Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

The copy filmed here has been reproduced thanks to the generosity of:

Douglas Library
Queen's University

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol \rightarrow (meaning "CONTINUED"), or the symbol ∇ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

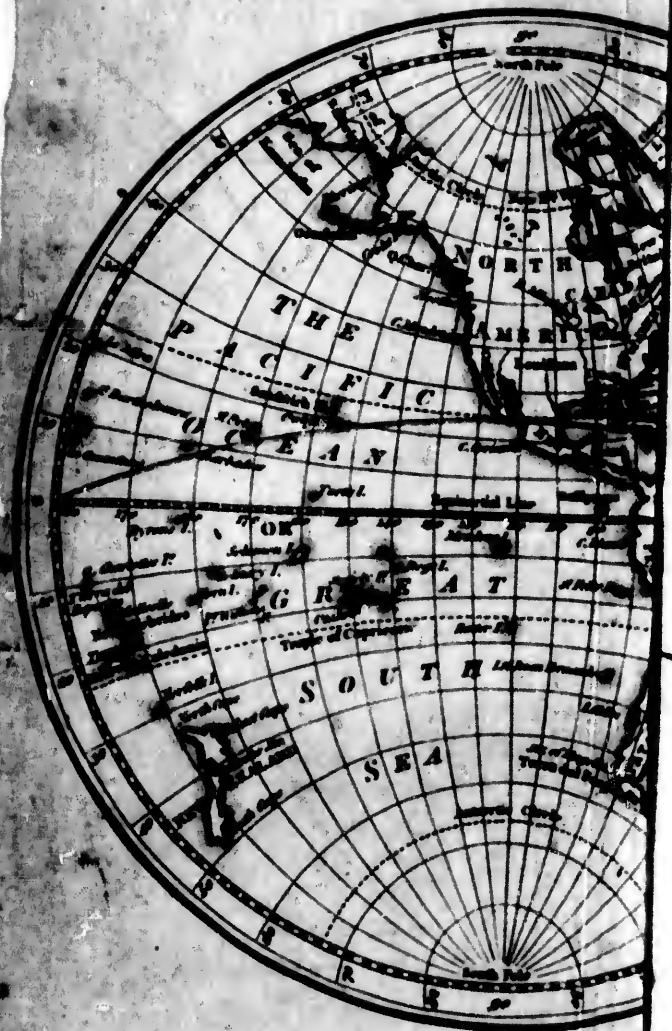

Douglas Library
Queen's University

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole \rightarrow signifie "A SUIVRE", le symbole ∇ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaires. Les diagrammes suivants illustrent la méthode.

P R E F A C E.

THE general approbation which the public have for so long a period shewn to GUTHRIE'S GEOGRAPHICAL GRAMMAR, supercedes the necessity of expatiating upon its excellence and utility. It will only be necessary to give some account of the additions and improvements which this edition has received.

No pains have been spared to render the Geographical part both amusing and instructing, to give a lively delineation of the manners of distant nations, and to exhibit those variations which different climates, different education, and different pursuits must stamp upon the human mind; in executing this difficult task, we have consulted the accounts of the latest travellers from whom either useful or entertaining information could be drawn. The many valuable publications which have been given to the world relative to India have been carefully investigated, and every thing either useful or amusing has been extracted. The Geography of that extensive country has been much improved by Major Rennel, of whose labours we have not failed to profit; Major Diron's narrative of the campaign in the Peninsula, which terminated the war with Tippoo Sultan in 1792; Maurice's Indian Antiquities, the work of a man of the first genius, and of the first abilities, has furnished us with valuable information, besides other books which have been occasionally consulted in the geographical account of Asia. Very considerable improvements and additions have been made in the history of the islands which lie scattered in the Indian Ocean; many of which had hitherto remained either totally unexplored, or very little known; partly defended by the tempestuous ocean which surrounded them, and partly by the inhospitable and ferocious manners of the natives. Concerning these we have been able to collect much valuable information, relative to their productions, to the wonderful phenomena which nature has displayed in these solitary recesses, and to the manners of their savage inhabitants. For most of these particulars we are indebted to the Asiatic researches. What little information could be collected concerning Africa has been carefully attended to. The travels of the enterprising Vaillant and the journey of Col. Paterson have been examined with attention, and many particulars have been extracted, which tend to exhibit a true portrait of the manners of its inhabitants. In our journey through the barren deserts of Arabia we have been much assisted by the ingenious Mr. Bruce, from whose valuable work we have extracted many particulars not to be found in any other edition. Our account of Egypt is much improved, and a more enlarged account is given of the magnificent ruins of the temples, domes, and triumphal pillars, which remind the classic traveller of the grandeur of this once renowned country. In the geographical account of America, we have followed Mr. Morse, who visited the several States in the Union, and has greatly improved the geography of that country.

The most astonishing and awful events, which have taken place in the world for some years back, have rendered it absolutely necessary to make very great additions to the historical part of this edition. The difficulty of this task has been moreover greatly increased by the diversity of opi-

nions to which these events have given rise, and the violence and animosity with which each party have defended the cause they have espoused. Though the fury of that flame which the French Revolution has excited may perhaps have somewhat abated, yet we are sensible we tread upon dangerous ground; *ignes suppositos cineri doloso*. But, however much we may wish to be unbiassed by factious views, we cannot imitate the example of those, who, assuming an appearance of great candour, pretend, that they are of no party, and view the struggles of both with frigid indifference. The history of the period we allude to has excited in our breast a more lively interest, and we cheerfully avow that we have warmly espoused the sentiments of the illustrious author of *Reflections on the French Revolution*, around whose grave honours will continue to thicken, and laurels to bloom, while genius, wisdom, erudition, and integrity, command the admiration of mankind; whose name will be inscribed in the lasting roll of immortality, while his feeble opponents will be at rest in the "family vault of all the Capulets."

It has been our particular study to give such a comprehensive history of that period, as our narrow limits would permit; and it is hoped, that such as have neither leisure nor opportunity to read the more minute histories of these transactions, will here be enabled to obtain such a satisfactory view of a very calamitous portion of the history of their own times, as will prevent them from being the dupes of artful falsehood or insidious misrepresentation.

The history of England is continued to the battle of the Nile, and concludes with a circumstantial account of that memorable victory and its probable influence on the powers of Europe; the history of France has also been greatly enlarged; it contains an account of all the awful events which have recently taken place in that country: the narrative is compiled from the writings of those who have had the best opportunities of information, and whose respectable characters render their veracity unimpeachable. Particular attention has been paid to that part of the history which relates to the fate of the unfortunate Lewis and his family—his cruel imprisonment, his protracted sufferings, and ignominious death. The account of his last affecting interview with his family is taken from the journal of Clery, his valet de chambre, who was a witness of the melancholy scene, which he so affectingly describes. The histories of Ireland, Spain, Germany, Prussia, Russia, Italy, &c. are all greatly enlarged and improved.—In the history of Egypt, some account is given of the invasion of that country by the French, and passages are extracted from the letters of Buonaparte, describing the situation of the French army.—The maps are executed in the best manner, and it is hoped, will do no discredit to the work.

To conclude, the publishers flatter themselves that this new edition of GUTHRIE'S GEOGRAPHICAL GRAMMAR considerably enlarged beyond any former one, will be found to be the best hitherto published.

INTRODUCTION.

PART I.

OF ASTRONOMICAL GEOGRAPHY.

SECT. I.

OF the PLANETS, the COMETS, the FIXED STARS, and the different SYSTEMS of the UNIVERSE.

THE science of GEOGRAPHY cannot be completely understood without considering the earth as a planet, or as a body moving round another at a considerable distance from it. But the science which treats of the planets, and other heavenly bodies, is called ASTRONOMY. Hence the necessity of beginning this work with an account of the heavenly bodies. Of these the most conspicuous is that glorious luminary the Sun, the fountain of light and heat to the several planets which move round it; and which, together with the sun, compose what astronomers have called the Solar System. The way, or path, in which the planets move round the sun, is called their Orbit; and it is now fully proved by astronomers, that there are seven planets which move round the sun, each in its own orbit. The names of these, according to their nearness to the centre, or middle point of the sun, are Mercury, Venus, the Earth, Mars, Jupiter, Saturn, and the Georgium Sidus. The first six, because they move within the orbit of the earth (being nearer the sun) are called *inferior* planets, or, perhaps more properly, *interior* or *inner* planets; the four last, moving without the orbit of the earth, are called *superior*, or perhaps more properly, *exterior* or *outer* planets. If we can form a notion of the manner in which any one of these planets, suppose our earth, moves round the sun, we can easily conceive the manner in which all the rest do it. We shall only therefore particularly consider the motion of the earth, or planet on which we live, leaving that of the others to be collected from a table, which we shall set down with such explications as may render it intelligible to the meanest capacity.

The earth upon which we live was long considered as one large extensive plane, of no remarkable thickness; and the regions below it were supposed to be the habitations of spirits. The heavens, in which the sun, moon, and stars appeared to move daily from east to west, were conceived to be at no great distance from it, and to be only designed for the use or ornament of our earth: several reasons, however, occurred, which rendered this opinion improbable; it is needless to mention them, because we have now a sufficient proof of the figure of the earth, from the voyages of many navigators, who have actually sailed round it: as from that of Magellan's ship, which was the first that surrounded the globe, sailing east from a port

Fig. 6.
New Orbit

Fig. 2

Fig. 3

Fig. 5

Fig. 6

Fig. 7
Winter begins 21. of Dec

in Europe in 1519, and returning to the same after a voyage of 1124 days, without apparently altering his direction, any more than a fly would appear to do in moving round a ball of wax.

The roundness of the earth being thoroughly established, a way was thereby naturally opened for the discovery of its motion. For while it was considered as a plane, mankind had an obscure notion of its being supported, like a scaffolding, on pillars, though they could not tell what supported these. But the figure of a globe is much better adapted to motion. This is confirmed by considering, that, if the earth did not move round the sun, not only the sun, but all the stars and planets, must move round the earth. Now, as philosophers, by reckonings founded on the surest observations, have been able to guess pretty nearly at the distances of the heavenly bodies from the earth, and from each other, just as every body that knows the first elements of mathematics can measure the height of a steeple, or any object placed on it; it appeared that, if we conceived the heavenly bodies to move round the earth, we must suppose them endowed with a motion or velocity so immense as to exceed all conception: whereas all the appearances in nature may be as well explained by imagining the earth to move round the sun in the space of a year, and to turn on its own axis once in 24 hours.

To form a conception of these two motions of the earth, we may imagine a ball moving on a billiard-table or bowling-green: the ball proceeds forwards upon the green or table, not by sliding along like a plane upon wood, or a slate upon ice, but by turning round its own axis, which is an imaginary line drawn through the centre or middle of the ball, and ending on its surface in two points called its poles. Conceiving the matter then in this way, and that the earth in the space of 24 hours, moves from west to east, the inhabitants on the surface of it, like men on the deck of a ship, who are insensible of their own motion, and think that the banks move from them in a contrary direction, will conceive that the sun and stars move from east to west in the same time of 24 hours, in which they, along with the earth, move from west to east. This daily or diurnal motion of the earth being once clearly conceived, will enable us easily to form a notion of its annual or yearly motion round the sun. For as that luminary seems to have a daily motion round our earth, which is really occasioned by the daily motion of the earth round its axis, so, in the course of a year, he seems to have an annual motion in the heavens, and to rise and set in different points of them, which is really occasioned by the daily motion of the earth in its orbit or path round the sun, which it completes in the time of a year. Now as to the first of these motions we owe the difference of day and night, so to the second we are indebted for the difference in the length of the days and nights, and in the seasons of the year.

[THE PLANETS.] Thus much being said with regard to the motion of the earth, which the smallest reflection may lead us to apply to the other planets, we must observe, before exhibiting our table, that, besides the seven planets already mentioned, which move round the sun, there are fourteen other bodies which move round four of these, in the same manner as they do round the sun; and of these our earth has one, called the moon; Jupiter has four, Saturn has seven (two* of these being lately

* See the 20th vol. of the Philosophical Transactions.

discovered.

discovered by the celebrated Dr. Herschell); and the Georgium Sidus has two, as has been proved by that excellent astronomer. These are all called moons, from their agreeing with our moon, which was first attended to: and sometimes they are called secondary planets, because they seem to be attendants of the Earth, Jupiter, Saturn, and the Georgium Sidus, about which they move, and which are called primary.

There are but two observations more necessary for understanding the following table. They are these: we have already said that the annual motion of the earth occasioned the diversity of seasons. But this would not happen, were the axis of the earth exactly parallel, or in a line with the axis of its orbit; because then the same parts of the earth would be turned towards the sun in every diurnal revolution; which would deprive mankind of the grateful vicissitudes of the seasons, arising from the difference in length of the days and nights. This therefore is not the case—the axis of the earth is inclined to the plane of the earth's orbit, which we may conceive by supposing a spindle put through a ball, with one end of it touching the ground; if we move the ball directly forwards, while one end of the spindle continues to touch the ground, and the other points towards some quarter of the heavens, we may form a notion of the inclination of the earth's axis to its orbit, from the inclination of the spindle to the ground. The same observation applies to some of the other planets, as may be seen from the table. The only thing that now remains, is to consider what is meant by the mean distance of the planets from the sun. In order to understand which, we must learn that the orbit, or path which a planet describes, were it to be marked out, would not be quite round or circular, but in the shape of a figure called an ellipsis, which, though resembling a circle, is longer than broad. Hence the same planet is not always at the same distance from the sun, and the mean distance of it is, that which is exactly betwixt its greatest, and least distance. Here follows the table.

A TABLE of the Diameters, Periods, &c. of the several Planets in the Solar System,

Names of the planets.	Diameter in Miles.	Mean distance from the sun as determined from observations of the transit of Venus in 1761.	Annual period round the sun.		Diurnal rotation on its axis.	Hourly motion in its orbit.	Hourly motion of its equator.	Inclination of its axis to the plane of its orbit.

I N T R O D U C T I O N.

As the Georgian planet (or Georgium Sidus) has considerably attracted the attention of astronomers, it will be necessary in a work of this nature, to give the reader a brief account of it. It was discovered by Dr. Herschell, with his telescope of great size and power, in the year 1781. For this discovery he obtained from the Royal Society the honorary recompense of Sir Godfrey Copley's medal. In so recent a discovery of a planet so distant, many particulars cannot be expected. We have introduced some account of it into the above table from the first authority.

Though the Georgium Sidus was not known as a planet till the time of Dr. Herschell, yet there are many reasons to suppose it had been seen before, but had then been considered as a fixed star; but, from the fluidness of its light, from its diameter being increased by high magnifying powers; from the change which he had observed in its situation, he concluded that it was a comet; but in a little time he, with others, determined that it was a planet, from its vicinity to the ecliptic, the direction of its motion being stationary in the time, and in such circumstances as correspond with similar appearances in other planets.—When the moon is absent it may be seen by the naked eye; and the discovery of two satellites attending it, seems to confer upon it a dignity, and to raise it into a more conspicuous situation among the great bodies of our solar system.—As the distances of the planets, when marked in miles, are a burden to the memory, astronomers often express their mean distances in a shorter way, by supposing the distance from the earth to the sun to be divided into ten parts. Mercury may then be estimated at four of such parts from the sun, Venus at seven, the Earth at ten, Mars at fifteen, Jupiter at fifty-two such parts, Saturn at ninety-five, and the Georgium Sidus one hundred and ninety parts.

COMETS.] The reader having obtained an idea of the planets from the table, and the previous observations necessary for understanding it, must next turn his reflection to the comets, which, as they revolve round our sun, are a part of the solar system. These descending from the far distant parts of the system with great rapidity, surprise us with their singular appearance of a train or tail, which accompanies them; become visible to us in the lower parts of their orbits, and, after a short stay, go off again to vast distances, and disappear. Though some of the ancients had more just notions of them, yet the opinion having prevailed, that they were only meteors generated in the air, like to those we see in it every night, and in a few moments vanishing, no care was taken to observe or record their phenomena accurately, till of late. Hence this part of astronomy is very imperfect. The general doctrine is that they are solid, compact bodies, like other planets, and regulated by the same laws of gravity, so as to describe equal areas in proportional times by radii drawn to the common centre. They move about the sun in very eccentric ellipses, and are of much greater density than the earth; for some of them are heated in every period to such a degree as would vitrify or dissipate any substance known to us. Sir Isaac Newton computed the heat of the comet that appeared in the year 1680, when nearest the sun, to be 2000 times hotter than red-hot iron, and that, being thus heated, it must retain its heat till it comes round again, although its period should be more than 20,000 years; and it is computed to be only 575. It is believed that there are at least 21 comets belonging to our system, moving in all manner of directions; and all those which have been observed have moved through the ethereal

regions

regions and the orbits of the planets, without suffering the least sensible resistance in their motions, which sufficiently proves that the planets do not move in solid orbs. Of all the comets, the periods of three only are known with any degree of certainty, being found to return at intervals of 75, 129, and 575 years: and of these, that which appeared in 1680 is the most remarkable. This comet, at its greatest distance, is about 11 thousand, 300 millions of miles from the sun, while its least distance from the centre of the sun is about 990 thousand miles; within less than one third part of the sun's semidiameter from his surface. In that part of its orbit which is nearest the sun, it flies with the amazing velocity of 880,000 miles in an hour; and the sun, as seen from it, appears 100 degrees in breadth, consequently 40,000 times as large as he appears to us. The astonishing distance that this comet runs out into empty space, naturally suggests to our imagination, the vast distance between our sun and the nearest of the fixed stars, of whose attractions all the comets must keep clear, to return periodically, and go round the sun. Dr. Halley, to whom every part of astronomy, but this in a particular manner, is highly indebted, has joined his labours to those of the great Sir Isaac Newton on this subject. Our earth was out of the way when this comet last passed near her orbit; but it requires a more perfect knowledge of the motion of the comet, to be able to judge if it will always pass by us with so little effect; for it may be here observed that the comet, in one part of its orbit, approaches very near to the orbit of the earth; so that in some revolutions, it may approach near enough to have very considerable if not fatal effects upon it. See Newton, Halley, Gregory, Keill, Mac Laurin, Derham, Ferguson, and Whiston.

[THE FIXED STARS.] Having thus briefly surveyed the solar system, which, though great in itself, is small in comparison of the immensity of the universe, we next proceed to the contemplation of those other vast bodies called the *fixed stars*; which being of infinite use in the practice of geography, claim a particular notice in this work. These fixed stars are distinguished by the naked eye from the planets, by being less bright and luminous, and by continually exhibiting that appearance which we call the twinkling of the stars. This arises from their being so extremely small, that the interposition of the least body, of which there are many constantly floating in the air, deprives us of the sight of them; when the interposed body changes its place, we again see the star, and this succession being perpetual, occasions the twinkling. But a more remarkable property of the fixed stars, and that from which they have obtained their name, is their never changing their situation, with regard to each other; as the planets, from what we have already said, must evidently be always changing theirs. The stars which are nearest to us seem largest, and are therefore called of the first magnitude. Those of the second magnitude appear less, being at a greater distance; and so proceeding on to the sixth magnitude, which includes all the fixed stars that are visible without a telescope. As to their number, though in a clear winter's night, without moonshine, they seem to be innumerable, which is owing to their strong sparkling, and eye looking at them in a confused manner; yet when the whole firmament is divided as it has been done by the ancients, into signs and constellations, the number that can be seen at a time, by the bare eye, is not above a thousand. Since the introduction of telescopes, indeed, the number of the fixed stars has been justly con-

sidered

Adored as immense; because the greater perfection we arrive at in our glasses, the more stars always appear to us. Mr. Flamsteed, late royal astronomer at Greenwich, has given us a catalogue of about 3000 stars. These are called telescopic stars, from their being invisible without the assistance of that instrument. Dr. Herschell, to whose ingenuity and assiduity the astronomical world is so much indebted, has evinced what great discoveries may be made by improvements in the instruments of observation. In speaking here of his discoveries, I shall use the words of M. de la Lande. "In passing rapidly over the heavens with his new telescope, the universe increased under his eye; 44,000 stars, seen in the space of a few degrees, seemed to indicate that there were seventy-five millions in the heavens." But what are all these when compared to those that fill the whole expanse, the boundless fields of *Æther*? Indeed the immensity of the universe must contain such numbers, as would exceed the utmost stretch of the human imagination; for who can say how far the universe extends, or point out those limits, where the Creator stayed "his rapid wheels" or where he "fixed the golden compasses?"

