished by vulgar language, absurd opinions, and an inattention to the dictates of reason and good sense.

Some of the English periodical writings, such as the *Spectator*, *Tatler*, and *Guardian*, being translated into the German language, excited great emulation among the writers of that country, and a number of periodical papers appeared, of various merit. One of the first and best was published at Hamburg, under the title of "The Patriot;" in which Dr. Thomas, the late bishop of Salisbury, was concerned; he being at that time chaplain to the British factory at Hamburg, and a considerable master of the German language. The late professor Gillert, who is one of the most elegant of the German authors, and one of the most esteemed, has greatly contributed to the improvement of their taste. His way of writing is particularly adapted to touch the heart, and to inspire sentiments of morality and piety. His fables and narrations, written in German verse, his letters, and his moral romances,

are so much read in Germany, that even many of the ladies have them almost by heart. His comedies are also very popular; though they are rather too sentimental, and better adapted for the closet than for the stage.

Haller, the famous physician, Hagedorn, Uz, Cronegh, Lessing, Gleim, Gerstenberger, Kleist, Klopstock, Ramler, Zacarie, Wieland, and others, have excelled in poetry. Schlegel, Cronegh, Lessing, Wieland, and Wiele, have acquired fame by their dramatic writings. Rabener has, by his satirical works, immortalized his name among the Germans; though some of his pieces are of too local a nature, and too much confined to German customs, manners, and characters, to be read with any high degree of pleasure by persons of other nations. Gesner, whose *Idylls* and *Death of Abel* have been translated into the English language, is known among us in a more favourable light.

In chemistry, and in medicine, the merit of the Germans is very conspicuous: and Reimarus, Zimmermann, Abt, Kacstner, Segner, Lambert, Mayer, Kruger, and Sulger, have acquired fame by their philosophical writings. Busching is an excellent geographical writer; and Masco, Bunau, Putter, Gatterer, and Gebaur, have excelled in historical works. But it cannot be denied that the Germans, in their romances, are a century behind us. Most of their publications of this kind are imitations of ours, or else very dry and uninteresting; which perhaps is owing to education, to false delicacy, or to a certain taste of knight-errantry, which is still predominant among some of their novel writers.

In works relating to antiquity, and the arts known among the ancients, the names of Winckelman, Klog, and Lessing, are familiar with those who are skilled in this branch of literature. In ecclesiastical, philosophical, and literary history, the names of Albertus Fabricius, Mosheim, Senaler, and Brucker, are well known among us. Raphaelius, Michaelis, and Walsh, are famous, in sacred literature. Cellarius, Burman, Taubman, Reiske, Ernesti, Reimarus, Havercamp, and Heyne, have published some of the best editions of Greek and Latin classics.

It is an unfavourable circumstance for German literature, that the French language should be so fashionable in the German courts instead of the German, and that so many of their princes should give it so decided a preference. Even the late king of Prussia had ordered the Philosophical Transactions of his royal society at Berlin, from the beginning of its institution, to be published in the French tongue: by which, some of the Germans think, his majesty has cast a very undeserved reproach upon his native language.

With respect to the fine arts, the Germans have acquitted themselves tolerably well. Germany has produced some good painters, architects, sculptors, and engravers. They even pretend to have been the first inventors of engraving, etching, and mezzotinto. Printing, if first invented in Holland, was soon after greatly improved in Germany. The Germans are generally allowed to be the first inventors of great guns; as also of gunpowder in Europe, about the year 1320. Germany has likewise produced some excellent musicians; Handel, Bach, and Haffe, of whom Handel stands at the head; and it is acknowledged, that he arrived at the sublime of music, but he had not the smallest idea of the difference between music and sentimental expression.

CITIES, TOWNS, FORTS, AND OTHER EDIFICES, } This is a copious

so in Germany, on account of the numerous independent states it contains.

The

The reader therefore must be contented with the mention of the most capital places, and their peculiarities.

Though Berlin is accounted the capital of all his Prussian majesty's dominions, and exhibits perhaps the most illustrious example of sudden improvement that this age can boast of; yet, during the late war, it was found a place of no strength, and fell twice, almost without resistance, into the hands of the Austrians, who, had it not been for the politeness of their generals, and their love of the fine arts, which always preserves mankind from barbarity and inhumanity, would have levelled it to the ground.

Berlin lies on the river Spree, and, besides a royal palace, has many other superb palaces; it contains fourteen Lutheran, and eleven Calvinist churches, besides a popish one. Its streets and squares are spacious, and built in a very regular manner. But the houses, though neat without, are ill-finished, and ill-furnished within; and very indifferently provided with inhabitants. The king's palace here, and that of prince Henry, are very magnificent buildings. The opera-house is also a beautiful structure: and the arsenal, which is handsomely built in the form of a square, contains arms for 200,000 men. There are sundry manufactures in Berlin, and several schools, libraries, and charitable foundations. The number of its inhabitants, according to Busching, in 1755, was 126,661, including the garrison. In the same year, and according to the same author, there were no fewer than 443 silk looms, 149 of half silks, 2858 for woolen stuffs, 453 for cotton, 248 for linen, 454 for lace-work, 39 frames for silk stockings, and 310 for worsted ones. They have here manufactures of tapestry, gold and silver-lace and mirrors.

The electorate of Saxony is, by nature, the richest country in Germany, if not in Europe; it contains 210 walled towns 61 market-towns, and about 3000 villages, according to the latest accounts of the Germans themselves (to which, however, we are not to give an implicit belief); and the revenue, estimating each rix dollar at four shillings and six-pence, amounts to 1,350,000. This sum is so moderate, when compared to the richness of the soil, which, if we are to believe Dr. Busching, produces even diamonds, and almost all the precious stones to be found in the East Indies and elsewhere, and the variety of splendid manufactures; that I am apt to believe the Saxon princes to have been the most moderate and patriotic of any in Germany.

We can say little more of Dresden, the elector of Saxony's capital, than hath been already said of all fine cities, that its fortifications, palaces, public buildings, churches, and charitable foundations, and, above all, its suburbs, are magnificent beyond all expression; that it is beautifully situated on both sides the Elbe; and that it is the school of Germany for statuary, painting, enamelling, and carving; not to mention its mirrors, and founderies for bells and cannon, and its foreign commerce carried on by means of the Elbe. The inhabitants of Dresden, by the latest accounts, amount to 110,000.

The city of Leipzig in Upper Saxony, 46 miles distant from Dresden, is situated in a pleasant and fertile plain on the Pleisse, and the inhabitants are said to amount to about 40,000. There are also large and well built suburbs, with handsome gardens. Between these suburbs and the town is a fine walk of lime-trees, which was laid out in the year 1702, and encompasses the city. Mulberry-trees are also planted in the town ditches; but the fortifications seem rather calculated for the use of the inhabitants to walk on, than for defence. The streets are clean, commodious, and agreeable, and are lighted in the night with seven hundred lamps. They reckon 436

merch-

merchant houses, and 192 manufactures of different articles, as brocades, paper, cards, &c. Leipzig has long been distinguished for the liberty of conscience allowed here to persons of different sentiments, in religious matters. Here is an university, which is still very considerable, with six churches for the Lutherans, theirs being the established religion, one for the Calvinists, and a chapel in the castle for those of the Romish church. The university-library consists of about 26,000 volumes, 6,000 of which are folios. Here is also a library for the magistrates, which consists of about 36,000 volumes and near 2,000 manuscripts, and contains cabinets of urns, antiques, and medals, with many curiosities of art and nature. The Exchange is an elegant building.

The city of Hanover, the capital of that electorate, stands on the river Leine, and is a neat, thriving, and agreeable city. It contains about twelve hundred houses among which there is an electoral palace. It carries on some manufactures; in its neighbourhood lie the palace and elegant gardens of Herrenhausen. The dominions of the electorate of Hanover contain about seven hundred and fifty thousand people, who live in fifty-eight cities, and sixty market-towns, besides villages. The city and suburbs of Bremen, belonging by purchase to the said elector, contain about fifty thousand inhabitants, who have a considerable trade by the Weser. The other towns belonging to this electorate have trade and manufactures; but in general, it must be remarked, that the electorate has suffered greatly by the accession of the Hanover family to the crown of Great Britain. I shall here just mention, on account of its relation to our royal family the secularised bishopric of Osnaburg, lying between the rivers Weser and Ems. The chief city, Osnaburg, has been long famous all over Europe for the manufacture known by the name of the duchy, and for the manufacture of the best Westphalia hams. The whole revenue of the bishopric amounts to about 30,000*l*.

Breslau, the capital of Silesia, which formerly belonged to the kingdom of Bohemia, lies on the river Oder, and is a fine city, where all sects of Christians and Jews are tolerated, but the magistracy is Lutheran. Since Silesia, fell under the Prussian dominion, its trade is greatly improved, being very inconsiderable before. The manufactures of Silesia which principally centre at Breslau, are numerous. The revenue of the whole is by some said to bring his Prussian majesty in near a million sterling; but this sum seems to be exaggerated; if, as other authors of good note write, it never brought into the house of Austria above 500,000*l*. yearly.

Frankfort on the Maine, so called to distinguish it from another of the same name on the Oder, is situated in a healthful, fertile, and delightful country, on the river just mentioned, by which it is divided into two parts, distinguished by the names of Frankfort and Saxenhausen. The former of these, being the largest, is divided into twelve wards, and the latter into two; and both are computed to contain about three thousand houses. The fortifications, which are both regular and solid, form a decagon, or figure consisting of ten bastions, faced with hewn stone; the ditches are deep, and filled with fresh water; and all the outworks are placed before the gates. Frankfort is the usual place of the election and coronation of the kings of the Romans, and is also a free and imperial city. It is in a circular form, without any suburbs; but the streets are generally narrow, and the houses are mostly built of timber and plaister, and covered with slate; though there are some handsome private structures, of a kind of red marble, that deserve the name of palaces; as the buildings called the Compestel and Frouhuf, the

Trierhof, the Cullenhof, the German-house, an august edifice, situated near the bridge over the Maine, the Flesse Darmst'dthof, the palace of the prince de la Tours, and the houses of the counts of Solms, Schauenburg, and Schouborn & there are three principal squares.

Vienna is the capital of the circle of Austria, and, being the residence of the emperor, is supposed to be the capital of Germany. It is a noble and a strong city, and the princes of the house of Austria have omitted nothing that could contribute to its grandeur and riches. Vienna contains an excellent university, a bank, which is in the management of her own magistrates, and a court of commerce immediately subject to the aulic council. Its religious buildings, with the walks and gardens, occupy a sixth part of the town; but the suburbs are larger than the city. It would be endless to enumerate the many palaces of this capital, two of which are imperial; its squares, academies, and libraries; and among others, the fine one of prince Eugene, with his and the imperial cabinets of curiosities. Among its rich convents is one for the Scotch nation, built in honour of their countryman St. Colman, the patron of Austria; and one of the six gates of this city is called the Scots gate, in remembrance of some notable exploit performed there by the troops of that nation. The inhabitants of Vienna, including the suburbs, are computed at about three hundred thousand; and the encouragement given them by their sovereigns, has rendered this city the rendezvous of all the nations around.

After all that has been said of this magnificent city, the most candid and sensible of those who have visited it, are far from being lavish in its praise. The streets, excepting those in the suburbs, are narrow and dirty; the houses and furniture of the citizens are greatly disproportioned to the magnificence of the palaces, squares, and other public buildings; but above all, the excessive imposts laid by the house of Austria upon every commodity in its dominions, must always keep the manufacturing part of their subjects poor. The emperor Joseph II became sensible of truths which were plain to all the world but his predecessors and their counsellors: he examined things with his own eyes, and descended from that haughtiness of demeanor which rendered the imperial court so long disagreeable, and even ridiculous, to the rest of Europe. In general, the condition of the Austrian subjects has been greatly meliorated since his accession to the imperial throne; great encouragement hath been given to the protestants, and many of the popish religious houses, convents, &c. were suppressed by him.

ANTIQUITIES AND CURIOSITIES } In describing the mineral and other
NATURAL AND ARTIFICIAL. } springs, I anticipated great part of this article, which is of itself very copious. Every court of Germany produces a cabinet of curiosities, artificial and natural, ancient and modern. The tun at Heidelburgh holds 800 hogsheads, and is generally full of the best Rhenish wine, from which strangers are seldom suffered to retire sober. Vienna itself is a curiosity; for here you see the greatest variety of inhabitants that is to be met with any where, as Greeks, Transylvanians, Scavonians, Turks, Tartars, Hungarians, Croats, Germans, Poles, Spaniards, French, and Italians, in their proper habits. The Imperial library at Vienna is a great literary rarity, on account of its ancient manuscripts. It contains upwards of 80,000 volumes, among which are many valuable manuscripts in Hebrew, Syriac, Arabic, Turkish, Armenian, Coptic, and Chinese; but the antiquity of some of them is questionable, particularly a New Testament in Greek, said to have been written 1500 years ago, in gold letters, upon purple.

Here

Here are likewise many thousand Greek, Roman, and Gothic coins and medals; with a vast collection of other curiosities in art and nature. The vast Gothic palaces, cathedrals, castles, and above all, town-houses in Germany, are very curious; they strike the beholder with an idea of rude magnificence; and sometimes they have an effect that is preferable even to Greek architecture. The chief houses in great cities and villages have the same appearance, probably, as they had 400 years ago; and their fortifications generally consist of a brick wall, trenches filled with water, and bastions or half-moons.

Next to the lakes and waters, the caves and rocks are the chief natural curiosities of Germany. Mention is made of a cave near Blackenburg in Hartz-forest, of which none have yet found the end, though many have advanced into it for 20 miles; but the most remarkable curiosity of that kind is near Hammelen, about 30 miles from Hanover, where at the mouth of a cave stands a monument which commemorates the loss of 130 children who were there swallowed up in 1284. Though this fact is very strongly attested, it has been disputed by some critics. Frequent mention is made of two rocks near Blackenburg, exactly representing two monks in their proper habits; and of many stones which seem to be petrifications of fishes, frogs, trees, and leaves.

COMMERCE AND MANUFACTURES.] Germany has vast advantages in point of commerce, from its situation in the heart of Europe, and perforated as it were with great rivers. Its native materials for commerce (besides the mines and minerals I have already mentioned) are hemp, hops, flax, anise, cummin, tobacco, saffron, madder, truffles, variety of excellent roots and pot-herbs, and fine fruits, equal to those of France and Italy. Germany exports to other countries, corn, tobacco, horses, lean cattle, butter, cheese, honey, wax, wines, linen and woollen yarn, ribands, silk and cotton stuffs, toys, turnery wares in wood, metals, and ivory, goat-skins, wool, timber both for ship-building and houses, cannon and bullets, bombs and bomb shells, iron plates and ~~brasses~~, tinned plates, steel work, copper, brass-wire, porcelain the finest upon earth, earthen-ware, glasses, mirrors, hogs, bristles, mum, beer, tartar, smalts, zaffer, Prussian blue, printer's ink, and many other things. Some think that the balance of trade between England and Germany is to the disadvantage of the former; but others are of a different opinion, as they cannot import coarse woollen manufactures, and several other commodities, so cheap from any other country.

The revocation of the edict of Nantes, by Lewis XIV. which obliged the French protestants to settle in different parts of Europe, was of infinite service to the German manufactures. They now make velvets, silks, stuffs of all kinds, fine and coarse; linen and thread, and every thing necessary for wear, to great perfection. The porcelain of Meissen, in the electorate of Saxony, and its paintings, exceed that of all the world.

TRADING COMPANIES.] The Asiatic company of Embden, established by his present Prussian majesty, was, exclusive of the Hanseatic league, the only commercial company in Germany; but no ships have been sent out since the year 1760. The heavy taxes that his majesty laid on the company, has been the cause of its total annihilation. In the great cities of Germany very large and extensive partnerships in trade subsist.

CONSTITUTION AND GOVERNMENT.] Almost every prince in Germany (and there are about 300 of them) is arbitrary with regard to the government of his own estates; but the whole of them form a great confederacy, governed by political laws, at the head of which is the emperor, and whose

power in the collective body, or the diet, is not directorial, but executive; but even that gives him vast influence. The supreme power in Germany is the diet, which is composed of the emperor, or, in his absence, of his commissary, and of the three colleges of the empire. The first of these is the electoral college; the second is the college of princes; and the third, the college of Imperial towns.

The empire was hereditary under the race of Charlemagne, but after this became elective; and in the beginning, all the princes, nobility, and deputies of cities, enjoyed the privilege of voting. In the reign of Henry V. the chief officers of the empire altered the mode of election, in their own favour. In the year 1239 the number of electors was reduced to seven. One elector was added in 1649, and another in 1692.

The dignity of the empire, though elective, has for some centuries belonged to the house of Austria, as being the most powerful of the German princes; but by French management, upon the death of Charles VI. grandfather, by the mother's side, to the emperor Joseph II, the elector of Bavaria was chosen to that dignity, and died, as it is supposed, heart-broken, after a short uncomfortable reign. The power of the emperor is regulated by the capitulation he signs at his election; and the person, who in his lifetime is chosen king of the Romans, succeeds without a new election to the empire. He can confer titles and enfranchisements upon cities and towns; but as emperor he can levy no taxes, nor make war nor peace without the consent of the diet. When that consent is obtained, every prince must contribute his quota of men and money, as valued in the matriculation roll, though perhaps as an elector or prince, he may espouse a different side from that of the diet. This forms the intricacy of the German constitution; for George II. of England, as elector of Hanover, was obliged to furnish his quota against the house of Austria, and also against the king of Prussia, while he was fighting for them both. The emperor claims a precedency for his ambassadors in all Christian courts.

The nine electors of the empire have each a particular office in the Imperial courts, and they have the sole election of the emperor. They are in order,

First, The archbishop of Mentz, who is high chancellor of the empire when in Germany.

Second, The archbishop of Triers, who is high chancellor of the empire in France.

Third, the archbishop of Cologne, who is the same in Italy.

The king, or rather elector of Bohemia, who is cup-bearer.

The elector of Bavaria, who is grand sewer, or officer who serves out the feasts.

The elector of Saxony, who is the great marshal of the empire.

The elector of Brandenburg (now king of Prussia), who is great chamberlain.

The elector Palatine, who is great steward: and,

The elector of Hanover (king of Great Britain,) who claims the post of arch-treasurer.

It is necessary for the emperor, before he calls a diet, to have the advice of those members; and during the vacancy of the Imperial throne, the electors of Saxony and Bavaria have jurisdiction, the former over the northern, and the latter over the southern circles.

The ecclesiastical princes are as absolute as the temporal ones in their several dominions. The chief of these, besides the three ecclesiastical elec-

tors already mentioned, are the archbishop of Saltzburgh, the bishops of Liege, Munster, Spire, Worms, Wurtzburgh, Straßburgh, Osnaburg, Bamberg, and Paderborn. Besides these, are many other ecclesiastical princes. Germany abounds with many abbots and abbesses, whose jurisdiction are likewise absolute, and some of them very considerable, and all of them are chosen by their several chapters. The chief of the secular princes are the Landgrave of Hesse, the dukes of Brunswick, Wolfenbuttle, Wirtemberg, Mecklenburgh, Saxe-Gotha, the marquises of Baden and Culmbach, with the princes of Nassau, Anhalt, Furstenburg, and many others, who have all high titles, and are sovereigns in their own dominions. The free cities are likewise sovereign states; those which are Imperial, or compose part of the diet, bear the Imperial eagle in their arms; those which are Hanse-towns, of which we have spoken in the Introduction, have still great privileges and immunities, but they subsist no longer as a political body.

The Imperial chamber, and that of Vienna, which is better known by the name of the Aulic-council, are the two supreme courts for determining the great causes of the empire, arising between its respective members. The Imperial council consists of 50 judges or assessors. The president and four of them are appointed by the emperor, and each of the electors chooses one, and the other princes and states the rest. This court is at present held at Wetzelar, but formerly resided at Spire; and causes may be brought before it by appeal. The Aulic-council was originally no better than a revenue court of the dominions of the house of Austria. As that family's power increased, the jurisdiction of the aulic-council was extended; and at last, to the great disgust of the princes of the empire, it usurped upon the powers of the imperial chamber, and even of the diet. It consists of a president, a vice-chancellor, a vice-president, and a certain number of aulic-counsellors, of whom six are protestants, besides other officers, but the emperor in fact is master of the court. These courts follow the ancient laws of the empire for their guides, the golden bull, the pacification of Passau, and the civil law.

Besides these courts of justice, each of the nine circles I have already mentioned has a director to take care of the peace and order of the circle. These directors are commonly as follow: For Westphalia, the bishop of Munster, or duke of Neuburg. For Lower Saxony, the elector of Hanover, or Brandenburg. For Upper Saxony, the elector of Saxony. For the Lower Rhine, the archbishop of Mentz. For the Upper Rhine, the elector Palatine, or bishop of Worms. For Franconia, the bishop of Bamberg, or marquis of Culmbach. For Swabia, the duke of Wirtemberg, or bishop of Constance. For Bavaria, the elector of Bavaria, or archbishop of Saltzburgh; and for Austria, the archduke of Austria, his imperial majesty.

Upon any great emergency, after the votes of the diet are collected, and sentence pronounced; the emperor, by his prerogative, commits the execution of it to a particular prince or princeps, whose troops live at free quarters upon the estates of the delinquent party, and he is obliged to make good all expences; upon the whole, the constitution of the Germanic body is of itself a study of no small difficulty. But however plausibly invented the several checks upon the imperial power may be, it is certain that the house of Austria has more than once endangered the liberties of the empire, and they have been saved by France. Lately, indeed, the house of Austria has met with a powerful opposition from the house of Brandenburg, in consequence

of the activity and abilities of the present king of Prussia. Before I close this head, it may be necessary to inform the reader of the meaning of a term which has of late frequently appeared in the German history, I mean that of the *Pragmatic Sanction*. This is no other than a provision made by the emperor Charles VI. for preserving the indivisibility of the Austrian dominions in the person of the next descendant of the last possessor, whether male or female. This provision has been often disputed by other branches of the house of Austria, who have been occasionally supported by France from political views, though the pragmatic sanction is strongly guaranteed by almost all the powers of Europe. The late emperor, elector of Bavaria, and the late king of Poland, attempted to overthrow it, as being descended from the daughters of the emperor Joseph, elder brother to Charles VI. It has likewise been again and again opposed by the court of Spain.

Few of the territories of the German princes are so large as to be assigned to viceroys, to be oppressed and fleeced at pleasure; nor are they entirely without redress when they suffer any grievance; they may appeal to the general diet or great council of the empire for relief. The subjects of the petty princes, in Germany are generally the most unhappy; for these princes, affecting the grandeur and splendor of the more powerful, in the number and appearance of their officers and domestics, in their palaces, gardens, pictures, curiosities, guards, bands of music, tables, dress, and furniture, are obliged to support all this vain pomp and parade, at the expence of their vassals and dependents. With respect to the burghers and peasants of Germany, the former in many places enjoy great privileges; the latter also, in some parts, as in Franconia, Swabia, and on the Rhine, are generally a free people, or perform only certain services to their superiors, and pay the taxes; whereas in the marquisate of Brandenburg, Pomerania, Lusatia, Moravia, Bohemia, Austria, &c. they may justly be denominated slaves, though in different degrees.

[REVENUES.] The only revenue falling under this head is that of the emperor, who, as such, hath an annual income of about 5 or 6000 pounds sterling, arising from some inconsiderable fiefs in the Black Forest. The Austrian revenues are immense, and are thought to amount to 7,000,000 sterling in Germany and Italy; a sum that goes far in those countries. The father of the late king of Prussia, whose revenues were not near so extensive as those of his son, though he maintained a large army, was so good an economist that he left 7,000,000 sterling in his coffers; and some have thought that Silesia alone brings above half a million sterling every year to this king. To behold the magnificence of many of the German courts, a stranger is apt to conceive very high ideas of the incomes of their princes; which is owing to the high price of money in that country, and consequently the low price of provisions and manufactures. In fact, though it is plain that some princes have much larger revenues than others, yet we cannot speak with any tolerable precision on a subject of such variety and uncertainty, and which comprehends so many independent states.

[MILITARY STRENGTH.] During the two last wars, very little regard was paid in carrying them on, to the ancient German constitutions, the whole management being engrossed by the head of the house of Austria. The elector of Mentz keeps what is called a matriculation book or register, which, among other letters, contains the assessments of men and money, which every prince and state who are members of the empire, is to advance when the army of the empire takes the field. The contributions in money are called Roman months, on account of the monthly assessments, paid to

the

the emperors when they visited Rome. Those assessments, however, are subject to great mutability. It is sufficient here to say, that upon a moderate computation the secular princes of the empire can bring to the field 379,000 men, and the ecclesiastical 74,500, in all 453,500; of those the emperor, as head of the house of Austria, is supposed to furnish 90,000.

The elector of Mentz may maintain	6000
The elector of Trier	6000

The othe princes and imperial towns	50000
The secular princes	379000
The ecclesiastical princes	74500
	453500

By this computation, which is far from being exaggerated, it appears that the emperor and empire form the most powerful government in Europe; and if the whole force was united, and properly directed, Germany would have nothing to fear from any of its ambitious neighbours. But the different interests pursued by the several princes of Germany, render the power of the emperor of little consequence, except with regard to his

own forces, which are indeed very formidable. The imperial army was computed in 1775, to amount to two hundred thousand.

IMPERIAL, ROYAL, AND OTHER } The emperor of Germany pretends
TITLES, ARMS, ORDERS. } to be successor to the emperors of
Rome, and has long, on that account, been admitted to a tacit precedence
on all public occasions among the powers of Europe. Austria is but an arch-
dukedome; nor has he, as the head of that house, a vote in the election of
emperor, which is limited to Bohemia. Innumerable are the titles of prin-
cipalities, dukedoms, baronies, and the like, with which he is vested as arch-
duke. The arms of the empire are a black eagle with two heads, hovering
with expanded wings, in a field of gold; and over the heads of the eagle is
seen the imperial crown. On the breast of the eagle is an escutcheon quar-
terly of eight, for Hungary, Naples, Jerusalem, Arragon, Anjou, Gelders,
Brabant, and Barr. It would be as useless as difficult to enumerate all the
different quarterings and armorial bearings of the archducal family. Every
elector, and indeed every independent prince of any importance in Germany,
claims a right of instituting orders; but the emperors pretend that they are
not admissible unless confirmed by them. The emperors of Germany, as well
as the kings of Spain, confer the order of the Golden Fleece, as descended
from the house of Burgundy. The empress dowager Eleonora in 1662 and
1666, created two orders of ladies, or female knights; and the late empress
queen instituted the order of St. Teresa.

The order of the *Golden Fleece* was instituted at Bruges, in Flanders, on
the 10th of January 1429, by Philip duke of Burgundy, on the day of his
marriage with his third wife. It is supposed that he chose the badge, it be-
ing the chief of the staple manufactures of his country. It at first consisted
of thirty knights, including the sovereign, who were of the first families in the Low
Countries, and it still continues to be classed with the most illustrious orders
of knighthood in Europe. At present there are two branches of it; of the
one, the emperor is sovereign, and the king of Spain of the other; all must
prove their noble descent from the twelfth century. The motto of the order
is "*Pretium non vile laborum.*" The *Teutonic order* owed its origin to some
religious Germans in Jerusalem during the crusades, who assumed the title of
"Teutonic knights, or brethren of the hospital of our Lady of the Germans
of Jerusalem." Conrad duke of Swabia invited them into Prussia about the
year 1230, soon after they conquered Prussia for themselves, and became one
of the most powerful orders in Europe. By the order dividing against itself
they afterwards lost their power and possessions; and Albert marquis of
Brandenburgh, grand-master of the order, on his abjuring popery, abdicat-
ed the grand-mastership, subdued Prussia, and expelled all the papists who
followed not his example. The order is now divided into two branches:
the protestant branch, who have a house at Utrecht, hath been noticed in
our accounts of orders in the Netherlands—that for papists, hath a house
at Mergenheim in Germany, and the members must take the oath of celibacy.
The ensign worn by this branch is worn round the neck, pendent to a
gold chain.

The time of the institution of the "*Order of the Red Eagle*" is uncertain.
The margrave of Bareith is sovereign thereof, and it is generally bestowed on
general officers. In the year 1690, John George, elector of Saxony, and
Frederick III. elector of Brandenburgh, on terminating their disputes, esta-
blished the "*Order of Sincerity*," as a confirmation and security hereafter
of their amity. The knights of this order wear a bracelet of gold; on one side

labours. But
many, render
eger, to his

the names of the two princes, with this device, *Amicit sincere*; on the other side are two armed hands, joined together, and placed on two swords, with two palm branches crossed, with this motto, *Unie pour jamais*.

John George, duke of Saxe Weissenfels, instituted the "*Order of the Noble Passion*," in the year 1704, of which the duke is the sovereign. Each knight of the order is to contribute to the maintenance of the maimed or decayed soldiers in the service of the sovereign. In the year 1709, Louisa Elizabeth, widow of Philip duke of Saxe Merzburg, revived the "*Order of the Death's Head*," first instituted in 1652, by her father the duke of Wirtemberg. A prince of that house alone can be sovereign of it, and none but women of virtue and merit (birth and fortune not regarded) can be received into it. They are to avoid gaming, theatrical amusements, and luxuries of all kinds. The badge of the order is a death's head enamelled white, surmounted with a cross pattée black; above the cross pattée, another cross composed of five jewels, by which it hangs to a black ribband edged with white, and on the ribband these words, *memento mori*, worn at the breast.

The great order of Wirtemberg, is that "*of the Grace*," instituted in the year 1702, by the then duke, and improved in the year 1719. On the left side of the coat is a silver star embroidered, of the same figure as the badge, in the middle of a green circle, with the motto, *Amicitia, Virtutisque Fœdus*. The festival of this order is on St. Hubert's day, he being the patron of sportsmen.

In the year 1709, the elector Palatine revived the "*Order of St. Hubert*," first instituted by a duke of Juliers and Cleves, in memory of a victory, gained by him on St. Hubert's day, in 1447. All the knights have either military employments or pensions. The archbishop of Saltzburgh in 1701, instituted the "*Orders of St. Ruperts*," in honour of the founder and patron of the see he held, and as the apostle of his country. As the archbishop is the richest and most powerful prince of Bavaria next to the elector, his order is in good esteem. In the year 1729, Albert, elector of Bavaria, instituted the "*Order of St. George, the Defender of the Immaculate Conception*." The knights of which are obliged to prove their nobility by father and mother for five generations.

The "*Order of the Golden Lion*," instituted by the present landgrave of Hesse Cassel, is equally a military and civil order, but mostly conferred on general officers. The present landgrave hath also instituted the military "*Order of Merit*," the badge of which, is a gold cross of eight points enamelled white, and in the centre this motto, *Pro Virtus et Fidelitate*; it is worn at the coat button-hole, pendent to a blue riband edged with silver.

[HISTORY.] The manners of the ancient Germans are well described by the elegant and manly pencil of Tacitus, the Roman historian. They were a brave and independent race of men, and particularly distinguished by their love of liberty and arms. They opposed the force of the Roman empire, not in its origin or its decline, but after it had arrived at maturity, and still continued in its full vigour. The country was divided into a number of principalities, independent of each other, though occasionally connected by a military union for defending themselves against such enemies as threatened the liberties of them all. At length the Roman power, connected with artifice, prevailed over a great part of Germany, and it was reduced to the condition of a province. When the Roman empire was shattered by the northern barbarians, Germany was over-run by the Franks about the year 480, and a considerable part of it long remained in subjection to earls and mar-

constitution
den-fesal (dw

marquisses of that nation. In this situation Germany continued, notwithstanding the efforts of particular chieftains, or princes, to reduce the rest into subjection, until the beginning of the ninth century; then it was that Charlemagne, one of those eccentric and superior geniuses who sometimes start up in a barbarous age, first extended his military power, and afterwards his civil authority over the whole of this empire. The posterity of Charlemagne inherited the empire of Germany until the death of Lewis III. in the year 911, at which time the different princes, assuming their original independence, rejected the Carolinian line, and placed Conrade, duke of Franconia, on the throne. Since this time, Germany has ever been considered as an elective monarchy. Princes of different families, according to the prevalence of their interest and arms, have mounted the throne. Of these the most considerable, until the Austrian line acquired the imperial power, were the houses of Saxony, Franconia, and Swabia. The reigns of these emperors contain nothing more remarkable than the contests between them and the popes. From hence, in the beginning of the thirteenth century, arose the factions of the Guelphs and Gibbelines, of which the former was attached to the pope and the latter to the emperor; and both by their violence and iniquity, tended to disquiet the empire for several ages. The emperors too were often at war with the Turks, and sometimes the German princes, as happens in all elective kingdoms, with one another about the succession. But what more deserves the attention of a judicious reader than all those noisy but uninteresting disputes, is the progress of government in Germany, which was in some measure opposite to that of the other kingdoms of Europe. When the empire, raised by Charlemagne, fell asunder, all the different independent princes assumed the right of election; and those now distinguished by the name of electors, had no peculiar or legal influence in appointing a successor to the imperial throne; they were only the officers of the king's household, his secretary, his stewards, chaplain, marshal, or master of his horse, &c. By degrees, as they lived near the king's person, and, like all other princes, had independent territories belonging to them, they increased their influence and authority; and in the reign of Otho III. of the house of Saxony, in the year 984, acquired the sole right of electing the emperor*. Thus, while in other kingdoms of Europe, the dignity of the great lords, who were all originally allodial, or independent barons, was diminished by the power of the king, as in France, and by the influence of the people, as in Great Britain; in Germany, on the other hand, the power of the electors was raised upon the ruins of the emperor's supremacy, and of the people's jurisdiction. Otho I. having, in the year 962, united Italy to the empire of Germany, procured a decree from the clergy that he and his successors should have the power of nominating the pope, and of granting investitures to bishops. Henry V. a weak and wicked prince, in the year 1127, surrendered up the right of investiture and other powers, to the disgrace of the imperial dignity: but pope Benedict XII. refusing abolition to Lewis V. of Bavaria, in 1338, it was declared, in the diet of the empire, that the majority of suffrages of the electoral college should confer the empire without the consent of the pope, that he had no superiority over the emperor, nor any right to reject or to approve of elections. In 1438, Albert II. archduke of Austria, was elected emperor, and the im-

* Wiquefort saith, that nothing was settled as to the number of electors, or the electoral dignity, till Charles IV. who was chosen emperor in 1347, and made that famous constitution for the election of emperors, called the *Golden Bull*, from the emperor's golden-seal (*Bulla*) affixed to it.

perial dignity continued in the male line of that family for three hundred years. One of his successors, Maximilian, married the heiress of Charles duke of Burgundy, whereby Burgundy, and the seventeen provinces of the Netherlands, were annexed to the house of Austria. Charles V. grandson of Maximilian, and heir to the kingdom of Spain, in right of his mother, was elected emperor in the year 1519. Under him Mexico and Peru were conquered by the Spaniards, and in his reign happened the reformation of religion in several parts of Germany, which however was not confirmed by public authority till the year 1648, by the treaty of Westphalia, and in the reign of Ferdinand III. The reign of Charles V. was continually disturbed by his wars with the German princes and the French king Francis I. Though successful in the beginning of his reign, his good fortune toward the conclusion of it began to forsake him; which, with other reasons, occasioned his abdication of the crown.

His brother, Ferdinand I. who, in 1558, succeeded to the throne, proved a moderate prince with regard to religion. He had the address to get his son Maximilian declared king of the Romans in his own lifetime, and died in 1564. By his last will he ordered, that if either his own male issue, or that of his brother Charles, should fail, his Austrian estates should revert to his second daughter Anne, wife to the elector of Bavaria, and her issue.

I mention this destination, as it gave rise to the late opposition made by the house of Bavaria to the pragmatic sanction, in favour of the late empress queen of Hungary, on the death of her father Charles VI. The reign of Maximilian II. was disturbed with internal commotions, and an invasion from the Turks; but he died in peace, in 1576. He was succeeded by his son Rodolph, who was involved in wars with the Hungarians, and in differences with his brother Matthias, to whom he ceded Hungary and Austria in his life-time. He was succeeded in the empire by Matthias, under whom the reformers, who went under the names of Lutherans and Calvinists, were so much divided among themselves, as to threaten the empire with a civil war. The ambition of Matthias at last reconciled them; but the Bohemians revolted, and threw the imperial commissaries out of a window at Prague. This gave rise to a ruinous war, which lasted thirty years. Matthias thought to have exterminated both parties; but they formed a confederacy, called the *Evangelic League*, which was counterbalanced by a *Catholic League*.

Matthias dying in 1618, was succeeded by his cousin Ferdinand II. but the Bohemians offered their crown to Frederic the elector Palatine, the most powerful protestant prince in Germany, and son-in-law to his Britannic majesty, James I. That prince was incautious enough to accept of the crown; but he lost it, being entirely defeated by the duke of Bavaria and the imperial generals, at the battle of Prague: and he was also deprived of his own electorate, the best part of which was given to the duke of Bavaria. The protestant princes of Germany, however, had among them at this time many able commanders, who were at the head of armies, and continued the war with great firmness and intrepidity; among them were the margrave of Baden Dourlach; Christian duke of Brunswick, and count Mansfield; the last was one of the best generals of the age. Christian IV. king of Denmark, declared for them; and Richelieu, the French minister, was not fond of seeing the house of Austria aggrandised. The emperor, on the other hand, had excellent generals; and Christian having put himself at the head of the evangelical league, was defeated by Tilly, an imperialist of great reputation in war. Ferdinand made such a use of his advantages obtained over the protestants, that they formed a fresh confederacy at Leipzig, of which the celebrated Gustavus Adolphus, king of Sweden, was at the head. I have already described his a-

mazing victories and progress, till he was killed at the battle of Lutzen, in 1632. But the protestant cause did not die with him. He had brought up a set of heroes such as the dukes of Saxe Weimar, Torstenson, Banier, and others, who shook the Austrian power, till, under the mediation of Sweden, a general peace was concluded among all the powers at war, at Munster, in the year 1648; which forms the basis of the present political system of Europe.

Ferdinand II. died in 1637, and was succeeded by his son Ferdinand III. who died 1657, and was succeeded by the emperor Leopold, a severe unamiable, and not very fortunate prince. He had two great powers to contend with; France on the one side, and the Turks on the other; and was a loser in his war with both. France took from him Alsace, and many other frontier places of the empire; and the Turks would have taken Vienna, had not the siege been raised by John Sobieski, king of Poland. Prince Eugene, of Savoy, was a young adventurer in arms about the year 1697; being one of the imperial generals, gave the Turks the first checks they received in Hungary, and by the peace of Carlowitz in 1699, Transylvania was ceded to the emperor. The empire, however, could not have withstood the power of France, had not the prince of Orange, afterwards king William III. of England, laid the foundation of the grand confederacy against the French power, the consequences of which have been already described. The Hungarians, secretly encouraged by the French, and exasperated by the unfeeling tyranny of Leopold, were still in arms, under the protection of the Porte or Turks, when that prince died in 1705.

He was succeeded by his son Joseph, who put the electors of Cologne and Bavaria to the ban of the empire; but being very ill served by prince Lewis of Baden, the general of the empire, the French partly recovered their affairs, notwithstanding their repeated defeats. The duke of Marlborough, though he obtained very splendid victories, had not all the success he expected or deserved. Joseph himself was suspected of a design to subvert the Germanic liberties; and it was plain, by his conduct, that he expected England should take the labouring oar in the war, which was chiefly carried on for his benefit. The English were disgusted at his slowness and selfishness; but he died in 1711, before he had reduced the Hungarians; and leaving no male issue, was succeeded in the empire by his brother Charles VI. whom the allies were endeavouring to place on the throne of Spain, in opposition to Philip duke of Anjou, grandson to Lewis XIV.

When the peace of Utrecht took place in 1713, Charles at first made a show as if he would continue the war; but found himself unable, now that he was forsaken by the English. He therefore was obliged to conclude a peace with France at Baden, in 1714, that he might attend the progress of the Turks in Hungary, where they received a total defeat from prince Eugene, at the battle of Peterwaradin. They received another of equal importance from the same general in 1717, before Belgrade, which fell into the hands of the imperialists; and next year the peace of Passarowitz, between them and the Turks, was concluded. Charles employed every minute of his leisure in making arrangements for increasing and preserving his hereditary dominions in Italy and the Mediterranean. Happily for him, the crown of Britain devolved to the house of Hanover; an event which gave him a very decisive weight in Europe, by the connections between George I. and II. in the empire. Charles was sensible of this, and carried matters with so high a hand, that about the years 1724 and 1725, a breach ensued between him and George I.; and so unsteady was the system of affairs all

over Europe at that time, that the capital powers often changed their old alliances, and concluded new ones, contradictory to their interest. Without entering into particulars, it is sufficient to observe, that the safety of Hanover, and its aggrandisement, was the main object of the British court; as that of the emperor was the establishment of the pragmatic sanction, in favour of his daughter, the late empress-queen, he having no male issue. Mutual concessions upon those great points restored a good understanding between George II. and the emperor Charles; and the elector of Saxony, being prevailed upon by the prospect of gaining the throne of Poland, relinquished the great claims he had upon the Austrian succession.

The emperor, after this, had very bad success in a war he entered into with the Turks, which he had undertaken chiefly to indemnify himself for the great sacrifices he had made in Italy to the princes of the house of Bourbon. Prince Eugene was then dead, and he had no general to supply his place. The system of France under cardinal Fleury, happened at that time to be pacific, and she obtained for him, from the Turks, a better peace than he had reason to expect. Charles, to keep the German and other European powers easy, had, before his death, given his eldest daughter, the late empress-queen, in marriage to the duke of Lorraine, a prince who could bring no accession of power to the Austrian family. Charles died in 1740.

He was no sooner in the grave, than all he had so long laboured for must have been overthrown, had it not been for the firmness of George II. The pragmatic sanction was attacked on all hands. The young king of Prussia, with a powerful army entered, and conquered Silesia, which he said had been wrongfully dismembered from his family. The king of Spain and the elector of Bavaria set up claims directly incompatible with the pragmatic sanction and in this they were joined by France; though all those powers had solemnly guaranteed it. The imperial throne, after a considerable vacancy, was filled up by the elector of Bavaria, who took the title of Charles VII. in January 1742. The French poured their armies into Bohemia, where they took Prague; and the queen of Hungary, to take off the weight of Prussia, was forced to cede to that prince the most valuable part of the duchy of Silesia by a formal treaty.

Her youth, her beauty, and sufferings, and the noble fortitude with which she bore them, touched the hearts of the Hungarians, into whose arms she threw herself and her little son; and though they had been always remarkable for their disaffection to the house of Austria, they declared unanimously in her favour. Her generals drove the French out of Bohemia; and George II. at the head of an English and Hanoverian army, gained the battle of Dettingen in 1743. Charles VII. was at this time miserable on the imperial throne, and driven out of his electoral dominions, as had been his ancestor in queen Anne's reign, for siding with France, and would have given the queen of Hungary almost her own terms; but she haughtily and impolitely rejected all accommodation, though advised to it by his Britannic majesty, her best, and indeed only friend. This obstinacy gave a colour for the king of Prussia to invade Bohemia, under pretence of supporting the imperial dignity: but though he took Prague, and subdued the greatest part of the kingdom, he was not supported by the French; upon which he abandoned all his conquests, and retired to Silesia. This event confirmed the obstinacy of the queen of Hungary, who came to an accommodation with the emperor, that she might recover Silesia. Soon after, his imperial majesty, in the beginning of the year 1745, died; and the duke of Lorraine,

then grand-duke of Tuscany, consort to her Hungariau majesty, after surmounting some difficulties, was chosen emperor, by the title of Francis I.

The bad success of the allies against the French and Bavarians in the Low Countries, and the loss of the battle of Fontenoy, retarded the operations of the empress-queen against his Prussian majesty. The latter beat the emperor's brother, prince Charles of Lorraine, who had before driven the Prussians out of Bohemia; and the conduct of the empress-queen was such, that his Britannic majesty thought proper to guarantee to him the possession of Silesia, as ceded by treaty. Soon after, his Prussian majesty pretended that he had discovered a secret convention which had been entered into between the empress-queen, the empress of Russia, and the king of Poland, as elector of Saxony, to strip him of his dominions, and to divide them amongst themselves. Upon this his Prussian majesty, all of a sudden, drove the king of Poland out of Saxony, defeated his troops, and took possession of Dresden; which he held till a treaty was made under the mediation of his Britannic majesty, by which the king of Prussia acknowledged the duke of Lorraine, now become great-duke of Tuscany, for emperor. The war continued in the Low Countries, not only to the disadvantage, but to the discredit of the Austrians and Dutch, till it was finished by the treaty of Aix-la-Chapelle, in April 1748. By that treaty, Silesia was once more guaranteed to the king of Prussia. It was not long before that monarch's jealousies were renewed and verified; and the empress of Russia's views falling in with those of the empress-queen and the king of Poland, who were unnaturally supported by France in their new schemes, a fresh war was kindled in the empire, in the year 1756. The king of Prussia declared against the admission of the Russians into Germany, and his Britannic majesty against that of the French. Upon those two principles all former differences between these monarchs were forgotten, and the British parliament agreed to pay an annual subsidy of 670,000*l.* to his Prussian majesty during the continuance of the war, the flames of which were now rekindled with more fury than ever.

His Prussian majesty once more broke into Saxony, defeated the Imperial general Brown at the battle of Lowositz, forced the Saxons to lay down their arms, though almost impregably fortified at Pirna, and the elector of Saxony again fled to his regal dominions in Poland. After this, his Prussian majesty was put to the ban of the empire; and the French poured, by one quarter, their armies, as the Russians did by another, into Germany. The conduct of his Prussian majesty on this occasion is the most amazing that is to be met with in history. He broke once more into Bohemia with inconceivable rapidity, and defeated an army of 100,000 Austrians, under general Brown, who was killed, as the brave marshal Schwerin was on the side of the Prussians. He then besieged Prague, and plied it with a most tremendous artillery; but just as he was beginning to imagine that his troops were invincible, they were defeated at Colin, by the Austrian general Daun, obliged to raise the siege, and to fall back upon Eisenach. The operations of the war now multiplied every day. The Imperialists, under count Daun, were formed into excellent troops; but they were beaten at the battle of Lissa, and the Prussians took Breslau, and obtained many other great advantages. The Russians, after entering Germany, gave a new turn to the aspect of the war; and the cautious, yet enterprising genius of count Daun, laid his Prussian majesty under infinite difficulties, notwithstanding all his amazing victories. At first he defeated the Russians at Zorndorf; but an attack made upon his army, in the night time, by count Daun at Hoch-

kirchen, had almost proved fatal to his affairs, though he retrieved them with admirable presence of mind. He was obliged, however, to sacrifice Saxony, for the safety of Silesia; and it has been observed, that few periods of history afford such room for reflection as this campaign did; six sieges were raised almost at the same time; that of Colberg, by the Russians; that of Leipzig, by the duke of Deux Ponts, who commanded the army of the empire; that of Dresden, by Daun; and those of Neiss, Cosel, and Torgau, also by the Austrians.

Brevity obliges me to omit many capital scenes which passed at the same time in Germany, between the French, who were driven out of Hanover, and the English, or their allies. The operations on both sides are of little importance to history, because nothing was done that was decisive, though extremely burdesome and bloody to Great Britain. Great was the ingratitude of the empress-queen to his Britannic majesty, and his allies, who were now daily threatened with the ban of the empire. The Russians had taken possession of the kingdom of Prussia, and laid siege to Colberg, the only port of his Prussian majesty in the Baltic. Till then, he had entertained too mean an opinion of the Russians; but he soon found them by far the most formidable enemies he had, advancing under count Soltikoff, in a body of 100,000 men, to Silesia. In this distress he acted with a courage and resolution that bordered upon despair; but was, at last, totally defeated by the Russians, with the loss of 20,000 of his best men, in a battle near Franzenfort. He became now the tennis-ball of fortune. Succeeding defeats seemed to announce his ruin, and all avenues towards peace were shut up. He had lost, since the first of October 1756, the great marshal Keith, and forty brave generals, besides those who were wounded and made prisoners. At Landshut, the Imperial general, Laudohn, defeated his army under Fouquet, on which he had great dependence, and thereby opened to the Austrians a ready gate into Silesia. None but his Prussian majesty would have thought of continuing the war under such repeated losses; but every defeat he received seemed to give him fresh spirits. It is not perhaps very easy to account for the inactivity of his enemies after his defeat near Frankfort, but by the jealousy which the Imperial generals entertained of their Russian allies. They had taken Berlin, and laid the inhabitants under pecuniary contributions; but towards the end of the campaign, he defeated the imperialists in the battle of Torgau, in which count Daun was wounded. This was the best fought action the king of Prussia had ever been engaged in, but it cost him 10,000 of his best troops, and was attended with no great consequence in his favour. New reinforcements which arrived every day from Russia, the taking of Colberg by the Russians, and of Schweidnitz by the Austrians, seemed almost to have completed his ruin, when his most formidable enemy, the empress of Russia, died, January 5, 1762; George II. had died on the 25th of October, 1760.

The deaths of those illustrious personages were followed by great consequences. The British ministry of George III. were solicitous to put an end to the war, and the new emperor of Russia recalled his armies.—His Prussian majesty was, notwithstanding, so very much reduced by his losses, that the empress-queen, probably, would have completed his destruction, had it not been for the wise backwardness of the other German princes, not to annihilate the house of Brandenburg. At first the empress-queen rejected all terms proposed her, and ordered 30,000 men to be added to her armies. The visible backwardness of her generals to execute her orders, and the successes obtained by his Prussian majesty, at last prevailed upon her to agree to

an armistice, which was soon followed by the treaty of Hubertsburg, February 15, 1763, which again secured to his Prussian majesty the possession of Silesia.

Upon the death of the emperor, her husband, in 1765, her son Joseph, who had been crowned king of the Romans in 1764, succeeded him in the empire. Soon after his accession, he discovered great talents for government, and for partitioning other countries. He joined in the dismemberment of Poland, with Russia and Prussia. He paid a visit incognito, and with moderate attendants, to Rome, and the principal courts of Italy; and had a personal interview with his Prussian majesty, though this did not prevent hostilities, from being commenced between Austria and Prussia, on account of the succession to the throne of Bavaria. The Austrian claims on this occasion were very unjust, but in the support of them, while the contest continued, the emperor displayed great military skill. Though vast armies were brought into the field on both sides, no action happened of much importance, and an accommodation at length took place. After this event, the emperor was much better employed than in the operations of war, except in his late demands on the Dutch for the free navigation of the Scheldt, &c. contrary to the stipulation of former treaties; in observance of which, to support his ancestors, the Dutch as well as English spent many millions of money, and sacrificed thousands of souls. He endeavoured, however, to promote the happiness of his subjects, granted a most liberal religious toleration, and suppressed most of the religious orders of both sexes as being utterly useless and even pernicious to society; and in 1783, by an edict, abolished the remains of servitude and villanage, and fixed also the fees of the lawyers at a moderate amount, granting them a pension in lieu. He also abolished the use of torture in his hereditary dominions, and removed many of the grievances under which the peasants and common people laboured. He was a prince of a philosophical turn of mind, and mixed with his subjects with an ease and affability that are very uncommon in persons of his rank. He loved the conversation of ingenious men, and appeared solicitous to cultivate that extensive knowledge, which ennobles those who adorn the elevated station to which he had been raised.

Peter-Leopold, grand duke of Tuscany succeeded his brother Joseph II. and engaged the public praise by repeated instances of moderation and solid principles. His former management of his Italian sovereignty, which was prudent and beneficent, shewed that he aspired to truer reputation, than can be acquired by the mere splendours of royalty.—One of the bishops of Hungary, having refused his licence to a catholic subject to marry a protestant woman, the emperor dismissed him from his see; but pardoned him afterwards upon concession, and desired the bishop to exhort his brethren to comply with the imperial ordinances, else no favour should be shewn.

No sovereign could succeed to a throne at a more difficult crisis, than that in which Leopold II. was invested with the imperial purple. By the temerity of his predecessor he found himself involved in a distant and unprofitable war; while the most flourishing part of his hereditary dominions appeared for ever alienated from the house of Austria. The emperor Joseph II. had by his unnecessary innovation in the church excited the highest discontents among his Flemish subjects, who are strongly attached to their religion. What was effected by violence was enforced by severity. The unrelenting persecution to which all the opponents of Joseph were exposed had depopulated the country by continued emigrations. The exiles in the mean time preserved a strict correspondence with each other; they had their agents

in every part of Brabant and Flanders, and it is generally supposed we are destitute of foreign support. On different parts of the Austrian frontier, they repeatedly attempted to collect their scattered forces, and were as constantly dispersed. It was not till the latter end of 1789 that they were able to take effectual measures. Then as if by magic an army of 40,000 men appeared in an instant of time, and over-ran the whole of Austrian Flanders. It was in vain that the emperor Joseph threatened, in vain he held forth the most flattering and conciliatory language, in vain offered to restore their ancient constitution, and even to endow them with additional privileges. In this inauspicious crisis did Leopold ascend the throne of his ancestors. That prince less heated with the rage of innovation than his unfortunate predecessor, was able clearly to discern that his real interest no longer consisted in reaping barren laurels in the unprofitable contest with the Ottomans, but in conciliating or reducing his revolted subjects, and in attending to the actual peace and prosperity of his extensive hereditary dominions. It was even said that the unfortunate Joseph when humbled and subdued by the approach of death, expressed the deepest contrition for his imprudent conduct, and recommended to his successor in the strongest terms, the adoption of pacific measures with his Flemish subjects. One of the first steps therefore of Leopold, was to issue a conciliatory proclamation, inviting the revolted provinces to return to their allegiance, pledging himself for the restoration of their civil and ecclesiastical constitutions, and promising a complete redress of every grievance. While such were his proceedings in public he did not neglect to treat in private with the leaders of the two parties. Whether successful or not in gaining them to his interests, one effect was certain to follow this mode of negotiation; it was certain to increase that distrust and disunion, which already existed; each party in fact considered and represented the other as sold and devoted to the views of Austria.

Not trusting, however, entirely to the effects of this negotiation, nor to the disunion which prevailed in the provinces themselves, the emperor began to withdraw his troops from the Ottoman frontiers, and prepared to subdue the insurgents by vigorous measures. General Bender being supplied with a reinforcement of fresh troops prepared to renew the war with activity and vigour; the insurgents being decoyed into a pass, were there defeated with great slaughter; and Leopold at the commencement of the year 1791 had the satisfaction to see himself completely master of the Austrian Netherlands.

The conference at Pilnitz, between the emperor, the king of Prussia, and the elector of Saxony, is the most memorable event since the peace with Turkey.

A proportional diminution of the forces of Austria and Prussia; the exchange of the Netherlands for Bavaria, the secularization of many German bishoprics, are some of the articles mentioned. A more probable object was to establish an alliance between the above powers for mutual defence, and for the preservation of the peace of Germany.

The emperor was one of the crowned heads, who alarmed by the proceedings of the democratic party of France resolved to take up arms against them. He was however taken away by death from the calamities and wars which were about to desolate Europe, and was succeeded by his son Francis, who was raised to the Imperial throne in the middle of July following. The politics of the court of Vienna underwent no change by the death of Leopold; his successor Francis continuing as strong an enemy to the French revolution as his father. He shortly afterwards together with the king of Prussia

Prussia declared war against them. The events of this war various and fluctuating, chequered sometimes by victories, generally disastrous, its unfortunate issue and the disgraceful peace concluded by the emperor have been related under France. The preliminaries were signed 18th of April 1797, and a congress was appointed shortly afterwards at Rastadt, it is not possible in our narrow limits to relate the progress of the tedious negotiation which followed, to point out the intrigues of the regicidal agents, the unprincipled, insatiable ambition, the duplicity and artful policy of those crafty tyrants who oppress France; to expose to view this "theatre of Gallic triumph and German degradation," to stigmatise that mean, cringing spirit, that wayward, selfish policy, which governed the councils of Germany, and other sovereign states of Europe; to mark with infamy the total want of all magnanimity, of all honourable pride, as independent nations; to point out the pernicious tendency of that irresolution and timidity, which instead of rejecting with indignation and scorn the insolent demands of the regicides, made the potentates of Europe strive together in "a wretched rivalry of degradation," and humble themselves to France, their inveterate, irreconcilable and determined foe.

While such was the weakness of the Imperial ministers, the French gained all those ends for the attainment of which they assumed for a time the mask of moderation, and insidiously protracted the conferences for peace. Their requisitions at home had so far succeeded as to supply a reinforcement of eighty thousand men for their armies, they had dethroned two monarchs, plundered their territories, and thus acquired the means of renewing the war; they had consolidated their power in Italy, stripped Switzerland, and nearly levied an army of eighteen thousand Swiss; they had reduced the important forests of Ehrenbreitstein, and opened for themselves a way into the heart of Germany. Having completed all these preparatory means, the French at last threw off the mask, and stimulated by a desire of crushing the Austrians, before their allies the Russians, could co-operate with them, and by the necessity of providing for their armies, by the plunder of foreign countries, commenced hostilities both in Germany and Italy, before the armistice was declared to be at an end. They expected by this treacherous proceeding to take the Austrians unawares, to overrun the country between the Rhine and the Danube, to excite by means of their emissaries, mutiny among the Imperial troops, insurrection among the peasantry, and then, pushing forward, to drive the archduke to the very walls of Vienna, and so to intimidate the emperor as to make him listen to the evil counsels of the enemies of his worthy minister Thugot, and to sacrifice the honour and safety of his crown and people, to a pusillanimous desire for peace. But, happily for the German empire, and for the whole civilized world, the heroic conduct of prince Charles, and the intrepidity of his troops, have averted the impending calamity, and triumphing over every obstacle, have overwhelmed their treacherous foes with disgrace.

In the country of the Grisons the French surprised a strong body of Austrians, and after a desperate resistance took them all prisoners together with Aussenburgh and the whole of his staff. In order, however, to complete their plan, which was to effect a junction of their two armies, that of Massena in Switzerland, with that of Jourdan in Germany, it was necessary to carry the important post of Feldkirch, which was occupied by the Austrian general Hotze, whose line extended from the frontiers of the Grisons, to the North-east, by the Vocaberg, to the eastern extremity of the lake of Constance. Being vigorously repulsed in his first attack, Massena, regardless, as usual,

usual, of the lives of men, renewed it five different times, with fresh forces and increased impetuosity. But all could not avail against the steady valour of the Austrians, who drove back the assailants with immense slaughter.

The French, however, being in possession of the country of the Grisons, the invasion of the Engadine and the county of Bormio, by a division of the army of Italy, cantoned in the Valteline, under the orders of general Casabianca was facilitated. The Austrians, too weak in that quarter to resist them, retreated into the Tyrol, whither they were pursued by the French, who, with considerable loss, forced some of the passes, by which the entrance of that country was defended, and extended their destructive incursions as far as Glurenz and Vauders. Meanwhile, the van-guard of the main army of the Imperialists, pushed forward to meet the enemy, and on the 21st. of March attacked the centre of Jourdan's army, which it compelled to retreat from Sulgau to Engen, a distance of about twelve leagues. The French then occupied the line from Schaffhausen through Engen to Dutlingen; and on the approach of the Austrians, Jourdan attacked them with his whole force on the 25th, but after gaining some advantage on his left wing, was completely defeated in his right and in his centre, and compelled to retreat with precipitation.

These successes were followed by others still more brilliant, and the enemy were compelled to retire with precipitation from the victorious Austrians. The accounts received are not sufficiently clear to enable us to state with accuracy either the loss of the French, in these different actions, or the situations of their respective armies, subsequent to their defeat. To rate the number of killed, wounded, and taken at thirty thousand men, would, as far as we can judge from the documents before us, be no exaggeration. But the good consequences resulting from the success of these first operations, in inspiring the enemies of the French with confidence, and in filling the minds of their own troops with dismay, are incalculable; every attempt to appreciate the influence, which it is calculated to have on the general affairs of Europe, would at this moment be in vain. What will be the final event of the contest no man can presume to determine; but the late brilliant successes of the combined powers, of Suwarrow in Italy, and the archduke Charles in Germany, render it probable that the enemy may be expelled from most of the countries, which they have plundered and oppressed; an event to which, every friend of social order looks with anxious expectation, and with lively hope, as a prelude to that wished for period, when Europe will be freed from the continuous apprehension of rapine, atheism, and anarchy.

Joseph Benedict Augustus, emperor of Germany, was born in 1741, crowned king of the Romans in 1764, succeeded his father as emperor in 1765, married the same year the princess Josephina Maria, of Bavaria, who died in 1767. He had by his first wife (the princess of Parma) a daughter, Theresa-Elizabeth, born in 1762, but she is dead and the emperor had no issue by his last consort.

Peter-Leopold, the late emperor, succeeded his brother as king of Hungary and Bohemia, on Feb. 19, 1790, and was crowned king of the Romans on the 30th of Sept. following. He was born May 5, 1747; married Feb. 16, 1765, Maria Louisa of Spain, and died March 17, 1792, not without suspicion of poison. His empress died the 13th of May following.

Francis-Joseph-Charles, emperor of Germany, and grand duke of Tuscany. He was born Feb. 3, 1768; married Jan. 6, 1788, Elizabeth, princess

cess of Wertemberg, who died 1790. He married adly, Sept. 17, 1790, Maria Theresia of Naples; his cousin.

On the death of his father Peter-Leopold, late emperor, March 1st. 1792, he succeeded to the crown of Hungary and Bohemia, and July 14, 1792, was elected emperor of Germany.

He had no issue by his first marriage. By the latter he has two daughters Maria Theresia, born Dec. 12, 1791.

The late emperor Peter-Leopold had 15 children, the eldest of whom is the present emperor; the others are,

Ferdinand-Joseph, born May 5, 1769; married Sept. 17, 1790, Maria-Amelia of Naples.

Charles Lewis, born Sept. 3, 1771.

Alexander-Leopold-Joseph, born Aug. 1, 1772.

Maximilian, born Dec. 23, 1774, died May 9, 1778.

Joseph-Anthony, born May 9, 1776.

Anthony-Victor, born Aug. 31, 1779.

A son, born Jan. 20, 1782.

Regnier-Jerom, born Sept. 30, 1783.

Theresa-Josepha-Charlotta-Jane, born Jan. 14, 1767.

Maria, born Jan. 14, 1767; married Oct. 18, 1787; Anthony brother to the elector of Saxony.

Mary Ann-Ferdinanda-Josepha, born April 21, 1770.

Mary-Clementina-Josepha; born April 24, 1777; married Sept. 1790.

Francis-Jannarius prince royal of Naples. Has issue, Nov. 1798; a son.

Maria-Josepha-Theresa, born Oct. 15, 1780.

A princess, born Oct. 22, 1784.

Maria-Antonietta, born and died in 1786.

The late emperor has living two sisters, and one brother *unmarried*. Those married are,

Maria-Christiana-Josepha, born May 13, 1742; married April 8, 1766, to prince Albert of Saxony. Died 24 June 1798.

Maria-Amelia-Josepha, born Feb. 26, 1746; married to the reigning duke of Parma, June 27, 1769.

Mary-Caroline-Louisa, born Aug. 13, 1752; married April 7, 1768, to the king of the Two Sicilies.

Ferdinand-Ch.-Antonine, born June 1, 1754; married to the princess Maria-Beatrice of Modena, and has issue.

Maria-Antonietta, born Nov. 2, 1755; married to Lewis XVI. the late unfortunate king of the French, murdered, Oct. 1793.

ELECTORS.] Three Ecclesiastical Electors, called Electoral Highnesses; and five secular ones, most Serene Electoral Highnesses.

ECCLESIASTICAL ELECTORS.] 1. Frederic-Charles-Joseph, baron of Erthal, archbishop and elector of Mentz, born July 18, 1774.

2. Prince Clement of Saxony (son of Aug. III, king of Poland) born Sept. 28, 1739, archbishop and elector of Treves, Feb. 10, 1768, also bishop of Trefingen and Augsburg, by dispensation from the pope.

3. Maximilian-Francis; brother to the late emperor, grand master of the Teutonic order, archbishop and elector of Cologne, and bishop of Munster, born Dec. 18, 1756.

SECULAR ELECTORS.] 1. Francis-Joseph-Charles, emperor of Germany, king of Hungary, Bohemia, &c. born Feb. 2, 1758.

2. Frederic-Augustus IV. elector and duke of Saxony, born Dec. 23, 1750; married Jan. 17, 1769, to the princess Amelia-Augusta, de Deux Ponts.

4 E

3. Charles

- 3. Charles-Frederic, elector and marquis of Brandenburg.
 - 4. The prince of Deux Ponts, elector Palatine, &c.
 - 5. George III. king of Great Britain, elector of Hanover, &c.
- SAXE-COBURG.]** Ernest Lewis, duke of, nephew to the late prince of dowager of Wales, born Jan. 30, 1745; married May 21, 1769, to Maria Charlotte of Saxe-Meningen, by whom he has,
- 1. Ernest, born Feb. 27, 1770.
 - 2. Emilius-Leopold, born Nov. 24, 1772.
- His brother Augustus, born Aug. 14, 1747.

MECKLENBURGH.] The house of Mecklenburgh is divided into two branches, viz.

1. Mecklenburgh Schwerin—Frederic, reigning duke, born Nov. 9, 1717; married in 1746, Louisa Fræderica, daughter of Frederic Louis, hereditary prince of Wertemburg Stutgard, born Feb. 3, 1722; they have no issue—Issue of the late Prince Louis, by the princess Charlotte Sophia, of Saxe-Coburg-Saellfield.

Frederic-Francis, born Dec. 10, 1756.
Princess Ulrica Sophia, sister to the reigning duke, born July 1, 1723, governess of the convent of Ruhnè.

II. Mecklenburgh Strelitz.—Adolphus-Frederic, reigning duke (knight of the garter), born May 5, 1738.—His brothers and sisters are,

- 1. Charles Lewis Frederic, a Lieut. general in the Hanoverian service, born Oct. 10, 1741; married Sept. 18, 1768, to Frederica-Charlotte-Louisa, of Hesse-Darmstadt, by whom he had issue,
 - 1. Carolina-Georgina-Louisa-Frederica, born Nov. 17, 1769.
 - 2. Theresia-Matilda-Amelia, born April 5, 1778.
 - 3. Ernest-Gotlob-Albert, major-general in the Hanoverian service and governor of Zell, born Aug. 7, 1742.
 - 4. Christiana Sophia-Albertina, born Dec. 6, 1735, died 1794.
 - 5. Charlotte, queen consort of Great Britain, born May 19, 1744; married Sept. 8, 1761; crowned Sept. 22, 1761;

THE KINGDOM OF PRUSSIA, FORMERLY DUCAL PRUSSIA.

Lat 52°-40—55°-50 N.
Long. 16°-00—to 23°-23° E.

Containing 22,154 square miles, with 67 inhabitants in each.—The whole dominions 60,000 square miles, with 104 inhabitants to each.

SITUATION, BOUNDARIES, AND EXTENT. } **T**HIS country is bounded to the North by part of Samogitia; to the South, by Poland Proper and Masovia; to the East, by part of Lithuania; and to the West, by Polish Prussia and the Baltic. Its greatest length is about 160 miles, and breadth about 112.

NAME, AIR, SOIL, PRODUCE, AND RIVERS. } The name of Prussia is probably derived from the Borussi, the ancient inhabitants of the country. The air, upon the whole, is wholesome, and the soil fruitful in corn and other commodities, and affords plenty of pit-coal and fuel. Its animal productions are horses, sheep, deer, and game, wild boars, and foxes. Its rivers and lakes are well stored with fishes; and amber, which is thought to be formed of an oil coagulated with vitriol, is found on its coasts towards the Baltic. The woods furnish the inhabitants with wax, honey, and pitch, besides quantities of pot-ashes. The rivers here sometimes do damage by inundations, and the principal are, the Vistula, the Pregel, the Memel or Mummel, the Oder, and the Elbe.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS, } As Prussia, since the beginning of the present century has become a most respectable power upon the continent of Europe, I shall for the information of my readers, deviate from my usual plan, that I may bring before their eyes the whole of his Prussian majesty's territories, which lie scattered in other divisions of Germany, Poland, Switzerland, and the northern kingdoms, with their names; all which they will find in the following table:

Protestants.	Countries Names.	Square Miles.	Length.	Breadth.	Chief Cities
Poland.	Ducal Prussia	9,950	160	114	Königsberg 54 43 N. Lat. 21-35 E. Lon.
	Royal Prussia	6,400	118	104	Eibing
Up. Sax.	Brandenburg	10,910	215	110	Berlin
	Pomerania	4,810	150	63	Camin
Lo. Sax.	Swed Pomerania	2,991	90	48	Stetin
	Magdeburg	1,535	63	50	Magdeburgh
Bohemia.	Halberstat	450	43	17	Halberstat
	Glatz	350	38	23	Glatz
Minden	Silesia	10,000	196	92	Breslaw
	Minden	595	42	26	Minden
Westphalia.	Ravensberg	525	39	34	Ravensburg
	Lingen	120	15	11	Lingen
Cleve	Cleve	630	43	21	Cleve
	Meurs	35	10	6	Meurs

	Gulich	528	44	24	Gulich
Netherlands.	Tecklenburg	36	12	6	Tecklenburg
	Gelder	360	34	23	Gelders
Switzerland.	Neufchatel	320	32	20	Neufchatel
	Total	51,281			

Besides a great part of Silesia, which the present king of Prussia under various pretences has wrested from Austria; availing himself also of the internal troubles in Poland, he has, by virtue of no other right than that which a powerful army confers on every tyrant, seized upon Thorn, with the countries on the Vistula, and the Neister, and other territories contiguous to his own dominions, close to the walls of Dantzic. These acquisitions may be traced in the map.

I shall here confine myself to Prussia as a kingdom, because his Prussian majesty's other dominions fall under the description of the countries where they lie.

The inhabitants of this kingdom alone, were, by Dr. Busching, computed to amount to 635,998 persons capable of bearing arms: and if so (some greatly doubt that this computation is exaggerated) it must then be more populous than is generally imagined. Since the year 1719, it is computed that about 34,000 colonists have removed thither from France, Switzerland, and Germany; of which number 17,000 were Saltzburghers. These emigrants have built 400 small villages, 11 towns, 86 seats, and 50 new churches; and have founded 1000 village schools, chiefly in that part of the country named Little Lithuania.

The manners of the inhabitants differ but little from those of the other inhabitants of Germany. The same may be said of their customs and diversions.

RELIGION, SCHOOLS, } The religion of Prussia is very tolerant. The AND ACADEMIES. } established religions are those of the Lutherans and Calvinists, but chiefly the former; but papists, antipedo-baptists, and almost all other sects, are here tolerated. The country, as well as the towns,

abounds in schools. An university was founded at Königsberg in 1544; but we know of no very remarkable learned men that it has produced.

The kingdom of Prussia is divided into the German and Lithuanian departments; the former of which contains 60 parishes, and the latter 107. Königsberg, the capital of the whole kingdom, seated on the river Pregel, over which it has seven bridges, is about 64 miles from Dantzick. According to Dru-Busching, this city is seven miles in circumference, and contains three thousand eight hundred houses, and about sixty thousand inhabitants. This computation is a little exaggerated, because it supposes at an average, near 16 persons in every house. Königsberg has ever made a considerable figure in commerce and shipping, its river being navigable for ships of which 499 foreign ones arrived here in the year 1752, besides 298 coasters; and 373 boats of timber were, in the compass of that year, brought down the Pregel. This city, besides its college or university, which contains 38 professors, boasts of magnificent palaces, a town-house, and exchange; not to mention gardens and other embellishments. It has a good harbour and a citadel, which is called Fredericksburg, a regular square.

ANTIQUITIES, AND CUSTOMS. See Germany.

COMMERCE AND MANUFACTURES. The present king of Prussia has endeavoured to encrease the commerce of his kingdom; but the despotic nature of his government is not favourable to trade and manufactures. The Prussian manufactures, however, are not inconsiderable; they consist of glass, iron-work, paper, gunpowder, copper, and brass mills; manufactures of cloth, camblet, linen, silk, stockings, and other articles. The inhabitants export variety of naval stores, amber, linseed, and hempseed, oatmeal, fish, mead, tallow, and caviar; and it is said that 500 ships are loaded every year with those commodities chiefly from Königsberg.

CONSTITUTION AND GOVERNMENT. His Prussian majesty is absolute through all his dominions; and he avails himself to the full of his power. The government of this kingdom is by a regency of four chancellors of state, viz. 1. The great master; 2. The great burgrave; 3. The great chancellor; and, 4. The great marshal. There are also some other councils, and 37 bailiwicks. The states consist, 1. Of counsellors of state; 2. Of deputies from the nobility; and 3. From the commons. Besides these institutions, his majesty has erected a board for commerce and navigation.

REVENUES. His Prussian majesty, by means of the happy situation of his country, its inland navigation, and his own skillful political regulations, derives an amazing revenue from this country, which, about a century and a half ago, was the seat of boors and barbarism. It is said, that amber alone brings him in 26,000 dollars annually. His other revenues arise from his demesnes, his duties of customs and tolls, and the subsidies yearly granted by the several states; but the exact sum is not known; though we may conclude it is very considerable from the immense changes of the late war. The revenue which the king draws from Silesia, amounts annually to 5,854,632 six dollars; and after deducting the expenses of the military establishment, and all others, there is a net revenue of 1,554,632 six dollars. His revenues now, since the accession of Polish or Royal Prussia, must be greatly increased: exclusive of its fertility, commerce and population; its local situation was of vast importance, as it lay between his German dominions and his kingdom of Prussia. By this acquisition, his dominions are compact, and his troops may march from Berlin to Königsberg without interruption.

MILITARY STRENGTH. The Prussian army, even in time of peace,

consists of about 180,000 of the best disciplined troops in the world; and, during the last war, that force was augmented to 300,000 men. But this great military force, however it may aggrandize the power and importance of the king, is utterly inconsistent with the interests of the people. The army is chiefly composed of provincial regiments; the whole Prussian dominions being divided into circles or cantons, in each of which, one or more regiments, in proportion to the size and populousness of the divisions, have been originally raised, and from it the recruits continue to be taken; and each particular regiment is always quartered, in the time of peace, near the canton from which its recruits are drawn. Whatever number of sons a peasant may have, they are all liable to be taken into the service except one, who is left to assist in the management of the farm. The rest wear badges from their childhood, to mark that they are destined to be soldiers, and obliged to enter into the service whenever they are called upon. But the maintaining so large an army in a country naturally so little equal to it, has occasioned such a drain from population, and such a withdrawing of strength from the labours of the earth, that the present king has endeavoured in some degree to save his own peasantry, by drawing as many recruits as he could from other countries. These foreign recruits remain continually with the regiments in which they are placed; but the native Prussians have every year some months of furlough, during which they return to the houses of their fathers or brothers, and work at the business of the farm, or in any other way they please.

ARMS, AND ORDERS OF KNIGHTHOOD.] The royal arms of Prussia are argent, an eagle displayed sable, crowned, or, for Prussia; Azure, the imperial sceptre, or, for Courland; Argent, an eagle displayed, gules, with semicircular wreaths, for the marquisate of Brandenburg. To these are added the respective arms of the several provinces subject to the Prussian crown.

There are four orders of knighthood, The "Order of Concord," instituted by Christian Ernest, margrave of Brandenburg, in the year 1660, to distinguish the part he had acted in restoring peace to many of the princes of Europe. Frederic III. elector of Brandenburg, and afterwards king of Prussia, instituted in 1685, the "Order of Generosity." The knights wear a cross of eight points enamelled blue, having in the centre this motto, "*La Generosité*," pendent to a blue riband. The same prince instituted the "Order of the Black Eagle," on the day of his coronation at Königsberg, in the year 1700; the sovereign is always grand-master, and the number of knights exclusive of the royal family, is limited to thirty who must all be admitted into the order of "Generosity," previous to their receiving this, unless they be sovereign princes. The Order of "*Mérite*," was instituted by the late king in the year 1740 to reward the merit of persons either in arms or arts, without distinction of birth, religion, or country; the king is sovereign, and the number of knights unlimited.

HISTORY.] The ancient history of Prussia, like that of other kingdoms, is lost in the clouds of fiction and romance. The inhabitants appear to have been a brave and warlike people, descended from the Slavonians, and refused to submit to the neighbouring princes, who, on pretence of converting them to christianity, wanted to subject them to slavery. They made a noble stand against the kings of Poland; one of whom, Boleslaus IV. was by them defeated and killed in 1163. They continued independent, and pagans, till the time of the crusades, when the German knights of the Teutonic order, about the year 1227, undertook their conversion by the edge of the sword, but upon condition of having, as a reward, the property

perty of the country when conquered. A long series of wars followed, in which the inhabitants of Prussia were almost extirpated by the religious knights, who, in the thirteenth century, after committing the most incredible barbarities, peopled the country with Germans.—After a vast waste of blood, in 1466, a peace was concluded between the knights of the Teutonic order, and Casimir IV. king of Poland, who had undertaken the cause of the oppressed people, by which it was agreed, that the part now called Polish Prussia should continue a free province, under the king's protection; and that the knights and the grand-master should possess the other part, but were to acknowledge themselves vassals of Poland. This gave rise to fresh wars, in which the knights endeavoured, but unsuccessfully, to show off their vassalage to Poland. In 1525, Albert, margrave of Brandenburg, and the last grand-master of the Teutonic order, laid aside the habit of his order, and embraced Lutheranism, and concluded a peace at Cracow, by which the margrave was acknowledged duke of the east part of Prussia (formerly called, for that reason, Ducal Prussia,) but to be held as a fief of Poland, and to descend to his male heirs; and upon failure of his male issue, to his brother, and their male heirs. Thus ended the sovereignty of the Teutonic order in Prussia, after it had subsisted near 300 years. In 1657, the elector Frederic-William of Brandenburg, deservedly called the Great, had Ducal Prussia confirmed to him, and by the conventions of Welau and Bromberg, it was freed by John Casimir, king of Poland, from vassalage; and he and his descendants were declared independent and sovereign lords of this part of Prussia.

As the protestant religion had been introduced into this country by the margrave Albert, and the electors of Brandenburg were now of that persuasion, the Protestant interest favoured them so much, that Frederick, the son of Frederick William the Great, was raised to the dignity of king of Prussia, in a solemn assembly of the states, and proclaimed January 18, 1701, and soon after acknowledged as such by all the powers of Christendom. His grandson, the late king of Prussia, in the memoirs of his family, gives us no high idea of this first king's talents for government, but expatiates on those of his own father, Frederic-William, who succeeded in 1713. He certainly was a prince of strong natural parts, and performed prodigious services to his country, but too often at the expence of humanity, and the magnanimity which ought to adorn a king. At his death, which happened in 1740, he is said to have left seven millions sterling in his treasury, which enabled his son, by his wonderful victories, and the more wonderful resources by which he repaired his defeats, to become the admiration of the present age. He improved the arts of peace as well as of war, and distinguished himself as a poet, philosopher, and legislator. Some of the principal transactions of his reign have already been related in our account of the history of Germany. In the year 1784 he published a rescript, signifying his pleasure that no kneeling in future should be practised in honour of his person, assigning for his reason, that the act of humiliation was not due but to the Divinity; and near 2,000,000 crowns were expended by him in draining marshes, establishing factories, settling colonies, relieving distress, and in other purposes of philanthropy and policy.

The present king of Prussia, who succeeded his uncle August 17, 1786, hath made many wise and salutary regulations for his subjects, and hath established a court of honour to prevent the diabolical practice of duelling in his dominions.

The exertions of Prussia against France have been already related in our account of that nation. If we credit the French accounts, the alliance be-

between Prussia and Austria is condemned by all the great Prussian statesmen; he produced a political schism in the court of Berlin, and a general discontent prevails in Prussia. The war exhausts the treasures laid up by the great Frederic, and the recruiting of the army has become so difficult, that the ministers cannot, without endangering the interior tranquillity, send the king an army of 30,000 men, which he ordered. Jealousies certainly prevail between the courts of Berlin and Vienna.

The conduct of Prussia with regard to Poland we can hardly explain, and it would apparently have been more for the interest of the former to have erected the latter as a formidable independent barrier against Russia and Austria, than to have exposed itself to the enormous and increased power of Russia. Prussia is no longer guided by the great Frederic; and should that kingdom continue to pursue an impolitic system of conduct, the inferiority of its extent and resources will cause it to vanish as suddenly as it arose.

The king of Prussia joined the coalition against France, of which however he soon tired, and would have withdrawn, if he had not had a very material object in view, and that was the reimbursement of expences. In the month of January the king had attempted to exact a sum for the provisioning of his army from the six frontier circles. Being disappointed in that quarter, however, he resolved to apply to the British ministry. For this purpose, he issued a proclamation on the 13th of March, addressed to the German empire, declaring his cessation from the grand confederacy. In consequence of this declaration, the British ministry and the States General agreed to take into pay, 62,400 Prussians, for which 50,000 pounds a month was agreed to be paid, besides the sum of 300,000, which was paid immediately. Having gained the end, for which he had acted with such duplicity, the king of Prussia at length threw off the mask, made a peace with the French, and recalled all his troops into his own dominions.

From this period the king of Prussia has remained an unconcerned spectator of the French usurpations; instead of making any attempt to support the emperor in the dreadful contest in which he was engaged, he took advantage of his distresses, and by an act of complicated baseness, seized upon part of his dominions. Whether he will ever awake from that false security in which he has hitherto remained, whether he will rise above the mean interested views by which all his motions have hitherto been directed; whether, animated by the glorious successes of the combined powers, and their gallant exertions, he will at length unite against the common enemy, is a point which can only be determined by his future conduct; his mind must be woefully blind, if he can for a moment imagine that Prussia will remain an independent nation, amid the sad wreck of every thing great and venerable in the world, the fall of thrones, the violation of altars, and the destruction of governments; if he can for a moment imagine that by any human prudence the vessel of state can be safely guided through the innumerable perils which threaten her, that any skill of the pilot can preserve her from being swallowed up in the troubled ocean, which roars around.

Frederic IV. king of Prussia, and Elector of Brandenburg, born Sept. 25, 1744; married, July, 14th, 1769, to the Princess Elizabeth, Christiana Ulrica, of Brunswick, Wolfenbuttel. 2. On July 14, 1769, to Frederica, Louisa, of Hesse-Darmstadt. Issue by the first marriage,

Frederica-Charlotta-Ulrica-Catherina, born May 7, 1767; married Sept. 29, 1791, to the Duke of York, the second son of his Britannic Majesty. Issue by the latter marriage,

1. Frederic William, born Aug. 3, 1770. 2. Frederic

2. Frederic-Louis Charles, born Aug. 3, 1773.
 3. Frederica-Sophia, Wilhelmina, born Nov. 18, 1774; married Oct. 1, 1791, to the Hereditary Prince of Orange.
 4. Frederic-Christian Augustus, born May 1, 1780.
 5. Another prince, born Dec. 20, 1781.
 6. Another prince born July, 1783.
- Queen Dowager, Elizabeth Christian of Brunswic Wolfenbuttle, born, Nov. 8, 1715.

Brother and sister to the king.

1. Frederic-Charles-Henry, born Dec. 30, 1747.
2. Frederica-Sophia-Wilhelmina, born in 1751; and married in 1767, to the present prince of Orange.

The KINGDOM of BOHEMIA.

SITUATION AND EXTENT.

SOIL AND AIR.] The air of Bohemia Proper is not thought so wholesome as that of the rest of Germany, though its soil and produce are pretty much the same.

MOUNTAINS AND RIVERS.] Bohemia, though almost surrounded with mountains, contains none of note or distinction: its woods are many, and the chief rivers are the Elbe, Muldaw, and Eger.

METALS AND MINERALS.] This kingdom contains rich mines of silver, quicksilver, copper, iron, lead, sulphur, and saltpetre. Its chief manufactures are, lace, copper, iron and glass.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.] We have no certain account of the present population of Bohemia; about 150 years ago, it was computed to contain near 3,000,000 of inhabitants; but at present not above 2,100,000. The Bohemians, in their persons, habits, and manners, resemble the Germans. There is, among them, no middle state of people; for every lord is a lord, and every tenant a slave. But the emperor Joseph II. generously discharged the Bohemian peasants, on the Imperial demesnes, from the state of villainage in which they had been so long and so unjustly retained; and it will be happy if his example should be followed by the Bohemian nobility; and they be thereby led to cease to deprive their vassals of the rights of human nature. Although the Bohemians, at present, are not remarkable either for arts or arms, yet they formerly distinguished themselves as the most intrepid assertors of civil and religious liberty in Europe; witness the early introduction of the reformed religion into their country, when it was scarcely known in any other; the many glorious defeats they gave to the Austrian power, and their generous struggles for independency. Their virtues may be considered as the causes of their decay; as no means were left unemploy'd by their despotic masters for breaking their spirit: though it is certain their internal jealousies and dissensions greatly contributed to their subjection. Their customs and diversions are the same as in Germany.

RELIGION.] Though popery is the established religion of Bohemia, yet there are many protestants among the inhabitants; who are now tolerated in the free exercise of their religion; and some of the Moravians have embraced a visionary unintelligible protestantism, if it deserves that name, which they have propagated, by their zealous missionaries, in several parts of the globe; some of whom a few years ago made proselytes in Great Britain; they have still a meeting house in London, and have obtained an act of parliament for a settlement in the plantations.

ARCHBISHOPS AND BISHOPS.] Prague is the only Bohemian archbishopric. (The bishoprics are Koninggratz, Breslaw, and Olmutz.)

LANGUAGE.] The proper language of the Bohemians is a dialect of the Sclavonian, but they generally speak German and High Dutch.

UNIVERSITY.] The only university in Bohemia is that of Prague.

CITIES AND TOWNS.] Prague, the capital of Bohemia, is one of the finest and most magnificent cities in Europe, and famous for its noble bridge. Its circumference is so large, that the grand Prussian army, in its last siege, never could completely invest it. For this reason it is able to make a vigorous defence in case of a regular siege. The inhabitants are thought not to be proportioned to its capacity, being computed not to exceed 70,000 Christians, and about 13,000 Jews. It contains 92 churches and chapels, and 44 cloisters. It is a place of little or no trade, and therefore the middling inhabitants are not wealthy; but the Jews are said to carry on a large commerce in jewels. Bohemia contains many other towns, some of which are fortified, but they are neither remarkable for strength nor manufactures. Olmutz is the capital of Moravia: it is well fortified, and has manufactures of woollen, iron, glass, paper, and gunpowder. Breslaw, the capital of Silesia, hath been already described.

COMMERCE AND MANUFACTURES.] See Germany.

CONSTITUTION AND GOVERNMENT.] The forms, and only the forms, of the old Bohemian constitution still subsist; but the government under the emperor is despotic. Their states are composed of the clergy, nobility, gentry, and representatives of towns. Their sovereigns of late

have not been fond of provoking them by ill usage, as they have a general aversion towards the Austrians. This kingdom is frequently described as part of Germany, but with little reason, for it is not in any of the nine circles, nor does it contribute any thing towards the forces or revenues of the empire, nor is it subject to any of its laws. What gives some colour to this mistake, is, that the king of Bohemia is the first secular elector of the empire, and their kings have been elected emperors of Germany for many years.

REVENUES.] The revenues of Bohemia are whatever the sovereign is pleased to exact from the states of the kingdom, when they are annually assembled at Prague. They may perhaps amount to 500,000*l.* a year.

ARMS.] The arms of Bohemia are, argent, a lion gules, the tail moved, and passed in saltire, crowned, langued, and armed, or.

HISTORY.] The Bohemian nobility used to elect their own princes, though the emperors of Germany sometimes imposed a king upon them, and at length usurped that throne themselves. In the year 1438, Albert II. of Austria, received three crowns, Hungary, the Empire, and Bohemia.

In 1414, John Hus, and Jerome of Prague, two of the first reformers, and Bohemians, were burnt at the council of Constance, though the emperor of Germany had given them his protection. This occasioned an insurrection in Bohemia: the people of Prague threw the emperor's officers out of the windows of the council-chamber; and the famous Zisca, assembling an army of 40,000 Bohemians, defeated the emperor's forces in several engagements, and drove the Imperialists out of the kingdom. The divisions of the Hussites among themselves enabled the emperors to regain and keep possession of Bohemia, though an attempt was made to throw off the imperial yoke, by electing, in the year 1618, a protestant king in the person of the prince Palatine, son-in-law to James I. of England. The misfortunes of this prince are well known. He was driven from Bohemia by the emperor's generals, and, being stripped of his other dominions, was forced to depend on the court of England for a subsistence. After a war of 30 years duration, which desolated the whole empire, the Bohemians have remained subject to the house of Austria.

Segedin, S. E.	
Agria, in the middle.	
Pest, on the Danube, opposite to Budz.	

To which may be added Temeswar, which has been considered as distinct from Hungary, because it was formerly governed by an independent king; and it has several times been in possession of the Turks; but the Austrians gaining possession of it, it was incorporated into the kingdom of Hungary in 1778. The province of Temeswar is 94 miles long, and 67 broad, containing about 3850 square miles: it has been divided into four districts, Cfsadat, Temeswar, Werfchez, and Lugos. Temeswar, the principal town, is situated E. lon. 22-15. N. lat. 45-54.

AIR, SOIL, AND PRODUCE.] The air, and consequently the climate of the southern parts of Hungary, is found to be unhealthful, owing to its numerous lakes, stagnated waters, and marshes; but the northern parts, being mountainous and barren, the air is sweet and wholesome. No country in the world can boast a richer soil, than that plain which extends 300 miles from Presburg to Belgrade, and produces corn, grass, esculent plants, tobacco, saffron, asparagus, melons, hops, pulse, millet, buck-wheat, delicious wine, fruits of various kinds, peaches, mulberry-trees, chestnuts, and wood: corn is in such plenty, that it sells for one sixth part of its price in England.

RIVERS.] These are the Danube, Drave, Save, Teyffe, Merish, and the Temes.

WATER.] Hungary contains several lakes, particularly four among the Carpathian mountains, of considerable extent, and abounding with fish. The Hungarian baths and mineral waters are esteemed the most sovereign of any in Europe; but their magnificent buildings, raised by the Turks when in possession of the country, particularly those of Buda, are suffered to go to decay.

MOUNTAINS.] The Carpathian mountains which divide Hungary from Poland on the north, are the chief in Hungary, though many detached mountains are found in the country. Their tops are generally covered with wood, and on their sides grow the richest grapes in the world.

METALS AND MINERALS.] Hungary is remarkably well stocked with both

both. It abounds not only with gold and silver mines, but with plenty of excellent copper, vitriol, iron, orpiment, quicksilver, chrysocholla, and terra sigillata. Before Hungary became the seat of destructive wars between Turks and Christians, or fell under the power of the House of Austria, those mines were furnished with proper works and workmen, and produced vast revenues to the native princes. The Hungarian gold and silver employed mint-houses, not only in Hungary, but in Germany, and the continent of Europe; but all those mines are now greatly diminished in their value, their works being destroyed or demolished: some of them however, still subsist; to the great emolument of the natives.

[VEGETABLE AND ANIMAL PRODUCTIONS.] Hungary is remarkable for a fine breed of Horses, generally mouse-coloured, and highly esteemed by military officers, so that great numbers of them are exported. There is a remarkable breed of large rams in the neighbourhood of Presburg. Its other vegetable and animal productions are in general the same with those of Germany, and the neighbouring countries. The Hungarian wines, however, particularly Tokay, are preferable to those of any other country at least in Europe.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. } It was late before the northern barbarians drove the Romans out of Hungary; and some of the descendants of their legionary forces are still to be distinguished in the inland parts, by their speaking Latin. Be that as it will, before the Turks got possession of Constantinople, we have reason to think that Hungary was one of the most populous and powerful kingdoms in Europe: and if the House of Austria should give the proper encouragement to the inhabitants to repair their works, and clear their fens, it might become so again in about a century hence. Both Hungarys, at present, exclusive of Transylvania and Croatia, are thought to contain about two millions and a half of inhabitants. The Hungarians have manners peculiar to selves. They pique themselves on being descended from those heroes, who formed the bulwark of Christendom against the infidels. In their persons they are well made. Their fur-caps, their close-bodied coats, girded by a sash, and their cloak or mantle, which is so contrived as to buckle under the arm, so that the right hand may be always at liberty, give them an air of military dignity. The men shave their beards, but preserve their whiskers on their upper lips. Their usual arms are a broad sword, and a kind of pole-ax, besides their fire-arms. The ladies are reckoned handsomer than those of Austria, and their sable dress with sleeves straight to their arms, and their stays fastened before with gold, pearl, or diamond little buttons, are well known to the French and English ladies. Both men and women, in what they call the mine towns, wear fur, and even sheep-skin dresses. The inns upon the roads are most miserable hovels, and even those seldom to be met with. The hogs, which yield the chief animal food for their peasants and their poultry, live in the same apartment with their owners. The gout and the fever, owing to the unwholesomeness of the air, are the predominant diseases in Hungary. The natives in general are indolent, and leave trade and manufactures to the Greeks and other strangers settled in their country, the stateness of which renders travelling commodious, either by land or water. The diversions of the inhabitants are of the warlike and athletic kind. They are in general a brave and magnanimous people. Their ancestors, even since the beginning of the present century, were so jealous of their liberties, that rather than be tyrannised over by the house of Austria, they often put themselves under the protection of the Ottoman court;

but

but their fidelity to the late empress-queen, notwithstanding the provocations they received from her house, will be always remembered to their honour.

The inhabitants of Temeswar, a province lately incorporated into the kingdom of Hungary, are computed at 450,000. There are in this country many facons, or gypsies, supposed to be real descendants of the ancient Egyptians. They are said to resemble the ancient Egyptians in their features, in their propensity to melancholy, and in many of their manners and customs; and it is asserted, that the lascivious dances of Isis, the worship of onions, many famous Egyptian superstitions and spetitics, and the Egyptian method of hatching eggs by means of dung, are still in use among the female gypsies in Temeswar.

RELIGION.] The established religion of the Hungarians is the Roman catholic, though the major part of the inhabitants are protestants, or Greeks; and they now enjoy the full exercise of their religious liberties.

ARCHBISHOPRICS AND BISHOPRICS.] The archbishoprics are Presburg, Gran, and Colocza. The bishoprics are, Great Waradin, Agria, Vespria, Raab, and five churches.

LANGUAGE.] As the Hungarians are mixed with Germans, Sclavonians, and Walachians, they have a variety of dialects, and one of them is said to approach near the Hebrew. The better and the middlemost rank speak German, and almost all even of the common people speak Latin, either pure or barbarous, so that the Latin may be said to be here still a living language.

UNIVERSITIES.] In the universities, (if they can be properly so called) of Firan, Buda, Raab, and Caschaw, are professors of the several arts and sciences, who used generally to be Jesuits; so that the Lutherans, and Calvinists, who are more numerous than the Roman Catholics in Hungary, go to the German and other universities.

ANTIQUITIES AND CURIOSITIES.] The artificial curiosities of this NATURAL AND ARTIFICIAL } country consist of its bridges, baths, and mines. The bridge of Esseck built over the Danube, and Drave, is, properly speaking, a continuation of bridges, five miles in length, fortified with towers at certain distances. It was an important pass during the wars between the Turks and Hungarians. A bridge of boats runs over the Danube, half a mile long, between Buda and Pest; and about twenty Hungarian miles distant from Belgrade, are the remains of a bridge erected by the Romans, judged to be the most magnificent of any in the world. The baths and mines here have nothing to distinguish them from the like works in other countries,

One of the most remarkable natural curiosities of Hungary, is a cavern, in a mountain near Szelitze; the aperture of this cavern, which fronts the south, is eighteen fathoms high, and eight broad; its subterraneous passages consist entirely of solid rock, stretching away farther south than has yet been discovered; as far as it is practicable to go, the height is found to be fifty fathoms, and the breadth 26. Many other wonderful particulars are related of this cavern, which is an article of great curiosity. Astonishing rocks are common in Hungary, and some of its churches are of admirable architecture.

CITIES, TOWNS, FORTS, AND OTHER } These are greatly decayed EDIFICES, PUBLIC AND PRIVATE; } from their ancient magnificence: but many of the fortifications are still very strong, and kept in good order. Presburg is fortified. In it the Hungarian regalia were kept, but

were lately removed to Vienna, the crown was sent in the year 1000 by pope Sylvester II. to Stephen, king of Hungary; and was made after that of the Greek emperors; it is of solid gold, weighing nine marks and three ounces, ornamented with 53 sapphires, 50 rubies one large emerald, and 338 pearls. Besides these stones, are the images of the apostles and the patriarchs. The pope added to this crown a silver patriarchal cross, which was afterwards inserted in the arms of Hungary. At the ceremony of the coronation a bishop carries it before the king. From the cross is derived the title of apostolic king; the use of which was renewed under the reign of the empress Maria Theresa. The sceptre and the globe of the kingdom are Arabian gold; the mantle, which is of fine linen, is said to be the work of Gisele, spouse to St. Stephen, who, they say, embroidered in gold the image of Jesus Christ crucified, and many other images of the patriarchs and apostles, with a number of inscriptions. The sword is two-edged, and rounded at the point. Buda, formerly the capital of Hungary, retains little of its ancient magnificence, but its strength and fortifications; and the same may be said of Pest, which lies on the opposite side of the Danube. Raab is likewise a strong city, as are Gran and Comorna. Tokay has been already mentioned for the excellency of its wines.

COMMERCE AND MANUFACTURES.] After having mentioned the natural produce of the country, it is sufficient to say, that the chief manufactures and exports of the natives consist of metals, drugs, and salt.

CONSTITUTION AND GOVERNMENT.] The Hungarians dislike the term of queen, and even called their late sovereign king Theresa. Their government preserves the remains of many checks upon the regal power. They have a diet or parliament, a Hungary-office, which resembles our chancery, and which resides at Vienna; as the stadtholder's council, which comes pretty near the British privy-council, but has a municipal jurisdiction, does at Presburg. Every royal town has its senate; and the Gespan chaffs resemble our justices of the peace. Besides this, they have an exchequer and nine chambers, and other subordinate courts.

MILITARY STRENGTH.] The emperor can bring to the field at any time, 50,000 Hungarians in their own country, but seldom draws out of it above 10,000; these are generally light-horse, and well known to modern times by the name of Hussars. They are not so large as the German horse; and therefore the Hussars stand upon their short stirrups when they strike. Their expedition and alertness have been found so serviceable in war, that the greatest powers in Europe, have troops that go by the same name. Their foot are called Heydukes, and wear feathers in their caps, according to the enemies they pretend to have killed: both horse and foot are an excellent militia, very good at a pursuit, or ravaging and plundering a country, but not equal to regular troops, in a pitched battle.

COINS.] Hungary was formerly remarkable for its coinage, and there are still extant, in the cabinets of the curious, a complete series of coins of their former kings. More Greek and Roman medals have been discovered in this country, than perhaps in any other in Europe.

ARMS.] The emperor, as king of Hungary, for armorial ensigns, bears quarterly, barwise argent, and gold, eight pieces.

HISTORY.] The Hungarians, subduing this country in the middle of the third century, communicated their name to it, being then part of the ancient Pannonia. They were succeeded by the furious Goths; the Goths were expelled by the Lombards; they by the Avari; and the Slavi were planted in their stead in the beginning of the 9th century. At the

close of it, the Anigours emigrated from the banks of the Volga, and took possession of the country. Hungary was formerly an assemblage of different states, and the first who assumed the title of king, was Stephen, in the year 997; when he embraced Christianity. In his reign, the form of government was established, and the crown rendered elective. About the year 1310, king Charles Robert ascended the throne, and subdued Bulgaria, Servia, Croatia, Dalmatia, Slavonia, and many other provinces; but many of those armies were afterwards reduced by the Venetians, Turks, and other powers. In the 15th century, Huniades, who was guardian to the infant king Ladislaus, bravely repulsed the Turks, when they invaded Hungary; and upon the death of Ladislaus, the Hungarians, in 1438 raised Matthias Corvinus, son of Huniades, to their throne. Lewis, king of Hungary, in 1526, was killed in a battle, fighting against Solymán, emperor of the Turks. This battle almost proved fatal to Hungary; but the archduke Ferdinand, brother to the emperor Charles V. having married the sister of Lewis, he claimed the title of Hungary, in which he succeeded, with some difficulty, and that kingdom has ever since belonged to the house of Austria, though by its constitution its crown ought to be elective. For the rest of the Hungarian history, see Germany.

TRANSYLVANIA, SCLAVONIA, CROATIA, AND HUNGARIAN DALMATIA.

I HAVE thrown these countries under one division, for several reasons, and particularly because we have no account sufficiently exact of their extent and boundaries. The best account of them is as follows; TRANSYLVANIA belongs to the house of Austria, and is bounded on the north by the Carpathian mountains, which divide it from Poland; on the east by Moldavia and Wallachia; on the South by Wallachia; and on the West by Upper and Lower Hungary. It lies between 22 and 26 degrees of east longitude, and 45 and 48 of north latitude. Its length is extended about 180, and its breadth 120 miles; and contains nearly 14,400 square miles, but is surrounded on all sides by high mountains. Its produce, vegetables, and animals, are almost the same with those of Hungary. The air is wholesome and temperate; but their wine, though good, is not equal to the Hungarian. Its chief city is Hermanstadt, and its interior government still partakes greatly of the ancient feudal system, being composed of many independent states and princes. They owe not much more than a nominal subjection to the Austrians, who leave them in possession of most of their privileges, Papists, Lutherans, Calvinists, Socinians, Arians, Greeks, Mahometans, and other sectaries, here enjoy their several religions. Transylvania is thought to add but little to the Austrian revenue, though it exports some metals and salt to Hungary. The other large places are Sagewar, Millenback, and Newmark. All sorts of provisions are very cheap, and excellent in their kinds. Hermanstadt, is a large, strong, and well built city, as are Clausenburg and Weissenburg. The seat of government is at Hermanstadt, and the governor is assisted by a council made up of Roman Catholics, Calvinists, and Lutherans. The diet, or parliament, meets by summons, and receives the commands of the sovereign, to whom of late they have been more devoted than formerly. They have a liberty of making remonstrances and representations in case of grievances.

Tran-

Transylvania is part of ancient Dacia, the inhabitants of which long employed the Roman arms, before they could be subdued. It was overrun by the Goths on the decline of the Roman empire, and then by the Huns. Their descendants retain the same military character. The population of the country is not ascertained; but if the Transylvanians can bring to the field, as has been asserted, 300,000 troops, the whole number of inhabitants must be considerable. At present its military force is reduced to six regiments of 1500 men each; but it is well known that during the last two wars, in which the house of Austria was engaged, the Transylvanians did great services. Hermanstadt is its only bishopric; and the Transylvanians at present seem to trouble themselves little either about learning or religion, though the Roman catholic is the established church. Stephen I. king of Hungary, introduced Christianity there about the year 1000, and it was afterwards governed by an Hungarian viceroy, or vicetroy. The various revolutions in their government prove their impatience under slavery; and though the treaty of Carlowitz in 1699, gave the sovereignty of Transylvania, as also of Sclavonia, to the house of Austria, yet the natives enjoy what we may call a loyal aristocracy, which their sovereigns do not think proper to invade. In October 1784, on account of the real or feigned oppressions of the nobility, near 10,000 assembled, and committed great depredations on those whose conduct had been reformed. Several had their palaces burnt, and were glad to escape with their lives. The revolters were disappointed in their attempt on Clausenburgh; and afterwards offered to separate, and go home in peace, on the terms of a general pardon, better treatment from the nobility, and a freedom from vassalage. In the present situation of the Austrians, lenient terms have been granted to them, and with the punishment of a few, the insurrection was suppressed.

SCLAVONIA lies between the 17th and 31st degrees of east longitude, and the 55th and 46th of north latitude. It is thought to be about 200 miles in length, and 60 in breadth; and contains about 10,000 square miles. It is bounded by the Drave on the North, by the Danube on the East, by the Save on the South, and by Kiria in Austria on the West. The reason why Hungary, Transylvania, Sclavonia, and the other nations, subject to the house of Austria in those parts, contain a surprising variety of people, differing in name, language, and manners, is because liberty here made its last stand against the Roman arms, which by degrees forced the remains of the different nations they had conquered into those quarters. The thickness of the woods, the rapidity of the rivers, and the strength of the country, favoured their resistance; and their descendants, notwithstanding the power of the Turks, the Austrians, the Hungarians, and the Poles, still retain the same spirit of independency. Without minding the arrangement made by the sovereigns of Europe, they are quiet under the government that leaves them most at liberty. That they are generous, as well as brave, appears from their attachment to the house of Austria, which, till the last two wars, never was sensible of their value and valour; insomuch that it is well known, that they preserved the pragmatic sanction, and kept the imperial crown in that family. The Sclavonians formerly gave so much work to the Roman arms, that it is thought the word *slave* took its original from them, on account of the great numbers of them who were carried into bondage, so late as the reign of Charlemagne. Though Sclavonia yields neither in beauty nor fertility to Hungary and Transylvania yet the ravages of war are still visible in the face of the country, which lies in a great measure unimproved. The Sclavonians, from their ignorance perhaps are zeal-

ous Roman Catholics, though Greeks and Jews are tolerated. Here we meet with two bishoprics; that of Pofega, which is the capital of the country, and Zagrab, which lies on the Drave; but we know of no universities. Esbeck is a large and strong town, remarkable, as before noticed, for a wooden bridge over the Drave, and adjoining marshes, five miles long, and fifteen pages broad, built by the Turks. Waradin and Peterwaradin are places noted in the wars between the Austrians and Turks. The inhabitants are composed of Servians, Radzians, Croats, Wallachians, Germans, Hungarians, and a vast number of other people, whose names were never known even to the Austrians themselves, but from the military muster-rolls; when they poured their troops into the field during the last two wars. In 1746, Scavonia was united to Hungary, and the states send representatives to the diet of Hungary.

CROATIA lies between the 15th and 17th degrees of east longitude, and the 45th and 47th of north latitude. It is 80 miles in length, and 70 in breadth, and about 2,500 square miles. The manners, government, religion, language, and customs of the Croats, are similar to those of the Scavonians and Transylvanians, who are their neighbours. They are excellent irregular troops, and as such are famed in modern history, under the name of Pandours, and various other designations. The truth is the house of Austria finds its interest in suffering them and the neighbouring nations, to live in their own manner. The towns are blended with each other, there scarcely being any distinction of boundaries. Carollstadt is a place of some note, but Zagrab (already mentioned), is the capital of Croatia. All the sovereignty exercised over them by the Austrians seems to consist in the military arrangements for bringing them occasionally into the field. A viceroy presides over Croatia, jointly with Scavonia, and

Hungarian Dalmatia: this lies in the upper part of the Adriatic sea, and consists of five districts, in which the most remarkable places are the two following: Segna, which is a royal free town, fortified both by nature and art and is situated near the sea, in a bleak, mountainous, and barren soil. The bishop of this place is a suffragan to the archbishop of Spalatro. Here are twelve churches, and two convents. The governor resides in the old palace, called the Royal Castle. 2. Ottoschatz, a frontier fortification on the river Gatzka. That part of the fortrefs where the governor, and the greatest part of the garrison reside, is surrounded with a wall, and some towers: but the rest of the buildings, which are mean, are erected on piles in the water; so that one neighbour cannot visit another without a boat.

Near Segna dwell the Ufcocs, a people, who being galled by oppression, escaped out of Dalmatia, from whence they obtained the name of Ufcocs, from the word Scoco, which signifies a *deserter*. They are also called springers, or leapers, from the agility with which they leap, rather than walk, along this rugged and mountainous country. Some of them live in scattered houses, and others in large villages. They are a rough, savage people, large bodied, courageous, and given to rapine; but their visible employment is grazing. They use the Wallachian language, and in their religious sentiments and mode of worship approach nearest to the Greek church; but some of them are Roman catholics.

A part of Wallachia belongs also to the emperor, as well as to the Turks, which lies to the east of Transylvania, and its principal towns are Tregowitz, Bucharest, and Severin.

NAME.] It is generally thought that Poland takes its name from Polu, or Pole, a Slavonian word signifying a country fit for hunting, for which none was formerly more proper, on account of its plains, woods, wild beasts, and game of every kind.

CLIMATE.] The air of Poland is such as may be expected from so extensive but level a climate. In the northern parts it is cold, but healthy, the Carpathian mountains, which separate Poland from Hungary, are covered with everlasting snow, which has been known to fall in the middle of summer. Upon the whole, however, the climate of Poland is temperate, and far from being so unsettled, either in winter or summer, as might be supposed from so northerly a situation; but the air is rather infalubrious by reason of the numerous woods and morasses.

SOIL, PRODUCE, AND WATERS.] Poland is in general a level country, and the soil is fertile in corn, as appears from the vast quantities that are sent from thence down the Vistula, to Dantzic, and which are bought up by the Dutch, and other nations. The pastures of Poland, especially in Podolja, are rich beyond expression; and it is said that one can hardly see the cattle that graze in the meadows. Here are mines of silver, copper, iron, salt, and coals; Lithuania abounds in iron, ochre, black agate, several species of copper and iron pyrites, and red and grey granite; false precious stones, and marine petrefactions. The interior parts of Poland contain forests, which furnish timber in such great quantities, that it is employed in house building, instead of bricks, stones, and tiles. Various kinds of fruits and herbs, and some grapes, are produced in Poland, and are excellent when they meet with culture, but their wine seldom or never comes to perfection. Poland produces various kinds of clays fit for pipes and earthen ware. The water of many springs is boiled into salt. The virtues of a spring in the palatinate of Cracow, which increases and decreases with the moon, are said to be wonderful for the preservation of life; and it is reported, that the neighbouring inhabitants commonly live to 100, and some of them to 150 years of age. This spring is inflammable, and by applying a torch to it, it flames like the subtlest spirit of wine. The flame, however, dances on the surface, without heating the water; and if neglected to be extinguished, which it never may be, it communicates itself, by subterraneous conduits, to the roots of trees, in a neighbouring wood, which it consumes; and about 35 years ago, the flames are said to have lasted for three years, before they could be extinguished.

RIVERS.] The chief rivers of Poland are, the Vistula or Weyfel, the Neister, Neiper, or Boristhenes, the Bug, and the Dwina.

LAKES.] The chief of the few lakes contained in Poland, is Gopto, in the Palatinate of Byzefty; and Birals, or, the White Lake, which is said to dye those who wash in it of a swarthy complexion.

VEGETABLE AND ANIMAL PRODUCTIONS.] The vegetable productions of Poland have been already mentioned under the article of SOIL, though some are peculiar to itself, particularly a kind of manna (if it can be called a vegetable), which in May and June the inhabitants sweep into sieves with the dew, and it serves for food dressed various ways. A great quantity of yellow amber is frequently dug up in Lithuania, in pieces as large as a man's fist, supposed to be the production of a resinous pine.

The forests of Warsovia or Masovia contain plenty of usi, or buffaloes, whose flesh the Poles powder, and esteem it an excellent dish. Horses, wolves, boars, the glouton, lynx, elks, and deer, all of them wild, are com-

position in the Polish forests; and there is a species of wild horses and asses, and wild oxen, that the nobility of the Ukraine, as well as natives, are fond of. A kind of wolf, resembling a hart, with spots on his belly and legs, is found here, and affords the best furs in the country; but the elk which is common in Poland, as well as in some other northern countries, is a very extraordinary animal. The flesh of the Polish elk forms the most delicious parts of their greatest feasts. His body is of the deer make, but much thicker and longer; the legs high, the feet broad, like a wild goat's. Naturalists have observed, that upon dissecting an elk, there was found in its head some large flies, with its brain almost eaten away; and it is an observation sufficiently attested, that in the large woods and wildernesses in the north, this poor animal is attacked, towards the winter chiefly, by a larger sort of flies, that through its ears attempt to take up their winter quarters in its head. This persecution is thought to affect the elk with the falling sickness, by which means it is taken, which would otherwise prove no easy matter.

Poland produces a creature called *bohac*: it resembles a guinea-pig, but seems to be of the beaver kind. They are noted for digging holes in the ground, which they enter in October, and do not come out, except occasionally for food, till April: they have separate apartments for their provisions, lodgings, and their dead; they live together by 10 or 12 in a herd. We do not perceive that Poland contains any species of birds peculiar to itself; only we are told that the quails there have green legs, and their flesh is reckoned to be unwholesome. Lithuania is rich in ornithology; among the birds of prey are the eagle and vulture. The *remiz*, or little species of titmouse, is frequently found in these parts, famous for the wondrous structure of its pendent nest, formed in the shape of a long purse, with amazing art.

POPULATION, INHABITANTS, MANNERS, } From what has been
CUSTOMS, AND DIVERSIONS, } said of the extent of Poland, it is impossible to form an estimate of the number of its inhabitants; they undoubtedly before the breaking out of the late war, were very numerous; but they are so little known, even at present, that numbers of them in remoter parts, continue still to be heathens, or have very imperfect notions of Christianity. Some have supposed Poland and Lithuania to contain 14,000,000 of inhabitants; and when we consider that the Poles have no colonies, and sometimes have enjoyed peace for many years together, and that no fewer than 2,000,000 of Jews are said to inhabit there, perhaps this calculation has not been exaggerated. But since the partition and dismemberment of the kingdom, the number is only 9,000,000, of which 600,000 are Jews. The provinces taken by Russia are the largest, by Austria the most populous, and by Prussia the most commercial. The Russian contain 1,500,000. The Austrian 2,500,000; and the Prussian about 860,000, amounting to about 5,000,000 of souls separated from their ancient kingdom.

The Poles, in their persons, make a noble appearance; their complexion is fair, and their shapes are well proportioned. They are brave, honest, and hospitable; and their women sprightly, yet modest, and submissive to their husbands. Their mode of salute, is to incline their heads, and to strike their breast with one of their hands, while they stretch the other towards the ground; but when a common person meets a superior, he bows his head near to the earth, and with his head touches the sleg near to the heel of the person

T Polish libe former ki have a po are subje and none lands. I privileges gage in t Polish ge power ov

to whom he pays obeisance. Their diversions are warlike and manly; vaulting, dancing, and riding the great horse, hunting, skating, bull and bear baiting. They usually travel on horseback; a Polish gentleman will not travel a stone's throw without his horse, and they are so hardy, that they will sleep upon the ground, without any bed or covering, in frost and snow. The Poles never live above stairs, and their apartments are not united: the kitchen is on one side, the stable on another, the dwelling-house on the third, and the gate in the front. They content themselves with a few small beds, and if any lodge at their houses, they must carry their bedding with them. When they sit down to dinner or supper, they have their trumpets and other music playing; and a number of gentlemen to wait on them at table, all serving with the most profound respect; for the nobles, who are poor, frequently find themselves under the necessity of serving them that are rich; but their patron usually treats them with civility, and permits the eldest to eat with him at his table, with his cap off; and every one of them has his peasant boy to wait on him, maintained by the master of the family. At an entertainment, the Poles lay neither knives, forks, nor spoons, but every guest brings them with him; and they no sooner sit down to table, than all the doors are shut, and not open till the company return home. It is usual for a nobleman to give his servant part of his meat, which he eats as he stands behind him, and to let him drink out of the same cup with himself; but this is the less extraordinary, if it be considered that these servants are esteemed his equals. Bumpers are much in fashion, both here and in Russia; nor will they easily excuse any person from pledging them. It would exceed the bounds of this work to describe the grandeur and equipages of the Polish nobility; and the reader may figure to himself an idea of all that is fastidious, ceremonious, expensive, and shewy in life, to have any conception of their way of living. They carry the pomp of their attendance when they appear abroad, even to ridicule; for it is not unusual to see the lady of a Polish grandee, besides a coach and six, with a great number of servants, attended by an old gentleman usher, an old gentlewoman for her governaite, and a dwarf of each sex to hold up her train; and if it be night, her coach is surrounded by a great number of flambeaux. The figure of their pomp, however, is proportioned to their estates; but each person goes as far as his income can afford.

The Poles are divided into nobles, clergy, citizens, or burghers and peasants; the peasants are divided into two sorts, those of the crown, and those belonging to individuals. Though Poland has its princes, counts, and barons, yet the whole body of the nobility are naturally on a level, except the difference that arises from the public posts they enjoy. Hence all who are of noble birth call one another *brothers*. They do not value titles of honour, but think a *gentleman of Poland* is the highest appellation they can enjoy. They have many considerable privileges; and indeed the boasted Polish liberty is properly limited to them alone, partly by the indulgence of former kings, but more generally from ancient custom and prescription. They have a power of life and death over their tenants and vassals, pay no taxes, are subject to none but the king, may choose whom they will for their king, and none but they, and the burghers of some particular towns, can purchase lands. In short, they are almost entirely independent, enjoying many other privileges entirely incompatible with a well regulated state; but if they engage in trade, they forfeit their nobility. These great privileges make the Polish gentry powerful; many of them have large territories, with a despotic power over their tenants, whom they call their subjects, and transfer or as-

sign over with the lands, cattle, and furniture. Until Casimir the Great, the lord could put his peasant to death with impunity, and when the latter had no children, considered himself as the heir, and seized all his effects. In 1347, Casimir prescribed a fine for the murder of a peasant, and enacted, that in case of his decease without issue, his next heir should inherit. But these and other regulations have proved ineffectual, against the power and tyranny of the nobles, and have been either abrogated or eluded. Some of them have estates from five to thirty leagues in extent, and are also hereditary sovereigns of cities, with which the king has no concern. One of their nobles possesses above 4000 towns and villages. Some of them can raise 8 or 10,000 men. The house of a nobleman is a secure asylum for persons who have committed any crime; for none must presume to take them from thence by force. They have their horse and foot guards, which are upon duty day and night before their palaces and in their anti-chambers, and march before them when they go abroad. They make an extraordinary figure when they come to the diet, some of them having 5000 guards and attendants; and their debates in the senate are often determined by the sword. When great men have suits at law, the diet, or other tribunals, decide them; yet the execution of the sentence must be left to the longest sword, for the justice of the kingdom is commonly too weak for the grandees. Sometimes they raise 6000 men of a side, plunder and burn one another's cities, and besiege castles and forts; for they think it below them to submit to the sentence of judges, without a field battle. If one lord kills the peasant of another, he is not capitally convicted, but only obliged to make reparation, by another peasant equal in value. A nobleman who is desirous of cultivating a piece of land, builds a little wooden house, in which he settles a peasant and his family, giving him a cow, two horses, a certain number of geese, hens, &c. and as much corn as is sufficient to maintain him the first year, and to improve for his own future subsistence and the advantage of his lord.

The clergy have many immunities; they are all free men, in some instances have their own courts of justice, in which the canon law is practised. A bishop is entitled to all the privileges of a senator; was usually appointed by the king, and confirmed by the pope, but is now nominated by the king out of three candidates chosen by the permanent council. The archbishop of Gnesna is primate, the first senator in rank, and viceroy during an interregnum. The burghers still enjoy some freedom and privileges; they chuse their own burgomaster and council, regulate their interior police, and have their own criminal courts of justice, and when defendant against a noble, he must be cited before the magistrate of his own town, from whence an appeal lies only to the king in his assessorial tribunal. Without this exemption from the jurisdiction of the nobles, they would long since have been reduced to a state of vassalage.

The peasants of the crown, if oppressed, may lodge a complaint in the royal court of justice, which is some check to injustice; but peasants belonging to individuals are at the absolute disposal of their master, and all their acquisitions serve only to enrich him. They are indispensably obliged to cultivate the earth; they are incapable of entering upon any condition of life that might procure them freedom, without the permission of their lords; and they are exposed to the dismal, and frequently fatal effects of the caprice, cruelty, and barbarity of their tyrannical masters, who oppress them with impunity; and having the power of life and property in their hands, too often abuse it in the most gross and wanton manner, their wives and daughters being exposed to the most brutal treatment.

One blessing, however, attends the wretched situation of the Polish peasants, which is their insensibility. Born slaves, and accustomed from their infancy, to hardships and severe labour, the generality of them scarcely entertain an idea of better circumstances and more liberty. They regard their masters as a superior order of beings, and hardly ever repine at their severe lot. Cheerful and contented with their condition, they are ready, upon every occasion, to sacrifice themselves and their families for their master, especially if the latter takes care to feed them well. Most of them seem to think that a man can never be very wretched while he has any thing to eat. There are some styled German peasants, whose ancestors were indulged in settling in Poland, in the use of the German laws, who enjoy several privileges not possessed by the generality of Polish peasants: their villages are better built, they possess more cattle, pay their quit rents better, and are cleaner and neater in their persons. I have been the more circumstantial in describing the manners and present state of the Poles, as they bear a near resemblance, in many particulars, to those of Europe in general during the feudal ages, but their tyranny over their tenants and vassals seems to be carried to a much greater height. Lately indeed, a few nobles of enlightened understandings, have ventured to give liberty to their vassals. The first who granted this freedom, was Zamoisiki, formerly great chancellor, who in 1760, enfranchised 6 villages in the palatine of Masovia, and afterwards on all his estates. The event hath shewed the project to be no less judicious than humane; friendly to the noble's own interests as well as the happiness of the peasants, for it appears, that in the districts in which the new arrangement has been introduced, the population of the villages is considerably increased, and the revenues of their estates augmented in a triple proportion. Prince Stanislaus, nephew of the king of Poland, hath very lately enfranchised four villages near Warsaw, and had not only emancipated his peasants from slavery, but condescends to direct their affairs. So that better times in that distressed country may be expected.

Torture was abolished in Poland in 1776 by an edict of the diet, under the influence of the king. Atrocious crimes, such as murder, &c. are punished by beheading or hanging; lesser delinquencies by whipping, imprisonment, and hard labour: the nobles never suffer any corporal punishment, but are liable only to imprisonment and death.

The inns in this country are long stables built with boards and covered with straw, without furniture or windows; there are chambers at one end, but none can lodge there, because of flies and other vermin; so that strangers generally chuse rather to lodge among the horses. Travellers are obliged to carry provision with them; and when foreigners want a supply, they apply to the lord of the village, who forthwith provides them with necessaries.

DRESS.] The dress of the Poles is pretty singular. They shave their heads, leaving only a circle of hair upon the crown, and men of all ranks generally wear large whiskers. They wear a vest which reaches down to the middle of the leg, and a kind of gown over it lined with fur, and girded with a sash, but the sleeves sit as close to their arms as a waistcoat. Their breeches are wide, and make but one piece with their stockings. They wear a fur cap or bonnet; their shirts are without collar or wristband, and they wear neither stock nor neckcloth. Instead of shoes, they wear Turkey leather boots, with thin soles, and deep iron heels bent like a half moon. They carry a pole-axe, and a sabre or cutlass, by their sides. When they appear on horseback, they wear over all a short cloak, which is commonly

cover.

covered with furs both within and without. The people of the best quality wear fables, and others the skins of the tygers, leopards, &c. Some of them have fifty suits of clothes, all as rich as possible, and which descend from father to son. Were it not for our own partiality to short dresses, we must acknowledge that of the Poles to be picturesque and majestic. Charles II. of England thought of introducing the Polish dress into his court, and after his restoration wore it for two years, chiefly for the encouragement of English broad cloth; but discontinued it through his connections with the French.

The habit of the women comes very near to that of the men, a simple Polonaife, or long robe edged with fur; but some people of fashion, of both sexes, affect the French or English modes. As to the peasants, in winter, they wear a sheep's-skin with the wool inwards, and in summer a thick coarse cloth; but as to linen, they wear none. Their boots are the rinds of trees wrapped about their legs, with the thicker parts to guard the sole of their feet. The women have a watchful eye over their daughters, and in the district of Samogitia particularly, make them wear little bells, before and behind, to give notice where they are, and what they are doing.

[RELIGION.] The number of Protestants, consisting of Lutherans and Calvinists, in the republic of Poland, is very considerable; and when these are joined to the Greek church, the whole are called Dissidents. At the same time, the Polish nobility, and the bulk of the nation, are tenacious of the Roman catholic religion. The treaty of Oliva, concluded in 1660, tolerated the Dissidents, and was guaranteed by the principal powers in Europe; but was so disregarded by the Poles, that in the year 1724, they made a public massacre of the protestants at Thorn. Numerous provisions were made for the protection of the protestants, who were persecuted, when Jews, Turks, and infidels of every kind, have been tolerated and encouraged. The monasteries in Poland are by some writers said to be 576, and the nunneries 117, besides 246 seminaries or colleges, and 31 abbeyes. The clergy are possessed of a very large proportion of the lands and revenues of the kingdom, but in general, are illiterate bigots, and the monks are some of the most profligate of mankind, without apprehending any disgrace to their order, or dreading the censure of their superiors, who require equal indulgence. Vain sway the popish clergy have had in Poland at different periods, notwithstanding the treaties and capitulations which have been made in favour of the protestants and the members of the Greek church. Indeed, it has been chiefly owing to the influence and conduct of the popish clergy, that the peasants in Poland have been reduced to such a state of wretched slavery.

The principles of Socinianism made a very early and considerable progress in Poland. A translation of the Bible into the Polish language was published in 1572; and two years after, under the direction of the same persons, the catechism, or confession of the Unitarians, was published at Cracow. The abilities and writings of Socinus greatly contributed to the extensive propagation of his opinions; but though the Socinians in Poland have been very numerous, they have at different times been greatly persecuted. However, it was lately resolved between the republic and partitioning powers, that all Dissidents should henceforth enjoy the free exercise of their religion, though to continue excluded from the diet, the senate, and the permanent council. They are to have churches, but without bells; also schools and seminaries of their own; they are capable of sitting in the inferior courts of justice, and

three of their communion are admitted as assessors in the tribunal to receive appeals in religion.

[**ARCHBISHOPS AND BISHOPS.**] Poland contains two archbishops; Gnesna and Lemberg. The archbishop of Gnesna, besides being primate, and during an inter-reign prince-regent of the kingdom, is always a cardinal. The other bishops, particularly of Cracow, enjoy great privileges and immunities.

[**LANGUAGE.**] The Polish language is a dialect of Slavonic, and is both harsh and unharmonious, on account of the vast number of consonants it employs, some of their words having no vowels at all. The Lithuanians and Livonians have a language full of corrupted Latin words; but the Russian and German tongues are understood in the provinces bordering on those countries.

[**LEARNING AND LEARNED MEN.**] Though Copernicus, the great restorer of the true astronomical system, Vorstius, and some other learned men, were natives of Poland, yet its soil is far from being favourable to learning. Latin is spoken, though incorrectly, by the common people in some provinces. But the contempt which the nobility, who place their chief importance in the privileges of their rank, have ever shewn for learning; the servitude of the lower people, and the universal superstition among all ranks of men, these circumstances have wonderfully retarded, and, notwithstanding the liberal efforts of his present majesty, still continue to retard the progress of letters in this kingdom. However, of late, a taste for science hath spread itself among the nobles, and begins to be regarded as an accomplishment.

[**UNIVERSITIES.**] The universities of Poland are those of Cracow, Wilna, and Posna or Posen. The first consists of eleven colleges, and has the superintendency of 14 grammar schools dispersed through the city. The number of students in 1778, amounted to 600. Wilna was under the superintendance of the Jesuits, but since their suppression the king hath established a committee of education, who appoint professors, and direct their salaries and studies: that of Posna was rather a Jesuits' college than a university.

[**ANTIQUITIES AND CURIOSITIES,** } The frequent incursions of the
NATURAL AND ARTIFICIAL. } Tartars, and other barbarous nations, into Poland, probably forced the women sometimes to leave their children exposed in the woods, where we must suppose they were nursed by bears and other wild beasts, otherwise it is difficult to account for their subsistence. It is certain that such beings have been found in the woods both of Poland and Germany, divested of almost all the properties of humanity but the form. When taken, they generally went on all fours; but it is said that some of them have, by proper management, attained to the use of speech.

The salt mines of Poland consist of wonderful caverns, several hundred yards deep, at the bottom of which are many intricate windings and labyrinths. Out of these are dug four different kinds of salts; one extremely hard, like crystal; another softer, but clearer; a third white, but brittle; these are all brackish, but the fourth is somewhat fresher. These four kinds are dug in different mines, near the city of Cracow; on one side of them is a stream of salt-water, and on the other, one of fresh. The revenue arising from those, and other salt-mines, is very considerable, and formed part of the royal revenue, before seized by Austria: the annual average profit of those of Wiolitzka, eight miles from Cracow, was about 98,000*l.* sterling. Out of some mines at Itza, about 70 miles north-east of Cracow, are dug several kinds of earth, which are excellently adapted to the potters use, and supply all Poland with

eastern ware. Under the mounts adjoining to Kiow, in the deserts of Podolia, are several grottos, where a great number of human bodies are preserved, though buried a vast number of years since, being neither so hard nor so black as the Egyptian mummies. Among them are two princes, in the habits they used to wear. It is thought that this preserving quality is owing to the nature of the soil, which is dry and sandy. Poland can boast of few antiquities, as old Sarmatia was never perfectly known to the Romans themselves. Its artificial rarities are but few, the chief being the gold, silver, and enamelled vessels, presented by the kings and prelates of Poland, and preserved in the cathedral of Gnesna.

CITIES, TOWNS, PORTS, AND OTHER } Warfaw lies on the Vistula,
EDIFICES PUBLIC AND PRIVATE. } and almost in the centre of Poland. It is the royal residence; and contains many magnificent palaces and other buildings, besides churches and convents. It is said to contain near 70,000 inhabitants, but a great number are foreigners. The streets are spacious but ill paved, and the greatest part of the houses, particularly in the suburbs, are mean wooden hovels. The city exhibits a strong contrast of wealth and poverty, as doth every part of this unhappy country. It has little or no commerce. The same may be said of Cracow, which is the capital (though that honour is disputed by Warfaw); for we are told, that notwithstanding it lies in the neighbourhood of the rich salt-mines, and is said to contain fifty churches and convents, its commerce is inconsiderable. The city stands in an extensive plain watered by the Vistula, and with the suburbs occupy a vast space of ground, but all together scarcely contain 16,000 souls. It is surrounded with high brick walls, strengthened with round and square towers in the ancient style of fortification, and is garrisoned with 600 Russians. Grodno, though not the capital, is the principal town in Lithuania, but a large and straggling place, containing ruined palaces, falling houses, and wretched hovels, with about 7000 inhabitants; 1000 of which are Jews, and 3,000 are employed in new manufactures of cloths, camlets, linen, cotton, silk, stuffs, &c. established there by the king in 1776. He hath also established in this place, an academy of physic for Lithuania, in which ten students are instructed for physic, and twenty for surgery, all taught and maintained at his own expence.

Dantzic is the capital of polish Russia, and is famous in history on many accounts, particularly that of being formerly at the head of the Hanseatic association, commonly called the Hanse towns. It is situated on the Vistula, near five miles from the Baltic, and is a large, beautiful, populous city; its houses generally are five stories high; and many of its streets are planted with chestnut-trees. It has a fine harbour, and is still a most eminent commercial city, although it seems to be somewhat past its meridian glory, which was probably about the time that the president de Thou wrote his much esteemed *Historia sui Temporis*, wherein, under the year 1607, he so highly celebrates its commerce and grandeur. It is a republic, claiming a small adjacent territory about forty miles round it, which were under the protection of the king and the republic of Poland. Its magistracy, and the majority of its inhabitants are Lutherans; although the Romanists and Calvinists be equally tolerated in it. It is rich, and has 26 parishes, with many convents and hospitals. The inhabitants have been computed to amount to 200,000 but later computations fall very considerably short of it; as appears by its annual bill of mortality, exhibited by Dr. Busching who tells us, that in the year 1752, there died but 1846 persons. Its own shipping is numerous; but the foreign ships constantly resorting to it are more so, whereof 1014 arrived

sived there in the year 1752 ; in which year also 1888 Polish vessels came down the Vistula, chiefly laden with corn, for its matchless granaries ; from whence that grain is distributed to many foreign nations ; besides which, Dantzic exports great quantities of naval stores, and vast variety of other articles. Dr. Busching affirms, that it appears from ancient records, as early as the year 997, that Dantzic was a large commercial city, and not a village or inconsiderable town, as some pretend.

The inhabitants of Dantzic have often changed their masters, and have sometimes been under the protection of the English and Dutch ; but generally have shewn a great predilection for the kingdom and republic of Poland, as being less likely to rival them in their trade, or abridge them of their immunities, which reach even to the privilege of coining money. Though strongly fortified, and possessed of 150 large brass cannon, it could not, through its situation, stand a regular siege, being surrounded with eminences. In 1734, the inhabitants discovered a remarkable attachment and fidelity towards Stanislaus, king of Poland, not only when his enemies, the Russians, were at their gates, but even in possession of the city. The reason why Dantzic, Thorn, and Elbing, have enjoyed privileges, both civil and religious, very different from those of the rest of Poland, is because not being able to endure the tyranny of the Teutonic knights, they put themselves under the protection of Poland, reserving to themselves large and ample privileges. This city, as well as that of Thorn, were exempted by the king of Prussia from those claims which he lately made on the neighbouring countries ; notwithstanding which, he soon after thought proper to seize on the territories belonging to Dantzic, under pretence of their having been formerly part of Polish Prussia. He then proceeded to possess himself of the port-dues belonging to that city, and erected a custom-house in the harbour, where he laid arbitrary and insupportable duties upon goods exported or imported. To complete the system of oppression custom-houses were erected at the very gates of Dantzic, so that no person could go in or out of the town, without being searched in the strictest manner. Such is the treatment which the city of Dantzic has received from the king of Prussia, though few cities have ever existed, which have been comprehended in so many general and particular treaties, and whose rights and liberties have been so frequently secured and guaranteed by so many great powers, and by such a long and regular succession of public acts, as that of Dantzic has been. In the year 1784, it was blockaded by his troops, on various pretences ; by the interposition of the empress of Russia, and of the king of Poland, they were withdrawn, and a negotiation carried on by deputies at Warsaw ; which was concluded on the 7th of September ; by which, as now acceded to by the citizens, the place and trade of the city are to be restored to its former stability. The city of Thorn was also treated by the king of Prussia in the same unjust and oppressive manner with that of Dantzic, and is now added to his dominions.

COMMERCE AND MANUFACTURES.] The chief exports of Poland are all species of grain, hemp, flax, cattle, masts, planks, pitch and tar, honey, wax, potash and tallow ; its imports are foreign wines, cloths, stuffs, manufactured silks and cotton, fine linen, hardware, tin, copper, silver and gold, glass ware, furs, &c. Some linen and woolen cloths, silk, stuffs, camlets, lace and hard wares, are manufactured in the interior parts of Poland and Lithuania, but commerce is chiefly confined to the city of Dantzic, and the other towns on the Vistula and the Baltic.

CONSTITUTION AND GOVERNMENT.] Whole volumes have been written upon this subject. It differs little from an aristocracy : hence Poland hath
been

been called a kingdom and commonwealth. The king is the head of the republic, and is elected by the nobility and clergy in the plains of Warsaw. They elect him on horseback; and in case there should be a refractory minority, the majority has no control over them, but to cut them in pieces with their sabres; but if the minority are sufficiently strong, a civil war ensues. Immediately after his election, he signs the *passa conventa* of the kingdom, by which he engages that the crown shall be elective, that his successor shall be appointed during his life—that the diets shall be assembled every two years—that every noble or gentleman in the realm shall have a vote in the diet of election, and that in case the king should infringe the laws and privileges of the nation, his subjects should be absolved from their allegiance.—In fact the king was no more than president of the senate, which used to be composed of the primate, archbishop of Lemberg, fifteen bishops, and 130 laymen, consisting of the great officers of state, the Palatines and Castellans. The Palatines are the governors of the provinces, who hold their offices for life.—The Castellans office in time of peace is almost nominal, but when the military or feudal services are required, they are the lieutenants of the Palatines, and command the troops of their several districts.

The diets of Poland are ordinary and extraordinary; the former meet once in two and sometimes three years; the latter is summoned by the king, upon critical emergencies, and continue no longer than a fortnight; but one dissenting voice renders all their deliberations ineffectual. Previous to a general diet, either ordinary or extraordinary, which can sit but six weeks, there are dietines, or provincial diets held in different districts. The king with the advice of the permanent council, sends them letters containing the heads of the business that is to be treated of in the general diet. The gentry of each palatinate may sit in the dietine, and chuse nuncios or deputies, to carry their resolutions to the grand diet. The great diet consists of the king, senators, and deputies from provinces and towns, viz. 178 for Poland and Lithuania, and 70 for Prussia; it met twice at Warsaw and once at Grodno, by turns, for the conveniency of the Lithuanians, who made it one of the articles of their union with Poland; but since the present reign, they have been always summoned at Warsaw. The king formerly nominated the great offices of state and to other places, but by the new constitution, for the election of senators, as bishops, palatines, castellans, and ministers, the permanent council nominates by ballot, three candidates, one of whom the king must appoint—the same respecting the commissioners of war, and of the treasury, &c, &c. The king was also forced to renounce the right of disposing of any of the royal demesnes and fiefdoms. When the king is absent from Poland, or dead, his place is supplied by the archbishop of Gnesna, as viceroy, and if that see is vacant, by the bishop of Plesco. The ten great officers of state in Poland, who are senators, are the two great marshals, one of Poland, the other of Lithuania, the two chancellors, the two vice-chancellors, the two treasurers, and the two sub-marshals.

Such are the outlines of this motley constitution, which was new modelled with almost every new king, according to the *passa conventa* he is obliged to sign. There hath been lately a total dissolution of all order in Poland, through the influence of some of the neighbouring powers, interested to foment anarchy and confusion in the Polish councils; and many of the first nobility do not blush to receive pension from foreign courts. However, in this imperfect sketch, we can discern the great outlines of a noble and free government. The precautions taken to limit the king's power, and yet

invest him with an ample prerogative, were worthy a wife people. The institution of the diet and dietines are favourable to public liberty, as are many other provisions in the republic: but it laboured even in its best state, under incurable disorders. The exercise of the *veto*, or the tribunal negative, that is vested in every deputy or nuncio, exclusive of the king and senate, at a diet, must always be destructive of order and government. It is founded upon Gothic principles, and that unlimited jurisdiction which the great lords in former ages used to enjoy all over Europe. According to Mr. Coxe, the privilege in question is not to be found in any period of the Polish history, antecedent to the reign of John Casimir. It was under his administration that in the year 1652, when the diet of Warsaw was debating upon transactions of the utmost importance, which required a speedy determination, that Siemski, nuncio of Lithuania, cried out, "I stop the proceedings." Having uttered these words, he quitted the assembly, and re-appearing immediately to the diet, protested, that as many acts had been proposed and carried contrary to the constitution of the republic; if the diet continued to sit, he should consider it as an infringement of the laws. The members were thunderstruck at a protest of this nature, hitherto unknown. Warm debates took place about the propriety of continuing or dissolving the diet; at length, the venal and discontented faction, who supported the protest, obtained the majority; and the assembly broke up in great confusion. The want of subordination in the executive parts of the constitution, and the rendering noblemen independent and unaccountable for their conduct, is a blemish impracticable to remove. After all, when we examine the best accounts of the present constitution of Poland, and compare them with the ancient history of Great Britain, and other European kingdoms, we may perceive a wonderful similarity between what these were formerly, and what Poland is at present. This naturally leads us to infer, that the government of Poland cannot be otherwise improved than by the introduction of arts, manufactures, and commerce, which would render the common people independent on the nobility, and prevent the latter from having it in their power to annoy their sovereign, and to maintain those unequal privileges which are so hurtful to the community.

Indeed the partitioning powers, beside dismembering the best provinces of Poland, proceeded to change and fix the constitution and government, under pretence of amending it; confirming all its defects, and endeavouring to perpetuate the principles of anarchy and confusion. The executive power, which was entrusted to the king and senate, is now vested in the permanent council, composed of the king, senate, and the equestrian order. The king as president, the primate and three bishops, nine lay senators, four from the ministry of the republic, the marshal with 17 counsellors of the equestrian order, in all 36. Of the 18 senators, six from each province of Great Poland, Little Poland, and Lithuania. They insisted upon four cardinal laws to be ratified, which was at last obtained. By the *first*, "that the crown of Poland shall be for ever elective, and all order of succession proscribed;" thus the exclusion of a king's son and grandson, removes the prospect of an hereditary sovereignty, and entails upon the kingdom all the evils inseparable from an elective monarchy. By the *second*, "that foreign candidates to the throne shall be excluded, and no person can be chosen king of Poland, excepting a native Pole of noble-origin, and possessing land in the kingdom;" the house of Saxony, and all foreign princes who might be likely to give weight to Poland by their hereditary dominions, and restore its provinces and liberties, are set aside. By the *third*, "the government of Poland shall be for

for ever free, independent, and of a republican form ;" the *liberum veto*, and all the exorbitant privileges of the equestrian order, are confirmed in their utmost latitude. And by the *fourth*, " a permanent council shall be established, in which the executive power shall be vested ; and in this council the equestrian order, hitherto excluded from the administration of affairs in the interval of diets, shall be admitted ; so that the prerogatives of the crown are still farther diminished ; but this change of the constitution was intended by the partitioning powers to serve their own purposes, and give a large scope to influence and faction over that part of the kingdom they had not seized.

REVENUES.] Though the king of Poland is limited in the political exercise of his prerogative, yet his revenue is sufficient to maintain him and his household with great splendor, as he pays no troops, or officers of state, nor even his body guards. The present king had 1,000,000 and a half of florins settled upon him by the commission of state ; and the income of his predecessors generally amounted to 140,000l. sterling. The public revenues arose chiefly from the crown-lands, the salt-mines in the palatinate of Cracow, now in Austrian Poland, which alone amounted to nearly 100,000l. sterling ; ancient tolls and customs, particularly those of Elbing and Dantzic, the rents of Marienburg, Dirshau, and Rogenhuis, and of the government of Cracow and district of Niepolo-niez.

Western Prussia was the greatest loss to Poland, as by the dismemberment of that province, the navigation of the Vistula depends entirely upon the king of Prussia. This was a fatal blow to the trade of Poland, for Prussia has laid such heavy duties on the merchandise passing to Dantzick, as greatly to diminish the trade of that town, and to transfer a considerable part of it to Memel and Konigsburgh.

By the dismemberment, Poland lost near half her annual income. To supply this deficiency, it became necessary to new-model and increase the taxes.

In 1775, all the imposts amounted to	323,012	0	0
The net revenue of the king is	195,500	0	0
Out of which he only pays his household expenses, and menial servants. It arises from his royal demesnes, starosties, and 74,074l. out of the treasury			
Whole revenue	443,938	0	0
Deduct the king's revenue for privy purse	194,500	0	0
For army, state officers, and all other charges	249,438	0	0

MILITARY STRENGTH.] The innate pride of the Polish nobility is such, that they always appear in the field on horseback ; and it is said that Poland can raise with ease 100,000, and Lithuania 70,000 cavalry, but it must be understood that servants are included. As to their infantry, they are generally hired from Germany, but are soon dismissed, because they must be maintained by extraordinary taxes, of which the Polish grandees are by no means fond. As to the ordinary army of the Poles, it consisted, in 1778, of 10,310 men in Poland, and 7,465 in Lithuania, cantoned into crown-lands. The empress of Russia maintains in the country 10,000 soldiers, and every garrison is composed of Russians and natives : 1000 of the former are station-

ed at Warsaw. These hold the nobles in subjection, and the king himself is little more than a viceroy, while the Russian ambassador regulates the affairs of the kingdom under the direction of his court. The possolite consists of all the nobility of the kingdom and their followers, excepting the chancellor, and the starosts of frontier places; and they may be called by the king into the field upon extraordinary occasions; but he cannot keep them above six weeks in arms, neither are they obliged to march above three leagues out of the kingdom.

The Polish hussars are the finest and most shrewd body of cavalry in Europe; next to them are the pancerns; and both those bodies wear defensive armour of coats of mail and iron caps. The rest of their cavalry are armed with muskets and heavy scymetars. After all that has been said, the Polish cavalry are extremely inefficient in the field; for though the men are brave, and their horses excellent, they are strangers to all discipline; and when drawn out, notwithstanding all the authority their crown-general, their other officers, and even the king himself, have over them, they are oppressive and destructive to the court. It is certain, notwithstanding, that the Poles may be rendered excellent troops by discipline, and that on various occasions, particularly under John Sobieski, they made as great a figure in arms as any people in Europe, and proved the bulwark of Christendom against the infidels. It did not suit the Saxon princes, who succeeded that hero, to encourage a martial spirit in the Poles, whom they perpetually overawed with their electoral troops; nor indeed to introduce any reformation among them, either civil or military; the effects of which conduct have been since severely felt in that country.

ORDERS.] The "order of the *White Eagle*" was first instituted by Uladislavus in the year 1325, but revived by Augustus I. in the year 1705, to attach to him some of the Polish nobles who he feared were inclined to Stanislaus, his competitor: it was conferred also on the czar Peter the Great of Russia. The present king instituted the "order of *St. Stanislaus*," soon after his election to the crown in 1765. The badge is a gold cross enamelled red, and on the centre of it is a medallion with the image of St. Stanislaus, enamelled in proper colours. It is worn pendent to a red riband edged with white. The star of the order is silver, and in the centre, is a cypher of S. A. R. (Stanislaus Augustus Rex) encircled with the motto "*Premendo incitat.*"

HISTORY.] Poland, of old, was possessed by the Vandals, who were afterwards partly expelled by the Rufs and Tartars. It was divided into many small states or principalities, each almost independent of another, though they generally had some prince who was paramount over the rest. In the year 700, the people, through the oppression of their petty chiefs, gave the supreme command, under the title of duke, to Cracus, the founder of the city of Cracow. His posterity failing, in the year 830, a peasant, one Piaslav, was elected to the ducal dignity. He lived to the age of 120 years, and his reign was so long and auspicious, that every native Pole who has since been elected king, is called a Piasl. From this period, till the accession of Micislaus II. in 964, we have no very certain records of the history of Poland. The title of duke was retained, till the year 999, when Boleslaus assumed the title of king, and conquered Moravia, Prussia, and Bohemia, making them tributary to Poland. Boleslaus II. added Red Russia to Poland, by marrying the heiress of that duchy, anno, 1059. Jagello, who, in 1384, mounted the throne, was grand duke of Lithuania, and a Pagan; but on his being elected king of Poland, he not only became a

Chris-

Christian, but was at pains to bring over his subjects to that religion. He united his hereditary dominions to those of Poland, which gave such influence to his posterity over the hearts of the Poles, that the crown was preserved in his family until the male line became extinct in Sigismund Augustus, in 1572; who indulged the reformed, with the Greeks and all other sects, to a seat in the diet, and to all the honours and privileges before confined to the catholics. He gave such evident marks of favour to the protestant confession, that he was suspected of being inclined to change his religion. At this time two powerful competitors appeared for the crown of Poland. These were, Henry duke of Anjou, brother to Charles IX. king of France; and Maximilian of Austria. The French interest prevailed, by private bribes to the nobles, and a stipulation to pay an annual pension to the republic from the revenues of France; but Henry had not been four months on the throne of Poland, when his brother died, and he returned privately to France; which kingdom he governed by the name of Henry III. They party who had espoused Maximilian's interest endeavoured once more to revive his pretensions; but the majority of the Poles being desirous to chuse a prince who might reside among them, made choice of Stephen Batori prince of Transylvania, who, in the beginning of his reign, meeting with some opposition from the Austrian faction took the wisest method to establish himself on the throne, by marrying Anne, the sister of Sigismund Augustus, and of the royal house of the Jagellons. Stephen produced a great change in the military affairs of the Poles, by establishing a new militia composed of Cossacs, a rough and barbarous race of men, on whom he bestowed the Ukraine, or frontiers of his kingdom. Upon this death, in 1586, the Poles chose Sigismund, son of John king of Sweden, by Catharine sister of Sigismund II. for their king.

Sigismund was crowned king of Sweden after his father's death; but being expelled, as we have seen in the history of Sweden, by the Swedes, a long war ensued between them and the Poles, but terminated in favour of the latter. Sigismund being secured in the throne of Poland, as to that of Russia as well as Sweden; but after long wars he was defeated in both views. He was afterwards engaged in a variety of unsuccessful wars with the Turks and Swedes. At last a truce was concluded under the mediation of France and England: but the Poles were forced to agree that the Swedes should keep Elbing, Memel, Branuberg, and Pillau, together with all they had taken in Livonia. In 1623, Sigismund died, and Uladislau his son succeeded. This prince was successful both against the Turks and the Russians, and obliged the Swedes to restore all the Polish dominions they had taken in Prussia. His reign, however, was unfortunate, by his being intigated, through the avarice of his great men, to encroach upon the privileges of the Cossacs in the Ukraine. As the war which followed, was carried on against the Cossacs upon ambitious and perfidious principles, the Cossacs, naturally a brave people, became desperate; and on the succession of John II. brother to Uladislau, the Cossac general Schmielinski defeated the Poles in two great battles; and forced them to a dishonourable peace. It appears that, during the course of this war, the Polish nobility behaved as the worst of russians, and their conduct was highly condemned by John; while his nobility disapproved of the peace he had concluded with them. As the jealousy hereby occasioned, continued, the Russians came to a rupture with the Poles; and being joined by many of the Cossacs, they in 1654, took Emolenko. This was followed with the taking of Wilna, and other places; and they committed most horrid ravages in Lithuania. Next year, Charles X. of Sweden, after

over-running Great and Little Poland, entered into Polish Prussia, all the towns of which received him, except Dantzic. The resistance made by that city gave the Poles time to re-assemble, and their king, John Casimir, who had fled into Silesia, was joined by the Tartars as well as the Poles: so that the Swedes, who were dispersed through the country, were every where cut in pieces. The Lithuanians, at the same time, disowned the allegiance they had been forced to pay to Charles, who returned to Sweden with no more than a handful of his army. It was during this expedition, that the Dutch and English protected Dantzic, and the elector of Brandenburg acquired the sovereignty of Ducal Prussia, which had submitted to Charles. Thus the latter lost Poland, of which he had made an almost complete conquest. The treaty of Oliva, was begun after the Swedes had been driven out of Cracow and Thorn, by which Royal Prussia was restored to the Poles. They were, however, forced to quit all pretensions to Livonia, and to cede Smolensko, Kiow, and the duchy of Siveria, to the Russians.

During those transactions, the Polish nobility grew very uneasy with their king. Some of them were dissatisfied with the concessions he had made to the Cossacs, many of whom had thrown off the Polish yoke; others taxed him with want of capacity: and some with an intention to rule by a mercenary army of Germans. Casimir who very possibly had no such intentions, and was fond of retirement and study, finding that cabals and factions increased every day, and that he himself might fall a sacrifice to the public discontent, abdicated his throne, and died abbot of St. Germain in France, employing the remainder of his days in Latin poetical compositions, which are far from being despicable.

The most remote descendants of the ancient kings ending in John Casimir, many foreign candidates presented themselves for the crown of Poland; but the Poles chose for their king a private gentleman, of little interest and less capacity, one Michael Wiefnowiski, because he was descended from a Piast. His reign was disgraceful to Poland, large bodies of the Cossacs had put themselves under the protection of the Turks, who conquered all the provinces of Podolia, and took Kaminiack, till then thought impregnable. The greatest part of Poland was then ravished, and the Poles were obliged to pay an annual tribute to the sultan. Notwithstanding those disgraceful events, the credit of the Polish arms was in some measure maintained by John Sobieski, the crown-general, a brave and active commander, who had given the Turks several defeats. Michael dying in 1673; Sobieski was chosen king; and in 1676, he was so successful against the infidels, that he forced them to remit the tribute they had imposed upon Poland; but they kept possession of Kaminiack. In 1683, Sobieski, though he had not been well treated by the house of Austria, was so public spirited, as to enter into the league that was formed for the defence of Christendom against the infidels, and acquired immortal honour, by obliging the Turks to raise the siege of Vienna, and making a terrible slaughter of the enemy; for all which glorious services, and driving the Turks out of Hungary, he was ungratefully requited by the emperor Leopold.

Sobieski returning to Poland, continued the war against the Turks, but unfortunately quarrelled with the senate, who suspected that he wanted to make the crown hereditary in his family. He died, after a glorious reign, in 1696.

Poland fell into great distractions upon Sobieski's death. Many confederacies were formed; but all parties seemed inclined to exclude the

Sobieski

Sobieski family. In the mean while, Poland was insulted by the Tartars, and her crown was in a manner put up to sale. The prince of Conti, of the blood royal of France, was the most liberal bidder; but while he thought the election almost sure, he was disappointed by the intrigues of the queen dowager, in favour of her younger son, prince Alexander Sobieski, for which he was driven from Warsaw to Dantzic. All of a sudden, Augustus, elector of Saxony, started up as a candidate, and after a sham election, being proclaimed by the bishop of Cujavis, he took possession of Cracow with a Saxon army, and actually was crowned in that city in 1697. The prince of Conti made several unsuccessful efforts to re-establish his interest, and pretended that he had been actually chosen; but he was afterwards obliged to return to France, and the other powers of Europe seemed to acquiesce in the election of Augustus. The manner in which he was driven from the throne, by Charles XII. of Sweden, (who procured the advancement of Stanislaus) and afterwards resisted by the czar, Peter the Great, has been already related in the history of Sweden. It was not till the year 1712 that Augustus was fully confirmed on the throne, which he held upon precarious and disagreeable terms. The Poles were naturally attached to Stanislaus, and were perpetually forming conspiracies and plots against Augustus, who was obliged to maintain his authority by means of his Saxon guards and regiments. In 1725, his natural son, prince Maurice, afterwards the famous count Saxe, was chosen duke of Courland; but Augustus was not able to maintain him in that dignity, against the power of Russia and the jealousy of the Poles. Augustus died, after an unquiet reign, in 1733, having done all he could to insure the succession of Poland to his son Augustus II. (or as he is called by some, III.) This occasioned a war, in which the French king maintained the interest of his father-in-law Stanislaus, who was actually re-elected to the throne by a considerable party, of which the prince primate was the head. But Augustus, entering Poland with a powerful army of Saxons and Russians, compelled his rival to retreat into Dantzic, from whence he escaped with great difficulty into France. I have, in the history of Germany, mentioned the war between Augustus II. as elector of Saxony, or rather as the ally of Russia and Austria, and his present Prussian majesty. It is sufficient to say, that though Augustus was a mild, moderate prince, and did every thing to satisfy the Poles, he never could gain their hearts; and all he obtained from them was merely shelter, when his Prussian majesty drove him from his capital and electorate. Augustus died at Dresden, in 1763, upon which count Stanislaus Poniatowski was chosen king, by the name of Stanislaus Augustus; though it is said that the election was conducted irregularly, and that he obtained the crown chiefly through the influence of the empress of Russia. He is a man of abilities and address; but, from various concurring causes, he has had the unhappiness to see Poland, during his reign, a scene of desolation and calamity. In 1766, two Polish gentlemen presented a petition to the king, in the name of all the protestant nobility, and in behalf also of the members of the Greek church, wherein they demanded to be reinstated in their ancient rights and privileges, and to be placed upon the same footing in every respect as the Roman catholic subjects of the kingdom. "The difference of sentiments upon some points of religion among Christians," said they in their petition, "ought not to enter into any consideration with regard to the employments of the state. The different sects of Christians, although they differ in opinion among themselves with respect to some points of doctrine, agree all in one point, that of being faithful to their sovereign, and obedient to his orders; all the Christian courts are convinced of this truth; and therefore,

having always this principle in view, and without having any regard to the religion they profess, Christian princes ought only to seek after those whose merit and talents make them capable of serving their country properly." The king gave no answer to the petition of the dissidents; but the matter was referred to the diet, which was held the following year, when the ministers of the courts of Russia, of London, of Berlin, and of Copenhagen, supported their pretensions. The diet appeared to flatter the complaints of the dissidents with great moderation, as to the free exercise of their worship, which gave some flattering expectations that the affair would be happily terminated. But the intrigues of the king of Prussia appear to have prevented this: for that prince, though he openly professed to be a zealous defender of the cause of the dissidents, it was manifest from the event, that his great aim was to promote the views of his own ambition. The intervention of the Russians in the affairs of Poland also gave great disgust to all parties in the kingdom. The whole nation run into confederacies formed in distinct provinces; the popish clergy were active in opposing the cause of the dissidents; and this unfortunate country became the theatre of the most cruel and complicated of all wars; partly civil, partly religious, and partly foreign. The confusion, devastation, and civil war, continued in Poland during the years 1765, 1770, and 1771, whereby the whole face of the country was almost destroyed; many of the principal Popish families retired into foreign states with their effects; and had it not been for a body of Russian troops which acted as guards to the king at Warsaw, that city had likewise exhibited a scene of plunder and massacre. To these complicated evils, were added, in the year 1770, that most dreadful scourge, the pestilence, which spread from the frontiers of Turkey to the adjoining provinces of Podolia, Volhinia, and the Ukraine; and in these provinces it is said to have swept off 250,000 of the people. Meanwhile some of the Polish confederates interceded with the Turks to assist them against their powerful oppressors; and a war ensued between the Russians and the Turks on account of Poland. The conduct of the Grand Signior and of the Ottoman Porte, towards the distressed Poles, was just and honourable, and the very reverse of that of their Christian, Catholic, and Apostolic neighbours*.

* In 1764, the empress of Russia transmitted to the court of Warsaw an act of renunciation signed with her own hand, and sealed with the seal of the empire; wherein she declared, "That she did by no means arrogate either to herself, her heirs and successors, or to her empire, any right or claim to the districts or territories, which were actually in possession, or subject to the authority of the kingdom of Poland, or great duchy of Lithuania; but that, on the contrary, her said majesty would guarantee to the said kingdom of Poland and duchy of Lithuania, all the immunities, lands, territories, and districts, which the said kingdom and duchy ought by right to possess, or did now actually possess; and would at all times, and for ever, maintain them in the full and free enjoyment thereof, against the attempts of all and every one who should at any time, or on any pretext, endeavour to dispossess them of the same." In the same year did the king of Prussia sign, with his own hand, an act, wherein he declared, "that he had no claims, formed no pretensions on Poland, or any part thereof; that he renounced all claims on that kingdom, either the king of Prussia, elector of Brandenburg, or duke of Pomerania. In the same instrument he guarantees, in the most solemn manner, the territories and rights of Poland against every power: whatever. The empress queen of Hungary, so late as the month of January 1771, wrote a letter with her own hand to the king of Poland, in which she gave him the strongest assurances, "That her friendship for him and the republic was firm and unalterable; that the motion of her troops ought not to alarm him: that she had never entertained a thought of seizing any part of his dominions, nor would even suffer any other power to do it."—From which, according to the political creed of princes we may infer, that to guarantee the rights, liberties, and revenues of a state, means to annihilate those liberties, seize upon those rights, and appropriate those revenues to their own use. Such is the faith of princes, the instability of human politics, and of human affairs!

On September 3d, 1771, an attempt was made by Czapinski, an officer among the Polish confederates, and several others, to assassinate the king of Poland, in the streets of Warsaw. His majesty received two wounds on his head, one from a ball, and the other from a sabre; notwithstanding which he had the good fortune to escape with life, by Kozlinski's relenting, for which his own life was saved, and he now resides in the papal territories, with an annual pension from the king. Pulaski, another of the conspirators, distinguished himself in the American service, and was killed in attacking the British lines at Evansville, in 1779.

The following year, 1772, it appeared, that the king of Prussia, the emperor, and empress queen, and the empress of Russia, had entered into an alliance to divide and dismember the kingdom of Poland: though Prussia was formerly in a state of vassalage to Poland, and the title of king of Prussia was never acknowledged by the Poles till 1764. Russia also in the beginning of the 17th century saw its capital and throne possessed by the Poles, while Austria in 1683 was indebted to a king of Poland for the preservation of its metropolis, and almost for its very existence. These three allied powers, acting in concert, set up their formal pretensions to the respective districts which they had allotted for and guaranteed to each other: Polish or Western Prussia, and some districts bordering upon Brandenburg, for the king of Prussia; almost all the south-east parts of the kingdom bordering upon Hungary, together with the rich salt-works of the crown, for the empress-queen of Hungary and Bohemia*; and a large district of country about Mohilow, upon the banks of the Dnieper, for the empress of Russia †. But though each of those powers pretended to have a legal title to the territories which were allotted them respectively, and published manifestoes in justification of the measures which they had taken, yet as they were conscious that the fallacies by which they supported their pretensions were too gross to impose upon mankind, they forced the Poles to call a new diet, and threatened them, that if they did not consent unanimously to sign a treaty for the ceding of those provinces to them respectively, the whole kingdom would be laid under a military execution, and treated as a conquered state. In this extremity of distress, several of the Polish nobility protested against this violent act of tyranny, and retired into foreign states, chusing rather to live in exile, and to have all their landed property confiscated, than be the instruments of bringing their country to utter ruin; but the king under the threatening of deposition and imprisonment, was prevailed upon to sign this act; and his example was followed by many of his subjects.

The king of Prussia's conduct in Poland was the most tyrannical that can be conceived. In the year 1771 his troops entered into Great Poland, and during the space of that year he carried off from that province, and

* The district claimed by Austria, was "all that tract of land lying on the right side of the Vistula, from Silesia above Sandomir to the mouth of the San, and from thence by Francopole, Zamolse, and Rubicislaw, to the Bog; from the Bog along the frontiers of Red Russia to Zabraz, on the borders of Volhinia and Podolia, and from Zabraz in a straight line to the Nisiper, where it intersects the Shyrta, taking in a part of Podolia, and then along the boundaries separating Podolia and Moldavia. This country is now incorporated with Austria, under the appellation of the kingdoms of Galicia and Lodomeria.

† The Russian claims comprise Polish Livonia, that part of the palatinate of Polork to the east of the Dniez. The palatinates of Vitepsk, Mieslaw, and two portions of the palatinate of Minsk. This tract of land (Polish Livonia excepted) is situated in White Russia, and includes full one third of Lithuania. It is now divided into the two governments of Polotok and Mohiloff.

neighbourhood, at a moderate computation, 12,000 families. On the 29th of October, in the same year, he published an edict, commanding every person, under the severest penalties, and even corporal punishment, to take in payment for forage, provisions, corn, horses, &c. the money offered by his troops and commissaries. This money was either silver bearing the impression of Poland, and exactly worth one third of its nominal value, or ducats struck in imitation of Dutch ducats, seventeen per cent. inferior to the real ducats of Holland. With this base money he bought up corn and forage enough, not only to supply his army for two whole years, but to stock magazines in the country itself, where the inhabitants were forced to come and repurchase corn for their daily subsistence at an advanced price, and with good money, his commissaries refusing to take the same coin they had paid. At the lowest calculation he gained, by this honest manœuvre, seven millions of dollars. Having stripped the country of money and provisions, his next attempt was to thin it still more of its inhabitants. To people his own dominions, at the expence of Poland, had been his great aim; for this purpose he hit upon a new contribution; every town and village was obliged to furnish a certain number of marriageable girls; the parents to give as a portion, a feather-bed, four pillows, a cow, two hogs, and three ducats in gold. Some were bound hand and foot, and carried off as criminals. His exactions from the abbeyes, convents, cathedrals, and nobles, were so heavy, and exceeded at last, their abilities so much, that the priests abandoned their churches, and the nobles their lands. These exactions continued with unabated rigour, from the year 1771, to the time the treaty of partition was declared, and possession taken of the provinces usurped. From these proceedings it would appear that his Prussian majesty knew of no rights but his own; no pretensions but those of the house of Brandenburg; no other rule of justice but his own pride and ambition.

The violent dismemberment and partition of Poland has justly been considered as the first great breach in the modern political system of Europe. The surpris of a town, the invasion of an insignificant province, or the election of a prince, who had neither abilities to be feared, nor virtues to be loved, would some years ago have armed one half of Europe, and called forth all the attention of the other. But the destruction of a great kingdom, with the consequent disarrangement of power, dominion, and commerce, has been beheld by the other nations of Europe with the most astonishing indifference and unconcern. The courts of London, Paris, Stockholm, and Copenhagen, remonstrated against the usurpations, but that was all. Poland was forced to submit, and the partition was ratified by their diet, held under the bribes and threats of the three powers. In the senate there was a majority of six, but in the lower house, or assembly of nuncios, there was but one in favour of the measure, 54 against 53. This is a very alarming circumstance, and shews that a most important, though not happy change, has taken place in that general system of policy, and arrangement of power and dominion, which had been for some ages an object of unremitting attention with most of the states of Europe. Our ancestors might, perhaps, on some occasions, discover rather more anxiety about preserving the balance of power in Europe than was necessary; but it has been well remarked, that the idea of considering Europe as a vast commonwealth, of the several parts being distinct and separate, though politically and commercially united of keeping them independent, though unequal in power, and of prevent-

ing any one, by any means, from becoming too powerful for the rest, was great and liberal, and, though the result of barbarism, was founded upon the most enlarged principles of the wisest policy. It appears to be owing to this system, that this small part of the western world has acquired so astonishing a superiority over the rest of the globe. The fortune and glory of Greece proceeded from a similar system of policy, though formed upon a smaller scale. Both her fortune and glory expired with that system.

The revolution, which happened in this country on the 3d of May 1791, deservedly engaged much of the public attention, as it established a free and apparently well balanced constitution in Poland, founded upon the genuine principles of liberty. The evils of elective monarchy were indeed the chief cause that Poland had almost ceased to be considered as a nation. The dynasty of future kings of Poland was to commence in Frederic Augustus elector of Saxony, with the right of inheritance to his male descendants: in case the present elector should have no male issue, a husband chosen by him for his daughter, with the consent of the Polish representatives, shall begin the dynasty. But after this boasted change, Poland would only have advanced to that degree of civilization which other European countries enjoyed in the 13th century. Here hundreds of citizens would have been free, here millions of peasants slaves; at the utmost, not above five hundred thousand out of fifteen millions would have been free.

After a short and unequal struggle with Russia, this unhappy country has been forced to abandon the new constitution, and may again be regarded as a Russian province. The constitution, which had been established in Poland was not of long duration. Although the king had joined most cordially in its support as it seemed calculated to promote the happiness of his people, he had neglected every means of defending the newly settled government. Neither the standing force of Poland was properly organized, nor the militia embodied. Not a magazine was erected, not an entrenchment thrown up to oppose the entrance of the enemy. It was all a dead calm and the Austrians appeared upon their frontiers before the diet had recovered from its surprize at the first hostile declaration of the empress. It was on the 21st. of April that they received the first notification from the king, of the inimical and unjust intentions of Russia. The diet and nation rose as one man to maintain their independence. All private animosities were obliterated, all private interests were sacrificed. On the 18th. of May, the Russian ambassador delivered his declaration, which was immediately followed by the appearance of the Russian troops on the frontiers. Many obstinate engagements were fought, and the Poles bravely resisted the progress of the enemy. Notwithstanding their exertions however they were obliged gradually to retire before a more numerous and better disciplined army. Niesvez, Wilna, Minsk, and several other places of less consequence, fell into their hands one after another.

The unequal contest was however prematurely terminated. The king instead of putting himself, according to his first resolve, at the head of his army surrendered at discretion. On the 2d. of August, a confederation was formed at Warsaw, whose acts were evidently the despotic dictates of Russia, and were calculated to restore ancient abuses, and to place the country under the aggravated oppression of a foreign yoke.

Meanwhile the king of Prussia observing with how much facility the empress had seized part of the dominions of Poland determined to join in the robbery. On the 6th. of January he published a declaration, which was in a short time followed up by a body of troops. Thorn and Dantzick were in a very short time completely subjected to the Prussians, and a garrison of

6,700 men was quartered upon the inhabitants. The further partition of this unfortunate country was now rapidly approaching. It was preceded by manifestoes from the combined potentates, all attempting to justify their proceedings. The Poles were now, however, driven almost to desperation by oppression. The peasants were compelled to lodge and board the Russian soldiers, and transport them from place to place, without receiving the least remuneration. Roused into action by these excesses general Kosciusko, early in February appeared at the head of a considerable body of insurgents, attacked the Prussians, who had taken possession of their country, forced them to retreat, and pursued them to a considerable distance. During the summer a number of battles were fought with various success. Early in September the Russian grand army arrived in Poland, and on the 10th of October, a dreadful engagement took place between the Russians under general Ferfen, and the troops under Kosciusko. The Russians advanced twice to the attack, but were repulsed by the Poles, who, not contented with the advantages they had gained, abandoned their favourable position on the heights, and pressed on to the attack in their turn. This movement threw the troops into confusion; and the Russians forming themselves anew, the rout soon became general. The battle, which began at seven in the morning, did not end till noon. Kosciusko flew from rank to rank, and was continually in the hottest part of the engagement, in the course of which he had three horses killed under him. At length he fell; and a Cossack, who did not know him in the peasant's dress which he constantly wore, wounded him from behind with a lance. He recovered, and advanced a few steps, but was again knocked down by another Cossack, who was preparing to give him a mortal blow, when his arm was stopped by a Russian officer, who is said to have been general Chirnozawow, to whose wife Kosciusko had a short time before politely given leave of departure from Warsaw to join her husband. The unfortunate Kosciusko implored the officer, if he wished to render him a service, to allow the soldier to put an end to his existence; but the latter chose rather to make him a prisoner. The Polish infantry defended themselves with bravery proportioned to that of their general, and fought with a degree of valour almost approaching to fury.

The Russians soon afterwards summoned Warsaw to surrender, and on being refused, they proceeded on the 4th of November to attack the suburb of Prague. Suwarrow, commanded his soldiers to mount to the assault in the same manner they had done at Ismael, over the dead bodies of their comrades and enemies. His further orders were, that they should fight only with the sabre and the bayonet. The Russians sprung to the charge with almost inconceivable impetuosity. They eagerly began to climb the works, and the six Russian columns presented themselves at the same moment before the lines at Prague. Thus surrounded the Polish generals found themselves unable to oppose with 10,000 soldiers, which was the whole of their force, the united attack of 50,000 men; and, to add their distress, the fire which they immediately commenced, from the darkness of the night was so ill directed as to pass over the heads of the assailants.

The cry raised by the successful columns penetrated to the entrenchments on the other side the Vistula, and added to the consternation of the Poles engaged with the other part of the Russian force; and they endeavoured to find safety by retiring into Warsaw, over a bridge. In their retreat they were met by another body of Russians, and a dreadful carnage ensued, in which a great part of the garrison of Prague was miserably slaughtered. After a severe conflict of eight hours, the resistance on the part of the Poles

ceased.

ended. Five thousand Poles were computed to have been slain in the assault; the remainder were either imprisoned or dispersed. The citizens were compelled to lay down their arms, and their houses were plundered by the merciless Russians, who, after the battle had ceased nearly ten hours, about nine o'clock at night set fire to the town, and again began to massacre the inhabitants. In this exigence count Potocki, the chief of the insurrection, proposed to treat with the Russians, and repaired to their head quarters with propositions of peace, in the name of the republic. He was received with extreme haughtiness by Suwarow, who intimated, that he should not treat with any insurgent, but only with such as, invested with legitimate authority, should come to speak in the name, and on the part of, his Polish majesty. Deputies were then dispatched from the magistracy of Warsaw to the Russian commander, who returned, after having been constrained to surrender the city at discretion, under the single condition of securing to the inhabitants their lives and property. The general insolently observed, that there was another article which without doubt they had forgotten to ask, but which he would accede to them, which was *pardon for the past*.

In consequence of this arrangement, the firing which had been kept up in the suburb of Prague ceased, and all the inhabitants of Warsaw were requested to surrender their arms. This was refused by the soldiers in the city, and their chief Wawrzechki, with many others of the supreme council, refused to take part in the capitulation. This impeded the close of the negotiation; but the military, who refused to lay down their arms, were allowed to leave Warsaw, not however without a declaration from Suwarow that they might be sure of not escaping; and that, when taken, no quarter would be granted. On the morning of the 7th the supreme council with the generalissimo Wawrzechki remitted into the hands of the king the authority they had exercised. On the 9th the Russian general made his triumphal entry into Warsaw, in which the streets were lined with his troops, and the inhabitants, shut up in their houses, observed a melancholy silence. The chief magistrate delivered him the keys at the bridge of Prague; after which he received the compliments of the king, and on the 10th went with much pomp to the castle to pay his respects to his majesty. Such was the fate of this unhappy country; though brave and enthusiastick in defence of their liberties, the inhabitants are compelled to bow beneath the oppressive yoke of foreign potentates.

SWITZERLAND.

SITUATION AND EXTENT.

Miles	Degrees.
Length 260 } between { 6 and 11 east longitude.	
Breadth 100 } between { 46 and 48 north latitude.	

Containing 13,000 square miles, with 138 inhabitants to each.

BOUNDARIES.] It is bounded by Alsace and Swabia in Germany, on the North; by the lake of Constance, Tirol, and Trent, on the East; by Italy, on the South; and by France, on the West.

DIVISIONS.] Switzerland is divided into thirteen cantons, which stand in point of precedency as follows; 1. Zurich; 2. Berne; 3. Lucerne; 4. Uri; 5. Schwetz; 6. Underwalden; 7. Zug; 8. Glaris; 9. Basle; 10. Fribourg; 11. Soleure; 12. Schaffhausen; 13. Appenzel.

AIR, CLIMATE, SOIL, AND FACE OF THE COUNTRY. } This being a mountainous country, lying upon the Alps (which form an amphitheatre of more than 100 miles), the frosts are consequently bitter in winter, the hills being covered with snow sometimes all the year long. In summer the inequality of the soil renders the same province very unequal in its seasons; on one side of those mountains the inhabitants are often reaping, while they are sowing on another. The vallies, however, are warm and fruitful, and well cultivated, and nothing can be more delightful than the summer months in this charming country. It is subject to rains and tempests; for which reason public granaries are every where erected to supply the failure of their crops. The water of Switzer- and is generally excellent, and often descends from the mountains in large or small cataracts, which have a delightful effect.

There is, perhaps, no country in the world wherein the advantageous effects of unwearied and persevering industry are more remarkably conspicuous than in Switzerland. In passing over the mountainous parts thereof, the traveller is struck with admiration, to observe rocks that were formerly barren, now planted with vines, or abounding with rich pasture; and to mark the traces of the plough along the sides of precipices so steep, that a horse could not even mount them without great difficulty. In short, the inhabitants seem to have surmounted every obstruction which soil, situation, and climate had thrown in their way, and to have spread fertility over various spots of the country, which nature seemed to have consigned to everlasting barrenness. The feet of the mountains, and sometimes also the very summits are covered with vineyards, corn-fields, meadows, and pasture grounds. Other parts of this country are more dreary, consisting almost entirely of barren and inaccessible rocks, some of which are continually covered with snow or ice. The vallies between these icy and snowy mountains appear like so many smooth frozen lakes, and from them vast fragments of ice frequently fall down into the more fruitful spots beneath. In some parts, there is a regular gradation from extreme wildness to high cultivation; in others the transitions are very abrupt, and very striking. Sometimes a continued chain of cultivated mountains, richly clothed with wood, and studded all over with hamlets, cottages above the clouds, pastures which appear suspended in the air, exhibit the most delightful landscape that can be conceived; and in other places appear rugged rocks, cataracts, and mountains of a prodigious height, covered with ice and snow. "Behold our walls and bulwarks," exclaimed a Swiss peasant, pointing to the mountains; "Constantinople is not so strongly fortified." In short, Switzerland abounds with the most picturesque scenes; and here are to be found some of the most sublime exhibitions of nature, in her most awful and tremendous forms, and in those stupendous Alps, "whose heads touch heaven."

GLACIERS.] No subject in natural history is more curious than the origin of these glaciers, which are immense fields of ice, and usually rest on an inclined plain; being pushed forwards by the pressure of their own weight, and but weakly supported by the rugged rocks beneath, they are intersected by large transverse crevices; and present the appearance of walls, pyramids, and other fantastic shapes, observed at all heights and in all situations, wherever the declivity is beyond thirty or forty degrees.

Mr. Coxe describes the method of travelling over these glaciers. "We had each of us a long pole spiked with iron; and in order to secure us as much as possible from slipping, the guides fastened to our shoes *crampans*, or small

cers. "We
o secure us as
s crampans, or
small

small bars of iron; provided with four small spikes of the same metal. At other times instead of *crampans*, we had large nails in our shoes, which more effectually answered our purpose. The difficulty of crossing these valleys of ice, arises from the immense chasms. We rolled down large stones into several of them; and the great length of time before they reached the bottom, gave us some conception of their depth; our guides assured us, that in some places they are not less than five hundred feet deep. I can no otherwise convey to you an image of this body of ice, broken into irregular ridges and deep chasms, than by comparing it to a lake instantaneously frozen in the midst of a violent storm." In speaking of an unsuccessful attempt of some gentlemen to reach the summit of Mont Blanc, he presents to his readers a most horrid image of the danger of these chasms. "As they were returning in great haste, (owing to the day being far advanced) one of the party slipped in attempting to leap over a chasm of ice. He held in his hand a long pole, spiked with iron, which he struck into the ice; and upon this he hung dreadfully suspended for a few moments, until he was released by his companions."

MOUNTAINS.] In this mountainous country, where nature is all upon a grand scale, Mont Blanc is particularly distinguished from other mountains, by having its summits and sides clothed to a considerable depth with a mantle of snow, almost without the intervention of the least rock to break the glare of the white appearance. According to the calculation of Mr. De Luc, (by whose improvement of the barometer, elevations are taken with a degree of accuracy before unattainable), the height of this mountain above the level of the sea is 2,391½ French toises, or 15,304 English feet; or according to Sir George Shuckborough, 15,662 feet, which gives a difference of only 358 feet. The Peak of Teneriff and *Ætna* have been frequently supposed to be the highest points of the globe, but from the most accurate observations it will be found that Mont Blanc is of much more considerable elevation, and that there are no mountains (except those in America, particularly Chimboraco, the highest point of the Cordilleras, the elevation of which according to Condamine, surpasses 3,000 toises, or 19,200 feet, but according to others, 20,608 feet), which are equal to the altitude of Mont Blanc.

RIVERS AND LAKES.] The chief rivers are the Rhine, which rises in the chain of mountains bordering on St. Gothard, the Aar, the Reuss, the *Tessin*, the Oglio, and the Rhone.—The lakes are those of Geneva, Constance, Thun, Lucerne, Zurich, Biel, and Brien.

METALS AND MINERALS.] The mountains contain mines of iron, crystal, virgin sulphur, and springs of mineral waters.

VEGETABLE AND ANIMAL PRODUCTIONS.] Switzerland produces sheep and cattle, wine, wheat, barley, oats, rye, flax, and hemp; plenty of apples, pears, nuts, cherries, plums, and chestnuts; the parts towards Italy abound in peaches, almonds, figs, citrons, and pomegranates; and most of the cantons abound in timber. Besides game, fish, and fowl, are also found, in some of the higher and more inaccessible parts of the Alps, the bouquetin and the chamois, whose activity in scouring along the steep and craggy rocks, and in leaping over the precipices, is hardly conceivable. The blood of both these animals is so hot a nature, that the inhabitants of some of these mountains, who are subject to pleuritis, take a few drops of it, mixed with water, as a remedy for that disorder. The flesh of the chamois is esteemed very delicious. Among the Alps is likewise found a species of hares, which in summer is said perfectly to resemble other hares, but in winter become all over white, so

that they are scarcely distinguishable among the snow. But this idea hath been lately exploded, nor is it certain whether the two species ever couple together. The white hare seldom quits his rocky residence.—Here are also yellow and white foxes; which in winter sometimes come down into the vallies.

POPULATION, INHABITANTS, MANNERS, } According to the best ac-
CUSTOMS, AND DIVERSIONS. } counts, the cantons of Switzer-
land contain about, 2,000,000 of inhabitants, who are a brave, hardy, in-
dustrious people, remarkable for their fidelity, and their zealous attachment
to the liberties of their country. Like the old Romans, they are equally in-
ured to arms and agriculture. A general simplicity of manners, an open and
unaffected frankness, together with an invincible spirit of freedom, are the
most distinguishing characteristics of the inhabitants of Switzerland. A very
striking proof of the simplicity and openness of manners of this people, and of
astonishing confidence, is mentioned by Mr. Coxe, who says, upon the author-
ity of general Piffier, that, on each side of the road that runs through the
valley of Muotta, in the canton of Schweitz, there are several ranges of small
shops uninhabited, yet filled with various goods, of which the prices are mark-
ed; any passengers who wish to become purchasers, enter the shops, take
away the merchandize, and deposit the price, which the owners call for in the
evening. They are in general a very enlightened nation; their common
people are far more intelligent than the same rank of men in most other coun-
tries; a taste for literature is very prevalent among those who are in better
circumstances, and even among many of the lowest rank; and a genuine and
unartful good breeding is extremely conspicuous in the Swiss gentry. On the
first entrance into this country, the traveller cannot but observe the air of con-
tent and satisfaction which appears in the countenances of the inhabitants.
The cleanliness of the houses, and of the people, is peculiarly striking; and
in all their manners, behaviour, and dress, some strong outlines may be traced,
which distinguish this happy people from the neighbouring nations, who
labour under the oppressions of despotic government. Even the Swiss cot-
tages convey the liveliest image of cleanliness, ease, and simplicity; and can-
not but strongly impress upon the observer a most pleasing conviction of the
peasant's happiness. In some of the cantons, each cottage has its little ter-
ritory, consisting generally of a field or two of fine pasture ground, and fre-
quently skirted with trees, and well supplied with water. Sumptuary laws
are in force in most parts of Switzerland: and no dancing is allowed, except
upon particular occasions. Silk, lace, and several other articles of luxury, are
totally prohibited in some of the cantons; and even the head-dresses of the
ladies are regulated. All games of hazard are also strictly prohibited; and in
other games, the party who loses above six florins, which is about nine shil-
lings of our money, incurs a considerable fine. Their diversions, therefore,
are chiefly of the active and warlike kind; and as their time is not wasted in
games of chance, many of them employ part of their leisure hours in reading,
to the great improvement of their understandings. The youth are diligently
trained to all the martial exercises, such as running, wrestling, throwing the
hammer, and shooting both with the cross-bow and the musket.

[GOITERS AND IDIOTS.] The inhabitants in one part of this country,
particularly in the republic of Vallais, are very much subject to *goiters*, or large
excrescences of flesh that grow from the throat, and often increase to a most
enormous size; but what is more extraordinary, idiotism also remarkably
abounds among them. "I saw," says Mr. Coxe, "many instances of
both kinds, as I passed through Sion: some idiots were basking in the

fun with their tongues out; their heads hanging down, exhibiting the most affecting spectacle of intellectual imbecility that can possibly be conceived. The causes which produce a frequency of these phenomena in this country, form a very curious question.

The notion that snow-water occasions these excrescences is totally void of foundation. For on that supposition, why are the natives of those places that lie most contiguous to the glaciers, and who drink no other water than what descends from these immense reservoirs of ice and snow, free from this malady? And why are the inhabitants of those countries in which there is no snow, afflicted with it? For, these guttural tumours are to be found in the environs of Naples, in the island of Sumatra, and at Patna, and Purnea in the East Indies, where snow is unknown.

The springs, that supply drink to the natives, are impregnated with a calcareous matter, called in Switzerland *tuf*, nearly similar to the incrustations of Matlock in Derbyshire, so minutely dissolved as not in the least to affect the transparency of the water. It is not improbable, that the impalpable particles of this substance, thus dissolved, should introduce themselves into the glands of the throat, and produce goiters; for the following reasons: because *tuf*, or this calcareous deposition, abounds in all those districts, where goiters are common. There are goitrous persons and much *tuf* in Derbyshire, in different parts of the Vallais, in the Valtelline, at Lucerne, Fribourgh, and Berne; near Aigle and Bex, in several places of the Pays de Vaud, near Dresden, in the valleys of Savoy and Piedmont, near Turin and Milan. But the strongest proof in favour of this opinion, says our author, is derived from the following facts. A surgeon whom I met at the baths of Leuk, informed me that he had not unfrequently extracted concretions of *tuff-stone* from several goiters; and that from one in particular, which suppurated, he had taken several flat pieces, each about half an inch long. He added that the same substance is found in the stomach of cows, and in the goitrous tumors, to which even the dogs of the country are subject. He had diminished and cured the goiters of many young persons by emollient liquours, and external applications; and prevented them in future, by removing his patients from the place where the springs are impregnated with *tuf*; and, if that could not be contrived, by forbidding the use of water which was not purified.

Children are occasionally born with guttural swellings, but this may arise from the ailment of the mother. It is to be presumed, that a people accustomed to these excrescences, will not be shocked at their deformity; but it does not appear, as some writers assert, that they consider them as beauties. To judge from the account of many travellers, it might be supposed that the natives, without exception, were either idiots or goitrous; whereas, in fact, the Vallaisians, in general are a robust race; and all that with truth can be affirmed, is, that goitrous persons and idiots are more abundant in some districts of the Vallais, than perhaps in any other part of the globe. It has been asserted that the people very much respect these idiots, and even consider them as *blessings from Heaven*. The common people, it is certain esteem them so, for they call them "*souls of God without sin*"; and many parents prefer these idiot children to those whose understandings are perfect, because as they are incapable of intentional criminality, they consider them as certain of happiness in a future state. Nor is this opinion entirely without its good effect, as it disposes the parents to pay greater attention to such help.

helpless beings. These idiots are suffered to marry, as well among themselves, as with others *.

RELIGION.] Though all the Swiss cantons form but one political republic, yet they are not united in religion, as the reader in the table prefixed, may perceive. Those differences in religion formerly created many public commotions, which seem now to have subsided. Zuinglius was the apostle of protestantism in Switzerland. He was a moderate reformer, and differed from Luther and Calvin only in a few speculative points; so that Calvinism may be said to be the religion of the protestant Swiss. But this must be understood chiefly with respect to the mode of the church government; for in some doctrinal points they are far from being universally Calvinistical. There is, however, too much religious bigotry prevalent among them; and though they are ardently attached to the interests of civil liberty, their sentiments on the subject of religious toleration are in general much less liberal.

LANGUAGE.] Several languages prevail in Switzerland; but the most common is German. The Swiss who border upon France speak a bastard French, as those near Italy do a corrupted Latin or Italian.

LEARNING AND LEARNED MEN.] Calvin, whose name is so well known in all protestant countries, instituted laws for the city of Geneva, which are held in high esteem by the most learned of that country. The ingenious and eloquent Rousseau too, whose works the present age have received with so much approbation, was a citizen of Geneva. Rousseau gave a force to the French language, which it was thought incapable of receiving. In England he is generally known as a prose writer only, but the French admire him as a poet. His opera of the *Devin de Village*, in particular is much esteemed. M. Bonner, and Mess. de Saussure and De Luc also deserve to be mentioned with applause, and will be remembered till the Alps shall be no more.

UNIVERSITIES.] The university of Basle, which was founded in 1459, has a very curious physic-garden, which contains the choicest exotics; and adjoining to the library, which contains some valuable manuscripts, is a museum well furnished with natural and artificial curiosities, and with a great number of medals and paintings. In the cabinets of Erasmus and Amerbach, which also belong to this university, there are no less than twenty original pieces of Holbein; for one of which, representing a dead Christ, a thousand ducats have been offered. The other universities, which indeed are commonly only styled colleges, are those of Bern, Lausanne, and Zurich.

ANTIQUITIES AND CURIOSITIES } Every district of a canton in this
NATURAL AND ARTIFICIAL. } mountainous country presents the traveller with a natural curiosity; sometimes in the shape of wild but beautiful prospects, interspersed with lofty buildings, and wonderful hermitages, especially one, two leagues from Fribourg. This was formed by the hands of a single hermit, who laboured on it for 25 years, and was living in 1707. It is the greatest curiosity of the kind perhaps in the world, as it contains a chapel, a parlour 28 paces in length, 12 in breadth, and 20 feet in height, a cabinet, a kitchen, a cellar, and other apartments, with the altar, benches, flooring, cieling, all cut out of the rock.

At Siffauffhausen is a very extraordinary bridge over the Rhine, justly admired for the singularity of its architecture. The river is extremely rapid

* Coxe's Travels through Switzerland, vol. i. p. 385, &c.

and had already destroyed several stone bridges of the strongest construction, when a carpenter of Appenzel offered to throw a wooden bridge, of a single arch across the river, which is near four hundred feet wide. The magistrates, however, required, that it should consist of two arches, and that he should for that purpose employ the middle pier of the old bridge. Accordingly the architect was obliged to obey; but he has contrived to leave it a matter of doubt, whether the bridge is supported by the middle pier, and whether it would not have been equally as safe if formed solely of one arch. The sides and top are covered, and it is what the Germans call a *hängeweh*, or hanging bridge; the road which is almost level, is not carried, as usual, over the top of the arch; but, if the expression may be allowed, is let into the middle of it and there suspended. A man of the slightest weight feels it almost tremble under him, yet waggons, heavily laden pass over without danger. It has been compared to a tight rope, which trembles when struck, but still preserves its firm and equal tension. On considering the greatness of the plan, and the boldness of the construction, it is matter of astonishment that the architect was originally a carpenter, without the least tincture of literature, totally ignorant of mathematics, and not versed in the theory of mechanics. His name was Ulric Grubenmann. The bridge was finished in less than three years, and cost about 8000l. sterling.

At the famous pass of *Pierre Pertuis*, the road is carried through a solid rock near 50 feet thick, the height of the arch 26, and its breadth 25. The marchalites, false diamonds, and other stones, found in those mountains, are justly ranked among the natural curiosities of the country. The ruins of Caesar's wall, which extended 18 miles in length, from Mount Jura to the banks of Lake Lemane, are still discernible.—Many monuments of antiquity have been discovered near the baths of Baden, which were known to the Romans in the time of Tacitus. Switzerland boasts of many noble religious buildings, particularly a college of Jesuits; and many cabinets of valuable manuscripts, antiques, and curiosities of all kinds. At Lucerne (says Mr. Coxe) is to be seen a topographical representation of the most mountainous part of Switzerland, by General Pfiffer, a native of this town, and an officer in the French service. It is a model in relief, and well deserves the attention of the curious traveller. What was finished in 1776, comprized about 60 square leagues, in the cantons of Lucerne, Zug, Berne, Uri, Schwitz, and Underwalden. The model was twelve feet long, and nine and a half broad. The composition is principally a mastic of charcoal, lime, clay, a little pitch, with a thin coat of wax; and is so hard as to be trod upon without receiving the least damage. The whole is painted with different colours, representing the objects as they exist in nature. It is worthy of particular observation, that not only the woods of oak, beech, pine, and other trees are distinguished; but also that strata of the several rocks are marked, each being shaped upon the spot, and formed with granite, gravel, calcareous stone, or such other natural substances as compose the original mountains. The plan is indeed so minutely exact, that it comprizes not only all the mountains, lakes, towns, villages, and forests; but every cottage, every torrent, every road, and every path is distinctly and accurately represented. The general takes his elevations from the level of the lake of Lucerne, which, according to Mr. de Saussure, is about fourteen hundred and eight feet above the Mediterranean. This model, exhibiting the most mountainous parts of Switzerland, conveys a sublime picture of immense Alps piled one upon another; as if the story of the Titans was realized

realized, and they had succeeded (at least in one spot of the globe) in heaping Ossa upon Pelion, and Olympus upon Ossa. From the account of this officer, it appears, that there are continued chains of mountains of the same elevation, rising in progression to the highest range, and from thence gradually descending in the same proportion to Italy. Near Rosiniere, is a famous spring which rises in the midst of a natural basin of 12 square feet—the force that acts upon it must be prodigious; after a great shower of rain, it carries up a column of water as thick as a man's thigh, nearly a foot above its surface. Its temperature never varies, its surface is clear as crystal, and in depth unfathomable; probably the end of some subterraneous lake, that hath here found an issue, for its waters.

CITIES.] Of the most considerable is the city of Bern, standing on the river Aar. This city and canton, it is said, forms almost a third of the Helvetic confederacy, and can, upon occasion, fit out 100,000 armed men. All the other cities in Switzerland are excellently well provided with arsenals, bridges, and public edifices. Basil is accounted by some the capital of all Switzerland: It is situated in a fertile and delightful country, on the bank of the Rhine, and the confines of Alsace and the empire. It contains two hundred and twenty streets, and six market-places. The town-house, which stands on the river Birsac, is supported by very large pillars, and its great hall is finely painted by the celebrated Hans Holbein, who was a native of this city. The situation of Basil is pleasing: the Rhine divides it into the upper and lower town, and it is considered as one of the keys of Switzerland. Baden is famous for its antiquity and baths. Zurich is far less considerable than Bern, but in the arsenal is shewn the bow of the famous William Tell, and in the library is a manuscript of excellent letters, written by the unfortunate Lady Jane Grey, to the judicious reformer Bullinger, in elegant Latin and German.

To prevent a repetition, I shall here mention the city of Geneva, which is an associate of Switzerland, and is under the protection of the Helvetic body; but within itself is an independent state, and republic. This city is well built and well fortified, and contains 24,000 inhabitants, most of whom are Calvinists. It is situated upon the afflux of the Rhone from the large fine lake of Geneva. It is celebrated for the learning of the professors of its university, and the good government of its colleges, the purity of its air, and the politeness of its inhabitants. By its situation, it is a thoroughfare from Germany, France, and Italy. It contains a number of fine manufactures and artists; so that the protestants, especially such as are of a liberal turn, esteem it a most delightful place.—But the fermentation of their politics; and particularly the usurpation of the senate, hath divided the citizens into parties; and the late struggle of patricians and plebeians had nearly ruined all. Many of its valuable citizens have accordingly left the place, and sought refuge and protection in Ireland and elsewhere.

COMMERCE AND MANUFACTURES.] The productions of the loom, linen, dimity, lace, stockings, handkerchiefs, ribands, silk and painted cottons, and gloves, are common in Switzerland, and the inhabitants are now beginning, notwithstanding their sumptuary laws, to fabricate silks, velvets, and woollen manufactures. Their great progress in those manufactures, and in agriculture, gives them a prospect of being able soon to make considerable exports.

CONSTITUTION AND GOVERNMENT.] These are very complicated heads, though belonging to the same body; being partly aristocratical, and partly democratical. Every canton is absolute in its own jurisdiction, but those of

REVEN Swiss con venues. T crowns, a to their p necessary e been said, funds, bef The re tenth of th ou mercha al taxes. MILIT dependent

Berne, Zurich, and Lucerne, with other dependencies, are aristocratical, with a certain mixture of democracy, Berne excepted. Those of Uri, Schwitz, Unterwald, Zug, Glaris, and Appenzel, are democratical. Basil, though it has the appearance of an aristocracy, rather inclines to a democracy. But even these aristocracies and democracies differ in their particular modes of government. However, in all of them the real interests of the people appear to be much attended to, and they enjoy a degree of happiness not to be expected in despotic governments. Each canton hath prudently reconciled itself to the errors of its neighbour, and cemented on the basis of affection, a system of mutual defence.

The confederacy, considered as a republic, comprehends three divisions. The first are the Swisses, properly so called. The second are the Grisons, or the states confederated with the Swisses, for their common protection. The third are those prefectures, which, though subject to the other two, by purchase or otherwise, preserve each its own particular magistrates. Every canton forms within itself a little republic; but when any controversy arises that may affect the whole confederacy, it is referred to the general diet, which sits at Baden, where each canton having a vote, every question is decided by the majority. The general diet consists of two deputies from each canton, besides a deputy from the abbot of St. Gall, and the cities of St. Gall and Bien. It is observed by Mr. Coxe, to whom the public have been indebted for the best account of Switzerland that has appeared, that there is no country in which happiness and content more universally prevail among the people. For whether the government be aristocratical, democratical, or mixed, a general spirit of liberty pervades and actuates the several constitutions; so that even the oligarchical states (which, of all others, are usually the most tyrannical) are here peculiarly mild; and the property of the subject is securely guarded against every kind of violation. A harmony is maintained by the concurrence of their mutual felicity; and their sumptuary laws, and equal division of their fortunes among the children, seem to ensure its continuance. There is no part of Europe which contains, within the same extent of region, so many independent commonwealths, and such a variety of different governments, as are collected together in this remarkable and delightful country; and yet, with such wisdom was the Helvetic union composed, and so little have the Swiss of late years, been actuated by the spirit of conquest, that since the firm and complete establishment of their general confederacy, they have scarcely ever had occasion to employ their arms against a foreign enemy; and have had no hostile commotions among themselves, that were not very soon happily terminated.

REVENUES AND TAXES.] The variety of cantons that constitute the Swiss confederacy, renders it difficult to give a precise account of their revenues. Those of the canton of Bern are said to amount annually to 300,000 crowns, and those of Zurich to 100,000; the other cantons in proportion to their produce and manufactures. Whatever is saved, after defraying the necessary expences of government, is laid up as a common stock; and it has been said, that the Swisses are possessed of 500,000 sterling in the English funds, besides their property in other banks.

The revenues arise, 1. From the profits of the demesne lands; 2. The tenth of the produce of all the lands in the country; 3. Customs and duties on merchandise; 4. The revenues arising from the sale of salt, and some casual taxes.

MILITARY STRENGTH.] The internal strength of the Swiss cantons, independent of the militia, consists of 13,400 men, raised according to the

population and abilities of each. The œconomy and wisdom with which this force is raised and employed, are truly admirable, as are the arrangements which are made by the general diet, for keeping up that great body of militia, from which foreign states and princes are supplied, so as to benefit the state, without any prejudice to its population. Every burgher, peasant, and subject, is obliged to exercise himself in the use of arms; appear on the stated days for shooting at the mark; furnish himself with proper clothing, accoutrements, powder, and ball; and to be always ready for the defence of his country. The Swiss engage in the service of foreign princes and states, either merely as guards, or as marching regiments. In the latter cases the government permits the enlisting volunteers, though only for such states, as they are in alliance with, or with whom they have entered into a previous agreement on that article. But no subject is to be forced into foreign service, or even to be enlisted without the concurrence of the magistracy.

HISTORY.] The present Swisses and Grisons, as has been already mentioned, are the descendants of the ancient Helvetii, subdued by Julius Cæsar. Their mountainous, uninviting situation, formed a better security for their liberties than their forts or armies; and the same is the case at present. They continued long under little better than a nominal subjection to the Burgundians and Germans, till about the year 1300, when the emperor Albert I. treated them with so much rigour, that they petitioned him against the cruelty of his governors. This served only to double the hardships of the people; and one of Albert's Austrian governors, Gresler, in the wantonness of tyranny, set up a hat upon a pole, to which he ordered the natives to pay as much respect as to himself. The famous William Tell, being observed to pass frequently without taking notice of the hat, and being an excellent marksman, the tyrant condemned him to be hanged, unless he cleft an apple upon his son's head, at a certain distance, with an arrow. Tell cleft the apple; and Gresler asking him the meaning of another arrow he saw stuck in his belt, he bluntly answered, that it was intended to his (Gresler's) heart if he had killed his son. Tell was condemned to prison upon this; but making his escape, he watched his opportunity, and shot the tyrant, and thereby laid the foundations of the Helvetic liberty.

It appears, however, that before this event, the revolt of the Swisses from the Austrian tyranny had been planned by some noble patriots among them. Their measures were so just, and their course so intrepid, that they soon effected a union of several cantons.

Zurich, driven by oppression, sought first an alliance with Lucerne, Uri, Suisse, and Underwald, on the principles of mutual defence; and the frequent successes of their arms against Albert, duke of Austria, insensibly formed the grand Helvetic union. They first conquered Glaris and Zug, and admitted them to an equal participation of their rights. Berne united itself in 1353; Friburg and Soleure 130 years after; Basil and Scaffhausen in 1501; and Appenzel in 1513 completed the confederacy, which repeatedly defeated the united powers of France and Germany; till, by the treaty of Westphalia in 1648, their confederacy was declared to be a free and independent state.

Neuschâtel, since the year 1707, had been under the dominion of the king of Prussia, but the inhabitants are free to serve any prince whatever, and by no means bound to take an active part in his wars. The king hath the power of recruiting among them, and of naming a governor, but the reve-

Such
of Fran

one he derives is not above 5000l. yearly, great part of which is laid out on the roads and other public works of the country. With regard to the military character, and great actions of the Swisses, I must refer the reader to the histories of Europe.

Before the French revolution Switzerland exhibited a picture of industry, of competence, and of happiness. A general content that pervaded the lowest classes and a love for the constitution, manners, and laws of their ancestors, checked the spirit of innovation. No allurements of public shows relaxed their virtue; no incitements of luxury inflamed their desires. The absence of commerce destroyed the means of corruption; and the advancement of knowledge extinguished the flames of that religious zeal which sullied with barbarism the manners of the ancient Swiss.

In the years 1793 and 1794, which in France was justly termed the reign of terror, Switzerland wore all the appearance of splendor, affluence, and gaiety. The principal towns were crowded with strangers from all nations; as this country was then the only one upon the continent left open for the transactions of commerce, the negotiations of peace, and the asylum of fugitives. But it was only an apparent state of prosperity and happiness, the usual forerunner of misery and distress. Revolutionary principles were daily gaining ground; and the views of the democrats were considerably favoured by the thinking part of the inhabitants being entirely absorbed in the hurry of commerce, and the means of increasing their wealth.

When the directory thought that the plans which they carried on by means of their emissaries in Switzerland were ripe for execution, they made several demands upon the Swiss, which, they knew, would not be complied with. Those demands, the just refusal of which, occasioned the hostilities that took place between the two nations may be comprised in the four following:

- 1st, A free navigation of the lake Lugano.
- 2d, A passage for 25,000 men under the command of two French generals, through the Vallais, from Buonaparte's army.
- 3d, The dismissal of M. Wickham the English envoy in Switzerland.
- 4th, The redress of several injuries which they pretended to have received from the Swiss.

With regard to the two first articles, it was resolved in a diet at Fribourg, both to preserve the exclusive navigation of the lake Lugano, and to resist, by force, any attempts that should be made by the French to force a passage through the Vallais. A message was at the same time sent from the Directory to the Helvetic confederacy, requiring them to recall all the Swiss officers, who had been banished for their political opinions, and the removal of all French emigrants from Switzerland.

The British cabinet being informed of the demand that was made by the French Republic for the dismissal of Mr. Wickham recalled their ambassador. The directory deprived of all cause of quarrel on this head, made other demands still more insulting to the honour and feelings of a free people. These were, requiring the Helvetic confederacy to deprive the Swiss officers of the orders of St. Louis and of Merit, which had been conferred upon them by Louis XVI. Although the demand of suppressing this order was the most degrading which could have been required, those men who were invested with that honour, fearful of being thought hostile to the tranquility of their country, immediately resigned it.

Such were the demands made upon the Helvetic confederacy by the rulers of France, in order to bring about an open rupture between the two nations; and

and altho' these may appear to have been dictated by French ambition and French avarice, they were more the formation of the revolutionary clubs in Switzerland, who never ceased to harass the French government, and insinuate the grossest calumnies against the rulers of their own country, until they carried their cursed views into execution.

Anxious to prevent hostilities, the Swiss made another attempt to bring the French to reasonable terms. They sent deputies to treat with Mengaud, the French ambassador. Being tired, however, with repeated insults, they sent orders to their deputies to break off all further negotiations. The directory alarmed at these warlike appearances, sent general Brune to command their army in the Pays de Vaud, with orders to conclude an armistice until he should receive a sufficient reinforcement. Immediately upon his arrival he announced to the senate of Berne that he was come with pacific intentions; and entreated that commissaries might be sent to him in order to settle their differences. Persons properly authorized did come, and at the request of Brune an armistice was concluded for eight days.

The plan which the Jacobins had laid, was now completed. The moment of disorder and confusion was not to be lost by the deceitful Brune. On Friday morning the 2d. of March, two days before the termination of the armistice, he attacked the town of Fribourg; and after a bloody engagement, carried it by assault. The Bernese now took the field to the number of 18,000 men, and notwithstanding the superiority of the enemy in point of numbers, by the junction of Schawenbourg and Brune, they resolved to shed the last drop of their blood in defence of their country and their liberty: the women also, imitating the example of the ancient Helvetians, attended in the field, and shared with their husbands the danger of the day. The village of Froubrun was the spot where the action began. There the armies on both sides remained under arms in anxious expectation during the night of the 3d of March. On the morning of the 4th the Bernese army was attacked in various points: whole ranks of men were cut down by the overwhelming cavalry and irresistible artillery of the French. Then a most moving spectacle was to be seen: a number of women, in anguish and despair, threw themselves in heaps before these dreadful engines, in hopes of stopping their destructive progress by clinging to the wheels of the cannon as they advanced. But their patriotic zeal was of no avail; the great guns made their way: and the Swiss, after sustaining nine successive attacks of the enemy, were obliged to give way, and to have recourse to a precipitate retreat. They left, however upon the field sufficient proofs of their valour and courage: the dead bodies of 4000 of the enemy displayed the astonishing deeds of the Bernese soldiers; and the mangled limbs of 150 women, crushed by the cannon, the heroism of their wives.

General Schawenbourg proceeded directly towards Berne. The confusion and dismay that prevailed in that city, when the French halted under its walls, exceed all description. Traitors within, the enemy at the gates, irresolution was in every step and in every action: a number, however, with a determination to hold out, hastened to the ramparts; but to their utter astonishment they found that balls of an improper caliber had been provided for the cannon. Deprived in this manner of their principal means of defence, they retreated towards the bridge, which they defended with the greatest obstinacy; but their strength and ammunition were at length exhausted; the artillery of the enemy forced their way; the ditch was filled with the bodies of the Swiss; the town was given up; three leagues round Berne were devoted for plunder and rapine; and not an article was suffered to escape.

In the Medi-
terranean.

Thus, in the short space of four days, this brave and warlike nation, which had maintained its independence for 500 years, was entirely crushed by the perfidious machinations of artful and designing men.

S P A I N.

SITUATION AND EXTENT.

Miles. Degrees.

Length 700 } between { 10 and 3 east longitude.
Breadth 500 } { 36 and 44 north latitude.

Containing 150,763 square miles, with 69 inhabitants to each.

BOUNDARIES.] IT is bounded on the West by Portugal and the Atlantic Ocean; by the Mediterranean on the East; by the Bay of Biscay and the Pyrenean Mountains, which separate it from France, on the North; and by the strait of the sea at Gibraltar on the South.

It is now divided into fourteen districts, besides islands in the Mediterranean.

The town and fortrefs of Gibraltar, subject to Great Britain.

[ANCIENT NAMES AND DIVISIONS.] Spain formerly included Portugal, and was known to the ancients by the name of Iberia, and Hesperia, as well as Hispania. It was, about the time of the Punic wars divided into Citerior and Ulterior; the Citerior contained the provinces lying north of the river Ebro; and the Ulterior, which was the largest part, comprehended all that lay beyond that river. Innumerable are the changes that it afterwards underwent; but there is no country of whose ancient history, at least the interior part of it, we know less than that of Spain.

[CLIMATE, SOIL, AND WATER.] Excepting during the equinoctial rains, the air of Spain is dry and serene, but excessively hot in the southern provinces in June, July, and August. The vast mountains that run through Spain are, however, very beneficial to the inhabitants, by the refreshing breezes that come from them in the southernmost parts; though those towards the north and north-east are in the winter very cold, and in the night make a traveller shiver.

Such is the moisture of the hills, bounded on the north by the Bay of Biscay, and to the south by snowy mountains, that no care is sufficient to preserve their fruits, their grain, their instruments of iron, from mould, from rot, and from rust. Both the acetous, and the putrid fermentation here make a rapid progress. Besides the relaxing humidity of the climate, the common food of the inhabitants contributes much to the prevalence of most diseases which affect the principality of Asturia. Yet, although subject to such a variety of endemical diseases, few countries can produce more instances of longevity; many live to the age of a hundred, some to a hundred and ten, and others much longer. The same observation may be extended to Galicia, where, in the parish of St. Juan de Poyo, A. D. 1724, the curate administered the sacrament to thirteen persons, whose ages together made one thousand four hundred and ninety-nine, the youngest of these being one hundred and ten, and the oldest one hundred and twenty-seven. But in Villa de Fofinanes, one Juan de Outeyro, a poor labourer, died in the year 1726, aged more than one hundred and forty-six years.

The soil of Spain was formerly very fruitful in corn, but the natives have lately found some scarcity of it, by their disuse of tillage, through their indolence; the causes of which I shall explain afterwards. It produces, in many places, almost spontaneously, the richest and most delicious fruits that are to be found in France and Italy, oranges, lemons, prunes, citrons, almonds, raisins and figs. Her wines, especially sack and sherry, are in high request among foreigners. There are, in the district of Malaga, (according to Mr. Townsend, the latest traveller) fourteen thousand vine presses, chiefly employed in making the rich wines, which, if white, from the nature of the country, is called mountain; if red, from the colour *vino tinto*, known in England by the name of tent. Good mountain is sold from thirteen to sixteen pounds the butt, of one hundred and thirty five gallons, according to quality and age. It is reckoned that from eight hundred to a thousand vessels enter this port every year, which, about one-tenth are Spanish, and the exports in wine, fruit, oil and fish, are computed at about £375,000 per annum; but there have been times when it has been considerably more.

Spain indeed offers to the traveller large tracts of unpromising, because uncultivated ground; but no country perhaps maintains such a number of inhabitants, who neither toil nor work for their food, such are the generous qualities of its soil. Even sugar-canes thrive in Spain; and it yields saffron, honey, and silk, in great abundance. A late writer, Ustariz, a Spaniard, computes the number of shepherds in Spain to be 40,000; and

has given us a most curious detail of their economy, their changes of pasture at certain times of the year, and many other particulars unknown till lately, to the public. Those sheep-walks afford the finest of wool, and are a treasure in themselves. Some of the mountains in Spain are clothed with rich trees, fruits, and herbage, to the tops; and Seville oranges are noted all over the world. No country produces a greater variety of aromatic herbs, which renders the taste of their kids and sheep so exquisitely delicious. The kingdom of Murcia abounds so much with mulberry trees, that the product of its silk amounts to 200,000 l. a-year. Upon the whole few countries in the world owe more than Spain does to nature, and less to industry.

The waters (especially those that are medicinal) of Spain are little known; but many saluterous springs are found in Granada, Seville, and Cordova. All over Spain, the waters are found to have such healing qualities, that they are outdone by those of no country in Europe; and the inclosing, and encouraging a resort to them, grow every day more and more in vogue, especially at Alhamar in Granada.

[MOUNTAINS.] It is next to impossible to specify these, they are so numerous: the chief, and the highest, are the Pyrenees, near 200 miles in length, which extend from the Bay of Biscay to the Mediterranean, and divide Spain from France. Over these mountains there are only five narrow passages to France, and the road over the pass that separates Roussillon from Catalonia, reflects great honour on the engineer who planned it. It formerly required the strength of 30 men to support, and nearly as many oxen to drag up, a carriage, which four horses now do with ease. The Cantabrian mountains (as they are called) are a kind of continuation of the Pyrenees, and reach to the Atlantic Ocean, south of Cape Finisterre. No Englishman ought to be unacquainted with Mount Calpe, now called the Hill of Gibraltar, and, in former times, one of the pillars of Hercules; the other Mount Abyla, lying opposite to it in Africa.

Among the mountains of Spain, Montserrat is particularly worthy the attention of the curious traveller; one of the most singular in the world, for situation, shape, and composition. It stands in a vast plain, about thirty miles from Barcelona, and nearly in the centre of the principality of Catalonia. It is called by the Catalonians *Monte-serrado*, or *Mount Scie*, words which signify a cut, or sawed mountain; and is so called from its singular and extraordinary form; for it is so broken and divided, and so crowned with an infinite number of spiring cones, or pine heads, that it has the appearance, at a distant view, to be the work of man; but upon a nearer approach, to be evidently the production of the God of nature. It is a spot so admirably adapted for retirement and contemplation, that it has, for many ages, been inhabited only by monks and hermits, whose first vow is, never to forsake it. When the mountain is first seen at a distance, it has the appearance of an infinite number of rocks cut into conical forms, and built one upon another to a prodigious height, or like a pile of grotto work, or Gothic spires. Upon a nearer view, each cone appears of itself a mountain; and the whole composes an enormous mass about 14 miles in circumference, and the Spaniards compute it to be two leagues in height*. As it is like no other mountain, so it stands quite unconnected with any, though

* Mr. Swinburne estimates its height at only 3,300 feet, and observes that the arms of the convent are, the Virgin Mary sitting at the foot of a rock half cut through by a saw.

nor far distant from some that are very lofty. A convent is erected on the mountain, dedicated to our Lady of Montserrat, to which pilgrims resort from the farthest parts of Europe. All the poor who come here are fed gratis for three days, and all the sick received into the hospital. Sometimes, on particular festivals, seven thousand persons arrive in one day; but people of condition pay a reasonable price for what they eat. On different parts of the mountain are a number of hermitages, all of which have their little chapels, ornaments for saying mass, water cisterns, and most of them little gardens. The inhabitant of one of these hermitages, which is dedicated to St. Benito, has the privilege of making an annual entertainment on a certain day, on which day all the other hermits are invited, when they receive the sacrament from the hands of the mountain vicar; and after divine service dine together. They meet also at this hermitage, on the days of the saints to which their several hermitages are dedicated, to say mass, and commune with each other. But at other times they live in a very solitary and reclusive manner, perform various penances, and adhere to very rigid rules of abstinence, nor do they ever eat flesh. Nor are they allowed to keep within their walls either dog, cat, bird, or any living thing, lest their attention should be withdrawn from heavenly to earthly affections. The number of professed monks there, is 76, of lay brothers 28, and of singing boys 25, besides physician, surgeon, and servants. Mr. Thicknesse, who has published a very particular description of this extraordinary mountain, was informed by one of the hermits, that he often saw from his habitation, the islands of Minorca, Majorca, and Yvica, and the kingdoms of Valencia and Murcia.

RIVERS, AND LAKES.] These are the Duero, formerly Durius, which falls into the Atlantic Ocean below Oporto in Portugal; the Tajo or Tagus, which falls into the Atlantic below Lisbon; the Guadiana falls into the same ocean near Cape Finisterre; as does the Guadalquivir, now Turio, at St. Lucar; and the Ebro, the ancient Iberus, falls into the Mediterranean sea below Tortosa.

The river Tinto, the qualities of which are very extraordinary, rises in Sierra Morena, and empties itself into the Mediterranean near Huelva, having the name of Tinto given it from the tinge of its waters, which are as yellow as a topaz, hardening the sand, and petrifying it in a most surprising manner. If a stone happens to fall in, and rest upon another, they both become in a year's time perfectly united and conglutinated.—This river withers all the plants on its banks, as well as the roots of trees, which it dries of the same hue as its waters. No kind of verdure will come up where it reaches, nor any fish live in its stream. It kills worms in cattle when given them to drink; but in general no animals will drink out of this river, excepting goats, whose flesh nevertheless has an excellent flavour. These singular properties continue till other rivulets run into it, and alter its nature; for when it passes by Niebla, it is not different from other rivers, and falls into the Mediterranean sea six leagues lower down.

Several lakes in Spain, particularly that of Beneventa, abound with fishes, particularly excellent trout. The water of a lake near Antiquera is made into salt by the heat of the sun.

BAYS.] The chief bays are those of Biscay, Ferrol, Corunna (commonly called the Groyne,) Vigo, Cadiz, Gibraltar, Carthagena, Alicante, Altes, Valencia, Rosas, Majorca in that island, and the harbour of Port-Mahon, in the island of Minorca. The strait of Gibraltar divides Europe from Africa.

METALS AND MINERALS.] Spain abounds in both, and in as great variety, and of the same kinds, as the other countries of Europe. Cornelian, agate, loadstones, jacinths, turquois stones, quicksilver, copper, lead, sulphur, alum, calamine, crystal, marbles of several kinds, porphyry, the finest jasper, and even diamonds, emeralds, and amethysts, are found here. The Spanish iron, next to that of Damascus, furnishes the best arms in the world; and, in former times, brought in a vast revenue to the crown; the art of working it being here in great perfection.—Even to this day, Spanish gun barrels, and swords of Toledo, are highly valued. Amongst the ancients, Spain was celebrated for gold and silver mines; and silver was in such plenty, that Strabo, who was contemporary with Augustus Cæsar, informs us, that when the Carthaginians took possession of Spain, their domestic and agricultural utensils were of that metal. These mines have now disappeared: but whether by their being exhausted, or through the indolence of the inhabitants in not working them, we cannot say; though the latter cause seems to be the most probable.

ANIMAL PRODUCTIONS.] The Spanish horses, especially those of Andalusia, are thought to be the handsomest of any in Europe, and at the same time very fleet and serviceable. The king does all he can to monopolise the finest breeds for his own stables and service. Spain furnishes likewise mules and black cattle; and their wild bulls have so much ferocity, that their bull feasts were the most magnificent spectacle the court of Spain could exhibit, nor are they now disused. Wolves are the chief beasts of prey that pester Spain, which is well stored with all the game and wild fowl that are to be found in the neighbouring countries already described. The Spanish seas afford excellent fish of all kinds, especially anchovies, which are here cured in great perfection. This country is much infested with locusts; and Mr. Dillon observes, that in 1754, La Mancha was covered with them, and the horrors of famine assailed the fruitful provinces of Andalusia, Murcia, and Valencia. They have sometimes appeared in the air in such numbers as to darken the sky; and the clear atmosphere of Spain has become gloomy; and the finest summer day in Estremadura, been rendered more dismal than the winter of Holland. Their sense of smelling is so delicate, that they can discover a corn field, or a garden, at a considerable distance; and which they will ravage almost in an instant. Mr. Dillon is of opinion, that the country people, by timely attention and observation, might destroy the eggs of these formidable insects, and thereby totally extirpate them.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, DIVERSIONS, AND DRESS.] Spain, formerly the most populous kingdom in Europe, is now but thinly inhabited. This is owing partly to the great drains of people sent to America, and partly to the indolence of the natives, who are at no pains to raise food for their families. Another cause may be assigned, and that is, the vast numbers of ecclesiastics, of both sexes, who lead a life of celibacy. Some writers have given several other causes, such as their wars with the Moors, and the final expulsion of that people. The present inhabitants of this kingdom have been computed by Fejoo, a Spanish writer, to amount to 9,250,000, so that England is three times as populous as Spain, considering its extent.

The persons of the Spaniards are generally tall, especially the Castilians; their hair and complexions swarthy, but their countenances are very expressive. The court of Madrid has of late been at great pains to clear, their upper lips of mustachoes, and to introduce among them the French dress, instead of their black cloaks, their short jerkin, strait breeches, and long Toledo

swords, which dress is now chiefly confined to the lower ranks. The Spaniards, before the accession of the house of Bourbon to their throne, affected that antiquated dress, in hatred and contempt of the French; and the government, probably, will find some difficulty in abolishing it quite, as the same spirit is far from being extinguished. An old Castilian, or Spaniard, who sees none above him, thinks himself the most important being in nature; and the same pride is commonly communicated to his descendants. This is the true reason why many of them are so fond of removing to America, where they can retain all their native importance, without the danger of seeing a superior.

Ridiculous, however, as this pride is, it is productive of the most exalted qualities. It inspires the nation with generous, humane, and virtuous sentiments; it being seldom found that a Spanish nobleman, gentleman or even trader, is guilty of a mean action. During the most embittered wars they have had with England for near 70 years past, we know of no instance of their taking advantage (as they might easily have done) of confiscating the British property on board their galleons and Plate fleet, which was equally secure in time of war as peace. This is the more surprising, as Phillip V. was often needy, and his ministers were far from being scrupulous of breaking their good faith with Great Britain.

By the best and most credible accounts of the late wars, it appears that the Spaniards in America gave the most humane and noble relief to all British subjects who were in distress, and fell into their hands, not only by supplying them with necessaries, but money; and treating them in the most hospitable manner while they remained among them.

Having said thus much, we are carefully to distinguish between the Spanish nobility, gentry, and traders, and their government, which is to be put on the same footing with the lower ranks of Spaniards, who are as mean and rapacious as those of any other country. The kings of Spain of the house of Bourbon, have seldom ventured to employ native Spaniards of great families as their ministers. These are generally French or Italians, but most commonly the latter, who rise into power by the most infamous arts, and of late times from the most abject stations.—Hence it is that the French kings of Spain, since their accession to that monarchy have been but very indifferently served in the cabinet. Alberoni, who had the greatest genius among them embroiled his master with all Europe, till he was driven into exile and disgrace; and Grimaldi, the last of their Italian ministers, hazarded a rebellion in the capital, by his oppressive and unpopular measures.

The common people who live on the coasts, partake of all the bad qualities that are to be found in other nations. They are an assemblage of Jews, French, Russians, Irish adventures, and English smugglers; who being unable to live in their own country, mingle with the Spaniards.—In time of war, they follow privateering with great success; and when peace returns, they engage in all illicit practices, and often enter into the Irish and Walloon guards in the Spanish service. There are about 40,000 gypsies, and who, besides their fortune telling, are inn keepers in the small towns and villages. The character of the Spaniards, is thus drawn by Mr. Swinburne after his late travels through the country: "The Catalans appear to be the most active stirring set of men, the best calculated for business, travelling, and manufactures. The Valencians, a more sullen sedate race, better adapted to the occupations of husbandmen, less eager to change place, and of a much more

timid, suspicious cast of mind than the former. The Andalusians seem to be the greatest talkers and rhodomontadors of Spain. The Castilians have a manly frankness, and less appearance of cunning and deceit. The New Castilians are perhaps the least industrious of the whole nation; the Old Castilians are laborious, and retain more of ancient simplicity of manner; both are of a firm determined spirit. The Arragonese are a mixture of the Castilian and Catalan, rather inclining to the former. The Biscayners are acute and diligent, fiery and impatient of control, more resembling a colony of republicans than a province of an absolute monarchy; and the Galicians are a plodding pains-taking race of mortals, that roam over Spain in search of an hardly earned subsistence."

The beauty of the Spanish ladies reigns mostly in their novels and romances; for, though it must be acknowledged that Spain produces as fine women as any country in the world, yet beauty is far from forming their general character. In their persons, they are commonly small and slender; but they are said to employ vast art in supplying the defects of nature.—If we are to hazard a conjecture, we might reasonably suppose that those artifices rather diminish than increase their beauty, especially when they are turned of 25. Their indiscriminate use of paint, not only upon their faces, but their necks, arms, and hands, undoubtedly disfigures their complexions and shrivels their skin. It is at the same time universally allowed, that they have great wit and vivacity.

After all I have said, it is more than probable that the vast pains taken by the government of Spain, may at last eradicate those customs and habits among the Spaniards that seem so ridiculous to foreigners. They are universally known to have refined notions and excellent sense; and this, if improved by study and travelling, which they now stand in great need of, would render them superior to the French themselves. Their slow, deliberate manner of proceeding, either in council or war, has of late years worn off to such a degree, that during the two last wars, they were found to be as quick both in resolving and executing, if not more so than their enemies. Their secrecy, constancy, and patience, have always been deemed exemplary; and in several of their provinces, particularly Galicia, Granada, and Andalusia, the common people have, for some time, assiduously applied themselves to agriculture and labour.

Among the many good qualities possessed by the Spaniards, their sobriety in eating and drinking is remarkable. They frequently breakfast, as well as sup, in bed; their breakfast is usually chocolate, tea being very seldom drank. Their dinner is generally beef, mutton, veal, pork, and bacon, greens, &c. all boiled together. They live much upon garlic, chives, sallad, and radishes; which, according to one of their proverbs, are food for a gentleman. The men drink very little wine: and the women use water or chocolate. Both sexes usually sleep after dinner, and take the air in the cool of the evening. This is the common practice in warm countries, such as Italy, Spain and Portugal, where, generally speaking, the weather is clear, and the inhabitants are mostly in the habit of rising much earlier than in England. The human body cannot furnish spirits sufficient to resist the effects of the violent heat, through the whole day, without some such refreshment; it is therefore the universal practice to go to sleep for some hours after dinner, which in these countries is over-early, and this time of repose, which lasts for two or three hours, is in Spain called *the Siesta*, and in Portugal *the Sesta*. Dancing is so much their favourite entertainment, that you may see a grandmother, a mother, and daughter, all in the same country-dance. Many of their theatrical

cal exhibitions are insipid and ridiculous bombast. The prompter's head sometimes appears through a trap door above the level of the stage, and he reads the play loud enough to be heard by the audience. Gallantry is a ruling passion in Spain. Jealousy, since the accession of the house of Bourbon, has slept in peace. The nightly musical serenades of mistresses by their lovers are still in use. The fights of the cavaliers, or bull-feasts, are almost peculiar to this country, and make a capital figure in painting the genius and manners of the Spaniards. On these occasions, young gentlemen have an opportunity of shewing their courage and activity before their mistresses; and the valour of the cavalier is proclaimed, honoured, and rewarded, according to the number and fierceness of the bulls he has killed in these encounters. Great pains are used in settling the form and weapons of the combat, so as to give a relief to the gallantry of the cavalier. The diversion itself, which is attended with circumstances of great barbarity, is undoubtedly of Moorish original, and was adopted by the Spaniards when upon good terms with that nation, partly through complaisance, and partly through rivalry.

There is not a town in Spain but what has a large square for the purpose of exhibiting bull-fights; and it is said that even the poorest inhabitants of the smallest villages will often club together in order to procure a cow or an ox, and fight them, riding upon asses for want of horses.

RELIGION.] The horrors of the Romish religion, the only one tolerated in Spain, are now greatly lessened there, by moderating the penalties of the inquisition, a tribunal disgraceful to human nature; but though disused, it is not abrogated; only the ecclesiastics and their officers can carry no sentence into execution without the royal authority: it is still in force against the Moorish and Jewish pretended converts. The Spaniards embrace and practise the Roman catholic religion with all its absurdities; and in this day they have been so steady, that their king is distinguished by the epithet of *Most Catholic*. It appears, however, that the burning zeal which distinguished their ancestors above the rest of the Catholic world hath lost much of its activity, and seems nearly extinguished, and the power of the clergy has been much reduced of late years. A royal edict has also been issued, to prevent the admission of noviciates into the different convents, without special permission, which has a great tendency to reduce the monastic orders. It is computed that there are now, in the kingdom of Spain, 54,000 friars, 34,000 nuns, and 20,000 secular clergy, but as little true moral religion as in any country under heaven.

In Catalonia, the confidence of the people on the intercession of saints has at all periods been a source of consolation to them, but upon some occasions, has betrayed them into mischief. Every company of artisans, and every ship that sails, is under the immediate protection of some patron. Besides solo volumes, which testify the innumerable miracles performed by our lady in Montserrat, every subordinate shrine is loaded with votive tablets. This has been the parent of presumption, and among the merchants has brought many families to want. The companies of insurance in the last war, having each of them its favourite saint, such as San Ramon de Penaforte, la Virgen de la Merced, and others, associated in form by the articles of partnership, and named in every policy of insurance, and having with the most scrupulous exactness allotted to them their correspondent dividend, the same as to any other partner, they concluded that with such powerful associates it was not possible for them to suffer loss. Under this persuasion they ventured about the year 1779 to insure the French West Indiamen at fifty per cent. when

the English when mortally struck, all in this manner

the English and Dutch had refused to do it at any premium, and indeed when most of the ships were already in the English ports. By this fatal stroke, all the insuring companies, except two, were ruined; yet notwithstanding this misfortune, this superstition remains in force.

ARCHBISHOPRICS AND BISHOPRICS.] In Spain there are eight archbishoprics, and forty-six bishoprics. The archbishop of Toledo is styled the Primate of Spain; he is great chancellor of Castile, and hath a revenue of 100,000. sterling per annum; but the Spanish court hath now many ways of lessening the revenues of the church, as by pensions, donations to hospitals, &c. and premiums to the societies of agriculture. The archbishopric pays annually 15000 ducats to the monks of the Escorial, besides other pensions, and it is asserted, that there is not a bishopric in Spain but hath somebody or other quartered upon it, and the second rate benefices are believed to be in the same predicament. Out of the rich canopies and prebends are taken the pensions of the new order of knights of Carlos Tercero. The riches of the Spanish churches and convents are the unvarying objects of admiration to all travellers as well as natives: but there is a sameness in them all, excepting that they differ in the degrees of treasure and jewels they contain.

LANGUAGE.] The ground-work of the Spanish language, like that of the Italian, is Latin; and it might be called a bastard Latin, were it not for the terminations, and the exotic words introduced into it by the Moors and Goths, especially the former. It is at present a most majestic and expressive language: and it is remarkable that the foreigners who understand it the best, prize it the most. It makes but a poor figure, even in the best translators; and Cervantes speaks almost as awkward English, as Shakespeare does French. It may, however, be considered as a standard tongue, having nearly retained its purity for upwards of 200 years. Their Pater-noster runs thus: *Padre nuestro, qui estas en le cielo, santificado se ul tu nombre; venga á nos el tu reyno; bagase tu voluntad, assi en la tierra como en el cielo; el pan nuestro de cada dia da nos le oy; y perdona nos nuestras deudas assi como nos otros perdonamos a nuestros deudores; no nos dexes cair en la tentacion, mas libra nos de mal, porque tao es le reyno; y la potencia; y la gloria per los siglos. Amen.*

LEARNING AND LEARNED MEN.] Spain has not produced learned men in proportion to the excellent capacities of its natives. This defect may, in some measure, be owing to their indolence and bigotry, which prevents them from making that progress in the polite arts which they otherwise would; but the greatest impediment to literature in Spain, is the despotic nature of its government. Several old fathers of the church were Spaniards; and learning owes a great deal to Isidore, bishop of Seville, and cardinal Ximenes. Spain has likewise produced some excellent physicians. Such was the gloom of the Austrian government, that took place with the emperor Charles V that the inimitable Cervantes, the author of Don Quixote, born at Madrid, in 1549, lifted in a station little superior to that of a common soldier, and died neglected, after fighting bravely for his country at the battle of Lepanto, in which he lost his left hand. His satire upon knight errantry, in his adventures of Don Quixote, did as much service to his country by curing them of that ridiculous spirit, as it now does honour to his own memory. He was in prison for debt, when he composed the first part of his history, and is perhaps to be placed at the head of moral and humorous satirists.

The visions of Quevedo, and some other of his humourous and satirical pieces,

pieces, having been translated into the English language, have rendered that author well known in this country. He was born at Madrid in the year 1570, and was one of the best writers of his age, excelling equally in verse and in prose. Besides his merit as a poet, he was well versed in the oriental languages, and possessed great erudition. His works are comprised in three volumes, 4to, two of which consist of poetry, and the third of pieces in prose. As a poet he excelled both in the serious and burlesque style, and was happy in a turn of humour similar to that which we admire in Butler and Swift.

Poetry was cultivated in Spain at an early period. After the Saracens had settled themselves in this kingdom, they introduced into it their own language, religion, and literature; and the oriental style of poetry very generally prevailed. Before this period, the Spaniards had addicted themselves much to Roman literature; but Alvara of Cordova complains, that, in his time, the Spaniards had so totally forgotten the Latin tongue, and given the preference to Arabic, that it was difficult even amongst a thousand people, to find one who could write a Latin letter.—The attachment of many of the inhabitants of Spain to oriental literature was then so great, that they could write Arabic with remarkable purity, and compose verses with as much fluency and elegance as the Arabians themselves. About this time the Spanish Jews made a considerable figure in literature, which was promoted by masters from Babylon, where they had academies supported by themselves. In the year 967 Rabbi Moses, and his son Rabbi Enoch, having been taken by pirates, were sold as slaves at Cordova, and redeemed by their brethren, who established a school in that city, of which Rabbi Moses was appointed the head: that learned Jew was, however, desirous of returning back to his own country; but the Moorish king of Cordova would not give his consent, rejoicing that his Hebrew subjects had masters of their own religion at home, without being under the necessity of receiving them from a foreign university, and every indulgence was granted them with respect to their worship. In 1039, Rabbi Ezechias was put to death at Babylon, and the college over which he had presided was transferred to Cordova, from whence a number of Hebrew poets issued forth, who have been noticed by various learned writers. The Spanish Jews had also flourishing schools at Seville, Granada, and Toledo, and from hence arose the Castilian language, and form a conspicuous part of its phraseology. To these Jews the Spanish language is indebted for a curious version of the Hebrew books of the Old Testament, which was afterwards printed at Ferrara, in 1553, in a Gothic Spanish letter.

The Spanish writers also boast of their Troubadours as high as the twelfth or thirteenth centuries, the Provençal and Galician dialects being then very prevalent. The marquis of Villena, who died in 1434, was the author of that famous work the *Arte de la Gaye Sciencia*, which comprehends a system of poetry, rhetoric, and oratory, besides describing all the ceremonies of the Troubadours at their public exhibitions.—That nobleman was also the author of a translation of the *Æneid* of Virgil into Spanish verse. Juan de Mena, of Cordova, was also much celebrated as a poet in his own time; his poems have passed through a variety of editions, the first of which was printed at Saragossa in 1515. Juan de la Encina was also a poet of considerable merit: he translated some of the Latin poems into Spanish, and published a piece on the art of poetry, and other works which were printed at Saragossa in 1516. and other. Spanish poets alfo obtained great reputation in their own country. But the moft diftinguifhed dramatic poet of this nation was Lopez de Vega, who was contemporary with our Shakefpeare. He poffeffed an imagination aftonifhingly fertile, and wrote with great facility; but in his dramatic works he difregarded the unities, and adapted his works more to the tafte of the age, than to the rules of criticifm. His lyric compofitions, and fugitive pieces, with his profe effays, form a collection of fifty volumes, befides his dramatic works, which make twenty-fix volumes, more; exclusive of four hundred fcriptural dramatic pieces, called in Spain *Auto Sacramentales*. Calderon was alfo a dramatic writer of confiderable note, but many of his plays are very licentious in their tendency.

Toftatus, a divine, the moft voluminous perhaps that ever wrote, was a Spaniard; but his works have been long diftinguifhed only by their bulk. Herrera, and fome other hiftorians, particularly De Solis, have fhewn great abilities in hiftory, by investigating the antiquities of America, and writing the hiftory of its conqueft by their countrymen.—Among the writers who have lately appeared in Spain, Father Feyjoo has been one of the moft diftinguifhed. His performances difplay great ingenuity, very extenfive reading and uncommon liberality of fentiment, efpecially when his fituation and country are confidered. Many of his pieces have been tranflated into Englifh, and publifhed in four volumes, 8vo. Don Francisco Perez Bayer, archdeacon of Valencia, and author of a difertation on the Phenician language, may be placed in the firft line of Spanifh literati. Spain has likewife produced many travellers and voyagers to both the Indies, who are equally amufing and inftructive. If it fhould happen the Spaniards could difengage themfelves from their abftracted metaphyfical turn of thinking, and from their prefent tyrannical form of government, they certainly would make a capital figure in literature. At prefent, it feems, that the common education of an Englifh gentlemen would conftitute a man of learning in Spain, and fhould he underftand Greek, he would be quite a phænomenon.

Some of the Spaniards have diftinguifhed themfelves in the polite arts, and not only the cities, but the palaces, efpecially the Efcorial, difcover many ftriking fpecimens of their abilities as fculptors and architects; Palomino in an elaborate treatife on the art of painting, in two volumes, folio, has inferted the lives of two hundred and thirty-three painters and fculptors, who flourifhed in Spain from the time of Ferdinand the Catholic to the conclufion of the reign of Philip IV. Among the moft eminent Spanifh painters, were Velafque, Murillo, who is commonly called the Spanifh Vandyke, Ribeira, and Claudio, Coello whole ftyle of painting was very fimilar to that of Paul Veronefe.

UNIVERSITIES.] In Spain are reckoned 24 univerfities, the chief of which is Salamanca, founded by Alphonfus, ninth king of Leon, in the year 1200. It contains 21 colleges, fome of which are very magnificent. Moft of the nobility of Spain fend their fons to be educated here. The reft are, Seville, Granada, Compoftella, Toledo, Valladolid, Alcalá, Sigüenza, Valencia, Lerida, Huéfcá, Saragoffa, Tortofa, Ofluna, Onata, Candia, Barcelona, Murcia, Taragona, Baeza, Oriuela, Oviedo, and Palencia.

ANTIQUITIES AND CURIOSITIES, } The former of thefe confift chiefly
ARTIFICIAL AND NATURAL. } of Roman and Moorifh antiquities.
Near Segovia, a grand aqueduct, erected by Trajan, extends over a deep valley between two hills, and is fupported by a double row of 159 arches.

Other Roman aqueducts, theatres, and circi, are to be found at Terrago, and different parts of Spain. A runique watch-tower near Cadiz is vulgarly, but erroneously thought to be one of the pillars of Hercules. Near the city of Salamanca are the remains of a Roman way, paved with large flat stones; it was continued to Merida, and from thence to Seville. At Toledo are the remains of an old Roman theatre, which is now converted into a church, said to be one of the greatest curiosities of antiquity. It is 600 feet in length, 500 in breadth, and of a proportionable height; the roof, which is amazingly bold and lofty, is supported by 350 pillars of fine marble, in ten rows, forming eleven aisles, in which are 366 altars, and 24 gates; every part being enriched and adorned with the most noble and costly ornaments. At Martorel, a large town, where much black lace is manufactured, is a very high bridge, built in 1768 out of the ruins of a decayed one that had existed 1085 years from its erection by Hannibal. At the north end is a triumphal arch or gateway, said to have been raised by that general in honour of his father Hamilcar. It is almost entire, well proportioned and simple, without any kind of ornament, except a rim or two of hewn stone. Near Murviedro (once the faithful Saguntum) destroyed by Hannibal, are some Roman remains—as the ruins of the theatre, an exact semicircle about 82 yards diameter, some of the galleries, are cut out of the rock, and 9000 persons might attend the exhibitions without inconvenience.

The Moorish antiquities are rich and magnificent. Among the most distinguished of these is the royal palace of the Alhambra at Granada, which is one of the most entire, as well as the most stately, of any of the edifices which the Moors erected in Spain. It was built in 1280, by the second Moorish king of Granada, and, in 1492, in the reign of their eighteenth king, was taken by the Spaniards. It is situated on a hill, which is ascended by a road bordered with hedges of double or imperial myrtles, and rows of elms. On this hill, within the walls of the Alhambra, the emperor Charles V. began a new palace in 1568, which was never finished, though the shell of it remains. It is built of yellow stone: the outside forms a square of one hundred and ninety feet. The inside is a grand circular court, with a portico of the Tuscan, and a gallery of the Doric order, each supported by thirty-two columns, made of as many single pieces of marble. The grand entrance is ornamented with columns of jasper, on the pedestals of which are representations of battles, in marble basso relievo. The Alhambra itself is a mass of many houses and towers, walled round, and built of large stones of different dimensions. Almost all the rooms have stucco walls and ceilings, some carved, some painted, and some gilt, and covered with various Arabic sentences. The most curious place within, that perhaps exists in Europe. Here are several baths, the walls, floor, and ceiling of which are of white marble. The gardens abound with orange and lemon trees, pomegranates, and myrtles. At the end of the gardens is another palace called Ginaliph, situated on a more elevated station than the Alhambra. From the balconies of this palace is one of the finest prospects in Europe over the whole fertile plain of Granada, bounded by the snowy mountains. The Moors to this day regret the loss of Granada, and still offer up prayers to God for the recovery of the city. Many other noble monuments, erected in the Moorish times, remain in Spain; some of them in tolerable preservation and others exhibiting superb ruins.

Among the natural curiosities, the medicinal springs, and some noisy lakes, form a principal part; but we must not forget the river Guadiana,

which like the Mole in England, runs under ground, and then is said to emerge. The royal cabinet of natural history at Madrid, was opened to the public by his majesty's orders in 1775. Every thing in this collection is ranged with neatness and elegance, and the apartments are opened twice a-week for the public, besides being shewn privately to strangers at request. The mineral part of the cabinet, containing precious stones, marbles, ores, &c. is very perfect; but the collection of birds and beasts at present is not large, though it may be expected to improve space, if care be taken to get the productions of the Spanish American colonies. Here is also a curious collection of vases, basons, ewers, cups, plates, and ornamental pieces of the finest agates, amethysts, rock crystals, &c. mounted in gold, and enamel, set with cameos, entaglios, &c. in elegant taste, and of very fine workmanship, said to have been brought from France by Philip. V. The cabinet also contains specimens of Mexican and Peruvian vases and utensils.

In blowing up the rock of Gibraltar, many pieces of bones and teeth have been found incorporated with the stone, some of which have been brought to England, and deposited in the British Museum. On the west side of the mountain is the cave called St. Michael's, eleven hundred and ten feet above the horizon. Many pillars of various sizes, some of them two feet in diameter, have been formed in it by the droppings of water, which have petrified in falling. The water perpetually drips from the roof, and forms an infinite number of stalactitz, of a whitish colour, composed of several coats or crusts, and which, as well as the pillars, continually increase in bulk, and may probably in time fill the whole cavern. From the summit of the rock, in clear weather, not only the town of Gibraltar may be seen, but the bay, the straits, the towns of St. Roque and Algeiras, and the Alpuxara mountains, mount Abyla on the African shores, with its snowy top, the cities of Ceuta, Tangier, and great part of the Barbary coast.

CHIEF CITIES, &c.] Madrid, though unfortified, it being only surrounded by a mud wall, is the capital of Spain, and contains about 300,000 inhabitants. It is surrounded with very lofty mountains, whose summits are frequently covered with snow. It is well paved and lighted, and some of the streets are spacious and handsome. The houses of Madrid are of brick, and are laid out chiefly for shew, conveniency being little considered; thus you will pass through usually two or three large apartments of no use, in order to come at a small room at the end where the family sit. The houses in general look more like prisons than the habitations of people at their liberty; the windows besides having a balcony, being grated with iron bars, particularly the lower range, and sometimes all the rest. Separate families generally inhabit the same house, as in Paris and Edinburgh. Foreigners are very much distressed for lodgings at Madrid, as the Spaniards are not fond of taking strangers into their houses, especially if they are not catholics. Its greatest excellency is the cheapness of its provisions; but neither tavern, coffee-house, nor newspaper, excepting the Madrid Gazette, are to be found in the whole city. The royal palace stands on an eminence, on the west side of the city; it is a spacious magnificent structure, consisting of three courts, and commands a very fine prospect. Each of the fronts is 470 feet in length, and 100 high, and there is no palace in Europe fitted up with greater magnificence: the great audience-chamber especially, which is 120 feet long, and hung with crimson velvet richly embroidered with gold. Ornamented also with 12

looking-glasses at St. Ildefonso, each 10 feet high, with 12 tables of the finest Spanish marbles. The other royal palaces round it are designed for hunting seats, or houses of retirement for their kings. Some of them contain fine paintings and good statues. The chief of those palaces are the Buen Retiro (now stripped of all its best pictures and furniture), Casa del Campo, Aranjuez, and St. Ildefonso.

A late traveller has represented the palace of Aranjuez, and its gardens, as extremely delightful. Here is also a park many leagues round, cut across in different parts, by alleys of two, three, and even four miles extent. Each of these alleys is formed by two double rows of elm-trees; one double row on the right, and one on the left, which renders the shade thicker. The alleys are wide enough to admit of four coaches abreast, and betwixt each double row there is a narrow channel, through which runs a stream of water. Between those alleys there are thick groves of smaller trees of various kinds, and thousands of deer and wild-boars wander there at large, besides numberless hares, rabbits, pheasants, partridges, and several other kinds of birds. The river Tagus runs through this place, and divides it into two unequal parts. The central point of this great park is the king's palace, which is partly surrounded by the garden, and is exceedingly pleasant, adorned with fountains and statues, and it also contains a vast variety of the most beautiful flowers, both American and European. As to the palace of Aranjuez itself, it is rather an elegant than a magnificent building.

The palace of St. Ildefonso is built of brick, plastered and painted, but no part of the architecture is agreeable. It is two stories high, and the garden-front has thirty one windows, and twelve rooms in a suite. The gardens are on a slope, on the top of which is a great reservoir of water, called here *El Mar*, the sea, which supplies the fountains; this reservoir is furnished from the torrents which pour down the mountains. The water-works are excellent, and far surpass those at Versailles. The great entry of the palace is somewhat similar to that of Versailles, and with a large iron pallisade. In the gardens are twenty-seven fountains; the basins are of white marble, and the statues, many of which are excellent, are of lead, bronzed and gilt. These gardens are in the formal French style, but ornamented with sixty-one very fine marble statues, as large as the life, with twenty-eight marble vases, and twenty leaded vases gilt. The upper part of the palace contains many valuable paintings, and the lower part antique statues, busts, and basso-relievos.

The pride of Spain, however, is the Escorial, and the natives say, perhaps with justice, that the building of it cost more than that of any other palace in Europe. The description of this palace forms a sizeable quarto-volume, and it is said, that Philip II. who was its founder, expended upon it six millions of ducats. It contains a prodigious number of windows, 200 in the west front, and in the east 366, and the apartments are decorated with an astonishing variety of paintings, sculpture, tapestry, ornaments of gold and silver, marble, jasper, gems and other curious stones. This building, besides its palace, contains a church large and richly ornamented, a mausoleum, cloisters, a convent, a college, and a library, containing about thirty thousand volumes; but it is more particularly valuable for the Arabic and Greek manuscripts, with which it is enriched. Above the shelves are paintings in fresco by Barthelmei Carducho, the subjects of which are taken from sacred or profane history, or have relation to the sciences of which the shelves below present to us the elements. presented above the books which treat of theology; the death of Archimedes at the siege of Syracuse, indicates those which relate to the mathematics; and Cicero pronouncing his oration in favour of Rabirius, the works relative to eloquence and the bar. A very singular circumstance in this library may be agreeable to the curious reader to know, which is, that, on viewing the books, he will find them placed the contrary way; so that the edges of the leaves are outwards, and contain their titles written on them. The reason for this custom is, that Arias Montanus, a learned Spaniard of the sixteenth century, whose library had served as a foundation for that of the Escorial, had all his books placed and inscribed in that manner, which no doubt appeared to him to be the most commodious method of arranging them; that he had introduced his own method into the Escorial; and since his time, and for the sake of uniformity, it had been followed with respect to the books afterwards added. Here are also large apartments for all kinds of artists and mechanics, noble walks, with extensive parks and gardens, beautified with fountains and costly ornaments. The fathers that live in the convent are 200, and they have an annual revenue of 12000*l*. The mausoleum, or burying place of the kings and queens of Spain, is called the Pantheon, because it is built upon the plan of that temple at Rome, as the church to which it belongs is upon the model of St. Peter's. It is 36 feet diameter, incrusted with fine marble.

Allowing to the Spaniards their full estimate of the incredible sums bestowed on this palace, and on its furniture, statues, paintings, columns, vases, and the like decorations, which are most amazingly rich and beautiful, yet we hazard nothing in saying, that the fabric itself discovers a bad taste upon the whole. The conceit of building it in the form of a gridiron, because St. Laurence, to whom it is dedicated, was broiled on such an utensil, and multiplying the same figure through its principal ornaments, upon the doors, windows, altars, rituals, and sacerdotal habits, could have been formed only in the brain of a tasteless bigot, such as Philip II. who erected it to commemorate the victory he obtained over the French (but by the assistance of the English forces) at St. Quintin, on St. Laurence's day, in the year 1557. The apartment where the king resides forms the handle of the gridiron. The building is a long square of 640 feet by 580. The height to the roof is 60 feet. It has been enriched and adorned by his successors; but its outside has a gloomy appearance, and the inside is composed of different structures, some of which are master-pieces of architecture, but forming a disagreeable whole. It must however be confessed, that the pictures and statues that have found admision here, are excellent in their kind, and some of them not to be equalled even in Italy itself.

Cadiz is the great emporium of Spanish commerce. It stands on an island separated from the continent of Andalusia, without the straits of Gibraltar, by a very narrow arm of the sea, over which a fortified bridge is thrown, and joins it to the main land. The entrance into the bay is about 500 fathoms wide, and guarded by two forts called the Puntals. The entrance has never been of late years attempted by the English, in their wars with Spain, because of the vast interest our merchants have in the treasures there, which they could not reclaim from the captors. The streets are narrow, ill paved, and filthy; and full of rats in the night. The houses lofty with flat roofs, and few are without a turret for a view of the sea. The population is reckoned at 140,000 inhabitants, of which 12,000 are French, and as many Italians. The cathedral hath been already 50 years building, and the roof is not half finished. The environs are beautifully rural.

Cordova is now an inconsiderable place; streets crooked and dirty, and but few of the public or private buildings conspicuous for their architecture. The palace of the inquisition and of the bishops are extensive and well situated. The cathedral was formerly a mosque, divided into seventeen aisles by rows of columns of various marbles, and is very rich in plate; four of the silver candlesticks, cost 850*l.* a piece. The revenue of the see amounts to 3500*l.* per ann. but as the bishops cannot devise by will, all they dispossessed of, elcheats to the king.

Seville, the Julia of the Romans, is next to Madrid, the largest city in Spain, but is greatly decayed both in riches and population. The shape is circular, and the walls seem of Moorish construction; its circumference is five miles and a half. The suburb of Triana, is as large as many towns, and remarkable for its gloomy Gothic castle, where, in 1481, the inquisition was first established in Spain. Its manufactures in wool and silk which formerly amounted to 16,000, are now reduced to 400, and its great office of commerce to Spanish America is removed to Cadiz. The cathedral of Seville is a fine Gothic building, with a curious steeple or tower, having a moveable figure of a woman at the top, called La Giralda, which turns round with the wind, and which is referred to in Don Quixote. This steeple is reckoned one of the greatest curiosities in Spain, and is higher than St. Paul's in London; but the cathedral, in Mr. Swinburne's opinion, is by no means equal to York minister for lightness, elegance, or Gothic delicacy. The first clock made in the kingdom was set up in this cathedral in the year 1400, in the presence of king Henry III. The prospect of the country round this city, beheld from the steeple of the cathedral, is extremely delightful.

Barcelona, formerly Barcino, said to be founded by Hamilcar Barca, is a large circular trading city, containing 15,000 houses, is situated on the Mediterranean facing Minorca, and is said to be the handsomest place in Spain; the houses are lofty and plain, and the streets well lighted, and paved. The citadel is strong, and the place and inhabitants famous for the siege they sustained in 1714 against a formidable army, when deserted both by England and the Emperor, for whom they had taken up arms. The number of inhabitants is supposed to be nearly 150,000, and they supply Spain with most of the cloathing and arms for the troops. A singular custom prevails among them on the 1st of November, the eve of All Souls; they run about from house to house to eat chestnuts, believing that for every chestnut they swallow, with proper faith and unction, they shall deliver a soul out of purgatory.

Valencia is a large and almost circular city, with lofty walls. The streets are crooked and narrow, and not paved, the houses ill built and filthy, and most of the churches tawdry. Priests, nuns, and friars, of every dress swarm in this city, whose inhabitants are computed at 80,000. Its archbishopric is one of the best in Spain, to the amount of 40,000*l.* sterling a year.

Carthagenia is a large city, but has very few good streets, and fewer remarkable buildings. The port is very complete, formed by nature in the figure of a heart, and the arsenal is a spacious square south-west of the town, with 40 pieces of cannon to defend it towards the sea. When Mr. Swinburne visited it, in 1775, there were 800 Spanish criminals, and 600 Barbary slaves working at the pumps to keep the docks dry, &c. and treated with great inhumanity. The crimes for which the Spaniards were sent there, deserved indeed exemplary punishments.

Granada stands on two hills, and the ancient palace of the Alhambra crowns the double summit between two rivers, the Douyo, and the Xenil.

The former glories of this city are passed away with its old inhabitants; the streets are now filthy, and the aqueducts crumbled to dust, and its trade lost. Of 50,000 inhabitants, only 18,000 are reckoned useful; the surplus is made up of clergy, lawyers, children, and beggars. The amphitheatre for bull fights is built of stone, and one of the best in Spain, and the environs of the city are still pleasing and healthful.

Bilboa is situated on the banks of the river Ybaizabal, and is about two leagues from the sea. It contains about eight hundred houses, with a large square by the water side, well shaded with pleasant walks, which extend to the outlets, on the banks of the river; where there are great numbers of houses and gardens, which form a most pleasing prospect, particularly in sailing up the river; for, besides the beautiful verdure, numerous objects open gradually to the eye, and the town appears as an amphitheatre, which enlivens the landscape, and completes the scenery. The houses are solid and lofty, and the streets well paved and level; and the water is so conveyed into the streets, that they may be washed at pleasure; which renders Bilboa one of the neatest towns in Europe.

Malaga is an ancient city, and not less remarkable for its opulence and extensive commerce than for the luxuriance of its soil, yielding in great abundance the most delicious fruits; whilst its rugged mountains afford those luscious grapes, which give such reputation to the Malaga wine, known in England by the name of Mountain. The city is large and populous, and of a circular form, surrounded with a double wall, strengthened by stately towers, and has nine gates. A Moorish castle on the point of a rock commands every part of it. The streets are narrow, and the most remarkable building in it is a stupendous cathedral, begun by Philip II. said to be as large as that of St. Paul's in London. The bishop's income is 16,000l. sterling.

The city of Salamanca is of a circular form, built on three hills and two vallies, and on every side surrounded with prospects of fine houses, noble seats, gardens, orchards, fields, and distant villages; and is ancient, large, rich, and populous. There are ten gates to this city, and it contains twenty-five churches, twenty-five convents of friars, and the same number of nunneries. The most beautiful part of this city is the great square, built about forty years ago. The houses are of three stories, and all of equal height and exact symmetry, with iron balconies, and a stone balustrade on the top of them: the lower part is arched, which forms a piazza all round the square, one of two hundred and ninety-three feet on each side. Over some of the arches are medallions, with busts of the kings of Spain, and of several eminent men, in stone basio relieve, among which are those of Ferdinando Cortez, Francis Pizarro, Davila, and Cid Ruy. In this square the bull-fights are exhibited for three days only, in the month of June. The river Tormes runs by this city, and has a bridge over it of twenty-five arches, built by the Romans, and yet entire.

Toledo is one of the most ancient cities in Spain, and during several centuries it held the rank of its metropolis. But the neighbourhood of Madrid has by degrees stripped it of its numerous inhabitants, and it would have been almost entirely deserted but for its cathedral, the income of which being in great part spent here, contributes chiefly to the maintenance of the few thousands that are left, and assists, in some degree, those small manufactures of sword blades and silk-stuffs that are established in this city. It is now exceedingly ill-built, poor and mean, and the streets very steep.

Burgos was the ancient capital of the kingdom of Castile, but now in obscurity. The cathedral is one of the most magnificent structures of the Gothic kind, now in Europe; its form is exactly the same as that of York minster, and on the east end is an octagon building exactly like the chaper house at York.

Gibraltar, once a celebrated town and fortress of Andalusia, is at present in possession of Great Britain. Till the arrival of the Saracens in Spain, which took place in the year 711, or 712, the rock of Gibraltar went by the name of *Mons Calpe*. On their arrival a fortress was built upon it, and it obtained the name of *Gibul-Tarif*, from the name of their general, and thence Gibraltar. It was in the possession of the Spaniards and Moors by turns, till it was taken from the former by a combined fleet of English and Dutch ships, under the command of Sir George Rooke, in 1704; and this rather through accident than any thing else. The prince of Hesse, with 1800 men, landed on the isthmus, but an attack on that side was found to be impracticable, on account of the steepness of the rock. The fleet fired 15,000 shot without making any impression on the works, so that the fortress seems to be equally impregnable both to the British and Spaniards, except by famine. At last, a party of sailors, having got merry with grog, rowed close under the New Mole in their boats, and as they saw that the garrison, who consisted only of 100 men, did not mind them, they were encouraged to attempt a landing; and having mounted the mole, hoisted a red jacket as a signal of possession. This being immediately observed from the fleet, more boats and sailors were sent out, who, in like manner, having ascended the works, got possession of a battery, and soon obliged the town to surrender. After many fruitless attempts to recover it, it was confirmed to the English by the treaty of Utrecht, in 1713. Repeated attempts have been since made to wrest it from England, but without success: the last war hath made it more famous than ever, when it underwent a long siege against the united forces of Spain and France by land and sea, and was gallantly defended by general Elliot and his garrison, to the great loss and disgrace of the assailants: though it must be granted, the place is by nature almost impregnable. Near 300 pieces of cannon of different bores, and chiefly brass, which were sunk before the port in the floating batteries, have been raised, and sold, to be distributed among the garrison. It is a commodious port, and formed naturally for commanding the passage of the Straits, or, in other words, the entrance into the Mediterranean and Levant seas. But the road is neither safe against an enemy nor storms: the bay is about twenty leagues in circumference. The Straits are 24 miles long, and 15 broad; through which sets a current from the Atlantic ocean into the Mediterranean, and for the stemming of it a brisk gale is required. The town was neither large nor beautiful, and in the last siege was totally destroyed by the enemies bombs, but on account of its fortifications, is esteemed the key of Spain, and is always furnished with a garrison well provided for its defence. The harbour is formed by a mole, which is well fortified and planted with guns. Gibraltar is accessible on the land side, only by a narrow passage between the rock and the sea, but that is walled and fortified both by art and nature, and so inclosed by high steep hills, as to be almost inaccessible that way. It has but two gates on that side, and as many towards the sea. Across this Isthmus the Spaniards have drawn a fortified line, chiefly with a view to hinder the garrison of Gibraltar from having any intercourse with the country behind them: notwithstanding which they carry on a clandestine trade, particularly in tobacco, of which the Spaniards are exceedingly fond. The garrison is however confined within very narrow

limits; and, as the ground produces scarcely any thing, all their provisions are brought them either from England or from Ceuta, on the opposite coast of Barbary. Formerly Gibraltar was entirely under military government; but that power producing those abuses which are naturally attendant on it, the parliament thought proper to erect it into a body corporate, and the civil power is now lodged in its magistrates.

The chief islands belonging to Spain in Europe, are those of Majorca and Yvica, of which we have nothing particularly to say. Minorca, which was taken by the English in 1708, under general Stanhope, and confirmed to Great Britain by the treaty of Utrecht 1713, was retaken by the Spaniards the last war, February 15, 1782, but has lately fallen again into the possession of Great Britain. It contains about 27,000 inhabitants.

COMMERCE AND MANUFACTURES.] The Spaniards, unhappily for themselves, make gold and silver the chief branches both of their exports and imports. They import it from America, from whence they export it to other countries of Europe. Cadiz is the chief emporium of this commerce. Hither (says Mr. Anderson, in his History of Commerce) other European nations send their merchandize, to be shipped off in Spanish bottoms for America, sheltered (or, as our old English phrase has it, coloured) under the names of the Spanish factors. Those foreign nations have here their agents and correspondents; and the consuls of those nations make a considerable figure. Cadiz has been said to have the finest storehouses and magazines for commerce of any city in Europe; and to it the flota and galleons regularly import the treasures of Spanish America. The proper Spanish merchandises exported from Cadiz to America are of no great value; but the duty on the foreign merchandize sent thither would yield a great revenue, (and consequently the profits of merchants and their agents would sink), were it not for the many fraudulent practices for eluding those duties."

At St. Ildefonso the glass-manufacture is carried on to a degree of perfection unknown in England. The largest mirrors are made in a brass frame, 162 inches long, 93 wide, and six deep, weighing near 9 tons. These are designed wholly for the royal palaces, and for presents from the king. Yet even for such purposes it is ill placed, and proves a devouring monster in a country where provisions are dear, fuel scarce, and carriage exceedingly expensive. Here is also a royal manufacture of linen, employing about 15 looms; by which it is said the king is a considerable loser.

In the city of Valencia there is a very respectable silk manufacture, in which five thousand looms, and three hundred stocking frames, give employment to upwards of 20,000 of the inhabitants, without enumerating those who exercise professions relative to the manufacture, such as persons who prepare the wood and iron work of so great a number of machines, or spin, wind, or dye the silk. At Alcora, in the neighbourhood of Valencia, a manufacture of porcelain has been successfully established; and they very much excel in painted tiles. In Valencia, their best apartments are floored with these, and are remarkable for neatness, for coolness, and for elegance. They are stronger and much more beautiful than those of Holland.

At Carthagena they make great quantities of the *esparto* ropes and cables, some of them spun like hemp, and others platted. Both operations are performed with singular rapidity. These cables are excellent, because they float on the surface of the water, and are not therefore liable to be cut by the rocks on a foul coast. The *esparto* rush makes good mats for houses *alpargates*

or short trowsers and buskins for peasants, and latterly it has been spun into thread for the purpose of making cloth. If properly encouraged, there is no doubt that the manufacture may be brought to such perfection, as to make this once useless ruff a source of abundant wealth to the southern provinces of Spain, for it is the peculiar and natural production of all the high and uncultivated mountains of the south.

As to the hempen cordage which is made in Spain, for the use of the royal navy, Mr. de Bourgoanne observes, that it is better and more durable than that of the principal dock-yards and magazines in Europe; besides, in combing the hemp, all the terry part we leave in it was taken out, and made use of in caulking, whence results the double advantage of more solid cordage, and the better caulking of vessels. Another custom in our rope-yards, which the Spaniards have avoided adopting, is the tarring the cordage and keeping it a long time piled up. In this state the tar ferments, and eats the hemp, and the cordage is extremely apt to break after being used but a short space of time.

The Spaniards formerly obtained their-hemp from the north; at present they are able to do without the assistance, in this article, of any other nation. The kingdom of Granada already furnishes them with the greatest part of the hemp they use, and, in case of need, they may have recourse to Arragon and Navarre. All the sailcloth and cordage in the magazines at Cadiz are made with Spanish hemp; the texture of which is even, close, and solid.

The most important production of this country, and the most valuable article of commerce, is barilla, a species of pot-ash, procured by burning a great variety of plants almost peculiar to the kingdoms of Valencia, and Murcia, such as *sisa*, *algazul*, *sison*, *sayonnes*, *salcornia*, with *barilla*. It is used for making soaps, for bleaching, and for glass. All the nations in Europe, by the combustion of various vegetable substances, make some kind of pot-ash; but the superior excellence of the barrilla has hitherto secured the preference. The country producing it is about sixty leagues in length, and eight in breadth, on the borders of the Mediterranean. The quantity exported annually from Spain, (according to the testimonies of both Mr. Townsend, and Mr. de Burgoanne) is about a hundred and fifty quintals, most of which is sent to France and England, and a small quantity to Genoa, and Venice.

Spain is one of the richest countries in Europe in salt-petre, a most important article of commerce. The account of this surprizing manufacture we shall abridge from Mr. Townsend. "I observed," says he, "a large enclosure, with a number of mounts of about twenty feet high, at regular distances from each other. These were collected from the rubbish of the city of Madrid, and the scrapings of the highways. They had remained all the winter piled up in the manner in which I found them. At this time men were employed in wheeling them away, and spreading abroad the earth to the thickness of about one foot, whilst others were turning what had been previously exposed to the influence of the sun and air. The preceding summers these heaps had been washed, and being thus exposed, would yield the same quantity of salt again, and as far as appears, the produce would never fail; but, after having been washed, no salt-petre can be obtained without a subsequent exposure. Some of this earth they can lixiviate once a year, some they have washed twenty times in the last seven years, and some they have subjected to this operation fifteen times in one year, judging always by their eye when they may wash it to advantage,

lage, and by their taste if it has yielded a salivum of a proper strength; from which, by evaporating the water in boiling, they obtain the salt-petre." *Spain, 1763, p. 100.*

The other manufactures of Spain are chiefly of wool, copper, and hardware. Great efforts have been made by the government to prevent the other European nations from reaping the chief advantage of the American commerce; but these never can be successful, till a spirit of industry is awakened among the natives, so as to enable them to supply their American possessions with their own commodities and merchandises. Meanwhile, the good faith and facility with which the English, French, Dutch, and other nations, carry on this contraband trade, render them greater gainers by it than the Spaniards themselves are; the clear profits seldom amounting to less than 10 per cent. This evidently makes it an important concern, that those immense riches should belong to the Spaniards, rather than to any active European nation: but I shall have occasion to touch on this subject in the account of America.

CONSTITUTION AND GOVERNMENT.] Spain from being the most free, is now the most despotic kingdom in Europe; and the poverty which is so visible in most parts of the country is in a great degree the result of its government, in the administration of which no proper attention is paid to the interests and welfare of the people. The monarchy is hereditary, and females are capable of succession. It has even been questioned, whether his catholic majesty may not bequeath his crown, upon his demise, to any branch of the royal family he pleases. It is at least certain, that the house of Bourbon mounted the throne of Spain in virtue of the last will of Charles II.

The cortes or parliaments of the kingdom, which formerly, especially in Castile, had greater power and privileges than that of England, are now abolished; but some faint remains of their constitution are still discernable in the government though all of them are ineffectual, and under the control of the king.

The privy council which is composed of a number of noblemen or grandees, nominated by the king, sits only to prepare matters, and to digest papers for the cabinet council or junta, which consists of the first secretary of state, and three or four more named by the king, and in them resides the direction of all the executive part of government. The council of war takes cognizance of military affairs only. The council of Castile is the highest law tribunal of the kingdom. The several courts of the royal audiences, are those of Galicia, Seville, Majorca, the Canaries, Saragossa, Valencia, and Barcelona. These judge primarily in all causes within fifteen miles of their respective cities or capitals, and receive appeals from inferior jurisdictions. Besides these there are many subordinate tribunals, for the police, the finances, and other branches of business.

The government of Spanish America forms a system of itself, and is delegated to viceroys, and other magistrates, who are in their respective districts almost absolute. A council for the Indies is established in Old Spain, and consists of a governor, four secretaries, and twenty-two counsellors, besides officers. Their decision is final in matters relating to America. The members are generally chosen from the viceroys and magistrates who have served in that country. The two great viceroalties of Peru and Mexico are so considerable, that they are seldom trusted to one person for more than three years; but they are thought sufficient to make his fortune in that time.

The foreign possessions of the crown of Spain, besides those in America are the towns of Ceuta, Oran, and Mafzulquivir, on the coast of Barbary,

in Africa; and the islands of St. Lazaro, the Philippines, and Ladrones, in Asia.

REVENUES.] The revenues arising to the king from Old Spain, yearly amount to 5,000,000l. sterling though some say eight, and they form the surest support of his government. His American income, it is true, is immense, but it is generally in a manner well equalled, anticipated before it arrives in Old Spain. The king has a fifth of all the silver mines that are worked; but little of it comes into his coffers. He falls upon means, however, in case of a war, or any public emergency, to sequester into his own hands great part of the American treasures belonging to his subjects who never complain, because they are always punctually repaid with interest. The finances of his present catholic majesty, before the French revolution, were in excellent order, and on a better footing, both for himself and his people, than those of any of his predecessors.

As to the taxes from whence the internal revenues arise, they are various, arbitrary, and so much suited to conveniency, that we cannot fix them at any certainty. They fall upon all kinds of goods, houses, lands, timber, and provisions; the clergy and military orders are likewise taxed.

MILITARY AND MARINE STRENGTH.] The land forces of the crown of Spain, in time of peace, are never fewer than 70,000; but in case of war, they amount, without prejudice to the kingdom, to 150,000. The great dependence of the king, however, is upon his Walloon or foreign guards. His present catholic majesty has been at great care and expence to raise a powerful marine; which has been considerably diminished since the war with Great Britain. They have however at present, (July 29. 1799.) in the Mediterranean 25 ships of the line. All along the coast of Spain are watch-towers from mile to mile, with lights and guards at night, so that from Cadiz to Barcelona, and from Bilbo to Ferrol, the whole kingdom may be soon alarmed in case of an invasion.

ROYAL ARMS, TITLES, NO.] Spain formerly comprehended twelve kingdoms; all which, with several others, were by name entered into the royal titles, so that they amounted in all to about 32. This absurd custom is still occasionally continued, but the king is now generally contented with the title of His Catholic Majesty. The kings of Spain are inaugurated by the delivery of a sword, without being crowned. Their signature never mentions their name, but, I THE KING. Their eldest son is called prince of Asturias, and their younger children, of both sexes, are by way of distinction called infants or infantas, that is; children.

The armorial bearings of the kings of Spain, like their title, is loaded with the arms of all their kingdoms. It is now a shield, divided into four quarters, of which the uppermost on the right hand, and the lowest on the left contain a castle, or, with three towers, for Castile; and in the uppermost on the left, and the lowest on the right, are three lions gules, for Leon; with three lilies in the centre for Anjou.

The general name for those Spanish nobility and gentry, who are mixed with the Moorish blood, is Hidalgo. They are divided into princes, dukes, marquises, counts, viscounts, and other inferior titles. Such as are created grandees, may stand covered before the king, and are treated with princely distinctions. A grandee cannot be apprehended without the king's order; and cardinals, archbishops, ambassadors, knights of the Golden Fleece, and certain other great dignitaries, both in church and state, have the privilege, as well as the grandees, to appear covered before the king.

The "Order of the Golden Fleece," particularly described before in the orders of Germany, is generally conferred on princes and sovereign dukes; but the Spanish branch of it hath many French and Italian nobility; there are no commanderies or revenues annexed to it.

The "Order of St James," or *St. Jago de Compostella*, is the richest of all the orders of Spain. It was divided into two branches, each under a grand-master, but the office of both was given by pope Alexander VI. to the kings of Spain and Portugal, as grand-masters in their respective dominions. The order is highly esteemed in Spain, and only conferred on persons of noble families. The same may be said of the "Order of Calatrava," first instituted by Sanchio, king of Toledo; it took its name from the castle of Calatrava, which was taken from the Moors, and here began the order, which became very powerful. Their number, influence, and possessions, were so considerable as to excite the jealousy of the crown, to which, at length, their revenues and the office of grand-master were annexed by pope Innocent VIII. The celebrated "Order of Alcantara" derived its origin from the order of St. Julian, or of the Pear-tree: but after Alcantara was taken from the Moors, and made the chief seat of the order, they assumed the name of Knights of the order of Alcantara, and laid aside the old device of a pear-tree. This order is highly esteemed, and conferred only on persons of ancient and illustrious families. The "Order of the Lady of Mercy" is said to have been instituted by James I. king of Arragon, about the year 1218, on account of a vow made by him to the Virgin Mary, during his captivity in France, and was designed for the redemption of captives from the Moors, in which they expended large sums of money. It was at first confined to men, but a lady of Barcelona afterwards got women included in it. This order possesses considerable revenues in Spain. The "Order of Montesa" was instituted at Valencia, at the close of the thirteenth century, in the place of the Templars, and enjoyed their possessions. Their chief seat being the town of Montesa, the order from thence derived its name, and chose St. George for patron. In the year 1771, the late king instituted, after his own name, the "Order of Charles III." in commemoration of the birth of the infant. The badge is, a star of eight points enamelled white, and edged with gold: in the centre of the cross is the image of the Virgin Mary, vestments white and blue. On the reverse, the letters C. C. with the number III. in the centre, and this motto, *Virtuti & Merito*. None but persons of noble descent can belong to this order.

[HISTORY OF SPAIN.] Spain was probably first peopled by the Celts from Gaul, to which it lies contiguous; or from Africa, from which it is only separated by the narrow strait of Gibraltar. The Phoenicians sent colonies thither, and built Cadiz and Malaga. Afterwards, upon the rise of Rome and Carthage, the possession of this kingdom became an object of contention between these powerful republics; but at length the Roman arms prevailed, and Spain remained in their possession until the fall of that empire, when it became a prey to the Goths. In the beginning of the fifth century the Suevi, the Vandals, and the Alani, divided this kingdom among them; but in the year 584, the Goths again became the masters.

These, in their turn, were invaded by the Saracens, who, about the end of the seventh century, had possessed themselves of the finest kingdoms of Asia and Africa; and not content with the immense regions that formerly composed great part of the Assyrian, Greek, and Roman empires, they cross the

Mediterranean, ravage Spain, and establish themselves in the southerly provinces of that kingdom.

Don Pelago is mentioned as the first Old Spanish prince who distinguished himself against these infidels (who were afterwards known by the name of Moors; the greater part of them having come from Mauritania), and he took the title of king of Asturias, about the year 720. His successes animated other Christian princes to take arms likewise, and the two kingdoms of Spain and Portugal for many ages were perpetually embroiled in bloody wars.

The Moors in Spain were superior to all their cotemporaries in arts and arms, and the Abdoulrahman line kept possession of the throne near 300 years. Learning flourished in Spain, while the rest of Europe was buried in ignorance and barbarity. But the Moorish princes by degrees became weak and effeminate, and their chief ministers proud and insolent. A series of civil wars continued, which at last overturned the throne of Cordova, and the race of Abdoulrahman. Several petty principalities were formed on the ruins of this empire, and many cities of Spain had each an independent sovereign. Now, every adventurer was entitled to the conquests he made upon the Moors, till Spain at last was divided into 12 or 11 kingdoms; and about the year 1095, Henry of Burgundy was declared by the king of Leon, count of Portugal; but his son, Alphonso, throw off his dependance on Leon, and declared himself king. A series of brave princes gave the Moors repeated overthrows in Spain, till about the year 1492, when all the kingdoms in Spain, Portugal excepted, were united by the marriage of Ferdinand, king of Arragon, and Isabella the heiress, and afterwards queen, of Castile, who took Granada, and expelled out of Spain the Moors and Jews, who would not be converts to the Christian faith, to the number of 170,000 families. I shall in their proper places, mention the vast acquisitions made at this time to Spain by the discovery of America, and the first expeditions of the Portuguese to the East-Indies; by the discovery of the Cape of Good Hope; but the successes of both nations were attended with disagreeable consequences.

The expulsion of the Moors and Jews in a manner depopulated Spain of artists, labourers, and manufacturers; and the discovery of America not only added to that calamity, but rendered the remaining Spaniards most deplorably indolent. To complete their misfortunes, Ferdinand and Isabella introduced the popish inquisition, with all its horrors, into their dominions, as a safeguard against the return of the Moors and Jews.

Charles V. of the house of Austria, and emperor of Germany, succeeded to the throne of Spain, in right of his mother, who was the daughter of Ferdinand and Isabella, in the year 1516. The extensive possessions of the house of Austria in Europe, Africa, and, above all, America, from whence he drew immense treasures, began to alarm the jealousy of neighbouring princes, but could not satisfy the ambition of Charles V. and we find him constantly engaged in foreign wars, or with his own protestant subjects, whom he in vain attempted to bring back to the catholic church. He also reduced the power of the nobles in Spain; abridged the privileges of the commons, and greatly extended the regal prerogative. At last, after a long and turbulent reign, he came to a resolution that filled all Europe with astonishment, the withdrawing himself entirely from any concern in the affairs of this world,

in order that he might spend the remainder of his days in retirement and solitude.

Agreeably to this resolution, he resigned Spain and the Netherlands, with great formality in the presence of his principal nobility, to his son Philip II. but could not prevail on the princes of Germany to elect him emperor, which they conferred on Ferdinand, Charles's brother, thereby dividing the dangerous power of the house of Austria into two branches; Spain, with all its possessions in Africa and the New World, also the Netherlands, and some Italian states, remained with the elder branch, whilst the empire, Hungary, and Bohemia, fell to the lot of the younger, which they still possess.

Philip II. inherited all his father's vices, with few of his good qualities. He was austere, haughty, immoderately ambitious, and through his whole life a cruel bigot in the cause of popery. His marriage with queen Mary of England, an unfeeling bigot like himself, his unsuccessful addresses to her

Charles, of all his vast possessions, reserved nothing for himself but an annual pension of 100,000 crowns and chose for the place of his retreat, a vale in Spain, of no great extent, watered by a small brook, and surrounded by rising grounds, covered with lofty trees. He gave strict orders, that the style of the building which he erected there should be such as suited his present situation, rather than his former dignity. It consisted only of six rooms; four of them in the form of friars' cells, with naked walls; and the other two, each twenty feet square, were hung with brown cloth, and furnished in the most simple manner; they were all level with the ground, with a door on one side into a garden, of which Charles himself had given the plan, and had filled it with various plants, which he proposed to cultivate with his own hands. After spending some time in the city of Ghent in Flanders, the place of his nativity, he set out for Zealand in Holland, where he prepared to embark for Spain; accompanied by his son, and a numerous retinue of princes and nobility; after taking an affectionate and last farewell of Philip and his attendants, he set out, on the 17th of September, 1556, under a convoy of a large fleet of Spanish, Flemish, and English ships. As soon as he landed in Spain he fell prostrate on the ground; and considering himself now as dead to the world, he kissed the earth, and said, "Naked came I out of my mother's womb, and naked I now return to thee, thou common mother of mankind." Some of the Spanish nobility paid their court to him as he passed along to the place of his retreat; but they were so few in number, and their attendance was so negligent, that Charles observed it, and felt, for the first time, that he was no longer a monarch. But he was more deeply affected with his son's ingratitude, who, forgetting already how much he owed to his father's bounty, obliged him to remain some weeks on the road, before he paid him the first moiety of that small portion, which was all that he had reserved of so many kingdoms. At last the money was paid; and Charles, having dismissed a great number of his domestics, whose attendance he thought would be superfluous, he entered into his humble retreat with twelve domestics only. Here he buried in solitude and silence, his grandeur, his ambition, together with all those vast projects which, during half a century, had alarmed and agitated Europe, filling every kingdom in it, by turns, with the terror of his arms, and the dread of being subjected to his power. Here he enjoyed, perhaps, more complete satisfaction than all his grandeur had ever yielded him. Far from taking any part in the political transactions of the princes of Europe, he restrained his curiosity even from any enquiry concerning them; and he seemed to view the busy scene which he had abandoned, with all the contempt and indifference arising from his thorough experience of its vanity, as well as from the pleasing reflection of having disengaged himself from its cares.

New amusements and new objects now occupied his mind; sometimes he cultivated the plants in his garden with his own hands; sometimes he rode out to the neighbouring wood on a little horse; the only one that he kept, attended by a single servant on foot. When his infirmities confined him to his apartment, he either admitted a few gentlemen who resided in the neighbourhood, and entertained them familiarly at his table; or he employed himself in studying the principles, and in forming curious works of mechanics, of which he had always been remarkably fond. He was particularly zealous with regard to the construction of clocks and watches; and having found, after repeated trials, that he could not bring any two of them to go exactly alike, he reflected, it is said, with a mixture of surprise and regret, on his own folly, in having bestowed so much time and labour on the more vain attempt of bringing mankind to a precise uniformity of sentiment concerning the intricate and mysterious doctrines of religion. And here, after two years retirement, he was seized with a fever, which carried him off in the 39th year of his age.

after

after Elizabeth's, his resentment and unsuccessful wars with that princess, his tyranny and persecutions in the Low Countries, the revolt and loss of the United Provinces with other particulars of his reign, have been already mentioned in the history of those countries.

In Portugal he was more successful. That kingdom, after being governed by a race of wise and brave princes, fell to Sebastian, about the year 1577. Sebastian lost his life and a fine army, in a headstrong, unskillful, and ill-concerted expedition against the Moors in Africa; and in the year 1580, Philip united Portugal to his own dominions, though the Braganza family of Portugal asserted a prior right. By this acquisition Spain became possessed of the Portuguese settlements in India, some of which she still holds.

The descendants of Philip proved to be very weak princes; but Philip and his father had so totally ruined the ancient liberties of Spain, that they reigned almost unopposed in their own dominions. Their viceroys, however, were at once so tyrannical and insolent over the Portuguese, that in the reign of Philip IV. in the year 1640, the nobility of that nation, by a well-conducted conspiracy, expelled their tyrants, and placed the duke of Braganza, by the title of John IV. upon their throne, and ever since, Portugal has been a distinct kingdom from Spain.

The kings of Spain, of the Austrian line, failing in the person of Charles II. who left no issue, Philip duke of Anjou, second son to the Dauphin of France, and grandson to Lewis XIV. mounted that throne, in virtue of his predecessor's will, by the name of Philip V. anno 1701. After a long and bloody struggle with the German branch of the house of Austria, supported by England, he was confirmed in his dignity, at the conclusion of the war, by the famous peace of Utrecht, 1713. And thus Lewis XIV. through a masterly train of politics (for in his wars to support his grandson, as we have already observed, he was almost ruined), accomplished his favourite project of transferring the kingdom of Spain, with all its rich possessions in America and the Indies, from the house of Austria, to that of his own family of Bourbon. In 1734, Philip invaded Naples, and got that kingdom for his son Don Carlos, the Sicilians readily acknowledging him for their sovereign, through the oppression of the Imperialists.

After a long and turbulent reign, which was disturbed by the ambition of his wife Elizabeth of Parma, Philip died in 1746, and was succeeded by his son Ferdinand VI. a mild and peaceable prince, who reformed many abuses, and wanted to promote the commerce and prosperity of his kingdom. In 1759, he died without issue, through melancholy for the loss of his wife; Ferdinand was succeeded by his brother, Charles III. then king of Naples, and the Two Sicilies, son to Philip V. by his wife the princess of Parma.

He was so warmly attached to the family compact of the house of Bourbon, that two years after his accession, he even hazarded his American dominions to support it. War being declared between him and England, the latter took from him the famous port and city of Havana, in the island of Cuba, and thereby rendered herself entirely mistress of the navigation of the Spanish Plate fleets. Notwithstanding the success of the English, their ministry thought proper hastily to conclude a peace, in consequence of which Havana was restored to Spain. In 1775, an expedition was concerted against Algiers by the Spanish ministry, which had a most unsuccessful termination. The troops, which amounted to upwards of 24,000, and who were commanded by lieutenant general Conde de O'Reilly, landed about a

league and a half to the eastward of the city of Algiers; but were disgracefully beaten back, and obliged to take shelter on board their ships, having 37 officers killed; and 191 wounded; and 501 rank and file killed, and 2080 wounded. In the years 1783, and 1784, they also renewed their attacks by sea to destroy it, but after spending much ammunition, and losing many lives, were forced to retire without doing it much injury.

When the war between Great Britain and her American colonies had subsisted for some time, and France had taken part with the latter, the court of Spain was also prevailed upon to commence hostilities against Great Britain. In particular, the Spaniards closely besieged Gibraltar, both by sea and land: it having been always a great mortification to them, that this fortress should be possessed by the English. The grand attack on the 13th of September, 1782, under the command of the duke de Crillon, by ten battering ships, from 600 to 1400 tons burden, carrying in all 312 brass guns entirely new, and discharging shot of 26 pounds weight. The showers of shot and shells which were directed from them, from their land-batteries, and on the other hand from the various works of the garrison, exhibited a scene, of which perhaps neither the pen nor the pencil can furnish a competent idea. It is sufficient to say, that four hundred pieces of the heaviest artillery were playing at the same moment; an instance which has scarcely occurred in any siege since the invention of those wonderful engines of destruction.

The irresistible impression of the red hot balls, which were sent from the garrison in such numbers and in such directions, was soon conspicuous; for in the afternoon smoke was perceived to issue from the admiral's ship and another, and by one in the morning several were in flames, and numbers of rockets were thrown up from each of their ships as signals of distress. To rescue from the flames those who were now incapable of acting as enemies, could not be done without the greatest hazard, by reason of the blowing up of the ships; and the previous discharge of the guns, as the fire reached them; yet in defiance of every danger, brigadier Curtis, distinguished himself in an eminent manner in this humane undertaking, and with twelve gun-boats saved nine officers, two priests, and 334 men, all Spaniards; besides one officer, and eleven Frenchmen, who had floated in the preceding evening.

Thus ended all the hopes of the Spaniards reducing the fortress of Gibraltar. But great as was the bravery of the British garrison, which deserves every encomium, the small numbers of the killed and wounded are alone sufficient to shew that they must have been assisted by very strong fortifications, or it was impossible that any skill whatever could have resisted such a tremendous power. Some trifling operations continued on the side of the Spaniards till the restoration of peace in 1783.

In other enterprises, however, the Spaniards proved more successful. The island of Minorca was surrendered to them on the 6th of February, 1782, after having been besieged for 171 days. The garrison consisted of no more than 2094 men, while the forces of the enemy amounted to 16,000, under the command of the duke de Crillon. The Spanish commander at first attempted to corrupt the governor (general Murray); but this being rejected with indignation, the siege was commenced in form: and the garrison would have shewed themselves equally invincible with those of Gibraltar, had it been possible to relieve them in the same manner. The scurvy soon made its appearance, and reduced them to such a deplorable situation that they were at last obliged to surrender, in spite of every effort of human fortitude or skill; and so sensible were both parties that this was the true cause;

that

that the Spanish general allowed them to march out with their arms shouldered, drums beating, and colours flying; while the disconsolate British soldiers protested that they surrendered their arms to God, and not to the Spaniards.

His late catholic majesty did all he could to oblige his subjects to desist from their ancient dress and manners, and carried his endeavours so far, that it occasioned so dangerous an insurrection at Madrid; as obliged him to part with his minister, the marquis of Squillace; thereby affording an instance of the necessity that even despotic princes are under, of paying some attention to the inclinations of their subjects.

The government of Spain testified much uneasiness at the French revolution, and watched narrowly those who spoke in favour of its principles. The circulation of all political pamphlets from France was severely prohibited. They published a proclamation against tinkers and knife-grinders, introducing seditious papers into the kingdom, and a rescript concerning strangers.

A short war arose between the Spaniards and the emperor of Morocco. The emperor besieged Ceuta; but peace is since restored. It was unjustly furnished that this war was entered into, in order to divert the attention of the people, who might be impressed with the affairs of France.

The sudden dismissal of count Florida Blanca from the office of prime minister originated in causes not disclosed. It is imagined that the court found this step necessary, to appease the public murmurs at some late measures particularly the edict concerning strangers, which contributed to impose further fetters upon commerce, and which has since been repealed. On the 28th of February 1792, the minister was removed; he has since been imprisoned in the castle of Pampeluna, and is to be tried for various offences; and count d'Aranda, an old statesman, a warm friend of the queen and nobility of France, succeeded to his employments, till some other arrangement could be formed. It is said, he abolished the superintendant tribunal of police; a kind of civil inquisition; and in other liberal measures appeared to see the real interest of monarchs, which is certainly to concede with grace, in order to prevent the despair of the people from recurring to force. His influence, however, was but short; and has been succeeded by that of the duke d'Alcudia.

After the trial of the king of France, previous to the passing of his sentence, the Spanish court made an application in his favour, which was rejected with insolence and contempt, and shortly afterwards war was declared against Spain by the National Convention. The army appointed to this war was entrusted to general Doppet, whose operations were all successful, almost without the smallest interruption. On the 21th of June he seized upon a manufactory of arms, which belonged to the Spaniards, great part of which he added to his military stores. Shortly afterwards he defeated the Count de l'Union who had made a bold attempt for the relief of Bellegarde, which was at this time closely pressed. The Spanish general had been reinforced by several foreign battalions lately arrived from Africa, whose impetuosity obliged the republicans at first to give way. They soon rallied, however, regained the heights from which they had at first been dislodged; and the Spaniards were completely defeated, leaving two thousand five hundred dead on the field of battle. Bellegarde being thus deprived of every chance of relief, submitted to general Dugommier on the 20th of the following month. The garrison consisted of 6000 men. On the day after its surrender, the Count de l'Union made another spirited attempt to dislodge the French, but

was completely repulsed with the loss of 600 men and four pieces of cannon. The French general Dugommier was soon after killed by a shell as he ascended the Black Mountain, the better to direct the military operations. On the 20th of the same month his great opponent the Count de l'Union was killed, with three other Spanish generals, near St. Fernando de Figueras. For the defence of this post, the Spaniards had spent upwards of six months in erecting from eighty to one hundred batteries mounted with heavy cannon. Their force amounted to forty thousand men strongly entrenched; and yet they were put to flight, and the batteries carried by the republicans in three hours.

The Spaniards were equally unsuccessful in the actions, which were fought at the Western Pyrenees. Several redoubts were stormed and carried by the republican general Delaforde. Great numbers of the Spaniards were killed, and three hundred and twenty prisoners were taken, with seven pieces of cannon, two hundred tents, and great quantities of ammunition and small arms. On the 1st of August fifteen thousand Spaniards fled before a body of six thousand French. By this retreat, immense magazines, two thousand muskets, six stand of colours, two hundred cannon and howitzers, tents for twenty thousand men, and two thousand prisoners, among whom were two entire regiments, who grounded their arms, fell into the hands of the conquerors. On the same evening Fontarabia, which guards the entrance into Spain, was taken almost instantaneously by a detachment of the French army. The Spanish troops were so disheartened by their repeated defeats, that they fled at the first approach of the enemy. A line of posts had been established upwards of forty leagues in extent; all these entrenchments were carried with the bayonet, and the works destroyed. The French general endeavoured to surround the Spaniards, but being favoured by a thick fog they were enabled to retreat to Sangonella, with the loss of two thousand five hundred men, and an equal number of prisoners. During the rest of this war defeat succeeded defeat, and one calamity was quickly followed by another still more disastrous; not one gleam of success ever dawned upon the Spanish arms, and the march of the enemy to Madrid was prevented by the disgraceful submission of the Spanish monarch. A treaty was speedily concluded in which the Spaniards ceded to France their part of St. Domingo, and the French agreed to relinquish all their conquests on the Spanish territory.

Spain being now entirely under the dominion of France, was driven by the mischievous influence of her ally, into a war with England, which it is probable was as much against her inclination as her interest. War, however, was proclaimed at Madrid in the usual form, and a fleet was shortly after equipped, which was defeated off Cape St. Vincent by Sir J. Jervis.

At present Spain is ripe for a revolution; independently of the successful efforts of the Directorial Emissaries to propagate Jacobinical principles throughout the country, there are circumstances in the domestic policy of that government, which have served to mature the seeds of disaffection, and to alienate the minds of the people from the natural objects of their attachment. A monarch incapable of holding the reins of government; and a Queen, rioting in excesses, that sink her beneath the lowest of her subjects. Upstart succeeds to upstart, and minion to minion, in monopolizing the good graces, and in engrossing the misplaced bounty, of this profligate princeps. The successor to the *Prince of Peace* is one *Mallo* a low militerant, devoted to the French interest; in whose behalf the Queen has had recourse to an act, of which it is difficult to say, whether its extreme folly

of its flagrant injustice are most conspicuous. The multiplicity of small notes in circulation, of a particular description, has long been a subject of general complaint in the Spanish dominions, and various means for paying them off, have, at different times, been suggested. At length it was determined to devote to this purpose some rich territorial possessions belonging to the University of Salamanca. The estates were accordingly taken; but, instead of employing them as proposed, the Queen gave the most extensive and valuable of them, the Marquisate of Saint Bartholomew, to her new favourite, who actually enjoys the title and the territory.

Equal attention has been paid to the wishes of the French in the appointment of a new Minister for Foreign Affairs. A young man, of the name of *Urquijo*, has been raised to this situation, who was formerly Secretary to the Spanish Embassy at the Court of St. James's; he is distinguished for his hatred of this country, his predilection for the tenets of modern philosophy, and his attachment to revolutionary principles. By the aid of such agents, joined to the influence of the Chevalier D'Azzara, the Directory have succeeded in establishing their ascendancy in the Cabinet of Madrid.

Charles IV. king of Spain, born Nov. 11, 1748; ascended the throne Dec. 13, 1788, (upon the death of his father Charles III) and was married to Louisa-Maria-Theresa, princess of Parma, Sept. 4, 1765, by whom he has issue.

1. Charlotte, born April 25, 1775.
2. Mary Louisa, born July 9, 1777.
3. Philip, born, Aug. 10, 1783.
4. Ferdinand, born Oct. 14, 1784.
5. Maria-Isabella, born July 6, 1789.
6. A Prince, March 10, 1794.

Brothers to the king :

1. Ferdinand, the present king of the Two Sicilies, born in 1751, married in 1768, to the arch-duchess Mary-Caroline-Louisa, sister to Joseph II. late emperor of Germany.
2. Anthony Pascal, born Dec. 31, 1755.

ANCIENT NAMES AND DIVISIONS. } This kingdom was, in the time of the Romans, called Lusitania. The etymology of the modern name is uncertain. It most probably is derived from some noted harbour or port, to which the Gauls (for so strangers are called in the Celtic) resorted. By the form of the country, it is naturally divided into three parts; the northern, middle, and southern provinces.

Provinces.	Chief towns.	Sq. M.	
The Northern Division contains	{ Entre Minho } { Douro, and } { Trallos Montes } Beira	{ Braga } { Oporto and Viana } { Miranda and Villa Real } Coimbra	6814
The Middle Division contains	{ Estremadura }	{ Guarda Casal Rodrigo } { Lisbon } 38.42 N. lat. { 8.53 W. lon. }	12640
The Southern Division contains	{ Entre Tajo } { Guadiana } { Alentejo } { Algarva }	{ Eborá, or Evora } { Portalegre, Elvas, Beja } { Lagos } { Faro, Tavara, and Silves }	8397

SOIL, AIR, AND PRODUCTIONS.] The soil of Portugal is not in general equal to that of Spain for fertility, especially in corn, which they import from other countries. Their fruits are the same as in Spain, but not so highly flavoured. The Portuguese wines, when old and genuine, are esteemed to be very friendly to the human constitution, and safe to drink. Portugal contains mines, but they are not worked; variety of gems, marbles, and mill-stones, and a fine mine of salt petre near Lisbon. Their cattle and poultry are but indifferent eating. The air, especially about Lisbon, is reckoned soft and beneficial to consumptive patients; it is not so searching as that of Spain, being refreshed from the sea-breezes.

MOUNTAINS.] The face of Portugal is mountainous, or rather rocky, for their mountains are generally barren: the chief are those which divide Algarva from Alentejo; those of Trallos Montes, and the rock of Lisbon at the mouth of the Tajo.

WATER AND RIVERS.] Though every brook in Portugal is reckoned a river, yet the chief Portuguese rivers are mentioned in Spain, all of them falling into the Atlantic ocean. The Tagus or Tajo was celebrated for its golden sand. Portugal contains several roaring lakes and springs; some of them are absorbent even of the lightest substances, such as wood, cork, and feathers; some, particularly one about 45 miles from Lisbon, are medicinal and sanative; and some hot baths are found in the little kingdom, or rather province of Algarva.

PROMONTORIES AND BAYS.] The promontories or capes of Portugal are Cape Mondego, near the mouth of the river Mondego; Cape Roca, at the north entrance of the River Tajo; Cape Espithel, at the south entrance of the river Tajo; and Cape St. Vincent, on the south-west point of Algarva.

* The port-wines are made in the district round Oporto, which does not produce one half the quantity that is consumed, under that name, in the British Dominions. The merchants in this city have spacious wine vaults, capable of holding 6 or 7000 pipes, and it is said that 20,000 are yearly exported from Oporto.

ANIMALS. The sea-fish, on the coast of Portugal, are reckoned excellent; on the land, the hogs and kids are tolerable eating. Their mules are sure, and serviceable both for draught and carriage; and their horses, though slight, are lively.

**POPULATION, INHABITANTS, } According to the best calculation, Port-
RANKERS, AND CUSTOMS. } ugal contains near two millions of inhabitants. By a survey made in the year 1732, there were in that kingdom 3,344 parishes, and 1,742,290 lay persons (which is but 522 laity to each parish on a medium), besides above 300,000 ecclesiasties of both sexes.**

The modern Portuguese retain nothing of that adventurous enterprising spirit that rendered their forefathers so illustrious 300 years ago. They have, ever since the house of Braganza mounted the throne, degenerated in all their virtues; though some noble exceptions are still remaining among them, and no people are so little obliged as the Portuguese are to the reports of historians and travellers. Their degeneracy is evidently owing to the weakness of their monarchy, which renders them inactive, for fear of obliging their powerful neighbours; and that inactivity has proved the source of pride, and other unmanly vices. Treachery has been laid to their charge, as well as ingratitude; and above all, an intemperate passion for revenge. They are, if possible, more superstitious, and, both in high and common life, affect more state than the Spaniards themselves. Among the lower people, thieving is commonly practised; and all ranks are accused of being unfair in their dealings, especially with strangers. It is hard, however, to say what alteration may be made in the character of the Portuguese, by the expulsion of the Jesuits, and diminution of the papal influence among them; but above all, by that spirit of independency, with regard to commercial affairs, upon Great Britain, which, not much to the honour of their gratitude, though to the interest of their own country, is now so much encouraged by their court and ministry.

The Portuguese are neither so tall nor so well made as the Spaniards, whose habits and customs they imitate, only the quality affect to be more gaily and richly dressed. The Portuguese ladies are thin and small of stature. Their complexion is olive, their eyes black and expressive, and their features generally regular. They are esteemed to be generous, modest, and witty. They dress like the Spanish ladies, with much awkwardness and affected gravity, but in general more magnificently; and they are taught by their husbands to exact from their servants an homage, that in other countries is paid only to royal personages. The furniture of the houses, especially of their grandees, is rich and superb to excess; and they maintain an incredible number of domestics, as they never discharge any who survive, after serving their ancestors. The poorer sort have scarcely any furniture at all, for they, in imitation of the Moors, sit always cross-legged on the ground. The Portuguese peasant has never reaped any advantage from the benefits of foreign trade, and of the fine and vast countries the kings of Portugal possessed in Africa or in the East; or of those still remaining to them in South America. The only foreign luxury he is yet acquainted with is tobacco; and when his feeble purse can reach it, he purchases a dried Newfoundland cod-fish; but this is a regale he dares seldom aspire to. A piece of bread made of Indian corn, and a salted pilchard, or a head of garlick, to give that bread a flavour, compose his standing dish; and if he can get a bit of the hog, or the calf, he himself fattens, to regale his wretched family at Christmas or Easter, he has reached the pinnacle

of happiness. A bit of penury would quicken being taught (warms, to which they

of happiness in this world; and indeed whatever he possessed beyond this habitual penury, according to the present state and exertions of his intellects, would quickly be taken from him, or rather he would willingly part with it, being taught by his numberless ghostly comforters, with which his country swarms, to look forward for ease and happiness to another state of existence, to which they are themselves the infallible guides and conductors.

RELIGION.] The established religion of Portugal is popery in the strictest sense. The Portuguese have a patriarch, but formerly he depended entirely upon the pope, unless when a quarrel subsisted between the courts of Rome and Lisbon. The power of his holiness in Portugal has been of late so much curtailed, that it is difficult to describe the religious state of that country: all we know is, that the royal revenues are greatly increased, at the expence of the religious institutions in the kingdom. The power of the inquisition is now taken out of the hands of the ecclesiastics, and converted to a state-trap for the benefit of the crown.

ARCHBISHOPRICS AND BISHOPRICS.] The archbishoprics are those of Braga, Evora, and Lisbon. The first of these haaten suffragan bishops; the second two; and the last ten, including those of the Portuguese settlements abroad. The patriarch of Lisbon is generally a cardinal, and a person of the highest birth.

LANGUAGE.] The Portuguese language differs but little from that of Spain, and that provincially. Their Paternoster runs thus: *Padre nosso que estas nos Ceos, sanctificado seio o tu nome; venha a nos tua reyno, seia feita a tua vontade, assi nos Ceos, commo na terra. O paonessa de cada dia, dano lo oei nestro dia. E perdoa nos senhor, as nossas devidas, assi como nos perdoamos a nos nossos devedores. E não nos dexes cabir om tentatio, mas libra nos do mal. Amen.*

LEARNING AND LEARNED MEN.] These are so few, that they are mentioned with indignation, even by those of the Portuguese themselves who have the smallest tincture of literature. Some efforts, though very weak, have of late been made by a few, to draw their countrymen from this deplorable state of ignorance. It is universally allowed that the defect is not owing to the want of genius, but of a proper education.—The ancestors of the present Portuguese were certainly possessed of more true knowledge, with regard to astronomy, geography, and navigation, than all the world besides, about the middle of the 16th century, and for some time after Camoens, who himself was a great adventurer and voyager, was possessed of a true, but neglected poetical genius.

UNIVERSITIES.] These are Coimbra, founded in 1291 by king Dennis; and which had fifty professors; but it has been lately put under some new regulations. Evora, founded in 1559; and the college of the nobles at Lisbon, where the young nobility are educated in every branch of polite learning and the sciences. All the books that did belong to the banished Jesuits are kept here, which compose a very large library. The English language is likewise taught in this college. Here is also a college where young gentlemen are educated in the science of engineering, and when qualified get commissions in that corps.

CURIOSITIES.] The lakes and fountains which have been already mentioned, form the chief of these. The remains of some castles in the Moorish taste are still standing. The Roman bridge and aqueduct at Coimbra are almost entire, and deservedly admired. The walls of Santareen are said to be of Roman work likewise. The church and monastery near Lisbon, where the kings of Portugal are buried, are inexpressibly magnificent; and several monasteries in Portugal are dug out of the hard rock. The chapel of St.

Roch

Roch, is probably one of the finest and richest in the world; the paintings are mosaic work, so curiously wrought with stones of all colours, as to astonish the beholders. To these curiosities we may add, that the king is possessed of the largest diamond (which was found in Brasil), that ever was perhaps seen in the world.

CHIEF CITIES.] Lisbon is the capital of Portugal, and is thought to contain 200,000 inhabitants. Great part of it was ruined by an earthquake, which also set the remainder on fire, upon All-Saints-day, 1755. It still contains many magnificent palaces, churches, and public buildings. Its situation (rising from the Tagus in the form of a crescent) renders its appearance at once delightful and superb, and it is deservedly accounted the greatest port in Europe, next to London and Amsterdam. The harbour is spacious and secure, and the city itself is guarded from any sudden attack towards the sea by forts, though they would make but a poor defence against ships of war. All that part of the city that was demolished by the earthquake, is planned out in the most regular and commodious form. Some large squares and many streets are already built. The streets form right angles, and are broad and spacious. The houses are lofty, elegant, and uniform; and being built of white stone, make a beautiful appearance. The second city in this kingdom is Oporto, which is computed to contain thirty thousand inhabitants. The chief article of commerce in this city is wine; and the inhabitants of half the shops in the city are coopers. The merchants assemble daily in the chief street, to transact business; and are protected from the sun by sail-cloths hung across from the opposite houses. About thirty English families reside here, who are chiefly concerned in the wine trade.

COMMERCE AND MANUFACTURES.] These, within these seven or eight years, have taken a surprising turn in Portugal. The ministry have projected many new companies and regulations, which have been again and again complained of as unjust and oppressive, and inconsistent with the privileges which the British merchants formerly enjoyed by the most solemn treaties.

The Portuguese exchange their wine, salt, and fruits, and most of their own materials for foreign manufactures. They make a little linen, and some coarse silk, and woollen, with a variety of straw work, and are excellent in preserving and candying fruit. The commerce of Portugal, though seemingly extensive, proves of little solid benefit to her, as the European nations, trading with her, engross all the productions of her colonies, as well as her own native commodities, as her gold, diamonds, pearls, sugars, coconuts, fine red wood, tobacco, hides, and the drugs of Brasil; her ivory, ebony, spices, and drugs of Africa and East-India, in exchange for the almost numberless manufactures, and the vast quantity of corn and salt-fish, supplied by those European nations, and by the English North American colonies.

The Portuguese foreign settlements are, however, not only of immense value, but vastly improveable; Brasil, the isles of Cape Verd, Madeira, and the Azores. They bring gold from their plantations on the east and west coast of Africa, and likewise slaves for manufacturing their sugars and tobacco in Brasil, and their South American settlements.

What the value of these may be, is unknown perhaps to themselves; but they certainly abound in all the precious stones, and rich mines of gold and silver, and other commodities that are produced in the Spanish dominions there. It is computed that the king's fifth of gold sent from Brasil, amounts

amounts annually to three hundred thousand pounds sterling, notwithstanding the vast contraband trade. The little shipping the Portuguese have, is chiefly employed in carrying on the slave trade, and a correspondence with Goa, their chief settlement in the East-Indies, and their other possessions there, as Du, Daman, Macao, &c.

CONSTITUTION AND GOVERNMENT.] The crown of Portugal is absolute; but the nation still preserves an appearance of its ancient free constitution, in the meeting of the cortes or states, consisting, like our parliaments, of clergy, nobility, and commons. They pretend to a right of being consulted upon the imposition of new taxes; but the only real power they have, is, that their assent is necessary in every new regulation, with regard to the succession. In this they are indulged, to prevent all future disputes on that account.

The nature of this government may be fairly pronounced the most despotic of any kingdom in Europe. The established law is generally a dead letter, excepting where its decrees are carried into execution by the supplementary mandates of the sovereign, which are generally employed in defeating the purposes of safety and protection, which law is calculated to extend equally over all the subjects.

Here the people have no more share in the direction of government, in enacting of laws, and in the regulating of agriculture and commerce, than they have in that of Russia, or China. The far greater part know nothing of what is done in that respect. Every man has no alternative but to yield a blind and ready obedience, in whatever concerns himself, to the decrees and laws of the despot, as promulgated from time to time by his secretaries of state. How would an Englishman, alive to all the feelings of civil liberty, tremble at reading the preamble of every new law published here; and which runs thus: "*I, the King, in virtue of my own certain knowledge, of my royal will and pleasure, and of my full supreme and arbitrary power, which I hold only of God, and for which I am accountable to no man on earth, I do in consequence of order and command, &c. &c.*"

All great preferments, both spiritual and temporal, are disposed of in the council of state, which is composed of an equal number of the clergy and nobility, with the secretary of state. A council of war regulates all military affairs; as the treasury courts do the finances. The council of the palace is the highest tribunal that can receive appeals, but the Casa da Supplicação is a tribunal from which no appeal can be brought. The laws of Portugal are contained in three duodecimo volumes, and have the civil law for their foundation.

REVENUES AND TAXES.] The revenues of the crown amount to above three millions and a half sterling, annually. The customs and duties on goods exported and imported are excessive, and farmed out; but if the Portuguese ministry should succeed in all their projects, and in establishing exclusive companies, to the prejudice of the British trade, the inhabitants will be able to bear those taxes without murmuring. Foreign merchandize pays 23 per cent. on importation, and fish from Newfoundland 25 per cent. Fish taken in the neighbouring seas and rivers pay 27 per cent. and the tax upon lands and cattle that are sold is 10 per cent. The king draws a considerable revenue from the several orders of knighthood, of which he is grand-master. The pope, in consideration of the large sums he draws out of Portugal, gives the king the money arising from indulgences and licences to eat flesh at times prohibited, &c. The king's revenue is now greatly increased by the suppression of the Jesuits, and other religious orders and institutions.

MILITARY AND NAVAL STRENGTH.] The Portuguese government used to depend chiefly for protection on England; and therefore, for many years, they greatly neglected their army and fleet; but the same friendly connexion between Great Britain and Portugal does not at present subsist. In the late reign, though they received the most effectual assistance from England, when invaded by the French and Spaniards, his Most Faithful Majesty judged it expedient to raise a considerable body of troops, who were chiefly disciplined by foreign officers: but since that period the army has been again neglected, no proper encouragement being given to foreign officers, and little attention paid to the discipline of the troops, so that the military force of Portugal is now again inconsiderable, amounting it is said to twenty-five thousand men. The naval force of this kingdom is about seventeen ships of war, including six frigates.

ROYAL TITLES AND ARMS.] The king's titles are, King of Portugal and the Algarves, Lord of Guinea, and of the navigation, conquest, and commerce of Ethiopia, Arabia, Persia, and Brasil. The last king was complimented by the pope, with the title of His Most Faithful Majesty. That of his eldest son is prince of Brasil.

The arms of Portugal are, argent, five escutcheons, azure, placed cross-wise, each charged with as many besants as the first, placed saltier-wise, and pointed, sable, for Portugal. The shield bordered, gules, charged with seven towers, or three in chief, and two in each flanch.—The supporters are two winged dragons, and the crest a dragon, or, under the two flanches, and the base of the shield appears at the end of it; two crosses, the two first flowers de-luce, vert, which is for the order of Aviez, and the second patee, gules, for the order of Christ; the motto is changeable, each king assuming a new one; but it is frequently these words, *pro Rege et Grege*, "For the King and the People."

NOBILITY AND ORDERS.] The title and distinctions of their nobility are much the same as those of Spain. Their orders of knighthood are three; 1. That of *Avis*, or *Aviz*, first instituted by Alphonseus Henriquez, king of Portugal, in the year 1147, as a military and religious order, on account of his taking Evora from the Moors. In 1213, it was subject to the order of Calatrava in Spain, but when Don John of Portugal seized the crown, he made it again independent. 2. The "Order of St. James" instituted by Dennis I. king of Portugal, in the year 1310, supposing that under that saint's protection he became victorious over the Moors, and he endowed it with great privileges. The knights profess chastity, hospitality, and obedience; and none are admitted till they prove the gentility of their blood. Their ensign is a red sword, the habit white, and their principal convent is at Dalmela. 3. The "Order of *Christ*" was instituted in the year 1317, by Dennis I. of Portugal, to engage the nobility to assist him more powerfully against the Moors. The knights obtained great possessions, and elected their grand master, till 1522, when pope Adrian VI. conferred that office on John III. and his successors to the crown of Portugal. These orders have small commanderies and revenues annexed to them, but are in small esteem. The "Order of *Malta*" hath likewise 22 commanderies in Portugal.

HISTORY OF PORTUGAL.] This kingdom comprehends the greatest part of the ancient Lusitania, and shared the same fate with the other Spanish provinces in the contests between the Carthaginians and Romans, and in the decline and fall of the Roman empire, and was successively in subjection to the Suesi, Alaus, Visigoths, and Moors. In the eleventh century, Alphonseus VI. king of Castile and Leon, rewarded Henry, grandson of Robert king

of France, for his bravery and assistance against the Moors, with his daughter, and that part of Portugal then in the hands of the Christians. Henry was succeeded by his son Alphonso Henry, in the year 1095 who gained a decisive victory over five Moorish kings, in July, 1139. This victory proved the origin of the monarchy of Portugal, for Alphonso was then proclaimed king by his soldiers. He reigned 46 years, and was esteemed for his courage and love of learning.—His descendants maintained themselves on the throne for some centuries; indeed Sancho II. was expelled from his dominions for cowardice in the year 1240.

Dennis I. or Dionysius, was called the *Father of his Country*; he built and rebuilt 44 cities and towns in Portugal, founded the military order of Christ, and was a very fortunate prince. He reigned 46 years.—Under his successor, Alphonso IV. happened several earthquakes at Lisbon, which threw down part of the city and destroyed many lives.—John I. was illustrious for his courage, prudence, and conquests in Africa; under him Madeira was first discovered in 1429, and the Canaries; he took Ceuta, and after a reign of 49 years, died in the year 1433. In the reign of Alphonso V. about 1480, the Portuguese discovered the coast of Guinea; and in the reign of his successor John II. they discovered the Cape of Good Hope, and the kingdom of Moni-Congo, and settled colonies, and built forts in Africa, Guinea, and the East Indies. Emanuel, surnamed the Great, succeeded him in 1495, and adopted the plan of his predecessors, fitting out fleets for new discoveries. Vasco de Gama, under him, cruised along the coast of Africa and Ethiopia, and landed in Indostan; and in the year 1500 Alvarez discovered Brasil.

John III. succeeded in 1521, and while he lost some of his African settlements, made new acquisitions in the Indies. He sent the famous Xavier as a missionary to Japan, and in the height of his zeal, established that infernal tribunal the inquisition, in Portugal, anno 1526, against the entreaties and remonstrances of his people. Sebastian his grandson succeeded him in 1557, and undertook a crusade against the Moors in Africa. In 1578, in a battle with the king of Fez and Morocco, on the banks of the river Lucco, he was defeated, and either slain or drowned. Henry, a cardinal, and uncle to the unfortunate Sebastian, being the son of Emanuel, succeeded, but died without issue in the year 1580; on which, Anthony Prior, of Crato, was chosen king, by the states of the kingdom; but Philip II. of Spain, as hath been observed in our history of that country, pretended that the crown belonged to him, because his mother was the eldest daughter of Emanuel, and sent the duke of Alva with a powerful force, who subdued the country and proclaimed his master king of Portugal, the 12th Sept. 1580.

The viceroys under Philip and his two successors, Philip III. and Philip IV. behaved towards the Portuguese with great rapacity and violence. The Spanish ministers treated them as vassals of Spain, and by their repeated acts of oppression and tyranny, they so kindled the hatred and courage of the Portuguese, as to produce a revolt at Lisbon, the first of December, 1640. The people obliged John duke of Braganza, the legitimate heir to the crown, to accept it, and he succeeded to the throne by the title of John IV. almost without bloodshed, and the foreign settlements also acknowledged him as their sovereign. A fierce war subsisted for many years between the two kingdoms, and all the efforts of the Spaniards to reunite them, proved vain, so that a treaty was concluded in February, 1668, by which Portugal was declared free and independent.

The Portuguese could not have supported themselves under their revolt
from

from Spain, had not the latter power been engaged in wars with England and Holland; and upon the restoration of Charles II. of England, that prince having married a princess of Portugal, prevailed with the crown of Spain to give up all pretensions to that kingdom. Alphonso, son to John IV. was then king of Portugal. He had the misfortune to disagree at once with his wife and his brother Peter; and they uniting their interests, not only forced Alphonso to resign his crown, but obtained a dispensation from the pope for their marriage, which was actually consummated. They had a daughter; but Peter by a second marriage had sons, the eldest of whom was John, his successor, and father to the late king of Portugal. John, like his father, joined the grand confederacy formed by king William; but neither of them were of much service in humbling the power of France. On the contrary, he almost ruined the allies, by occasioning the loss of the battle of Almanza in 1707.—John died in 1750, and was succeeded by his son Joseph, whose reign was neither happy to himself nor fortunate for his people. The fatal earthquake, in 1755, overwhelmed his capital, and shook his kingdom to the centre. His succeeding administration was not distinguished by the affection that it acquired at home, or the reputation which it sustained abroad. It was deeply stained with domestic blood; and rendered odious by excessive and horrible cruelty. In September, 1759, the king was attacked by assassins, and narrowly escaped with his life, in a solitary place near his country palace of Belem. Some of the first families of the kingdom were hereupon ruined, tortured, and nearly cut off from the face of the earth, in consequence of an accusation being exhibited against them of having conspired against the king's life. But they were condemned without any proper evidence, and their innocence has since been authentically declared. From this supposed conspiracy is dated the expulsion of the Jesuits (who were conjectured to have been at the bottom of the plot) from all parts of the Portuguese dominions. The marquis de Pombal, who was at this time the prime minister of Portugal, governed the kingdom for many years with a most unbounded authority, and which appears to have been sometimes directed to the most cruel and arbitrary purposes.

In 1762, when a war broke out between Spain and England, the Spaniards and their allies the French, attempted to force his faithful Majesty into their alliance, and offered to garrison his sea-towns against the English with their troops. The king of Portugal rejected this proposal, and declared war against the Spaniards, who, without resistance, entered Portugal with a considerable army, while a body of French threatened it from another quarter. Some have doubted whether any of these courts were in earnest upon this occasion, and whether the whole of the pretended war was not concerted to force England into a peace with France and Spain, in consideration of Portugal's apparent danger. It is certain, that both the French and Spaniards carried on the war in a very dilatory manner, and that had they been in earnest, they might have been masters of Lisbon long before the arrival of the English troops to the assistance of the Portuguese. However, a few English battalions put an effectual stop, by their courage and manœuvres, to the progress of the invasion. Portugal was saved, and a peace was concluded at Fontainebleau in 1763. Notwithstanding this eminent service performed by the English to the Portuguese, who often had been saved before in the like manner, the latter, ever since that period, cannot be said to have held their deliverers with a friendly eye. The most captious distinctions and frivolous pretences have been invented by the Portuguese ministers for tramping the English trade, and depriving them of their privileges.

held their deliverers with a friendly eye. The most capricious and frivolous pretences have been invented by the Portuguese ministers for tramping the English trade, and depriving them of their privileges.

His

His Portuguese majesty having no son, his eldest daughter was married, by dispensation from the pope, to Don Pedro, her own uncle, to prevent the crown from falling into a foreign family. The late king died on the 24th of February, 1777, and was succeeded by his daughter the present queen. One of the first acts of her majesty's reign was the removal from power of the marquis de Pombal; an event which excited general joy throughout the kingdom, as might naturally be expected from the arbitrary and oppressive nature of his administration; though it has been alledged in his favour, that he adopted sundry public measures, which were calculated to promote the real interests of Portugal.

On the 10th of March, 1792, the prince of Brasil, as presumptive heir to the crown, published an edict, declaring, that as his mother, from her unhappy situation, was incapable of managing the affairs of government, he would place his signature to public papers, till the return of her health; and that no other change should be made in the forms.

The queen is disordered by religious melancholy; and Dr. Willis has been called to cure her; but her recovery remaining hopeless, the government of the country rests with the prince of Brasil.

The government of Portugal joined the coalition against France, but was never able to afford any effectual assistance. At present, with a disaffected army and an inert people, she is ill calculated for a vigorous resistance if attacked. The French seem at present, however, to be in no situation to attempt the conquest of Portugal.

Maria-Frances-Isabella, queen of Portugal, born Dec. 17, 1743; married June 6, 1760, to her uncle Don Pedro Clement; F. R. S. born July 5, 1717, who died May 25, 1786. Began to reign Feb. 24, 1777.

Their Issue.

John-Maria-Joseph-Lewis, born May 13, 1767; married March 20, 1785, Maria-Louisa of Spain, born July 9, 1777.

The Issue by the late King.

1. Her present majesty.
2. Anna-Frances-Antoinetta, born Oct 8, 1736.
3. Maria-Françisca-Benedicta, born July 24, 1746; married in 1776, to her nephew the prince of Brasil, who died Sept. 11, 1788.

I T A L Y.

SITUATION AND EXTENT.

Miles	Degrees.
Length 600 } Breadth 400 }	between { 38 and 47 north latitude. { 7 and 19 east longitude.

Containing 116,967 square miles, with 70 inhabitants in each.

THE form of Italy renders it very difficult to ascertain its extent and dimensions; or, according to some accounts, it is, from the frontiers

of Switzerland to the extremity of the kingdom of Naples, about 750 miles in length; and from the frontiers of the duchy of Savoy, to those of the dominions of the states of Venice, which is its greatest breadth, about 400 miles, though in some parts it is scarcely 100.