The immense distance of the fixed stars from our earth, and one another, is of all considerations the most proper for raising our ideas of the works of God. For notwithstanding the great extent of the earth's orbit or path (which is at least 190 millions of miles in diameter) round the sun, the distance of a fixed star is not sensibly affected by it; so that the star does not appear to be any nearer us when the earth is in that part of its orbit nearest the star, than it seemed to be when the earth was at the most distant part of its orbit, or 100 millions of miles farther removed from the same star. The star nearest us, and consequently the largest in appearance, is the dog-star, or *Sirius*. Modern discoveries make it probable that each of these fixed stars is a sun, having planets and comets revolving round it, as our sun has the earth and other planets revolving round him. Now the dog-star appears 27,000 times less than the sun; and, as the distances of the stars must be greater in proportion as they seem less, mathematicians have computed the distance of *Sirius* from us to be two billions and two hundred thousand millions of miles. The motion of light, therefore, which, though so quick as to be commonly thought instantaneous, takes up more time in travelling from the stars to us than we do in making a West India voyage. A sound would not arrive to us from thence in 50,000 years; which, next to light, is considered as the quickest body we are acquainted with. And a cannon ball flying at the rate of 480 miles an hour, would not reach us in 700,000 years.

The stars being at such immense distances from the sun, cannot possibly receive from him so strong a light as they seem to have; nor any brightness sufficient to make them visible to us. For the sun's rays must be so scattered and dissipated before they reach such remote objects, that they can never be transmitted back to our eyes, so as to render these objects visible by reflection. The stars therefore shine with their own native and unborrowed lustre, as the sun does; and since each particular star as well as the sun, is confined to a particular portion of space, it is plain that the stars are of the same nature with the sun.

It is no way probable that the Almighty, who always acts with infinite wisdom, and does nothing in vain, should create so many glorious suns, fit for so many important purposes, and place them at such distances from one another, without proper objects near enough to be benefited by their

INTRODUCTION,

insurers. Whoever imagines that they were created only to give a faint glimmering light to the inhabitants of this globe, must have a very superficial knowledge of astronomy *, a mean opinion of the Divine Wisdom; since, by an infinitely less exertion of creating power, the Deity could have given our earth much more light by one single additional moon.

Instead then of one sun and one world only, in the universe, as the unskillful in astronomy imagine, ~~the~~ science discovers to us such an inconceivable number of suns, systems, and worlds, dispersed through boundless space, that if our sun, with all the planets, moons, and comets belonging to it, were annihilated, they would be no more missed by an eye that could take in the whole creation, than a grain of sand from the seashore; the space they possess, being comparatively so small, that it would scarcely be a sensible blank in the universe, although the Georgium Sidus the outermost of our planets, revolves about the sun in an orbit of 10,830 millions of miles in circumference, and some of our comets make excursions upwards of ten thousand millions of miles beyond the orbit of the Georgium Sidus; and yet at that amazing distance, they are incomparably nearer to the sun than to any of the stars; as is evident from their keeping clear of the attracting power of all the stars, and returning periodically by virtue of the sun's attraction.

From what we know of our own system, it may be reasonably concluded, that all the rest are with equal wisdom contrived, situated, and provided with accommodations for rational inhabitants. For although there is almost an infinite variety in the parts of the creation which we have opportunities of examining, yet there is a general analogy running through and connecting all the parts into one scheme, one design, one whole!

Since the fixed stars are prodigious spheres of fire, like our sun, and at inconceivable distances from one another, as well as from us, it is reasonable to conclude they are made for the same purposes that the sun is: each to bestow light, heat and vegetation, on a certain number of inhabited planets, kept by gravitation within the sphere of its activity.

What an august! what an amazing conception, if human imagination can conceive it, does this give of the works of the Creator! Thousands and Thousands of suns, multiplied without end, and ranged all around us, at immense distances from each other, attended by ten thousand times ten thousand worlds, all in rapid motion, yet calm, regular and harmonious, invariably keeping the paths prescribed them; and these worlds peopled with myriads of intelligent beings formed for endless progression in perfection and felicity.

If so much power, wisdom, goodness, and magnificence is displayed in the material creation, which is the least considerable part of the universe, how great, how wise, how good must HE be, who made and governs the whole!

THE CONSTELLATIONS.] The first people who paid much attention to the fixed stars, were the *Sophists* in the beautiful plains of Egypt and Baby-

* Especially since there are many stars which are not visible without the assistance of a good telescope; and therefore, instead of giving light to this world, they can only be seen by a few astronomers.

lon; who partly for amusement, and partly with a view to direct them in travelling during the night, observed the situation of these celestial bodies. Endowed with a lively fancy, they divided the stars into different companies or constellations; each of which they supposed to represent the image of some animal, or other terrestrial object. The peasants in our own country do the same thing; for they distinguish that great northern constellation, which the philosophers call the *Ursa Major*, by the name of the *Plough*, the figure of which it certainly may represent with a very little help from the fancy. But the constellations in general have preserved the names which were given them by the ancients; and they are reckoned 48 northern, and 28 southern; but the moderns have increased the number of the northern to 56, and of the southern to 32. Besides these, there are the 12 signs or constellations in the Zodiac, as it is called from a Greek word, signifying an animal, because each of these 12 represents some animal. This is a great circle which divides the heaven into two equal parts, of which we shall speak hereafter. In the mean time we shall conclude this section with an account of the rise, progress, and revolutions in astronomy.

[DIFFERENT SYSTEMS OF THE UNIVERSE.] Mankind must have made a very considerable improvement in observing the motions of the heavenly bodies, before they could so far disengage themselves from the prejudices of sense and popular opinion, as to believe that the earth, upon which we live, was not fixed and immovable. We find accordingly, that Thales, the Milesian, who, about 580 years before Christ, first taught astronomy in Europe, had gone so far in this subject as to calculate eclipses, or interpositions of the moon between the earth and the sun, or of the earth between the sun and the moon (the nature of which may be easily understood from what we have already observed.) Pythagoras, a Greek philosopher, flourished about 50 years after Thales, and was, no doubt equally well acquainted with the motion of the heavenly bodies. This led Pythagoras to conceive an idea, which there is no reason to believe had ever been thought of before, namely, that the earth itself was in motion, and that the sun was at rest. He found that it was impossible, in any other way, to give a consistent account of the heavenly motions. The system, however, was so extremely opposite to all the prejudices of sense and opinion, that it never made great progress, nor was ever widely diffused in the ancient world. The philosophers of antiquity, despairing of being able to overcome ignorance by reason, set themselves to adapt the one to the other, and to form a reconciliation between them. This was the case with Ptolemy, an Egyptian philosopher, who flourished 138 years before Christ. He supposed with the vulgar, who measure every thing by themselves, that the earth was fixed immovably in the center of the universe, and that the seven planets, considering the moon as one of the primaries, were placed near to it; above them was the firmament of fixed stars, then the crystalline orbs, then the primum mobile, and, last of all, the æther, or heaven of heavens. All these vast orbs he supposed to revolve round the earth once in 24 hours; and besides that, in certain fixed and periodical times. To account for these motions, he was obliged to conceive a number of circles called excentrics and epicycles, crossing and intersecting with one another. The system was universally maintained by the peripatetic philosophers, who were the most considerable sect in Europe from the time of Ptolemy to the revival of learning in the sixteenth century.

At length, Copernicus, a native of Poland, a bold and original genius, adopted the Pythagorean, or true system of the universe; and published it to the world in the year 1543. This doctrine had been so long in obscurity, that the restorer of it was considered as the inventor; and the system obtained the name of the Copernican philosophy, though only revived by that great man.

Europe however was still immersed in ignorance; and the general ideas of the world were not able to keep pace with those of a refined philosophy.

This emboldened Copernicus to have few abettors, but many opponents. Tycho Brahe, in particular, a noble Dane, sensible of the defects of the Ptolemaic system, but unwilling to acknowledge the motion of the earth, endeavoured, about 1586, to establish a new system of his own, which was still more perplexed and embarrassed than that of Ptolemy. It allows a monthly motion of the moon round the earth, as the centre of its orbit; and it makes the sun to be the centre of the orbits of Mercury, Venus, Mars, Jupiter, and Saturn. The sun, however, with all the planets, is supposed to be whirled round the earth in a year, and even once in the twenty-four hours. This system, notwithstanding its absurdity, met with its advocates. Longomontanus, and others, so far refined upon it, as to admit the diurnal motion of the earth, though they insisted that it had no annual motion.

About this time, after a darkness of a great many ages, the first dawn of learning and taste began to appear in Europe. Learned men in different countries began to cultivate astronomy. Galileo, a Florentine; about the year 1610, introduced the use of telescopes, which discovered new arguments in support of the motion of the earth, and confirmed the old ones. The fury and bigotry of the clergy indeed, had almost checked this flourishing bud: Galileo was obliged to renounce the Copernican system as a damnable heresy. The happy reformation in religion, however, placed the one half of Europe beyond the reach of the papal thunder. It taught mankind that the scriptures were not given for explaining systems of natural philosophy, but for a much nobler purpose, to make us just, virtuous, and humane; that, instead of opposing the word of God, which in speaking of natural things suits itself to the prejudices of weak mortals, we employed our faculties in a manner highly agreeable to God himself, in tracing the nature of his works, which, the more they are considered, afford us the greater reason to admire his glorious attributes of power, wisdom, and goodness. From this time therefore, noble discoveries were made in all the branches of astronomy. The motions of the heavenly bodies were not only clearly explained, but the general law of nature, according to which they moved, was discovered and illustrated by the immortal Newton. This law is called *Gravity* or *Attraction*, and is the same by which any body falls to the ground, when disengaged from what supported it. It has been demonstrated, that this same law which keeps the sea in its channel, and the various bodies which cover the surface of this earth from flying off into the air, operates throughout the universe, keeps the planets in their orbits, and preserves the whole fabric of nature from confusion and disorder.

INTRODUCTION.

S E C T. II.

Of the Doctrine of the SPHERE.

HAVING, in the foregoing Section, treated of the UNIVERSE in general, in which the earth has been considered as a planet, we now proceed to the doctrine of the SPHERES, which ought always to be premised before that of the Globe or earth, as we shall see in the next Section. In handling this subject, we shall consider the earth as at rest, and the heavenly bodies, as performing their revolutions around it. This method cannot lead the reader into any mistake, since we have previously explained the true system of the universe, from which it appears, that it is the *real* motion of the earth, which occasions the *apparent* motion of the heavenly bodies. It is besides attended with this advantage, that it perfectly agrees with the information of our senses, which always leads us to conceive the matter in this way. The imagination therefore is not put on the stretch; the idea is easy and familiar, and, in delivering the elements of science, this object cannot be too much attended to.

N. B. In order more clearly to comprehend what follows, the reader may occasionally turn his eye to the figure of the artificial sphere on the opposite page.

The ancients observed, that all the stars turned (in appearance) round the earth, from east to west, in twenty-four hours; that the circles which they described in those revolutions, were parallel to each other, but not of the same magnitude; those passing over the middle of the earth being the largest of all, while the rest diminished in proportion to their distance from it. They also observed, that there were two points in the heavens, which always preserved the same situation. These points they termed celestial poles, because the heavens seemed to turn round them. In order to imitate these motions, they invented what is called the *Artificial Sphere*, through the centre of which they drew a wire or iron rod, called an *Axis*, whose extremities are fixed to the immoveable points called *Poles*. They farther observed, that on the 20th of March, and 23d of September, the circle described by the sun, was at an equal distance from both of the poles. This circle, therefore, must divide the earth into two equal parts, and on this account was called the *Equator* or *Equaller*. It was also called the *Equinoctial Line*, because the sun, when moving in it, makes the days and nights of equal length all over the world. Having also observed that from the 21st of June to the 23d of December, the sun advanced every day towards a certain point, and having arrived there, returned towards that from whence it set out, from the 22d of December to the 21st of June: they fixed these points, which they called *Solstices*, because the direct motion of the sun was stopped at them; and represented the bounds of the sun's motion, by two circles, which they named *Tropics*, because the sun no sooner arrived there than he turned back. Astronomers observing the motion of the sun, found its quantity, at a mean rate, to be nearly a degree (or the 360th part) of a great circle in the heavens, every 24 hours. This great circle is called the *Ecliptic*, and it passes through certain constellations, distinguished by the names of animals, in a zone called the *Zodiac*. It touches the tropic of Cancer on one side, and that of Capricorn on the other, and cuts the equator obliquely, at an angle of 23 degrees, 29 minutes, the sun's greatest declination. To express this motion, they supposed two points in the

the heavens, equally distant from and parallel to, this circle, which they call the *Poles* of the zodiac, which, turning with the heavens, by means of their axis, describes the *two polar circles*. In the artificial sphere, the equinoctial, the two tropics, and two polar circles, are cut at right angles, by two other circles called *Colures* which serve to mark the points of the solstices, equinoxes, and poles of the zodiac. The ancients also observed, that when the sun was in any point of his course, all the people inhabiting directly north and south, as far as the poles, have noon at the same time. This gave occasion to imagine a circle passing through the poles of the world, which they call a *Meridian*, and which is immovable in the artificial sphere, as well as the horizon; which is another circle representing the bounds betwixt the two hemispheres, or half spheres, viz. that which is above it, and that which is below it.

S E C T. III.

The Doctrine of the GLOBE naturally follows that of the SPHERE.

BY the doctrine of the GLOBE is meant the representation of the different places and countries, on the face of the earth, upon an artificial globe or ball. Now the manner in which geographers have represented the situation of one place upon this earth with regard to another, or with regard to the earth in general, has been by transferring the circles of the sphere to the artificial globe; and this is the only method they could employ. This will be abundantly obvious from an example. After that circle in the heavens, which is called the equator, was known to astronomers, there was nothing more easy than to transfer it to the earth, by which the situation of places was determined according as they lay on one side of the equator or another. The same may be observed of the other circles of the sphere above-mentioned. The reader having obtained an idea of the principle upon which the Doctrine of the Globe is founded, may proceed to consider this doctrine itself, or in other words, the description of our earth, as represented by the *artificial globe*.

FIGURE OF THE EARTH.] Though in speaking of the earth, along with other planets, it was sufficient to consider it as a spherical or globular body; yet it has been discovered, that this is not its true figure; and that the earth, though nearly a sphere or ball, is not perfectly so. This matter occasioned great dispute between the philosophers of the last age, among whom Sir Isaac Newton, and Cassini, a French astronomer, were the heads of two different parties. Sir Isaac demonstrated, from mathematical principles, that the earth was an *oblate sphere*, or that it was flatted at the poles, or north and south points, and jutted out towards the equator; so that a line, drawn through the centre of the earth, and passing through the poles, which is called a diameter, would not be so long as the line drawn through the same centre, and passing through the east and west points. The French philosopher asserted quite the contrary. But the matter was put to a trial by the French king in 1736, who sent out a company of philosophers towards the north pole, and likewise towards the equator, in order to measure a degree, or the three hundred and sixtieth part of a great circle, in these different parts; and from their report, the opinion of Sir Isaac Newton was confirmed beyond dispute. Since that time, therefore, the earth has always been considered as more flat towards the poles than towards the equator. The reason of this figure may be easily understood, if the reader fully comprehends what we for-

merly observed, with regard to the earth's motion. For if we fix a ball of clay on a spindle, and whirl it round, we shall find that it will jut out or project towards the middle, and flatten towards the poles. Now this is exactly the case with regard to our earth; only that its axis, represented by the spindle, is imaginary. But though the earth be not properly spherical, the difference from that figure is so small, that it may be represented by a globe or ball without any sensible error.

CIRCUMFERENCE AND DIAMETER OF THE EARTH.] In the general table which we have exhibited, page 3, the diameter of the globe is given according to the best observations; so that its circumference is 25,038 English miles. This circumference is conceived, for the conveniency of measuring, to be divided into three hundred and sixty parts or degrees, each degree containing sixty geographical miles, or sixty nine English miles and a half. These degrees are in the same manner conceived to be divided each into sixty minutes.

AXIS AND POLES OF THE EARTH.] The axis of the earth is that imaginary line passing through its centre, on which it is supposed to turn round once in twenty-four hours. The extreme points of this line are called the Poles of the earth; one in the north and the other in the south, which are exactly under the two points of the heavens called the North and South Poles. The knowledge of these poles is of great use to the geographer, in determining the distances and situation of places; for the poles mark as it were the ends of the earth, which is divided in the middle by the equator; so that the nearer one approaches to the poles, the farther he removes from the equator; and contrariwise, in removing from the poles, you approach the equator.

CIRCLES OF THE GLOBE.] These are commonly divided into the greater and lesser. A great circle is that whose plane passes through the centre of the earth, and divides it into two equal parts or hemispheres. A lesser circle is that which, being parallel to a greater, cannot pass through the centre of the earth, nor divide it into two equal parts. The greater circles are six, in number the lesser only four.

EQUATOR.] The first great circle we shall speak of is the Equator, which we have had occasion to hint at already. It is called sometimes the Equinoctial, the reason of which we have explained; and by navigators it is also called the Line, because, according to their rude notions, they believed it to be a great Line drawn upon the sea from east to west, dividing the earth into the northern and southern hemispheres, and which they were actually to pass in sailing from one into the other. The poles of this circle are the same with those of the world. It passes through the east and west points of the world, and, as has been already mentioned, divides it into the northern and southern hemispheres. It is divided into three hundred and sixty degrees, the use of which will soon appear.

HORIZON.] This great circle is represented by a broad circular piece of wood encompassing the globe and dividing it into the upper and lower hemispheres. Geographers very properly distinguish the horizon into the sensible and rational. The first is that which bounds the utmost prospect of our sight, when we view the heavens around us, apparently touching the earth or sea.

This circle determines the rising or setting of the sun and stars, in any particular place; for when they begin to appear above the eastern edge, we say they rise; and when they go beneath the western, we say they are set. It appears that each place has its own sensible horizon. The other horizon, called the rational, encompasses the globe exactly in the middle. Its poles (that is, two points in its axis, each ninety degrees distant from its plane, as those

(those of all circles are) are called the *Zenith* and *Nadir*; the first exactly above our heads, and the other directly under our feet. The broad wooden circle which represents it on the globe, has several circles drawn upon it; of these the innermost is that exhibiting the number of degrees of the twelve signs of the Zodiac (of which hereafter), viz. thirty to each sign. Next to this, you have the names of these signs. Next to this, the days of the month according to the old style, and then according to the new style. Besides these, there is a circle representing the thirty-two rhumbs, or points of the mariner's compass. The use of all these will be explained afterwards.

MERIDIAN.] This circle is represented by the *braze ring*, on which the globe hangs and turns. It is divided into three hundred and sixty degrees, and cuts the equator at right angles; so that, counting from the equator each way to the poles of the world, it contains four times ninety degrees, and divides the earth into the eastern and western hemispheres. This circle is called the *meridian*, because when the sun comes to the south part of it, it is then *meridies* or mid-day, and then the sun has its greatest altitude for that day, which is therefore called its meridian altitude. Now as the sun is never in its meridian altitude at two places east or west of one another at the same time, each of these places must have its own meridian. There are commonly marked on the globe twenty-four meridians, one through every fifteen degrees of the equator.

ZODIAC.] The zodiac is a *broad circle*, which cuts the equator obliquely; in which the twelve signs above mentioned are represented. In the middle of this circle is supposed another called the *Ecliptic*, from which the sun never deviates in his annual course, and in which he advances thirty degrees every month. The twelve signs are,

1. Aries	♈	— —	March	7. Libra	♎	— —	September
2. Taurus	♉	— —	April	8. Scorpio	♏	— —	October
3. Gemini	♊	— —	May	9. Sagittarius	♐	— —	November
4. Cancer	♋	— —	June	10. Capricorn	♑	— —	December
5. Leo	♌	— —	July	11. Aquarius	♒	— —	January
6. Virgo	♍	— —	August	12. Pisces	♓	— —	February

COLURES.] If you imagine two *great circles* passing both through the poles of the world, and one of them through the equinoctial points, Aries and Libra, and the other through the solstitial points, Cancer and Capricorn, these are called the *Colures*; the one the *Equinoctial*, the other the *Solstitial Colure*. These divide the ecliptic into four equal parts or quarters, which are denominated according to the points which these pass through, viz. the four cardinal points, and are the first points of Aries, Libra, Cancer, and Capricorn; and these are all the *great circles*.