BOUNDARIES.] Nature has fixed the boundaries of Italy; for towards the East it is bounded by the Gulf of Venice, or Adriatic Sea; on the South and West by the Mediterranean Sea; and on the North, by the lofty mountains of the Alps, which divide it from France and Switzerland.

The whole of the Italian dominions, comprehending Corsica, Sardinia, the Venetian and other islands, are divided and exhibited in the following table:

Italy.	Countries Names.	Square Miles.	Length.	Breadth.	Chief Cities.

and commodity: wines, the most delicious fruits, and oil, are the most general productions. As much corn grows here as serves the inhabitants; and were the ground properly cultivated, the Italians might export it to their neighbours. The Italian cheeses particularly those called Parmesans, and their native silk, form a principal part of their commerce. There is here a great variety of air; and some parts of Italy bear melancholy proofs of the alterations that accidental causes make on the face of nature; for the Campagna di Roma, where the ancient Romans enjoyed the most salubrious air of any place perhaps on the globe, is now almost pestilential, through the decrease of inhabitants, which has occasioned a stagnation of waters, and putrid exhalations. The air of the northern parts, which lie among the Alps, or in their neighbourhood, is keen and piercing, the ground being in many places covered with snow in winter. The Appennines, which are a ridge of mountains that longitudinally almost divide Italy, have great effects on its climate; the countries on the south being warm, those on the north, mild and temperate. The sea-breezes refresh the kingdom of Naples so much, that no remarkable inconveniency of air is found there, notwithstanding its southern situation. In general, the air of Italy may be said to be dry and pure.

MOUNTAINS.] We have already mentioned the Alps and the Appennines, which form the chief mountains of Italy. The famous volcano of Mount Vesuvius lies in the neighbourhood of Naples.

RIVERS AND LAKES.] The rivers of Italy are the Po, the Var, the Adige, the Trebia, the Arno, and the Tiber, which runs through the city of Rome. The famous Rubicon forms the southern boundary between Italy and the ancient Cisalpine Gaul.

The lakes of Italy are, the Maggiore, Lugano, Como, Isco, and Garda in the North; the Perugia or Thrasimene, Bracciana, Terni, and Celano, in the middle.

SEAS, GULPHS, OR BAYS, CAPES, PROMONTORIES, AND STRAITS.] Without a knowledge of these, neither the ancient Roman authors, nor the history nor geography of Italy, can be understood. The seas of Italy are, the gulfs of Venice, or the Adriatic sea; the seas of Naples, Tuscany, and Genoa; the bays or harbours of Nice, Villa Franca, Oneglia, Final, Savona, Vado, Spezzia, Lucca, Pisa, Leghorn, Piombino, Civita Vecchia, Gaeta, Naples, Salerno, Policastro, Rhegio, Quilace, Tarento, Manfredonia, Ravenna, Venice, Trieste, Istria, and Fiume; Cape Spartavento del Alice, Otranto, and Ancona; the strait of Messina, between Italy and Sicily.

The gulfs and bays in the Italian islands are those of Fiorenzo, Bastia, Talada, Porto Novo, Cape Corfa, Bonifacio, and Ferra, in Corsica; and the strait of Bonifacio, between Corsica and Sardinia. The bays of Cagliari and Oristagni; Cape de Sardis, Cavello, Monte Santo, and Polo, in Sardinia. The gulfs of Messina, Melazzo, Palermo, Mazara, Syracuse, and Catania; cape Faro, Melazzo, Orlando, Gallo, Trapano, Passaro, and Alessia, in Sicily; and the bays of Porto Feraio, and Porto Longone, in the island of Elba.

METALS AND MINERALS.] Many places of Italy abound in mineral springs; some hot, some warm, and many of sulphureous, chalybeat and medicinal qualities. Many of its mountains abound in mines that produce great quantities of emeralds, jasper, agate, porphyry, lapis lazuli, and other valuable stones. Iron and copper-mines are found in a few places; and a mill for forging and fabricating these metals is erected near Tivoli, in Naples. Sardinia is said to contain mines of gold, silver, lead, iron, sulphur, and alum, though

though they are now neglected; and curious crystals and coral are found on the coast of Corfica. Beautiful marble of all kinds is one of the chief productions of Italy.

VEGETABLE AND ANIMAL PRODUCTIONS, BY SEA AND LAND. } Besides the rich vegetable productions mentioned under the article of soil, Italy produces citrons, and such quantities of chestnuts, cherries, plums, and other fruits, that they are of little value to the proprietors.

There is little difference between the animal productions of Italy, either by land or sea, and those of France and Germany already mentioned.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. } Authors are greatly divided on the head of Italian population. This may be owing, in a great measure, to the partiality which every Italian has for the honour of his own province. The number of the king of Sardinia's subjects in Italy is about 2,300,000. The city of Milan itself, by the best accounts, contains 300,000, and the duchy is proportionably populous. As to the other provinces of Italy, geographers and travellers have paid very little attention to the numbers of natives that live in the country, and inform us by conjecture only of those who inhabit the great cities. Some doubts have arisen whether Italy is as populous now as it was in the time of Pliny, when it contained 14,000,000 of inhabitants. I am apt to believe that the present inhabitants exceed that number. The Campagna di Roma, and some other of the most beautiful parts of Italy, are at present in a manner desolate; but we are to consider that the modern Italians are in a great measure free from the unintermitting wars, not to mention the transmigration of colonies, which formerly, even down to the 16th century, depopulated their country. Add to this, that the princes and states of Italy now encourage agriculture and manufactures of all kinds, which undoubtedly promotes population; so that it may not perhaps be extravagant, if we assign to Italy 20,000,000 of inhabitants; but some calculations greatly exceed that number*. The Italians are generally well proportioned, and have such meaning in their looks, that they have greatly assisted the ideas of their painters. The women are well-shaped, and very amorous. The marriage ties, especially of the better sort, are said to be of very little value in Italy. Every wife has been represented to have her gallant or cicisbeo, with whom she keeps company, and sometimes cohabits, with very little ceremony, and no offence on either side. But this practice is chiefly remarkable at Venice; and indeed the representations which have been made of this kind by travellers, appear to have been much exaggerated. With regard to the modes of life, the best quality of a modern Italian is sobriety, and they submit very patiently to the public government. With great taciturnity they discover but little reflection. They are rather vindictive than brave, and more superstitious than devout. The middling ranks are attached to their native customs, and seem to have no ideas of improvement. Their fondness for greens, fruits, and vegetables of all kinds, contributes to their contentment and satisfaction; and an Italian gentleman or peasant can be luxurious at a very small expence. Though perhaps all Italy does not contain many descendents of the ancient Romans, yet the present inhabitants speak of themselves as successors of the conquerors of the world, and look upon the rest of mankind with contempt.

The dress of the Italians is little different from that of the neighbouring countries, and they affect a medium from the French, volatility and the solemnity

* Mr. Swinburne saith, that in 1779, the number of inhabitants in the kingdom of Naples, amounted to 4,247,430, exclusive of the army and naval establishment.

nity

nity of the Spaniards. The Neapolitans are commonly drest in black, in compliment to the Spaniards. It cannot be denied that the Italians excel in fine arts; though they make at present but a very inconsiderable figure in the sciences. They cultivate and enjoy vocal music at a very dear rate, by emasculating their males when young; to which their mercenary parents agree without remorse.

The Italians, the Venetians especially, have very little or no notion of the impropriety of many customs that are considered as criminal in other countries. Parents, rather than their sons should throw themselves away by unsuitable marriage, or contract diseases by promiscuous amours, hire mistresses for them, for a month, or a year, or some determined time; and concubinage, in many places of Italy, is an avowed licensed trade. The Italian courtizans, or *bona robas*, as they are called, make a kind of profession in all their cities. Masquerading and gaming, horse races without riders, and conversations or assemblies, are the chief diversions of the Italians, excepting religious exhibitions, in which they are pompous beyond all other nations.

A modern writer, describing his journey through Italy, gives us a very unfavourable picture of the Italians, and their manner of living. Give what scope you please to your fancy, says he, you will never imagine half the disagreeableness that Italian beds, Italian cooks, and Italian nastiness, offer to an Englishman. At Turin, Milan, Venice, Rome, and perhaps two or three other towns, you meet with good accommodations; but no words can express the wretchedness of the other inns. No other beds than those of straw, with a mattress of straw, and next to that a dirty sheet, sprinkled with water, and consequently damp: for a covering, you have another sheet as coarse as the first, like one of our kitchen jack-towels, with a dirty coverlet. The bedstead consists of four wooden forms or benches: an English peer and peeress must lie in this manner, unless they carry an upholsterer's shop with them. There are, by the bye, no such things as curtains; and in all their inns the walls are bare, and the floor has never once been washed since it was first laid. One of the most indelicate customs here is, that men, and not women, make the ladies beds, and would do every office of a maid servant, if suffered. They never scour their pewter; their knives are of the same colour. In these inns they make you pay largely, and send up ten times as much as you can eat. The soup, like wash, with pieces of liver swimming in it; a plate full of brains fried in the shape of fritters; a dish of livers and gizzards; a couple of fowls (always killed after your arrival) boiled to rags, without any the least kind of sauce or herbage. another fowl, just killed, stewed as they call it; then two more fowls, or a turkey roasted to rags. All over Italy, on the roads, the chickens and fowls are so stringy, you may divide the breast into as many filaments as you can a halfpenny-worth of thread. Now and then we get a little piece of mutton or veal; and, generally speaking, it is the only eatable morsel that falls in our way. The bread all the way is exceeding bad: and the butter so rancid, that it cannot be touched or even born within the reach of your smell. But what is a greater evil to travellers than any of the above recited; are the infinite numbers of gnats, bugs, fleas, and lice, which infest us by day and night.

[RELIGION.] The religion of the Italians is Roman catholic. The inquisition here is little more than a sound; and persons of all religions live unmolested in Italy, provided no gross insult is offered to their worship. In the Introduction, we have given an account of the rise and establishment of popery in Italy, from whence it spread over all Europe; likewise of the

causes

causes and symptoms of its decline. The ecclesiastical government of the papacy has employed many volumes in describing it. The cardinals, who are next in dignity to his holiness, are seventy: but that number is seldom or never complete; they are appointed by the pope, who takes care to have a majority of Italian cardinals, that the chair may not be removed from Rome, as it was once to Avignon in France, the then pope being a Frenchman. In promoting foreign prelates to the cardinalship, the pope regulates himself according to the nomination of the princes who profess that religion. His chief minister is the cardinal patron, generally his nephew, or near relation, who improves the time of the pope's reign by amassing what he can. When met in a consistory, the cardinals pretend to control the pope, in matters both spiritual and temporal, and have been sometimes known to prevail. The reign of a pope is seldom of long duration, being generally old men at the time of their election. The conclave is a scene where the cardinals principally endeavour to display their parts, and where many transactions pass which hardly shew their inspiration to be from the Holy Ghost. During the election of a pope in 1721, the animosities ran so high, that they came to blows with both their hands and feet, and threw the ink standishes at each other. We shall here give an extract from the creed of pope Six. IV. 1560, before his elevation to the chair, which contains the principal points wherein the church of Rome differs from the protestant churches. After declaring his belief in one God, and other heads wherein Christians in general are agreed, he proceeds as follows.

"I most firmly admit and embrace the apostolical and ecclesiastical traditions, and all other constitutions of the church of Rome.

"I do admit the holy scriptures in the same sense that holy mother-church doth, whose business it is to judge of the true sense and interpretation of them; and I will interpret them according to the unanimous consent of the fathers.

"I do profess and believe that there are seven sacraments of the law, truly and properly so called, instituted by Jesus Christ our Lord, and necessary to the salvation of mankind, though not all of them to every one; namely, baptism, confirmation, eucharist, penance, extreme unction, orders, and marriage, and that they do confer grace; and that of these, baptism, confirmation, and orders, may not be repeated without sacrilege. I do also receive and admit the received and approved rites of the catholic church in her solemn administration of the above-said sacraments.

"I do embrace and receive all and every thing that hath been defined and declared by the holy council of Trent* concerning original sin and justification.

"I do also profess that in the mass there is offered unto God a true proper, and propitiatory sacrifice for the quick and the dead; and that in the most holy sacrament of the eucharist there is truly, really, and substantially, the body and blood, together with the soul and divinity, of our Lord Jesus Christ; and that there is a conversion made of the whole substance of the bread into the body, and of the whole substance of the wine into the blood, which conversion the catholic church calls Transubstantiation. I profess that under one kind only, whole and entire, Christ and a true sacrament is taken and received.

* A convocation of the most catholic cardinals, archbishops, bishops, and divines, who assembled at Trent, by virtue of a bull from the pope, anno 1545, and devoted to him, to determine upon certain points of faith, and to suppress what they were pleased to term the Rising Heresies in the church.

" I do firmly believe that there is a purgatory; and that the souls kept prisoners there do receive help by the suffrages of the faithful.

" I do likewise believe that the saints reigning together with Christ are to be worshipped and prayed unto: and that they do offer prayers unto God for us, and that their relics are to be had in veneration.

" I do most firmly assert, that the images of Christ, of the blessed Virgin the mother of God, and of other saints, ought to be had and retained; and that due honour and veneration ought to be given unto them *.

" I do likewise affirm, that the power of indulgences was left by Christ to the church, and that the use of them is very beneficial to christian people †.

" I do acknowledge the holy, catholic, and apostolical Roman church to be the mother and mistress of all churches: and I do promise and swear

* An English traveller, speaking of a religious procession some years ago at Florence, in Italy, describes it as follows: I had occasion says he, to see a procession, where all the noblesse of the city attended in their coaches. It was the anniversary of a charitable institution in favour of poor maidens, a certain number of whom are portioned every year. About two hundred of these virgins walked in procession, two and two together. They were preceded and followed by an irregular mob of penitents, in sack cloth, with lighted tapers, and monks carrying crucifixes, bawling and bellowing the litanies: but the greatest object was the figure of the Virgin Mary, as big as the life, standing within a gilt frame, dressed in a gold stuff, with a large hoop, a great quantity of false jewels, her face painted and patched, and her hair frizzled and curled in the very extremity of the fashion. Very little regard had been paid to the image of our Saviour on the cross; but when the Lady Mother appeared on the shoulders of three or four luby friars, the whole populace fell upon their knees in the dirt.

† A long list of indulgences, or fees of the pope's chancery, may be seen in a book printed 150 years ago, by the authority of the then pope. It has been translated into English, under the title of *Rome a great Custom-House for Sin*; from which we shall give a few extracts.

A B S O L U T I O N S.

For him that stole holy or consecrated things out of a holy place, 10s. 6d.

For him who lies with a woman in the church, 9s.

For a layman for murdering a layman, 7s. 6d.

For him that killeth his father, mother, wife, or sister, 10s. 6d.

For laying violent hands on a clergyman, so it be without effusion of blood, 10s. 6d.

For a priest that keeps a concubine; as also his dispensation for being irregular, 10s. 6d.

For him that lyeth with his own mother, sister, or godmother, 7s. 6d.

For him that burns his neighbour's house, 12s.

For him that forgeth the pope's hand, 11. 7s.

For him that forgeth the apostolical, 11. 7s.

For him that takes two holy orders in one day, 41. 6s.

For a king for going to the holy sepulchre without licence, 71. 10s.

D I S P E N S A T I O N S.

For a barrard to enter all holy orders, 18s.

For a man or woman that is found hanged, that they may have Christian burial, 11. 7s. 6d.

For a layman to change his vow of going to Rome to visit the apostolic churches, 18s.

To eat flesh and white wine in Lent and other fasting days, 10s. 6d.

That a king or queen shall enjoy such indulgences, as if they went to Rome, 151.

For a queen to adopt a child, 300l.

To marry in times prohibited, 21. 5s.

To eat flesh in times prohibited, 11. 4s.

Not to be tied to fasting days, 11. 4s.

For a town to take out of a church them (murderers) that have taken sanctuary therein, 41. 10s.

F A C U L T I E S.

To absolve all delinquents, 31.

To dispense with irregularities, 31.

true obedience to the bishop of Rome, the successor of St. Peter, the prince of the apostles, and vicar of Jesus Christ.

"I do undoubtedly receive and profess all other things which have been delivered, defined, and declared by the sacred canons and oecumenical councils, and especially by the holy synod of Trent. And all other things contrary thereto, and all heresies condemned, rejected, and anathematized by the church, I do likewise condemn, reject, and anathematize."

ARCHBISHOPS.] There are thirty eight archbishoprics in Italy, but the suffragans annexed to them are too indefinite and arbitrary for the reader to depend upon, the pope creating or suppressing them as he pleases.

LANGUAGE.] The Italian language is remarkable for its smoothness, and the facility with which it enters into musical compositions. The ground work of it is Latin, and it is easily mastered by a good classical scholar. Almost every state in Italy has a different dialect; and the prodigious pains taken by the literary societies there, may at last fix the Italian into a standard language. At present the Tuscan style and writings are most in request.

The Lord's prayer runs thus: *Padre nostro, che sei, nel cielo, sia santificato il tuo nome; ill tuo regno venga; la tua volonta sia fatta, sic come in cielo cosi anche in terra: dacci oggi ill nostro pane cotidiano: e rimettici i nostri debita, sic come noi ancora rimettiamo a' nostri debitori; e non inducici in tentatione, ma liberaci dal maligno; percioche tue e il regno' e la potenza, e la gloria in sempiterno. Amen.*

LEARNING AND LEARNED MEN, PAINTERS, STATUARIES, ARCHITECTS, AND ARTISTS. } In the introduction we have particularised some of the great men which ancient Italy has produced. In modern times, that is, since the revival of learning, some Italians have shone in controversial learning, but they are chiefly celebrated by bigots of their own persuasion. The mathematics and natural philosophy owe much to Galileo, Toricelli Malpighi, Borelli, and several other Italians. Strada is an excellent historian; and the history of the council of Trent, by the celebrated father Paul, is a standard work. Guicciardin, Bentivoglio, and Davila, have been much commended as historians by their several admirers. Machiavel is equally famous as an historian, and as a political writer. His comedies have much merit; and the liberality of his sentiments, for the age in which he lived, is amazing. Among the prose writers in the Italian language, Boccace has been thought one of the most pure and correct in point of style: he was a very natural painter of life and manners, but his productions are too licentious. Petrarch, who wrote both in Latin and Italian, revived among the moderns the spirit and genius of ancient literature: but among the Italian poets, Dante, Ariosto, and Tasso, are the most distinguished. There are said to be upwards of a thousand comedies in the Italian language, though not many that are excellent: but Metastasio has acquired a great reputation by writing dramatic pieces set to music. Sanzarius, Fracastorius, Bembo, Vida, and other natives of Italy, have distinguished themselves by the elegance, correctness, and spirit of their Latin poetry, many of their compositions not yielding to the classics themselves. Socinus, who was so much distinguished by his opposition to the doctrine of the Trinity, was a native of Italy.

The Italian painters, sculptors, architects, and musicians, are unrivalled, not only in their numbers, but their excellencies. The revival of learning, after the sack of Constantinople by the Turks, revived taste likewise, and gave mankind a relish for truth and beauty in design and colouring. Raphael, from

his own ideas, assisted by the ancients, struck out a new creation with his pencil, and still stands at the head of the painting art: Michael Angelo Buonaroti united in his own person, painting, sculpture, and architecture. The colouring of Titian has perhaps never yet been equalled. Bramante, Bernini, and many other Italians, carried sculpture and architecture to an amazing height. Julio Romano, Correggio, Caraccio, Veronese, and others, are, as painters unequalled in their several manners. The same may be said of Corelli, and other Italians, in music: At present Italy cannot justly boast of any paramount genius in the fine arts.

UNIVERSITIES.] Those of Italy are, Rome, Venice, Florence, Mantua, Padua, Parma, Verona, Milan, Pavia, Bologna, Ferrara, Pisa *, Naples, Salerno, and Perugia.

ANTIQUITIES AND CURIOSITIES } Italy is the native country of all
NATURAL AND ARTIFICIAL. } that is stupendous, great or beautiful,
either in ancient or modern times. A library may be filled by descriptions
and delineations of all that is rare and curious in the arts; nor do the bounds
of this work admit of enlarging upon this subject. We can give but a very
brief account of those objects that are most distinguished either for antiquity
or excellence.

The amphitheatres claim the first rank, as a species of the most striking magnificence: there are at Rome considerable remains of that which was erected by Vespasian, and finished by Domitian, called the Colisso. Twelve thousand Jewish captives were employed by Vespasian in this building; and it is said to have been capable of containing eighty-seven thousand spectators seated, and twenty thousand standing. The architecture of this amphitheatre is perfectly light, and its proportions are so just, that it does not appear near so large as it really is. But it has been stripped of all its magnificent pillars and ornaments, at various times, and by various enemies. The Goths, and other barbarians, began its destruction, and popes and cardinals have endeavoured to complete its ruin. Cardinal Farnese, in particular, robbed it of some fine remains of its marble cornices, friezes, &c. and, with infinite pains and labour, got away what was practicable of the outside casing of marble, which he employed in building the palace of Farnese. The amphitheatre of Verona, erected by the consul Flaminius, is thought to be the most entire of any in Italy. There are forty-five rows of steps carried all round, formed of fine blocks of marble about a foot and a half high each, and about two feet broad. Twenty-two thousand persons may be seated here at their ease, allowing one foot and a half for each person. This amphitheatre is quite perfect, and has been lately repaired with the greatest care at the expence of the inhabitants. They frequently give public spectacles in it, such as horse-races, combats of wild beasts, &c. The ruins of theatres and amphitheatres are also visible in other places. The triumphal arches of Vespasian, Septimius Severus, and Constantine the Great, are still standing though decayed. The ruins of the baths, palaces, and temples, answer all the ideas we can form of the Roman grandeur. The Pantheon, which is at present converted into a modern church, and which from its circular figure is commonly called the Rotunda, is more entire than any other Roman temple which is now remaining. There are still left several of the niches which anciently contained the statues of the Heathen deities. The outside of the building is of Tivoli free stone, and within it is incrusted with marble. The roof of the Pantheon is a round dome, without pillars, the diameter of which

* Pisa hath 46 professors.

It is a hundred and forty-four feet; and though it has no windows, but only a round aperture in the centre of this dome, it is very light in every part. The pavement consists of large square stones and porphyry, sloping round towards the centre, where the rain-water, falling down through the aperture on the top of the dome, is conveyed away by a proper drain covered with a stone full of holes. The colonnade in the front, which consists of sixteen columns of granite, three feet high, exclusive of the pedestals and capitals, each cut out of a single block, and which are of the Corinthian order, can hardly be viewed without astonishment. The entrance of the church is adorned with columns forty eight feet high, and the architrave is formed of a single piece of granite. On the left hand, on entering the portico, is a large antique vase of Numidian marble; and in the area before the church is a fountain with an antique basin of porphyry. The pillars of Trajan and Antonine, the former 175 feet high, and the latter covered with instructive sculptures, are still remaining. A traveller forgets the devastations of the northern barbarians, when he sees the rostrated column erected by Duillius in commemoration of the first naval victory the Romans gained over the Carthaginians; the statue of the wolf giving suck to Romulus and Remus, with visible marks of the stroke of lightning, mentioned by Cicero; the very original brass plates containing the laws of the twelve tables; and a thousand other identical antiquities, some of them transmitted unhurt to the present times; not to mention medals, and the infinite variety of seals and engraved stones which abound in the cabinets of the curious. Many palaces, all over Italy, are furnished with busts and statues fabricated in the times of the republic and the higher empire.

The Appian, Flaminian, and Æmilian roads, the first 200 miles, the second 190, and the third 50 miles in length, are in many places still entire; and magnificent ruins of villas, reservoirs, bridges and the like, present themselves all over the country of Italy.

The subterraneous constructions of Italy are as stupendous as those above ground; witness the cloacæ, and the catacombs, or repositories for dead bodies, in the neighbourhood of Rome and Naples. It is not above 300 years since a painter's apprentice discovered the ancient city of Pæstum or Posidonia, in the kingdom of Naples, still standing; for so indifferent are the country people of Italy about objects of antiquity, that it was a new discovery to the learned. An inexhaustible mine of curiosities are daily dug out of the ruins of Herculaneum, a city lying between Naples and Vesuvius, which in the reign of Nero was almost destroyed by an earthquake, and afterwards, in the first year of the reign of Titus, overwhelmed by a stream of the lava of Vesuvius. The melted lava in its course filled up the streets and houses in some places to the height of sixty-eight feet above the tops of the latter, and in others one hundred and ten feet. This lava is now of a consistency which renders it extremely difficult to be removed or cleared away: it is composed of bituminous particles mixed with cinders, minerals, metallics, and vitrified sandy substances, which all together form a close and heavy mass. In the solution of so many ages, the spot it stood upon was entirely forgotten; but in the year 1713, upon digging into these parts, somewhat of this unfortunate city was discovered, and many antiquities were dug out: but the search was afterwards discontinued, till the year 1736, when the king of Naples employed men to dig perpendicularly eighty feet deep, whereupon not only the city made its appearance, but also the bed of the river which ran through it. The temple of Jupiter was then brought to light, and the whole of the theatre. In the temple was found

found a statue of gold, and the inscription that decorated the great doors of entrance. In the theatre the fragments of a gilt chariot of bronze with horses of the same metal, likewise gilt: this had been placed over the principal door of entrance. They likewise found among the ruins of this city multitudes of statues, bustos, pillars, paintings, manuscripts, furniture, and various utensils, and the search is still continued. The streets of the town appear to have been quite straight and regular, and the houses well built, and much alike; some of the rooms paved with mosaic, others with fine marble, others again with bricks, three feet long and six inches thick. It appears that the town was not filled up so unexpectedly with the melted lava, as to prevent the greatest part of the inhabitants from escaping with many of their richest effects: for when the excavations were made, there was not more than a dozen skeletons found, and but little gold, silver, or precious stores.

The town of Pompeii was destroyed by the same eruption of Mount Vesuvius, which occasioned the destruction of Herculaneum; but it was not discovered till near forty years after the discovery of Herculaneum. One street, and a few detached buildings of this town, have been cleared: the street is well paved with the same kind of stone of which the ancient roads are made, and narrow causeways are raised to a foot and a half on each side for conveniency of foot passengers. Dr. Moore observes, that the street itself is not so broad as the narrowest part of the Strand, and is supposed to have been inhabited by trades-people. The traces of wheels of carriages are to be seen on the pavement. The houses are small, but give an idea of neatness and conveniency. The stucco on the walls is smooth and beautiful, and as hard as marble. Some of the rooms are ornamented with paintings, mostly single figures, representing some animal. They are tolerably well executed, and a little water being thrown on them the colours appear surprisingly fresh. Most of the houses are built on the same plan, and have one small room from the passage, which is conjectured to have been the shop, with a window to the street, and a place which seems to have been contrived for shewing the goods to the greatest advantage. In another part of the town is a rectangular building, with a colonnade, towards the court, something in the style of the Royal Exchange at London, but smaller. At a considerable distance from this, is a temple of the goddess Isis, the pillars of which are of brick, stuccoed like those of the guard room; but there is nothing very magnificent in the appearance of this edifice. The best paintings, hitherto found at Pompeii, are those of this temple; they have been cut out of the walls, and removed to Portici. Few skeletons were found in the streets of this town, but a considerable number in the houses. In one apartment (says Mr. Sutherland) we saw the skeletons of 17 poor wretches, who were confined by the ancles in an iron machine. Many other bodies were found, some of them in circumstances which plainly shew that they were endeavouring to escape, when the irruption overtook them.

With regard to modern curiosities in Italy, they are as bewildering as the remains of antiquity. Rome itself contains 300 churches, filled with all that is rare in architecture, painting, and sculpture. Each city and town of Italy contains a proportionable number. The church of St. Peter, at Rome, is the most astonishing, bold, and regular fabric, that ever perhaps existed; and when examined by the rules of art, it may be termed faultless. The house and chapel of Loretto is rich beyond imagination, notwithstanding the ridiculous romance that composes its history.

The natural curiosities of Italy, though remarkable, are not so numerous as its artificial. Mount Vesuvius, which is five Italian miles distant from the city of Naples, and Mount *Ætna*, in Sicily, are remarkable for emitting fire from their tops. The declivity of Mount Vesuvius towards the sea, is every where planted with vines and fruit trees, and it is equally fertile towards the bottom. The circumjacent plain affords a delightful prospect, and the air is clear and wholesome. The south and west sides of the mountain form very different views, being, like the top, covered with black cinders and stones. The height of Mount Vesuvius has been computed to be 3900 feet above the surface of the sea. It hath been a volcano, beyond the reach of history or tradition. An animated description of its ravages in the year 97, is given by the younger Pliny, who was a witness to what he wrote. From that time to the year 1631, its irruptions were but small and moderate; however, then it broke out with accumulated fury and desolated miles around. In 1694, was a great eruption, which continued near a month, when burning matter was thrown out with so much force, that some of it fell at thirty miles distance, and a vast quantity of melted minerals, mixed with other matter, ran down like a river for three miles, carrying every thing before it which lay in its way. In 1707, when there was another eruption, such quantities of cinders and ashes were thrown out, that it was dark at Naples at noon day. In 1767, a violent eruption happened, which is reckoned to be the 27th from that which destroyed Herculaneum in the time of Titus. In this last eruption, the ashes, or rather small cinders, showered down so fast at Naples, that the people in the streets were obliged to use umbrellas, or adopt some other expedient, to guard themselves against them. The tops of the houses and the balconies were covered with these cinders; and ships at sea, twenty leagues, from Naples, were covered with them to the great astonishment of the sailors. An eruption happened also in 1766, and another in 1779, which has been particularly described by Sir William Hamilton in the Philosophical Transactions. It has been observed by a modern traveller, that though Mount Vesuvius often fills the neighbouring country with terror, yet as few things in nature are so absolutely noxious as not to produce some good; even this raging volcano, by its sulphureous and nitrous manure, and the heat of its subterraneous fires, contributes not a little to the uncommon fertility of the country about it, and to the profusion of fruits and herbage with which it is every where covered. Besides, it is supposed, that open and active, the mount is less hostile to Naples, than it would be, if its eruptions were to cease, and its struggles confined to its own bowels, for then might ensue the most fatal shocks to the unstable foundation of the whole district of Terra del Lavoro.

Sir William Hamilton, in his account of the earthquakes in Calabria Ultra, and Sicily, from February 5th, to May, 1783, gives several reasons for believing that they were occasioned by the operation of a volcano, the seat of which lay deeper either under the bottom of the sea, between Stromboli, and the coast of Calabria, or under the parts of the plain towards Oppido and Terra Nuova. He plainly observed a gradation in the damage done to the buildings, as also in the degree of mortality, in proportion as the countries were more or less distant from this supposed centre of the evil. One circumstance he particularly remarked: if two towns were situated at an equal distance from this centre, the one on a hill, the other on the plain, or in a bottom, the latter had always suffered greatly more by the shocks of the earthquakes, than the former; a sufficient proof to him, of the cause coming from beneath, as this must naturally have been productive of such an effect.

Mount *Etna* is 10954 feet in height, and has been computed to be 60 miles in circumference. It stands separate from all other mountains, its figure is circular, and it terminates in a cone. The lower parts of it are very fruitful in corn and sugar canes; the middle abounds with woods, olive-trees, and vines; and the upper part is almost the whole year covered with snow. Its fiery eruptions have always rendered it famous; in one of these, which happened in 1669, fourteen towns and villages were destroyed, and there have been several terrible eruptions since that time. There is generally an earthquake before any great eruption. In 1693, the port town of *Catania* was overturned, and 18,000 people perished.

Between the lakes *Agnano* and *Puzzelli*, there is a valley called *Soltafara*, because vast quantities of Sulphur are continually forced out of the cliffs by subterranean fires. The grotto del *Cani* is remarkable for its poisonous streams, and is so called from their killing dogs that enter it, if forced to remain there. Scorpions, vipers, and serpents, are said to be common in *Apulia*.

Among the natural curiosities of Italy, those vast bodies of snow and ice, which are called the *Glaciers* of *Savoy*, deserve to be particularly mentioned. There are five glaciers, which extend almost to the plain of the vale of *Chomouny*, and are separated by wild forests, corn-fields, and rich meadows: so that immense tracts of ice are blended with the highest cultivation, and perpetually succeed to each other, in the most singular and striking vicissitude. All these several valleys of ice, which lie chiefly in the hollows of the mountains, and are some leagues in length, unite together at the foot of *Mont Blanc*; the highest mountain in Europe, and probably of the ancient world. According to the calculations of *Mr. de Luc*, the height of this mountain, above the level of the sea, is 23 $\frac{1}{2}$ French toises, or 15,203 English feet. "I am convinced," says *Mr. Coxe*, "from the situation of *Mont Blanc*, from the height of the mountains around it, from its superior elevation above them, and its being seen at a great distance from all sides, that it is higher than any mountain in *Switzerland*; which, beyond a doubt is, next to *Mont Blanc*, the highest ground in Europe."

STATES OF ITALY, CONSTITUTION, AND CHIEF CITIES. } Thus far, of Italy in general; but as the Italian states are not like the republics of *Holland* or *Switzerland*, or the empire of *Germany*, cemented by a political confederacy, to which every member is accountable, for every Italian state has a distinct form of government, trade and interest, I shall be obliged to take a separate view of each, to assist the reader in forming an idea of the whole.

The duke of *Savoy*, or as he is now styled, king of *Sardinia*, taking his royal title from that island, is a powerful prince in Italy, of which he is called the *Janus*, or keeper, against the French. His capital, *Turin*, is strongly fortified, and one of the finest cities in Europe; but the country of *Savoy* is mountainous and barren, and its natives are forced to seek their bread all over the world. They are esteemed a simple, but very honest people. The king is so absolute, that his revenues consist of what he pleases to raise upon his subjects. His ordinary income, besides his own family provinces, cannot be less than 500,000 sterling, out of which he maintains 15,000 men in time of peace. During a war, when assisted by foreign subsidies, he can bring to the field 40,000 men. The aggrandizement of his

present Sardinian majesty is chiefly owing to England, to whom, by his situation, he was esteemed a natural ally, for the preservation of the balance of power in Europe.

The MILANESE, belonging to the house of Austria, is a most formidable state, and formerly gave law to all Italy, when under the government of its own dukes. The fertility and beauty of the country are almost incredible. Milan, the capital, and its citadel, is very strong, and furnished with a magnificent cathedral in the Gothic taste, which contains a very rich treasury, consisting chiefly of ecclesiastical furniture, composed of gold, silver, and precious stones. The revenue of the duchy is above 300,000*l.* annually, which is supposed to maintain an army of 30,000 men. The natives are fond of literary and political assemblies; where they converse almost on all subjects. With all its natural and acquired advantages, the natives of Milan make but few exports; so that its revenue, unless the court of Vienna should pursue some other system of improvement, cannot be much bettered. The duchy of Mantua being now incorporated with it, the province is to take the name of Austrian Lombardy.

The republic of GENOA is vastly degenerated from its ancient power and opulence, though the spirit of trade still continues among its nobility and citizens. Genoa is a most superb city*, and contains some very magnificent palaces, particularly those of Doria †, and Durazzo. The inhabitants of distinction dress in black, in a plain, if not an uncouth manner, perhaps to save expences. Their chief manufactures are velvets, damasks, gold and silver tissues, and paper. The city of Genoa contains about 150,000 inhabitants (but some writers greatly diminish that number), among whom are many rich trading individuals. Its maritime power is dwindled down to six galleys. The chief safety of this republic consists in the jealousy of other European powers, because to any one of them it would be a most valuable acquisition. The common people are wretched beyond expression, as is the soil of its territory. Near the sea some parts are tolerably well cultivated. The government of Genoa is aristocratical, being vested in the nobility; the chief person is called the Doge, or Duke; to which dignity no person is promoted till he is fifty years of age. Every two years a new doge is chosen, and the former is incapable during five years of holding the same post again. The doge gives audience to ambassadors, all orders of government are issued in his name, and he is allowed a body-guard of two hundred Germans.

VENICE is one of the most celebrated republics in the world, on account both of its constitution and former power. It is composed of several fine provinces on the continent of Italy, some islands in the Adriatic, and part of Dalmatia. The city of Venice ‡ is seated on 72 islands at the bottom of the north end of the Adriatic sea, and is separated from the continent by a marshy lake of five Italian miles in breadth, too shallow for large ships to navigate, which forms its principal strength. Venice preserves the vestiges of its ancient magnificence, but is in every respect degenerated, except in the passion which its inhabitants still retain for music and mumery during their carnivals. They

* Genoa is governed by a Doge. Ellarame Pallavicina was elected July 30, 1789.

† Andrew Doria, the head of this family, famous for his military exploits, and the deliverer of Genoa, was born in the territory of Genoa, in the year 1468; he was offered the sovereignty of the state, but refused it, and gave to the people that republican form of government which still subsists; he lived to the age of 93, the refuge and friend of the unfortunate.

‡ Venice was made a free port, on the 11th of May, 1736, governed by a Doge (Ludovico Manani, who was elected on March 9, 1789) and the nobility.

seem to have lost their ancient taste for painting and architecture, and to be returning to Gothicism. They have had however lately some spirited differences with the court of Rome, and seem to be disposed to throw off their obedience to its head. As to the constitution of the republic, it was originally democratical, the magistrates being chosen by a general assembly of the people, and so continued for one hundred and fifty years; but various changes afterwards took place; doges, or dukes were appointed, who were invested with great power, which they often grossly abused, and some of them were assassinated by the people. By degrees a body of hereditary legislative nobility was formed; continued, and progressive encroachments were made on the rights of the people, a complete aristocracy was at length established upon the ruins of the ancient popular government. The nobility are divided into six classes, amounting in the whole to 2500, each of whom, when twenty-five years of age, has a right to be a member of the grand council. These elect a doge or chief magistrate, in a peculiar manner by ballot, which is managed by gold and silver balls. The Doge is invested with great state, and with emblems of supreme authority, but has very little power, and is not permitted to stir from the city, without the permission of the grand council. The government and laws are managed by different councils of the nobles.

The college, otherwise called the seigniori, is the supreme cabinet council of the state, and also the representative of the republic. This court gives audience, and delivers answers, in the name of the republic, to foreign ambassadors, to the deputies of towns and provinces, and to the generals of the army. It also receives all requests and memorials on state affairs, summons the senate at pleasure, and arranges the business to be discussed in that assembly. The council of ten takes cognizance of state crimes, and has the power of seizing accused persons, examining them in prison, and taking their answers in writing, with the evidence against them. But the tribunal of state inquisitors, which consists only of three members, and which is in the highest degree despotic in its manner of proceeding, has the power of deciding without appeal, on the lives of every citizen belonging to the Venetian state; the highest of the nobility, even the doge himself, not being excepted. To these three inquisitors, is given the right of employing spies, considering secret intelligence, issuing orders to seize all persons whose words or actions they think reprehensible, and afterwards trying them, and ordering them to be executed, when they think proper. They have keys to every apartment of the ducal palace, and can, whenever they please, penetrate into the very bed-chamber of the doge, open his cabinet, and examine his papers: and of course, they may command access to the house of every individual in the state. They continue in office only for one year, but are not responsible afterwards for their conduct whilst they were in authority. So much distrust and jealousy are displayed by this government, that the noble Venetians are afraid of having any intercourse with foreign ambassadors, or with foreigners of any kind, and are even cautious of visiting at each other's houses.

All the orders of Venetian nobility are dressed in black gowns, large wigs, and caps which they hold in their hands. The ceremony of the doge's marrying the Adriatic once a year, by dropping into it a ring, from his bucentaur or state-berge, attended by those of all the nobility, is the most superb exhibition in Venice, but not comparable for magnificence to a lord mayor's show. The inhabitants of Venice are said to amount to 200,000. The grandeur and convenience of the city, particularly the public palaces, the

treasury, and the arsenal, are beyond expression. Over the several canals of Venice, are laid near 500 bridges, the greatest part of which are stone. The Venetians still have some manufactures in scarlet cloth, gold and silver stuffs, and above all, fine looking-glasses, all which bring in a considerable revenue to the owners; that of the state annually is said to amount to 8,000,000 of Italian ducats, each valued at twenty pence of our money. Out of this are defrayed the expences of the state and the pay of the army, which in the time of peace consists of 16,000 regular troops (always commanded by a foreign general), and 10,000 militia. They keep up a small fleet for curbing the insolencies of the piratical states of Barbary, and they have among them some orders of knighthood, the chief of which are those of the *Stola d'oro*; so called from the robe they wear, which is conferred only on the first quality, and the military order of St. Mark; of which in the proper place.

In ecclesiastical matters the Venetians have two patriarchs; the authority of one reaches over all the provinces, but neither of them have much power; and both of them are chosen by the senate; and all religious sects, even the Mahometan and Pagan, excepting protestants, are here tolerated in the free exercise of their religion.

The Venetians are a lively, ingenious people, extravagantly fond of public amusements, with an uncommon relish for humour. They are in general tall and well made; and many fine manly countenances are met with in the streets of Venice, resembling those transmitted to us by the pencils of Paul Veronese and Titian. The women are of a fine style of countenance, with expressive features, and are of an easy address. The common people are remarkably sober, obliging to strangers, and gentle in their intercourse with each other. As it is very much the custom to go about in masks at Venice, and great liberties are taken during the time of the carnival, an idea has prevailed; that there is much more licentiousness of manners here than in other places; but this opinion seems to have been carried too far. Great numbers of strangers visit Venice during the time of the carnival, and there are eight or nine theatres here, including the opera-houses.

The dominions of Venice consist of a considerable part of Dalmatia, of four towns in Greece, and of the islands of Corfu, Pachus, Antipachus, Santa Maura, Curzolari, Val di Compare, Cephalonia, and Zante. The Venetian territories in Italy contain the duchy of Venice, the Paduanese, the peninsula of Rovigo, the Veronese, the territories of Vicenza and Brescia, the districts of Bergamo, Cremasco, and the Marca Trevigiana, with part of the country of Friuli. The subjects of the Venetian republic are not oppressed: the senate has found that mild treatment, and good usage, are the best policy, and more effectual than armies, in preventing revolts.

The principal city of Tuscany is Florence, which is now possessed by a younger branch of the house of Austria, after being long held by the illustrious house of Medicis, who made their capital the cabinet of all that is valuable, rich, and masterly in architecture, literature, and the arts, especially those of painting and sculpture. It is thought to contain above 70,000 inhabitants. The beauties and riches of the grand duke's palaces have been often described; but all description falls short of their contents, so that in every respect it is reckoned, after Rome, the second city in Italy. The celebrated Venus of Medici, which, take it all in all, is thought to be the standard of taste in female beauty and proportion, stands in a room called the Tri-

bnal. The inscription on its base mentions its being made by Cleomenes an Athenian, the son of Apollodorus. It is of white marble, and surrounded by other master-pieces of sculpture, some of which are said to be the works of Peaxiteles, and other Greek masters. Every corner of this beautiful city, which stands between mountains covered with olive-trees, vineyards, and delightful villas, and divided by the Arno, is full of wonders in the arts of painting, statuary, and architecture. It is a place of some strength, and contains an archbishop's see, and an university. The inhabitants boast of the improvements they have made in the Italian tongue, by means of their Academia della Cruica; and several other academies are now established at Florence. Though the Florentines affect great state, yet their nobility and gentry drive a retail trade in wine, which they sell from their cellar-windows, and sometimes they even hang out a broken flask, as a sign where it may be bought. They deal, besides wine and fruits, in gold and silver stuffs.— Upon the accession of the archduke Peter Leopold, afterwards the emperor of Germany, to this duchy, a great reformation was introduced, both into the government and manufactures, to the great benefit of the finances. It is thought that the great duchy of Tuscany could bring to the field, upon occasion, 30,000 fighting men, and that its present revenues are above 500,000*l.* a year. The other principal towns of Tuscany are Pisa, Leghorn, and Sienna; the first and last are much decayed; but Leghorn is a very handsome city, built in the modern taste, and with such regularity, that both gates are seen from the market-place. It is well fortified, having two forts towards the sea, besides the citadel. The ramparts afford a very agreeable prospect of the sea, and of many villas on the land side. Here all nations, and even the Mahometans, have free access, and may settle. The number of inhabitants is computed at 40,000, among whom are said to be 20,000 Jews, who live in a particular quarter of the city, have a handsome synagogue, and though subject to very heavy imposts, are in a thriving condition, the greatest part of the commerce of this city going through their hands.

The inhabitants of Lucca, which is a small free commonwealth, lying on the Tuscan sea, in a most delightful plain, are the most industrious of all the Italians. They have improved their country into a beautiful garden, so that though they do not exceed 120,000, their annual revenue amounts to 80,000*l.* sterling. Their capital is Lucca, which contains about 4,000 inhabitants, who deal in mercery goods, wines, and fruits, especially olives. This republic is under the protection of the emperor. The vicinity of the grand duchy of Tuscany keeps the people of Lucca constantly on their guard, in order to preserve their freedom; for in such a situation, a universal concord and harmony can alone enable them to transmit to posterity the blessings of their darling Liberty, whose name they bear on their arms, and whose image is not only impressed on their coin, but also on the city gates, and all their public buildings.—It is also observable, that the inhabitants of this little republic, being in possession of freedom, appear with an air of cheerfulness and plenty, seldom to be found among those of the neighbouring countries.

The republic of St. MARINO is here mentioned as a geographical curiosity. Its territories consist of a high, craggy mountain, with a few eminences at the bottom, and the inhabitants boast of having preserved their liberties, as a republic, for 1300 years. It is under the protection of the pope; and the inoffensive manners of the inhabitants, who are not above 5000 in all, with the small value of their territory, have preserved its constitution.

The Duchy and city of **PARMA**, together with the duchies of Placentia and Guastalla, now form one of the most flourishing states in Italy of its extent. The soils of Parma and Placentia are fertile, and produce the richest fruits and pasturages, and contain considerable manufactures of silk. It is the seat of a bishop's see, and an university; and some of its magnificent churches are painted by the famous Correggio. The present duke * of Parma is a prince of the house of Bourbon, and son to the late Don Philip, the king of Spain's younger brother. This country was, some years past, the seat of a bloody war between the Austrians, Spaniards, and Neapolitans. The cities of Parma and Placentia are enriched with magnificent buildings; but his catholic majesty, on his accession to the throne of Naples, is said to have carried with him thither, the most remarkable pictures and moveable curiosities. The duke's court is thought to be the politest of any in Italy, and it is said that his revenues exceed 100,000*l.* sterling a year, a sum rather exaggerated.—The city of Parma is supposed to contain 50,000 inhabitants.

MANTUA, formerly a rich duchy, bringing to its own dukes 500,000 crowns a year, is now much decayed. The government of it is annexed to that of the Milanese, in possession of the house of Austria. The capital is one of the strongest fortresses in Europe, and contains about 16,000 inhabitants, who boast that Virgil was a native of their country. By an order of the emperor in 1785, this duchy is incorporated with that of Milan into one province, and is now called Austrian Lombardy.

The duchy of **MODENA** (formerly Mutina) is still governed by its own duke †, the head of the house of Este, from whom the family of Brunswick descended. The duke is absolute within his own dominions, which are fruitful. The duke is under the protection of the house of Austria, and is a vassal of the empire. His dominions are far from being flourishing, though very improveable, they having been alternately wasted by the late belligerent powers in Italy.

The **ECCLESIASTICAL STATE**, which contains Rome, formerly the capital of the world, lies about the middle of Italy. The bad effects of popish tyranny, superstition, and oppression, are here seen in the highest perfection. Those spots, which under the masters of the world were formed into so many terrestrial paradises, surrounding their magnificent villas, and enriched with all the luxuries that art and nature could produce, are now converted into noxious pestilential marshes and quagmires: and the Campagna di Roma, that formerly contained a million of inhabitants, would afford at present of itself, but a miserable subsistence to about five hundred. Notwithstanding this, the pope ‡ is a considerable temporal prince, and some suppose that his annual revenue amounts to above a million sterling; other authors calculate it to be much higher. When we speak comparatively, the sum of a million sterling is too high a revenue to arise from his territorial possessions: his accidental income, which formerly far exceeded that sum, is now diminished, by the suppression of the order of the Jesuits, from whom he drew vast supplies, and the measures taken by the popish

* Ferdinand duke of Parma, born Jan. 20, 1751, married to the archduchess Maria Amalia Josepha, June 27, 1769. Their issue are a prince and two princesses.

† Hercules Renaud, duke of Modena, born Nov. 22, 1727; married April 16, 1741, to the princess of Massa Carrara. Their issue, Mary Beatrice, born April 29, 1750; married to Ferdinand, archduke of Austria, 1771.

‡ His holiness, Pope Pius VI. (formerly Count Braschi) was born at Cascena, Dec. 27, 1717; created a cardinal 1773; and elected Pope, Feb. 15, 1775.

powers, for preventing the great ecclesiastical issues of money to Rome. According to the best and latest accounts, the taxes upon the provisions and lodgings, furnished to foreigners, who spend immense sums in visiting his dominions, form now the greatest part of his accidental revenues. From what has happened, within these thirty years past, there is reason to believe that the pope's territories will be reduced to the limits which the houses of Austria and Bourbon shall please to prescribe. Some late popes have aimed at the improvement of their territories, but their labours have had no great effect. The discouragement of industry, and agriculture seems to be interwoven in the constitution of the papal government, which is vested in proud, lazy ecclesiastics. Their indolence, and the fanaticism of their worship, infect their inferiors, who prefer begging, and imposing upon strangers, to industry and agriculture, especially as they must hold their properties by the precarious tenure of the will of their superiors. In short, the inhabitants of many parts of the ecclesiastical state must perish through their sloth, did not the fertility of their soil spontaneously afford them subsistence. However, it may be proper to make one general remark on Italy, which is, that the poverty and sloth of the lower ranks do not take their rise from their natural dispositions.

This observation is not confined to the papal dominions. The Italian princes affected to be the patrons of all the curious and costly arts, and each vied with the other to make his court the repository of taste and magnificence. This passion disabled them from laying out money upon works of public utility, or from encouraging the industry, or relieving the wants of their subjects; and its miserable effects are seen in many parts of Italy. The splendour and furniture of churches in the papal dominions are inexpressible, and partly account for the misery of the subjects. But this censure admits of exceptions, even in a manner at the gates of Rome.

Modern Rome contains, within its circuit, a vast number of gardens and vineyards. I have already touched upon its curiosities and antiquities. It stands upon the Tyber, an inconsiderable river when compared to the Thames, and navigated by small boats, barges, and lighters. The castle of St. Angelo, though its chief fortress, would be found to be a place of small strength, were it regularly besieged. The city standing upon the ruins of ancient Rome, lies much higher, so that it is difficult to distinguish the seven hills on which it was originally built. When we consider Rome as it now stands, there is the strongest reason to believe that it exceeds ancient Rome itself in the magnificence of its structures; nothing in the old city, when mistress of the world, could come in competition with St. Peter's church; and perhaps many other churches in Rome exceed in beauty of architecture, and value of materials, utensils, and furniture, her ancient temples; though it must be acknowledged that the Pantheon must have been an amazing structure. The inhabitants of Rome, in 1714, amounted to 143,000. If we consider that the spirit of travelling is much increased since that time, we cannot reasonably suppose them to be diminished at present.

There is nothing very particular in the pope's temporal government at Rome. Like other princes, he has his guaras, or sbirri, who take care of the peace of the city, under proper magistrates, both ecclesiastical and civil. The Campagna di Roma, which contains Rome, is under the inspection of his holiness. In the other provinces he governs by legates and vice-

vice-legates. He monopolises all the corn in his territories, and has always a sufficient number of troops on foot, under proper officers, to keep the provinces in awe. Pope Clement XIV. wisely disclaimed all intention of opposing any arms to the neighbouring princes, but those of prayers and supplications.

I have under the head of religion mentioned the ecclesiastical government of the papacy. As to the rota, and other subordinate chambers of this complicated jurisdiction, they are too numerous to be even named, and do not fall properly under my plan. Under a government so constituted, it cannot be supposed that the commercial exports of the ecclesiastical state are of much value.

Next to Rome, Bologna, the capital of the Bolognese, is the most considerable city in the ecclesiastical state, and an exception to the indolence of its other inhabitants. The government is under a legate *a latere*, who is always a cardinal, and changed every three years. The people here live more sociably and comfortably than the other subjects of the pope; and perhaps their distance from Rome, which is 195 miles north-west, has contributed to their ease. The rest of the ecclesiastical state contains many towns celebrated in ancient history, and even now exhibiting the most striking vestiges of their flourishing state about the beginning of the 16th century; but they are at present little better than desolate, though here and there a luxurious magnificent church and convent may be found, which is supported by the toil and sweat of the neighbouring peasants.

The grandeur of FERRARA, RAVENNA, RIMINI, URBINO (the native city of the celebrated painter Raphael), ANCONA, and many other states and cities, illustrious in former times, are now to be seen only in their ruins and ancient history. LORETTO, on the other hand, an obscure spot never thought or heard of in times of antiquity, is now the admiration of the world, for the riches it contains, and the prodigious resort to it of pilgrims, and other devotees, from a notion industriously propagated by the Romish clergy, that the house in which the Virgin Mary is said to have dwelt at Nazareth, was carried thither through the air by angels, attended with many other miraculous circumstances, such as that all the trees, on the arrival of the sacred mansion, bowed with the profoundest reverence; and great care is taken to prevent any bits of the materials of this house from being carried to other places, and exposed as relics, to the prejudice of Loretto. The image of the Virgin Mary, and of the divine infant, are of cedar, placed in a small apartment, separated from the others by a silver ballustrade, which has a gate of the same metal.—It is impossible to describe the gold chains, the rings and jewels, emeralds, pearls, and rubies, wherewith this image is or was loaded; and the angels of solid gold, who are here placed on every side, are equally enriched with the most precious diamonds. To the superstition of Roman catholic princes, Loretto is indebted for this mass of treasure. It has been a matter of surprise, that no attempt has yet been made by the Turks or Barbary states upon Loretto, especially as it is badly fortified, and stands near the sea; but it is now generally supposed, that the real treasure is withdrawn, and metals and stones of less value substituted in its place.

The king of NAPLES AND SICILY, or, as he is more properly called, the King of the Two Sicilies (the name of Sicily being common to both), is possessed of the largest dominions of any prince in Italy, as they comprehend the ancient countries of Samnium, Campania, Apulia, Magna-Grecia, and the island of Sicily, containing in all about 32,000 square miles. They are

bounded on all sides by the Mediterranean and the Adriatic, except on the north east, where Naples terminates on the ecclesiastical state. The Apennine runs through it from north to south, and its surface, is estimated at 3500 square leagues. The air is hot, and its soil fruitful of every thing produced in Italy. The wines called *Vino Greco*, and *Lachrymæ Christi*, are excellent. The city of Naples, its capital, which is extremely superb, and adorned with all the profusion of art and riches, and its neighbourhood, would be one of the most delightful places in Europe to live in, were it not for their vicinity to the volcano of Vesuvius, which sometimes threatens the city with destruction, and the soil being pestered with insects and reptiles, some of which are venomous. The houses in Naples are inadequate to the population, but in general, are five or six stories in height, and flat at the top; on which are placed numbers of flower vases, or fruit trees, in boxes of earth, producing a very gay and agreeable effect. Some of the streets are very handsome: no street in Rome equals in beauty the *Strada di Toledo* at Naples; and still less can any of them be compared with those beautiful streets that lie open to the bay. The richest and most commodious convents in Europe, both for male and female votaries, are in this city; the most fertile and beautiful hills of the environs are covered with them: and a small part of their revenue is spent in feeding the poor, the monks distributing bread and soup to a certain number every day before the doors of the convents.

Though above two-thirds of the property of the kingdom are in the hands of the ecclesiastics, the protestants live here with great freedom; and though his Neapolitan majesty presents to his holiness, every year a palfrey, as an acknowledgment that his kingdom is a fief of the pontificate, yet no inquisition is established in Naples. The present revenues of that king amount to above 750,000l. sterling a year; but it is more than probable that, by the new established police pursued by the princes of Bourbon, of abridging the influence and revenues of the clergy, his Neapolitan majesty's annual income will considerably exceed a million sterling. The exports of the kingdom are legumes, hemp, anniseeds, wool, oil, wine, cheese, fish, honey, wax, manna, saffron, gums, capers, macaroni, salt, pot-ash, flax, cotton, silk, and divers manufactures. The king has a numerous but generally poor nobility, consisting of princes, dukes, marquises, and other high founding titles; and his capital, by far the most populous in Italy, contains at least 350,000 inhabitants. Among these are about 30,000 lazaroni, or black-guards, the greater part of which have no dwelling-houses, but sleep every night in summer under porticos, piazzas, or any kind of shelter they can find, and in the winter or rainy time of the year, which lasts several weeks, the rain falling by pailfull, they resort to the caves under *Capo di Monte*, where they sleep in crowds like sheep in a pinfold. Those of them who have wives and children, live in the suburbs of Naples, near *Paullippo*, in huts, or in caverns or chambers dug out of that mountain. Some gain a livelihood by fishing, others by carrying burthens to and from the shipping; many walk about the streets ready to run on errands, or to perform any labour in their power for a very small recompence. As they do not meet with constant employment, their wages are not sufficient for their maintenance; but the deficiency is in some degree supplied by the soup and bread which are distributed at the doors of the convents.

But though there is so much poverty among the lower people, there is a great appearance of wealth among some of the great. The Neapolitan nobility are excessively fond of show and splendor. This appears in the brilliancy of their equipages, the number of their attendants, the richness of their dress, and the grandeur of their titles. According to a late traveller.

veller. (Mr. Swinburne), luxury of late hath advanced with gigantic strides in Naples. Forty years ago, the Neapolitan ladies wore nets and ribbands on their heads, as the Spanish women do to this day, and not twenty of them were possessed of a cap; but hair plainly dressed is a mode now confined to the lowest order of inhabitants, and all distinction of dress between the wife of a nobleman and that of a citizen is entirely laid aside. Expence and extravagance are here in the extreme.

Through every spot of the kingdom of Naples, the traveller may be said to tread on classic ground, and no country presents the eye with more beautiful prospects. There are still traces of the memorable town of Cannæ, as fragments of alters, cornices, gates, walls, vaults, and underground granaries; and the scene of action between Hannibal and the Romans, is still marked out to posterity by the name of *pezzo di sangue*, "field of blood." Taranto, a city that was once the rival of Rome, is now remarkable for little else than its fisheries. Sorrento is a city placed on the brink of steep rocks, that overhang the bay, and of all the places in the kingdom, had the most delightful climate. Nola, once famous for its amphitheatres, and as the place where Augustus Cæsar died; is now hardly worth observation.

Brundisium, now Brindisi, was the great supplier of oysters for the Roman tables. It hath a fine port, but the buildings are poor and ruinous; and the fall of the Grecian empire under the Turks reduced it to a state of inactivity and poverty, from which it hath not yet emerged. Except Rome, no city can boast of so many remains of ancient sculpture as Benevento: here the arch of Trajan, one of the most magnificent remains of Roman grandeur out of Rome, erected in the year 114, is still in tolerable preservation. Reggio had nothing remarkable but a Gothic cathedral. It was destroyed by an earthquake before the Marston war, and rebuilt by Julius Cæsar; part of the wall still remains, and was very roughly handled by the earthquake in 1782, but not destroyed: only 126 lost their lives out of 16,000 inhabitants. The ancient city of Oppido was entirely ruined by the earthquake of the 5th of February, and the greatest force thereof seems to have been exerted near that spot, and at Casal Nuova, and Terra Nuova. From Trupea to Squillace, most of the towns and villages were either totally or in part overthrown, and many of the inhabitants buried in the ruins. To ascertain the extent of the ravages, Sir William Hamilton, who surveyed it, gives the following description: "If on a map of Italy, and with your compasses on the scale of Italian miles, you were to measure off 22, and then fixing your central point in the city of Oppido (which appeared to me to be the spot on which the earthquake had exerted its greatest force), form a circle (the radii of which will be, as I just said, 22 miles) you will then include all the towns and villages that have been utterly ruined, and the spots where the greatest mortality has happened, and where there have been the most visible alterations on the face of the earth. Then extend your compasses on the same scale to 72 miles, preserving the same centre, and form another circle, you will include the whole of the country that has any mark of having been affected by the earthquake."

The island of SICILY, once the granary of the world for corn, still continues to supply Naples, and other parts, with that commodity; but its cultivation, and consequently, fertility, is greatly diminished. Its vegetable, mineral, and animal productions, are pretty much the same with those of Italy.

Both the ancients and moderns have maintained, that Sicily was originally joined to the continent of Italy; but gradually separated from it by the encroachments of the sea, and the shocks of earthquakes, so as to become a perfect island. The climate of Sicily is so hot, that even in the beginning of January the shade is refreshing; and cooling winds are only felt a few days in March, and then a small fire is sufficient to banish the cold. The only appearance of winter is found towards the summit of Mount *Ætna*, where snow falls, which the inhabitants have a contrivance for preserving. Churches, convents, and religious foundations are extremely numerous here: the buildings are handsome, and the revenues considerable. If this island were better cultivated, and its government more equitable, it would in many respects be a delightful place of residence. There are a great number of fine remains of antiquity here. Some parts of this island are remarkable for the beauty of the female inhabitants. Palermo, the capital of Sicily, is computed to contain 120,000 inhabitants. The two principal streets, and which cross each other, are very fine. This is said to be the only town in all Italy which is lighted at night at the public expence. It carries on a considerable trade; as also did Messina, which, before the earthquake in 1783, was a large and well-built city, containing many churches and convents, generally elegant structures. By that earthquake a great part of the lower district of the city and of the port was destroyed, and considerable damage done to the lofty uniform buildings called the *Palazzata*, in the shape of a crescent; but the force of the earthquake, though violent, was nothing at Messina or Reggio, to what it was in the plain, for of 30,000, the supposed population of the city only 700 is said to have perished. "The greatest mortality fell upon those towns and countries situated in the plain of Calabria Ultra; on the western side of the mountains Dejo, Sacro, and Caulone. At Casal Nuovo, the princefs Gerace, and upwards of 4000 of the inhabitants, lost their lives; at Bagnara, the number of dead amounts to 3017; Radicina and Palmi count their loss at about 3000 each; Terra Nuova about 1400; Seminari still more." The sum total of the mortality in both Calabrias and in Sicily, by the earthquakes alone, according to the returns in the secretary of state's office at Naples, is 32,267; "but Sir William Hamilton saith" he has good reason to believe, that, including strangers, the number of lives lost must have been considerably greater: 40,000 at least may be allowed, he believes, without exaggeration.

The island of *SARDINIA*, which gives a royal title to the duke of Savoy, lies about 150 miles west of Leghorn, and hath seven cities or towns. Its capital, Cagliari, is an university, an archbishopric, and the seat of the viceroy, containing about 15,000 inhabitants. It is thought that his Sardinian majesty's revenues, from this island, do not exceed 5000. Sterling a year, though it yields plenty of corn and wine, and has a coral fishery. Its air is bad, from its marshes and high mountains on the North, and therefore was a place of exile for the Romans. It was formerly annexed to the crown of Spain, but at the peace of Utrecht it was given to the emperor, and in 1719, to the house of Savoy.

On the 16th. Sept. 1792 war was declared by the national assembly of France against the king of Sardinia, and about the 20th. general Montefquieu entered the territories of Savoy. He describes his march as a triumph. A deputation from Chambery waited on him almost as soon as he passed the boundary, and on the 21st. he proceeded with a detachment to take possession of that city. The municipality waited for him at the gate in their dress of

ceremony to deliver up the keys, and testified, in warm terms, the esteem in which the people of Savoy held the French nation. At the Hotel de Ville he received the homage of all their citizens, and invited them all to an entertainment he had prepared for that purpose.

With another body of troops general Anselm crossed the Var, and on the 19th. of September, being supported by admiral Truguet with nine sail of the line, took possession of Nice, which was evacuated by the Piedmontese garrison on the appearance of the French. With the city of Nice the fortrefs of Montalban, and Villa Franca, and indeed the whole country of Nice submitted to the conquerors. General Anselme was extremely popular on his first arrival among the Piedmontese, and they appeared disposed in every respect cordially to unite with the French republic. But in a short time the soldiers began to commit the grossest excesses, and the name of the French nation became odious in that quarter.

The experiment of raising the people in a mass was tried by the king of Sardinia in Piedmont in the month of July 1794; but in such a manner as fully justifies the king of Prussia's censure of this mode of warfare, in a regular government, where the people are not actuated by enthusiasm. Ten thousand of these raw and undisciplined recruits were dispersed by a few French battalions. On the 14th. of September the Piedmontese army were again defeated with considerable slaughter by the army of the Alps. In the same month a grand plan was formed for attacking the French posts in the vicinity of Genoa. The French anticipated this plan, carried the Austrian and Sardinian posts with the bayonet, pursued them to Alexandria, and forced them to evacuate le Caife with considerable loss. During the following months of the year 1794 the war on the part of the Austrians and Sardinians was defensive; and in some inconsiderable attacks they were fortunate enough to repulse the Republicans.

The enemy having repeatedly failed in their attempts to pass through Piedmont into Italy, in 1796 recruited their armies and determined once more to attempt the conquest of Piedmont. The first action terminated in favour of the Austrian and Sardinian forces, but they were shortly after defeated in a decisive battle fought at the village of Millesimo. Buonaparte, who had received the command of the French army, taking advantage of the disorder of the Austrians, pushed forward and gained possession of Cairo, a post on the Bormida, which commanded the roads leading to Turin. The desiles of Millesimo were forced by general Angereau on the 11th. of April, who surrounded a division of 1500 grenadiers, commanded by the Austria general Provera, who threw himself into the ruins of an old castle. After a severe cannonade for several hours, a general attack was made in four columns on this post, in which the French were repulsed, with the loss of two of their generals who commanded the assault; and Provera keeping firm to his position, stopped the progress of the enemy for five days. On the fifth day the two armies prepared for a general action. Angereau, who commanded the left wing of the French army, still held Provera blockaded in the ruins of the castle. The Austrians and Piedmontese, attempting to force the centre, were repulsed with great loss; and their left wing which was flanked by the village of Dego, where they were strongly entrenched was turned by general Massena. General Laharpe, in the mean time, passing the Bormida with his division in close columns, succeeded in turning the right flank of the left wing of the Austrian army. The allies were completely defeated, and lost upwards of 10,000 men, of whom eight thousand were prisoners

On the following day, whilst the French were indulging themselves in security after the fatigues of the battle they were surprized at the village of Degò by general Baulieu, at the head of seven thousand men whom he had rallied. The Austrians dislodged the French from this post, and repulsed them three times in their attempt to retake it. The Austrians long maintained their post with obstinate valour, but pressed by the French troops, they were at last compelled to retreat after losing two thousand men, fourteen hundred of whom were prisoners.

After the defeat at Degò the Piedmontese army evacuated the post of Montefimo, and in retreating towards Turin, had taken several advantageous positions at the confluence of the rivers Cunaglia and Tanaro on the banks of which they had placed batteries, so as to render their retreat irrevocable. The Piedmontese general, however, count Colli, fearing lest by the superiority of numbers the enemy might be enabled to surround him, withdrew during the night. At break of day he was attacked at the entrance of the village of Vico; the redoubt which covered the centre of the Piedmontese army was taken, and Mondovi fell into the hands of the French. The Piedmontese finding it impossible to withstand the force of the republicans, retreated further towards Turin, from whence the French were now distant only twenty-four miles. Thus situated, with no prospect of effective defence, for the capital, count Colli, on the 23d. of April, proposed a suspension of arms; the conditions of which were dictated by Buonaparte. Having put the French in possession of the fortresses stipulated in the armistice, his Sardinian majesty sent his ministers to Paris, who concluded a treaty of peace with the republic on the 17th. of May 1796; a peace in every point of view in which it can be regarded, most humiliating and disgraceful.

The island of Corsica lies opposite to the Genoese continent, between the gulf of Genoa and the island of Sardinia, and is better known by the noble stand which the inhabitants made for their liberty, against their Genoese tyrants, and afterwards against the base and ungenerous efforts of the French to enslave them, than from any advantages they enjoy, from nature or situation. Though mountainous and woody, it produces corn, wine, figs, almonds, chestnuts, olives, and other fruits. It has also some cattle and horses, and is plentifully supplied, both by sea and rivers, with fish. The inhabitants are said to amount to 120,000. Bastia, the capital, is a place of some strength; though other towns of the island that were in possession of the malecontents, appear to have been but poorly fortified.

In 1794, Corsica was reduced by lord Hood, who, after leaving Toulon cruized some time off Hieres bay; and early in the month of May proceeded for Corsica, which was in a state of revolt against the authority of the Convention. The tower and garrison of Mortella surrendered on the 10th of that month; the tower of Tornelli was abandoned by the republicans on the 17th and in two days after, they evacuated St. Fiorenzo, and retreated to Bastia; whither they were followed as soon as possible by lord Hood. The number of persons bearing arms in Bastia originally amounted to no more than 3000 men. The fortifications were not in the best state, and the garrison but indifferently provided; yet they made an obstinate defence, and resisted till the 19th of May, when lord Hood "in consideration of the very gallant defence made by the garrison of Bastia, and from principles

of humanity," offered honourable terms to the commandant Gentili, which in the situation of the garrison it would have been desperate to reject. In consequence of this negociation the garrison on the 24th marched out with the honours of war, and Bastia was taken possession of by the English.

In consequence of this success the whole island submitted to the British arms, except the town of Calvi, which resisted till the 10th of August, when it surrendered on terms of capitulation. The garrison marched out with the honours of war, and were transported at the expence of Great Britain to Toulon.

Corfica did not, however, long remain in possession of the English. In 1796 the directory planned its reduction; nor could the vigilance of the viceroy hinder such communications, or his authority suppress such tendencies to insurrection, as were sufficient to mark the disposition of his newly acquired subjects. While the French were forming plans, the execution of which was checked by the superiority of the English naval force, the Corsicans were employed in finding means how to co-operate with their former countrymen, and shake off their new allegiance. The viceroy who knew how to estimate the alternately subtle and stubborn politics of these islanders, did not wait the explosion, but gave notice that he was going to withdraw his troops, and along with them the kingly government he was going to establish. The Corsicans scarcely waited the withdrawing of the English troops, before they formed themselves into primary assemblies to send deputies to the commissioners in Italy to divest themselves of their title of subjects to the king of England.

CAPRI the ancient CAPREA, is an island to which Augustus Cæsar, often came for his health and recreation, and which Tiberius made a scene of the most infamous pleasures. It lies three Italian miles from that part of the main land which projects farthest into the sea. It extends four miles in length from East to West, and about one in breadth. The western part is, for above two miles a continued rock, vastly high, and inaccessible next the sea; yet Ano Capri, the largest town of the island, is situated here; and in this part are several places covered with a very fruitful soil. The eastern end of the island also rises up in precipices that are nearly as high, though not quite so long as the western. Between the rocky mountains, at each end, is a slip of lower ground that runs across the island, and is one of the pleasantest spots that can easily be conceived. It is covered with myrtles, olives, almonds, oranges, figs, vineyards, and corn-fields, which look extremely fresh and beautiful, and afford a most delightful little landscape, when viewed from the tops of the neighbouring mountains. Here is situated the town of Caprea, two or three convents, and the bishop's palace. In the midst of this fertile tract rises a hill, which in the reign of Tiberius was probably covered with buildings, some remains of which are still to be seen.—But the most considerable ruins are at the very extremity of the eastern promontory.

From this place there is a very noble prospect; on one side of it, the sea extends farther than the eye can reach; just opposite is the green promontory of Sarentum, and on the other side the bay of Naples.

ISCHIA, and some other islands on the coasts of Naples and Italy, have nothing to distinguish them but the ruins of their antiquities, and their being now beautiful summer retreats for their owners. Elba hath been renowned for its mines from a period beyond the reach of history. Virgil, and Aristotle mention it. Its situation is about ten miles south from

Tuscany, and 80 miles in circumference, containing near 7000 inhabitants. It is divided between the king of Naples, to whom Porto Longone belongs, and the great duke of Tuscany, who is master of Porto Ferrajo, and the prince of Piombino. The fruits and wine of the island are very good, and the tunnery, fisheries, and salt produce a good revenue.

I shall here mention the isle of MALTA, though it is not properly ranked with Italian islands. It was formerly called Melita, and is situated in 15 degrees E. lon. and 36 degrees N. lat. 60 miles south of Cape Passaro in Sicily, and is of an oval figure, 20 miles long, and 12 broad. Its air is clear, but excessively hot: the whole island seems to be a white rock covered with a thin surface of earth, which is however amazingly productive of excellent fruits and vegetables, and garden-stuff of all kinds. This island, or rather rock, was given to the knights of St. John of Jerusalem in 1530, by the emperor, Charles V. when the Turks drove them out of Rhodes, under the tender of one falcon yearly to the viceroy of Sicily, and to acknowledge the kings of Spain and Sicily for their protectors; they are now known by the distinction of the knights of Malta. They are under vows of celibacy and chastity; but they keep the former much better than the latter. They have considerable possessions in the Roman Catholic countries on the continent, and are under the government of a grand master who is elected for life. The lord-prior of the order, was formerly accounted the prime baron in England. The knights are in number 1000: 500 are to reside on the island, the remainder are in their seminaries in other countries, but at any summons are to make a personal appearance. They had a seminary in England till it was suppressed by Henry VIII. but they now give to one the title of Grand Prior of England. They are considered as the bulwark of Christendom against the Turks on that side. They wear the badge of the order, a gold cross of eight points enamelled white, pendant to a black watered ribband at the breast, and the badge is decorated so, as to distinguish the country of the knight. They are generally of noble families, or such as can prove their gentility for six descents, and are ranked according to their nations. There are sixteen called the Great Crosses, out of whom the officers of the order, as the marshal, admiral, chancellor, &c. are chosen. When the great master dies, they suffer no vessel to go out of the island till another is chosen to prevent the pope from interfering in the election. Out of the sixteen great crosses, the great master is elected, whose title is, "The most illustrious, and most reverend prince, the lord friar A. B. great master of the hospital of St. John of Jerusalem, prince of Malta and Gaza." All the knights are sworn to defend the church, to obey their superiors, and to live on the revenues of their order only. Not only their chief town Valletta or Malta, and its harbour, but the whole island was so well fortified, as to be deemed impregnable. On the 18th of September there is an annual procession at Malta in memory of the Turks raising the siege on that day 1563, after four months assault, leaving their artillery, &c. behind.

No event of any importance has happened at Malta till the year 1798, when the whole island was conquered by the French. Their fleet commanded by Buonaparte arrived there on the 9th at day break, within sight of the island of Goze. On the same evening, an aid-de-camp was sent by Buonaparte, to ask liberty of the grand master to water in the different anchorages in the island; this request being refused, admiral Bruceys was ordered to pre-

* The island of Malta is governed by a Grand Master,

pare for making a descent. He sent rear-admiral Blanquet with his squadron, and the convoy from Civita Vecchia, to effect a descent in the bay of Maria Siroca. On the 10th at day-break the French troops were landed at all points, notwithstanding the opposition of a heavy cannonade. In the evening the fortress was invested on all sides, and the rest of the island submitted. The unfortunate inhabitants being alarmed beyond any thing that can be imagined, took refuge in the town of Malta; which was by these means filled with people. During all the evening a brisk cannonade was kept up from the town. The besieged made a sortie; but the chief of brigade, Marmont, at the head of the 18th, took from them the standard of their order. The grand master, sent on the morning of the 11th, to request a suspension of arms. The chief of the brigade, Junot was immediately sent to him with authority to sign a suspension of arms, if he consented as a preliminary to negotiate for the surrender of the place. The suspension of arms was then concluded for 24 hours; and the whole island surrendered to the French.

ARMS AND ORDERS.] The chief armorial bearings in Italy are as follow: The pope, as sovereign prince over the land of the church, bears for his escutcheon, gules, consisting of a long headcape; or, surmounted with a cross, pearled and garnished with three royal crowns, together with the two keys of St. Peter, placed in saltier. The arms of Tuscany, or, five roundels, gules, two, two, and one, and one in chief, azure, charged with three flowers-de-Luce, or. Those of Venice, azure, a lion winged, sejant, or, holding under one of his paws a book covered, argent. Those of Genoa, argent, a cross, gules, with a crown closed for the island of Corsica; and for supporter, two griffins, or. The arms of Naples, are, azure, semée of flower-de-Luce, or, with a label of five points, gules. The French after the conquest of Italy had for their arms the figure of Brutus rising out of the tomb and its standard tricoloured, with white, and red, and black.

The "order of St. Januarius," was instituted by the present king of Spain, when king of Naples, in July 1738. The number of knights limited to 30, and after the present sovereign, that office of the order, was possessed by the kings of Naples. All the knights must prove the nobility of their descent for four centuries, and are to be addressed by the title of excellency. St. Januarius, the celebrated patron of Naples, is the patron of this order. The "order of Annunciation" was instituted in the year 1355, by Amadeus V. count of Savoy, in memory of Amadeus I. who bravely defended Rhodes against the Turks, and won those arms which are now borne by the dukes of Savoy, "Gules, a cross argent." It is counted among the most respectable orders in Europe: the knight must be of a noble family, and also a papist. In the year 1572, Emanuel Philibert, duke of Savoy, instituted the "order of St. Lazarus," and revived and united the obsolete order of St. Maurice to it; which was confirmed by the pope on the condition of maintaining two galleys against the Turks.

In the year 828 it is pretended that the body of St. Mark was removed from Alexandria in Egypt to Venice. Accordingly this saint hath been taken for their tutelary saint and guardian, and his picture was formerly painted on their ensigns and banners. When the "order of St. Mark" was first instituted is uncertain, but it is an honour conferred by the doge or duke of Venice and the senate, on persons of eminent quality, or who have done some signal service to the republic. The knights, when made, if present, are dubbed with a sword on their shoulders, the duke saying "Esse miles fidelis" (be

a faithful soldier). Absent persons are invested by letters patent, but their title, "*Knights of St. Mark*," is merely honorary: they have no revenues, nor are they under any obligation by vows as other orders. About the year 1460, Frederick III, emperor of Germany, instituted the "*order of St. George*," and dedicated it to St. George, tutelary saint and patron of Genoa. The doge is perpetual grand-master. The badge, a plain cross enamelled, gules, pendant to a gold chain, and worn about their necks. The cross is also embroidered on their cloaks. In the year 1561, Casimir of Medici, first grand duke of Tuscany, instituted the "*order of St. Stephen*," in memory of a victory which secured to him the sovereignty of that province. He and his successors were to be the grand-masters. The knights are allowed to marry, and their two principal conventual houses are at Pisa. It is a religious as well as military order, but the knights of justice and the Ecclesiastics are obliged to make proof of nobility of four descents. They wear a red cross with right angles, orled, or, on the left side of their habit, and on their mantle.

The "*order of the Holy Ghost*" was founded with their chief seat, the hospital of that name in Rome, by pope Innocent III. about the year 1198. They have a grand-master, and profess obedience, chastity, and poverty. Their revenue is estimated at 24,000 ducats daily, with which they entertain strangers, relieve the poor, train up deserted children, &c. Their ensign is a white patriarchal cross with 12 points, sewed on their breast on the left side of a black mantle. The "*order of Jesus Christ*," instituted by pope John XXII. was reformed and improved by pope Paul V. The reigning pope was to be always sovereign of it, and was designed as a mark of distinction for the popes Italian nobility, but on account of its frequent prostitution, hath fallen into discredit. The "*order of the Golden Spur*" is said to have been instituted by pope Pius IV. 1559, and to have been connected with the "*order of Pins*," instituted a year afterwards; but the badges were different. The knights of Pius are suppressed, and all that the knights of the Golden Spur have preserved to themselves, is the title of counts of the sacred palace of the Lateran. The badge is a star of eight points, white, and between the two bottom points, a spur, gold.

[HISTORY.] Italy was probably first peopled from Greece, as we have mentioned in the Introduction, to which we refer the reader for the ancient history of this country, which, for many ages, gave law to the then known world under the Romans.

The empire of Charlemagne, who died in 814, soon experienced that of Alexander. Under his successors it was in a short time entirely dismembered. His son, Lewis the Debonair, succeeded to his dominions in France and Germany, while Bernard, the grandson of Charlemagne, reigned over Italy and the adjacent islands. But Bernard having lost his life by the cruelty of his uncle, against whom he levied war, and Lewis himself dying in 840, his dominions were divided among his sons Lothario, Lewis, and Charles. Lothario with the title of emperor, retained Italy, Provence, and the fertile countries situated between the Saone and the Rhine; Lewis had Germany; and France fell to the share of Charles, the youngest of the three brothers. Shortly after this, Italy was ravaged by different contending tyrants; but in 964, Otho the Great, re-united Italy to the Imperial dominions. Italy afterwards suffered much by the contests between the popes and the emperors; it was harassed by wars and internal divisions; and at length various principalities and states were erected under different heads.

Savoy and Piedmont, in time, fell to the lot of the counts of Maurienne, the

the ancestors of his present Sardinian majesty, whose father became king of Sardinia, in virtue of the quadruple alliance concluded in 1718*. In 1794 Savoy and Piedmont were subdued by the French, and were added to them by their late treaty with the king of Sardinia.

The great duchy of Tuscany belonged to the emperors of Germany, who governed it by deputies to the year 1240, when the famous distinctions of the Guelphs, who were the partizans of the pope, and the Ghibellines, who were in the emperor's interest, took place. The pope then persuaded the imperial governors in Tuscany to put themselves under the protection of the church; but the Florentines, in a short time, formed themselves into a free commonwealth, and bravely defended their liberties against both parties by turn. Faction at last shook their freedom; and the family of Medici, long before they were declared either princes or dukes, in fact governed Florence, though the rights and privileges of the people seemed still to exist. The Medici, particularly Cosmo, who was deservedly called the Father of his Country, being in the secret, shared with the Venetians in the immense profits of the East-India trade, before the discoveries made by the Portuguese. His revenue, in ready money, which exceeded that of any sovereign prince in Europe, enabled his successors to rise to sovereign power; and pope Pius V. gave one of his descendants, Cosmo (the great patron of the arts), the title of Great Duke of Tuscany in 1570, which continued in his family to the death of Gaston de Medici in 1737, without issue. The great duchy was then claimed by the emperor Charles VI. as a fief of the empire, and given to his son-in-law, the duke of Lorraine, (afterwards emperor, and father of Joseph II.) in lieu of the duchy of Lorraine, which was ceded to France by treaty. Leopold, his second son, (brother and successor to the emperor Joseph II.) upon the death of his father, became Grand Duke. When he succeeded to the imperial crown, his son Ferdinand entered upon the sovereignty of the great duchy of Tuscany, who has now succeeded his father in the empire of Germany. Leghorn, which belongs to him, carries on a great trade: and several ships of very considerable force are now stationed on the Tuscan coasts to prevent the depredations of the infidels.

No country has undergone greater vicissitudes of government than Naples or Sicily, chiefly owing to the inconstancy of the natives, which seems to be incorporated with the air. Christians and Saracens by turns conquered it. The Normans under Tancred drove out the Saracens, and by their connections with the Greeks, established there, while the rest of Europe was plunged in monkish ignorance, a most respectable monarchy flourishing in arts and arms. About the year 1166, the popes being then all-powerful in Europe, their in-

trigues broken into the succession of Tancred's line, and Naples and Sicily at last came into the possession of the French; and the house of Anjou, with some interruptions and tragical revolutions, held it till the Spaniards drove them out in 1504, and it was then annexed to the crown of Spain.

The government of the Spaniards under the Austrian line, was so oppressive, that it gave rise to the famous revolt, headed by Massaniello, a young fisherman, without shoes or stockings, in the year 1647. His success was so surprising, that he obliged the haughty Spaniards to abolish the oppressive taxes, and to confirm the liberties of the people. Before these could be re-established perfectly, he turned delirious, through his continual agitations of body and mind, and he was put to death at the head of his own mob. Naples and Sicily continued with the Spaniards till the year 1760, when the extinction of the Austrian line opened a new scene of litigation. In 1706 the archduke Charles, afterwards emperor, took possession of the kingdom. By virtue of various treaties, which had introduced Don Carlos, the king of Spain's son, to the possession of Parma and Placentia, a new war broke out in 1733, between the houses of Austria and Bourbon; about the possession of Naples; and Don Carlos was received into the capital, where he was proclaimed king of both Sicilies; this was followed by a very bloody campaign, but the farther effusion of blood was stopt by a peace between France and the emperor, to which the courts of Madrid and Naples at first demurred, but afterwards acceded in 1736, and Don Carlos remained king of Naples. Upon his accession to the crown of Spain in 1759, it being found, by the inspection of physicians, and other trials, that his eldest son was by nature incapacitated for reigning, and his second being heir apparent to the Spanish monarchy, he resigned the crown of Naples to his third son, Ferdinand IV. who married an archduchess of Austria.

The king of Naples joined the coalition which was formed by the princes of Europe against the French Republic; but terrified by the rapid and unparalleled successes of his enemies, he was forced to request an armistice, which was granted to him, together with the pope; and on the 25th of October 1797 a definitive treaty was concluded upon such conditions as the French were pleased to dictate.

It was impossible, however that a peace concluded on such disgraceful conditions could be of long continuance; being insulted beyond endurance, they began, particularly after admiral Nelson's victory, to give evident proofs of enmity towards the French, and clearly shewed an inclination to join any confederacy, which might be formed against them. The king of Naples, however, either not being sufficiently informed of the designs and views of the other powers or misunderstanding them, commenced his military operations before they were ready to co-operate with him. His troops were not able to withstand those of the enemy but were defeated in almost every engagement. Finally the unfortunate monarch was at last forced to abandon his capital to the enemy. He embarked together with his queen and family on board Lord

* Ferdinand IV. king of the two Sicilies, third son of his late Catholic Majesty, the king of Spain, born Jan. 24, 1752; ascended the throne October 5, 1759; and married April 7, 1768, to the archduchess Maria-Carolina-Louisa, sister to the late emperor, by whom he has had issue 15 children, of whom 9 are living: One died lately on board admiral Nelson's ship on his passage to Palermo, of fright and sickness. The rest are,

1. Maria-Theresa, present empress of Germany, born June 6, 1774.
2. Theresa Clementine; born November 23, 1775; married September 17, 1790, the archduke Ferdinand.
3. Francis Januarius, Prince Royal, born August 17, 1777; married Maria-Clementina, the Archduchess September 1790. Has issue Nov. 5, 1798, a son.

the French and Imperialists. Their duke, or first magistrate, used to be crowned king of Corsica, though it does not clearly appear by what title; that island is now ceded to the French by the Genevois. The successful effort they made in driving the victorious Austrians out of their capital, during the war which was terminated by the peace of Aix-la-Chapelle in 1784, has few parallels in history, and serves to shew the effect of despair under oppression. At present they are possessed of revenue barely sufficient to preserve the appearance of a sovereign state.

At the same time that the government of Venice was overturned, the republic of Genoa felt the predominant influence of the French; and its government, which was one of those mild aristocracies, where the great are content with having all the political power without oppressing their fellow citizens, was destroyed in order to make way for a government founded upon their vile principles. That the change is for the worse, it is quite unnecessary to relate; for however despotic the government of any country in Europe may be, a change for that execrable system of tyranny, which subsists in France, must assuredly be for the worse.

The history of the Papacy is connected with that of Christendom itself. The most solid foundations for its temporal power were laid by the famous Matilda, countess of Tuscany, and heiress to the greatest part of Italy, who bequeathed a large portion of her dominions to the famous pope Gregory VII. (who, before his accession in 1073, was so well known by the name of Hildebrand). It is not to be expected that I am here to enter into a detail of the ignorance of the laity, and the other causes that operated to the aggrandizement of the papacy, previous to the Reformation. Even since that era the state of Europe has been such, that the popes have had more than once great weight in its public affairs, chiefly through the weakness and bigotry of temporal princes who have long ago recovered from their religious delusions.

The Papal power even before the French revolution was reduced very low; but that dreadful event struck the finishing blow; the order of Jesus had been exterminated out of France, Spain, Naples and Portugal. On the resumption of Avignon, and the Comtat Venaissin by the national assembly, the pontiff sent a memorial to most European courts, in which he vehemently and justly remonstrated against this nefarious act of robbery. In consequence of this unprovoked injury, the Pope joined the confederacy which was formed against France; but was compelled by the misfortunes of war to seek a temporary enjoyment of his kingdom in a humiliating and disgraceful peace. His holiness agreed, without reserve, to the annexation of Avignon, and the county of Venaissin to France, and also transferred to the republic the legations of Bologna, Ferrara, and Romagna. In conclusion, he consented to pay the conquerors the sum of 30 millions of livres, 20 of them in specie, and the rest in diamonds and other valuables, with 16,000 horses, as the ransom of that remnant of his dominions of which he was still permitted to enjoy the precarious possession. This treaty, however, so dearly purchased, was not of long continuance. Pretending that the brother of Buonaparte, the French envoy at Rome had been insulted by the populace, they declared war against the Pope and immediately commenced their operations. As the sovereign Pontiff was in no situation to resist, they were not interrupted in their march by hostile troops, and in a short time they entered Rome in triumph, and placed their trees of liberty on the capitol. Immediately on their arrival, they laid a contribution on the city of four millions in ready money, two millions in provisions, and three thousand in horses. They disbanded the militia,

and dispersed the Papal troops, they plundered the city, likewise of all those monuments of the arts by which it was adorned, and removed them to Paris. The Pope himself after being confined and treated with the utmost indignity was permitted to embark for Spain in a Spanish frigate. Such was the final overthrow of the Papal power, which at one period had risen to such a towering height, that it made the greatest monarch of Europe tremble on the throne.

John Angelo Braschi, born in 1717, was elected pope in 1775, and took upon him the name of Pius VI.

*The republic of Ragusa, though reckoned by geographers part of Turkey in Europe, is not under the Turkish government. It is an aristocratical state, formed nearly after the model of that of Venice. The government is in the hands of the nobility; and the chief of the republic, who is styled rector, is changed every month, and elected by scrutiny or lot. During his short administration, he lives in the palace, and wears a ducal habit. As the Ragusans are unable to protect themselves, they make use of their wealth to procure them protectors, the chief of whom, for many years, was the grand signior. They endeavour also to keep them upon good terms with the Venetians, and other neighbouring states. But in the year 1783 a dispute arose between them and the king of Naples, respecting a claim of right to his appointing a commander of the Ragusan troops. It was terminated by the republic's putting itself under that king's protection. The city of Ragusa is not above two miles in circumference, but it is well built, and contains some handsome edifices. The ancient Epidaurus was situated not far from this city. The Ragusans profess the Romish religion, but Greeks, Armenians, and Turks, are tolerated. Almost all the citizens are traders, and they keep so watchful an eye over their freedom, that the gates of the city of Ragusa are allowed to be open only a few hours in the day. The language chiefly in use among the Ragusans is the Slavonian, but the greatest part of them speak the Italian. They have many trading vessels, and are carriers in the Mediterranean like the Dutch, being constantly at peace with the piratical states of Barbary. The city of Gravosa, and Botone, 30 miles N. E. of Ragusa, are within the jurisdiction of this republic, and there are also five small islands belonging to it, the principal of which is Melida.

	Arcadia	Coron Partaa	
	Elis	Elis, or Belvidere on the riv. Peneus.	

SOIL, AIR, SEASONS, AND WATER.] Nature has lavished upon the inhabitants of Turkey all her blessings in those four particulars. The soil, though unimproved, is luxuriant beyond description. The air is salubrious, and friendly to the imagination, unless when it is corrupted from the neighbouring countries, or through the indolence and uncleanness of the Turkish manner of living. The seasons are here regular and pleasant, and have been celebrated from the remotest times of antiquity. The Turks are invited to frequent bathings, by the purity and wholesomeness of the water all over their dominions.

MOUNTAINS.] These are the most celebrated of any in the world, and at the same time often the most fruitful. Mount Athos lies on a peninsula, running into the Egean sea; the mounts Pindus and Olympus, celebrated in Grecian fables, separate Thessaly from Epirus. Parnassus, in Achaia, so famous for being consecrated to the muses, is well known. Mount Hæmus is likewise often mentioned by the poets: but most of the other mountains have changed their name; witness the mountains Sulis, Witofka, Staras, Plamina, and many others. Even the most celebrated mountains above mentioned, have modern names imposed upon them by the Turks, their new masters, and others in their neighbourhood.

SEAS.] The Euxine or Black sea; the Palus Mæotis, or sea of Afoph; the sea of Marmora, which separates Europe from Asia; the Archipelago; the Ionian sea, and the Levant, are so many evidences that Turkey in Europe, particularly that part of it where Constantinople stands, of all other countries, had the best claim to be the mistress of the world.

STRAITS.] Those of the Hellespont and Bosphorus are joined to the sea of Marmora, and are remarkable in modern as well as ancient history. The former viz. the Hellespont, or Dardanelles, is only two miles and a half in breadth, and is famous for the passage of Xerxes over it, when about to invade Greece, and of Alexander in his expedition against Asia. The former, for the more easy transportation of his numerous forces, laid a bridge of boats over it. It is also celebrated by the poets in the story of two lovers, Hero and Leander, of whom the latter swam across it to his mistress; but one night was unhappily drowned. The Bosphorus is about the same breadth, but has not been so much celebrated by historians and poets.

RIVERS.] The Danube, the Save, the Neister, the Neiper, and the Doa, are the best known rivers in this country; though many others have been celebrated by poets and historians.

LAKES.] These are not extremely remarkable, nor are they mentioned with any great applause, either by the ancients or moderns. The Lago di Sentari lies in Albania. It communicates with the Lago di Plave and the Lago di Holti. The Stympalus, so famous for its harpies and ravenous birds, lies in the Moxia; and Peneus, from its qualities, is thought to be the lake from which the Styx issues, conceived by the ancients to be the passage into hell.

METALS AND MINERALS.] Turkey in Europe contains a variety of all sorts of mines, and its marbles are esteemed the finest in the world.

VEGETABLE PRODUCTIONS.] These are excellent all over the European Turkey, especially when assisted by the smallest degree of industry. Besides pot and garden herbs of almost every kind, this country produces in great abundance and perfection, oranges, lemons, citrons, pomegranates, grapes of an uncommon sweetness, excellent figs, almonds, olives, and cotton. Besides these, many drugs, not common in other parts of Europe, are produced here.

ANIMALS.] The Thessalian or Turkish horses are excellent both for their beauty and service. The black cattle are large, especially in Greece. The goats are a most valuable part of the animal creation to the inhabitants, for the nutrition they afford, both of milk and flesh. The large eagles which abound in the neighbourhood of Badadagi, furnish the best feathers for arrows for the Turkish archers, and they sell at an uncommon price. Partidges are very plentiful in Greece; as are all other kinds of fowls and quadrupeds all over Turkey in Europe; but the Turks and Mahometans in general are not very fond of animal food.

ANTIQUITIES AND CURIOSITIES.] Almost every spot of ground, every NATURAL AND ARTIFICIAL } river, and every fountain in Greece, presents the traveller with the ruins of a celebrated antiquity. On the Isthmus of Corinth, the ruins of Neptune's temple, and the theatre where the Isthmian games were celebrated, are still visible. Athens, which contains at present above 10,000 inhabitants, is a fruitful source of the most magnificent and celebrated antiquities in the world; a minute account of which would exceed the limits of this work: but it will be proper to mention some of the most considerable. Among the antiquities of this once superb city, are the remains of the temple of Minerva, built of white marble, and encompassed with forty-six fluted columns of the Doric order, forty-two feet high, and seven feet and a half in circumference: the architrave is adorned with bass-reliefs, admirably executed, representing the wars of the Athenians. To the south east of the Acropolis, a citadel which defends the town, are seventeen beautiful columns of the Corinthian order, thought to be the remains of the emperor Adrian's palace. They are of fine white marble, about fifty feet high, including the capitals and bases. Just without the city stands the temple of Theseus, surrounded with fluted columns of the Doric order; the portico at the west end is adorned with the battle of the Centaurs, in basso-relievo; that at the east end appears to be a continuation of the same history; and on the outside of the porticos, in the spaces between the triglyphs, are represented the exploits of Theseus. On the south-west of Athens is a beautiful structure, commonly called the Lantern of Demosthenes; this is a small round edifice of white marble, the roof of which is supported by six fluted columns of the Corinthian order, nine feet and a half high; in the space between the columns are panels of marble; and the whole is covered with a cupola, carved with the resemblance of scales; and on the frieze are beautifully represented in relievo the labours of Hercules. Here are also to be seen the temple of the Winds; the remains of the theatre of Bacchus; of the magnificent

sificent aqueduct of the emperor Adrian; and of the temples of Jupiter Olympus, and Augustus. The remains of the temple of the oracle of Apollo are still visible at Castri, on the south side of mount Parnassus, and the marble steps that descend to a pleasant running water, supposed to be the renowned Castalian spring, with the niches for statues in the rock, are still discernible. The famous cave of Trophonius is still a natural curiosity in Livadia, the old Boeotia.

Mount Athos, which has been already mentioned, and which is commonly called *Monto Santo*, lies on a peninsula, which extends into the Ægean sea, and is indeed a chain of mountains, reaching the whole length of the peninsula, seven Turkish miles in length, and three in breadth: but it is only a single mountain that is properly called Athos. This is so lofty, that on the top, as the ancients relate, the sun-rising was beheld four hours sooner than by the inhabitants of the coast; and, at the solstice, its shade reached into the Agora or market-place of Myrina, a town in Lemnos, which island was distant eighty-seven miles eastward. There are twenty-two convents on mount Athos, besides a great number of cells and grottos, with the habitations of no less than six thousand monks and hermits; though the proper hermits, who live in grottos, are not above twenty: the other monks are anchorites, or such as live in cells. These Greek monks, who call themselves the inhabitants of the holy mountain, are so far from being a set of slothful people, that, besides their daily offices of religion, they cultivate the olive and vineyards, are carpenters, masons, stone-cutters, cloth-workers, taylor, &c. They also live a very austere life; their usual food, instead of flesh, being vegetables, dried olives, figs, and other fruit; onions, cheese, and on certain days, Lent excepted, fish. Their fasts are many and severe; which, with the healthfulness of the air, renders longevity so common there, that many of them live above an hundred years. It appears from *Ælian*, that anciently the mountain in general, and particularly the summit, was accounted very healthy, and conducive to long life: whence the inhabitants were called *Macrobi*, or long-lived. We are farther informed by *Philostratus*, in the life of *Apollonius*, that numbers of philosophers used to retire to this mountain, for the better contemplation of the heavens, and of nature; and after their example the monks doubtless built their cells.

CITYS.] Constantinople, the capital of this great empire, is situated on the European side of the Bosphorus. It was built upon the ruins of the ancient Byzantium, by the Roman emperor Constantine the Great, as a more inviting situation than Rome for the seat of empire. It became afterwards the capital of the Greek empire, and having escaped the destructive rage of the barbarous nations, it was the greatest as well as the most beautiful city in Europe, and the only one, during the Gothic ages, in which there remained any image of the ancient elegance in manners and arts. While it remained in the possession of the Greek emperors, it was the only mart in Europe for the commodities of the East Indies. It derived great advantages from its being the rendezvous of the crusaders; and being then in the meridian of its glory, the European writers, in the ages of the crusades, speak of it with astonishment. "O what a vast city is Constantinople (exclaims one, when he first beheld it), and how beautiful! How many monasteries are there in it, and how many palaces built with wonderful art! How many manufactures are there in the city, amazing to behold! It would be astonishing to relate how it abounds with all good things, with gold, silver, and stuffs of various kinds; for every hour ships arrive at this port with all things necessary for the use of man." Constantinople

tinople is at this day one of the finest cities in the world by its situation and its port. The prospect from it is noble. The most regular part is the Beffetin, inclosed with walls, and gates, where the merchants have their shops excellently ranged. In another part of the city is the Hippodrome, an oblong square of 400 paces by 100, where they exercise on horseback. The Meidan, or parade, is a large spacious square, the general resort of all ranks. On the opposite side of the port, are four towns, but considered as a part of the suburbs, their distance being so small, a person may easily be heard on the other side. They are named Pera, Galata, Pacha, and Tophana. In Pera the foreign ambassadors and all the Franks or strangers reside, not being permitted to live in the city: Galata also is mostly inhabited by Franks or Jews, and is a place of great trade. The city abounds with antiquities. The tomb of Constantine the Great is still preserved. The mosque of St. Sophia, once a Christian church, is thought in some respects to exceed in grandeur and architecture St. Peter's at Rome. The city is built in a triangular form, with the Seraglio standing on a point of one of the angles, from whence there is a prospect of the delightful coast of the Lesser Asia, which is not to be equalled. When we speak of the seraglio, we do not mean the apartments in which the grand signior's women are confined, as is commonly imagined, but the whole inclosure of the Ottoman palace, which might well suffice for a moderate town. The wall which surrounds the seraglio, is thirty feet high, having battlements, embrasures, and towers, in the style of ancient fortifications. There are in it nine gates, but only two of them magnificent; and from one of these the Ottoman court takes the name of the *Porte*, or the *Sublime Porte*, in all public transactions and records. Both the magnitude and population of Constantinople have been greatly exaggerated by credulous travellers. It is surrounded by a high and thick wall, with battlements after the Oriental manner, and towers, defended by a lined but shallow ditch, the works of which are double on the land side. The site forms an unequal triangle resembling a harp, and the total circumference may be twelve or fourteen English miles, including a surface of about 2000 acres, surrounded by walls, and defended on two sides by the sea, and the harbour called "the Golden Horn." Not less than 400,000 inhabitants are numbered in the whole capital; but in this estimation must be included the suburbs of Galata, Pera, Tophana, and Scutari. Two hundred thousand are Turks, one hundred thousand Greeks; and the remainder Jews, Armenians, and Franks, of all the European nations. Amongst the former, it is asserted that population is much on the decline; for there are few cities in which can be found so many young men unmarried. The inhabitants are frequently changed, and the ravages of the plague are supplied by settlers from other parts of the empire. With no people is longevity more common or extended, nor health more constant, than with the Turks. The city hath been frequently assailed by fires, either owing to the narrowness of the streets and the structure of the houses, or the arts of the Janizaries. In August 1784, a fire broke out in the quarter situated towards the harbour, and spread into other quarters, and about 10,000 houses, (most of which had been rebuilt since the fire in 1782) were consumed.

Opposite to the seraglio, on the Asian side, and about a mile and a half distant across the water, is Scutari, adorned with a royal mosque, and a pleasant house of the grand signior. On the brow of an adjacent hill is a grand prospect. In one view are the cities of Constantinople, Galata, and Pera, the small seas of the Bosphorus and Propontis, with the adjacent countries on each shore.

As to the population, manners, religion, government, revenues, learning, military strength, commerce, and manufactures of the Turks, these several heads depending on the same principles all over the empire, shall be mentioned under Turkey in Asia.

CRIM-TARTARY or the CRIMEA, is the ancient Taurica Cherfonefus, and is a peninsula, lying on the Euxine, or Black sea, by which it is bounded on the west and south, and on the east and north-east, by that of Asoph. It is between 44 and 46 degrees of north latitude; and 34 and 37 degrees of east longitude.

This peninsula was esteemed a part of Turkey in Europe, until it was ceded to Russia, in consequence of the peace in 1784. Many cities were built on it by the Greeks, particularly those of Kherfon, Theodosia, Panticapeum, and some others, which carried on a great trade with the Scythians, as well as with the Greek cities on the continent.

The most considerable rivers in the Crimea are those of Karafu and Salagin, both of which take an easterly course.

Of the towns in this part of the world we have but very slight descriptions; and indeed where the country has been so often the seat of war, and the inhabitants are still so rude, very little can be expected from their buildings. Lady Craven, now the margravine of Anspach, who, without doubt, had access to the best lodgings in the country, informs us, that "a Tartar's house is a very slight building of only one story, without any chair, table, or piece of wooden furniture. Large cushions are ranged round the room for seats; and what is extremely convenient, there is more than double the space of the room, behind the wainscot, which draws back in most places; so that in a place where the room appears exceedingly small and confined, there is yet every conveniency to be met with."

Among the curiosities in this country, we may reckon the source of the river Karafu, which is situated among rocks, in a very romantic manner, and rises in a considerable stream. It was visited by lady Craven in 1786. No less wonderful are those lakes which receive the rivulets without any visible outlet. This celebrated female traveller mentions a house near Sebastopol situated in a very romantic manner at the foot of some rocks, from which issue many clear springs that amply supply the houses and baths with water. On the summit of these rocks, there are places where immense cables have certainly passed and been tied. The Tartars insist that the sea was once clove to the foot of them, and ships were fastened there. Near Bacziseria there is a mine of earth, exactly like soap, which is reckoned very good for the skin, and vast quantities of it are consumed by the women at Constantinople. Lady Craven bestows the greatest encomiums on the sheep, which in this peninsula are innumerable, and afford the most beautiful and costly fleeces. The sheep are all spotted; the lambskins very beautiful, and they kill the ewes to have them before birth, when their skins have small spots, and are smooth like the finest and lightest fattins. Coats lined with these skins are called Pelisses; and as a great number of these small animals must be killed to make the lining of one coat, this is one of the finest presents the empress can make to an ambassador.

The peninsula of the Crimea has a considerable trade in what is called Morocco leather, of various colours, which is to be had very cheap, and like fattin. At Bacziseria there is a great trade of sword-blades, knives, and hangers, many of which are not to be distinguished from such as are made at Damascus.

ISLANDS belonging to TURKEY in EUROPE be- ing part of Ancient GREECE.

I Shall mention these islands chiefly for the use of such readers as are conversant with ancient history, of which they make so distinguished a part.

NEGROPONT, the ancient Eubœa, stretches from the south-east to the north-west, and on the eastern coast of Achaia or Livadia. It is 90 miles long, and 25 broad, and contains about 1300 square miles. Here the Turkish gallees lie. The tides on its shore are irregular; and the island itself is very fertile, producing corn, wine, fruit, and cattle, in such abundance, that all kinds of provisions are extremely cheap. The chief towns in the island are, Negropont, called by the Greeks Egripos, situated on the south-west coast of the island, on the narrowest part of the strait; and Castel Rosso, the ancient Carystus.

LEMNOS or **STALIMENE**, lies on the north part of the Egean sea or Archipelago, and is almost a square of 25 miles in length and breadth. Though it produces corn and wine, yet its principal riches arise from its mineral earth, much used in medicine, sometimes called *terra Lemna*, or *scyllita*, because it is sealed up by the Turks, who receive from it a considerable revenue.

TENELOS is remarkable only for its lying opposite to old Troy, and its being mentioned by Virgil as the place to which the Greeks retired, and left the Trojans in a fatal security. It hath a tower of the same name.

SEYROS is about 60 miles in circumference, and is remarkable chiefly for the remains of antiquity which it contains: about 300 Greek families inhabit it.

LESSOS, or **MYTELENE**, is about 60 miles long, and is famous for the number of philosophers and poets it produced. The inhabitants were formerly noted for their prodigality.

SCIO, or **CHIOS**, lies about 80 miles west of Smyrna, and is about 100 miles in circumference. This island, though rocky and mountainous, produces excellent wine, but no corn. It is inhabited by 100,000 Greeks, 10,000 Turks, and about 3,000 Latins. It hath 300 churches, besides chapels and monasteries, and a Turkish garrison of 1400 men. The inhabitants have manufactures of silk, velvet, gold and silver stuffs. The island likewise produces oil and silk, and the lentisk-tree, or mastic, from which the government draws its chief revenue. The women of this, and almost all the other Greek islands, have in all ages been celebrated for their beauty, and their persons have been the most perfect models of symmetry to painters and statuaries. A late learned traveller, Dr. Richard Chandler, says, "The beautiful Greek girls are the most striking ornaments of Scio. Many of these were sitting at the doors and windows, twisting cotton or silk, or employed in spinning and needle-work, and accosted us with familiarity, bidding us welcome as we passed. The streets on Sundays and holidays are filled with them in groups. They wear short petticoats, reaching only to their knees, with white silk or cotton hose. Their head-dress, which is peculiar to the island, is a kind of turban, the linen so white and thin it seemed snow. Their slippers are chiefly yellow,

with a knot of red fringe at the heel. Some wore them fastened with a thong. Their garments were silk of various colours; and their whole appearance so fantastic and lively, as to afford us much entertainment. The Turks inhabit a separate quarter, and their women are concealed." Among the poets and historians said to be born here, the inhabitants reckon Homer, and shew a little square house, which they call Homer's school.

SAMOS lies opposite to Ephesus, on the coast of the Lesser Asia, about seven miles from the continent. It is 30 miles long, and 15 broad. This island gave birth to Pythagoras, and is inhabited by Greek Christians, who are well treated by the Turks, their masters. The muscadine Samian wine is in high request; and the island also produces wool, which they sell to the French; oil, pomegranates, and silk. This island is supposed to have been the native country of Juno; and some travellers think that the ruins of her temple, and of the ancient city Samos, are the finest remains of antiquity in the Levant.

To the south of Samos lies PARMOS, about 20 miles in circumference, but so barren and dreary, that it may be called a rock rather than an island. It has, however, a convenient haven; and the few Greek monks who are upon the island shew a cave where St. John is supposed to have written the Apocalypse.

The CYCLADES islands lie like a circle round Delos, the chief of them, which is south of the islands Mycone and Tirse, and almost midway between the continents of Asia and Europe. Though Delos is not above six miles in circumference, it is one of the most celebrated of all the Grecian islands, as being the birth-place of Apollo and Diana, the magnificent ruins of whose temples are still visible. This island is almost destitute of inhabitants.

PAROS lies between the islands of Luxia and Melos. Like all the other Greek islands, it contains the most striking and magnificent ruins of antiquity; but is chiefly renowned for the beauty and whiteness of its marble.

CERIGO, or CYTHEREA, lies, south-east of the Morea, and is about 50 miles in circumference, but rocky and mountainous, and chiefly remarkable for being the favourite residence of Venus.

SANTORIN is one of the most southernmost islands in the Archipelago, and was formerly called Calista, and afterwards Thera. Though seemingly covered with pumice-stones, yet, through the industry of the inhabitants, who are about 10,000, it produces barley and wine, with some wheat. One-third of the people are of the Latin Church, and subject to a popish bishop. Near this island another arose of the same name, from the bottom of the sea, in 1707. At the time of its birth there was an earthquake, attended with most dreadful lightnings and thunders, and boilings of the sea for several days, so that when it arose out of the sea, it was a mere volcano, but the burning soon ceased. It is about 200 feet above the sea; and at the time of its first emerging, it was about a mile broad, and five miles in circumference, but it has since increased. Several other islands of the Archipelago appear to have had the like original; but the sea in their neighbourhood is so deep as not to be fathomed.

The famous island of RHODES is situated in the 28th degree of east longitude, and 36 degrees 20 minutes north latitude, about 20 miles south-west of the continent of Lesser Asia, being about 60 miles long, and 20 broad. This island is healthful and pleasant, and abounds in wine, and many of the necessaries of life; but the inhabitants import their corn from the neighbouring country. stands on the side of a hill fronting the sea, and is three miles in circum-
 ference, interspersed with gardens, minarets, churches, and towers. The har-
 bour is the grand signior's principal arsenal for shipping, and the place is es-
 teemed among the strongest fortresses belonging to the Turks. The colossus
 of brass, which anciently stood at the mouth of its harbour, and was 50 fa-
 thoms wide, was deservedly accounted one of the wonders of the world; one
 foot being placed on each side of the harbour, ships passed between its legs;
 and it held in one hand a light-house for the direction of mariners. The face
 of the colossus represented the sun, to whom this image was dedicated; and
 its height was about 135 feet. The inhabitants of this island were formerly
 masters of the sea; and the Rhodian law was the directory of the Romans in
 maritime affairs. The knights of St. John of Jerusalem, after losing Palestine,
 took this island from the Turks in 1301, but lost it to them in 1522, after a
 brave defence, and afterwards retired to Malta.

CANDIA, the ancient Crete, is still renowned for its hundred cities, for its
 being the birth-place of Jupiter, the seat of legislature to all Greece, and
 many other historical and political distinctions. It lies between 35 and 36
 degrees of north latitude, being 200 miles long, and 60 broad, almost equally
 distant from Europe, Asia, and Africa, and contains 3220 square miles.
 The famous Mount Ida stands in the middle of the island, and is no better
 than a barren rock; and Lethæ, the river of oblivion, is a torpid stream.
 Some of the vallies of this island produce wine, fruits, and corn; all of them
 are remarkably excellent in their kind. The siege of Candia, the capital of
 the island, in modern times, was far more wonderful and bloody than that of
 Troy. The Turks invested it in the beginning of the year 1645, and its
 Venetian garrison, after bravely defending itself against 56 storms, till the lat-
 ter end of September 1669, made, at last, an honourable capitulation. The
 siege cost the Turks 180,000 men, and the Venetians 80,000.

CYPRUS lies in the Levant sea, about 30 miles distant from the coasts of
 Syria and Palestine. It is 150 miles long, and 70 broad, and lies at almost
 an equal distance from Europe and Africa. It was formerly famous for the
 worship of Venus, the Cyprian goddess; and, during the time of the Cru-
 sades, was a rich flourishing kingdom, inhabited by Christians. Its wine,
 especially that which grows at the bottom of the celebrated Mount Olym-
 pus, is the most palatable and the richest of all that grows in the Greek
 islands. Nicosia is the capital, in the midst of the country, and the see of the
 archbishop; indeed, most part of the inhabitants of the island are
 Christians. Famagusta, its ancient capital, has a good harbour, and the natural produce
 of the island is so rich, that many European nations find their account in
 keeping consuls residing upon it; but the oppressions of the Turks have de-
 populated and impoverished it to a surprising degree, that the revenue they
 get from it does not exceed 1250*l.* a year. The island produces great quan-
 tities of grapes, from which excellent wine is made; and also cotton of a
 very fine quality is here cultivated, and oil, silk, and turpentine. Its female
 inhabitants do not degenerate from their ancestors as devotees to Venus;
 and Paphos, that ancient seat of pleasure and corruption, is one of the di-
 visions of the island. Richard I. king of England, subdued Cyprus, on
 account of its king's treachery; and its royal title was transferred to Guy
 Lusignan, king of Jerusalem, from whence it passed to the Venetians, who
 still hold that empty honour.

The islands in the Ionian sea are, SAPIENZA, STIVALI, ZANTE, CEPHA-
 LONIA, SANTAMAURA, CORFU, FANNU, and others of smaller note, parti-
 cularly Isola del Compare, which would not deserve mention, had it not been
 the

the ancient Ithaca, the birth place and kingdom of Ulysses. These islands in general are fruitful, and belong to the Venetians.

Zante has a populous capital of the same name, and is a place of considerable trade, especially in currants, grapes, and wine. The citadel is erected on the top of a large hill, strong by nature, but now little better than a heap of ruins. Here is a garrison of 500 men, but their chief dependence is on their fleet and the island of Corfu. The inhabitants of Zante are about 30,000, mostly Greeks, and friendly to strangers. Corfu, which is the capital of that island, and the residence of the governor general over all the other islands, is a place of great strength, and its circumference about four miles. The Venetians are said to concern themselves very little about the welfare or government of these islands, so that the inhabitants, who are generally Greeks, bear a very indifferent character. Their number at Corfu is estimated at 50,000, and their manners more severe than at Zante.

A S I A.

AS Asia exceeds Europe, and Africa in the extent of its territories, it is also superior to them in the serenity of its air, the fertility of its soil, the deliciousness of its fruits, the fragrancy and balsamic qualities of its plants, spices, and gums; the salubrity of its drugs; the quantity, variety, beauty, and value of its gems, the richness of its metals, and the fineness of its silks and cottons. It was in Asia, according to the sacred records, that the all-wise Creator planted the garden of Eden, in which he formed the first man and first woman, from whom the race of mankind was to spring. Asia became again the nursery of the world after the deluge, whence the descendants of Noah dispersed their various colonies into all the other parts of the globe. It was in Asia that God placed his once favourite people, the Hebrews, whom he enlightened by revelations delivered by the prophets, and to whom he gave the Oracles of Truth. It was here that the great and merciful work of our redemption was accomplished by his divine Son; and it was from hence that the light of his glorious gospel was carried with amazing rapidity into all the known nations by his disciples and followers. Here the first Christian churches were founded, and the Christian faith miraculously propagated and cherished even with the blood of innumerable martyrs. It was in Asia that the first edifices were reared, and the first empires founded, while the other parts of the globe were inhabited only by wild animals. On all these accounts, this quarter claims a superiority over the rest; but it must be owned, that a great change hath happened in that part of it called Turkey, which hath lost much of its ancient splendor; and from the most populous and best cultivated spot in Asia, it become a wild and uncultivated desert. The other parts of Asia continue much in their former condition, the soil being as remarkable for its fertility, as most of the inhabitants for their indolence, effeminacy, and luxury. This effeminacy is chiefly owing to the warmth of the climate, though in some measure heightened by custom and education; and the symptoms of it are more or less visible, as the several nations are seated nearer or farther from the north. Hence the Tartars who live near the same latitudes with us, are as brave, hardy, strong, and vigorous, as any European nation. What is wanting in the robust frame of their bodies among the Chinese, Mogul-Indians, and all the inhabitants of the most south-

an regions, is in a great measure made up to them by the vivacity of their minds, and ingenuity in various kinds of workmanship, which our most skilful mechanics have in vain endeavoured to imitate.

This vast extent of territory was successively governed in past times by the Assyrians, the Medes, the Persians, and the Greeks; but the immense regions of India and China were little known to Alexander, or the conquerors of the ancient world. Upon the decline of those empires, great part of Asia submitted to the Roman arms; and afterwards, in the middle ages, the successors of Mahomet, or, as they were usually called, Saracens, founded in Asia, in Africa, and in Europe, a more extensive empire than that of Cyrus, Alexander, or even the Roman, when in its height of power. The Saracenic greatness ended with the death of Tamerlane; and the Turks, conquerors on every side, took possession of the middle regions of Asia, which they still enjoy. Besides the countries possessed by the Turks and Russians, Asia contains at present three large empires, the Chinese, the Mogul, and the Persian, upon which the lesser kingdoms and sovereignties of Asia generally depend. The prevailing form of government in this division of the globe is absolute monarchy. If any of them can be said to enjoy some share of liberty, it is the wandering tribes, as the Tartars and Arabs. Many of the Asiatic nations, when the Dutch first came among them, could not conceive how it was possible for any people to live under any other form of government than that of a despotic monarchy. Turkey, Arabia, Persia, part of Tartary and part of India, profess Mahometanism. The Persian and Indian Mahometans are of the sect of Hali, and the others of that of Omar; but both own Mahomet for their lawgiver, and the Koran for their rule of faith and life. In the other parts of Tartary, India, China, Japan, and the Asiatic Islands, they are generally heathens and idolaters. Jews are to be found every where in Asia. Christianity, though planted here with wonderful rapidity by the apostles and primitive fathers, suffered an almost total eclipse by the conquests of the Saracens, and afterwards of the Turks. Incredible indeed have been the hazards, perils, and sufferings of popish missionaries, to propagate their doctrines in the most distant regions, and among the grossest idolaters; but their labours have hitherto failed of success, owing in a great measure to their own avarice, and the avarice and profligacy of the Europeans, who resort thither in search of wealth and dominion.

The principal languages spoken in Asia are, the modern Greek, the Turkish, the Russian, the Tartarian, the Persian, the Arabic, the Malayan, the Chinese, and the Japanese. The European languages are also spoken upon the coasts of India and China.

The continent of Asia is situated between 25 and 180 degrees of east longitude, and between the equator and 80 degrees of north latitude. It is about 4740 miles in length, from the Dardanelles on the west, to the eastern shore of Tartary; and about 4380 miles in breadth, from the most southern part of Malacca, to the most northern cape of Nova Zembla. It is bounded by the Frozen Ocean on the north; on the west it is separated from Africa by the Red Sea, and from Europe by the Levant or Mediterranean, the Archipelago, the Hellespont, the sea of Marmora, the Bosphorus, the Black Sea, the river Don, and a line drawn from it to the river Tobol, and from thence to the river Ob, which falls into the Frozen Ocean. On the east, it is bounded by the Pacific Ocean, or South Sea, which separates it from America; and on the south, by the Indian Ocean; so that it is almost surrounded by the sea. The principal regions which divide this country are as follow:

Nations.	Length.	Breadth	Square Miles.	Chief Cities.	Dist. and bearing from London.	Diff. of time from London	Religions

SITUATION AND EXTENT.

Miles. Degrees. Sq. Miles.
 Length 1000 } between { 27 and 46 east longitude. } 520,820.
 Breadth 800 } { 28 and 45 north latitude. }

BOUNDARIES.] BOUNDED by the Black Sea and Circassia on the North; by Persia on the East; by Arabia and the Levant Sea, on the South; and by the Archipelago, the Hellespont, and Propontis, which separate it from Europe, on the West.

Divisions.	Sub-divisions.	Chief Towns.
The eastern provinces are	1. Eyraca Arabic or Chaldea	Bassora and Bagdad.
	2. Diarbec, or Mesopotamia	Diarbec, Orfa, &c.
	3. Curdistan or Assyria	Mouful and Betlis.
	4. Turcomania or Armenia	Erzerum and Van.
	5. Georgia, including Mengrelia and Imaretta, and part of Circassia	Teflis, Amarchia, & Gonie.
Natalia, or the Lesser Asia, on the west,	1. Natalia Proper	Bursa, Nici, Smyrna, and Ephesus.
	2. Amasia	Amasia, Trapezond, and Sinope.
	3. Aladulia	Ajazzo and Marat.
	4. Caramania	Satalia and Terasso.
East of the Levant Sea.	Syria, with Palestine, or the Holy Land.	Aleppo, Antioch Damascus, Tyre, Sidon, Tripoli, Scanderoon, and Jerusalem.

MOUNTAINS.] These are famous in sacred as well as profane writings. The most remarkable are, Olympus, Taurus and Anti-taurus; Caucasus and Ararat; Lebanon; and Hermon.

RIVERS.] The same may be observed of the rivers, which are the Euphrates; Tigris, Orontes, Meander, Sarabat, Kara, and Jordan.

AIR AND CLIMATE.] Though both are delightful in the utmost degree, and naturally salubrious to the human constitution, yet such is the equality with which the Author of nature has dispensed his benefits, that Turkey, both in Europe and Asia, is often visited by the plague; a frightful scourge to mankind wherever it takes place, but here doubly destructive, from the native indolence of the Turks, and their superstitious belief in a predestination, which prevents them from using the proper precautions to defend themselves against this calamity.

SOIL AND PRODUCE.] As this country contains the most fertile provinces of Asia, I need scarcely inform the reader that it produces all the luxuries of life in the utmost abundance, notwithstanding the indolence of its owners. Raw silk, corn, wine, oil, honey, fruit of every species, coffee, myrrh, frankincense, and odoriferous plants and drugs, are natives here almost without culture,

culture, which is practised chiefly by Greek and Armenian Christians. The olives, citrons, lemons, oranges, figs, and dates, produced in these provinces, are highly delicious, and in such plenty, that they cost the inhabitants a mere trifle, and it is said, in some places nothing. Their asparagus is often as large as a man's leg, and their grapes far exceed those of other countries in largeness. In short, nature has brought all her productions here to the highest perfection.

ANIMAL PRODUCTIONS BY } The same may be said of their animals,
SEA AND LAND. } The breed of the Turkish and Arabian horses, the latter especially, are valuable beyond any in the world, and have considerably improved that of the English. We know of no quadrupeds that are peculiar to these countries, but they contain all that are necessary for the use of mankind. Camels are here in much request, from their strength, their agility, and, above all, their moderation in eating and drinking, which is greater than that of any other known animal. Their manufacture, known by the name of camlets, was originally made by a mixture of camels hair and silk, though it is now often made with wool and silk. Their kids and sheep are exquisite eating, and are said to surpass, in flavour and taste, those of Europe; but their own butchers meat, beef particularly, is not so fine.

As to birds, they have wild fowl in vast perfection; their ostriches are well known by their tallness, swiftness in running, and stupidity. The Roman epicures prized no fish except lampreys, mullets and oysters, but those that were found in Asia.

METALS AND MINERALS.] This country contains all the metals that are to be found in the richest kingdoms and provinces in Europe; and its medicinal springs and baths exceed those of any in the known world.

OF THE TURKS IN EUROPE AND ASIA.

POPULATION, INHABITANTS, MANNERS, } THE population of
CUSTOMS, AND DIVERSIONS. } this great country is by no means equal either to its extent or fertility, nor have the best geographers been able to ascertain it, because of the uncertainty of its limits. It certainly is not so great as it was before the Christian æra, or even under the Roman emperors; owing to various causes, and above all, to the tyranny under which the natives live, and their polygamy, which is undoubtedly an enemy to population, as may be evinced from many reasons; and particularly, because the Greeks and Armenians, among whom it is not practised, are incomparably more prolific than the Turks, notwithstanding the rigid subjection in which they are kept by the latter. The plague is another cause of depopulation. The Turkish emperor, however, has more subjects than any two European princes.

As to the inhabitants, they are generally well made and robust men; when young, their complexions are fair, and their faces handsome; their hair and eyes are black or dark brown. The women, when young, are commonly handsome, but they generally look old at thirty. In their demeanour, the Turks are rather hypocondriac, grave, sedate, and passive; but when agitated by passion, furious, raging, ungovernable; big with dissimulation, jealous, suspicious, and vindictive beyond conception; in matters of religion, tenacious, superstitious, and morose. Though the generality seem hardly capable of much benevolence, or even humanity with regard to Jews, Christians, or any

who differ from them in religious matters, yet they are far from being devoid of social affections for those of their own religion. But interest is their supreme good, and when that comes in competition, all ties of religion, con-anguinity, or friendship, are with the generality speedily dissolved. The morals of the Asiatic Turks are far preferable to those of the European. They are hospitable to strangers; and the vices of avarice and inhumanity reign chiefly among their great men. They are likewise said to be charitable to one another, and punctual in their dealings. Their charity and public spirit is most conspicuous in their building caravanseras, or places of entertainment, on roads that are destitute of accommodations, for the refreshment of poor pilgrims or travellers. With the same laudable view they search out the best springs, and dig wells, which in those countries are a luxury to weary travellers. The Turks sit cross-legged upon mats, not only at their meals but in company. Their ideas, except what they acquire from opium, are simple and confined, seldom reaching without the walls of their own houses; where they sit conversing with their women, drinking coffee, smoking tobacco, or chewing opium. They have little curiosity to be informed of the state of their own, or any other country. If a visier, bashaw, or other officer, is turned out, or strangled, they say no more on the occasion, than that there will be a new visier or governor, seldom enquiring into the reason of the disgrace of the former minister. They are perfect strangers to wit and agreeable conversation. They have few printed books, and seldom read any other than the Koran, and the comments upon it. Nothing is negotiated in Turkey without presents; and here justice may commonly be bought and sold.

The Turks dine about eleven o'clock in the forenoon, and they sup at five in the winter, and six in the summer; and this is their principal meal. Among the great people, their dishes are served up one by one; but they have neither knife or fork, and they are not permitted by their religion to use gold or silver spoons. Their victuals are always high seasoned.—Rice is the common food of the lower sort, and sometimes it is boiled up with gravy; but their chief dish is pilan, which is mutton and fowl boiled to rags, and the rice being boiled quite dry, the soup is high seasoned, and poured upon it. They drink water, sherbet, and coffee; and the only debauch they know is in opium, which gives them sensations resembling those of intoxication. Guests of high rank sometimes have their beards perfumed by a female slave of the family. They are temperate and sober from a principle of their religion, which forbids them the use of wine; though in private many of them indulge themselves in the use of strong liquors. Their common salutation is by an inclination of the head, and laying their right hand on their breast. They sleep in linen waistcoats and drawers, upon mattresses, and cover themselves with a quilt. Few or none of the considerable inhabitants of this vast empire have any notion of walking or riding either for health or diversion. The most religious among them find, however, sufficient exercise when they conform themselves to the frequent ablutions, prayers, and rites prescribed them by Mahomet.

Their active diversions consist in shooting at a mark, or tilting it with darts, at which they are very expert. Some of their great men are fond of hunting, and take the field with numerous equipages, which are joined by their inferiors; but this is often done for political purposes, that they may know the strength of their dependents. Within doors, the chess or draught-board are their usual amusements; and if they play at chance games they never bet money, that being prohibited by the Koran.

DRESS.] The men shave their heads, leaving a lock on the crown, and wear their beards long. They cover their heads with a turban, and never put it off but when they sleep. Their shirts are without collar or wristband, and over them they throw a long vest, which they tie with a sash, and over the vest they wear a loose gown somewhat shorter. Their breeches, or drawers, are of a piece with their stockings; and instead of shoes they wear slippers, which they put off when they enter a temple or house. They suffer no Christians, or other people, to wear white turbans. The dress of the women differs little from that of the men, only they wear stiffened caps upon their heads with horns something like a mitre, and wear their hair down. When they appear abroad, they are so muffled up as not to be known by their nearest relation. Such of the women as are virtuous make no use of paint to heighten their beauty, or to disguise their complexion; but they often tinge their hands and feet with *henna*, which gives them a deep yellow. The men make use of the same expedient to colour their beards.

MARRIAGES.] Marriages in this country are chiefly negotiated by the ladies. When the terms are agreed upon, the bridegroom pays down a sum of money, a licence is taken out from the *cadi*, or proper magistrate, and the parties are married. The bargain is celebrated, as in other nations, with mirth and jollity; and the money is generally employed in furnishing the house of the young couple. They are not allowed by their law more than four wives, but they may have as many concubines as they can maintain. Accordingly, besides their wives, the wealthy Turks keep a kind of seraglio of women; but all these indulgences are sometimes insufficient to gratify their unnatural desires.

FUNERALS.] The burials of the Turks are decent. The corpse is attended by the relations, chanting passages from the Koran; and after being deposited in a mosque (for so they call their temples), they are buried in a field by the *iman* or priest, who pronounces a funeral sermon at the time of the interment. The male relations express their sorrow by alms and prayers; the women, by decking the tomb on certain days with flowers and green leaves; and in mourning for a husband they wear a particular head-dress, and leave off all finery for twelve months.

RELIGION.] The established religion is the Mahometan, so called from Mahomet the author of it; some account of whom the reader will find in the following history of Arabia, the native country of that impostor. The Turks profess to be of the sect of Omar; but these are split into as many sectaries as their neighbours the Christians. There is no ordination among their clergy; any person may be a priest that pleases to take the habit, and perform the functions of his order, and may lay down his office when he pleases. Their chief priest, or *mufi*, seems to have great power in the state.

ECCLESIASTICAL INSTITUTIONS } OF CHRISTIANS. The Turkish government having formed these into part of its finances, they are tolerated where they are most profitable; but the hardships imposed upon the Greek church are such, as must always dispose that people to favour any revolution of government. Constantinople, Jerusalem, Alexandria, and Antioch, are patriarchates; and their heads are indulged, according as they pay for their privilege, with a civil as well as an ecclesiastical authority over their votaries. The same may be said of the Nestorian and Armenian patriarchs; and every great city that can pay for the privilege, has its archbishop or bishop. All male christians pay also a capitation tax from seventeen years old to sixty, according to their stations.

LANGUAGE.] The radical languages of this empire are the Sclavonian, which seems to have been the mother-tongue of the ancient Turks; the Greek modernized, but still bearing a relation to the old language; the Arabic and the Syriac, a dialect of which is still spoken.—A specimen of the modern Greek follows in their paternoster.

Pater hemas, opios iso ees tos ouranou : hagiasthito to onoma sou : na eti he basilia sou : to thelmaq sou na genetex itzoni eg te ge, os is ton ouranin : to psfomi hemas dose hemas semoren : ka si chorafe hemos ta crimata bemon itzone, ka hemas feborafomen ekinous opou : mas adikounka uen ternes hemais is to pirasmo, alla soston hemas apo to kaxo. Amen.

LEARNING AND LEARNED MEN.] The Turks, till of late, professed a sovereign contempt for our learning. Greece, which was the native country of genius, arts, and sciences, produces at present, besides Turks, numerous bands of Christian bishops, priests, and monks, who in general are as ignorant as the Turks themselves, and are divided into various absurd sects of what they call Christianity. The education of the Turks seldom extends farther than reading the Turkish language, and the Koran, and writing a common letter. Some of them understand astronomy, so far as to calculate the time of an eclipse; but the number of these being very small, they are looked upon as extraordinary persons.

ANTIQUITIES AND CURIOSITIES, } These are so various, that they
NATURAL AND ARTIFICIAL. } have furnished matter for many voluminous publications, and others are appearing every day. These countries contained all that was rich and magnificent in architecture and sculpture; and neither the barbarity of the Turks, nor the depredations they have suffered from the Europeans, seem to have diminished their number. They are more or less perfect, according to the air, soil, or climate, in which they stand, and all of them bear deplorable marks of neglect. Many of the finest temples are converted into Turkish mosques, or Greek churches, and are more disfigured than those which remain in ruin. Amidst such a plentitude of curiosities, all that can be done here is to select some of the most striking; and I shall begin with Balbec and Palmyra, which form the pride of all antiquity.

Balbec is situated on a rising plain, between Tripoli in Syria, and Damascus, at the foot of Mount Libanus, and is the Heliopolis of Cælo Syria.

Its remains of antiquity display, according to the best judges, the boldest plan that ever was attempted in architecture. The portico of the temple of Heliopolis is inexpressibly superb, though disfigured by two Turkish towers. The hexagonal court behind it is now known only by the magnificence of its ruins. The walls were adorned with Corinthian plaisters and statues, and it opens into a quadrangular court of the same taste and grandeur. The great temple to which this leads is now so ruined, that it is known only by an entablature, supported by nine lofty columns, each consisting of three pieces joined together, by iron pins, without cement. Some of those pins, are a foot long, and a foot in diameter; and the fordid Turks are daily at work to destroy the columns for the sake of the iron. A small temple is still standing, with a pedestal of eight columns in front, and fifteen in flank, and every where richly ornamented with figures in alto relief, expressing the heads of gods, heroes, and emperors, and part of the ancient mythology. To the west of this temple is another, of a circular form, of the Corinthian and Ionic order, but disfigured with Turkish mosques and houses,

houses. The other parts of this ancient city are proportionably beautiful and stupendous.

Various have been the conjectures concerning the founders of these immense buildings. The inhabitants of Asia ascribe them to Solomon, but some make them so modern as the time of Antoninus Pius. Perhaps they are of different æras; and though that prince and his successors may have rebuilt some part of them, yet the boldness of their architecture, the beauty of their ornaments, and the stupendous execution of the whole, seem to fix their foundation to a period before the Christian æra, but without mounting to the ancient times of the Jews or Phœnicians, who probably knew little of the Greek style in building and ornamenting. Balbec is at present a little city, encompassed with a wall. The inhabitants, who are about 5000 in number, chiefly Greeks, live in or near the circular temple, in houses built out of the ancient ruins.—A free-stone quarry, in the neighbourhood, furnished the stones for the body of the temple; and one of the stones, not quite detached from the bottom of the quarry, is 70 feet long, 14 broad, and 14 feet five inches deep, and reduced to our measure is 1135 tons. A coarse white marble quarry, at a greater distance, furnished the ornamental parts.

Palmyra, or as it was called by the ancients, Tadmor in the Desert, is situated in the wilds of Arabia Petrea, about 33 degrees of N. lat. and 280 miles to the south-east of Aleppo. It is approached through a narrow plain, lined as it were with the remains of antiquity; and, opening all at once, the eye is presented with the most striking objects that are to be found in the world. The temple of the Sun lies in ruins; but the access to it is through a vast number of beautiful Corinthian columns of white marble, the grandeur and beauty of which can only be known by the plates of it, which have been drawn and published by Mr. Wood, who with his friends, paid it a visit some years ago, purposely to preserve some remembrance of such a curiosity. As those drawings, or copies from them, are now common, we must refer the reader to them, especially as he can form no very adequate ideas of the ruins from a printed relation. Superb arches, amazing columns, a colonnade extending 4000 feet in length, terminated by a noble mausoleum, temples, fine porticos, peristyles, intercolumniations, and entablatures, all of them in the highest style, and finished with the most beautiful materials, appear on all hands, but so dispersed and disjointed, that it is impossible from them to form an idea of the whole when perfect. These striking ruins are contrasted by the miserable huts of the wild Arabs, who reside in or near them.

Nothing but ocular proof could convince any man, that so superb a city, formerly 10 miles in circumference, could exist in the midst of what now are tracts of barren uninhabitable sands. Nothing however is more certain than that Palmyra was formerly the capital of a great kingdom; that it was the pride as well as the emporium of the eastern world, and that its merchants dealt with the Romans, and the western nations, for the merchandises and luxuries of India and Arabia. Its present altered situation, therefore, can be accounted for only by natural causes, which have turned the most fertile tracts into barren deserts. The Asiatics think that Palmyra, as well as Balbec, owes its original to Solomon; and in this they receive some countenance from sacred history. In profane history it is not mentioned before the time of Marc Anthony; and its most superb buildings are thought to be of the lower empire, about the time of Gallenus: Odenathus, the last king of Palmyra was highly caressed by that emperor, and even declared Au-

Augustus. His widow Zenobia reigned in great glory for some time, and Longinus, the celebrated critic was her secretary. Not being able to brook the Roman tyranny, she declared war against the emperor Aurelian, who took her prisoner, led her in triumph to Rome, and butchered her principal nobility, and among others the excellent Longinus. He afterwards destroyed her city, and massacred its inhabitants, but expended large sums out of Zenobia's treasures in repairing the temple of the sun, the majestic ruins of which have been mentioned. This it must be acknowledged is but a very lame account of that celebrated city; nor do any of the Palmyrene inscriptions reach above the Christian æra, though there can be no doubt but the city itself is of much higher antiquity. The emperor Justinian made some efforts to restore it to its ancient splendor, but without effect, for it dwindled by degrees to its present wretched state. It has been observed very justly, that its architecture and the proportions of its columns are by no means equal in purity to those of Balbec.

Nothing can be more futile, than the boasted antiquities shewn by the Greek and Armenian priests in and near Jerusalem, which is well known to have been so often razed to the ground, and re-built anew, that no scene of our Saviour's life and sufferings can be ascertained; and yet those ecclesiastics subsist by their forgeries, and pretending to guide travellers to every spot mentioned in the Old and New Testament. They are, it is true, under severe contributions to the Turks, but the trade still goes on, though much diminished in its profits. The church of the Holy Sepulchre, as it is called, said to be built by Helena, mother to Constantine the great, is still standing, and of tolerable good architecture; but its different divisions and the dispositions made round it are chiefly calculated to support the forgeries of its keepers. Other churches built by the same lady are found in Palestine: but the country is so altered in its appearance and qualities that it is one of the most despicable of any in Asia, and it is in vain for a modern traveller to attempt to trace in it any vestiges of the kingdom of David and Solomon. But let a fertile country be under the frowns of heaven, and abandoned to tyranny and wild Arabs, it will in time become a desert. Thus oppression soon thinned the delicious plains of Italy; and the noted countries of Greece and Asia the Less, once the glory of the world, are now nearly destitute of learning, arts, and people.

Mecca and Medina are curiosities only through the superstition of the Mahometans. Their buildings are mean when compared to European houses or churches; and even the temple of Mecca, in point of architecture makes but a sorry appearance, though erected on the spot where the great prophet is said to have been born. The same may be said of the mosque at Medina, where that impostor was buried: so that the vast sums spent yearly by Mahometan pilgrims, in visiting those places, are undoubtedly converted to temporal uses. I shall not amuse the reader with any accounts of the spot which is said to have formed Paradise, and to have been situated between the rivers Euphrates and Tigris, where there are some tracts which undoubtedly deserve that name. The different ruins, some of them inexpressibly magnificent, that are to be found in those immense regions, cannot be appropriated with any certainty to their original founder: so great is the ignorance in which they have been buried for these thousand years past. It is indeed easy to pronounce whether the style of their buildings be Greek, Roman, or Saracen; but all other information must come from their inscriptions.

The

The neighbourhood of Smyrna (now called *İzmir*), contains many valuable antiquities. The same may be said of Aleppo, and a number of other places celebrated in antiquity, and now known only by geographical observations. The seat of Old Troy cannot be distinguished by the smallest vestige, and is known only by its being opposite to the isle of Tenedos, and the name of a brook, which the poets magnified into a wonderful river. A temple of marble built in honour of Augustus Cæsar, at Midos in Caria, and a few structures of the same kind, in the neighbourhood, are among the antiquities that are still entire. Three theatres of white marble, and a noble circus near Laodicea, now Latichea, have suffered very little from time or barbarism; and some travellers think that they discern the ruins of the celebrated temple of Diana near Ephesus.

CHIEF CITIES, MOSQUES, } These are very numerous, and at the
AND OTHER BUILDINGS } same time very insignificant, because they have little or no trade, and are greatly decayed from their ancient grandeur. Scanderoon stands upon the site of Old Alexandria, but it is now almost depopulated. Superb remains of antiquity are found in its neighbourhood. Aleppo, however, preserves a respectable rank among the cities of the Asiatic Turkey. It is still the capital of Syria, and is superior in its buildings and conveniences to most of the Turkish cities. Its houses, as usual in the East, consist of a large court, with a dead wall to the street, an arcade or piazza running round it, paved with marble, and an elegant fountain of the same in the middle. Aleppo and its suburbs are seven miles in compass, standing on eight small hills, on the highest of which the citadel or castle is erected, but of no great strength. An old wall and a broad ditch, now in many places turned into gardens, surround the city, which contains 235,000 inhabitants, of whom 30,000 are Christians and 5000 are Jews. It is furnished with most of the conveniences of life, excepting good water within the walls, and even that is supplied by an aqueduct distant about four miles, said to have been erected by the empress Helena. The streets are narrow, but well paved with large square stones, and are kept very clean. Their gardens are pleasant, being laid out in vineyards, olive, fig, and pistachio trees; but the country round is rough and barren. Foreign merchants are numerous here, and transact their business in caravanferas or large square buildings, containing their warehouses, lodging rooms, and counting houses. This city abounds in neat, and some of them magnificent mosques, public bagnios, which are very refreshing, and bazars, or market-places, which are formed into long, narrow, arched or covered streets, with little shops, as in other parts of the East. Their coffee is excellent, and considered by the Turks as a high luxury; and their sweetmeats and fruits are delicious. European merchants live here in greater splendor and safety than in any other city of the Turkish empire, which is owing to particular espulations with the Porte. Coaches or carriages are not used here, but persons of quality ride on horseback with a number of servants before them, according to their rank. The English, French, and Dutch, have consuls who are much respected, and appear abroad, the English especially, with marks of distinction.

The heat of the country makes it convenient for the inhabitants to sleep in the open air, here, over all Arabia, and many other parts of the East, for which reason their houses are flat on the top. This practice accounts, for the early acquaintance those nations had with astronomy, and the motions of the heavenly bodies, and explains some parts of the holy scripture. As

the Turks are very uniform in their way of living, this account of Aleppo may give the reader an idea of the other Turkish cities.

Bagdad, built upon the Tigris, not far it is supposed from the site of ancient Babylon, is the capital of the ancient Chaldea, and was the metropolis of the caliphate, under the Saracens, in the twelfth century. This city retains but few marks of its ancient grandeur. It is in the form of an irregular square, and rudely fortified, but the convenience of its situation renders it one of the seats of the Turkish government, and it has still a considerable trade, being annually visited by the Symna, Aleppo, and western caravans. The houses of Bagdad are generally large, built of brick and cement, and arched over to admit the freer circulation of the air; many of their windows are made of elegant Venetian glass, and the ceilings ornamented with chequered work. Most of the houses have also a court-yard before them, in the middle of which is a small plantation of orange trees. The number of houses is computed at 80,000, each of which pay an annual tribute to the Bashaw, which is calculated to produce 300,000l. sterling. Their bazars, in which their tradesmen have their shops, are tolerably handsome, large, and extensive, filled with shops of all kinds of merchandises, to the number of 12,000. These were erected by the Persians, when they were in possession of the place, as were also their bagnios, and almost every thing here worthy the notice of a traveller. In this city are five mosques, two of which are well built, and have handsome domes, covered with varnished tiles of several colours. Two chapels are permitted for those of the Romish and Greek persuasions. On the north-west corner of the city stands the castle, which is of white stone, and commands the river, consisting of curtains, and bastions, on which some large cannon are mounted, with two mortars in each bastion; but in the year 1779 they were so honey-combed and bad, as to be supposed not to support one firing. Below the castle, by the water-side, is the palace of the Turkish governor; and there are several summer-houses on the river, which make a fine appearance. The Arabians, who inhabited this city under the caliphs, were remarkable for the purity and elegance of their dialect.

Ancient Assyria is now called the Turkish Curdistan, though part of it is subject to the Persians. The capital is Curdistan, the ancient Nineveh, being now a heap of ruins. Curdistan is said to be for the most part cut out of a mountain, and is the residence of a viceroi, or beglerbeg. Orsa, formerly Edessa, is the capital of the fine province of Mesopotamia. It is now a mean place, and chiefly supported by a manufacture of Turkey leather. Mousul is also in the same province, a large place situated on the west shore of the Tigris, opposite where Nineveh formerly stood.

Georgia, or Gurgistan, now no longer subject to the Turks, is chiefly peopled by Christians, a brave, warlike race of men. Their capital, Teflis, is a handsome city, and makes a fine appearance; all the houses are of stone, neat and clean, with flat roofs, which serve as walks for the women, but the streets are dirty and narrow; its inhabitants being about 30,000. It is situated at the foot of a mountain, by the side of the river Kur, and is surrounded by strong walls; except on the side of the river. It has a large fortress on the declivity of the mountain, which is a place of refuge for criminals and debtors, and the garrison consists of native Persians. There are thirteen Greek churches in Teflis, seven Armenian, and one Roman Catholic church; the Mahometans who are here have no mosques. In the neighbourhood of the city are many pleasant houses, and fine gardens. The Georgians in general are by some travellers said to be the

handsomest people in the world; and some think that they early received the practice of inoculation for the small-pox. They make no scruple of selling and drinking wines in their capital, and other towns; and their valour has procured them many distinguishing liberties and privileges. Lately they have formed an alliance with Russia, under the brave prince Heraclius; as hath the czar or prince Solomon, sovereign of Immetretta, a district between the Caspian and Black Seas, who is distinguished from his subjects (all of the Greek religion) by riding on an ass, and wearing boots.

The ancient cities of Damascus, Tyre, and Sidon, still retain part of their former trade. Damascus is called Sham, and the approach to it by the river is expressively beautiful. It contains a fine mosque, which was formerly a Christian church. It still is famous for its steel works, such as sword blades, knives, and the like; the excellent temper of which is said to be owing to a quality in the water. The inhabitants manufacture also those beautiful silks, called damasks, from their city, and carry on a considerable traffic in raw and worked silk, rose-water, extracted from the famous damask roses, fruits, and wine. The neighbourhood of this city is still beautiful, especially to the Turks, who delight in verdure and gardens. Sidon, now Said, which likewise lies within the ancient Phœnicia, has still some trade, and a tolerable harbour.

Tyre, now called Sur, about 20 miles distant from Sidon, so famous formerly for its rich dye, is now inhabited by scarcely any but a few miserable fishermen, who live in the ruins of its ancient grandeur. There are strong walls on the land side, of stone, eighteen feet high, and seven broad. The circumference of the place is not more than a mile and a half, and Christians and Mahometans make up the number of about 500. Some of the ruins of ancient Tyre are still visible. The pavements of the old city, Mr. Bruce tells us he saw, and observes that they were $7\frac{1}{2}$ feet lower than the ground upon which the present city stands. Passing by Tyre (says our author, who deserves much praise for some happy elucidations of scripture) I came to be a mournful witness of the truth of that prophecy, That Tyre the Queen of Nations should be a rock for fishers to dry their nets on*. Two wretched fishermen, with miserable nets, having just given over their occupation with very little success, I engaged them, at the expence of their nets, to drag in those places, where they said shell-fish might be caught; in hopes to have brought out one of the famous purple-fish. I did not succeed, but in this I was, I believe, as lucky as the old fishers had ever been. The purple-fish at Tyre seems to have been only a concealment of their knowledge of cochineal, as, had they depended upon the fish for their dye, if the whole city of Tyre applied to nothing else but fishing, they would not have coloured twenty yards of cloth in a year †.

Natolia, or Asia Minor, comprehending the ancient provinces of Lydia, Pamphylia, Pisidia, Lycaonia, Cilicia, Cappadocia, and Pontus, or Amasia; all of them territories celebrated in the Greek and Roman history, are now, through the Turkish indolence and tyranny, either forsaken, or a theatre of ruins. The sites of ancient cities are still discernible; and so luxurious is nature in those countries, that in many places she triumphs over her forlorn condition. The selfish Turks cultivate no more land than maintains themselves, and their gardens and summer-houses fill up the circuit of their most flourishing cities. The most judicious travellers, upon an at-

tentive survey of those countries, fully vindicate all that has been said by sacred and profane writers of their beauty, strength, fertility, and population. Even Palestine and Judaea, the most despicable at present of all those countries, lie buried within the luxuries of their own soil. The Turks seem particularly fond of representing it in the most dreadful colours, and have formed a thousand falsehoods concerning it, which being artfully propagated by some among ourselves, have imposed upon weak Christians.

Whether those countries of Asia could ever be restored to their ancient grandeur, trade, and population, may be a question with some; but I apprehend that it would now be impossible (let the Turkish government be ever so beneficent) to divert commerce, without which all attempts of that kind must be feeble, from its European channels. There can, however, be no question, that a government less brutal and bigoted than that of the Turks, might make the natives as well as a happy people within themselves. The misfortune is, that the Greeks, Armenians, and other sects of Christians there, partake but too much of the Turkish stupidity. Though they are not suffered to wear white turbans, or to ride on horseback, and are subjected to a thousand indignities and miseries, and are even, in many places, far more numerous than their oppressors, yet so abject is their spirit, that they make no efforts for their own deliverance, and they are contented under all their mortifications. If they are less indolent than their oppressors, it is because they must otherwise starve; and they dare not enjoy even the property they acquire, lest it should be discovered to their tyrants, who would consider it as their own.

COMMERCE AND MANUFACTURES.] These objects are little attended to in the Turkish dominions. The nature of their government destroys that happy security which is the mother of arts, industry, and commerce; and such is the debasement of the human mind, when borne down by tyranny and oppression, that all the great advantages of commerce, which nature has as it were thrown under the feet of the inhabitants by their situation, are here totally neglected. The advantages of Tyre, Sidon, Alexandria, and all those countries which carried on the commerce of the ancient world, are overlooked. They command the navigation of the Red Sea, which opens a communication to the southern ocean, and presents them with all the riches of the Indies. Whoever looks on a map of Turkey, must admire the situation of their capital, upon a narrow strait that separates Europe from Asia, and communicates on the south by the Mediterranean sea, thereby opening a passage to all the European nations as well as the coast of Africa. The same strait, communicating northwards with the Black Sea, opens a passage, by means of the Danube and other great rivers, into the interior parts of Germany, Poland, and Russia.

4 Z 2

* The late reverend Dr. Shaw, professor of Greek at Oxford, who seems to have examined that country with an uncommon degree of accuracy, and was qualified by the soundest philosophy to make the most just observations, says, that were the Holy Land as well cultivated as in former times, it would be more fertile than the very best parts of Syria and Phoenicia, because the soil is generally much richer, and, every thing considered, yields larger crops. Therefore the barrenness, says he, of which some authors complain, does not proceed from the natural unfruitfulness of the country, but from the want of inhabitants, the indolence which prevails among the few who possess it, and the perpetual disorders and depredations of the petty princes who share this fine country. Indeed the inhabitants can have but little inclination to cultivate the earth. "In Palestine, says Mr. Wood, I have often seen the husbandman sowing, accompanied by an armed friend, to prevent his being robbed of the seed". And, after all, whoever sows, is uncertain whether he shall ever reap the harvest.

secretary of state, and the aga of the janizaries, are the most considerable. These, as well as the mufti, or high priest, the bashaws, or governors of provinces, the civil judges, and many others, are commonly raised, by their application and assiduity, from the meanest stations in life, and are often the children of Tartar or Christian slaves taken in war. Tutors in the school of adversity, and arriving at pre-eminence through a thousand difficulties and dangers, these men are generally as distinguished for abilities, as deficient in virtue. They possess all the dissimulation, intrigue, and corruption, which often accompanies ambition in an humble rank, and they have a farther reason for plundering the people, because they are uncertain how long they may possess the dignities to which they are arrived. The administration of justice, therefore, is extremely corrupt over the whole empire; but this proceeds from the manners of the judges, and not from the laws of the kingdom, which are founded upon very equitable principles.

[REVENUES.] The riches drawn from the various provinces of this empire, must be immense. The revenues arise from the customs, and a variety of taxes which fall chiefly on the Christians, and other subjects, not of the Mahometan religion. The rich pay a capitation tax of 30 shillings a year; tradesmen 15 shillings, and common labourers 6 shillings and ten-pence half-penny. Another branch of the revenue arises from the annual tribute paid by the Tartars, and other nations bordering upon Turkey, but governed by their own princes and laws. All these, however, are trifling, when compared with the vast sums extorted from the governors of provinces, and officers of state, under the name of *resents*. These harpies, to indemnify themselves, as we have already observed, exercise every species of oppression that their avarice can suggest, till, becoming wealthy from the vitals of the countries and people they are sent to govern, their riches frequently give rise to a pretended suspicion of disloyalty or misconduct, and the whole fortune of the offender devolves to the crown. The devoted victim is seldom acquainted with the nature of the offence, or the names of his accusers; but without giving him the least opportunity of making a defence, an officer is dispatched, with an imperial decree, to take off his head. The unhappy basha receives it with the highest respect, putting it on his head, and after he has read it, says, "*The will of God and the emperor be done*," or some such expression, testifying his entire resignation to the will of his prince. Then he takes the silken cord, which the officer has ready in his bosom, and having tied it about his own neck, and said a short prayer, the officer's servants throw him on the floor, and, drawing the cord taut, soon dispatch him; after which his head is cut off, and carried to the court.

[FORCES.] The militia of the Turkish empire is of two sorts: the first have certain lands appointed for their maintenance, and the other is paid out of the treasury. Those that have certain lands, amount to about 268,000 troopers, effective men. Besides these, there are also certain auxiliary forces raised by the tributary countries of this empire; as the Tartars, Walachians, Moldavians, and till of late, the Georgians, who are commanded by their respective princes. The Khan of the Crim Tartars, before his country was subjected to Russia, was obliged to furnish 100,000 men, and to serve in person, when the grand signior took the field. In every war, besides the above forces, there are great numbers of volunteers, who live at their own charge, in expectation of succeeding the officers. These adventurers do not only promise themselves an estate if they survive, but are taught, that if they die in war against the Christians,

tians, they shall go immediately to paradise. The forces which receive their pay from the treasury, are called the *spahis*, or horse-guards, and are in number about 12,000; and the *janizaries*, or foot-guards, who are esteemed the best soldiers in the Turkish armies, and on them they principally depend in an engagement. These amount to about 25,000 men, who are quartered in and near Constantinople; They frequently grow mutinous, and have proceeded so far sometimes as to depose the sultan. They are educated in the *seraglio*, and trained up to the exercise of arms from their infancy; and there are not less than 100,000 foot soldiers, scattered over every province of the empire, who procure themselves to be registered in this body, to enjoy the privileges of *janizaries*, which are very great, being subject to no jurisdiction but that of their *aga*, or chief commander.

ARMS AND TITLES.] The emperor's titles are swelled with all the pomp of eastern magnificence. He is styled by his subjects, *the shadow of God, a God on earth, brother to the Sun and Moon, Disposer of all earthly Crowns, &c.* The grand signior's arms are, vert, a crescent argent, crested with a turban charged with three black plumes of heron's quills, with this motto, *Donec totum impleat orbem.*

COURT AND SERAGLIO.] Great care is taken in the education of the youths who are designed for the state, the army, or the navy; but they are seldom preferred till about 40 years of age, and they rise by their merit. They are generally the children of Christian parents, either taken in war, purchased, or presents from their viceroys and governors of distant provinces, the most beautiful, well made, and sprightly children that can be met with, and are always reviewed and approved of by the grand signior, before they are sent to the colleges or seminaries, where they are educated for employments according to their genius or abilities.

The ladies of the *seraglio* are a collection of beautiful young women, chiefly sent as presents from the provinces and the Greek islands, most of them the children of Christian parents. The brave prince Heraclius, hath for some years past abolished the infamous tribute of children of both sexes, which Georgia formerly paid every year to the Porte. The number of women in the harem, depends on the taste of the reigning monarch. Sultan Selim had 2000. Achmet had but 300, and the present sultan hath nearly 1600. On their admission they are committed to the care of old ladies, taught to sew and embroider, music, dancing, and other accomplishments, and furnished with the richest clothes and ornaments. They all sleep in separate beds, and between every fifth there is a preceptress. Their chief governess is called *Katon Kiaja*, or governess of the noble young ladies. There is not one servant among them, for they are obliged to wait on one another by rotation; the last that is entered serves her who preceded her, and herself. These ladies are scarcely ever suffered to go abroad, except when the grand-signior removes from one place to another, when a troop of black eunuchs conveys them to the boats; which are inclosed with lattices and linen curtains; and when they go by land they are put into close chariots, and signals are made at certain distances, to give notice that none approach the roads through which they march. Among the emperor's attendants are a number of mutes, who act and converse by signs with great quickness, and some dwarfs who are exhibited for the diversion of his majesty.

ORIGIN AND PROGRESS OF THE TURKS.] It has been the fate of the more southern and fertile parts of Asia, at different periods, to be conquered by that warlike and hardy race of men, who inhabit the vast country, known to the ancients by the name of Scythia, and among the moderns by that of

Tartary

Tartary. One tribe of these people, called Turks or Turcomans, which name signifies *wanderers*, extended its conquests under various leaders, and during several centuries, from the shore of the Caspian to the strait of the Dardanelles. Being long resident in the capacity of body guards, about the courts of the Saracens, they embraced the doctrine of Mahomet, and acted for a long time as mercenaries in the armies of contending princes. Their chief residence was in the neighbourhood of mount Caucasus, from whence they removed to Armenia Major, and after being employed as mercenaries by the sultans of Persia, they seized that kingdom, about the year 1037, and spread their ravages over all the neighbouring countries. Bound by their religion to make converts to Mahometanism, they never were without a pretence for invading and ravaging the dominions of the Greek emperors, and were sometimes commanded by very able generals. Upon the declension of the caliphate or empire of the Saracens, they made themselves masters of Palestine; and the visiting the Holy City of Jerusalem, being then part of the Christian exercises, in which they had been tolerated by the Saracens, the turks laid the European pilgrims under such heavy contributions, and exercised such horrible cruelties upon the Christian inhabitants of the country, as gave rise to the famous Crusades, which we have mentioned more fully in the Introduction.