TROPICS.] If you suppose two circles drawn parallel to the equinoctial, at twenty-three degrees thirty minutes distance from it, measured on the brazen meridian, and one towards the north, the other towards the south, these are called *Tropics*, because the sun appears, when in them, to turn backwards from his former course. The one is called the *Tropic of Cancer*, the other of *Capricorn*, because they pass through these points.

POLAR CIRCLES.] If two other circles are supposed to be drawn at the like distance of twenty-three degrees, thirty minutes, reckoned on the meridian from the polar points, these are called the *Polar Circles*. The *northern* is called the *Arctic*, because the north pole is near the constellation of the Bear; the *southern*, the *Antarctic*, because opposite to the former. And these are the

the four lesser circles. Besides these ten circles now described, which are always drawn on the globe, there are several others, which are only supposed to be drawn on it. These will be explained as they become necessary, lest the reader should be disgusted with too many definitions at the same time, without seeing the purpose for which they serve. The main design then of all these circles being to exhibit the respective situation of places on the earth, we shall proceed to consider more particularly how that is effected by them. It was found easier to distinguish places by the quarters of the earth, in which they lay, than by their distances from any one point. Thus, after it was discovered that the equator divided the earth into two parts, called the Northern and Southern hemispheres, it was easy to see that all places on the globe might be distinguished, according as they lay on the north or south side of the equator.

[ZONES.] After the four lesser circles we have mentioned, came to be known, it was found that the earth, by means of them, might be divided into five portions; and consequently that the places on its surface might be distinguished according as they lay in one or other of these portions, which are called Zones; from the Greek word *ζώνη*, which signifies a girdle; being broad spaces, like swaths, girding the earth about.

The *torrid zone* is that portion of the earth between the tropics, and called by the ancients *torrid*, because they conceived, that, being continually exposed to the perpendicular or direct rays of the sun, it was rendered uninhabitable, and contained nothing but parched and sandy deserts. This notion, however, has long since been refuted. It is found that the long nights, great dews, regular rains and breezes, which prevail almost throughout the torrid zone, render the earth not only habitable, but so fruitful, that in many places they have two harvests in a year; all sorts of spices and drugs are almost solely produced there; and it furnishes more perfect metals, precious stones, and pearls, than all the rest of the earth together. In short, the countries of Africa, Asia, and America, which lie under this zone, are in all respects the most fertile and luxuriant upon earth.

The two *temperate zones* are comprised between the tropics and polar circles. They are called temperate, because, meeting the rays of the sun obliquely, they enjoy a moderate degree of heat.

The two *frigid zones* lie between the polar circles and the poles, or rather are inclosed within the polar circles. They are called the Frigid or Frozen, because most part of the year it is extremely cold there, and every thing is frozen so long as the sun is under the horizon, or but a little above it. However, these zones are not quite uninhabitable, though much less fit for living in than the torrid.

None of all these zones are thoroughly discovered by the Europeans. Our knowledge of the southern temperate zone is very scanty; we know little of the northern frigid zone; and still less of the southern frigid zone. The northern, temperate, and torrid zones, are those we are best acquainted with.

[CLIMATE.] But the divisions of the earth into hemispheres and zones, though it may be of advantage in letting us know in what quarter of the earth any place lies, is not sufficiently minute for giving us a notion of the distances between one place and another. This however is still more necessary; because it is of more importance to mankind to know the situations of places, with regard to one another, than with regard to the earth itself. The first step taken for determining this matter, was to divide the earth into what are called Climates. It was observed, that the day was always twelve hours long

long on the equator, and that the longest day increased in proportion as we advanced north or south on either side of it. The ancients therefore determined how far any place was north or south of the equator, or what is called the *Latitude* of the place, from the greatest length of the day in that place. This made them conceive a number of circles parallel to the equator, which bounded the length of the day at different distances from the equator. And as they called the space contained between these circles, *Climates*, because they declined from the equator towards the pole, so the circles themselves may be called *Climatical Parallels*. This, therefore was a new division of the earth, more minute than that of zones, and still continues in use; though, as we shall show, the design which first introduced it may be better answered in another way. There are 30 climates between the equator and either pole. In the first 24, the days increase by half hours; but in the remaining six, between the polar circle and the poles, the days increase by months. This the reader will be convinced of, when he becomes acquainted with the use of the globe: in the mean time, we shall insert a table, which will serve to shew in what climate any country lies, supposing the length of the day, and the distance of the place from the equator, to be known.

QUADRANT OF ALTITUDE.] In order to supply the place of the compasses in this operation, there is commonly a plain narrow plate of brass, screwed on the brazen meridian, which contains 90 degrees, or one quarter of the circumference of the globe, by means of which the distances and bearings of places are measured without the trouble of first extending the compasses between them, and then applying the same to the equator. This plate is called the Quadrant of Altitude.

HOUR CIRCLE.] This is a small brass circle fixed on the brazen meridian, divided into 24 hours, and having an index moveable round the axis of the globe.

PROBLEMS PERFORMED BY THE GLOBE.

PROB. 1. *The diameter of an artificial globe being given, to find its surface in square, and its solidity in cubic measures.*

Multiply the diameter by the circumference, which is a great circle dividing the globe into two equal parts, and the product will give the first: then multiply the said product by one sixth of the diameter, and the product of that will give the second. After the same manner we may find the surface and solidity of the natural globe, as also the whole body of the atmosphere surrounding the same, provided it be always and every where of the same height; for having found the perpendicular height thereof, by the common experiment of the ascent of Mercury at the foot and top of a mountain, then double the said height, and add the same to the diameter of the earth; then multiply the whole, as a new diameter by its proper circumference, and from the product subtract the solidity of the earth, it will leave that of the atmosphere.

PROB. 2. *To rectify the globe.*

The globe being set upon a true plane, raise the pole according to the given latitude; then fix the quadrant of altitude in the zenith, and if there be any mariner's compass upon the pedestal, let the globe be so situated, as that the brazen meridian may stand due south and north, according to the two extremities of the needle, allowing their variation.

PROB. 3. *To find the longitude and latitude of any place.*

For this, see page 17.

PROB. 4. *The longitude and latitude of any place being given to find that place on the globe.*

Bring the degree of longitude to the brazen meridian; reckon upon the same meridian the degree of latitude, whether south or north, and make a mark with chalk where the reckoning ends; the point exactly under the chalk is the place desired.

PROB. 5. *The latitude of any place being given, to find all those places that have the same latitude.*

The globe being rectified (a) according to the latitude of (a) Prob. 2. the given place, and that place being brought to the brazen meridian, make a mark exactly above the same, and turning the globe round, all those places passing under the said mark have the same latitude with the given place.

PROB. 6. *To find the Sun's place in the Ecliptic at any time.*

The month and day being given, look for the same upon the wooden horizon; and over-against the day you will find the particular sign and degree in which the Sun is at that time, which sign and degree being noted in the ecliptic, the same is the Sun's place, or nearly, at the time desired.

PROB. 7. *The month and day being given, as also the particular time of that day, to find those places of the globe to which the Sun is in the meridian at that particular time.*

stances and
ending the
ator. This

The pole being elevated according to the latitude of the place, where you are, bring the said place to the brazen meridian, and setting the index of the horary circle at the hour of the day, in the given place, or where you are, turn the globe till the index point at the upper figure of XII. which done, fix the globe in that situation, and observe what places are exactly under the upper hemisphere of the brazen meridian, for those are the places desired.

PROB. 8. *To know the length of the day and night in any place of the earth at any time.*

Elevate the pole (a) according to the latitude of the given place; find the Sun's place in the ecliptic (b) at that time; which being brought to the east side of the horizon, set the index of the horary circle at noon, or the upper figure XII. and turning the globe about till the aforesaid place of the ecliptic touch the western side of the horizon, look upon the horary circle, and wheresoever the index pointeth, reckon the number of hours between the same and the upper figure of 12, for that is the length of the day, the complement whereof to 24 hours is the length of the night.

PROB. 9. *To know what a clock it is by the globe in any part of the world, and at any time, provided you know the hour of the day where you are at the same time.*

Bring the place in which you are to the brazen meridian, the pole being raised (c) according to the latitude thereof, and set the index of the horary circle to the hour of the day at that time: Then bring the desired place to the brazen meridian, and the index will point out the present hour at that place wherever it is.

PROB. 10. *A place being given in the Torrid Zone, to find those two days of the year in which the Sun shall be vertical to the same.*

Bring the given place to the brazen meridian, and mark what degree of latitude is exactly above it. Move the globe round, and observe the two points of the ecliptic that pass through the said degree of latitude. Search upon the wooden horizon (or by proper tables of the Sun's annual motion) on what days he passed through the aforesaid points of the ecliptic, for those are the days required in which the sun is vertical to the given place.

PROB. 11. *The month and day being given, to find by the globe those places of the North Frigid Zone, where the Sun then beginneth to shine constantly without setting; and also those places of the South Frigid Zone, where he then begins to be totally absent.*

The day given, (which must always be one of those either between the vernal equinox and the summer solstice, or between the autumnal equinox and winter solstice) find (d) the Sun's place in the ecliptic, and marking the same, bring it to the brazen meridian, and reckon the like number of degrees from the north pole towards the equator, as there is between the equator and the Sun's place in the ecliptic, setting a mark with chalk where the reckoning ends. This done, turn the globe round, and all the places passing under the said chalk are those in which the Sun begins to shine constantly without setting upon the given day. For solution of the latter part of the problem, set off the same distance from the south pole upon the brazen meridian towards the equator, as was formerly set off from the north; then marking with chalk, and turning the globe round, all places passing under the mark are those where the Sun begins his total disappearance from the given day.

PROB. 12. *A place being given in the North Frigid, Zone, to find by the globe what number of days the sun doth constantly shine upon the said place, and what day he is absent, as also the first and last day of his appearance.*

Bring the given place to the brazen meridian, and observing its latitude, (a) elevate the globe accordingly; count the same number of degrees upon the meridian from each side of the equator as the place is distant from the pole; and making marks where the reckonings end, turn the globe, and carefully observe what two degrees of the ecliptic pass exactly under the two points marked in the meridian; first for the northern arch of the circle, namely, that comprehended between the two degrees marked, being reduced to time, will give the number of days that the sun doth constantly shine above the horizon of the given place; and the opposite arch of the said circle will in like manner give the number of days in which he is totally absent, and also will point out which days those are. And in the interval he will rise and set.

PROB. 13. *The month and day being given to find those places on the globe, to which the sun when in the meridian, shall be vertical on that day.*

The sun's place in the ecliptic being (b) found, bring the same to the brazen meridian, in which make a small mark with chalk, exactly above the Sun's place. Which done, turn the globe, and those places which have the Sun vertical in the meridian, will successively pass under the said mark.

PROB. 14. *The month and day being given, to find upon what point of the compass the sun then riseth in any place.*

Elevate the pole according to the latitude of the desired place, and finding the Sun's place in the ecliptic at the given time, bring the same to the eastern side of the horizon, and you may there clearly see the point of the compass upon which he then riseth. By turning the globe about till his place coincide with the western side of the horizon, you may also see upon the said circle the exact point of his setting.

PROB. 15. *To know by the globe the length of the longest and shortest days and nights in any part of the world.*

Elevate the pole according to the latitude of the given place, and bring the first degree of Cancer, if in the northern, or Capricorn if in the southern hemisphere, to the east side of the horizon; and setting the index of the horary circle at noon, turn the globe about till the sign of Cancer touch the western side of the horizon, and then observe upon the horary circle the number of hours between the index and the upper figure of XII. reckoning them according to the motion of the index, for that is the length of the longest day, the complement wherof is the extent of the shortest night. As for the shortest day and longest night, they are only the reverse of the former.

PROB. 16. *The hour of the day being given in any place, to find those places of the earth where it is either noon or midnight, or any other particular hour at the same time.*

Bring the given place to the brazen meridian, and set the index of the horary circle at the hour of the day in that place. Then turn about the globe till the index point at the upper figure of XII. and observe what places are exactly under the upper semicircle of the brazen meridian, for in them it is

midday at the time given. Which done, turn the globe about till the index point at the lower figure of XII. and what places are then in the lower semicircle of the meridian, in them it is midnight at the given time. After the same manner we may find those places that have any other particular hour at the time given, by moving the globe till the index point at the hour desired, and observing the places that are then under the brazen meridian.

PROB. 17. *The day and hour being given, to find by the globe that particular place of the earth to which the Sun is vertical at that very time.*

The Sun's place in the ecliptic (a) being found and brought to the brazen meridian, make a mark above the same with chalk; then (b) find those places of the earth in whose meridian the Sun is at that instant, and bring them to the brazen meridian; which done, observe narrowly that individual part of the earth which falls exactly under the foresaid mark in the brazen meridian; for that is the particular place to which the Sun is vertical at that very time.

(a) PROB. 6.
(b) PROB. 16.

PROB. 18. *The day and hour at any place being given, to find all those places where the Sun is then rising, or setting, or on the meridian; consequently, all those places which are enlightened at that time, and those which are in the dark.*

This problem cannot be solved any globe fitted up in the common way, with the hour circle fixed upon the brazen meridian; unless the Sun be on or near some of the tropics on the given day. But by a globe fitted up according to Mr. Joseph Harris's invention, where the hour-circle lies on the surface of the globe, below the meridian, it may be solved for any day in the year, according to his method; which is as follows.

Having found the place to which the Sun is vertical at the given hour, if the place be in the northern hemisphere, elevate the north pole as many degrees above the horizon, as are equal to the latitude of that place; if the place be in the southern hemisphere elevate the south pole accordingly; and bring the said place to the brazen meridian. Then, all those places which are in the western semicircle of the horizon, have the Sun rising to them at that time; and those in the eastern semicircle have it setting; to those under the upper semicircle of the brazen meridian it is noon; and to those under the lower semicircle, it is midnight. All those places which are above the horizon, are enlightened by the Sun, and have the Sun just as many degrees above them, as they themselves are above the horizon; and this height may be known, by fixing the quadrant of altitude on the brazen meridian over the place to which the Sun is vertical; and then, laying it over any other place, observe what number of degrees on the quadrant are intercepted between the said place and the horizon. In all those places that are 18 degrees below the western semicircle of the horizon, the morning twilight is just beginning; in all those places that are 18 degrees below the eastern semicircle of the horizon, the evening twilight is ending; and all those places that are lower than 18 degrees, have dark night.

If any place be brought to the upper semicircle of the brazen meridian, and the hour index to be set to the upper XII or noon, and then the globe be turned round eastward on its axis; when the place comes to the western semicircle of the horizon, the index will shew the time of sun-rising at that place; and when the same place comes to the eastern semicircle of the horizon, the index will shew the time of sun-set.

INTRODUCTION.

To those places which do not go under the horizon, the sun sets not on that day: and to those which do not come above it, the Sun does not rise.

PROB. 19. *The month and day being given, with the place of the Moon in the Zodiac and her true latitude, to find thereby the exact hour when she shall rise and set, together with her southing, or coming to the meridian of the place.*

The Moon's place in the zodiac may be found readily enough at any time by an ordinary almanac; and her latitude, which is her distance from the ecliptic, by applying the semicircle of position to her place in the zodiac. For the solution of the problem (*a*), elevate the

(*a*) PROB. 2. pole according to the latitude of the given place, and the Sun's place in the ecliptic at that time being (*b*) found and marked with chalk, as also the Moon's place at the same time, bring the Sun's place to the brazen meridian, and set the index of the horary circle at noon, then turn the globe till the Moon's place successively meet with the eastern and western side of the horizon, as also the brazen meridian, and the index will point at those various times, the particular hours of her rising, setting and southing.

PROB. 20. *Two places being given on the globe, to find the true distance between them.*

Lay the graduated edge of the quadrant of altitude over both the places, and the number of degrees intercepted between them will be their true distance from each other, reckoning every degree to be 69½ English miles.

PROB. 21. *A place being given on the globe, and its true distance from a second place, to find thereby all other places of the earth that are of the same distance from the given place.*

Bring the given place to the brazen meridian, and elevate the pole according to the latitude of the said place; then fix the quadrant of altitude in the zenith, and reckon, upon the said quadrant, the given distance between the first and second place, provided the same be under 90 degrees, otherwise you must use the semicircle of position, and making a mark where the reckoning ends, and moving the said quadrant or semicircle quite round upon the surface of the globe, all places passing under that mark, are those desired.

GEOGRAPHICAL OBSERVATIONS.

1. The latitude of any place is equal to the elevation of the pole above the horizon of that place, and the elevation of the equator is equal to the complement of the latitude, that is, to what the latitude wants of 90 degrees.

2. Those places which lie on the equator, have no latitude, it being there that the latitude begins; and those places which lie on the first meridian have no longitude, it being there that the longitude begins. Consequently, that particular place of the earth where the first meridian intersects the equator has neither longitude nor latitude.

3. All places of the earth do equally enjoy the benefit of the sun, in respect of time, and are equally deprived of it.

4. All places upon the equator have their days and nights equally long, that

that is, 12 hours each, at all times of the year. For, although the sun declines alternately, from the equator towards the north and towards the south, yet, as the horizon of the equator cuts all the parallels of latitude and declination in halves, the sun must always continue above the horizon for one half a diurnal revolution about the earth, and for the other half below it.

5. In all places of the earth between the equator and poles, the days and nights are equally long, viz. 12 hours each, when the sun is in the equinoctial: for, in all elevations of the pole, short of 90 degrees (which is the greatest) one half of the equator or equinoctial will be above the horizon, and the other half below it.

6. The days and nights are never of an equal length at any place between the equator and polar circles, but when the sun enters the signs γ Aries and ζ Libra. For in every other part of the ecliptic, the circle of the sun's daily motion is divided into two unequal parts by the horizon.

7. The nearer that any place is to the equator, the less is the difference between the length of the days and nights in that place; and the more remote, the contrary. The circles which the sun describes in the heaven every 24 hours, being cut more nearly equal in the former case, and more unequally in the latter.

8. In all places lying upon any given parallel of latitude, however long or short the day and night be at any of these places, at any time of the year, it is then of the same length at all the rest; for in turning the globe round its axis (when rectified according to the sun's declination) all these places will keep equally long above or below the horizon.

9. The sun is vertical twice a year to every place between the tropics; to those under the tropics, once a year, but never any where else. For, there can be no place between the tropics, but that there will be two points in the ecliptic, whose declination from the equator is equal to the latitude of that place; and but one point of the ecliptic which has a declination equal to the latitude of places on the tropic which that point of the ecliptic touches; and as the sun never goes without the tropics, he can never be vertical to any place that lies without them.

10. In all places lying exactly under the polar circles, the sun, when he is in the nearest tropic, continues 24 hours above the horizon without setting; because no part of that tropic is below their horizon. And when the sun is in the farthest tropic, he is for the same length of time without rising; because no part of that tropic is above their horizon. But, at all other times of the year, he rises and sets there, as in other places; because all the circles that can be drawn parallel to the equator, between the tropics, are more or less cut by the horizon, as they are farther from, or nearer to, that tropic which is all above the horizon: and when the sun is not in either of the tropics, his diurnal course must be in one or other of these circles.

11. To all places in the northern hemisphere, from the equator to the polar circle, the longest day and shortest night is when the sun is in the northern tropic; and the shortest day and longest night is when the sun is in the southern tropic; because no circle of the sun's daily motion is so much above the horizon, and so little below it, as the northern tropic; and none so little above it, and so much below it, as the southern. In the southern hemisphere, the contrary.

12. In all places between the polar circles and poles, the sun appears for some number of days (or rather diurnal revolutions) without setting; and at the

opposite time of the year without rising : because some part of the ecliptic never sets in the former case, and as much of the opposite part never rises in the latter. And the nearer unto, or the more remote from the pole (these places are, the longer or shorter is the sun's continuing presence or absence.

13. If a ship sets out from any port, and sails round the earth eastward to the same port again, let her take what time she will to do it in, the people in that ship, in reckoning their time, will gain one complete day at their return or count one day more than those who reside at the same port ; because, by going contrary to the sun's diurnal motion, and being forwarder every evening than they were in the morning, their horizon will get so much the sooner above the setting sun, than if they had kept for a whole day at any particular place. And thus, by cutting off a part proportionable to their own motion, from the length of every day, they will gain a complete day of that sort at their return ; without gaining one moment of absolute time more than is elapsed during their course, to the people at the port. If they sail westward, they will reckon one day less than the people do who reside at the said port ; because, by gradually following the apparent diurnal motion of the sun, they will keep him each particular day so much longer above the horizon, as answers to that day's course ; and thereby they cut off a whole day in reckoning, at their return, without losing one moment of absolute time.

Hence, if two ships should set out at the same time from any port, and sail round the globe, one eastward and the other westward, so as to meet at the same port on any day whatever, they will differ two days in reckoning their time, at their return. If they sailed twice round the earth, they will differ four days ; if thrice, then six, &c.

OF THE NATURAL DIVISIONS OF THE EARTH.

THE constituent parts of the Earth are two, the *land* and *water*. The parts of the land are continents, islands, peninsulas, isthmuses, promontories, capes, coasts, mountains, &c. This land is divided into two great continents (besides the islands), viz. the *eastern* and *western* continent. The eastern is subdivided into three parts, viz. Europe, on the north-west ; Asia, on the north-east ; and Africa (which is joined to Asia by the isthmus of Suez, 60 miles over) on the south. The western continent consists of North and South America, joined by the isthmus of Darien, 60 or 70 miles broad.

A continent is a large portion of land, containing several countries or kingdoms, without any entire separation of its parts by water, as Europe. An *island* is a smaller part of land, quite surrounded by water, as Great Britain. A *peninsula* is a track of land every where surrounded by water, except at one narrow neck, by which it joins the neighbouring continent ; as the Morea in Greece ; and that neck of land which so joins it, is called an *isthmus* ; as the isthmus of Suez, which joins Africa to Asia, and the isthmus of Darien, which joins North and South America. A *promontory* is a hill, or point of land, stretching itself into the sea, the end of which is called a *cape* ; as the Cape of Good Hope. A *coast* or *shore* is that part of a country which borders on the sea-side. Mountains, valleys, woods, deserts, plains, &c. need no description. The most remarkable are taken notice of, and described in the body of this work.

The parts of the water are oceans, seas, lakes, straits, gulfs, bays, or creeks, rivers, &c. The waters are divided into three extensive oceans (besides lesser seas, which are only branches of these), viz. the *Atlantic* the

Pacific, and the *Indian Ocean*. The Atlantic, or Western Ocean, divides the eastern and western continents, and is 3000 miles wide. The Pacific divides America from Asia, and is 10,000 miles over. The Indian Ocean lies between the East Indies and Africa, being 3000 miles wide.

The *ocean* is a great and spacious collection of water without any entire separation of its parts by land; as the Atlantic Ocean. The *sea* is a smaller collection of water, which communicates with the ocean, confined by the land; as the Mediterranean and the Red Sea. A *lake* is a large collection of water, entirely surrounded by land; as the lake of Geneva, and the lakes in Canada. A *strait* is a narrow part of the sea, restrained or lying between the shores, and opening a passage out of one sea into another; as the strait of Gibraltar, or that of Magellan. This is sometimes called a *sound*; as the strait into the Baltic. A *gulf* is a part of the sea running up into the land, and surrounded by it except at the passage whereby it communicates with the sea or ocean. If a gulf be very large it is called an inland sea; as the Mediterranean: if it do not go far into the land, it is called a *bay*, as the Bay of Biscay: if it be very small, a *creek*, *bayou*, *station* or *road* for ships, as Milford Haven. Rivers, canals, brooks, &c. need no description; for these lesser divisions of water, like those of land, are to be met with in most countries, and every one has a clear idea of what is meant by them. But in order to strengthen the remembrance of the great parts of the land and water we have described, it may be proper to observe, that there is a strong analogy or resemblance between them.

The description of a continent resembles that of an ocean; an island encompassed with water resembles a lake encompassed with land. A peninsula of land is like a gulf or inland sea. A promontory or cape of land, is like a bay or creek of the sea: and an isthmus, whereby two lands are joined, resembles a strait, which unites one sea to another.

To this description of the divisions of the earth, rather than add an enumeration of the various parts of land and water, which correspond to them, and which the reader will find in the body of the work, we shall subjoin a table, exhibiting the superficial content of the whole globe in square miles, first to a degree, and also of the seas and unknown parts, the habitable earth, the four quarters or continents; likewise of the great empires and principal islands, which shall be placed as they are subordinate to one another in magnitude.

To these islands may be added the following, which have lately been discovered, or more fully explored. The exact dimensions of them are not ascertained; but they may be arranged in the following order, according to their magnitude, beginning at the largest, which is supposed to be nearly equal in size to the whole continent of Europe.

- New Holland,
- New Guinea,
- New Zealand,
- New Caledonia,
- New Hebrides,
- Otaheite or King George's Island,
- Friendly Islands,
- Marquesas,
- Baker, or Davis's island.

* The number of inhabitants computed at present to be in the known world at a medium taken from the best calculations, are about 953 millions.

Europe contains	—	153	Millions

WINDS AND TIDES.] We cannot finish the doctrine of the earth, without considering Winds and Tides, from which the changes that happen on its surface principally arise.

WINDS.] The earth on which we live is every where surrounded by a fine invisible fluid, which extends to several miles above its surface, and is called Air. It is found by experiments, that a small quantity of air is capable of being expanded, so as to fill a very large space, or to be compressed into a much smaller compass than it occupied before. The general cause of the expansion of the air is heat; the general cause of its compression is cold. Hence if any part of the air or atmosphere receive a greater degree of cold or heat than it had before, its parts will be put in motion, and expanded or compressed. But when air is put in motion, we call it wind in general; and a breeze, gale, or storm, according to the quickness or velocity of that motion.

motion. Winds, therefore, which are commonly considered as things extremely variable and uncertain depend on a general cause, and act with more or less uniformity in proportion as the action of this cause is more or less constant. It is found by observations made at sea, that from thirty degrees north latitude, to thirty degrees south, there is a constant east wind throughout the year, blowing on the Atlantic and Pacific oceans, and called the *Trade Wind*. This is occasioned by the action of the sun, which in moving from east to west, heats, and consequently expands the air immediately under him; by which means a stream or tide of air, always accompanies him in his course, and occasions a perpetual east wind within these limits. This general cause however is modified by a number of particulars; the explication of which would be too tedious and complicated for our present plan; which is to mention facts rather than theories.

The winds called the *Tropical Winds*, which blow from some particular point of the compass without much variation, are of three kinds: 1. The *General Trade Winds*, which extend to near thirty degrees of latitude on each side of the equator in the Atlantic, Ethiopic, and Pacific seas. 2. The *Monsoons*, or shifting trade-winds, which blow six months in one direction, and the other six months in the opposite direction. These are mostly in the Indian, or Eastern Ocean, and do not extend above two hundred leagues from the land. Their change is at the vernal and autumnal equinox, and it is accompanied with terrible storms of thunder, lightning, and rain. 3. The *Sea and Land Breezes*, which are another kind of periodical winds that blow from the land from midnight to mid-day, and from the sea from about noon till midnight: these, however, do not extend above two or three leagues from shore. Near the coast of Guinea in Africa, the wind blows nearly always from the west, south-west, or south. On the coast of Peru in South America, the winds blow constantly from the south west. Beyond the latitude of thirty north and south, the winds, as we daily perceive in Great Britain, are more variable, though they blow oftener from the west than any other point. Between the south and tenth degree of north latitude, and between the longitude of Cape Verd and the easternmost of the Cape Verd Islands, there is a tract of sea condemned to perpetual calms, attended with terrible thunder and lightning, and such rains, that this sea has acquired the name of *the Rains*.

It may be also useful to students in navigation and geography to observe farther, that the course or latitude our ships generally keep in their passage from England to America and the West Indies, is,

To Boston in New England, and Halifax in Nova Scotia, from 42 to 43 degrees.

To New York by the Azores or Western Islands, 39 degrees.

To Carolina and Virginia by Madeira, which is called the upper course, 32 degrees: but the usual course, to take advantage of the trade-winds, is from 16 to 23 degrees: and in this course they frequently touch at Antigua: it is this course our West India ships sail in.

The Spanish galleons and the flota from Spain keep from 15 to 18 degrees; and in their return to Spain about 37 degrees.

TIDES.] By the *tides* are meant that regular motion of the sea, according to which it ebbs and flows twice in twenty four hours. The doctrine of the tides remained in obscurity, till the immortal Sir Isaac Newton explained it by his great principle of gravity or attraction. For having demonstrated that there is a principle in all bodies, within the solar system, by which they mutually draw, or attract one another, in proportion to their distance; it follows, that those parts of the sea which are immediately

below the

below the moon, must be drawn towards it; and consequently, wherever the moon is nearly vertical, the sea will be raised, which occasions the flowing of the tide there. A similar reason occasions the flowing of the tide likewise in those places where the moon is in the nadir, and which must be diametrically opposite to the former: for in the hemisphere farthest from the moon, the parts in the nadir being less attracted by her than the other parts which are nearer to her, gravitate less towards the earth's centre, and consequently must be higher than the rest. Those parts of the earth, on the contrary, where the moon appears on the horizon, or ninety degrees distant from the zenith and nadir, will have low water; for as the waters in the zenith and nadir rise at the same time, the waters in their neighbourhood will press towards those places to maintain the equilibrium; to supply the places of these, others will move the same way, and so on to the places ninety degrees distant from the zenith and nadir, where the water will be lowest. By combining, this doctrine with the diurnal motion of the earth, above explained, we shall be sensible of the reason why the tides ebb and flow twice in twenty-four hours, in every place on this globe.

The tides are higher than ordinary, twice every month, that is, about the times of new and full moon, and are called *Spring Tides*: for at these times the actions of both the sun and moon are united, and draw in the same straight line, and consequently the sea must be more elevated. At the conjunction, or when the sun and moon are on the same side of the earth, they both conspire to raise the waters in the zenith, and consequently in the nadir; and at the opposition, or when the earth is between the sun and moon, while one occasions high water in the zenith and nadir, the other does the same. The tides are less than ordinary twice every month, about the first and last quarters of the moon, and are called *Neap Tides*: for in the quarters, the sun raises the waters where the moon depresses them, and depresses where the moon raises them: so that the tides are only occasioned by the difference by which the action of the moon, which is nearest us, prevails over that of the sun. These things would happen uniformly, were the whole surface of the earth covered with water; but since there are a multitude of islands, and continents which interrupt the natural course of the water, a variety of appearances are to be met with in different places, which cannot be explained without regarding the situation of shores, straits, and other objects which have share in producing them.

CURRENTS.] There are frequently streams or currents in the Ocean, which set ships a great way beyond their intended course. There is a current between Florida and the Bahama Islands, which always runs from north to south. A current runs constantly from the Atlantic, through the straits of Gibraltar, into the Mediterranean. A current sets out of the Baltic sea, through the sound or strait between Sweden and Denmark, into the British channel, so that there are no tides in the Baltic. About small islands and head-lands in the middle of the ocean, the tides rise very little; but in some bays, and about the mouths of rivers, they rise from 12 to 50 feet.

MAPS.] A map is the representation of the earth, or a part thereof, on a plane surface. Maps differ from the globe in the same manner as a picture does from a statue. The globe truly represents the earth; but a map, no more than a plane surface, can represent one that is spherical. But although the earth can never be exhibited exactly by one map, yet, by means of several of them, each containing about ten or twenty degrees of latitude, the representation will not fall very much short of the globe for ex-

actress

ness; because such maps, if joined together, would form a spherical convex nearly as round as the globe itself.

CARDINAL POINTS.] The north is considered as the upper part of the map; the south is at the bottom, opposite to the north; the east is on the right hand, the face being turned to the north; and the west on the left hand opposite to the east. From the top to the bottom are drawn meridians, or *lines of longitude*: and from side to side, *parallels of latitude*. The outermost of the meridians and parallels are marked with degrees of latitude or longitude, by means of which, and the scale of miles commonly placed in the corner of the map, the situation, distance, &c. of places, may be found as on the artificial globe. Thus, to find the distance of two places, suppose London and Paris, by the map, we have only to measure the space between them with the compasses, or a bit of thread, and to apply this distance to the scale of miles, which shews that London is 210 miles distant from Paris. If the places lie directly north or south, east or west, from one another, we have only to observe the degrees on the meridians and parallels, and by turning these into miles, we obtain the distance without measuring. Rivers are described in maps by black lines, and are wider towards the mouth than towards the head of the spring. Mountains are sketched on maps as on a picture. Forests and woods are represented by a kind of shrub; bogs and morasses, by shades; sands and shallows are described by small dots; and roads usually by double lines. Near harbours, the depth of the water is expressed by figures representing fathoms.

LENGTH OF MILES IN DIFFERENT COUNTRIES.] There is scarcely a greater variety in any thing than in this sort of measure, not only those of separate countries differ, as the French from the English, but those of the same country vary, in the different provinces, and all commonly from the standard. Thus the common English mile differs from the statute mile; and the French have three sorts of leagues. We shall here give the miles of several countries compared with the English, by Dr. Halley.

The English statute mile consists of 5280 feet, 1760 yards, or 8 furlongs.

The Russian verst is little more than $\frac{1}{2}$ English.

The Turkish, Italian, and old Roman lesser mile, is nearly one English.

The Arabian, ancient and modern, is about $1\frac{1}{2}$ English.

The Scotch and Irish mile is about $1\frac{1}{4}$ English.

The Indian is almost 3 English.

The Dutch, Spanish, and Polish, is about $3\frac{1}{2}$ English.

The German is more than 4 English.

The Swedish, Danish, and Hungarian, is from 5 to 6 English.

The French common league is near 3 English; and

The English marine league is 3 English miles.

PART II.

OF THE ORIGIN OF NATIONS, LAWS, GOVERNMENT, AND COMMERCE.

HAVING, in the following work mentioned the ancient names of countries, and even sometimes, in speaking of these countries, carried our researches beyond modern times; it was thought necessary, in order to prepare the reader for entering upon the particular history of each country we describe, to place before his eye a general view of the history of mankind, from the first ages of the world to the reformation in religion during the 16th century.

century

century. By a history of the world, we do not mean a mere list of dates, which, when taken by itself, is a thing extremely insignificant; but an account of the most interesting and important events which have happened among mankind; with the causes which have produced, and the effects which have followed from them. This we judge to be a matter of high importance in itself, and indispensibly requisite to the understanding of the present state of commerce, government, arts, and manners, in any particular country; which may be called commercial and political geography, and which, undoubtedly, constitutes the most useful branch of that science.

The great event of the creation of the world, before which there was neither matter nor form of any thing, is placed, according to the best chronologists in the years before Christ 4004; and in the 710th year of what is called the Julian period, which hath been adopted by some chronologists and historians, but is of little real service. The sacred records have fully determined the question, that the world was not eternal, and also ascertained the time of its creation with great precision.

It appears in general, from the first chapters in Genesis, that the world, before the flood, was extremely populous; that mankind had made considerable improvement in the arts, and were become extremely vicious, both in their sentiments and manners. Their wickedness gave occasion to a memorable catastrophe, by which the whole human race, except Noah and his family, were swept from off the face of the earth. The deluge took place in the 1656th year of the world, and produced a very considerable change on the soil and atmosphere of this globe, and gave them a form less friendly to the frame and texture of the human body. Hence the abridgment of the life of man, and that formidable train of diseases which had ever since made such havoc in the world. A curious part of history follows that of the deluge, the re-peopling of the world, and the rising of a new generation from the ruins of the former. The memory of the three sons of Noah, the first founders of nations, was long preserved among their several descendants. Japhet continued famous among the western nations, under the celebrated name of Japetus; the Hebrews paid an equal veneration to Shem, who was the founder of their race; and among the Egyptians, Ham was long revered as a divinity, under the name of Jupiter Hammon. It appears that hunting was the principal occupation some centuries after the deluge. The world teemed with wild beasts; and the great heroism of those times consisted in destroying them. Hence Nimrod acquired immortal renown; and by the admiration which his courage and dexterity universally excited, was enabled to acquire an authority over his fellow-creatures, and to found at Babylon the first monarchy, whose origin is particularly mentioned in history. Not long after the foundation of Nineveh was laid by Assur; in Egypt the four governments of Thebes, Theis, Memphis, and Tanis, began to assume some appearance of form and regularity. That these events should have happened so soon after the deluge, whatever surprize it may have occasioned to the learned some centuries ago, need not in the smallest degree excite the wonder of the present age. We have seen from many instances, the powerful effects of the principles of population, and how speedily mankind increase, when the generative faculty lies under no restraint. The kingdoms of Mexico and Peru were incomparably more extensive than those of Babylon, Ninerech,

* The Samaritan copy of the Bible makes the antediluvian period only 2249 years, 319 short of the Hebrew Bible computation; and the Septuagint copy exceeds it to 1263 years, which is 666 years exceeding it; but the Hebrew chronology is generally acknowledged to be of superior authority.

and Egypt, during this early age; and yet these kingdoms are not supposed to have existed four centuries before the discovery of America by Columbus. As mankind continued to multiply on the earth, and to separate from each other, the tradition concerning the true God was obliterated or obscured. This occasioned the calling of Abraham to be the father of a chosen people. From this period the history of ancient nations begins a little to expand itself; and we learn several particulars of very considerable importance.

Mankind had not long been united into societies before they set themselves to oppress and destroy one another. Chedorlaomer, king of the Elamites, or Persians, was already become a robber and a conqueror. His force, however, must not have been very considerable, since, in one of these expeditions, Abraham, assisted only by his household, set upon him in his retreat, and, after a fierce engagement, recovered all the spoil that had been taken. Abraham was soon after obliged by a famine to leave Canaan, the country where God had commanded him to settle, and to go into Egypt. This journey gives occasion to Moses to mention some particulars with regard to the Egyptians, and every stroke discovers the characters of an improved and powerful nation. The court of the Egyptian monarch is described in the most brilliant colours. He is surrounded with a crowd of courtiers, solely occupied in gratifying his passions. The particular governments into which this country was divided, are now united under one powerful prince; and Ham, who led the colony into Egypt, is become the founder of a mighty empire. We are not, however, to imagine that all the laws which took place in Egypt, and which have been so justly admired for their wisdom, were the work of this early age. Diodorus Siculus, a Greek writer, mentions many successive princes, who laboured for their establishment and perfection. But in the time of Jacob, two centuries after, the first principles of civil order and regular government seem to have been tolerably understood among the Egyptians. This country was divided into several districts or separate departments; councils, composed of experienced and select persons, were established for the management of public affairs; granaries for preserving corn were erected; and, in fine, the Egyptians in this age enjoyed a commerce far from inconsiderable. These facts, though of an ancient date, deserve our particular attention. It is from the Egyptians, that many of the arts, both of elegance and utility, have been handed down in an uninterrupted chain to the modern nations of Europe. The Egyptians communicated their arts to the Greeks; the Greeks taught the Romans many improvements both in the arts of peace and war; and to the Romans, the present inhabitants of Europe are indebted for their civility and refinement. The kingdoms of Babylon and Nineveh remained separate for several centuries; but we know not even the names of the kings who governed them, unless it be Ninus, the successor of Assur, who, fired with the spirit of conquest, extends the bounds of his kingdom, adds Babylon to his dominions and lays the foundation of that monarchy, assisted by his enterprising successor Semiramis, which, under the name of the Assyrian empire, kept Asia under the yoke for many ages.