It unfortunately happened, that the Greek emperors were generally more jealous of the progress of the Christians than the Turks; and though, after oceans of blood were spilt, a Christian kingdom was erected at Jerusalem under Godfrey of Bouillon, neither he nor his successors were possessed of any real power of maintaining it. The Turks about the year 1099, had extended their dominions on every side, and possessed themselves, under Othman, of some of the finest provinces in Asia, of Nice, and Prusa in Bithynia, which Othman made his capital, and, as it were, first embodied them into a nation; hence they took the name of Othmans from that leader; the appellation of Turks, as it signifies in the original, wanderers, or banished men, being considered by them as a term of reproach. Othman, is to be styled the founder of the Turkish empire, and was succeeded by a race of the most warlike princes that are mentioned in history. About the year 1357, they passed the Hellespont, and got a footing in Europe, and Amurath settled the seat of his empire at Adrianople, which he took in the year 1360: under him the order of Janizaries was established. Such were their conquests, that Bajazet I. after conquering Bulgaria, and defeating the Greek emperor Sigismund, laid siege to Constantinople, in hopes of subjecting all the Greek empire. His greatness and insolence provoked Tamerlane, a Tartarian prince, who was just then returned from his eastern conquests, to declare war against him. A decisive battle was fought between those rival conquerors, in Natolia, in the plain where Pompey defeated Mithridates, when Bajazet's army was cut in pieces, and he himself taken prisoner, and shut up in an iron cage, where he ended his life.

The successors of Tamerlane, by declaring war against one another, left the Turks more powerful than ever: and though their career was checked by the valour of the Venetians, Hungarians, and the famous Scanderbeg, a prince of Epirus, they gradually reduced the dominions of the Greek emperors; and, after a long siege, Mahomet II. took Constantinople in 1453. Thus, after an existence of ten centuries, from its first commencement under Constantine the Great, ended the Greek empire; an event which had been long foreseen, and was owing to many causes; the chief was the total degeneracy

generacy of the Greek emperors themselves, their courts and families; and the dislike their subjects had to the popes, and the western church, one of the patriarchs declaring publicly to a Romish legate, "that he would rather see a turban than the pope's tiara upon the great altar of Constantinople." But as the Turks, when they extended their conquests, did not exterminate, but reduced the nation, to subjection, the remains of the ancient Greeks still exist, as we have already observed, particularly in Constantinople, and the neighbouring islands, where, though under grievous oppressions, they profess Christianity under their own patriarchs of Constantinople, Alexandria, Antioch, and Jerusalem; and the Armenians have three patriarchs, who are richer than those of the Greek church, on account of their people being richer and more conversant in trade. It is said that the modern Greeks, though pining under the tyrannical yoke of the Turkish government, still preserve somewhat of the exterior appearance, though nothing of the internal principles which distinguished their ancestors.

The conquest of Constantinople was followed by the submission of all Greece; and from this time the Turks have been looked upon as an European power.

Mahomet died in 1481, and was succeeded by Bajazet II. who carried on war against the Hungarians and Venetians, as well as the Persians and Egyptians. Bajazet falling ill of the gout, became indolent, was harassed by family differences, and at last, by order of his second son, Selim, he was poisoned by a Jew physician. Selim afterwards ordered his eldest brother, Achmet, to be strangled, with many other princes of the Othman race. He defeated the Persians and the prince of Mount Taurus; but being unable to penetrate into Persia, he turned his arms against Egypt, which, after many bloody battles, he annexed to his own dominions, in the year 1517, as he did Aleppo, Antioch, Tripoli, Damascus, Gaza, and many other towns.

He was succeeded, in 1520, by his son, Soliman the Magnificent; who, taking advantage of the differences which prevailed among the Christian powers, took Rhodes, and drove the knights from that Island to Malta, which was given them by the emperor Charles V. The reign of Soliman, after this, was a continual war with the Christian powers, and generally successful, both by sea and land. He took Buda the metropolis of Hungary, at that time, and Belgrade, and carried off near 200,000 captives, A. D. 1526, and two years afterwards advanced into Austria and besieged Vienna, but retired on the approach of Charles V. He miscarried also in an attempt he made to take the isle of Malta. This Soliman is looked upon as the greatest prince that ever filled the throne of Othman.

He was succeeded, in 1566, by his son Selim II. In his reign, the Turkish marine received an irrecoverable blow from the Christians, in the battle of Lepanto. This defeat might have proved fatal to the Turkish power, had the blow been pursued by the Christians, especially the Spaniards. Selim, however, took Cyprus from the Venetians, and Tunis in Africa, from the Moors; he was succeeded, in 1575, by his son Amurath III. who forced the Persians to cede Tauris, Teflis, and many other cities, to the Turks. He likewise took the important fortress of Raab, in Hungary; and in 1593, he was succeeded by Mahomet III. The memory of this prince is distinguished by his ordering nineteen of his brothers to be strangled, and ten of his father's concubines, who were supposed to be pregnant, to be thrown into the sea. He was often unsuccessful in his wars with the Christians, and died of the plague in 1604. Though his successor Achmet was beaten by the Persians, yet he forced the Austrians to a treaty in 1606, and to consent that

he should keep what he was possessed of in Hungary. Osman, a prince of great spirit, but no more than sixteen years of age, being unsuccessful against the Poles, was put to death by the janizaries, whose power he intended to have reduced. Morad IV. succeeded, in 1623, and took Bagdad from the Persians. His brother, Ibrahim, succeeded him in 1640, a worthless inactive prince, and strangled by the janizaries in 1648. His successor, Mahomet IV. was excellently well served by his grand vizier, Cuperli. He took Candia from the Venetians, after it had been besieged for thirty years. This conquest cost the Venetians, and their allies, 80,000 men, and the Turks, it is said, 180,000. A bloody war succeeded between the Imperialists and the Turks, in which the latter were so successful, that they laid siege to Vienna, but were forced (as has been already mentioned) to raise it with great loss, by John Sobieski, king of Poland, and other Christian generals. Mahomet was, in 1687, shut up in prison by his subjects, and succeeded by his brother, Soliman II.

The Turks continued unsuccessful in their wars during this reign, and that of his brother and successor, Achmet II. but Mustapha II. who mounted the throne in 1694, headed his armies in person, and after some brisk campaigns, he was defeated by prince Eugene; and the peace of Carlowitz, between the Imperialists and Turks, was concluded in 1709. Soon after, Mustapha was deposed, his musti was beheaded, and his brother Achmet III. mounted the throne. He was the prince who gave shelter at Bender, to Charles XII. of Sweden; and ended a war with the Russians, by a peace concluded at Pruthi. When the Russian army was surrounded without hope of escape, the Czarina inclined the grand vizier to the peace, by a present of all the money, plate, and jewels that were in the army, but the Russians delivered up to the Turks, Asoph, Kaminnieck, and Paiganrog, and agreed to evacuate Poland. He had afterwards a war with the Venetians, which alarmed all the Christian powers. The scene of action was translated to Hungary, where the Imperial general, prince Eugene, gave so many repeated defeats to the infidels, that they were forced to conclude a disgraceful peace at Passarowitz, in 1718. An unfortunate war with the Persians, under Kouli Khan, succeeding, the populace demanded the heads of the vizier, the chief admiral, and secretary, which were accordingly struck off; but the sultan also was deposed, and Mahomet V. advanced to the throne. He was unsuccessful in his wars with Kouli Khan, and at last obliged to recognise that usurper as king of Persia. He was, after that, engaged in a war with the Imperialists and Russians; against the former he was victorious; but the successes of the latter, which threatened Constantinople itself, forced him to agree to a hasty treaty with the emperor, and after that, another with the Russians, which was greatly to his advantage. Mahomet died in 1754.

He was succeeded by his brother Osman III. who died in 1757, and was succeeded by his brother, Mustapha III. who died on the 21st of January, 1774, whilst engaged in an unsuccessful war with the Russians, of which some account has been already given in the history of that country. In the course of this war, a considerable Russian fleet was fitted out, which set sail from the Baltic, with a view of shaking the remote parts of the Archipelago. This fleet having arrived at Minorca, departed from thence in the beginning of February 1770, and shaped its course for the Morea. Count Orlov, having debarked such land forces as he had with him at Maina, which lies a little to the westward of cape Metapan, and about 50 miles to the south west of Mithra, the ancient Sparta; the Mainotes, the descendants of the Lacedæmonians, and who still possessed the country of their ancestors, under subjection to the grand signior, immediately flew to their arms in every quarter, and

joined the Russians by thousands, from their aversion to the tyranny of the Turks. The other Greeks immediately followed their example, or rather only waited to hear of the arrival of the Russians, to do what they had long intended; and the whole Morea seemed every where in motion. The open country was quickly over-run, and Mistra, Arcadia, and several other places, as speedily taken, while the Russian ships, that had been separated, or that put into Italy, arrived successively, and landed their men in different quarters, where every small detachment soon swelled into a little army, and the Turks were every where attacked or intercepted. In the mean time, the Greeks gave the utmost loose to their revenge, and every where slaughtered the Turks without mercy; and the rage and fury with which the inhabitants of the continent were seized, extended itself to the islands, where also the Turks were massacred in great numbers. They were, indeed, unable to make head against the Russians and Greeks in the field: their only protection was found within the fortresses. The malcontents had so much increased since the first debarkation of the Russians, that they invested Napoli de Romania, Corinth, and the castle of Patras, with several other places of less note. But whilst they were employed in these enterprizes, an army of thirty thousand men, composed chiefly of Albanians and Epirotes, entered the Morea, commanded by Seraskier, Basha of Bosnia. This Turkish general recovered all the northern part of the peninsula, as soon as he appeared in it; and all the Greeks that were found in arms, or out of their villages, were instantly put to death. The Russians were now driven back to their ships; but about the same time, another Russian squadron, commanded by admiral Elphinstone, arrived from England to reinforce count Orlow's armament. The Turkish fleet also appeared, and an obstinate engagement was fought in the channel of Scio, which divides that island from Natolia, or the Lesser Asia. The Turkish fleet was considerably superior in force, consisting of fifteen ships of the line, from sixty to ninety guns, besides a number of chebeques and galleys, amounting in the whole to near thirty sail; the Russians had only ten ships of the line, and five frigates. Some of the ships engaged with great resolution, while others on both sides found various causes for not approaching sufficiently near. But Spirito, a Russian admiral, encountered the captain pacha, in the Sultana, of ninety guns, yard-arm and yard-arm; they fought with the greatest fury, and at length run so close, that they locked themselves together with grappling-irons and other tackling. In this situation, the Russians, by throwing hand-granades from the tops, set the Turkish ship on fire, and as they could not now be disentangled, both ships were in a little time equally in flames. Thus dreadfully circumstanced, without a possibility of success, they both at length blew up with a most terrible explosion. The commanders and principal officers on both sides were mostly saved; but the crews were almost totally lost. The dreadful fate of these ships, as well as the danger to those that were near them, produced a kind of pause on both sides; after which the action was renewed, and continued till night without any material advantage on either side. When it became dark, the Turkish fleet cut their cables, and run into a bay on the coast of Natolia: the Russians surrounded them thus closely pent up, and in the night some fire-ships were successfully conveyed among the Turkish fleet; by the inepid behaviour of lieutenant Dugdall, an Englishman in the Russian service, who, though abandoned by his crew, himself directed the operations of the fire-ships. The fire took place so effectually, that in five hours the whole fleet, except one man of war and a few galleys that were towed off by the Russians, was totally destroyed; after which they entered the harbour, and bombarded and cannonaded the town, and a castle that protected it, with

such success, that a shot having blown up the powder magazine in the latter, both were reduced to a heap of rubbish. Thus was there scarcely a vestige left at nine o'clock, of a town, a castle, and a fine fleet, which had been all in existence at one the same morning.

Some of the principal military transactions by land, in the war between Russia and Turkey, having been already noticed in our account of the former empire we shall here only add, that after a most unfortunate war on the side of the Turks, peace was at length concluded between them and the Russians, on the 21st of July, 1774, a few months after the accession of Achmet IV. The emperor, Mustapha III. left a son, then only in his 13th year; but as he was too young to manage the reins of government in the then critical situation of the Turkish affairs, Mustapha appointed his brother, the late emperor, to succeed him in the throne: and to this prince, under the strongest terms of recommendation, he confided the care of his infant son.

The perseverance of the Turks, supplied by their numerous Asiatic armies, and their implicit submission to their officers, rather than an excellency in military discipline or courage in war, have been the great springs of those successes which have rendered their empire so formidable. The extension, as well as duration of their empire, may indeed be in some measure owing to the military institution of the Janizaries, a corps originally composed of children of such Christian parents as could not pay their taxes. These being collected together, were formed to the exercise of arms under the eyes of their officers in the seraglio. They were generally in number about 40,000; and so excellent was their discipline, that they were deemed to be invincible, and they still continue the flower of the Turkish armies; but the Ottoman power is in a declining state. The political state of Europe, and the jealousies that subsist among its princes, is now the surest basis of this empire, and the principal reason why the finest provinces in the world are suffered to remain any longer in the possession of these haughty infidels.

Notwithstanding the peace which was established in 1774, between Russia and the Porte, various sources of discord having been left open, very little tranquillity could subsist between them. For an account of these we refer our readers to our historical narrative of the former empire. Towards the latter end of the year 1786, the Turks seem to have adopted a regular system of indirect hostility against Russia, who was continually making such encroachments, as made the Turks resolve to tempt again the fortune of war; Searce had the empress returned from the splendid journey which she made to Cherfon, before a declaration of Turkish hostilities was announced at Petersburg. What part the emperor of Germany would take in this war was not at first known. The capriciousness of his character kept the spirit of curiosity in suspense for some little time, but he soon declared himself determined to support all the claims which Russia had upon the Porte.

Instead of being disheartened at the invincibility of the confederacy that had broken out against them, the Turks applied themselves with redoubled ardour to prepare for resistance. But an event that seems greatly to have contributed to the bad success, experienced by the crescent in the year 1789, was the death of Achmet the Fourth, grand signior, on the 7th of April.

This prince, if we make suitable allowances for the disadvantages under which he laboured, as a despotic monarch and the prejudices of his country, may be allowed to possess some claim to toleration. He filled the throne of Constantinople without reflecting disgrace upon human nature. His temper

appears to have been mild and humane. He not only permitted Selim his nephew, son of the late emperor, to live, but even publicly acknowledged him for his successor. His reign was not stained with so many arbitrary murders, as those of his predecessors, nor did he think it at all necessary that a disgraced minister should part at once with his office and his life. He suffered his countrymen to improve by the arts and military discipline of Europe. Yssof, his prime minister, during the three last years of his life, though by no means consistently great, must be allowed to deserve our applause; and will be better known to posterity as the patron of the Turkish translation of the Encyclopédie, than as the victorious and skilful rival of the Austrian arms in the Bannat of Transylvania.

Achmet died at the unenterprising age of sixty-four, and Selim the Third succeeded at twenty-eight. In the vigour of youth he thought it necessary to distinguish himself by something extraordinary, and at first purposed to put himself at the head of his forces. He was easily, as might be expected from his effeminate education, dissuaded from this rash and ridiculous project. But he conceived that at least it became him to disquietance the ministers of his predecessor, to confound their plans, and reverse all their proceedings. These ministers had acquired in some degree the confidence of those who acted under their command; and it appeared in the sequel that the fantastic splendour of a new and juvenile sovereign, could not compensate for the capricious and arbitrary changes with which his accession was accompanied.

In the year 1788 Choczim surrendered to the arms of Russia, as will be found in the history of that country and Ockzacow was taken by storm; on the 12th of September, 1789, the Austrian forces sat down before Belgrade, and with that good fortune which seemed almost constantly to attend their present commander marshal Laudohn. The place, together with its numerous garrison, surrendered, after a vigorous resistance, on the 8th of October. The rest of the campaign was little else than a succession of the most important successes; and a circumstance that did not little contribute to this, was the system adopted by the Austrians and Russians, of suffering the Turkish troops to march out of the several places they garrisoned without molestation. Bucharest, the capital of Walachia, fell without opposition into the hands of prince Cobourg; while Akerman on the Black Sea was reduced by the Russians; and Bender surrendered to prince Potemkin, not without suspicion of sinister practices, on the 15th of November. One only check presented itself to the allied arms. The garrison of Orsova displayed the most inflexible constancy, and marshal Laudohn was obliged to raise the siege of this place in the middle of December, after having sat down before it for a period of six weeks. In a short time after the siege was renewed, and Orsova was reduced the 16th of April, 1790.

After the reduction of Orsova, the war was carried on with languor on the part of Austria; and in the month of June a conference was agreed upon at Reichenbach, at which the ministers of Prussia, Austria, England, and the United Provinces assisted, and which also an envoy from Poland was occasionally present. After a negotiation, which continued till the 17th of August, it was agreed that a peace should be concluded between the king of Hungary and the Ottoman Porte; that the basis of this treaty should be a general surrender of all the conquests made by the former, retaining only Choczim as a security till the Porte should accede to the terms of the agreement, when it was also to be restored. On the other hand, the king of Prussia gave up the Belgic provinces, and even promised his assistance in reducing them to the Austrian dominions.

The king of Prussia was less successful in his mediation with Russia. Ca-

therine had not, like Leopold, an imperial crown at stake, which, unsubstantial as it is, has always its charms with those who are educated in the habitual adoration of rank and dignities. Her conquests also, on the side of Turkey, were too important to be easily relinquished; and she considered her dignity attacked by the insolent style of Prussian mediation. The substance of her answer to the Prussian memorial was therefore. "That the empress of Russia would make peace and war with whom she pleased, without the interference of any foreign power."

The campaign of 1791 opened, on the part of Russia, with the taking of Maczin, on the 4th of April, by prince Gallitzin; and in a subsequent victory, on the 12th, by the same general, in the neighbourhood of Brailow, the Turks lost not less than 4000 men, and upwards of 100 officers, besides many pieces of cannon. On the 14th the Russian arms experienced a check, by which they lost about 700 men, and were obliged to relinquish the intention of besieging Brailow. After reinforcing this place, the vizir proceeded to the banks of the Danube near Silistria; and by means of a bridge, which he threw across the river, his advanced posts were enabled to make incursions on the opposite side. The ability of the vizir, and the valour of the Turks, were however exerted in vain against the discipline and experience of European armies. In the month of June, 15,000 Turks were defeated by a party of cavalry under general Kutusow. On the 3d of July the fortrefs of Anape was taken by general Gudowitsch, and the garrison, to the amount of 6000 men, made prisoners. This event was followed on the 9th of the same month by a signal victory which prince Repnin obtained near Maczin over a body of 70,000, the flower of the Turkish army. The Ottomans left upwards of 4000 dead upon the field of battle, and lost their entire camp equipage, colours, and 30 pieces of cannon. The Russians are said to have lost only 150 men killed, and between 2 and 300 wounded.

While the war was thus vigorously carried on, the mediating powers were not inactive. Great Britain and Prussia, in particular, declared themselves determined to support the balance of Europe, and to force the empress to peace upon the basis of a *status quo*. Of the interference of Britain in this dispute, we have treated more largely in another place. To the first applications of the English minister, the empress answered in nearly the same terms in which she had before replied to the memorial of Prussia—"That the British court would not be permitted to dictate the terms of peace." In the course of the negotiation, however, her demands became more moderate; and as the northern powers, and particularly Denmark, began to exert themselves for the prevention of hostilities, she confined her views to the possession of Oczakow, with the district extending from the Bog to the Niester, and even then providing for the free navigation of the latter river. The negotiation was protracted to the 11th of August, when at length peace was concluded between the Czarina and the Porte, nearly upon these terms;—terms which, considering the ill success of the war, cannot be accounted very disadvantageous to the Porte, who have lost a fortrefs more useful for the purpose of annoying Russia, than for defending their own territories; but certainly of considerable importance to Russia, which, by this cession has secured the peaceable enjoyment of the Crimea. Peace was probably more desirable to Russia at this period as the Poles had taken an opportunity of emancipating themselves from the ignominious yoke which Russia had imposed upon them.

It is computed that in the last war Turkey lost 200,000 soldiers; Russia 100,000; the Austrians, who fell in battle, or in the unhealthy marches, are supposed to exceed 130,000.

Selim

Russia. Ca-
therine

Selim III. grand signior, born in 1761; succeeded to the throne of Turkey on the death of his uncle, the late sultan, April 6, 1789.

No event of any consequence has since happened in the Turkish empire till the year 1798 when the French among other mad and ambitious projects added to the number the plan of invading Egypt. This unprovoked insult roused the Turkish government from the indifference and unconcern with which they had regarded the contest of the European powers, and they determined to make vigorous preparations for repelling this attack. A proclamation of war was issued Aug. 18 with the usual solemnities. The standard of Mahomet was hoisted, and the declaration of war dispatched on the same day by couriers through the whole empire. It calls upon all Mussulmen, in the name of the most high and of the prophet, to assemble and range themselves under the banners of the Ottoman empire, in order to support and vindicate its just cause. Orders have been issued for forming immense magazines to obviate any embarrassment which might arise from want of provisions; in short warlike preparations are carried on upon all sides with vigour and activity. The French minister likewise together with his legation was sent to the Castle of the seven Towers, and several merchant ships in the harbour of Constantinople were taken possession of.

The grand Signior partook of the joy which the memorable victory of admiral Nelson occasioned through all Europe. Immediately upon receiving the news, he directed a superb diamond, taken from one of the imperial turbans to be sent to the gallant admiral, together with a piece of sable fur of the finest quality. He directed also a purse of 2000 sequins to be distributed among the British seamen wounded at the battle of the Nile. Considering the hostile disposition of the Grand Signior to the French, the destruction of their fleet, and the dangers of the climate, we may venture to predict that very few of them will ever see their native country.

BOUNDARIES.] IT would be deceiving the reader to desire him to depend upon the accounts given us by geographers of the extent, limits, and situation of these vast regions. Even the empress of Russia and her ministry are ignorant of her precise limits with the Chinese, the Persians, and other nations. Tartary, taken in its fullest extent, is bounded by the Frozen Ocean on the North, by the Pacific Ocean on the East, by China, India, Persia, and the Caspian Sea, on the South; and by Muscovy on the West.

Kamtshatka is a great peninsula, which extends from North to South about seven degrees thirty minutes. It is divided into four districts, Bolcherefsk, Tigiliskaia Krepost, Verchnei or Upper Kamtshatkoï Otkrog, and Nishnei or Lower Kamtshatkoï Otkrog.

MOUNTAINS.] The principal mountains are Caucasus in Circassia, and the mountains of Taurus and Ararat, so contiguous to it, that they appear like a continuation of the same mountains, which cross all Asia from Mongalia to the Indies; and the mountains of Stolp, in the North.

SEAS.] These are the Frozen Ocean, the Pacific Ocean, and the Caspian Sea.

RIVERS.] The principal rivers are, the Wolga, which runs a course of two thousand miles; the Obey, which divides Asia from Europe; the Tobol, Irtyz, Genesfa or Jenska; the Burrumpooter; the Lena, and the Argun, which divides the Russian and Chinese empires.

AIR, CLIMATE, SOIL, AND PRODUCTS.] The air of this country is very different, by reason of its vast extent from north to south; the northern parts reaching beyond the arctic polar circle, and the southern being in the same latitude with Spain, France, Italy, and part of Turkey.

Nova Zembla and Russian Lapland are most uncomfortable regions; the earth, which is covered with snow nine months in the year, being extremely barren, and every where incumbered with unwholesome marshes, uninhabited mountains, and impenetrable thickets. The climate of Siberia is cold, but the air pure and wholesome; and Mr. Took observes, that its inhabitants in all probability would live to an extreme old age, if they were not so much addicted to an immoderate use of intoxicating liquors. Siberia produces rye, oats, and barley, almost to the 60th degree of northern latitude. Cabbages, radishes, turnips, and cucumbers, thrive here tolerably well; but scarcely any other greens. All experiments to bring fruit-trees to bear have hitherto been in vain: but there is reason to believe that industry and patience may at length overcome the rudeness of the climate. Currants and strawberries of several sorts are said to grow here in as great perfection as in the English gardens. Herbs, as well medicinal as common, together with various edible roots, are found very generally here: but there are no bees in all Siberia. Astrachan and the southern parts of Tartary, are extremely fertile, owing more to nature than industry. The parts that are cultivated produce excellent fruits of almost all the kinds known in Europe, especially grapes, which are reckoned the largest and finest in the world. The summers are very dry; and from the end of July to the beginning of October, the air is pestered, and the soil sometimes ruined, by incredible quantities of locusts. Mr. Bell, who travelled with the Russian ambassador to China, represents some parts of Tartary as desirable and fertile countries, the grass growing spontaneously to an amazing height. The country of Thibet is the highest in Asia, and is a part of that elevated tract which gives rise to the rivers of India and China, and those of Siberia, and other parts of Tartary.

METALS

METALS AND MINERALS.] It is said that Siberia contains mines of gold, silver, copper, iron, jasper, lapis lazuli, and loadstones; a sort of large teeth found here, creates some dispute among the naturalists, whether they belong to elephants, or are a marine production; their appearance is certainly whimsical and curious, when polished with art and skill. It is now apprehended that they are real, and must have been brought here by the waters of a deluge, being found separate as if they had been scattered by the waves, covered with a stratum of mud, and commonly intermixed with the remains of marine plants and similar substances: which prove that these regions of Siberia were once overwhelmed with the sea.

ANIMALS.] These are camels, dromedaries, bears, wolves, and all the other land and amphibious animals that are common in the northern parts of Europe. Their horses are of a good size for the saddle, and very hardy; as they run wild till they are five or six years old, they are generally headstrong. Near Astracan there is a bird called by the Russians baba, of a grey colour, and something larger than a swan; he has a broad bill, under which hangs a bag that may contain a quart or more: he wades near the edge of a river, and on seeing a shoal or fry of small fishes, spreads his wings and drives them to a shallow, where he gobbles as many of them as he can into his bag, and then going ashore, eats them, or carries them to the young. Some travellers take this bird to be the pelican.

The forests of Siberia are well stocked with a variety of animals, some of which are not to be found in other countries. These supply the inhabitants with food and cloaths: and at the same time furnish them with commodities for an advantageous trade. Siberia may be considered as the native country of black foxes, fables, and ermines, the skins of which are here superior to those of any part of the world. Horses and cattle are in great plenty, and sold at low prices. The bos grunniens of Linnæus, or grunting ox, which inhabits Tartary and Thibet, hath a tail of uncommon beauty, full and flowing, of a glossy and silky texture. These tails are a considerable article of exportation from Thibet. The Indians fasten small bundles of the hair to a handle which they use for fly flaps; the Chinese dye ruffs of it with a beautiful scarlet, to decorate their caps, and the Turks employ it as ornaments to their standards, and by some erroneously called horsetails.

**POPULATION, INHABITANTS, MANNERS, } We can form no probable
DIVERSIONS AND CUSTOMS. } guesses as to the number of inhabitants in Tartary; but from many circumstances we must conclude, that they are far from being proportioned to the extent of their country. They are in general strong made, stout men; their faces broad, their noses flattish, their eyes small and black, but very quick; their beards are scarcely visible, as they continually thin them by pulling up the hairs by the roots. The beauty of the Circassian women is a kind of staple commodity in that country; for parents there make no scruple of selling their daughters to recruit the seraglios of the great men of Turkey and Persia. They are purchased when young, by merchants, and taught such accomplishments as suit their capacities, to render them more valuable against the day of sale. The Tartars are in general a wandering sort of people: in their peregrinations they set out in the spring, their number in one body being frequently 10,000, preceded by their flocks and herds. When they come to an inviting spot, they live upon it till all its grass and verdure is eaten up. They have little money, except what they get from their neighbours the Russians, Persians, or Turks, in exchange for cattle; with this they purchase cloth, silks, stuffs, and other apparel for their women. They have few mechanics, except those who make arms. They avoid all labour as the greatest slavery; their only employment is tending their flocks, hunting, and managing their horses. If they are angry with a person, they will he may live in one fixed place, and work like a Russian.**

Among

Among themselves they are very hospitable, and wonderfully so to the strangers and travellers who confidentially put themselves under their protection. They are naturally of an easy, cheerful temper, always disposed to laughter, and seldom depressed by care or melancholy. There is a strong resemblance between the northern and independent Tartar, and some nations of Canada in North America: particularly, when any of their people are infirm through great age, or seized with distempers, reckoned incurable, they make a small hut for the patient near some river, in which they leave him with some provisions, and seldom or never return to visit him. On such occasions, they say they do their parents a good office, in sending them to a better world. Notwithstanding this behaviour, many nations of the Tartars, especially towards the south, are tractable, humane, and are susceptible of pious and virtuous sentiments. Their affection for their fathers, and their submission to their authority, cannot be exceeded; and this noble quality of filial love has distinguished them in all ages. History tells us, that Darius king of Persia, having invaded them with all the forces of his empire, and the Scythians retiring by little and little, Darius sent an ambassador to demand where it was they proposed to conclude their retreat, and when they intended to begin fighting. They returned for an answer, with a spirit so peculiar to that people, "That they had no cities or cultivated fields, for the defence of which they should give him battle: but when once he was come to the place of their father's monuments, he should then understand in what manner the Scythians used to fight."

The Tartars are inured to horsemanship from their infancy; they seldom appear on foot. They are dexterous in shooting at a mark, inasmuch that a Tartar, while at full gallop, will split a pole with an arrow, though at a considerable distance. The dress of the men is very simple and fit for action; it generally consists of a short jacket with narrow sleeves made of deer's skin, having the fur outward; trowsers and hose of the same kind of skin, both of one piece, and light to the limbs. The Tartars live in huts half sunk under ground; they have a fire in the middle, with a hole in the top to let out the smoke, and benches round the fire to sit or lie upon. This seems to be the common method of living among all the northern nations, from Lapland eastward, to the Japanese Ocean. In the extreme northern provinces, during the winter, every family burrows itself as it were underground; and we are told, that so sociable are they in their dispositions, that they make subterraneous communications with each other, so that they may be said to live in an invisible city. The Tartars are immoderately fond of horse flesh, especially if it be young, and a little tainted, which make their cabbins extremely nauseous. Though horse-flesh be preferred raw by some northern tribes, the general way of eating it is after it has been smoked and dried. The Tartars purchase their wives with cattle. In their marriages they are not very delicate. Little or no difference is made between the child of a concubine or slave, and that of the wife; but among the heads of tribes the wife's son is always preferred to the succession. After a wife is turned off forty, she is employed in menial duties as another servant, and as such must attend the young wives who succeed to their places, nor is it uncommon, in some of the more barbarous tribes, for a father to marry his own daughter.

The descendants of the old inhabitants of Siberia are still most of them idolaters. They consist of many nations, entirely different from each other in their manner of living, religion, language, and countenances. But in this they agree, that none of them follow agriculture, which is carried on

by some Tartars, and such as are converted to Christianity. A few of them breed cattle, and others follow hunting. The population of Siberia has been much increased since it became a Russian province; for the Russians have founded therein a number of towns, fortresses, and villages. Notwithstanding which, it presents but a void and desert view; since, by its extent, it is capable of several millions more than it at present contains. For the manners and customs of the other Tartars belonging to the Russian empire, we refer to our account of that country.

RELIGION.] The religion of the Tartars somewhat resembles their civil government, and is commonly accommodated to that of their neighbours: for it partakes of the Mahometan, the Gentoo, the Greek, and even the popish religions. Some of them are the grossest idolaters, and worship little rude images dressed up in rags. Each has his own deity, with whom they make very free when matters do not go according to their own mind. But the religion and government of the kingdom of Thibet, and Lassa, a large tract of Tartary, bordering upon China, are the most remarkable, and the most worthy of attention. The Thibetians are governed by the Grand Lama, or Dahi Lama, who is not only submitted to, and adored by them, but is also the great object of adoration for the various tribes of Heathen Tartars, who roam through the vast tract of continent which stretches from the banks of the Wolga, to Correa on the sea of Japan. He is not only the sovereign pontiff, the vicegerent of the Deity on earth; but as superstition is ever the strongest where it is most removed from its object, the more remote Tartars absolutely regard him as the Deity himself. They believe him to be immortal, and endowed with all knowledge and virtue. Every year they come up from different parts to worship and make rich offerings at his shrine; even the emperor of China, who is a Manchou Tartar, does not fail in acknowledgements to him in his religious capacity, though the Lama is tributary to him; and actually entertains at a great expence, in the palace of Peking, an inferior Lama reputed as his nuncio from Thibet. The opinion of those who are reputed the most orthodox among the Thibetians is, that when the Grand Lama seems to die, either of old age or of infirmity, his soul in fact only quits a crazy habitation, to look for another younger or better, and it is discovered again in the body of some child, by certain tokens known only to the Lamas or priests, in which order he always appears. In 1774, the Grand Lama was an infant, which had been discovered some time before by the Tayshoo Lama, who in authority and sanctity of character is next to the Grand Lama, and during his minority acts as chief. The Lamas, who form the most numerous, as well as the most powerful body in the state, have the priesthood entirely in their hands; and besides, fill up many monastic orders, which are held in great veneration among them. The residence of the Grand Lama is at Patoli, a vast palace on a mountain near the banks of Burumpooter, about seven miles from Lahassa. The English East India Company made a treaty with the Lama in 1774. The religion of Thibet, though in many respects it differs from that of the Indian Bramins, yet in others it has a great affinity to it. The Thibetians have a great veneration for the cow, and also highly respect the waters of the Ganges, the source of which they believe to be in heaven. The sumasses, or Indian pilgrims, often visit Thibet as a holy place, and the Lama always entertains a body of two or three hundred in his pay. Besides his religious influence and authority, the Grand Lama is possessed of unlimited power throughout his dominions which are very extensive, and border on Bengal.

Another religion, which is very prevalent among the Tartars, is that of Schamanism. The professors of this religious sect believe in one Supreme God, the Creator of all things. They believe that he loves his creation, and all his creatures; that he knows every thing, and is all-powerful; but that he pays no attention to the particular actions of men, being too great for them to be able to offend him, or to do any thing that can be meritorious in his sight. But they also maintain, that the Supreme Being has divided the government of the world, and the destiny of men, among a great number of subaltern divinities, under his command and control, but who nevertheless generally act according to their own fancies; and therefore mankind cannot dispense with using all the means in their power for obtaining their favour. They likewise suppose, that, for the most part, these inferior deities abominate and punish premeditated villainy, fraud, and cruelty. They are all firmly persuaded of a future existence; but they have many superstitious notions and practices. Among all the Schamanes, women are considered as beings vastly inferior to men, and are thought to have been created only for their sensual pleasure, to people the world, and to look after household affairs; and in consequence of these principles, they are treated with much severity and contempt.

[LEARNING.] The reader may be surprised to find this article among a nation of Tartars; yet nothing is more certain, than that under Zingis Khan and Tamerlane, and their early descendants, Astracan and the neighbouring countries were the seats of learning and politeness, as well as empire and magnificence. Modern luxury, be it ever so splendid, falls short of that of those princes; and some remains of their taste in architecture are still extant, but in spots so desolate, that they are almost inaccessible. The cultivation of learning was the first care of the prince, and generally also committed to the care of his own relations or principal grandees. They wrote in the Persian and Arabic tongues; and their histories, many of which are still extant in manuscript, carry with them the strongest marks of authenticity.

[CURIOSITIES.] These are comprehended in the remains of the buildings, left by the above mentioned great conquerors and their successors. Remains of ditches and ramparts are frequently met with, which heretofore either surrounded small towns, now quite demolished, or were designed for the defence of camps, forts or castles, the vestiges of which are often to be discovered upon the spot, as well as other traces of decayed importance. Many of them are in admirable preservation, and make some figure even at present. The Slabode, or Tartarian suburb of Kasimof, on the Oka, seems to have been the residence of some khan. In the midst of the ruins of that city is a round and elevated tower, called in their language *Misquir*, a sort of temple, or building dedicated to devotion. Here are also the remains of the walls of a palace; and in one of the maselets or burial places, is a very considerable mausoleum: all which edifices are built of hewn stone and bricks. From an Arabic inscription we learn, that the khan of Schagali was buried there in the 962d year of the hejira, or the 1520th of the Christian era. Near mount Caucasus are still very considerable remains of Madschar, a celebrated city of former times. In the environs of Astracan the ruins of ancient Astracan are very visible; and the rubbish and ramparts of another respectable town still exist near Tzaritzin, on the left shore of the Wolga. A little below the mouth of the Kama, which empties itself into the above-mentioned river, are many superb monuments of the ancient city Bulgaria, consisting of towers, mosques, houses, and sepulchres, all built of stone or brick.

brick. The oldest epitaphs have been there more than eleven centuries, and the most modern at least four hundred years. Not far from hence, on the Tschermitscham, a little river that runs into the Wolga, are found ruins somewhat more injured by the depredations of time; they are those of Boulyner, an ancient and very considerable city of the Bulgarians. The Tartars have erected upon its ruins the small town of Bilyairsk. In the forests of Kasan is a monument of the ancient Tartarian kingdom of that name. Its lofty walls are so broad, that they serve at present for ramparts; the turrets of which, as well as the old palace of the khan, are built of hewn stone. Ascending the river Kasan, we meet with epitaphs, and the strong ramparts of the old Kasan. Near the Oufa are cemeteries full of innumerable inscriptions, and several sepulchral vaults. The ramparts of Sibir, the ancient capital of Tartary, are still seen about Tobolsk upon the Irtisch. The lofty walls of Tontoura appear yet in the Baraba, a little gulf in the river Om; and near the mouth of the Oural are the ditches of the city Saratschik. Not to mention a great number of other cities and ruins of Siberia; and especially all those that are to be met with in the desert of Kirguis, which abounds in the relics of opulent cities. Some gold and silver coins have likewise been found, with several manuscripts neatly written, which have been carried to Petersburg. In 1720, there were found in Calmuc Tartary a subterraneous house of stone, some urns, lamps, and ear-rings, an equestrian statue, an oriental prince with a diadem on his head, two women seated on thrones, and a roll of manuscripts, which was sent by Peter the Great to the Academy of Inscriptions at Paris, and proved to be the language of Thibet. The quantity of gold ornaments found in the tombs of Siberia; and of elegant workmanship, as bracelets, collars in the shape of serpents, vases, crowns, rings, bucklers, sabres, figures of animals, Tartar idols, &c. is surprising. It is supposed that these burial places were made about the time of Zinghis Khan, and that the superstition prevailed in those parts, of departed souls following the same kind of life they did in this world, and therefore on the death of a prince, they sacrificed his favourite wife, &c. and buried with him his arms and other valuable things.

[CITIES AND TOWNS.] Of these we know little: but the names, and that they are in general no better than fixed borders. They may be said to be places of shade rather than towns or cities, for we do not find that they are under any regular government, or that they can make a defence against an enemy. The few places, however, that are mentioned in the preceding divisions of this country, merit notice. Tobolsk and Astrachan are considerable cities, the first containing 15,000, and the latter 70,000 inhabitants. Forts, villages, and towns, have also lately been erected in different parts of Siberia, for civilizing the inhabitants, and rendering them obedient to the Russian government.

[COMMERCE AND MANUFACTURES.] This head makes no figure in the history of Tartary, their chief traffic consisting in cattle, fine ox tails, skins, beavers, rhubarb, musk, and fish. The Astracans, notwithstanding their interruptions by the wild Tartars, carry on a considerable traffic into Persia, to which they export red leather, woollen and linen cloth, and some European manufactures. The Bucharians also are a very commercial people: their caravans travel through a great part of Asia, and traffick with Thibet, China, India, Persia, and Russia. Their principal marts are Tomsk and Orenburg. Gold dust is often found in the sand of the rivers of Bucharia.

[HISTORY.] Though it is certain that Tartary, formerly known by the

name of Scythia, was the seat of the most famous nations of the world, yet it is not learning and industry that have made it famous, but the two more common names of Tartary and Calmuc.

name of Scythia, was the seat of the most famous nations of the world, yet it is not learning and industry that have made it famous, but the two more common names of Tartary and Calmuc.

The conquest of the empire than that of the favourer, which enriched it, have abused conquerors, the writers. more permitted by Bajazet, his conquests, princes of this country, Bucharia, 13 miles of Tamerlan.

The tribes, which were patriarchal, who, upon the mount, perished from the field from military state, and other under his had formed. They are the Persians, who, in the Persian conquests, in a tribute, powerful ship of them, they are, and they, neighbour.

The name among them. This city must be the ways man.

name of Scythia, peopled the northern parts of Europe, and furnished those amazing numbers, who, under various names, destroyed the Roman empire, yet it is now but very thinly inhabited; and those fine provinces, where learning and the arts resided, are now scenes of horror and barbarity. This must have been owing to the dreadful massacres made among the nations by the two above mentioned conquerors and their descendants; for nothing is more common in their histories, than their putting to the sword three or four hundred thousand people in a few days.

The country of Ubec Tartary was once the seat of a more powerful empire than that of Rome or Greece. It was not only the native country, but the favourite residence of Zingis, or Jenghis Khan and Tamerlane, who enriched it with the spoils of India and the eastern world. But some authors have absurdly questioned the veracity of the historians of these great conquerors, though it be better established than that of the Greek or Roman writers. The same may be said of Tamerlane, whose memory has been more permanent than that of Zingis Khan: his defeat of the Turkish emperor Bajazet, hath been noticed in the history of that nation, and great were his conquests. His descent is claimed not only by all the Khans and petty princes of Tartary, but by the emperor of Indostan himself. The capital of this country is Bokharia, which was known to the ancients by the name of Bucharja; and it is situated in the latitude of 39 degrees 15 minutes, and 13 miles distant from the once famous city of Samarcand, the birth-place of Tamerlane the Great.

The present inhabitants of this immense common compose innumerable tribes, who range at pleasure with their flocks and their herds, in the old patriarchal manner. Their tribes are commanded by separate Khans or leaders, who, upon particular emergencies, elect a great Khan, who claims a paramount power over strangers as well as natives, and who can bring into the field from 20 to 100,000 horsemen. Their chief residence is a kind of military station, which is moved and shifted according to the chance of war and other occasions. When the vast dominions of Zingis Khan fell to pieces under his successors in the 16th century the Mogul and Tartar hordes who had formed one empire, again separated, and have since continued distinct. They are bounded on every side by the Russian, the Chinese, the Mogul, the Persian, or the Turkish empires; each of whom are pushing on their conquests in this extensive, and in some places fertile country. The Khans pay a tribute, or acknowledgment of their dependency upon one or other of their powerful neighbours, who treat them with caution and lenity; as the friendship of these barbarians is of the utmost consequence to the powers with whom they are allied. Some tribes, however, affect independency: and when united they form a powerful body, and of late have been very formidable to their neighbours, particularly to the Chinese.

The method of carrying on war, by waltzing the country, is very ancient among the Tartars, and practised by all of them from the Danube eastward. This circumstance renders them a dreadful enemy to regular troops, who must thereby be deprived of all subsistence; while the Tartars, having always many spare horses to kill and eat, are at no loss for provisions.

BOUNDARIES.] It is bounded by Tartary and an amazing stone-wall of five hundred leagues in length, on the North; by the Pacific ocean, which divides it from North America, on the East; by the Chinesean sea, South; and by Tonquin and the Tartarian countries and mountains of Thibet and Russia, on the West.

DIVISIONS.] The great division of this empire, according to the authors of the Universal History, and the abbé Grosier, in his general description of China, is into fifteen provinces (exclusive of that of Lyautong, which is situated without the Great Wall, though under the same dominion); each of which might, for their largeness, fertility, populousness, and opulence, pass for so many distinct kingdoms. We give the following account of the division of this empire from the best authority:

Provinces.	Chief Towns.	CHINESE TARTARY.								
Pe-tcheli	Pekin	<p>This is bounded on the north by Siberia; on the east by the Gulf of Kamtschatka and the Eastern sea; on the south by China; and on the west by the country of the Kalmouks, who are established between the Caspian sea, and Casghar.</p> <p>EASTERN CHINESE TARTARY.</p> <p>Extends north and south from the 41st. to the 55th degree of north latitude, and east and west from about the 137th degree of longitude to the eastern sea. It is bounded on the north by Siberia, on the South by the Gulf of Lea-tong and Corea; on the east by the eastern sea; and on the west by the country of the Moguls. The country is divided into three grand departments.</p>

But

But it is necessary to acquaint the reader, that the informations contained in Du Halde's voluminous account of China, are drawn from the papers of Jesuits, and other religious sent thither by the pope, but whose missions have been at an end for above half a century. Some of those fathers were men of penetration and judgment; and had great opportunities of being informed about a century ago; but even their accounts of this empire are justly to be suspected. They had powerful enemies at the court of Rome, where they maintained their footing only by magnifying their own labours and successes, as well as the importance of the Chinese empire. If their accounts are to be received with much caution, much more are those of succeeding travellers, who have it scarce in their power to enter the empire farther than what is absolutely necessary for the purposes of trade. On account of this want of information, therefore, which is acknowledged even by M. Grosier, the latest writer on the subject, we must be much more brief in our description of this celebrated empire, than otherwise we would wish to be.

NAME.] It is probably owing to a Chinese word, signifying middle, from a notion the natives had that their country lay in the middle of the world.

MOUNTAINS.] China, excepting to the north, is a plain country, and contains no remarkable mountains.

RIVERS AND WATER.] The chief are the Yamour and the Argun, which are the boundary between the Russian and Chinese Tartary; the Croceus, or Whamboos, or the Yellow River; the Kiam, or the Blue River, and the Tay. Common water in China is very indifferent, and is in some places boiled to make it fit for use.

BAYS.] The chief are those of Nankin and the Canton.

CANALS.] These are sufficient to entitle the ancient Chinese to the character of a most wise and industrious people. The commodiousness and length of their canals are incredible. The chief of them are lined with hewn stone on the sides, and they are so deep, that they carry large vessels, and sometimes they extend above 1000 miles in length. Those vessels are fitted up for all the conveniencies of life; and it has been thought by some, that in China the water contains as many inhabitants as the land. They are furnished with stone quays, and sometimes with bridges of an amazing construction. The navigation is slow, and the vessels sometimes drawn by men. No precautions are wanting, that could be formed by art or perseverance, for the safety of the passengers, in case a canal is crossed by a rapid river, or exposed to torrents from the mountains. These canals, and the variety that is seen upon their borders, renders China delightful in a very high degree, as well as fertile, in places that are not so by nature.

FORESTS.] Such is the industry of the Chinese, that they are not encumbered with forests or wood, though no country is better fitted for producing timber of all kinds. They suffer, however, none to grow but for ornament, and use, or on the sides of mountains, from whence the trees when cut down can be conveyed to any place by water.

AIR, SOIL, AND PRODUCE.] The air of this empire is according to the situation of the places. Towards the north it is sharp, in the middle mild and in the south hot. The soil is, either by nature or art, fruitful of every thing that can minister to the necessities, conveniencies, or luxuries of life. The culture of the cotton, and the rice fields, from which the bulk of the inhabitants are clothed and fed, is ingenious almost beyond description. The rare trees, and aromatic productions either ornamental or medicinal, that abound in other parts of the world, are to be found in China, and some are

peculiar to itself; but even a catalogue of them would form a little volume. Some however, must be mentioned.

The tallow-tree has a short trunk, a smooth bark, crooked branches, red leaves, shaped like a heart, and is about the height of a common cherry-tree. The fruit it produces has all the qualities of our tallow, and when manufactured with oil, serves the natives as candles; but they smell strong, nor is their light clear. Of the other trees peculiar to China, are some which yield a kind of flour; some partake of the nature of pepper. The gum of some is poisonous, but affords the finest varnish in the world. After all that can be said of these, and many other beautiful and useful trees, the Chinese, notwithstanding their industry, are so wedded to their ancient customs, that they are very little, if at all meliorated by cultivation. The same may be said of their richest fruits, which in general, are far from being so delicious as those of Europe, and indeed of America. This is owing to the Chinese never practising grafting, or inoculation of trees, and knowing nothing of experimental gardening.

It would be unpardonable here not to mention the raw-silk, which so much abounds in China, and above all the *tea plant* or shrub. It is planted in rows, and pruned to prevent its luxuriancy. Notwithstanding our long intercourse with China, writers are still divided about the different species and culture of this plant. It is generally thought that the green and bohea grows on the same shrub, but that the latter admits of some kind of preparation, which takes away its raking qualities, and gives it a deeper colour. The other kinds, which go by the names of imperial, congo, singlo, and the like, are occasioned probably by the nature of the soils, and from the provinces in which they grow. The culture of this plant seems to be very simple; and it is certain that some kinds are of a much higher and more delicious flavour than others. It is thought that the finest, which is called the flower of the tea, is imported over land to Russia; but we know of little difference in their effects on the human body. The greatest is between the bohea and the green.

It is supposed that the Portuguese had the use of tea long before the English, but it was introduced among the latter before the Restoration, as mention of it is made in the first act of parliament, that settled the excise on the king for life, in 1660. Catharine of Lisbon, wife to Charles II. rendered the use of it common at his court. The *ginseng*, so famous among the Chinese as the universal remedy, and monopolized even by their emperors, is now found to be but a common root, and is plentiful in British America. When brought to Europe, it is little distinguished for its healing qualities; and this instance alone ought to teach us with what caution the former accounts of China are to be read. The *ginseng*, however, is a native of the Chinese Tartary.

METALS AND MINERALS.] China (if we are to believe some naturalists) produces all metals and minerals that are known in the world. White copper is peculiar to itself, but we know of no extraordinary quality it possesses. One of the fundamental maxims of the Chinese government is, that of not introducing a superabundance of gold and silver, for fear of hurting industry. Their gold mines, therefore, are but slightly worked, and the currency of that metal is supplied by the grains the people pick up in the sand of rivers and mountains. The silver specie is furnished from the mines of Honan.

POPULATION AND INHABITANTS.] According to some accounts, there are fifty-eight millions of inhabitants in China, and all between twenty and

under the reg

sixty years of age, pay an annual tax. Notwithstanding the industry of the people, their amazing population frequently occasions a dearth. Parents, who cannot support their female children are allowed to cast them into the river; but they fasten a gourd to the child, that it may float on the water; and there are often compassionate people of fortune, who are moved by the cries of the children to save them from death. The Chinese, in their persons, are middle-sized, their faces broad, their eyes black and small, their noses rather short. The Chinese have particular ideas of beauty. They pluck up the hairs of the lower part of their faces by the roots with tweezers leaving a few straggling ones by way of beard. Their Tartar princes compel them to cut off the hair of their heads, and, like Mahometans, to wear only a lock on the crown. Their complexion towards the north is fair, towards the south swarthy, and the fatter a man is, they think him the handsomer. Men of quality and learning, who are not much exposed to the sun, are delicately complexioned, and they who are bred to letters let the nails of their fingers grow to an enormous length, to shew that they are not employed in manual labour.

The women have little eyes, plump, rosy lips, black hair, regular features and a delicate though florid complexion. The smallness of their feet is reckoned a principal part of their beauty, and no swathing is omitted, when they are young, to give them that accomplishment, so that when they grow up, they may be said to totter rather than to walk. This fanciful piece of beauty was probably invented by the ancient Chinese, to palliate their jealousy.

To enter into all the starchy ridiculous formalities of the Chinese, especially of their men of quality, when paying or receiving visits, would give little information, and less amusement, and very probably come too late, as the manners of the Chinese, since they fell under the power of the Tartars, are greatly altered, and daily vary. It is sufficient to observe, that the legislators of China, looking upon submission and subordination as the corner stones of all society, devised those outward marks of respect, ridiculous as they appear to us, as the test of duty and respect from inferiors to superiors; and their capital maxim was, that the man, who was deficient in civility, was void of good sense.

The Chinese in general have been represented, as the most dishonest, low, thieving set in the world: employing their natural quickness only to improve the arts of cheating the nations they deal with, especially the Europeans, whom they cheat with great ease, particularly the English; but they observe that none but a Chinese can cheat a Chinese. They are fond of law disputes beyond any people in the world. Their hypocrisy is without bounds; and the men of property among them practise the most avowed bribery, and the lowest meannesses to obtain preferment. It should, however, be remembered, that some of the late accounts of China have been drawn up by those who were little acquainted with any parts of that empire but the sea-port towns; in which they probably met with many knavish and designing people. But it seems not just to attempt to characterise a great nation by a few instances of this kind, though well attested; and we appear not to be sufficiently acquainted with the interior parts of China to form an accurate judgment of the manners and character of the inhabitants. By some of the Jesuit missionaries the Chinese seem to have been too much extolled, and by later writers too much degraded.

[DRESS.] This varies according to the distinction of ranks, and is entirely under the regulation of the law, which has even fixed the colours that distinguish

the different conditions. The emperor, and princes of the blood, have alone a right to wear yellow; certain mandarins are intitled to wear satten of a red ground, but only upon days of ceremony; in general, they are clothed in black, blue, or violet. The colour to which the common people are confined, is blue or black; and their dress is always composed of plain cotton cloth. The men wear caps on their heads of the fashion of a bell; those of quality are ornamented with jewels. The rest of their dress is easy and loose, consisting of a vest and *sa*, a coat or gown thrown over them, silk boots quilted with cotton, and a pair of drawers. The ladies towards the south wear nothing on their head. Sometimes their hair is drawn up in a net, and sometimes it is dishevelled. Their dress differs but little from that of the men, only their gown or upper garment has very large open sleeves. The dress both of men and women, varies, however, according to the climate.

MARRIAGES.] The parties never see each other in China till the bargain is concluded by the parents, and that is generally when the parties are perfect children. Next to being barren, the greatest scandal is to bring females into the world; and if a woman of poor family happens to have three or four girls successively, it not unfrequently happens that she will expose them on the high roads, or cast them into a river.

FUNERALS.] People of note cause their coffins to be made, and their tombs to be built in their life-time. No persons are buried within the walls of a city, nor is a dead corpse suffered to be brought into a town, if a person died in the country. Every Chinese keeps in his house a table, upon which are written the names of his father, grandfather, and great grandfather, before which they frequently burn incense, and prostrate themselves; and when the father of a family dies, the name of the great grandfather is taken away, and that of the deceased is added.

LANGUAGE.] The Chinese language contains only three hundred and thirty words, all of one syllable; but then each word is pronounced with such various modulations, and each with a different meaning that it becomes more copious than could be easily imagined, and enables them to express themselves very well on the common occasions of life. The missionaries, who adapt the European characters, as well as they can, to the expression of Chinese words, have devised eleven different, and some of them very compounded, marks and aspirations, to signify the various modulations, elevations, and depressions of the voice, which distinguish the several meanings of the same monosyllable. The Chinese oral language being thus barren and contracted, is unfit for literature; and, therefore, their literature is all comprised in arbitrary characters, which are amazingly complicated and numerous, amounting to about eighty thousand. This language being wholly addressed to the eye, and having no affinity with their tongue, as spoken, the latter hath still continued in its original rude, uncultivated state, while the former has received all possible improvement.

GENIUS AND LEARNING.] The genius of the Chinese is peculiar to themselves, they have no conception of what is beautiful in writing, regular in architecture, or natural in painting, and yet in their gardening, and planning their grounds, they hit upon the true sublime and beautiful. They perform all the operations of arithmetic with prodigious quickness, but differently from the Europeans. Till the latter came among them, they were ignorant of mathematical learning, and all its depending arts. They had no proper apparatus for astronomical observations; and the metaphysical learning, which existed among them, was only known to their philosophers;

but even the arts introduced by the Jesuits were of very short duration among them, and lasted very little longer than the reign of Canghi, who was contemporary with our Charles II. nor is it very probable they will ever be revived. It has been generally said, that they understood printing, before the Europeans; but that can only be applied to block printing, for the fusile and moveable types were undoubtedly Dutch or German inventions. The Chinese, however, had almanacks, which were stamped from plates or blocks, many hundred years before printing was discovered in Europe.

The difficulty of mastering and retaining such a number of arbitrary marks and characters, as there are in what may be called the Chinese written language, greatly retards the progress of their erudition. But there is no part of the globe where learning is attended with such honours and rewards, and where there are more powerful inducements to cultivate and pursue it. The literati are revered as another species, and are the only nobility known in China. If their birth be ever so mean and low, they become mandarins of the highest rank, in proportion to the extent of their learning. On the other hand, however exalted their birth may be, they quickly sink into poverty and obscurity, if they neglect those studies which raised their fathers. It has been observed, that there is no nation in the world where the first honours of the state lie so open to the lowest of the people, and where there is less of hereditary greatness. The Chinese range all their works of literature into four classes. The first is the class of *King*, or the sacred books, which contain the principles of the Chinese religion, morality, and government, and several curious and obscure records, relative to these important subjects. History forms a class apart: yet, in this first class, there are placed some historical monuments on account of their relation to religion and government, and among others, the *Tekun tsiou*, a work of Confucius, which contains the annals of twelve kings of *Low*, the native country of that illustrious sage. The second class is that of the *Su*, or *Che*, that is, of history and the historians. The third class, called *Tsu* or *Tse*, comprehends philosophy and the philosophers, and contains all the works of the Chinese literati, the productions also of foreign sects and religions, which the Chinese consider only in the light of philosophical opinions, and all books relative to mathematics, astronomy, physic, military science, the art of divination, agriculture and the arts and sciences in general. The fourth is called *Tsai*, or *Miscellanies*, and contains all the poetical books of the Chinese, their pieces of eloquence, their songs, romances, tragedies, and comedies. The Chinese literati in all the periods of their monarchy, have applied themselves less to the study of nature, and to the researches of natural philosophy, than to moral inquiries, the practical science of life, and internal polity and manners. It is said, that it was not before the dynasty of the Song in the 10th and 11th centuries after Christ, that the Chinese philosophers formed hypotheses concerning the natural system of the universe, and entered into discussions of a scholastic kind, in consequence, perhaps, of the intercourse they had long kept up with the Arabians, who studied with ardour the works of Aristotle. And since the Chinese have begun to pay some attention to natural philosophy, their progress in it has been much inferior to that of the Europeans.

The invention of gunpowder is justly claimed by the Chinese, who made use of it against Zinghis Khan and Tamerlane. They seem to have known nothing of small fire arms, and to have been acquainted only with the cannon, which they call the fire-pan. Their industry in their manufactures of

stuffs, porcelain, japanning and the like sedentary trades is amazing, and can be equalled only by their labours in the field, in making canals, levelling mountains, raising gardens, and navigating their junks and boats.

ANTQUITIES AND CURIOSITIES.] Few natural curiosities present themselves in China, that have not been comprehended under preceding articles. Some volcanos, and rivers and lakes of particular qualities, are to be found in different parts of the empire. The volcano of Linsung is said sometimes to make so furious a discharge of fire and ashes, as to occasion a tempest in the air; and some of their lakes are said to petrify fishes when put into them. The Great Wall separating China from Tartary, to prevent the incursions of the Tartars, is supposed to extend from 1200 to 1500 miles. It is carried over mountains and vallies, and reaches, according to M. Grosier, from the province of the Shenst to the Whang-Hay, or Yellow Sea. It is in most places built of brick and mortar, which is so well tempered, that though it has stood for 1800 years, it is but little decayed. The beginning of this wall is a large bulwark of stone raised in the sea, in the province of Petcheli, to the east of Peking, and almost in the same latitude: it is built like the walls of the capital city of the empire, but much wider, being terraced and cased with bricks, and is from twenty to twenty-five feet high. P. Régis, and the other gentleman, who took a map of these provinces, often stretched a line on the top, to measure the basis of triangles, and to take distant points with an instrument. They always found it paved wide enough for five or six horsemen to travel abreast with ease. Mention has been already made of the prodigious canals and roads that are cut through this empire.

The artificial mountains present on their tops, temples, monasteries, and other edifices. Some part, however, of what we are told concerning the cavities in these mountains, seems to be fabulous. The Chinese bridges cannot be sufficiently admired. They are built sometimes upon barges strongly chained together, yet so as to be parted, and to let the vessels pass that sail up and down the river. Some of them run from mountain to mountain, and consist only of one arch; that over the river Safrany is 400 cubits long, and 500 high, though a single arch, and joins two mountains and some in the interior parts of the empire are said to be still more stupendous. The triumphal arches of this country form the next species of artificial curiosities. Though they are not built in the Greek or Roman style of architecture, yet they are superb and beautiful, and erected to the memory of their great men, with vast labour and expence. They are said in the whole to be eleven hundred, two hundred of which are particularly magnificent. Their sepulchral monuments made likewise a great figure. Their towers, the models of which are now so common in Europe under the name of pagodas, are vast embellishments to the face of their country. They seem to be constructed by a regular order, and all of them are finished with exquisite carvings and gildings, and other ornaments. That at Nanking, which is 200 feet high, and 40 in diameter, is the most admired. It is called the Porcelane Tower, because it is lined with Chinese tiles. Their temples are chiefly remarkable for the disagreeable taste in which they are built, for their capaciousness, their whimsical ornaments, and the ugliness of the idols they contain. The Chinese are remarkably fond of bells, which gave name to one of their principal festivals. A bell of Peking weighs 120,000 pounds, but its found is said to be disagreeable. The last curiosity I shall mention, is their fireworks, which in China exceed those of all other nations. In short, every

province in China is a scene of curiosities, their buildings, except the pagodas, being confined to no order, and susceptible of all kinds of ornaments, have a wild variety, and a pleasing elegance, not void of magnificence, agreeable to the eye and the imagination, and present a diversity of objects not to be found in European architecture.

CHIEF CITIES.] Little can be said of these more than that some of them are immense, and there is great reason to believe their population is much exaggerated. The empire is said to contain 4,400 walled cities; the chief of which are Peking, Nanking, and Canton. Peking, the capital of the whole empire of China, and the ordinary residence of the emperors, is situated in a very fertile plain, 20 leagues distant from the Great Wall. It is an oblong square, and is divided into two cities: that which contains the emperor's palace is called the Tartar city, because the houses were given to the Tartars when the present family came to the throne; and they refusing to suffer the Chinese to inhabit it, forced them to live without the walls, where they in a short time built a new city; which, by being joined to the other, renders the whole of an irregular form, six leagues in compass. The walls and gates of Peking are of the surprising height of fifty cubits, so that they hide the whole city; and are so broad, that centinels are placed upon them on horseback; for there are slopes within the city of considerable length, by which horsemen may ascend the walls; and in several places there are houses built for the guards. The gates, which are nine in number are neither embellished with statues, nor other carving, all their beauty consisting in their prodigious height, which at a distance gives them a noble appearance. The arches of the gates are built of marble; and the rest with large bricks, cemented with excellent mortar. Most of the streets are built in a direct line; the largest are about 120 feet broad, and a league in length. The shops where they sell silks and china-ware generally take up the whole street, and afford a very agreeable prospect. Each shop-keeper places before his shop, on a small kind of pedestal, a board about twenty feet high, painted, varnished, and often gilt, on which are written in large characters the names of the several commodities he sells. These being placed on each side of the street, at nearly an equal distance from each other, have a very pretty appearance; but the houses are poorly built in the front, and very low, most of them having only a ground floor, and none exceeding one story above it. Of all the buildings in this great city, the most remarkable is the imperial palace, the grandeur of which does not consist so much in the nobleness and elegance of the architecture, as the multitude of its buildings, courts, and gardens, all regularly disposed; for within the walls are not only the emperor's house, but a little town, inhabited by the officers of the court, and a multitude of artificers employed and kept by the emperor; but the houses of the courtiers and artificers are low and ill-contrived. F. Attiret, a French Jesuit, who was indulged with a sight of the palace and gardens, says, that the palace is more than three miles in circumference, and that the front of the building shines with gilding, paint, and varnish, while the inside is set off and furnished with every thing that is most beautiful and precious in China, the Indies, and Europe. The gardens of this palace are large tracts of ground, in which are raised, at proper distances, artificial mountains, from 20 to 60 feet high, which form a number of small vallies, plentifully watered by canals, which uniting, form lakes and meres. Beautiful and magnificent barks sail on these pieces of water, and the banks are ornamented with ranges of buildings, not any two of which are said to have any resemblance to each other; which diversity produces

duces

duces a very pleasing effect. Every valley has its house of pleasure, large enough to lodge one of our greatest lords in Europe with all his retinue; many of these houses are built with cedar, brought at a vast expence, the distance of 500 leagues. Of these palaces, or houses of pleasure, there are more than 200 in this vast enclosure. In the middle of a lake, which is near half a league in diameter every way, is a rocky island, on which is built a palace, containing more than an hundred apartments. It has four fronts, and is a very elegant and magnificent structure. The mountains and hills are covered with trees, particularly such as produce beautiful and aromatic flowers; and the canals are edged with rustic pieces of rock, disposed with such art, as exactly to resemble the wildness of nature.

The city of Peking is computed to contain two millions of inhabitants, though Nanking is said to exceed it both in extent and population. But Canton is the greatest port in China, and the only port that has been much frequented by Europeans. The city wall is about five miles in circumference, with very pleasant walks around it. From the top of some adjacent hills, on which forts are built, you have a fine prospect of the country. It is beautifully interspersed with mountains, little hills, and vallies, all green; and these again pleasantly diversified with small towns, villages, high towers, temples, the seats of mandarins and other great men, which are watered with delightful lakes, canals, and small branches from the river Ta; on which are numberless boats and junks, sailing different ways through the most fertile parts of the country. The city is entered by several iron gates, and within-side of each there is a guard-house. The streets of Canton are very straight, but generally narrow, and paved with flag stones. There are many pretty buildings in this city, great numbers of triumphal arches, and temples well stocked with images. The streets of Canton are so crowded, that it is difficult to walk in them; yet a woman of any fashion is seldom to be seen, unless by chance when coming out of their chairs. There are great numbers of market places for fish, flesh, poultry, vegetables and all kinds of provisions, which are sold very cheap. There are many private walks about the skirts of the town, where those of the better sort have their houses which are very little frequented by Europeans, whose business lies chiefly in the trading part of the city, where there are only shops and warehouses. Few of the Chinese traders of any substance keep their families in the house where they do business, but either in the city, in the more remote suburbs, or farther up in the country. They have all such a regard to privacy, that no windows are made towards the streets, but in shops and places of public business, nor do any of their windows look towards those of their neighbours. The shops of those that deal in silks are very neat, make a fine show, and are all in one place; for tradesmen, or dealers in one kind of goods, held together in the same street. It is computed that there are in this city, and its suburbs, 1,200,000 people; and there are often 5000 trading vessels lying before the city.

TRADE AND MANUFACTURES.] China is so happily situated, and produces such a variety of materials for manufactures, that it may be said to be the native land of industry; but it is an industry without taste or elegance, though carried on with great art and neatness. They make paper of the bark of bamboo, and other trees, as well as of cotton, but not comparable, for records or printing, to the European. Their ink, for the use of drawing, is well known in England, and is said to be made of oil and lampblack. I have already mentioned the antiquity of their printing, which they still do by cutting their characters on blocks of wood. The manufacture of that

earthen ware, generally known by the name of China, was long a secret in Europe, and brought immense sums to that country. The ancients knew and esteemed it highly under the name of porcelain, but it was of much better fabric than the modern. Though the Chinese affect to keep that manufacture still a secret, yet it is well known that the principal material is a prepared pulverized earth, and that several European countries far exceed the Chinese in manufacturing this commodity*. The Chinese silks are generally plain and flowered gauzes, and they are said to have been originally fabricated in that country, where the art of rearing silk worms was first discovered. They manufacture silks likewise of a more durable kind, and their cotton, and other cloths, are famous for furnishing a light warm wear.

Their trade, it is well known, is open to all the European nations, with whom they deal for ready money; for such is the pride and avarice of the Chinese, that they think no manufactures equal to their own. But it is certain, that since the discovery of the porcelain manufactures, and the vast improvements the Europeans have made in the weaving branches, the Chinese commerce has been on the decline.

[CONSTITUTION AND GOVERNMENT.] This was a most instructive and entertaining article, before the conquest of China by the Tartars; for though their princes retain many fundamental maxims of the old Chinese, they obliged the inhabitants to deviate from the ancient discipline in many respects. Perhaps their acquaintance with the Europeans may have contributed to their degeneracy. The original plan of the Chinese government was patriarchal, almost in the strictest sense of the word. Duty and obedience to the father of each family was recommended and enforced in the most rigorous manner: but, at the same time, the emperor was considered as the father of the whole. His mandarins, or great officers of state, were looked upon as his substitutes, and the degrees of submission which were due from the inferior ranks to the superior, were settled and observed with the most scrupulous precision, and in a manner that to us seems highly ridiculous. The simple claim of obedience required great address and knowledge of human nature to render it effectual; and the Chinese legislators, Confucius particularly, appear to have been men of wonderful abilities. They enveloped their dictates in a number of mystical appearances, so as to strike the people with awe and veneration. The mandarins had modes of speaking and writing different from those of other subjects, and the people were taught to believe that their princes partook of divinity, so that they were seldom seen, and more seldom approached.

Though this system preserved the public tranquillity for an incredible number of years, yet it had a fundamental defect that often convulsed, and at last proved fatal to the state, because the same attention was not paid to the military as to the civil duties. The Chinese had passions like other men, and sometimes a weak or wicked administration drove them into arms, and a revolution easily succeeded, which they justified by saying, that their sovereign had ceased to be their father. During those commotions, one of the parties naturally invited their neighbours the Tartars to their assistance, and it was thus those barbarians, who had great sagacity, became acquainted with the weak side of their constitution, and they availed themselves ac-

* The English in particular have carried this branch to a high degree of perfection, as appears from the commissions which have been received of late from several princes of Europe; and we hope that a manufacture so generally useful, will meet with encouragement from every true patriot among ourselves.

ordingly, by invading and conquering the empire, and conforming to the Chinese institutions.

Besides the great doctrine of the patriarchal obedience, the Chinese had sumptuary laws, and regulations for the expences of all degrees of subjects, which were very useful in preserving the public tranquillity, and preventing the effects of ambition. By their institutions likewise, the mandarins might remonstrate to the emperor, but in the most submissive manner, upon the errors of his government, and when he was a virtuous prince, this freedom was often attended with the most salutary effects. No country in the world is so well provided with magistrates for the discharge of justice, both in civil and criminal matters, as China: but they are often ineffectual through want of public virtue in the execution. The emperor is styled "*Holy Son of Heaven, Sole Governor of the Earth, Great Father of his People.*"

RELIGION.] This article is nearly connected with the preceding. Though the ancient Chinese worshipped idols, yet their philosophers and legislators had juster sentiments of the Deity, and indulged the people in the worship of sensible objects, only to make them more submissive to government. The Jesuits made little opposition to this when they attempted to convert the Chinese, and suffered their proselytes to worship Tien, pretending that it was no other than the name of God. The truth is, Confucius, and the Chinese legislators, introduced a most excellent system of morals among the people, and endeavoured to supply the want of just ideas of a future state, by prescribing to them the worship of inferior deities. Their morality approximates to that of Christianity; but as we know little of their religion but through the Jesuits, we cannot adopt for truth the numerous instances which they tell us of the conformity of the Chinese with the Christian religion. Those fathers, it must be owned, were men of great abilities, and made a wonderful progress above a century ago in their conversions; but they mistook the true character of the emperor, who was their patron; for he no sooner found that they were in fact aspiring to the civil direction of the government, than he expelled them, levelled their churches with the ground, and prohibited the exercise of their religion; since which time Christianity has made no figure in China.

PUBLIC ROADS.] The security of travellers, and an easy mode of conveyance for passengers and merchandize of every kind, are objects to which particular attention seems to have been paid by administration in China. The manner in which the public roads are managed greatly contributed to the former.

These roads are in general very broad; they are paved in all the southern provinces, and some of the northern. Valleys have been filled up, and passages have been cut through rocks and mountains, in order to make commodious highways, and to preserve them as nearly as possible on a level. They are generally bordered with very lofty trees, and sometimes with walls eight or ten feet in height, to prevent travellers from entering into the fields. Openings are left in them at certain intervals, which give a passage into cross roads, that conduct to different villages. On all the great roads covered seats are erected at proper distances, where the traveller may shelter himself from the inclemency of the winter, or the excessive heats of summer.

There is no want of inns on the principal highways and even on the cross roads. The former are very spacious, but they are badly supplied with provisions. People are even obliged to carry beds with them, or to

sleep on a plain mat. Government requires of those who inhabit them to give lodging only to those who ask and pay for it.

We meet with many turrets, (says Mr. Bell) called post-houses, erected at certain distances one from another, with a flag-staff, on which is hoisted the imperial pendent. These places are guarded by soldiers, who run from one post to another with great speed, carrying letters which concern the emperor. The turrets are in sight of one another, and by signals they can convey intelligence of any remarkable event. By these means the court is informed in the speediest manner of whatever disturbance may happen in the most remote part of the empire.

REVENUES.] These are said by some to amount to twenty, or, according to the abbé Grosier, to forty-one millions sterling a year; but this cannot be meant in money, which does not at all abound in China. The taxes collected for the use of government in rice, and other commodities, are certainly very great, and may easily be imposed, as an account of every man's family and substance is annually enrolled, and very possibly may amount to that sum.

MILITARY AND MARINE STRENGTH.] China is, at this time, a far more powerful empire, than it was before its conquest by the eastern Tartars in 1644. This is owing to the consummate policy of Chun-tehi, the first Tartarian emperor of China, who obliged his hereditary subjects to conform themselves to the Chinese manners and policy, and the Chinese to wear the Tartar dress and arms. The two nations were thereby incorporated. The Chinese were appointed to all the civil offices of the empire. The emperor made Peking the seat of his government, and the Tartars quietly submitted to a change of their country and condition, which was so much in their favour.

This security, however, of the Chinese from the Tartars, takes from them all military objects; the Tartar power alone being formidable to that empire. The only danger that threatens it at present, is the difuse of arms. The Chinese land army is said to consist of more than seven hundred thousand men; but in these are comprehended all who are employed in the collection of the revenue, and the preservation of the canals, the great roads, and the public peace. The imperial guards amount to about 30,000. As to the marine force it is composed chiefly of the junk, we have already mentioned, and other small ships, that trade coast-ways, or to the neighbouring countries, or to prevent sudden descents.

A treatise on the military art, translated from the Chinese into the French language, was published at Paris in 1772, from which it appears that the Chinese are well versed in the theory of the art of war; but caution and care, and circumspection, are much recommended to their generals; and one of their maxims is, never to fight with enemies either more numerous or better armed than themselves.

HISTORY.] The Chinese pretend, as a nation, to an antiquity beyond all measure of credibility; and their annals have been carried beyond the period to which the Scripture chronology assigns the creation of the world. Poan-Kou is said by them to have been the first man, and the interval of time betwixt him and the death of their celebrated Confucius, which was in the year before Christ, 479, hath been reckoned from 276,000 to 96,961,740 years. But upon an accurate investigation of this subject it appears, that all the Chinese historical relations of events, prior to the reign of the emperor Yao, who lived 2057 years before Christ, are entirely

tirely fabulous, composed in modern times, unsupported by authentic records, and full of contradictions. It appears also, that the origin of the Chinese empire cannot be placed higher than two or three generations before Yao. But even this is carrying the empire of China to a very high antiquity: and it is certain that the materials for the Chinese history are extremely ample. The grand annals of the empire of China are comprehended in 668 volumes, and consist of the pieces that have been composed by the tribunal or department of history, established in China, for transmitting to posterity the public events of the empire, and the lives, characters, and transactions of its sovereigns. It is said that all the facts, which concern the monarchy since its foundation, have been deposited in this department, and from age to age have been arranged according to the order of times under the inspection of government, and with all the precautions against illusion or partiality that could be suggested. These precautions have been carried so far, that the history of the reign of each imperial family, has only been published after the extinction of that family, and was kept a profound secret during the dynasty, that neither fear nor flattery might adulterate the truth. It is asserted, that many of the Chinese historians exposed themselves to exile, and even to death, rather than disguise the defects and vices of the sovereign. But the emperor Chi-hoang-ti, at whose command the Great Wall was built; in the year 213 before the Christian era, ordered all the historical books and records, which contained the fundamental laws and principles of the ancient government, to be burnt, that they might not be employed by the learned to oppose his authority, and the changes he proposed to introduce into the monarchy. Four hundred literati were burnt with their books; yet this barbarous edict had not its full effect; several books were concealed, and escaped the general ruin. After this period, strict search was made for the ancient books and records that yet remained; but though much industry was employed for the purpose, it appears that the authentic historical sources of the Chinese, for the times anterior to the year 200 before Christ, are very few, and that they are still in smaller number for more remote periods. But notwithstanding the depredations that have been made upon the Chinese history it is still immensely voluminous, and has been judged by some writers superior to that of all other nations. Of the grand annals before mentioned, which amount to 668 volumes, a copy is preserved in the library of the French king. A chronological abridgement of this great work, in one hundred volumes, was published in the 42d year of the reign of Kang-hi; that is, in the year 1703. This work is generally called Kam-mo, or the abridgement. From these materials the abbé Grosier proposed to publish at Paris, in the French language, a General History of China, in 12 volumes 4to. some of which have been printed, and a smaller work in 12 volumes 8vo. by the late Father de Maille, missionary at Peking, hath been just concluded and published.

But the limits to which our work is confined will not permit us to enlarge upon so copious a subject as that of the Chinese history; and which, indeed, would be very uninteresting to the generality of European readers. A succession of excellent princes, and a duration of domestic tranquillity, united legislation with philosophy, and produced their Fo-hi, whose history is wrapped up in mysteries, their Li-Laokum, and above all their Confucius, at once the Solon and the Socrates of China. After all, the internal revolutions of the empire, though rare, produced the most dreadful effects, in proportion as its constitution was pacific, and they were attended with the

most bloody exterminations, in some provinces; so that though the Chinese empire is hereditary, the imperial succession was more than once broken into, and altered. Upwards of twenty dynasties, or different tribes and families of succession, are enumerated in their annals.

Neither the great Zinghis Khan, nor Tamerlane, though they often defeated the Chinese, could subdue their empire, and neither of them could keep the conquests they made there. Their celebrated wall proved but a feeble barrier against the arms of those famous Tartars. After their invasions were over, the Chinese went to war with the Manchew Tartars, while an indolent worthless emperor, Tsong-ching, was upon the throne. In the mean while, a bold rebel, named Li-cong-tse, in the province of Setchuen, dethroned the emperor, who hanged himself, as did most of his courtiers and women. Ou-fan-quey, the Chinese general, on the frontiers of Tartary, refused to recognise the usurper, and made a peace with Tsongate, or Chun-tehi, the Manchew prince, who drove the usurper from the throne, and took possession of it himself, about the year 1644. The Tartar maintained himself in his authority, and, as has been already mentioned, wisely incorporated his hereditary subjects with the Chinese, so that in effect Tartary became an acquisition to China. He was succeeded by a prince of great natural and acquired abilities, who was the patron of the Jesuits, but knew how to check them when he found them intermeddling with the affairs of his governments. About the year 1661, the Chinese, under this Tartar family, drove the Dutch out of the island of Formosa, which the latter had taken from the Portuguese.

In the year 1771, all the Tartars which composed the nation of the Tourgouths, left the settlements which they had under the Russian government on the banks of the Wolga, and the Jaick, at a small distance from the Caspian sea, and in a vast body of fifty thousand families, they passed through the country of the Hafsaks: after a march of eight months, in which they surmounted innumerable difficulties and dangers, they arrived in the plains that lie on the frontier of Carapen, not far from the banks of the river Ily, and offered themselves as subjects to Kien-long, emperor of China, who was then in the thirty-sixth year of his reign. He received them graciously, furnished them with provisions, clothes, and money, and allotted to each family a portion of land for agriculture and pasturage. The year following there was a second emigration of about thirty thousand other Tartar families, who also quitted the settlements which they enjoyed under the Russian government, and submitted to the Chinese sceptre. The emperor caused the history of these emigrations to be engraven upon stone, in four different languages.

With a view to promote a greater degree of social and commercial intercourse betwixt the countries, in 1792 Lord Macartney was sent as ambassador from Great Britain to China; the embassy was peculiarly splendid, the presents sent to the emperor noble and magnificent, such as were calculated to impress the Chinese with a high opinion, of our superior advancement in science and the arts, and also with a view to create a taste for the elegant productions of Great Britain in that immense Empire. A variety of adventitious and adverse circumstances contributed in a great measure to render abortive the purposes of the embassy; from the ill success of this attempt on the part of Great Britain to be received on terms of mutual friendship in this great empire, it appears that a considerable period must yet elapse before they relinquish the cautious and forbidding policy by which they have always been guided in their intercourse with foreign nations.

INDIA IN GENERAL

SITUATION AND BOUNDARIES. } THIS vast country is situated between the 66th and 109th degrees of East longitude, and between 1 and 40 of North latitude. It is bounded on the North, by the countries of Usbec Tartary and Thibet; on the South, by the Indian Ocean; on the East, by China and the Chinese sea; and on the West, by Persia and the Indian sea.

DIVISION.] I shall divide, as others have done, India at large into three greater parts; first, the Peninsula of India beyond the Ganges, called the Inner Peninsula; secondly, the main land, or the Mogul's empire; thirdly, the Peninsula within or on this side the Ganges; all of them vast, populous, and extended empires. But it is necessary, in order to save many repetitions, to premise on account of some particulars that are in common to those numerous nations, which shall be extracted from the most enlightened of our modern writers who have visited the country in the service of the East India Company.

POPULATION, INHABITANTS, RELIGION, AND GOVERNMENT. } Mr. Orme, an excellent and an authentic historian, comprehends the two latter divisions under the title of Indostan. The Mahometans (says he) who are called Moors, of Indostan, are computed to be about ten millions, and the Indians about a hundred millions. Above half the empire is subject to rajahs, or kings, who derive their descent from the old princes of India, and exercise all rights of sovereignty, only paying a tribute to the great mogul, and observing the treaties by which their ancestors recognised his superiority. In other respects, the government of Indostan is full of wise checks upon the overgrowing greatness of any subject; but (as all precautions of that kind depend upon the administration) the indolence and barbarity of the moguls or emperors, and their great viceroys, have rendered them fruitless.

The original inhabitants of India are called Gentooes; or, as others call them, Hindoos, and the country Hindoostan. They pretend that Brumma, who was their legislator both in politics and religion, was inferior only to God, and that he existed many thousand years before our account of the creation. This Brumma, probably, was some great and good genius, whose beneficence, like that of the pagan legislators, led his people and their posterity to pay him divine honours. The Bramins (for so the Gentoo priests are called) pretend that he bequeathed to them a book called the Vidam, containing his doctrines and institutions; and that though the original is lost, they are still possessed of a commentary upon it, called the Shahstah, which is wrote in the Shanferite, now a dead language, and known only to the Bramins, who study it.

The foundation of Brumma's doctrine consisted in the belief of a Supreme Being, who has created a regular gradation of beings, some superior, and some inferior to man; and in the immortality of the soul, and a future state of rewards and punishments, which is to consist of a transmigration into different bodies, according to the lives they have led in their pre-existent state. From this it appears more than probable, that the Pythagorean metempsychosis took its rise in India. The necessity of inculcating this sublime,

but otherwise complicated doctrine, into the lower ranks, induced the Bramins, who are by no means unanimous in their doctrines, to have recourse to sensible representations of the Deity and his attributes; so that the original doctrines of Brumma have degenerated to rank ridiculous idolatry; in the worship of different animals, and various images, and of the most hideous figures, either delineated or carved.

The Hindoos have, from time immemorial, been divided into four great tribes. The first and most noble tribe are the Bramins, who alone can officiate in the priesthood, like the Levites among the Jews. They are not, however, excluded from government, trade, or agriculture, though they are strictly prohibited from all menial offices by their laws. The second in order is the Sitri tribe, who, according to their original institution, ought to be all military men; but they frequently follow other professions. The third is the tribe of Beise, who are chiefly merchants, bankers, and banias or shopkeepers. The fourth tribe is that of Sudder, who ought to be menial servants; and they are incapable of raising themselves to any superior rank. If any one of them should be excommunicated from any of the four tribes, he and his posterity are for ever shut out from the society of every body in the nation, excepting that of the Harri cast, who are held in utter detestation by all the other tribes, and are employed only in the meanest and vilest offices. This circumstance renders excommunication so dreadful, that any Hindoo will suffer the torture, and even death itself, rather than deviate from one article of his faith.

Besides this division into tribes, the Gentoos are also subdivided into casts of small classes and tribes; and it has been computed that there are eighty-four of these casts, though some have supposed there was a greater number. The order of pre-eminence of all the casts, in a particular city or province, is generally indisputably decided. The Indian of an inferior would think himself honoured by adopting the customs of a superior cast; but this would give battle sooner than not vindicate its prerogatives; the inferior receives the victuals prepared by a superior cast with respect, but the superior will not partake of a meal which has been prepared by the hands of an inferior cast. Their marriages are circumscribed by the same barriers as the rest of their intercourses; and hence, besides the national physiognomy, the members of each cast preserve an air of still greater resemblance to one another. There are some casts remarkable for their beauty, and others as remarkable for their ugliness.

The members of each cast, says Dr. Robertson, adhere invariably to the profession of their forefathers. From generation to generation, the same families have followed, and will always continue to follow, one uniform line of life. To this may be ascribed that high degree of perfection conspicuous in many of the Indian manufactures; and though veneration for the practices of their ancestors may check the spirit of invention, yet, by adhering to these, they acquire such an expertness and delicacy of hand, that Europeans, with all the advantages of superior science, and the aid of more complete instruments, have never been able to equal the exquisite execution of their workmanship. While this high improvement of their more curious manufactures excited the admiration, and attracted the commerce of other nations, the separation of professions in India, and the early distribution of the people into classes, attached to particular kinds of labour, secured such abundance of the more common and useful commodities, as not only supplied their own wants, but ministered to those of the countries around them.

To the early division of the people into casts, we must likewise ascribe a striking peculiarity in the state of India; the permanence of its institutions, and the immutability in the manners of its inhabitants. What now is in India, always was there, and is still likely to continue: neither the ferocious violence and illiberal fanaticism of its Mahomedan conquerors, nor the power of its European masters, have effected any considerable alteration. The same distinctions of condition take place, the same arrangements in civil and domestic society remain, the same maxims of religion are held in veneration, and the same sciences and arts are cultivated. Hence, in all ages, the trade with India has been the same: gold and silver have uniformly been carried thither in order to purchase the same commodities with which it now supplies all nations; and from the age of Pliny to the present times, it has always been considered and execrated as a gulf which swallows up the wealth of every other country, that flows incessantly towards it, and from which it never returns.

All these casts acknowledge the Bramins for their priests, and from them derive their belief of the transmigration; which leads many of them to assist themselves even at the death of a fly, although occasioned by inadvertence.—But the greater number of casts are less scrupulous, and eat, although very sparingly, both of fish and flesh; but, like the Jews, not of all kinds indiscriminately. Their diet is chiefly rice and vegetables, dressed with ginger, turmeric, and other hotter spices, which grow almost spontaneously in their gardens. They esteem milk the purest of foods, because they think it partakes of some of the properties of the nectar of their gods, and because they esteem the cow itself almost like a divinity.

Their manners are gentle; their happiness consists in the solaces of a domestic life; and they are taught by their religion, that matrimony is an indispensable duty in every man, who does not entirely separate himself from the world from a principle of devotion. Their religion also permits them to have several wives; but they seldom have more than one; and it has been observed, that their wives are distinguished by a decency of demeanour, a solicitude in their families, and a fidelity to their vows, which might do honour to human nature in the most civilized countries. The amusements of the Hindoos consist in going to their pagodas, in assisting at religious shews, and in fulfilling a variety of ceremonies prescribed to them by the Bramins. Their religion forbids them to quit their own shores; nor do they want any thing from abroad. They might, therefore, have lived in much tranquillity and happiness, if others had looked on them with the same indifference with which they regard the rest of the world.

The soldiers are commonly called Rajah-poots, or persons descended from rajahs; and reside chiefly in the northern provinces, and are generally more fair-complexioned than the people of the southern provinces, who are quite black.

* Dr. Robertson's historical disquisition concerning India, Appendix p. 261, 262.

† The Gentoos are persuaded, that the waters of the three great rivers, Ganges, Kistna, and Indus, have the sacred virtue of purifying those who bathe in them, from all pollutions and sins. This religious idea seems to be founded on a principle of politeness, intended to restrain the natives from migrating into distant countries: for it is reasonable, that the sacred rivers are so situated, that there is not any part of India where the inhabitants may not have an opportunity of washing away their sins. The Ganges, which rises in the mountains of Thiber, with its affluent branches, runs through the provinces of Bengal, Bahar, and Orissa, and the provinces of Oude, Rohilcund, Agra, Delhi, and Lahore. The Kistna divides the Carnatic from Goiconda, and runs through the interior parts of the Deccan. And the Indus bounding the Guzarat provinces, separates Indostan from the dominions of Persia.

black. These rajah-noots are a robust, brave, faithful people, and enter into the service of those who will pay them: but when their leader falls in battle, they think that their engagements to him are finished, and they run off the field without any stain upon their reputation.

The custom of women burning themselves, upon the death of their husbands, still continues to be practised, though much less frequently than formerly. The Gentoos are as careful of the cultivation of their lands, and their public works and conveniences, as the Chinese; and there scarcely is an instance of a robbery in all Indostan, though the diamond merchants travel without defensive weapons.

RELIGION.] The institutions of religion, publicly established in all the extensive countries stretching from the banks of the Indus to Cape Comorin, present to the view an aspect nearly similar. They form a regular and complete system of superstition, strengthened and upheld by every thing which can excite the reverence and secure the attachment of the people. The temples, consecrated to their deities, are magnificent, and adorned not only with rich offerings, but with the most exquisite works in painting and sculpture, which the artists, highest in estimation among them, were capable of executing. The rites and ceremonies of their worship are pompous and splendid, and the performance of them not only mingles in all the transactions of common life, but constitutes an essential part of them. The Brahmins, who, as ministers of religion, preside in all its functions, are elevated above every other order of men, by an origin deemed not only more noble, but acknowledged to be sacred. They have established among themselves a regular hierarchy and gradation of ranks, which by securing subordination in their own order, adds weight to their authority, and gives them a more absolute dominion in the minds of the people. This dominion they support by the command of the immense revenues, with which the liberality of princes, and the zeal of pilgrims and devotees, have enriched their pagodas.

It is far from my intention to enter into any minute detail with respect to this vast and complicated system of superstition. An attempt to enumerate the multitude of deities which are the objects of adoration in India; to describe the splendour of worship in their pagodas, and the immense varieties of their rites and ceremonies: to recount the various attributes and functions which the craft of priests, or the credulity of the people, have ascribed to their divinities; especially if I were to accompany all this with a review of the numerous and often fanciful speculations and theories of learned men on this subject, would too much swell this part of our work.

The temples or pagodas of the Gentoos are stupendous but disgusting stone buildings, erected in every capital, and under the direction of the Bramins. To this, however, there are some exceptions; for in proportion, says Dr. Robertson, the philosophical historian of India, to the progress of the different countries of India in opulence and refinement, the structure of their temples gradually improved. From plain buildings they became highly ornamented fabrics, and, both by their extent and magnificence, are monuments of the power and taste of the people by whom they were erected. In this highly finished style there are pagodas of great antiquity in different parts of Indostan, particularly in the southern provinces, which were not exposed to the destructive violence of Mahomedan zeal. In order to assist my readers in forming a proper idea of these buildings, I shall briefly describe two, of which we have the most accurate accounts. The

entry

entry to the pagoda of Chillambrum, near Porto Nova, on the Coromandel coast, held in high veneration on account of its antiquity, is, by a stately gate under a pyramid an hundred and twenty two feet in height, built with large stones above forty feet long, and more than five feet square, and all covered with plates of copper, adorned with an immense variety of figures neatly executed. The whole structure extends one thousand three hundred and thirty-two feet in one direction, and nine-hundred and thirty six in another. Some of the ornamental parts are finished with an elegance entitled to the admiration of the most ingenious artists.

The pagoda of Seringham, superior in sanctity to that of Chillambrum, surpasses it as much in grandeur; and fortunately I can convey a more perfect idea of it, by adopting the words of an elegant and accurate historian. This pagoda is situated about a mile from the western extremity of the island of Seringham, formed by the division of the great river Caveri into two channels. "It is composed of seven square inclosures, one within the other, the walls of which are twenty-five feet high, and four thick. These enclosures are three hundred and fifty feet distant from one another, and each has four large gates with a square tower; which are placed, one in the middle of each side of the enclosure, and opposite to the four cardinal points. The outward wall is near four miles in circumference, and its gateway to the south is ornamented with pillars, several of which are single stones thirty-three feet long, and nearly five in diameter; and those which form the roof are still larger; in the inmost inclosures are the chapels. Here, as in all the other great pagodas of India, the Brahmins live in a subordination which knows no resistance, and slumber in a voluptuousness which knows no wants*."

If the Bramins are masters of any uncommon art or science, they frequently turn it to the purposes of profit from their ignorant votaries. Mr. Scrafton says, that they know how to calculate eclipses; and that judicial astrology is so prevalent among them, that half the year is taken up with unlucky days; the head astrologer being always consulted in their councils. The Mahometans likewise encourage these superstitions, and look upon all the fruits of the Gentoo industry as belonging to themselves. Though the Gentoos are entirely passive under all their oppressions, and by their state of existence, the practice of their religion, and the scantiness of their food, have nothing of that resentment in their nature that animates the rest of mankind; yet they are susceptible of avarice, and sometimes bury their money, and rather than discover it, put themselves to death by poison or otherwise. This practice, which it seems is not uncommon, accounts for the vast scarcity of silver that till of late prevailed in Indostan.

The reasons above mentioned account likewise for their being less under the influence of their passions than the inhabitants of other countries. The perpetual use of rice, their chief food, gives them but little nourishment; and their marrying early, the males before fourteen, and their women at ten or eleven years of age, keeps them low and feeble in their persons. A man is in the decline of life at thirty, and the beauty of the women is on decay at eighteen; at twenty-five they have all the marks of old age. We are not therefore to wonder at their being soon strangers to all personal exertion and vigour of mind; and it is with them a frequent saying, that it is better to sit than to walk, to lie down than to sit, to sleep than to wake; and death is the best of all.

Th

The Mahometans, who in Indostan are called Moors, are of Persian, Turkish, Arabic, and other extractions. They early began, in the reigns of the califs of Bagdad, to invade Indostan. They penetrated as far as Delhi, which they made their capital. They settled colonies in several places, whose descendants are called Pytans; but their empire was overthrown by Tamerlane, who founded the Mogul government, which still subsists. Those princes being strict Mahometans, received under their protection all that professed the same religion, and who being a brave, active people, counterbalanced the numbers of the natives. They are said to have introduced the division of provinces, over which they appointed soubahs; and those provinces, each of which might be stiled an empire, were subdivided into nabobships; each nabob being immediately accountable to his soubah, who in process of time became almost independent of the emperor, or, as he is called the Great Mogul, upon their paying him an annual tribute. The vast resort of Persian and Tartar tribes has likewise strengthened the Mahometan government; but it is observable, that in two or three generations, the progeny of all those adventurers, who brought nothing with them but their horses and their swords, degenerated into all eastern iddolence and sensuality.

Of all those tribes, the Mahrattas at present make the greatest figure. They are a kind of mercenaries, who live on the mountains between Indostan and Persia. They commonly serve on horseback, and, when well commanded, they have been known to give law even to the court of Delhi. Though they are originally Gentoos, yet they are of bold active spirits, and pay no great respect to the principles of their religion. Mr. Scrafton says, that the Mahometans or Moors are of so detestable a character, that he never knew above two or three exceptions, and those were among the Tartar and Persian officers of the army. They are void, we are told, of every principle even of their own religion; and if they have a virtue, it is an appearance of hospitality, but it is an appearance only; for while they are drinking with, and embracing a friend, they will stab him to the heart. But it is probable, that these representations of their moral depravity are carried beyond the bounds of truth.

The people of Indostan are governed by no written laws; nor is there a lawyer in their whole empire; and their courts of justice are directed by precedents. The Mahometan institutes prevail only in their great towns and their neighbourhood. The empire is hereditary, and the emperor is heir only to his own officers. All lands go in the hereditary line, and continue in that state even down to the subtenants, while the lord can pay his taxes, and the latter their rent, both which are immutably fixed in the public books of each district. The imperial demefine lands are those of the great rajah families, which fell to Tamerlane and his successors. Certain portions of them are called jaghire lands, and are bestowed by the crown on the great lords or omrahs, and upon their death revert to the emperor; but the rights of the subtenants, even of those lands, are indefeasible.

Such are the outlines of the government by which this great empire long subsisted, without almost the semblance of virtue among its great officers, either civil or military. It was shaken, however, after the invasion of Mahomet Shah, by Kouli Khan, which was attended by so great a diminution of the imperial authority, that the soubahs and nabobs became absolute in their own governments. Though they could not alter the fundamental laws of property, yet they invented new taxes, which beggared the people,

to pay their armies and support their power; so that many of the people, a few years ago, after being unmercifully plundered by collectors and tax-masters, were left to perish through want. To sum up the misery of the inhabitants, those soubahs and nabobs, and other Mahometan governors, employ the Gentoos themselves, and some even of the Bramins, as the ministers of their rapaciousness and cruelties. Upon the whole, ever since the invasion of Kouli Khan, Indostan, from being a well regulated government, is become a scene of mere anarchy or stratocracy; every great man protects himself in his tyranny by his soldiers, whose pay far exceeds the natural riches of his government. As private assassinations and other murders are here committed with impunity, the people, who know they can be in no worse estate, concern themselves very little in the revolutions of government. To the above causes are owing the late successes of the English in Indostan. The reader, from this representation, may perceive, all that the English have acquired in point of territory, has been gained from usurpers and robbers; and their possession of it being guarantied by the present lawful emperor, is said to be founded upon the laws and constitutions of that country. We are, however, sorry to be obliged to remark, that the conduct of many of the servants of the East India Company towards the natives, and not properly punished or checked by the directors, or the British legislature, has in too many instances been highly dishonourable to the English name, and totally inconsistent with that humanity which was formerly our national characteristic.

It may be here proper just to observe, that the complexion of the Gentoos is black, their hair long, and the features of both sexes regular. At court, however, the great families are ambitious of intermarrying with Persians and Tartars, on account of the fairness of their complexion, resembling that of their conqueror Tamerlane and his great generals.

BOUNDARIES. THIS peninsula is bounded by Thibet and China, on the North; by China and the Chinese sea, on the East; by the same sea and the straits of Malacca, on the South; and by the Bay of Bengal and the Hither India on the West. The space between Bengal and China, is now called the Province of Mecklus, and other districts subject to the king of Ava or Burmah.

NAME.] The name of India is taken from the river Indus, which of all others was the best known to the Persians. The whole of this peninsula was unknown to the ancients, and is partly so to the moderns.

AIR AND CLIMATE.] Authors differ concerning the air of this country, some preferring that of the southern, and some that of the northern parts. It is generally agreed, that the air of the former is hot and dry, but in some places moist, and consequently unhealthy. The climate is subject to hurricanes, lightnings, and inundations, so that the people build their houses upon high pillars to defend them from floods, and they have no other idea of seasons, but wet and dry. Easterly and westerly monsoons (which is an Indian word) prevail in this country.

MOUNTAINS.] These run from North to South almost the whole length of the country; but the lands near the sea are low, and annually overflowed in the rainy season.

RIVERS.] The chief are Sanpoo or Burrampooter, Domea, Mecon, Menan, and Ava, or the great river *Nou Kian*.

Of these the Burrampooter, called Sanpoo, in the upper part of its course, is by far the most considerable. This rival sister of the Ganges issues from the same mountains that give birth to that river; but taking a contrary, i. e. an easterly direction, through Thibet, winds to the south-west through Assam, and entering Indostan, flows to the south, assume the name of Megna, and joins the western branch of the Ganges with an immense body of water, equal if not superior to the Ganges itself.

These two noble rivers, when they approach the sea, divide into such a multitude of channels, and receive such a number of navigable streams, that a tract of country, nearly equal to Great Britain, in extent, enjoys by their means the finest inland navigation that can be conceived, and which gives constant employment to 30,000 boatmen. These channels are so numerous that very few places in this tract are even in the dry season 25 miles from a navigable stream; and in the season of the periodical rains, they overflow their banks to the depth of 30 feet, and form an inundation that fertilizes the soil to the extent of more than 100 miles*.

BAYS AND STRAITS.] The bays of Bengal, Siam, and Cochin-China. The straits of Malacca and Sincapora. The promontories of Siam, Romana, and Banfac.

SOIL AND PRODUCT OF THE } DIFFERENT NATIONS. The soil of this peninsula is fruitful in general, and produces all the delightful fruits that are found in other countries contiguous to the Ganges, as well as

roots and vegetables: also saltpetre, and the best teck timber or Indian oak, which for ship building in warm climates is superior to any European oak. It abounds likewise in silks, elephants, and quadrupeds both domestic and wild, that are common in the southern kingdom of Asia. The natives drive a great trade in gold, diamonds, rubies, topazes, amethysts, and other precious stones. Tonquin produces little or no corn or wine, but is the most healthful country of all the peninsula. In some places, especially towards the north, the inhabitants have swellings in their throats, said to be owing to the badness of their water.

INHABITANTS, CUSTOMS, } AND DIVERSIONS. } The Tonquinese are excellent mechanics and fair traders; but greatly oppressed by their king and great lords. His majesty engrosses the trade, and his factors sell by retail to the Dutch and other nations. The Tonquinese are fond of lacker-houses, which are unwholesome and poisonous. The people in the south are a savage race, and go almost naked, with large silver and gold ear-rings, and coral, amber, or shell bracelets. In Tonquin and Cochin China, the two sexes are scarcely distinguishable by their dress which resembles that of the Persians. The people of quality are fond of English broad-cloth, red or green: and others wear a dark-coloured cotton cloth. In Azem, which is thought one of the best countries in Asia, the inhabitants prefer dog's flesh to all other animal food. The people of that kingdom pay no taxes, because the king is sole proprietor of all the gold and silver and other metals found in his kingdom. They live, however, easily and comfortably. Almost every housekeeper has an elephant for the conveniency of his wives and women; polygamy being practised all over India.

It is unquestionable, that those Indians, as well as the Chinese, had the use of gunpowder before it was known in Europe; and the invention is generally ascribed to the Azemese. The inhabitants of the southern division of this peninsula go under the name of Malayans, from the neighbouring country of Malacca.

Though the religious superstitions that prevail in this peninsula are extremely gross, yet the people believe in a future state; and when their kings are interred, a number of animals are buried with them, and such vessels of gold and silver as they think can be of use to them in their future life. The people in this peninsula are commonly very fond of show, and often make an appearance beyond their circumstances. They are delicate in no part of their dress but in their hair, which they buckle up in a very agreeable manner. In their food they are loathsome; for besides dogs, they eat rats, mice, serpents, and stinking fish. The people of Aracan are equally indelicate in their amours, for they hire Dutch and other foreigners to consummate the nuptials with their virgins, and value their women most when in a state of pregnancy. Their treatment of the sick is ridiculous beyond belief, and in many places, when a patient is judged to be incurable, he is exposed on the bank of some river, where he is either drowned or devoured by birds or beasts of prey.

The diversions common in this country are fishing and hunting, the celebrating of festivals, and acting comedies, by torch-light, from evening to morning.

LANGUAGE.] The language of the court of Delhi is Persian, but in this peninsula it is chiefly Malayana, as we have already observed, interspersed with other dialects.

the priesthood, descend from those Brachmens who are mentioned to us with so much reverence by antiquity; and although much inferior, either as philosophers or men of learning, to the reputation of their ancestors, as priests, their religious doctrines are still implicitly followed by the whole nation; and as preceptors, they are the source of all the knowledge which exists in Indostan. But the utmost stretch of their mathematical knowledge seems to be the calculation of eclipses. They have a good idea of logic; but it does not appear that they have any treatises on rhetoric; their ideas of music, if we may judge from their practice, are barbarous; and in medicine, they derive no assistance from the knowledge of anatomy, since dissections are repugnant to their religion.

The poetry of the Asiatics is too turgid, and full of conceits, and the diction of their historians very diffuse and verbose; but though the manner of eastern compositions differs from the correct taste of Europe, there are many things in the writings of Asiatic authors worthy the attention of literary men. Mr. Dow observes, that in the Shanserita, or learned language of the Bramins, which is the grand repository of the religion, philosophy, and history of the Hindoos, there are in particular many hundred volumes in prose, which treat of the ancient Indians and their history. The same writer also remarks, that the Shanserita records contain accounts of the affairs of the Western Asia very different from what any tribe of the Arabians have transmitted to posterity; and that it is more than probable, that, upon examination, the former will appear to bear the marks of more authenticity, and of greater antiquity, than the latter. The Arabian writers have been generally so much prejudiced against the Hindoos, that their accounts of them are by no means to be implicitly relied on.

Mr. Dow observes, that the small progress, which correctness and elegance of sentiment and diction have made in the East did not proceed from a want of encouragement to literature. On the contrary, it appears, that no princes in the world patronized men of letters with more generosity and respect, than the Mahometan emperors of Indostan. A literary genius was not only the certain means to acquire a degree of wealth which must astonish Europeans, but an infallible road for rising to the first offices of the state. The character of the learned was at the same time so sacred, that tyrants, who made a pastime of embroiling their hands in the blood of their other subjects, not only abstained from offering violence to men of genius, but stood in fear of their pens.

MANUFACTURES AND COMMERCE.] These vary in the different countries of this peninsula; but the chief branches have been already mentioned. The inhabitants, in some parts, are obliged to manufacture their salt out of ashes. In all handicraft trades that they undertake, the people are more industrious, and better workmen, than most of the Europeans; and in weaving, sewing, embroidering, and some other manufactures, it is said, that the Indians do as much work with their feet as their hands. Their painting, though they are ignorant of drawing, is amazingly vivid in its colours. The fineness of their linen, and their sillagree works in gold and silver, are beyond any thing of those kinds to be found in other parts of the world. The commerce of India, in short, is courted by all trading nations in the world, and probably has been so from the earliest ages: it was not unknown even in Solomon's time; and the Greeks and Romans drew from thence their highest materials of luxury. The greatest share of it, through events foreign to this part of our work, is now centered

centered in England, the Dutch, together with the French, having lost their possessions in that part of the world; nor is that of the Swedes and Danes of much importance.

CONSTITUTION, GOVERNMENT, } This article is so extensive, that
RARIETIES, AND CITIES. } it requires a slight review of the
kingdoms that form this peninsula. In Azem I have already observed, the king is proprietor of all the gold and silver; he pays little or nothing to the Great Mogul; his capital is Ghergong, or Kirganu. We know little or nothing of the kingdom of Tipra, but that it was anciently subject to the kings of Arracan; and that they send to the Chinese gold and silk, for which they receive silver in return. Arracan lies to the south of Tipra and is governed by twelve princes subject to the chief king, who resides in his capital. His palace is very large, and contains, as we are told, seven idols cast in gold, of two inches thick, each of a man's height, and covered over with diamonds and other precious stones. Pegu is about 350 English miles in length, and almost the same in breadth. In the year 1754. Pegu was reduced to the state of a dependant province by the king of Ava. Macao is the great mart of trade in Pegu. We know little of the kingdom of Ava. It is said the honours the king assumes are next to divine. His subjects trade chiefly in musk and jewels, rubies and sapphires. In other particulars, the inhabitants resemble those of Pegu. In those kingdoms, and indeed in the greater part of this peninsula, the doctrines of the Grand Lama of Thibet prevail, as well as those of the Bramins.

The kingdom of Laos or Lahos formerly included that of Jangoma or Jangomay; but that is now subject to Ava; we know few particulars of it that can be depended upon. It is said to be immensely populous, to abound in all the rich commodities as well as the gross superstitions of the East, and to be divided into a number of petty kingdoms, all of them holding of one sovereign, who like his oriental brethren, is absolutely despotic, and lives in inexplicable pomp and magnificence; but is of the Lama religion, and often the slave of his priests and ministers.

The kingdom of Siam has been often described by missionaries and pretended travellers in the most romantic terms; and therefore we can pay little other credit to their accounts, farther than that it is a rich and flourishing kingdom, and that it approaches, in its government, policy, and the quickness and acuteness of its inhabitants, very near to the Chinese. The kingdom of Siam is surrounded by high mountains, which, on the east side, separate it from the kingdoms of Jamboja and Laos; on the west, from Pegu; and on the north, from Ava, or, more properly, from Jangoma; on the south it is washed by the river Siam, and has the peninsula of Malacca, the north-west part whereof is under its dominion. The extent of the country, however, is very uncertain, and is but indifferently peopled. The inhabitants of both sexes are more modest than any found in the rest of this peninsula. Great care is taken of the education of their children. Their marriages are simple, and performed by their talapouns, or priests, sprinkling holy water upon the couple, and repeating some prayers. We are told that gold is so abundant in this country, that their most ponderous images are made of it; and that it is seen in vast quantities on the outside of the king's palace. These relations are found, by modern travellers, to be the fictions of French and other missionaries; for the country has no mines of gold, their ornaments are either excessively thin plates of that metal, or a very bright lacker that covers wooden or other materials. The government here is extremely despotic; even servants must appear before their masters in a kneeling posture; and the mandarins are treated before

the king.

the king. Siam, the capital, is represented as a large city, but scarcely a sixth part of it is inhabited; and the palace is about a mile and a half in circuit. Bangkok, which stands about 18 leagues to the south of Siam, and 12 miles from the sea, is the only place towards the coast that is fortified with walls, batteries, and brass cannon; and the Dutch have a factory at Ligor, which stands on the east side of the peninsula of Malacca, but belonging to Siam.

The peninsula of Malacca is a large country, and contains several kingdoms or provinces. The Dutch, however, are said to be the real masters and sovereigns of the whole peninsula, being in possession of the capital (Malacca). The inhabitants differ but little from brutes in their manner of living; and yet the Malayan language is reckoned the purest of any spoken in all the Indies. We are told by the latest travellers, that its chief produce is tin, pepper, elephants' teeth, canes, and gums. Some missionaries pretend that it is the Golden Chersonesus or Peninsula of the ancients, and the inhabitants used to measure their riches by bars of gold. The truth is, that the excellent situation of this country admits of a trade with India; so that when it was first discovered by the Portuguese, who were afterwards expelled by the Dutch, Malacca was the richest city in the East, next to Goa and Ormus, being the key of the China, the Japan, the Moluccas, and the Sunda trade. The country, however, at present, is chiefly valuable for its trade with the Chinese. This degeneracy of the Malaysans, who were formerly an industrious, ingenious people, is easily accounted for, by the tyranny of the Dutch, whose interest it is they should never recover from their present state of ignorance and slavery.

The English carry on a smuggling kind of trade in their country ships, from the coast of Coromandel and the bay of Bengal to Malacca. This commerce is connived at by the Dutch governor and council among them, who little regard the orders of their superiors, provided they can enrich themselves.

Cambodia, or Comboja, is a country little known to the Europeans; but according to the best information, its greatest length, from north to south, is about 520 English miles: and its greatest breadth, from west to east, about 398 miles. This kingdom has a spacious river running through it, the banks of which are the only habitable parts of the nation, on account of its sultry air, and the pestiferous gnats, serpents, and other animals bred in the woods. Its soil, commodities, trade, animals, and products by sea and land, are much the same with the other kingdoms of this vast peninsula. The betel, a creeping plant of a particular flavour, and, as they say, an excellent remedy for all those diseases that are common to the inhabitants of the East Indies, is the highest luxury of the Cambodians, from the king to the peasant; but is very unpalatable and disagreeable to the Europeans. The same barbarous magnificence, the despotism of their king, and the ignorance of the people, prevail here as throughout the rest of the peninsula. Between Cambodia, and Cochin-China, lies the little kingdom of Chiampa, the inhabitants of which trade with the Chinese, and seem therefore to be somewhat more civilized than their neighbours.

Cochin-China, or the western China, is situated under the torrid zone, and extends, according to some authors, about 500 miles in length; but it is much less extensive in its breadth from east to west. Laos, Cambodia, and Chiampa, as well as some other smaller kingdoms, are said to be tributary to Cochin-China. The manners and religion of the people seem to be originally Chinese; and they are much given to trade. Their king is said

to

to be immensely rich, and his kingdom enjoys all the advantages of commerce that are found in the other parts of the East Indies; but at the same time we are told that this mighty prince, as well as the king of Tonquin, are subject to the Chinese emperor. It is reasonable to suppose, that all those rich countries were peopled from China, or at least that they had, some time or other, been governed by one head, till the mother-empire became so large, that it might be convenient to parcel it out; reserving to itself a kind of feudal superiority over them all.

Tonquin has been already mentioned, and little can be added to what has been said, unless we adopt the fictions of the popish missionaries. The government of this kingdom, however, is particular. The Tonquinese had revolted from the Chinese, which was attended by a civil war. A compromise at last took place between the chief of the revolt and the representative of the ancient kings, by which the former was to have all the executive powers of the government, under the name of the Chouah; but that the Bua, or real king, should retain the royal titles, and be permitted some inconsiderable civil prerogatives within his palace, from which neither he nor any of his family can stir without the permission of the chouah.

The chouah resides generally in the capital Cachao, which is situated near the centre of the kingdom. The Bua's palace is a vast structure, and has a fine arsenal. The English have a very flourishing house on the north side of the city, conveniently fitted up with store-houses and office-houses, a noble dining-room, and handsome apartments for the merchants, factors, and officers of the company.

The possession of rubies, and other precious stones of an extraordinary size, and even of white and party-coloured elephants, convey among those credulous people a pre-eminence of rank and royalty, and has sometimes occasioned bloody wars. After all, it must be acknowledged, that however dark the accounts we have of those kingdoms may be, yet there is sufficient evidence to prove, that they are immensely rich in all the treasures of nature; but that those advantages are attended with many natural calamities, such as floods, volcanos, earthquakes, tempests, and above all, rapacious and poisonous animals, which render the possession of life, even for an hour, precious and uncertain.

The British nation possess in full sovereignty, the whole south of Bengal, and the greatest part of B.ihar. In Orissa or Orixa, only the districts of Midnapour. The whole of the British possessions in this part of Indostan, contain about 150,000 square British miles of land; to which, if we add the district of Benares, the whole will be 162,000, that is, 30,000 more than are contained in Great Britain and Ireland: and near eleven millions of inhabitants. The total net revenue, including Benares, is about 287 lacks of Sicca rupees, which may be reckoned equal to 3,050,000^l. *Rennel*. With their allies and tributaries, they now occupy the whole navigable course of the Ganges from its entry on the plains to the sea, which by its winding course is more than 1350 miles.

AIR AND SEASONS.] The winds in this climate generally blow for six months from the south, and six from the north. April, May, and the be-

* A considerable addition both to the territory and revenue of the East India Company was obtained by the cessions in the late treaty of peace with Tippoo Sultan, to the amount of 13,374 square miles, affording a revenue of 1,315,765 *Koontary pagodas*.

RENNEL.

ginning

ginning of June, are excessively hot, but refreshed by sea breezes; and in some dry seasons, the hurricanes, which tear up the sands, and let them fall in dry showers, are excessively disagreeable. The English, and consequently the Europeans in general, who arrive at Indostan, are commonly seized with some illness, such as flux or fever in their different appearances; but when properly treated, especially if the patients are abstemious, they recover, and afterwards prove healthy.

MOUNTAINS.] The most remarkable mountains are those of Caucasus and Naugracut, which divide India from Persia, Usbec Tartary, and Thibet; and are inhabited by Mahrattas, Afghans, or Patans, and other people more warlike than the Gentoos. As to the mountains of Balesgaut which run almost the whole length of India, from north to south, they are so high as to stop the western monsoon; the rains beginning sooner on the Malabar, than they do on the Coromandel coast.

RIVERS.] These are the Indus called by the natives Sinda and Sindch, and the Ganges, both of them known to the ancients, and as observed in p. 750, held in the highest esteem, and even veneration, by the modern inhabitants. Besides these rivers, many others water this country.

SEAS, BAYS, AND CAPES.] These are the Indian ocean; the bay of Bengal; the gulf of Cambaya; the straits of Ramanakoel; Cape Comorin and Diu.

INHABITANTS.] I have already made a general review of this great empire, and have only to add, to what I have said of their religion and sects, that the fakirs are a kind of Mahometan mendicants or beggars, who travel about, practising the greatest austerities; but many of them are impostors. Their number is said to be 800,000. Another set of mendicants are the Joghies, who are idolaters, and much more numerous, but most of them are vagabonds and impostors, who live by amusing the credulous Gentoos with foolish fictions. The Banians, who are so called from their affected innocence of life, serve as brokers, and profess the Gentoos religion, or somewhat like it.

The Persees, or Parfes, of Indostan, are originally the Gaürs, described in Persia, but are a most industrious people, particularly in weaving, and architecture of every kind. They pretend to be possessed of the works of Zoroaster, whom they call by various names, and which some Europeans think contain many particulars that would throw light upon ancient history both sacred and profane. This opinion is countenanced by the few parcels of those books that have been published; but some are of opinion that the whole is a modern impostor, founded upon sacred, traditional, and profane histories. They are known as paying divine adoration to fire, but it is said only as an emblem of the divinity.

The nobility and people of rank delight in hunting with the bow as well as the gun, and often train the leopard to the sports of the field. They affect shady walks and cool fountains, like other people in hot countries. They are fond of tumblers, mountebanks, and jugglers; of barbarous music, both in wind and string instruments, and play at cards in their private parties. Their houses make no appearance, and those of the commonalty are poor and mean, and generally thatched, which renders them subject to fire; but the manufacturers chuse to work in the open air; and the inside of houses belonging to principal persons are commonly neat, commodious, and pleasant, and many of them magnificent.

COMMERCE OF INDOSTAN.] I have already mentioned this article, as well as the manufactures of India; but the Mahometan merchants here car-

Bengal,
English res

ry on a trade that has not been described, I mean that with Mecca, in Arabia, from the western parts of this empire, up the Red Sea. This trade is carried on in a particular species of vessels called junks, the largest of which, we are told, besides the cargoes, will carry 1700 Mahometan pilgrims to visit the tombs of their prophet. At Mecca they meet with Abyssinian, Egyptian, and other traders, to whom they dispose of their cargoes for gold and silver; so that a Mahometan junk returning from this voyage is often worth 200,000l.

PROVINCES, CITIES, AND OTHER } The province of Agra, is the
BUILDINGS, PUBLIC AND PRIVATE. } largest in all Indostan, containing 40
large towns and 340 villages. Agra is the greatest city, and its castle the
largest fortification in all the Indies. The Dutch have a factory there, but
the English have none.

The city of Delhi, which is the capital of that province, is likewise the capital of Indostan. It is described as being a fine city, and containing the imperial palace, which is adorned with the usual magnificence of the East. Its stables formerly contained 12,000 horses, brought from Arabia, Persia, and Tartary; and 500 elephants. When the forage is burnt up by the heats of the season, as is often the case, these horses are said to be fed in the morning with bread, butter, and sugar, and in the evening with rice-milk properly prepared.

Tatta, the capital of Sindia, is a large city; and it is said that a plague which happened there in 1699 carried off above 80,000 of its manufacturers in silk and cotton. It is still famous for the manufacture of palanquins, which are a kind of canopied couches, on which the great men all over India, Europeans as well as natives, repose when they appear abroad. They are carried by four men, who will trot along, morning and evening, 40 miles a day; to being usually hired, who carry the palanquin by turns, four at a time. Though a palanquin is dear at first cost, yet the porters may be hired for nine or ten shillings a month each, out of which they maintain themselves. The Indus, at Tatta, is about a mile broad, and famous for its fine carp.

Though the province of Moulton is not very fruitful, yet it yields excellent iron and canes; and the inhabitants, by their situation, are enabled to deal with the Persians and Tartars yearly for above 60,000 horses.

The province of Cassimere being surrounded with mountains, is difficult of access, but when entered, it appears to be the paradise of the Indies. It is said to contain 100,000 villages, to be stored with cattle and game, without any beasts of prey. The capital (Cassimere) stands by a large lake; and both sexes, the women especially, are almost as fair as the Europeans, and are said to be witty, dexterous, and ingenious.

The province and city of Lahor formerly made a great figure in the Indian history, and is still one of the largest and finest provinces in the Indies, producing the best sugars of any in Indostan. Its capital was once about nine miles long, but is now much decayed. We know little of the provinces of Ayud, Varad, Bekar, and Hallabas, that is not in common with the other provinces of Indostan, excepting that they are inhabited by a hardy race of men, who seem never to have been conquered, and though they submit to the Moguls, live in an easy, independent state. In some of those provinces many of the European fruits, plants, and flowers, thrive as in their native soil.

Bengal, of all the Indian provinces, is perhaps the most interesting to an English reader. It is esteemed to be the storehouse of the East Indies. Ita

fertility exceeds that of Egypt after being overflowed by the Nile, and the produce of its soil consists of rice, sugar, canes, corn, sciamum, small mulberry, and other trees. Its calicoes, silks, salt-petre, lakka, opium, wax, and civet, go all over the world: and provisions here are in vast plenty, and incredibly cheap, especially pullets, ducks, and geese. The country is intersected by canals cut out of the Ganges for the benefit of commerce, and extends near 100 leagues on both sides the Ganges, full of cities, towns, castles, and villages.

In Bengal, the worship of the Gentoos is practised in its greatest purity, and their sacred river (Ganges) is in a manner lined with their magnificent pagodas or temples. The women, notwithstanding their religion, are said by some to be lascivious and enticing.

The principal English factory in Bengal is at Calcutta, and is called Fort William: it is situated on the river Hugley, the most westerly branch of the Ganges. It is about 105 miles from the sea; and the river is navigable up to the town, for the largest ships that visit India. The fort itself is said to be irregular, and untenable against disciplined troops, but the servants of the company have provided themselves with an excellent house, and most convenient apartments for their own accommodation. As the town itself has been in fact for some time in possession of the company, an English civil government, by a mayor and aldermen, was introduced into it. This was immediately under the authority of the company. But, in 1773, an act of parliament was passed to regulate the affairs of the East India company, as well in India as in Europe. By this act, a governor-general and four counsellors were appointed, and chosen by the parliament, with whom was veiled the whole civil and military government of the presidency of Fort William; and the ordering, management, and government of all the territorial acquisitions and revenues in the kingdom of Bengal, Bahar, and Orissa, so long as the company should remain possessed of them. The governor-general and council so appointed, are invested with the power of superintending and controlling the government and management of the presidencies of Madras, Bombay and Bencoolen. The governor-general and council to pay obedience to the orders of the court of directors, and to correspond with them. The governor-general and counsellors are likewise empowered to establish a court of judicature at Fort-William; to consist of a chief justice and three other judges, to be named from time to time by his majesty: these are to exercise all criminal, admiralty, and ecclesiastical jurisdiction: to be a court of record, and a court of oyer and terminer for the town of Calcutta, and factory of Fort-William, and its limits; and the factories subordinate thereto. But the establishment of this supreme court does not appear to have promoted either the interests of the East India company, or the felicity of the people of the country. No proper attention has been paid to the manners and customs of the natives: acts of great oppression and injustice have been committed; and the supreme court has been a source of great dissatisfaction, disorder, and confusion. For the subsequent regulations of the East India territories and company, we refer to our account in the History of England.

In 1756, an unhappy event took place at Calcutta, which is too remarkable to be omitted. The India nabob, or viceroy, quarrelled with the company, and invested Calcutta with a large body of black troops. The governor, and some of the principal persons of the place, threw themselves, with their chief effects, on board the ships in the river; they who remained for some hours, bravely defended the place; but their ammunition being expended,

pended, they tyrant, inflexible chief called the Bl almost all co inexpressible, the rest dying phrensy. A

ended, they surrendered upon terms. The foubah, a capricious, unfeeling tyrant, instead of observing the capitulation, forced Mr. Holwel, the governor's chief servant, and 147 British subjects, into a little but secure prison called the Black-hole, a place about eighteen feet square, and shut up from almost all communication of free air. Their miseries during the night were inexpressible, and before morning no more than twenty-three were found alive, the rest dying of suffocation, which was generally attended with a horrible phrensy. Among those saved was Mr. Holwel himself, who has written a most affecting account of the catastrophe. The insensible nabob returned to his capital, after plundering the place, imagining he had routed the English out of his dominions; but the seasonable arrival of admiral Watson and colonel (afterwards lord) Clive, put them once more, with some difficulty, in possession of Calcutta; and the war was concluded by the battle of Plassey, gained by the colonel, and the death of the tyrant Surajah Dowla, in whose place Mhriz Jaffier, one of his generals, who had previously signed a secret treaty with Clive to desert his master, and amply reward the English, was advanced of course to the foubahship.

The capital of Bengal, where the nabob keeps his court, is Patna or Moorshedabad; and Benares, lying in the same province, is the Gentoo university, and celebrated for its sanctity.

Chandernagore was the principal place possessed by the French in Bengal; it lies higher up the river than Calcutta. But though strongly fortified, furnished with a garrison of 500 Europeans, and 1200 Indians, and defended by 123 pieces of cannon and three mortars, it was taken by the English admirals Watson and Pococke, and colonel Clive, and also was taken the last war, but restored at the peace. Since the beginning of the present war it has been taken possession of by the English. Hugley, which lies fifty miles to the north of Calcutta upon the Ganges, is a place of prodigious trade for the richest of all Indian commodities. The Dutch had here a well fortified factory. The search for diamonds is carried on by about 10,000 people from Saumelpour, which lies thirty leagues to the north of Hugley, for about fifty miles farther. Dacca is said to be the largest city of Bengal, and the tide comes up to its walls. The other chief towns are Cassumbazar, Chinchura, Barnagua, and Maldo; besides a number of other places of less note, but all of them rich in the Indiann manufactures.

We know little concerning the province or foubah of Malva, which lies to the west of Bengal, but that it is as fertile as the other provinces, and that its chief cities are Ratipor, Ougein, and Indoor. The province of Candish includes that of Berar and part of Orissa, and its capital is Brampur, or Burhampoor, a flourishing city, and carries on a vast trade in chintzes, calicoes, and embroidered stuffs. Cattac is the capital of Orissa.

The above are the provinces belonging to the Mogul's empire to the north of what is properly called the Peninsula within the Ganges. Those that lie to the southward fall into the description of the peninsula itself.

HISTORY.] The first invader of this country, worthy to be noticed, was the famous Alexander of Macedon. Zinghis Khan also directed his force there in the year 1221, and made the emperor forsake his capital; he is said to have given the name of Mogul to India. Long before Tamerlane descended in the female line from that conqueror, Mahometan princes had entered, made conquests, and established themselves in India. Valid, the sixth of the caliphs, named Ommiades, who ascended the throne in the 908th year of the Christian era, and in the 90th of the hegira, made

con-

conquests in India; so that the Koran was introduced very early into this country. Mahmoud, son of Sebegetchin, prince of Gazna, the capital of a province separated by mountains from the north-west parts of India, and situated near Kandahar, carried the Koran with the sword into Indostan, in the year 1000 or 1002 of the Christian æra. He treated the Indians with all the rigour of a conqueror; and all the fury of a zealot; plundering treasures, demolishing temples, and murdering idolaters throughout his route. The wealth found by him in Indostan is represented to be immense. The successors of this Mahmoud are called the dynasty of the Gaznavides, and maintained themselves in a great part of the countries which he had conquered in India until the year 1155, or 1157, when Kosrou Schah, the 13th and last prince of the Gaznavide race, was deposed by Kulsain Gauri, who founded the dynasty of the Gaurides, which furnished five princes, who possessed nearly the same dominions as their predecessors the Gaznavides. Scheabbedin, the fourth of the Gauride emperors, during the life of his brother and predecessor Gaiatheddin, conquered the kingdoms of Moultan and Delhi, and drew from thence prodigious treasures. But an Indian, who had been rendered desperate by the pollutions and insults to which he saw his gods and temples exposed, made a vow to assassinate Scheabbedin, and executed it. The race of Gaurides finished in the year 1212, in the person of Mahmoud, successor and nephew to Scheabbedin, who was also cut off by the swords of assassins. Several revolutions followed till the time of Tamerlane, who entered India at the end of the year 1398, descending more terrible than all its former inundations, from the centre of the northern part of the Indian Caucasus. This invincible barbarian met with no resistance sufficient to justify, even by the military maxims of Tartars, the cruelties with which he marked his way. But after an immense slaughter of human creatures, he at length rendered himself lord of an empire which extended from Smyria to the banks of the Ganges. The history of the successors of Tamerlane, who reigned over Indostan with little interruption more than 350 years, has been variously represented, but all agree in the main, that they were magnificent and despotic princes; that they committed their provinces, as has been already observed, to rapacious governors, or to their own sons, by which their empire was often miserably torn in pieces. At length, the famous Aurengzebe, in the year 1667, though the youngest among many sons of the reigning emperor, after defeating or murdering all his brethren, mounted the throne of Indostan, and may be considered as the real founder and legislator of the empire. He was a great and a politic prince, and the first who extended his dominion, though it was little better than nominal, over the Peninsula within the Ganges, which is at present so well known to the English. He lived so late as the year 1707, and it is said that some of his great officers of state were alive in the year 1750. From what has been already said of this empire, Aurengzebe seems to have left too much power to the governors of his distant provinces, and to have been at no pains in preventing the effects of that dreadful despotism, which, while in his hands, preserved the tranquillity of his empire; but when it descended to his weak indolent successors, occasioned its overthrow.

In 1713, four of his grandsons disputed the empire, which after a bloody struggle, fell to the eldest, Mauzoldin, who took the name of Jehander Shah. This prince was a slave to his pleasures, and was governed by his mistress so absolutely, that his great omrahs conspired against him, and raised to the throne one of his nephews, who struck off his uncle's head. The new emperor, whose name was Furrukhsir, was governed and at last en-

slaved by two brothers of the name of Seyd, who abused his power so grossly, that being afraid to punish them publicly, he ordered them both to be privately assassinated. They discovered his intention, and dethroned the emperor, in whose place they raised a grandson of Aurengzebe, by his daughter, a youth of seventeen years of age, after imprisoning and strangling Furrukhsir. The young emperor proved disagreeable to the brothers, and being soon poisoned, they raised to the throne his elder brother, who took the title of Shah Jehan. The rajahs of Indostan, whose ancestors had entered into stipulations, or what may be called *pacta conventa*, when they admitted the Mogul family, took the field against the two brothers; but the latter were victorious, and Shah Jehan was put in tranquil possession of the empire, but died in 1719. He was succeeded by another prince of the Mogul race, who took the name of Mahommed Shah, and entered into private measures with his great rajahs for destroying the Seyds, who were declared enemies to Nizam al Muluck, one of Aurengzebe's favourite generals. Nizam, it is said, was privately encouraged by the emperor to declare himself against the brothers, and to proclaim himself soubah of Decan, which belonged to one of the Seyds, who was assassinated by the emperor's order, and who immediately advanced to Delhi to destroy the other brother, but he no sooner understood what had happened, than he proclaimed the sultan Ibrahim, another of the Mogul princes, emperors. A battle ensued in 1720, in which the emperor was victorious, and is said to have used his conquest with great moderation, for he remitted Ibrahim to the prison from whence he had been taken; and Seyd, being likewise a prisoner, was condemned to perpetual confinement, but the emperor took possession of his vast riches. Seyd did not long survive his confinement; and upon his death, the emperor abandoned himself to the same course of pleasures that had been so fatal to his predecessors. As to Nizam, he became now the great imperial general, and was often employed against the Mahrattas, whom he defeated, when they had almost made themselves masters of Agra and Delhi. He was confirmed in his soubahship, and was considered as the first subject in the empire. Authors, however, are divided as to his motives for inviting Nadir Shah, otherwise Kamb Khan, the Persian monarch, to invade Indostan. It is thought, that he had intelligence of a strong party formed against him at court, but the truth perhaps is, that Nizam did not think that Nadir Shah could have success, and at first wanted to make himself useful by opposing him. The success of Nadir Shah is well known, and the immense treasure which he carried from Indostan in 1739. Besides those treasures he obliged the Mogul to surrender to him all the lands to the west of the rivers Attock and Synd, comprehending the provinces of Peythor, Kabul, and Gagna, with many other rich and populous principalities, the whole of them almost equal in value to the crown of Persia itself.

This invasion cost the Gentoos 200,000 lives. As to the plunder made by Nadir Shah, some accounts, and those too strongly authenticated, make it amount to the incredible sum of two hundred and thirty-one millions sterling, as mentioned by the London Gazette of those times. The most moderate say that Nadir's own share amounted to considerably above seventy millions. Be that as it will, the invasion of Nadir Shah may be considered as putting a period to the greatness of the Mogul empire in the house of Tamerlane. However, when Nadir had raised all the money he could in Delhi, he re-instated the Mogul, Mahommed Shah, in the sovereignty, and returned into his own country. A general defection of the provinces soon after ensued; none being willing to yield obedience to a prince deprived

deprived of the power to enforce it. The provinces to the north-west of the Indus had been ceded to Nadir Shah, who being assassinated in 1747, Achmet Abdallah, his treasurer, an unprincipled man, but possessed of great intrepidity, found means, in the general confusion occasioned by the tyrant's death, to carry off three hundred camels loaded with wealth, whereby he was enabled to put himself at the head of an army, and march against Delhi with fifty thousand horse. Thus was the wealth, drawn from Delhi made the means of continuing those miseries of war which it had at first brought upon them. Prince Ahmed Shah, the Mogul's eldest son, and the vizier, with other leading men, in this extremity took the field, with eighty thousand horse, to oppose the invader. The war was carried on with various success, and Mahommed Shah died before its termination. His son, Ahmed Shah, then mounted the imperial throne at Delhi; but the empire fell every day more into decay. Abdallah erected an independent kingdom, of which the Indus is the general boundary.

The Mahrattas, a warlike nation, possessing the south-western peninsula of India, had, before the invasion of Nadir Shah, exacted a chout or tribute from the empire, arising out of the revenues of the province of Bengal, which being withheld, in consequence of the enfeebled state of the empire, the Mahrattas became clamorous. The empire began to totter to its foundation; every petty chief, by counterfeiting grants from Delhi, laying claim to jaghires* and to districts. The country was torn to pieces by civil wars, and groaned under every species of domestic confusion. Ahmed Shah reigned only seven years, after which much disorder and confusion prevailed in Indostan, and the people suffered great calamities. At present, the imperial dignity of Indostan is vested in Shah Zadah, who is universally acknowledged to be the true heir of the Tamerlane race; but his power is feeble: the city of Delhi, and a small territory round it, is all that is left remaining to the house and heir of Tamerlane, who depends upon the protection of the English, and whose interest it is to support him, as his authority is the best legal guarantee.

We shall now conclude the history of Indostan with some account of the British transactions in that part of the world, since 1765, when they were quietly settled in the possession of the provinces of Bengal, Bahar, and Orixá; not indeed as absolute sovereigns, but as tributaries to the emperor. This state of tranquillity, however, did not long continue; for in 1767 they found themselves engaged in a very dangerous war with Hyder Ally the sovereign of Mysore. This man had originally been a military adventurer, who learned the rudiments of the art of war in the French camp; and in the year 1753, had distinguished himself in their service. In 1763, having been advanced to the command of the army of Mysore, he deposed his sovereign, and usurped the supreme authority under the title of regent. In a short time he extended his dominions on all sides, except the Carnatic, until at last his dominions equalled the island of Great Britain in extent, with a revenue of not less than four millions sterling annually. The disorders which took place in various parts of Indostan, particularly among the Mahrattas, enabled him to aggrandize himself in such a manner, that his power soon became formidable to his neighbours; and in 1767 he found himself in danger of being attacked on one side by the Mahrattas, and on the other

by the British. The former were bought off with a sum of money, and the latter were in consequence obliged to retire. Having soon, however, assembled all their forces, several obstinate engagements took place; and the British now, for the first time, found a steady opposition from an Indian prince. The war continued with various success during the years 1767, 1768, and part of 1769, when Hyder, with a strong detachment of his army, passing by that of the British, advanced within a little distance of Madras, when he intimidated the government into a peace upon his own terms. The advantages gained by this peace, however, were quickly lost by an unfortunate war with the Mahrattas, from whom, in the year 1771, he received a most dreadful defeat, almost his whole army killed. Hyder was now reduced to the necessity of allowing his enemies to invade the country, till they retired of their own accord; after which he conducted his affairs with incredible perseverance and diligence, so that in a few years he became more formidable than ever. In 1772, the Mahrattas made some attempts to get possession of the provinces of Corah and some others, but were opposed by the British; who, next year, defeated and drove them across the river Ganges, when they had invaded the country of the Rohillas. On this occasion the latter had acted only as the allies of Sujah Dowlah, to whom the Rohilla chiefs had promised to pay 40 lacks of rupees for the protection offered them; but when the money came to be paid, it was under various pretences refused; the consequence of which was, that the Rohilla country was next year (1774) invaded and conquered by the British, as well as several other large tracts of territory; by which means the boundary of Oude was advanced to the westward, within 25 miles of Agra; north westward to the upper part of the navigable course of the Ganges; and south-westward to the Jumna river.

In 1778, a new war commenced with the Mahrattas; on which occasion a brigade, consisting of 7000 Indian troops, commanded by British officers, traversed the whole empire of the Mahrattas, from the river Jumna to the western ocean. About this time the war with France broke out, and Hyder Ally, probably expecting assistance from the French, made a dreadful irruption into the Carnatic, at the head of 100,000 men. For some time he carried every thing before him; and, having the good fortune to defeat, or rather destroy a detachment of the British army under colonel Baillie, it was generally imagined that the power of Britain in that part of the world would have soon been annihilated. By the happy exertions of Sir Eyre Coote, however, to whom the management of affairs was now committed, the progress of this formidable adversary was stopped; and he soon became weary of a war, which was attended with incredible expence to himself, without any reasonable prospect of success. By the year 1782, therefore, Hyder Ally was sincerely desirous of peace, but died before it could be brought to a conclusion; and his rival Sir Eyre Coote did not survive him above five months; a very remarkable circumstance, that the commanders in chief of two armies, opposed to each other, should both die natural deaths, within so short a space of time.

To Hyder Ally succeeded his son Tippoo Sultan, whose military prowess is well known. Of all the native princes of India, Tippoo was the most formidable to the British government, and the most hostile to its authority. The peace of Mangalore in 1784 had, it was supposed, secured his fidelity by very feeble ties; and the splendid embassy which, not long after that event, he dispatched to France, afforded much reason to apprehend that some plan was concerted between the old

18

01

government of that country and the tyrant of Myfore, for the annoyances of Great Britain in its Indian possessions; but the good sense of the unfortunate Louis XVII. induced him to refuse entering into these visionary schemes.

Disappointed in the hopes of assistance from this quarter, Tippoo either impelled by real or imagined injuries commenced a hostile attack upon one of the allies of Great Britain. An engagement took place and the British conceived themselves bound to take an active part, and to unite with two of the most powerful states of India, the Nizam and the Mahrattas, to crush the rising power of Myfore. The transactions of the British army have been assiduously detailed as is necessary for the entertainment of the reader in the History of England; they were almost invariably crowned with success, and Tippoo was at last reduced to the greatest distress, and on the 24th of February, when the preparations for a general assault were in great forwardness, it was announced that preliminaries of peace were settled. Nothing could equal the disappointment of the soldiers at this news, who expected to make fortunes by the plunder of this wealthy capital. After the cessation of arms, which then took place, the conduct of Tippoo Sultan was so equivocal and suspicious, as to make it necessary on our part, to renew the preparations for the siege. Overawed at length, by the firmness and decision of lord Cornwallis, and probably alarmed by the discontent of his own people, the reluctant Sultan submitted to all the terms proposed; and on the 19th of March, the copies of the definitive treaty were delivered in form, by his sons to lord Cornwallis, and the agents of the allied princes. The Nizam's son, prince Secunder Jah; and the Mahratta plenipotentiary Hurry Punt, thought it beneath their dignity to be present on this occasion in person, and were represented by their vakeels.

The substance of the treaty was, 1st, That Tippoo was to cede one half of his dominions to the allied powers. 2d, That he was to pay three crores, and thirty lacks of rupees. 3d, That all prisoners were to be restored. 4th, That two of the Sultan's three eldest sons were to become hostages for the due performance of the treaty.

Tippoo is said to have been prevailed upon with infinite difficulty to subscribe to the terms of peace; and now that all was settled, the uneasiness in the seraglio became extreme in parting with the boys, who were to be sent out as hostages. The sultan was again intreated to request they might be allowed to stay another day, in order to make suitable preparations for their departure: and lord Cornwallis, who had dispensed with their coming at the time the treaty was sent, had again the goodness to grant his request.

When the princes left the fort, which appeared to be manned, as they went out, and every where crowded with people, who, from curiosity or affection, had come to see them depart; the sultan himself was on the rampart above the gateway. They were saluted by the fort when leaving it, and with twenty one guns from the park as they approached our camp, where the part of the line they passed was turned out to meet them. The vakeels conducted them to the tents, which had been sent from the fort for their accommodation, where they were met by Sir John Kennaway, the Nizam's and Nizam's vakeels, and from thence accompanied by them to head quarters.

The princes were each mounted on an elephant richly caparisoned, and seated in a silver canopied seat and were attended by their father's vakeels, and the persons already mentioned, also on elephants. The procession was led by several camel harraras, [messengers] and seven standard bear-

... carrying small green flags suspended from rockets*, followed by one hundred pikemen, with spears inlaid with silver. Their guard of two hundred sepoy, and a party of horse, brought up the rear. In this order they approached head quarters, where the battalion of Bengal sepoy, commanded by captain Welch, appointed for their guard, formed a street to receive them. Lord Cornwallis, attended by his staff, and some of the principal officers of the army, met the princes at the door of his large tent, as they dismounted from the elephants; and, after embracing them, led them in, one in each hand, to the tent; the eldest, A'dul-Kalick, was about ten, the youngest, Mooza-ud-Deen, about eight years of age. When they were seated on each side of lord Cornwallis, Gullam Ally, the head vakeel, addressed his lordship as follows: "These children were this morning the sons of the sultan my master; their situation is now changed, and they must now look up to your lordship as their father."

Lord Cornwallis, who had received the boys as if they had been his own sons, anxiously assured the vakeel and the young princes themselves, that every attention possible would be shewn to them, and the greatest care taken of their persons. Their little faces brightened up; the scene became highly interesting; and not only their attendants, but all the spectators were delighted to see that any fears they might have harboured were removed, and that they would soon be reconciled to their change of situation, and to their new friends.

The princes were dressed in long white muslin gowns, and red turbans. They had several rows of large pearls round their necks, from which was suspended an ornament consisting of a ruby and an emerald of considerable size, surrounded by large brilliants; and in their turbans, each had a sprig of rich pearls. Bred up from their infancy with infinite care, and instructed in their manners to imitate the reserve and politeness of age, it astonished all present to see the correctness and propriety of their conduct. The eldest boy, rather dark in his colour, with thick lips, a small flattish nose, and a long thoughtful countenance, was less admired than the youngest, who is remarkably fair, with regular features, a small round face, large full eyes, and a more animated appearance. Placed too, on the right hand of lord Cornwallis, the youngest was said to be the favourite son, and the sultan's intended heir. His mother (a sister of Burham-ud-Deen's, who was killed at Sattimungulum), a beautiful delicate woman, had died of fright and apprehension, a few days after the attack of the lines. This melancholy event made the situation of the youngest boy doubly interesting, and, with the other circumstances, occasioned his attracting by much the most notice. After some conversation, his lordship presented a handsome gold watch to each of the princes, with which they seemed much pleased.

Next day, the 27th, lord Cornwallis, attended as the day before, went to pay the princes a visit at their tents, pitched near the mosque redoubt, within the green canout or wall. After embracing them, he led them, one in each hand, into the tent, where chairs were placed for his lordship, themselves, and his suite. The eldest boy, now seated on his lordship's right hand, appeared less serious than the former day, and when he spoke was not only graceful in his manner, but had a most affable, animated appearance. Each of the princes presented his lordship with a fine Persian sword, and in return he gave the oldest a fuzee, and the youngest a pair of pistols, of very fine and curious workmanship.

* Rocket is a missile weapon, consisting of an iron tube of about a foot long, and an inch in diameter, fixed to a bamboo of ten or twelve feet long.

Thus ended the Indian War; the justice and policy of which has been very much doubted by those who must be allowed to be competent judges of Indian politics: Others however are of a different opinion and defend this war, which, says Major Drom, "has vindicated the honour of the nation, has given the additional possessions and security to the settlements in India, which they required; has effected the wished-for balance amongst the native powers on the peninsula; has, beyond all former example, raised the character of the British arms in India; and has afforded an instance of good faith in alliance and moderation in conquest, so eminent, as ought to constitute the English arbiters of power; worthy of holding the sword and scales of justice in the east."

However different our opinions may be with regard to the justice of the war, none can withhold their approbation from lord Cornwallis in every thing that respects the conduct of the military operations; and his moderation and sound policy in the concluding scenes, cannot be too highly extolled; and we sincerely hope that by his wisdom, firmness and humanity he may be enabled by the blessing of providence to establish tranquillity in a neighbouring kingdom, lately entrusted to his government, of infinitely more importance to Britain than India.

It is utterly impossible says Major Rennel, in the present imperfect state of our knowledge of the geography of the northern part of the peninsula (notwithstanding the present improvements), to describe, with any degree of accuracy, the boundaries of the new cessions to the Mahrattas and Nizam; or even the positions of all the principal places situated within them.

RIVERS.] The Cattack or Mahanada, the Soane and Nerbudda, the Padder, and the famous Kistna.

CLIMATE, SEASONS, AND PRODUCE.] The chain of mountains already mentioned, running from north to south, renders it winter on one side of this peninsula, while it is summer on the other. About the end of June, a south-west wind begins to blow from the sea, on the coast of Malabar, which, with continual rains, lasts four months, during which time all is serene upon the coast of Coromandel (the western and eastern coasts being so denominated). Towards the end of October, the rainy season and the change of the monsoons begins on the Coromandel coast, which being destitute of good harbours, renders it extremely dangerous for ships to remain there, during that time; and to this is owing the periodical returns of the English shipping to Bombay, upon the Malabar coast. The air is naturally hot in this peninsula, but it is refreshed by breezes, the wind altering every twelve hours; that is, from midnight to noon it blows off the land, when it is tolerably hot; and during the other twelve hours from the sea, which last proves a great refreshment to the inhabitants of the coast. The produce of the soil is the same with that of the other part of the East Indies. The like may be said of their quadrupeds, fish, fowl, and noxious creatures and insects.

INHABITANTS.] The inhabitants of this part are more black in complexion, than those of the other peninsula of India, though lying nearer to the equator, which makes some suspect them to be the descendants of an ancient colony from Ethiopia. The greatest part of them have but a faint complexion.

tion of any allegiance they owe to the emperor of Indostan, whose tribute from hence has been, ever since the invasion of Shah Nadir, intercepted by their soubahs and nabobs, who now exercise an independent power in the government; but besides those soubahs, and other imperial viceroys, many estates in this peninsula belong to rajahs, or lords, who are descendants of their old princes, and look upon themselves as being independent on the Mogul, and his authority. On the subject of eastern manners, we cannot pass over the dreadful austerities practised by the Hindoo-devotees that they may obtain a certain and speedy admission into the delights of paradise. Animated by the desire of obtaining that glorious reward, the patient Hindoo smiles amidst unutterable misery, and exults in every variety of voluntary torture; he equally braves the raging flood and the devouring fire, his courage is not to be shaken by the sharpest pangs of torture or by the approach of death in its most ghastly and appalling form. In the hope of expiating former crimes by adequate penance, and of regaining speedily that fancied elysium, he binds himself to the performance of vows which make human nature shudder and human reason stagger. He passes whole weeks without the smallest nourishment, and whole years in painful vigils. He wanders about naked as he came from the womb of his parent, and suffers, without repining, every vicissitude of heat and cold, of driving storm and beating rain. He stands with his arms crossed above his head, till the sinews shrink and the flesh withers away. He fixes his eye upon the burning orb of the sun, till its light be extinguished and its moisture entirely dried up*.

PROVINCES, CITIES, AND OTHER BUILDINGS, PUBLIC AND PRIVATE. } From what has been said above, this peninsula is rather to be divided into great governments, or soubahships, than into provinces. One soubah often engrosses several provinces, and fixes the seat of his government, according to his own conveniency. I shall speak of those provinces, as belonging to the Malabar, or Coromandel coast, the two great objects of English commerce in that country; and first, of the eastern, or Coromandel coast.

Madura begins at Cape Comorin, the southernmost point of the peninsula. It is about the bigness of the kingdom of Portugal, and is said to have been governed by a sovereign king; who had under him seventy tributary princes, each of them independent in his own dominions, but paying him a tax; now the case is much altered, the prince being scarcely able to protect himself and his people from the depredations of his neighbours, but by a tribute to buy them off; the capital is Tritchinopoli. The chief value of this kingdom seems to consist of a pearl fishery upon its coast. Tanjour is a little kingdom, lying to the east of Madura. The soil is fertile, and its prince rich, till plundered by the nabob of Arcot, and some British subjects connected with him. Within it lies the Danish East India settlement of Tranquebar, and the fortress of Negapatam, which was taken from the Dutch the last war, and confirmed to the English by the late treaty of peace; the capital city is Tanjour.

The Carnatic, as it is now called, is well known to the English. It is bounded on the east by the bay of Bengal; on the north by the river Kistna, which divides it from Golconda, on the west by Vissapour; and on the south by the kingdoms of Messaur and Tanjour; being in length, from south to north, about 345 miles, and 276 in breadth from east to west. The capital of the Carnatic is Bishnagar, and of our ally the nabob, Arcot. The country in general is esteemed healthful, fertile, and populous. Within this country,

upon the Coromandel coast, lies fort St. David's, or Cuddalore, belonging to the English, with a district round it. The fort is strong, and of great importance to our trade. Five leagues to the north lies Pondicherry, once the emporium of the French in the East Indies, but which hath been repeatedly taken by the English, and as often restored by the treaties of peace. Since the beginning of the present war it was again taken by the English, and has since remained in their possession.

Fort St. George, better known by the name of Madras, is the capital of the English East India Company's dominions in that part of the East Indies, and is distant eastward from London, about 4,800 miles. Great complaints have been made of the situation of this fort; but no pains have been spared by the company, in rendering it impregnable to any force that can be brought against it by the natives. It protects two towns, called, from the complexions of their several inhabitants, the White and the Black. The White Town is fortified, and contains an English corporation of a mayor and alderman. Nothing has been omitted to mend the natural badness of its situation, which seems originally to be owing to the neighbourhood of the diamond mines, which are but a week's journey distant. These mines are under the direction of a Mogul officer, who lets them out by admeasurement, enclosing the contents by pallisadoes; all diamonds above a certain weight originally belonged to the emperor. The district belonging to Madras, extending about 40 miles round, is of little value for its product; 80,000 inhabitants of various nations are said to be dependent upon Madras; but its safety consists in the superiority of the English by sea. It carries on a considerable trade with China, Persia, and Mocha.

The reader needs not be informed of the immense fortunes acquired by the English, upon this coast, within these thirty years; but some of these fortunes appear to have been obtained by the most iniquitous practices. There seems to have been some fundamental errors in the constitution of the East India Company. The directors considered the riches acquired by their governors and other servants as being plundered from the company, and accordingly sent out superintendants to controul their governors and overgrown servants; and have from time to time changed their governors, and members of the council there. As this is a subject of the greatest importance that ever perhaps occurred in the history of a commercial country, the reader will indulge us in one or two reflections.

The English East India Company, through the distractions of the Mogul empire, the support of our government, and the undaunted, but fortunate success of their military officers, have acquired so amazing a property in this peninsula, and in Indostan, that it is superior to the revenues of many crowned heads; and some of their own servants pretend, that when all their expences are paid, their clear revenue amounts to near two millions sterling; out of which they were to pay 400,000l. annually to the government, while suffered to enjoy their revenues. How that revenue is collected, or from whence it arises, is best known to the company; part of it, however, has been granted in property, and part of it is secured on mortgages, for discharging their expences in supporting the interests of their friends, the emperor, and the respective soubahs and nabobs they have assisted.

Be this as it may, this company has exercised many rights appropriated to sovereignty; such as those of holding forts, coining money, and the like. Those powers were thought incompatible with the principles of a commercial limited company, and therefore the English ministry and parliament, have repeatedly interfered, in order to regulate the affairs of the company, and a board

board of a control at home is at length established. By the success which attended the British arms in the late war, and by the extent of territory which was ceded to the Company, their possessions being more safe from the incursions of Tippoo Sultan, are now rendered permanent and secure. It is much to be dreaded, however, that the natives are not sufficiently protected from the oppression, injustice, and cruelty of which the servants of the East India Company have been too often guilty.

The celebrated Hyder Ally, with whom the servants of the company often embroiled them, shared the Carnatic with the nabob of Arcot. In the last war he took many of its chief places, obtained great advantages over the company's troops, and brought his forces to the gates of Madras, but died before the conclusion of the war. He is said to be a native of the province of Messar, or Mysore, which lies to the south west of the Carnatic; and the Christians of the apostle St. Thomas live at the foot of the mountains Getti, that separate Messar from Malabar. Pellicate, lying to the north of Madras, belongs to the Dutch. I have already mentioned the kingdom of Golconda, which, besides its diamonds, is famous for the cheapness of its provisions, and for making white wine of grapes that are ripe in January. Golconda is subject to a prince, called the Nizam, or Subah of the Deccan, who is rich, and can raise 100,000 men. The capital of his dominions is called Bagnagar, or Hyderabad, but the kingdom takes its name from the city of Golconda. East-south-east of Golconda lies Masulipatan, where the English and Dutch have factories. The English have also factories at Ganjam and Vizigapatan, on this coast; and the Dutch at Narispore. The province of Orissa, from whence the English company draw some part of their revenues, lies to the north of Golconda, extending in length from east to west about 550 miles, and in breadth about 240. It is governed chiefly by Moodajee Booslah, and his brother, allies to the Mahrattas. In this province stands the temple of Jagaryunt, which they say is attended by 500 priests. The idol is an irregular pyramidal black stone, of about 4 or 500lb. weight, with two rich diamonds near the top, to represent the eyes, and the nose and mouth painted with vermilion.

The country of Deccan* comprehends several large provinces, and some kingdoms; particularly those of Baglana, Balagate, Telenga, and the kingdom of Visapour. The truth is, the names, dependencies, and government of those provinces are extremely unsettled; they having been reduced by Aurengzebe, or his father, and subject to almost annual revolutions and alterations. Modern geographers are not agreed upon their situation and extent, but we are told, that the principal towns are Aurengabad, and Doltabad, or Dowlet-abad; and the latter is the strongest place in all Indostan, near it lies the famous pagod of Elora, in a plain about two leagues square. The tombs, chapels, temples, pillars, and many thousand figures that surround it, are said to be cut out of the natural rock, and to surpass all the other efforts of human art. Telenga lies on the east of Golconda; and its capital, Beder, contains a garrison of 3000 men. The inhabitants of this province speak a language peculiar to themselves.

Baglani lies to the west of Telenga, and forms the smallest province of the empire; its capital is Mouler. The Portuguese territory begins here at the

* This name DECCAN signifies the SOUTH, and in its most extensive signification, includes the whole peninsula south of Indostan Proper. However, in its ordinary signification, it means only the countries situated between Indostan Proper, the Carnatic, and Orissa; that is, the provinces of Condish, Amednagar, Visapour, and Orissa.

port of Daman, twenty-one leagues south of Surat, and extends almost twenty leagues to the north of Goa. Visapour is a large province, the western part is called Concan, which is intermingled with the Portuguese possessions. The rajah of Visapour is said to have had a yearly revenue of six millions sterling, and to bring to the field 150,000 soldiers. The capital is of the same name, and the country very fruitful. The principal places on this coast are, Daman, Bassaim, Trapar, or Tarapor, Chawl, Dandi, Rajahour, Dabul Rajupur, Ghiria, and Vingurla. The Portuguese have lost several valuable possessions on this coast, and those which remain are on the decline.

Guzerat is a maritime province on the gulf of Cambaya, and one of the finest in India, but inhabited by a fierce rapacious people. It is said to contain 35 cities. Amed-Abad is the capital of the province, where there is an English factory, and is said, in wealth, to vie with the richest towns in Europe. About 43 French leagues distant lies Surat, where the English have a flourishing factory.

Among the islands lying upon the same coast is that of Bombay, belonging to the English East India company. Its harbour can conveniently hold 1000 ships at anchor. The island itself is about seven miles in length, and twenty in circumference; but its situation and harbour are its chief recommendations, being destitute of almost all the conveniencies of life. The town is about a mile long, and poorly built; and the climate was fatal to the English constitutions, till experience, caution, and temperance, taught them preservatives against its unwholesomeness. The best water there is preserved in tanks, which receive it in the rainy seasons. The fort is a regular quadrangle, and well built of stone. Many black merchants reside here. This island was part of the portion paid with the infants of Portugal to Charles II. who gave it to the East India company; and the island is still divided into three Roman catholic parishes, inhabited by Portuguese, and what are called popish Mestizes and Canarins; the former being a mixed breed of the natives and Portuguese, and the other the Aborigines of the country. The English have fallen upon methods to render this island and town, under all their disadvantages, a safe, if not an agreeable residence. The reader scarcely needs to be informed, that the governor and council of Bombay have lucrative posts, as well as the officers under them. The troops on the island are commanded by English officers; and the natives, when formed into regular companies, and disciplined, are here, and all over the East Indies, called Sepoys. The inhabitants of the island amount to near 60,000, of different nations; each of whom enjoys the practice of his religion unmolested.

Near Bombay are several other islands, one of which, called Elephanta, contains the most inexplicable antiquity perhaps in the world. A figure of an elephant, of the natural size, cut coarsely in stone, presents itself on the landing place, near the bottom of a mountain. An easy slope then leads to a stupendous temple, hewn out of the solid rock, eighty or ninety feet long, and forty broad. The roof, which is cut flat, is supported by regular rows of pillars, about ten feet high, with capitols, resembling round cushions, as if pressed by the weight of the incumbent mountain. At the farther end are three gigantic figures, which have been multiplied by the blind zeal of the Portuguese. Besides the temple, are various images, and groups on each hand cut in the stone; one of the latter bears a rude resemblance of the judgement of Solomon; besides a colonnade, and a door of regular architecture; but the whole bears no manner of resemblance to any of the Gentoo works.

The island and city of Goa, the capital of the Portuguese settlements, in the East Indies, lies about thirty miles south of Vinguria. The island is about twenty-seven miles in compass. It has one of the finest and best fortified ports in the Indies. This was formerly a most superb settlement, and was surpassed either in bulk or beauty by few of the European cities. It is said that the revenues of the Jesuits upon this island, equalled those of the crown of Portugal. Goa, as well as the rest of the Portuguese possessions of this coast, is under a viceroy, who still keeps up the remains of the ancient splendour of the government. The rich peninsula of Salset is dependent on Goa. Sunda lies south of the Portuguese territory, and is governed by a rajah, tributary to the Mogul. The English factory of Corwar is one of the most pleasant and healthy of any upon the Malabar coast. Kanora lies about forty miles to the south of Goa, and reaches to Calicut. Its soil is famous for producing rice, that supplies many parts of Europe, and some of the Indies. The Kanorines are said generally to be governed by a lady, whose son has the title of Rajah; and her subjects are accounted the bravest and most civilised of any in that peninsula, and remarkably given to commerce.

Though Malabar gives name to the whole south-west coast of the peninsula, yet it is confined at present to the country so called, lying on the west of Cape Comorin, and called the Dominions of the Samorin. The Malabar language, however, is common in the Carnatic; and the country itself is rich and fertile but pestered with green adders, whose poison is incurable. It was formerly a large kingdom of itself. The most remarkable places in Malabar are Kannamore, containing a Dutch factory and fort; Tellicherry, where the English have a small settlement, keeping a constant garrison of thirty or forty soldiers. Calicut, where the French and Portuguese have small factories, besides various other distinct territories and cities. Cape Comorin, which is the southernmost part of this peninsula, though not above three leagues in extent, is famous for uniting in the same garden the two seasons of the year; the trees being loaded with blossoms and fruit on the one side, while on the other side they are stripped of all their leaves. This surprising phenomenon is owing to the ridge of mountains so often mentioned, which traverse the whole peninsula from south to north. On the opposite sides of the Cape, the winds are constantly at variance; blowing from the west on the west side, and from the east on the eastern side.

It may be proper to observe, that in the district of Cochin, within Malabar, are to be found some thousands of Jews, who pretended to be of the tribe of Manasseh, and to have records engraven on copper-plates in Hebrew characters. They are said to be so poor, that many of them embrace the Gentoo religion. The like discoveries of the Jews and their records have been made in China, and other places of Asia, which have occasioned various speculations among the learned.

Before we close our account of Indostan, it may be proper to describe its present division according to the different powers among whom it is shared, and this is the more necessary as it may serve to give the reader a clearer idea of these extensive regions, and at the same time shew him how very considerable a portion belongs to the British and their allies.

ed the unhappy prince his dominions, but annexed to Persia all the countries westward of the Indus.

This dreadful incursion so weakened the authority of the emperor, that the viceroys of the different provinces either threw off their allegiance, or acknowledged a very precarious dependence; and engaging in wars with each other, called in, as allies the East India companies of France and England, who had been originally permitted as traders, to form establishments on the coasts: these, from the great superiority of European discipline, from allies became in a short time principals in an obstinate contest, that at length terminated in the expulsion of the French from Indostan; and thus a company of British merchants have acquired, partly by cessions from the country powers, and partly by injustice and usurpation, territories equal in extent, and superior in wealth and population to most of the kingdoms in Europe.

The Mahrattas originally possessed several provinces of Indostan, from whence they were driven by the arms of the Mogul conquerors; they were never wholly subjected, but retiring to the northern part of the Gauts, made frequent incursions from these inaccessible mountains: taking advantage of the anarchy of the empire, they have extended their frontiers, and are at present possessed of a tract of country 1000 British miles long, by 700 wide.

Hyder Ally*, a soldier of fortune, who had learned the art of war from the Europeans, having possessed himself of that part of the ancient Carnatic, called the kingdom of Mysore, has within a few years acquired, by continual conquests, a considerable portion of the southern part of the Peninsula. This able and active prince, the most formidable enemy that the English ever experienced in Indostan, dying in 1781, left to his son Tippoo Saib the peaceful possession of his dominions, superior in extent to the kingdom of England.

These extraordinary revolutions, with others of less importance, render the following account of the present division of property, in this unhappy empire, absolutely necessary, in order to understand its modern history.

PRESENT DIVISION OF INDO-TAN.

Such is the instability of human greatness, that the present Mogul, Shah Allum, the descendant of the Great Tamerlane, is merely a nominal prince, of no importance in the politics of Indostan; he is permitted to reside at Delhi, which with a small adjacent territory, is all that remains to him of that vast empire, which his ancestors governed for more than 350 years.

The principal divisions of this country, as they stood at the peace with Tippoo in 1792, are as follow, viz. The British possessions; States in alliance with Britain; Tippoo Saib's territories; Mahratta states and their tributaries; and the territories of the Subah of the Deccan.

* The character of the late Hyder Ally appearing to me (says Major Rennell) to be but little understood in this part of the world, I have ventured to attempt an outline of it. His military success, founded on the improvement of discipline, attention to merit of every kind; conciliation of the different tribes that served under his banners; contempt of state and ceremony, except what naturally arose from the dignity of his character; and his consequent economy in personal expences (the different habits of which form the chief distinction of what is called character among ordinary princes), together with his minute attention to matters of finance, and the regular payment of his army, all these together raised Hyder as far above the princes of Indostan as the great qualities of the late Prussian monarch raised him above the generality of European princes; and hence I have ever considered Hyder as the FREDERIC of the East. Cruelty was the vice of Hyder; but we are to consider that Hyder's ideas of mercy were regulated by an Asiatic standard; and it is not improbable that he might rate his own character for moderation and clemency, as far above those of Tamerlane, Nadir Shah, and Abdallah, as he rated his discipline above theirs.

BRITISH POSSESSIONS.

The British possessions contain about 177,374 square British miles *. They consist of three distinct governments, viz.

Government of Calcutta or Bengal, { Bengal Bahar and part of Orissa } on the Ganges.
Benares

Northern Circars on the coast of Orissa

Government of Madras, { The Jaghire Territory of Cuddalore } on the coast of Coromandel.
— of Devicotta
— of Negipatam

Government of Bombay, on the Gulf of Cambay,

To these we have now to add the districts ceded by Tippoo Sultan in his late treaty, signed at Seringapatam on the 18th of March, 1792, viz.

	Koontary pagodas.
Calicut and Palgaut-cherry, yielding a revenue of	9,36,765
Dindigul, Pyalny, and Verapachry	90,000
Salim, Kooh, Namcool, and Sunkagherry	88,000
Ahtoor, Permuttee, Shadmungul, and Vamloor	68,000
Barra Mohul, Raycottah, Darampoury, &c.	1,34,000
	13,16,765

At the rate of 3 rupees to each pagoda, and the rupees reckoned at 2s. 1d. each, the annual value of the late British acquisitions will be £. 411,450 according to Major Rennell in his Memoir of a map of the Peninsula of India, p. 33. For the revenue of the other British possessions, see this Grammar, p. 677.

GOVERNMENT OF BENGAL.] This government was rich, flourishing, and populous, before the late usurpations in Indostan. It is finely watered by the Ganges and Burrampooter with their numerous navigable channels, and the several navigable rivers they receive: it is fertilized by their periodical inundations; and by its natural situation is well secured against foreign enemies. But for a more particular description of this province, we refer our readers to the account we have already given of it.

GOVERNMENT OF MADRAS.] The great defects of this government, are not only the want of connection between its parts, which are scattered along an extensive coast, and separated from each other by states frequently hostile, but being totally devoid of good harbours. Hopes, however, have been entertained of removing this last defect, by removing the bar at the mouth of that branch of the Caveri called Coleroon, which falls into the sea at Devicotta. The capital and seat of government, is MADRAS in the Jaghire, called also Fort St George. It is ill situated, without a harbour, and badly fortified, yet contains upwards of 200,000 inhabitants—Fort St. DAVID, in the territory of Cuddalore, is rich, flourishing, and contains 60,000 inhabitants.—MASULIPATAM, in the northern Circars, at one of the

mouths of the Kistna, was formerly the most flourishing and commercial city on this coast, and though much declined, is still considerable.

The northern Circars, which are denominated from the towns of Cicacole, Rajamundry, Elore, and Condapily, are defended inland by a strong barrier of mountains and extensive forests, beyond which the country is totally unknown for a considerable space.

GOVERNMENT OF BOMBAY.] This government is watered by the Tapee and Nerbudda. Its capital and seat of government is BOMBAY, in a small island, and an unhealthy situation, but it is well fortified and has a fine harbour. SURAT on the Tapee, which forms an indifferent port, is one of the most rich and commercial cities in Indostan.—TELICHERRY, on the Malabar coast, is dependant on Bombay.

ALLIES OF THE BRITISH.

Dominions of the nabob of Oude.

Fyzabad.
Lucknow the present capital of Oude.
Arcot on the Paliar is the capital, though the nabob usually resides at Madras.
Gingee, the strongest Indian fortress in the Carnatic.

Tritchinnapoly near the Caveri, well fortified in the Indian manner, was rich and populous, containing near 400,000 inhabitants, now almost ruined by the numerous sieges, it has sustained.

Dominions of the nabob of Arcot, comprehending the eastern part only of the ancient Carnatic,

Seringham Pagoda, in an island of the Caveri, is famous throughout Indostan for its sanctity, and has no less than 40,000 priests, who constantly reside here in voluptuous indolence.

Chandegeri, the ancient capital of the empire of Narzzingus, formerly rich, powerful, and populous; near it is the famous pagoda of Tripetti, the Loretto of Indostan. The offerings of the numerous pilgrims who resort hither, bring in an immense revenue.

Tanjore, Madura, and Tinivelly, are the capitals of small states of the same name, which, with Marawar, are dependent on the nabob of Arcot.

Territory of Futty Sing Guicker in the foubah of Guzerat,
Territory of the rajah of Ghod,

Amedabad.
Cambay.
Gwalior, a celebrated fortress.

MAHRATTA STATES, in alliance with the BRITISH, and their TRIBUTARIES.

This extensive country is divided among a number of chiefs whose obedience to their paiswah or head is merely nominal; as they often go to war against each other, and are seldom confederated, but on occasions that would unite the most discordant states, that is, for their mutual defence.

Southern Poonah Mahrattas, or the territories of Pailwah, are naturally strong, being intersected by the various branches of the Gauts.

Satara the nominal capital of the Mahratta states: the Pailwah, at present resides at Poonah.

Aurungabad, Amednagar, and Vissapour, are in his territories.

The Concan or tract between the Gauts and the sea, is sometimes called the Pirate coast, as it was subject to the celebrated pirate Angria, and his successors, whose capital was the strong fortress of Gheria, taken by the English and Mahrattas in 1755: by the acquisition of this coast the Mahrattas have become a maritime power.

By the treaty of peace, Tippoo Sultan ceded to the Mahrattas:

In the Doab, being the circar of Bancapour, with part of Moodgul, &c. affording a revenue of	} Koontary Pagoda,	13,06,666

13,16,666

TERRITORIES of the NIZAM, an ally to the BRITISH.

The possessions of the Nizam or Soubah of the Deccan, (a younger son of the famous Nizam-al-Muluck), comprise the province of Golconda, that is, the ancient province of Tellingana, or Tilling, situated between the lower parts of the Kistna and Godavery rivers, and the principal part of Dowlatabad; together with the western part of Berar, subject to a tribute of a chout, or fourth part of its net revenue, to the Berar Mahratta. The Nizam has the Pailwah, or Poonah Mahratta on the west and north-west; the Berar Mahratta on the north; the northern circars on the east; and the Carnatic, and Tippoo Sultan, on the south. I am not perfectly clear, says Major Rennell, in my idea of his western boundary, which, during his wars with the Mahrattas, was subject to continual fluctuation; but I understand generally, that it extends more than 40 miles beyond the city Aurungabad, westwards; and comes within 80 miles of the city of Poonah, and that on the S. W. it goes considerably beyond the river Beemah, and to the borders of Sanore Bancapour. His capital is Hydrabad, or Bagnagar, situated on the Mouffi river near the famous fortress of Golconda.

The districts of Adoni and Rachore, which were in the hands of Bazalet Jung, (brother to the Nizam) during his lifetime, are now in the hands of the Nizam. The Sourapour, or Sollapoor rajah, on the west of the Beemah river, together with some other rajahs, are his tributaries. The Nizam's dominions are supposed to be no less than 430 miles in length, from N. W. to S. E. by 300 wide. Till he took possession of the Guntoor Circar, his dominions no where touched the sea.

To the above, we have now to add those which Tippoo Sultan ceded to him in the treaty of peace, signed, March, 18, 1792. viz.

castian Tartary, on the North-West; by the Caspian sea, which divides it from Russia on the north; by the river Oxus, which divides it from Usbes Tartary, on the north-East; by India, on the East; and by the Indian ocean, and the gulfs of Persia and Ormus, on the South; and by Arabia and Turkey, on the West.

This kingdom is divided into the following provinces: on the frontiers of India are Chorasan, part of the ancient Hyrcania, including Herat and Ekterabad; Sableustan, including the ancient Bactriana and Candahor; and Sigistan the ancient Drangiana. The southern division contains Makeran, Kerman, the ancient Gedrossia, and Faristan, the ancient Persia. The south-west division, on the frontiers of Turkey, contains the provinces of Chusistan, the ancient Sufiana, and Irac-Agem, the ancient Parthia. The north-west division, lying between the Caspian sea and the frontiers of Turkey in Asia, contains the provinces of Aderbeitzen, the ancient Media; Gangea, and Dagistan, part of the ancient Iberia and Colchis; Ghilan, part of the ancient Hyrcania; Shirvan, and Mazanderan.

NAME. Persia, according to the poets, derived its name from Persens, the son of Jupiter and Danaë. Less fabulous authors suppose it derived from Paras, which signifies a horseman; the Persians, or Parthians, being always celebrated for their skill in horsemanship.

AIR AND CLIMATE.] In so extensive a country as this the air and climate is very different. All along the coast of the Persian gulf, from West to East, to the very mouth of the river Indus, the heat for four months is so excessive, that even those who are born in the country, unable to bear it, are forced to quit their houses and retire to the mountains. The eastern provinces of Persia from the river Indus to the border of Tartary are subject to great heats though not quite so unwholesome as on the coasts of the Indian ocean and the Persian gulf. But in the northern provinces, on the coast of the Caspian sea, the heat is full as great, and though attended with moisture, is as unwholesome as on the coast before-mentioned. From October to May there is no country in the world more pleasant than this, but the yellow complexion of the inhabitants are melancholy proofs of the malign influence of summer. The rest of Persia enjoys a dry air, the sky being perfectly serene, and hardly so much as a cloud seen to fly in it. In the night, a brisk wind springs up, which gives such a coolness to the air, that a man can bear a tolerable warm garment. The seasons in general, and particularly in the middle of this kingdom, happen thus, the winter beginning in November and lasting until March, is very sharp and rude, attended with frost and snow, which last descends in great flakes in the mountains but never on the plains.

SOIL, VEGETABLE AND ANIMAL PRODUCTIONS.] These vary like the air. The soil is far from being luxuriant towards Tartary and the Caspian sea, but with cultivation it might produce abundance of corn and fruits. South of Mount Taurus, the fertility of the country in corn, fruits, wine, and the other luxuries of life, is equalled by few countries. It produces wine and oil in plenty, fenna, rhubarb, and the finest of drugs. The fruits are delicious, especially their dates, oranges, pistachia-nuts: melons, cucumbers, and garden stuffs, not to mention vast quantities of excellent silk; and the gulf of Bassora formerly furnished great part of Europe and Asia with very fine pearls. Some parts, near Spahat especially, produce almost all the flowers that are valued in Europe; and from some of them, the roses especially, they extract waters of a salubrious and odorific kind, which form a gainful commodity in trade. In short, the fruits, vegetables, and flowers of Persia, are of a most exalted flavour; and had the natives the art of horticulture to as great perfection as some nations in

Europe, transplanting, engrafting, and other meliorations, they would add greatly to the natural riches of the country. The Persian assa-fetida flows from a plant called bistot, and turns into a gum. Some of it is white, and some black; but the former is so much valued, that the natives make very rich sauces of it, and sometimes eat it as a rarity.

No place in the world produces the necessaries of life in greater abundance and perfection than Shirauz; nor is there a more delightful spot in nature to be conceived, than the vale in which it is situated, either for the salubrity of the air, or for the profusion of every thing necessary to render life comfortable and agreeable. The fields yield plenty of rice, wheat, and barley, which they generally begin to reap in the month of May, and by the middle of July the harvest is completed. Most of the European fruits are produced here, and many of them are superior in size and flavour to what can be raised in Europe, particularly the apricot and grape. Of the grape of Shirauz there are several sorts, all of them very good, but two or three more particularly so than the rest; one is the large white grape, which is extremely luscious and agreeable to the taste; the small white grape, as sweet as sugar; and the black grape, of which the celebrated wine of Shirauz is made, which is really delicious, and well deserving of praise; so much so, that people who have drunk it for a space of time, seldom care for any other, though at the first taste it is rather unpleasant to an European. It is pressed by the Armenians and Jews, in the months of October and November, and a vast deal is exported annually to Abu Shehr, and other parts in the Persian Gulph, for supply of the Indian market. The pomegranate is good to a proverb; the Persians call it the fruit of Paradise.

The breed of horses in the province of Fars is at present very indifferent, owing to the ruinous state of the country; but in the province of Dushistan, lying to the south-west, it is remarkably good. The sheep are of a superior flavour, owing to the excellence of the pasturage in the neighbourhood of Shirauz, and are also celebrated for the fineness of their fleeces; they have tails of an extraordinary size, some of which I have seen weigh (says Mr. Francklin) upwards of thirty pounds; but those which are sold in the markets do not weigh above six or seven. Their oxen are large and strong, but their flesh is seldom eaten by the natives, who confine themselves chiefly to that of sheep and fowls.

Provisions of all kinds are very cheap; and the neighbouring mountains affording an ample supply of snow throughout the year, the meanest artificer of Shirauz may have his water and fruits cooled without any expence worthy consideration. This snow being gathered on the tops of the mountains, and brought in carts to the city, is sold in the markets. The price of provisions is regulated in Shirauz with the greatest exactness by the Daroga or judge of the police, who sets a fixed price upon every article, and no shop-keeper dares to demand more, under the severe penalty of losing his nose and ears; such being the punishment attached to a crime of this nature; by which means the poorest inhabitants are effectually secured from imposition, in so capital a point as the necessaries of life.

MOUNTAINS.] These are Caucasus and Ararat, which are called the mountains of Daghistan; and the vast collection of mountains called Taurus, and their divisions, run through the middle of the country from Natolia to India.

RIVERS.] It has been observed, that no country, of so great an extent, has so few navigable rivers as Persia. The most considerable are those of Kur, anciently Cyrus; and Aras, anciently Araxes, which rise in or near the

mountains of Ararat, and, joining their streams, fall into the Caspian sea. Some small rivulets falling from the mountains water the country; but their streams are so inconsiderable, that few or none of them can be navigated even by boats. The Oxus can scarcely be called a Persian river, though it divides Persia from Usbec Tartary. Persia has the river Indus on the east, and the Euphrates and Tigris on the west.

WATER.] The scarcity of rivers, in Persia, is joined to a scarcity of water; but the defect, where it prevails, is admirably well supplied by means of reservoirs, aqueducts, canals, and other ingenious methods.

METALS AND MINERALS.] Persia contains mines of iron, copper, lead, and above all, turquoise stones, which are found in Chorasan. Sulphur, saltpetre, and antimony, are found in the mountains. Quarries of red, white, and black marble, have also been discovered near Tauris.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.] It is impossible to speak with any certainty concerning the population of a country so little known as that of Persia. If we are to judge by the vast armies in modern as well as in ancient times, raised there, the numbers it contains must be very great. The Persians of both sexes are generally handsome; the men being fond of Georgian and Circassian women. Their complexions towards the south are somewhat swarthy. The men shave their heads, but the young men suffer a lock of hair to grow on each side, and the beard of their chin to reach up to their temples; religious people wear long beards. Men of rank and quality wear very magnificent turbans, many of them cost twenty-five pounds, and few under nine or ten. They have a maxim to keep their heads very warm, so that they never pull off their caps or their turbans out of respect even to the king. Their dress is very simple. Next to their skin they wear callico shirts, over them a vest, which reaches below the knee, girt with a sash, and over that a loose garment somewhat shorter. The materials of their cloaths, however, are commonly very expensive; consisting of the richest furs, silks, muslin, cottons, and the like valuable stuffs, richly embroidered with gold and silver. They wear a kind of loose boots on their legs, and slippers on their feet. They are fond of riding, and very expensive in their equipages. They wear at all times a dagger in their sash, and linen trowsers. The collars of their shirts and clothes are open; so that their dress upon the whole is far better adapted for the purpose both of health and activity than the long flowing robes of the Turks. The dress of the women is not much different; their wear, as well as that of the men, is very costly; and they are at great pains to heighten their beauty by art, colours, and washes.

The Persians accustom themselves to frequent ablutions, which are the more necessary, as they seldom change their linen. In the morning early they drink coffee, about eleven go to dinner, upon fruits, sweetmeats, and milk. Their chief meal is at night. They eat at their repasts cakes of rice, and others of wheat flour; and as they esteem it an abomination to cut either bread, or any kind of meat, after it is dressed, these cakes are made thin, that they may be easily broken with the hand; and their meat, which is generally mutton, or fowls, is so prepared, that they divide it with their fingers. When every thing is set in order before them, they eat fast, and without any ceremony. But it is observed by a late traveller, that when the oldest man in the company speaks, though he be poor, and set at the lower end of the room, they all give a strict attention to his words. They are temperate, but use opium, though not in such abundance as the Turks; nor are they very delicate in their entertainments of eating and drinking. They are great

masters of moderate E to sit cross smoke thro when it has their coun are natural wars, and barbarous are still ple markable f The Pe in their sea The numb allowed th their equip the Turks, pleasure in of the field, which they did, in arch wild beasts

There are name of Zo resort for room, with the light an forated aper earth, well raised about are seated. morning by which each hands two shape of a p up, they m with their f a very pro hour, upon hands, in a munc, whic for some ti is always th proves con three pence as odd stre; bear some r In attem; (says Mr. F as during m native family

masters of ceremony towards their superiors, and so polite, that they accommodate Europeans who visit them with stools, that they may not be forced to sit cross-legged. They are so immoderately fond of tobacco, which they smoke through a tube fixed in water, so as to be cool in the mouth, that when it has been prohibited by their princes, they have been known to leave their country rather than be debarred from that enjoyment. The Persians are naturally fond of poetry, moral sentences, and hyperbole. Their long wars, and their national revolutions, have mingled the native Persians with barbarous nations, and are said to have taught them dissimulation; but they are still pleasing and plausible in their behaviour, and in all ages have been remarkable for hospitality.

The Persians write like the Hebrews, from the right to the left; are neat in their seals and materials for writing, and wonderfully expeditious in the art. The number of people employed on their manuscripts (for no printing is allowed there) is incredible. Their great soile seems to be ostentation in their equipages and dresses; nor are they less jealous of their women than the Turks, and other eastern nations. They are fond of music, and take a pleasure in conversing in large companies; but their chief diversions are those of the field, hunting, hawking, horsemanship, and the exercise of arms, in all which they are very dextrous. They excel, as their ancestors the Parthians did, in archery. They are fond of rope-dancers, jugglers, and fighting of wild beasts; and privately play at games of chance.

There are places in Shirauz (Mr. Francklin observes) distinguished by the name of Zoor Khana, the house of strength or exercise, to which the Persians resort for the sake of exercising themselves. These houses consist of one room, with the floor sunk about two feet below the surface of the earth, and the light and air are admitted to the apartment by means of several small perforated apertures made in the dome. In the centre is a large square terrace of earth, well beaten down, smooth and even; and on each side are small alcoves raised about two feet above the terrace, where the musicians and spectators are seated. When all the competitors are assembled, which is on every Friday morning by day-break, they immediately strip themselves to the waist; on which each man puts on a pair of thick woollen drawers, and takes in his hands two wooden clubs of about a foot and a half in length, and cut in the shape of a pear; these they rest upon each shoulder, and the music striking up, they move them backwards and forwards with great agility, stamping with their feet at the same time, and straining every nerve, till they produce a very profuse perspiration. After continuing this exercise about half an hour, upon a signal given they all leave off, quit their clubs, and joining hands in a circle, begin to move their feet very briskly in union with the music, which is all the while playing a lively tune. Having continued this for some time, they commence wrestling, in which the master of the house is always the challenger; and being accustomed to the exercise, generally proves conqueror. The spectators pay each a shahee in money, equal to three pence English, for which they are refreshed with a calcan to smoke, and coffee. This mode of exercise must contribute to health, as well as add strength, vigour, and a manly appearance to the frame. It seems to bear some resemblance to the gymnastic exercises of the ancients.

In attempting to say any thing of the character of the modern Persians (says Mr. Francklin) I am sensible of the difficulty of the undertaking; yet as during my stay in Persia, from the situation I was placed in, by living in a native family, I had an opportunity of seeing more of the nature and disposition

tion of the middling sort of people, and their manners and customs, than has fallen to the lot of most travellers, I am induced to give the few observations I made during that period. The Persians, with respect to outward behaviour, are certainly the Parisians of the East. Whilst a rude and insolent demeanour peculiarly marks the character of the Turkish nation towards foreigners and Christians, the behaviour of the Persians would, on the contrary, do honour to the most civilized nations; they are kind, courteous, civil and obliging to all strangers, without being guided by those religious prejudices so very prevalent in every other Mahometan nation; they are fond of enquiring after the manners and customs of Europe; and in return very readily afford any information in respect to their own country. The practice of hospitality is with them so grand a point, that a man thinks himself highly honoured if you will enter his house and partake of what the family affords; whereas going out of a house, without smoking a calan, or taking any other refreshment, is deemed, in Persia, a high affront; they say that every meal a stranger partakes with them brings a blessing upon the house.

The Persians, in their conversation, use such extravagant and hyperbolic compliments on the most trifling occasions, that it would at first inspire a stranger with an idea, that every inhabitant of the place was willing to lay down his life, shed his blood, or spend his money in your service; and this mode of address (which in fact means nothing) is observed not only by those of a higher rank, but even amongst the meanest artificers, the lowest of which will make no scruple, on your arrival, of offering you the city of Shiraz and all its appurtenances, as a *peishkush* or present. This behaviour appears at first very remarkable to Europeans, but after a short time becomes equally familiar. Freedom of conversation is a thing totally unknown in Persia, as that *wall* *have tars* is proverbially in the mouth of every one.—The fear of chains which bind their bodies has also enslaved their minds; and their conversation to men of superior rank to themselves is marked with signs of the most abject and slavish submission; while, on the contrary, they are as haughty and overbearing to their inferiors.

In their conversation, the Persians aim much at elegance, and are perpetually repeating verses and passages from the works of their most favourite poets, Hafez, Sadi, and Jami; a practice universally prevalent from the highest to the lowest; because those who have not the advantages of reading and writing, or the other benefits arising from education, by the help of their memories, which are very retentive, and what they learn by heart, are always ready to bear their part in conversation. They also delight much in jokes and quaint expressions, and are fond of playing upon each other; which they sometimes do, with great elegance and irony. There is one thing much to be admired in their conversation, which is the strict attention they always pay to the person speaking, whom they never interrupt on any account. They are in general a personable, and in many respects a handsome people: their complexions, saving those who are exposed to the inclemencies of the weather, are as fair as Europeans.

The bright and sparkling eyes of the women, which is a very striking beauty, is in a great measure owing to art, as they rub their eye-brows and eye-lids with the black powder of antimony (called *furma*) which adds an incomparable brilliancy to their natural lustre.

MARRIAGES.] When the parents of a young man have determined upon marrying him, they look out amongst their kindred and acquaintance for a suitable match; they then go to the house where the female, they intend to

RELIGI which real call them tactical and with some with drink

demand,

demand, lives. If the father of the woman approves, he immediately orders sweetmeats to be brought in, which is taken as a direct sign of compliance. After this, the usual presents on the part of the bridegroom are made, which if the person be in middling circumstances, generally consist of two complete suits of apparel of the best sort, a ring, a looking glass, and a small sum in ready money, of about ten or twelve tomanas, which is to provide for the wife in case of divorce. There is also provided a quantity of household stuff of all sorts, such as carpets, mats, bedding, utensils for dressing victuals, &c. The contract is witnessed by the *cadi*, or magistrate. The wedding-night being come, the bride is brought forth covered from head to foot in a veil of red silk, or painted muslin; a horse is then presented for her to mount, which is sent thither expressly by the bridegroom; and when she is mounted, a large looking glass is held before her by one of the bridesmaids, all the way to the house of her husband, as an admonition to her, that it is the last time she will look into the glass as a virgin, being now about to enter into the cares of the married state. The procession then sets forward in the following order:—first, the music and dancing girls, after which the presents in trays borne upon men's shoulders; next come the relations and friends of the bridegroom, all shouting, and making a great noise; who are followed by the bride herself, surrounded by all her female friends and relations, one of whom leads the horse by the bridle, and several others on horseback close the procession. Rejoicings upon this occasion generally continue eight or ten days. Men may marry for life, or for any determined time, in Persia, as well as through all Tartary; and travellers, or merchants, who intend to stay some time in any city, commonly apply to the *cadec*, or judge, for a wife during the time he proposes to stay. The *cadec*, for a stated gratuity, produces a number of girls, whom he declares to be honest, and free from diseases; and he becomes surety for them. A gentleman who lately attended the Russian embassy to Persia declares, that, amongst thousands, there has not been one instance of their dishonesty during the time agreed upon.

FUNERALS.] The funerals of the Persians are conducted in a manner similar to those in other Mahomedan countries. On the death of a Mussulman, the relations and friends of the deceased being assembled, make loud lamentations over the corpse; after which it is washed and laid out on a bier, and carried to the place of interment without the city walls, attended by a Mullah, or priest, who chaunts passages from the Koran all the way to the grave. If any Mussulman should chance to meet the corpse during the procession, he is obliged by the precepts of his religion, to run up to the bier, and offer his assistance in carrying it to the grave, crying out at the same time, *Lab Illah, Ill Lillab!* There is no God, but God. After interment, the relations of the deceased return home, and the women of the family make a mixture of wheat, honey and spices, which they eat in memory of the deceased, sending a part of it to their friends and acquaintance, that they also may pay him a like honour. This custom seems to be derived from very great antiquity, as we read in Homer of sacrifices and libations being frequently made to the memory of departed souls.

RELIGION.] The Persians are Mahometans of the sect of Ali; for which reason the Turks, who follow the succession of Omar and Abu-Bekr, call them heretics. Their religion is, if possible, in some things more fantastical and sensual than that of the Turks; but in many points it is mingled with some Bramin superstitions. When they are taxed by the Christians with drinking strong liquours, as many of them do, they answer very sensibly,

“ You

"You Christians whore and get drunk, though you know you are committing sins, which is the very case with us." Having mentioned the Bramins the comparison between them and the Persian *guebres* or *gaur*s, who pretend to be the disciples and successors of the ancient Magi, the followers of Zoroaster, may be highly worth a learned disquisition; that both of them held originally pure and simple ideas of a Supreme Being, may be easily proved; but the Indian Bramins and Parfies accuse the Gaur's, who still worship the fire, of having sensualized those ideas, and of introducing an evil principle into the government of the world. A combustible ground, about ten miles distant from Baku, a city in the north of Persia, is the scene of the Guebres devotions. It must be admitted, that this ground is impregnated with very surprising inflammatory qualities, and contains several old little temples; in one of which the Guebres pretend to preserve the sacred flame of the universal fire, which rises from the end of a large hollow cane stuck into the ground, resembling a lamp burning with very pure spirits. The Mahometans are the declared enemies of the Gaur's, who were banished out of Persia by Shah Abbas. Their sect, however, is said to be numerous, though tolerated in very few places.

The long wars between the Persians and the Romans seem early to have driven the ancient Christians into Persia, and the neighbouring countries. Even to this day, many sects are found that evidently have Christianity for the ground-work of their religion. Some of them, called Souffees, who are a kind of quietists, sacrifice their passions to God, and profess the moral duties. The Sabeen Christians have, in their religion, a mixture of Judaism and Mahometanism; and are numerous towards the Persian gulf. I have already mentioned the Armenian and Georgian Christians, who are very numerous in Persia. The present race of Persians are said to be very cool in the doctrines of Mahomet, owing partly to their late wars with the Turks.

The Persians observe the fast during the month of Ramazan (the 9th month of the Mahomedan year) with great strictness and severity. About an hour before daylight, they eat a meal which is called *sehre*, and from that time until the next evening at sun-set, they neither eat nor drink of any thing whatever. It is even so rigid, that if in the course of the day, the smoke of a caléau, or the smallest drop of water, reaches their lips, the fast is in consequence deemed broken, and of no avail. From sun set until the next morning, they are allowed to refresh themselves. This fast, when the month Ramazan falls in the middle of summer, as it sometimes must do, (the Mahomedan year being lunar) is extremely severe, especially to those who are obliged by their occupations to go about during the day-time, and is rendered still more so, as there are also several nights during its existence, which they are enjoined to spend in prayer. The Persians particularly observe two; the one being, that in which their prophet Ali died, from a wound which he received from the hands of an assassin three days before; which night is the 21st of Ramazan, the day of which is called by the natives, the day of murder.—The other is the night of the 23d, in which they affirm that the Koran was brought down from heaven by the hands of the angel Gabriel, and delivered to their prophet Mahomed: wherefore it is denominated the night of power.

LANGUAGE.] It has been disputed among the learned whether the Arabs had not their language from the Persians; but this chiefly rests on the great intermixture of Arabic words in the Persian language, and the decision seems to be in favour of the Arabs. The common people, especially

ly towards the southern coasts of the Caspian Sea, speak Turkish; and the Arabic probably was introduced into Persia, under the caliphate, when learning flourished in those countries. Many of the learned Persians have written in the Arabic, and people of quality have adopted it as the modish language, as we do the French. The pure Persian is said to be spoken in the southern parts, on the coast of the Persian Gulf, and in Isfahan; but many of the provinces speak a barbarous mixture of the Turkish, Russian, and other languages: Their Paternoster is of the following tenour:

Ei Padere ma kib der osmoni; pak basched mam tu; bayaged padfchabi tu; sebwad chwâstse tu henrjunâukih der osmôn niz derzemîn; bêh mârâ jmroux nân keshâf roux marâ; wadargudfar marâ konâban-ma xjunankibma nis mig farim ormân marâ; wador osmajfch miredâzxmara; lîkin ebalas kun marâ ez efeberir. Amen.

[LEARNING AND LEARNED MEN.] The Persians, in ancient times, were famous for both, and their poets renown'd all over the East. There is a manuscript at Oxford, containing the lives of an hundred and thirty-five of the finest Persian poets. Ferdusi and Sadi were among the most celebrated of the Persian poets. The former comprised the history of Persia in a series of epic poems, which employed him for near thirty years, and which are said by Mr. Jones to be "a glorious monument of eastern genius and learning." Sadi was a native of Shirauz, and flourished in the thirteenth century, and wrote many fine pieces both in prose and verse. Schemfeddin was one of the most eminent lyric poets that Asia has produced; and Nakhsheb wrote in Persian a book, called the Tales of a Parrot, not unlike the Decameron of Boccace. Jami was a most animated and elegant poet, who flourished in the middle of the fifteenth century, and whose beautiful composition, on a great variety of subjects, are preserved at Oxford in twenty two volumes. Hairsi, composed in a rich, elegant, and flowery style, a moral work, in fifty dissertations, on the changes of fortune, and the various conditions of human life; interspersed with a number of agreeable adventures and several fine pieces of poetry.

Of the sprightly and voluptuous bard of Shirauz, the name and character are sufficiently known to orientallists. It may, however, excite the curiosity of the English reader, that the poet Hafez, here introduced to his notice, conciliated the favour of an offended emperor, by the delicacy of his wit, and the elegance of his verses: that the most powerful monarchs of the East fought in vain to draw him from the enjoyment of literary retirement, and to purchase the praises of his Muse by all the honours and splendour of a court: and that his works were not only the admiration of the jovial and the gay, but the manual of mystic piety to the superstitious Mahometan; the oracle, which, like the *Sortes Virgilianæ*, determined the councils of the wise, and prognosticated the fate of armies and of states. Seventeen odes have already been translated into English by Mr. Nott, with which he has published the originals; for the purpose of promoting the study of the Persian language. The 12th ode has also appeared in an English dress, by the elegant hand of Sir William Jones.

The tomb of this celebrated and deservedly admired poet, stands about two miles distant from the walls of the city of Shirauz, on the north east side. It is placed in a large garden, and under the shade of some cyprus trees of extraordinary size and beauty; it is composed of fine white marble from Tauris, eight feet in length and four in breadth; this was built

by

by Kerim Khan, and covers the original one: on the top and sides of the tomb, are select pieces from the poet's own works, most beautifully cut in the Persian Nasta'leek character. During the spring and summer seasons, the inhabitants visit here, and amuse themselves with smoking, playing at chess and other games, reading also the works of Hafez, who is in greater esteem with them than any other of their poets, and they venerate him almost to adoration, never speaking of him but in the highest terms of rapture and enthusiasm; a most elegant copy of his works is kept upon the tomb, for the purpose and the inspection of all who go there. The principal youth of the city assemble here, and shew every possible mark of respect for their favourite poet, making plentiful libations of the delicious wine of Shirauz to his memory. Close by the garden runs the stream of Roknabad, so celebrated in the works of Hafez, and, within a small distance, the sweet bower of Mofellay.

At present learning is at a very low ebb among the Persians. Their boasted skill in astronomy is now reduced to a mere smattering in that science, and terminates in judicial astrology; so that no people in the world are more superstitious than the Persians. The learned profession in greatest esteem among them is that of medicine; which is at perpetual variance with astrology, because every dose must be in the lucky hour fixed by the astrologer, which often defeats the ends of the prescription. It is said, however, that the Persian physicians are acute and sagacious. Their drugs are excellent, and they are no strangers to the practices of Galen and Avicenna. Add to this, that the plague is but little known in this country; as equally rare are many other diseases that are fatal in other places; such as the gout, the stone, the small-pox, consumptions, and apoplexies. The Persian practice of physic is therefore pretty much circumscribed, and they are very ignorant in surgery, which is exercised by barbers, whose chief knowledge of it is in letting blood; for they trust the healing of green wounds to the excellency of the air, and the good habit of the patient's body.

ANTIQUITIES AND CURIOSITIES, } The monuments of antiquity in
NATURAL AND ARTIFICIAL. } Persia, are more celebrated for
their magnificence and expence, than their beauty or taste. No more than
nineteen columns, which formerly belonged to the famous palace of * Per-
sepolis, are now remaining. Each is about fifteen feet high, and compos-
ed of excellent Parian marble. The ruins of other ancient buildings are
found in many parts of Persia, but void of that elegance and beauty which
are displayed in the Greek architecture. The tombs of the kings of Per-
sia are stupendous works; being cut out of a rock, and highly ornamented
with sculptures. The chief of the modern edifices is a pillar to be seen at
Ispahan, sixty feet high, consisting of the skulls of beasts, erected by Shah
Abbas, after the suppression of a rebellion. Abbas had vowed to erect
such a column of human skulls; but upon the submission of the rebels, he
performed his vow by substituting those of brutes, each of the rebels fur-
nishing one.

The baths near Gombroon work such cures, that they are esteemed
among the natural curiosities of Persia. The springs of the famous
Naphtha, near Baku, are mentioned often in natural history for their sur-

* Mr. Fraeclin has lately favoured the world with a very full account of the ruins of
this celebrated palace. We have availed ourselves of many of his observations upon
this empire; but his description of these ruins is too long to be inserted in this work.

About the

prising qualities; but the chief of the natural curiosities in this country, is the burning phenomenon, and its inflammatory neighbourhood, already mentioned under the article of Religion.

[HOUSES, CITIES, AND PUBLIC EDIFICES.] The houses of men of quality in Persia, are in the same taste with those of the Asiatic Turks already described. They are seldom above one story high, built of bricks, with flat roofs for walking on, and thick walls. The hall is arched, the doors are clumsy and narrow, and the rooms have no communication but with the hall; the kitchens and office-houses being built apart. Few of them have chimnies, but a round hole in the middle of the room. Their furniture chiefly consists of carpets, and their beds are two thick cotton quilts, which serve them likewise as coverlids, with carpets under them.

Ispahan or Spahawn, the capital of Persia, is seated on a fine plain, within a mile of the river Zenderhend, which supplies it with water. It is said to be twelve miles in circumference. The streets are narrow and crooked, and the chief amusement of the inhabitants is on the flat roofs of their houses, where they spend their summer evenings; and different families associate together. The royal square is a third of a mile in length, and about half as much in breadth; and we are told, that the royal palace, with the buildings and gardens belonging to it, is three miles in circumference. There are in Ispahan 160 mosques, 1800 caravanserais, 260 public baths, a prodigious number of fine squares, streets, and palaces, in which are canals, and trees planted to shade and better accommodate the people. This capital is said formerly to have contained 650,000 inhabitants; but was often depopulated by Kouli Khan during his wars, so that we may easily suppose, that it has lost great part of its ancient magnificence. In 1744, when Mr. Hanway was there, it was thought that not above 5000 of its houses were inhabited.

Shiraz lies about 225 miles to the south-east of Ispahan. It is seated at the north west end of a spacious plain surrounded with very high mountains, under one of which the town stands. It is an open town, but its neighbourhood is inexpressibly rich and beautiful, being laid out for many miles in gardens, the flowers, fruits, and wines of which are incomparable. The wines of Shiraz are reckoned the best of any in Persia. This town is the capital of Faristan, or Persia Proper, and had a college for the study of eastern learning. It contains an uncommon number of mosques, tiled with stones of a bluish green colour, and lined within with black polished marble, and is adorned by many noble buildings, but its streets are narrow and inconvenient, and not above 4000 of its houses are inhabited. Shiraz has many good bazars and caravanserais: that distinguished by the appellation of the Vakeel's bazar (so called from its being built by Kherim Khan) is, upon the authority of Mr. Franklin, who lately visited it, by far the handsomest. It is a long street, extending about a quarter of a mile, built entirely of brick, and roofed something in the style of the piazzas in Covent Garden; it is lofty and well made; on each side are the shops of the tradesmen, merchants, and others, in which are exposed for sale, a variety of goods of all kinds: these shops are the property of the khan, and are rented to the merchants at a very easy monthly rate. Leading out of this bazar is a spacious caravanserai, of an octagon form, built of brick; the entrance through a handsome arched gate-way; in the centre is a place for the baggage and merchandize, and on the sides above and below, commodious apartments for the merchants and travellers; these are also rented at a moderate monthly sum. About the centre of the above-mentioned bazar, is another spacious capa-

vansera of a square form, the front of which is ornamented with a blue and white enamelled work, in order to represent China ware, and has a pleasing effect to the eye.

The cities of Ormus and Gombroon, on the narrow part of the Persian Gulf, were formerly places of great commerce and importance. The English and other Europeans, have factories at Gombroon, where they trade with the Persians, Arabians, Banyans, Armenians, Turks, and Tartars, who come hither with the caravans which set out from various inland cities of Asia, under the convoy of guards.

MOSQUES AND BAGNIOS.] I thought proper to place them here under a general head, as their form of building is pretty much the same all over the Mahometan countries.

Mosques are religious buildings, square, and generally of stone: before the chief gate there is a square court, paved with white marble, and low galleries round it, whose roof is supported by marble pillars. These galleries serve for places of ablution before the Mahometans go into the mosque. About every mosque there are six high towers, called minarets, each of which has three little open galleries, one above another. These towers, as well as the mosques, are covered with lead, and adorned with gilding and other ornaments; and from thence, instead of a bell, the people are called to prayer by certain officers appointed for that purpose. No woman is allowed to enter the mosque; nor can a man with his shoes or stockings on. Near most mosques is a place of entertainment for strangers during three days; and the tomb of the founder, with conveniences for reading the Koran, and praying.

The city of Shiraz is adorned (according to Mr. Franklin) with many fine mosques, particularly that built by the late Kerim Khan, which is a noble one: being very well disguised, says our traveller, in my Persian dress, I had an opportunity of entering the building unobserved; it is of a square form; in the centre is a stone reservoir of water, made for performing the necessary ablutions, previous to prayer; on the four sides of the building are arched apartments allotted for devotion, some of the fronts of which are covered with China tiles; but Kerim Khan dying before the work was completed, the remainder has been made up with a blue and white enamelled work. Within the apartments, on the walls, on each side, are engraved various sentences from the Koran, in the Nushki character; and at the upper end of the square, is a large dome with a cupola at top, which is the particular place appropriated for the devotion of the vakeel or sovereign: this is lined throughout with white marble, ornamented with the curious blue and gold artificial lapis lazuli, and has three large silver lamps suspended from the roof of the dome. In the centre of the city is another mosque, which the Persians call the *Musjid-e-Azam*, the New Mosque, but its date is nearly coeval with the city itself, at least since it has been inhabited by Mahometans: it is a square building of a noble size, and has apartments for prayer on each side; in them are many inscriptions in the old Cusick character, which of themselves denote the antiquity of the place.

The bagnios in the Mahometan countries are wonderfully well constructed for the purpose of bathing. Sometimes they are square, but oftener circular, built of white well polished stone or marble. Each bagnio contains three rooms; the first for dressing and undressing; the second contains the water, and the third the bath; all of them paved with black and white marble. The operation of the bath is very curious, but wholesome; though to those not accustomed to it, it is painful. The waiter rubs the patient

with great vigour, then handles and stretches his limbs as if he was dislocating every bone in the body; all which exercises are, in those inert warm countries, very conducive to health. In public bagnios, the men bathe from morning to four in the afternoon; when all male attendants being removed, the ladies succeed, and when coming out of the bath display their finest clothes.

I might here attempt to describe the eastern seraglios or harems, the women's apartments; but from the most credible accounts, they are contrived according to the taste and conveniency of the owner, and divided into a certain number of apartments, which are seldom or never entered by strangers; and there is no country where women are so strictly guarded and confined, as among the great men in Persia.

POLICE.] The police in Shirauz, as well as all over Persia, is very good. At sun-set, the gates of the city are shut; no person whatever is permitted either to come in or go out, during the night; the keys of the different gates being always sent to the hakim or governor, and remaining with him until morning. During the night, three tiblas, or drums, are beaten at three different times; the first at eight o'clock, the second at nine, and the third at half past ten. After the third tibla has sounded all persons whatsoever found in the streets by the daroga, or judge of the police, or by any of his people, are instantly taken up, and conveyed to a place of confinement, where they are detained until next morning, when they are carried before the hakim; and if they cannot give a very good account of themselves, are punished, either by the bastinado, or a fine.

Civil matters are all determined by the cazi, and ecclesiastical ones, (particularly divorces) by the sheick al Sellaum, or head of the faith, an office answering to that of Mufti in Turkey. Justice is carried on in Persia in a very summary manner; the sentence, whatever it may be, being always put into execution on the spot. Theft is generally punished with the loss of nose and ears; robbing on the road, by ripping up the belly of the criminal, in which situation he is exposed upon a gibbet in one of the most public parts of the city, and there left until he expires in torment. The penal laws in this country are so varied, sanguinary, and cruel, that the bare recital of them must excite horror in the minds of those who are born in a land of freedom, where the high are protected from the spoliations of rapacity, and the low from the iron hand of oppression, and where the awful brow of justice is crowned with the milder attributes of lenity and compassion.

MANUFACTURE AND COMMERCE.] The Persians equal, if not exceed, all the manufactures in the world in silk, woollen, mohair, carpets, and leather. Their works in these join fancy, taste, and elegance to richness, neatness, and shew; and yet they are ignorant of painting and their drawings are very rude. Their dying excels that of Europe. Their silver and gold laces, and threads, are admirable for preserving their lustre. Their embroideries and horse furniture are not to be equalled; nor are they ignorant of the pottery and window-glass manufactures. On the other hand, their carpenters are very indifferent artists, which is said to be owing to the scarcity of timber all over Persia. Their jewellers and goldsmiths are clumsy workmen; and they are ignorant of lock-making, and the manufacture of looking-glasses. Upon the whole, they lie under inexpressible disadvantages from the form of their government, which renders them slaves to their kings, who often engross either their labour or their profits.

The trade of the Persians, who have little or no shipping of their own, is

carried on in foreign bottoms. That with the English and other nations, by the gulf of Ormus at Gombroon, was the most gainful they had; but the perpetual wars they have been engaged in have ruined their commerce. A trade was also not many years since opened by the English with Persia through Russia and the Caspian sea; but that is now discontinued, having been prohibited by the court of Russia, who were apprehensive that the English would teach the Persians to build ships and dispute the navigation of the Caspian sea with them; this Sea is about 680 miles long and 260 broad in the widest part. It has no tide, but is navigable by vessels drawing from 9 to 10 feet water, with several good ports. The Russian ports are, Kassar and Gurief. Derbent and Niezabad belong to Persia, as also Einzellee and Atrabad, with Baku, the most commodious haven in this sea, and which hath a fortress surrounded with high walls. As the manufactures and silk of Ghilan are esteemed the best in Persia, Reschd on the Caspian is one of the first commercial towns in this part of Asia, and supplies the bordering provinces with European merchandize.

CONSTITUTION AND GOVERNMENT.] Both these are extremely precarious, as resting in the breast of a despotic, and often capricious monarch. The Persians, however, had some fundamental rules of government. They excluded from their throne females, but their male progeny. Blindness likewise was a disqualification for the royal succession. In other respects the king's will was a law for the people. The instances that have been given of the cruelties and inhumanities practised by the Mahometan kings of Persia, are almost incredible, especially during the last two centuries. The reason given to the Christian ambassadors, by Shah Abbas, one of their most celebrated princes, was, that the Persians were such brutes, and so insensible by nature, that they could not be governed without the exercise of exemplary cruelties. The prime minister sustains the whole weight of the administration. His chief study is to please his master, to secure to himself an ascendant over his mind, and to avoid whatever may give him uneasiness or umbrage. The favourites of the prince, female as well as male, are his only counsellors, and the smallest disobedience to their will is attended with immediate death. There is no nobility in Persia, or any respect shewn to any man on account of his family, except to those who are of the blood of their great prophet or patriarchs, but every man is esteemed according to the post he possesses; and when he is dismissed, he loses his honour, and he is no longer distinguished from the vulgar.

REVENUES.] The king claims one third of the cattle, corn, and fruits of his subjects, and likewise a third of silk and cotton. No rank or condition of Persians is exempted from severe taxations and services. The governors of provinces have particular lands assigned to them for maintaining their retinues and troops; and the crown lands defray the expences of the court, king's household, and great officers of state. After saying thus much, the reader cannot doubt that the revenues of the Persian kings were prodigious; but nothing can be said with any certainty in the present distracted state of that country. Even the water that is let into the fields and gardens is subject to a tax, and foreigners, who are not Mahometans, pay each a ducat a head.

MILITARY STRENGTH.] This consisted formerly of cavalry, and it is now thought to exceed that of the Turks. Since the beginning of this century, however, their kings have raised bodies of infantry. The regular troops of both brought to the field, even under Kouli Khan, did not exceed 60,000; but, according to the modern histories of Persia, they are easily recruited in case of a defeat. The Persians have few fortified towns; not

[ARMS AND TITLES.] The arms of the Persian monarch are a lion couchant looking at the rising sun. His title is Shah, or the "*Disposer of kingdoms.*" Shah or Khan, and Sultan, which he assumes likewise, are Tartar titles. To acts of state the Persian monarch does not subscribe his name; but the grant runs in this manner: "This act is given by him whom the universe obeys."

[HISTORY.] All ancient historians mention the Persian monarchs and their grandeur; and no empire has undergone a greater variety of governments. It is here sufficient to say, that the Persian empire succeeded the Assyrian or Babylonian, and that Cyrus laid its foundation about 556 years before Christ, and restored the Israelites, who had been captive at Babylon, to liberty. It ended in the person of Darius, who was conquered by Alexander 329 years before Christ. When Alexander's empire was divided among his great general officers, their posterity were conquered by the Romans. These last, however, never fully subdued Persia, and the natives had princes of their own, by the name of Arsacides, who more than once defeated the Roman legions. The successors of those princes survived the Roman empire itself, but were subdued by the famous Tamerlane, whose posterity were supplanted by a doctor of law, the ancestor of the Sefi or Sophi family, and who pretended to be descended from Mahomet himself. His successors, from him sometimes called Sophis, though some of them were valiant and politic, proved in general to be a disgrace to humanity, by their cruelty, ignorance, and indolence, which brought them into such a disrepute with their subjects, barbarous as they were, that Hassen, a prince of the Sefi race, who succeeded in 1694, was murdered by Mahmud, son and successor to the famous Miriweis; as Mahmud himself was by Esref, one of his general officers, who usurped the throne. Prince Tahmas, the representative of the Sefi family, had escaped from the rebels, and assembling an army, took into his service Nadir Shah, who defeated and killed Esref, and reannexed to the Persian monarchy all the places dismembered from it by the Turks and Tartars during their late rebellions. At last, the secret ambition of Nadir broke out, and after assuming the name of Tahmas Kouli Khan, and pretending that his services were not sufficiently rewarded, he rebelled against his sovereign, made him a prisoner, and, it is supposed, put him to death.

This usurper afterwards mounted the throne, under the title of Shah Nadir. His expedition into Indostan, and the amazing booty he made there, has been mentioned in the description of that country. It has been remarked, that he brought back an inconsiderable part of his booty from India; losing great part of it upon his return by the Mahrattas and accidents. He next conquered Usbec Tartary; but was not so successful against the Daghestani Tartars, whose country he found to be inaccessible. He beat the Turks in several engagements, but was unable to take Bagdad. The great principle of his government was to strike terror into all his subjects by the most cruel executions. His conduct became so intolerable, and particularly his attempt to change the religion of Persia to that of Omar, and hanging the chief priests that resisted, it was thought his brain was touched; and he was assassinated in his own tent, partly in self-defence, by his chief officers, and his relations, in the year 1747. Many pretenders upon his death, started up; and it may, naturally be supposed, that a chronological and accurate account of these various and rapid revolutions is very difficult to be obtained. The confusion which prevailed through the whole country, from the death of Nadir, until

until the settlement of Kerim Khan, prevented all attempts of literature, arts, and sciences. During this interval, the whole empire of Persia was in arms, and rent by commotions; different parties in different provinces of the kingdom struggling for power, and each endeavouring to render himself independent of the other, torrents of blood were shed, and the most shocking crimes were committed with impunity. The whole face of the country, from Gombroon to Russia, presents to the view thousands of instances of the misery and devastation which has been occasioned by these commotions. The picture is melancholy, but just.

From the death of Nadir Shaw until the final establishment of Kerim Khan's government, there were no less than nine pretenders to the throne including himself; from this the reader may form some notion of the troubles which convulsed that unhappy country. Kerim Khan Zund was a most favourite officer of Nadir Shah, and at the time of his death was in the southern provinces. Shirauz and other places had declared for him. He found means, at last, after various encounters, with doubtful success, completely to subdue all his rivals; and finally to establish himself as ruler of all Persia. He was in power about thirty years, the latter part of which he governed Persia under the appellation of Vakeel, or regent; for he never would receive the title of Shah. He made Shirauz the chief city of his residence, in gratitude for the assistance he had received from its inhabitants, and those of the southern inhabitants. He died in the year 1779, in the eightieth year of his age, regretted by all his subjects, who esteemed and honoured him as the glory of Persia. His character is most deservedly celebrated for the public buildings which he erected, and the excellent police which he maintained, so that during his whole reign there was not in Shirauz a single riot productive of bloodshed; besides these, his aversion to severe punishments, his liberality and kindness to the poor, his toleration of people of different persuasions, his partiality for Europeans, and his encouragement of trade, together with his great military abilities, and personal courage, rendered him not only beloved by his own subjects, but greatly respected by foreign powers.

From the death of Kerim Khan to the present time, a variety of competitors have been desirous of filling the throne of Persia. Akau Mahomet Khan keeps possession of the provinces of Mazanderan and Ghilan, as well as the cities of Ispahan, Hamadan, and Tauris, where he is acknowledged as sovereign. Jaafar Khan has possession of the city of Shirauz and the provinces of Beaboon and Shuster; he also receives an annual present from the province of Carmania, and another from the city of Yezd; Abu Shehr and Lar also send him tribute.

Jaafar Khan is a middle aged man, very corpulent, and has a cast in his right eye; in the places where he is acknowledged he is well beloved and respected. He is very mild in his disposition, and just. In Shirauz he keeps up a most excellent police, and good government. He is very kind and obliging to strangers in general, and to the English in particular. Of the two competitors, Mr. Francklin from whose excellent observations these particulars are mostly extracted, says, that Jaafar Kawn "is the most likely in case of success against his opponent, to restore the country to a happy and reputable state; but it will require a long space of time to recover it from the calamities into which the different revolutions have brought it:—a country, if an Oriental metaphor may be allowed, once blooming as the garden of Eden, fair and flourishing to the eye;—now, sad reverse; despoiled and leafless by the cruel ravages of war, and desolating contention."

NAME.] It is remarkable that this country has always preserved its ancient name. The word *Arab*, it is generally said, signifies a robber, or freebooter. The word *Saracen*, by which one tribe is called, is said to signify both a thief and an inhabitant of the desert. These names justly belong to the Arabians, for they seldom let any merchandise pass through the country without extorting something from the owners, if they do not rob them.

MOUNTAINS.] The mountains of Sinai and Horeb, lying in Arabia Petraea, east of the Red Sea, and those called Gabel el Ared, in Arabia Felix, are the most noted.

RIVERS, SEAS, GULFS, AND CAPES.] There are few mountains, springs, or rivers in this country, except the Euphrates, which washes the north-east limits of it. It is almost surrounded with seas; as the Indian Ocean, the Red Sea, the gulfs of Persia and Ormus. The chief capes or promontories are those of Rosafgate and Musledon.

CLIMATE, AIR, SOIL, AND PRODUCE.] As a considerable part of this country lies under the torrid zone, and the tropic of Cancer passes over Arabia Felix, the air is excessively dry and hot, and the country is subject

to hot poisonous winds, like those on the opposite shores of Persia, which often prove fatal, especially to strangers. The soil, in some parts, is nothing more than immense sands, which, when agitated by the winds, roll like the troubled ocean, and sometimes form mountains by which whole caravans have been buried or lost. In these deserts, the caravans, having no tracks, are guided, as at sea, by a compass, or by the stars, for they travel chiefly in the night. Here, says Dr. Shaw, are no pastures clothed with flocks, nor vallies standing thick with corn; here are no vineyards or olive yards; but the whole is a lonesome desolate wilderness, no other ways diversified than by plains covered with sand, and mountains that are made up of naked rocks and precipices. Neither is this country ever, unless sometimes at the equinoxes, refreshed with rain; and the intenseness of the cold in the night is almost equal to that of the heat in the day time. But the southern part of Arabia, deservedly called the Happy, is blessed with an excellent soil, and in general, is very fertile. There the cultivated lands, which are chiefly about the towns near the sea coast, produce balm of Gilead, manna, myrrh, cassia, aloes, frankincense, spikenard, and other valuable gums; cinnamon, pepper, cardamom, oranges, lemons, pomegranates, figs, and other fruits; honey and wax in plenty, with a small quantity of corn and wine. This country is famous for its coffee and its dates, which last are found scarcely any where in such perfection as here and in Persia. There are few trees fit for timber in Arabia, and little wood of any kind.

ANIMALS.] The most useful animals in Arabia are camels and dromedaries; they are amazingly fitted by Providence for traversing the dry and parched deserts of this country; for they are so formed, that they can throw up the liquor from their stomach into their throat, by which means they can travel six or eight days without water. The camels usually carry 800lb. weight upon their backs, which is not taken off during the whole journey, for they naturally kneel down to rest, and in due time rise with their load. The dromedary is a small camel that will travel many miles a day. It is an observation among the Arabs, that wherever there are trees, the water is not far off; and when they draw near a pool, their camels will smell it at a distance, and set up their great trot till they come to it. The Arabian horses are well known in Europe, and have contributed to improve the breed of those in England. They are only fit for the saddle, and are admired for their make as much as for their swiftness and high mettle. The finest breed is in the kingdom of Sunnaa, in which Mecca is situated.

**INHABITANTS, MANNERS, } The Arabians, like most of the nations of
CUSTOMS, AND DRESS. } Asia, are of a middle stature, thin, and of a
swarthy complexion, with black hair and black eyes. They are swift of
foot, excellent horsemen, and are said to be, in general, a martial brave people,
expert at the bow and lance, and, since they became acquainted with
fire arms, good marksmen. The inhabitants of the inland country live in
tents, and remove from place to place with their flocks and herds, as they
have ever done since they became a nation.**

The Arabians in general are such thieves, that travellers and pilgrims, who are led thither from all nations, through motives of devotion or curiosity, are struck with terror on their approaches towards the deserts. These robbers, headed by a captain, traverse the country in considerable troops on horseback, and assault and plunder the caravans; and we are told, that in late as the year 1750, a body of 50,000 Arabians attacked a caravan of merchants and pilgrims returning from Mecca, killed about 60,000 persons

and plundered it of every thing valuable, though escorted by a Turkish army. On the sea coast they are mere pirates, and make prize of every vessel they can master, of whatever nation.

The habit of the common class of Arabs is a kind of blue shirt tied about them with a white sash or girdle; and some of them have a vest of furs or sheep-skins over it; they also wear drawers, and sometimes slippers, but no stockings; and have a cap or turban on their head. Many of them go almost naked; but, as in the eastern countries, the women are so wrapped up, that nothing can be discerned but their eyes. Nothing can be more inconvenient and expensive than the headdress worn by Arabians of fashion. They wear fifteen caps, one over another, of which some indeed are of linen, but the rest of thick cloth or cotton. That which covers all the rest is usually richly embroidered with gold, and has always some sentence of the Koran embroidered upon it. Like other Mahometans, the Arabs eat all manner of flesh, except that of hogs, and prefer that of camels, as we prefer venison, to other meat. They take care to drain the blood from the flesh, as the Jews do, and like them refuse such fish as have no scales. As the Arabians squat themselves upon the ground when they eat, so their manner of eating at meals is conformable to their way of sitting. They spread a large cloth in the middle of the room, put upon this cloth a small table only one foot high, and upon the table a large round plate of tinned copper. Upon this are set different copper dishes neatly tinned within and without. Instead of table napkins, Arabians of rank use a long linen cloth, which those at table put under their knees. Where this linen cloth is wanting, every one uses a small handkerchief of his own. They use no knives nor forks, but use their fingers with great dexterity; and eat all dishes with the hand. Coffee and tea, water, and sherbet made of oranges, water, and sugar, is their usual drink: they have no strong liquors.

[RELIGION.] Of this the reader will find an account in the following history of Mahomet their countryman. Many of the wild Arabs are still Pagans, but the people in general profess Mahometanism.

[LEARNING AND LANGUAGE.] Though the Arabians in former ages were famous for their learning and skill in all the liberal arts, there is scarcely a country at present where the people are so universally ignorant. The vulgar language used in the three Arabias is, the Arabick, or corrupt Arabian, which is likewise spoken, with some variation of dialect, over great part of the East, from Egypt to the court of the Great Mogul. The pure old grammatical Arabic, which is said to be a dialect of the Hebrew, and by the people of the East accounted the richest, most energetic, and copious language in the world, is taught in their schools, as Greek and Latin is amongst Europeans, and used by Mahometans in their worship: for as the Koran was written in this language, they will not suffer it to be read in any other: they look upon it to have been the language of Paradise, and think no man can be a master of it without a miracle, as consisting of several millions of words. The books which treat of it, say, they have no fewer than a thousand terms to express the word *camel*, and five hundred for that of a *lion*. The Paternoster in the Arabic is as follows:

*Abuna elladhi si-ssamawat: jethadda: esmâc; tati malacniac: taouri maj-
biatic, cama; si-ssama; kedhale: ala lardh aating choprena ksatna iaun beiaum;
wag for lena donubena wachataina, cama nog for nachna lemen aca doina; wala
adulchalha sibajariô; lakas mejjina me nnefcherir. Amen.*

CHIEF CITIES, CURIOSITIES,
AND ARTS.

What is called the Desert of Sinai, is a beautiful plain near nine miles long, and above three in breadth; it lies open to the north-east, but to the southward is closed by some of the lower eminences of mount Sinai; and other parts of that mountain make such encroachments upon the plain as to divide it in two, each so capacious as to be sufficient to receive the whole camp of the Israelites.

From Mount Sinai may be seen Mount Horeb, where Moses kept the flocks of Jethro, his father-in-law, when he saw the burning bush. On those mountains are many chapels and cells, possessed by the Greek and Latin monks, who like the religious at Jerusalem pretend to shew the very spot where every miracle or transaction recorded in Scripture happened.

The chief cities in Arabia are Mocha, Aden, Muscat, Suez, and Juddah, where most of the trade of this country is carried on.

Mocha is well built, the houses very lofty, and are with the walls and forts covered with a chinam or stucco, that gives a dazzling whiteness to them. The harbour is semicircular, the circuit of the wall is two miles, and there are several handsome mosques in the city. Suez, the Arsinoe of the ancients is surrounded by the Desert, and but a shabby ill-built place. The ships are forced to anchor a league from the town, to which the leading channel has only about nine feet water. Juddah is the place of the greatest trade in the Red Sea, for there the commerce between Arabia and Europe meets, and is interchanged, the former sending her gums, drugs, coffee, &c. and from Europe come cloths, iron, furs, and other articles, by the way of Cairo. The revenues of these, with the profits of the port, are shared by the Grand Signior, and the Xeriff of Mecca, to whom this place jointly belongs.

Mecca, the capital of all Arabia, and Medina, deserves particular notice. Mecca is a place of no strength having neither walls nor gates, and the buildings are very mean. At Mecca, the birth-place of Mahomet, is a mosque so glorious, that it is generally counted the most magnificent of any temple in the Turkish dominions: its lofty roof being raised in fashion of a dome, and covered with gold, with two beautiful towers at the end, of extraordinary height and architecture, make a delightful appearance, and are conspicuous at a great distance. The mosque hath a hundred gates, with a window over each; and the whole building within, is decorated with the finest gildings and tapestry. The number of pilgrims who yearly visit this place is almost incredible, every Mussulman being obliged by his religion to come hither once in his lifetime, or send a deputy. This annual resort of pilgrims is indeed the only thing which supports it, for the shops are scarcely open all the year besides. At Medina, about fifty miles from the Red Sea, the city to which Mahomet fled when he was driven out of Mecca, and the place where he was buried, is a stately mosque, supported by 400 pillars, and furnished with 300 silver lamps, which are continually burning. It is called the "*Mosk Holy*," by the Turks, because in it is placed the coffin of their prophet Mahomet, covered with cloth of gold, under a canopy of silver tissue, which the bashaw of Egypt, by order of the Grand Signior, renews every year. The camel which carries it derives a sort of sanctity from it, and is never to be used in any drudgery afterwards. Over the foot of the coffin is a rich golden crescent, so curiously wrought, and adorned with precious stones, that it is esteemed a masterpiece of great value. Thither the pilgrims resort, as to Mecca, but not in such numbers.

GOVERNMENT.] The inland country of Arabia is under the government of many petty princes, who are styled xeriffs and imams, both of them including the offices of king and priest, in the same manner as the califs of the Saracens, the successors of Mahomet. These monarchs appear to be absolute, both in spirituals and temporals; the succession is hereditary, and they have no other laws than those found in the Koran, and the comments upon it. The northern Arabs owe subjection to the Turks, and are governed by bashaws residing among them; but it is certain, that they receive large gratuities from the Grand Signior for protecting the pilgrims that pass through their country from the robberies of their countrymen. The Arabians have no standing regular militia, but the kings command both the persons and the purses of their subject, as the necessity of affairs require.

HISTORY.] The history of this country in some measure differs from that of all others; for as the slavery and subjection of other nations make a great part of their history, that of the Arabs is entirely composed of their conquests or independence. The Arabs are descended from Ishmael, of whose posterity it was foretold, that they should be invincible: "have their hands against every man, and every man's hands against theirs." They are at present, and have remained from the remotest ages, during the various conquests of the Greeks, Romans, and Tartars, a convincing proof of the divinity of this prediction. Towards the north, and the sea-coasts of Arabia, the inhabitants are, indeed, kept in awe by the Turks; but the wandering tribes in the southern and inland parts acknowledge themselves subject to no foreign power, and do not fail to harass and annoy all strangers who come into their country. The conquests of the Arabs make as wonderful a part of their history, as the independence and freedom which they have ever continued to enjoy. These, as well as their religion, began with one man, whose character forms a very singular phenomenon in the history of mankind. This was the famous Mahomet, a native of Mecca, a city of that division of Arabia, which, for the luxuriancy of its soil, and happy temperature of its climate, has ever been esteemed the loveliest and sweetest region of the world, and is distinguished by the epithet of Happy.

Mahomet was born in the sixth century, anno 569, in the reign of Justinian II. emperor of Constantinople. Though descended of mean parentage, illiterate and poor, Mahomet was endued with a subtle genius, like those of the same country, and possessed a degree of enterprize and ambition peculiar to himself, and much beyond his condition. He had been employed, in the early part of his life, by an uncle, Abuteleb, as a factor, and had occasion, in this capacity, to travel into Syria, Palestine, and Egypt. He was afterwards taken into the service of a rich merchant, upon whose death he married his widow, Cadiga, and by her means came to be possessed of great wealth and of a numerous family. During his peregrinations into Egypt and the East, he had observed the vast variety of sects in religion, whose hatred against each other was strong and inveterate, while at the same time there were many particulars in which the greater part of them were agreed. He carefully laid hold of these particulars, by means of which, and by addressing himself to the love of power, riches, and pleasure, passions universal among them, he expected to raise a new system of religion, more general than any which hitherto had been established. In this design he was assisted by Sergius, a monk, whose libertine disposition had made him forsake his cloister, and profession, and engage in the service of Cadiga, with whom he remained

as a domestic when Mahomet was taken to her bed. This monk was perfectly qualified, by his great learning, for supplying the defects which his master, for want of a liberal education, laboured under, and which, in all probability, must have obstructed the execution of his design. It was necessary, however, that the religion they proposed to establish should have a divine sanction; and for this purpose Mahomet turned a calamity, with which he was afflicted, to his advantage. He was often subject to fits of the epilepsy; a disease which those whom it afflicts are desirous to conceal; Mahomet gave out therefore that these fits were trances, into which he was miraculously thrown by God Almighty, during which he was instructed in his will, which he was commanded to publish to the world. By this strange story, and by leading a retired, abstemious, and austere life, he easily acquired a character for superior sanctity among his acquaintance and neighbours. When he thought himself sufficiently fortified by the numbers and the enthusiasm of his followers, he boldly declared himself a prophet, sent by God into the world, not only to teach his will, but to compel mankind to obey it.

As we have already mentioned, he did not lay the foundation of his system so narrow as only to comprehend the natives of his own country. His mind, though rude and enthusiastic, was enlarged by travelling into distant lands, whose manners and religion he had made a peculiar study. He proposed that the system he established should extend over all the neighbouring nations, to whose doctrines and prejudices he had taken care to adapt it. Many of the inhabitants of the eastern countries were at this time much addicted to the opinions of Arius, who denied that Jesus Christ was co-equal with God the Father, as is declared in the Athanasian creed. Egypt and Arabia were filled with Jews, who had fled into these corners of the world from the persecution of the emperor Adrian, who threatened the total extinction of that people. The other inhabitants of these countries were Pagans. These, however, had little attachment to their decayed and derided idolatry; and like men whose religious principles is weak, had given themselves over to pleasure and sensuality, or to the acquisition of riches, to be the better able to indulge in the gratifications of sense, which together with the doctrine of predestination, composed the sole principles of their religion and philosophy. Mahomet's system was exactly suited to these three kinds of men. To gratify the two former, he declared that there was one God, who created the world and governed all things in it; that he had sent various prophets into the world to teach his will to mankind, among whom Moses and Jesus Christ were the most eminent; but the endeavours of these had proved ineffectual, and God had therefore now sent his last and greatest prophet, with a commission more ample than what Moses or Christ had been entrusted with. He had commanded him not only to publish his laws, but to subdue those who were unwilling to believe or obey them; and for this end to establish a kingdom upon earth which should propagate the divine law throughout the world; that God had designed utter ruin and destruction to those who should refuse to submit to him; but to his faithful followers, he had given the spoils and possessions of all the earth, as a reward in this life, and had provided for them hereafter a paradise of all sensual enjoyments, especially those of love; that the pleasures of such as died in propagating the faith, would be peculiarly intense, and vastly transcend those of the rest. These, together with the prohibition of drinking strong liquors (a restraint not very severe in warm climates) and the doctrine of predestination, were the capital articles of Mahomet's creed. They were no sooner published than a vast many of his countrymen embraced them with implicit faith. They were written by the priest we formerly mentioned, and compose a

book called Bible, which is similar to the scriptures sufficiently men entered their intent of the Pro custom, grow with open Christ, the his followe Arabic; He

book called the Koran, or Alkorza, by way of eminence we say the Bible, which means the book. The person of Mahomet, however, was familiar to the inhabitants of Mecca; so that the greater part of them were sufficiently convinced of the deceit. The more enlightened and leading men entered into a design to cut him off; but Mahomet getting notice of their intention, fled from his native city to Medina Tadmachi, or the City of the Prophet. The fame of his miracles and doctrine was, according to custom, greatest at a distance, and the inhabitants of Medina received him with open arms. From this flight, which happened in the 622 year of Christ, the fifty-fourth year of Mahomet's age, and the tenth of his ministry, his followers, the Mahometans, compute their time, and the era is called, in Arabic, Hegira, i. e. the Flight.

Mahomet, by the assistance of the inhabitants of Medina, and of others whom his insinuation and address daily attached to him, brought over all his countrymen to a belief, or at least to an acquiescence in his doctrines. The speedy propagation of his system among the Arabians was a new argument in its behalf among the inhabitants of Egypt and the East, who were previously disposed to it. Arians, Jews, and Gentiles, all forsook their ancient faith, and became Mahometans. In a word, the contagion spread over Arabia, Syria, Egypt and Persia; and Mahomet, from a deceitful hypocrite, became the most powerful monarch in his time. He was proclaimed king at Medina in the year 627, and after subduing part of Arabia and Syria, he died in 632 leaving two branches of his race, both esteemed divine among their subjects. These were the caliphs of Persia and of Egypt, under the last of which Arabia was included. The former of these turned their arms to the East, and made conquests of many countries. The caliphs of Egypt and Arabia directed their ravages towards Europe, and under the name of Saracens or Moors (which they obtained because they entered Europe from Mauritania, in Africa, the country of the Moors) reduced most of Spain, France, Italy, and the islands in the Mediterranean.

In this manner did the successors of that impostor spread their religion and conquests over the greatest part of Asia, Africa, and Europe; and they still give law to a very considerable part of mankind.

The INDIAN and ORIENTAL ISLANDS.

THE JAPAN ISLANDS, Japan or Nippon, Bongo, Tonsa, and Dezima, form together what has been called the empire of JAPAN, and are governed by a most despotic prince, who is sometimes called emperor, and sometimes king. They are situated about 150 miles east of China, and extend from the 30th to the 41st degree of north latitude, and from the 130th to the 147th of east longitude. The chief town is Jeddo, in the 141st degree of east longitude, and the 36th of north latitude.

The soil and productions of the country are pretty much the same with those of China; and the inhabitants are famous for their lacker ware, known by the name of Japan. I have already mentioned the circumstances of the Dutch expelling the Portuguese from this gainful trade. The islands themselves are very inaccessible, through their high rocks and tempestuous seas; they are subject to earthquakes, to which the inhabitants are

fo.

so accustomed, that they are scarcely alarmed at any, unless they be very terrible indeed, and lay whole towns in ruins, which very often proves the case. Their seas, lakes, and rivers abound with fish; and their mountains, woods, and forests are well stocked with horses, elephants, deer, oxen, buffaloes, sheep, hogs, and other useful animals. Some of their mountains are also enriched with mines of gold, silver, and copper, exquisitely fine; of these mountains some may be justly ranked among the natural curiosities of this country; one, in particular in the great island of Nippon, is of such a prodigious height as to be easily seen 40 leagues off at sea, though its distance from the shore is 18. Some authors think it exceeds the peak of Teneriff, but it may rather be called a cluster or group of mountains among which are no less than eight dreadful volcanoes, burning with incredible fury, and often laying waste the country round them. The many brooks and rivers that have their sources among the mountains form a great number of delightful cascades as well as some dreadful cataracts. Among the great variety of trees in the forests here, the cedars exceed all of that kind through India for straightness, height, and beauty. The Japanese are the grossest of all idolaters, and so irreconcilable to Christianity, that it is commonly said the Dutch, who are the only European people with whom they now trade, pretend themselves to be no Christians, and humour the Japanese in the most absurd superstitions. Notwithstanding all this compliance, the natives are very shy and rigorous in all their dealings with the Dutch, and Nagasacki, in the island of Dezima, is the only place where they are suffered to trade. The complexions of the Japanese are in general yellowish, although some few, chiefly women, are almost white. Their narrow eyes, and high eyebrows, are like those of the Chinese and Tartars; and their noses are short and thick. Their hair is universally black; and such a sameness of fashion reigns throughout this whole empire, that the head-dress is the same from the emperor to the peasant. The fashion of their cloaths has also remained the same from very high antiquity. They consist of one or more loose gowns, tied about the middle with a sash. People of rank have them made of silk, but the lower class of cotton stuffs. Women generally wear a greater number of them than men, and much longer, and have them more ornamented, often with gold or silver flowers woven into the stuff. Their houses are built with upright posts, crossed and wattled with bamboo, plaistered both without and within, and white-washed. They generally have two stories; but the uppermost is low, and seldom inhabited. The roofs are covered with pan-tiles, large and heavy, but neatly made. The floors are elevated two feet from the ground, and covered with planks, on which mats are laid. They have no furniture in their rooms; neither tables, chairs, stools, benches, cupboards, or even beds. Their custom is to sit down on their heels upon the mats, which are always soft and clean. Their victuals are served up to them on a low board, raised but a few inches from the floor, and one dish only at a time. Mirrors they have, but never fix them up in their houses as ornamental furniture: they are made of a compound metal, and used only at their toilets. Notwithstanding the severity of their winter which obliges them to warm their houses from November to March, they have neither fire-places nor stoves; instead of these they use large copper pots standing upon legs. These are lined on the inside with loam, on which ashes are laid to some depth, and charcoal lighted upon them, which seems to be prepared in such a manner that the fumes of it are not at all dangerous. The first compliment offered to a stranger, in their houses, is a dish of tea, and a pipe of tobacco.

Fans are used by both sexes equally; and are, within or without doors, their inseparable companions. The whole nation are naturally cleanly; every house, whether public or private, has a bath, of which constant and daily use is made by the whole family. Obedience to parents, and respect to superiors, are the characteristics of this nation. Their salutations and conversations between equals abound also with civility and politeness; to this children are early accustomed by the example of their parents. Their penal laws are very severe; but punishments are seldom inflicted. Perhaps there is no country where fewer crimes against society are committed. Commerce and manufactures flourish here, though, as these people have few wants, they are not carried to the extent which we see in Europe. Agriculture is so well understood, that the whole country, even to the tops of the hills, is cultivated. They never use trade with any foreigners except the Dutch and Chinese; the Dutch exported thither annually, before they declared war against Britain, goods to a great amount, but their trade to the East Indies has been since ruined by the conquests of the English in those distant countries. The merchandise they exported from these islands, both for Bengal and Europe, consisted in 9000 chests of copper, each weighing 120 pounds, and from 25 to 30,000 weight of camphor.

The LADRONE ISLANDS, of which the chief town is said to be Guam, east longitude 140, north latitude 14: they are about twelve in number. The people took their name from their pilfering qualities. We know nothing of them worth a particular mention, excepting that lord Anson landed upon one of them (Tinian), where he found great refreshment for himself and his crew.

FORMOSA is likewise an oriental island. It is situated to the east of China, near the province of Fo-kien, and is divided into two parts by a chain of mountains, which runs through the middle, beginning at the south coast, and ending at the north. This is a very fine island, and abounds with all the necessaries of life. That part of the island which lies to the west of the mountains, belongs to the Chinese, who consider the inhabitants of the eastern parts as savages, though they are said to be a very inoffensive people. The inhabitants of the cultivated parts are the same with the Chinese, already described. The Chinese have likewise made themselves masters of several other islands in these seas, of which we scarcely know the names; that of Ainan is between sixty and seventy leagues long, and between fifty and sixty in breadth, and but twelve miles from the province of Canton. The original inhabitants are a shy, cowardly people, and live in the most unwholesome part of the island, the coast and cultivated parts, which are very valuable, being possessed by the Chinese.

To our description of Formosa we shall add an account of the dreadful disaster that lately befel this unhappy island. On the 22 May 1782, a most furious wind accompanied with heavy rain and a swell of the sea greater than ever remembered kept the inhabitants under continual apprehension of being swallowed up by the waves, or buried in the bowels of the earth. The buildings, where the tribunals were held, the public granaries, the barracks, and other works were totally destroyed, and presented nothing to the eye but one continued prospect of ruin and desolation. Of 27 ships of war, which were in the harbour, 12 disappeared; two were dashed to pieces, and 10 were shattered in such a manner that they were rendered totally unfit for service. As the whole island was covered with water the provisions were either swept away or spoiled; the crops were totally destroyed.

The

The PHILIPPINES, of which there are 1100 in number, lying in the Chinese Sea (part of the Pacific Ocean,) 300 miles south east of China, of which Manilla, or Luconia, the chief, is 400 miles long and 200 broad. The inhabitants consist of Chinese, Ethiopians, Malays, Spaniards, Portuguese, Pintadoes, or painted people, and Mestees, a mixture of all these. The property of the islands belongs to the king of Spain, they having been discovered by Magellan, and afterwards conquered by the Spaniards in the reign of Philip II. from whom they take their name. Their situation is such, between the eastern and western continents, that the inhabitants trade with Mexico and Peru, as well as with all the islands and places of the East Indies. Two ships from Acapulco, in Mexico, carry on this commerce for the Spaniards, who make 400 per cent. profit. The country is fruitful in all the necessaries of life, and beautiful to the eye. Venison of all kinds, buffaloes, hogs, sheep, goats, and a particular large species of monkey, are found here in great plenty. The nest of the bird saligan affords that dissolving jelly, which is so voluptuous a rarity at European tables. Many European fruits and flowers thrive surprisingly in these islands. If a spring of an orange or lemon tree is planted here, it becomes within the year a fruit-bearing tree; so that the verdure and luxuriance of the soil are almost incredible. The tree amiet supplies the natives with water; and there is also a kind of cane, which if cut, yields fair water enough for a draught, of which there is plenty in the mountains, where water is most wanted. In those islands are monkeys and baboons of a monstrous bigness, that will defend themselves, if attacked by men. When they can find no fruit in the mountains they go down to the sea to catch crabs and oysters; and that the oysters may not close and catch their paws, they first put a stone betwixt their shell to prevent their shutting close. They take crabs by putting their tail in the holes where they lie, and when the crab lays hold of it they draw him out.

The city of Manilla contains about 3000 inhabitants; its port is Cavite lying at the distance of three leagues, and defended by the castle of St. Philip. In the year 1762, Manilla was reduced by the English under general Draper and admiral Cornish, who took it by storm, and humanely suffered the archbishop, who was the Spanish viceroy, at the same time, to ransom the place for about a million sterling. The bargain, however, was ungenerously disowned by him and the court of Spain, so that great part of the ransom is still unpaid. The Spanish government is settled there, but the Indian inhabitants pay a capitation tax. The other islands, particularly Mindanao, the largest next to Manilla, are governed by petty princes of their own, whom they call sultans. The sultan of Mindanao is a Mahometan.

Upon the whole, though these islands are enriched with all the profusion of nature, yet they are subject to most dreadful earthquakes, thunder, rains, and lightning; and the soil is pestered with many noxious and venomous creatures, and even herbs and flowers, whose poisons kill almost instantaneously. Some of their mountains are volcanoes.

The MOLUCCAS, commonly called the SPICE or CLOVE ISLANDS, These are not out of sight of each other, and lie all within the compass of twenty-five leagues to the south of the Philippines, in 125 degrees of east longitude, and between one degree south, and two north latitude. They are in number five, viz. Bachian, Machian, Motyr, Ternate, and Tydore. These islands produce neither corn nor rice, so that the inhabitants live upon a bread made of yagou. Their chief produce consists of cloves,

cloves, mace, and nutmegs, in vast quantities; which the Dutch formerly monopolized with so much jealousy, that they destroyed the plants, lest the natives should sell their supernumerary spices to other nations. These islands, after being subject to various powers, fell into the hands of the Dutch who appointed three kings to govern them subordinate to their authority. They have since the revolution effected by the French in Holland, been reduced to the dominion of Great Britain with almost all the other possessions of the Dutch in that quarter of the world. Ternate is the largest of these islands, though no more than thirty miles in circumference. The Dutch had here a fort called Victoria; and another called Fort Orange, in Machian.

The BANDA, or NUTMEG ISLANDS, are situated between 127 and 128 degrees east longitude, and between four or five south latitude, comprehending the islands of Lantor, the chief town of which is Lantor, Polorong, Rosising, Pooloway, and Gonapi. The chief forts on these islands, are those of Revenge and Nassau. The nutmeg, covered with mace, grows on these islands only, and they were formerly entirely subject to the Dutch. In several islands that lie near Banda and Amboyna, the nutmeg and clove would grow, because, as naturalists tell us, birds, especially doves and pigeons, swallow the nutmeg and clove whole, and void them in the same state: which is one of the reasons why the Dutch declare war against both birds in their wild plantations. The great nutmeg harvest is in June and August.

AMBOYNA. This island, taken in a large sense, is one, and the most considerable, of the Moluccas, which, in fact, it commands. It is situated in the Archipelago of St. Lazarus, between the third and fourth degree of south latitude, and 120 leagues to the eastward of Batavia. Amboyna is about seventy miles in circumference, and defended by a Dutch garrison of 7 or 800 men, besides small forts, which protect their clove plantations. It is well known, that when the Portuguese were driven off this island, the trade of it was carried on by the English and Dutch; and the barbarities of the latter in first torturing and then murdering the English, and thereby engrossing the whole trade, and that of Banda, can never be forgotten; but will be transmitted as a memorial of Dutch infamy at that period to all posterity. This tragical event happened in 1622.

The island of CELEBES, or MACASSAR, is situated under the equator, between the island of Borneo and the Spice Islands, at the distance of 160 leagues from Batavia, and is 500 miles long, and 200 broad. This island, notwithstanding its heat, is rendered habitable by breezes from the north, and periodical rains. Its chief product is pepper and opium; and the natives are expert in the study of poisons, with a variety of which nature has furnished them. In this, and indeed in almost all the Oriental islands, the inhabitants live in houses built on large posts, which are accessible only by ladders, which they pull up in the night-time, for their security against venomous animals. They are said to be hospitable and faithful, if not provoked. They carry on a large trade with the Chinese. Their port of Jampoden is the most spacious of any in that part of the world.

GILORO and CERAM, two other spice islands lying under the equator, were fortified by the Dutch but have been since reduced by the English.

The SUNDA ISLANDS. These are situated in the Indian Ocean, between 93 and 120 degrees of east longitude, and between eight degrees north, and eight degrees south latitude, comprehending the islands of Borneo, Sumatra, Java, Bally, Lamboe, Banca, &c. The three first, from their great extent and importance, require to be separately described.

BORNEO is said to be 800 miles long, and 700 broad, and except New Holland is the largest island in the world. The inland part of the coun-

try is marshy and unhealthy; and the inhabitants live in towns built upon floats in the middle of the rivers. The soil produces rice, cotton, canes, pepper, camphor, the tropical fruits, gold, and excellent diamonds. The famous ourang-outang, one of which was dissected by Dr. Tyson at Oxford, is a native of this country, and is thought, of all irrational beings, to resemble a man the most. The original inhabitants still remain in the mountains, and are styled *Beajus*, which signifies a wildman. The beasts are oxen, buffaloes, deer, goats, elephants, tygers, and monkeys.

SUMATRA has Malacca on the north, Borneo on the east, and Java on the south-east; from which it is separated by the Straits of Sunda; it is divided into two equal parts by the equator, extending five degrees and upwards north-west of it, and five on the south-east; and is 900 miles long, and from 100 to 150 broad. Its chief trade with the Europeans lies in pepper. The English East India company have two settlements here, Bencoolen and Fort-Marborough; from whence they bring their chief cargoes of pepper. The king of Achen is the chief of the Mahometan princes who possess the sea coasts. The interior parts are governed by pagan princes; and the natural products of Sumatra are pretty much the same with those of the adjacent islands.

This island is represented by Mr. Marsden as surpassed by few in the beautiful indulgences of nature. A chain of high mountains runs through its whole extent. Between the ridges of these mountains the air is cool; and from this advantage they are the most cleared from woods, which elsewhere cover both hills and valleys with an eternal shade. Here too are found many large and beautiful lakes, that facilitate much the communication betwixt different parts of the country. The inhabitants are below the middle size; their limbs for the most part slight; but well shaped, particularly at the wrists and ancles. Their hair is strong and of a shining black. Some of the inhabitants of the hilly parts are observed to have a swelling in the throat, about the size of an ostrich's egg. The customs of the Sumatrans allow polygamy; but it is extremely rare that an instance occurs of their having more wives than one. The Cassia country is inhabited by Battas, who differ from all the other inhabitants in language, customs, and manners. They eat the prisoners whom they take in war. They prefer human flesh to all others, and speak with peculiar rapture of the palms of the hands and soles of the feet. They fortify their villages very strongly with double fences of camphor plank, pointed, and placed with their points projecting outwards; and between these fences they place pieces of bamboo, hardened by fire, and likewise pointed, which are concealed by the grass, but which will run quite through a man's foot. The people who inhabit the coast are Malays, who came hither from the peninsula of Malacca. Their language and character differ much from the inhabitants of Malacca, who use the Arabic character. The people between the districts of the English company and those of the Dutch at Palimban, on the other side of the island, write on long narrow slips of the bark of a tree, with a piece of bamboo. They begin at the bottom and write from the left hand to the right, contrary to the custom of other Eastern nations. It is from this country that most of cassia sent to Europe is produced. The cassia tree grows to 50 or 60 feet in diameter from a beautiful and regular trunk. The wild beasts of Sumatra are tigers, elephants, rhinoceroses, bears, and monkeys. The tygers prove to the inhabitants both in their journeys and even in their domestic occupations most destructive enemies. The size and strength of the species, which prevails on this island, is prodigious. They are said to break with a stroke of their

their fore-paw the leg of a horse or buffalo. Within about ninety miles of Sumatra is the island of **ENGANHO**, which is very little known, on account of the terrible rocks and breakers which entirely surround it. It is inhabited by naked savages, who are tall and well made, and who generally appear armed with lances and clubs, and speak a different language from the inhabitants of any of the neighbouring islands.

The greatest part of **JAVA** formerly belonged to the Dutch, who here erected a kind of commercial monarchy, the capital of which is **Batavia**, a noble and populous city, lying in the latitude of six degrees south, at the mouth of the river **Jucata**, and furnished with one of the finest harbours in the world. Since the revolution in Holland it has been reduced by Great Britain together with all the other possessions of the Dutch in the East Indies. The town itself is built in the manner of those in Holland, and is about a league and a half in circumference, with five gates, and surrounded by regular fortifications; but its suburbs are said to be ten times more populous than itself. The government here was a mixture of eastern magnificence and European police, and held by the Dutch governor-general of the Indies. When he appeared abroad, he was attended by his guards and officers, and with a splendor superior to that of any European potentate, except upon some solemn occasions. This city is as beautiful as it is strong, and its fine canals, bridges, and avenues, render it a most agreeable residence. The description of it, its government, and public edifices, have employed whole volumes. The citadel, where the governor has his palace, commands the town and the suburbs, which are inhabited by natives of almost every nation in the world; the Chinese residing in this island are computed at 100,000; but about 30,000 of that nation were barbarously massacred, without the smallest offence ever proved upon them, in 1740. This massacre was too unprovoked and detestable to be defended even by the Dutch, who, when the governor arrived in Europe, sent him back to be tried at **Batavia**; but he never has been heard of since. A Dutch garrison of 3000 men constantly resided at **Batavia**, and about 15,000 troops were quartered in the island and the neighbourhood of the city.

The **ANDAMAN** and **NICOBAR** islands, are situated on the eastern side of **Bengal**, extending from north latitude $10^{\circ} 32'$ to $13^{\circ} 40'$. Until of late years these islands have been very little known, probably on account of the wild appearance of the country which has deterred navigators from frequenting them. The **Great Andaman** is about 140 British miles in length, but no more than 20 in the broadest part. Its coasts are indented by several deep bays, intersected by many vast inlets or creeks, one of which has been found to run quite through, and is navigable for small vessels. The shores of the main island, and indeed of all the rest, are in some parts rocky, and in a few places are lined with a smooth and sandy beach, where boats may easily land. The inland parts of these islands are covered with a variety of tall trees, darkened by the intermixture of creepers, which form altogether a vast and impervious forest, spreading over the whole country. The smaller islands are equally covered with wood; they mostly contain hills of a moderate height, but the main island is distinguished by a mountain of prodigious bulk, called from its shape the **saddle Peak**; it is visible in clear weather at the distance of 25 leagues, being nearly 2400 feet in perpendicular height. There are no rivers of any size upon these islands, but a number of small rills pour down from the mountains, affording good water, and exhibiting in their descent over the rocks a variety of little cascades, which are overshadowed by the superincumbent woods. Many of the trees afford

timbers and planks for the construction of ships. A particular tree grows here to an enormous size, one having been found to measure 30 feet in circumference, producing a very rich dye. The quadrupeds are wild hogs, monkeys, and rats. Guanas and various reptiles abound; among the latter is the green snake, very venomous; centipedes of ten inches long and scorpions. The inhabitants of the Andaman isles are perhaps the least civilized in the world. Their colour is of the darkest hue, their stature in general small and their aspect uncouth. Their limbs are ill-formed and slender, their bellies prominent, and like the Africans they have wool heads, thick lips and flat noses. They go quite naked, the women wearing only at times a fringe or tassel round the middle which is merely for ornament as they do not betray any shame when seen without it. The men are cunning crafty and revengeful; and frequently express their aversion to strangers in a loud and threatening tone of voice. At other times they appear quiet and docile with the most hostile intent.

On the appearance of any vessel they frequently lie in ambush among the trees, and send one of the oldest among them to allure the strangers by friendly signs to the shore. Should the crew venture to land without arms, they instantly rush from their lurking places to attack them. About 15 miles to the eastward of these islands lies an island justly styled, *Barren*, on which is a dreadful volcano. The following account is given of this island by Capt. Blair in his report of the survey of the Andaman islands See Asiatic Research. vol. 4. p. 412.

"I left that coast March 21. and landed on *Barren island* on the 24th. The volcano was in a violent state of eruption, bursting out immense volumes of smoke, and frequently showers of red hot stones. Some were of a size to weigh three or four tons, and had been thrown some hundred yards from the foot of the cone. There were two or three eruptions, while we were close to it; several of the red hot stones rolled down the sides of the cone and bounded a considerable way beyond us. The base of the cone is the lowest part of the island and very little higher than the level of the sea. The mountain rises in the form of a cone with an acclivity of 1800 feet which is also the elevation of the other parts of the island."

CEYLON. This island, though not the largest, is thought to be, by nature, the richest and finest island in the world. It is situated in the Indian Ocean, near Cape Comorin; the southern extremity of the Hither Peninsula of India, being separated from the coast of Coromandel by a narrow strait, and is 250 miles long, and 200 broad. The natives call it, with some shew of reason, the terrestrial paradise; and it produces, besides excellent fruits of all kinds, long pepper, fine cotton, ivory, silk, tobacco, ebony, musk, crystal, saltpetre, sulphur, lead, iron, steel, copper; besides cinnamon, gold and silver, and all kinds of precious stones, except diamonds. All kinds of fowl and fish abound here. Every part of the island is well wooded and watered; and besides some curious animals peculiar to itself, it has plenty of cows, buffaloes, goats, hogs, deer, hares, dogs, and other quadrupeds. The Ceylon elephants are the largest and best in the world, and their woods are infested by tygers, the most terrible of all ravenous beasts. They abound also with snakes of a monstrous size, one of which has been known to devour a tyger at one meal. The chief commodity of the island, is its cinnamon, which is by far the best in all Asia. Though its trees grow in great profusion, yet the best is found in the neighbourhood of Colombo; the chief settlement of the Dutch, and Negambo. The middle of the country is mountainous and woody, but the beautiful vallies were subdued and taken possession of by the Dutch.

Dutch, who after a bloody war drove the Ceylonese monarch from his capital city, Candy; which stands on a mountain in the middle of the island, so that he has scarcely any communication with other nations, or any property in the riches of his own dominions. The descendants of the ancient inhabitants are called Cinglasses, who, though idolaters, value themselves upon maintaining their ancient laws and customs. They are, in general, a sober, inoffensive people, and are mingled with Moors, Malabars, Portuguese, and Dutch.

It may be here proper to observe, that the cinnamon-tree, which is a native of this island, has two, if not three barks, which form the true cinnamon; the trees of a middling growth and age afford the best; and the body of the tree, which, when stripped, is white, serves for building and other uses. This island was conquered by the Portuguese, who tyrannized over the inhabitants in such a manner that they assisted the Dutch in expelling them from the island, and by their united efforts this was accomplished in 1658. In January 1782, Trincomale, the chief sea-port of the island, was taken by the English, but soon afterwards retaken by the French, and restored to the Dutch by the last treaty of peace. It has since been taken by the English and is at present (1799) in their possession.

THE MALDIVES. These are a vast cluster of small islands or little rocks above the water, lying between the equator and eight degrees north latitude, near Cape Comorin. They are chiefly resorted to by the Dutch, who carry on a profitable trade with the natives for couries, a kind of small shells, which go, or rather formerly went for money upon the coasts of Guinea and other parts of Africa. The cocoa of the Maldives is an excellent commodity in a medicinal capacity: "Of this tree (says a well-informed author) they build vessels of twenty or thirty tons; their hulls, masts, sails, rigging, anchors, cables, provisions, and firing, are all from this useful tree."

We have already mentioned BOMBAY, on the Malabar coast, in speaking of India. With regard to the language of all the Oriental islands, nothing certain can be said. Each island has a particular tongue, but the Malayan, Chinese, Portuguese, Dutch, and Indian words, are so frequent among them, that it is difficult for an European, who is not very expert in those matters to know the radical language. The same may be almost said of their religion; for though its original is certainly Pagan, yet it is intermixed with many Mahometan, Jewish, Christian and other foreign superstitions.

The sea which separates the southern point of the peninsula of Kamtschatka from Japan, contains a number of islands in a position from north-north-east to south south-west, which are called the KURILE ISLANDS. They are upwards of twenty in number, are all mountainous, and in several of them are volcanoes and hot springs. The principal of these islands is inhabited; but some of the little ones are entirely desert and unpeopled. They differ much from each other, in respect both to their situation and natural constitution. The forests in the more northern ones, are composed of laryx and pines; those to the southern produce canes, bamboos, vines, &c. In some of them are bears and foxes. The sea-otter appears on the coasts of all these islands, as well as whales, sea-horses, seals, and other amphibious animals. Some of the inhabitants of these islands have a great likeness to the Japanese, in their manners, language, and personal appearance; others very much resemble the Kamtschadales. The northern islands acknowledge the sovereignty of the empire of Russia but those to the south pay homage to Japan. The Kurilians discover much humanity and probity in their conduct, and are courteous and hospitable; but adversity renders them

them timid, and prompts them to suicide. They have a particular veneration for old age. They reverence an old man whoever he be, but have an especial affection for those of their respective families. Their language is agreeable to the ear, and they speak and pronounce it slowly. The men are employed in hunting, fishing for sea animals and whales, and catching fowl. Their canoes are made of the wood that their forests produce, or that the sea casts upon their shores. The women have charge of the kitchen, and make clothes. In the northern isles they sew, and make different cloths of the thread of nettles. The southern islanders are more refined and polished than the northern, and carry on a sort of commerce with Japan, whither they export whale-oil, furs and eagle's feathers to fledge arrows with. In return, they bring Japanese utensils of metal and varnished wood, skillers, sabres, different stuffs, ornaments of luxury and parade, tobacco, all sorts of trinkets, and small wares.

A F R I C A.

AFRICA, the third grand division of the globe, is generally represented as bearing some resemblance to the form of a pyramid, the base being the northern part of it, which runs along the shores of the Mediterranean, and the point or top of the pyramid, the Cape of Good Hope. Africa is a peninsula of a prodigious extent, joined to Asia only by a neck of land, about sixty miles over, between the Red Sea and the Mediterranean, usually called the Isthmus of Suez, and its utmost length from north to south, from Cape Bona in the Mediterranean, in 37 degrees north, to the Cape of Good Hope in 34-7 south latitude, is 4,300 miles; and the broadest part from Cape Verd, in 17-20 deg. W. lon. to Cape Guardafui, near the straits of Babel-Mandel, in 51-20 east longitude, is 3,500 miles from east to west. It is bounded on the north by the Mediterranean Sea, which separates it from Europe; on the east by the Isthmus of Suez, the Red Sea, and the Indian Ocean, which divides it from Asia; on the south by the Southern Ocean, and on the west by the great Atlantic Ocean, which separates it from America. As the equator divides this extensive country almost in the middle, and the far greatest part of it is within the tropics, the heat is in many places almost insupportable to an European; it being there increased by the rays of the sun, from vast deserts of burning sands. The coasts, however, and banks of rivers, such as the Nile, are generally fertile; and most parts of this region are inhabited, though it is far from being so populous as Europe and Asia. From what has been said the reader cannot expect to find here a variety of climates. In many parts of Africa, snow seldom falls in the plains: and it is generally never found but on the tops of the highest mountains. The natives, in these scorching regions, would as soon expect that marble should melt, and flow in liquid streams, as that water by freezing should lose its fluidity, be arrested by the cold, and ceasing to flow, become like the solid rock.

The most considerable rivers in Africa, are the Niger, which falls into

the Atlantic or western ocean at Senegal, after a course of 2800 miles*. It increases and decreases as the Nile, fertilises the country, and has grains of gold in many parts. The Gambia and Senegal are only branches of this river. The Nile, which dividing Egypt into two parts, discharges itself into the Mediterranean, after a prodigious course from its source in Abyssinia. The most considerable mountains in Africa are the Atlas, a ridge extending from the western ocean, to which it gives the name of Atlantic Ocean, as far as Egypt, and had its name from a king of Mauritania, a great lover of astronomy, who used to observe the stars from its summit; on which account, the poets represent him as bearing the heavens on his shoulders. The mountains of the Moon, extending themselves between Abyssinia and Monomotapa, and are still higher than those of Atlas. Those of Sierra Leona, or the Mountain of the Lions, which divide Nigritia from Guinea, and extend as far as Ethiopia. These were styled by the ancients the Mountains of God, on account of their being subject to thunder and lightning. The Peak of Teneriffe, which the Dutch make their first meridian, is about two miles high, in the form of a sugar-loaf, and is situated on an island of the same name near the coast. The most noted capes, or promontories, in this country, are Cape Verd, so called, because the land is always covered with green trees and mossy ground. It is the most westerly point of the continent of Africa. The Cape of Good Hope, so denominated by the Portuguese, when they first went round it in 1498, and discovered the passage to Asia. It is the south extremity of Africa, in the country of the Hottentots; at present in the possession of the English, and the general rendezvous of ships of every nation who trade to India, being about half way from Europe. There is but one strait in Africa, which is called Babel-Mandel, and joins the Red Sea with the Indian Ocean.

The situation of Africa for commerce is extremely favourable, standing as it were in the centre of the globe, and having thereby a much nearer communication with Europe, Asia, and America, than any of the other quarters has.

* This is extremely difficult if not impossible, to ascertain. For, (according to Mr. Lucas's communications to the African Association) both the rise and termination of the Niger are unknown, but the course is from east to west. So great is its rapidity, that no vessel can ascend its stream: and such is the want of skill, or such the absence of commercial inducements among the nations who inhabit its borders, that even with the current, neither vessels nor boats are seen to navigate. In one place, indeed, the traveller finds accommodations for the passage of himself and of his goods; but even there, though the ferrymen, by the indulgence of the sultan of Cahna, are exempted from all taxes, the boat which contains the merchandize is nothing more than an ill-constructed raft, for the planks are fastened to the timbers with ropes, and the seams are closed both within and without, by a plaster of tough clay, of which a large provision is always carried on the raft, for the purpose of excluding the stream wherever its entrance is observed.

The depth of the river at the place of passage, which is more than a hundred miles to the south of the city of Cahna, the capital of the empire of that name, is estimated at twenty three or twenty-four feet English.

Its width is such, that even at the Island of Gongo, where the ferrymen reside, the sound of the loudest voice from the northern shore is scarcely heard; and at Tombuctou, where the name of Gnewa, or black, is given to the stream, the width is described as being that of the Thames at Westminster. In the rainy season it swells above its banks, and so only floods the adjacent lands, but often sweeps before it the cattle and cottages of the most lighted, or too confident, inhabitants.

That the people who live in the neighbourhood of the Niger should refuse to profit by its navigation, may justly surprize the traveller; but much greater is his astonishment, when he finds that even the bounty of the stream would give, is uselessly offered to their acceptance; for such is the want of skill, or such the settled dislike of the people to this sort of provision, that the fish, with which the river abounds, are left in undisturbed possession of its waters.

has with the rest. That it abounds with gold, we have not only the testimony of the Portuguese, the Dutch, the English, and the French, who have settlements on the coast of Africa, but that of the most authentic historians. It is, however, the misfortune of Africa, that, though it has 10,000 miles of sea-coast, with noble, large, deep rivers, it should have no navigation, nor receive any benefit from them; and that it should be inhabited by an innumerable people, ignorant of commerce, and of each other. At the mouths of these rivers are the most excellent harbours, deep, safe, calm, and sheltered from the wind, and capable of being made perfectly secure by fortifications; but quite destitute of shipping, trade, and merchants, even where there is plenty of merchandise. In short, Africa, though a full quarter of the globe, stored with an inexhaustible treasure, and capable, under proper improvements, of producing so many things delightful, as well as convenient, within itself, seems to be almost entirely neglected, not only by the natives, who are quite unsolicitous of reaping the benefits which nature has provided for them, but also by the more civilised Europeans who are settled in it, particularly the Portuguese.

Africa once contained several kingdoms and states, eminent for the liberal arts, for wealth and power, and the most extensive commerce. The kingdoms of Egypt and Ethiopia, in particular, were much celebrated; and the rich and powerful state of Carthage, that once formidable rival to Rome itself, extended her commerce to every part of the then known world: even the British shores were visited by her fleets, till Juba, who was king of Mauritania, but tributary to the republic of Carthage, unhappily called in the Romans, who, with the assistance of the Mauritians, subdued Carthage, and by degrees, all the neighbouring kingdoms and states. After this the natives, constantly plundered, and consequently impoverished, by the governors sent from Rome; neglected their trade, and cultivated no more of their lands than might serve for their subsistence. Upon the decline of the Roman empire, in the fifth century, the north of Africa was over-run by the Vandals, who contributed still more to the destruction of arts and sciences; and, to add to this country's calamity, the Saracens made a sudden conquest of all the coasts of Egypt and Barbary, in the seventh century. These were succeeded by the Turks; and both being of the Mahometan religion, whose professors carried desolation with them wherever they came, the ruin of that once flourishing part of the world was thereby completed.

The inhabitants of this continent, with respect to religion, may be divided into three sorts; namely, Pagans, Mahometans, and Christians. The first are the more numerous, possessing the greatest part of the country, from the tropic of Cancer to the Cape of Good Hope, and these are generally black. The Mahometans, who are of a tawny complexion, possess Egypt, and almost all the northern shores of Africa, or what is called the Barbary coast. The people of Abyssinia, or the Upper Ethiopia, are denominated Christians, but retain many Pagan and Jewish rites. There are also some Jews on the north of Africa, who manage all the little trade that part of the country is possessed of.

There are scarcely any two nations, or indeed any two of the learned, that agree in the modern divisions of Africa; and for this very reason, that scarcely any traveller has penetrated into the heart of the country; and consequently we must acknowledge our ignorance of the bounds, and even the names of several of the inland nations, which may be still reckoned among the unknown and undiscovered parts of the world; but according to the best accounts and conjectures, Africa may be divided according to the following table:

Having given the reader some idea of Africa, in general, with the principal kingdoms, and their supposed dimensions, we shall now consider it under the three grand divisions: first, Egypt; secondly the states of Barbary, stretching along the coast of the Mediterranean, from Egypt in the east, to the Atlantic Ocean, west; and lastly, that part of Africa, between the tropic of Cancer and the Cape of Good Hope; the last of these divisions, indeed, is vastly greater than the other two; but the nations, which it contains, are so little known, and so barbarous, and, like all barbarous nations, so similar in most respects to one another, that they may, without impropriety, be thrown under one general head.

AIR AND CLIMATE.] The air and climate of Egypt are extremely hot, both from the height of the sun, and from the vicinity of burning and sandy deserts. From March to November the heat is intolerable. During the whole of this season the air seems to be inflamed, the sky sparkles, and every one sweats profusely when covered with the lightest dress. Egypt is likewise infested by those destructive blasts commonly called the *poisonous winds*. Of these travellers have given various descriptions. Mr. Volney compares the violence of their heat to that of a large oven at the moment of drawing out the bread. When they begin to blow, the sky loses its usual serenity, and assumes a dark, heavy, and alarming aspect, the sun himself laying aside his usual splendor, and becoming of a violet colour. The streets are deserted, the inhabitants retiring to their houses for shelter till the destructive blast is over. Mr. Bruce describes a blast of this kind with which he was overtaken in a still more terrible manner. The sandy pillars raised in the desert were observed by our traveller in all their terrific appearance. Some-

times

times they appeared to move slowly: at other times with incredible swiftness, so that they could not have been avoided by the fleetest horse. Sometimes they came so near, that they threatened destruction to the whole company. Frequently the tops, when arrived at an immense height, so that they were lost in the clouds, suddenly separated from the bodies, and dispersed themselves in the air; and sometimes the whole column broke off near the middle, as if it had received a cannon shot; their size was such, that, at the distance of about three miles, they appeared ten feet in diameter. Next day they appeared of a smaller size but more numerous, and sometimes approached within two miles of the company. The sun was now obscured by them, and the transmission of his rays gave them a dreadful appearance, resembling pillars of fire. On the guide calling out that Simoom, or poisonous wind was coming, Mr. Bruce turned for a moment to the quarter from whence it came. It appeared like a hazy fog, of a purple colour but less bright than the purple part of the rainbow. It moved with such rapidity, that, before he could turn about, and fall upon his face, he felt the vehement heat of its current; Mr. Bruce had unfortunately inspired some part of the pernicious blast by which he almost entirely lost his voice and became subject to an asthmatic complaint from which he did not get free for two years. The third time the Simoom appeared, it was preceded by sandy pillars still more magnificent, the sun shining through them in such a manner as to give those which were nearest a resemblance of being spangled with stars of gold.

SOIL AND PRODUCTS.] Whoever is in the least acquainted with literature, knows that the vast fertility of Egypt is not owing to rain (little falling in that country,) but to the annual overflowing of the Nile. It begins to rise when the sun is vertical in Ethiopia; and the annual rains fall there, viz. from the latter end of May, to September, and sometimes October. At the height of its flood in the Lower Egypt, nothing is to be seen in the plains, but the tops of forests and fruit-trees, their towns and villages being built upon eminences either natural or artificial. When the river is at its proper height, the inhabitants celebrate a kind of jubilee, with all sorts of festivities. The banks or mounds which confine it, are cut by the Turkish baths, attended by his grantees; but according to captain Norden, who was present on the occasion, the spectacle is not very magnificent. When the banks are cut, the water is led into what they call the Chalis, or grand canal, which runs through Cairo, from whence it is distributed into cuts, for supplying their fields and gardens. This being done, and the waters beginning to retire, such is the fertility of the soil, that the labour of the husbandman is next to nothing. He throws his wheat and barley into the ground in October and May. He turns his cattle out to graze in November, and in about six weeks, nothing can be more charming than the prospect which the face of the country presents, in rising corn, vegetables, and verdure of every sort. Oranges, lemons, and fruits, perfume the air. The culture of pulse, melons, sugar canes, and other plants, which require moisture, is supplied by small but regular cuts from cisterns and reservoirs. Dates, plantanes, grapes, figs, and palm trees, from which wine is made, are here plentiful. March and April are the harvest months, and they produce three crops; one of lettuces and cucumbers (the latter being the chief food of the inhabitants,) one of corn, and one of melons. The Egyptian pasturage is equally prolific, most of the quadrupeds producing two at a time, and the sheep four lambs a year.

ANIMALS.] Egypt abounds in black cattle; and it is said, that the in-

habitants employ every day 200,000 oxen in raising water for their grounds. They have a fine large breed of asses, upon which the Christians ride, those people not being suffered by the Turks to ride on any other beast. The Egyptian horses are very fine; they never trot, but walk well, and gallop with great speed, turn short, stop in a moment, and are extremely tractable. The hippopotamus, or river horse, an amphibious animal, resembling an ox in its hinder parts, with the head like a horse, is common in Upper Egypt. Tygers, hyenas, camels, antelopes, apes, with the head like a dog, and the rat, called ichneumon, are natives of Egypt. The camelion, a little animal something resembling a lizard, that changes colour as you stand to look upon him, is found here as well as in other countries. The crocodile was formerly thought peculiar to this country; but there does not seem to be any material difference between it and the alligators of India and America. They are both amphibious animals, in the form of a lizard, and grow till they are about twenty feet in length, and have four short legs, with large feet armed with claws, and their backs are covered with a kind of impenetrable scales like armour. The crocodile waits for his prey in the sedge, and other cover, on the sides of rivers; and pretty much resembling the trunk of an old tree, sometimes surprises the unwary traveller with his fore paws, or beats him down with his tail.

This country produces likewise great numbers of eagles, hawks, pelicans, and water-fowls of all kinds. The ibis, a creature (according to Mr. Norden) somewhat resembling a duck, was deified by the ancient Egyptians for its destroying serpents and pestiferous insects. They were thought to be peculiar to Egypt, but a species of them is said to have been lately discovered in other parts of Africa. Oltriches are common here, and are so strong, that the Arabs sometimes ride upon their backs.

The Cerastes or horned viper inhabits the greatest part of the eastern continent, especially the desert sandy parts of it. It abounds in Syria, in the three Arabias, and in Africa: this is supposed to be the asp which Cleopatra employed to procure her death. Alexandria, plentifully supplied by water, must then have had fruit of all kinds in its gardens. The baskets of figs must have come from thence, and the asp, or Cerastes, that was hid in them, from the adjoining desert, where there are plenty to this day.

POPULATION, MANNERS, CUSTOMS, AND DIVERSIONS. } As the population of Egypt is almost confined to the banks of the Nile, and the rest of the country inhabited by Arabs, and other nations, we can say little upon this head with precision. It seems, however, to be certain, that Egypt is at present not near so populous as formerly, and that its depopulation is owing to the inhabitants being slaves to the Turks. They are, however, still very numerous; but what has been said of the populousness of Cairo, as if it contained two millions, is a mere fiction.

The inhabitants of Egypt may be distinguished into four distinct races of people. 1st, The Arabs. 2nd, The Copts. 3d, The Turks. 4th, The Mamlouks. The former of these classes partly employ themselves in agriculture and mechanical operations; and partly pass their lives among rocks, ruins, and sequestered places, where they can find water; sometimes uniting in tribes and living in smoky tents, and shifting their habitation from the desert to the banks of the river and back again as best suits their conveniency. The Copts are descendants of the ancient Egyptians, an ill looking-slovenly people, immersed in indolence; in their complexions they are rather sun-burnt than black. At Cairo they are called *writers*, and are the intendants, secretaries and collectors for government, they are generally excellent accountants, and many of them live by teaching the natives to read and write.

They are all hated by the Turks to whom they are slaves, and by the peasants whom they oppress. The Turks have the title of masters of Egypt, but are chiefly to be met with at Cairo: where they possess the religious and military employments. They who reside in Egypt, retain all their Ottoman pride and insolence, and the Turkish habit, to distinguish themselves from the Arabs and the Copts, who dress very plain, their chief linen being an upper garment of white linen, and linen drawers; but their ordinary dress is blue linen with a long cloth coat either over or under it. The *Manjons*, are all horsemen, the principal body of them reside at Cairo, but many of them are dispersed through the country in order to keep up their authority, collect the tribute, and oppress the people. The Christians and Arabs of the meaner kind content themselves with a linen or woollen wrapper, which they fold, blanket-like, round their body. The Jews wear blue leather slippers, the other natives of their country wear red, and the foreign Christians yellow. The dress of the women is tawdry and unbecoming; but their clothes are silk, when they can afford it; and such of them as are not exposed to the sun, have delicate complexions and features. The women are not admitted to the society of men, even at table. When the rich are desirous of dining with one of their wives, they give her previous notice, who accordingly prepares the most delicate dishes, and receives her lord with the greatest attention and respect. The women of the lower class usually remain standing, or seated in a corner of the room, while their husband is at dinner, and present him with water to wash, and help him at the table.

[RELIGION.] To what I have already said concerning the religion of Egypt, it is proper to add, that the bulk of the Mahometans are enthusiasts, and have among them their *santos*, or fellows who pretend to a superior degree of holiness, and without any ceremony intrude into the best houses, where it would be dangerous to turn them out. The Egyptian Turks mind religious affairs very little, and it would be hard to say what species of Christianity is professed by the Christian Copts, who are here numerous, but they profess themselves to be of the Greek church, and enemies to that of Rome. In religious, and indeed in many civil matters, they are under the jurisdiction of the patriarch of Alexandria, who by the dint of money generally purchases a protection at the Ottoman court.

[LANGUAGE.] The Coptic is the most ancient language of Egypt. This was succeeded by the Greek, about the time of Alexander the Great; and that by the Arabic, upon the commencement of the califate, when the Arabs dispossessed the Greeks of Egypt. The Arabic, or Arabesque, as it is called, is still the current language, but the Coptic and modern Greek continue to be spoken.

[LEARNING AND LEARNED MEN.] Though it is past dispute that the Greeks derived all their knowledge from the ancient Egyptians, yet scarcely a vestige of it remains among their descendants. This is owing to the bigotry and ignorance of their Mahometan masters; but here it is proper to make one observation, which is of general use. The califs or Saracens who subdued Egypt, were of three kinds. The first, who were the immediate successors of Mahomet, made war from conscience and principle, upon all kinds of literature, excepting the Koran; and hence it was, that when they took possession of Alexandria, which contained the most magnificent library the world ever beheld, its valuable manuscripts were applied for some months in cooking their victuals, and warming their baths. The same fate attended upon the other magnificent Egyptian libraries. The califs of the second race were

men

They

men of taste and learning, but of a peculiar strain. They bought up all the manuscripts that survived the general conflagration, relating to astronomy, medicine, and some useless parts of philosophy; but they had no taste for the Greek arts of architecture, sculpture, painting, or poetry, and learning was confined to their own courts and colleges, without ever finding its way back to Egypt. The lower race of califs, especially those who called themselves califs of Egypt, disgraced human nature; and the Turks have rivetted the chains of barbarous ignorance which they imposed; enemies to human knowledge they have stifled wisdom and learning throughout their whole empire. Their only studies at present are theology, while their innumerable commentators have made a chaos of the Koran; grammar, which is necessary to read this book correctly; and astrology to which ignorant nations are always addicted.

CURIOSITIES AND ANTIQUITIES.] Egypt abounds more with these than perhaps any other part of the world. Its pyramids have been often described. Their antiquity is beyond the researches of history itself, and their original uses are still unknown. The basis of the largest covers eleven acres of ground, and its perpendicular height is upwards of 500 feet, but if measured obliquely to the terminating point, 700 feet. It contains a room thirty-four feet long, and seventeen broad, in which is a marble chest, but without either cover or contents, supposed to have been designed for the tomb of the founder. In short, the pyramids of Egypt are the most stupendous, and, to appearance, the most useless structures that ever were raised by the hands of men. *Mr. Savary* thus describes his visit to the pyramids, "We left Giza about an hour after midnight, and scarcely had proceeded a quarter of a league, before we perceived the tops of the Pyramids. We were about three leagues from them and the moon shone on them with full splendour. They appeared like two pointed rocks with their summits in the clouds, and the aspect of these antique monuments which have survived nations, empires, and the ravages of time inspired veneration. The calm of nature and the silence of night added to their majesty; and the mind casting a retrospective glance over the ages that have passed by these mountains, which time himself cannot shake, shudders with involuntary awe. Peace be to the last seven wonders of the world! Honour'd be the people by whom they were raised.—At half past three in the morning we found ourselves at the foot of the greatest; we left our clothes at the door where it is entered and descended each with a torch. We proceeded till we were obliged to crawl like snakes, to pass into the second entry, which corresponded to the first. We fired a pistol about the middle, the fearful noise of which was long reverberated among the cavities of this immense edifice, and which awakened thousands of bats, much larger than those of Europe, that darting up and down, beat against our hands and face, and extinguished several of our lights.—After examining these caverns where the light of day never enters, and the shades of eternal night grow more thick and dark, we descended by the way we came. When we came out, we were bathed in sweat, as pale as death, and might have been taken for spectres rising from the abyss of darkness." See *Savary's Letters*, p. 192.

The mummy pits, so called for their containing the mummies or embalmed bodies of the ancient Egyptians, are subterraneous vaults of a prodigious extent; but the art of preparing the mummies is now lost. It is said that some of the bodies thus embalmed, are perfect and distinct at this day, though buried 3000 years ago. The labyrinth in Upper Egypt, is a curiosity thought to be more wonderful than the pyramids themselves. It is partly under-ground, and cut of a marble rock, consisting of twelve

palaces, and 1000 houses, the intricacies of which occasion its name. The lake Mæris was dug by orders of an Egyptian king, to correct the irregularities of the Nile, and to communicate with that river, by canals and ditches which still subsist, and are evidences of the utility, as well as grandeur of the work. Wonderful grottos and excavations, mostly artificial, abound in Egypt. The whole country towards Grand Cairo is a continued scene of antiquities, of which the oldest are the most stupendous, but the more modern the most beautiful. Cleopatra's needle, and its sculptures, are admirable. Pompey's pillar is a fine regular column of the Corinthian order, the shaft of which is one stone, being eighty-eight feet nine inches in height, or ten diameters of the column; the whole height is 114 feet, including the capital and the pedestal: it still preserves a perfect polish. Nothing can equal its majesty. At a distance it is seen predominant over the city, and at sea serves as a signal for mariners: near, it creates astonishment mingled with awe; the spectator is never weary of admiring the beauty of the capital, the length of the shaft, or the grand simplicity of the pedestal. The Sphynx, as it is called, is no more than the head and part of the shoulders of a woman hewn out of the rock, and about thirty feet high, near one of the pyramids.

The papyrus is one of the natural curiosities of Egypt, and served the ancients to write upon, but we know not the manner of preparing it. The pith of it is a nourishing food. The manner of hatching chickens in ovens is common in Egypt, and now practised in some parts of Europe. The construction of the oven is very curious.

CITIES, TOWNS, AND } Alexandria, which lies on the Levant coast,
PUBLIC EDIFICES. } was once the emporium of all the world, and by means of the Red sea furnished Europe and great part of Asia with the riches of India. It was a league and a half in length, and one third as wide; so that its walls were about four leagues in circumference, and were washed by the lake Mærotis on the south, and the Mediterranean on the north. The streets lengthwise, ran straight, and parallel to each other; thus giving a free passage to the north wind, which, alone, is healthy and temperate in Egypt. A street 2000 feet wide began at the marine gate, and ended at the gate of Canopus, adorned by magnificent houses, temples, and public edifices. Through this extent of prospect the eye was never fatiated with admiring the marble, the porphyry, and the obelisks. This street, the finest the world ever saw, was crossed by another of equal width, thus forming a square, at the point of intersection, half a league in circumference from the centre of which the two gates were seen, and vessels under sail, both to the north and south. A mole was thrown up from the continent to the island of Pharos, which divided the harbour. On this island was built the light-house called Pharos. This miraculous tower was near 400 feet high; on its summit was a mirror of vast polished steel, so disposed as to present the image of distant vessels before they were visible to the eye. Modern Alexandria is a place of small extent scarcely containing 6000 inhabitants. Yet are not all the tokens of its ancient magnificence effaced; its cisterns vaulted with great art, which were built under all parts of the city, and its numerous aqueducts are almost entire; though they have remained 2000 years. In many places not only temples but the walls of cities built before the time of Alexander the Great, are still entire and many of their ornaments, particularly the colours of the paintings are as fresh and vivid as when first laid on. The inhabitants are quite sunk in ignorance,
poverty.

poverty, and indolence. Alexandria stands 40 miles west of the Nile and 140 north-west of Cairo.

Rosetta or Raschid stands 25 miles north of Alexandria. It was founded in the eighth century, and became soon after the store-house of the merchandise of Alexandria and Cairo. Trade soon made it flourish, and it is now one of the pleasantest towns in Egypt. It spreads along the western bank of the Nile, and is nearly a league in length, and one fourth as wide. No remarkable square is seen here, no street perfectly straight, but the houses, built with terraces, standing asunder, and kept in good repair, have a pleasing air of neatness and elegance. The only remarkable public edifices are the mosques, the lofty minarets of which are built in a light bold stile, and produce a picturesque effect, in a town where the roofs are all flat, by throwing a variety into the picture; most of the houses have a prospect of the Nile and the Delta, a truly magnificent one; vessels and boats, some rowing some under sail, continually cover the river; while the tumult of the port, the mirth of the mariners, and their noisy music present a scene, ever moving, ever alive.

Cairo the capital of Egypt, is a large and populous, but a disagreeable residence, on account of its pestilential air and narrow streets. In the interesting letters of Buonaparte lately published, it is described by him as "an execrable dog-hole of a city, inhabited by a lazy set of wretches, who squat all day before their filthy huts, smoking and taking coffee, or eating pumpions, or drinking water. It is easy enough to lose one's self in the stinking narrow streets of this illustrious capital." It is divided into two towns, the Old and the New; the streets are so narrow and winding, that it is impossible to follow their direction, amidst the multitude of houses, which stand crowding on each other. The castle of Cairo stands on a steep rock and is surrounded by thick walls, on which are strong towers. This castle includes the palaces of the sultans of Egypt, now almost buried under their own ruins; domes overthrown, heaps of rubbish, gilding, and pictures, the colours of which have defied corroding time, stately marble columns still standing, but in general without capitals; such are the tokens of its former magnificence. Joseph's well is among the things the most curious the castle contains. It is sunk in the rock 280 feet deep, and forty-two in circumference. It includes two excavations not perpendicular to each other. A stair-case, the descent of which is exceedingly gentle, is carried round; the partition which separates this stair-case from the well is part of the rock, left only six inches thick, with windows, cut at intervals, to give light; but as they are small, and some of them low, it is necessary to descend by the light of candles. There is a reservoir, and a level space at that part of the well where it takes a new direction; and oxen which turn a machine which draws from the well. Other oxen, above, raise, it from this reservoir by a similar machine. The memory of the patriarch Joseph is still revered in Egypt, where they shew granaries and many other works of public utility, that go under his name. They are certainly of vast antiquity; but it is very questionable whether they were erected by him. On the bank of the Nile, facing Cairo, lies the village of Gizie, which is thought to be the ancient Memphis. Two miles west, is Bulac, called the port of Cairo. The Christians of Cairo practise a holy cheat, during the Easter holidays, by pretending that the limbs and bodies of the dead arise from their graves, to which they return peaceably. The streets of Cairo are pestered with jugglers and fortune-tellers. One of their favourite exhibitions is their dancing camels, which, when young, they place upon a large heated floor: the intense heat makes

the poor creatures caper, and being plied all the time with the sound of drums, the noise of that instrument sets them a dancing all their lives after. The other towns of note in Egypt are Damietta, supposed to be the ancient Pelusium; Seyd, on the west banks of the Nile, 200 miles south of Cairo and Cassian on the west coast of the red Sea. Damietta is larger and not less agreeable than Rosetta; it forms a semicircle, on the eastern shore of the Nile, two leagues and a half from its mouth. This city carries on a great trade to Syria and Cyprus. Multitudes of boats and small vessels incessantly fill its port, and bespeak it a commercial place. The slip of land on which Damietta is built, is painted with all the luxuries of nature. Imagine all the delights that running brooks and fresh verdure, all the odour that orange-flowers, all that a mild suavity, a balsamic air, and a most enchanting horizon can impart, and you will then have but a feeble idea of the small slip of earth, included between this expansive lake and the ever-flowing Nile.

Seyd, by the few who have visited it, is reported to be the most capital antique curiosity that is now extant. The general practice of strangers, who visit those places, is to hire a Janizary, whose authority commonly protects them from the insults of the other natives. Suez formerly a place of great trade, is now a small city, and gives name to the Isthmus that joins Africa with Asia. The children of Israel are supposed to have marched near this city, when they left Egypt, in their way towards the Red Sea. In our description of Alexandria and the other towns, we have made considerable additions, on account of the celebrity which the French invasion of Egypt has given them; but we have no doubt that the additions in this and in other articles will to the curious reader prove agreeable and interesting.

MANUFACTURES AND COMMERCE.] The Egyptians export great quantities of unmanufactured as well as prepared flax, thread, cotton, and leather of all sorts, callicoes, yellow wax, sal ammoniac, saffron, sugar, fena, and cassia. They trade with the Arabs for coffee, drugs, spices, callicoes, and other merchandizes, which are landed at Suez, from whence they send them to Europe. Several European states have consuls resident in Egypt, but the customs of the Turkish government are managed by Jews. A number of English vessels arrive yearly at Alexandria; some of which are laden on account of the owners, but most of them are hired and employed as carriers to the Jews, Armenians, and Mahometan traders.

CONSTITUTION AND GOVERNMENT.] The government of Egypt is both monarchical and republican. The monarchical is executed by the pasha, and the republican by the mamalukes or sangiacks. The pasha is appointed by the grand signior as his viceroy. The republican, or rather the aristocratical part of the government of Egypt, consists of a divan, composed of twenty-four sangiacks, beys, or lords. The head of them is called the sheik biellet, who is chosen by the divan, and confirmed by the pasha. Every one of these sangiacks is arbitrary in his own territory, and exerts sovereign power: the major part of them reside at Cairo. If the grand signior's pasha acts in opposition to the sense of the divan, or attempts to violate their privileges, they will not suffer him to continue in his post; and they have an authentic grant of privileges, dated in the year 1517, in which year sultan Selim conquered Egypt from the Mamalukes.

REVENUES.] These are very inconsiderable, when compared to the natural riches of the country, and the despotism of its government. Some say that they amount to a million sterling, but that two thirds of the whole is spent in the country.

MILITARY STRENGTH.] The military strength of Egypt consisted formerly in two corps of Janizaries and Assassins, who were once very formidable.

They were however degraded by the Mamlouks, who are at present the real masters of Egypt. Their number amounts to 8000 men "all cavalry, under the command of 24 Beys; every Mamlouk is purchased; they are all from Georgia and mount Caucasus; there are a great number of Russians among them, and even some French. Their religion is Mahometanism. Exercised from their infancy in the military art, they acquire an extraordinary degree of dexterity in the management of their horses, in shooting with the carbine and pistol, in throwing the lance and in wielding the sabre. There have been instances of their severing at one blow a head of wet cotton. Every Mamlouk has two or three and sometimes four servants, who follow him on foot wherever he goes, nay even to the field. The arms of the Mamlouk on horseback are two carabines, carried by his servants; these are never fired but once; two pair of pistols stuck in his girdle; eight lances in a kind of quiver, which he flings with admirable dexterity; and an iron-headed mace. When all these are discharged, he comes to his last resource, his two sabres; putting then the bridle of his horse between his teeth he takes one of them in each hand and runs full speed upon the foe, cutting and slashing from right to left; woe be to those who cannot parry his blows, for some of them have been known to cleave a man down the middle." See Buonaparte's Correspondence.

[HISTORY.] It is generally agreed, that the princes of the line of the Pharaohs sat on the throne of Egypt, in an uninterrupted succession, till Cambyses II. king of Persia, conquered the Egyptians, 520 years before the birth of Christ; and that in the reign of these princes, those wonderful structures, the pyramids, were raised, which cannot be viewed without astonishment. Egypt continued a part of the Persian empire, till Alexander the Great vanquished Darius, when it fell under the dominion of that prince, who soon after built the celebrated city of Alexandria. The conquests of Alexander, who died in the prime of life, being seized upon by his generals, the province of Egypt fell to the share of Ptolemy, by some supposed to have been a half-brother of Alexander, when it again became an independent kingdom, about 300 years before Christ. His successors, who sometimes extended their dominion over great part of Syria, ever after retained the name of Ptolemies, and in that line Egypt continued between two and three hundred years, till the famous Cleopatra, the wife and sister of Ptolemy Dionysius the last king, ascended the throne. After the death of Cleopatra, who had been mistress successively to Julius Cæsar and Mark Anthony, Egypt became a Roman province, and thus remained till the reign of Omar, the second calif of the successors of Mahomet, who expelled the Romans, after it had been in their hands 700 years. The famous library of Alexandria, said to consist of 700,000 volumes, was collected by Ptolemy Philadelphus, son of the first Ptolemy; and the same prince caused the Old Testament to be translated into Greek: this translation is known by the name of the Septuagint. About the time of the crusades, between the years 1150 and 1190, Egypt was governed by Noredin, whose son, the famous Saladin, was so dreadful to the Christian adventurers, and retook from them Jerusalem. He instituted the military corps of Mamlouks, who, about the year 1242, advanced one of their own officers to the throne, and ever after chose their prince out of their own body. Egypt, for some time, made a figure under those illustrious usurpers, and made a noble stand against the prevailing power of the Turks, till under Selim, who, after giving the Mamlouks several bloody defeats, reduced Egypt to its present state of subjection.

While Selim was settling the government of Egypt, great numbers of the ancient inhabitants withdrew into the deserts and plains, under one Zingancus.

nies, from whence they attacked the cities and villages of the Nile, and plundered whatever fell in their way. Selim and his officers perceiving that it would be a matter of great difficulty to extirpate those marauders, left them at liberty to quit the country, which they did in great numbers, and their posterity is known all over Europe and Asia, by the name of Gipsies.

An attempt was made a few years since, to deprive the Ottoman Porte of its authority over Egypt, by Ali Bey, whose father was a priest of the Greek church. Ali having turned Mahometan, and being a man of abilities and address, rendered himself extremely popular in Egypt. A false accusation having been made against him to the Grand Signior, his head was ordered to be sent to Constantinople; but being apprised of the design, he seized and put to death the messengers who brought this order, and soon found means to put himself at the head of an army. Being also assisted by the dangerous situation to which the Turkish empire was reduced, in consequence of the war with Russia, he boldly mounted the throne of the ancient sultans of Egypt. But not content with the kingdom of Egypt, he also laid claim to Syria, Palestine, and that part of Arabia which had belonged to the ancient sultans. He marched at the head of his troops to support these pretensions, and actually subdued some of the neighbouring provinces, both of Arabia and Syria. At the same time that he was engaged in these great enterprises, he was not less attentive to the establishing of a regular form of government, and of introducing order into a country that had been long the seat of anarchy and confusion. His views were equally extended to commerce; for which purpose he gave great encouragement to the Christian traders, and took off some shameful restraints and indignities, to which they were subjected in that barbarous country. He also wrote a letter to the republic of Venice, with the greatest assurances of his friendship, and that their merchants should meet with every degree of protection and safety. His great design was said to be, to make himself master of the Red Sea; to open the port of Suez to all nations, but particularly to the Europeans, and to make Egypt once more the great centre of commerce. The conduct and views of Ali Bey shewed an extent of thought and ability, that indicated nothing of the barbarian, and bespoke a mind equal to the founding of an empire; but he was not finally successful. He was, however, for some time extremely fortunate; he assumed the titles and state of the ancient sultans of Egypt, and was ably supported by Sheik Daher, and some other Arabian princes, who warmly espoused his interests. He also succeeded in almost all his enterprises against the neighbouring Asiatic governors and bashas, whom he repeatedly defeated; but he was afterwards deprived of the kingdom of Egypt, by the base and ungrateful conduct of his brother-in-law, Mahomed Bey Abudahap, his troops being totally defeated on the 7th of March, 1773. He was also himself wounded and taken prisoner; and dying of his wounds, was buried honourably at Grand Cairo; Abudahap afterwards governed Egypt as Sheik Bellet, and marched into Palestine to Subdæ Sheik Daher. After behaving with great cruelty to the inhabitants of the places he took, he was found dead in his bed one morning at Acre, supposed to be strangled. Sheik Daher accepted the Porte's full amnesty, and trusting to their assurances, embraced the captain pasha's invitation to dine on board his ship, when the captain produced his orders, and the brave Daher, Ali Bey's ally, had his head cut off in the 15th year of his age.

From that time Egypt has been torn by a civil war, between the adherents of Ali, and other beys or princes, who rose on his ruins. Of these

the principal are Morad and Ybrahim, who having driven their enemies into banishment, began to quarrel among themselves. Alternately expelled from Cairo, they finally agreed to a compromise, March, 1789. From this time nothing of importance occurs till the late invasion of Egypt by the French; an enterprize equally unprecedented and unjust; equally chimerical and perfidious. The potentates of Europe in their mutual wars made usually some pretence to justice; they never so far insulted the common feelings of mankind, as to attack without the smallest provocation, without the smallest colour or pretence, a neutral power who had never done them the smallest injury; this public contempt of all moral obligation, this open violation of all principles human and divine was reserved for that bloody, atheistical, and impious faction who have so long oppressed France, and who wish to introduce their base and degrading doctrines into every quarter of the world.

The views of the French in this expedition have been variously represented; in one of the letters from Buonaparte's army lately published, a very plausible and apparently true object is stated as the motive of this expedition. "To indemnify herself for the loss of her colonies, (says the writer) France turned her attention towards Egypt and Syria; countries which by their climate and fertility are capable of being made the store-house of France; and in process of time the mart of her commerce with India. It is certain, that by seizing and organizing these countries, we shall be enabled to extend our views still farther; to annihilate, by degrees, the English East India trade, enter into it with advantage ourselves, and finally get into our hands, the whole commerce of Africa and Asia."

For this purpose a fleet of 13 ships of the line and 4 frigates, together with a great number of transports were fitted out. The command of the fleet was given to admiral Bruceys, that of the land forces to Buonaparte. After making themselves masters of Malta, and leaving a garrison to defend it, they set sail for Egypt and arrived on the first of July before Alexandria; and in the night landed 2000 men to the westward of the town. Some divisions of Arabs and Mamlouks attacked the rear-guard of the French and made about 100 men prisoners. At 9 in the morning Buonaparte was under the walls of Alexandria, which he took after a fire of small arms for about an hour; the inhabitants made but a feeble resistance, and by eleven the French were masters of the town with the loss of 300 men killed and wounded. On the 7th all the troops arrived at Rosetta; and on the 9th they halted within ten leagues of Cairo, which soon after surrendered to them. The French army is estimated at 22,000 men, besides marines. They are constantly harassed by the Mamlouks who decline engaging in any general action. Buonaparte's letters which have been lately published, give a dreadful account of their miserable situation. Rear admiral Perceé says, "we were six days without any thing but water-melons to eat—water-melons for our dinner, and water-melons for our desert! The peasantry of the country kept up a firing all day about our ears. I can assure thee that if these people knew how to level a musket, not a man of us would return alive." The other letters give the same account of their distress. Buonaparte, in a letter to Kleber, thus describes their journey to Cairo; "Thou hast not an idea of the fatiguing marches we made to get to Cairo; never halting till 3 or 4 o'clock in the afternoon, after broiling in the sun all day; the greatest part of the time without food; obliged to glean what the divisions which preceded us had left in those detestable villages, which they had frequently pillaged; and harassed during the whole march by those *hordes of robbers* called Bedouins, who killed not only our men, but

our officers, at 25 paces from the main body.—It is a more destructive war, on my soul, than that of La Vendée. There is a general relaxation in the service; I do all I can to preserve unity among the parties; but all goes very ill; the troops are neither paid nor fed; and thou mayst easily guess what murmurs this occasions: they are loudest perhaps among the officers.”

From these letters it evidently appears, that Egypt has not proved that *land of promise* which the French were taught to expect. The scheme indeed always appeared perfectly chimerical, and as they are precluded from the possibility of returning to France, by the ever memorable victory of admiral Nelson, it is probable that they will be obliged to surrender themselves prisoners of war, or be gradually exterminated by famine and disease.

THE STATES OF BARBARY.

UNDER this head I shall rank the countries of, 1. Morrocco and Fez; 2. Algiers; 3. Tunis; 4. Tripoli and Barca.

The empire of Morocco, including Fez, is bounded on the north by the Mediterranean sea; on the south by Taflet; and on the east, by Sagelmessa and the kingdom of Algiers; being 500 miles in length, and 480 in breadth.

Fez, which is now united to Morocco, is about 125 miles in length, and much the same in breadth. It lies between the kingdom of Algiers, to the east, and Morocco on the south, and is surrounded in other parts by the sea.

Algiers, formerly a kingdom, is bounded on the east by the kingdom of Tunis, on the north by the Mediterranean, on the south by Mount Atlas, and on the west by the kingdoms of Morocco and Taflet. According to Dr. Shaw, this country extends in length 480 miles along the coast of the Mediterranean, and is between 40 and 100 miles in breadth.

Tunis is bounded by the Mediterranean on the north and east; by the kingdom of Algiers on the west; and by Tripoli, with part of Biledulgerid, on the south; being 220 miles in length from north to south, and 170 in breadth from east to west.

Tripoli, including Barca, is bounded on the north by the Mediterranean sea; on the south, by the country of the Berberies; on the west by the kingdom of Tunis, Biledulgerid, and a territory of the Gadamis; and on the east by Egypt; extending about 1100 miles along the sea-coast; and the breadth is from 1 to 300 miles.

Each capital bears the name of the state or kingdom to which it belongs.

This being premised, I shall consider the Barbary states as forming (which they really do) a great political confederacy, however independent each may be as to the exercise of its internal policy; nor is there a greater difference than happens in different provinces of the same kingdom, in the customs and manners of the inhabitants.

[AIR AND SEASONS.] The air of Morocco is mild, as is that of Algiers, and indeed all the other states, except in the months of July and August,

yet it is in general friendly to the constitution of its inhabitants as well as to those of Europeans.

SOIL, VEGETABLE AND ANIMAL } These states under the Roman
PRODUCTIONS, BY SEA AND LAND. } empire, were justly denominated the
garden of the world; and to have a residence there; was considered as the
highest state of luxury. The produce of their soil formed those maga-
zines, which furnished all Italy, and great part of the Roman empire, with
corn, wine, and oil. Though the lands are now uncultivated, through the
oppression and barbarity of their government yet they are still fertile; not
only in the above mentioned commodities, but in dates, figs, raisins, al-
monds, apples, pears, cherries, plums, citrons, lemons, oranges, pomégra-
nates, with plenty of roots and herbs in their kitchen gardens. Excellent
hemp and flax grow on their plains; and by the report of Europeans, who
have lived there for some time, the country abounds with all that can add
to the pleasures of life; for their great people find means to evade the fo-
briety prescribed by the Mahometan law, and make free with excellent
wines, and spirits of their own growth and manufacture. Algiers produces
salt-petre, and great quantities of excellent salt; and lead and iron have
been found in several places of Barbary.

Neither the elephant nor the rhinoceros are to be found in the states of
Barbary; but their deserts abound with lions, tigers, leopards, hyænas,
wolves, wild boars, and monstrous serpents. The Barbary horses were
formerly very valuable, and thought equal to the Arabian. Though their
breed is slow said to be decayed, yet some very fine ones are occasionally
imported into England. Dromedaries, asses, mules, and kumrahs, a
most serviceable creature, begot by an ass upon a cow, are their beasts of
burden.

But from the services of the camel they derive the greatest advantages, both
on account of the great fatigue he is capable of undergoing, and the subsistence
he requires. This useful quadruped enables the African to perform his long
and toilsome journies across that continent. The camel is, therefore, (says
Mr. Bruce) emphatically called the *ship of the desert*. He seems to have been
created for this very trade, endued with parts and qualities adapted to the
office he is employed to discharge. The driest thistle, and the barest thorn,
is all the food this useful animal requires, and even these, to save time, he eats
while advancing on his journey, without stopping, or occasioning a moment of
delay. As it is his lot to cross immense deserts, where no water is found,
and countries not even moistened by the dew of heaven, he is endued with the
power at one watering-place to lay in a store with which he supplies himself
for thirty days to come. To contain this enormous quantity of fluid, nature
has formed large cisterns within him, from which, once filled, he draws at
pleasure the quantity he wants, and pours it into his stomach with the same
effect as if he then drew it from a spring, and with this he travels, patiently
and vigorously, all the day long, carrying a prodigious load upon him, through
countries infested with poisonous winds, and glowing with parching and never
cooling fands.

Fowls and pigeons are remarkably plenty and good in the empire of Morocco;
but ducks are scarce, and geese and turkies (says Mr. Lempriere) I never saw
there. The country abounds with the red-legged partridge, likewise with
quails, eagles, and hawks. In the proper season the frankolin, a bird of the
partridge species is found here; also a few wood cocks, snipes in great num-
bers, all kinds of water-fowl, and a variety of small singing birds; of these the
sapsa-sparrow is remarkable for the sweetness of its note, which is thought to

exceed that of any other bird, but it cannot live out of its own climate. The oxen and sheep of this country are small; but their flesh is well favoured. Hares, rabbits, antelopes, porcupines, bears, ferrets, weasels, moles, foxes, wild cats, and cameloons are all natives of this empire; likewise all kinds of reptiles. Besides vermin, says Dr. Shaw (speaking of his travels through Barbary), the apprehensions we are under, in some parts at least of this country, of being bitten or stung by the scorpion, the viper, or the venomous spider, rarely failed to interrupt our repose; a refreshment so very grateful, and so highly necessary to a weary traveller. The seas and bays of Barbary abound with the finest and most delicious fish of every kind, and were preferred by the ancients to those of Europe.

POPULATION, INHABITANTS, MANNERS, } Morocco was certainly for-
CUSTOMS; AND DIVERSIONS. } merly far more populous than
it is now, if, as travellers say, its capital contained 100,000 houses, whereas at present, it is thought not to contain above 25,000 inhabitants; nor can we think that the other parts of the country are more populous, if it is true, that their king or emperor has 80,000 horse and foot; of foreign negroes, in his armies.

The city of Algiers is said to contain 100,000 Mahometans, 15,000 Jews, and 2000 Christian slaves; but no estimate can be formed as to the populousness of its territory. Some travellers report that it is inhabited by a friendly hospitable people, who are very different in their manners and character from those of the metropolis.

Tunis is the most polished republic of all the Barbary states. The capital contains 10,000 families, and above 3000 tradesmen's shops; and its suburbs consist of 1000 houses. The Tunisines are indeed exceptions to the other states of Barbary; for even the most civilized of the European governments might improve from their manners. Their distinctions are well kept up, and proper respect is paid to the military, mercantile, and learned professions. They cultivate friendship with the European states; arts and manufactures have been lately introduced among them; and the inhabitants are said at present to be well acquainted with the various labours of the loom. The women are handsome in their persons; and though the men are sun-burnt, the complexion of the ladies is very delicate, nor are they less neat and elegant in their dress; but they improve the beauty of their eyes by art, particularly the powder of lead-ore, the same pigment, according to the opinion of the learned Dr. Shaw, that Jezebel made use of when she is said (2 Kings, chap. ix. verse 30.) to have painted her face; the words of the original being, that she set off her eyes with the powder of lead-ore. The gentlemen in general are sober, orderly, and clean in their persons, their behaviour complaisant, and a wonderful regularity reigns through all the city.

Tripoli was once the richest, most populous, and opulent of all the states on the coast; but it is now much reduced, and the inhabitants, who are said to amount to between 4 and 500,000, have all the vices of the Algerines.

Their manners are much of a piece with those of the Egyptians already described. The subjects of the Barbary states, in general subsisting by piracy, are allowed to be bold intrepid mariners, and will fight desperately when they meet with a prize at sea; they are, notwithstanding, far inferior to the English, and other European states, both in the construction and management of their vessels. They are, if we except the Tunisines, void of all arts and literature. The misery and poverty of the inhabitants of Morocco, who are not immediately in the emperor's service, are beyond all description; but those

who

who inhabit the inland parts of the country are an hospitable inoffensive people; and indeed it is a general observation, that the more distant the inhabitants of those states are from the seats of their government, their manners are the more pure. Notwithstanding their poverty, they have a liveliness about them, especially those who are of Arabic descent, that gives them an air of contentment; and having nothing to lose, they are peaceable among themselves. They are naturally of a grave disposition, fervid in professions of friendship but very insincere in their attachments. They have no curiosity, no ambition of knowledge. When in adversity they manifest the most abject submission to their superiors; and in prosperity their tyranny and pride is insupportable. The Moors are supposed to be the original inhabitants, but are now blended with the Arabs, and both are cruelly oppressed by a handful of insolent domineering Turks, the refuse of the streets of Constantinople.

DRESS.] The dress of these people is a linen shirt, over which they tie a silk or cloth vestment with a sash, and over that a loose coat. Their drawers are made of linen. The arms and legs of the wearer are bare, but they have slippers on their feet; and persons of condition sometimes wear buskins. They never move their turbans, but pull off their slippers when they attend religious duties, or the person of their sovereign. They are fond of striped and fancied silks. The dress of the women is not very different from that of the men, but their drawers are longer, and they wear a sort of cawl on their heads instead of a turban. The chief furniture of their houses consists of carpets and mattresses, on which they sit and lie. In eating, their slovenliness is disgusting. They are prohibited gold and silver vessels; and their meat, which they swallow by handfuls, is boiled or roasted to rags.

RELIGION.] The inhabitants of these states are Mahometans; but many subjects of Morocco follow the tenets of one Hamed, a modern sectarist, and an enemy to the ancient doctrines of the califs. All of them are very fond of idiots; and in some cases their protection screens offenders from punishment for the most notorious crimes. In the main, however, the Moors of Barbary, as the inhabitants of these states are now promiscuously called, (because the Saracens first entered Europe from Mauritania, the country of the Moors) have adopted the very worst parts of the Mahometan religion, and seem to have retained only as much of it as countenances their vices. Adultery in the women is punished with death; but though the men are indulged with a plurality of wives and concubines, they commit the most unnatural crimes with impunity. All foreigners are allowed the open profession of their religion.

LANGUAGE.] As the states of Barbary possess those countries that formerly went by the name of Mauritania and Numidia, the ancient African language is still spoken in some of the inland countries, and even by some inhabitants of the city of Morocco. In the sea-port towns, and maritime countries, a bastard kind of Arabic is spoken; and seafaring people are no strangers to that medley of living and dead languages, Italian, French, Spanish, &c. that is so well known in all ports of the Mediterranean, by the name of *Lingua Franca*.

ANTIQUITIES AND CURIOSITIES, &c.] This article is well worth the study of an antiquary, but the subjects of it are difficult of access. The reader can scarcely doubt that the countries which contained Carthage, and the pride of the Phœnician, Greek, and Roman works, are replete with the most curious remains of antiquity, but they lie scattered amidst ignorant, barbarous inhabitants. Some memorials of the Mauritanian and Numidian greatness are still to be met with, and

and many ruins which bear evidence of their ancient grandeur and populousness. These point out the old Julia Cæsarea of the Romans, which was little inferior in magnificence to Carthage itself. A few of the aqueducts of Carthage are still remaining, particularly at Manuba, a country house of the Bey's, four miles from Tunis; but no vestige of its walls. The same is the fate of Utica, famous for the retreat and death of Cato; and many other renowned cities of antiquity; and so over-run is the country with barbarism, that their very scites are not known, even by their ruins, amphitheatres, and other public buildings which remain still in tolerable preservation. Besides those of classical antiquity, many Saracen monuments, of the most stupendous magnificence, are likewise found in this vast tract: these were erected under the califs of Bagdad, and the ancient kings of the country, before it was subdued by the Turks, or reduced to its present form of government. Their walls form the principal fortifications in the country, both inland and maritime. We know of few or no natural curiosities belonging to this country, excepting its salt-pits, which in some places take up an area of six miles. Dr. Shaw mentions springs found here, that are so hot as to boil a large piece of mutton very tender in a quarter of an hour.

[CITIES AND PUBLIC BUILDINGS.] Mention has already been made of Morocco, the capital of that kingdom, but now almost in ruins, the court having removed to Mequinez, a city of Fèz. Incredible things are recorded of the magnificent palaces in both cities: but by the best accounts the common people live in a very slovenly manner.

The city of Algiers is not above a mile and a half in circuit, though it is computed to contain near 120,000 inhabitants, 15,000 houses, and 107 mosques. Their public baths are large, and handsomely paved with marble. The prospect of the country and sea from Algiers is very beautiful, being built on the declivity of a mountain; but the city, though for several ages it has braved some of the greatest powers in Christendom, could make but a faint defence against a regular siege; and it is said that three English fifty-gun ships might batter it about the ears of its inhabitants from the harbour. If so, the Spaniards must have been very deficient either in courage or conduct. They attacked it in 1775 by land and by sea, but were repulsed with great loss, though they had near 20,000 foot and 2000 horse, and 47 king's ships of different rates, and 346 transports. In the years 1783 and 1784, they also renewed their attacks by sea to destroy the city and galleys, but after spending a quantity of ammunition, bombs, &c. were forced to retire without either its capture or extinction. The mole of the harbour is 500 paces in length, extending from the continent to a small island where there is a castle and large battery.

The kingdom of Tunis, which is naturally the finest of all these states, contains the remains of many noble cities, some of them still in good condition. Tunis, built near the original site of Carthage, hath a wall and fortifications, and is about three miles in circumference. The houses are not magnificent, but neat and commodious: as is the public exchange for merchants and their goods; but, like Algiers, it is distressed for want of fresh water, but that of rain, preserved in cisterns, is chiefly used by the inhabitants.

The city of Tripoli consists of an old and new town, the latter being the most flourishing; but great inconveniences attend its situation, particularly the want of sweet water. The city of Oran, lying upon this coast, is about a mile in circumference, and is fortified both by art and nature. It was a place of considerable trade, and the object of many bloody disputes between the Spaniards and the Moors. Constantina was the ancient Cirta

and one of the strongest cities of Numidia, being inaccessible on all sides, excepting the south-west.

Besides the above towns and cities, many others, formerly of great renown, lie scattered up and down this immense tract of country. The city of Fez, at present the capital of the kingdom so called, is said to contain near 300,000 inhabitants, besides merchants and foreigners. Its mosques amount to 500; one of them magnificent beyond description, and about a mile and a half in circumference. Mequinez is esteemed the great emporium of all Barbary. Salée was formerly famous for the piracies of its inhabitants. Tangier, situated about two miles within the straits of Gibraltar, was given by the crown of Portugal as part of the dowry of queen Catherine, consort to Charles II. of England. It was intended to be to the English what Gibraltar is now; and it must have been a most noble acquisition, had not the misunderstandings between the king and his parliament occasioned him to blow up its fortifications and demolish its harbour; so that from being one of the finest cities in Africa, it is now little better than a fishing town. Ceuta, upon the same strait, almost opposite to Gibraltar, is still in the hands of the Spaniards, but often, if not always, besieged or blocked up by the Moors. Tetuan, which lies within twenty miles of Ceuta, is now but an ordinary town, containing about 800 houses; but the inhabitants are said to be rich, and tolerably civilized in their manners.

The provinces of Suz, Tafilet, and Gefula, form no part of the states of Barbary, though the king of Morocco pretends to be their sovereign; nor do they contain any thing, that is particularly curious. Zaara, is a desert country, thinly peopled, and almost destitute both of water and provisions.

MANUFACTURES AND COMMERCE.] The lower subjects of these states know very few imaginary wants, and depend partly upon their piracies to be supplied with necessary utensils and manufactures; so that their exports consist chiefly of leather, fine mats, embroidered handkerchiefs, sword-knots, and carpets, which are cheaper and softer than those of Turkey, though not so good in other respects. As they leave almost all their commercial affairs to the Jews and Christians settled among them, the latter have established silk and linen works; which supply the higher ranks of their own subjects. They have no snips, that, properly speaking, are employed in commerce; so that the French and English carry on the greatest part of their trade. Their exports, besides those already mentioned, consist in elephants' teeth, ostrich feathers, copper, tin, wool, hides, honey, wax, dates, raisins, olives, almonds, gum arabic, and sandrac. The inhabitants of Morocco are likewise said to carry on a considerable trade by caravans to Mecca, Medina, and some inland parts of Africa, from whence they bring back vast numbers of Negroes, who serve in their armies and are slaves in their houses and fields.

In return for their exports, the Europeans furnish them with timber, artillery of all kinds, gunpowder, and whatever they want, either in their public or private capacities. The duties paid by the English in the ports of Morocco, are but half of those paid by other Europeans. It is a general observation, that no nation is fond of trading with these states, not only on account of their capricious despotism, but the villainy of their individuals, both natives and Jews, many of whom take all opportunities of cheating, and when detected are seldom punished.

It has often been thought surprising, that the Christian powers should suffer their marine to be insulted by these barbarians, who take the ships of all nations with whom they are at peace, or rather, who do not pay them a subsidy

either in money or commodities. We cannot account for this forbearance otherwise than by supposing, first, that a breach with them might provoke the Porte, who pretends to be the lord paramount; secondly, that no Christian power would be fond of seeing Algiers, and the rest of that coast, in possession of another; and, thirdly, that nothing could be got by a bombardment of any of their towns, as the inhabitants would instantly carry their effects into the deserts and mountains, so that the benefit resulting from the conquest, must be tedious and precarious.—Indeed, expeditions against Algiers have been undertaken by the Spaniards, but they were ill-conducted and unsuccessful, as before noticed.

CONSTITUTION AND GOVERNMENT.] In Morocco, government cannot be said to exist. The emperors have for some ages been parties, judges, and even executioners with their own hands, in all criminal matters; nor is their brutality more incredible than the submission with which their subjects bear it. In the absence of the emperor, every military officer has the power of life and death in his hand, and it is seldom that they mind the form of a judicial proceeding. Some vestiges, however, of the califate government still continue; for in places where no military officer resides, the mufti or high-priest is the fountain of all justice, and under him the cadis, or civil officers, who act as our justices of the peace. Though the emperor of Morocco is not immediately subject to the Porte, yet he acknowledges the grand signior to be his superior, and he pays him a distant allegiance as the chief representative of Mahomet. What I have said of Morocco is applicable to Fez, both kingdoms being now under one emperor.