Javan, son of Japhet, and grand-son of Noah, is the stock from whom all the people known by the name of Greeks are descended. Javan established himself in the islands in the western coast of Asia Minor, from whence

* According to Dr. Playfair's Chronological Tables, the birth of Abraham is fixed at before Christ 2069, and his being called out of Urr, at 1986.

it was impossible that some wanderers should not pass over into Europe. The kingdom of Sicily near Corinth, founded by the Pelasgi, is generally supposed to have commenced in the year before Christ 2090. To these first inhabitants succeeded a colony from Egypt, who about 2000 years before the Christian era, penetrated into Greece, and, under the name of Titans, endeavoured to establish monarchy in this country, and to introduce into it the laws and civil policy of the Egyptians. But the empire of the Titans was soon dissolved; and the ancient Greeks, who seem at this time to be as rude and barbarous as any people in the world, again fell back into their lawless and savage manner of life. Several colonies, however, soon after passed over from Asia into Greece, and by remaining in that country, produced a more considerable alteration in the manner of its inhabitants. The most ancient of these were the colonies of Inachus and Ogyges; of whom the former settled in Argos and the latter in Attica. We know very little of Ogyges or his successors. Those of Inachus endeavoured to unite the dispersed and wandering Greeks; and their endeavours for this purpose were not altogether unsuccessful.

But the history of God's chosen people, the Israelites, is the only one with which we are much acquainted during those ages. The train of curious events which occasioned the settling of Jacob and his family in that part of Egypt, of which Tanis was the capital, are universally known. That patriarch died, according to the Septuagint version, 1794 B.C. years before Christ, but according to the Hebrew Chronology, only 1689 years, and in the year of the world 2315. This is a remarkable era with respect to the nations of heathen antiquity, and concludes that period of time which the Greeks considered as altogether unknown, and which they have greatly disfigured by their fabulous narrations. Let us regard this period then in another point of view, and consider what we can learn from the sacred writings, with respect to the arts, manners, and laws of ancient nations.

It is a common error among writers on this subject, to consider all the nations of antiquity as being on the same footing with regard to those matters. They find some nations extremely rude and barbarous, and hence they conclude, that all were in that situation. They discover others acquainted with many arts, and hence they infer the wisdom of the first ages. There appears, however, to have been as much difference between the inhabitants of the ancient world, in point of art and refinement, as between the civilized kingdoms of modern Europe and the Indians in America, or the Negroes on the coast of Africa. Noah was undoubtedly acquainted with all the arts of the antediluvian world: these he would communicate to his children, and they again would hand them down to their posterity. Those nations, therefore, who settled nearest the original seat of mankind, and who had the best opportunities to avail themselves of the knowledge which their great ancestor was possessed of, early formed themselves into regular societies, and made considerable improvements in the arts which are most subservient to human life. Agriculture appears to have been known in the first ages of the world. Noah cultivated the vine; in the time of Jacob, the fig-tree and the almond were well known in the land of Canaan; and the instruments of husbandry, long before the discovery of them in Greece, are often mentioned in the sacred writings. It is hardly to be supposed, that the ancient cities, both in Asia and in Egypt, whose foundation, as we have already mentioned, extends to the remotest antiquity, could have been built, unless the culture of the ground had been practised at that time. Nations who live by hunting

or pasturage only, lead a wandering life, and seldom fix their residence in cities. Commerce naturally follows agriculture; and though we cannot trace the steps by which it was introduced among the ancient nations, we may, from detached passages in sacred writ, ascertain the progress which had been made in it during the patriarchal times. We know from the history of civil society, that the commercial intercourse between men must be pretty considerable, before the metals came to be considered as the medium of trade; and yet this was the case even in the days of Abraham. It appears, however, from the relations which establish this fact, that the use of money had not been of ancient date; it had no mark to ascertain its weight or fineness; and in a contract for a burying-place, in exchange for which Abraham gave silver, the metal is weighed in presence of all the people. But as commerce improved, and bargains of this sort became more common, this practice was laid aside, and the quantity of silver was ascertained by a particular mark, which saved the trouble of weighing it. But this does not appear to have taken place till the time of Jacob, the second from Abraham. The *ryshak*, of which we read in his time, was a piece of money, stamped with the figure of the lamb, and of a precise and stated value. It appears from the history of Joseph, that the commerce between different nations was by this time regularly carried on. The Israelites and Midianites, who bought him of his brethren, were travelling merchants, resembling the modern caravans, who carried spices, perfumes, and other rich commodities, from their own country into Egypt. The same observation may be made from the book of Job, who, according to the best writers, was a native of Arabia Felix, and also a contemporary with Jacob. He speaks of the roads of Tema and Saba, i. e. of the caravans which set out from those cities of Arabia. If we reflect, that the commodities of this country were rather the luxuries than the conveniencies of life, we shall have reason to conclude, that the countries into which they were sent for sale, and particularly Egypt, were considerably improved in arts and refinement: for people do not think of luxuries, until the useful arts have made high advancement among them.

In speaking of commerce, we ought carefully to distinguish between the species of it, which is carried on by land or inland commerce, and that which is carried on by sea: which last kind of traffic is both later in its origin, and slower in its progress. Had the descendants of Noah, been left to their own ingenuity, and received no tincture of the antediluvian knowledge from their wise ancestors, it is improbable that they should have ventured on navigating the open seas so soon as we find they did. That branch of his posterity, who settled on the coasts of Palestine, were the first people of the world, among whom navigation was made subservient to commerce: they were distinguished by a word, which in the Hebrew tongue signifies *merchants*, and are the same nation afterwards known to the Greeks by the name of Phœnicians. Inhabiting a barren and ungrateful soil, they set themselves to better their situation by cultivating the arts. Commerce was their capital object: and with all the writers of pagan antiquity, they pass for the inventors of whatever is subservient to it. At the time of Abraham they were regarded as a powerful nation; their maritime commerce is mentioned by Jacob in his last words to his children; and, if we may believe Herodotus in a matter of such remote antiquity, the Phœnicians had by this time navigated the coasts of Greece, and carried off the daughter of Inachus.

The arts of agriculture, commerce, and navigation, suppose the knowledge of several others; astronomy, for instance, or a knowledge of the situation and revolutions of the heavenly bodies, is necessary both to agriculture and naviga-

navigation; that of working metals, to commerce; and so of other arts. In fact, we find that before the death of Jacob, several nations were so well acquainted with the revolutions of the moon, as to measure by them the duration of their year. It had been an universal custom among all the nations of antiquity, as well as the Jews, to divide time in the portion of a week, or seven days: this undoubtedly arose from the tradition with regard to the origin of the world. It was natural for those nations who led a pastoral life, or who lived under a serene sky, to observe that the various appearances of the moon were completed nearly in four weeks; hence the division of a month. Those people again who lived by agriculture, and who had gotten among them the division of the month, would naturally remark, that twelve of these brought back the same temperature of the air, or the same seasons; hence the origin of what is called the *lunar year*, which has every where taken place in the infancy of science. This, together with the observation of the fixed stars, which, as we learn from the book of Job, must have been very ancient, naturally paved the way for the discovery of the *solar year*, which at that time would be thought an immense improvement in astronomy. But with regard to those branches of knowledge which we have mentioned, it is to be remembered, that they were peculiar to the Egyptians, and a few nations of Asia. Europe offers a frightful spectacle during this period. Who could believe that the Greeks, who in later ages became the pattern of politeness and every elegant art, were descended from a savage race of men, traversing the woods and wilds, inhabiting the rocks and caverns; a wretched prey to wild animals, and sometimes to one another! This, however, is no more than what was to be expected. Those descendants of Noah, who had removed to a great distance from the plains of Shinar, lost all connection with the civilized part of mankind. Their posterity became still more ignorant; and the human mind was at length sunk into an abyss of misery and wretchedness.

We might naturally expect, that from the death of Jacob, and as we advance forward in time, the history of the great empires of Egypt and Assyria would emerge from their obscurity. This, however, is far from being the case: we only get a glimpse of them, and they disappear entirely for many ages. After the reign of Ninias, who succeeded Semiramis and Ninus B. C. in the Assyrian throne, we find an astonishing blank in the history of this empire, for no less than eight hundred years. The silence of ancient history on this subject, is commonly attributed to the softness and effeminacy of the successors of Ninus, whose lives afforded no events worthy of narration. Wars and commotions are the great themes of the historian, while the gentle and happy reigns of wise princes pass unobserved and unrecorded. Sesostris, a prince of wonderful abilities, is supposed to have mounted the throne of Egypt, after Amenophis, who was swallowed up in the Red Sea about the year before Christ 1492; by his assiduity and attention, the civil and military establishments of the Egyptians received very considerable improvements. Egypt, in the time of Sesostris, and his immediate successors, was, in all probability, the most powerful kingdom upon earth, and, according to the best calculation, is supposed to have contained twenty-seven millions of inhabitants. But ancient history often excites, without gratifying our curiosity; for, from the reign of Sesostris to that of Bocchoris, in the year before Christ 1781, we have little knowledge of even the name of the intermediate princes. If we judge, however, from collateral circumstances, the country must still have continued in a very flourishing condition; for Egypt continued to pour forth her colonies into distant nations. Athens, that seat of learning and politeness, that school for all who aspire after wisdom, owes its founda-

tion to Cecrops, who landed in Greece with an Egyptian colony, and endeavoured to civilize the rough manners of the original inhabitants. From the institutions which Cecrops established among the Athenians, it is easy to infer in what situations they must have lived before his arrival. The laws of marriage, which few nations are so barbarous as to be altogether unacquainted with, were not known in Greece. Mankind, like the beasts of the field, were propagated by accidental rencounters, and with little knowledge of those to whom they owed their generation. Cranaus, who succeeded Cecrops in B.C. 1366 the kingdom of Attica, pursued the same beneficial plan, and endeavoured by wise institutions, to bridle the keen passions of a rude people.

Whilst these princes used their endeavours for civilizing this corner of Greece, the other kingdoms, into which this country, by the natural boundaries of rocks, mountains, and rivers, is divided, and which had been already peopled by colonies from Egypt and the East, began to assume some appearance of form and regularity. This engaged Amphictyon, one of those uncommon geniuses who appear in the world, for the benefit of the age in which they live, and the admiration of posterity, to think of some expedient by which he might unite in one plan of politics the several independent kingdoms of Greece, and thereby deliver them from those intestine divisions, which must render them a prey to one another, or to the first enemy who might think proper to invade them. These reflections he communicated to the kings, or leaders of the different territories; and by his eloquence and address engaged twelve cities to unite together for their mutual preservation. Two deputies from each of these cities assembled twice a year at Thermopylae, and formed what, after the name of its founder, was called the Amphictyonic council. In this assembly, whatever related to the general interest of the confederacy, was discussed and finally determined. Amphictyon likewise, sensible that those political connections are the most lasting which are strengthened by religion, committed to the Amphictyons the care of the temple at Delphi, and of the riches which, from the dedications of those who consulted the oracle, had been amassed in it. This assembly, constituted on such solid foundations, was the great spring of action in Greece, while that country preserved its independence; and, by the union which it inspired among the Greeks, enabled them to defend their liberties against all the force of the Persian empire. Considering the circumstances of the age in which it was instituted, the Amphictyonic council is perhaps the most remarkable political establishment which ever took place among mankind. In the year before Christ 1322 the Isthmian games were instituted at Corinth; and in 1303 the famous Olympic games by Pelops; which games, together with the Pythian, and Nemean, have been rendered immortal by the genius of Pindar.

The Greek states, who formerly had no connection with one another, except by mutual inroads and hostilities, soon began to act with concert, and to undertake distant expeditions for the general interest of the community. The first of these was the obscure expedition of the Argonauts, in which all Greece appears to have been concerned. The object of the Argonauts was to open the commerce of the Euxine sea, and to establish colonies in the adjacent country of Colchis. The ship Argo, which was the admiral of the fleet, is the only one particularly taken notice of; though we learn from Homer, and other ancient writers, that several sail were employed in this expedition. The fleet of the Argonauts was, from the ignorance of those who conducted it, long tossed about on different coasts. The rocks, at some distance, from the mouth of the Euxine sea, occasioned great labour: they

sent forward a light vessel, which passed through, but returned with the loss of her rudder. This is expressed in the fabulous language of antiquity, by their sending out a bird which returned with the loss of its tail, and may give us an idea of the allegorical obscurity in which the other events of this expedition are involved. The fleet, however, at length arrived at Eon, the capital of Colchis, after performing a voyage, which, considering the mean condition of the naval art during this age, was not less considerable than the circumnavigation of the world by our modern discoverers. From this expedition to that against Troy, which was undertaken to recover the fair Helena, a queen of Sparta, who had been carried off by Paris, son of the Trojan king, the Greeks must have made a wonderful progress in power and opulence: no less than twelve hundred vessels were employed in this voyage, each of which, at a medium, contained upwards of a hundred men. These vessels, however, were but half-decked; and it does not appear that iron entered at all into their construction. If we add to these circumstances, that the Greeks had not the use of the saw, an instrument so necessary to the carpenter, a modern must form but a mean notion of the strength or elegance of this fleet.

Having thus considered the state of Greece as a whole, let us examine the circumstances of the particular countries into which it was divided. This is of great importance to our present undertaking, because it is in this country only that we can trace the origin and progress of government, arts, and manners, which compose so great a part of our present work. There appears originally to have been a very remarkable resemblance between the political situation of the different kingdoms of Greece. They were governed each by a king, or rather by a chieftain, who was their leader in time of war, their judge in time of peace, and who presided in the administration of their religious ceremonies. This prince, however, was far from being absolute. In each society there were a number of other leaders, whose influence over their particular clans, or tribes, was not less considerable than that of the king over his immediate followers. These captains were often at war with one another, and sometimes with their sovereign. Such a situation was, in all respects, extremely unfavourable: each particular state was, in miniature, what the whole country had been before the time of Amphictyon. They required the hand of another delicate painter to shade the opposite colours, and to enable them to produce one powerful effect. The history of Athens affords us an example of the manner in which these states, that, for want of union, were weak and insignificant, became, by being cemented together, important and powerful. Theseus, king of Attica, about the year before Christ 1234, had acquired great reputation by his exploits of valour and ability. He saw the inconveniencies to which his country, from being divided into twelve districts, was exposed; and he conceived, that by means of the influence which his personal character, united to the royal authority with which he was invested, had universally procured him, he might be able to remove them. For this purpose he endeavoured to maintain, and even to encrease, his popularity among the peasants and artisans; he detached, as much as possible, the different tribes from the leaders who commanded them; he abolished the courts which had been established in different parts of Attica, and appointed one council-hall common to all the Athenians. Theseus, however, did not trust solely to the force of political regulations. He called to his aid all the power of religious prejudices; by establishing common rites of religion to be performed in Athens, and by inviting thither strangers from all quarters, by the prospect of protection and privileges, he raised this city from an inconsiderable village to a powerful metropolis. The splendor of Athens and of Theseus now totally eclipsed that

of the other villages and their particular leaders. All the power of the state was united in one city, and under one sovereign. The petty chieftains, who had formerly occasioned so much confusion, by being divested of all influence and consideration, became humble and submissive; and Attica remained under the peaceable government of a monarch.

This is a rude sketch of the origin of the first monarchy of which we have a distinct account, and may without much variation, be applied to the other states of Greece. This country, however, was not destined to continue long under the government of kings. A new influence arose, which in a short time proved too powerful both for the king and the nobles. Theseus had divided the Athenians into three distinct classes; the nobles, the artisans, and the husbandmen. In order to abridge the exorbitant power of the nobles, he had bestowed many privileges on the two other ranks of persons. This plan of politics was followed by his successors; and the lower ranks of the Athenians, partly from the countenance of their sovereign, and partly from the progress of arts and manufactures, which gave them an opportunity of acquiring property, became considerable and independent. These circumstances were attended with a remarkable effect. Upon the death of Codrus, a prince of great merit, in the year B. C. 1070, the Athenians became weary of the regal authority, under pretence of finding no one worthy of filling the throne of that monarch, who had devoted himself to death for the safety of his people, abolished the regal power and proclaimed that none but Jupiter should be king of Athens. This revolution in favour of liberty was so much the more remarkable, as it happened soon after that the Jews became unwilling to remain under the government of the true God, and desired a mortal sovereign, that they might be like unto other nations.

The government of Thebes, another of the Grecian states, much about the same time assumed the republican form. Near a century before the Trojan war, Cadmus, with a colony from Phœnicia, had founded this city, which from that time had been governed by kings. But the last sovereign being overcome in single combat, by a neighbouring prince, the Thebans abolished the regal power. Till the days however of Pelopidas and Epaminondas, a period of seven hundred years, the Thebans performed nothing worthy of the republican spirit. Other cities of Greece, after the examples of Thebes and Athens, erected themselves into republics. But the revolutions of Athens and Sparta, two rival states, which, by means of the superiority they acquired, gave the tone to the manners, genius, and politics of the Greeks, deserve our particular attention. We have seen a tender shoot of liberty spring up in the city of Athens upon the death of Codrus, its last sovereign. This shoot gradually improved into a vigorous plant; and it cannot but be pleasant to observe its progress. The Athenians, by abolishing the name of king, did

B. C.

1070.

not entirely subvert the regal authority: they established a perpetual magistrate, who, under the name of Archon, was invested with almost the same rights which their kings had enjoyed. The Athenians, in time, became sensible, that the archonic office was too lively an image of royalty for a free state. After it had continued therefore, three hundred and thirty-one years in the family of Codrus, they endeavoured to lessen its dignity, not by abridging its power, but by shortening its duration. The first period assigned for the continuance of the Archonship in the same hands, was three years. But the desire of the Athenians for a more perfect system of

B. C.

624.

freedom than had hitherto been established, increased in proportion to the liberty they enjoyed. They again called out for a fresh reduction of the power of their Archons; and it was at length determined that nine annual magistrates should be appointed for this office. These magistrates

were not only chosen by the people, but accountable to them for their conduct at the expiration of their office. These alterations were too violent not to be attended with some dangerous consequences. The Athenians, intoxicated with their freedom, broke out into the most unruly and licentious behaviour. No written laws had been as yet enacted in Athens, and it was hardly possible that the ancient customs of the realm, which were naturally supposed to be in part abolished by the successive changes in the government, should sufficiently restrain the tumultuary spirits of the Athenians in the first flutter of their independence. This engaged the wiser part of the state, who began to prefer any system of government to their present anarchy and confusion, to cast their eyes on Draco, a man of an austere but virtuous disposition, as the fittest person for composing a system of law, to bridle the furious and unruly manners of their countrymen. Draco undertook the office about the year 688, but executed it with so much rigour, that in the words of an ancient historian, "His laws were written with blood, and not with ink." Death was the indiscriminate punishment of every offence, and the laws of Draco were found to be a remedy worse than the disease. Affairs again returned into confusion and disorder, and remained so till the time of Solon, who died in the year before Christ 549. The gentle manners, disinterested virtue, and wisdom more than human, by which this sage was distinguished, pointed him out as the only character adapted to the most important of all offices, the giving laws to a free people. Solon, though this employment was assigned him by the unanimous voice of his country, long deliberated whether he should undertake it. At length, however the motives of public utility overcame all considerations of private ease, safety, and reputation, and determined him to enter an ocean pregnant with a thousand dangers. The first step of his legislation was to abolish all the laws of Draco, excepting those relative to murder. The punishment of this crime could not be too great; but to consider other offences as equally criminal, was to confound all notions of right and wrong, and to render the law ineffectual by means of its severity. Solon next proceeded to new-model the political law; his establishments on this head remained among the Athenians, while they preserved their liberties. He seems to have set out with this principle, that a perfect republic, in which each citizen should have an equal political importance, was a system of government, beautiful indeed in theory, but not reducible to practice. He divided the citizens therefore into four classes, according to the wealth which they possessed, and the poorest class he rendered altogether incapable of any public office.

They had a voice, however, in the general council of the nation, in which all matters of principal concern were determined in the last resort. But lest this assembly, which was composed of all the citizens, should, in the words of Plutarch, like a ship with too many sails, be exposed to the gust of folly, tumult, and disorder, he provided for its safety by the two anchors of the Senate and Areopagus. The first of these courts consisted of four hundred persons, a hundred out of each tribe of the Athenians, who prepared all important bills that came before the assembly of the people; the second, though but a court of justice, gained a prodigious ascendancy in the republic, by the wisdom and gravity of its members, who were not chosen, but after the strictest scrutiny, and the most serious deliberation.

Such was the system of government established by Solon, which, the nearer we examine it, will afford the more matter for our admiration. Upon the same plan most of the other ancient republics were established. To insist on all of them, therefore, would neither be entertaining nor

INTRODUCTION.

instructive. But the government of Sparta, or Lacedæmon, had some-
 thing in it so peculiar, that the great lines of it at least, ought not to
 be omitted even in a delineation of this sort. Sparta, like the other states
 of Greece, was originally divided into a number of petty principalities, of
 which each was under the jurisdiction of its own immediate chieftain.
 Lelex is said to be the first king, about the year B. C. 1516. At length,
 B. C. the two brothers, Euristhenes and Procles, getting possession of this
 country, became conjunct in the royalty; and, what is extremely singu-
 lar, their posterity, in the direct line, continued to rule conjunctly for nine
 hundred years, ending with Cleomenes, anno 220 before the Christian æra.
 The Spartan government, however, did not take that singular form which
 renders it so remarkable, until the time of Lycurgus, the celebrated
 legislator. The plan of policy devised by Lycurgus, agreed with
 that already described in comprehending a senate and assembly of the
 people, and in general all those establishments which are deemed most re-
 quise for the security of political independence. It differed from that of
 Athens, and indeed from all other governments, in having two kings, whose
 office was hereditary, though their power was sufficiently circumscribed by
 proper checks and restraints. But the great characteristic of the Spartan
 constitution arose from this, that, in all laws, Lycurgus had at least as much
 respect to war as to political liberty. With this view, all sorts of luxury,
 all arts of elegance or entertainment, every thing, in short, which had the
 smallest tendency to soften the minds of the Spartans, was absolutely pro-
 scribed. They were forbidden the use of money; they lived at public tables
 on the coarsest fare, the younger were taught to pay the utmost reverence
 to the more advanced in years, and all ranks capable to bear arms, were
 daily accustomed to the most painful exercises. To the Spartans alone,
 war was a relaxation rather than a hardship, and they behaved in it with a
 spirit of which hardly any but a Spartan could even form a conception.

In order to see the effect of these principles, and to connect under one
 point of view the history of the different quarters of the globe, we must now
 cast our eyes on Asia, and observe the events which happened in those great
 empires, of which we have so long lost sight. We have already
 mentioned in what obscurity the history of Egypt is involved, until
 the reign of Bocchoris. From this period to the dissolution of
 their government by Cambyzes of Persia, in the year B. C. 524, the Egyp-
 tians are more celebrated for the wisdom of their laws, and political institu-
 tions, than for the power of their arms. Several of these seem to have been
 dictated by the true spirit of civil wisdom, and were admirably calculated for
 preserving order and good government in an extensive kingdom. The great
 empire of Assyria likewise, which had so long disappeared, becomes again
 an object of attention, and affords the first instance we meet with in history,
 of a kingdom which fell asunder by its own weight, and the effeminate weak-
 ness of its sovereigns. Sardanapalus, the last emperor of Assyria, neglecting
 the administration of affairs, and shutting himself up in his palace with his
 women and eunuchs, fell into contempt with his subjects. The governors
 of his provinces, to whom, like a weak and indolent prince, he had entire-
 ly committed the command of his armies, did not fail to lay hold of this op-
 portunity of raising their own fortune on the ruins of their master's power.
 Arbaces, governor of Media, and Belesis governor of Babylon, conspire
 against their sovereign, set fire to his capital, in which Sardanapalus perished,
 B. C. 82, and divide between them his extensive dominions. These
 two kingdoms, sometimes united under one prince, and sometimes governed

each by a particular sovereign, maintained the chief sway of Asia for many years. Phul revived the kingdom of Assyria, anno B. C. 777, and Shalmaneser, one of his successors, put an end to the kingdom of Israel, and carried the ten Tribes captive into Assyria and Media, B. C. 721. Nebuchadnezzar king of Babylon also, in the year B. C. 587, overturned the kingdom of Judah, which had continued in the family of David from the year 1055, and mastered all the countries around him. But in the year 538, Cyrus the Great took Babylon, and reduced this quarter of the world under the Persian yoke. The manners of this people, as brave, hardy, and independent, as well as the government of Cyrus, in all its various departments, are elegantly described by Xenophon, a Grecian philosopher and historian. It is not necessary, however, that we should enter on the same detail upon this subject, as with regard to the affairs of the Greeks. We have, in modern times, sufficient examples of monarchical governments; but how few are our republics! But the era of Cyrus is in one respect extremely remarkable, besides delivering the Jews from their captivity, because, with it the history of the great nations of antiquity, which has hitherto engaged our attention may be supposed to finish. Let us consider then the genius of the Assyrians, Babylonians, and Egyptians, in arts and sciences; and if possible discover what progress they had made in those acquirements which are most subservient to the interests of society.

The tale for the great and magnificent, seems to have been the prevailing character of these nations; and they principally displayed it in their works of architecture. There are no vestiges, however now remaining, which confirm the testimony of ancient writers, with regard to the great works which adorned Babylon and Nineveh: neither is it clearly determined in what year they were begun or finished. There are three pyramids, stupendous fabrics, still remaining in Egypt, at some leagues distance from Cairo, and about nine miles from the Nile, which are supposed to have been the burying places of the ancient Egyptian kings. The largest is five hundred feet in height, and each side of the base six hundred and ninety-three feet in length. The apex is 13 feet square. The second stands on as much ground as the first, but is 40 feet lower. It was a superstition among this people, derived from the earliest times, that even after death the soul continued in the body as long as it remained uncorrupted. Hence proceeded the custom of embalming, or of throwing into the dead body such vegetables as experience had discovered to be the greatest preservatives against putrefaction. The pyramids were erected with the same view. In them the bodies of the Egyptian kings were concealed. This expedient, together with embalming, as these superstitious monarchs conceived, would inevitably secure a safe and comfortable retreat for their souls after death. From what we read of the walls of Babylon, the temple of Belus, and other works of the East, and from what travellers have recorded of the pyramids, it appears that they were really superb and magnificent structures, but totally void of elegance. The orders of architecture were not yet known, nor even the constructing of vaults. The arts in which these nations, next to architecture principally excelled, were sculpture and embroidery. As to the sciences, they had all along continued to bestow their principal attention on astronomy. It does not appear, however, that they made great progress in explaining the causes of the phenomena of the universe, or indeed in any species of rational and sound philosophy. To demonstrate this to an intelligent reader, it is sufficient to observe that according to the testimony of sacred and profane writers, the absurd reveries of magic and astrology, which always decrease in proportion to the advancement of true science, were in high esteem among them, during the

latest period of their government. The countries which they occupied were extremely fruitful, and afforded without much labour all the necessaries, and even luxuries of life. They had long been accustomed to a civilized and polished life in great cities. These circumstances had tainted their manners with effeminacy and corruption, and rendered them an easy prey to the Persians, a nation just emerging from barbarism, of consequence brave and warlike. This was still more easy in the infancy of the military art; when, strength and courage were the only circumstances which gave the advantage to one nation over another; when, properly speaking, there were no fortified places which in modern times have been discovered to be so useful in stopping the progress of a victorious enemy; and when the event of a battle commonly decided the fate of an empire. But we must now turn our attention to other objects.

The history of Persia, after the reign of Cyrus, who died in the year B. C. 529, offers little, considered in itself, that merits our regard; but when combined with that of Greece, it becomes particularly interesting. The monarchs who succeeded Cyrus, gave an opportunity to the Greeks to exercise those virtues which the freedom of their government had created and confirmed. Sparta remained under the influence of Lycurgus's institutions: Athens had just recovered from the tyranny of the Pisistratide, a family who had trampled on the laws of Solon and usurped the supreme power.

B. C. 504. Such was their situation, when the lust of universal empire, which freedom fails to torment the breast of tyrants, led Darius (at the instigation of Hippias, who had been expelled from Athens, and on account of the Athenians burning the city of Sardis), to send forth his numerous armies into Greece. But the Persians were no longer those invincible soldiers, who under Cyrus, had conquered Asia. Their minds were enervated by luxury and servitude. Athens, on the contrary, teemed with great men, whose minds

were nobly animated by the late recovery of their freedom. Miltiades, B. C. 490. in the plains of Marathon, with ten thousand Athenians overcame the Persian army of a hundred thousand foot and ten thousand cavalry.

His countrymen, Themistocles and Aristides, the first celebrated for his abilities, the second for his virtue gained the next honours to the general. It does not fall within our plan to mention the event of this war, which, as the noblest monuments of virtue over force, of courage over numbers, of liberty over servitude, deserve to be read at length in ancient writers.

B. C. 480. Xerxes, the son of Darius, came in person into Greece, with an immense army, which according to Herodotus, amounted to two millions and one hundred thousand men. This account has been justly considered by some ingenious modern writers as incredible. The truth cannot now be ascertained; but that the army of Xerxes was extremely numerous, is the most probable, from the great extent of his empire, and from the absurd practice of the eastern nations of encumbering their camp with a superfluous multitude. Whatever the numbers of his army were, he was every where defeated, by sea and land, and escaped to Asia in a fishing-boat. Such was the spirit of the Greeks and so well did they know that "wanting virtue, life is pain and woe; that "wanting liberty, even virtue mourns, and looks around for happiness in vain." But though the Persian war concluded gloriously for the Greeks, it is in a great measure, to this war, that the subsequent misfortunes of that nation are to be attributed. It was not the battles in which they suffered the loss of so many brave men, but those in which they acquired an immensity of Persian gold; it was not their enduring so many hardships in the course of the war, but their connexions with the Persians after the conclusion of it, which subverted the Grecian establishments, and ruined the most virtuous confederacy that ever existed upon earth. The Greeks became haughty

after their victories; delivered from the common enemy, they began to quarrel with one another; their quarrels were fomented by Persian gold, of which they had acquired enough to make them desirous of more. Hence proceeded the famous Peloponnesian war, in which the Athenians and Lacedæmonians acted as principals, and drew after them the other states of Greece. They continued to weaken themselves by these intestine divisions, till Philip, king of Macedon; (a country till this time little known, but which, by the active and crafty genius of this prince, became important and powerful), rendered himself the absolute master of Greece, by the battle of Cheronæa. But this conquest is one of the first we meet with in history which did not depend on the event of a battle. Philip had laid his scheme so deeply, and by bribery, promises, and intrigues, gained over such a number of considerable persons in the several states of Greece to his interest, that another day would have put in his possession what Cheronæa had denied him. The Greeks had lost that virtue which was the basis of their confederacy. Their popular governments served only to give a sanction to their licentiousness and corruption. The principal orators, in most of their states, were bribed in the service of Philip; and all the eloquence of a Demosthenes, assisted by truth and virtue, was unequal to the mean, but more seductive arts of his opponents, who, by flattering the people, used the surest method of winning their affections.

Philip had proposed to extend the boundaries of his empire beyond the narrow limits of Greece. But he did not long survive the battle of Cheronæa: Upon his decease, his son Alexander was chosen general against the Persians, by all the Grecian states, except the Athenians and Thebans. These made a feeble effort for expiring liberty: but they were obliged to yield to superior force. Secure on the side of Greece, Alexander set out on his Persian expedition, at the head of thirty thousand foot, and five thousand horse. The success of this army in conquering the whole force of Darius, in three pitched battles, in over-running and subduing not only the countries then known to the Greeks, but many parts of India, the very name of which had never reached an European ear, has been described by many authors, both ancient and modern, and constitutes a singular part of the history of the world. Soon after this rapid career of victory and success, Alexander died at Babylon. His captains, after sacrificing all his family to their ambition, divided among them his dominions. This gives rise to a number of wars and events too complicated for our present purpose, and even too uninteresting. After considering therefore the state of arts and sciences in Greece, we shall pass over to the Roman affairs, where the historical deduction is more simple, and also more important.

The bare name of illustrious men who flourished in Greece from the time of Cyrus to that of Alexander, would fill a large volume. During this period, all the arts were carried to the highest pitch of perfection; and the improvements we have hitherto mentioned, were but the dawnings of this glorious day. Though the eastern nations had raised magnificent and stupendous structures, the Greeks were the first people in the world, who, in their works of architecture, added beauty to magnificence, and elegance to grandeur. The temples of Jupiter Olympus, and the Ephesian Diana, are the first monuments of good taste. They were erected by the Grecian colonies, who settled in Asia Minor, before the reign of Cyrus. Phidias the Athenian, who died in the year B. C. 432, is the first sculptor whose works have been immortal. Zeuxis, Parrhasius, and Timantheus, during the same age, first discovered the power of the pencil, and all the magic of painting. Composition in all its various branches, reached a degree of perfection in the

Greek language, of which a modern reader can hardly form an idea. After Hesiod and Homer, who flourished 1000 years before the Christian era, the tragic poets, Æschylus, Sophocles, and Euripides, were the first considerable improvers of poetry. Herodotus gave simplicity and elegance to profane writing. Isocrates gave it cadence and harmony, but it was left to Thucydides and Demosthenes to discover the full force of the Greek tongue. It was not, however, in the finer arts alone that the Greeks excelled. Every species of philosophy was cultivated among them with the utmost success. Not to mention the divine Socrates, the virtues of whose life, and the excellence of whose philosophy, justly entitled him to a very high degree of veneration; his three disciples, Plato, Aristotle, and Xenophon, may, for strength of reasoning, justness of sentiment, and propriety of expression, be put on a footing with the writers of any age or country. Experience, indeed, in a long course of years, has taught us many secrets in nature, with which these philosophers were unacquainted, and which no strength of genius could divine. But whatever some vain empirics in learning may pretend, the most learned and ingenious men, both in France and England, have acknowledged the superiority of the Greek philosophers, and have reckoned themselves happy in catching their turn of thinking, and manner of expression. But the Greeks were not less distinguished for their active than for their speculative talents. It would be endless to recount the names of their famous statesmen and warriors, and it is impossible to mention a few without doing injustice to a greater number. War was first reduced to a science by the Greeks. Their soldiers fought from an affection to their country, and an ardour for glory, and not from a dread of their superiors. We have seen the effects of this military virtue in their wars against the Persians; the cause of it was the wise laws which Amphictyon, Solon, and Lycurgus had established in Greece. But we must now leave this nation, whose history, both civil and philosophical, is as important as their territory was inconsiderable, and turn our attention to the Roman affairs, which are still more interesting, both on their own account, and from the relation in which they stand to those of Modern Europe.

The character of Romulus, the founder of the Roman state, when we view him as the leader of a few lawless and wandering banditti, is an object of extreme insignificance. But when we consider him as the founder of an empire as extensive as the world, and whose progress and decline have occasioned the two greatest revolutions that ever happened in Europe, we cannot help being interested in his conduct. His disposition was extremely martial; and the political state of Italy, divided into a number of small but independent districts, afforded a noble field for the display of military talents. Romulus was continually embroiled with one or other of his neighbours; and war was the only employment by which he and his companions expected not only to aggrandise themselves, but even to subsist. In the conduct of his wars with the neighbouring people, we may observe the same maxims by which the Romans afterwards became masters of the world. Instead of destroying the nations he had subjected, he added them to the Roman state, whereby Rome acquired a new accession of strength from every war she undertook, and became powerful and populous from that very circumstance which ruins and depopulates other kingdoms. If the enemies, with which he contended had, by means of the art or arms they employed, any considerable advantage, Romulus immediately adopted that practice, or the use of that weapon, and improved the military system of the Romans by the united experience of all their enemies. We have an example of both these maxims, by means of

which the Roman state arrived at such a pitch of grandeur, in the war with the Sabines. Romulus having conquered that nation, not only united them to the Romans, but finding their buckler preferable to the Roman, instantly threw aside the latter, and made use of the Sabine buckler in fighting against other nations. Romulus, though principally attached to war, did not altogether neglect the civil policy of his infant kingdom: He instituted what was called the Senate, a court originally composed of a hundred persons, distinguished for their wisdom and experience. He enacted laws for the administration of justice, and for bridling the fierce and unruly passions of his followers: and after a long reign, spent in promoting the civil or military interests of his country, was, according to the most probable conjecture, privately assassinated by some of the members of that Senate, which he himself had instituted. B. C. 717.

The successors of Romulus were all very extraordinary personages. Numa who came next to him, established the religious ceremonies of the Romans, and inspired them with that veneration for an oath, which was ever after the soul of their military discipline. Tullus Hostilius, Ancus Martius, Tarquinius Priscus, and Servius Tullius, laboured each, during his reign, for the grandeur of Rome. But Tarquinius Superbus, the seventh and last king, having obtained the crown by the execrable murder of his father-in-law Servius, continued to support it by the most cruel and infamous tyranny. This, together with the insolence of his son Sextus Tarquinius, who, by dishonouring Lucretia, a Roman lady, affronted the whole nation, occasioned the expulsion of the Tarquin's family, and with it the dissolution of the regal government. B. C. 509. As the Romans, however, were continually engaged in war, they found it necessary to have some officer invested with supreme authority, who might conduct them to the field, and regulate their military enterprises. In the room of the kings, therefore, they appointed two annual magistrates, called consuls, who, without creating the same jealousy, succeeded to all the powers of their sovereigns. This resolution was extremely favourable to the Roman grandeur. The consuls who enjoyed but a temporary power, were desirous of signalizing their reign by some great action: each vied with those who had gone before him, and the Romans were daily led out against some new enemy. When we add to this, that the people, naturally warlike, were inspired to deeds of valour, by every consideration which could excite them; that the citizens of Rome were all soldiers, and fought for their lands, their children, and their liberties, we need not be surpris'd that they should, in the course of some centuries, extend their power all over Italy.

The Romans, now secure at home, and finding no enemy to contend with, turn their eyes abroad, and meet with a powerful rival in the Carthaginians. This state had been founded or enlarged on the coast of the Mediterranean in Africa, some time before Rome, by a colony of Phœnicians' anno B. C. 869, and, according to the practice of their mother-country, they had cultivated commerce and naval greatness.

Carthage, in this design, had proved wonderfully successful. She now commanded both sides of the Mediterranean. Besides that of Africa, which she almost entirely possessed, she had extended herself on the Spanish sides through the Straits. Thus mistress of the sea, and of commerce, she had seized on the islands of Corsica and Sardinia. Sicily had difficulty to defend itself; and the Romans were too nearly threatened not to take up arms. Hence a succession of hostilities between these rival states B. C. 264. known in history by the name of Punic wars, in which the Carthaginians, with all their wealth and power, were an unequal match for the Romans.

Romans. Carthage was a powerful republic when Rome was an inconsiderable state; but she was now become corrupt and effeminate, while Rome was in the vigour of her political constitution. Carthage employed mercenaries to carry on her wars; Rome, as we have already mentioned, was composed of soldiers. The first war with Carthage lasted twenty-three years, and taught the Romans the art of fighting on the sea, with which they had hitherto been unacquainted. A Carthaginian vessel was wrecked on their

B. C.
160. coast; they used it for a model; in three months fitted out a fleet, and the consul Duilius, who fought their first naval battle, was victorious. It is not to our purpose to mention all the transactions of these wars. The behaviour of Regulus, the Roman general, may give us an idea of the spirit which then animated this people. Being taken prisoner in Africa, he is sent back on his parole to negotiate a change of prisoners. He maintains in the senate, the propriety of that law which cut off from those who suffered themselves to be taken, all hopes of being saved, and returns to a certain death.