Though Algiers, Tunis, and Tripoli, have each of them a Turkish pasha or dey who governs in the name of the grand signior, yet very little regard is paid by his ferocious subjects to his authority. He cannot even be said to be nominated by the Porte. When a vacancy of the government happens, which it commonly does by murder, every soldier in the army has a vote in choosing the succeeding dey; and though the election is often attended with bloodshed, yet it is no sooner fixed than he is cheerfully recognised and obeyed. It is true, he must be confirmed by the Porte; but this is seldom refused, as the divan is no stranger to the dispositions of the people. The power of the dey is despotic; and the income of the dey of Algiers amounts to about 150,000*l.* a year, without greatly oppressing his subjects, who are very tenacious of their property. These deys pay slight annual tributes to the Porte. When the grand signior is at war with a Christian power, he requires their assistance, as he does that of the king of Morocco; but he is obeyed only as they think proper. Subordinate to the deys are officers, both military and civil; and in all matters of importance the dey is expected to take the advice of a common council, which consists of thirty pashas. These pashas seldom fail of forming parties amongst the soldiers, against the reigning dey, whom they make no scruple of assassinating, even in council; and the strongest candidate then fills his place. Sometimes he is deposed; sometimes, though but very seldom, he resigns his authority to save his life, and it is seldom he dies a natural death upon the throne. The authority of the dey is unlimited; but an unsuccessful expedition, or too pacific a conduct, seldom fails to put an end to his life and government.

REVENUES.] I have already mentioned those of Algiers, but they are now said to be exceeded by Tunis. They consist of a certain proportion of the prizes taken from Christians, a small capitation tax, and the customs paid by the English, French, and other nations, who are suffered to trade with those states. As to the king of Morocco, we can form no

idea of his revenues, because none of his subjects can be said to possess any property. From the manner of his living, his attendance, and appearance, we may conclude he does not abound in riches. The ransoms of Christian slaves are his perquisites. He sometimes shares in the vessels of the other states, which entitles him to part of their prizes. He claims a tenth of the goods of his Mahometan subjects, and six crowns a year from every Jew merchant. He has likewise considerable profits in the Negroland and other caravans, especially the slave trade towards the south. It is thought that the whole of his ordinary revenue, in money, does not exceed 165,000*l.* a year. A detachment of the army of these states is annually sent into each province to collect the tribute from the Moors and Arabs; and the prizes they take at sea, sometimes equal the taxes laid upon the natives.

MILITARY STRENGTH } By the best accounts we have received, the
AT SEA AND LAND. } king of Morocco can bring to the field 100,000 men; but the strength of his army consists of cavalry mounted by his negro slaves. Those wretches are brought young to Morocco, know no other state but servitude, and no other master but that king, and prove the firmest support of his tyranny. About the year 1727, all the naval force of Morocco consisted only of three small ships, which lay at Sallee, and being full of men, sometimes brought in prizes. The Algerines maintain about 6500 foot, consisting of Turks, and cologies, or the sons of soldiers. Part of them serve as marines on board their vessels. About 1000 of them do garrison duty, and part are employed in fomenting differences among the neighbouring Arab princes. Besides these, the dey can bring 2000 Moorish horse to the field; but as they are enemies to the Turks, they are little trusted. Those troops are under excellent discipline, and the deys of all the other Barbary states keep up a force in proportion to their abilities; so that a few years ago they refused to send any tribute to the Turkish emperor, who seems to be satisfied with the shadow of obedience which they pay him.

It is very remarkable, that though the Carthaginians, who inhabited this very country of Barbary, had greater fleets and a more extensive commerce than any other nation, or than all the people upon the face of the earth, when that state flourished, the present inhabitants have scarcely any merchant ships belonging to them, nor indeed any other than what Sallee, Algiers, Tunis, and Tripoli fit out for piracy; which though increased since the last attack of the Spaniards, are now but few and small, and some years ago did not exceed six ships, from thirty-six to fifty guns. The admiral's ship belongs to the government; the other captains are appointed by private owners, but subject to military law. With such a contemptible fleet, these inhels not only harrafs the nations of Europe, but oblige them to pay a kind of tribute by way of presents.

HISTORY.] There perhaps is no problem in history so unaccountable as the decadence of the splendor, power, and glory of the states of Barbary; which, when Rome was mistress of the world, formed the fairest jewels in the imperial diadem. It was not till the seventh century that, after these states had been, by turns in possession of the Vandals and the Greek emperors, the califs or Saracens of Bagdad conquered them, and from thence became masters of almost all Spain, from whence their posterity was totally driven about the year 1492, when the exiles settled among their friends and countrymen on the Barbary coast. This naturally begot a perpetual war between them and the Spaniards, who pressed them so hard, that they called to their assistance the two famous brothers Barbarossa, who were admirals of the Turkish fleet, and who,

who, after breaking the Spanish yoke, imposed upon the inhabitants of all those states (excepting Morocco) their own. Some attempts were made by the emperor Charles V. to reduce Algiers and Tunis, but they were unsuccessful; and, as observed, the inhabitants have in fact shaken off the Turkish yoke likewise.

The emperors or kings of Morocco are the successors of those sovereigns of that country who are called Sheriffs, and whose powers resembled that of the califate of the Saracens. They have been in general a set of bloody tyrants; though they have had among them some able princes, particularly Muley Moluc, who defeated and killed Don Sebastian, king of Portugal. They have lived in almost a continued state of warfare with the kings of Spain and other Christian-princes ever since; nor does the crown of Great Britain sometimes disdain, as in the year 1769, to purchase their friendship with presents.

The empire of Morocco has been greatly disturbed by intestine commotions; a battle was fought between the emperor and his brother Ben Affer, in which the latter was defeated and slain. Late accounts say that the Spaniards had assisted another brother against the emperor, and that the conflict proved fatal to the latter. The present emperor is Muley Yazid, who falling under the displeasure of his father was obliged to take refuge in a religious sanctuary. His father was preparing to drive him, by force from this sanctuary, when he was overtaken by death. Immediately upon this event Muley Yazid came from his sanctuary and quietly ascended the throne.

SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 900 Breadth 800	} between } 6 and 20 north latitude. 26 44 east longitude.	} 378,000

BOUNDARIES.] It is bounded on the north by the kingdom of Sennaar, or Nubia; on the east, partly by the Red Sea, and partly by Dancala; on the west, by Gorham; and on the south, by the kingdom of Gingiro, and Alaba.

It contains the following provinces, viz.

1. Masuah; 2. Tigre; 3. Samen; 4. Begemder; 5. Amhara; 6. Walaka; 7. Gojam; 8. Damot; 9. Maitsha; 10. Dembea; 11. Kuara; 12. Nara. In this division, according to Mr. Bruce, from whom this account is taken, there is neither geographical nor historical precision.

AIR AND SEASONS.] The rainy season continues for six months of the year, from April to September, which is succeeded, without interval, by a cloudless sky, and vertical sun; and cold nights, which as immediately follow these scorching days. The earth, notwithstanding the heat of these days, is yet perpetually cold so as to feel disagreeably to the soles of the feet; partly owing

owing to the six months rains, when no sun appears, and partly to the perpetual equality of nights and days.

QUADRUPEDS.] There is no country in the world which produces a greater number or variety of quadrupeds, whether tame or wild, than Abyssinia. Of the tame or cow-kind, great abundance present themselves every where, differing in size, some having horns of various dimensions, some without horns at all; differing also in the colour and length of their hair.

Among the wild animals are prodigious numbers of the gazel, or antelope kind; the bohur, fassa, fecho, and madequa, and many others. The hyæna is still more numerous. There are few varieties of the dog, or fox kind. Of these the most numerous is the deep, or, as he is called, the jackal; this is precisely the same in all respects as the deep of Barbary and Syria, who are heard hunting in great numbers, and howling in the evening and morning. The wild boar, smaller and smoother in the hair than that of Barbary or Europe, but differing in nothing else, is met frequently in swamps or banks of rivers covered with wood.

The elephant, rhinoceros, giraffa, and camelopardalis, are inhabitants of the low hot country; nor is the lion, leopard, or faadh, which is the panther, seen in the high and cultivated country. The hippopotamus and crocodile abound in all the rivers, not only of Abyssinia, but as low down as Nubia and Egypt. There are many of the ass kind in the low country towards the frontiers of Atbara, but no zebras; these are the inhabitants of Fazuco and Narea.

But of all the other quadrupeds, there is none exceeds the hyæna for its merciless ferocity. They were a plague, says our author, speaking of these animals, in Abyssinia in every situation, both in the city and in the field, and I think surpassed the sheep in number. Gondar was full of them from the time it turned dark till the dawn of day, seeking the different pieces of slaughtered carcases which this cruel and unclean people expose in the streets without burial.

It is a constant observation in Numidia, that the lion avoids and flies from the face of a man, till by some accident they have been brought to engage, and the beast has prevailed against him; then that feeling of superiority imprinted by the Creator in the heart of all animals for man's preservation, seems to forsake him. The lion, having once tasted human blood, relinquishes the pursuit after the flock. He repairs to some high-way or frequented path, and has been known in the kingdom of Tunis, to interrupt the road to a market for several weeks; and in this he persists till hunters or soldiers are sent out to destroy him.

BIRDS.] The number of birds in Abyssinia exceeds that of other animals beyond proportion. The high and low countries are equally stored with them: the first kind are the carnivorous birds. Many species of the eagle and hawk, many more still of the vulture kind, as it were, over-stock all parts of the country. That species of gleebe, called Haddaya, so frequent in Egypt, comes very punctually into Ethiopia, at the return of the sun, after the tropical rains. The Nissia, or Golden Eagle is not only the largest of the eagle kind, but surely one of the largest birds that flies. From wing to wing he is eight feet four inches. The black eagle, Rachamah, Erkoom, Moroc, Sheregrig, and Waalia, are particularly described by the historian of Abyssinia, to whose celebrated work we refer the reader who is desirous of information concerning them.

There is no great plenty of water-fowl in Abyssinia, especially of the web-footed kind. Vast variety of storks cover the plains in May, when the

rains become constant. All the deep and grassy bogs have snipes in them; and swallows there are of many kinds unknown in Europe; those that are common in Europe appear in passage at the very season when they take their flight from thence. There are few owls in Abyssinia; but those are of an immense size and beauty. There are no geese, wild or tame, excepting what is called the Golden Goose, Goose of the Nile, or Goose of the Cape, common in all the south of Africa; these build their nests upon trees, and when not in water, generally sit upon them.

INSECTS.] From the class of insects, we shall select the most remarkable, viz. the Tfaltfalya or fly, which is an insect that furnishes a striking proof how fallacious it is to judge by appearances. If we consider its small size, its weakness, want of variety or beauty, nothing in the creation is more contemptible or insignificant. Yet passing from these to his history, and to the account of his powers, we must confess the very great injustice we do him from want of consideration. We are obliged with the greatest surprize to acknowledge, that those huge animals, the elephant, the rhinoceros, the lion, and the tyger, inhabiting the same woods, are still vastly his inferiors, and that the appearance of this small insect, nay, his very sound, though he is not seen, occasions more trepidation, movement, and disorder, both in the human and brute creation, than would whole herds of these monstrous animals collected together, though their number was in a ten-fold proportion greater than it really is.

This insect has not been described by any naturalist. It is in size very little larger than a bee, of a thicker proportion. As soon as this plague appears, and their buzzing is heard, all the cattle forsake their food, and run wildly about the plain, till they die, worn out with fatigue, fright, and hunger. No remedy remains but to leave the black earth, and halten down to the sands of Athara, and there they remain while the rains last, this cruel enemy never daring to pursue them farther. Though the size of the camel is immense, his strength vast, and his body covered with a thick skin, defended with strong hair, yet still he is not capable to sustain the violent punctures the fly makes with his pointed proboscis. He must lose no time in removing to the sands of Athara; for, when once attacked by this fly, his body, head, and legs break out into large bosses, which swell, break, and putrify, to the certain destruction of the creature.

VEGETABLE PRODUCTIONS.] The *Papyrus*, which is a plant well known in Egypt, appears to have been early brought thither from Ethiopia. It is also found in Abyssinia. *Balsam*, or *Balsam*, is also a native of Abyssinia. The great value set upon this drug in the east, remounts to very early ages. We know from scripture, the oldest history extant, as well as most infallible, that the Ishmaelites, or Arabian carriers and merchants, trafficking with the India commodities into Egypt, brought with them balsam as part of the cargo.—The *Ensete* is an herbaceous plant, which grows and comes to great perfection at Gondar, but it most abounds in that part of Maitsha and Goutto west of the Nile, where there are large plantations of it, and is there, almost exclusive of every thing else, the food of the Galla inhabiting that province. When soft, like a turnip well boiled, if eat with milk or butter, it is the best of all food; wholesome, nourishing, and easily digested. The *Teff* is a grain commonly sown all over Abyssinia, where it seems to thrive equally on all sorts of ground; from it is made the bread which is commonly used throughout this country. The Abyssinians indeed have plenty of wheat, and some of it of an excellent quality. They likewise make as fine wheat-bread as any in the world, both

for

for colour and taste; but the use of wheat-bread is chiefly confined to people of the first rank. The acacia tree is very common in Abyssinia, as are several other curious productions of the vegetable world, many of which are described in the Appendix of our author, and illustrated by many elegant engravings, which will afford a very great entertainment to the curious botanist.

[LAKES.] The lake of Tzana (not to mention those of Gooderoo, and Court Ohha) is by much the largest expanse of water known in this country. Its extent, however, has been greatly exaggerated. Its greatest breadth is 35 miles, and its extent in length is 49. The Nile, by a current always visible, crosses the end of it. In the dry months, from October to March, the lake shrinks greatly in size; but after that all those rivers are full which are on every side of it, and fall into the lake, like radii drawn to a center; then it swells, and extends itself into the plain country, and has of course a much larger surface.

There are about eleven inhabited islands in the lake. All these islands were formerly used as prisons for the great people, or for a voluntary retreat, on account of some disgust or great misfortune, or as places of security to deposit their valuable effects during troublesome times.

[CATARACTS OF THE NILE.] Omitting those of inferior note, we shall here give the reader some account of the great cataract of Alata, "which," says Mr. Bruce, "was the most magnificent sight that ever I beheld. The height has been rather exaggerated. The missionaries say the fall is about sixteen eils, or fifty feet. The measuring is, indeed, very difficult; but, by the position of long sticks, and poles of different lengths, at different heights of the rock, from the water's edge, I may venture to say that it is nearer forty feet than any other measure. The river had been considerably increased by rains, and fell in one sheet of water, without any interval, above half an English mile in breadth with a force and noise that was truly terrible, and which stunned, and made me, for a time, perfectly dizzy. A thick fame, or haze, covered the fall all round, and hung over the course of the stream both above and below, marking its tract, though the water is not seen. The river, though swelled with rain, preserved its natural clearness, and fell, as far as I could discern, into a deep pool, or basin, in the solid rock, which was full, and in twenty different eddies to the very foot of the precipice; the stream, when it fell, seeming part of it to run back with great fury upon the rock, as well as forward in the line of its course, raising a wave, or violent ebullition, by chafing against each other.

"Jerome Lobo pretends, that he has sat under the curve, or arch, made by the projectile force of the water rushing over the precipice. He says he sat calmly at the foot of it, and looking through the curve of the stream, as it was falling, saw a number of rainbows of inconceivable beauty in this extraordinary prism. This however," continues Mr. Bruce, "without hesitation, I aver to be a downright falsehood. A deep pool of water reaches to the very foot of the rock, and is in perpetual agitation. Not allowing that there was a seat or arch, which there is not, in the middle of the pool, it is absolutely impossible, by any exertion of human strength, to have arrived at it. Although I was a very robust man, in the prime and vigour of life, and a hardy, unweary, indefatigable swimmer, I am perfectly confident he could not have got to that seat from the shore through the quietest part of that basin. And, supposing the friar placed in his imaginary seat under the curve of the immense arch of water, he must have had a portion of firmness more than falls to the share of ordinary men, and which

is not likely to be acquired in a monastic life, to philosophize upon optics in such a situation, where every thing would seem to his dazzled eyes to be in motion, and the stream, in a noise like the loudest thunder, to make the solid rock (at least as to sense) shake to its very foundation, and threaten to tear every nerve to pieces, and to deprive one of other senses besides that of hearing. It was a most magnificent sight, that ages, added to the greatest length of human life, would not efface or eradicate from my memory; it struck me with a kind of stupor, and a total oblivion of where I was, and of every other sublunary concern. It was one of the most stupendous sights in the creation."

[SOURCES OF THE NILE.] The Agows of Damot pay divine honour to the Nile; they worship the river, and thousands of cattle have been offered, and still are offered, to the spirit supposed to reside at its sources. The village of Geesh, though not farther distant than 600 yards, is not in sight of the sources of the Nile. The country upon the same plane with the fountains, terminates in a cliff about 300 yards deep down to the plain of Asia, which flat country continues in the same subaltern degree of elevation, till it meets the Nile again about 70 miles southward, after it has made the circuit of Gojam and Damot. In the middle of a marsh, about 80 yards in breadth, and something less than 40 yards from the bottom of the mountain of Geesh, arises a hillock, of a circular form, about three feet from the surface of the marsh itself, though apparently sounded much deeper in it. The diameter of this is something short of twelve feet; it is surrounded by a shallow trench, which collects the water, and voids it eastward; it is firmly built with sod or earthen turf, brought from the sides, and constantly kept in repair, and this is the altar upon which all their religious ceremonies are performed. In the middle of this altar is a hole, obviously made, or at least enlarged, by the hand of man. It is kept clear of grass, or other aquatic plants, and the water in it is perfectly pure and limpid, but has no ebullition or motion of any kind discernible upon its surface. This mouth, or opening of the source, is some parts of an inch less than three feet diameter, and the water stood on the 5th of November, when Mr. Bruce visited it, about two inches from the lip of the brim, nor did it increase or diminish during all the time Mr. Bruce remained at Geesh, though he made plentiful use of it. This spring is about six feet six inches deep.

Ten feet distant from the first of these springs, a little to the west of south, is the sacred fountain, about eleven inches in diameter; but this is eight feet three inches deep. And about twenty feet distant from the first, to the S. S. W. is the third source, its mouth being something more than two feet large, and it is five feet eight inches deep. Both these last fountains stand in the middle of small altars, made like the former of firm sod, but neither of them above three feet diameter, and having a foot of less elevation than the first. With a brass quadrant of three feet radius, he found the latitude to be $10^{\circ} 59'$ north; and by $10^{\circ} 59' 25''$ in round numbers, for the exact latitude of the principal fountain of the Nile, though the Jesuits have supposed it 12° N. by a random guess. The longitude he ascertained to be $36^{\circ} 55' 30''$ east of the meridian of Greenwich.

[CAUSES OF THE INUNDATIONS OF THE NILE.] The sun being nearly stationary for some days in the tropic of Capricorn, the air there becomes so much rarefied, that the heavier winds, charged with watery particles, rush in upon it from the Atlantic on the west, and from the Indian Ocean, on the east. The south wind, moreover, loaded with heavy vapours, condensed in that high ridge of mountains, not far south of the Line, which

forms a spine to the peninsula of Africa, and running northward with the other two, furnish wherewithal to restore the equilibrium. Having thus gathered such a quantity of vapours as it were to a focus, the sun now puts them in motion, and drawing them after it in its rapid progress northwards, on the 7th of January, for two years together, seemed to have extended its power to the atmosphere of Gondar; when for the first time, there appeared in the sky, white, dappled, thin clouds, the sun being then distant 34° from the zenith, without any one cloudy or dark speck having been seen for several months before. Advancing to the line with increased velocity, and describing larger spirals, the sun brings on a few drops of rain at Gondar the 1st of March, being then distant 5° from the zenith; these are greedily absorbed by the thirsty soil, and this seems to be the farthest extent of the sun's influence, capable of causing rain, which then only falls in large drops, and lasts but a few minutes; the rainy season, however, begins most seriously upon its arrival at the zenith of every place, and these rains continue constant and increasing after he has passed it, in his progress northward. Before this, green boughs and leaves appear floating in the Bahar el Abiad, and shew that about 5° from the line, the latitude where it rises, the rains are already abundant.

In April, all the rivers in Amhara, Begemder, and Lafta, first discoloured, and then beginning to swell, join the Nile in the several parts of its course nearest them; the river then, from the height of its angle of inclination forces itself through the stagnant lake without mixing with it. In the beginning of May, hundreds of streams pour themselves from Gogjam, Damot, Maitsha, and Dembea, into the lake Tzana, which had become low by intense evaporation, but now begins to fill insensibly, and contributes a large quantity of water to the Nile, before it falls down the cataract of Alata. In the beginning of June, the sun having now passed all Abyssinia, the rivers there are all full, and then is the time of the greatest rains in Abyssinia, while it is for some days as it were, stationary in the tropic of Cancer.

Immediately after the sun has passed the line, he begins the rainy season to the southward, still as he approaches the zenith of each place; but the situation and necessities of this country being varied, the manner of promoting the inundation is changed. A high chain of mountains run from about 6° south all along the middle of the continent towards the Cape of Good Hope, and intersects the southern part of the peninsula, nearly in the same manner that the river Nile does the northern. A strong wind from the south, stopping the progress of the condensed vapours dashes them against the cold summits of this ridge of mountains, and forms many rivers which escape in the direction either east or west; as the level presents itself. If this is towards the west, they fall down the sides of the mountains into the Atlantic, and if on the east, into the Indian Ocean.

CITIES AND TOWNS.] GONDAR, the metropolis of Abyssinia, is situated upon a hill of considerable height, the top of it nearly plain, on which the town is placed. It consists of about ten thousand families in time of peace: the houses are chiefly of clay, the roofs thatched in the form of cones; which is always the construction within the tropical rains. On the west end of the town is the king's house, formerly a structure of considerable consequence. It was a square building, flanked with square towers. It was formerly four stories high, and from the top of it is a magnificent view of all the country southward to the lake Tzana. Great part of this house is now in ruins, having been burnt at different times; but there is

Bill ample lodging in the two lowest floors of it, the audience-chamber being above one hundred and twenty feet long.

The palace and all its contiguous buildings are surrounded by a substantial stone wall thirty feet high, with battlements upon the outer wall, and a parapet roof between the outer and inner, by which you can go along the whole and look into the street. There appears to have been never any embrasures for cannon, and the four sides of the wall are above an English mile and a half in length. Gondar, by a number of observations of the sun and stars, made by day and night, in the course of three years, with an astronomical quadrant of three feet radius, and two excellent telescopes, and by a mean of all their small differences, is in N. lat. $12^{\circ} 34' 30''$; and by many observations of the satellites of Jupiter, especially the first, both in their immersions and emersions during that period, Mr. Bruce concluded its longitude to be $37^{\circ} 33' 0''$ east from the meridian of Greenwich.

DIXAN is the first town in Abyssinia, on the side of Taraut. It is built on the top of a hill perfectly in form of a sugarloaf; a deep valley surrounds it every where like a trench, and the road winds spirally up the hill till it ends among the houses. It is true of Dixan, as of most frontier towns, that the bad people of both contiguous countries resort thither. The town consists of Moors and Christians, and is very well peopled; yet the only trade of either of these sects is a very extraordinary one, that of selling children. The Christians bring such as they have stolen in Abyssinia to Dixan as to a sure deposit; and the Moors receive them there, and carry them to a certain market at Masuah, whence they are sent over to Arabia or India. The priests of the province of Tigre, especially those near the rock Damo, are openly concerned in this infamous practice. Dixan is in lat. $14^{\circ} 57' 55''$ north, and lon. $40^{\circ} 7' 30''$ east of the meridian of Greenwich.

AXUM is supposed to have been once the capital of Abyssinia, and its ruins are now very extensive; but, like the cities of ancient times, consist altogether of public buildings. In one square, which seems to have been the center of the town, there are forty obelisks, none of which have any hieroglyphics upon them. They are all of one piece of granite, and, on the top of that which is standing, there is a *patera* exceedingly well carved in the Greek taste. There is a great deal of carving upon the top of the obelisk in Gothic taste, disposed rudely, and without order. Axum is watered by a small stream, which flows all the year from a fountain in the narrow valley, where stand the rows of obelisks. The spring is received into a magnificent basin of 150 feet square, and thence it is carried at pleasure to water the neighbouring gardens, where there is little fruit excepting pomegranates, neither are these very excellent. The latitude of this town is $14^{\circ} 6' 36''$ north.

MASUAH, is a small island immediately on the Abyssinian shore, having an excellent harbour and water deep enough for ships of any size to the edge of the island. The houses of this town, are in general built of poles and bent grass, as in the towns of Arabia; but besides these, there are about twenty of stone, six or eight of which are two stories each. N. lat. $15^{\circ} 35' 5''$ E. lon. $39^{\circ} 36' 30''$.

[TRADE AND COMMERCE.] Masuah continued a place of much resort as long as commerce flourished and notwithstanding the oppression of the Turks is still a place of considerable trade. But it is all done in a slovenly manner, and for articles where a small capital is invested. Property here is too pre-

carious to risk a venture in valuable commodities, where the hand of power enters into every transaction.

Gondar and all the neighbouring country depend for the necessaries of life, cattle, honey, butter, wheat, hides, wax, and a number of such articles, upon the Agows, who inhabit a province in which the sources of the Nile are found, and which province is no where 60 miles in length, nor half that in breadth. These Agows come constantly in succession, a thousand or fifteen hundred at a time, loaded with these commodities to the capital.

It may naturally occur, that, in a long carriage, such as that of a hundred miles in such a climate, butter must melt, and be in a state of fusion, consequently very near putrefaction: this is prevented by the root of an herb, called Moc moco, yellow in colour, and in shape nearly resembling a carrot; this they bruise, and mix with their butter, and a very small quantity preserves it fresh for a considerable time.

RELIGION.] Mr. Bruce informs us, from the annals of Abyssinia, that in the time of Solomon all this country was converted to Judaism, and the government of the church and state modelled according to what was then in use at Jerusalem.

Some ecclesiastical writers, rather from attachment to particular systems, than from any conviction that the opinion they espouse is truth, would persuade us that the conversion of Abyssinia to Christianity happened in the days of the apostles; but it appears that this was effected by the labours of Frumentius (the apostle of the Abyssinians) in the year of Christ 333, according to our account.

Their first bishop, Frumentius, being ordained about the year 333, preserved Abyssinia untainted with heresy till the day of his death, and being instructed in the religion of the Greeks of the church of Alexandria, by St. Athanasius, then sitting in the chair of St. Mark, it follows that the true religion of the Abyssinians, which they received on their conversion to Christianity, is that of the Greek church. They receive the holy sacrament in both kinds, in unavened bread, and in the grape bruised with the husk together as it grows, so that it is a kind of marmalade, and is given in a flat spoon. Large pieces of bread are given to the communicants in proportion to their quality, which they chew as indecently and with full as much noise as they eat at table. They observe also circumcision.

HISTORY.] As the accounts of kings and princes of remote ages are not always entertaining, and as the history of so barbarous and uncivilised a people will, we presume, afford but small amusement to our readers, whatever satisfaction they may have received from surveying the manners and customs of the people, and the natural history of the country; we shall therefore make no farther apology for omitting the account of the annals of Abyssinia, but refer those, who have any desire of information upon this subject, to the second volume of the Travels of our adventurous author, where he will find a very ample detail through more than 700 pages of a ponderous qu

Fezzan,
the peop

that an association has been entered into for the purpose of exploring these dreary regions. This association took place on the 9th of June, 1788, and consists of 95 members; out of which number the following persons were elected a committee, viz. *lord Rawdon, the Bishop of Landaff, Sir Joseph Banks, Mr. Beaufoy, and Mr. Stuart.* To these gentlemen were assigned the direction of its funds, the management of its correspondence, and the choice of the person to whom the geographical mission was to be assigned. Persuaded of the importance of the object which the association had in view, their committee lost no time in executing the plan which it had formed. Two gentlemen were recommended to them; and appearing to be eminently qualified for making the projected researches, they were chosen. One was a *Mr. Ledyard*; the other a *Mr. Lucas.*

Such a person as *Mr. Ledyard* was formed by nature for the object in contemplation, and were we unacquainted with the sequel, we should congratulate the society in being so fortunate as to find such a man for one of their missionaries; but the reader will soon be acquainted with the melancholy circumstance to which we allude.

From two such geographical missionaries (observes a very respectable literary journal^{ist} *) much information was no doubt expected; and, though the views of the society are not yet fully answered, the communications which it has received, are of a nature which will excite, though not fully gratify, the curiosity of geographers.

Mr. Ledyard undertook, at his own desire, the difficult and perilous task of traversing from east to west in the latitude attributed to the Niger, the widest part of the continent of Africa. On this bold adventure, he left London, June 30, 1788, and arrived at Cairo on the 19th of August.

Hence, he transmitted such accounts to his employers, as manifest him to have been a traveller who observed, reflected, and compared; and such was the information which he collected here from the travelling slave-merchants, and from others, respecting the interior districts of Africa, that he was impatient to explore them. He wrote to the committee, that his next communication would be from Sennaar, (600 miles to the south of Cairo); but death, attributed to various causes, arrested him at the commencement of his researches, and disappointed the hopes, which were entertained of his projected journey.

Endowed with a soul for discovery; and formed, by nature, for achievements of hardihood and peril; the death of *Mr. Ledyard* must be considered as a public misfortune. Ladies as well as philosophers will lament him, especially when they read his character of the fair sex, which conceiving it to be just we shall here insert. "Not haughty, not arrogant, not supercilious, they are full of courtesy and fond of society; if hungry, dry, cold, wet or sick, the women have ever been friendly to me and uniformly so; and to add to this virtue these actions have been performed in so free and kind a manner, that if I was dry, I drank the sweetest draught, and if hungry, I eat the sweetest morsel."

With a mixture of regret and disappointment, we turn from poor *Ledyard*, to notice *Mr. Lucas's* communications, which occupy the greatest part of the volume published by the association. He embarked for Tripoli, October 18, 1788, with instructions to proceed over the Desert of Zahara to Fezzan, to collect, and to transmit by way of Tripoli, whatever intelligence the people of Fezzan, or the traders thither, might be able to afford respect-

* Monthly Review, new Series vol. ii. p. 63.

ing the interior of the continent; and to return by the way of Gambia, or the coast of Guinea.

Instructions to undertake great enterprises, are more easily given than executed. So Mr. Lucas found; and so the reader, to his disappointment will find likewise. Only a part of the plan was this geographical missionary able to carry into execution. He sets out, indeed, mounted on a handsome mule, presented to him by the bey, the bashaw's eldest son, in company with sheerefs, for the kingdom of Fezzan; resolved, we will suppose, to penetrate from Tripoli even unto Gambia; but his peregrinations, which began Feb. 1. 1789, terminated at Mesurata, on Feb. 7.

Deprived of visiting Fezzan, and the other inland districts of Africa, Mr. Lucas solicits the information of his fellow-travellers, and transmits to the society the result of his conferences. A memoir compiled in this way, from the reports of a sheeref Imhammed, will not be deemed very satisfactory; and yet it certainly merits consideration, as it is, in part, corroborated by other testimonies.

Having no other sources of information, however, we must, for the present, content ourselves with these communications. From the various conferences of Mr. Lucas with the sheeref Imhammed, the following narrative is composed:

It describes the kingdom of Fezzan to be a small circular domain, placed in a vast wilderness, as an island in the midst of the ocean, containing near an hundred towns and villages, of which Mourzouk is the capital, distant, south from Mesurata, about 390 miles. In this kingdom are to be seen some venerable remains of ancient magnificence, some districts of remarkable fertility, and numerous smoking lakes, producing a species of fossil alkali called *irona*. Agriculture and pasturage are the principal occupations of the Fezzaners: they do not appear to have any coin; their medium of commerce is gold-dust; their houses, or rather huts, are built of clay, and are covered with branches of trees, on which earth is laid. As rain never falls at Fezzan, this covering is a sufficient protection. Their dress resembles that of the Moors of Barbary: but, during the heats of summer, which are intense, they only wear drawers, and a cap to protect their heads from the immediate action of the sun. To these, many particulars are added of their persons, diseases, and mode of cure; of their religion, government, taxes, animal and vegetable productions. Their sovereign, who is a tributary of the bashaw of Tripoli, administers impartial justice.

The narrative proceeds to state, that south east of Mourzouk, at the distance of 300 miles, is a sandy desert, 200 miles wide; beyond which, are the mountains of Tibesti, inhabited by ferocious savages, tributary to Fezzan. The vallies between the mountains are said to be fertilised by innumerable springs, to abound with corn, and to be celebrated for their breed of camels. The tribute of the Tibestins to the king of Fezzan, is twenty camel loads of senna.

This kingdom is inconsiderable, when compared with the two great empires of Bornou and Cassina, which lie south of Fezzan, occupying that vast region which spreads itself from the river of the Antelopes for 1200 miles westward, and includes a great part of the Niger's course. Cassina, we are informed, contains a thousand towns and villages; and in Bornou, which is still more considerable, thirty languages are said to be spoken. The latter is represented as a fertile and beautiful country; its capital being situated within a day's journey of the river *Wod-el-Gazel*, which is lost in the sandy wastes of the vast desert of Bilma, and is inhabited by herdsmen, dwelling, like the old

patriarchs, in tents, and whose wealth consists in their cattle. (Bornou or Bernou, is a word signifying the land of Noah; for the Arabi conceive, that; on the retiring of the deluge, its mountains received the ark.) Though they cultivate various sorts of grain, the use of the plough is unknown; and the hoe is the only instrument of husbandry. Here grapes, apricots, and pomegranates, together with limes and lemons, and two species of melons, the water and the musk, are produced in large abundances; but one of the most valuable of its vegetables is a tree called kedeyna, which, in form and height, resembles the olive, is like the lemon in its leaf, and bears a nut, of which the kernel and the shell are both in great estimation, the first as a fruit, the last on account of the oil which it furnishes when bruised, and which supplies the lamps of the people of Bornou with a substitute for the oil of olives, P. 139. Bees, it is added, are so numerous, that the wax is often thrown away as an article of no value in the market. Many other particulars are added, for which we must refer to the work. The population is described by the expression, *a countless multitude*. We shall pass over the nature of their religion, which is Mohammedan; of their government, which is an elective monarchy; and the singular mode of their electing a new king from among the children of the deceased sovereign: but the account of the present sultan, his wives, and his children (p. 127), is too curious not to be exhibited.

The present sultan, whose name is Alli, is a man of an unostentatious, plain appearance; for he seldom wears any other dress than the common blue shirt of cotton or silk, and the silk or muslin turban, which form the usual dress of the country. Such, however, is the magnificence of his seraglio, that the ladies who inhabit it are said to be 500 in number, and he himself is described as the reputed father of 350 children, of whom 300 are males; a disproportion which naturally suggests the idea that the mother, preferring to the gratification of natural affection, the joy of seeing herself the supposed parent of a future candidate for the empire, sometimes exchanges her female child for a male offspring of a stranger.

We are told that fire-arms, though not unknown to the people of Bornou, are not possessed by them.

South-east from Bornou, lies the extensive kingdom of Begarnee; and beyond this kingdom, are said to be several tribes of negroes, idolaters, and feeders on human flesh. These, we are told, are annually invaded by the Begarnee; and, when they have taken as many prisoners as their purpose may require, they drive the captives, like cattle, to Begarnee. It is further said, that if any of them, exhausted by fatigue, happen to linger in their pace, one of the horsemen seizes on the oldest, and, cutting off his arm, uses it as a club to drive on the rest.

We are not much disposed to give credit to this relation. That the negroes, who are sold for slaves, are different from the other Africans, is not probable; and that they should be driven along with the mangled limbs of their associates, utterly exceeds belief.

The empire of Cashna bears a great resemblance to that of Bornou.

After perusing what is here related of the extent, population, fertility, manufactures, and commerce of these regions, we may be permitted to wonder at their having remained altogether unknown to Europeans. We cannot but suspect considerable exaggerations. That the interior parts of Africa are peopled, the caravans which go from Cairo and Tripoli, and

Horses and horned cattle, goats, sheep, and camel, are the common animals of the country.

which

which are often absent three years, sufficiently evince: but that they are divided into regular and civilized states, may be a question. *A thousand towns and villages* in one empire, and *thirty different languages* spoken in the other, manifest a disposition in the shereef Imhammed to enlargement, or, at least to retail loose reports. That they should be acquainted with, yet not possess fire-arms, nor make any attempt to navigate the Niger, nor even to take the fish that abound in its waters, but little accords with the history of their commerce, and of their progress in manufactures.

Let us, however, make all possible deductions, and be ever so incredulous as to some particulars, the prospect which this narrative opens to us, of the interior of Africa (the greater part of which we have been accustomed to consider as consigned, by nature, to perpetual sterility and desolation) must afford great pleasure; and though, as we have already remarked, it is far from being satisfactory, or from having answered the object of the mission, it may be regarded by the society as that sort of evidence which should encourage them to persevere, and ought to induce Europeans, without delay, actually to explore the central provinces of the African continent.

SIERRA LEONE AND BULAM.

CONSIDERING the ardour of the maritime nations of Europe for settling colonies in distant regions of the globe, it is somewhat surprising that a climate so temperate and a soil so productive as that of Sierra Leone did not long ago attract their notice. A settlement was formed there in 1791 for a better purpose than that which first drew the natives of Europe to the West Indies and the American continent; it was not to plunder and oppress the miserable natives; but to diffuse among them the light of knowledge, the blessings of religion and the comforts of civilization; and thereby to cement and perpetuate the most confidential union between the European colonies and the natives of that country.

It had been ascertained beyond a doubt, that the climate and soil of Africa were admirably suited to the growth of sugar, coffee, cotton, indigo, &c. The company proposed to instruct the natives to raise these articles, and to let them the example, by a spirited cultivation, on its own account.

Every thing was settled with the native chiefs upon the most equitable principles, and the ships sailed in March 1792. Before the end of two years from the institution of the colony, order and industry had begun to show their effects in increasing prosperity. The woods had been cut down to the distance of about three English miles all round the town. By these means the climate had become healthier, and sickness had diminished. The fame of the colony had spread not only along the whole western coast of Africa, but also to parts far distant from the coast; embassies had been received of the most friendly nature from kings and princes several hundred miles distant; and the native chiefs had begun to send their children to the colony, with full confidence, to be taught reading, writing, and accounts, and to be brought up in the Christian religion. In a word, it was not without grounds that the directors looked forward to that joyful period when, by the influence of the company's measures, the continent of Africa should be rescued from her present state of darkness and misery, and exhibit a scene of light and knowledge, of civilization and order, of peaceful industry and domestic comfort. this cheerful scene was soon overcast, and this beautiful and prosperous colony overwhelmed with ruin. The French Convention (a name infamous and ever to be execrated) having violated every principle of truth and justice in Europe, determined by the same means to give light and liberty to the Africans. They arrived at Sierra Leone, on the 28th of September 1794, fired upon the town and did much damage. The inhabitants being in no respect provided for their reception were forced to submit.

In the afternoon the enemy landed, finding the town almost destitute of people, but rich in provisions, clothing, and other stores. They began immediately to break open the houses and to plunder. What they did not want, they destroyed, burnt, or threw into the river. They killed all the cattle and animals they found in the fields or streets, yards, or elsewhere, not sparing even asses, dogs, and cats. These proceedings they continued the whole succeeding week, till they had entirely ruined this beautiful and prosperous colony; and when they found nothing more worth plundering, they set fire to the public buildings and all the houses belonging to the Europeans; and burnt, as they said, by mistake nine or ten houses of the colonists.

It was thus that the French Convention executed their purpose of spreading light and liberty through the world. The Sierra Leone colony was established for no other end than to abolish the slave trade, to enlighten the Africans, and to render them rational, virtuous, free and happy; and those powerful patrons of the rights of man destroyed that colony with many circumstances of the most wanton cruelty. It is with pleasure, however, that we learn from the proceedings of the general court held on the 25th of February 1795, that the directors do not yet despair of the colony; and that they have adopted prudent measures to avert all such calamities in future.

A settlement of a similar nature was formed upon the island of Bulam, on the same coast, to the eastward of the island of Bisagos, under the direction of Mr. Dalrymple. But this is now entirely relinquished. A great part of the colonists has been massacred by the natives of the shore at the mouth of the river Gambia, who were accustomed to make annual plantations of rice in Bulam; and it was certainly a gross error that this circumstance was not before discovered, and a formal bargain of the isle made with the Africans. The surviving colonists have taken refuge among their countrymen at Sierra Leone; and Mr. Dalrymple, the governor, has returned to England.

OF AFRICA, from the Tropic of Cancer to the Cape of Good Hope.

See the Table and Map.

THIS immense territory is, comparatively speaking, very little known; there is no modern traveller that has penetrated into the interior parts; so that we are not only ignorant of the bounds, but even of the names of several inland countries. In many material circumstances, the

inhabitants of this extensive continent agree with each other. If we except the people of Abyssinia, who are tawny, and profess a mixture of Christianity, Judaism, and Paganism, they are all of a black complexion: in their religion, except on the sea-coasts, which have been visited and settled by strangers, they are pagans; and the form of government is every where monarchical. Few princes, however, possess a very extensive jurisdiction; for as the natives of this part of Africa are grossly ignorant in all the arts of utility or refinement, they are little acquainted with one another; and generally united in small societies, each governed by its own prince. In Abyssinia, indeed; as well as in Congo, Loango, and Angola, we are told of powerful monarchs; but, on examination, it is found that the authority of these princes stands on a precarious footing, each tribe or separate body of their subjects being under the influence of a petty chieftain of their own, styled *Negus*, to whose commands, however contrary to those of the *negafcha negafchi*, or king of-kings, they are always ready to submit. This indeed must always be the case among rude nations, where the art of governing like all others, is in a very simple and imperfect state. In the succession to the throne, force generally prevails over right; and an uncle, a brother, or other collateral relation, is on this account commonly preferred to the descendants whether male or female.

The fertility of a country so prodigiously extensive, might be supposed more various than we find it is: in fact, there is no medium in this part of Africa with regard to the advantages of soil; it is either perfectly barren, or extremely fertile. This arises from the intense heat of the sun, which, where it meets with sufficient moisture, produces the utmost luxuriance; and in those countries where there are few rivers, reduces the surface of the earth to a barren sand. Of this sort are the countries of Anian and Zaara, which for want of water, and consequently of all other necessaries, are reduced to perfect deserts, as the name of the latter denotes. In those countries, on the other hand, where there is plenty of water, and particularly where the rivers overflow the land, part of the year, as in Abyssinia, the productions of nature, both of the animal and vegetable kinds, are found in the highest perfection and greatest abundance. The countries of Mandingo, Ethiopia, Congo, Angola, Batua, Truticui, Monomotapa, Casati, and Mehenemugi, are extremely rich in gold and silver. The baser metals likewise are found in these and many other parts of Africa. But the persons of the natives make the most considerable article in the produce and traffic of this miserable quarter of the globe.

On the Guinea or western coast, the English trade to James' Fort and other settlements near and up the river Gambia, where they exchange their woollen and linen manufactures, their hard ware and spirituous liquors, for the persons of the natives. Among the negroes, a man's wealth consists in the number of his family, whom he sells like so many cattle, and often at an inferior price. Gold and ivory, next to the slave trade, form the principal branches of African commerce. These were carried on from the same coast, where the Dutch and French had their settlements for the purpose, most of which have been since reduced by the English. The Portuguese are in possession of the east and west coast of Africa, from the tropic of Capricorn, to the equator; which immense tract they became masters of by their successive attempts and happy discovery and navigation of the Cape of Good Hope. From the coast of Zanguabar, on the eastern side, they trade not only for the articles above-mentioned, but likewise for several others,

others, as senna, and aloes, civet, ambergrise, and frankincense. The settlement of the Dutch towards the southern parts of the continent, in the country called Caffraria, or the land of the Hottentots, particularly Cape Town, which is well settled and fortified are in possession of the English; where their ships bound for India usually put in, and trade with the natives for their cattle, in exchange for which they give them spirituous liquors.

COUNTRY OF THE HOTTENTOTS.

DURING the thirty six hours that I passed (says Vaillant) among the Gonaquai Hottentots, I had time to make some useful observations on their manners and speech. I remarked that they clucked with their tongues like the other Hottentots.

The affinity of customs, manners, and dispositions, the neighbourhood of Caffraria, and the insight that I afterwards received, convinced me that the Hoords of the Gonaquais, which resemble equally the Caffrees and Hottentots, must have been originally the produce of those two nations. The dress of the men, though better contrived and arranged, has the same form with that of the Hottentots, but as the first are of a more elevated stature, it is not with the skins of sheep, but with those of calves they make their cloaks, which are called, *Krofes*. Some of them wear on their neck a bit of ivory, or very white sheep's bone, which contrasted with the colour of their skins has a very good effect. When the neat is excessive, they take off all their covering but their *jacksals*, which is a piece of skin of the animal so named, and hangs from their girdles. The women take a great deal more trouble than the men in regard to dress; they also wear the *Kros*, but their aprons are larger, and wrought with a good deal of skill. In very hot weather, they only wear this last habiliment, and a skin that descends from the loins to the calf of their legs. Young girls until nine years old go absolutely naked, after that age they wear an apron.

The population of Africa must not be calculated by the innumerable quantities of blacks that swarm in the west and border the ocean from the Canaries on the kingdom of Morocco, to the environs of the Cape of Good Hope; there is certainly no proportion to enable us to form even a conjecture, since the barbarous navigators of Europe, by a commerce approved by a small number, detested by the greater, have seduced the negroes to give up their prisoners or those in their power; and taught them in proportion to their wants to become perfidious and inhuman. The chief has sold his subjects, the parents their children, and nature, as if to furnish them with the means of this unnatural traffick, has rendered them fruitful.

But this execrable trade is yet unknown in the interior of the continent, the desert is strictly the desert, and it is only at distances from each other, that we find scattered settlements, the people few, living on the fruits of the earth,

and the produce of their cattle, and ever a long way from one horde to another. The heat of the climate, the sterility of the soil, the scarcity of water, mountains almost impassable, savage beasts to cope with, or what is possibly worse, the phlegmatic temperament of this people may be a sufficient reason, why a Hottentot is seldom or never the father of six children.

The country of the *Gonaquais*, which I was exploring, might reckon 3000 people, on an extent of thirty or forty leagues. They were not here degenerate and miserable Hottentots like those who languish in the neighbourhood of the Cape, despising, and despised, remembering of their origin but the empty name; and enjoying, at the price of their liberty, a little peace bought dearly at the expence of excessive labour. Here I could contemplate a people brave and free, possessing only independence yielding to the impulse of their natures.

The form of their huts is the same with those of the Hottentots of the colonies, and measure about eight or nine feet in diameter. Some of them are covered with the hides of oxen or sheep, but more with mats. They have but one aperture, which is very low and narrow; the fire is made in the centre of the hut, so that the thick smoke which descends from it, mingled with the fetid smells from innumerable causes, would suffocate an European, who should have the courage to remain in it two minutes. Yet custom has rendered this bearable perhaps comfortable to savages. It is true they are always in the open air during the day, but when night approaches, every one gains his habitation, where stretched on his mat, and covered with a sheep's skin, he rests as content, and sleeps as soundly as if reposing on a bed of down. When the night happens to be more cold than ordinary, they cover themselves with larger skins, such as they put over their mats to sleep on.

I have before observed that the female *Gonaquais* have an appearance of care and finery in their ornaments unknown to the Hottentots of the colonies. Their aprons descend almost to their knees, and it is in the ornaments, I might say in the prodigious effusion of embroidery, that is lavished on them, that consists the richness, the magnificence on which they pride themselves. The flourishes and compartments, the art, with which the different colours are mingled and contrasted, in short nothing is neglected which they think will render them pleasing to the eye. They take the greatest care in the decoration of their persons; bracelets, girdles, necklaces, nothing is forgotten, when they mean to appear full dressed, which they think can add to their embellishment.

Though so much habituated to the sight of those Africans, I could never reconcile myself to the custom they have of painting themselves with a thousand ridiculous marks and figures; to the last it appeared to me hideous and disgusting. The two colours in greatest estimation among them are red and black. The first is an ochre, which is found in a number of places in this country, and is prepared for their use by being ground up with a quantity of grease. The black colour is nothing more than soot or charcoal, and is prepared in the same manner. Some women, indeed content themselves with painting their cheeks only, but the generality divide their faces into several distinct compartments, and this article of embellishment they are a considerable time of completing. These favourite colours of the Hottentots are always perfumed with the powder of *Bucku*, which does not strike the smell of an European with any agreeable sensation; but perhaps our essences, odours, and perfumes, would be equally insupportable to a Hottentot. At least, the *bucku* has one advantage over our pastes, washes, and rouge; it is

not pernicious to the skin, and never reduces those who use it to consumptions. The Hottentot who knows nothing of musk, ambergrease, or benjamin, is likewise unacquainted with megrims, spasms, and vapours. The men never paint their faces like the women, but they frequently make use of a mixture to daub their upper lip; by which disposition of it they have the satisfaction of enjoying the smell incessantly. The young girls sometimes suffer their lovers to apply this delicate mixture under their noses; this is considered as a great favour, and gives the girl so decorated an air of smartness, which renders her extremely interesting in the eyes of a young Hottentot. I would not have my readers infer from what I have said, that the female Hottentots are so intent on decorating their persons, as to neglect those daily and necessary occupations which their mode of living requires; it is only on certain holidays which occur but seldom that they spend so much of their time in dress. Separated from Europe by an immense ocean, and from the European colonies by deserts, mountains and dangerous rocks; they are cut off from all communication with other people, and if they have not arrived at our improvements, they have equally avoided the excess of our depravity. When women here have the happiness to become mothers, they apply themselves more intensely than in more polished countries, to the duties of their situation; nothing can possibly exceed the tenderness and solicitude with which they rear their infant offspring.

They are fond of hunting, and have great skill in it; independent of the snares spread for large game, they lay wait for, and attack them with their *Affagay*, (a kind of lances) or shoot them with empoisoned arrows. The first time I inspected their arrows, I did not suppose them such deadly weapons; but even their smallness renders them dangerous; for, when shot, it is impossible for the eye to perceive their flight, consequently there is no means to avoid them, and the smallest wound is always mortal, if the poison reaches the blood; the only remedy is a speedy amputation of the wounded part, if in the limb; but if the wound is in the body, it is inevitable death. These arrows are made of reeds and very curiously formed; they are not above 18 inches, or at most two feet long; at the end of the reed they fix a small bit of bone, three or four inches long, which they have previously rounded, this is smaller in diameter than the reed, and so slightly fixed in it, that when the arrow has entered the flesh the reed may be drawn away, while the bone still remains in the wound. To make it more deadly it has a small barb of iron on one side which on the least motion, continues to lacerate the flesh, and renders every attempt to extract it abortive. This bone they anoint with a poison, that has the consistence of mastic; and it is usually pointed with a little angular head, which altogether renders this weapon very terrible. In each country, they have a particular manner of preparing their poison, according to the different noxious plants their soil produces, and from which they extract the juice. A particular species of serpent likewise supplies them with another kind, which the savages prefer, as being the most subtil. It is impossible to gain the least information of their manner of preparing the venom extracted from these serpents, it being a secret which they inviolably preserve. The *affagay*, in the hand of a Hottentot is not a very certain weapon, even the length renders it less dangerous, as its course through the air may be readily seen, and easily avoided. Such are the means used for attack and defence by some of the savage nations of Africa; a European will perhaps look on them with disdain, and tax them with ferocity, forgetting that before those thundering engines were employed, which in a moment

make

make so many ruins and fill so many tombs, his forefathers were obliged like him to make use of similar, and content themselves with less destructive weapons.

The Hottentot is unacquainted even with the first elements of agriculture; he neither sows, plants, nor reaps; all that has been said of cultivating the earth &c. can only regard the colonists; if they had any taste for agriculture, it would certainly begin with tobacco and the vine; for drinking and smoking are the darling pleasures of both young and old. They sometimes make an intoxicating liquor composed of honey, and a root which they leave to ferment in water; this liquor is not their ordinary drink; they never make any reserve of it but drink it up at once. They smoke a plant which is called *dagba*; this plant is not indigenous, it is the hemp of Europe. The pipes that come from Europe are held in less estimation than those they fabricate themselves; the former they reckon too small; theirs is composed of bamboo, and the bowl of baked earth, or of a soft kind of stone, which they make very capacious.

Though they have prodigious quantities of sheep and oxen, it is very uncommon for them to kill any of the latter, unless they meet with some accident, or old age has rendered them useless; their principal food is the milk of cows and ewes, with the produce of the chase and now and then a sheep. When they wish to fatten these animals they have a custom which is not the less efficacious because unknown in Europe; and it has this peculiar advantage over our method, that it requires no care or skill in the operation. Instead of castrating these animals, they bruise the part with a couple of flat stones, which answers the same purpose; in a short time after, they get extremely fat, and when killed, are very good eating. The beasts set apart to carry burdens, are trained very early to this work; otherwise they would be perfectly unmanageable. While the animal is young, they pierce the gristle that separates the nostrils, through which they pass a stick of about eight or ten inches in length, and one in diameter; to prevent this from coming out, a leather strap is fastened to each end. The task of milking the cows belongs to the women, and the animals are surprisingly tractable.

Of their sheep and kine each village hath one common herd; every inhabitant taking it in his turn to be herdsman. This charge requires many precautions, very different from those which are taken by our herdsmen, beasts of prey being much more numerous and fierce in the southern parts of Africa than in Europe. Lions, indeed, are not very common; but there are elephants, rhinoceroses, leopards, tygers, hyenas, and several kinds of wolves, more destructive than ours, together with many other furious animals that abound in the forests, and occasionally make excursions towards the Cape, and destroy the tame cattle. To prevent these misfortunes, it is the business of the herdsman to go, or send, every day round his district, in order to discover if any beast of prey be lurking in that quarter. In which case, he assembles the whole village together, and makes his report; when a party of the stoutest among them arm themselves with javelins and poisoned arrows, and follow the person who may have discovered the beast, to the cave or covert where he is lodged. Here they arrange themselves in two lines; the herdsman entering the cave, and endeavouring to provoke the beast to follow him out, where he is inevitably destroyed.

The Hottentots divide the year by the wet and dry seasons, which is the general custom among the inhabitants of the tropics; they subdivide it by moons, never counting days when the number exceeds that of their fingers; a longer period of time is marked by some particular occurrence; such as a

in the fam

form, the killing of an elephant, or, some such circumstance. They count the time of the day by the sun; for example, pointing with their finger they say, "It was there when I departed, yonder when I returned." Though this method is not very exact, it answers well enough for people, who have no amorous rendezvous which requires a scrupulous exactitude; no lawsuits to attend, no scandal to publish; who make no mean despicable court to patrons, nor have any theatrical pieces either to hiss or commend; with calm tranquillity they behold the rising or the setting of the sun, unknowing and regardless of the pointed hour on the time-piece; which is ever bringing joy to some few, but sorrow to the greater number.

An idea of propriety among those savages, ever keeps those who are indisposed at a distance from the healthy; and it certainly never entered the imagination of a Hottentot to expose his distresses from a view of exciting commiseration; indeed it would be useless in a country where every one is naturally compassionate.

As soon as a Hottentot dies, he is wrapped up in his worst *kross*, his legs being bent in such a manner as to be entirely covered with it; his relatives then carry him to a certain distance from the *Horde*, and lay him in a hole dug for that purpose, which is never deep; covering him with earth, and then with stones, if it happens to be a place where there can be procured. It is not to be imagined that such a tomb can withstand the efforts of the jackal or hyena, and the body is often rooted up and devoured. The children, or in default of those, the next of kin take possession of whatever a person may happen to have at the time of his death: but the quality of chief is not hereditary. He is always elected by the horde, and his power is very limited. He is not honoured with any exterior mark of distinction, he enjoys no privilege above the rest, except that of being excused from taking his turn in watching the cattle. In their councils they take his advice if it is agreeable to the majority, if not, they pay no regard to it. When they go to battle, they have neither order nor divisions; neither generals nor captains; all are soldiers, all are officers; every one attacks or defends as he sees occasion; the boldest march at the head; and when they chance to gain a victory they never give to one man the whole honour of an action, which has been achieved by the joint efforts and courage of them all; in these instances it is the whole *Horde* that triumphs.

The Gonaquais (continues Mons. Vaillant) is the only nation among all those I have seen, who may be considered as absolutely free; at some future time, perhaps, they will be obliged to remove farther up the country, or to receive laws from their neighbours. Eastwards the lands are generally good, and the colonists are ever endeavouring to enlarge their limits on that side, and one day, no doubt, their avarice will succeed. Woe to that peaceable and happy people when that period shall arrive! oppressions, massacres, all the horrors attending unjust invasion, will obliterate every vestige of their liberty. These misfortunes have been experienced by all those *Hordes*, of which the first authors have given an account. Weakened by frequent dismembersments, they became at last absolutely dependent on the Dutch, and the primitive manners, original customs and history of this people, would either have been forgotten or considered as fables, had not some travellers, curious to discover the remains of them, had courage to penetrate the deserts of the great Namaquais, whose barren rocks, whose steep and sterile mountains produce no plant, no tree that can tempt the speculative avidity of the Europeans.

Some ancient authors have assured us that the Hottentots sleep altogether in the same hut, without regard to difference of age or feeling that invincible horror

horror which sets bounds to the passions among near relations. It is true, that these savages confined to what is strictly necessary have no idea of concealing a monstrous inclination under an outward appearance of scrupulous decency. The whole family inhabit one scanty hut, the father sleeps with his daughter, the brother with his sister, the mother with her son; but on the return of Aurora every one rises with a pure heart; without having cause to blush before the father of beings; or any of those creatures whom he has sealed with his divine image. The savage is neither a brute, nor is he unnatural. The horror of uniting with his own blood; is one of the most striking traits of character by which the creator has been pleased to mark the difference between the human and the brute creation; and nothing but the most glaring depravity can induce them to break down this almost insurmountable barrier.

It is necessary in this narration to take notice of that disgusting apron of Hottentot women, which has long made a figure in history. It is still fashionable among a certain horde. I say, it is fashionable (observes our author), for, instead of being the gift of nature, it ought to be considered as one of the most monstrous refinements ever invented by I know not what coquetry, altogether peculiar to a certain small corner of the world. This singularity is nothing else but a prolongation of the nymphæ, occasioned by weights suspended from them. They may hang down about nine inches more or less, according to the age of the persons, or the assiduous care which is bestowed on this singular decoration. A physiognomist, or if you will, a modern wit, might divert himself, and companions of a similar disposition, by giving the *Hottentot* a place in the scale of being, between a human creature, and an *Ourang-Outang*, but I cannot consent to do him that wrong, being sensible that he does not deserve to be so degraded. I have found his person agreeable, because I knew his soul to be respectable. I must own his features are different from those of other men, the prominence of his cheek bones makes his face appear very broad in that part, this contrasted with the narrowness of his jaw, which gradually lessens towards the chin, gives him an appearance of meagreness that makes his head seem disproportioned and too little for his body, which is in general fat and bulky. His nose is broad and flat, his nostrils very open, his mouth large, but filled with small teeth of an amazing whiteness, his eyes large and fine, inclining a little towards his nose, like the Chinese. His hair both to the sight and touch, resembles wool, is black as ebony, and in no great quantity; yet they are continually thinning of it. His eye-brows, which are very scantily set, do not require that care. The beard only grows on the upper lip, and on the extremity of the chin; this they never fail to pull out by the roots, which gives them an air of effeminacy that, joined to the natural softness of their character, tends very much to deprive them of that haughty aspect which has procured men in general, the title of lords of the creation. The *Hottentot* is perfectly well made, his carriage graceful and active, very different from the savages of South America, who appear only the rough draughts of nature. The women, though more delicate, have the same features, are equally well made, their necks beautifully formed, their hands small and their feet well shaped; though, in general, they wear no sandals. They have a soft tone of voice, and their speech is not unpleasing. They make use of an infinity of gesture when they talk, which shows their arms to great advantage.

The natural timidity of the *Hottentot*, prevents his being enterprising, while his *rang froid*, and deliberate method of speaking, gives him an air of reserve;

even in his hours of joy and relaxation; when, on the contrary, all the other black or tawny nations, give way to lively pleasure, and the most expanded gaiety; careless to inaction and laziness, tending his flocks and procuring himself food is his only study. When he hunts, he must not be considered as a sportsman, but as one oppressed with hunger; in short, he is forgetful of the past and regardless of the future, the present alone employs and interests his thoughts; but he is good, generous and hospitable; those who travel among them, are sure to find meat and lodging; they will receive you with pleasure, but never exact a recompense. If the traveller has far to go, and the *Hottentot* knows he will encounter no *Hoards* by the way, he will furnish him with as much provision as his means will permit, and enable him to continue his journey to the place of destination. Before the arrival of the Europeans at the Cape, commerce was unknown to the *Hottentots*, perhaps they had not even an idea of exchange; but the appearance of tobacco and beads, initiated them into mercantile mysteries; these new luxuries in time became wants, which the *Hottentots* of the colonies procure for them; for I must observe, that fond as they are, of these trifles, they will rather do without, than stir a step to fetch them: a useful lesson to those who drag through life in search of, and agitated by chimeras. Such were these people, or at least such they appeared to me, in all the innocence of pastoral life; and they yet offer to my imagination the idea of human nature in its infancy.

C A F F R A R I A

THE country known by the general denomination of Caffraria, is a very extensive region, bounded on the north by Negroland and Abyssinia; on the west by part of Guinea, Congo, and the sea; on the south by the Cape of Good Hope, and on the east by the sea. It is divided into several territories and kingdoms, of which little is known, and is computed to be 700 miles long and 660 broad.

The men among the Caffres, says lieutenant Paterfon, are from five feet ten inches to six feet high, and well proportioned, and in general evince great courage in attacking lions or any beasts of prey.

The colour of the Caffres is a jet black, their teeth white as ivory, and their eyes large. The cloathing of both sexes is nearly the same, consisting entirely of the hides of oxen, which are as pliant as cloth. The men wear tails of different animals tied round their thighs; pieces of brals in their hair, and large ivory rings on their arms; they are also adorned with the hair of lions, and feathers fastened in their heads, with many other fantastical ornaments.

They are extremely fond of dogs, which they exchange for cattle; and to such a height do they carry this passion, that if one particularly please them, they will give two bullocks in exchange for it. Their whole exercise through the day is hunting, fighting, or dancing. They are expert in throwing their lances, and in time of war, use shields made of the hides of oxen.

The women are employed in the cultivation of their gardens and corn. They cultivate several vegetables, which are not indigenous to their country, such as tobacco, water melons, a sort of kidney beans, and hemp. The women also make baskets, and the mats which they sleep on. The men

men have great pride in their cattle; they cut the horns in such a way as to be able to turn them into any shape they please, and they teach them to answer a whistle. When they wish their cattle to return home, they go a little way from the house, and blow this small instrument, which is made of ivory or bone, and so constructed as to be heard at a great distance, and in this manner bring all their cattle home without any difficulty. The soil of this country is a blackish loomy ground, and so extremely fertile, that every vegetable substance, whether sown or planted, grows here with great luxuriance.

There are great varieties in the climates; but I had no thermometer to observe the degrees of heat. It seldom rains except in the summer season, when it is accompanied with thunder and lightning. The country, however, is extremely well supplied with water, not only from the high land towards the north, which furnishes abundance through the year, but from many fountains of excellent water, which are found in the woods. From what I observed of this country, I am induced to believe that it is greatly superior to any other known part of Africa. The woods produce variety of arboreous plants, and some of a great size; they are inhabited by elephants, buffaloes, &c. There were also varieties of beautiful birds and butterflies; but they were so shy, that I was able only to preserve two birds of that country.

To judge of the Caffrees by those I had seen, says monsieur Vaillant, they are taller than the Hottentots of the colonies, or even than the Gonaquis, though they greatly resemble the latter, but are more robust, and possess a greater degree of pride and courage. The features of the Caffrees are likewise more agreeable, none of their faces contracting towards the bottom, nor do the cheek bones of those people project in the uncouth manner of the Hottentots; neither have they large flat faces and thick lips like their neighbours, the negroes of Mosambique, but a well formed contour, and agreeable nose, with eyes sparkling and expressive; so that setting aside our prejudice with regard to colour, there are many women among them who might be thought handsome by the side of an European lady. They do not disfigure themselves by daubing their eye-brows like the Hottentots, but are very much tattooed, particularly about the face.

The hair of the Caffrees, which is strong and curling, is never greased, but they anoint the rest of their bodies, with a view of making themselves active and strong. The men are more particular in decorations than the women, being very fond of beads and brass rings. They are seldom seen without bracelets on their legs and arms, made of the tusks of an elephant, which they saw to a convenient thickness, and then polish and round. As these rings cannot be opened, it is necessary to make them big enough to pass the hand through, so that they fall or rise according to the motion of the arm. Sometimes they place small rings on the arms of their children, whose growth soon fills up the space, and fixes the ornament; a circumstance which is particularly pleasing to them.

They likewise make necklaces of the bones of animals, which they polish and whiten in the most perfect manner. Some content themselves with the leg-bone of a sheep hanging on the breast, which is thought as pleasing a decoration, as a patch on the face of a pretty woman. Sometimes this embellishment is changed for the horn of a *gazelle*, or any other thing for the caprice of the moment; and I think they would display as much variety and whimsicality in decoration as the Europeans themselves, was it equally in their power. In the warm season the Caffrees only wear their ornaments; when

when the weather is cold, they make use of kroses made of the skins of calves or oxen, which reach to the feet. One particularity which deserves attention, and does not exist elsewhere, is; that the Caffree women care little for ornaments. Indeed, they are well made and pretty, when compared to other savages; and never use the uncouth profusion of Hottentot coquetry, nor even wearing copper bracelets. Their aprons, like those of the Gonaquis, are bordered with small rows of beads, which is the only vanity they exhibit.

The skin that the female Hottentot ties about the loins, the Caffree woman wears as high as her shoulders, tying it over the bosom which it covers. They have, like the men; a tunic or cloak of calf or ox skin, divested of the hair; but it is only in the rainy season that either sex wear it. These skins are as soft and pliant as the finest fluff. Let the weather or season prove ever so bad, the Caffree women cover their heads. Sometimes indeed, I have seen one of a Caffree adorned with a feather stuck in the hair, but this highness is no means common.

One part of the daily occupation of the women is making earthen ware, which they fashion as dexterously as their husbands; they likewise make a curious kind of baskets, of a texture so compact as to contain milk; and they also prepare the fields for feed; scratching the earth, rather than digging it, with wooden pick axes.

The huts of the Caffrees are higher and more commodious than those of the Hottentots; it is absolutely a perfect hemisphere; they are composed of wooden works very strong and compact, covered both within and without, with a mixture of earth, clay and cow dung. The opening or door-way is so low, that to enter the dwelling you must crawl on your hands and knees, which makes it easier to defend themselves against animals, or the sudden attacks of an enemy. The hearth or fire-place is in the centre surrounded by a circular rim which rises two or three inches.

The lands of Caffraria, either from their situation, or the number of small rivers that refresh them, are more fertile than those of the Hottentots. The Caffrees practise agriculture, which proves they are not naturally wanderers. I have made a remark (continues monsieur Vaillant) which, though it may appear strange is no less certain, that notwithstanding the beautiful forests that adorn Caffraria, and the delightful pastures which spring up and almost cover the animals who feed on them, with the numerous rivulets and brooks that meander in a thousand different directions, the oxen, cows, and almost all other animals in this country are smaller than those of the Hottentots. This peculiarity certainly arises from the properties of the sap which gives the grass a different quality; and I remarked in my travels among the Namaquais, who inhabit the most rocky and sterile spot of all Africa, that the oxen were the finest I had seen, and that the elephants and hippopotamuses were larger and stronger than elsewhere; which proves that the scanty pastures of this country must be salutary. Industry is a leading trait in the character of the Caffrees. Some arts, taught indeed by necessity, a love of agriculture, with a few religious dogmas, distinguish them as a more civilised people than those towards the south. Circumcision, which is generally practised among them, proves that they either owe their origin to an ancient people, or have simply imitated the inhabitants of some neighbouring country, of whom they have no longer any remembrance, neither do they use it (as they say) in any religious or mystical sense.

They entertain a very high opinion of the Supreme Being, and of his power; believe in a future state, where the good will be rewarded, and the wicked

wicked punished; but have no idea of the creation, thinking the world had no beginning, and will ever continue in its present state. They have no sacred ceremonies, and never pray. They instruct their own children living no priests; but instead of them a kind of sorcerers or conjurers, whom they greatly distinguish and revere.

The Caffres are governed by a chief or king, whose power is very limited, receiving no tax, having no troops at his command, but being the father of a free people, neither attended nor feared, but respected and beloved, and frequently poorer than many of his subjects. Being permitted to take as many wives as he pleases, who think it an honour to belong to him, it is necessary that he should have a larger portion of land to cultivate, and a greater number of cattle to tend and feed; these being his only resources for the maintenance of his numerous family, he is frequently in danger of being ruined. His cabin is neither higher, nor better decorated than the rest; his whole family and seraglio live round him, composing a group of a dozen or fifteen huts: the adjoining land is generally of his own cultivation. It is a custom among the Caffres for each to gather his own grain, which is their favourite nourishment, and which they grind or crush between two stones; for which reason, the families living separately, each surrounded by his own plantation of corn, necessitate a small *herd* sometimes to occupy a league square of ground; a circumstance never seen among the Hottentots.

The distance of the different *herds* makes it necessary that they should have chiefs, who are appointed by the king. When there is any thing to communicate, he sends for and gives them orders, or rather information, which the chiefs bear to their several *herds*.

The principal weapon of the Caffree is the lance or assagay, which shews his disposition to be at once intrepid and noble, despising, as below his courage, the envenomed dart, so much in use among his neighbours; seeking his enemy face to face, and never throwing his lance but openly. In war he carries a shield of about three feet in height, made of the thickest part of the hide of a buffalo; this defends him from the arrow or assagay, but is not proof against a musquet ball. The Caffree also manages with great skill a club of about two feet and a half long, made of a solid piece of wood, three or four inches thick, in the largest part, and gradually diminishing towards one of the ends. When, in a close engagement, they strike with this weapon, or frequently throw it to the distance of fifteen or twenty paces, in which case it seldom fails of the intended effect.

The sovereignty here is hereditary; the eldest son ever succeeding. In default of male heirs, it is not the king's brother that succeeds, but the eldest nephew; and in case the king should have neither children nor nephews, the chiefs of the different *herds* elect a king.

Polygamy is customary among the Caffrees; their marriages are even more simple than those of the Hottentots, the parents of the bridegroom being always content with his choice; the friends of the bride are rather more difficult, but seldom refuse their consent; after which they rejoice, drink and dance for weeks together, according to the wealth of the families; but these feasts are never held but on the first espousals. They have no musical instruments, but such as are used by the Hottentots. As for their dances, the step is not unlike the English.

At the death of the father, the sons and the mother divide the property he has left between them. The daughters claiming nothing, remain at home with their mother or brother, unless it pleases some man to take them; and if this circumstance takes place, during the life of the parents, they receive

cattle in proportion to the wealth of their father. The dead are seldom buried, but carried away from the Kraal by their family, and deposited in a deep trench common to the whole horde on such occasions; where the wild beasts repair at leisure, which preserves the air from those noxious vapours which otherwise the putrefaction would occasion. The honours of burial are only due to the king or chief of a horde; they cover these bodies with piles of stones in the form of a dome.

I am unacquainted with the disposition of the Caffrees, respecting love and jealousy, but believe that they only feel the latter sensation in regard to their countrymen; voluntarily giving up their women for a small consideration to the first white man that expresses an inclination for them.

HISTORY.] The history of the continent of Africa is little known, and probably affords no materials which deserve to render it more so. We know from the ancients, who sailed a considerable way round the coasts, that the inhabitants were in the same rude situation near 2000 years ago in which they are at present, that is, they had little of humanity about them but the form. This may either be accounted for by supposing that nature has placed some insuperable barrier between the natives of this division of America and the inhabitants of Europe, or that the former, being so long accustomed to a savage manner of life, and degenerating from one age to another, at length became hardly capable of making any progress in civility or science. It is very certain that all the attempts of Europeans, particularly of the Dutch, at the Cape of Good Hope, have been hitherto ineffectual for making the least impression on these savage mortals, or giving them the least inclination, or even idea, of the European manner of life.

The Portuguese are sovereigns of the greatest part of the coast, and have a number of black princes their tributaries. There are some independent princes who have extensive dominions, particularly the kings of Dabomy and Widah, the most noted of any for the infamous slave trade. Upwards of 200 years have the European nations traded with Africa in human flesh, and encouraged in the Negro countries, wars, rapine, desolation, and murder, that the West India islands might be supplied with that commodity. The annual exportation of poor creatures from Africa hath exceeded 100,000, many of whom are driven a thousand miles to the sea coast, their villages having been surrounded in the night by an armed force, and the inhabitants dragged into perpetual captivity.

A sea officer lately visited all the chiefs of the negroes in our settlements from Santa Apollonia to Athera, an extent of more than 250 miles, and found the police and punishment of all crimes regulated by the slave trade. Those who commit crimes or trespasses against their laws, are, at the decision of twelve elders, sold for slaves for the use of their government, and the support of their chiefs. Theft, adultery, and murder, are the highest crimes, and, whenever they are detected, subject the whole family to slavery. But any individual condemned to slavery for the crime of his relation, may redeem his own person, by furnishing two slaves in his room. Or when a man commits one of the above cardinal crimes, all the male part of his family are forfeited to slavery; if a woman, the female part is sold. "This traffic in crimes makes the chiefs vigilant. Nor do our planters, who purchase them, use any pains to instruct them in religion, to make them amends for the oppression thus exercised on them. I am sorry to say they are unannaturally averse to every thing that tends to it; yet the Portuguese, French, and Spaniards, in their settlements, succeeded in their attempts to instruct them

them, as much to the advantage of commerce, as of religion. It is for the sake of Christianity, and the advantages accompanying it, that English slaves embrace every occasion of deserting to the settlements of those nations."

It is high time for the legislature to interfere and put an end to this most infamous of all trades, so disgraceful to the Christian name, and so repugnant to the principles of our constitution. Let the negroes, already in our islands, be properly treated, made free, and encouragement given to their population; measures that would be attended with no less profit than honour.

AFRICAN ISLANDS.

OF the African islands, some lie in the Eastern or Indian Ocean, and some in the Western or Atlantic. We shall begin with those in the Indian Ocean, the chief of which are Zocotra, Babelmandel, Madagascar, the Comora Islands, Bourbon and Mauritius. See the Map.

ZOCOTRA. This island is situated in east long. 53. north. lat. 12. 30 leagues east of Cape Guardafui, on the continent of Africa; it is 80 miles long, and 54 broad, and has two good harbours, where the European ships used formerly to put in when they lost their passage to India. It is a populous plentiful country, yielding most of the fruits and plants that are usually found within the tropics, together with frankincense, gum ragacanth, and aloes. The inhabitants are Mahometans, of Arab extraction, and are under the government of a prince or their who is probably tributary to the Porte.

BABELMANDEL. The island of Babelmandel gives name to the strait at the entrance of the Red Sea, where it is situated in East long. 44-30 north. lat. 12. about four miles both from the Arabian and Abyssinian shores. The Abyssinians, or Ethiopians, and the Arabians, formerly contended with great fury for the possession of this island, as it commands the entrance into the South Sea, and preserves a communication with the ocean. This strait was formerly the only passage through which the commodities of India found their way to Europe; but since the discovery of the Cape of Good Hope, the trade by the Red Sea is of little importance. The island is of little value, being a barren sandy spot of earth not five miles round.

COMORA. These islands are five; Joanna, Mayotta, Mohilla Angazeia, and Comora, situated between 41 and 46 east long. and between 10 and 14 south lat. at an equal distance from Madagascar and the continent of Africa. Joanna, the chief, and which exacts tribute from the others, is about 30 miles long and 15 broad, and affords plenty of provisions, and such fruits as are produced between the tropics. East India ships, bound to Bombay, usually touch here for refreshments. The inhabitants are negroes of the Mahometan persuasion, and entertain our seamen with great humanity.

MADAGASCAR. This is the largest of the African islands, and is situated between 43 and 51 deg. east long. and between 10 and 26 south lat. 300 miles south east of the continent of Africa; it being near 1000 miles in length from north to south; and generally between 2 and 300 miles broad. The sea rolls with great rapidity, and is extremely rough between this island and the continent of the Cape of Good Hope, forming a channel or passage, through which all European ships, in their voyage to and from India, generally sail, unless prevented by storms.

Madaga

Madagascar is a pleasant, desirable, and fertile country, abounding in sugar, honey, vines, fruit trees, vegetables, valuable gums, corn, cattle, fowls, precious stones, iron, some silver, copper, steel, and tin. It affords an agreeable variety of hills, vallies, woods, and champaign : watered with numerous rivers, and well stored with fish. The air is generally temperate, and said to be very healthy, though in a hot climate. The inhabitants are of different complexions and religions ; some white, some negroes, some Mahometans, some Pagans. The whites and those of a tawny complexion, who inhabit the coasts, are descended from the Arabs, as is evident from their language, and their religious rites ; but here are no mosques, temples, nor any stated worship, except that they offer sacrifices of beasts on particular occasions ; as when sick, when they plant yams, or rice, when they hold their assemblies, circumcise their children, declare war, enter into new-built houses, or bury their dead. Many of them observe the Jewish sabbath, and give some account of the sacred history, the creation and fall of man, as also of Noah, Abraham, Moses, and David ; from whence it is conjectured they are descended from Jews who formerly settled here, though none knows how, or when. This island was discovered by the Portuguese, and the French took possession of it in 1641 ; but the people disliking their government, they were driven out in 1652 ; since which the natives have had the sole possession of the island, under a number of petty princes, who make war upon one another for slaves and plunder.

MAURITIUS, or Maurice, was so called by the Dutch, who first touched here in 1598, in honour of prince Maurice their stadtholder. It is situated in east long. 56, south lat. 20, about 400 miles east of Madagascar. It is of an oval form, about 150 miles in circumference, with a fine harbour, capable of holding 50 large ships, secure against any wind that blows, and 100 fathoms deep at the entrance. The climate is extremely healthy and pleasant. The mountains, of which there are many, and some so high that their tops are covered with snow, produce the best ebony in the world, besides various other kinds of valuable wood, two of which greatly resemble ebony in quality ; one red, the other yellow, as wax. The island is watered with several pleasant rivers well stocked with fish ; and though the soil is none of the most fruitful, yields plenty of tobacco, rice, fruit, and feeds a great number of cattle, deer, goats, and sheep. It was formerly subject to the Dutch, but is now in the possession of the French.

BOURBON. The isle of Bourbon is situated in east long. 54, south lat. 21, about 300 miles east of Madagascar, and is about 90 miles round. There are many good roads for shipping round Bourbon, particularly on the north and south sides ; but hardly a single harbour where ships can ride secure against those hurricanes which blow during the monsoons. Indeed, the coast is so surrounded with blind rocks, sunk a few feet below the water, that coasting along shore is at all times dangerous. On the southern extremity is a volcano, which continually throws out flames, smoke and sulphur, with a hideous roaring noise, terrible in the night to mariners. The climate here, though extremely hot, is healthy, being refreshed with cooling gales, that blow morning and evening from the sea and land ; sometimes, however, terrible hurricanes shake the whole island almost to its foundation ; but generally without any other bad consequence than frightening the inhabitants. The island abounds in brooks and springs, and in fruits, grass, and cattle, with excellent tobacco (which the French have planted there), aloes, white pepper, ebony, palm, and other kinds of wood, and fruit trees. Many of the trees yield odoriferous gums and resins, particularly benzoim of an excel-

lent

lent fort in great plenty. The rivers are well stocked with fish, the coast with land and sea tortoises, and every part of the country with horned cattle, as well as hogs and goats. Ambergris, coral, and the most beautiful shells, are found upon the shore. The woods are full of turtle doves, pigeons, and a great variety of other birds, beautiful to the eye, and pleasant to the palate. The French first settled here in the year 1672, after they were driven from the island of Madagascar. They have now some considerable towns in the island, with a governor; and here their East India ships touch and take in refreshments.

There are a great many more small islands about Madagascar, and on the eastern coast of Africa, laid down in maps, but no where described.

Leaving therefore the eastern world and the Indies, we now turn round the Cape of Good Hope, which opens to our view the Atlantic, an immense ocean, lying between the two grand divisions of the globe, having Europe, Asia, and Africa, or the old world, on the east; and America, or the new world, on the west; towards which divisions we now steer our course, touching in our way at the following islands upon the African coast, that have not yet been described, viz. St. Helena, Ascension, St. Matthew, St. Thomas, &c. Gorée, Cape Verd, the Canary and Madeira islands. See the *Map*.

ST. HELENA. The first island on this side the Cape is St. Helena, situated in west long. 6.4 south lat. 16, being 1200 miles west of the continent of Africa, and 1800 east of South America. The island is a rock about 21 miles in circumference, very high and very steep, and only accessible at the landing place, in a small valley at the east side of it, which is defended by batteries of guns planted level with the water; and as the waves are perpetually dashing on the shore, it is generally difficult landing, even here. There is no other anchorage about the island but at Chapel Valley Bay; and as the wind always blows from the south-east, if a ship overshoots the island ever so little, she cannot recover it again. The English plantations here afford potatoes and yams, with figs, plantains, bananas, grapes, kidney-beans, and Indian corn; of the last, however, most part is devoured by rats, which harbour in the rocks, and cannot be destroyed; so that the flower they use is almost wholly imported from England; and in times of scarcity they generally eat yams and potatoes instead of bread. Though the island appears on every side a hard barren rock, yet it is agreeably diversified with hills and plains, adorned with plantations of fruit-trees and garden-stuff. They have great plenty of hogs, bullocks, poultry, ducks, geese, and turkeys, with which they supply the sailors, taking in exchange shirts, drawers, or any light cloths, pieces of calico, silks, muslin, arrack, sugar, &c.

St. Helena is said to have been first discovered by the Portuguese on the festival of the empress Helena, mother of the emperor Constantine the Great, whose name it still bears. It does not appear that the Portuguese ever planted a colony here: and the English East India Company took possession of it in 1600, and held it without interruption till the year 1673, when the Dutch took it by surprize. However, the English, under the command of captain Munden, recovered it again within the space of a year, and at the same time took three Dutch East India ships that lay in the road. There are about 200 families in the island, most of them descended from English parents. The East India ships take in water and fresh provisions here, in their way home; but the island is so small, and the wind so much against them outward bound, that they then very seldom see it.

The company's affairs are here managed by a governor, deputy-governor, and store-keeper, who have standing salaries allowed by the company, besides

ASCENSION. This island is situated in 7 deg. 40 min. south lat. 600 miles north-west of St. Helena; it received its name from its being discovered by the Portuguese on Ascension-day; and is a mountainous barren island, about 20 miles round, and uninhabited; but it has a safe convenient harbour, where the East India ships generally touch to furnish themselves with turtle, or tortoises, which are very plentiful here, and vastly large, some of them weighing above 100 pounds each. The sailors going ashore in the night time, frequently turn 2 or 3 hundred of them on their backs before morning; and are sometimes so cruel, as to turn many more than they use, leaving them to die on the shore.

St. MATTHEW. This is a small island, lying in 6-1 west lon. and 1-30 south lat. 500 miles to the north-west of Ascension, and was also discovered by the Portuguese, who planted and kept possession of it for some time; but afterwards deserted it. This island now remains uninhabited, having little to invite other nations to settle there, except a small lake of fresh water.

The four following islands, viz. **St. THOMAS, ANABOA, PRINCES ISLAND,** and **FERNANDO PO,** are situated in the gulf of Guinea, between Congo and Benin; all of them were first discovered by the Portuguese, and are still in the possession of that nation, and furnish shipping with fresh water, and provisions as they pass by.

CAPEVERD ISLANDS. These islands are so called from a cape of that name on the African coast, near the river Gambia, over against which they lie, at the distance of 300 miles, between 23 and 26 deg. west lon. and 14 and 18 deg. north lat. They were discovered in the year 1482, by the Portuguese, and are about 20 in number; but some of them, being only barren uninhabited rocks, are not worth notice. St. Jago, Bravo, Fogo, Mayo, Bonavista, Sal, St. Nicholas, St. Lucia, St. Vincent, Santa Cruz, and St. Antonio, are the most considerable, and are subject to the Portuguese. The air, generally speaking, is very hot, and in some of them very unwholesome. They are inhabited by Europeans, or the descendants of Europeans and negroes.

St. JAGO, where the Portuguese viceroy resides, is the most fruitful, best inhabited, and largest of them all, being 150 miles in circumference; yet it is mountainous, and has much barren land in it. Its produce is sugar, cotton, some wine, Indian corn, cocoa nuts, oranges, and other tropical fruits, plenty of roots, and garden stuff; but the plant of most consequence to them is the Madder, which grows in abundance among the cliffs; and here is also plenty of hogs and poultry, and some of the prettiest green monkeys, with black faces, that are to be met with any where. Baya, or Praya (famous for an action between an English and French Squadron) is situated on the east side, has a good port, and is seldom without ships, those outward bound to Guinea or the East Indies, from England, Holland and France, often touching here for water and refreshments.

In the island of **MAYO** or **MAY,** immense quantities of salt are made by the heat of the sun from the sea water, which at spring tides is received into a sort of pan, formed by a sand-bank, which runs along the coast for two or three miles. Here the English drive a considerable trade for salt, and have commonly a man of war to guard the vessels that come to load with it, which in some years amount to an hundred or more. The salt costs nothing, except for raking it together, wheeling it out of the pond, and carrying it on asses to the boats, which is done at a very cheap rate. Several of our ships come hither for a freight of asses, which they carry to Barbadoes and other

British plantations. The inhabitants of this island, even the governor and priests, are all negroes, and speak the Portuguese language. The negro governor expects a small present from every commander that loads salt, and is pleased to be invited aboard their ships. The sea water is so clear on this coast, that an English sailor who dropped his watch, perceived it at the bottom, though many fathoms deep, and had it brought up by one of the natives, who are in general expert at diving.

The island of FOGO is remarkable for being a volcano, continually sending up sulphureous exhalations; and sometimes the flame breaks forth like fire, in a terrible manner, throwing out pumice stones that annoy all the adjacent parts.

GOREE is situated within cannon shot of Cape Verd, N. lat. 14-43. W. long. 17-20, and was so called by the Dutch from an island and town of the same name in Holland. It is a small spot not exceeding two miles in circumference, but its importance arises from its situation for trade to near Cape Verd, and has been therefore a bone of contention between European nations. It was first possessed by the Dutch, from whom, in 1663, it was taken by the English, but in 1665 it was retaken by the Dutch, and in 1667 subdued by the French, in whose possession it remained till the year 1759, when the British arms, every where triumphant, again reduced it, but it was restored to the French at the treaty of peace in 1763. It was retaken by the English the last war, but given up again by the peace of 1783.

CANARIES. The Canaries, anciently called the Fortunate Islands, are seven in number, and situated between 12 and 19 deg. west long. and between 27 and 29 deg. north lat. about 150 miles south-west of Morocco. Their particular names are, Palma, Hiero, Gomera, Teneriffe, Grand Canaria, Fuerteventura, and Langarote. These islands enjoy a pure temperate air, and abound in the most delicious fruits, especially grapes, which produce those rich wines that obtain the name of the Canary, whereof the greatest part is exported to England, which in time of peace is computed at 10,000 hogshheads annually. The Canaries abound with those little beautiful birds that bear their name, and are now so common and so much admired in Europe; but their wild notes in their native land far excel those in a cage or foreign clime.

Grand Canary, which communicates its name to the whole, is about 150 miles in circumference, and so extremely fertile as to produce two harvests in a year. Teneriffe, the largest of these islands next to that of the Grand Canary, is about 120 miles round: a fertile country abounding in corn, wine, and oil; though it is pretty much encumbered with mountains, particularly the peak. Captain Glas observes, that in coming in with this island, in clear weather, the Peak may be easily discerned at 120 miles distance, and is sailing from it at 150. The Peak is an ascent in the form of a sugar loaf, about 15 miles in circumference, and according to the account of Sprat, bishop of Rochester, published in the Philosophical Transactions, nearly three miles perpendicular—lately ascertained to, be only 13,265 feet. This mountain is a volcano, and sometimes throws out such quantities of sulphur and melted ore, as to convert the richest lands into barren deserts. These islands were first discovered and planted by the Carthaginians; but the Romans destroying that state, put a stop to the navigation, on the west coast of Africa, and the Canaries lay concealed from the rest of the world, until they were again discovered by the Spaniards in the year 1405, to whom they

bill belong. It is remarkable, that though the natives resembled the Africans in their stature and complexion when the Spaniards first came among them, their language was different from that spoken on the continent; they retained none of their customs, were masters of no science, and did not know there was any country in the world besides their own.

MADEIRAS. The three islands called the Madeiras, are situated, according to the author of Anson's Voyage, in a fine climate in 32-27, north lat. and from 18-30 to 19-30 west long. about 100 miles south of the Canaries, and as many west of Salée, in Morocco. The largest, from which the rest derive the general name of Madeiras, or rather Matters, on account of its being formerly almost covered with wood, is about 75 miles long, 10 broad, and 180 in circumference. It is composed of one continued hill of a considerable height, extending from east to west; the declivity of which, on the south side, is cultivated and interspersed with vineyards; and in the middle of this slope the merchants have fixed their country seats, which form a very agreeable prospect. There is but one considerable town in the whole island, which is named Funchal, seated on the south part of the island, at the bottom of a large bay; towards the sea, it is defended by a high wall, with a battery of cannon, and is the only place where it is possible for a boat to land; and even here the beach is covered with large stones, and a violent surf continually beats upon it.

Though this island seems to have been known to the ancients, yet it lay concealed for many generations, and was at length discovered by the Portuguese in 1519; but others assert that it was first discovered by an Englishman, in the year 1344. Be that as it may, the Portuguese took possession of it, and are still almost the only people who inhabit it. The Portuguese, at their first landing, finding it little better than a thick forest, rendered the ground capable of cultivation by setting fire to this wood; and it is now very fertile, producing in great abundance the richest wine, sugar, the most delicious fruits, especially oranges, lemons, and pomegranates; together with corn, honey, and wax; it abounds also with boars and other wild beasts, and with all sorts of fowls, besides numerous groves of cedar trees, and those that yield dragon's blood, mastic and other gums. The inhabitants of this island make the best sweet meats in the world, and succeed wonderfully in preserving citrons and oranges, and in making marmalade and perfumed pastes, which exceed those of Genoa. The sugar they make is extremely beautiful, and smells naturally of violets. This indeed is said to be the first place in the west, where that manufacture was set on foot, and from thence was carried to the Brasils in America. The Portuguese not finding it so profitable as at first, have pulled up the greatest part of their sugar-canes, and planted vineyards in their stead, which produce several sorts of excellent wine, particularly that which bears the name of the island, Malmsey, and tent; of all which the inhabitants make and sell prodigious quantities. No less than 20,000 hogsheds of Madeira it is said, are yearly exported, the greatest part to the West Indies, especially to Barbadoes; the Madeira wine not only enduring a hot climate better than any other, but even being improved when exposed to the sun in barrels after the bung is taken out. It is said no venomous animal can live here. Of the two other islands, one is called Porto Santo, which lies at a small distance from Madeira, is about eight miles in compass, and extremely fertile. It has very good harbours, where ships may ride with safety against all winds, except the south west; and is frequented by Indiamen outward and homeward bound. The other island is an inconceivable barren rock.

AZORES. Leaving the Madras, with which are close the coast of Africa, we continue our course westward through the immense ocean, which brings us to the Azores, or as they are called the Western Islands, that are situated between 35 and 38 deg. west long. and between 37 and 40 north lat. 600 miles west of Portugal, and at nearly east of Newfoundland, lying almost in the mid-way between Europe and America. They are nine in number, and are named Santa Maria, St. Miguel or St. Michael, Terceira, St. George, Graciosa, Fayal, Pico, Flores, and Corvo. They were discovered in the middle of the fifteenth century by John Vander Berg, a merchant driven to these islands, who, in a voyage to Lisbon, was, by stress of weather driven to these islands, which he found destitute of inhabitants, and called them the Finnish Islands. On his arrival at Lisbon he boasted of this discovery, on which the Portuguese set sail immediately, and took possession of them, and to whom they still belong, and were called in general the Azores, from the great number of hawks and falcons found among them. All these islands enjoy a very clear and serene sky, with a salubrious air; but are exposed to violent earthquakes, from which they have frequently suffered; and also by the inundations of surrounding waves. They are however extremely fertile in corn, wine, and a variety of fruits, also cattle, fowls and fish. It is said, that no poisonous or noxious animal breeds on the Azores, and that if carried thither, they will expire in a few hours.

St. Michael, which is the largest, being near 100 miles in circumference, and containing 50,000 inhabitants, was twice invaded and plundered by the English in the reign of queen Elizabeth. Terceira is the most important of these islands, on account of its harbour, which is spacious, and has good anchorage, but is exposed to the south-east winds. Its capital town, Angra, contains a cathedral and five churches, and is the residence of the governor of the islands, as well as of the bishop.

A M E R I C A.

ITS DISCOVERY AND CONQUEST.

WE are now to treat of a country of vast extent and fertility, and which, though little cultivated by the hand of art, owes in many respects more to that of nature than any other division of the globe. The particular circumstances of this country require that we should in some measure vary our plan, and before describing its present state, afford such information with regard to its discovery, as is most necessary for satisfying our readers.

Towards the close of the 15th century, Venice and Genoa were the only powers in Europe who owed their support to commerce. An interference of interests inspired a mutual rivalry; but in traffic Venice was much superior. She engrossed the whole commerce of India, then, and indeed always, the most valuable in the world, but hitherto entirely carried on through

through the inland parts of Asia; or by the way of Egypt and the Red sea. In this state of affairs, Columbus, a native of Genoa, whose knowledge of the true figure of the earth, however attained, was much superior to the general notions of the age in which he lived, conceived a project of sailing to the Indies by a bold and unknown route, and of opening to his country a new source of opulence and power. But this proposal of sailing westward to the Indies was rejected by the Genoese as chimerical, and the principles on which it was founded were condemned as absurd. Stung with disappointment and indignation, Columbus retired from his country, hid his scheme before the court of France, where his reception was still more mortifying, and where, according to the practice of that people, he was laughed at and ridiculed. Henry VII. of England was his next resort; but the cautious politics of that prince were the most opposite imaginable to a great but uncertain design. In Portugal, where the spirit of adventure and discovery about this time began to operate, he had reason to expect better success. But the Portuguese contented themselves with creeping along the coast of Africa, and discovering one cape after another; they had no notion of venturing boldly into the open sea, and of risking the whole at once. Such repeated disappointments would have broken the spirit of any man but Columbus. The expedition required expence, and he had nothing to defray it. His mind, however, still remained firm; he became the more enamoured of his design, the more difficulty he found in accomplishing it, and he was inspired with that noble enthusiasm which always animates an adventurous and original genius. Spain was now his only resource, and there, after eight years attendance, he succeeded, and chiefly through the interest of queen Isabella. Columbus now set sail, anno 1492, with a fleet of three ships, upon the most adventurous attempt ever undertaken by man, and in the fate of which the inhabitants of two worlds were interested. In this voyage he had a thousand difficulties to contend with; the most striking was the variation of the compass, then first observed, and which seemed to threaten that the laws of nature were altered to an unknown ocean, and that the only guide he had left was ready to forsake him. His sailors, always discontented, now broke out into open mutiny, threatening to throw him overboard, and insisted on their return. But the firmness of the commander, and much more the discovery of land, after a voyage of 33 days, put an end to the commotion. Columbus first landed on one of the Bahama islands, but there, to his surprise and sorrow, discovered, from the poverty of the inhabitants, that these could not be the Indies he was in quest of. In steering southward, however, he found the island called Hispaniola, abounding in all the necessaries of life, inhabited by a humane and hospitable people, and what was of still greater consequence, as it insured his favourable reception at home, promising, from some samples he received, considerable quantities of gold. This island therefore he proposed to make the centre of his discoveries: and having left upon it a few of his companions, as the ground-work of a colony, returned to Spain to procure the necessary reinforcements.

The court was then at Barcelona: Columbus travelled thither from Seville, amidst the acclamations of the people, attended by some of the inhabitants, the gold, the arms, utensils, and ornaments of the country he had discovered. This entry into Barcelona was a species of triumph more glorious than that of conquerors, more uncommon, and more innocent. In this voyage he had acquired a general knowledge of all the islands in that great sea which divides North and South America; but he had no idea that there was an ocean between him and China. The countries which he had discover-

ed were considered as a part of India. Even after the error, which gave rise to this opinion was detected, and the true position of the New World was ascertained, the name has remained, and the appellation of *West Indies* is given by all the people of Europe to the country, and that of *Indians* to its inhabitants. Thus were the West Indies discovered by seeking a passage to the East; and even after the discovery, still conceived to be a part of the eastern hemisphere. The present success of Columbus, his former disappointments, and the glory attending so unexpected a discovery, rendered the court of Spain as eager to forward his designs now, as it had been dilatory before. A fleet of seventeen sail was immediately prepared; all the necessaries for conquest or discovery were embarked; and 1500 men, among whom were several of high rank and fortune, prepared to accompany Columbus, now appointed governor with the most ample authority. It is impossible to determine whether the genius of this great man in first conceiving the idea of these discoveries, or his sagacity in the execution of the plan he had conceived, most deserve our admiration. Instead of hurrying from sea to sea, and from one island to another, which, considering the ordinary motives to action among mankind, was naturally to be expected, Columbus, with such a field before him, unable to turn on either hand without finding new objects of his curiosity and his pride, determined rather to turn to the advantage of the court of Spain the discoveries he had already made, than to acquire for himself the unavailing applause of visiting a number of unknown countries, from which he reaped no other benefit but the pleasure of seeing them. With this view he made for Hispaniola, where he established a colony, and erected forts in the most advantageous grounds for securing the dependence of the natives. Having spent a considerable time in this employment, and laboured for establishing this colony with as much zeal and assiduity as if his views had extended no farther, he next proceeded to ascertain the importance of his other discoveries, and to examine what advantages were most likely to be derived from them. He had already touched at Cuba, which, from some specimens, seemed a rich discovery; but whether it was an island, or a part of some great continent, he was altogether uncertain. To ascertain this point was the present object of his attention. In coasting along the southern shore of Cuba, Columbus was entangled in a multitude of Islands, of which he reckoned 160 in one day. These Islands, which were well inhabited, and abounding in all the necessaries of life, gave him an opportunity of reflecting on this fertility of nature where the world expected nothing but the barren ocean; he called them *Jardin de la Reina*, or the Queen's Garden, in gratitude to his royal benefactors, who was always uppermost in his memory. In the same voyage Jamaica was discovered. But to so many difficulties was Columbus exposed, on an unknown sea, among rocks, shelves, and sands, that he returned to Hispaniola, without learning any thing more certain with regard to Cuba, the main object of this enterprise.

By the first success of this great man, the public diffidence was turned into admiration; but by a continuance of the same success, their admiration degenerated into envy. His enemies in Spain set every spring in motion against him; and there is no difficulty in finding specious grounds of accusation against such as are employed in the execution of an extensive and complicated plan. An officer was dispatched from Spain, fitted by his character to act the part of a spy and informer, and whose presence plainly demonstrated Columbus the necessity of returning to Europe, for obviating the objections or calumny of his enemies.

It was not without great difficulty that he was enabled to set out on a third expedition, still more famous than any he had hitherto undertaken. He designed to stand to the southward of the Canaries until he came under the equinoctial line, and then to proceed directly westward that he might discover what opening that might afford to India, or what new islands, or what continent might reward his labour. In this navigation, after being long buried in a thick fog, and suffering numberless inconveniencies from the excessive heats and rains between the tropics, they were at length favoured with a smart gale, and went before it seventeen days to the westward. At the end of this time, a seaman saw land, which was an island on the coast of Guiana, now called Trinidad. Having passed this island, and two others which lie in the mouth of the great river Oronoco, the admiral was surprised with an appearance he had never seen before: this was the frightful tumult of the waves, occasioned by a conflict between the tide of the sea and the rapid current of the immense river Oronoco. But sailing forward, he plainly discovered that they were in fresh water; and judging rightly that it was improbable any island should supply so vast a river, he began to suspect he had discovered the continent; but when he left the river, and found that the land continued on the westward for a great way, he was convinced of it. Satisfied with this discovery, he yielded to the uneasiness and distresses of his crew, and bore away for Hispaniola. In the course of this discovery, Columbus landed at several places, where in a friendly manner he traded with the inhabitants, and found gold and pearl in tolerable plenty.

About this time the spirit of discovery spread itself widely, and many adventurers all over Europe wished to acquire the reputation of Columbus without possessing his abilities. The Portuguese discovered Brasil, which makes at present the most valuable part of their possessions: Cabot, a native of Bristol, discovered the north-east coasts, which formerly composed the British empire in North America: and Americus Vespulius, a merchant of Florence, sailed to the southern continent of America, and, being a man of address, had the honour of giving his name to half the globe. But no one is now imposed on by the name; all the world knows that Columbus was the first discoverer. The being deprived of the honour of giving name to the new world, was one of the smallest mortifications to which this great man was compelled to submit. For such were the clamours of his enemies, and the ingratitude of the court of Spain, that, after discovering the continent, and making settlements in the islands of America, he was treated like a traitor, and carried over to Europe in irons. He enjoyed, however, the glory of rendering the one half of the world known to the other; a glory so much the more precious, as it was untainted by cruelty or plunder, which disfigured all the exploits of those who came after him, and accomplished the execution of his plan. He fully vindicated himself at court, was restored to favour, and undertook another voyage in which he suffered great fatigues. He returned to Spain, and died at Valladolid, in 1506, in the 59th year of his age. The succeeding governors of Cuba and Hispaniola endeavoured to purchase the same advantages by the blood of the natives, which Columbus had obtained by his good sense and humanity. These islands contained mines of gold.—The Indians only knew where they were situated; and the extreme avarice of the Spaniards, too furious to work by the gentle means of persuasion, hurried them to acts of the most shocking violence and cruelty against those unhappy men, who, they believed, concealed from them part of their treasure. The slaughter, once begun, they set no bounds to their fury: in a few years

years they depopulated Hispaniola, which contained three millions of inhabitants; and Cuba, that had about 600,000. Bartholomew de las Casas, a witness of these barbarous depopulations, says, that the Spaniards went out with their dogs to hunt after men. The unhappy savages, almost naked and unarmed, were pursued like deer into the thick of the forests, devoured by dogs, killed with gun shot, or surpris'd and burnt in their habitations.

The Spaniards had hitherto only visited the continent: from what they saw with their eyes, or learned by report, they conjectured that this part of the new world would afford a still more valuable conquest. Fernando Cortez is dispatched from Cuba with 600 men, 18 horses, and a small number of field pieces. With this inconsiderable force, he proposes to subdue the most powerful state on the continent of America; this was the empire of Mexico: rich, powerful, and inhabited by millions of Indians, passionately fond of war, and then headed by Montezuma, whose fame in arms struck terror in the neighbouring nations. Never history, to be true, was more improbable and romantic than that of this war. The empire of Mexico had subsisted for ages: its inhabitants, it is said, were not rude and barbarous; every thing announced a polished and intelligent people. They knew, like the Egyptians of old, whose wisdom is still admired in this particular, that the year consisted nearly of 365 days. Their superiority in military affairs was the object of admiration and terror over all the continent; and their government, founded on the sure basis of laws combined with religion, seemed to bid defiance to time itself. Mexico, the capital of the empire, situated in the middle of a spacious lake, was the noblest monument of American industry: it communicated to the continent by immense causeways, which were carried through the lake. The city was admired for its buildings, all of stone, its squares, and market-places, the shops which glittered with gold and silver, and the sumptuous palaces of Montezuma, some erected on columns of jasper, and containing whatever was most rare, curious, or useful. But all the grandeur of this empire could not defend it against the Spaniards. Cortez, in his march, met with feeble opposition from the nations along the coast of Mexico, who were terrified at their first appearance: the warlike animals, on which the Spanish officers were mounted, the artificial thunder which issued from their hands, the wooden castles which had wafted them over the ocean, struck a panic into the natives, from which they did not recover until it was too late. Wherever the Spaniards marched they spared no age or sex, nothing sacred or profane. At last the inhabitants of Tlascala, and some other states on the coast, despairing of being able to oppose them, entered into their alliance, and joined armies with those terrible, and, as they believed, invincible conquerors. Cortez, thus reinforced, marched onward to Mexico: and, in his progress, discovers a volcano of sulphur and salt-petre, whence he could supply himself with powder. Montezuma heard of his progress without daring to oppose it. This sovereign is reported by the boasting Spaniards, to have commanded thirty vassals, of whom each could appear at the head of 100,000 combatants, armed with bows and arrows, and yet he dares not resist a handful of Spaniards aided by a few Americans, whose allegiance would be shaken by the first reverse of fortune. Such was the difference between the inhabitants of the two worlds, and the fame of the Spanish victories, which always marched before them.

By sending a rich present of gold, which only whetted the Spanish avarice, Montezuma hastened the approach of the enemy. No opposition is made to

their entry into his capital. A place is set apart for Cortez and his companions, who are already treated as the masters of the new world. He had good reason, however, to distrust the affected politeness of this emperor, under which he suspected some plot for his destruction to be concealed; but he had no pretence for violence; Montezuma loaded him with kindness, and with gold in greater quantities than he demanded, and his palace was surrounded with artillery, the most frightful of all engines to the Americans. At last a circumstance fell out which afforded Cortez a pretext for beginning hostilities. In order to secure a communication by sea to receive the necessary reinforcements, he had erected a fort, and left a small garrison behind him at Vera Cruz, which has since become an emporium of commerce between Europe and America. He understood that the Americans in the neighbourhood had attacked this garrison in his absence, and that a Spaniard was killed in the action; that Montezuma himself was privy to this violence, and had issued orders that the head of the slain Spaniard should be carried through his provinces, to destroy a belief, which then prevailed among them, that the Europeans were immortal. Upon receiving this intelligence, Cortez went in person to the emperor, attended by a few of his most experienced officers. Montezuma pleaded innocence, in which Cortez seemed extremely ready to believe him, though, at the same time, he alleged that the Spaniards in general would never be persuaded of it, unless he returned along with them to their residence, which would remove all jealousy between the two nations. The success of this interview shewed the superiority of the European address. A powerful mosaic, in the middle of his own palace, and surrounded by his guards, gave himself up a prisoner, to be disposed of according to the inclination of a few gentlemen who came to demand him. Cortez had now got into his hands an engine by which every thing might be accomplished. The Americans had the highest respect, or rather a superstitious veneration for their emperor. Cortez, therefore, by keeping him in his power, allowing him to enjoy every mark of royalty but his freedom, and, at the same time, from a thorough knowledge of his character, being able to flatter all his tastes and passions, maintained the easy sovereignty of Mexico, by governing its prince. Did the Mexicans, grown familiar with the Spaniards, begin to abate of their respect; Montezuma was the first to teach them more politeness. Was there a tumult excited through the cruelty or avarice of the Spaniards; Montezuma ascended the battlements of his prison, and harangued his Mexicans into order and submission. This farce continued a long while; but on one of these occasions, when Montezuma was shamefully disgracing his character by justifying the enemies of his country, a stone, from an unknown hand, struck him on the temple, which in a few days occasioned his death. The Mexicans, now delivered from this emperor, who co-operated so strongly with the Spaniards, elect a new prince, the famous Guatimozin, who from the beginning discovered an implacable animosity against the Spanish name. Under his conduct the unhappy Mexicans rushed against those very men, whom a little before they had offered to worship. The Spaniards, however, by the dexterous management of Cortez, were too firmly established to be expelled from Mexico. The immense tribute which the grandees of this country had agreed to pay to the crown of Spain, amounted to 600,000 marks of pure gold, besides an amazing quantity of precious stones, a fifth part of which, distributed among his soldiers, stimulated their avarice and their courage, and made them willing to perish rather than part with so precious a

booty. The Mexicans, however, made no small efforts for independence; but all their valour, and despair itself, gave way before what they called the Spanish thunder. Guatimozin and the empress were taken prisoners. This was the prince who, when he lay stretched on burning coals, by order of one of the receivers of the king of Spain's exchequer, who inflicted the torture to make him discover into what part of the lake he had thrown his riches, said to his high priest, condemned to the same punishment, and who loudly expressed his sense of the pain that he endured, "Do you take me to lie on a bed of roses?" The high priest remained silent, and died in an act of obedience to his sovereign. Cortez, by getting a second emperor into his hands, made a complete conquest of Mexico; with which the Castille D'Or, Darien, and other provinces, fell into the hands of the Spaniards.

While Cortez and his soldiers were employed in reducing Mexico, they got intelligence of another great empire, situated towards the equinoctial line and the tropic of Capricorn, which was said to abound in gold and silver, and precious stones, and to be governed by a prince more magnificent than Montezuma. This was the empire of Peru, which extended in length near 30 degrees, and was the only other country in America, which deserved the name of a civilized kingdom. Whether it happened, that the Spanish government had not received certain intelligence concerning Peru, or that being engaged in a multiplicity of other concerns, they did not chuse to adventure on new enterprizes; certain it is, that this extensive country, more important than Mexico itself, was reduced by the endeavours, and at the expence, of three private persons. The names of these were, Frances Pizarro, Almagro, and Lucques, a priest, but a man of considerable fortune. The two former were natives of Panama, men of doubtful birth and of low education. Pizarro, the soul of the enterprize, could neither read nor write. They sailed over into Spain, and without difficulty obtained a grant of what they should conquer. Pizarro then set out for the conquest of Peru, with 250 foot, 60 horse, and twelve small pieces of cannon, drawn by slaves from the conquered countries. If we reflect that the Peruvians naturally entertained the same prejudices with the Mexicans, in favour of the Spanish nation, and were beside, of a character still more soft and unwarlike, it need not surprise us after what has been said of the conquest of Mexico, that with this inconsiderable force, Pizarro should make a deep impression on the Peruvian empire. There were particular circumstances likewise which conspired to assist him, and which, as they discover somewhat of the history, religion, and state of the human mind in this immense continent, it may not be improper to relate.

Mango Capac was the founder of the Peruvian empire. He was one of those uncommon men, who, calm and dispassionate themselves, can observe the passions of their fellow-creatures, and turn them to their own profit or glory. He observed that the people of Peru were naturally superstitious, and had a particular veneration for the sun. He pretended therefore to be descended from that luminary, whose worship he was sent to establish, and whose authority he was entitled to bear. By this story, romantic as it appears, he easily deceived a credulous people and brought a large extent of territory under his jurisdiction: a larger still he subdued by his arms; but both the force and the deceit he employed for the most laudable purposes. He united and civilized the distressed barbarous people; he bent them to laws and arms; he softened them by the institution of a benivolent religion; in short, there was no part of America, where

agriculture, and the arts were so assiduously cultivated, and where the people were of so mild and ingenuous manners. A race of princes succeeded Mango, distinguished by the title of Yucas, and revered by the people as descendants of their great God the Sun. The twelfth of these was now on the throne, and named Atabalipa. His father, Guina Capac, had conquered the province of Quito, which now makes a part of Spanish Peru. To secure himself in the possession, he had married the daughter of the natural prince of that country, and of this marriage was sprung Atabalipa. His elder brother, named Huascar, of a different mother, had claimed the succession to the whole of his father's dominions, not excepting Quito, which devolved on the younger by a double connection. A civil war had been kindled on this account, which, after various turns of fortune, and greatly weakening the kingdom, ended in favour of Atabalipa, who detained Huascar, as a prisoner, in the tower of Cusco, the capital of the Peruvian empire. In this feeble and disjointed state was the kingdom of Peru, when Pizarro advanced to it. The ominous predictions of religion too, as in most other cases, joined their force to human calamities. Prophecies were recorded, dreams were recollected, which foretold the subjection of the empire, by unknown persons, whose description exactly corresponded to the appearance of the Spaniards. In these circumstances, Atabalipa, instead of opposing the Spaniards, set himself to procure their favour. Pizarro, however, whose temper partook of the meanness of his education, had no conception of dealing gently with those he called Barbarians, but who, however, though less acquainted with the cruel art of destroying their fellow-creatures, were more civilized than himself. While he was engaged in conference, therefore, with Atabalipa, his men, as they had been previously instructed, furiously attacked the guards of that prince, and having butchered 5000 of them, as they were pressing forward, without regard to their particular safety, to defend the sacred person of their monarch, seized Atabalipa himself, whom they carried off to the Spanish quarters. Pizarro, with the sovereign in his hands, might already be deemed the master of Peru; for the inhabitants of this country were as strongly attached to their emperor, as were the Mexicans. Atabalipa was not long in their hands before he began to treat of his ransom. On this occasion the ancient ornaments, amassed by a long line of magnificent kings, the hallowed treasures of the most magnificent temples were brought out to save him, who was the support of the kingdom, and of the religion. While Pizarro was engaged in this negotiation, by which he proposed, without releasing the emperor, to get into his possession an immense quantity of his beloved gold, the arrival of Almagro caused some embarrassment in his affairs. The friendship, or rather the external shew of friendship, between these men, was solely founded on the principle of avarice, and a bold enterprising spirit, to which nothing appeared too dangerous, that might gratify their ruling passion. When their interests, therefore, happened to interfere, it was not to be thought that any measures could be kept between them. Pizarro expected to enjoy the most considerable share of the treasure, arising from the emperor's ransom, because he had the chief hand in acquiring it. Almagro insisted on being upon an equal footing; and at length, lest the common cause might suffer by any rupture between them, this disposition was agreed to: the ransom is paid in without delay, a sum exceeding three millions, but not capable to gratify their avarice. It exceeded 1,500,000 sterling, and considering the value of money at that time, was prodigious; on the dividend, after deducting a fifth for the king of Spain, and the shares of the chief command-

fers and officers, each private soldier had above 2000l. English money. With such fortunes it was not to be expected that a mercenary army would incline to be subjected to the rigours of military discipline. They insisted on being disbanded; that they might enjoy the fruits of their labour in quiet. Pizarro complied with this demand, sensible that avarice would still detain a number in his army, and that those who returned with such magnificent fortunes, would induce new adventurers to pursue the same plan for acquiring gold. These wise reflections were abundantly verified; it was impossible to send out better recruiting officers, than those who had themselves so much profited by the field; new soldiers constantly arrived, and the American armies never wanted reinforcements.

This immense rashness was only a farther reason for detaining Atabalipa in confinement, until they discovered whether he had another treasure to gratify their avarice. But whether they believed he had no more to give, and were unwilling to employ their troops in guarding a prince, from whom they expected no farther advantage, or that Pizarro had conceived an aversion against the Peruvian emperor, on account of some instances of craft and policy which he observed in his character, and which he conceived might prove dangerous to his affairs, it is certain, that, by his command, Atabalipa was put to death. To justify this cruel proceeding, a sham charge was exhibited against the unhappy prince, in which he was accused of idolatry; of having many concubines, and other circumstances of equal impertinence. The only just ground of accusation against him was, that his brother Huascar had been put to death by his command; and even this was considerably palliated, because Huascar had been plotting his destruction, that he might establish himself on the throne. Upon the death of the Ynca, a number of candidates appeared for the throne. The principal nobility set up the full brother of Huascar; Pizarro set up a son of Atabalipa; and two generals of the Peruvians endeavoured to establish themselves by the assistance of the army. These distractions, which in another empire would have been extremely hurtful, and even here at another time, were at present rather advantageous to the Peruvian affairs. The candidates fought against one another; their battles accustomed the harmless people to blood; and such is the preference of a spirit of any kind raised in a nation to a total lethargy, that in the course of those quarrels among themselves, the inhabitants of Peru assumed some courage against the Spaniards, whom they regarded as the ultimate cause of all their calamities. The losses which the Spaniards met with in these quarrels, though inconsiderable in themselves, were rendered dangerous by lessening the opinion of their invincibility; which they were careful to preserve among the inhabitants of the new world. This consideration engaged Pizarro to conclude a truce; and this interval he employed in laying the foundations of the famous city Lima; and in settling the Spaniards in the country. But as soon as a favourable opportunity offered, he renewed the war against the Indians, and after many difficulties, made himself master of Cusco, the capital of the empire. While he was engaged in these conquests, new grants and supplies arrived from Spain. Pizarro obtained 200 leagues along the sea-coast, to the southward of what had been before granted, and Almagro 200 leagues to the southward of Pizarro's government. This division occasioned a warm dispute between them, each reckoning Cusco within his own district. But the dexterity of Pizarro brought about a reconciliation. He persuaded his rival, that the country which really belonged to him, lay to the southward of Cusco, and that it was no way inferior in riches, and might be as easily conquered as

Peru. He offered him his assistance in the expedition, the success of which he did not even call in question.

Almagro, that he might have the honour of subduing a kingdom for himself, listened to his advice; and joining as many of Pizarro's troops to his own as he judged necessary, penetrated with great danger and difficulty into Chili; losing many of his own men as he passed over mountains of an immense height, and always covered with snow. He reduced, however, a very considerable part of this country. But the Peruvians were now become too much acquainted with war, not to take advantage of the division of the Spanish troops. They made an effort for regaining their capital, in which, Pizarro being indisposed, and Almagro removed at a distance, they were well nigh successful. The latter, however, no sooner got notice of the siege of Cusco, than, relinquishing all views of distant conquests, he returned to secure the grand objects of their former labours. He raised the siege with infinite slaughter of the assailants; but, having obtained possession of the city, he was unwilling to give it up to Pizarro, who now approached with an army, and knew of no other enemy but the Peruvians. This dispute occasioned a long and bloody struggle between them, in which the turns of fortune were various, and the resentment fierce on both sides, because the fate of the vanquished was certain death. This was the lot of Almagro, who, in an advanced age, fell a victim to the security of a rival in whose dangers and triumphs he had long shared, and with whom, from the beginning of the enterprise, he had been ultimately connected. During the course of this civil war, many Peruvians served in the Spanish armies, and learned, from the practice of Christians, to butcher one another. That blinded nation, however, at length opened their eyes, and took a very remarkable resolution. They saw the ferocity of the Europeans, their unextinguishable resentment and avarice, and they conjectured that these passions would never permit their contests to subside. Let us retire, said they, from among them, let us fly to our mountains; they will speedily destroy one another, and then we may return in peace to our former habitations. This resolution was instantly put in practice; the Peruvians dispersed, and left the Spaniards in their capital. Had the force on each side been exactly equal, this singular policy of the natives of Peru might have been attended with success. But the victory of Pizarro put an end to Almagro's life, and to the hopes of the Peruvians, who have never since ventured to make head against the Spaniards.

Pizarro, now sole master of the field, and of the richest empire in the world, was still urged on, by his ambition, to undertake new enterprises. The southern countries of America, into which he had some time before dispatched Almagro, offered the richest conquest. Towards this quarter the mountains of Potosi, composed of entire silver, had been discovered, the shell of which only remains at present. He therefore followed the track of Almagro into Chili, and reduced another part of that country. Orellana, one of his commanders, passed the Andes, and sailed down to the mouth of the river of Amazons: an immense navigation, which discovered a rich and delightful country, but as it is mostly flat, and therefore not abounding in minerals the Spaniards then, and ever since, neglected it. Pizarro meeting with repeated success, and having no superior to control, no rival to keep him within bounds, now gave loose reins to the natural ferocity of his temper, and behaved with the basest tyranny and cruelty against all who had not concurred in his designs. This conduct raised a conspiracy against him, to which he fell a sacrifice in his own palace, and in the city of Lima, which he himself had founded. The partisans of old Almagro, now declared his son of the

the

Peru.

the same name their viceroys. But the greater part of the nation, though extremely well satisfied with the fate of Pizarro, did not concur with this declaration. They waited the orders of the emperor Charles V. then king of Spain, who sent over Vaca di Castro to be their governor. This man, by his integrity and wisdom, was admirably well fitted to heal the wounds of the colony, and to place every thing on the most advantageous footing, both for it and for the mother country. By his prudent management, the mines of La Plata and Potosi, which were formerly a matter of private plunder, became an object of public utility to the court of Spain. The parties were silenced or crushed; young Almagro, who would hearken to no terms of accommodation, was put to death; and a tranquillity, since the arrival of the Spaniards unknown, was restored to Peru. It seems, however, that Castro had not been sufficiently skilled in gaining the favour of the Spanish ministry, by proper bribes or promises, which a ministry would always expect from the governor of so rich a country. By their advice, a council was sent over to control Castro, and the colony was again unsettled. The parties but just extinguished, began to blaze anew; and Gonzalo, the brother of the famous Pizarro, set himself at the head of his brother's partisans, with whom many new malcontents had united. It was now no longer a dispute between governors about the bounds of their jurisdiction. Gonzalo Pizarro only paid a nominal submission to the king. He strengthened daily, and even went so far as to behead a governor, who was sent over to curb him. He gained the confidence of the admiral of the Spanish fleet in the South Seas, by whose means he proposed to hinder the landing of any troops from Spain, and he had a view of uniting the inhabitants of Mexico in his revolt.

Such was the situation of affairs, when the court of Spain, sensible of their mistake in not sending into America men whose character and virtue only, and not importunity and cabal, pleaded in their behalf, dispatched, with unlimited powers, Peter de la Gasca, a man differing only from Castro by being of a more mild and insinuating behaviour, but with the same love of justice, the same greatness of soul, and the same disinterested spirit. All those who had not joined in Pizarro's revolt, flocked under his standard; many of his friends, charmed with the behaviour of Gasca, forsook their old connections: the admiral was gained over by insinuation to return to his duty; and Pizarro himself was offered a full indemnity, provided he should turn to the allegiance of the Spanish crown. But so intoxicating are the ideas of royalty, that Pizarro was inclined to run every hazard, rather than submit to any officer of Spain. With those of his partizans, therefore, who still continued to adhere to his interest he determined to venture a battle, in which he was conquered and taken prisoner. His execution followed soon after; and thus the brother of him, who conquered Peru for the crown of Spain, fell a sacrifice for the security of the Spanish dominion over that country.

The conquest of the great empires of Mexico and Peru, is the only part of the American history, which deserves to be treated under the present head. What relates to the reduction of the other parts of the continent or of the islands, if it contains either instruction or entertainment, shall be handled under these particular countries. We now proceed to treat of the manners, government, religion, and whatever composes the character of the natives of America; and as these are extremely similar all over this part of the globe, we shall speak of them in general, in order to save continual

repetitions, noticing, at the same time, when we enter upon the description of the particular countries, whatever is peculiar or remarkable in the inhabitants of each.

Of the Original inhabitants of AMERICA.

THE discovery of America has not only opened a new source of wealth to the busy and commercial part of Europe, but an extensive field of speculation to the philosopher, who would trace the character of man under various degrees of refinement, and observe the movements of the human heart, or the operations of the human understanding, when untutored by science or untainted by corruption. So striking seemed the disparity between the inhabitants of Europe, and the natives of America, that some speculative men have ventured to affirm, that it is impossible they should be of the same species, or derived from one common source. This conclusion, however, is extremely ill founded. The characters of mankind may be infinitely varied according to the different degrees of improvement at which they are arrived, the manner in which they acquire the necessaries of life, the force of custom and habit, and a multiplicity of other circumstances too particular to be mentioned, and too various to be reduced under any general head. But the great outlines of humanity are to be discovered among them all, notwithstanding the various shades which characterise nations, and distinguish them from each other.

When the thirst of gold carried the inhabitants of Europe beyond the Atlantic, they found the inhabitants of the new world immerged in what they reckoned barbarity, but which, however, was a state of honest independence, and noble simplicity. Except the inhabitants of the great empire of Peru and Mexico, who, comparatively speaking, were refined nations, the natives of America were unacquainted with almost every European art; even agriculture itself, the most useful of them all, was hardly known, or cultivated very sparingly. The only method on which they depended for acquiring the necessaries of life, was by hunting the wild animals, which their mountains and forests supplied in great abundance. This exercise, which among them is a most serious occupation, gives a strength and agility to their limbs, unknown among other nations. The same cause, perhaps, renders their bodies, in general, where the rays of the sun are not too violent, uncommonly straight and well proportioned. Their muscles are firm and strong; their bodies and heads flattish, which is the effect of art; their features are regular, but their countenances fierce, their hair long, black, lank, and as strong as that of a horse. The colour of their skin is a reddish brown, admired among them and heightened by the constant use of bears fat and paint. The character of the Indians is altogether founded upon their circumstances and way of life. A people who are constantly employed in procuring the means of a precarious subsistence, who live by hunting the wild animals, and who are generally engaged in war with their neighbours, cannot be supposed to enjoy much gaiety of temper, or high flow of spirits. The Indians therefore are, in general, grave even to sadness; they have nothing of that giddy vivacity peculiar to some nations in Europe, and they despise it. Their behaviour

haviour to those about them is regular, modest, and respectful. Ignorant of the arts of amusement, of which those of saying tribes agreeably, is one of the most considerable, they never speak, but when they have something important to observe; and all their actions, words, and even looks, are attended with some meaning. This is extremely natural to men who are almost continually engaged in pursuits, which to them are of the highest importance. Their subsistence depends entirely on what they procure with their hands; and their lives, their honour, and every thing dear to them, may be lost by the smallest inattention to the designs of their enemies. As they have no particular object to attach them to one place rather than another, they fly wherever they expect to find the necessaries of life in greatest abundance. Cities, which are the effects of agriculture and arts, they have none. The different tribes or nations are for the same reason extremely simple, when compared with civilized societies, in which industry, arts, agriculture, and commerce, have united a vast number of individuals, whom a complicated luxury renders useless to one another. The small tribes live at so immense a distance; they are separated by a desert frontier, and hid in the bottom of impenetrable and almost boundless forests.

There is established in each society a certain species of government, which over the whole continent of America prevails with very little variation; because over the whole of this continent the manners and way of life are nearly similar and uniform. Without arts, riches, or luxury, the great instruments of subjection in polished societies, an American has no method by which he can render himself considerable among his companions, but by a superiority in personal qualities of body or mind. But as nature has not been very lavish in her personal distinctions, where all enjoy the same education, all are pretty much equal, and will desire to remain so. Liberty therefore is the prevailing passion of the Americans, and their government, under the influence of this sentiment, is better secured than by the wisest political regulations. They are very far, however, from despising all sorts of authority; they are attentive to the voice of wisdom, which experience has conferred on the aged, and they enlist under the banners of the chief, in whose valour and military address they have learned to repose their confidence. In every society therefore there is to be considered the power of the chief and of the elders: and according as the government inclines more to the one or to the other, it may be regarded as monarchical, or as a species of aristocracy. Among those tribes which are most engaged in war, the power of the chief is naturally predominant, because the idea of having a military leader, was the first source of his superiority, and the continual exigencies of the state requiring such a leader, will continue to support and even to enhance it. His power, however, is rather persuasive than coercive: he is revered as a father, rather than feared as a monarch. He has no guards, no prisons, no officers of justice, and one act of ill-judged violence would put him from the throne. The elders, in the other form of government, which may be considered as an aristocracy, have no more power. In some tribes indeed there are a kind of hereditary nobility, whose influence being constantly augmented by time, is more considerable. But this source of power, which depends chiefly on the imagination, by which we annex to the merit of our contemporaries, that of their forefathers, is too refined to be very common among the natives of America. In most countries therefore age alone is sufficient for acquiring respect, influence, and authority. It is age which teaches experience, and experience is the only source of knowledge among.

among a barbarous people. Among those persons business is conducted with the utmost simplicity, and which may recall to those who are acquainted with antiquity a picture of the most early ages. The heads of families meet together in a house or cabin, appointed for the purpose. Here the business is discussed, and here those of the nation, distinguished for their eloquence or wisdom, have an opportunity of displaying those talents. Their orators, like those of Homer, express themselves in a bold figurative style, stronger than refined, or rather softened nations can well bear, and with gestures equally violent, but often extremely natural and expressive. When the business is over, and they happen to be well provided in food, they appoint a feast upon the occasion, of which almost the whole nation partakes. The feast is accompanied with a song, in which the real, or fabulous exploits of their forefathers are celebrated. They have dances too, though, like those of the Greeks and Romans, chiefly of the military kind, and their music and dancing accompanies every feast.

It often happens, that those different tribes or nations, scattered as they are at an immense distance from one another, meet in their excursions after prey. If there subsist no animosity between them, which seldom is the case they behave in the most friendly and courteous manner. But if they happen to be in a state of war, or if there has been no previous intercourse between them, all who are not friends being deemed enemies, they fight with the most savage fury.

War, if we except hunting, is the only employment of the men; as to every other concern, and even the little agriculture they enjoy, it is left to the women. Their most common motive for entering into a war, when it does not arise from an accidental rencounter or interference, is either to revenge themselves for the death of some lost friend, or to acquire prisoners, who may assist them in their hunting, and whom they adopt into their society. These wars are either undertaken by some private adventurers, or at the instance of the whole community. In the latter case, all the young men, who are disposed to go out to battle, for no one is compelled contrary to his inclination, give a bit of wood to the chief, as a token of their design to accompany him. For every thing among these people is transacted with a great deal of ceremony and many forms. The chief, who is to conduct them, fasts several days, during which he converses with no one, and is particularly careful to observe his dreams; which the presumption natural to savages, generally renders as favourable as he could desire. A variety of other superstitious and ceremonies are observed. One of the most hideous is setting the war-kettle on the fire, as an emblem that they are going out to devour their enemies, which among some nations must formerly have been the case, since they still continue to express it in clear terms, and use an emblem significant of the ancient usage. Then they dispatch a porcelane, or large shell, to their allies, inviting them to come along, and drink the blood of their enemies. For with the Americans, as with the Greeks of old,

“ A generous friendship no cold medium knows,

“ But with one love, with one resentment glows.”

They think that those in their alliance must not only adopt their enmities, but have their resentment wound up to the same pitch with themselves. And indeed no people carry their friendships, or their resentments, so far as they do: and this is what should be expected from their peculiar circumstances; that principle in human nature, which is the spring of the social affection, acts with so much the greater force, the more it is restrained. The American

sans, who live in small societies, who see few objects and few persons, become wonderfully attached to these objects and persons, and cannot be deprived of them, without feeling themselves miserable. Their ideas are too confined, their breasts are too narrow to entertain the sentiment of general benevolence, or even of ordinary humanity. But this very circumstance, while it makes them cruel and savage to an incredible degree, towards those with whom they are at war, adds a new force to their particular friendships, and to the common tie which unites the members of the same tribe, or of those different tribes which are in alliance with one another. Without attending to this reflection, some facts we are going to relate would excite our wonder, without informing our reason, and we should be bewildered in a number of particulars seemingly opposite to one another, without being sensible of the general cause from which they proceed.

Having finished all the ceremonies previous to the war, they issue forth with their faces blackened with charcoal, intermixed with streaks of vermilion, which give them a most horrid appearance. Then they exchange their clothes with their friends, and dispose of all their finery to the women, who accompany them a considerable distance to receive those last tokens of eternal friendship.

The great qualities in an Indian war are vigilance and attention, to give and to avoid a surprise; and indeed in these they are superior to all nations in the world. Accustomed to continual wandering in the forests, having their perceptions sharpened by keen necessity, and living in every respect according to nature, their external senses have a degree of acuteness which at first view appears incredible. They can trace out their enemies, at an immense distance, by the smoke of their fires, which they smell, and by the tracks of their feet on the ground, imperceptible to an European eye, but which they can count and distinguish with the utmost facility. They even distinguish the different nations with whom they are acquainted, and can determine the precise time when they passed, where an European could not, with all his glasses, distinguish footsteps at all. These circumstances, however, are of small importance, because their enemies are no less acquainted with them. When they go out, therefore, they take care to avoid making use of any thing by which they might run the danger of a discovery. They light no fire to warm themselves, or to prepare their victuals: they lie close to the ground all day, and travel only in the night; and marching along in files, he that closes the rear diligently covers with leaves the tracks of his own feet, and of theirs who preceded him. When they halt to refresh themselves, scouts are sent out to reconnoitre the country, and beat up every place where they suspect an enemy may lie concealed. In this manner they enter unawares the villages of their foes; and while the flower of the nation are engaged in hunting, massacre all the children, women, and helpless old men, or make prisoners of, as many as they can manage, or have strength enough to be useful to their nation. But when the enemy is apprised of their design, and coming on in arms against them, they throw themselves flat on the ground among the withered herbs and leaves, which their faces are painted to resemble. Then they allow a part to pass un molested, when all at once, with a tremendous shout, rising up from their ambush, they pour a storm of musket bullets on their foes. The party attacked returns the same cry. Every one shelters himself with a tree, and returns the fire of the adverse party, as soon as they raise themselves from the ground to give a second fire. until the one party is so much weakened as to be incapable of farther resistance. But if the force on each side continues nearly equal, the fierce spirits of the savages, inflamed by the loss of their friends, can no longer be restrained. They abandon their distant war, they rush upon one another, with clubs and hatchets in their hands, magnifying their own courage, and insulting their enemies with the bitterest reproaches. A cruel combat ensues, death appears in a thousand hideous forms, which would congeal the blood of civilized nations to behold, but which rouse the fury of the savages. They trample, they insult over the dead bodies, tearing the scalp from the head, wallowing in their blood like wild beasts, and sometimes devouring their flesh. The flame rages on till it meet with no resistance; then the prisoners are secured, those unhappy men, whose fate is a thousand times more dreadful than theirs who have died in the field. The conquerors set up a hideous howling to lament the friends they have lost. They approach in a melancholy and severe gloom to their own village; a messenger is sent to announce their arrival, and the women, with frightful shrieks, come out to mourn their dead brothers, or their husbands. When they are arrived, the chief relates in a low voice to the elders, a circumstantial account of every particular of the expedition. The orator proclaims aloud this account to the people, and as he mentions the names of those who have fallen, the shrieks of the women are redoubled. The men too join in these cries, according as each is most connected with the deceased by blood or friendship. The last ceremony is the proclamation of the victory; each individual then forgets his private misfortunes, and joins in the triumph of his nation; all tears are wiped from their eyes, and by an unaccountable transition, they pass in a moment from the bitterness of sorrow to an extravagance of joy. But the treatment of the prisoners, whose fate all this time remains undecided, is what chiefly characterises the savages.

We have already mentioned the strength of their affections or resentments. United as they are in small societies, connected within themselves by the firmest ties, their friendly affections, which glow with the most intense warmth within the walls of their own village, seldom extend beyond them. They feel nothing for the enemies of their nation; and their resentment is easily extended from the individual who has injured them to all others of the same tribe. The prisoners, who have themselves the same feelings, know the intentions of their conquerors, and are prepared for them. The person who has taken the captive attends him to the cottage, where, according to the distribution made by the elders, he is to be delivered to supply the loss of a citizen. If those who receive him have their family weakened by war or other accidents, they adopt the captive into the family, of which he becomes a member. But if they have no occasion for him, or their resentment for the loss of their friends be too high to endure the sight of any connected with those who were concerned in it, they sentence him to death. All those who have met with the same severe sentence being collected, the whole nation is assembled at the execution, as for some great solemnity. A scaffold is erected, and the prisoners are tied to the stake, where they commence their death song, and prepare for the ensuing scene of cruelty with the most undaunted courage. Their enemies, on the other side, are determined to put it to the proof, by the most refined and exquisite tortures. They begin at the extremity of his body, and gradually approach the more vital parts. One plucks out his nails by

the roots, one by one; another takes a finger into his mouth; and tears off the flesh with his teeth; a third thrusts the finger mangled as it is, into the bowl of a pipe made red hot, which he smokes like tobacco; then they pound the toes and fingers to pieces between two stones; they pull off the flesh from the teeth, and cut circles about his joints, and gashes in the fleshy parts of his limbs, which they sear immediately with red hot irons, cutting, burning, and pinching them alternately; they pull off this flesh, thus mangled and roasted, bit by bit, devouring it with greediness, and smearing their faces with the blood in an enthusiasm of horror and fury. When they have thus torn off the flesh, they twist the bare nerves and tendons about an iron, tearing and snapping them, whilst others are employed in pulling and extending their limbs in every way that can increase the torment. This continues often five or six hours; and sometimes, such is the strength of the savages, days together. Then they frequently unbind him, to give a breathing to their fury, to think what new torments they shall inflict, and to refresh the strength of the sufferer, who, wearied out with such a variety of unheard of torments, often falls into so profound a sleep, that they are obliged to apply the fire to awake him, and renew his sufferings. He is again fastened to the stake, and again they renew their cruelty; they stick him all over with small matches of wood, that easily takes fire, but burns slowly; they continually run sharp reeds into every part of his body; they drag out his teeth with pincers, and thrust out his eyes; and lastly, after having burned his flesh from the bones with slow fires; after having so mangled the body that it is all but one wound; after having mutilated his face in such a manner as to carry nothing human in it; after having peeled the skin from the head, and poured a heap of red hot coals, or boiling water on the naked skull, they once more unbind the wretch, who, blind and staggering with pain and weakness, assaulted and pelted on every side with clubs and stones, now up, now down, falling into their fires at every step, runs hither and thither, until one of the chiefs, whether out of compassion, or weary of cruelty, puts an end to his life with a club or a dagger. The body is then put into the kettle, and this barbarous employment is succeeded by a feast as barbarous.

The women, forgetting the human as well as the female nature, and transformed into something worse than furies, even out-do the men in this scene of horror; while the principal persons of the country sit round the stake, smoking and looking on without the least emotion. What is most extraordinary, the sufferer himself, in the little intervals of his torments, smokes too, appears unconcerned, and converses with his torturers about indifferent matters. Indeed, during the whole time of his execution, there seems a contest which shall exceed, they, in inflicting the most horrid pains, or he in enduring them, with a firmness and constancy almost above human; not a groan, not a sigh, not a distortion of countenance escapes him; he possesses his mind entirely in the midst of his torments; he recounts his own exploits; he informs them what cruelties he has inflicted upon their countrymen, and threatens them with the revenge that will attend his death; and, though his reproaches exasperate them to a perfect madness of rage and fury, he continues his insults even of their ignorance of the art of tormenting, pointing out more exquisite methods, and more sensible parts of the body to be afflicted. The women have this part of courage as well as the men; and it is as rare for any Indian to behave otherwise, as it would be for any European to suffer as

an Indian. Such is the wonderful power of an early institution, and a ferocious thirst of glory. *I am brave and intrepid*, exclaims the savage in the face of his tormentors; *I do not fear death, nor any kind of torture; those who fear them are cowards; they are less than women; life is nothing to those that have courage; may my enemies be confounded with despair and rage! Oh! that I could devour them, and drink their blood in the last drop.*

These circumstances of cruelty, which so exceedingly degrade human nature, ought not, however, to be omitted, because they serve to shew, in the strongest light, to what an inconceivable degree of barbarity, to what a pitch the passions of men may be carried, when untamed by the refinements of polished society, when let loose from the government of reason, and uninfluenced by the dictates of Christianity; a religion that teaches compassion to our enemies, which is neither known nor practised in other institutions; and it will make us more sensible, than some appear to be, of the value of commerce, the arts of a civilized life, and the light of literature; which, if they have abated the force of some of the natural virtues, by the luxury which attends them, have taken out likewise the sting of our natural vices, and softened the ferocity of the human race.

Nothing in the history of mankind forms a stronger contrast than this cruelty of the savages towards those with whom they are at war, and the warmth of their affection towards their friends, who consist of all those who live in the same village, or are in alliance with it; among these all things are common; and this, though it may in part arise from their not possessing very distinct notions of separate property, is chiefly to be attributed to the strength of their attachment; because in every thing else, with their lives as well as their fortunes, they are ready to serve their friends. Their houses, their provision, even their young women, are not enough to oblige a guest. Has any one of these succeeded ill in his hunting? Has his harvest failed? or is his house burned? He feels no other effect of his misfortune, than that it gives him an opportunity to experience the benevolence and regard of his fellow citizens; but to the enemies of his country, or to those who have privately offended, the American is implacable. He conceals his sentiments, he appears reconciled, until by some treachery or surprise he has an opportunity of executing an horrible revenge. No length of time is sufficient to allay his resentment; no distance of place great enough to protect the object; he crosses the steepest mountains, he pierces the most impracticable forests, and traverses the most hideous bogs, and deserts for several hundreds of miles; bearing the inclemency of the seasons, the fatigue of the expedition, the extremes of hunger and thirst, with patience and cheerfulness, in hopes of surprising his enemy, on whom he exercises the most shocking barbarities, even to the eating of his flesh. To such extremes do the Indians push their friendship or their enmity; and such indeed, in general, is the character of all strong and uncultivated minds.

But what we have said respecting the Indians would be a faint picture, did we omit observing the force of their friendship, which principally appears by the treatment of the dead. When any one of the society is cut off, he is lamented by the whole: on this occasion a thousand ceremonies are practised, denoting the most lively sorrow. Of these, the most remarkable, as it discovers both the height and continuance of their grief, is what they call the feast of the dead, or the feast of souls. The day of this ceremony

is appointed by public order; and nothing is omitted, that it may be celebrated with the utmost pomp and magnificence. The neighbouring tribes are invited to be present and to join in the solemnity. At this time all who have died since the last solemn occasion (which is renewed every ten years among some tribes, and every eight among others), are taken out of their graves; those who have been interred at the greatest distance from the villages are diligently sought for, and brought to this great rendezvous of carcases.

It is not difficult to conceive the horror of this general disinterment. I cannot describe it in a more lively manner than it is done by Lafitau, to whom we are indebted for the most authentic account of those nations.

Without question, says he, the opening of these tombs displays one of the most striking scenes that can be conceived; this humbling portrait of human misery, in so many images of death, wherein she seems to take a pleasure to paint herself in a thousand various shapes of horror, in the several carcases, according to the degree in which corruption has prevailed over them, or the manner in which it has attacked them. Some appear dry and withered; others have a sort of parchment upon their bones; some look as if they were baked and smoked, without any appearance of rottenness; some are just turning towards the point of putrefaction; while others are all swarming with worms, and drowned in corruption. I know not which ought to strike us most, the horror of so shocking a sight, or the tender piety and affection of these poor people towards their departed friends; for nothing deserves our admiration more than that eager diligence, and attention with which they discharge this melancholy duty of their tenderness; gathering up carefully even the smallest bones; handling the carcases, disgustful as they are with every thing loathsome, cleansing them from the worms, and carrying them upon their shoulders, through tiresome journeys of several days, without being discouraged from the offensiveness of the smell, and without suffering any other emotions to arise than those of regret, for having lost persons who were so dear to them in their lives, and so lamented in their death.

They bring them into their cottages, where they prepare a feast in honour of the dead; during which their great actions are celebrated, and all the tender intercourses which took place between them and their friends are piously called to mind. The strangers, who have come sometimes many hundred miles to be present on the occasion join in the tender condolence; and the women, by frightful shrieks, demonstrate that they are pierced with the sharpest sorrow. Then the dead bodies are carried from the cabins for the general re-interment. A great pit is dug in the ground, and thither, at a certain time, each person, attended by his family and friends, marches in solemn silence, bearing the dead body of a son, a father, or a brother. When they are conveyed, the dead bodies, or the dust of those which were quite corrupted, are deposited in the pit: then the torrent of grief breaks out anew. Whatever they possess most valuable is interred with the dead. The strangers are not wanting in their generosity, and confer those presents which they have brought along with them for the purpose. Then all present go down into the pit, and every one takes a little of the earth, which they afterwards preserve with the most religious care. The bodies, ranged in order are covered with entire new furs, and over these with bark, on which they throw stones, wood, and earth. Then taking their last farewell, they return each to his own cabin.

We have mentioned that in this ceremony the savages offer, as presents to the

the dead, whatever they value most highly. This custom, which is universal among them, arises from a rude notion of the immortality of the soul. They believe this doctrine more firmly, and it is the principle tenet of their religion. When the soul is separated from the body of their friends, they conceive that it still continues to hover around it, and to require and take delight in the same things with which it formerly was pleased. After a certain time, however, it forsakes this dreary mansion, and departs far westward into the land of spirits. They have even gone so far as to make a distinction between the inhabitants of the other world; some, they imagine, particularly those who in their life-time have been fortunate in war, possess a high degree of happiness, have a place for hunting and fishing, which never fails, and enjoy all sensual delights, without labouring hard in order to procure them. The souls of those, on the contrary, who happen to be conquered or slain in war, are extremely miserable after death.

Their taste for war, which forms the chief ingredient in their character, gives a strong bias to their religions. Areskou, or the god of battle, is revered as the great god of the Indians. Him they invoke before they go into the field; and according as his disposition is more or less favourable to them, they conclude they will be more or less successful. Some nations worship the sun and moon; among others there are a number of traditions, relative to the creation of the world, and the history of the gods; traditions which resemble the Grecian fables, but which are still more absurd and inconsistent. But religion is not the prevailing character of the Indians; and except when they have some immediate occasion for the assistance of their gods, they pay them no sort of worship. Like all rude nations, however, they are strongly addicted to superstition. They believe in the existence of a number of good and bad genii or spirits, who interfere in the affairs of mortals, and produce all our happiness or misery. It is from the evil genii, in particular, that our diseases proceed; and it is to the good genii we are indebted for a cure. The ministers of the genii are the jugglers, who are also the only physicians among the savages. These jugglers are supposed to be inspired by the good genii, most commonly in their dreams, with the knowledge of future events; they are called in to the assistance of the sick, and are supposed to be informed by the genii whether they will get over the disease, and in what way they must be treated. But these spirits are extremely simple in their system of physic, and, in almost every disease, direct the juggler to the same remedy. The patient is inclosed in a narrow cabin, in the midst of which is a stone red hot; on this they throw water, until he is well soaked with the warm vapour and his own sweat. Then they hurry him from the bagnio, and plunge him suddenly into the next river. This coarse method, which costs many their lives, often performs very extraordinary cures. The jugglers have likewise the use of some specifics of wonderful efficacy; and all the savages are dexterous in curing wounds by the application of herbs. But the power of these remedies is always attributed to the magical ceremonies with which they are administered.

It should be observed by the reader, that the particulars which have just been mentioned concerning the manners of the Americans, chiefly relate to the inhabitants of North America. The manners and general characteristics of great part of the original inhabitants of South America, were very different. On the first appearance of the inhabitants of the New World, their discoverers found them to be in many particulars very unlike the generality of the people of the ancient hemisphere. They were dis-

sent,

ferent in their features and complexions; they were not only averse to toil, but seemed incapable of it; and when roused by force from their native indolence, and compelled to work, they sunk under tasks which the inhabitants of the other continent would have performed with ease. This feebleness of constitution seemed almost universal among the inhabitants of South America. The Spaniards were also struck with the smallness of their appetite for food. The constitutional temperance of the natives far exceeded in their opinion, the abstinence of the most mortified hermits; while, on the other hand, the appetite of the Spaniards appeared to the Americans insatiably voracious; and they affirmed, that one Spaniard devoured more food in a day than was sufficient for ten Americans. But though the demands of the native Americans for food were very sparing, so limited was their agriculture, that they hardly raised what was sufficient for their own consumption. Many of the inhabitants of South America confined their industry to rearing a few plants, which, in a rich and warm climate, were easily trained to maturity; but if a few Spaniards settled in any district, such a small addition of supernumerary mouths soon exhausted their scanty stores, and brought on a famine. The inhabitants of South America, compared with those of North America, are generally more feeble in their frame, less vigorous in the efforts of their minds, of a gentle but dastardly spirit, more enslaved by pleasure, and sunk in indolence.

A General description of AMERICA.

THIS great western continent, frequently denominated the **NEW WORLD**, extends from the 80th degree North, to the 56th degree South latitude; and where its breadth is known, from the 33th to the 136th degree of West longitude from London; stretching between 8 and 9000 miles in length, and in its greatest breadth 3690. It sees both hemispheres, has two summers, and a double winter, and enjoys all the variety of climates which the earth affords. It is washed by the two great oceans. To the eastward it has the Atlantic, which divides it from Europe and Africa. To the west it has the Pacific, or great South Sea, by which it is separated from Asia. By these seas it may, and does, carry on a direct commerce with the other three parts of the world. It is composed of two great continents, one on the North, the other on the South, which are joined by the kingdom of Mexico, which forms a sort of isthms 1500 miles long, and in one part, at Darien, so extremely narrow, as to make the communication between the two oceans by no means difficult, being only 60 miles over. In the great gulf, which is formed between the isthms and the northern and southern continents, lie a multitude of islands, many of them large, most of them fertile, and denominated the **West Indies**, in contradistinction to the countries and islands of **Asia**, beyond the **Cape of Good Hope**, which are called the **East Indies**.

Before we begin to treat of separate countries in their order, we must, according to just method, take notice of those mountains and rivers, which disdain, as it were, to be confined within the limits of particular provinces, and extend over a great part of the continent. For though America in general

be not a South A coast of in the o the Stra and sun length, f with snow about 24 was alcer In North we know that long them from mountain extremely country.

Ameri tered; a fertility. part with nels of t beyond t from the which no rivers, pa into the miles, an Misaires, or the D trary cou Newfound open the: for commo try adjae vilized peo Hudson, great dep the settle creeks, th harbour a

South a plies much Rio de la South Sea and Guian digious nu the heart accession o the sea, a there are considerab A cou

be not a mountainous country, it has the greatest mountains in the world. In South America, the Andes, or Cordilleras, run from north to south along the coast of the Pacific Ocean. They exceed in length any chain of mountains in the other parts of the globe; extending from the Isthmus of Darien to the Straits of Magellan, they divide the whole southern parts of America, and run a length of 4300 miles. Their height is as remarkable as their length, for though in part within the torrid zone, they are constantly covered with snow. Chimborazo, the highest of the Andes, is 20,608 feet; of this about 2400 feet from the summit are always covered with snow. Caracon was ascended by the French astronomers, and is said to be 15,800 feet high. In North America, which is chiefly composed of gentle ascents, or level plains, we know of no considerable mountains, except those towards the pole, and that long ridge which lies on the back of the American States, separating them from Canada and Louisiana, which we call the Apalachian or Alligany mountains; if that may be considered as a mountain, which upon one side is extremely lofty, but upon the other is nearly on a level with the rest of the country.

America is, without question, that part of the globe which is best watered; and that not only for the support of life, and all the purposes of fertility, but for the convenience of trade, and the intercourse of each part with the others. In North America, such is the wisdom and goodness of the Creator of the universe; those vast tracts of country, situated beyond the Apalachian mountains, at an immense and unknown distance from the ocean, are watered by inland seas, called the lakes of Canada, which not only communicate with each other, but give rise to several great rivers, particularly the Mississippi, running from north to south till it falls into the gulf of Mexico, after a course, including its turnings, of 4500 miles, and receiving in its progress the vast tribute of the Illinois, the Misaures, the Ohio, and other great rivers, scarcely inferior to the Rhine, or the Danube; and on the north the river St. Laurence, running a contrary course from the Mississippi, till it empties itself into the ocean near Newfoundland; all of them being almost navigable to their heads, lay open the inmost recesses of this great continent, and afford such an inlet for commerce, as must produce the greatest advantage, whenever the country adjacent shall come to be fully inhabited, and by an industrious and civilized people. The eastern side of North America, besides the noble rivers Hudson, Delawar, Susquehanna, and Potowmack, supplies several others of great depth, length, and commodious navigation: hence many parts of the settlements are so advantageously intersected with navigable rivers and creeks, that the planters, without exaggeration, may be said to have each a harbour at his door.

South America is, if possible, in this respect even more fortunate. It supplies much the two largest rivers in the world, the river of Amazons, and the Rio de la Plata, or Plata River. The first rising in Peru not far from the South Sea, passes from West to East, and falls into the ocean between Brazil and Guiana, after a course of more than 3000 miles, in which it receives a prodigious number of great and navigable rivers. The Rio de la Plata rises in the heart of the country, and having its strength gradually augmented, by an accession of many powerful streams, discharges itself with such vehemence into the sea, as to make its taste fresh for many leagues from land. Besides these there are other rivers in South America, of which the Oronoco is the most considerable.

A country of such vast extent on each side of the equator, must neces-

family have a variety of soils as well as climates. It is a treasury of Nature, producing most of the metals, minerals, plants, fruits, trees, and wood, to be met with in the other parts of the world, and many of them in greater quantities and high perfection. The gold and silver of America have supplied Europe with such immense quantities of those valuable metals, that they are become vastly more common; so that the gold and silver of Europe now bears little proportion to the high price set upon them before the discovery of America.

This country also produces diamonds, pearls, emeralds, amethysts, and other valuable stones, which, by being brought into Europe, have contributed likewise to lower their value. To these, which are chiefly the productions of Spanish America, may be added a great number of other commodities, which, though of less price, are of much greater use, and many of them make the ornament and wealth of the British empire in this part of the world. Of these are the plentiful supplies of cochineal, indigo, anatto, logwood, brazil, fustic, pimento, lignum vitæ, rice, ginger, cocoa, or the chocolate nut; sugar, cotton, tobacco, banillas, red-wood, the balsams of Tolu, Peru, and Chili; that valuable article in medicine the Jesuit's bark, mechoacan, sassafras, sarsaparilla, cassia, tamarinds, hides, furs, ambergris, and a great variety of woods, roots, and plants, to which, before the discovery of America, we were either entire strangers, or forced to buy at an extravagant rate from Asia and Africa, through the hands of the Venetians and Genoese, who then engrossed the trade of the eastern world.

This continent has also a variety of excellent fruits, which here grow wild to great perfection; as pine-apples, pomegranates, citrons, lemons, oranges, malicacans, cherries, pears, apples, figs, grapes, great numbers of culinary, medicinal, and other herbs, roots, and plants; and so fertile is the soil, that many exotic productions are nourished in as great perfection as in their native ground.

Though the Indians still live in the quiet possession of many large tracts, America, so far as known, is chiefly claimed, and divided into colonies, by three European nations, the Spaniards, English, and Portuguese. The Spaniards, as they first discovered it, have the largest and richest portion, extending from New Mexico and Louisiana, in North America, to the straits of Magellan, in the South Sea, excepting the large province of Brazil, which belongs to Portugal; for though the French and Dutch have some forts upon Surinam and Guiana, they scarcely deserve to be considered as proprietors of any part of the southern continent.

Next to Spain, the most considerable proprietor of America was Great Britain, who derived her claim to North America from the first discovery of that continent by Sebastian Cabot, in the name of Henry VII. anno 1497, about six years after the discovery of South America by Columbus, in the name of the king of Spain. This country was in general called Newfoundland, a name which is now appropriated solely to an island upon its coast. It was a long time before we made any attempt to settle this country. Sir Walter Raleigh, an uncommon genius, and a brave commander, first shewed the way by planting a colony in the southern part, which he called Virginia, in honour of his mistress queen Elizabeth.

The French, indeed, from this period until the conclusion of the war in 1763, laid a claim to, and actually possessed Canada and Louisiana, comprehending all that extensive inland country, reaching from Hudson's Bay on the north, to Mexico, and the gulf of the same name on the south: regions which all Europe could not people in the course of many ages; but no ter-

ritory, however extensive, no empire, however boundless, could gratify the ambition of that aspiring nation: hence, under the most solemn treaties, they continued in a state of hostility, making gradual advances upon the back of our settlements, and rendering their acquisitions more secure and permanent by a chain of forts, well supplied with all the implements of war. At the same time they laboured incessantly to gain the friendship of the Indians, by various arts, even by intermarriages, and whom they not only trained to the use of arms, but infused into these savages the most unfavourable notions of the English, and the strength of their nation. The British colonies thus hemmed in, and confined to a slip of land along the sea-coast, by an ambitious and powerful nation, the rivals and the natural enemies of Great Britain, began in 1755 to take the alarm. The British empire in America, yet in its infancy, was threatened with a total dissolution. The colonies, in their distress, called out aloud to the mother country. The bulwarks, and the thunder of England, were sent to their relief, accompanied with powerful armies, well appointed, and commanded by a set of heroes, the Scipios of that age. A long war succeeded, which ended gloriously for Great Britain; for after oceans of blood were spilt, and every inch of ground was bravely disputed, the French were not only driven from Canada and its dependencies, but obliged to relinquish all that part of Louisiana, lying on the east side of the Mississippi.

Thus at an immense expence, and with the loss of many brave men, our colonies were preserved, secured, and extended so far, as to render it difficult to ascertain the precise bounds of our empire in North America, to the northern and western sides; for to the northward, it should seem that we might have extended our claim quite to the pole itself, nor did any nation seem inclined to dispute the property of this northernmost country with us. But our flattering prospects respecting our American possessions, have been annihilated by that unhappy contest between the mother-country and the colonies, which, after eight years continuance, with great expence of treasure and blood, ended in the establishment of a new Republic, styled "The Thirteen United States of America." The territory of the United States contains by computation a million of square miles, in which are

Acres 640,000,000
Deduct 51,000,000 of water

589,000,000 of land

The extent of unappropriated western territory, containing 222,000,000 of acres, is transferred to the federal government, and is pledged as a fund for sinking the national debt. It is in contemplation to divide it into new states with republican constitutions similar to the others.

The multitude of islands, which lie between the two continents of North and South America, are divided amongst the Spaniards, English and French. The Dutch indeed possess three or four small islands, which in any other hands would be of no consequence: and the Danes have one or two, but they hardly deserve to be named among the proprietors of America. We shall now proceed to the particular provinces, beginning, according to our method, with the north; but Labrador, or New Britain, and the country round Hudson's Bay, with those vast regions towards the Pole, are little known.

A summary View of the first Settlements of NORTH AMERICA.

Names of Places, when settled	By whom
Quebec 1608	By the French.
Virginia June 10, 1609	By Lord de la War.
Newfoundland June 1610	By Governor John Gay.
New York } New Jersey } about 1614	By the Dutch.
Plymouth 1620	{ By part of Mr. Robinson's congregation.
New Hampshire 1623	{ By a small English colony, near the mouth of Piscataqua river.
Delaware } Pennsylvania } 1627	By the Swedes and Fins.
Massachusetts Bay 1628	By Capt. John Endicott and company
Maryland 1633	By Lord Baltimore, with a colony of Roman Catholics.
Connecticut 1635	By Mr. Fenwick, at Saybrook, near the mouth of Connecticut river.
Rhode Island 1635	By Mr. Roger Williams, and his persecuted brethren.
New Jersey 1664	Granted to the Duke of York by Charles II. and made a distinct government, and settled some time before this by the English.
South Carolina 1659	By Governor Sals.
Pennsylvania 1682	By William Penn, with a colony of Quakers.
North Carolina about 1728	Erected into a separate government, settled before by the English.
Georgia 1732	By General Oglethorpe.
Kentucky 1773	By Col. Daniel Boone.
Vermont 1777	By emigrants from Connecticut, and other parts of New England.
Territory N. W. of } Ohio River }	1787 By the Ohio and other companies.

they all assume the livery of winter, and every sort of beasts, and most of their fowls, are of the colour of the snow: every thing animate and inanimate is white. This is a surprising phenomenon. But what is yet more surprising, and what is indeed one of the most striking things, that draw the most inattentive to an admiration of the wisdom and goodness of Providence, is, that the dogs and cats from England, that have been carried into Hudon's Bay, on the approach of winter, have entirely changed their appearance, and acquired a much longer, softer, and thicker coat of hair, than they had originally.