Neither was Carthage, though corrupted, deficient of great men. Of all the enemies the Romans ever had to contend with, Hannibal the Carthaginian, was the most inflexible and dangerous. His father Hamilcar had imbibed an extreme hatred against the Romans, and having settled the intestine troubles of his country, he took an early opportunity to inspire his son, though but nine years old, with his own sentiments. For this purpose he ordered a solemn sacrifice to be offered to Jupiter, and leading his son to the altar, asked him whether he was willing to attend him in his expedition against the Romans; the courageous boy not only consented to go, but conjured his father, by the gods present, to form him to victory, and teach him the art of conquering. That I will joyfully do, replied Hamilcar, and with all the care of a father, who loves you, if you will swear upon the altar to be an eternal enemy to the Romans. Hannibal readily complied; and the solemnity of the ceremony, and the sacredness of the oath, made such an impression upon his mind, as nothing afterwards could ever efface. Being appointed general at twenty-five years of age, he crosses the Ebro, the Pyrenees, and the Alps, and in a moment falls down upon Italy. The loss of four battles threatens the fall of Rome. Sicily sides with the con-

B. C.
218. queror. Hieronymus, king of Syracuse, declares against the Romans, and almost all Italy abandons them. In this extremity, Rome owed its preservation to three great men. Fabius Maximus, despising popular clamour, and the military ardour of his countrymen, declines coming to an engagement. The strength of Rome has time to recover. Marcellus raises the siege of Nola, takes Syracuse, and revives the drooping spirits of his troops. The Romans admired the character of these great men, but saw something more divine in the young Scipio. The success of this young hero confirmed the popular opinion, that he was of divine extraction, and beld converse with the Gods. At the age of four and twenty, he flies into

B. C.
210. Spain, where both his father and uncle had lost their lives, attacks New Carthage, and carries it at the first assault. Upon his arrival in Africa, kings submit to him, Carthage trembles in her turn, and sees her armies defeated. Hannibal, sixteen years victorious, is in vain called home to defend his country. Carthage is rendered tributary, gives hostages, and engages never to enter upon a war, but with the consent of the Roman people.

After the conquest of Carthage, Rome had inconsiderable wars, but great victories; before this time its wars were great, and its victories inconsiderable.

able. At this time the world was divided, as it were, into two parts; in the one fought the Romans and Carthaginians; the other was agitated by those quarrels which had lasted since the death of Alexander the Great. Their scene of action was Greece, Egypt, and the East. The states of Greece had once more disengaged themselves from a foreign yoke. They were divided into three confederacies, the Etolians, Acheans, and Bœotians; each of these was an association of free cities, which had assemblies and magistrates in common. The Etolians were the most considerable of them all. The kings of Macedon maintained that superiority, which, in ancient times, when the balance of power was little attended to, a great prince naturally possessed over his less powerful neighbours. Philip, the present monarch, had rendered himself odious to the Greeks, by some unpopular and tyrannical steps; the Etolians were most irritated; and hearing the fame of the Roman arms, called them into Greece, and overcame Philip by their assistance. The victory, however, chiefly redounded to the advantage of the Romans. The Macedonian garrisons were obliged to evacuate Greece; the cities were all declared free; but Philip became a tributary to the Romans, and the states of Greece became their dependents. The Etolians discovering their first error, endeavoured to remedy it by another still more dangerous to themselves, and more advantageous to the Romans. As they had called the Romans into Greece to defend them against king Philip, they now called in Antiochus, king of Syria, to defend them against the Romans. The famous Hannibal too had recourse to the same prince, who was at this time the most powerful monarch in the East, and the successor to the dominions of Alexander in Asia. But Antiochus did not follow his advice so much as that of the Etolians; for instead of renewing the war in Italy, where Hannibal, from experience, judged the Romans to be the most vulnerable, he landed in Greece with a small body of troops and being overcome without difficulty, fled over into Asia. In this war the Romans made use of Philip for conquering Antiochus, as they had before done of the Etolians for conquering Philip. They now pursue Antiochus, the last object of their resentment, into Asia, and having vanquished him by sea and land, compel him to submit to an infamous treaty.

In these conquests the Romans still allowed the ancient inhabitants to possess their territory; they did not even change the form of government; the conquered nations became the allies of the Roman people; which denomination, however, under a specious name, concealed a condition very servile, and inferred that they should submit to whatever was required of them. When we reflect on these easy conquests, we have reason to be astonished at the resistance which the Romans met with from Mithridates, king of Pontus, for the space of 26 years. But this monarch had great resources. His kingdom bordered on the inaccessible mountains of Caucasus, abounded in a race of men whose minds were not enervated by pleasure, and whose bodies were firm and vigorous, and he gave the Romans more trouble than even Hannibal.

The different states of Greece and Asia, who now began to feel the weight of their yoke, but had not a spirit to shake it off, were transported at finding a prince who dared to shew himself an enemy to the Romans, and cheerfully submitted to his protection. Mithridates, however, at last, was compelled to yield to the superior fortune of the Romans. Vanquished successively by Sylla and Lucullus, he was at length subdued by Pompey, and stripped of his dominions and of his life, in the year B. C. 63. In Africa, the Roman arms met with equal success. Marius, in conquering Jugurtha, made all secure in that quarter. Even the barbarous

B. C.

106.

nations

nations beyond the Alps began to feel the weight of the Roman arms, Gallia Narbonensis had been reduced into a province. The Cimbri, Teutones, and the other northern nations of Europe, broke into this part of the empire. The same Marius, whose name was so terrible in Africa, then made the north of Europe to tremble. The Barbarians retired to their wilch and deserts, less formidable than the Roman legions. But while Rome conquered the world, there subsisted an eternal war within her walls. This war had subsisted from the first period of the government. Rome, after the expulsion of her kings, enjoyed but a partial liberty. The descendants of the senators, who were distinguished by the names of Patricians, were invested with so many odious privileges, that the people felt their dependence, and became determined to shake it off. A thousand disputes on the subject arose betwixt them and the Patricians, which always terminated in favour of liberty.

These disputes, while the Romans preserved their virtue, were not attended with any dangerous consequences. The Patricians, who loved their country, cheerfully parted with some of their privileges to satisfy the people; and the people, on the other hand, though they obtained laws, by which they might be admitted to enjoy the first offices of the state, and though they had the power of nomination, always named Patricians. But when the Romans, by the conquest of foreign nations, became acquainted with all their luxuries and refinements; when they became tainted with the effeminacy and corruption of the eastern courts, and sported with every thing just and honourable in order to obtain them, the state, torn by the factions between its members, and without virtue on either side to keep it together, became a prey to its own children. Hence the bloody, seditions of the Gracchi, which paved the way for an inextinguishable hatred between the nobles and commons, and made it easy for any turbulent demagogue to put them in action against each other. The love of their country was now no more than a specious name; the better sort were too wealthy and effeminate to submit to the rigours of military discipline, and the soldiers, composed of the dregs of the republic, were no longer citizens. They had little respect for any but their commander; under his banner they fought, and conquered, and plundered; and for him they were ready to die. He might command them to embroe their hands in the blood of their country. They who knew no country but the camp, and no authority but that of their general, were ever ready to obey him. The multiplicity of the Roman conquests, however, which required their keeping on foot several armies at the same time, retarded the subversion of the republic. These armies were so many checks upon each other. Had it not been for the soldiers of Sylla, Rome would have surrendered its liberty to the army of Marius.

Julius Cæsar at length appears. By subduing the Gauls, he gained his country the most useful conquest it ever made. Pompey, his own rival, is overcome in the plains of Pharsalia. Cæsar appears victorious almost at the same time all over the world: in Egypt, in Asia, in Mauritania, in Spain, in Gaul, and in Britain: conqueror on all sides, he is acknowledged master at Rome, and in the whole empire. Brutus and Cassius think to give Rome her liberty, by stabbing him in the senate-house. But though they thereby deliver the Romans from the tyranny of Julius, the republic does not obtain its freedom. It falls into the hands of Mark Antony; young Cæsar Octavianus, nephew to Julius Cæsar, wrests it from him by the sea-fight at Actium, and there is no Brutus or Cassius to put an end to his life. Those friends of liberty had killed themselves in despair; and Octavian, under the name of Augustus,

Augustus, and title of emperor, remained the undisturbed master of the empire. During these civil commotions, the Romans still preserved the glory of their arms among distant nations; and while it was unknown who should be master of Rome, the Romans were, without dispute, the masters of the world. Their military discipline and valour abolished all the remains of the Carthaginian, the Persian, the Greek, the Assyrian, and Macedonian glory; they were now only a name. No sooner, therefore, was Octavius established on the throne, than ambassadors from all quarters of the known world crowded to make their submissions. Ethiopia sues for peace; the Parthians, who had been a most formidable enemy, court his friendship; India seeks his alliance; Pannonia acknowledges him; Germany dreads him; and the West receives his laws. Victorious by sea and land, he shuts the temple of Janus. The whole earth lives in peace under his power, and Jesus Christ comes into the world four years before the common æra. B. C. 7.

Having thus traced the progress of the Roman government; while it remained a republic, our plan obliges us to say a few words with regard to the arts, sciences, and manners of that people. During the first ages of the republic, the Romans lived in a total neglect, or rather contempt, of all the elegant improvements of life. War, politics, and agriculture, were the only arts they studied, because they were the only arts they esteemed. But upon the downfall of Carthage, the Romans having no enemy to dread from abroad, began to taste the sweets of security, and to cultivate the arts. Their progress, however, was not gradual, as in the other countries we have described. The conquest of Greece at once put them in possession of every thing most rare, curious, or elegant. Asia, which was the next victim, offered all its stores; and the Romans, from the most simple people, speedily became acquainted with the arts, the luxuries, and refinements of the whole earth. Eloquence they had always cultivated as the high road to eminence and preferment. The orations of Cicero are inferior only to those of Demosthenes. In poetry, Virgil yields only to Homer, whose verse, like the prose of Demosthenes, may be considered as inimitable. Horace, however, in his Satires and Epistles, had no model among the Greeks, and stands to this day unrivalled in that species of writing. In history, the Romans can boast of Livy, who possesses all the natural ease of Herodotus, and is more descriptive, more eloquent, and sentimental. Tacitus indeed did not flourish in the Augustan age, but his works do himself the greatest honour, while they disgrace his country and human nature, whose corruption and vices he paints in the most striking colours. In philosophy, if we except the works of Cicero, and the system of the Greek philosopher Epicurus, described in the nervous poetry of Lucretius, the Romans, during the time of the republic, made not the least attempt. In tragedy they never produced any thing excellent; and Terence, though remarkable for purity of style, wants that *comica vis*, or lively vein of humour, that distinguishes the Greek comedians, and which distinguishes our Shakespeare.

We now return to our history, and are arrived at an æra which presents us with a set of monsters, under the name of emperors, whose histories, a few excepted, disgrace human nature. They did not indeed abolish the forms of the Roman republic, though they extinguished its liberties; and while they were practising the most unwarrantable cruelties upon their subjects, they themselves were the slaves of their soldiers. They made the world tremble, while they in their turn trembled at the army. Rome, from the time of Augustus, became the most despotic empire that ever subsisted in Europe. To form an idea of their government, we need only recall to our mind the situation of Turkey at present. It is of no importance therefore to con-

sider the character of the emperors, since they had no power but what arose from a mercenary standing army; nor to enter into a detail with regard to the transactions of the court, which were directed with that caprice, cruelty, and corruption, which universally prevail under a despotic government. When it is said that the Roman republic conquered the world, it is only meant of the civilized part of it, chiefly in Greece, Carthage, and Asia. A more difficult task still remained for the emperors, to subdue the barbarous nations of Europe; the Germans, the Gauls, the Britons, and even the remote corner of Scotland; for though these countries had been discovered, they were not effectually subdued by the Roman generals. These nations, though rude and ignorant, were brave and independent. It was rather from the superiority of their discipline than of their courage that the Romans gained any advantage over them. The Roman wars with the Germans are described by Tacitus, and from his accounts, though a Roman, it is easy to discover with what bravery they fought, and with what reluctance they submitted to a foreign yoke. From the obstinate resistance of the Germans, we may judge of the difficulties the Romans met with in subduing the other nations of Europe. The contests were on both sides bloody; the countries of Europe were successively laid waste, the inhabitants perished in the field, many were carried into slavery, and but a feeble remnant submitted to the Roman power. This situation of affairs was extremely unfavourable to the happiness of mankind. The barbarous nations, indeed, from their intercourse with the Romans, acquired some taste for the arts, sciences, language, and manners of their new masters. These, however, were but miserable consolations for the loss of liberty, for being deprived of the use of their arms, for being overawed by mercenary soldiers kept in pay to restrain them, and for being delivered over to rapacious governors, who plundered them without mercy. The only circumstance which could support them under these complicated calamities, was the hope of seeing better days.

The Roman empire, now stretched out to such an extent, had lost its spring and force. It contained within itself the seeds of dissolution; and the violent irruptions of the Goths, Vandals, Huns, and other barbarians, hastened its destruction. These fierce tribes, who came to take vengeance on the empire, either inhabited the various parts of Germany, which had never been subdued by the Romans, or were scattered over the vast countries of the north of Europe, and the north-west of Asia, which are now inhabited by the Danes, the Swedes, the Poles, the subjects of the Russian empire, and the Tartars. They were drawn from their native country by that restlessness which actuates the minds of barbarians, and makes them rove from home in quest of plunder, or new settlements. The first invaders met with a powerful resistance from the superior discipline of the Roman legions; but this, instead of daunting men of a strong and impetuous temper, only roused them to vengeance. They return to their companions, acquaint them with the unknown conveniences and luxuries that abounded in countries better cultivated, or blessed with a milder climate than their own; they acquaint them with the battles they had fought, or the friends they had lost, and warn them with resentment against their opponents. Great bodies of armed men (says an elegant historian, in describing this scene of desolation) with their wives and children, and slaves and flocks, issued forth, like regular colonies, in quest of new settlements. New adventurers followed them. The lands which they deserted were occupied by more remote tribes of barbarians. These in their turn pushed forward into more fertile countries, and, like a torrent continually increasing, rolled on, and swept every thing before them. Wherever the barbarians marched, their

route was marked with blood. They ravaged or destroyed all around them. They made no distinction between what was sacred and what was profane. They respected no age, or sex, or rank. If a man was called to fix upon the period in the history of the world, during which the condition of the human race was most calamitous and afflicted, he would, without hesitation, name that which elapsed from the death of Theodosius the Great, A. D. 395, to the establishment of the Lombards in Italy, A. D. 571. The contemporary authors, who beheld that scene of desolation, labour and are at a loss for expressions to describe the horror of it. *The scourge of God, the destroyer of nations*, are the dreadful epithets by which they distinguish the most noted of the barbarous leaders.

Constantine, who was emperor at the beginning of the fourth century, and who had embraced Christianity, changed the seat of empire from Rome to Constantinople. This occasioned a prodigious alteration. The western and eastern provinces were separated from each other, and governed by different sovereigns. The withdrawing the Roman legions from the Rhine and the Danube to the East, threw down the western barriers of the empire, and laid it open to the invaders. A. D. 328.

Rome (now known by the name of the *Western Empire*, in contradistinction of Constantinople, which, from its situation, was called the *Eastern Empire*), weakened by this division, becomes a prey to the barbarous nations. Its ancient glory, vainly deemed immortal, is effaced, and Odoacer, a barbarian chieftain, is seated on the throne of the Cæsars. These irruptions into the empire were gradual and successive. The immense fabric of the Roman empire was the work of many ages, and several centuries were employed in demolishing it. The ancient discipline of the Romans, in military affairs, was so efficacious, that the remains of it descended to their successors, and mult have proved an overmatch for all their enemies, had it not been for the vices of their emperors, and the universal corruption of manners among the people. Satiated with the luxuries of the known world, the emperors were at a loss to find new provocatives. The most distant regions were explored, the ingenuity of mankind was exercised, and the tribute of provinces expended upon one favourite dish. The tyranny and the universal depravation of manners that prevailed under the emperors, or, as they are called, Cæsars, could only be equalled by the barbarity of those nations who overcame them. A. D. 476.

Towards the close of the sixth century, the Saxons, a German nation, were masters of the southern and more fertile provinces of Britain; the Franks, another tribe of Germans, of Gaul; the Goths of Spain; the Goths and Lombards of Italy, and the adjacent provinces. Scarcely any vestige of the Roman policy, jurisprudence, arts, or literature, remained. New forms of government, new laws, new manners, new dresses, new languages, and new names of men and countries, were every where introduced.

From this period, till the 16th century, Europe exhibited a picture of most melancholy Gothic barbarity. Literature, science, taste, were words scarcely in use during these ages. Persons of the highest rank, and in the most eminent stations, could not read or write. Many of the clergy did not understand the Breviary which they were obliged daily to recite; some of them could scarcely read it. The human mind, neglected, uncultivated, and depressed, sunk into the most profound ignorance. The superior genius of Charlemagne, who, in the beginning of the 9th century, governed France and Germany, with part of Italy; and Alfred the Great in England, during the latter part of the same century, endeavoured to dispel this darkness, and give their subjects, a short glimpse of light. But the ignorance of the

age was too powerful for their efforts and institutions. The darkness returned, and even increased; so that a still greater degree of ignorance and barbarism prevailed throughout Europe.

A new division of property gradually introduced a new species of government, formerly unknown; which singular institution is now distinguished by the name of the *Feudal System*. The king or general who led the barbarians to conquest, parcelled out the lands of the vanquished among his chief officers, binding those on whom they were bestowed to follow his standard with a number of men, and to bear arms in his defence. The chief officers imitated the example of the sovereign, and in distributing portions of their lands among their dependents annexed the same condition to the grant. But though this system seemed to be admirably calculated for defence against a foreign enemy, it degenerated into a system of oppression.

The usurpation of the nobles became unbounded and intolerable. They reduced the great body of the people into a state of actual servitude. They were deprived of the natural and most unalienable rights of humanity. They were slaves fixed to the soil which they cultivated, and together with it were transferred from one proprietor to another, by sale or by conveyance. Every offended baron or chieftain buckled on his armour, and sought redress at the head of his vassals. His adversaries met him in like hostile array. The kindred and dependents of the aggressor, as well as of the defender, were involved in the quarrel. They had not even the liberty of remaining neuter*.

The monarchs of Europe perceived the encroachment of their nobles with impatience. In order to create some power that might counterbalance those potent vassals, who while they enslaved the people, controlled or gave laws to the crown, a plan was adopted of conferring new privileges on towns. These privileges abolished all marks of servitude; and the inhabitants of towns were formed into corporations or bodies politic, to be governed by a council and magistrates of their own nomination.

The acquisition of liberty made such a happy change in the condition of mankind, as roused them from the stupidity and inaction into which they had been sunk by the wretchedness of their former state. A spirit of industry revived; commerce became an object of attention, and began to flourish.

Various causes contributed to revive this spirit of commerce, and to renew the intercourse between different nations. Constantinople, the capital of the Eastern or Greek empire, had escaped the ravages of the Goths and Vandals, who overthrew that of the West. In this city some remains of literature and science were preserved: this too, for many ages, was the great emporium of trade, and where some relish for the precious commodities and curious manufactures of India was retained. They communicated some knowledge of these

to their neighbours in Italy; and the crusades, which were begun by the Christian powers of Europe with a view to drive the Saracens from Jerusalem, opened a communication between Europe and the East. Constantinople was the general place of rendezvous for the Christian armies in their way to Palestine, or on their return from thence. Though the object of these expeditions was conquest, and not commerce, and though the issue of them proved unfortunate, their commercial effects were both beneficial and permanent.

* This Gothic system still prevails in Poland; a remnant of it continued in the Highlands of Scotland so late as the year 1748. And even in England, a country renowned for civil and religious liberty, some relics of these Gothic institutions are perceivable at this day.

Soon after the close of the holy war, the mariner's compass was invented, which facilitated the communication between remote nations, and brought them nearer to each other. The Italian states, particularly those of Venice and Genoa, began to establish a regular commerce with the East, and the ports of Egypt, and drew from thence all the rich productions of India. These commodities they disposed of to great advantage among the other nations of Europe, who began to acquire some taste of elegance unknown to their predecessors, or despised by them. During the 12th and 13th centuries, the commerce of Europe was almost entirely in the hands of the Italians, more commonly known in those ages by the name of Lombards. Companies, or societies of Lombard merchants, settled in every different kingdom; they became the carriers, the manufacturers, and the bankers of Europe. One of these companies settled in London, and from thence the name of Lombard street was derived.