Before we advance farther in the description of America, it may be proper to observe in general, that all the quadrupeds of this new world are less than those of the old; even such as are carried from hence to breed there, are often found to degenerate, but are never seen to improve. If with respect to size, we should compare the animals of the new and the old world, we shall find the one bear no manner of proportion to the other. The Asiatic elephant, for instance, often grows to above fifteen feet high, while the tapurette, which is the largest native of America, is not bigger than a calf of a year old. The lama, which some also call the American camel, is still less. Their beasts of prey are quite divested of that courage, which is so often fatal to man in Africa or Asia. They have no lions, nor, properly speaking, either leopard, or tyger. Travellers, however, have affixed those names to such ravenous animals as are there found most to resemble those of the ancient continent. The congar, the taquar, and the taquavetti among them, are despicable in comparison of the tyger, the leopard, and the panther of Asia. The tyger of Bengal has been known to measure six feet in length, without including the tail; while the congar, or American tyger, as some affect to call it, seldom exceeds three. All the animals, therefore, in the southern parts of America, are different from those in the southern parts of the ancient continent; nor does there appear to be any common to both, but those which, being able to bear the colds of the north, have travelled from one continent to the other. Thus the bear, the wolf, the rein deer, the stag, and the beaver, are known as well by the inhabitants of New Britain and Canada, as Russia; while the lion, the leopard, and the tyger, which are natives of the south with us, are utterly unknown in Southern America. But if the quadrupeds of America be smaller than those of the ancient continent, they are in much greater abundance; for it is a rule that obtains through nature, and evidently points out the wisdom of the Author of it, that the smallest animals multiply in the greatest proportion. The goat, exported from Europe to Southern America, in a few generations becomes much less; but then it also becomes more prolific, and instead of one kid at a time, or two at the most, generally produces five, six, and sometimes more. The wisdom of Providence in making formidable animals unprolific is obvious: had the elephant, the rhinoceros, and the lion, the same degree of fecundity with the rabbit, or the rat, all the arts of man would soon be unequal to the contest, and we should soon perceive them become the tyrants of those who call themselves the masters of the creation.

PERSONS AND HABITS.] The men of this country shew great ingenuity in their manner of kindling a fire, in clothing themselves, and in preserving their eyes from the ill effects of that glaring white which every where surrounds them, for the greatest part of the year; in other respects they are very savage. In their shapes and faces they do not resemble the Americans who live to the southward: they are much more like the Laplanders and the Samoeds of Europe, already described.

DISCOVERY AND COMMERCE.] The knowledge of these northern seas and countries was owing to a project started in England for the discovery of a north-west passage to China and the East-Indies, as early as the year 1576. Since then it has been frequently dropped, and as often revived, but never yet completed; and from the late voyages of discovery it seems manifest, that no practicable passage ever can be found. Forbisher only discovered the main of New Britain, or Terra de Labrador, and those straits to which he has given his name. In 1585, John Davis sailed from Portsmouth, and viewed that and the more northerly coasts, but he seems never to have entered the bay. Hudson made three voyages on the same adventure, the first in 1607, the second in 1608, and his third and last in 1610. This bold and judicious navigator entered the straits that lead into this new Mediterranean, the bay known by his name, coasted a great part of it, and penetrated to eighty degrees and a half into the heart of the frozen zone. His ardour for the discovery not being abated by the difficulties he struggled with in this empire of winter, and world of frost and snow, he staid here until the ensuing spring, and prepared in the beginning of 1611, to pursue his discoveries; but his crew, who suffered equal hardships, without the same spirit to support them, mutinied, seized upon him, and seven of those who were most faithful to him, and committed them to the fury of the icy seas, in an open boat. Hudson and his companions were either swallowed up by the waves, or, gaining the inhospitable coast, were destroyed by the savages; but the ship and the rest of the men returned home.

Another attempt towards a discovery was made in 1746 by captain Ellis, who wintered as far north as 57 degrees and a half; but though the adventurers failed in the original purpose for which they navigated this bay, their project, even in its failure, has been of great advantage to this country. The vast countries which surround Hudson's Bay, as we have already observed, abound with animals, whose fur and skins are excellent. In 1670, a charter was granted to a company, which does not consist of above nine or ten persons, for the exclusive trade to this bay, and they have acted under it ever since with great benefit to the private men, who compose the company, though comparatively with little advantage to Great Britain. The fur and peltry trade might be carried on to a much greater extent were it not entirely in the hands of this exclusive company, whose interested, not to say iniquitous spirit, has been the subject of long and just complaint. The company employ but four ships, and 130 seamen. They have several forts, viz. Prince of Wales, Churchill, Nelson, New Severn, and Albany, which stand on the west side of the bay, and are garrisoned by 186 men. The French attacked, took, and made some depredations on them the last war, it was said to the amount of 400,000*l.* They export commodities to the value of 16,000*l.* and bring home returns to the value of 29,340*l.* which yield to the revenue 3,734*l.* This includes the fishery in Hudson's Bay. This commerce, small as it is, affords immense profits to the company, and even some advantages to Great Britain in general; for the commodities we exchange with the Indians for their skins and furs, are all manufactured in Britain; and as the Indians are not very nice in their choice, such things are sent of which we have the greatest plenty, and which, in the mercantile phrase, are drugs with us. Though the workmanship may happen to be in many respects so deficient, that no civilized people would take it off our hands, it may be admired among the Indians. On the other hand, the skins and furs we bring from Hudson's Bay, enter largely into our manufactures, and afford us materials for trading with many nations of Europe, to great advantage.

CANADA, or the PROVINCE OF QUEBEC.

SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 600	between { 61 and 81 west longitude. 45 and 52 north latitude. }	100,000.
Breadth 200		

BOUNDARIES.] BOUNDED by New Britain and Hudson's Bay, on the North and East; by Nova Scotia, New England, and New York, on the South; and by unknown lands on the West.

AIR AND CLIMATE.] The climate of this province is not very different from the colonies mentioned above; but as it is much farther from the sea, and more northerly than a great part of these provinces, it has a much severer winter, though the air is generally clear; but like most of those American tracts, that do not lie too far to the northward, the summers are very hot and exceedingly pleasant.

SOIL AND PRODUCE.] Though the climate be cold, and the winter long and tedious, the soil is in general very good, and in many parts both pleasant and fertile, producing wheat, barley, rye, with many other sorts of grains, seeds, and vegetables; tobacco, in particular, thrives well, and is much cultivated. The Isle of Orleans near Quebec, and the lands upon the river St. Laurence and other rivers, are remarkable for the richness of their soil. The meadow grounds in Canada, which are well watered, yield excellent grass, and breed vast numbers of great and small cattle. As we are now entering upon the cultivated provinces of British America, and as Canada is upon the back of the United States, and contains almost all the different species of wood and animals that are found in these provinces, we shall, to avoid repetitions, speak of them here at some length.

TIMBER AND PLANTS.] The uncultivated parts of North America contain the greatest forests in the world. They are a continued wood, not planted by the hands of men, and in all appearance as old as the world itself. Nothing is more magnificent to the sight; the trees lose themselves in the clouds; and there is such a prodigious variety of species, that even among those persons who have taken most pains to know them, there is not one perhaps that knows half the number. The province we are describing produces, amongst others, two sorts of pines, the white and the red; four sorts of firs; two sorts of cedar and oak, the white and the red; the male and female maple; three sorts of ash-trees, the free, the mungre, and the bastard; three sorts of walnut-trees, the hard, the soft, and the smooth; vast numbers of beech-trees, and white wood; white and red elms, and poplars. The Indians hollow the red elms into canoes, some of which, made out of one piece, will contain 20 persons; others are made of the bark, the different pieces of which they sew together with the inner rind, and daub over the seams with pitch, or rather a bituminous matter resembling pitch, to prevent their leaking; and the ribs of these canoes are made of boughs of trees. About November the bears and wild cats take up their habitations in the hollow elms, and remain there till April. Here are also found cherry trees, plum-trees, the vinegar tree, the fruit of which, infused in water, produces vinegar;

vinegar; an aquatic plant, called alaco, the fruit of which may be made into a confection; the white thorn; the cotton-tree, on the top of which grow several tufts of flowers, which, when shaken in the morning, before the dew falls off, produce honey, that may be boiled up into sugar, the seed being a pod, containing a very fine kind of cotton; the sun-plant, which resembles a marigold, and grows to the height of seven or eight feet; Turkey corn; French beans; gourds, melons, capillaire, and the hop-plant.

METALS AND MINERALS.] Near Quebec is a fine lead mine, and in some of the mountains, we are told, silver has been found. This country also abounds with coals.

RIVERS.] The rivers branching through this country are very numerous, and many of them large, bold, and deep. The principal are, the Outtauais, St. John's Seguinary, Desprairies, and Trois Rivieres, but they are all swallowed up by the river St. Laurence. This river issues from the lake Ontario, and taking its course north-east, washes Montreal, where it receives the Outtauais, and forms many fertile islands. It continues the same course and meets the tide upwards of 400 miles from the sea, where it is navigable for large vessels; and below Quebec, 320 miles from the sea, it becomes broad, and so deep, that ships of the line contributed, in the war before the last, to reduce that capital. After receiving in its progress innumerable streams, this great river falls into the ocean at Cape Rosieres, where it is 90 miles broad, and where the cold is intense, and the sea boisterous. In its progress it forms a variety of bays, harbours, and islands, many of them fruitful, and extremely pleasant.

LAKES.] The great river St. Laurence is that only upon which the French (now subjects of Great Britain) have settlements of any note; but if we look forward into futurity, it is nothing improbable that Canada, and those vast regions to the west, will be enabled of themselves to carry on a considerable trade upon the great lakes of fresh water, which these countries environ. Here are five lakes, the smallest of which is a piece of sweet water, greater than any in the other parts of the world; this is the lake Ontario, which is not less than 200 leagues in circumference; Erie, or Oswego, longer, but not so broad, is about the same extent. That of the Huron spreads greatly in width, and is in circumference not less than 300, as is that of Michigan, though, like lake Erie, it is rather long and comparatively narrow. But the lake Superior, which contains several large islands, is 500 leagues in the circuit. All of these are navigable by any vessels, and they all communicate with one another, except that the passage between Erie and Ontario is interrupted by a stupendous fall or cataract, which is called the Falls of Niagara. The water here is about half a mile wide, where the rock crosses it, not in a direct line, but in the form of a half moon. When it comes to the perpendicular fall, which is 150 feet, no words can express the consternation of travellers at seeing so great a body of water falling, or rather violently thrown, from so great a height, upon the rocks below; from which it again rebounds to a very great height, appearing as white as snow, being all converted into foam, through those violent agitations. The noise of this fall is often heard at the distance of 15 miles, and sometimes much farther. The vapour arising from the fall may sometimes be seen at a great distance, appearing like a cloud, or pillar of smoke, and in the appearance of a rainbow, whenever the sun and the position of the traveller favours. Many beasts and fowls here lose their lives, by attempting to swim, or cross the stream in the rapids above the fall, and are found dashed in pieces below; and some-

times the Indians, through carelessness or drunkenness, have met with the same fate; and perhaps no place in the world is frequented by such a number of eagles as are invited hither by the carnage of deer, elks, bears, &c. on which they feed. The river St. Laurence, as we have already observed, is the outlet of these lakes; by this they discharge themselves into the ocean. The French, when in possession of the province, built forts at the several mouths, by which these lakes communicate with each other, as well as where the last of them communicates with the river. By these they effectually secured to themselves the trade of the lakes, and an influence upon all the nations of America which lay near them.

ANIMALS.] These make the most curious, and hitherto the most interesting part of the natural history of Canada. It is to the spoils of these that we owe the materials of many of our manufactures, and moit of the commerce as yet carried on between us and the country we have been describing. The animals that find shelter and nourishment in the immense forests of Canada, and which indeed traverse the uncultivated parts of all this continent, are stags, elks, deer, bears, foxes, martins, wild cats, ferrets, weasels, squirrels of a large size and greyish hue, hares, and rabbits. The southern parts in particular breed great numbers of wild bulls, deer of a small size, divers sorts of roebucks, goats, wolves, &c. The marshes, lakes, and pools, which in this country are very numerous, swarm with otters, beavers or castors, of which the white are highly valued, being scarce, as well as the right black kind. The American beaver, though resembling the creature known in Europe by that name, has many particulars which render it the most curious animal we are acquainted with. It is near four feet in length, and weighs sixty or seventy pounds; they live from fifteen to twenty years, and the females generally bring forth four young ones at a time. It is an amphibious quadruped, that continues not long at a time in the water, but yet cannot live without frequently bathing in it. The savages, who waged a continual war with this animal, believed it to be a rational creature, that it lived in society, and was governed by a leader, resembling their own sachem, or prince.—It must indeed be allowed, that the curious accounts given of this animal by ingenious travellers, the manner in which it contrives its habitation, provides food to serve during the winter, and always in proportion to the continuance and severity of it, are sufficient to shew the near approaches of instinct to reason, and even in some instances the superiority of the former. Their colours are different; black, brown, white, yellow, and straw colour; but it is observed, that the lighter their colour the less quantity of fur they are clothed with, and live in warmer climates. The furs of the beaver are of two kinds, the dry and the green; the dry fur is the skin before it is applied to any use; the green are the furs that are worn, after being sewed to one another, by the Indians, who beset them with unctuous substances, which not only render them more pliable, but give the fine down, that is manufactured into hats, that oily quality which renders it proper to be worked up with the dry fur. Both the Dutch and the English have of late found the secret of making excellent cloths, gloves, and stockings, as well as hats, from the beaver fur. Besides the fur, this useful animal produces the wuc castoreum, which is contained in bags in the lower part of the belly, different from the testicles: the value of this drug is well known. The flesh of the beaver is a most delicious food, but when boiled it has a disagreeable relish.

The musk rat is a diminutive kind of beaver (weighing about five or six pounds

which it resembles in every thing but its tail; and it affords a very strong muck.

The elk is of the size of a horse or mule. Many extraordinary medicinal qualities, particularly for curing the falling-sickness, are ascribed to the hoof of the left foot of this animal. Its flesh is very agreeable and nourishing, and its colour a mixture of light grey and dark red. They love the cold countries; and when the winter affords them no grass, they gnaw the bark of trees. It is dangerous to approach very near this animal when he is hunted, as he sometimes springs furiously on his pursuers, and tramples them to pieces. To prevent this, the hunter throws his clothes to him, and while the deluded animal spends his fury on these, he takes proper measures to dispatch him.

There is a carnivorous animal here, called the carajou, of the feline or cat kind, with a tail so long, that Charlevoix says he twisted it several times round his body. Its body is about two feet in length, from the end of the snout to the tail. It is said, that this animal, winding himself about a tree, will dart from thence upon the elk, twist his strong tail round his body, and cut his throat in a moment.

The buffaloe, a kind of wild ox, has much the same appearance with those of Europe; his body is covered with a black wool, which is highly esteemed. The flesh of the female is very good; and the buffaloe hides are as soft and pliable as chamois leather, but so very strong, that the bucklers which the Indians make use of are hardly penetrable by a musket ball. The Canadian roebuck is a domestic animal, but differs in no other respect from those of Europe. Wolves are scarce in Canada, but they afford the finest furs in all the country; their flesh is white, and good to eat; and they pursue their prey to the tops of the tallest trees. The black foxes are greatly esteemed, and very scarce; but those of other colours are more common; and some on the Upper Mississippi are of a silver colour, and very beautiful. They live upon water-fowls, which they decoy within their clutches by a thousand antic tricks, and then spring upon, and devour them. The Canadian polecat has a most beautiful white fur, except the tip of his tail, which is as black as jet. Nature has given this animal no defence, but its urine, the smell of which is nauseous and intolerable; this, when attacked, it sprinkles plentifully on its tail, and throws it on the assailant. The Canadian wood rat is of a beautiful silver colour, with a bushy tail, and twice as big as the European; the female carries under her belly a bag, which she opens and shuts at pleasure; and in that she places her young when pursued. Here are three sorts of squirrels; that called the flying squirrel will leap forty paces and more, from one tree to another. This little animal is easily tamed, and is very lively, except when asleep, which is, often the case; and he puts up wherever he can find a place, in one's sleeve, pocket, or muff; he first pitches on his master, whom he will distinguish among twenty persons. The Canadian porcupine is less than a middling dog; when roasted, he eats as full as well as a sucking pig. The hares and rabbits differ little from those in Europe, only they turn grey in winter. There are two sorts of bears here, one of a reddish, and the other of a black colour; but the former is the most dangerous. The bear is not naturally fierce, unless when wounded, or oppressed with hunger. They run themselves very poor in the month of July, when it is somewhat dangerous to meet them; and they are said to support themselves during the winter, when the snow lies from four to six feet deep, by sucking their paws. Scarcely any thing among the Indians

is undertaken with greater solemnity than hunting the bear; and an alliance with a noted bear-hunter, who has killed several in one day, is more eagerly sought after, than that of one who has rendered himself famous in war. The reason is, because the chase supplies the family with both food and raiment.

Of the feathered creation, they have eagles, falcons, goshawks, tercols, partridges, grey, red, and black; with long tails, which they spread out as a fan, and make a very beautiful appearance. Woodcocks are scarce in Canada; but snipes, and other water-game, are plentiful. A Canadian raven is said by some writers to eat as well as a pullet, and an owl better. Here are black-birds, swallows, and larks; no less than twenty-two different species of ducks, and a great number of swans, turkeys, geese, bustards, teal, water-hens, cranes, and other large water-fowl; but always at a distance from houses. The Canadian wood-pecker is a beautiful bird. Thrushes and goldfinches are found here; but the chief Canadian bird of melody is the white-bird, which is a kind of ortolan, very shrewy, and remarkable for announcing the return of spring. The fly-bird is thought to be the most beautiful of any in nature; with all his plumage, he is no bigger than a cockchafer, and he makes a noise with his wings like the humming of a large fly.

Among the reptiles of this country, the rattle-snake chiefly deserves attention. Some of these are as big as a man's leg, and they are long in proportion. What is most remarkable in this animal is the tail, which is scaly like a coat of mail, and on which it is said there grows every year one ring, or row of scales; so that they know its age by its tail, as we do that of a horse by its teeth. In moving, it makes a rattling noise, from which it has its name. The bite of this serpent is mortal, if a remedy is not applied immediately. In all places where this dangerous reptile is bred, there grows a plant which is called rattle-snake herb, the root of which (such is the goodness of Providence) is a certain antidote against the venom of this serpent, and that with the most simple preparation; for it requires only to be pounded or chewed, and applied like a plaster to the wound. The rattle-snake seldom bites passengers, unless it is provoked, and never darts itself at any person without first rattling three times with its tail. When pursued, if it has but a little time to recover, it folds itself round, with the head in the middle, and then darts itself with great fury and violence against its pursuers; nevertheless, the savages chase it, and find its flesh very good; and being used of a medicinal quality, it is used by the American apothecaries in particular cases.

Some writers are of opinion that the fisheries in Canada, if properly improved, would be more like to enrich that country than even the fur trade. The river St. Laurence contains perhaps the greatest variety of any in the world, and these in the greatest plenty and of the best sorts.

Besides a great variety of other fish in the rivers and lakes, are sea-wolves, sea-cows, porpoises, the leincornet, the goberque, the sea plaife; salmon, trout, turtle, lobsters, the chaourafou, sturgeon, the achigau; the gilthead, tunny, shad, lamprey, smelts, conger eels, mackarel, foals, herrings, anchov., and pilchards. The sea-wolf, so called from its howling, is an amphibious creature; the largest are said to weigh two thousand pounds; their flesh is good eating; but the profit of it lies in the oil, which is proper for burning and currying of leather; their skins make excellent coverings for trunks, and though not so fine as Morocco leather, they preserve their freshness better,

parts of the

and are less liable to cracks. The shoes and boots made of those skins let in no water, and, when properly tanned, make excellent and lasting covers for seats. The Canadian sea-cow is larger than the sea-wolf, but resembles it in figure: it has two teeth of the thickness and length of a man's arm, that, when grown, look like horns, and are very fine ivory, as well as its other teeth. Some of the porpoises of the river St. Laurence are said to yield a hoghead of oil; and of their skins waistcoats are made, which are exceedingly strong, and musket proof. The tencornet is a kind of cuttle-fish, quite round, or rather oval: there are three sorts of them, which differ only in size; some being as large as a hoghead, and others but a foot long; they catch only the last, and that with a torch; they are excellent eating. The guberque has the taste and smell of a small cod. The sea-plaife is good eating; they are taken with long poles armed with iron hooks. The chaourafou is an armed fish, about five feet long, and as thick as a man's thigh, resembling a pike; but is covered with scales that are proof against a dagger; its colour is a silver grey; and there grows under his mouth a long bony substance, ragged at the edges. One may readily conceive, that an animal so well fortified is a ravager among the inhabitants of the water; but we have few instances of fish making prey of the feathered creation, which this fish does, however, with much art. He conceals himself among the caues, and reeds, in such a manner that nothing is to be seen besides his weapon, which he holds raised perpendicularly above the surface of the water: the fowls, which come to take rest, imagining the weapon to be only a withered reed, perch upon it; but they are no sooner alighted, than the fish opens his throat, and makes such a sudden motion to seize his prey, that it seldom escapes him. This fish is an inhabitant of the lakes. The sturgeon is both a fresh and salt-water fish, taken on the coasts of Canada and the lakes, from eight to twelve feet long, and proportionably thick. There is a small kind of sturgeon, the flesh of which is very tender and delicate. The achigau, and the gilthead, are fish peculiar to the river St. Laurence. Some of the rivers breed a kind of crocodile, that differs but little from those of the Nile.

INHABITANTS AND PRINCIPAL TOWNS.] Before the late war, the banks of the river St. Laurence, above Quebec, were vastly populous; but we cannot precisely determine the number of French and English settled in this province, who are undoubtedly upon the increase. In the year 1783, Canada and Labrador was supposed to contain about 130,000 inhabitants*. The different tribes of Indians in Canada are almost innumerable; but these people are observed to decrease in population where the Europeans are most numerous, owing chiefly to the immoderate use of spirituous liquors, of which they are excessively fond. But as liberty is the ruling passion of the Indians, we may naturally suppose that as the Europeans advance, the former will retreat to more distant regions.

Quebec, the capital, not only of this province, but of all Canada, is situated at the confluence of the rivers St. Laurence and St. Charles, or the Little River, about 320 miles from the sea. It is built on a rock, partly of marble, and partly of slate. The town is divided into an upper and a lower; the houses in both are of stone, and built in a tolerable manner. The fortifications are strong, though not regular. The town is covered with a regular and beautiful citadel, in which the governor resides. The number of in-

* In 1784, general Haldimand ordered a census of the inhabitants to be taken, when they amounted to 213,012 English and French, exclusive of 10,000 loyalists, settled in the upper parts of the province.

habitants have been computed at 12. or 15,000. The river, which from the sea thither is four or five leagues broad, narrows all of a sudden to about a mile wide. The haven, which lies opposite the town is safe and commodious, and about five fathoms deep. The harbour is flanked by two bastions, that are raised 25 feet from the ground, which is about the height of the tides at the time of the equinox.

From Quebec to Montreal, which is about 170 miles, in sailing up the river St. Laurence, the eye is entertained with beautiful landscapes, the banks being in many places very bold and steep, and shaded with lofty trees. The farms lie pretty close all the way; several gentlemen's houses, neatly built, shew themselves at intervals, and there is all the appearance of a flourishing colony; but there are few towns or villages. It is pretty much like the well settled parts of Virginia and Maryland, where the planters are wholly within themselves. Many beautiful islands are interspersed in the channel of the river, which have an agreeable effect upon the eye. After passing the Richelieu islands, the air becomes so mild and temperate, that the traveller thinks himself transported to another climate; but this is to be understood in the summer months.

The town called Trois Rivieres, or the Three Rivers, is about half way between Quebec and Montreal, and has its name from three rivets which join their currents here, and fall into the river St. Laurence. It is much resorted to by several nations of Indians, who, by means of these rivers, come here and trade with the inhabitants in various kinds of furs and skins. The country is pleasant, and fertile in corn, fruit, &c. and great numbers of handsome houses stand on both sides of the rivers.

Montreal stands on the island in the river St. Laurence, which is ten leagues in length and four in breadth, at the foot of a mountain which gives name to it; about half a league from the south shore. While the French had possession of Granada, both the city and island of Montreal belonged to private proprietors, who had improved them so well that the whole island was become a most delightful spot, and produced every thing that could administer to the conveniences of life. The city forms an oblong square, divided by regular and well-formed streets; and when it fell into the hands of the English, the houses were built in a very handsome manner; and every house might be seen at one view from the harbour, or from the southernmost side of the river, as the hill on the side of which the town stands falls gradually to the water. This place is surrounded by a wall and a dry ditch; and its fortifications have been much improved by the English. Montreal is nearly as large as Quebec; but since it fell into the hands of the English it hath suffered much by fires.

GOVERNMENT.] Before the late war, the French lived in affluence, being free from all taxes, and having full liberty to hunt, fish, sell timber, and to sow and plant as much land as they could cultivate. By the capitulation granted to the French, when this country was reduced, both individuals and communities were entitled to all their former rights and privileges.

In the year 1774, an act was passed by the parliament of Great Britain, for making more effectual provision for the government of the province of Quebec. By this it was enacted, that it should be lawful for his majesty, his heirs, and successors, by warrant under his or their signet or sign manual, and with the advice of the privy-council, to constitute and appoint a council for the affairs of the province of Quebec, to consist of such persons resident there,

not exceeding twenty-three, nor less than seventeen, as his majesty, his heirs, and successors, shall be pleased to appoint; and upon the death, removal, or absence of any of the members of the said council, in like manner to constitute and appoint others to succeed them. And this council, so appointed and nominated, or the majority of them, are vested with power and authority to make ordinances for the peace, welfare, and good government of the province, with the consent of the governor, or, in his absence, of the lieutenant-governor, or commander in chief for the time being. The council, however, are not empowered to lay taxes, except for the purpose of making roads, reparation of public buildings, or such local conveniences. By this act, all matters of controversy relative to property and civil rights are to be determined by the French laws of Canada; but the criminal law of England is to be continued in the province. The inhabitants of Canada are also allowed by this act not only to profess the Romish religion, but the popish clergy are invested with a right to claim and obtain their accustomed dues from those of the same religion. This act occasioned a great alarm both in England and America, and appears to have contributed much towards spreading a spirit of disaffection to the British government in the colonies. The city of London petitioned against the bill before it received the royal assent; declaring, that they apprehended it to be entirely subversive of the great fundamental principles of the British constitution, as well as of the authority of various solemn acts of the legislature. And in one of the petitions of the American congress to the king, they complained, that by the Quebec act, the limits of that province were extended, the English laws abolished, and the French laws restored, whereby great numbers of British freemen were subjected to the latter; and that an absolute government, and the Roman catholic religion, were also established by that act, throughout those vast regions that border on the westerly and northerly boundaries of the Protestant English settlements.

[TRADE AND COMMERCE.] The nature of the climate, severely cold in winter, and the people manufacturing nothing, shews what Canada principally wants from Europe; wine, or rather rum, cloths, chiefly coarse linen, and wrought iron. The Indian trade requires rum, tobacco, a sort of duffil blankets, guns, powder, balls, and flints, kettles, hatchets, toys, and trinkets of all kinds.

While this country was possessed by the French, the Indians supplied them with peltry; and the French had traders, who, in the manner of the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience, carrying their goods into the remotest parts of America, and amongst nations entirely unknown to us. These again brought the market home to them, as the Indians were thereby habituated to trade with them. For this purpose, people from all parts even from the distance of 1000 miles, came to the French fair at Montréal, which began in June, and sometimes lasted three months. On this occasion, many solemnities were observed, guards were placed, and the governor assisted, to preserve order, in such a concourse, and so great a variety of savage nations. But sometimes great disorders and tumults happened; and the Indians being so fond of brandy, frequently gave for a dram all that they were possessed of. It is remarkable that many of these nations actually passed by our settlement of Albany in New York, and travelled 250 miles farther to Montréal, though they might have purchased the goods cheaper at the former. So much did the French exceed us in the arts of winning the affections of these savages!

Since we became possessed of Canada, our trade with that country has been computed to employ about 60 ships and 1000 seamen. Their exports, in an average of three years, in skins, furs, ginseng, snake-root, capillaire, and wheat, amount to 105,500l. Their imports from Great Britain, in a variety of articles, are computed at nearly the same sum. It is unnecessary to make any remarks on the value and importance of this trade, which not only supplies us with manufactured materials, indispensably necessary in many articles of our commerce, but also takes in exchange the manufactures of our own country, or the production of our other settlements in the East and West Indies.

But whatever attention be paid to the trade and peopling of Canada, it will be hardly possible to overcome certain inconveniences, proceeding from natural causes; I mean the severity of the winter, which is so excessive from December to April, that the greatest rivers are frozen over, and the snow lies commonly from four to six feet deep on the ground, even in those parts of the country which lie three degrees south of London, and in the temperate latitude of Paris. Another inconvenience arises from the falls in the river St. Laurence, below Montreal, which render it difficult for very large ships to penetrate to that emporium of inland commerce; but vessels from 300 to 400 tons are not prevented by these falls from going there annually.

BOUNDARIES.] BOUNDED by the river St. Laurence on the North; by the gulf of St. Laurence, and the Atlantic ocean, East; by the same ocean, South; and by Canada and New England, West. In the year 1784, this province was divided into two governments: the province and government, now styled New Brunswick, is bounded on the westward of the river St. Croix, by the said river to its source, and by a line drawn due north from thence to the southern boundary of the province of Quebec, to the northward by the same boundary as far as the western extremity of the Bay de Chaleurs, to the eastward by the said bay to the gulf of St. Laurence to the bay called Bay Verte, to the south by a line in the centre of the Bay of Fundy, from the river St. Croix aforesaid, to the mouth of the Musquat River, by the said river to its source, and from thence by a due east line across the isthmus into the Bay Verte,

The amount of the exports from this province in the year 1786, was £. 343,263. Amount of imports the same year was £. 325,116.

to join the eastern lot above described, including all islands within six leagues of the coast.

RIVERS.] The river of St. Laurence forms the northern boundary. The rivers Rigouche and Nipisiquin run from West to East, and fall into the bay of St. Laurence. The rivers of St. John, Passamagnadi, Penobscot, and St. Croix, which run from North to South, fall into Fundy Bay, or the sea a little to the eastward of it.

SEAS, BAYS, AND CAPES.] The seas adjoining to it are, the Atlantic ocean, Fundy Bay, and the gulf of St. Laurence. The lesser bays are, Chignigto and Green Bay upon the isthmus, which joins the north part of Nova Scotia to the south; and the bay of Chaleurs on the north-east; the bay of Chedibucto on the south-east; the bay of the islands, the ports of Barts, Chebucto, Prosper, St. Margaret, La Heve, port Maltois, port Rysignol, port Vert, and port Joly, on the south; port La Tour, on the south-east; port St. Mary, Annapolis, and Minas, on the south side of Fundy Bay, and port Roseway, now the most populous of all.

The chief capes are, Cape Portage, Ecoumenac, Tourmentin, Cape Port and Epis, on the East. Cape Fogeri, and Cape Canceau, on the south-east. Cape Blanco, Cape Vert, Cape Theodore, Cape Dore, Cape La Heve, and Cape Negro, on the south. Cape Sable, and Cape Foutche on the south-west.

LAKES.] The lakes are very numerous, but have not yet received particular names.

CLIMATE.] The climate of this country, though within the temperate zone, has been found rather unfavourable to European constitutions. They are wrapt up in the gloom of a fog during great part of the year, and for four or five months it is intensely cold. But though the cold in winter and the heat in summer are great, they come on gradually, so as to prepare the body for enduring both.

SOIL AND PRODUCE.] From such an unfavourable climate little can be expected. Nova Scotia, or New Scotland, till lately was almost a continued forest; and agriculture, though attempted by the English settlers, made little progress. In most parts, the soil is thin and barren, the corn it produces is of a shrivelled kind like rye, and the grass intermixed with a cold spongy moss. However, it is not uniformly bad; there are tracts in the peninsula to the southward, which do not yield to the best land in New England, and by the industry and exertions of the loyalists from the other provinces, are now cultivated and likely to be fertile and flourishing. In general, the soil is adapted to the produce of hemp and flax. The timber is extremely proper for ship-building, and produces pitch and tar. Flattering accounts have been given of the improvements making in the new settlements and bay of Fundy. A great quantity of land hath been cleared, which abounds in timber, and ship-loads of good masts and spars have been shipped from thence already.

ANIMALS.] This country is not deficient in the animal productions of the neighbouring provinces, particularly deer, beavers, and otters. Wild fowl, and all manner of game, and many kinds of European fowls and quadrupeds have, from time to time, been brought into it, and thrive well. At the close of March, the fish begin to spawn, when they enter the rivers in such shoals, as are incredible. Herrings come up in April, and the surgeon and salmon in May. But the most valuable appendage of New Scotland is the Cape Sable coast, along which is one continued range of cod-fishing banks, navigable rivers, basons, and excellent harbours.

HISTORY, SETTLEMENT, CHIEF TOWNS, AND COMMERCE. } Notwithstanding the forbidding appearance of this country, it was here that some of the first European settlements were made. The first grant of lands in it was given by James I. to his secretary Sir William Alexander, from whom it had the name of Nova Scotia, or New Scotland. Since then it has frequently changed hands, from one private proprietor to another, and from the French to the English nation backward and forward. It was not confirmed to the English, till the peace of Utrecht, and their design in acquiring it, does not seem to have so much arisen from any prospect of direct profit to be obtained by it, as from an apprehension that the French, by possessing this province, might have had it in their power to annoy our other settlements. Upon this principle, 3000 families were transported in 1749, at the charge of the government, into this country. The town they erected is called Halifax, from the earl of that name, to whose wisdom and care we owe this settlement. The town of Halifax stands upon Chebucto Bay, very commodiously situated for the fishery, and has a communication with most parts of the province, either by land carriage, the sea, or navigable rivers, with a fine harbour, where a small squadron of ships of war lies during the winter, and in summer puts to sea, under the command of a commodore, for the protection of the fishery, and to see that the articles of the late peace, relative thereto, are duly observed by the French. The town has an intrenchment, and is strengthened with forts of timber. The other towns of less note are Annapolis Royal, which stands on the east side of the bay of Fundy, and, though but a small place, was formerly the chief of the province. It has one of the finest harbours in America, capable of containing a thousand vessels at anchor, in the utmost security. St. John's is a new settlement at the mouth of the river of that name, that falls into the bay of Fundy, on the west side.

Since the conclusion of the war, the emigration of loyalists to this province from the United States, hath been very great: by them new towns have been raised, as Shelburne, which extends two miles on the water-side, and is said to contain already 9000 inhabitants. Of the old settlements, the most flourishing and populous are Halifax, and the townships of Windsor, Norton, and Cornwallis, between Halifax and Annapolis. Of the new settlements, the most important are Shelburne, Parr-town, Digby, and New Edinburgh. Large tracts of land have been lately cultivated, and the province is now likely to advance in population and fertility.

UNITED STATES OF AMERICA.

OF the rise, progress, and most remarkable events of that war, between Great Britain and her American colonies, which at length terminated in the establishment of the United States of America, we have already given an account, in our view of the principal transactions in the history of Great Britain. It was on the 4th of July, 1776, that the congress published a

solemn declaration, in which they assigned their reasons for withdrawing their allegiance from the king of Great Britain. In the name, and by the authority of the inhabitants of the united colonies of New Hampshire, Massachusetts Bay, Rhode Island, and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia, they declared, that they then were, and of right ought to be, Free and Independent States; and that, as such, they had full power to levy war, conclude peace, contract alliances, establish commerce, and do all other acts and things which independent states may of right do. They also published articles of confederation, and perpetual union, between the united colonies, in which they assumed the title of "the United States of America;" and by which each of the colonies contracted a reciprocal treaty of alliance and friendship for their common defence, for the maintenance of their liberties, and for their general and mutual advantage; obliging themselves to assist each other against all violence that might threaten all, or any one of them, and to repel, in common, all the attacks that might be levelled against all, or any one of them, on account of religion, sovereignty, commerce, or under any other pretext whatsoever. Each of the colonies reserved to themselves alone the exclusive right of regulating their internal government, and of framing laws in all matters not included in the articles of confederation. But for the more convenient management of the general interests of the United States, it was determined, that delegates should be annually appointed in such manner as the legislature of each state should direct, to meet in congress on the first Monday in November of every year, with a power reserved to each state to recall its delegates, or any of them, at any time within the year, and to send others in their stead, for the remainder of the year. No state is to be represented in congress by less than two, nor more than seven members; and no person is capable of being a delegate for more than three years, in any term of six years; nor is any person, being a delegate, capable of holding any office under the United States, for which he, or any other for his benefit, shall receive any salary, fees, or emolument of any kind. In determining questions in the United States, in congress assembled, each state is to have one vote. Every state is to abide by the determinations of the United States in congress assembled, on all questions which are submitted to them by the confederation. The articles of the confederation are to be inviolably observed by every state, and the union is to be perpetual; nor is any alteration, at any time hereafter, to be made in any of them, unless such alteration be agreed to in a congress of the United States, and be afterwards confirmed by the legislatures of every state. It was on the 30th of January, 1778, that the French king concluded a treaty of amity and commerce with the thirteen United Colonies of America, as independent states. Holland acknowledged them as such April 19, 1782; and on the 30th of November, 1782, provisional articles were signed at Paris, by the British and American commissioners, in which his Britannic majesty acknowledged the Thirteen Colonies to be Free, Sovereign, and Independent States; and these articles were afterwards ratified by a definitive treaty. Sweden acknowledged them as such February 5, 1783; Denmark the 25th of February; Spain in March, and Russia in July 1783.

UNITED STATES OF AMERICA.

The following calculations were made from actual measurement, & are the best made by
THOMAS HUTCHINS, Esq. Geographer to the United States.

The territory of the United States (as before mentioned) contains by computation a million of square miles, in which are	640,000,000 of acres.
Deduct for water	51,000,000
Acres of land in the United States	589,000,000

That part of the United States comprehended between the west temporary line of Pennsylvania on the east, the boundary line between Britain and the United States extending from the river St. Croix to the north-west extremity of the Lake of the Woods on the north, the river Mississippi to the mouth of the Ohio on the west, and the river Ohio on the south, to the aforementioned bounds of Pennsylvania, contains by computation about four hundred and eleven thousand square miles in which are

Deduct for water	263,040,000 of acres.
	43,040,000
To be disposed of by order of congress	220,000,000

The whole of this immense extent of unappropriated western territory, containing, as above stated, 220,000,000 of acres has been, by the cession of some of the original thirteen states, and by the treaty of peace transferred to the federal government, and is pledged as a fund for sinking the continental debt. It is in contemplation to divide it into new states, with republican constitutions similar to the old states near the Atlantic ocean.

Estimate of the number of acres of water, north and westward of the river Ohio, within the territory of the United States.

	Acres.
In Lake Superior	2,195,278
Lake of the Woods	1,133,800
Lake Rain, &c.	165,200
Red Lake	551,000
Lake Michigan	10,368,000
Bay Puan	1,216,000
Lake Huron	5,009,930
Lake St. Clair	89,500
Lake Erie, western part	2,252,800
Sundry small lakes and rivers	301,000
	43,040,000

meanders, receiving the innumerable rivulets and larger streams which proceed from the mountains on each side. To a spectator on the top of a neighbouring mountain, the vales between the ridges, while in a state of nature, exhibit a romantic appearance. They seem an ocean of woods, swelled and depressed in its surface, like that of the great ocean itself.

There are four principal ranges of mountains, passing nearly from north-east to south-west, through New England. They consist of a multitude of parallel ridges, each having many spurs, deviating from the course of the general range; which spurs are again broken into irregular, hilly land. The main ridges terminate, sometimes in high bluff heads, near the sea coast; and sometimes by a gradual descent in the interior part of the country.—These ranges of mountains are full of lakes, ponds, and springs of water, that give rise to numberless streams of various sizes. No country on the globe is better watered than New England *

RIVERS.] Their rivers are, 1. Connecticut; 2. Thames; 3. Patuxent; 4. Merimac; 5. Piscataway; 6. Saco; 7. Casco; 8. Kennebeque; and 9. Penobscot, or Pentagonet.

BAYS AND CAPES.] The most remarkable bays and harbours are those formed by Plymouth, Rhode Island, and Providence Plantations; Monument Bay, West Harbour, formed by the bending of Cape Cod; Boston Harbour; Piscataway; and Casco Bay.

The chief capes are, Capes Cod, Marble Head, Cape Anne, Cape Netic, Cape Porpus, Cape-Elizabeth, and Cape Small Point.

AIR AND CLIMATE.] New England, though situated almost ten degrees nearer the sun than the mother country, has an earlier winter, which continues longer, and is more severe than with us. The summer again is extremely hot, and much beyond any thing known in Europe, in the same latitude. The clear and serene temperature of the sky, however, makes amends for the extremity of heat and cold, and renders the climate of this country so healthy, that it is reported to agree better with British constitutions than any other of the American provinces. The winds are very boisterous in the winter season, and naturalists ascribe the early approach, and the length, and severity of the winter, to the large fresh water lakes lying to the north west of New England, which being frozen over several months, occasion those piercing winds, which prove so fatal to mariners on this coast.

The sun rises at Boston, on the longest day, at 26 minutes after four in the morning, and sets at 34 minutes after seven in the evening; and on the shortest day, it rises at 35 minutes after seven in the morning, and sets at 27 minutes after four in the afternoon: thus their longest day is about fifteen hours, and the shortest about nine.

SOIL AND PRODUCE.] We have already observed, that the lands lying on the eastern shore of America are low, and in some parts swampy, but farther back they rise into hills. In New England, towards the north-east, the lands become rocky and mountainous. The soil here is various, but best as you approach the southward. Round Massachusetts's bay the soil is black, and rich as in any part of England; and here the first planters found the grass above a yard high. The uplands are less fruitful, being for the most part a mixture of sand and gravel, inclining to clay. The low grounds abound in meadows and pasture land. The European grains have not been cultivated here with much success; the wheat is subject to be blasted; the barley is a hungry grain, and the oats are lean and chaffy. But the Indian

corn flourishes in high perfection, and makes the general food of the lower sort of people. They likewise malt and brew it into a beer, which is not contemptible. However, the common table drink is cyder and spruce beer: the latter is made of the tops of the Spruce fir, with the addition of a small quantity of molasses. They likewise raise in New England a large quantity of hemp and flax. The fruits of old England come to a great perfection here, particularly peaches and apples. Seven or eight hundred fine peaches may be found on one tree, and a single apple-tree has produced seven barrels of cyder in one season.

But New England is chiefly distinguished for the variety and value of its timber, as oak, ash, pine, fir, cedar, elm, cyprus, beech, walnut, chefnut, hazel, fallafra, sumach, and other woods used in dying or tanning leather, carpenter's work, and ship building. The oaks here are said to be inferior to those of England; but the firs are of an amazing bulk, and formerly furnished the royal navy of England with masts and yards. They draw from their trees considerable quantities of pitch, tar, resin, turpentine, gums, and balm; and the soil produces hemp and flax. A ship may here be built and rigged out with the produce of their forests, and indeed, ship-building forms a considerable branch of their trade.

METALS.] Rich iron mines of a most excellent kind and temper, have been discovered in New England, which, if improved, may become very beneficial to the inhabitants.

ANIMALS.] The animals of this country furnish many articles of New-England commerce. All kinds of European cattle thrive here, and multiply exceedingly; the horses of New England are hardy, mettlesome, and serviceable, but smaller than ours, though larger than the Welch. They have few sheep; and the wool, though of a staple sufficiently long, is not nearly so fine as that of England. Here are also elks, deers, hares, rabbits, squirrels, beavers, otters, monkies, minks, martens, racoons, sabbes, bears, wolves, which are only a kind of wild dogs, foxes, ounces, and a variety of other tame and wild quadrupeds. But one of the most singular animals, of this and the neighbouring countries, is the moose or moose deer, of which there are two sorts; the common light grey moose which resembles the ordinary deer; these herd sometimes thirty together: and the larger black moose, whose body is about the size of a bull; his neck resembles a stag's, and his flesh is extremely grateful. The horns, when full grown, are about four or five feet from the head to the tip, and have shoots or branches to each horn, which generally spread about six feet. When this animal goes through a thicket, or under the boughs of a tree, he lays his horns back on his neck, to place them out of his way: and these prodigious horns are shed every year. This animal does not spring or rise in joining, like a deer; but a large one, in his common walk, has been seen to step over a gate five feet high. When unharmed, he will run a course of twenty or thirty miles before he takes to a bay; but when chased, he generally takes to the water.

There is hardly any where greater plenty of fowls, as turkeys, geese, partridges, ducks, widgeons, dappers, swans, heathcocks, herons, storks, blackbirds, all sorts of barn-door fowl, vast flights of pigeons, which come and go at certain seasons of the year, cormorants, ravens, crows, &c. The reptiles are rattle-snakes, frogs, and toads, which swarm in the uncleared parts of these countries, where, with the owls, they make a most hideous noise in the summer evenings.

The seas round New England, as well as its rivers, abound with fish, and even whales of several kinds, such as the whalebone whale, the spermaceti whale, which yields ambergrise, the fin-backed whale, the scrag whale, and the bunch whale, of which they take great numbers, and send besides some ships every year to fish for whales in Greenland, and as far as Falkland Islands. A terrible creature, called the whale-killer, from 20 to 30 feet long, with strong teeth and jaws, persecutes the whale in these seas; but, afraid of his monstrous strength, they seldom attack a full-grown whale, or indeed a young one, but in companies of ten or twelve. At the mouth of the river Penobscot, there is a mackarel fishery; they likewise fish for cod in winter, which they dry in the frost.

POPULATION, INHABITANTS, AND } There is not one of the colonies
 FIELDS OF THE COUNTRY. } which can be compared in the abundance of people, the number of considerable and trading towns, and the manufactures that are carried on in them, to New England. The most populous and flourishing parts of the mother-country hardly make a better appearance than the cultivated parts of this province, which reach about 60 miles back. There are here many gentlemen of considerable landed estates; but the great body of the people are land-holders, and cultivators of the soil. The former attaches them to their country; the latter, by making them strong and healthy, enables them to defend it*. These freeholds generally pass to their children in the way of gavelkind; which keeps them from being hardly ever able to emerge out of their original happy mediocrity. In no part of the world are the ordinary sort so independent, or possess more of the conveniences of life; they are used from their infancy to the exercise of arms; and before the contest with the mother-country, they had a militia, which was by no means contemptible; but their military strength is now much more considerable.

The inhabitants of New England are almost universally of English descent; and it is owing to this circumstance, and to the great and general attention that has been paid to education, that the English language has been preserved among them so free of corruption. It is true, that from laziness, inattention, and want of acquaintance with mankind, many of the people in the country have accustomed themselves to use some peculiar phrases, and to pronounce certain words in a flat, drawing manner. Hence foreigners pretend they know a New Englandman from his manner of speaking. But the same may be said with regard to a Pennsylvanian, a Virginian, or a Carolinian; for all have some phrases and modes of pronunciation peculiar to themselves, which distinguish them from their neighbours.

The New Englanders are generally tall, stout, and well built. They glory, and perhaps with justice, in possessing that spirit of freedom, which induced their ancestors to leave their native country, and to brave the dangers of the ocean, and the hardships of settling a wilderness. Their education, laws, and situation, serve to inspire them with high notions of liberty.—In New England, learning is more generally diffused among all ranks of people, than in any other part of the globe; arising from the excellent establishment of schools in every township. A person of mature age, who cannot both read and write is rarely to be found. By means of this general establishment of schools, the extensive circulation of newspapers, of which not less than 30,000 are printed every week in New Eng-

land, and sent to almost every town and village in the country), and the consequent spread of learning, every township, throughout this country, is furnished with men capable of conducting the affairs of their town with judgement and discretion.*

New England, should any great and sudden emergency require it, could furnish an army of 164,600 men †. The inhabitants of Massachusetts's Bay are estimated at 350,000.

Connecticut is said, in proportion to its extent, to exceed every other colony of British America, as well in the abundance of people as cultivation of soil. Its inhabitants are about 266,000. The men, in general, throughout the province, are robust, stout, and tall. The greatest care is taken of the limbs and bodies of infants, which are kept straight by means of a board; a practice learnt of the Indian women, who abhor all crooked people; so that deformity is here a rarity. The women are fair, handsome, and genteel, and modest and reserved in their manners and behaviour. They are not permitted to read plays, nor can they converse about whist, quadrille, or operas; but it is said that they will talk freely upon the subjects of history, geography, and other literary topics. The inhabitants of Connecticut are extremely hospitable to strangers.

New Hampshire, of late years hath greatly increased in population, so that in 1783 the number of inhabitants was reckoned to amount to 82,200; and of Rhode Island province to 50,400.

RELIGION.] Calvinism, from the principles of the first settlers, has been very prevalent in New England; many of the inhabitants also formerly observed the sabbath with a kind of Jewish rigour; but this hath of late been much diminished. There is at present no established religion in New England; but every sect of Christians is allowed the free exercise of their religion, and is equally under the protection of law §. They annually celebrate fasts and thankgivings. In the spring, the several governors issue their proclamations, appointing a day to be religiously observed in fasting, humiliation and prayer, throughout their respective states, in which the predominating vices; that particularly call for humiliation, are enumerated. In autumn, after harvest, that gladsome era of the husbandman's life, a day of public thanksgiving is appointed, enumerating the public blessings received in the course of the year. This pious custom originates with their venerable ancestors, the first settlers. A custom so rational, and so well calculated to cherish in the minds of the people a sense of their dependence on the GREAT BENEFICATOR of the world for all their blessings, it is hoped will ever be sacredly preserved*. The Connecticut province hath lately provided a bishop for the episcopalians among them, by sending one of their number to Scotland to be ordained by the nonjuring bishops of the episcopal church in that kingdom.

CHIEF TOWNS.] Boston, the capital of New England, stands on a peninsula at the bottom of Massachusetts's Bay, about nine miles from its mouth. At the entrance of this bay are several rocks, which appear above water, and upwards of a dozen small islands, some of which are inhabited. There is but one safe channel to approach the harbour, and that so narrow, that two ships can scarcely sail through abreast; but within the harbour there is room for

* Morfe's American Geography.

† Morfe.

§ By a late account there are 400 Independent and Presbyterian churches in this province, 84 Baptist, and 31 of other denominations.

* Morfe's American Geography.

500 sail to lie at anchor, in a good depth of water. On one of the islands of the bay, stands Fort William, the most regular fortress in all the plantations. This castle is defended by 100 guns, twenty of which lie on a platform level with the water, so that it is scarcely possible for an enemy to pass the castle. To prevent surprise, they have a guard placed on one of the rocks, at two leagues distance, from whence they make signals to the castle, when any ships come near it. There is also a battery of guns at each end of the town. At the bottom of the bay is a noble pier, near 2000 feet in length; along which, on the north side, extends a row of warehouses for the merchants, and to this pier ships of the greatest burthen may come and unload, without the help of boats. The greatest part of the town lies round the harbour, in the shape of a half-moon; the country beyond it rising gradually, and affording a delightful prospect from the sea. The head of the pier joins the principal street of the town, which is, like most of the others, spacious and well built. The trade of Boston was so considerable in the year 1768, that 1200 sail entered or cleared at the custom-house there.

Cambridge, in the same province, four miles from Boston, has an university, containing two spacious colleges, called by the names of Harvard College, and Stoughton Hall, with a well-furnished library. It consists of a president, five fellows, a treasurer, three professors, four tutors, and a librarian. The college charter was first granted in 1650, and renewed in 1692, and is held under the colony seal.

The other towns in New England, the chief of which have already been mentioned, are generally neat, well built, and commodiously situated upon fine rivers, with capacious harbours.

[COMMERCE AND MANUFACTURES.] New England has no one staple commodity. The ocean and the forests afford the two principal articles of export; and therefore the trade is great, as it supplies a large quantity of goods from within itself; but it is yet greater, as the people in this country are in a manner the carriers for all the colonies of North America, and to the West Indies, and even for some parts of Europe. The commodities which the country yields are principally pig and bar iron, which were imported to Great Britain duty free; also masts and yards, pitch, tar, and turpentine, for which they contracted largely with the royal navy; pot and pearl ashes, staves, lumber, hoards; all sorts of provisions, which they sent to the French and Dutch sugar islands, and formerly to Barbadoes, and the other British isles, as grain, biscuit, meal, beef, pork, butter, cheese, apples, cyder, onions, mackarel, and cod-fish dried. They likewise sent thither cattle, horses, planks, hoops, shingles, pipe-staves, oil, tallow, turpentine, bark, calf-skins, and tobacco. Their peltry trade is not very considerable. They have a most valuable fishery upon their coasts in mackarel and cod, which employs vast numbers of their people; with the produce of which they trade to Spain, Italy, the Mediterranean, and the West Indies, to a considerable amount. Their whale-fishery has been already mentioned. The arts most necessary to subsistence, are those which the inhabitants of New England have been at the greatest pains to cultivate. They manufacture coarse linen and woollen cloth for their own use; hats are made here, which find a good vent in all the other colonies. Sugar-baking, distilling, paper-making, and salt-works, are upon the improving hand. The business of ship-building is one of the most considerable, which Boston, Newbury, or the other sea-port towns in New England carry on. Ships are sometimes built here upon commission; but frequently the merchants of New England have them constructed upon their own

in a short t

account: and loading them with the produce of the colony, naval stores, fish, and fish-oil principally, they send them upon a trading voyage to Spain, Portugal, or the Mediterranean; where, having disposed of their cargo, they make what advantage they can by freight, until such time as they can sell the vessel herself to advantage, which they seldom fail to do in a reasonable time.

It was computed, that, before the late unhappy differences arose, the amount of English manufactures, and India goods sent into this colony from Great Britain, was not less, at an average of three years, than 395,000*l*. Our imports from the same were calculated at 370,500*l*.

HISTORY AND GOVERNMENT.] New England is at present divided into the four provinces of New Hampshire, Massachusetts, Rhode Island, and Connecticut. As early as 1606, King James I. had by letters patent erected two companies, with a power to send colonies into those parts, then comprehended under the general name of Virginia, as all the north-east coast of America was some time called. No settlements, however, were made in New England by virtue of this authority. The companies contented themselves with sending out a ship or two, to trade with the Indians for their furs, and to fish upon their coast. This continued to be the only sort of correspondence between Great Britain and this part of America, till the year 1620. By this time the religious dissensions, by which England was torn to pieces, had become warm and furious. Archbishop Laud persecuted all sorts of non-conformists with an unrelenting severity. Those men, on the other hand, were ready to submit to all the rigour of persecution rather than give up their religious opinions, and conform to the ceremonies of the church of England, which they considered as abuses of the most dangerous tendency. There was no part of the world into which they would not fly, in order to obtain liberty of conscience. America opened an extensive field. There they might transport themselves, and establish whatever sort of religious policy they were inclined to. With this view, having purchased the territory, which was within the jurisdiction of the Plymouth Company, and having obtained from the king the privilege of settling it in whatever way they had a mind, 150 persons embarked for New England, and built a city, which because they had sailed from Plymouth, they called by that name. Notwithstanding the severity of the climate, the unwholesomeness of the air, and the diseases to which, after a long sea voyage, and in a country which was new to them, they were exposed; notwithstanding the want of all sorts of conveniencies, and even of many of the necessaries of life, those who had constitutions fit to endure such hardships, not dispirited or broken by the death of their companions, and supported by the vigour then peculiar to Englishmen, and the satisfaction of finding themselves beyond the reach of the spiritual arm, set themselves to cultivate this country, and to take the best steps for the advancement of their infant colony. New adventurers, encouraged by their example, and finding themselves, for the same reasons, uneasy at home, passed over into this land of religious and civil liberty. By the close of the year 1630, they had built four towns, Salem, Dorchester, Charles Town, and Boston, which last has since become the capital of New England. But as necessity is the natural source of that active and frugal industry, which produces every thing great among mankind, so an uninterrupted flow of prosperity and success occasions those dissensions, which are the base of human affairs, and often subvert the best founded establishments.

The inhabitants of New England, who had fled from persecution, became in a short time strongly tainted with this illiberal vice, and were eager to

Introduce an uniformity in religion, among all who entered their territories. The minds of men were not in that age superior to many prejudices; they had not that open and generous way of thinking, which at present distinguishes the natives of Great Britain; and the doctrine of universal toleration, which, to the honour of the first settlers in America, began to appear among them, had few abettors, and many opponents. Many of them were bigotted Calvinists; and though they had felt the weight of persecution themselves, they had no charity for those who professed sentiments different from their own. It was not the general idea of the age, that men might live comfortably together in the same society, without maintaining the same religious opinions; and wherever these were at variance, the members of different sects kept at a distance from each other, and established separate governments. Hence several slips, torn from the original government of New England by religious violence, planted themselves in a new soil, and spread over the country. Such was that of New Hampshire, which continues to this day a separate jurisdiction; such too was that of Rhode Island, whose inhabitants were driven out from the Massachusetts colony (for that is the name by which the government first erected in New England was distinguished), for supporting the freedom of religious sentiments, and maintaining that the civil magistrate had no right over the speculative opinions of mankind. These liberal men founded a city, called Providence, which they governed by their own principles; and such is the connection between justness of sentiment and external prosperity, that the government of Rhode Island, though small, became extremely populous and flourishing. Another colony, driven out by the same persecuting spirit, settled on the river Connecticut, and received frequent reinforcements from England, of such as were dissatisfied either with the religious or civil government of that country.

America indeed was now become the main resource of all discontented and enterprising spirits; and such were the numbers which embarked for it from England, that in 1637 a proclamation was published, prohibiting any person from sailing thither, without an express licence from the government. For want of this license, it is said, that Oliver Cromwell, Mr. Hampden, and others of that party, were detained from going into New England, after being on ship-board for that purpose.

These four provinces, though always confederates for their mutual defence, were at first, and still continue, under separate jurisdictions. They were all of them by their charters originally free, and in a great measure independent of Great Britain. The inhabitants had the choice of their own magistrates, the governor, the council, the assembly, and the power of making such laws as they thought proper, without sending them to Great Britain for the approbation of the crown. Their laws, however, were not to be opposite to those of Great Britain. Towards the latter end of the reign of Charles II. when he and his ministers wanted to destroy all the charters and liberties, the Massachusetts colony was accused of violating their charter, in like manner as the city of London, and by a judgment in the King's Bench of England was deprived of it. From that time to the Revolution, they remained without any charter. Soon after that period, they received a new one, which, though very favourable, was much inferior to the extensive privileges of the former. The appointment of a governor, lieutenant-governor, secretary, and all the officers of the admiralty, was vested in the crown; the power of the militia was wholly in the hands of the governor, as captain-general; all judges, justices, and sheriffs, to whom the execution of the law was entrusted, were nominated by the governor, with the advice of the council; the

governor had a negative on the choice of counsellors, peremptory and unlimited; and he was not obliged to give a reason for what he did in this particular, or restrained to any number; authentic copies of the several acts passed by this colony, as well as others, were to be transmitted to the court of England, for the royal approbation; but if the laws of this colony were not repealed within three years after they were presented, they were not repealable by the crown after that time; no laws, ordinances, election of magistrates, or acts of government whatsoever, were valid without the governor's consent in writing; and appeals for sums above 300l. were admitted to the king and council. Notwithstanding these restraints, the people had still a great share of power in this colony; for they not only chose the assembly, but this assembly, with the governor's concurrence, chose the council, resembling our house of lords; and the governor depended upon the assembly for his annual support.

But the government of New England has been entirely changed, in consequence of the revolt of the colonies from the authority of Great Britain; of the origin and progress of which an account hath been given in another place. It was on the 25th of July 1776, that, by an order from the council at Boston, the declaration of the American Congress, dissolving the United Colonies from their allegiance to the British crown, and declaring them free and independent, was publicly proclaimed from the balcony of the state-house in that town.

A constitution, or form of government, for the commonwealth of Massachusetts, including a declaration of rights, was agreed to, and established by the inhabitants of that province, and took place in October, 1780. In the preamble to this it was declared, that the end of the institution, maintenance, and administration of government, is to secure the existence of the body politic; to protect it, and to furnish the individuals who compose it, with the power of enjoying, in safety and tranquillity their natural rights, and the blessings of life; and that whenever these great objects are not obtained, the people have a right to alter the government, and to take measures necessary for their prosperity and happiness. They expressed their gratitude to the great legislator of the universe, for having afforded them, in the course of his providence, an opportunity, deliberately and peaceably, without fraud, violence, or surprise, of entering into an original, explicit, and solemn compact with each other; and of forming a new constitution of civil government for themselves and their posterity. They declared that it was the right, as well as the duty, of all men in society, publicly, and at stated seasons, to worship the Supreme Being; and that no subject should be hurt, molested, or restrained, in his person, liberty, or estate, for worshipping God in the manner and season most agreeable to the dictates of his own conscience; or for his religious profession or sentiments: provided he did not disturb the public peace, or obstruct others in their religious worship.

It was also enacted, that the several towns, parishes, precincts, and other bodies politic, or religious societies, should, at all times, have the exclusive right of electing their public teachers, and of contracting with them for their support and maintenance. That all monies paid by the subject to the support of public worship, and of the public teachers, should, if he required it, be uniformly applied to the support of the public teacher or teachers of his own religious sect or denomination, provided there were any on whose instructions he attended; otherwise it might be paid towards the support of the teacher or teachers of the parish or precinct in which the said monies should

be

governor

be raised. That every denomination of Christians, demeaning themselves peaceably, and as good subjects of the commonwealth, should be equally under the protection of the law: and that no subordination of any sect or denomination to another should ever be established by law.

It was likewise declared, that as all power resided originally in the people, and was derived from them, the several magistrates and officers of government, vested with authority, whether legislative, executive or judicial, are their substitutes and agents, and are at all times accountable to them. That no subject should be arrested, imprisoned, despoiled, or deprived of his property, immunities, or privileges, put out of the protection of the law, exiled, or deprived of his life, liberty, or estate, out by the judgment of his peers, or the law of the land. That the legislature should not make any law that should subject any person to a capital or infamous punishment, excepting for the government of the army or navy, without trial by jury. That the liberty of the press is essential to the security of freedom in a state; and that it ought not, therefore, to be restrained in that commonwealth. That the people have a right to keep, and bear arms, for the common defence; but that as in times of peace armies are dangerous to liberty, they ought not to be maintained without the consent of the legislature; and that the military power should always be held in an exact subordination to the civil authority, and be governed by it.

It was likewise enacted, that the department of legislation should be formed by two branches, a senate, and a house of representatives; each of which should have a negative on the other. That the senators, consisting of forty, and the members of the house of representatives, should be elected annually; and that every male person, being twenty-one years of age, or upwards, who had resided in any particular town in the commonwealth, for the space of one year, and having a freehold estate, within the said town, of the annual income of three pounds, or any estate of the value of sixty pounds, should have a right to vote for senators and representatives of the district of which he was an inhabitant. And that there should be a supreme executive magistrate, who should be styled, the governor of the commonwealth of Massachusetts, and also a lieutenant-governor, both of whom should be chosen annually by the whole body of electors in the commonwealth, and assisted by nine counsellors, chosen by ballot, out of the senate. The secretary, treasurer, receiver-general, notaries public, and naval officers, to be chosen annually by the senators and representatives. The judiciary power to be septennial, and the delegates to congress shall be annually elected by and out of the senate and house of representatives, or general court. The governor has a negative on bills sent to him for assent from the general court, but has no control in their choice of officers.

The state of Rhode Island admits their original charter as the rule of their government. New Hampshire and Connecticut have not yet finally established their forms of government, but have chiefly adopted that of Massachusetts's bay.

It is worthy of notice, that since the commencement of the war between Great Britain and the colonies, and even while that war was carried on with great animosity on both sides, an act was passed, on the 4th of May, 1780, by the council and house of representatives of Massachusetts's Bay, for incorporating and establishing a society for the cultivation and promotion of the arts and sciences. It is entitled, "The American Academy of Arts and Sciences;" the first members were named in the act; and they were

never to be more than two hundred, nor less than forty. It was declared in the act, that the end and design of the institution of the said academy, was to promote and encourage the knowledge of the antiquities of America, and of the natural history of the country; and to determine the uses to which its various natural productions might be applied; to promote and encourage medicinal discoveries; mathematical disquisitions; philosophical inquiries and experiments; astronomical, meteorological, and geographical observations; and improvements in agriculture, arts, manufactures, and commerce; and in short, to cultivate every art and science, which might tend to advance the interest, honour, dignity, and happiness, of a free, independent, and virtuous people.

Montgomery — —	Johnstown
* Cumberland — —	None
• Gloucester — —	None

RIVERS.] The principal of these are Hudson's and the Mohawk; the former abounds with excellent harbours, and is well stored with great variety of fish; on this the cities of New York and Albany are situated.

The tide flows a few miles above Albany, which is 600 miles from New York. It is navigable for sloops of 80 tons to Albany, and for ships to Hudson. About 60 miles above New York the water becomes fresh. The river is stored with a variety of fish, which renders a summer passage to Albany delightful and amusing to those who are fond of angling †. On the Mohawk is a large cataract called the Cohoes, the water of which is said to fall 30 feet perpendicular; but including the descent above, the fall is as much as 60 or 70 feet, where the river is a quarter of a mile in breadth.

CAVES.] These are Cape May on the East entrance of Delaware river; Sandy Hook, near the entrance of Raritan river; and Montock Point, at the East end of Long Island.

CLIMATE, SOIL, AND PRODUCE.] This province, lying to the South of New England, enjoys a more happy temperature of climate. The air is very healthy, and agrees well with all constitutions. The face of the country, resembling that of the other British American colonies, is low, flat, and marshy towards the sea. As you recede from the coast, the eye is entertained with the gradual swelling of hills, which become large in proportion as you advance into the country. The soil is extremely fertile, producing wheat, rye, Indian corn, oats, barley, flax, and fruits, in great abundance and perfection. The timber is much the same with that of New England. A great deal of iron is found here.

CITIES, POPULATION, AND COMMERCE.] The city of New York stands on the south west end of York-island, which is twelve miles long, and near three in breadth, extremely well situated for trade, at the mouth of Hudson's river, where it is three miles broad, and proves a noble conveyance from Albany and many other inland towns towards Canada, and the lakes. This city is in length above a mile, and its mean breadth a quarter of a mile. This city and harbour are defended by a fort and battery; in the fort is a spacious mansion-house for the use of the governor. Many of the houses are very elegant; and the city though irregularly built, affords a fine prospect. A fourth part of the city was burnt down by some incendiaries in 1776, on the king's troops taking it. A great part of the inhabitants are descended from the Dutch families, who remained here after the surrender of the New Netherlands to the English, and the whole province in 1786 was calculated at 238,897, of which 18,889 were blacks. The population for every square mile, including the whole state is only five, so that this state is but a ninth part as populous as Connecticut. But it is to be considered that Connecticut has no waste lands, and not half the State of New York is settled †.

The city of Albany contains about 4000 inhabitants, collected from almost all parts of the Northern world. As great a variety of languages are spoken

* These counties are claimed by New York, but are within the limits and under the jurisdictions of Vermont.

in Albany, as in any town in the United States. Adventurers in pursuit of wealth are led here by the advantages for trade which this place affords. Situated on one of the finest rivers in the world, at the head of sloop navigation, surrounded with a rich and extensive back country, and the storehouse of the trade to and from Canada, and the Lakes, it must flourish, and the inhabitants cannot but grow rich.

The city of Hudson however is their great rival, and has had the most rapid growth of any place in America, if we except Baltimore in Maryland. It is 130 miles north of New York. It was not begun till the autumn of 1783*.

The situation of New York, with respect to foreign markets, has decidedly the preference to any of the states. It has at all seasons of the year a short and easy access to the ocean. It commands the trade of a great proportion of the best settled and best cultivated parts of the United States. It has been supposed by gentlemen well informed, that more wealth is conveyed down Connecticut river, and through the Sound to New York, than down the Hudson. This is not improbable, as the banks of the Connecticut are more fertile and much thicker, and more extensively settled than the banks of the Hudson †. The commodities in which they trade are wheat, flour, barley, oats, beef, and other kinds of animal food. Their markets are the same with those which the New Englanders use; and they have a share in the log-wood trade, and that which is carried on with the Spanish and French plantations. They used to take almost the same sort of commodities from England with the inhabitants of Boston. At an average of three years, their exports were said to amount to 526,000l. and their imports from Great Britain to 531,000l.

[AGRICULTURE AND MANUFACTURES.] New York is at least half a century behind her neighbours in New England, New Jersey and Pennsylvania, in point of improvement in agriculture and manufactures. Among other reasons for this deficiency, that of want of enterprize in the inhabitants is not the least. Indeed their local advantages have been such that they have grown rich without enterprize. Besides lands have hitherto been cheap, and farms of course large, and it requires much less ingenuity to raise 1000 bushels of wheat upon 60 acres of land, than to raise the same quantity upon 30 acres. So long, therefore, as the farmer in New York can have 60 acres of land to raise 1000 bushels of wheat, he will never trouble himself to find out how he can raise the same quantity upon half the land. It is population alone that stamps a value upon lands, and lays a foundation for high improvements in agriculture. When a man is obliged to maintain a family upon a small farm, his invention is exercised to find out every improvement that may render it more productive. This appears to be the great reason why the lands on Delaware and Connecticut rivers produce to the farmer twice as much clear profit as lands in equal quantity, and of the same quality upon the Hudson. If the preceding observations be just, improvements will keep pace with population and the increasing value of lands.

Improvements in manufactures never precede, but invariably follow improvements in agriculture. This observation applies more particularly to the country. The city of New York contains a great number of people who are employed in the various branches of manufactures, viz. wheel carriages of all kinds, loaf-sugar, bread, beer, shoes and boots, saddlery, cabinet work, cutlery,

* Morse.

† Morse.

hats, clocks, watches, mathematical and musical instruments, ships, and every thing necessary for their equipment; a glass work and several iron works have been established*.

RELIGION, AND LEARNING.] It is ordained, by the late constitution of New York, that the free exercise and enjoyment of religious profession and worship, without discrimination or preference, shall for ever be allowed, within that state, to all mankind.

A college was erected in New York, by act of parliament, about the year 1755; but as the assembly was at that time divided into parties, it was formed on a contracted plan, and has for that reason never met with the encouragement which might naturally be expected for a public seminary in so populous a city.

HISTORY AND GOVERNMENT.] The Swedes and Dutch were the first Europeans who formed settlements on this part of the American coast. The tract claimed by the two nations extended from the 38th to the 41st degree of latitude, and was called the New Netherlands. It continued in their hands till the time of Charles II. who obtained it from them by right of conquest in 1664; and it was confirmed to the English by the treaty of Breda, 1667. The New Netherlands were not long in our possession before they were divided into different provinces. New York took that name from the king's brother, James, duke of York, to whom the king granted it, with full powers of government, by letters patent, dated March 20, 1664. On James's accession to the throne, the right to New York became vested in the crown, and it became a royal government. The king appointed the governor and council; and the people, once in seven years, elected their representatives to serve in general assemblies. These three branches of the legislature (answering to those of Great Britain) had power to make any laws not repugnant to those of England; but, in order to their being valid, the royal assent to them was first to be obtained.

By the constitution of the state of New York, established in 1777, the supreme legislative power was vested into two separate and distinct bodies of men; the one to be called, "The Assembly of the State of New York," to consist of seventy members, annually chosen by ballot; and the other "The Senate of the State of New York," to consist of twenty-four for four years, who together are to form the legislature, and to meet once, at least, in every year, for the dispatch of business. The supreme executive power is to be vested in a governor, who is to continue in office three years, assisted by four counsellors, chosen by and from the senate. Every male inhabitant, of full age, who shall possess a freehold of the value of twenty pounds, or have rented a tenement of the yearly value of forty shillings, and been rated and have paid taxes to the state for six months preceding the day of election, is entitled to vote for members of the assembly; but those who vote for the governor, and the members of the senate, are to be possessed of freeholds of the value of one hundred pounds. The delegates to the congress, the judges, &c. are to be chosen by ballot of the senate and assembly.

SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 160 } Breadth 60 }	between { 39 and 43 north latitude. } { 74 and 76 west longitude. }	10,000.

BOUNDARIES.] NEW JERSEY is bounded on the West and South-west, by Delaware river and Bay; on the South-east and East, by the Atlantic Ocean; and by the Sound which separates Staten Island from the continent, and Hudson's river, on the North.

Divisions.	Counties.	Chief Towns.
East Division contains	Middlesex	Perth Amboy and New Brunswick Shrewbury and Freehold Elizabeth and Newark Boundbrook Hakkenfak
	Monmouth	
	Essex	
	Somerset	
	Bergen	
West Division contains	Burlington	BURLINGTON, { 40-8 N. lat. 75-0 W. lon.
	Gloucester	Woodbury, and Gloucester
	Salem	Salem
	Cumberland	Hopewell, Bridgetown
	Cape May	None
	Hunterdon	Trenton
	Morris	Morristown
	Suffex	Newton

RIVERS.] These are the Delaware, Raritan, and Passaic, on the latter of which is a remarkable cataract; the height of the rock from which the water falls is said to be about 70 feet perpendicular, and the river there 80 yards broad.

CLIMATE, SOIL, AND PRODUCE.] The climate is much the same with that of New York; the soil is various, at least one-fourth part of the province is barren, sandy land, producing pines and cedars; the other parts in general are good, and produce wheat, barley, rye, Indian corn, &c. in great perfection.

HISTORY, GOVERNMENT, POPULATION, } New Jersey is part of that
CHIEF TOWNS, AND COMMERCE. } west tract of land, which we have observed was given by king Charles II. to his brother, James duke of York; he sold it, for a valuable consideration, to Lord Berkeley and Sir George

George Carteret (from which it received its present name, because Sir George had estates in the island of Jersey) and they again to others, who in the year 1702 made a surrender of the powers of government to queen Anne, which she accepted; after which it became a royal government. By an account published in 1765, the number of inhabitants appears to have been about 100,000; but in 1784, a census of the inhabitants was made by order of the legislature, when they amounted to 140,435, of which 10,501 were blacks. Of these blacks, 1939 only were slaves; so that the proportion of slaves to the whole of the inhabitants in the state is as one to seventy-six. The population for every square mile is eighteen*.

Perth-Amboy and Burlington were the seats of government; the governor generally resided in the latter, which is pleasantly situated on the fine river Delaware, within twenty miles of Philadelphia. Both have been lately made free ports for twenty-five years. The former is as good a port as most on the continent; and the harbour is safe, and capacious enough to contain many large ships.—In Bergen county is a very valuable copper mine.

By the new charter of rights established by the provincial congress, July 2, 1776, the government of New York is vested in a governor, legislative council, and general assembly. The members of the legislative council are to be freeholders, and worth at least one thousand pounds real and personal estate; and the members of the general assembly to be worth five hundred pounds. All inhabitants worth fifty pounds are entitled to vote for representatives in council and assembly, and for all other public officers. The election of the governor, legislative council, and general assembly, are to be annual; the governor, and lieutenant-governor to be chosen out of and by the assembly and council. The judges of the supreme court are chosen for seven years, and the officers of the executive power for five years.

RELIGION AND LEARNING.] According to the present constitution of this province, all persons are allowed to worship God in the manner that is most agreeable to their own consciences; nor is any person obliged to pay tithes, taxes, or any other rates, for the purpose of building or repairing any other church or churches, for the maintenance of any minister or ministry, contrary to what he believes to be right, or has deliberately or voluntarily engaged himself to perform. There is to be no establishment of any one religious sect in this province, in preference to another; and no protestant inhabitants are to be denied the enjoyment of any civil right, merely on account of their religious principles.

A college was established at the town of Princeton, in this province, by governor Belcher, in 1746, and has a power of conferring the same degrees as Oxford or Cambridge. There were generally, before the war between Great Britain and the colonies, between 80 and 100 students here; who came from all parts of the continent, some even from the extremities of it.

PENNSYLVANIA AND DELAWARE,

SITUATION AND EXTENT.

Suffex		Lewestown, Milford

which

which form a distinct state and government, having a president, council of nine persons, and house of assembly of twenty-one representatives: the judges and other officers of state, civil and military, are chosen by the president and general assembly.

RIVER.] The rivers are, Delaware, which is navigable for vessels of one sort or other, more than 200 miles above Philadelphia. The Susquehanna and Schuylkill are also navigable a considerable way up the country. These rivers, with the numerous bays and creeks in Delaware bay, capable of containing the largest fleets, render this province admirably suited to carry on an inland and foreign trade.

CLIMATE, AIR, SOIL, AND } The face of the country, air, soil, and pro-
FACE OF THE COUNTRY. } duce, do not materially differ from those of
New York. If there be any difference, it is in favour of this province. The air is sweet and clear. The winters continue from December till March, and are so extremely cold and severe, that the river Delaware, though very broad, is often frozen over. The months of July, August, and September, are almost intolerably hot, but the country is refreshed by frequent cold breezes. It may be remarked in general, that in all parts of the British plantations, from New York to the southern extremity, the woods are full of wild vines of three or four species, all different from those we have in Europe. But, whether from some fault in their nature, or in the climate, or the soil where they grow, or, what is much more probable, from a fault in the planters, they have yet produced no wine that deserves to be mentioned, though the Indians from them make a sort of wine, with which they regale themselves. It may also be observed of the timber of these colonies, that towards the south it is not so good for shipping, as that of the more northern provinces. The farther southward you go, the timber becomes less compact, and rives easily, which property, as it renders it less serviceable for ships, makes it more useful for staves.

HISTORY, GOVERNMENT, SETTLEMENT, PO- } This country, un-
PULATION, CHIEF TOWNS, AND COMMERCE. } der the name of the
New Netherlands, was originally possessed by the Dutch and Swedes. When these nations, however, were expelled from New York by the English, admiral Penn, who, in conjunction with Venables, had conquered the island of Jamaica (under the auspices of Cromwell) being in favour with Charles II. obtained a promise of a grant of this country from that monarch. Upon the admiral's death, his son, the celebrated quaker, availed himself of this promise, and, after much court solicitation, obtained the performance of it. Though as an author and a divine, Mr. Penn be little known but to those of his own persuasion, his reputation in a character no less respectable is universal among all civilized nations. The circumstances of the times engaged vast numbers to follow him into his new settlement, to avoid the persecutions to which the quakers, like other sectaries, were then exposed; but it was to his own wisdom and ability that they are indebted for that charter of privileges, which placed this colony on so respectable a footing. Civil and religious liberty, in the utmost latitude, was laid down by the great man, as the chief and only foundation of all his institutions. Christians of all denominations might not only live unmolested, but have a share in the government of the colony. No laws could be made but by the consent of the inhabitants. —Even matters of benevolence, to which the laws of few nations have extended, were by Penn subjected to regulations. The affairs of widows and orphans were to be inquired into by a court constituted for that purpose.

pose. The causes between man and man were not to be subjected to the delay and chicanery of the law, but decided by wise and honest arbitrators. His benevolence and generosity extended also to the Indian natives; instead of taking immediate advantage of his patent, he purchased of these people the lands he had obtained by his grant, judging that the original property, and eldest right, was vested in them. William Penn, in short, had he been a native of Greece, would have had his statue placed next to those of Solon and Lycurgus. His laws, founded on the solid basis of equity, still maintain their force; and as a proof of their effects, it is only necessary to mention that land was lately granted at twelve pounds an hundred acres, with a quit-rent of four shillings reserved; whereas the terms on which it was formerly granted, were at twenty pounds the thousand acres, with one shilling quit-rent for every hundred. Near Philadelphia, before the commencement of the war with the mother-country, land rented at twenty shillings the acre; and even at several miles distance from that city, sold at twenty years purchase.

In some years, more people transported themselves into Pennsylvania, than into all the other settlements together. Upon the principal rivers settlements are made, and the country has been cultivated 150 miles above Philadelphia. In the grand convention which was held in Philadelphia, in the summer of 1787, the inhabitants of Pennsylvania were reckoned at 360,000. It is probable they are now more numerous, perhaps 400,000. If we fix them at this, the population for every square mile will be only nine; by which it appears that Pennsylvania is only one-fifth as populous as Connecticut.

But Connecticut was settled nearly half a century before Pennsylvania; so that in order to do justice to Pennsylvania in the comparison, we must anticipate her probable population fifty years hence. The people are hardy, industrious, and most of them substantial, though but few of the landed people can be considered as rich; but before the commencement of the civil war, they were all well lodged, well fed, and, for their condition, well clad; and this at the more easy rate, as the inferior people manufactured most of their own wear, both linens and woollens.

This province contains many very considerable towns, such as German-Town, Chester, Oxford, Radnor, all of which, in any other colony, would deserve being taken notice of more particularly. But here the city of Philadelphia, which is beautiful beyond any city in America, and in regularity unequalled by any in Europe, totally eclipses the rest, and deserves our chief attention. It was built after the plan of the famous Penn, the founder and legislator of this colony. It is situated 100 miles from the sea, between two navigable rivers, the Delaware, which it is above a mile in breadth on the north, and the Schuylkill, on the south, which it unites, as it were, by running in a line of two miles between them. The whole town, when the original plan can be fully executed, is in this manner: every quarter of the city forms a square of eight acres, and almost in the centre of it is a square of ten acres, surrounded by the town-house, and other public buildings. The High-street is 100 feet wide, and runs the whole breadth of the town; parallel to it run nineteen other streets, which are crossed by eight more at right angles, all of them 30 feet wide, and communicating with canals from the two rivers, which add not only to the beauty, but to the wholesomeness of the city. According to the

original plan, every man in possession of 1000 acres in the province, had his house either in one of the fronts, facing the river, or in the High street, running from the middle of one front to the middle of the other. Every owner of 5000 acres, besides the above-mentioned privilege, was entitled to have an acre of ground in the front of the house and all others might have half an acre for gardens and court yards. The proprietor's seat, which is the usual place of the governor's residence, and is about a mile above the town, is the first private building, both for magnificence and situation, in all British America. The barracks for the troops, the market, and other public buildings, are proportionably grand. The quays are spacious and fine; and the principal quay is 200 feet wide.

There were in this city a great number of very wealthy merchants; which is no way surprising, when we consider the great trade which it carried on with the English, Spanish, French, and Dutch colonies in America; with the Azores, the Canaries, and the Madeira islands; with Great Britain and Ireland; with Spain, Portugal, and Holland. Besides the Indian trade, and the quantity of grain, provisions, and all kinds of the produce of this province, which is brought down the rivers upon which this city is so commodiously situated, the Germans, who are settled in the interior parts of this province, employ several hundred waggons, drawn each by four horses, in bringing the product of their farms to this market. In the year 1749, 303 vessels entered inwards at this port, and 291 cleared outwards; but in the year 1786, the number of vessels entered at the custom-house was 910.

The commodities formerly exported into Pennsylvania, at an average of three years, amounted to the value of 611,000*l*. Those exported to Great Britain and other markets, besides timber, ships built for sale, copper ore, and iron in pigs and bars, consisted of grain, flour, and many sorts of animal food; and at an average of three years, were calculated at 705,500*l*. Since the colony's independence, the new duty upon imported goods of two and a half per cent. *ad valorem* produced from the 1st March to the first December 1784, 2,000*l*. in Philadelphia, which corresponds to an importation of 3,168,000*l*.

There was an academy established at Philadelphia, which has been greatly encouraged by contributions from England and Scotland, and which, before the civil war broke out, bid fair to become a bright seminary of learning. It is now stiled an UNIVERSITY; its funds were partly given by the state, and partly taken from the old college. And in 1787 a college was founded at Lancaster, and, in honour to Dr. Franklin, called Franklin College.

Besides several other very improving institutions in this city, there is one which deserves a particular notice, which is THE AMERICAN PHILOSOPHICAL SOCIETY, HELD AT PHILADELPHIA, FOR PROMOTING USEFUL KNOWLEDGE. This society was formed January, 2, 1769, by the union of two other literary societies that had subsisted for some time in Philadelphia; and were created one-body corporate and politic, with such powers, privileges, and immunities as are necessary for answering the valuable purposes which the society had originally in view, by a charter, passed by the commonwealth of Pennsylvania, on the 15th of March, 1785. This society has already published two very valuable volumes of their transactions, one in 1771, the other in 1786. In 1771, this society consisted of nearly 300 members; and upwards of 120 have since been added; a large proportion of which are foreigners of the

the first distinction in Europe. This is an evidence of the increasing respectability and improvement of the society.

It was in Philadelphia that the general congress of America met in September 1774; and their meetings continued to be chiefly held there, till the king's troops made themselves masters of that city, on the 26th of September 1777. But in June 1778, the British troops retreated to New York, and Philadelphia again became the residence of the congress.

In 1776, the representatives of the freemen of Pennsylvania met in a general convention at Philadelphia, and agreed upon the plan of a new constitution of government for that colony. They determined, that the commonwealth, or state of Pennsylvania, should be governed hereafter by an assembly of the representatives of the freemen of the same; and a president and council. That the supreme legislative power should be vested in a house of representatives of the freemen of the commonwealth or state of Pennsylvania. That the supreme executive power should be vested in a president and council of twelve. That every freeman of twenty-one years of age, having resided in Pennsylvania one year before the day of election for representatives, and paid public taxes during that time, should enjoy the right of an elector; and that the sons of freeholders, of twenty-one years of age, should be entitled to vote, although they had not paid taxes. That the house of representatives of the freemen of this commonwealth should consist of persons most noted for wisdom and virtue, to be chosen by the freemen of every city and county of this commonwealth respectively. And that no person should be elected, unless he had resided in the city or county for which he should be chosen two years before the election; and that no member, while he continued such, should hold any other office, except in the militia. That no person should be capable of being elected a member to serve in the house of representatives of the freemen of this commonwealth more than four years in seven. That the members of the house of representatives should be chosen annually by ballot, and should be styled, "The general assembly of representatives of the freemen of Pennsylvania," and should have power to choose their speaker, the treasurer of the state, and their other officers, to prepare bills and enact them into laws, to redress grievances, impeach state criminals, and have all other powers necessary for the legislature of a free state or commonwealth. That delegates to represent Pennsylvania in congress should be annually chosen by ballot, in the general assembly of representatives. That the supreme executive council of this state should consist of twelve persons, to be chosen by the freemen of Philadelphia, and the several counties of Pennsylvania. That a president, and vice-president of this council, should be chosen annually. That the president, and in his absence the vice-president, and the council, five of whom are to be a quorum, should have power to appoint and commissionate judges, naval officers, judge of the admiralty, attorney-general, and other officers civil and military. That the president shall be commander in chief of the forces of the state, but shall not command in person, except advised thereto by the council, and then only so long as they shall approve. That all trials shall be by jury; and that freedom of speech, and of the press, shall not be restrained. That all persons in public offices should declare their belief in one God, and creator, and governor of the universe, the rewarder of the good, and the punisher of the wicked; and also acknowledge the Scriptures of the Old and New Testament to be given by divine inspiration. A variety of other particulars were also contained in this plan of government; wherein it was like-

wife determined, that the freemen of this commonwealth, and their sons, should be trained and armed for its defence, under such regulations, restrictions, and exceptions, as the general assembly should by law direct, preserving always to the people the right of choosing their colonel, and all commissioned officers under that rank, in such manner and as often as by the said laws should be directed. Two persons also are to be chosen by ballot every year for each county and city, by the freemen, to be called the "Council of Censors" who are to examine into the conduct of the legislative and executive powers.

[RIVERS.] This country is indented with a vast number of navigable creeks and rivers. The chief are Patowmac, Pocomoac, Patuxent, Chesapeake, Severn, and Sassafras.

[FACE OF THE COUNTRY, AIR, SOIL, AND PRODUCE.] In these particulars this province has nothing remarkable by which it may be distinguished from those already described. The hills in the inland country are of so easy ascent, that they rather seem an artificial than a natural production. The climate is generally mild and agreeably suited to agricultural productions, and a great variety of fruit trees. In the interior hilly country the inhabitants are healthy; but in the flat country, in the neighbourhood of the marshes and stagnant waters, they are, as in the other southern states, subject to intermittents. The vast number of rivers diffuses fertility through the soil, which is admirably adapted to the rearing of tobacco, and wheat, which are the staple commodities of that country; hemp, Indian corn and grain, &c.

[POPULATION AND COMMERCE.] The number of inhabitants including the negroes is estimated at 254,050, which is eighteen for every square mile. The commerce of Maryland depends on the same principles with that of Virginia, and is so closely connected with it, that any separation of them would rather confuse than instruct. It will be considered therefore under that head.

[HISTORY AND GOVERNMENT.] It seems as if all the provinces of North America were planted from motives of religion. Maryland, like those we have formerly described, owes its settlement to religious considerations. As they however were peopled by protestants, Maryland was originally planted by Roman catholics. This sect, towards the close of Charles the First's reign, was the object of great hatred to the bulk of the English nation; and the laws in force against the Papists were executed with great severity. This in part arose from an opinion, that the court was too favourably disposed towards this form of religion. It is certain, that many marks of favour were conferred on the Roman catholics. Lord Baltimore was one of the most eminent, in favour with the court, and on that account most odious to the majority of Englishmen. This nobleman, in 1632, obtained a charter of that country, which formerly was considered as a part of Virginia, but was now called Maryland, in honour of Queen Henrietta Maria, daughter to Henry IV. of France, and spouse to king Charles the First. He following about 200 popish families, some of considerable distinction, embarked with lord Baltimore, to enter into possession of this new territory. These settlers, who had that liberality and good breeding which distinguish gentlemen of every religion, bought their lands at an easy price from the native Indians; they even lived with them for some time in the same city; and the same harmony continued to subsist between the two nations, until the Indians were imposed on by the malicious insinuations of some planters in Virginia, who envied the prosperity of this popish colony, and inflamed the Indians against them by ill-grounded reports, such as were sufficient to stir up the resentment of men naturally jealous, and who from experience had reason to be so. The colony, however, was not wanting to its own safety on this occasion. Though they continued their friendly intercourse with the natives, they took care to erect a fort, and to use every other precaution for their defence against sudden hostilities; the defeat of this attempt gave a new spring to the activity of this plantation, which was likewise receiving frequent reinforcements from

RIVERS.]

from England of those who found themselves in danger by the approaching revolution. But during the protectorship of Cromwell, every thing was overturned in Maryland. Baltimore, was deprived of his rights, and a new governor, appointed by the protector, substituted in his room. At the Restoration, however, the property of this province reverted to its natural possessor. Baltimore was reinstated in his rights, and fully discovered how well he deserved to be so. He established a perfect toleration in all religious matters: the colony increased and flourished, and dissenters of all denominations, allured by the prospect of gain, flocked into Maryland. But the tyrannical government of James II. again deprived this noble family of their possession, acquired by royal bounty, and improved by much care and expence.

At the Revolution lord Baltimore was again restored to all the profits of the government, though not to the right of governing, which could not consistently be conferred on a Roman catholic. But after the family changed their religion, they obtained the power as well as the interest. The government of this country exactly resembled that in Virginia, except that the governor was appointed by the proprietors, and only confirmed by the crown. The government of Maryland is now vested in a governor, senate of 15, and house of delegates, all which are to be chosen annually. The governor is to be elected by ballot, by the senate and house of delegates. All freemen above twenty-one years of age, having a freehold of fifty acres, or property to the value of thirty pounds, have a right of suffrage in the election of delegates, which is *viva voce*. All persons appointed to any office of profit or trust, are to subscribe a declaration of their belief in the Christian religion.

In 1782, a college was founded at Chester town in this province, under the name of *Washington College*, in honour of general Washington.

[CAPES, BAYS, AND RIVERS.] In sailing to Virginia or Maryland, you pass a strait between two points of land, called the Capes of Virginia, which opens a passage into the bay of Chesapeak, one of the largest and safest in the

the whole world; for it enters the country near 300 miles from the south to the north, is about 18 miles broad for a considerable way, and seven where it is the narrowest, the waters in most places being nine fathoms deep. This bay, through its whole extent, receives a vast number of navigable rivers from the sides of both Maryland and Virginia. From the latter, besides others of less note, it receives James River, York River, the Rappahannock, and the Potowmac: these are not only navigable for large ships into the heart of the country, but have so many creeks, and receive such a number of smaller navigable rivers, that Virginia is without all manner of doubt the country in the world of all others of the most convenient navigation. It has been observed, and the observation is not exaggerated, that every planter has a river at his door.

FACE OF THE COUNTRY.] The whole face of this country is so extremely low towards the sea, that you are very near the shore before you can discover land from the mast-head. The lofty trees, which cover the soil, gradually rise as it were from the ocean, and afford an enchanting prospect. You travel 100 miles into the country, without meeting with a hill, which is nothing uncommon on this extensive coast of North America.

AIR AND CLIMATE.] In summer the heats here are excessive, though not without refreshing breezes from the sea. The weather is changeable, and the changes sudden and violent. Their winter frosts come on without the least warning. To a warm day there sometimes succeeds such an intense cold in the evening, as to freeze over the largest rivers.

The air and seasons here depend very much upon the wind, as to heat and cold, dryness and moisture. In winter they have a fine clear air, and dry, which renders it very pleasant. Their spring is about a month earlier than in England; in April they have frequent rains; in May and June, the heat increases; and the summer is much like ours, being refreshed with gentle breezes from the sea, that rise about nine o'clock, and decrease or increase as the sun rises or falls. In July and August these breezes cease, and the air becomes stagnant, and violently hot; in September the weather generally changes, when they have heavy and frequent rains, which occasion all the train of diseases incident to a moist climate, particularly agues and intermitting fevers. They have frequent thunder and lightning, but it rarely does any mischief.

SOIL AND PRODUCE.] Towards the sea shore and the banks of the rivers, the soil of Virginia consists of a dark rich mould, which, without manure, returns plentifully whatever is committed to it. At a distance from the water there is a lightness and sandiness in the soil, which, however, is of a generous nature, and helped by a kindly sun, yields corn and tobacco extremely well.

From what has been said of the soil and climate, it is easy to infer the variety and perfection of the vegetable productions of this country. The forests are covered with all sorts of lofty trees; and no underwood or bushes grow beneath; so that people travel with ease through the forests on horseback, under a fine shade to defend them from the sun; the plains are enamelled with flowers and flowering shrubs of the richest colours and most fragrant scent. Silk grows spontaneous in many places, the fibres of which are as strong as hemp. Medicinal herbs and roots, particularly the snake-root, and the ginseng of the Chinese, are here in great plenty. There is no sort of grain but might be cultivated to advantage. The inhabitants, however, are so engrossed with the culture of the tobacco-plant, that they think if corn sufficient for their support can be reared, they do enough in this way. But

flax and hemp are produced, not only for their own consumption, but for exportation, though not in such quantities as might be expected from the nature of the soil, admirably fitted for producing this commodity.

ANIMALS.] We shall here observe, that there were neither horses, cows, sheep, nor hogs in America, before they were carried thither by the Europeans; but now they are multiplied so extremely, that many of them, particularly in Virginia, and the southern colonies, run wild. Before the war between Great Britain and the colonies, beef and pork were sold here from one penny to two-pence a pound; their fattest pullets at six-pence a-piece; chickens at three or four shillings a dozen; geese at ten-pence; and turkeys at eighteen-pence a-piece. But fish and wild fowl were still cheaper in the season, and deer were sold from five to ten shillings a-piece. This estimate may serve for the other American colonies, where provisions were equally plentiful and cheap, and in some still lower. Besides the animals transported from Europe, those natural to the country are deer, of which there are great numbers, a sort of panther or tyger, bears, wolves, foxes, and racoons. Here is likewise that singular animal, called the opossum, which seems to be the wood-rat mentioned by Charlevoix, in his history of Canada. It is about the size of a cat; and besides the belly common to it with other animals, it has another peculiar to itself, and which hangs beneath the former. This belly has a large aperture, towards the hinder legs, which discovers a large number of teats on the usual parts of the common belly. Upon these, when the female of this creature conceives, the young are formed, and there they hang like fruit upon the stalk, until they grow in bulk and weight to the appointed size; when they drop off, and are received into the false belly, from which they go out at pleasure, and in which they take refuge when any danger threatens them. In Virginia there are all sorts of tame and wild fowl. They have the nightingale, whose plumage is crimson and blue; the mocking-bird, thought to excel all others in his own note, and including that of every one; the humming-bird, the smallest of all the winged creation, and by far the most beautiful, all arrayed in scarlet, green and gold. It sips the dew from the flowers, which is all its nourishment; and is too delicate to be brought alive into England.

CHARACTER, MANNERS, CUSTOMS.] Virginia has produced some of the most distinguished and influential men that have been active in effecting the late grand and important revolution in America. Her political and military character will rank among the first in the page of history. But it is to be observed, that this character has been obtained for the Virginians by a few eminent men, who have taken the lead in all their public transactions, and who, in short, govern Virginia; for the great body of the people do not concern themselves with politics, so that their government, though nominally republican, is, in fact, oligarchal, or aristocratical.

Several travellers give but a very indifferent account of the generality of the people of this province. The young men, observes one, generally speaking, are gamblers, cock-fighters, and horse jockies. The ingenuity of a Locke, or the discoveries of a Newton, are considered as infinitely inferior to the accomplishments of him, who is expert in the management of a cock-fight, or dexterous in manœuvring at a horse-race. A spirit for literary enquiries, if not altogether confined to a few, is, among the body of the people, evidently subordinate to a spirit of gaming and barbarous sports. At almost every tavern or ordinary, on the public road, there is a billiard-table, a backgammon-table, cards, and other implements for various

games. To these public-houses the gambling gentry in the neighbourhood resort to *kill* time, which hangs heavily upon them; and at this business they are extremely expert, having been accustomed to it from their earliest youth. The passion for cock-fighting, a diversion not only inhumanly barbarous, but infinitely beneath the dignity of a man of sense, is so predominant, that they even advertize their matches in the public papers*. This dissipation of manners is the consequence of indolence and luxury, which are the fruit of African slavery.

HISTORY, GOVERNMENT, POPULATION, TOWNS, AND COMMERCE. } This is the first country which the English planted in America. We derived our right, not only to this, but to all our other settlements, as has been already observed, from the discovery of Sebastian Cabot, who, in 1497, first made the northern continent of America, in the service of Henry VII. of England. No attempts, however, were made to settle it till the reign of queen Elizabeth. It was then that Sir Walter Raleigh applied to court, and got together a company, which was composed of several persons of distinction, and several eminent merchants, who agreed to open a trade, and settle a colony, in that part of the world, which, in honour of queen Elizabeth, he called Virginia. Towards the close of the sixteenth century, several attempts were made for settling this colony, before any proved successful. The three first companies who failed in Virginia, perished through hunger and diseases, or were cut off by the Indians. The fourth was reduced to almost the same situation; and, being dwindled to a feeble remainder, had set sail for England, in despair of living in such an uncultivated country, inhabited by such hostile and warlike savages. But in the mouth of Chesapeak bay, they were met by lord Delawar, with a squadron loaded with provisions, and with every thing necessary for their relief and defence. At his persuasion they returned: by his advice, prudence, and winning behaviour, the internal government of the colony was settled within itself, and put on a respectable footing with regard to its enemies. This nobleman, who had accepted the government of the unpromising province of Virginia from the noblest motives, was compelled, by the decayed state of his health, to return into England. He left behind him, however, his son, as deputy; with Sir Thomas Gates, Sir George Summers, the honourable George Piercy, and Mr. Newport, for his council. By them, James Town, the first town built by the English in the New World, was erected. The colony continued to flourish, and the true sources of its wealth began to be discovered and improved. The first settlers, like those of Maryland, were generally persons of consideration and distinction. It remained a steady ally to the royal party during the troubles of Great Britain. Many of the cavaliers, in danger at home, took refuge here; and under the government of Sir William Berkley, held out for the crown, until the parliament, rather by stratagem than force, reduced them. After the restoration, there is nothing very interesting in the history of this province. Soon after this time, a young gentleman, named Bacon, a lawyer, availing himself of some discontents in the colony, on account of restraints in trade, became very popular, and set every thing in confusion. His natural death, however, restored peace and unanimity; and the inhabitants of Virginia ceased to destroy themselves.

* A traveller through Virginia observes, Three or four matches were advertised in the public prints at Williamsburg; and I was witness of five in the course of my travels from that to Port Royal.

The government of this province was not at first adapted to the principles of the English constitution, and to the enjoyment of that liberty to which a subject of Great Britain thinks himself entitled in every part of the globe. It was governed by a governor and council, appointed by the king of Great Britain. As the inhabitants increased, the inconveniency of this form became more grievous; and a new branch was added to the constitution, by which the people, who had formerly no consideration, were allowed to elect their representatives from each county, into which this country is divided, with privileges resembling those of the representatives of the commons of England. Thus two houses, the upper and lower house of assembly, were formed. The upper house, which was before called the council, remained on its former footing; its members were appointed, during pleasure, by the crown; they were styled Honourable, and answered in some measure to the house of peers in the British constitution. The lower house was the guardian of the people's liberties. And thus, with a governor representing the king, an upper and lower house of assembly, this government bore a striking resemblance to our own. When any bill had passed the two houses, it came before the governor, who gave his assent or negative as he thought proper. It now acquired the force of a law, until it was transmitted to England, and his majesty's pleasure known on that subject. The upper house of assembly acted not only as a part of the legislature, but also as privy-council to the governor, without whose concurrence he could do nothing of moment; it sometimes acted as a court of chancery.

The present government of this province as settled in convention at Williamsburg, July 5th, 1776; is, that the legislative, executive, and judiciary departments be separate and distinct; that the house of delegates be chosen annually by the freeholders, two for each county, and for the district of West Augusta; and one representative for the city of Williamsburg and town of Norfolk. The senate to consist of 24 members, also chosen by the freeholders of the state, divided into 20 districts. The executive is a governor and privy-council of eight members, chosen annually by the joint ballot of the general assembly of the state, who also chose the delegates to congress, the judges and other law officers, president, treasurer, secretary, &c. justices, sheriffs, and coroners, commissioned by the governor and council.

The inhabitants of Virginia were estimated in 1782 at 567,614; of whom 270,762 are negroes. So much do they increase under the mild treatment they receive. In the very first session after their independence on Great Britain, the assembly passed a law for the perpetual prohibition of the importation of slaves. This will in some measure stop the increase of this great political and moral evil, while the minds of men may be ripening for a complete emancipation of human nature*. The inhabitants of Virginia are a cheerful, hospitable, and in general a well-bred people: some of them are accused of vanity and ostentation. Here are only two towns which deserve that name; the largest of which, and the capital of the province, is WILLIAMSBURG, 37-12 N. lat. 76-48 W. long. containing about sixty houses, and some spacious public buildings. It is about 40 miles from the mouth of James-river, and seven from James-town, which was formerly the capital, and before the American war, contained many taverns and public houses, for the entertainment of mariners. York-town and Gloucester will ever be famous for the capture of Lord Cornwallis and his army.

* Meric.

In the following account of the commerce of Virginia, is also included that of Maryland. These provinces were supposed to export, of tobacco alone, to the annual value of 768,000*l.* into Great Britain. This, at eight pounds per hoghead, makes the number of hogheads amount to 96,000. Of these, it is computed, that about 13,500 hogheads were consumed at home, the duty on which, at 2*l.* 1*s.* per hoghead came to 351,675*l.* the remaining 82,500 hogheads, were exported by our merchants to the other countries of Europe, and their value returned to Great Britain. The advantages of this trade appear by the bare mention of it. It may not be improper to add, that this single branch employed 330 sail of ships, and 7960 seamen. Not only our wealth, therefore, but the very sinews of our national strength were powerfully braced by it. The other commodities of these colonies, of which naval stores, wheat, Indian corn, iron in pigs and bars, are the most considerable, made the whole exportation, at an average of three years, amount to 1,040,000*l.* The exports of Great Britain, the same as to our other colonies, at a like average, came to 865,000*l.*

Here is a college, founded by king William, called William and Mary college, who gave 2000*l.* towards it, and 20,000 acres of land, with power to purchase and hold lands to the value of 2000*l.* a year, and a duty of one penny per pound, on all tobacco exported to the other plantations. There is a president, six professors, and other officers, who are named by the governors or visitors. The honourable Mr. Boyle made a very large donation to the college for the education of Indian children. The Presbyterian denomination of Christians is the most numerous in this province; for though the first settlers were Episcopalians, yet through the indolence of the clergy, two-thirds of the people had become dissenters at the commencement of the American revolution.

RIVERS.] These are the Roanoke, or Albemarle river; Pamlico; Cape Fear, or Clarendon river; Pedee; Santee; Savannah; Altamaha, or George River, and St. Mary's, which divides Georgia from Florida; all which rivers rise in the Apalachian mountains, and running east, fall into the Atlantic Ocean. The back parts are watered by the Cherokees, Yafous, Mobile, Apalachicola, the Pearl river, and many other noble streams which fall into the Mississippi, or the gulf of Mexico.

SEAS, BAYS, AND CAPES.] The only sea bordering on this country is that of the Atlantic Ocean; which is so shallow near the coast, that a ship of any great burden cannot approach it, except in some few places. There has not yet been found one good harbour in North Carolina; the best are those of Roanoke, at the mouth of Albemarle River, Pamlico, and Cape Fear. In South Carolina, there are the harbours of Winyaw, or Georg

Town, Charles Town, and Port Royal. In Georgia, the mouths of the rivers Savannah and Alatamaha form good harbours.

The most remarkable promontories are, Cape Hatteras, in 35 deg. odd minutes north lat. Cape Fear to the south of it, and Cape Carteret still farther south.

CLIMATE AND AIR.] There is not any considerable difference between the climate of these countries. In general it agrees with that of Virginia; but where they differ, it is much to the advantage of Carolina. The summers, indeed are of a more, intense heat than in Virginia, but the winters are milder and shorter. The climate of Carolina, like all American weather, is subject to sudden transitions from heat to cold, and from cold to heat; but not to such violent extremities as Virginia. The winters are seldom severe enough to freeze any considerable water, affecting only the mornings and evenings; the frosts have never sufficient strength to resist the noon day sun; so that many tender plants, which do not stand the winter of Virginia, flourish in Carolina, for they have oranges in great plenty near Charles-Town, and excellent in their kinds, both sweet and sour.

SOIL, PRODUCE, AND FACE } In this respect, too, there is a considerable coincidence between these countries and Virginia; the Carolinas, however, in the fertility of nature, have the advantage; but Georgia hath not so good a soil as the other provinces. The whole country is in a manner one forest, where our planters have not cleared it. The trees are almost the same in every respect with those produced in Virginia; and by the different species of these, the quality of the soil is easily known. The land in Carolina is easily cleared, as there is little or no underwood, and the forests mostly consist of tall trees at a considerable distance. Those grounds which bear the name of the oak, the walnut, and the hickory, are extremely fertile; they are of a dark sand, intermixed with loam; and as all their land abounds with nitre, it is a long time before it is exhausted; for they here never use any manure. The pine barren is the worst of all; there is an almost perfectly white sand; yet it bears the pine tree, and some other useful plants, naturally yielding good profit in pitch, tar, and turpentine. When this species of land is cleared, for two or three years together it produces very good crops of Indian corn and pease; and, when it lies low, and is flooded, it even answers for rice. But what is most fortunate for this province is, that this worst part of its land is favourable to a species of the most valuable of all its products, to one of the kinds of indigo. The low, rich, swampy grounds bear their great staple, rice. The country near the sea is much the worst, in many parts little better than an unhealthy salt marsh; for Carolina is all an even plain for 80 miles from the sea, not a hill, not a rock, not scarcely even a pebble to be met with. But the country, as you advance in it, improves continually; and at 100 miles distance from Charles-Town, where it begins to grow hilly, the soil is of a prodigious fertility, fitted for every purpose of human life; nor can any thing be imagined more pleasant to the eye than the variegated disposition of this back country. Here the air is pure and wholesome, and the summer heat much more temperate than in the flat sandy coast.

In Carolina, the vegetation of every kind of plant is incredibly quick. The climate and soil have something in them so kindly, that the latter, when left to itself, naturally throws out an immense quantity of flowers and flowering shrubs. All the European plants arrive at perfection here beyond

beyond that in which their native country affords them. With proper culture and encouragement, silk, wine, and oil, might be produced in these colonies. The first we have seen, samples equal to what is brought to us from Italy. What grows extremely well in the back parts, and yields a prodigious increase.

From what we have observed of these valuable provinces, their productions appear to be, vines, wheat, rice, Indian corn, barley, oats, pease, beans, hemp, flax, cotton, tobacco, indigo, olives, orange, citron, cypress, sassafras, oak, walnut, cassia, and pine trees; white mulberry-trees for feeding silk-worms; sarsaparilla, and pines which yield turpentine, resin, tar, and pitch. There is a kind of tree from which runs an oil of extraordinary virtue for curing wounds, and another, which yields a balm thought to be little inferior to that of Mecca. There are other trees besides these that yield gums. The Carolinas produce prodigious quantities of honey, of which they make excellent spirits, and mead as good as Malaga sack. Of all these the three great staple commodities at present are, the indigo, rice, and the produce of the pine. Nothing surprises an European more at first sight than the size of the trees here, as well as in Virginia and other American countries. Their trunks are often from 50 to 70 feet high, without a branch or limb; and frequently above 36 feet in circumference. Of these trunks when hollowed, the people of Charles-Town, as well as the Indians make canoes, which serve to transport provisions and other goods from place to place; and some of them are so large, that they will carry 30 or 40 barrels of pitch; though formed of one piece of timber. Of these are likewise made curious pleasure boats.

ANIMALS.] The original animals of this country do not differ much from those of Virginia; but in Carolina they have a still greater variety of beautiful fowls. All the animals of Europe are here in plenty; black cattle are multiplied prodigiously: to have 2 or 300 cows is very common, but some have 1000 or upwards. These ramble all day at pleasure in the forests; but their calves being separated and kept in fenced pastures, the cows return every evening to them. The hogs range in the same manner, and return like the cows; these are very numerous, and many run quite wild, as well as horned cattle and horses, in the woods. It is surprising that the cattle should have increased so quickly since their being first improved from Europe, while there are such numbers of wolves, tygers, and panthers, constantly ranging the woods and forests. We have already observed that these animals are less ravenous than the beasts of Africa and Asia; they very seldom attempt to kill either calves or foals in America, and when attacked, their dams make a vigorous defence.

HISTORY, GOVERNMENT, POPULATION, } The first English expedi-
CHIEF TOWNS, AND COMMERCE. } tions into Carolina were
unfortunate. Nothing successful was done in this way till the year 1663, in the reign of Charles II. At that time several English noblemen, and others of great distinction, obtained a charter from the crown, investing them with the property and jurisdiction of this country. They parcelled out the lands to such as were willing to go over into the new settlement, and to submit to a system of laws, which they employed the famous Locke to compose for them.

They began their first settlement at a point of land towards the southward of their district, between two navigable rivers. Here they laid the foundation of a city, called Charles-Town, which was designed to be, what it now is, the capital of the province. In time, however, the disputes between

between the church of Englandmen and dissenters, caused a total confusion in the colony. This was rendered still more intolerable by the incursions of the Indians, whom they had irritated by their insolence and injustice. In order to prevent the fatal consequences of these intestine divisions, and foreign wars, an act of parliament was passed, which put this colony under the immediate protection of the crown. The lords proprietors accepted a recompense of about 24,000*l.* for both the property and jurisdiction, and the constitution of this colony, in those respects in which it differed from the royal colonies, was altered. Earl Granville, however, thought fit to retain his seventh share, which continued in the possession of his family. For the more convenient administration of affairs, too, Carolina was divided into two districts, and two governments. This happened in 1728, and from that time peace being restored with the general government, as well as with the Cherokees and other Indians, the two provinces began to breathe, and their trade advanced with wonderful rapidity.

The settlement of Carolina was projected in 1732, when several public-spirited noblemen and others, from compassion to the poor of these kingdoms, subscribed a considerable sum, which, with 10,000*l.* from the government, was given to provide necessaries for such poor persons as were willing to transport themselves into this province, and to submit to the regulations imposed on them. In process of time, new sums were raised, and new inhabitants sent over. Before the year 1752, upwards of 1000 persons were settled in this province. It was not, however, to be expected, that the inhabitants of Georgia, removed as they were, at a great distance from their benefactors, and from the check and control of those who had a natural influence over them, would submit to the magistrates appointed to govern them. Many of the regulations, too, by which they were bound, were very improper in themselves, and deprived the Georgians of privileges which their neighbours enjoyed, and which, as they increased in numbers and opulence, they thought it hard they should be deprived of. From these corrupt sources arose all the bad humours which tore to pieces this constitution of government. Dissensions of all kinds sprung up, and the colony was on the brink of destruction, when, in 1752, the government took it under their immediate care, removed their particular grievances, and placed Georgia on the same footing with the Carolinas.

The method of settling in Carolina, and indeed in other provinces of British America, was to pitch upon a void space of ground, and either to purchase it at the rate of 20*l.* for 1000 acres, one shilling quit-rent for every 100 acres; or otherwise, to pay a penny an acre quit-rent yearly to the proprietors, without purchase-money. The people of Carolina live in the same easy, plentiful, and luxurious manner with the Virginians already described. Poverty is here almost an entire stranger; and the planters are the most hospitable people that are to be met with to all strangers; and especially to such as by accident or misfortunes are rendered incapable of providing for themselves.

The general topics of conversation among the men, when cards, the bottle, and occurrences of the day do not intervene are negroes, the prices of indigo, rice and tobacco, &c. They appear to have as little taste for the sciences as for religion. Political enquiries and philosophical disquisitions are attended to but by a few men of genius and industry; and are too laborious for the indolent minds of the people at large. Less attention and respect are paid to the women here, than in those parts of the United States, where the inhabitants have made greater progress

gress in the arts of civilized life. Indeed, it is a truth, confirmed by observation, that in proportion to the advancement of civilization, in the same proportion will respect for the women be increased: so that the progress of civilization in countries, in states, in towns and in families, may be remarked by the degree of attention which is paid by husbands to their wives, and by the young men to the young women.

Temperance and industry are not to be reckoned among the virtues of the North Carolinians. The time which they waste in drinking, idling and gambling, leaves them very little opportunity to improve their plantations or their minds. The improvement of the former is left to their overseers and negroes; the improvement of the latter is too often neglected. Were the time, which is thus wasted, spent in cultivating the soil and in treasuring up knowledge, they might be both wealthy and learned, for they have a productive country, and are by no means destitute of genius.

Time that is not employed in study or useful labour, is generally spent in every country in hurtful or innocent exercises, according to the custom of the place or the taste of the parties. The citizens of North Carolina, who are not better employed, spend their time in drinking, or gaming at cards or dice, in cock-fighting, or horse-racing. Many of the interludes are filled up with a boxing match; and these matches frequently become memorable by feats of *gouging*.*

In a country that pretends to any degree of civilization, one would hardly expect to find a prevailing custom of putting out the eyes of each other; yet this more than barbarous custom is prevalent in both the Carolinas, and in Georgia, among the lower class of people. Of the origin of this custom we are not informed. We presume there are few competitors for the honour of having originated it; and equally as few who are envious of the *placure* of those who have the *honour* to continue it.

The only place in either of the Carolinas worthy of notice is Charleston, W. Lon. 79-12. N. Lat. 32-45; the metropolis, of South Carolina, which for size, beauty, and trade, may be considered as one of the first in British America. It is admirably situated at the confluence of two navigable rivers, one of which is navigable for ships 20 miles above the town, and for boats and large canoes near 40. The harbour is good in every respect, but that of a bar, which hinders vessels of more than 200 tons burthen, loaded, from entering. The town is regularly and pretty strongly fortified by nature and art; the streets are well cut; the houses are large and well built; some of them are of brick, and others of wood, but all of them handsome and elegant, and rent is extremely high. The streets are wide and straight, intersecting each other at right angles; those running east and west extend about a mile from one river to the other. It contains about 1000 houses, and was the seat of the governor, and the place of meeting of the assembly. Its neighbourhood is beautiful beyond description. Several handsome equipages are kept here. The planters and merchants are rich and well bred:

* The *placure* and *entertaining diversion*, with propriety called *gouging*, is thus performed. When two boxers are wearied with fighting and bruising each other, they come, as it is called, to *close quarters*, and each endeavours to twist his forefingers in the ear-loops of his antagonist. When these are fast clinched, the thumbs are extended each way to the nose, and the eyes gently turned out of their sockets. The victor for his expertise receives shouts of applause from the sportive throng, while his poor *opposite* antagonist is laughed at for his misfortune. *Morfe.*

junction;

and before the war between Great Britain and the colonies, the people were shewy and expensive in their dress and way of living; so that every thing conspired to make this by much the liveliest, the loveliest, and politest place, as it is one of the richest too, in all America. It ought also to be observed, for the honour of the people of Carolina, that when, in common with the other colonies, they resolved against the use of certain luxuries, and even necessities of life, those articles which improve the mind, enlarge the understanding, and correct the taste were excepted: the importation of books was permitted as formerly.

North and South Carolina joined with the other colonies in their revolt against Britain; and in 1780, Charles Town being besieged by the king's troops, surrendered on capitulation, with 6000 men in arms prisoners, on the 11th of May in that year, after the siege had continued seven weeks.

As South Carolina has met with infinitely more attention than the other provinces, the commerce of this country alone employed 140 ships, while that of the other two did not employ 60. Its exports to Great Britain of native commodities, on an average of three years, amounted to more than 395,000*l.* annual value; and its imports to 365,000*l.* The exports of North Carolina were computed at about 70,000*l.* and its imports at 18,000*l.* The trade of Georgia is likewise in its infancy; the exports amounted to little more than 74,000*l.* and the imports to 49,000*l.*

The trade between Carolina and the West-Indies was the same in all respects with that of the rest of the colonies, and was very large; their trade with the Indians was in a very flourishing condition; and they formerly carried English goods on pack-horses 5 or 600 miles into the country west of Charles-Town.

The mouths of the rivers in North Carolina form but ordinary harbours, and do not admit, except one at Cape Fear, vessels of above 70 or 80 tons. This lays a weight upon their trade, by the expence of lighter-ages. Edenton is the capital of North Carolina, but little more than a trifling village; they were lately projecting a town farther south, which would be more central.

Georgia has two towns already known in trade. Savannah, the capital, is commodiously situated for an inland and foreign trade, about ten miles from the sea, upon a noble river of the same name, which is navigable for 200 miles farther for large boats, to the second town, called Augusta, which stands in a country of the greatest fertility, and carries on a considerable trade with the Indians. From the town of Savannah you see the whole course of the river towards the sea; and on the other hand, you see the river for about 60 miles up into the country. Here the Rev. Mr. George Whitefield founded an orphan-house, which is now converted to a very different use, into a college for the education of young men designed chiefly for the ministry. By a late estimate of their population, the number of inhabitants in North Carolina is 270,000, of which 60,000 are negroes; in South Carolina 80,000 whites, and about 100,000 negroes; and in Georgia, in the grand convention at Philadelphia, in 1787, the inhabitants of this state were reckoned at 90,000, including three fifths of 20,000 negroes*.

In October 1779, the town of Savannah being in possession of the king's troops, was besieged by 8000 of the American and French troops in conjunction; but they were bravely repulsed by the king's troops, with a great

* Morfr.

daughter of the French and Americans. But Savannah, as well as Charles Town, were afterwards evacuated by the king's troops, and restored to the Americans.

The government of North Carolina is now vested in a governor, senate, and house of commons; all elected annually; the executive power in a governor and seven counsellors; of South Carolina, in a governor, senate of 25, and a house of representatives of 302 members; and that of Georgia in a governor, executive council of 12, and house of assembly of 72 representatives.

NEW STATES FORMED IN NORTH AMERICA.

THE *New State of Franklin*, was formed by the union of three counties in North Carolina. But, after much confusion, all pretensions to independency were at length relinquished, and it is now re-united with its parent state. Besides this, two other states have lately arisen, those of **KENTUCKE**, and **VERMONT**. Of these we shall give some account in this place.

K E N T U C K E.

[Belonging at present to State of Virginia.]

THIS country was first discovered by one Mc'Bride, in 1754. Its central part is situated near the latitude of 38 N. and 85 W. long. It is bounded on the North by Sandy Creek, by the Ohio on the N. W., by North Carolina on the South, and by Cumberland mountains on the East.

Kentucke is divided into seven counties.

Counties.	Chief Towns.
Jefferson, at the falls of the Ohio	Louisville
Fayette	Lexington
Bourbon	None
Mercer	Harrodstown
Nelson	Bardstown
Maddison	None
Lincoln	None

In all these, as well as in many other places, are houses for the inspection of tobacco.

The Ohio bounds Kentucke in its whole length. This state is watered by many rivers, and the greatest part of the soil is amazingly fertile, and is more

The Al

more temperate and healthy than any part in America. Here are buffaloes, bears, deer, elks, and many other animals, common to the United States, and others entirely unknown to them. In the rivers are the finest fish, and abundant. Salmon, roach, perch, eel, and all kinds of hook-fish. The parouet is common here, as is the ivory-bill, wood-cock, of a whitish colour, with a white plume. The bill is pure ivory. Here is an owl like ours, but different in vociferation. It makes a surprizing noise like a man in distress. Its natural curiosities are astonishing and innumerable. Caves are found amazingly large, in some of which you may travel several miles under a fine limestone rock, supported by curious arches and pillars. In most of them run streams of water. Near Lexington are to be seen curious sepulchres, full of human skeletons. There are three springs or ponds of bitumen near Green River, which discharge themselves into a common reservoir, and when used in lamps, answer all the purposes of the finest oil. There are many allum banks, and different places abounding with copper, which when refined is equal to any in the world. At a salt spring near the Ohio river, very large bones have been found far surpassing the size of any species of animals now in America, the head appears to have been considerably above three feet long. Dr. Hunter said it could not be the elephant, and that from the form of the teeth it must have been carnivorous, and belonging to a race of animals now extinct. Specimens have been sent both to France and England. What animal this is, and by what means its ruins are found in these regions, (where none such now exist) are very difficult questions, and variously resolved. The variety of conjectures serves only to prove the futility of all.

The Mississippi and Ohio, are the keys to the northern parts of the western continent. The usual route to Kentucke is from Philadelphia or Baltimore, by the way of Peterburgh. From the mouth of the Ohio to New Orleans, (a distance not exceeding 460 miles in a straight line) is 856 by water. The mouth empties itself by several channels into the gulf of Mexico.

An idea may be formed of the astonishing emigrations to this country, from the following account taken by the adjutant of the troops stationed at Fort Harmer, at the mouth of Muskingum.

From the 10th of October, 1786, to the 12th of May 1787, 177 boats, containing 2689 souls, 1353 horses, 766 cattle, 112 waggons and two phaetons, besides a very considerable number that passed in the night unobserved.

It is at present peopled by above one hundred and fifty thousand settlers. From the interior settlements of this vast country, America will derive her future greatness, and establish new empires to rival, and perhaps outdo the ancient world.

V E R M O N T.

THE state of Vermont is a vast country, situated eastward of New Hampshire, south of Massachusetts, and west of New York. It is 155 miles in length, and 60 in breadth. The capital of the state is Bennington.

The Allens are the chiefs or head men of the country. It is governed by

• Morse's American Geography, p 407.

its own laws, independent of congress and the states. Hitherto it has been an object of contention between the states of New York and New Hampshire. The people had, for a long time, no other name than Green Mountain Boys, which they gallicized into Vermont, and since corrupted into the easier pronunciation of Vermont.

The antique forests, into which the arm of man is just carrying the destructive ax, every where afford the most grand and sublime prospects. Little of the land of this state is yet cleared, but the emigrations to it from other states are great, and it will soon become well cultivated, and equal in fertility to the states it approximates. Its population is said already to amount to 150,000.

The declaration which they made by their representatives in convention at Windsor, on the 25th of December, 1777, and which makes a part of its constitution, breathes as high a spirit of liberty, as that of any of their neighbours. They assert that all men are born equally free—with equal rights, and ought to enjoy liberty of conscience—freedom of the press—trial by jury—power to form new states in vacant countries, and to regulate their own internal police—that all elections ought to be free—that all power is originally in the people—that government ought to be instituted for the common benefit of the community—and that the community have a right to reform or abolish government—that every member of society had a right to protection of life, liberty and property—and in return is bound to contribute his proportion of the expence of that protection, and yield his personal service when necessary—that he shall not be obliged to give evidence against himself—that the people have a right to bear arms—but no standing armies shall be maintained in time of peace—that the people have a right to hold themselves, their houses, papers, and possessions free from search or seizure, and therefore warrants, without oaths first made, affording sufficient foundation for them, are contrary to that right, and ought not to be granted—that no person shall be liable to be transported out of this state for trial for any offence committed within this state, &c. *

The states of New York and Pennsylvania have large tracts of fertile land, extending to the lakes proper for the forming of settlements, and very capital ones have lately been made. This country will in future prove one of the most advantageous commercial situations in America, having in a manner the key of Canada, and of all the northern Indian trade; the navigation extending from the western sea to the lakes, has no other obstruction than small portages, which in time will be converted into canals. The fur trade will chiefly centre in this country.

In the inland country of Virginia and North Carolina, the settlements in many parts extend to the mountains. In the eastern parts of Virginia, settlements have been made in the mountains themselves, where some industrious Germans (who found the lands in the valleys taken up,) have established considerable plantations.

South Carolina has immense tracts of fertile land unsettled.

The state of Virginia, possessing lands on the other side of the mountains, (and having more immediate communication with the Ohio country on the river) many thousands have passed over them, and settled themselves in

that tract which lies between the mountains and the river. It is said some emigrants have crossed that river, and settled in the country bordering on the lakes.

By a late settlement, the country to the southward of the Ohio is included in the state of Virginia. All the country to the northward of this great river, extending from Pennsylvania to the east, the lakes on the north, and the Mississippi on the west, are intended to be divided by congress into ten new states.

WASHINGTON,
METROPOTAMIA,
PESILIPPA,
MICHIGANIA,
ILLINOIA,

CHERSONESUS,
SARATOGA,
SYLVANIA,
ASSENIPI,
POLYPOTAMIA.

These ten states (spreading over an immense tract of land,) are traversed by the great river Ohio, in a course of 1400 miles, receiving into its waters the innumerable rivers which are scattered over the whole country. On the north they are bounded by the five great lakes, Superior, Michigan, Huron, Erie, and Ontario; which empty themselves into the river St. Laurence. On the east they have the states of New York, Pennsylvania and Virginia, whose navigation (as well as the St. Laurence) affords them a direct communication with the Atlantic Ocean. On the south they are partly bounded by the mountains, and on the west by the vast river Mississippi, (whose source is unknown) and which after flowing through the great continent of America, (admitting into its swelling waves the tributes of a thousand waters) falls into the gulf of Mexico.

On the 30th Nov. 1782 the provisional articles of peace and reconciliation between Great Britain and the United States were signed at Paris; these were afterwards ratified by a definitive treaty Sept. 3d. 1783. Thus was terminated a war equally ruinous to Great Britain and America, a war craftily and insidiously fomented by France, the common enemy of both. No sooner was peace restored and the British troops withdrawn from the country, than the United States began to experience the defects of their general government, and finding that the articles of the confederation would not enable them to surmount those national embarrassments, which they experienced, at length recommended to the several governments, the appointing of delegates, who met at Philadelphia in June 1787. In this convention such alterations were made on their constitution as were suited to their present circumstances and calculated to promote unity among the several members of the confederation, and to give vigour to all their operations. The old congress terminated in April 1789. A new congress with more ample powers and a new constitution partly national and partly federal succeeded in their place, to the great joy of all who wished for the happiness of the United States. By this new constitution or rather improvement of the old their situation was considerably meliorated, they still however continued to experience all the difficulty and embarrassment which naturally result from the necessary weakness of a new government; in many places the laws were resisted, and there wanted sufficient vigour to enforce obedience, the people were impatient under the taxes which it was necessary to impose for supporting the government and paying the interest of the debt contracted during the war; in these circumstances it is probable that a great part of the people found themselves disappointed of the happiness they had

had promised themselves as the fruit of their independence, and began to suspect, that their imaginations being dazzled by a phantom, which did not in reality exist, they had purchased at an immense price what was merely a name. Time has in some degree remedied these evils, and by the gradual operation of the same agent, the government of the United States will, it is to be hoped, increase in energy and stability; and like the British constitution of which it is the legitimate offspring, become the parent of prosperity and happiness to every order of the people. At the breaking out of the French revolution, while the terror and alarm which it excited in all the nations of Europe, warned them to keep at a distance from the mighty ruin, various circumstances served rather to cement the union of France and America. They had espoused her cause during her struggle with their mother-country, by her assistance they had been enabled to secure their independence, and though the principles of the revolutionary government of France were, as inimical to the American government as they were to every other, yet their distance from the scene of action and the little intercourse which the people of one country could have with the other, removed all apprehension of danger; perhaps the very name of republic served to promote their union; another reason may have operated as powerfully as either, the propagation of the pernicious principles of the French revolution among the people of America. But whatever friendly disposition might exist in that country towards France, or to the new order of things established there, she wisely determined to make use of the advantages of her situation, far removed from the contending powers, and to adhere to the strictest neutrality; it is however impossible but that neutral nations must experience many things from the conduct of the powers at war, giving rise to discussion and negotiation; subjects of this sort frequently occurred betwixt Great Britain and America. The rules laid down by the former country at the beginning of the war respecting the commerce of France and her colonies, although strictly conformable to the law and practice of nations, and to the conduct observed in all former wars, had been greatly misrepresented by the activity of the French partizans who abounded in America; these misrepresentations were not without their effects there, inasmuch that at one time matters seemed to wear a very threatening appearance; all the mischiefs however which would have resulted from a commencement of hostilities were prevented by the timely prudence and pacific disposition of both countries: and a treaty of mutual friendship and amity was signed at London in 1794 by Lord Grenville and Mr Jay; this treaty notwithstanding all the arts and influence of the French party was afterwards ratified by congress. From the beginning of the war the object of France had been to prevail upon America to make a common cause with her, and as the likeliest means to promote these views, every effort was made to foment jealousies and divisions betwixt Great Britain and America. It is not therefore to be wondered at, that her disappointment should break out into rage, when by this treaty she saw all her prospects of embroiling the two countries totally blasted, all their differences composed, and the foundation of a friendly intercourse solidly laid. To this source alone may be traced all the complaints of the French government against this treaty betwixt Great Britain and the United States; for it contains not one article capable of being construed into a violation, or even inconsistency with any former treaties by which America stood bound to other nations; nor can it in any degree be considered as the smallest departure from the principles of that strict neutrality, to which from the beginning of the war, she seemed determined to adhere,

adhere, unless driven from it by acts of violence on the part of either of the contending powers. Soon after this France was induced to throw aside the very thin veil by which she had endeavoured to cover all her proceedings towards the United States; the consequences were such acts of aggression, insult and outrage on her part as it was impossible for any people to bear, without renouncing all title to the character of a brave and independent nation.

Anxious however to preserve to their country the blessings of peace, ambassadors were sent to Paris, if possible to settle their existing differences by negotiation; they were treated by the French rulers with the utmost contempt, they were not so much as received in their public character, and they were given to understand by some private communication, that the business of their mission could not even be entered upon without submitting themselves to France; in the course of these private communications such a discovery was made of the infamous duplicity and unprincipled meanness of the French rulers as is truly astonishing, if any thing of this sort from such men could be astonishing; but for an account of this as well as of every thing that passed at Paris betwixt the agents of the directory and the American plenipotentiaries we must refer to the account published by themselves after leaving France. This account was attended with the best effects in America; such appeared to be the insolent views of France so unequivocal and undisguised that every man of virtue and discernment in the United States, was at once persuaded that they had no alternative but either to resist the encroachments of France or tamely submit themselves to her power. They found themselves therefore in the same dilemma in which all the kingdoms of Europe now stand; but here a brave people sprung from the land of liberty could not long hesitate which to chuse; one principle seemed at once to actuate and unite the whole country in a firm resolution to preserve their liberty and repel the unjust aggressions of an insulting foe; and we cannot entertain a doubt, but their vigorous efforts will be crowned with success.

WEST INDIES.

WE have already observed, that between the two continents of America lie a multitude of islands which we call the West Indies, and which, such as are worth cultivation, now belong to five European powers, as Great Britain, Spain, France, Holland, and Denmark. As the climate and seasons of these islands, differ widely from what we can form any idea of, by what we perceive at home, we shall, to avoid repetitions, speak of them in general, and mention some other particulars that are peculiar to the West-Indies.

The climate in all our West Indian islands is nearly the same, allowing for those accidental differences which the several situations and qualities of the lands themselves produce. As they lie within the tropics and the sun goes quite

pass over their heads, passing beyond them to the north, and never returning farther from any of them than about 30 degrees to the south; they are continually subjected to the extreme of an heat, which would be intolerable, if the trade wind, rising gradually as the sun gathers strength, did not blow in upon them from the sea, and refresh the air in such a manner, as to enable them to attend to their concerns even under the meridian sun. On the other hand, as the night advances, a breeze begins to be perceived, which blows sparsely from the land, as it were from the east, towards the sea; to all parts of the compass at once.

By the same remarkable Providence in the disposing of things, it is, that when the sun has made a great progress towards the tropic of Cancer, and becomes in a manner vertical, he draws after him such a vast body of clouds, as shield them from his direct beams; and dissolving into rain, cool the air, and refresh the country, thirsty with the long drought, which commonly reigns from the beginning of January to the latter end of May.

The rains in the West Indies (and we may add in the East Indies) are by no means so moderate as with us. Our heaviest rains are but dewa comparatively. They are rather floods of water, poured from the clouds with a prodigious impetuosity; the rivers rise in a moment; new rivers and lakes are formed, and in a short time, all the low country is under water. Hence it is the rivers which have their source within the tropics, swell and overflow their banks at a certain season; but so mistaken were the ancients in their ideas of the torrid zone, that they imagined it to be dried and scorched up with a continual and fervent heat, and to be for that reason uninhabitable; when, in reality, some of the largest rivers of the world have their course within its limits, and the moisture is one of the greatest inconveniencies of the climate in several places.

The rains make the only distinction of seasons in the West Indies; the trees are green the whole year round; they have no cold, no frosts, no snows, and but rarely some hail; the storms of hail are, however, very violent when they happen, and the hailstones very great and heavy.——Whether it be owing to this moisture, which alone does not seem to be a sufficient cause, or to a greater quantity of a sulphureous acid, which predominates in the air of this country, metals of all kinds, that are subject to the action of such causes, rust and canker in a very short time; and this cause, perhaps as much as the heat itself, contributes to make the climate of the West Indies unfriendly and unpleasant to an European constitution.

It is in the rainy season (principally in the month of August, more rarely in July and September) that they are assailed by hurricanes; the most terrible calamity to which they are subject (as well as the people in the East Indies) from the climate; this destroys, at a stroke, the labours of many years, and prostrates the most exalted hopes of the planter, and often just at the moment when he thinks himself out of the reach of fortune. It is a sudden and violent storm of wind, rain, thunder, and lightning, attended with a furious swelling of the seas, and sometimes with an earthquake; in short, with every circumstance, which the elements can assemble, that is terrible and destructive. First, they see as the prelude to the ensuing havoc, whole fields of sugar-canes whirled into the air, and scattered over the face of the country. The strongest trees of the forest are torn up by the roots, and driven about like stubble; their windmills are swept away in a moment; their utensils, the fixtures, the ponderous copper boilers, and stills of seve-

several hundred weight, are wrenched from the ground, and battered to pieces; their houses are so proscribed; the roofs are torn off at one blast; whilst the rain, which in an hour rises five feet, rushes in upon them with an irresistible violence.

The hurricane comes on either in the quarters, or at the full or change of the moon. If it comes at the full moon, observe these signs. That day you will see the sky very turbulent; you will observe the sea more red than at other times; you will perceive a dead calm, and the hills clear of all those clouds and mists which usually hover about them. In the clefts of the earth, and in the wells, you hear a hollow rumbling sound, like the rushing of a great wind. At night the stars seem much larger than usual, and surrounded with a sort of bars; the north-west sky has a black and menacing look; the sea emits a strong smell, and rises into vast waves, often without any wind; the wind itself now forsakes its usual steady easterly stream, and shifts about to the west; from whence it sometimes blows with intermissions, violently and irregularly for about two hours at a time. The moon herself is surrounded with a green bar, and sometimes the sun has the same appearance. These are signs which the Indians of these islands taught our planters, by which they can prognosticate the appearance of an hurricane.

The grand staple commodity of the West Indies is sugar; this commodity was not at all known to the Greeks and Romans, though it was made in China in very early times, from whence we had the first knowledge of it; but the Portuguese were the first who cultivated it in America; and brought it into request, as one of the materials of a very universal luxury in Europe. It is not settled whether the cane, from which this substance is extracted be a native of America, or brought thither to their colony of Brazil, by the Portuguese, from India and the coast of Africa; but, however that matter may be, in the beginning they made the most, as they still do the best sugars which come to market in this part of the world. The juice within the sugar-cane is the most lively, elegant, and least cloying sweet in nature; and which, sucked raw, has proved extremely nutritive and wholesome. From the molasses run, is distilled, and from the scummings of the sugar a mesmet spirit is procured. Rum finds its market in North America, where it is consumed by the inhabitants, or employed in the African trade, or distributed from thence to the fishery of Newfoundland, and other parts; besides what comes to Great Britain and Ireland. However, a very great quantity of molasses is taken off raw, and carried to New England to be distilled there. The tops of the canes, and the leaves which grow upon the joints, make very good provender for their cattle, and the refuse of the cane, after grinding, serves for fire; so that no part of this excellent plant is without its use.

They compute that, when things are well managed, the rum and molasses pay the charges of the plantation, and the sugars are clear gain. However, by the particulars we have seen, and by others which we may easily imagine, the expences of a plantation in the West-Indies are very great, and the profits at the first, very precarious; for the chargeable articles of the windmill, the boiling, cooling, and distilling houses, and the buying and subsisting a suitable number of slaves and cattle, will not suffer any man to begin a sugar plantation of any consequence, not to mention the purchase of the land, which is very high, under a capital of at least 5000l. Neither is the life of a planter, if he means to acquire a fortune, a life of idleness and luxury; at all times he must keep a watchful eye upon his overseers, and even oversee himself occasionally. But at the boiling season, if he is properly attentive

tentive to his affairs, no way of life can be more laborious, and more dangerous to the health; from a constant attendance day and night, in the extreme united heats of the climate, and so many fiery hurricanes; add to this, the losses by hurricanes, earthquakes, and bad seasons; and then consider when the sugars are in the cask, that he quits the hazard of a planter, to engage in the hazards of a merchant, and ships his produce at his own risk. These considerations might make one believe, that it could never answer to engage in this business; but, notwithstanding all this, there are no parts of the world, in which great estates are made in so short a time, from the produce of the earth, as the West Indies. The produce of a few good seasons generally provides against the ill effects of the worst, as the planter is sure of a speedy and profitable market for his produce, which has a ready sale than perhaps any other commodity in the world.

Large plantations are generally under the care of a manager, or chief overseer, who has commonly a salary of 150*l.* a year; with overseers under him in proportion to the greatness of the plantation; one to about 30 negroes, with a salary of about 40*l.* Such plantations too have a surgeon at a fixed salary, employed to take care of the negroes which belong to it. But the course which is the least troublesome to the owner of the estate is, to let the land, with all the works, and the stock of cattle and slaves, to a tenant, who gives security for the payment of the rent, and the keeping up repairs and stock. The estate is generally estimated to such a tenant at half the neat produce of the best years; such tenants, if industrious and frugal men, soon make good estates for themselves.

The negroes in the plantations are subsisted at a very easy rate. This is generally by allotting to each family of them a small portion of land, and allowing them two days in the week, Saturday and Sunday, to cultivate it; some are subsisted in this manner, but others find their negroes a certain portion of Guinea and Indian corn, and to some a salt herring, or a small portion of bacon or salt pork a-day. All the rest of the charge consists in a cap, a shirt, a pair of breeches, and a blanket; and the profit of their labour yields 10 or 12*l.* annually. The price of men negroes upon their first arrival is from 30*l.* to 36*l.* women and grown boys 50*l.* less; but such negro families as are acquainted with the business of the islands generally bring above 40*l.* upon an average one with another; and there are instances of a single negro man expert in business bringing 150 guineas; and the wealth of a planter is generally computed from the number of slaves he possesses.

To particularise the commodities proper for the West India market, would be to enumerate all the necessaries, conveniencies, and luxuries of life; for they have nothing of their own but cotton, coffee, tropical fruits, spices, and the commodities I have already mentioned.

Traders there make a very large profit upon all they sell; but from the numerous shipping constantly arriving from Europe, and a continual succession of new adventurers, each of whom carry out more or less as a venture, the West India market is frequently overstocked; money must be raised, and goods are sometimes sold at prime cost or under. But those who can afford to store their goods, and wait for a better market, acquire fortunes equal to any of the planters. All kinds of handicraftsmen, especially carpenters, bricklayers, braziers, and coopers, get very great encouragement. But it is the misfortune of the West Indies, that physicians and surgeons even outdo the planter and merchant, in accumulating riches.

least 250,000 negro slaves; and, upon the highest calculation, the whites there in all did not amount to 99,000 souls. This disproportion between the freemen and negroes, which grows more visible every day, some writers have endeavoured to account for, by alleging, that the enterprising spirit, which the novelty of the object, and various concurrent causes, had produced in the last century, has decayed very much. That the disposition of the West Indians themselves, who for cheapness choose to do every thing by negroes which can possibly be done by them, contributes greatly to the small number of whites of the lower stations. Such indeed is the powerful influence of avarice, that though the whites are kept in constant terror of insurrections and plots, many families employ 25 or 30 negroes as menial servants, who are infinitely the most dangerous of the slaves, and, in case of any insurrection they have it more in their power to strike a sudden and fatal blow, and the cruelty with which the negroes are often treated, gives the white inhabitants too much reason for their apprehensions, that the negroes may endeavour to revenge themselves upon their masters.

The first observation that has been mentioned, in order to account for the present disproportion between the freemen and the negroes in the West Indies, we think it is not well founded; that enterprising spirit which first led Britons out to discovery and colonization, still animates in a very considerable degree the people of this nation; but the field has been lately more ample and enlarged, and emigrants have had greater scope, whereon to range. Besides the vast continent of North America, which takes in such a variety of climates, and discovers such a richness of soil; the East Indies, an inexhaustible mine of riches, have in some degree drawn the attention of mankind from that of the West. Countries as well as individuals, attain a name and reputation for something extraordinary, and have their day. Many of the best families of this nation are ambitious of procuring places for their sons in the East Indies. Here is an ample field for all adventurous spirits, who, disdaining an idle life at home, and ambitious of becoming useful to themselves, their connections, or the community, boldly venture into the immense regions of this Eastern world. Others, full as remote from an indolent disposition, but with less conduct and inferior abilities, set out with the most languine hopes. These are your fiery, restless tempers, willing to undertake the severest labour, provided it promises but a short continuance, who love risk and hazard, whose schemes are always vast, and who put no medium between being great and being undone.

The islands of the West Indies lie in the form of a bow, or semicircle, stretching almost from the coast of Florida north, to the River Orinoco, in the main continent of South America. Some call them the Caribbees, from the first inhabitants; though this is a term that most geographers confine to the Leeward Islands. Sailors distinguish them into the Windward and Leeward Islands, with regard to the usual courses of ships, from Old Spain, or the Canaries, to Carthagenæ or New Spain and Portobello. The geographical tables and maps distinguish them into the great and little Antilles.

[JAMAICA.] The first that we come to belonging to Great Britain, and also the most important, after leaving Florida, is Jamaica, which lies between the 75th and 79th degrees of west longitude from London, and between 17 and 18 north latitude. From the east and west it is in length about 140 miles, and in the middle about 60 in breadth, growing less towards each end, in the form of an egg. It lies near 4500 miles south-west of England.

This

This island is intersected with a ridge of steep rocks tumbled by the frequent earthquakes in a stupendous manner upon one another. These rocks, though containing no soil on their surface, are covered with a great variety of beautiful trees, flourishing in a perpetual spring; they are nourished by the rains, which often fall, or the mists which continually brood on the mountains, and which, their roots penetrating the crannies of the rocks, industriously seek out for their own support. From the rocks issue a vast number of small rivers of pure wholesome water, which tumble down in cataracts, and together with the stupendous height of the mountains, and the bright verdure of the trees through which they flow, form a most delightful landscape. On each side of this chain of mountains are ridges of lower ones, which diminish as they remove from it. On these coffee grows in great plenty. The valleys or plains between those ridges are level beyond what is ordinary in most other countries, and the soil is prodigiously fertile.

The longest day in summer is about thirteen hours, and the shortest in winter about eleven; but the most usual divisions of the seasons in the West Indies are into the dry and wet seasons. The air of this island is in most places, excessively hot, and unfavourable to European constitutions; but the cool sea breezes, which set in every morning at ten o'clock, render the heat more tolerable; and the air upon the high grounds is temperate, pure, and cooling. It lightens almost every night, but without much thunder, which when it happens is very terrible, and roars with astonishing loudness, and the lightning in these violent storms frequently does great damage. In February or March, they expect earthquakes, of which we shall speak hereafter. During the months of May and October, the rains are extremely violent, and continue sometimes for a fortnight together. In the plains are found several salt fountains; and in the mountains, not far from Spanish Town, is a hot bath, of great medicinal virtues. It gives relief in the dry belly-ach, which, excepting the bilious and yellow fever, is one of the most terrible endemial distempers of Jamaica.

Sugar is the greatest and most valuable production of this island. Cocoa was formerly cultivated in it to great extent. It produces also ginger, and the pimento or, as it is called, Jamaica pepper; the wild cinnamon-tree, whose bark is so useful in medicine; the manchineel, whose fruit, though uncommonly delightful to the eye, contains one of the worst poisons in nature; the mahogany, in such use with our cabinet-makers, and of the most valuable quality; but this wood begins to wear out, and of late is very dear. Excellent cedars, of a large size and durable; the cabbage-tree, remarkable for the hardness of its wood, which when dry is incorruptible, and hardly yields to any kind of tool; the palma affording oil, much esteemed by the savages, both in food and medicine; the soap-tree, whose berries answer all purposes of washing; the mangrove and olive bark, useful to tanners; the suttic and redwood to the dyers; and lately the logwood. The indigo plant was formerly much cultivated; and the cotton-tree is still so. No sort of European grain grows here; they have only maize, or Indian corn, Guinea corn, peas of various kinds, but none of them resembling ours, with variety of roots. Fruits, as has been already observed, grow in great plenty; citrons, Seville and China oranges, common and sweet lemons, limes, shadocks, pomegranates, mamees, sourlops, papas, pine-apples, custard-apples, star-apples, prickly pears, allcanda, pears, melons, pompions, guavas, and several kinds of berries, also garden stuffs in great plenty, and good. The cattle bred on this island are but few; their beef is tough and lean; the mutton and lamb, are tolerable; they have great plenty of hogs; many planta-

plantations have hundreds of them, and their flesh is exceedingly sweet and delicate. Their horses are small, mettlesome, and hardy, and when well made, generally sell for 30 or 40 sterling. Jamaica likewise supplies the apothecary with gusiacum, sarsaparilla, china, cassia, and tamarinds. Among the animals are the land and sea turtle, and the alligator. Here are all sorts of fowl, wild and tame, and in particular more parrots than in any of the other islands; besides parroquets, pelicans, snips, teal, Guinea hens, geese, ducks, and turkeys; the humming bird, and a great variety of others. The rivers and bays abound with fish. The mountains breed numberless adders, and other noxious animals, as the fens and marshes do, the guana and gullewasp; but these last are not venomous. Among the insects are the ciror or chegos, which eats into the nervous and membranous parts of the flesh of the negroes, and the white people are sometimes plagued with them. These insects get into any part of the body, but chiefly the legs and feet, where they breed in great numbers, and shut themselves up in a bag. As soon as the person feels them, which is not perhaps till a week after they have been in the body, they pick them out with a needle, or point of a penknife, taking care to destroy the bag entirely, that none of the breed, which are like nits, may be left behind. They sometimes get into the toes, and eat the flesh to the very bone.

This island was originally a part of the Spanish empire in America. Several descents had been made upon it by the English, prior to 1656; but it was not till this year that Jamaica was reduced under our dominion.—Cromwell had fitted out a squadron under Penn and Venables, to reduce the Spanish island of Hispaniola, but there this squadron was unsuccessful. The commanders of their own accord, to atone for this misfortune, made a descent upon Jamaica, and having carried the capital, St. Jago, soon compelled the whole island to surrender. Ever since it has been subject to the English, and the government of it is one of the richest places, next to that of Ireland, in the disposal of the crown, the standing salary being 2,500*l.* per annum, and the assembly commonly voting the governor as much more; which, with the other perquisites, make it on the whole little inferior to 10,000*l.* per annum.

We have already observed, that the government of all the American islands is the same, namely, that kind which we have formerly described under the name of a royal government. Their religion too is universally of the church of England; though they have no bishop, the bishop of London's commissary being the chief religious magistrate in those parts.

About the beginning of this century, it was computed, that the number of whites in Jamaica amounted to 60,000, and that of the negroes to 120,000. It appears at present that Jamaica is rather on the decline, as is the number of inhabitants, the whites not exceeding 25,000, and the blacks 90,000. Besides these, a number of fugitive negroes have formed a sort of colony among the Blue Mountains, independent of the whites, with whom they make treaties, and are in some respects useful to the inhabitants of the island, particularly in sending back runaway slaves.

Indigo was once very much cultivated in Jamaica, and it enriched the island to so great a degree, that in the parish of Vera, where this drug was chiefly cultivated, they are said to have had no less than 300 gentlemen's coaches; a number perhaps even the whole island exceeds not at this day; and there is great reason to believe, that there were many more persons of property in Jamaica formerly than there are now; though perhaps they had

had not those vast fortunes which dazzle us in such a manner at present; However, the Jamaicans were undoubtedly very numerous, until reduced by earthquakes, and by terrible epidemical diseases, which, treading on the heels of the former calamities, swept away vast multitudes. The decrease of inhabitants, as well as the decline of their commerce, arises from the difficulties to which their trade is exposed, of which they do not fail to complain to the court of Great Britain: as that they are of late deprived of the most beneficial part of their trade, the carrying of negroes and dry goods to the Spanish coast; the low value of their produce, which they ascribe to the great improvements the French make in their sugar colonies, who are enabled to undersell them by the lowness of their duties; and the trade carried on from Ireland and the northern colonies to the French and Dutch islands, where they pay no duties, and are supplied with goods at an easier rate. Some of these complaints, which equally affect the other islands, have been heard, and some remedies applied; others remain unredressed. Both the log-wood trade, and this contraband, have been the subjects of much contention, and the cause of a war between Great Britain and the Spanish nation. The former we always avowed, and claimed as our right, and at the peace of 1763, it was confirmed to us. The latter we permitted; because we thought, and very justly, that if the Spaniards found themselves aggrieved by any contraband trade, it lay upon them, and not upon us, to put a stop to it, by their guarda costas which cruise in these seas, purposely to seize and confiscate such vessels and cargoes as are found in this trade. In this manner did the British court argue, till the politics of this nation, in compliance with the court of Spain, thought proper to send English cruisers to the American coast, effectually to crush that lucrative trade, of which the whole body of British subjects in America loudly complained, as it put a stop to the principal channel which hitherto enabled them to remit so largely to Great Britain.

Port Royal was formerly the capital of Jamaica. It stood upon the point of a narrow neck of land, which, towards the sea, formed part of the border of a very fine harbour of its own name. The conveniency of this harbour, which was capable of containing a thousand sail of large ships, and of such depth as to allow them to load and unload at the greatest ease, weighed so much with the inhabitants, that they chose to build their capital on this spot; though the place was a hot dry land, and produced none of the necessaries of life, not even fresh water. But the advantage of its harbour, and the resort of pirates, made it a place of great consideration. These pirates were called Buccaneers; they fought with an inconsiderate bravery, and then spent their fortune in this capital with as inconsiderate dissipation. About the beginning of the year 1698, no place, for its size, could be compared to this town for trade, wealth, and an entire corruption of manners. In the month of June, in this year, an earthquake, which shook the whole island to the foundations, totally overwhelmed this city, so as to leave, in one quarter, not even the smallest vestige remaining. In two minutes, the earth opened and swallowed up nine-tenths of the houses, and two thousand people. The water gushed out from the openings of the earth, and tumbled the people on heaps; but some of them had the good fortune to catch hold of beams and rafters of houses, and were afterwards saved by boats. Several ships were cast away in the harbour; and the Swan frigate, which lay in the dock to careen, was carried over the tops of sinking houses, and did not overset, but afforded a retreat to some hundreds of people, who saved their lives upon

her. An earthquake, who was in town at this time, says, the earth opened and shut very often in some places, and he saw several people sink down to the middle, and others appeared with their heads just above ground, and were squeezed to death. At Savannah, above a thousand acres were sunk, with the houses and people in them; the place appearing for some time like a lake, was afterwards dried up, but no houses were seen. In some parts, mountains were split; and at one place a plantation was removed to the distance of a mile. They again rebuilt the city; but it was a second time, ten years after, destroyed by a great fire. The extraordinary convenience of the harbour tempted them to build it once more; and once more, in 1722, was it laid in rubbish by a hurricane, the most terrible on record. Such repeated calamities seemed to mark out this place as a devoted spot; the inhabitants, therefore, resolved to forsake it for ever, and to reside at the opposite bay, where they built Kingston, which is lately become the capital of the island. It consists of upwards of one thousand houses, many of them handsomely built, and in the taste of these islands, as well as the neighbouring continent, one story high, with porticos, and every conveniency for a comfortable habitation in that climate. Not far from Kingston, stands St. Jago de la Yega, a Spanish town which though at present inferior to Kingston, was once the capital of Jamaica, and is still the seat of government, and the place where the courts of justice are held.

On the 3d of October 1780, was a dreadful hurricane, which almost overwhelmed the little sea port town of Savannah-la-Mer, in Jamaica, and part of the adjacent country. Very few houses were left standing, and a great number of lives were lost. Much damage was also done, and many lives perished, in other parts of the island.

In 1795, Jamaica was not exempted from the calamities which afflicted the other West India Islands. On the 14th of June, a dreadful fire broke out at Montego bay, which consumed an immense quantity of stores, and reduced to ashes the greater part of the town. This was succeeded by a calamity of a still more serious aspect, a war with the Maroons. After several bloody engagements in which the British had generally the advantage, the Maroons by the indefatigable zeal of general Walpole were completely hemmed in. They were reduced to such distress, that they surrendered to the British together with their families, and were removed in the month of June following to Lower Canada, where lands were provided for them, and where they are to form a settlement.

The whole product of the island may be reduced to three heads. First, sugars, of which they exported in 1753, twenty thousand three hundred and sixteen hogheads, some vastly great, even to a tun weight, which cannot be worth less in England than 424,725*l*. Most of this goes to London, Bristol, and Glasgow, and some part of it to North America, in return for the beef, pork, cheese, corn, peas, staves, planks, pitch, and tar, which they have from hence. Second, rum, of which they export about four thousand puncheons. The rum of this island is generally esteemed the best, and is the most used in Great Britain. Third, molasses, in which they made a great part of their returns for New England, where there are vast distilleries. All these are the produce of the grand staple, the sugar-cane. According to the late testimony of a respectable planter, in Jamaica, that island hath 280,000 acres in canes of which 210,000 are annually cut, and make from 68 to 70,000 tons of sugar, and 4,200,000 gallons of rum. Fourth, cotton, of which they send out two thousand bags. The indigo, formerly much cultivated, is now inconsiderable; but some cocoa and coffee

are exported, with a considerable quantity of pepper, ginger, drugs for dyers and apothecaries, sweatmeats, mahogany, and manchineel planks. But some of the most considerable articles of their trade are with the Spanish continent of New Spain and Terra Firma; for in the former they cut great quantities of logwood, and both in the former and latter they carried on a vast and profitable trade in Negroes, and all kinds of European goods. And even in time of war with Spain, this trade between Jamaica and the Spanish Main goes on, which will be impossible for Spain to stop, whilst it is so profitable to the British merchant, and whilst the Spanish officers, from the highest to the lowest, shew so great a respect to presents properly made. Upon the whole, many of the people of Jamaica, whilst they appear to live in such a state of luxury, as in most other places leads to beggary, acquire great fortunes, in a manner, instantly. Their equipages, their clothes, their furniture, their tables, all bear the tokens of the greatest wealth and profusion imaginable. This obliges all the treasure they receive to make but a very short stay, being hardly more than sufficient to answer the calls of their necessity and luxury on Europe and North America.

On Sundays, or court time, gentlemen wear wigs, and appear very gay in coats of silk, and vests trimmed with silver. At other times they generally wear only thread stockings, linnen drawers, a vest, a Holland cap, and a hat upon it. Men servants wear a coarse linnen frock, with buttons at the neck and hands, long trowsers of the same, and a check shirt. The negroes, except those who attend gentlemen, who have them dressed in their own livery, have once a year Osnaburghs, and a blanket for clothing, with a cap or handkerchief for the head. The morning habit of the ladies is a loose nightgown, carelessly wrapped about them; before dinner they put off the dishabille, and appear with a good grace in all the advantage of a rich and becoming dress.

The common drink of persons in affluent circumstances is Madeira wine mixed with water. Ale and claret are extravagantly dear; and London porter sells for a shilling per bottle. But the general drink, especially among those of inferior rank, is rum punch, which they call Kill-Devil, because being frequently drunk to excess, it heats the blood, and brings on fevers, which in a few hours send them to the grave, especially those who are just come to the island, which is the reason that so many die here upon their first arrival.

English money is seldom seen here, the current coin being entirely Spanish. There is no place where silver is so plentiful, or has a quicker circulation. You cannot dine for less than a piece of eight, and the common rate of boarding is three pounds per week; though in the markets beef, pork, fowl and fish, may be bought as cheap as in London; but mutton sells at nine pence per pound.

Learning is here at a very low ebb; there are indeed some gentlemen well versed in literature, and who send their children to Great Britain, where they have the advantage of a polite and liberal education; but the bulk of the people take little care to improve their minds, being generally engaged in trade or riotous dissipation.

The misery and hardships of the Negroes are truly moving: and though great care is taken to make them propagate, the ill treatment they receive so shortens their lives, that instead of increasing by the course of nature, many thousands are annually imported to the West Indies, to supply the place of those who pine and die by the hardships they receive. that they are stubborn and untractable, for the most part, and that they must be ruled with a rod of iron; but they ought not to be crushed with it, or to be thought a sort of beasts, without souls, as some of their masters or overseers do at present, though some of these tyrants are themselves the dogs of this nation, and the refuse of the jails of Europe. Many of the Negroes, however, who fall into the hands of gentlemen of humanity, find their situations easy and comfortable; and it has been observed, that in North America, where in general these poor wretches are better used, there is a less waste of Negroes, they live longer, and propagate better. And it seems clear, from the whole course of history, that those nations which have behaved with the greatest humanity to their slaves, were always best served, and ran the least hazard from their rebellions.— The slaves on their first arrival from the coast of Guinea, are exposed naked to sale; they are then generally very simple and innocent creatures, but soon become roguish enough; and when they come to be whipped excuse their faults by the example of the whites. They believe every Negro returns to his native country after death. This thought is so agreeable, that it cheers the poor creatures, and renders the burthen of life easy, which would otherwise, to many of them, be quite intolerable.— They look on death as a blessing, and it is surprising to see with what courage and intrepidity some of them meet it; they are quite transported to think their slavery is near at an end; that they shall revisit their native shores, and see their old friends and acquaintance. When a negroe is about to expire, his fellow slaves kiss him, and wish him a good journey, and send their hearty good wishes to their relations in Guinea. They make no lamentation; but with a great deal of joy enter his body, believing he is gone home, and happy.

BARBADOES.] This island, the most easterly of all the Caribbees, is situated in 59 degrees west long. and 13 degrees north lat. It is 21 miles in length, and in breadth 14. When the English, some time after the year 1625, first landed here, they found it the most savage and destitute place they had hitherto visited. It had not the least appearance of ever having been peopled even by savages. There was no kind of beasts of pasture or of prey, no fruit, no herb, nor root, fit for supporting the life of man. Yet as the climate was so good, and the soil appeared fertile, some gentlemen of small fortunes in England resolved to become adventurers thither. The trees were so large, and of a wood so hard and stubborn, that it was with great difficulty they could clear as much ground as was necessary for their subsistence. By unremitting perseverance, however, they brought it to yield them a tolerable support; and they found that cotton and indigo agreed well with the soil, and that tobacco, which was beginning to come into repute in England, answered tolerably. These prospects, together with the storm between the king and parliament, which was beginning to break out in England, induced many new adventurers to transport themselves into this island. And what is extremely remarkable, so great was the increase of people in Barbadoes, 25 years after its first settlement; that in 1650, it contained more than 50,000 whites, and a much greater number of Negroes and Indian slaves; the latter they acquired by means not at all to their honour; for they seized upon all those unhappy men, without any pretence, in the neighbouring islands, and carried them into slavery. A practice which has rendered the Caribbee Indians irreconcilable to us ever since. They had begun, a little before this, to cultivate sugar, which soon rendered them extremely wealthy.—The number of the slaves therefore was still augmented; and in 1676, it is supposed that their number

amounted to 100,000 which, together with 50,000, make 150,000 on this small spot; a degree of population unknown in Holland, in China, or any other part of the world most renowned for numbers. At this time Barbadoes employed 400 sail of ships, one with another of 150 tons, in their trade. Their annual exports in sugar, indigo, ginger, cotton, and citron-water, were above 350,000*l.* and their circulating cash at home was 200,000*l.* Such was the increase of population, trade, and wealth, in the course of 50 years. But since that time, this island has been much on the decline, which is to be attributed partly to the growth of the French sugar colonies, and partly to our own establishments in the neighbouring isles. Their numbers at present are said to be 20,000 whites, and 100,000 slaves. Their commerce consists in the same articles as formerly, though they deal in them to less extent. The capital is Bridgetown, where the governor resides, whose employment is said to be worth 5000*l.* per annum. They have a college, founded and well endowed by colonel Codrington, who was a native of this island. Barbadoes, as well as Jamaica, has suffered much by hurricanes, fires, and the plague. On the 10th of October 1780, a dreadful hurricane occasioned vast devastation in Barbadoes, great numbers of the houses were destroyed, not one house in the island was wholly free from damage, many persons were buried in the ruins of the buildings, and great numbers were driven into the sea, and there perished.

St. CHRISTOPHER'S.] This island, commonly called by the sailors *St. Kitt's*, is situated in 62 degrees west long. and 17 degrees north lat. about 14 leagues from Antigua, and is twenty miles long and seven broad. It has its name from the famous Christopher Columbus, who discovered it for the Spaniards. That nation, however, abandoned it, as unworthy of their attention; and in 1626, it was settled by the French and English conjointly; but entirely ceded to us by the peace of Utrecht. Besides cotton, ginger, and the tropical fruits, it generally produces near as much sugar as Barbadoes, and sometimes quite as much. It is computed that this island contains 6000 whites, and 36,000 Negroes. In February, 1782, it was taken by the French, but was restored again to Great Britain by the late treaty of peace.

ANTIGUA.] Situated in 61 deg. W. lon. and 17 deg. N. lat. is of a circular form, near 20 miles over every way. This island, which was formerly thought useless, has now got the start of the rest of the English harbours, being the best and safest as a dock-yard, and an establishment for the royal navy; but *St. John's* is the port of greatest trade; and this capital, which, before the fire in 1769, was large and wealthy, is the ordinary seat of the governor of the Leeward islands. Antigua is supposed to contain about 7000 whites, and 30,000 slaves.

NEVIS AND MONTSERRAT.] Two small islands, lying between *St. Christopher's* and Antigua, neither of them exceeding 18 miles in circumference, and are said each to contain 5000 whites, and 10,000 slaves. The soil in these four islands is pretty much alike, light and sandy, but notwithstanding, fertile in a high degree; and their principal exports are derived from the sugar cane. Both were taken by the French in the year 1782, but restored at the peace.

BARBUDA.] Situated in 18 deg. N. lat. 35 miles north of Antigua, is 20 miles in length, and 12 in breadth. It is fertile, and has an indifferent road for shipping, but no direct trade with England. The inhabitants are chiefly employed in husbandry, and raising fresh provisions for the use of the neighbouring isles. It belongs to the Codrington family, and the inhabitants amount to about 1500.

ANGUILLA.] Situated in 19 deg. N. lat. 60 miles north-west of St. Christopher's, is about 30 miles long and 10 broad. This island is perfectly level, and the climate nearly the same with that of Jamaica.—The inhabitants, who are not numerous, apply themselves to husbandry, and feeding of cattle.

DOMINICA.] Situated in 16 deg. N. lat. and in 62 W. lon. lies about half way between Guadalupe and Martinico. It is near 28 miles in length, and 13 in breadth: it got its name from being discovered by Columbus on a Sunday. The soil of this island is thin, and better adapted to the rearing of coffee than sugar; but the sides of the hills bear the finest trees in the West Indies, and the island is well supplied with rivulets of fine water. The French have always opposed our settling here, because it must cut off their communication, in time of war, between Martinico and Guadalupe. However, by the peace of Paris, in 1763, it was ceded in express terms to the English; but we have derived little advantage from this conquest, the island being, till lately, no better than a harbour for the natives of the other Caribbees, who being expelled their own settlements, have taken refuge here. But, on account of its situation between the principal French islands, and Prince Rupert's Bay being one of the most capacious in the West Indies, it has been judged expedient to form Dominica into a government of itself, and to declare it a free port. It was taken by the French in 1778; but was restored again to Great Britain by the late peace. A plan was concerted for the reduction of this island in 1793 by Victor Hughes; the enemy were, however attacked by the inhabitants with such spirit, that they were obliged to submit.

St. VINCENT.] Situated in 13 deg. N. lat. and 61. deg. W. lon. 50 miles north west of Barbadoes, 30 miles south of St. Lucia, is about 24 miles in length, and 18 in breadth. It is extremely fruitful, being a black mould upon a strong loam, the most proper for the raising of sugar. Indigo thrives here remarkably well, but this article is less cultivated than formerly throughout the West Indies. Many of the inhabitants are Caribbeans, and many here are also fugitives from Barbadoes and the other islands. The Caribbeans were treated with so much injustice and barbarity, after this island came into possession of the English, to whom it was ceded by the peace in 1763; that they greatly contributed towards enabling the French to get possession of it again in 1779; but it was restored to Great Britain by the late treaty of peace. In 1795 an insurrection broke out among the Caribbs, who repulsed the British troops in several serious conflicts. They were obliged soon after to submit to the British arms.

GRANADA AND THE GRANADINES.] Granada is situated in 12 deg. north lat. and 62 deg. west lon. about 30 leagues south-west of Barbadoes, and almost the same distance north of New Andalusia, or the Spanish Main. This island is said to be 30 miles in length, and 15 in breadth. Experience has proved, that the soil of this island is extremely proper for producing sugar, coffee, tobacco, and Indigo; and upon the whole it carries with it all the appearance of becoming as flourishing a colony as any in the West Indies, of its dimensions. A lake on the top of a hill, in the middle of the island, supplies it plentifully with fine rivers, which adorn and fertilize it. Several bays and harbours lie round the island, some of which may be fortified with great advantage, which renders it very convenient for shipping; and has the happiness of not being subject to hurricanes. St. George's bay has a sandy bottom, and is extremely capacious, but open. In its harbour, or careening place, 100 large vessels may be moored with perfect safety. This island was long the theatre of bloody wars between

the

the native Indians and the French, during which these handful of Caribbees defended themselves with the most resolute bravery. In the last war but one, when Granada was attacked by the English, the French inhabitants, who were not very numerous, were so amazed at the reduction of Guadaloupe and Martinico, that they lost all spirit, and surrendered without making the least opposition; and the soil property of this island, together with the small islands on the north, called the Granadines, which yield the same produce, were confirmed to the crown of Great Britain by the treaty of Paris in 1763.—But in July 1775, the French made themselves masters of this island; though it was restored to Great Britain by the late treaty of peace. Granada in 1795 at the same time that the other islands were in a state of tumult likewise suffered the calamities of an insurrection. The insurgents, were seconded by Victor Hughes, who was dispatched thither with a small detachment of French troops, but they were obliged at last to submit to the British.

NEWFOUNDLAND.] Exclusive of the West-India sugar islands, lying between the two continents of America; Great Britain claims several others, that are seated at the distance of some thousand miles from each other, in this quarter of the globe, of which we shall speak according to our method, beginning with the north.

Newfoundland is situated to the east of the gulf of St. Lawrence, between 46 and 52 deg. north lat. and between 53 and 59 deg. west long. separated from Labrador or New Britain by the Straits of Belleisle, and from Canada by the bay of St. Lawrence, being 350 miles long, and 200 broad. The coasts are extremely subject to fogs, attended with almost continual storms of snow and sleet, the sky being usually overcast. From the soil of this island we are far from reaping any sudden or great advantage, for the cold is long continued, and severe; and the summer heat, though violent, warms it not enough to produce any thing valuable; for the soil, at least in those parts of the island with which we are acquainted, is rocky and barren. However, it is watered by several good rivers, and hath many large and good harbours. This island, whenever the continent shall come to fail of timber, convenient to navigation (which on the sea-coast perhaps is no very remote prospect) it is said, will afford a large supply for masts, yards, and all sorts of lumber for the West-India trade. But what at present it is chiefly valuable for, is the great fishery of cod, carried on upon those shoals, which are called the Banks of Newfoundland. Great Britain and North America, at the lowest computation, annually employ 3000 sail of small craft in this fishery; on board of which, and on shore to cure and pack the fish, are upwards of 10,000 hands; so that this fishery is not only a very valuable branch of trade to the merchant, but a source of livelihood to so many thousands of poor people, and a most excellent nursery to the royal navy. This fishery is computed to increase the national stock 300,000*l.* a year in gold and silver, remitted to us for the cod we sell in the North, in Spain, Portugal, Italy, and the Levant. The plenty of cod both on the Great Bank, and the lesser ones, which lie on the east and south-east of this island, is inconceivable; and not only cod, but several other species of fish are caught there in abundance; all of which are nearly in an equal plenty along the shores of Newfoundland, Nova Scotia, New England, and the Isle of Cape Breton; and very profitable fisheries are carried on upon all their coasts, from which we may observe, that where our colonies are thinly peopled, or so barren as not to produce any thing from their soil, their coasts make us ample amends, and pour in upon us a wealth of another kind, and no way inferior to that arising from the most fertile soil.

This island, after various disputes about the property, was entirely ceded to England by the treaty of Utrecht in 1713; but the French were left at liberty to dry their nets on the northern shores of the island; and by the treaty of 1763, they were permitted to fish in the gulf of St. Laurence, but with this limitation, that they should not approach within three leagues of any of the coasts belonging to England. The small islands of St. Pierre and Miquelon, situated to the south of Newfoundland, were also ceded to the French, who stipulated to erect no fortifications on these islands, nor to keep more than 50 soldiers to enforce the police. By the last treaty of peace, the French are to enjoy the fisheries on the north and west coast of the island. The chief towns in Newfoundland are Placentia, Bonavista, and St. John; but not above 1000 families remain here in the winter.

CAPE BRETON.] This island, seated between Newfoundland and Nova Scotia, is in length about 110 miles. The soil is barren, but it has good harbours, particularly that of Louisburgh, which is near four leagues in circumference, and has every where six or seven fathoms water.

The French began a settlement in this island in 1714, which they continued to increase, and fortified it in 1720. They were, however, dispossessed in 1745, by the bravery of the inhabitants of New England, with little assistance from Great Britain; but it was again, by the treaty of Aix la Chapelle, ceded to the French, who spared no expence to fortify and strengthen it. Notwithstanding which, it was again reduced, in 1758, by the British troops under general Amherst and Admiral Boscawen, together with a large body of New-England men, who found in that place two hundred and twenty-one pieces of cannon, and eighteen mortars, together with a large quantity of ammunition and stores: and it was ceded to the crown of Great Britain by the peace of 1763, since which the fortifications have been blown up, and the town of Louisburgh dismantled.

ST. JOHN'S.] Situated in the Gulf of St. Lawrence, is about 60 miles in length, and 30 or 40 broad, and has many fine rivers; and though lying near Cape Breton and Nova Scotia, has greatly the advantage of both in pleasantness and fertility of soil. Upon the reduction of Cape Breton, the inhabitants of this island, amounting to 4000, submitted quietly to the British arms; and, to the disgrace of the French governor, there were found in his house several English scalps, which were brought there to market by the savages; this being the place where they were encouraged to carry on that barbarous and inhuman trade. This island was so well improved by the French, that it was styled the granary of Canada, which it furnished with great plenty of corn, as well as beef and pork.

BERMUDAS, OR SUMMER ISLANDS.] These received their first name from their being discovered by John Bermudas, a Spaniard; and were called the Summer Islands, from sir George Summers, who was shipwrecked on their rocks in 1609, in his passage to Virginia. They are situated, at a vast distance from any continent, in 32 deg. north lat. and 75 degrees west lon. Their distance from the Land's End is computed to be near 1500 leagues, from the Madeiras about 1200, and from Carolina 300. The Bermudas are but small, not containing in all above 20,000 acres; and are very difficult of access, being, as Waller the poet, who resided some time there expresses it, 'walled with rocks.' The air of these islands, which Waller celebrates in one of his poems, has been always esteemed extremely healthful; and the beauty and richness of the vegetable productions are perfectly delightful. Though the soil of these islands is admirably adapted to the cultivation

tion of the wine, the chief and only business of the inhabitants, who consist of about 10,000, is the building and navigating of light sloops and brigantines, which they employ chiefly in the trade between North America and the West Indies. These vessels are as remarkable for their swiftness, as the cedar, of which they are built, is for its hard and durable quality.

The town of St. George, which is the capital, is seated at the bottom of a haven in the island of the same name, and is defended with seven or eight forts, and seventy pieces of cannon. It contains above 1000 houses, a handsome church, and other elegant public buildings.

LUCAY'S, OR BAHAMA ISLANDS.] The Bahama are situated to the south of Carolina, between 22 and 27 degrees north lat. and 73 and 81 degrees west lon. They extend along the coast of Florida quite down to the Isle of Cuba; and are said to be 500 in number, some of them only mere rocks; but 12 of them are large, fertile, and in nothing different from the soil of Cuba; they are, however, almost uninhabited, except Providence, which is 200 miles east of Florida; though some others are larger and more fertile, on which the English have plantations. Between them and the continent of Florida is the gulf of Bahama, or Florida, through which the Spanish galleons sail in their passage to Europe. These islands were the first fruits of Columbus's discoveries; but they were not known to the English till 1667, when captain Seyle, being driven among them in his passage to Carolina, gave his name to one of them; and being a second time driven upon it, gave it the name of Providence. The English, observing the advantageous situation of these islands for being a check on the French and Spaniards, attempted to settle them in the reign of Charles II. Some unlucky incidents prevented this settlement from being of any advantage, and the Isle of Providence became a harbour for the buccaners, or pirates, who for a long time infested the American navigation. This obliged the government, in 1718, to send out captain Woods Rogers with a fleet to dislodge the pirates, and for making a settlement. This the captain effected; a fort was erected, and an independent company was stationed in the island. Ever since this last settlement these islands have been improving, though they advance but slowly. In time of war, people gain considerably by the prizes condemned there; and at all times by the wrecks, which are frequent in this labyrinth of rocks and shelves. The Spaniards captured these islands during the last war, but they were retaken by a detachment from St. Augustine, April 7th, 1783.

FALKLAND ISLANDS.] Leaving the Bahama and West-India islands, we shall now proceed along the south-east coast of America, as far as the 52d. deg. of south lat. where the reader, by looking into the map, will perceive the Falkland Islands situated near the Straits of Magellan, at the utmost extremity of South America. Falkland Islands were first discovered by Sir Richard Hawkins, in 1594, the principal of which he named Hawkins-Maidenland, in honour of queen Elizabeth. The present English name Falkland, was probably given them by captain Strong, in 1639, and being adopted by Halley, it has from that time been received into our maps. They have occasioned some contest between Spain and Great Britain, but being of very little worth, seem to have been silently abandoned by the latter, in 1774, in order to avoid giving umbrage to the Spanish court.

MARTINICO.] Which is situated between 14 and 15 deg. of north lat. and in 61 degrees west lon. lying about 40 leagues north-west of Barbadoes, is about 60 miles in length, and half as much in breadth. The inland part of it is hilly, from which are poured out, upon every side, a number of agreeable

and useful rivers, which adorn and enrich this island in a high degree. The produce of the soil is sugar, cotton, indigo, ginger, and such fruits as are found in the neighbouring islands. But sugar is here, as in all the West-India islands, the principal commodity, of which they export a considerable quantity annually. Martinico was formerly the residence of the governor of the French islands in these seas. Its bays and harbours are numerous, safe, and commodious, and so well fortified, that they used to bid defiance to the English, who in vain, often attempted this place. However, in the war of 1756, when the British arms were triumphant in every quarter of the globe, this island was added to the British empire, but it was given back at the treaty of peace. Since the beginning of the present war (1799) it has been reduced by the British arms and still remains in their possession.

St. LUCIA.] Situated in 14 deg. north lat. and in 61 deg. west lon. 80 miles north-west of Barbadoes, is 23 miles in length, and 12 in breadth. It received its name from being discovered on the day dedicated to the virgin martyr St. Lucia. The English first settled on this island in 1637. From this time they met with various misfortunes from the natives and French; and at length it was agreed on between the latter and the English, that this island, together with Dominica and St. Vincent, should remain neutral. But the French, before the war of 1756 broke out, began to settle these islands; which, by the treaty of peace, were yielded up to Great Britain, and this island to France. The soil of St. Lucia, in the vallies, is extremely rich. It produces excellent timber, and abounds in pleasant rivers, and well-situated harbours; and is now declared a free port under certain restrictions. The English made themselves masters of it in 1778; but it was restored again to the French in 1783. The British made themselves masters of this island in 1794, and it still remains in their possession.

TOBAGO.] This island is situated 11 degrees odd min. north lat. 120 miles south of Barbadoes, and about the same distance from the Spanish Main. It is about 32 miles in length, and nine in breadth. The climate here is not so hot as might be expected so near the equator; and it is said that it lies out of the course of those hurricanes that have sometimes proved so fatal to the other West-India islands. It has a fruitful soil, capable of producing sugar, and indeed every thing else that is raised in the West-Indies, with the addition (if we may believe the Dutch) of the cinnamon, nutmeg, and gum copal. It is well watered with numerous springs; and its bays and creeks are so disposed as to be very commodious for all kinds of shipping. The value and importance of this island appear from the expensive and formidable armaments sent thither by European powers in support of their different claims. It seems to have been chiefly possessed by the Dutch, who defended their pretensions against both England and France with the most obstinate perseverance. By the treaty of Aix-la-Chapelle, in 1748, it was declared neutral; but by the treaty of peace in 1763, it was yielded up to Great Britain. In June 1781, it was taken by the French; and was ceded to them by the treaty of 1782. This island in 1794 was reduced by the British arms, and it still belongs to them.

TRINIDAD.] Situated between 59 and 62 degrees west lon. and in 10 degrees north lat. lies between the island of Tobago and the Spanish Main; from which it is separated by the Straights of Paria. It is about 90 miles long, and 60 broad; and is an unhealthy, but fruitful soil, producing sugar, fine tobacco, indigo, ginger, variety of fruit, and some cotton trees, and Indian corn. It was taken by Sir Walter Raleigh in 1595, and by the French in 1676, who plundered the island, and extorted money from the inhabitants.

It was again taken by the British forces in 1797, under Sir Ralph Abercrombie and admiral Hervey.

SPANISH DOMINIONS IN NORTH AMERICA.

EAST AND WEST FLORIDA.

SITUATION AND EXTENT.

Miles.		Degrees.	Sq. M.
Length 500 } between		{ 86 and 91 West longitude.	} 100,000
Breadth 440 }		{ 25 and 32 North latitude.	

BOUNDARIES.] THIS country, which was ceded by Great Britain to Spain by the late treaty of peace, is bounded by Georgia on the North; by the Mississippi on the West; by the Gulf of Mexico on the South; and by the Bahama Straits on the East.

RIVERS.] These are the Mississippi, which is one of the finest in the world, as well as the largest; for, including its turnings and windings, it is supposed to run a course of 4500 miles; but its mouths are in a manner choked up with sands and shoals, which deny access to vessels of any considerable burden; there being, according to Mitchell's map, only twelve feet water over the bar (captain Pitman says seventeen) at the principal entrance. Within the bar there is 100 fathom water, and the channel is every where deep, and the current gentle, except at a certain season, when, like the Nile, it overflows and becomes extremely rapid. It is, except at the entrance already mentioned, every where free from shoals and cataraets, and navigable for craft of one kind or other almost to its source. The Mobile, the Apalachicola, and St. John's rivers, are also large and noble streams.

BAYS AND CAPES.] The principal bays are St. Bernard's, Ascension, Mobile, Pensacola, Dauphin, Joseph, Apalaxy, Spiritu Sancto, and Charles Bay.

The chief capes are, Cape Blanco, Sables, Anclote, and Cape Florida, at the extremity of the peninsula.

AIR AND CLIMATE.] Very various reports have been given of these particulars in this country; but that the air of Florida is pure and wholesome, appears from the size, vigour, and longevity of the Floridian Indians, who, in these respects, far exceed their more southern neighbours the Mexicans.

SOIL, PRODUCTIONS, AND } East Florida, near the sea, and 40 miles
FACE OF THE COUNTRY. } back, is flat and sandy. But even the country round St. Augustine, in all appearance the worst in the province, is far from being unfruitful; it produces two crops of Indian corn a-year; the garden vegetables are in great perfection; the orange and lemon-trees grow here, without cultivation, to a large size, and produce better fruit than in Spain and Portugal. The inward country toward the hills is extremely rich and

 temperate

and fertile, producing spontaneously the fruits, vegetables, and gums, that are common to Georgia and the Carolinas, and is likewise favourable to the rearing of European productions.

This country also produces rice, indigo, ambergris, cochineal, amethysts, turquoises, lapis lazuli, and other precious stones; copper, quick-silver, pitch-coal, and iron-ore; pearls are also found on the coast of Florida; mahogany grows on the southern parts of the peninsula, but inferior in size and quality to that of Jamaica. The animal creation are here so numerous, that you may purchase a good saddle-horse, in exchange for goods of five shillings value prime cost; and there are instances of horses being exchanged for a hatchet per head.

CHIEF TOWNS.] The chief town in West Florida is Pensacola, N. lat. 30-22. W. long. 87-20. which is situated within the bay of the same name, on a sandy shore that can only be approached by small vessels. The road is, however, one of the best in all the Gulf of Mexico, in which vessels may lie in safety against every kind of wind, being surrounded by land on every side.

St. Augustine, the capital of East Florida, N. lat. 29-45. W. long. 81-12. runs along the shore, and is of an oblong form, divided by four regular streets, crossing each other at right angles. The town is fortified with bastions, and enclosed with a ditch. It is likewise defended by a castle, which is called Fort St. John, and the whole is well furnished with cannon.

At the entrance into the harbour are the north and south breakers, which form two channels, whose bars, or low tides, have eight feet water.

NEW MEXICO, INCLUDING CALIFORNIA.

Divisions. Subdivisions. Chief Towns.

North-east division	{ New Mexico Proper }	{ SANTA FE, W. Lon. 104. N. lat. 36.
South-east division	Apacheira — —	St. Antonio.
South division	Sonora — —	Tuape.
Western division	California, a peninsula	St. Juan.

SOIL AND CLIMATE.] These countries lying for the most part within the temperate zone, have a climate in many places extremely agreeable, and a soil

productive of every thing, either for profit or delight. In California, however, they experience great heats in the summer, particularly towards the sea-coast; but in the inland country the climate is more temperate, and in winter even cold.

FACE AND PRODUCE OF THE COUNTRY.] The natural history of these countries, is as yet in its infancy. The Spaniards themselves know little of the matter, and the little they know they are unwilling to communicate. Their authority being on a precarious footing with the Indians, who here at least still preserve their independence; they are jealous of discovering the natural advantages of these countries, which might be an inducement to the other nations of Europe to form settlements there. It is certain, however, that in general the provinces of New Mexico and California are extremely beautiful and pleasant; the face of the country is agreeably varied with plains, intersected by rivers, and adorned with gentle eminences covered with varied kinds of trees, some producing excellent fruit. With respect to the value of the gold-mines in those countries, nothing positive can be asserted. They have undoubtedly enough of natural productions, to render them advantageous colonies to any but the Spaniards. In California there falls in the morning a great quantity of dew, which, settling on the rose leaves, candies, and becomes hard like manna, having all the sweetness of refined sugar, without its whiteness. There is also another very singular natural production; in the heart of the country there are plains of salt, quite firm, and clear as crystal, which, considering the vast quantities of fish found on its coasts, might render it an invaluable acquisition to any industrious nation.

INHABITANTS, HISTORY, GOVERNMENT, } The Spanish settlements
RELIGION, AND COMMERCE. } here are comparatively weak; though they are increasing every day in proportion as new mines are discovered. The inhabitants are chiefly Indians whom the Spanish missionaries have in many places brought over to Christianity, to a civilized life, and to raise corn and wine, which they now export pretty largely to Old Mexico. California was discovered by Cortez, the great conqueror of Mexico; our famous navigator, sir Francis Drake, took possession of it in 1578, and his right was confirmed by the principal king, or chief in the whole country. This title, however, the government of Great Britain have not hitherto attempted to vindicate, though California is admirably situated for trade, and on its coast has a pearl fishery of great value. The inhabitants and government here do not materially differ from those of Old Mexico.

BAYS.] On the north sea are the gulfs or bays of Mexico, Campeachy, Vera Cruz, and Honduras; in the Pacific Ocean, or South Sea, are the bays Micoya and Amapalla, Acapulco and Salinas.

CAPEs.] These are the Cape Sardo, Cape St. Martin, Cape Corrucedo, Cape Catoelo, Cape Honduras, Cape Cameron, and Cape Gracias Dios, in the North Sea.

Cape Marques, Cape Spirito Sancto, Cape Coricantes, Cape Gallero, Cape Blanco, Cape Burica, Cape Pruceos, and Cape Mala, in the South Sea.

WINDS.] In the gulf of Mexico, and the adjacent seas, there are strong north winds from October to March, about the full and change of the moon. Trade winds prevail every where at a distance from land within the tropics. Near the coast, in the South Sea, they have periodical winds, viz. Monsoons, and sea and land breezes, as in Asia.

SOIL AND CLIMATE.] Mexico, lying for the most part within the torrid zone, is excessively hot, and on the eastern coast, where the land is low, marshy, and constantly flooded in the rainy seasons, it is likewise extremely unwholesome. The inland country, however, assumes a better aspect, and the air is of a milder temperament; on the western side, the land is not so low as on the eastern, much better in quality, and full of plantations. The soil of Mexico in general is of a good variety, and would not refuse any sort of grain, were the industry of the inhabitants to correspond with their natural advantages.

PRODUCE.] Mexico, like all the tropical countries, is rather more abundant in fruits than in grain. Pine apples, pomegranates, oranges, lemons, citrons, figs, and cocoa-nuts are here in the greatest plenty and perfection. Mexico produces also a prodigious quantity of sugar, especially towards the gulf of Mexico, and the province of Guaxaca and Guatemala, so that here are more sugar-mills than in any other part of Spanish America. Cedar trees and logwood flourish much about the Bays of Campeachy and Honduras. The maho-tree also, which hath a bark with such strong fibres, as they twist and make ropes of. They have also a tree, which is called light wood, being as light as a cork, of which they make floats to carry their merchandize on the sea-coasts. But what is considered as the chief glory of this country, and what first induced the Spaniards to form settlements upon it, are the mines of gold and silver. The chief mines of gold are in Veragua and New Granada, bordering upon Darien and Terra Firma. Those of silver, which are much more rich, as well as numerous, are found in several parts, but in none so much

ft ; by Terra
Firma

as in the province of Mexico. The mines of both kinds are always found in the most barren and mountainous part of the country: nature making amends in one respect for her defects in another. The working of the gold and silver mines depends on the same principles. When the ore is dug out, compounded of several heterogeneous substances, mixed with the precious metals, it is broken into small pieces by a mill, and afterwards washed, by which means it is disengaged from the earth, and other soft bodies which cling to it. Then it is mixed with mercury, which, of all substances, has the strongest attraction for gold, and likewise a stronger attraction for silver than the other substances which are united with it in the ore. By means of the mercury, therefore, the gold and silver are first separated from the heterogeneous matter, and then by straining an evaporation, they are disunited from the mercury itself. Of the gold and silver, which the mines of Mexico afford, great things have been said. Those who have enquired most into this subject, compute the revenues of Mexico at twenty-four millions of our money; and it is well known that this, with the other provinces of Spanish America, supply the whole world with silver. The other articles next in importance to gold and silver, are the cochineal and cocoa. After much dispute concerning the nature of the former, it seems at last agreed, that it is of the animal kind, and of the species of the gall insects. It adheres to the plant called *Opuntia*, and sucks the juice of the fruit, which is of a crimson colour. It is from this juice, that the cochineal derives its value, which consists in dyeing all sorts of the finest scarlet, crimson, and purple. It is also used in medicine as a sudorific, and as a cordial; and it is computed that the Spaniards annually export no less than nine hundred thousand pounds weight of this commodity; to answer the purposes of medicine and dyeing. The cocoa, of which chocolate is made, is the next considerable article in the natural history and commerce of Mexico. It grows on a tree of a middling size, which bears a pod about the size and shape of a cucumber, containing the cocoa. The Spanish commerce in this article is immense; and such is the internal consumption, as well as the external call for it, that a small garden of cocoas is said to produce to the owner twenty thousand crowns a year. At home it makes a principal part of their diet, and is found wholesome, nutritious, and suitable to the climate. This country likewise produces silk, but not so much as to make any remarkable part of their export. Cotton is here in great abundance, and on account of its lightness is the common wear of the inhabitants.

POPULATION, INHABITANTS, } We shall place these heads under one
GOVERNMENT, AND MANNERS. } point of view, because the reader will
soon be sensible they are very nearly connected. We have already described the original inhabitants of Mexico, and the conquest of that country by the Spaniards. The present inhabitants may be divided into Whites, Indians, and Negroes. The Whites are either born in Old Spain, or they are Creoles, i. e. natives of Spanish America. The former are chiefly employed in government or trade, and have nearly the same character with the Spaniards in Europe; only a still more considerable portion of pride; for they consider themselves as entitled to every high distinction as natives of Europe, and look upon the other inhabitants as many degrees beneath them. The Creoles have all the bad qualities of the Spaniards, from whom they are descended, without that courage, firmness, and patience, which make the praise-worthy of the Spanish character. Naturally weak and effeminate, they dedicate the greatest part of their lives to loitering and inactive pleasures. Luxurious without variety or elegance, and expensive with great parade, and little convenience, their general character is no more than a grave

and specious insignificance. From idleness and constitution their whole business is amour and intrigue; and their ladies of consequence are not at all distinguished for their chastity, or domestic virtues. The Indians, who, notwithstanding the devastations of their first invaders, remain in great numbers, are become, by continual oppression and indignity, a dejected, timorous, and miserable race of mortals. The blacks here, like all those in other parts of the world, are stubborn, hardy, and as well adapted for the gross slavery they endure, as any human creatures can be.

Such is the general character of the inhabitants, not only in Mexico, but the greatest part of Spanish America. The civil government is administered by tribunals, called Audiencias, which bear a resemblance to the old parliaments in France. In these courts the viceroy of the king of Spain presides. His employment is the greatest trust and power which his Catholic majesty has in his disposal, and is perhaps the richest government entrusted to any subject in the world. The greatness of the viceroy's office is diminished by the shortness of its duration. For, as jealousy is the leading feature of Spanish politics, in whatever regards America, no officer is allowed to maintain his power for more than three years, which no doubt may have a good effect in securing the authority of the crown of Spain, but is attended with unhappy consequences to the miserable inhabitants, who become a prey to every new governor. The clergy are extremely numerous in Mexico, and it has been computed, that priests, monks, and nuns of all orders, make upwards of a fifth of all the white inhabitants, both here and in other parts of Spanish America. It is impossible indeed to find a richer field, or one more peculiarly adapted to ecclesiastics, in any part of the world. The people are superstitious, ignorant, rich, lazy, and licentious: with such materials to work upon it is not remarkable, that the church should enjoy one fourth of the revenues of the whole kingdom. It is more surprising that it has not a half.

COMMERCE CITIES AND SHIPPING.] The trade of Mexico consists of three great branches, which extend over the whole known world. It carries on a traffic with Europe, by La Vera Cruz, situated on the gulf of Mexico, or North Sea; with the East Indies, by Acapulco on the South Sea, and with South America, by the same port. These two sea-ports, Vera Cruz and Acapulco, are wonderfully well situated for the commercial purposes to which they are applied. It is by means of the former that Mexico pours her wealth over the whole world; and receives in return the numberless luxuries and necessaries, which Europe affords to her, and which the indolence of her inhabitants will never permit them to acquire for themselves. To this port the fleet from Cadiz, called the Flota, consisting of three men of war, as a convoy, and fourteen large merchant ships, annually arrive about the beginning of November. Its cargo consists of every commodity and manufacture of Europe, and there are few nations but have more concern in it than the Spaniards, who send out little more than wine and oil. The profit of these, with the freight and commission to the merchants, and duty to the king, is all the advantage which Spain derives from her American commerce. When all the goods are landed and disposed of at La Vera Cruz, the fleet takes in the plate, precious stones, and other commodities for Europe. Sometime in May they are ready to depart. From La Vera Cruz they sail to the Havannah, in the isle of Cuba, which is the rendezvous where they meet the galleons, another fleet which carries on the trade of Terra Firma, by Cartliagena, and of Peru by Panama and Porto Bello. When

When all are collected, and provided with a convoy necessary for their safety, they steer for Old Spain.

Acapulco is the sea port, by which the communication is kept up between the different parts of the Spanish empire in America, and the East-Indies. About the month of December, the great galleon, attended by a large ship as a convoy, which make the only communication between the Philippines and Mexico, annually arrives here. The cargoes of these ships, (for the convoy, though in an under-hand manner, likewise carries goods), consist of all the rich commodities and manufactures of the East. At the same time the annual ship from Lima, the capital of Peru, comes in, and is not computed to bring less than two millions of pieces of eight in silver, besides quicksilver and other valuable commodities, to be laid out in the purchase of the galleon's cargoes. Several other ships, from different parts of Chili and Peru, meet upon the same occasion. A great fair, in which the commodities of all parts of the world are bartered for one another, lasts thirty days. The galleon then prepares for her voyage, loaded with silver and such European goods as have been thought necessary. The Spaniards, though this trade be carried on entirely through their hands, and in the very heart of their dominions, are comparatively but small gainers by it. For as they allow the Dutch, Great Britain, and other commercial states, to furnish the greater part of the cargoe of the Flota, so the Spanish inhabitants of the Philippines, tainted with the same indolence which ruined their European ancestors, permit the Chinese merchants to furnish the greater part of the cargoe of the galleon. Notwithstanding what has been said of Vera Cruz, and Acapulco; the city of Mexico, the capital of the empire, ought to be considered as the centre of commerce in this part of the world: for here the principal merchants reside, and the greatest part of the business is negotiated. The East India goods from Acapulco, and the European from Vera Cruz, all pass through this city. Hither all the gold and silver come to be coined, here the king's fifth is deposited, and here are wrought all those utensils and ornaments in plate which are every year sent into Europe. The city itself breathes the air of the highest magnificence, and according to the best accounts contains about 80,000 inhabitants.

the East; by the country of the Amazons and Peru, on the South; and by the Pacific Ocean and New Spain, on the West.

Divisions.	Subdivisions.	Chief Towns.
The northern division contains the provinces of	1. Terra Firma Proper, or Darien	Porto Bello PANAMA, W. lon. 80. 21. N. lat. 8-47.
	2. Cartagena	Cartagena
	3. St. Martha	St. Martha
	4. Rio de la Hacha	Rio de la Hacha
	5. Venezuela	Venezuela
	6. Comana	Comana
	7. New Andalusia, or Paria	St. Thomas
The southern division contains the provinces of	1. New Granada	Santa Fé de Bagota
	2. Popayan	Popayan.

BAYS, CAPES, &c. The Isthmus of Darien, or Terra Firma Proper, joins North and South America. A line drawn from Porto Bello in the North, to Panama in the South Sea, or rather a little west of these two towns, is the proper limit between North and South America, and here the Isthmus or neck of land, is only 60 miles over. The principal rivers are the Rio Grande, Darien, Chagre, and the Oronoque.

The principal bays in Terra Firma are, the bay of Panama, and the bay of St. Michael's, in the South Sea, the bay of Porto Bello, the gulf of Darien, Sino bay, Cartagena bay and harbour, the gulf of Venezuela, the bay of Maracaibo, the gulf of Triesto, the bay of Guaira, the bay of Curiaco and the gulf of Paria, or Andalusia, in the North Sea.

The chief capes are, Samblas point, Point-Canoa, Cape del Agua, Swart point, Cape de Vela, Cape Conquibacua, Cape Cabelo, Cape Blanco, Cape Galera, Cape Three Points, and Cape Nassau; all on the north shore of Terra Firma.

CLIMATE.] The climate here, particularly in the northern divisions, is extremely hot; and it was found by Ulloa, that the heat of the warmest day in Paris is continual in Cartagena; the excessive heats raise the vapour of the sea, which is precipitated in such rains as seem to threaten a general deluge. Great part of the country, therefore, is almost continually flooded; and this, together with the excessive heat, so impregnates the air with vapours, that in many provinces, particularly about Popayan and Porto Bello, it is extremely unwholesome.

SOIL AND PRODUCE.] The soil of this country, like that of the greater part of South America, is wonderfully rich and fruitful. It is impossible to view, without admiration, the perpetual verdure of the woods, the luxuriance of the plains, and the towering height of the mountains. This, however, only applies to the inland country, for the coasts are generally barren sand, and incapable of bearing any species of grain. The trees, most remarkable for their dimensions, are the caobo, the cedar, the maria, and balsam tree. The manchineel tree is particularly remarkable. It bears a fruit resembling an apple, but which, under this specious appearance, contains the most subtle poison, against which common oil is found to be the best

best antidote. The malignity of this tree is such, that if a person only sleeps under it, he finds his body all swelled, and racked with the severest tortures. The beasts from instinct, always avoid it. The *Habella de Carthagen* is the fruit of a species of willow, and contains a kernel resembling an almond, but less white, and extremely bitter. This kernel is found to be an excellent and never failing remedy for the bite of the most venomous vipers and serpents, which are very frequent all over this country. There were formerly rich mines of gold here, which are now in a great measure exhausted. The silver, iron, and copper mines have been since opened, and the inhabitants find emeralds, sapphires, and other precious stones.

ANIMALS.] In treating of North America, we have taken notice of many of the animals that are found in the southern parts; it is therefore unnecessary to repeat them hereafter. Among those peculiar to this country, the most remarkable is the sloth, or, as it is called by way of derision, the *Swift Peter*. It bears a resemblance to an ordinary monkey in shape and size; but is of a most wretched appearance, with its bare hams and feet, and its skin all over corrugated. He stands in no need of either chain or hutch, never stirring unless compelled by hunger; and he is said to be several minutes in moving one of his legs, nor will blows make him mend his pace. When he moves, every effort is attended with such a plaintive, and at the same time, so disagreeable a cry, as at once produces pity and disgust. In this country consists the whole defence of this wretched animal. For on the first hostile approach it is natural for him to be in motion, which is always accompanied with disgusting howlings, so that his pursuer flies much more speedily in his turn, to be beyond the reach of this horrid noise. When this animal finds no wild fruits on the ground, he looks out with a great deal of pains for a tree well loaded, which he ascends with a world of uneasiness, moving, and crying, and stopping by turns. At length having mounted, he plucks off all the fruit, and throws it on the ground, to save himself such another troublesome journey; and rather than be fatigued with coming down the tree, he gathers himself in a bunch, and with a shriek drops to the ground.

The monkeys in these countries are very numerous; they keep together 20 or 30 in company, rambling over the woods, leaping from tree to tree, and if they meet with a single person, he is in danger of being torn to pieces by them; at least they chatter, and make a frightful noise, throwing things at him; they hang themselves by the tail, on the boughs, and seem to threaten him all the way he passes; but where two or three people are together, they usually scamper away.

NATIVES.] Besides the Indians in this country, who fall under our general description of the Americans, there is another species, of a fair complexion, delicate habit, and of a smaller stature than the ordinary Indians. Their dispositions too are more soft and effeminate; but what principally distinguishes them is their large, weak, blue eyes, which, unable to bear the light of the sun, see best by moon light, and from which they are therefore called *Moon-eyed Indians*.

INHABITANTS, COMMERCE, &c.] We have already mentioned how this AND CHIEF TOWNS. } country fell into the hands of the Spaniards. The inhabitants therefore do not materially differ from those of Mexico. To what we have observed, with regard to this country, it is only necessary to add, that the original inhabitants of Spain are variously intermixed with the negroes and Indians. These intermixtures form various gradations, which are carefully distinguished from each other, because

cause every person expects to be regarded, in proportion as a greater share of the Spanish blood runs in his veins. The first distinction, arising from the intermarriage of the whites with the Negroes, is that of the Mulattoes, which is well known. Next to these are the Tercerones, produced from a white and mulatto. From the intermarriage with these and the whites, arise the Quarterones, who, though still near the former, are disgraced with a tint of the Negro blood. But the produce of these and the whites are the Quinterones, who, which is very remarkable, are not to be distinguished from the real Spaniards, but by being of a still fairer complexion. The same gradations are formed in a contrary order, by the intermixture of the Mulattoes and the Negroes; and besides these, there are a thousand others, hardly distinguishable by the natives themselves. The commerce of this country is chiefly carried on from the ports of Panama, Carthagena, and Porto Bello; which are three of the most considerable cities in Spanish America; and each containing several thousand inhabitants. Here there are annual fairs for American, Indian, and European commodities. Among the natural merchandize of Terra Firma, the pearls found on the coast, particularly in the bay of Panama, are not the least considerable. An immense number of Negro slaves are employed in fishing for these, and who have arrived at wonderful dexterity in this occupation. They are sometimes however devoured by fish, particularly the sharks, while they dive to the bottom, or are crushed against the shelves of the rocks. The government of Terra Firma is on the same footing with that of Mexico.

P E R U.

SITUATION AND EXTENT.

Miles.		Degrees.	Sq. Miles.
Length 1800	} between	{ the equator and 25 south latitude.	} 970,000
Breadth 500		{ 60 and 81 west longitude.	

BOUNDARIES.] BOUNDED by Terra Firma, on the North; by the mountains, or Cordeleirias des Andes, East; by Chili, South; and by the Pacific Ocean, West.

Divisions.	Provinces.	Chief towns.
The northern division	{ Quito — }	{ Quito Payta
The middle division	{ Lima, or Los Royes }	{ LIMA, 76-49 W. lon. 12-11. S. lat. Cusco, and Callao.
The southern division	{ Los Charcos }	{ Potosi Porco.

SEAS, BAYS, AND HARBOURS.] The only sea which borders on Peru is the Pacific Ocean, or South Sea. The principal bays and harbours are

Payta, Malabrigo, Cuanchaco, Cosma, Vermeio, Guara, Callao, the port town to Lima, Ylo, and Arica.

RIVERS.] There is a river whose waters are as red as blood. The rivers Granada, or Cagdallena, Oronoque, Amazon, and Platé, rise in the Andes: Many other rivers rise also in the Andes, and fall into the Pacific Ocean, between the equator and eight deg. S. lat.

PETRIFIED WATERS.] There are some waters, which, in their course, turn whatever they pass over into stone; and here are fountains of liquid matter, called 'copper, resembling pitch and tar, and used by seamen for the same purpose.

SOIL AND CLIMATE.] Though Peru lies within the torrid zone, yet having on one side the South Sea, and on the other the great ridge of the Andes, it is not so stifled with heat, as the other tropical countries. The sky too, which is generally cloudy, shields them from the direct rays of the sun; but what is extremely singular, it never rains in Peru. This defect, however, is sufficiently supplied by a soft kindly dew, which falls gradually every night on the ground, and so refreshes the plants and grass, as to produce in many places the greatest fertility. Along the sea-coast, Peru is generally a dry barren sand, except by the banks of rivers, where it is extremely fertile, as are all the low lands in the inland country.

ANIMAL, VEGETABLE, AND MINERAL PRODUCTIONS. } There are many gold mines in the northern part, not far from Lima. Silver too is produced in great abundance in various provinces; but the old mines are constantly decaying, and new ones daily opened. The towns shifit with the mines. That of Potosi, when the silver there was found at the easiest expence, (for now having gone so deep, it is not so easily brought up) contained 90,000 souls, Spaniards and Indians, of which the latter were six to one. The northern part of Peru produces wine in great plenty. Wool is another article of its produce, and is no less remarkable for its fineness than for the animals on which it grows; these they call Lamas and Vicunna. The Lama has a small head, in some measure resembling that of a horse and a sheep at the same time. It is about the size of a stag, its upper lip is cleft like that of a hare, through which, when enraged, it spits a kind of venomous juice, which inflames the part it falls on. The flesh of the Lama is agreeable and salutary and the animal is not only useful in affording wool and food, but also as a beast of burden. It can endure amazing fatigue, and will travel over the steepest mountains with a burden of 60 or 70 pounds. It feeds very sparingly, and never drinks. The Vicunna is smaller and swifter than the Lama, and produces wool still finer in quality. In the Vicunna too is found the Bezoar stones, regarded as a specific against poisons. The next great article in their produce and commerce is the Peruvian bark, known better by the name of Jesuits bark. The tree which produces this invaluable drug, grows principally in the mountainous part of Peru, and particularly in the province of Quito. The best bark is always produced in the high and rocky grounds; the tree which bears it, is about the size of a cherry tree, and produces a kind of fruit, resembling the almond. But it is only the bark which has those excellent qualities that render it so useful in intermitting fevers, and other disorders to which daily experience extends the application of it. Guinea pepper, or Cayenne pepper, as we call it, is produced in the greatest abundance in the vale of Arica, a district in the southern parts of Peru, from whence they export it annually, to the value of 600,000 crowns. Peru is likewise the only part of Spanish America which produces quick-silver; an article of immense value, considering the various purposes to which it is applied, and especially

ially the metal is in a white fire, and by means of liquid.

MAN cause of there is Peru, and and delight proper for watered by mand a st tures, part of slight stone hou suffer by province. miles, and ants, of sufficient de la Pala honour, c seventeen corations o oroament e the immen ants of Lin both on the ducts of th harbour of the fleet fr the commo other. ially the purification of gold and silver. The principal mine of this singular metal is at a place called Guancavelica, discovered in 1567, where it is found in a whitish mass resembling brick ill burned. This substance is volatilised by fire, and received in steam by a combination of glass vessels, where it condenses by means of a little water at the bottom of each vessel, and forms a pure heavy liquid.

[MANUFACTURES, TRADE, AND CITIES.] We join these articles here because of their intimate connection; for, except in the cities we shall describe, there is no commerce worth mentioning. The city of Lima is the capital of Peru, and of the whole Spanish empire: its situation in the middle of a spacious and delightful valley, was fixed upon by the famous Pizarro, as the most proper for a city, which he expected would preserve his memory. It is so well watered by the river Rimac, that the inhabitants, like those of London, command a stream, each for his own use. There are many very magnificent structures, particularly churches, in this city; though the houses in general are built of slight materials, the equality of the climate, and want of rain, rendering stone houses unnecessary; and besides it is found, that these are more apt to suffer by shocks of the earth, which are frequent and dreadful all over this province. Lima is about two leagues from the sea, extends in length two miles, and in breadth one and a quarter. It contains about 60,000 inhabitants, of whom the whites amount to a sixth part. One remarkable fact is sufficient to demonstrate the wealth of this city. When the viceroy, the duke de la Palada, made his entry into Lima in 1682, the inhabitants, to do him honour, caused the streets to be paved with ingots of silver, amounting to seventeen millions sterling. All travellers speak with amazement of the decorations of the churches with gold, silver, and precious stones, which load and ornament even the walls. The only thing that could justify these accounts, is the immense richness and extensive commerce of the inhabitants. The merchants of Lima may be said to deal with all the quarters of the world, and that both on their own accounts, and as factors for others. Here all the products of the southern provinces are conveyed, in order to be exchanged at the harbour of Lima, for such articles as the inhabitants of Peru stand in need of; the fleet from Europe, and the East Indies, land at the same harbour, and the commodities of Asia, Europe and America, are there bartered for each other. What there is no immediate vent for, the merchants of Lima purchase on their own accounts, and lay up in warehouses, knowing that they must soon find an outlet for them, since by one channel or other they have a communication with almost every commercial nation. But all the wealth of the inhabitants, all the beauty of the situation, and fertility of the climate of Lima, are not sufficient to compensate for one disaster, which always threatens, and has sometimes actually befallen them. In the year 1747, a most tremendous earthquake laid three-fourths of this city level with the ground, and entirely demolished Callao, the port town belonging to it. Never was any destruction more terrible or perfect, not more than one of three thousand inhabitants being left to record this dreadful calamity, and he by a providence the most singular and extraordinary imaginable.—This man, who happened to be on a fort which overlooked the harbour, perceived in one minute the inhabitants running from their houses in the utmost terror and confusion; the sea, as is usual on such occasions, receding to a considerable distance, returned in mountainous waves, foaming with the violence of the agitation, buried the inhabitants for ever in its bosom, and immediately all was silent; but the same wave which destroyed the town, drove a little boat by the place where the man stood, into which he threw himself and was saved. Cusco, the

the ancient capital of the Peruvian empire, has already been taken notice of. As it lies in the mountainous country, and at a distance from the sea, it has been long on the decline. But it is still a very considerable place, and contains above 40,000 inhabitants, three parts Indians, and very industrious in manufacturing baize, cotton, and leather. They have also, both here and in Quito, a particular taste for painting; and their productions in this way, some of which have been admired in Italy, are dispersed all over South America. Quito is next to Lima in populousness if not superior to it. It is, like Cusco, an inland city, and having no mines in its neighbourhood, is chiefly famous for its manufactures of cotton, wool, and flax, which supply the consumption over all the kingdom of Peru.

INHABITANTS, MANNERS, AND GOVERNMENT. It would be in vain to pretend saying any thing decisive with regard to the number of inhabitants in Peru. The Spaniards themselves are remarkably silent on this head. It has been guessed by some writers, that in all Spanish America there are about three millions of Spaniards and Creoles of different colours; and undoubtedly the number of Indians is much greater; though neither in any respect proportionable to the wealth, fertility, and extent of the country. The manners of the inhabitants do not remarkably differ over the whole Spanish dominions. Pride and laziness are the two predominant passions. It is agreed on by the most authentic travellers, that the manners of Old Spain have degenerated in its colonies. The Creoles, and all the other descendants of the Spaniards, according to the above distinctions, are guilty of many mean and pilfering vices, which a true born Castilian could not think of but with detestation. This, no doubt, in part arises from the contempt in which all but the real natives of Spain are held in the Indies, mankind generally behaving according to the treatment they meet with from others. In Lima the Spanish pride has made the greatest descents; and many of the first nobility are employed in commerce. It is in this city that the viceroy resides, whose authority extends over all Peru, except Quito, which has lately been detached from it. The viceroy is as absolute as the king of Spain; but as his territories are so extensive, it is necessary that he should part with a share of his authority to the several audiences or courts established over the kingdom. There is a treasury court established at Lima, for receiving the fifth of the produce of the mines, and certain taxes paid by the Indians, which belong to the king of Spain.

On the east side of the Andes.	Cuyo, or Cutio	St. John de Frontiera.

LAKES.] The principal lakes are those of Tagatagua near St. Jago, and that of Paren. Besides which, they have several salt-water lakes, that have a communication with the sea, part of the year. In stormy weather the sea forces a way through them, and leaves them full of fish; but in the hot season the water congeals, leaving a crust of fine white salt a foot thick.

SEAS, RIVERS, BAYS, AND HARBOURS.] The only sea that borders upon Chili, is that of the Pacific Ocean on the west. The principal rivers are the Salado or Salt River, Guasco, Coquimbo, Chiapa, Bohio, and the Baldivia, all scarcely navigable but at their mouths.

The principal bays, or harbours, are Capiapo, Coquimbo, Govanadore, Valpariso, Iata, Conception, Santa Maria, La Moucha, Baldivia, Brewer's-haven, and Castro.

CLIMATE, SOIL, AND PRODUCE.] These are not remarkably different from the same in Peru; and if there be any difference, it is in favour of Chili. There is indeed no part of the world more favoured than this is, with respect to the gifts of Nature. For here, not only the tropical fruits, but all species of grain, of which a considerable part is exported, come to great perfection. Their animal productions are the same with those of Peru; and they have gold almost in every river.

INHABITANTS.] This country is very thinly inhabited. The original natives are still in a great measure unconquered and uncivilized; and leading a wandering life, attentive to no object but their preservation from the Spanish yoke, are in a very unfavourable condition with regard to population. The Spaniards do not amount to above 20,000; and the Indians, Negroes, and Mulattoes, are not supposed to be thrice that number. However, there have lately been some formidable insurrections against the Spaniards, by the natives of Chili, which greatly alarmed the Spanish court.

COMMERCE.] The foreign commerce of Chili is entirely confined to Peru, Panama, and some parts of Mexico. To the former they export annually corn sufficient for 60,000 men. Their other exports are hemp, which is raised in no other part of the South Seas; hides, tallow, and salted provisions; and they receive in return the commodities of Europe and the East Indies, which are brought to the port of Callao.

BAYS AND LAKES.] The principal bay is that at the mouth of the river La Plata, on which stands the capital city of Buenos Ayres; and Cape St. Antonio, at the entrance of that bay, is the only promontory. This country abounds with lakes, one of which Cafacoroes, is 100 miles long.

RIVERS.] This country, besides an infinite number of small rivers, is watered by three principal ones Paragua, Uragua, and Parana, which, united near the sea, form the famous Rio de la Plata, or Plate River, and which annually overflow their banks; and, on their recess leave them enriched with a slime that produces the greatest plenty of whatever is committed to it.

AIR, SOIL, and PRODUCE.] This vast tract is far from being wholly subdued or planted by the Spaniards. There are many parts in a great degree unknown to them, or to any other people of Europe. The principal province of which we have any knowledge, is that which is called Rio de la Plata, towards the mouth of the above-mentioned rivers. This province, with all the adjacent parts, is one continual level, not interrupted by the least hill for several hundred miles every way; extremely fertile, and producing cotton in great quantities; tobacco, and the valuable herb called Paragua, with a variety of fruits, and prodigious rich pastures, in which are bred such herds of cattle, that it is said the hides of the beasts are all that is properly bought, the carcase being in a manner given into the bargain. A horse some time ago might be bought for a dollar; and the usual price for a beast, chosen out of a herd of two or three hundred, was only four rials. But contrary to the general nature of America, this country is delitute of

woods. The air is remarkably sweet and serene, and the waters of La Plata are equally pure and wholesome.

FIRST SETTLEMENT, CHIEF CITY, AND COMMERCE. } The Spaniards first discovered this country, by sailing up the river La Plata in 1515, and founded the town of Buenos Ayres, so called on account of the excellence of the air, on the south side of the river, fifty leagues within the mouth of it, where the river is seven leagues broad. This is one of the most considerable towns in South America, and the only place of traffic to the southward of Brasil. Here we meet with the merchants of Europe and Peru; but no regular fleet comes here, as to the other parts of Spanish America; two, or at most three, register ships, make the whole of their regular intercourse with Europe. Their returns are very valuable, consisting chiefly of the gold and silver of Chili and Peru, sugar and hides. Those who have now and then carried on a contraband trade to this city, have found it more advantageous than any other whatever. The benefit of this contraband is now wholly in the hands of the Portuguese, who keep magazines for that purpose, in such parts of Brasil as lie near this country. The trade of Paraguay, and the manners of the people, are so much the same with those of the rest of the Spanish colonies in South America, that nothing farther can be said on those articles.

But we cannot quit this country without saying something of that extraordinary species of commonwealth, which the Jesuits erected in the interior parts, and of which these crafty priests endeavoured to keep all strangers in the dark.

About the middle of the last century, those fathers represented to the court of Spain, that their want of success in their missions was owing to the scandal which the immorality of the Spaniards never failed to give, and to the hatred which their insolent behaviour caused in the Indians, wherever they came. They insinuated, that, if it were not for that impediment, the empire of the Gospel might, by their labours, have been extended into the most unknown parts of America; and that all those countries might be subdued to his catholic majesty's obedience, without expence, and without force. This remonstrance met with success; the sphere of their labours was marked out: and uncontrolled liberty was given to the Jesuits within these limits; and the governors of the adjacent provinces had orders not to interfere, nor to suffer any Spaniards to enter into this pale without licence from the fathers. They, on their part, agreed to pay a certain capitation tax, in proportion to their flock; and to send a certain number to the king's works whenever they should be demanded, and the missions should become populous enough to supply them.

On these terms the Jesuits gladly entered upon the scene of action, and opened their spiritual campaign. They began by gathering together about 50 wandering families, whom they persuaded to settle; and they united them into a little township. This was the slight foundation upon which they built a superstructure, which has amazed the world, and added so much power, at the same time that it has brought on so much envy and jealousy, to their society. For when they had made this beginning, they laboured with such indefatigable pains, and such masterly policy, that, by degrees, they mollified the minds of the most savage nations; fixed the most rambling, and subdued those to their government, who had long disdained to submit to the arms of the Spaniards and Portuguese. They prevailed upon thousands of various dispersed tribes to embrace their religion, and these soon

induced others to follow their example, magnifying the peace and tranquillity they enjoyed under the direction of the Fathers.

Our limits do not permit us to trace with precision all the steps which were taken in the accomplishment of so extraordinary a conquest over the bodies and minds of so many people. The Jesuits left nothing undone, that could conduce to their remaining in this subjection, or that could tend to increase their number to the degrees requisite for a well-ordered and potent society; and it is said that above 340,000 families, several years ago, were subject to the Jesuits, living in obedience, and an awe bordering upon adoration, yet procured without any violence or constraint: That the Indians were instructed in the military art with the most exact discipline, and could raise 60,000 men well armed: That they lived in towns; they were regularly clad; they laboured in agriculture; they exercised manufactures; some even aspired to the elegant arts; and that nothing could equal the obedience of the people of these missions, except their contentment under it. Some writers have treated the character of these Jesuits with great severity; accusing them of ambition, pride, and of carrying their authority to such an excess, as to cause not only persons of both sexes, but even the magistrates, who are always chosen from among the Indians, to be corrected before them with stripes, and to suffer persons of the highest distinction, within their jurisdiction, to kiss the hem of their garments, as the greatest honour. The priests themselves possessed large property, all manufactures were theirs, the natural produce of the country was brought to them, and the treasures annually remitted to the superior of the order, seemed to evince, that zeal for religion was not the only motive of their forming these missions. The Fathers would not permit any of the inhabitants of Peru, whether Spaniards, Mestizos, or even Indians, to come within their missions in Paraguay. In the year 1757, when part of this territory was ceded by Spain to the crown of Portugal, in exchange for Santo Sacramento, to make the Uragua the boundary of their possessions, the Jesuits refused to comply with this division, or to suffer themselves to be transferred from one hand to another, like cattle, without their own consent. And we were informed by authority of the Gazette, that the Indians actually took up arms; but notwithstanding the exactness of their discipline, they were easily, and with considerable slaughter, defeated by the European troops, who were sent to quell them. And, in 1767, the Jesuits were sent out of America, by royal authority, and their late subjects were put upon the same footing with the rest of the inhabitants of the country.

SPANISH ISLANDS IN AMERICA.

CUBA.] The island of Cuba is situated between 19 and 23 degrees north lat. and between 74 and 87 degrees west long. 100 miles to the south of Cape Florida, and 75 north of Jamaica, and is near 700 miles in length, and generally about 70 miles in breadth. A chain of hills runs through the middle of the island from east to west; but the land near the sea is in general level and flooded in the rainy season, when the sun is

vertical. This noble island is supposed to have the best soil, for so large a country, of any in America. It produces all commodities known in the West Indies, particularly ginger, long pepper, and other spices, cassia fistula, mastic, and aloes. It also produces tobacco and sugar; but from the want of hands, and the laziness of the Spaniards, not in such quantities as might be expected. It is owing to the same cause that this large island does not produce, including all its commodities, so much for exportation as our small island of Antigua.

The course of the rivers is too short to be of any consequence; but there are several good harbours in the island, which belong to the principal towns; as that of St. Jago, facing Jamaica, strongly situated, and well fortified, but neither populous nor rich. That of the Havannah, facing Florida, which is the capital city of Cuba, and a place of great strength and importance, containing about 2000 houses, with a great number of convents and churches. It was taken, however, by the courage and perseverance of the English troops in the year 1762, but restored in the subsequent treaty of peace. Besides these, there is likewise Cumberland harbour, and that of Santa Cruz, a considerable town thirty miles east of the Havannah.

PORTO RICO.] Situated between 64 and 67 degrees west lon. and in 18 degrees north lat. lying between Hispaniola and St. Christopher's, is 100 miles long, and 40 broad. The soil is beautifully diversified with woods, vallies, and plains; and is extremely fertile, producing the same fruits as the other islands. It is well watered with springs and rivers; but the island is unhealthy in the rainy seasons. It was on account of the gold that the Spaniards settled here; but there is no longer any considerable quantity of this metal found in it.

Porto Rico, the capital town, stands in a little island on the north side, forming a capacious harbour, and joined to the chief island by a causeway, and defended by forts and batteries, which render the town almost inaccessible. It was, however, taken by Sir Francis Drake, and afterwards by the earl of Cumberland. It is better habited than most of the Spanish towns, because it is the centre of the contraband trade carried on by the English and French with the king of Spain's subjects.

VIRGIN ISLANDS.] Situated at the east end of Porto Rico, are extremely small.

MARGARETTA.] Situated in 64 degrees west lon. and 11-30 north lat. separated from the northern coast of New Andalusia in Terra Firma, by a strait of 24 miles, is about 40 miles in length, and 24 in breadth; and being always verdant, affords a most agreeable prospect. The island abounds in pasture, in maize, and fruit; but there is a scarcity of wood and water. There was once a pearl fishery on its coast, which is now discontinued.

There are many other small islands in these seas, to which the Spaniards have paid no attention. We shall therefore proceed round Cape Horn into the South Seas, where the first Spanish island of any importance is CHILOE, on the coast of Chili, which has a governor, and some harbours well fortified.

JUAN FERNANDES.] Lying in 83 degrees west lon. and 33 south lat. 300 miles west of Chili. This island is uninhabited; but having some good harbours, it is found extremely convenient for the English cruisers to touch at, and water; and here they are in no danger of being discovered, unless when, as is generally the case, their arrival in the South Seas, and their motions, have been made known to the Spaniards by our good friends in

Brasil. This island is famous for having given rise to the celebrated romance of Robinson Crusoe. It seems, one Alexander Selkirk, a Scotsman, was left ashore in this solitary place by his captain; where he lived some years, until he was discovered by captain Woodes Rogers, in 1709; when taken up, he had forgotten his native language, and could scarcely be understood, seeming to speak his words by halves. He was dressed in goats skins, would drink nothing but water, and it was some time before he could relish the ship's victuals. During his abode in this island, he had killed 500 goats, which he caught by running them down; and he marked as many more on the ear, which he let go. Some of these were caught, 30 years after, by lord Anson's people; their venerable aspect and majestic beards discovered strong symptoms of antiquity. Selkirk, upon his return to England, was advised to publish an account of his life and adventures in his little kingdom. He is said to have put his papers into the hands of Daniel Defoe, to prepare them for publication. But that writer, by the help of these papers and a lively fancy, transformed Alexander Selkirk into Robinson Crusoe, and returned Selkirk his papers again; so that the latter derived no advantage from them. They were probably too indigested for publication, and Defoe might derive little from them but those hints, which might give rise to his own celebrated performance.

The other islands that are worth mentioning are, the Gallipago isles, situated 400 miles west of Peru under the equator; and those in the bay of Panama called the King's or Pearl Islands.

SEAS, BAYS, HARBOURS, } The Atlantic Ocean washes the coast of
AND CAPES. } Brasil on the north-east and east, upwards of 3000 miles, forming several fine bays and harbours: as the harbours of Pernambuco, All Saints, Porto Seguro, the port and harbour of Rio Janeiro, the port of St. Vincent, the harbour of St. Gabriel, and the port of St. Salvador, on the north shore of the river la Plata.

The principal capes are, Cape Roque, Cape St. Augustine, Cape Trio, and Cape St. Mary, the most southerly promontory of Brasil.

FACE OF THE COUNTRY, AIR, } The name of Brasil was given to this
CLIMATE AND RIVERS. } country, because it was observed to abound with wood of that name. To the northward of Brasil, which lies almost under the equator, the climate is hot, boisterous, and unwholesome, subject to great rains and variable winds, particularly in the months of March and September, when they have such deluges of rain, with storms and tornadoes, that the country is overflowed. But to the southward, beyond the tropic of Capricorn, there is no part of the world that enjoys a more serene and wholesome air, refreshed with the soft breezes of the ocean on one hand, and the cool breath of the mountains on the other. The land near the coast is in general rather low than high, but exceedingly pleasant, it being interspersed with meadows and woods; but on the west, far within land, are mountains from whence issue many noble streams, that fall into the great rivers Amazon and La Plata; others running across the country from east to west till they fall into the Atlantic Ocean, after meliorating the lands which they annually overflow, and turning the sugar-mills belonging to the Portuguese.

SOIL AND PRODUCE.] In general the soil is extremely fruitful, producing sugar, which being clayed, is whiter and finer than our muscovado, as we call our unrefined sugar. Also tobacco, hides, indigo, ipecacuanha, balsam of Copaibo, Brasil wood, which is of a red colour, hard and dry, and is chiefly used in dyeing, but not the red of the best kind; it has likewise some place in medicine, as a stomachic and restringent.

The animals here are the same as in Peru and Mexico. The produce of the soil was found very sufficient for subsisting the inhabitants, until the mines of gold and diamonds were discovered; these, with the sugar plantations, occupy many hands, that agriculture lies neglected; and, in consequence, Brasil depends upon Europe for its daily food.

INHABITANTS, MANNERS, AND CUSTOMS.] The portrait given us of the manners and customs of the Portuguese in America, by the most judicious travellers, is very far from being favourable. They are described as a people, who,

who, while sunk in the most effeminate luxury, practise the most desperate crimes. Of a temper hypocritical and dissembling; of little sincerity in conversation, or honesty in dealing; lazy, proud, and cruel. In their diet peevish; for like the inhabitants of most southern climates, they are much more fond of stew, state, and attendance, than of the pleasures of free society, and of a good table; yet their feasts, which are seldom made, are sumptuous to extravagance. When they appear abroad, they cause themselves to be carried out in a kind of cotton hammocks, called Serpentine, which are borne on the Negroes shoulders, by the help of a bamboo, about twelve or fourteen feet long. Most of these hammocks are blue, and adorned with fringes of the same colour: they have a velvet pillow, and above the head a kind of tester, with curtains; so that the person carried cannot be seen, unless he pleases; but may either lie down or sit up, leaning on his pillow. When he has a mind to be seen, he pulls the curtains aside, and salutes his acquaintance whom he meets in the streets; for they take a pride in complimenting each other in their hammocks, and will even hold long conferences in them in the streets; but then the two slaves who carry them, make use of a strong well-made staff, with an iron fork at the upper end, and pointed below with iron: this they stick fast in the ground, and rest the bamboo, to which the hammock is fixed, on two of these, till their master's business or compliment is over. Scarcely any man of fashion, or any lady, will pass the streets without being carried in this manner.

[TRADE AND CHIEF TOWNS.] The trade of Portugal is carried on upon the same exclusive plan on which the several nations of Europe trade with their colonies of America; and it more particularly resembles the Spanish method, in not sending out single ships, as the convenience of the several places, and the judgment of the European merchants, may direct; but by annual fleets, which sail at stated times from Portugal, and compose three fleets, bound to as many ports in Brasil; namely, to Pernambuco, in the northern part; to Rio Janeiro, at the southern extremity; and to the Bay of All Saints, in the middle.

In this last is the capital, which is called St. Salvador, and sometimes the city of Bahia, and where all the fleets rendezvous on their return to Portugal. This city commands a noble, spacious, and commodious harbour. It is built upon a high and steep rock, having the sea upon one side, and a lake, forming a crescent, investing it almost wholly, so as nearly to join the sea, on the other. The situation makes it in a manner impregnable by nature; and they have besides added to it very strong fortifications. It is populous, magnificent, and, beyond comparison, the most gay and opulent city in all Brasil.

The trade of Brasil is very great, and increases every year; which is the less surprising, as the Portuguese have opportunities of supplying themselves with slaves for their several works at a much cheaper rate than any other European power that has settlements in America; they being the only European nation that has established colonies in Africa, and from hence they import between 40 and 50,000 Negroes, annually, all of which go into the amount of the cargo of the Brasil fleets for Europe. Of the diamonds there is supposed to be returned to Europe to the amount of 130,000. This, with the sugar, the tobacco, the hides, and the valuable drugs for medicine and manufactures, may give some idea of the importance of this trade, not only to Portugal, but to all the trading powers of Europe.

The chief commodities the European ships carry thither in return, are not the fiftieth part of the produce of Portugal; they consist of woollen goods of all kinds, from England, France, and Holland; the linens and laces

of Holland, France, and Germany; the silks of France and Italy; silk and thread stockings, hats, lead, tin, pewter, iron, copper, and all sorts of utensils wrought in these metals, from England; as well as salt-fish, beef, flour, and cheese. Oil they have from Spain; wine, with some fruit, is nearly all they are supplied with from Portugal. England is at present most interested in the trade of Portugal, both for home consumption and what they want for the use of the Brasils. However, the French have become very dangerous rivals to us in this, as in many other branches of trade.

Brasil is a very wealthy and flourishing settlement. Their export of sugar, within 40 years, is grown much greater than it was, though anciently it made almost the whole of their exportable produce, and they were without rivals in the trade. Their tobacco is remarkably good, though not raised in such large quantities as in the American colonies. The northern and southern parts of Brasil abound with horned cattle: these are hunted for their hides only, of which no less than 20,000 are sent annually to Europe.

The Portuguese had been long in possession of Brasil before they discovered the treasures of gold and diamonds, which have since made it so considerable. Their fleets rendezvous in the Bay of All Saints, to the amount of 100 sail of large ships, in the month of May or June, and carry to Europe a cargo little inferior in value to the treasures of the Spanish flota and galleons. The gold alone, great part of which is coined in America, amounts to near four millions sterling; but part of this is brought from their colonies in Africa, together with ebony and ivory.

[HISTORY AND GOVERNMENT.] This country was first discovered by Americus Vesputio, in 1498, but the Portuguese did not plant it till 1549, when they fixed themselves at the bay of All Saints, and founded the city of St. Salvador. They met with some interruption at first from the court of Spain, who considered the whole continent of South America as belonging to them. However, the affair was at length made up by treaty; and it was agreed that the Portuguese should possess all the country lying between the two great rivers Amazon and Plata, which they still enjoy. The French also made some attempts to plant colonies on this coast, but were driven from thence by the Portuguese, who remained without a rival till the year 1580, when, in the very meridian of prosperity, they were struck by one of those blows which instantly decides the fate of kingdoms: Don Sebastian, the king of Portugal, lost his life in an expedition against the Moors in Africa, and by that event the Portuguese lost their liberty, being absorbed into the Spanish dominions.

The Dutch, soon after this, having thrown off the Spanish yoke, and being not satisfied with supporting their independency by a successful defensive war; and flushed with the juvenile ardor of a growing commonwealth, pursued the Spaniards into the remotest recesses of their extensive territories, and grew rich, powerful, and terrible, by the spoils of their former masters. They particularly attacked the possessions of the Portuguese; they took almost all their fortresses in the East Indies, and then turned their arms upon Brasil, where they took seven of the captainships or provinces; and would have subdued the whole colony, had not their career been stopp'd by the archbishop, at the head of his monks, and a few scattered forces. The Dutch were, about the year 1654, entirely driven out of Brasil, but their West India company still continuing their pretensions to this country, and harassing the Portuguese at sea, the latter agreed, in 1661, to pay the Dutch eight tons of gold, to relinquish their interest in that country, which was accepted; and the Portuguese have remained in peaceable possession of all Brasil from that

FRENCH AMERICAN ISLANDS.

that time, till about the end of the year 1762, when the Spanish Governor of Buenos Ayres, hearing of a war between Portugal and Spain, took, after a month's siege, the Portuguese frontier fortrefs called St. Sacrament; but, by the treaty of peace, it was restored.

FRENCH AMERICA.

THE possessions of the French on the continent of America are at present inconsiderable. They were masters of Canada and Louisiana; but they have now lost all footing in North America; though on the southern continent they have still a settlement, which is called

CAYENNE, or EQUINOCTIAL FRANCE.

IT is situated between the equator and fifth degree of north latitude, and between the 50th and 55th of west longitude. It extends 240 miles along the coast of Guiana, and near 300 miles within land; bounded by Surinam on the North, by the Atlantic Ocean, East; by Amazonia, South; and by Guiana, West. The chief town is Caen. All the coast is very low, but within land there are fine hills very proper for settlements; the French have, however not yet extended them so far as they might; but they raise the same commodities which they have from the West India Islands, and in no inconsiderable quantity. They have also taken possession of the island of Cayenne, on this coast, at the mouth of the river of that name, which is about 45 miles in circumference. The island is very unhealthy; but having some good harbours, the French have here some settlements, which raise sugar and coffee.

FRENCH ISLANDS IN AMERICA.

THE French were amongst the last nations who made settlements in the West Indies; but they made ample amends by the vigour with which they pursued them, and by that chain of judicious and admirable measures which they used in drawing from them every advantage that the nature of the climate would yield; and in contending against the difficulties which it threw in their way.

The government of the French West India islands was formerly under the most judicious and excellent regulations; their commerce flourished; and they were daily increasing in riches and population, when the Revolution took place in the mother country, and soon communicated its baneful influence

fluence to the colonies, where the most dreadful disorders took place and desolated their most flourishing colonies.

[HISPANIOLA, or ST. DOMINGO.] This island was at first possessed by the Spaniards alone; but by far the most considerable part fell into the hands of the French. As that part of the island possessed by the Spaniards was ceded to France by the treaty of peace lately concluded between the two countries, it must now be considered as a French island.

It is situated between the 17th and 21st degrees north lat. and the 67th and 4th of west lon. lying in the middle between Cuba and Porto-Rico, and is 450 miles long, and 150 broad. When Hispaniola was first discovered by Columbus, the number of its inhabitants was computed to be at least a million. But such was the cruelty of the Spaniards, and so infamous a height did they carry their oppression of the poor natives, that they were reduced to sixty thousand in the space of fifteen years. The face of the island presents an agreeable variety of hills, vallies, woods, and rivers; and the soil is allowed to be extremely fertile, producing sugar, cotton, indigo, tobacco, maize, and cassava root. The European cattle are so multiplied here, that they run wild in the woods, and, as in South America, are hunted for their hides and tallow only. In the most barren parts of the rocks, they discovered formerly silver and gold. The mines, however, are not worked now. The north-west parts, which are in the possession of the French, consist of large fruitful plains, which produce the articles already mentioned in vast abundance. This indeed is the best and most fruitful part of the best and most fertile island in the West Indies, and perhaps in the world.

The most ancient town in this island, and in all the New World, built by Europeans, is St. Domingo. It was founded by Bartholomew Columbus, brother to the admiral, in 1504, who gave it that name in honour of his father Dominic, and by which the whole island is sometimes named especially by the French. It is situated on a spacious harbour, and is a large, well-built city, inhabited, like the other Spanish towns, by a mixture of Europeans, Creoles, Mulattoes, Mestizos and Negroes.

The French towns are; Cape St. Francois, the capital, which is neither walled or palled in, and is said to have only two batteries, one at the entrance of the harbour, and the other before the town. It contains about 8000 whites and blacks. Leogane, though inferior in point of size, is a good port, a place of considerable trade, and the seat of the French government in that island. They have two other towns considerable for their trade, Petit Guaves, and Port Louis.

It is computed that the exports of the French, from the above-mentioned places, are not less in value than 1,200,000*l*. They likewise carry on a contraband trade with the Spaniards, which is much to their advantage, as they exchange French manufactures for Spanish dollars.

In the night between the 22d and 23d of August, 1791, a most alarming insurrection of the negroes began on the French plantations upon this island. A scene of the most horrid cruelties ensued. In a little time no less than one hundred thousand negroes were in rebellion, and all the manufactories and plantations of more than half the northern province appeared as one general conflagration. The plains and the mountains were filled with carnage and deluged with blood. Two commissioners were dispatched from France, while the Gironde party was in power, who acting upon the principles of the rights of man, were rather apostles of discord than of peace: they seem to have united with the people of colour, and a series of assassinations and pillage obliged the majority of the white colonists to take refuge in Ameri-

ca. In October 1793 the royalists of fort Jeremie, invited the English to take possession of that part of the island, and Cape Nichola Mole submitted in a few days after to the British forces. They were obliged, however, partly on account of the disorders which desolated the island and partly on account of that dreadful scourge the yellow fever, to abandon this island altogether.

Only one reflection we shall make from the above facts, which is, that the situation of these unhappy negroes, men as well as their masters, and who have as good a right to the liberty of independence as they have, will very much extenuate some of the enormities which they committed, enormities which will not bear a mention with those which these poor sufferers, have received from their tyrants in their first captivity, and in the subsequent hard treatment they have had. Let the proprietors of these slaves ask themselves, whether, had these negroes carried them as slaves into Africa, they would not have thought it a noble effort to endeavour to regain their freedom? Every man feels the answer which would be given: and that answer will place the conduct of these Africans in its proper point of light.

GUADALOUPE.] So called by Columbus, from the resemblance of its mountains to those of that name in Spain, is situated in 16 degrees north lat. and in 62 west lon. about 30 leagues north of Martinico, and almost as much south of Antigua; being 45 miles long, and 38 broad.—It is divided into two parts by a small arm of the sea, or rather a narrow channel, through which no ships can venture; but the inhabitants pass it in a ferry-boat. Its soil is equally fertile with that of Martinico, producing sugar, cotton, indigo, ginger, &c. This island was in a flourishing condition, and its exports of sugar were almost incredible. Like Martinico, it was formerly attacked by the English, who gave up the attempt; but in 1759, it was reduced by the British arms, and was given back at the peace of 1763. It was reduced in 1794 by the British but retaken by Victor Hughes.

ST. BARTHOLOMEW, DESEADA, } Are three small islands
AND MARIGALANTE, } lying in the neighbourhood
of Antigua and St. Christopher's, and of no great consequence to the French; except in time of war, when they give shelter to an incredible number of privateers, which greatly annoy our West-India trade. The former was given to Sweden in 1785.

The small islands of St. Pierre and Miquelon, situated near Newfoundland have been already mentioned in our account of that Island, p. 967.

DUTCH AMERICA.

Containing SURINAM, on the Continent of SOUTH AMERICA.

with two or three small and barren islands in the north sea, not far from the Spanish main.

Dutch Guiana is situated between five and seven degrees north lat. extending 100 miles along the coast from the mouth of the river Oronoque, north, to the river Maroni, or French Guiana, south. The climate of this country is generally reckoned unwholesome; and a considerable part of the coast is low, and covered with water. The chief settlement is at Surinam, a town built on a river of the same name; and the Dutch have extended their plantations 30 leagues above the mouth of this river. This is one of the richest and most valuable colonies belonging to the United Provinces; but it is in a less prosperous situation than it was some years since, owing, among other causes, to the wars they have been engaged in with their fugitive Negroes, whom they have treated with great barbarity, and who are become so numerous, having increased from year to year, that they have formed a kind of colony in the woods, which are almost inaccessible, along the rivers of Surinam, Saranama, and Copename, and are become very formidable enemies to their former masters. Under the command of chiefs, whom they have elected among themselves, they have cultivated lands for their subsistence, and making frequent incursions into the neighbouring plantations, revenge themselves upon their old oppressors. The chief trade of Surinam consists in sugar, a great deal of cotton, coffee of an excellent kind, tobacco, flax, skins, and some valuable dyeing drugs. They trade with the North American colonies, who bring hither horses, live cattle, and provisions; and take home a large quantity of molasses.

Connected with Surinam, we shall mention the two Dutch colonies of Demerary and Isequibo on the Spanish main, which surrendered to the English in the year 1781, and were represented as a very valuable acquisition, which would produce more revenue to the crown than all the British West-India islands united. But the report was either not believed or slighted, for the colonies were left defenceless, and soon were retaken by a French frigate.

Dr. Bancroft observes, that the inhabitants of Dutch Guiana are either whites, blacks, or the reddish-brown aboriginal natives of America. The promiscuous intercourse of these different people has likewise generated several intermediate casts, whose colours immutably depend on their degree of consanguinity to either Whites, Indians, or Negroes. These are divided into Mulattoes, Tercerones, Quarterones and Quinterones, with several intermediate subdivisions, proceeding from their retrograde intercourse. There are so great a number of birds, of various species, and remarkable for the beauty of their plumage, in Guiana, that several persons in this colony have employed themselves advantageously, with their slaves and dependants, in killing and preserving birds for the cabinets of naturalists in different parts of Europe. The torporific eel is found in the rivers of Guiana, which, when touched either by the hand, or by a rod of iron, gold, silver, copper, or by a stick of some particular kinds of heavy American wood, communicates a shock perfectly resembling that of electricity. There are an immense number and variety of snakes in this country, and which form one of its principal inconveniences. A snake was killed some years since, on a plantation which had belonged to Peter Amyatt, Esq. which was upwards of thirty-three feet in length, and in the largest place, near the middle, was three feet in circumference. It had a broad head, large prominent eyes, and a very wide mouth, in which was a double row of teeth. Among the animals of Dutch Guiana is the Laubba, which is peculiar to this country. It is a small amphibious

creature, about the size of a pig four months old, covered with fine short hair; and its flesh, by the Europeans who reside here, is preferred to all other kinds of meat.

DUTCH ISLANDS IN AMERICA.

ST. EUSTATIUS, } **SITUATED** in 17° 29' N. lat. 63° 10' W. long.
 or **EUSTATIA.** } and three leagues north-west of St. Christophers,
 is only a mountain, about 29 miles in compass, rising out of the sea like a pyramid, and almost round. But though small, and inconveniently laid out by nature, the industry of the Dutch has made it to turn to very good account; and it is said to contain 5000 whites, and 15,000 negroes. The sides of the mountains are laid out in very pretty settlements; but they have neither springs nor rivers. They raise here sugar and tobacco; and this island, as well as Curassou, is engaged in the Spanish contraband trade, for which, however, it is not so well situated; and it has drawn the same advantage from its constant neutrality. But when hostilities were commenced by Great Britain against Holland, admiral Rodney was sent with a considerable land and sea-force against St. Eustatius, which, being incapable of any defence, surrendered at discretion, on the 3d of February, 1781. The private property of the inhabitants was confiscated, with a degree of rigour very uncommon among civilized nations, and very inconsistent with the humanity and generosity by which the English nation were formerly characterised. The reason assigned was, that the inhabitants of St. Eustatius had assisted the revolted colonies with naval and other stores. But on the 27th of November, the same year, St. Eustatius was retaken by the French, under the command of the marquis de Bouillé, though their force consisted of only three frigates and some small craft, and about 300 men.

CURASSOU.] Situated in 12 degrees north lat. 9 or 10 leagues from the continent of Terra Firma, is 30 miles long, and 10 broad. It seems as if it were fated, that the ingenuity and patience of the Hollanders should every where, both in Europe and America, be employed in fighting against an unfriendly nature; for the island is not only barren, and dependent upon the rains for its water, but the harbour is naturally one of the worst in America; yet the Dutch have entirely remedied that defect; they have upon this harbour one of the largest, and by far one of the most elegant and cleanly towns in the West Indies. The public buildings are numerous and handsome; the private houses commodious; and the magazines large, convenient, and well filled. All kind of labour is here performed by engines; some of them so well contrived, that ships are at once lifted into the dock. Though this island is naturally barren, the industry of the Dutch has brought it to produce a considerable quantity both of tobacco and sugar; it has, besides, good salt-works, for the produce of which there is a brisk demand from the English islands, and the colonies on the continent. But what renders this island of most advantage to the Dutch, is the contraband trade which is carried on between the inhabitants and the Spaniards, and their harbour being the rendezvous to all nations in time of war.

The Dutch ships from Europe touch at this island for intelligence, or pilots,

and then proceed to the Spanish coasts for trade, which they force with a strong hand, it being very difficult for the Spanish guarda costas to take these vessels; for they are not only stout ships, with a number of guns, but are manned with large crews of chosen seamen, deeply interested in the safety of the vessel and the success of the voyage. They have each a share in the cargo, of a value proportioned to the station of the owner, supplied by the merchants upon credit, and at prime cost. This animates them with an uncommon courage, and they fight bravely, because every man fights in defence of his own property. Besides this, there is a constant intercourse between this island and the Spanish continent.

Curassou has numerous warehouses, always full of the commodities of Europe and the East Indies. Here are all sorts of woollen and linen cloth, laces, silks, ribbands, iron utensils, naval and military stores, brandy, the spices of the Moluccas, and the calicoes of India, white and painted. Hither the Dutch West India, which is also their African Company, annually bring three or four cargoes of slaves; and to this mart the Spaniards themselves come in small vessels, and carry off not only the best of the Negroes, at a very high price, but great quantities of all the above sorts of goods; and the seller has this advantage, that the refuse of warehouses and mercers' shops, with every thing that is grown unfashionable and unsaleable in Europe, go off here extremely well; every thing being sufficiently recommended by its being European. The Spaniards pay in gold and silver, coined or in bars, cacao, vanilla, Jesuits' bark, cochineal, and other valuable commodities.

The trade of Curassou, even in times of peace, is said to be annually worth to the Dutch no less than 500,000*l.* but in time of war the profit is still greater, for then it becomes the common emporium of the West Indies; it affords a retreat to ships of all nations, and at the same time refuses none of them arms and ammunition to destroy one another. The intercourse with Spain being then interrupted, the Spanish colonies have scarcely any other market from whence they can be well supplied, either with slaves or goods. The French come hither to buy the beef, pork, corn, flour, and lumber, which the English bring from the continent of North America, or which is exported from Ireland; so that, whether in peace or in war, the trade of this island flourishes extremely.

The trade of all the Dutch American settlements was originally carried on by the West-India company alone: at present such ships as go upon that trade pay two and a half per cent. for their licences: the company however, reserve to themselves the whole of what is carried on between Africa and the American islands.

The other islands, Bonaire and Aruba, are inconsiderable in themselves, and should be regarded as appendages to Curassou, for which they are chiefly employed in raising cattle and other provisions.

The small islands of Saba and St. Martin's, situated at no great distance from St. Eustatia, hardly deserve to be mentioned; they were both captured by admiral Rodney and General Vaughan, at the time when St. Eustatia surrendered to the arms of Great Britain; but were afterwards retaken by the French.

DANISH ISLANDS IN AMERICA.

St. THOMAS.] AN inconsiderable member of the Carribbees, situated in 64 degrees west lon. and 16 north lat. about 15 miles in circumference, and has a safe and commodious harbour.

St. CROIX, or SANTA CRUZ.] Another small and unhealthy island, lying about five leagues east of St. Thomas, ten or twelve leagues in length, and three or four where it is broadest. These islands, so long as they remained in the hands of the Danish West-India company, were ill managed, and of little consequence to the Danes; but that wise and benevolent prince, the late king of Denmark, bought up the company's stock, and laid the trade open; and since that time the island of St. Thomas has been so greatly improved, that it is said to produce upwards of 3000 hogheads of sugar of 1000 weight each, and others of the West-India commodities in tolerable plenty. In time of war privateers bring in their prizes here for sale; and a great many vessels trade from hence along the Spanish Main, and return with money in specie or bars, and valuable merchandise. As for Santa Cruz, from a perfect desert a few years since, it is beginning to settle fast; several persons from the English islands, some of them of very great wealth, have gone to settle there, and have received very great encouragement to do so. But, indeed, these two nations, the Dutch and Danes, hardly deserve to be mentioned among the proprietors of America; their possessions there being so inconsiderable; and yet the Dutch are said to make their share of them worth at least 600,000*l.* a year.

NEW DISCOVERIES.

OUR knowledge of the globe has been considerably augmented by the late discoveries of the Russians, and still more by those that have been made by British navigators in the present reign, which have been numerous and important: and of these discoveries we shall therefore give a compendious account.

NORTHERN ARCHIPELAGO.

continent of America*. Mr. Muller divides these islands into four principal groups, the first two of which are styled the Aleutian islands. The first group, which is called by some of the islanders Saignan, comprehends, 1. Beering's Island; 2. Copper Island; 3. Otma; 4. Samyra, or Shemya; 5. Anakta. The second group is called Khao, and comprizes eight islands, viz. 1. Immak; 2. Kiska; 3. Tchetchia; 4. Ava; 5. Kavia; 6. Tschanguelek; 7. Ulagama; 8. Amtschidga. The third general name is Neglio and comprehends the islands known to the Russians under the name of Andreanoffski Ostrova; sixteen of which are mentioned under the following names: 1. Amatkinak; 2. Ulak; 3. Unalga; 4. Navotsha; 5. Unga; 6. Anagin; 7. Kagulak; 8. Illak, or Ilak; 9. Takavanga; upon which is a volcano; 10. Kanaga, which has also a volcano; 11. Leg; 12. Sketshuna; 13. Tagaloon; 14. Gorleoi; 15. Otchu; 16. Amla. The fourth group is called Kavalang, and comprehends sixteen islands; which are called by the Russians Lyssic Ostrova, or the Fox Islands; and which are named; 1. Amuchta; 2. Tschigama; 3. Tschegula; 4. Unistra; 5. Ulaga; 6. Tauagulana; 7. Kagamin; 8. Kigalga; 9. Skelmaga; 10. Umnak; 11. Agin-Alashka; 12. Unimma; 13. Uligan; 14. Anturo-Leiffume; 15. Semidit; 16. Senagak.

Some of these islands are only inhabited occasionally, and for some months in the year, and others are very thinly peopled; but others have a great number of inhabitants, who constantly reside in them. Copper Island receives its name from the copper which the sea throws upon its coasts. The inhabitants of these islands are, in general, of a short stature, with strong and robust limbs, but free and supple. They have lank black hair, and little beard, flattish faces, and fair skins. They are for the most part well made, of strong constitutions, suitable to the boisterous climate of their isles. The inhabitants of the Aleutian isles live upon roots which grow wild, and sea animals. They do not employ themselves in catching fish, though the rivers abound with all kinds of salmon, and the sea with turbot. Their clothes are made of the skins of birds, and of sea-otters.

The Fox islands are so called from the great number of black, grey, and red foxes with which they abound. The dress of the inhabitants consists of a cap and a fur coat, which reaches down to the knee. Some of them wear common caps of a party-coloured bird-skin, upon which they leave part of the wings and tail. On the fore part of their hunting and-fishing caps, they place a small board like a screen adorned with the jaw-bones of sea-bears, and ornamented with glass beads, which they receive in barter from the Russians. At their festivals and dancing parties they use a much more showy sort of caps. They feed upon the flesh of all sorts of sea animals, and generally eat it raw. But if at any time they choose to dress their victuals, they make use of a hollow stone; having placed the fish or flesh therein, they cover it with another, and close the interstices with lime or clay.

* Mr. Coxe observes, that "the first project for making discoveries in that tempestuous sea, which lies between Kamtschatka and America, was conceived and planned by Peter I." Voyages with that view were accordingly undertaken at the expense of the crown; but when it was discovered, that the islands of the sea abounded with valuable furs private merchants immediately engaged with ardour in similar expeditions; and within a period of ten years, more important discoveries were made by these individuals, at their own private cost, than had hitherto been effected by all the efforts of the crown. The investigation of useful knowledge has also been greatly encouraged by the present empress of Russia; and the most distant parts of her vast dominions, and other countries and islands, have been explored, at her expense, by persons of abilities and learning, in consequence of which considerable discoveries have been made.

They then lay it horizontally upon two stones, and light a fire under it. The provision intended for keeping is dried without salt in the open air. Their weapons consist of bows, arrows, and darts, and for defence they use wooden shields.

The most perfect equality reigns among these islanders. They have neither chiefs nor superiors, neither laws nor punishments. They live together in families, and societies of several families united, which form what they call a race, who, in case of an attack, or defence, mutually help and support each other. The inhabitants of the same island always pretend to be of the same race; and every person looks upon this island as a possession, the property of which is common to all the individuals of the same society. Feasts are very common among them, and more particularly when the inhabitants of one island are visited by those of the others. The men of the village meet their guests beating drums, and preceded by the women, who sing and dance. At the conclusion of the dance, the hosts serve up the best provisions, and invite their guests to partake of the feast. They feed their children when very young with the coarsest flesh, and for the most part raw. If an infant cries, the mother immediately carries it to the sea side; and, whether it be summer or winter, hold it naked in the water until it is quiet. This custom is so far from doing the children any harm, that it hardens them against the cold, and they accordingly go barefooted through the winter without the least inconvenience. They seldom heat their dwellings: but, when they are desirous of warming themselves, they light a bundle of hay, and stand over it; or else they set fire to train oil, which they pour into a hollow stone. They have a good share of plain natural sense, but are rather slow of understanding. They seem cold and indifferent in most of their actions; but let an injury, or even a suspicion only, rouse them from this phlegmatic state, and they become inflexible and furious, taking the most violent revenge, without any regard to the consequences. The least affliction prompts them to suicide, the apprehension of even an uncertain evil often leads them to despair, and they put an end to their days with great apparent insensibility.

THE DISCOVERY OF AN INLAND SEA CONTAINING A GREAT NUMBER OF ISLANDS IN NORTH AMERICA.

FROM the observations made by Captain Cook on the inhabitants of the western parts of America, about the latitude of 64° north, it appeared that a strong similarity appeared between them and the Esquimaux on the eastern coast. Hence it was even then conjectured that a communication by sea existed between the eastern and western sides of that continent.

In this part of America, however, a most surprizing discovery has lately been made, which, when properly authenticated, cannot fail to be of the utmost utility, not only to science in general, but to the commercial and political interests of mankind; not to say that it will undoubtedly contribute, by giving an opportunity for the advancement of civilization, to their moral interests also. This, though not made by captain Cook himself, took place in consequence of his discoveries on the north-west continent of America.

In these parts he found that such quantities of valuable furs might be purchased from the inhabitants, as promised to be a very valuable article of commerce, provided any regular connection could be established between that part of the world and the British settlements in the East Indies. This task was quickly undertaken by some spirited adventurers, who unluckily found themselves opposed both by friends and foes, viz. the East India Company, and the Spaniards; the former pretending that they had no right to dispose of furs in the East Indies, and the latter, that they had none to bring them from the western coast of America. By one Mr. Etches, who fitted out ships for this purpose, it was discovered that all the western coast of America from lat. 48° to 57° north, was no continued tract of land, but a chain of islands which had never been explored, and that these concealed the entrance to a vast inland sea like the Baltic or Mediterranean in Europe, and which seems likewise to be full of islands*. Among these, Mr. Etches' ship, the Princess Royal, penetrated several hundred leagues in the north-east direction, till they came within 200 leagues of Hudson's Bay; but as the intention of their voyage was merely commercial, they had not time fully to explore the Archipelago, just mentioned, nor did they arrive at the termination of this new Mediterranean sea. From what they really did discover, it was supposed that there might be this way a communication with Hudson's Bay, in which case, the north-west passage to the East Indies would be found through seas much more navigable than those in which it had hitherto been attempted. With a view to ascertain the existence of any navigable communication between the North Pacific and North Atlantic oceans, a voyage was undertaken by his majesty's orders the command of which was given to Captain Vancouver. Captain Vancouver set sail from Deptford February, 7. 1791, and arrived in England in 1795. The result of his explorations, on the principal point of his mission, is the complete certainty, that within the limits of his researches on the continental shore of North America, no internal sea, nor other navigable communication exists, uniting the Pacific and Atlantic oceans.

THE PELEW ISLANDS.

THE existence and situation of these islands were probably known to the Spaniards at a distant period; but from a report among the neighbouring islands, of their being inhabited by a savage race of Cannibals, it appears that there had never been the least communication between them and any of the Europeans, till the Antelope Packet (belonging to the East India Company) was wrecked on one of them, in August, 1783. From the accounts given of these islands, by captain Wilson, who commanded the packet, it appears that they are situated between the 5th and 9th degrees north latitude, and between 130 and 136 degrees of East longitude from Greenwich, and lie in a N. E. and S. W. direction; they are long but narrow, of a moderate height, and well covered with wood; the climate temperate and agreeable; the lands produce sugar-cane, yams, cocoa nuts; plan-

* In our map of North America, an Island is laid down at the entrance of the river of the west, north latitude 45°, and west longitude 130°, the place where this discovery is said to have been made.

tains, bananas, oranges and lemons; and the surrounding seas abound with the finest and greatest variety of fish.

The natives of these islands are a stout, well made, people, above the middle stature; their complexions are of a far deeper colour than what is understood by the Indian copper, but not black. The men go entirely naked, and the women wear only two small aprons, one behind, and one before, made of the hulks of the cocoa-nut dyed with different shades of yellow.

The government is monarchical, and the king is absolute, but his power is exercised more with the mildness of a father than a sovereign. In the language of Europeans, he is the fountain of honour; he occasionally creates his nobles, called *Rupacks* or Chief, and confers a singular honour of knighthood, called the *Order of the Bone*, the members of which are distinguished by wearing a Bone on their arm.

The idea, which the account published by captain Wilson gives us of these islanders, is that of a people, who, though naturally ignorant of the arts and sciences, and living in the simplest state of nature, yet possess all that genuine politeness, that delicacy, and chastity of intercourse between the sexes, that respect for personal property, that subordination to government, and those habits of industry, which are so rarely united in the more civilized societies of modern times.

It appears that when the English were thrown on one of these islands, they were received by the natives, with the greatest humanity and hospitality, and till their departure, experienced the utmost courtesy and attention. "They felt our people were distressed, and in consequence wished they should share whatever they had to give. It was not that worldly munificence that bestows and spreads its favours with a distant eye to retribution. It was the pure emotion of native benevolence. It was the love of man to man. It was a scene that pictures human nature in triumphant colouring, and whilst their liberality gratified the sense, their virtue struck the heart."

THE MARQUESAS ISLANDS.

ARE five in number, first discovered by Quiros, in 1595; and their situation better ascertained by captain Cook in 1774. St. Dominica is the largest, about 16 leagues in circuit. The inhabitants, their language, manners, and cloathing, with the vegetable productions, are nearly the same as the Society isles.

OTAHEITE, or KING GEORGE'S ISLAND.

THIS island was discovered by captain Wallis, in the *Dolphin*, on the 19th of June, 1767. It is situated between the 17th degree 28 min.

* The *Dolphin* was sent out, under the command of captain Wallis, with the *Swallow*, commanded by captain Carteret, at the expense of the British government, in August, 1766, in order to make discoveries in the southern hemisphere. These vessels proceeded together, till they came within sight of the South Sea, at the western entrance of the strait of Magellan, and from thence returned by different routes to England. On the 6th of June 1767, captain Wallace, discovered an island, about four miles long, and three wide, to which he gave the name of *Whitson-Island*, it being discovered on *Whitson-eye*. Its latitude is $19^{\circ} 26' S.$ and its longitude, $137^{\circ} 36' W.$ The next day he discovered another island, to which he gave the name of *Queen Charlotte's* and

and the 17th degree 53 min. south latitude; and between the 149th degree 11 min. and the 149th degree 39 minutes west long. It consists of two peninsulas, of a somewhat circular form, joined by an isthmus, and is surrounded by a reef of coral rocks, which form several excellent bays and harbours, where there is room and depth of water for almost any number of the largest ships. The face of the country is very extraordinary, for a border of low land almost entirely surrounds each peninsula, and behind this border the land rises in ridges that run up into the middle of these divisions, and these form mountains that may be seen at sixty leagues distance. The soil, except upon the very tops of the ridges, is remarkably rich and fertile, watered by a great number of rivulets, and covered with fruit-trees of various kinds, forming the most delightful groves. The border of low land that lies between the ridges and the sea, is in few places more than a mile and a half broad, and this, together with some of the vallies, are the only parts that are inhabited. Captain Wallis made some stay at this island; and it was afterwards visited again by Captain Cook in the Endeavour, in April 1769. That commander was accompanied by Joseph Banks, Esq; now Sir Joseph Banks, and Dr. Solander; and those gentlemen, together with the captain, made a very accurate survey of the island.

Some parts of the island of Otaheite are very populous; and captain Cook was of opinion, that the number of inhabitants on the whole island amounted to 204,000, including women and children. They are of a clear olive complexion; the men are tall, strong, well-limbed, and finely shaped: the women are of an inferior size, but handsome, and very amorous, and indeed generally somewhat licentious. Their clothing consists of cloth or matting of different kinds; and the greatest part of the food eaten here is vegetable, as cocoa-nuts, bananas, bread-fruit, plantains, and a great variety of other fruit. Their houses, those which are of a middling size, are of an oblong square, about 24 feet long, and eleven wide, with a shelving

Island. The inhabitants of this island, captain Wallis says, were of a middle stature, dark complexion, with long black hair, which hung loose over their shoulders. The men were well made, and the women handsome. Their clothing was a kind of coarse cloth or matting, which was fastened about their middle, and seemed capable of being brought up round their shoulders. This island is about six miles long, and one mile wide and lies in latitude $19^{\circ} 18' S.$ longitude $138^{\circ} 4' W.$ In the space of a few days after, he also discovered several other small islands, to which he gave the names of *Egmont Island, Gloucester Island, Cumberland Island, Prince William Henry's Island, and Osnoburgh Island.*

On the 19th of the same month he discovered the Island of Otaheite; and, after he had quitted that island, he discovered, on the 28th of July 1767, another island about six miles long, which he called *Sir Charles Saunders's Island*; and on the 30th of the same month, another about ten miles long, and four broad, which he called *Lord Howe's Island.* After having discovered some other small islands, one of which was named *Wallis's Island,* he arrived at Batavia on the 30th of November, at the Cape of Good Hope on the 4th of February, 1768, and his ship anchored safely in the Downs, on the 20th of May following.

Captain Carteret, in the *Swallow*, after he had parted with captain Wallis, in the *Dolphin*, having passed through the strait of Magellan, and made some stay at the island of Masafueiro, discovered, on the 2d of July 1787, an island about five miles in circumference, to which he gave the name of *Pitcairn's Island.* It lies in latitude $25^{\circ} 2' S.$ longitude $133^{\circ} 21' W.$ and about a thousand leagues to the westward of the continent of America. The 12th of the same month he discovered another small island, to which he gave the name of *Bishop of Osnoburgh's Island.* The next day, he discovered two other small islands, which he called *the Duke of Gloucester's Islands.* The following month he discovered a cluster of small islands, to which he gave the name of *Queen Charlotte's Islands,* and also three others, which he named *Gover's Island, Simpson's Island, and Gardner's Island.* On the 24th of the same month, he discovered *Sir Charles Hardy's Island,* which lies in latitude $4^{\circ} 50' S.$ and the next day *Winnebass's Island,* which is distant about ten leagues in the direction of S, by E. He afterwards discovered several other islands, and proceeded round the Cape of Good Hope to England, where he arrived in March, 1769.

roof supported on three rows of posts, parallel to each other, one row on each side, and one in the middle. The utmost height within is about nine feet, and the eaves on each side reach to within about three feet and a half from the ground. All the rest is open, no part being inclosed with a wall. The roof is thatched with palm-leaves, and the floor covered some inches deep with soft hay, over which they lay mats; and upon these they sit in the day, and sleep in the night. They have no soles among them made of metal; and those they use are made of stone, or some kind of bones. The inhabitants of Otahite are remarkable for their cleanliness; for both men and women constantly wash their whole bodies in running-water three times every day. Their language is soft and melodious, and abounds with vowels. There are no tame animals on the island but hogs, dogs, and poultry; and the only wild animals are tropical birds, paroquets, pigeons, ducks, and a few other birds, rats, and a very few serpents. The sea, however, supplies the inhabitants with a great variety of the most excellent fish.

In other countries, the men cut their hair short, and the women pride themselves on its length; but here the women always cut it short, round their ears, and the men (except the fishers, who are almost continually in the water) suffer it to spread over their shoulders, or tie it up in a bunch on the top. They have the custom of discolouring the skin, by pricking it with a small instrument, the teeth of which are dipped into a mixture of a kind of lamp-black, and this is called tattowing. This is performed upon the youth of both sexes, when they are about twelve or fourteen years of age, on several parts of the body, and in various figures. Their principal manufacture is their cloth, of which there are three kinds, made of the bark of three different trees. The finest and whitest is made of the Chinese paper mulberry tree, and this is chiefly worn by the principal people. Another considerable manufacture is matting, some of which is finer, and in every respect better than any we have in Europe. The coarser sort serves them to sleep upon, and the finer to wear in wet weather. They are likewise very dexterous in making wicker-work; their baskets are of a thousand different patterns, and many of them exceedingly neat. The inhabitants of Otahite believe in one Supreme Deity, but at the same time acknowledge a variety of subordinate Deities; they offer up their prayers without the use of idols, and believe the existence of the soul in a separate state, where there are two situations, of different degrees of happiness. Among these people a subordination is established, which somewhat resembles the early state of the European nations, under the feudal system. If a general attack happens to be made upon the island, every district is obliged to furnish its proportion of soldiers for the common defence. Their weapons are slings, which they use with great dexterity, and clubs of about six or seven feet long, and made of a hard heavy wood. They have a great number of boats, many of which are constructed for war-like operations.

THE SOCIETY ISLANDS.

OF the several islands so called, and which were discovered by captain Cook *, in the year 1769, the principal are; HUANING, URUVA, OTAHA, and BOLASOLA. HUANING is about 31 leagues to the north-west of Otaheite, and its productions are exactly the same, but it appears to be a month forwarder. The inhabitants seem to be larger made, and

As the close of the year 1767 it was resolved, by the Royal Society, that it would be proper to send persons into some part of the South Sea, to observe a transit of the planet Venus over the Sun's disk, which, according to astronomical calculation, would happen in the year 1769: and that the islands called Marquesas de Mendoza, or those of Rotterdam or Amsterdam, were the properest places then known for making such observations. In consequence of these resolutions, it was recommended to his Majesty, in a memorial from the society, dated February, 1768, that he would be pleased to order such an observation to be made; upon which his Majesty signified to the lords commissioners of the admiralty his pleasure, that a ship should be provided to carry such observers, as the society should think fit to the South Sea; and accordingly a bark of three hundred and seventy tons was prepared for that purpose. It was then the Endeavour, and commanded by captain James Cook, who was soon after, by the Royal Society, appointed with Mr. Charles Green, a gentleman who had been long assistant to Dr. Bradley, at the Royal Observatory at Greenwich, to observe the transit. But while this vessel was getting ready for her expedition, captain Wallis returned; and it having been recommended to him by lord Morton, when he went out, to fix on a proper place for this astronomical observation, he, by letter, dated on board the Dolphin, the 18th of May 1768, the day before he sailed at Haliings, mentioned Port Royal harbour, in the island of Otaheite; the Royal Society, therefore, by letter, dated the beginning of June, in answer to an application from the Admiralty, to be informed whether they would have their observers sent, made choice of that place. Captain Cook set sail from Plymouth, in the Endeavour, on the 26 of August 1768. He was accompanied in his voyage by Joseph Banks, Esq. and Dr. Solander. They made no discovery till they got within the tropic, where they fell in with Tonga Island, Two Groups, Bird Island, and Chain Island; and they arrived at Otaheite on the 13th of April 1769. During their stay at that island, they had the opportunity of making very accurate inquiries relative to its produce and inhabitants; and on the 4th of June, the whole passage of the planet Venus over the sun's disk was observed by them with great advantage. The result of their observations may be found in the Philosophical Transactions. After his departure from Otaheite, captain Cook discovered and visited the Society Islands and Oheeroto, and thence proceeded to the south till he arrived in the latitude of 40 degrees, 32 minutes; longitude 127 degrees 29 minutes W.; and afterwards made an accurate survey of the coast of New Zealand. In November he discovered a chain of Islands, which he called *Barrier Islands*. He afterwards proceeded to New Holland, and from thence to New Guinea; and in September, 1770, arrived at the island of Savu, from whence he proceeded to Batavia, and from thence round the Cape of Good Hope to England, where he arrived on the 12th of June 1771.

Soon after captain Cook's return home in the Endeavour, it was resolved to equip two ships, in order to make farther discoveries in the southern hemisphere. Accordingly the Resolution and the Adventure were appointed for that purpose; the first was commanded by captain Cook, and the latter by captain Tobias Furneaux. They sailed from Plymouth Sound, on the 13th of July, 1771; and on the 29th of the same month arrived at the island of Madaira. From thence they proceeded to the Cape of Good Hope; and in February, 1773, arrived at New Zealand, having sought in vain for a southern continent. In that month the Resolution and the Adventure separated, in consequence of a thick fog, but they joined company again in Queen Charlotte's Sound, on the 18th of May following. In August they arrived at Otaheite; and in September they discovered Hervey's Island. On the 2d of October, they came to Middleburgh, one of the Friendly Islands; and about the close of that month, the Resolution and the Adventure were separated, and did not join company any more. Captain Cook, however, proceeded in the Resolution, in order to make discoveries in the southern polar regions, but was stopped, in his progress by the ice, in the latitude of 71 degrees 10 minutes south; longitude 100 degrees 54 minutes west. He then proceeded to Easter Island, where he arrived in March 1774, as he did also in the same month at the Marquesas Island. He afterwards discovered four islands, which he named Palliser's Islands; and again steered for Otaheite, where he arrived on the 2d of April, and made some stay, and also visited the neighbouring Isles. In August, he came to the New He-

more

more stout, than those of Otaheite. Mr. Banks measured one of the men, and found him to be six feet three inches and a half high; yet they are so indolent, that he could not persuade one of them to go up the hills with him; for they said, if they were to attempt it, the fatigue would kill them. The women are fairer than those of Otaheite, and both sexes appear less timid and less curious; though in their dress, language, and almost every other circumstance, they are the same. Their houses are neat, and they have boat houses that are remarkably large. *Ulitea* is about seven or eight leagues to the south-westward of Huaheine, and is a much larger island, but appears neither so fertile nor so populous. The principal refreshments to be procured here are plantains, cocos nuts, yams, hogs, and fowls; but the two last are rather scarce. *Otato* is divided from Ulitea by a strait, that in the narrowest part is not above two miles broad. This island affords two good harbours, and its produce is of the same kind as that of the other islands. About four leagues to the north-west of Otaheite lies *Balabola*, which is surrounded by a reef of rocks, and several small islands, all of which are no more than eight leagues in compass. To these islands, and those of Marua, which lie about fourteen miles to the westward of Balabola, containing six in all, captain Cook gave the name of the Society Islands,

O H E T E R O A.

THIS island is situated in the latitude of 22 deg. 47 min. south, and in the longitude of 150 deg. 47 min. west from Greenwich. It is thir-

ty miles in length, and about five miles in breadth, some of which were first discovered by him. After leaving these islands, he steered to the southward a few days, and discovered New Caledonia. Having surveyed the south-west coast of this island, Captain Cook steered again for New Zealand, in order to refresh his crew, and put his ship into a condition to encounter the danger attending the navigation in the high southern latitudes. Directing his course to the south and east, after leaving New Zealand, till he arrived in the latitude of 53 degrees, six minutes south, longitude 138 degrees 36 minutes west, without meeting with any continent, captain Cook gave up all hopes of discovering any in this ocean; and therefore came to a resolution to steer directly for the west entrance of the strait of Magellan, with a view of coasting and surveying the outermost or south side of Terra del Fuego. Keeping accordingly in about the latitude of 53 or 55; and steering nearly east, he arrived off the western mouth of the Straits of Magellan, without meeting with any thing remarkable in his new route. In January, 1775, he discovered a large and dreary island, to which he gave the name of *South Georgia*. He afterwards discovered various capes and elevated snow clad coasts, to the most southern part of which he gave the name of the *Southern Thule*, as being the nearest land to that pole, which has yet been discovered. In February he discovered *Sandwich Land*, and several islands covered with snow. He then proceeded round the Cape of Good Hope to England, where he arrived on the 30th of July, 1775. Captain Furneaux had returned to England, in the *Adventure*, a year before, having proceeded home round the Cape of Good Hope without making any remarkable discovery. Ten of his men, a boat's crew, had been murdered and eaten by some of the savages of New Zealand; so that this voyage afforded a melancholy proof that cannibals really exist; and, indeed, in the course of these voyages of discovery, other evidence appeared of this fact. As to Captain Cook, in the course of his voyage in the *Resolution*, he had made the circuit of the southern ocean, in a high latitude, and had traversed it in such a manner, as to leave not the least room for the possibility of there being a southern continent, unless near the pole, and out of the reach of navigation. It deserves also to be remembered, in honour of that able commander, captain Cook, that, with a company of a hundred and eighteen men, he performed this voyage of three years and eighteen days, throughout all the climates, from sixty-two degrees north, to seventy one degrees south, with the loss of only one man by sickness; and this appears, in a considerable degree, to have arisen from the great humanity of the commander, and his uncommon care and attention to adopt every method for preserving the health of his men.

ten miles in circuit, and rather high than low, but neither so populous nor fertile as some of the other islands in these seas. The inhabitants are lusty and well made, but are rather browner than those of Otaheite. Their principal weapons are long lances, made of etoa-wood, which is very hard, and some of them are near twenty feet long.

THE FRIENDLY ISLANDS.

THESE islands were so named by Captain Cook in the year 1773, on account of the friendship which appeared to subsist among the inhabitants, and from their courteous behaviour to strangers. Abel Jansen Tasman, an eminent Dutch navigator, first touched here in 1643, and gave names to the principal islands. Captain Cook laboriously explored the whole cluster, which he found to consist of more than sixty. The three islands which Tasman saw he named New Amsterdam, Rotterdam, and Middeburg. The first is the largest, and extends about 21 miles from east to west and 13 from north to south. These islands are inhabited by a race of Indians, who cultivate the earth with great industry. The island of Amsterdam is intersected by straight and pleasant roads, with fruit trees on each side, which provide shade from the scorching heat of the sun.

The chief islands are Annamooka, Tongataboo, and Eooa. This last when viewed from the ship at anchor, formed one of the most beautiful prospects in nature; and very different from the others of the Friendly Isles; which, being low and perfectly level, exhibit nothing to the eye but the trees which cover them: whereas here, the land rising gently to a considerable height, presented an extensive prospect, where groves of trees are only interspersed at irregular distances, in beautiful disorder, and all the rest is covered with grass, except near the shores, where it is entirely covered with fruit and other trees: amongst which are the habitations of the natives. In order to have a view of as great a part of the island as possible, captain Cook and some of his officers walked up to the highest point of the island. From this place they had a view of almost the whole island, which consisted of beautiful meadows, of prodigious extent, adorned with tufts of trees, and intermixed with plantations. 'While I was surveying this delightful prospect,' says captain Cook, 'I could not help flattering myself with the pleasing idea that some future navigator may, from the same station, behold these meadows stocked with cattle, brought to these islands by the ships of England; and that the completion of this single benevolent purpose, independent of all other considerations, would sufficiently mark to posterity, that our voyages had not been useless to the general interests of humanity.'

NEW ZEALAND.

THIS country was first discovered by Tasman, the Dutch navigator, in the year 1622, who gave it the name of Staten Land, though it has been generally distinguished in our maps and charts, by the name of New Zealand,

Zealand, and was supposed to be part of a southerly continent; but it is now known, from the late discoveries, of captain Cook, who sailed round it, to consist of two large islands, divided from each other by a strait four or five leagues broad. They are situated between the latitudes of 34 and 48 degrees south, and between the longitudes of 166 and 180 degrees east from Greenwich. One of these islands is for the most part mountainous, rather barren, and but thinly inhabited; but the other is much more fertile, and of a better appearance. In the opinion of Sir Joseph Banks, and of Dr. Solander, every kind of European fruits, grain, and plants, would flourish here in great luxuriance. From the vegetables found here, it is supposed, that the winters are milder than those in England, and the summers not hotter, though more equally warm; so that it is to be imagined, that if this country were to be settled by people from Europe, they would with moderate industry, be soon supplied, not only with the necessaries, but the luxuries of life, in great abundance. Here are forests of vast extent, filled with very large timber trees; and near four hundred plants were found here that had not been described by the naturalists. The inhabitants of New Zealand are stout and robust, and equal in stature to the largest Europeans. Their colour in general is brown, but in few deeper than that of a Spaniard who has been exposed to the sun, and in many not so deep; and both sexes have good features. Their dress is very uncouth, and they mark their bodies in a manner similar to the inhabitants of Otaheite, which is called tattooing. Their principal weapons are lances, darts, and a kind of battle-axes; and they have generally shewn themselves very hostile to the Europeans who have visited them.

THE NEW HEBRIDES.

THIS name was given by captain Cook to a cluster of islands, the most northerly of which was seen by Quiros, the Spanish navigator, in 1606, and by him named Tierra del Espiritu Santo. From that time till captain Cook's voyage in the Endeavour, in 1769, this land was supposed to be part of a great southern continent, called Terra Australis incognita. But when captain Cook had sailed round New Zealand, and along the eastern coast of New Holland, this opinion was fully confuted. On his next voyage in the Resolution, he resolved to explore those parts accurately; and accordingly, in 1774, besides ascertaining the extent and situation of these islands, he discovered several in the group, which were before unknown. The New Hebrides are situated between the latitudes of 14 deg. 29 min. and 20. deg. 4 min. south; and between 166 deg. 41 min. and 170 deg. 21 min. east longitude. They consist of the following islands, some of which have received names from the different European navigators, and others retain the names which they bear among the natives, viz. Tierra del Espiritu Santo, Mallicollo, St. Bartholomew, Isle of Lepers, Aurora, Whitfuntide, Ambrym, Immer, Appee, Three Hills, Sandwich, Montagu, Hinchinbrook, Shepherd, Erromanga, Irrouan, Annatom, and Tanna.

Not far distant from the New Hebrides, and south-westward of them, lies New CALLEDONIA, a very large island, first discovered by Captain Cook, in 1774. It is about eighty-seven leagues long, but its breadth is not considerable, nor any where exceeds ten leagues. It is inhabited by a race of stout, tall, well proportioned Indians, of a swarthy or dark chestnut-brown. A few leagues distant are two small islands called the island of Fince, and Botany Island.

NEW HOLLAND.

THE largest island in the world, and formerly supposed to be a part of that imaginary continent, called Terra Australis Incognita, lies between 10 deg. 30. min. and 43 deg. south latitude, and between 110 and 153 deg. 30 min. east longitude; extending in all as much as the whole continent of Europe, the eastern coast running no less than 2000 miles in length from north-east to south-west. Its dimensions from east to west have not been so exactly ascertained, as we are obliged to take our information concerning them from the account of navigators of different nations, who visited this part of the world at a time when the method of making observations, and finding the latitudes and longitudes of places was less accurate than it is now. Different parts of the country have been called by the names of these discoverers as Van Diemen's land, Carpentaria, &c. and though the general appellation of the whole was New Holland, it is now applied by geographers to the north and west parts of the country. The eastern part, called New South Wales, was taken possession of in his majesty's name by Captain Cook, and now forms a part of the British dominions, a colony being very lately formed there chiefly of the convicts, sentenced to transportation.

The accounts of the climate and soil of this extensive country, now become an object of importance to Great Britain, are very various, and indeed it cannot be expected otherwise, as different parts have been explored at different times, and at different seasons of the year. In general, however, the relations are by no means favourable; the sea-coast, the only place on which any inhabitants have been discovered, appearing sandy and barren, and as for the inland parts, which might reasonably be supposed more fertile, they are now thought to be wholly uninhabited; but whether this proceeds from the natural sterility of the soil, or the barbarity of the inhabitants, who know not how to cultivate it, is not yet discovered.

One thing we are assured of by all who have ever visited this country, that its coast is surrounded by very dangerous shoals and rocks, so that it is by no means easy to effect a landing upon it. A shoal called Houtman's Abrolhos, or shoal, from Frederick Houtman, commander of a fleet of Dutch Indiamen in 1618, lies on this western coast, on which commodore Pelsart, a Dutch navigator, was wrecked in 1629. When his ship, the Batavia, having on board 330 men, struck on this shoal, there was no land in sight, excepting some small rocky islands, and one considerably bigger, about three leagues distant. All these were explored in search of fresh water, and none being found, they were obliged to sail in their ships to the continent, which they soon after discovered. But on their approach, they found the coast so excessively rocky, that it was impossible to land. Continuing their course northward for two days they found them-

themselves in 27 degrees of south latitude; but still the shore was so extremely steep, that there was no possibility of approaching it. It presented the same appearance as far north as 24 degrees; but the men being now resolved to get on shore at any rate, six of them, who were expert swimmers threw themselves into the sea, and with much ado got to land. Here they employed themselves in searching for fresh water, but finding none, they were obliged to swim back again to their skiff. Next day they discovered a cape, from the extreme points of which ran a ridge of rocks for about a mile into the sea, with another behind it; but still no passage was found to the continent. Another opening appeared about noon the same day, into which they ventured, though the passage was extremely dangerous, even for a skiff, having only two feet water, with a rugged stony bottom. Here, however, they effected a landing, but though they made the most diligent search for fresh water, they could find neither rivulets, springs, nor even water that could be drunk by digging of wells. The shoal on which commodore Pelsart was wrecked, is placed by Dampier in 27 degrees south latitude.

This navigator explored the coast of New Holland in 1688 and 1699. In the last of these voyages he fell in with the land in 26 deg. south latitude; but could not land on account of the steepness of the shore. In 22 deg. 22 min. he found another shoal, which was the first he had met with since leaving the Abrolhos in 27 deg. In 20 deg. 21 min. he fell in with some rocky Islands, which from the nature of the tides, he supposed to extend in a range as far south as Shark's Bay, in 25 deg. and nine or ten leagues in breadth from east to west. In 18 deg. 21 min. he effected a landing, but the shore here, as in all other places visited by this navigator, was excessively rocky at low water, so that it is then impossible to land. At high water, however, the tides rise so high, that boats may get over the rocks to a sandy beach, which runs all along the coast.

The southern part of this island, visited by captain Tasman in 1642, was found less difficult of access. He pursued the coast as far south as 44 degrees, where it begins to run to the eastward; and from his time the country appears not to have been visited by any Europeans, till the year 1770, when captain Furneaux of the Adventure, reached the point we speak of, lying in 43 deg. 17 min. south, 145 deg. 36 min. and by account 143 deg. 16 min. east from Greenwich. Several islands appeared to the north-west, one of which was named by Captain Cook, Eddystone, from its resemblance to the light house of that name; and he observes that nature seems to have left these two rocks for the same purpose that the Eddystone light house was built by man, viz. to give navigators warning of their danger; for they are the conspicuous summits of a ledge of rocks under water, on which the sea in many places breaks very high. Their surface is white with the dung of sea fowls, which makes them conspicuous at a considerable distance.

This celebrated navigator Captain Cook, spent upwards of four months in surveying the eastern coast, the extent of which, as has already been mentioned, is nearly 2000 miles. The bay in which he anchored, from the great quantity of herbs found on shore, was called BOTANY BAY, and is the place for which the convicts were originally destined; though now they are settled in another part of the Island, about fifteen miles to the northward, named by captain Cook, Port Jackson, the principal settlement being called SYDNEY COVE.

This was not visited or explored by Captain Cook; it was seen at the distance

distance of between two and three miles from the coast; but had fortune conducted him into the harbour, he would have found it much more worthy of his attention as a seaman than Botany Bay, where he passed a week. From an entrance not more than two miles broad, Port Jackson gradually extends into a noble and spacious basin, having soundings sufficient for the largest vessels; and space to accommodate in perfect security any number that could be assembled. It runs chiefly in a western direction about 13 miles into the country, and contains no less than 100 small coves formed by narrow necks of land, whose projections afford shelter from the winds.

SYDNEY COVE lies on the south side of the harbour, between five and six miles from the entrance. The neck of land that forms this cove is mostly covered with wood, yet so rocky, that it is not easy to comprehend how the trees could have found sufficient nourishment, to bring them to so considerable a magnitude. The soil in other parts of the coast, immediately about Port Jackson, is of various qualities. This neck of land, which divides the south end of the harbour from the sea, is chiefly sand. Between Sydney Cove and Botany Bay the first space is occupied by a wood, in some parts a mile and a half, in others three miles broad. Beyond that is a kind of heath, poor, sandy, and full of swamps; but, as far as the eye can reach to the westward, the country is one continued wood.

The name of Cumberland county was given by the government to this part of the territory. It is above 50 miles in length, and 30 broad. The boundaries fixed for Cumberland county were, on the west, Carmarthen and Landdown Hills; on the north, the northern parts of Broken Bay; and to the southward, the southern parts of Botany Bay. Thus including completely these three principal bays, and leaving the chief place of settlement at Sydney Cove, nearly in the centre.

At the very first landing of Governor Philip on the shore of Botany Bay, an interview took place with the natives. They were all armed, but on seeing the governor approach with signs of friendship, alone and unarmed, they readily returned his confidence by laying down their arms.

They were perfectly devoid of cloathing, yet seemed fond of ornaments, putting the beads and red baize that were given them on their heads or necks, and appearing pleased to wear them.

The different coves of Port Jackson were examined with all expedition, and the preference was given to one which had the finest spring of water; and in which ships can anchor so close to the shore, that at a very small expence quays may be constructed, at which the largest vessels may unload.

After they had all landed at Sydney Cove, a plan was laid down for building a town, according to which were traced out the principal streets, the governor's house, main-guard, hospital, church, store-houses, and barracks. In some parts of this space, temporary barracks are erected, but no permanent building will be allowed, except in conformity to the plan laid down. Should the town be farther extended in future, the form of other streets are also marked out, in such a manner as to ensure a free circulation of air. The principal streets, according to this design, will be 200 feet wide.

The climate at Sydney Cove is considered, on the whole, as equal to the finest in Europe. The rains are never of long duration, and there are seldom any fogs. The soil, though in general light, and rather sandy. In this part, is full as good as usually is found so near the sea-side. All the plants

plants and fruit trees brought from Brasil and the Cape, which were not damaged in the passage, thrive exceedingly; and vegetables have now become plentiful, both the European sorts, and such as are peculiar to New South Wales.

The natives of New Holland, in general, seem to have no great aversion to the new settlers: the only acts of hostility they ever committed were on account of their occupying the fishing-grounds, which the New Hollanders justly supposed to belong to themselves. They appear, however, to be in too savage a state to be capable as yet of deriving any instruction from their new neighbours. They are so ignorant of agriculture, that it seems most probable, they do not even know the use of corn, and, therefore, perhaps more from ignorance than malice, set fire to that which the colonists had raised for their own use. To avoid such disagreeable incidents, a new settlement was begun on a small uninhabited island, named *Norfolk Island*, lying in south latitude 30° , and east long. $168^{\circ} 30'$ at the distance 1200 miles from New Holland. The party sent out to form this settlement consisted only of 26 persons, who took possession on the 14th of February, 1788. This settlement was found so eligible, that, in October 1788, another party was sent thither, so that the new colony, at the time the last advices were received, consisted of 44 men and 16 women; who being supplied with 18 months provisions, will probably be able to cultivate the soil in such a manner, as to enable them to form a granary, which will put those who are settled on New Holland, entirely out of danger from their barbarous neighbours.

For a more particular account of this new settlement, we refer our readers to the Voyage of Governor Phillip to Botany Bay, published by Stockdale.

NEW GUINEA.

TILL the late discoveries, was thought to be the north coast of an extensive continent, and to be joined to New Holland; but captain Cook discovered a strait between them, which runs north-east, through which he sailed. Thus it was found to be a long narrow island, extending north-east, from the second degree of south latitude to the twelfth, and from one hundred and thirty-one to one hundred and fifty degrees east longitude; but in one part it does not appear to be above fifty miles broad. The country consists of a mixture of very high hills and vallies, interspersed with groves of cocoa-nut trees, plantains, breadfruit, and most of the trees, shrubs, and plants, that are found in the other South-sea islands. It affords from the sea a variety of delightful prospects. The inhabitants make nearly the same appearance as the New Hollanders on the other side the straits.

To the north of New Guinea is NEW BRITAIN, which is situated in the 4th degree of south latitude, and 152° deg. 19 min. east longitude from Greenwich. It was supposed to be part of an imaginary continent till capt. Dampier found it to be an island, and sailed through a strait which divides it from New Guinea. Capt. Carteret, in his voyage round the world, in 1767, found it was of much less extent than it was till then imagined to be, by sailing through another straight to the north, which separates it from a long island, to which he gave the name of New Ireland: There are many high hills in New Britain, and it abounds with large and stately trees. To the eastward of New Britain, and in both the above straits, are many islands, most

most of which are said to be extremely fertile, and to abound with plantains and cocoa-nut trees.

NEW IRELAND extends in length, from the north-east to the south-east, about two hundred and seventy miles, but is in general very narrow. It abounds with a variety of trees and plants, and with many pigeons, parrots, rooks, and other birds. The inhabitants are black and woolly headed like the Negroes of Guinea, but have not their flat noses and thick lips. North westward of New Ireland a cluster of islands was seen by capt. Carteret, lying very near each other, and supposed to consist of twenty or thirty in number. One of these, which is of very considerable extent, was named NEW HANOVER; but the rest of the cluster received the name of the ADMIRALTY ISLANDS.

SANDWICH ISLANDS.

BESIDES the voyages of discovery already mentioned, another voyage was performed by capt. Cook and capt. Clerke, in the Pelelution and Discovery, during the years 1776, 1777, 1778, and 1779, in search of a north-west passage between the continents of Asia and America. After they had arrived at the Cape of Good Hope they proceeded from thence to New Holland. In their course they discovered two islands, which capt. Cook called Prince Edward's Isles. The largest about 15 leagues in circuit, is in latitude 46, 53 south, longitude 37, 46; the other about 9 leagues in circuit, lat. 46, 40, and long. 38, 8, E. both barren and almost covered with snow. From New Holland to New Zealand, and afterwards they visited the Friendly and the Society Isles. In January, 1777, they arrived at the Sandwich Isles, which are twelve in number, and are situated between 22 deg. 15 min. and 18 deg. 53 min. N. latitude. The air of these islands is in general salubrious, and many of the vegetable productions are the same with those of the Society and Friendly Isles. The inhabitants are of a middle size, stout, and well made, and their complexions in general a brown olive. On the 7th of February, being nearly in lat. 44 deg. 33 min. north, and long. 235 deg. 36 min. east, they saw part of the American continent, bearing north east. They afterwards discovered King George's Sound, which is situated on the north-west coast of America, and is extensive: that part of it where the ships under the command of capt. Cook anchored, is in lat. 49 deg. 36 min. north, and long. 233 deg. 28 min. east. The whole sound is surrounded by high land, which in some places appears very broken and rugged, and is in general covered with wood to the very top. They found the inhabitants here rather below the middle size, and their complexions approaching to a copper colour. On the 12th of May, they discovered Sandwich Sound, in lat. 59 deg. 54 min. north. The harbour in which the ships anchored, appeared to be almost surrounded with high land; which was covered with snow; and here they were visited by some of the Americans in their canoes. They afterwards proceeded to the island of Unalafchka, and after their departure from thence, still continued to trace the American coast, till they discovered the strait which separates it from the continent of Asia. Here both the hemispheres presented to the view, a naked and flat country, without any defence, and the sea between them not very deep. They passed the strait, and arrived on the 20th of August 1778, in lat. 70 deg. 54 min. long. 194 deg. 55 min. where they found themselves almost surrounded with ice, and the farther they proceeded to the eastward,

the

the closer the ice became compacted. They continued labouring among the ice till the 25th, when a storm came on, which made it dangerous for them to proceed; and a consultation was therefore held on board the Resolution; as soon as the violence of the gale abated, when it was resolved, that as this passage was impracticable for any useful purpose of navigation, which was the great object of the voyage, it should be prosecuted no farther; and especially on account of the condition the ships were in, the approach of winter, and their great distance from any known place of refreshment. The voyage, indeed, afforded sufficient evidence, that no practicable passage exists between the Atlantic and Pacific Oceans towards the North; and this voyage also ascertained the western boundaries of the great continent of America. On their return it unfortunately happened, that the celebrated and able navigator, captain Cook, was killed in an affray with the natives, on the island of O'why'hee, one of the Sandwich isles, on the 14th of February, 1779; not so much by his own rashness, as through the inadvertence and neglect of some of his own people; his death was universally regretted, not only in Great Britain, but also in other parts of Europe, by those to whom his merits and public services were known. In his last voyage he had explored the coast of America, from 42 deg. 27 min. to 70 deg. 40 min. 57 sec. north. After the death of captain Cook, the command devolved on captain Clerke, who died at sea on his return to the southward on the 22d day of August 1779. The two ships returned home by the Cape of Good Hope, and on the 5th of October 1780, anchored at the Nore.

We cannot conclude this article without inserting the following extract, to perpetuate the memory and services of so excellent a navigator.

Perhaps no science ever received greater additions from the labours of a single man than geography has done from those of captain Cook. In his first voyage to the South Seas, he discovered the Society Islands; determined the insularity of New Zealand; discovered the straits which separate the two islands, and are called after his name; and made a complete survey of both. He afterwards explored the eastern coast of New Holland, hitherto unknown; an extent of twenty-seven degrees of latitude, or upwards of two thousand miles.

In his second expedition, he resolved the great problem of a southern continent having traversed that hemisphere between the latitude of 40° and 70°, in such a manner as not to leave a possibility of its existence, unless near the pole, and out of the reach of navigation. During this voyage he discovered New Caledonia, the largest island in the Southern Pacific Ocean, except New Zealand; the island of Georgia; and an unknown coast, which he named Sandwich Land, the Thule of the Southern hemisphere; and having twice visited the tropical seas, he settled the situations of the old, and made several new discoveries.

But the last voyage is distinguished above all the rest, by the extent and importance of its discoveries. Besides several smaller islands in the Southern Pacific, he discovered, to the North of the Equinoctial Line; the group called the Sandwich Islands, which, from their situation and productions, bid fairer for becoming an object of consequence in the system of European navigation, than any other discovery in the South Sea. He afterward explored what had hitherto remained unknown of the Western coast of America, from the latitude of 43° to 70° North, containing an extent of three thousand and five hundred miles; ascertained the proximity of the two great continents of Asia and America; passed the straits between them, and surveyed the coast on each side, to such a height of northern latitude, as to

demonstrate the impracticability of a passage, in that hemisphere, from the Atlantic into the Pacific Ocean, either by an Eastern or a Western course. In short; if we except the Sea of Amur, and the Japanese Archipelago, which still remain imperfectly known to Europeans, he has completed the hydrography of the habitable globe.

As a navigator, his services were not perhaps less splendid, certainly not less important and meritorious. The method which he discovered, and so successfully pursued, of preserving the health of seamen, forms a new æra in navigation, and will transmit his name to future ages, amongst the friends and benefactors of mankind.

Those who are conversant in naval history, need not be told at how dear a rate the advantages which have been sought, through the medium of long voyages at sea, have always been purchased. That dreadful disorder which is peculiar to their service, and whose ravages have marked the tracks of discoverers with circumstances almost too shocking to relate, mult, without exercising an unwarrantable tyranny over the lives of our seamen, have proved an insuperable obstacle to the prosecution of such enterprizes. It was reserved for Captain Cook to shew the world, by repeated trials, that voyages might be protracted to the unusual length of three, or even four years, in unknown regions, and under every change and rigour of the climate, not only without affecting the health, but even without diminishing the probability of life, in the smallest degree.

TERRA INCOGNITA, or UNKNOWN COUNTRIES.

NOTWITHSTANDING the amazing discoveries of navigators, and the progress made in geography, since the first voyage of Columbus, anno 1492, there still remain some countries, either absolutely unknown, or very superficially surveyed.

I N A F R I C A.

OF this quarter of the globe the moderns are acquainted with the sea-coasts only, and these very imperfectly; the internal parts being little known to us, nor have we any satisfactory accounts of their inhabitants, their productions, or their trade. It is well known, however, that the rivers of Africa bring down large quantities of gold, and it is equally certain that the ancients drew prodigious riches from a country blessed with a variety of climates, some of them the finest in the world.

I N A M E R I C A.

IN North America, towards the pole, are Labrador, or New Britain, New North, and South Wales, New Denmark, &c. very little known. The inhabitants, like those of Nova Zembla, Greenland, Groenland, and the northern parts of Siberia, are few, and these savage; low in stature, and of an ugly appearance. They live upon the raw flesh of whales, bears, oxen, &c. and go muffled up in skins, the hairy sides next their bodies. In these inhospitable regions, their nights (as may be seen in the table of climates in the

introduction) are from one to six months, and the earth bound up in impene- trable snow; so that the miserable inhabitants live under ground part of the year. Again, when the sun makes his appearance, they have a day of equal length.

All that vast tract on the back of the British settlements, from Canada and the lakes to the Pacific Ocean, which washes America on the west, is perfectly unknown to us, no European having ever travelled thither. From the climate and situation of the country, it is supposed to be fruitful; it is inhabited by innumerable tribes of Indians, many of whom used to resort to the great fair of Montreal, even from the distance of 1000 miles, when that city was in the hands of the French.

In South America, the country of Guiana, extending from the equator to the eight degree of north latitude, and bounded by the river Oronoque on the north, and the Amazonas on the south, is unknown, except a slip along the coast; where the French at Cayenne, and the Dutch at Surinam, have made some settlements; which, from the unhealthfulness of the climate, almost under the equator, and other causes, can hardly be extended any considerable way back.

The country of Amazonia, so called from the great river of that name, has never been thoroughly discovered; though it is situated between the European colonies of Peru and Brasil, and every where navigable by means of that great river and its branches. Some attempts have been made by the Spaniards and Portuguese; but being always attended with vast difficulties, so that few of the adventurers ever returned back, and no gold being found in the country as they expected, no European nation has hitherto made any settlement there.

Patagonia, at the southern extremity of America, is sometimes described as part of Chili: but as neither the Spaniards, nor any other European nation, have any colonies here, it is almost unknown, and is generally represented as a barren, inhospitable country. And here in $52\frac{1}{2}$ degrees south lat. we fall in with the Straits Magellan, having Patagonia on the north, and the islands of Terra del Fuego on the south. These Straits extend from east to west 110 leagues, but the breadth in some places falls short of one. They were first discovered by Magellan, or Magelhaens, a Portuguese, in the service of Spain, who sailed through them in the year 1520, and thereby discovered a passage from the Atlantic to the Pacific or Southern Ocean. He has been since considered as the first navigator that sailed round the world, but having lost his life in a skirmish with some Indians before the ships returned to Europe, the honour of being the first circumnavigator has been disputed in favour of the brave Sir Francis Drake, who in 1574 passed the same strait in his way to India, from which he returned to Europe by the Cape of Good Hope. In 1616, La Maire, a Dutchman, keeping to the southward of these straits, discovered in lat. $54\frac{1}{2}$ another passage, since known by the name of the Straits La Maire, and this passage, which has been generally preferred by succeeding navigators, is called doubling Cape Horn. The author of Anson's voyage, however, from fatal experience, advises mariners to keep clear of these straits and islands, by running down to 61 or 62 deg. south lat. before they attempt to set their face wellward, towards the South Seas; but the extremes long night, and the intense cold in those latitudes, render that passage practicable only in the months of January and February, which is there the middle of summer.

A

MODERN UNIVERSAL TABLE;

The most **COPIOUS** and **AUTHENTIC** that ever was published of the present State of the **REAL** and **IMAGINARY MONIES** of the World.

Divided into four Parts, viz.

EUROPE, ASIA, AFRICA, AND AMERICA;

Which are subdivided into fifty-five Parts, containing the Names of the most capital Places, the Species whereof are inserted, shewing how the Monies are reckoned by the respective Nations; and the Figures standing against the Denomination of each foreign Piece is the English intrinsic Value thereof, according to the best Assays made at the Mint of the Tower of LONDON.

EXPLANATION.

By real Money is understood an Effective Specie, representing in itself the value denominated thereby, as a GUINEA, &c.

* This Mark is prefixed to the imaginary Money, which is generally made use of in-keeping Accounts, signifying a fictitious Piece which is not in being or which cannot be represented but by several other Pieces, as a Pound Sterling, &c.

All Fractions in the Value English are Parts of a Penny.

= This Mark signifies, *is, make, or equal to.*

Note; for all the Spanish, Portuguese, Dutch, and Danish Dominions, either on the Continent, or in the West Indies, see the Monies of the respective Nations.

NEW CHRONOLOGICAL TABLE

OF

REMARKABLE EVENTS, DISCOVERIES, and INVENTIONS;

ALSO,

The *ÆRA*, the *COUNTRY*, and *WRITINGS* of *LEARNED MEN*;The whole comprehending in one View, the Analysis or Outlines of *Genesis* History, from the Creation to the present Time.

Bef. Christ.

- 4004 THE creation of the world, and Adam and Eve.
 4003 The birth of Cain, the first who was born of a woman.
 3017 Enoch, for his piety, is translated in Heaven.
 2348 The old world is destroyed by a deluge, which continued 377 days.
 2347 The tower of Babel is built about this time by Noah's posterity, upon which God miraculously confounds their language, and thus disperses them into different nations.
 About the same time, Noah is, with great probability, supposed to have parted from his rebellious offspring, and to have led a colony of some of the more tradable into the East, and there either he or one of his successors to have founded the ancient Chinese monarchy.
 2334 The celestial observations are begun at Babylon, the city which first gave birth to learning and the sciences.
 2188 Misraim, the son of Ham, founds the kingdom of Egypt, which lasted 1663 years, down to its conquest by Cambyses, in 525 before Christ.
 2039 Ninus, the son of Belus, founds the kingdom of Assyria, which lasted above 1000 years, and out of its ruins were formed the Assyrians of Babylon, those of Nineveh, and the kingdom of the Medes.
 1931 The covenant of God made with Abram, who leaves Haran to go into Canaan, which begins the 430 years sojourning.
 1897 The cities of Sodom and Gomorrah are destroyed for their wickedness, by fire from Heaven.
 1836 The kingdom of Argos, in Greece, begins under Inachus.
 1824 Memnon, the Egyptian, invents the letters.
 1715 Prometheus first struck fire from flint.
 1633 Joseph dies in Egypt, which concludes the books of Genesis, containing a period of 2369 years.
 1574 Aaron born in Egypt; 1490, appointed by God first high-priest of the Israelites.
 1558 Moses, brother to Aaron, born in Egypt, and adopted by Pharaoh's daughter, who educates him in all the learning of the Egyptians.
 1536 Cecrops brings a colony of Saites from Egypt into Attica, and begins the kingdom of Athens, in Greece.
 1546 Scamander comes from Crete into Phrygia, and begins the kingdom of Troy.
 1493 Cadmus carried the Phœnician letters into Greece, and built the citadel of Thebes.
 1491 Moses performs a number of miracles in Egypt, and departs from that kingdom together with 600,000 Israelites, besides children; which continued the 430 years of sojourning. They miraculously pass through the Red Sea, and come to the Desert of Sinai, where Moses receives from God, and delivers to the people the

- Ten Commandments, and the other laws, and sets up the tabernacle, and in it the ark of the covenant.
- 1485 The first ship that appeared in Greece was brought from Egypt by Danaus, who arrived at Rhodes and brought with him his fifty daughters.
- 1483 The first Olympic games celebrated at Olympia, in Greece.
- 1453 The Pentateuch, or five first books of Moses, are written in the land of Moab, where he died the year following, aged 120.
- 1452 The Israelites, after sojourning in the Wilderness forty years, are led under Joshua into the land of Canaan, where they stay themselves, after having subdued the natives; and the period of the sabbatical year commences.
- 1406 Iron is found in Greece from the accidental burning of the woods.
- 1398 The rape of Helen by Paris, which, in 1193 gave rise to the Trojan war, and siege of Troy by the Greeks; which continued ten years, when that city was taken and burnt.
- 1048 David is sole king of Israel.
- 1004 The Temple is solemnly dedicated by Solomon.
- 896 Elijah, the prophet, is translated to heaven.
- 894 Money first made of gold and silver at Argos.
- 869 The city of Carthage, in Africa, founded by queen Dido.
- 814 The kingdom of Macedon begins.
- 776 The first Olympiad begins.
- 753 Era of the building of Rome in Italy by Romulus, first king of the Romans.
- 720 Samaria taken, after three years' siege, and the kingdom of Israel finished, by Salmanser, king of Assyria, who carried the ten tribes into captivity.
- The first eclipse of the moon on record.
- 618 Byzantium (now Constantinople) built by a colony of Athenians.
- 604 By order of Necho, king of Egypt, some Phœnicians sailed from the Red Sea round Africa, and returned by the Mediterranean.
- 600 Thales of Miletus travels into Egypt, consults the priests of Memphis, acquires the knowledge of geometry, astronomy, and philosophy; returns to Greece, calculates eclipses, gives general notions of the universe, and maintains that one supreme intelligence regulates all its motions.
- Maps, globes, and the signs of the Zodiac, invented by Anaximander, the scholar of Thales.
- 587 Jehoiachin, king of Judah, is carried away captive, by Nebuchadnezzar, to Babylon.
- 587 The city of Jerusalem taken, after a siege of 18 months.
- 562 The first comedy at Athens acted upon a moveable scaffold.
- 559 Cyrus the first king of Persia.
- 538 The kingdom of Babylon finished; that city being taken by Cyrus, who, in 536, issued an edict for the return of the Jews.
- 534 The first tragedy was acted at Athens, on a waggon by Thepiss.
- 526 Learning is greatly encouraged at Athens, and a public library first founded.
- 515 The second Temple at Jerusalem is finished under Darius.
- 509 Tarquin, the seventh, and last king of the Romans, is expelled, and Rome is governed by two consuls, and other republican magistracies, till the battle of Pharsalia, being a space of 461 years.
- 504 Sardinia taken and burnt by the Athenians, which gave occasion to the Persian invasion of Greece.
- 486 Elchylus, the Greek poet, first gains the prize of tragedy.
- 481 Xerxes the Great king of Persia, begins his expedition against Greece.
- 458 Ezra is sent from Babylon to Jerusalem, with the captive Jews and the vessels of gold and silver, &c. being seventy weeks of years, or 498 years before the crucifixion of our Saviour.
- 454 The Romans send to Athens for Solon's laws.
- 431 The Decemvirs created at Rome, and the laws of the twelve tables compiled and ratified.
- 430 The history of the Old Testament finishes about this time. Malachi the last of the prophets.
- 401 Retreat of 10,000 Greeks under Xenophon.
- 400 Socrates, the founder of moral philosophy among the Greeks, believes the immortality of the soul, and a state of rewards and punishments, for which and other sublime doctrines, he is put to death by the Athenians, who soon after repent, and erect to his memory a statue of brass.
- 331 Alexander the Great, king of Macedon, conquers Darius, king of Persia, and other nations of Asia.
- 323 Dies at Babylon, and his empire is divided by his generals into four kingdoms.
- 845 Dionysius, or Alexandria, began his astronomical era on Monday June 26, being

•• I have character of if Christ, at them. Not them and aff ded the very

- the first who found the exact solar year to consist of 365 days, 5 hours, and 49 minutes.
- 284 Ptolemy Philadelphus, king of Egypt, employs seventy-two interpreters to translate the Old Testament into the Greek language, which is called the Septuagint.
- 289 The first coining of silver at Rome.
- 64 The first Punic war begins, and continues 23 years. The chronology of the Arundelians is therein corrected.
- 260 The Romans first concern themselves in naval affairs, and defeat the Carthaginians at sea.
- 237 Hannibal, the Carthaginian, causes his son Hannibal, at nine years old, to swear eternal enmity to the Romans.
- 218 The second Punic war begins, and continues 77 years. Hannibal passes the Alps, and defeats the Romans in several battles, but being assisted by his women, does not improve his victories by the storming of Rome.
- 190 The first Roman army enters Asia, and from the spoils of Antiochus brings the Asiatic luxury first to Rome.
- 168 Perseus defeated by the Romans, which ends the Macedonian kingdom.
- 167 The first library erected at Rome, of books brought from Macedonia.
- 163 The government of Judah under the Maccabees begins, and continues 140 years.
- 140 Carthage, the rival of Rome, is razed to the ground by the Romans.
- 125 The history of the Apocryphal ends.
- 58 Julius Caesar makes his first expedition into Britain.
- 47 The battle of Pharsalia between Caesar and Pompey, in which the latter is defeated. The Alexandrian library, consisting of 400,000 valuable books, burnt by accident.
- 45 The war of Actium, in which Octo kills himself. The solar year introduced by Caesar.
- 44 Caesar, the greatest of the Roman conquerors, after having fought fifty pitched battles, and slain 1,192,000 men, and overturned the liberties of his country, is killed in the senate-house.
- 31 The battle of Actium fought, in which Mark Anthony and Cleopatra are totally defeated by Octavius, nephew to Julius Caesar.
- 30 Alexandria, in Egypt, is taken by Octavius, upon which Anthony and Cleopatra put themselves to death, and Egypt is reduced to a Roman province.
- 27 Octavius, by a decree of the senate, obtains the title of Augustus Caesar, and an absolute exemption from the laws, and is properly the first Roman emperor.
- 8 Rome at this time is fifty miles in circumference and contains 463,000 men fit to bear arms.
- The temple of Janus is shut by Augustus, as an emblem of universal peace, and JESUS CHRIST is supposed to have been born in September, or on Monday, December 25.

A. C.

- 15 CHRIST hearing the Doctors in the temple; and asking them questions
- 29 ——— is baptised in the wilderness by John.
- 33 ——— is crucified on Friday, April 3, at 3 o'clock P. M.
- His Resurrection on Sunday, April 5; his Ascension, Thursday, May 14.
- 36 St. Paul converted.
- 39 St. Matthew writes his Gospel.
- Pontius Pilate kills himself.
- 40 The name of Christians first given at Antioch to the followers of Christ.
- 43 Claudius Caesar's expedition into Britain.
- 44 St. Mark writes his Gospel.
- 49 London is founded by the Romans; 368, surrounded by ditches with a wall, some parts of which are still observable.
- 51 Caradæus, the British king, is carried in chains to Rome.
- 52 The council of the apostles at Jerusalem.
- 53 St. Luke writes his Gospel.
- 59 The emperor Nero puts his mother and brothers to death.
- Persecutes the Druids in Britain.

“I have often thought (says a judicious Commentator) that it is a great injury to the character of our Blessed Redeemer, to represent this story, whether in pictures or words, as if Christ, at this tender age, went up into the seats of the Doctors and there disputed with them. Not one word is said of his disputing by the Evangelist, but only of his hearing them and asking them questions, which was a very usual thing in these assemblies, and indeed the very end of them. All was conducted with the utmost modesty and decorum.”

- 61 Boadicea the British queen, defeats the Romans; but is conquered soon after by Suetonius, governor of Britain.
- 62 St. Paul is sent in bonds to Rome—writes his epistles between 51 and 66.
- 63 The acts of the Apostles written. Christianity is supposed to be introduced into Britain by St. Paul, or some of his disciples about this time.
- 64 Rome set on fire, and burned for six days; upon which began (under Nero) the first persecution against the Christians.
- 65 St. Peter and St. Paul put to death.
- 70 While the factious Jews are destroying one another with mutual fury, Titus, the Roman general, takes Jerusalem, which is razed to the ground, and the plough made to pass over it.
- 79 Herculaneum overwhelmed by an eruption from Mount Vesuvius.
- 83 The philosophers expelled Rome by Domitian.

- Britals, impeached Warren Hastings, late governor general of Bengal, of high crimes and misdemeanours, May 21.
- 1787 The king, by letters patent, erected the province of Nova Scotia into a bishop's see, and appointed Dr. Charles Inglis to be the bishop, Aug. 11.
- 1788 In the early part of October, the first symptoms appeared of a severe disorder, which afflicted our gracious sovereign. On the sixth of November they were very alarming, and on the thirteenth a form of prayer for his recovery was ordered by the privy council.
- 1789 His majesty was pronounced to be in a state of convalescence, Feb. 17, and to be free from complaint, Feb. 26.
- A general thanksgiving for the king's recovery, who attended the service at St. Paul's with a great procession, April 23.
- 1790 Revolution in France, capture of the basilica, execution of the governor, &c. July 14.
- 1790 Grand confederation in the Champ de Mars, July 14.
- 1791 In consequence of some gentlemen meeting to commemorate the French revolution in Birmingham, on the 14th of July, the mob atrociously committed the most daring outrages for some days on the persons and properties of many of the inhabitants of the town and neighbourhood; burning and destroying meeting-houses, private dwellings, &c. Peace and security were at length restored by the interposition of the military power.
- 1792 The definitive treaty of peace was signed between the British and their allies, the Nizam and Maharatas on the one part, and Tippoo Sultan on the other, March 19th, by which he ceded one half of his territorial possessions, and delivered up two of his sons to Lord Cornwallis as hostages for the fulfilment of the treaty.
- Gustavus III. king of Sweden, died on the 29th of March, in consequence of being assassinated by Ankerström.
- 1793 Lewis XVI. after having received innumerable indignities from his people, was brought to the scaffold, Jan. 21, and had his head severed by the guillotine, contrary to the express laws of the new constitution, which had declared the person of the king inviolable.
- 1794 The habeas corpus act suspended in consequence of a report of a secret committee of the House, that a conspiracy existed against the king and constitution.
- Defeat of the Royalists in La Vendée and horrid massacres.
- Jacobin club in France dissolved.
- 1795 An illustrious naval victory gained by Lord Howe over the French fleet; six ships of the line taken and one sunk.
- French over run the Netherlands.
- enter Holland, and overturn the government.
- 1796 A negotiation begun at Paris by Lord Malmesbury, on the part of Britain terminates unsuccessfully; Lord Malmesbury ordered to quit Paris in 24 hours.
- 1797 Dreadful mutiny in the British fleet at Portsmouth; is quieted by conciliatory measures, again breaks out with greater violence at the Nore, and proceeds to the most desperate extremities; is suppressed, the ringleaders tried and executed.
- 1798 Dreadful rebellion in Ireland; martial law is proclaimed; after the greatest exertions the rebellion is quieted, and a great numbers of the rebels executed.
- One of the most brilliant naval victories which adorn the history of Great Britain gained by admiral Nelson off the mouth of the Nile; and the French fleet totally destroyed.
- 1799 The emperor of Germany, provoked by the conduct of the French, declares war against them; is joined by Russia; the French defeated and compelled to retire with precipitation from their conquests.

MEN

MEN of LEARNING and GENIUS.

N. B. By the date is implied the Time when the above Writers died, but when that Period happens not to be known, the Age in which they flourished is signified by R. The Names in Italics, are those who have given the best English Translations, and those of School Books.

Grec. Ch.

- 907 **HOMER**, the first profane writer and Greek poet, flourished. *Pope's Homer.*

 438 Eutropeus, the Roman historian.
 524 Boetius, the Roman poet and Platonic philosopher. *Bellamy, Puffton. Eckford.*
 529 Procopius, of Caesarea, the Roman historian. *Herbst.*

Here ends the illustrious list of ancient, or, as they are styled, Classic authors, for whom mankind are indebted to Greece and Rome, those two great theatres of human glory; but it will ever be regretted, that a small part only of their writings have come to our hands. This was owing to the barbarous policy of those fierce illiterate tyrants, who, in the fifth century, subverted the Roman empire, and in which practices they were joined soon after by the Saracens, or followers of Mahomet. Constantinople alone had escaped the ravages of the Barbarians; and to the few literati who sheltered themselves within its walls, is chiefly owing the preservation of those valuable remains of antiquity. To learning, civility, and refinement, succeeded worse than Gothic ignorance—the superstition and barbarism of the church of Rome; Europe therefore produces few names worthy of occupying the space of a thousand years; a period which historians, with great propriety, designate the dark or Gothic ages.

The invention of printing contributed to the revival of learning in the sixteenth century, from which memorable era a race of men have sprung up in a new soil, France, Germany, and Britain; who, if they do not exceed, at least equal the greatest geniuses of antiquity. Of these our own countrymen have the reputation of the first rank, with whose names we shall finish our list.

A. C.

- 753 Bede, a priest of Northumberland; history of the Saxons, Scots, &c.
 901 King Alfred; history, philosophy, and poetry.
 1239 Matthew Paris, monk of St. Alban's; history of England.
 1292 Roger Bacon, Somersetshire; natural philosophy.
 1308 John Fordun, a priest of Merca-shire, History of Scotland.
 1403 Geoffrey Chaucer, London; the father of English poetry.
 1405 John Gower, Wales; the poet.
 1535 Sir Thomas More, London; history, politics, divinity.
 1552 John Leland, London; lives and antiquities.
 1568 Roger Ascham, Yorkshire; philology and polite literature.