Whilst the Italians in the south of Europe cultivated trade with such industry and success, the commercial spirit awakened in the north towards the middle of the thirteenth century. As the Danes, Swedes, and other nations round the Baltic, were at that time extremely barbarous, and infested that sea with their piracies, this obliged the cities of Lubec and Hamburgh, soon after they had begun to open some trade with the Italians, to enter into a league of mutual defence. They derived such advantage from this union that other towns acceded to their confederacy; and, in a short time, eighty of the most considerable cities, scattered through those large countries of Germany and Flanders, which stretch from the bottom of the Baltic to Cologne on the Rhine, joined in an alliance, called the *Hanseatic League*; which became so formidable that its alliance was courted, and its enmity was dreaded by the greatest monarchs. The members of this powerful association formed the first systematic plan of commerce known in the middle ages, and conducted it by common laws enacted in their general assemblies. They supplied the rest of Europe with naval stores, and pitched on different towns, the most eminent of which was Bruges, in Flanders, where they established staples, in which their commerce was regularly carried on. Thither the Lombards brought the productions of India, together with the manufactures of Italy, and exchanged them for the more bulky, but not less useful commodities of the North.

As Bruges became the centre of communication between the Lombards and Hanseatic merchants, the Flemings traded with both in that city to such extent, as well as advantage, as diffused among them a general habit of industry, which long rendered Flanders and the adjacent provinces the most opulent, the most populous, and best cultivated countries in Europe.

Struck with the flourishing state of these provinces of which he discovered the true cause, Edward III. of England endeavoured to excite a spirit of industry among his own subjects, who, blind to the advantages of their situation, and ignorant of the source from which opulence was destined to flow into their country, totally neglected commerce, and did not even attempt those manufactures, the materials of which they furnished to foreigners. By alluring Flemish artizans to settle in his dominions, as well as by many wise laws for the encouragement and regulation of trade, he gave a beginning to the woollen manufactures of England; and first turned the active and enterprising genius of his people towards those arts which have raised the English to the first rank among commercial nations.

The Christian princes, after their great losses in the crusades, endeavoured to cultivate the friendship of the great khans of Tartary, whose fame in arms had reached the most remote corners of Europe and Asia, that they might

A. D.

1330.

be some check upon the Turks, who had been such enemies to the Christian name; and who, from a contemptible handful of wanderers, serving occasionally in the armies of contending princes, had begun to extend their ravages over the finest countries of Asia.

The Christian embassies were managed chiefly by monks a wandering profession of men, who, impelled by zeal, and undaunted by difficulties and danger, found their way to the remote courts of these infidels. The English philosopher Roger Bacon, was so industrious as to collect from their relations or traditions many particulars of the Tartars, which are to be found in Purchas's Pilgrim, and other books of travels. The first regular traveller of the monkish kind, who committed his discoveries to writing, was John du Plant Carpin, who with some of his brethren, about the year 1246, carried a letter from pope Innocent to the great khan of Tartary, in favour of the Christian subjects in that prince's extensive dominions. Soon after this, a spirit of travelling into Tartary and India became general; and it would be no difficult matter to prove that many Europeans, about the end of the fourteenth century, served in the armies of Tamerlane, one of the greatest princes of Tartary, whose conquests reached to the remotest corners of India, and that they introduced into Europe the use of gunpowder and artillery; the discovery made by a German chemist being only partial and accidental.

After the death of Tamerlane, who, jealous of the rising power of the Turks, had checked their progress, the Christian adventurers, upon their return, magnifying the vast riches of the East Indies, inspired there
A. D. 1493. countrymen with a spirit of adventure and discovery, and were the first that rendered a passage thither by sea probable and practicable. The Portuguese had been always famous for their application to maritime affairs; and to their discovery of the Cape of Good Hope, Great Britain is at this day indebted for her Indian commerce.

At first they contented themselves with short voyages, creeping along the coast of Africa, discovering cape after cape; but by making a gradual progress southward, they, in the year 1497, were so fortunate as to sail beyond the Cape, which opened a passage by sea to the eastern ocean, and all those countries known by the names of India, China, and Japan.

While the Portuguese were intent upon a passage to India by the east, Columbus, a native of Genoa, conceived a project of sailing thither by the west. His proposal being condemned by his countrymen as chimerical and absurd, he laid his schemes successively before the courts of France, England, and Portugal, where he had no better success. Such repeated disappointments would have broken the heart of any man but Columbus. The expedition required expence, and he had nothing to defray it. Spain was now his only resource; and there after eight years attendance he at length succeeded, through the interest of queen Isabella. This princess was prevailed upon to patronize him by the representation of Juan Perez, guardian of the monastery of Rabida. He was a man of considerable learning, and of some credit with queen Isabella; and being warmly attached to Columbus, from his personal acquaintance with him, and knowledge of his merit, he had entered into an accurate examination of that great man's project, in conjunction with a physician settled in his neighbourhood, who was eminent for his skill in mathematical knowledge. This investigation completely satisfied them, of the solidity of the principles on which Columbus founded his opinion, and of the probability of success in executing the plan which he proposed; Perez, therefore, so strongly recommended it to queen Isabella, that she entirely entered into the scheme, and even generously offered, to the honour of her sex, to pledge her own jewels in order to raise as much money

as might be required in making preparations for the voyage. But Santagel, another friend and patron of Columbus, immediately engaged to advance the sum that was requisite, that the queen might not be reduced to the necessity of having recourse to that expedient.

Columbus now set sail, anno 1492, with a fleet of three ships, upon one of the most adventurous attempts ever undertaken by man, and in the fate of which the inhabitants of two worlds were interested. In this voyage he had a thousand difficulties to contend with; and his sailors, who were often discontented, at length began to insist upon his return, threatening, in case of refusal, to throw him overboard; but the firmness of the commander, and the discovery of land, after a passage of 33 days, put an end to the commotion. From the appearance of the natives, he found to his surprise that this could not be the Indies he was in quest of, and which he soon discovered to be a new world: of which the reader will find a more circumstantial account in that part of the following work which treats of America.

Europe now began to emerge out of that darkness into which she had been sunk since the subversion of the Roman empire. These discoveries, from which such wealth was destined to flow to the commercial nations of Europe, were succeeded by others of unspeakable benefit to mankind. The invention of printing, the revival of learning, arts, and sciences; and, lastly, the happy reformation in religion, all distinguish the 15th and 16th centuries as the first æra of modern history. "It was in these ages that the powers of Europe were formed into one great political system, in which each took a station, wherein it has since remained, with less variation than could have been expected, after the shocks occasioned by so many internal revolutions, and so many foreign wars, of which we have given some account in the history of each particular state, in the following work. The great events which happened then have not hitherto spent their force. The political principles and maxims then established, still continue to operate; and the ideas concerning the balance of power then introduced or rendered general, still influence, in some degree, the councils of European nations.

From all which it seems extremely certain, that the concurrence of so many rival princes will always prevent any one of them from gaining the empire over Europe. But it is no less certain, that, in contending for it, they must weaken their own force, and may at length render themselves incapable of defending even their just possessions. The partial conquests they may make are extremely illusive; instead of promoting, they rather oppose their designs: the more any kingdom is extended, it becomes the weaker; and great projects have not been so often executed by slow reiterated efforts, as in the course of a few years, and sometimes by a single expedition. A prince may form a deliberate plan of destroying the rights of his subjects; he may proceed by slow degrees in the execution of it, and if he die before it is completed, his successor may pursue the same steps, and avail himself of what was done before him. But external conquests cannot be concealed; they generally occasion more fear than hurt, and are almost always less solid than brilliant. Hence the alarms they excite, the confederacies they give occasion to, by which the prince, who by misfortune has been a conqueror, is commonly reduced to the last extremities. This doctrine, however contrary to the prejudices of a powerful and victorious nation, is one of the best established in the science of politics. It is confirmed by examples both ancient and modern. The states of Greece in particular, delivered from the terror of the Persian invasions, exhibit the same truth in a great variety of lights. There was not one of the most inconsiderable of these little societies, but in its turn imbibed the phrenzy of conquest, and in its turn too was reduced by this phrenzy to the utmost misery

misery and distress *. The modern examples are so well known that it is almost unnecessary to mention them. Who does not know that the house of Austria † excited the terror of all Europe, before it excited the pity of Great Britain! Had that family never been the object of fear, the empress-queen would never have become the object of compassion. France affords an example not less striking. The nerves of that kingdom were strained so far beyond their strength, by an ambitious monarch, that it seemed hardly possible they should acquire their natural tone in the course of this century. The debility of their efforts in the war of 1756 proved the greatness of the evil, and the inefficacy of any remedy which is not slow and gradual.

Of all the kingdoms of Europe, Great Britain for a long time enjoyed the greatest degree of prosperity and glory. She ought, therefore, to have been the more attentive to preserve so brilliant an existence. A great empire cannot be continued in a happy situation, but by wisdom and moderation. Every attempt to extend her dominions must be attended with two infallible consequences: the first to alarm her neighbours; the second, to augment her armies. The augmentation of armies may, in time, endanger our constitution; and the farther our conquests are removed from home, this danger becomes the greater, as those armies will soon, by living in a distant climate, lose all affection for their native country. Without entering into the labyrinth of political disputes, it will be acknowledged, that the unhappy contest of Great Britain with the American colonies has plunged her into difficulties; her national debt has been augmented to a prodigious height, and her taxes greatly increased.

P A R T. III.

OF THE ORIGIN AND PROGRESS OF RELIGION.

DEITY is an awful object, and has ever roused the attention of mankind; but they being incapable of elevating their ideas to all the sublimity of his perfections, have too often brought down his perfections to the level of their own ideas. This is more particularly true with regard to those nations whose religion had no other foundation but the natural feelings, and more often the irregular passions, of the human heart, and who had received no light from heaven respecting this important object. In deducing the history of religion, therefore, we must make the same distinction which we have hitherto observed in tracing the progress of arts, sciences, and of civilization among mankind. We must separate what is human from what is divine; what had its origin from particular revelations, from what a

* The reader who would see this subject fully illustrated, may look at Cicero's Oration on the Peace; one of the most finished models of ancient eloquence; and which contains a rich fund of political knowledge.

† Germany, Holland, and all the Low Countries, several states in Italy, the kingdom of Spain, with the vast empires of Mexico and Peru in South America, were, at the time of the Reformation, governed by Charles V. of the house of Austria, under whose reign, though exceeding in riches and extent the most powerful empires of antiquity, did not gratify the ambition of that monarch, and his whole reign was a scene of hostility against his neighbours. One of his successors, the late empress-queen, and the representative of that family, was, however, upon the death of her father, not only stripped of her dominions, but reduced to low as to be in the want of necessaries; and contributions were actually raised for her in Great Britain, whose king, George II. engaged in her cause, and at the expense of this nation reinstated her upon the imperial throne.

the effect of general laws, and of the unassisted operations of the human mind.

Agreeably to this distinction, we find, that in the first ages of the world, the religion of the eastern nations was pure and luminous. It arose from a divine source, and was not then disfigured by human fancies or caprice. In time, however, these began to have their influence; the ray of tradition was obscured, and among those tribes which separated at the greatest distance, and in the smallest numbers, from the more improved societies of men, it was altogether obliterated.

In this situation a particular people were selected by God himself, to be the depositories of his law and worship; but the rest of mankind were left to form hypotheses upon these subjects, which were more or less perfect, according to an infinity of circumstances, which cannot properly be reduced under any general heads.

The most common religion of antiquity, that which prevailed the longest, and extended the widest, was POLYTHEISM, or the doctrine of a plurality of gods. The rage of system, the ambition of reducing all the phenomena of the moral world to a few general principles, has occasioned many imperfect accounts, both of the origin and nature of this species of worship. For without entering into a minute detail, it is impossible to give an adequate idea of the subject; and what is said upon it in general, must always be liable to many exceptions.

One thing, however, may be observed, that the polytheism of the ancients seems neither to have been the fruit of philosophical speculations, nor of disfigured traditions, concerning the nature of the divinity. It seems to have arisen during the rudest ages of society, while the rational powers were feeble, and while mankind were under the tyranny of imagination and passion. It was built, therefore, solely upon sentiment; as each tribe of men had their heroes, so likewise they had their gods. Those heroes who led them forth to the combat, who presided in their councils, whose image was engraved on the fancy, whose exploits were imprinted on their memory, even after death enjoyed an existence in the imagination of their followers. The force of blood, of friendship, of affection, among rude nations, is what we cannot easily conceive: but the power of imagination over the senses is what all men have in some degree experienced. Combine these two causes, and it will not appear strange that the image of departed heroes should have been seen by their companions, animating the battle, taking vengeance on their enemies, and performing, in a word, the same functions which they performed when alive. An appearance so unnatural would not excite terror among men unacquainted with evil spirits, and who had not learned to fear any thing but their enemies. On the contrary, it consumed their courage, flattered their vanity, and the testimony of those who had seen it, supported by the extreme credulity and romantic cast of those who had not, gained an universal assent among all the members of their society. A small degree of reflection, however, would be sufficient to convince them, that, as their own heroes existed after death, it might likewise be the case of those of their enemies. Two orders of gods, therefore, would be established, the propitious and the hostile; the gods who were to be loved, and those who were to be feared. But time, which wears off the impressions of tradition, the frequent invasions by which the nations of antiquity were ravaged, desolated, or transplanted, made them lose the names and confound the characters of those two orders of divinities, and form various systems of religion, which, though warped by a thousand particular circumstances, gave no small indications of their first texture and original materials. For, in general, the gods of the ancients gave abundant

proof of human infirmity. They were subject to all the passions of men; they partook even of their partial affections, and in many instances discovered their preference of one race or nation to all others. They did not eat and drink the same substances with men; but they lived on nectar and ambrosia; they had a particular pleasure in smelling the steam of the sacrifices, and they made love with a ferocity unknown in northern climates. The rites by which they were worshipped, naturally resulted from their character. The most enlightened among the Greeks entertained nearly the same notion of gods and religion, with those that are to be met with in the poems of Hesiod and Homer; and Anaxagoras, who flourished B. C. 430 years, was the first even in Greece that publicly announced the existence of one Creator and Governor of the universe.

It must be observed, however, that the religion of the ancients was not much connected, either with their private behaviour, or with their political arrangements. If we except a few fanatical societies, whose principles do not fall within our plan, the greater part of mankind were extremely tolerant in their principles. They had their own gods who watched over them; their neighbours, they imagined, also had theirs; and there was room enough in the universe for both to live together in good fellowship, without interfering or jostling with one another.

The introduction of Christianity, by inculcating the unity of God, by announcing the purity of his character, and by explaining the service he required of men, produced a total alteration in their religious sentiments and belief. But this is not the place for handling this sublime subject. It is sufficient to observe here, that a religion which was founded on the unity of the Deity, which admitted of no association with false gods, must either be altogether destroyed, or become the prevailing belief of mankind. The latter was the case. Christianity made its way among the civilized part of mankind, by the sublimity of its doctrine and precepts; it required not the aid of human power; it sustained itself by the truth and wisdom by which it was characterised. But in time it became corrupted by the introduction of worldly maxims, of maxims very inconsistent with the precepts of its divine author, and by the ambition of the clergy.

The management of whatever related to the church being naturally conferred on those who had established it, first occasioned the elevation and then the domination of the clergy, and the exorbitant claims of the bishop of Rome, over all the members of the Christian world. It is impossible to describe within our narrow limits, all the concomitant causes, some of which were extremely delicate, by which this species of universal monarchy was established. The bishops of Rome, by being removed from the control of the Roman emperors, then residing in Constantinople; by borrowing, with little variation, the religious ceremonies and rites established among the heathen world, and otherwise working on the credulous minds of barbarians, by whom that empire began to be dismembered; and by availing themselves of every circumstance which fortune threw in their way, slowly erected the fabric of the antichristian power, at first an object of veneration, and afterwards of terror to all temporal princes. The causes of its happy dissolution are more palpable, and operated with greater activity. The most efficacious were the invention of printing, the rapid improvement of arts, government, and commerce, which, after many ages of barbarity, made its way into Europe. The scandalous lives of those who called themselves the "ministers of Jesus Christ," their ignorance and tyranny, the desire nat-

to sovereigns of delivering themselves from a foreign yoke, the opportunity of applying to national objects the immense wealth which had been diverted to the service of the church in every kingdom of Europe, conspired with the ardour of the first reformers, and hastened the progress of the Reformation. The unreasonableness of the claims of the church of Rome was demonstrated; many of their doctrines were proved to be equally unscriptural and irrational; and some of their absurd mummeries and superstitions were exposed both by argument and ridicule. The services of the reformers in this respect give them a just claim to our veneration; but, involved as they had themselves been in the darkness of superstition, it was not to be expected that they should be able wholly to free themselves from errors; they still retained an attachment to some absurd doctrines, and preserved too much of the intolerant spirit of the church from which they had separated themselves. With all their defects they are entitled to our admiration and esteem; and the reformation begun by Luther in Germany, in the year 1517, and which took place in England A. D. 1534, was an event highly favourable to the civil as well as to the religious rights of mankind.

We shall now proceed to the main part of our work, beginning with EUROPE.

E U R O P E.

EUROPE, though the least extensive quarter of the globe, containing, according to Zimmerman, 2,627,574 * square miles, whereas the habitable parts of the world, in the other quarters, are estimated at 36,666,806 square miles, is, in many respects, that which most deserves our attention. There the human mind has made the greatest progress towards improvement; and there the arts, whether of utility or ornament, the sciences both military and civil, have been carried to the greatest perfection. If we except the earliest ages of the world, it is in Europe that we find the greatest variety of character, government, and manners, and from whence we draw the greatest number of facts and memorials, either for our entertainment or instruction.

Geography discovers to us two circumstances with regard to Europe, which perhaps have had a considerable tendency in giving it the superiority over the rest of the world. First, the happy temperature of its climate, no part of it lying within the torrid zone; and secondly, the great variety of its surface. The effect of a moderate climate, both on plants and animals, is well known from experience. The immense number of mountains, rivers, seas, &c. which divide the different countries of Europe from one another, is likewise extremely commodious for its inhabitants. These natural boundaries check the progress of conquest or despotism, which has always been so rapid in the extensive plains of Africa and the East: the seas and rivers facilitate the intercourse and commerce between different nations; and even the barren rocks and mountains are more favourable for exciting human industry and invention, than the natural unsolicited luxuriance of more fertile soils. There is no part of Europe so diversified in its surface, so interrupted by natural boundaries or divisions, as Greece: and we have seen that it was

* See Zimmerman's Political Survey of Europe, p. 5.

there the human mind began to know and to avail itself of its strength, and that many of the arts, subservient to utility or pleasure, were invented or at least greatly improved. What Greece therefore is with regard to Europe, Europe itself is with regard to the rest of the globe. The analogy may even be carried farther, and it is worth while to attend to it. As ancient Greece (for we do not speak of Greece as it is at present, under the domination of Turks and unnatural tyranny of Barbarians) was distinguished above all the rest of Europe for the equity of its laws and the freedom of its political constitution: so has Europe in general been remarkable for smaller deviations, at least from the laws of nature and equality, than have been admitted in other quarters of the world. Though most of the European governments are monarchical, we may discover, on due examination, that there are a thousand little springs, which check the force and soften the rigour of monarchy in Europe, that do not exist any where else. In proportion to the number and force of these checks, the monarchies of Europe, such as Russia, France, Spain, and Denmark, differ from one another. Besides monarchies, in which one man bears the chief sway, there are in Europe, aristocracies or governments of the nobles, and democracies or governments of the people. Venice is an example of the former; Holland, and some states of Italy and Switzerland, afford examples of the latter. There are likewise mixed governments, which cannot be assigned to any one class. Great Britain, which partakes of all the three, is the most singular instance of this kind we are acquainted with. The other mixed governments of Europe are composed only of two of the simple forms, such as Poland, several states of Italy; all which shall be explained at length in their proper places.

The Christian religion is established throughout every part of Europe, except Turkey; but from the various capacities of the human mind, and the different lights in which speculative opinions are apt to appear, when viewed by persons of different educations and passions, that religion is divided into a number of different sects, but which may be comprehended under three general denominations; 1st, The Greek church; 2d, Popery; and 3d, Protestantism: which last is again divided into Lutheranism and Calvinism, so called from Luther and Calvin, the two distinguished reformers of the 16th century.

The languages of Europe are divided into the six following: the Greek, Latin, Teutonic or old German, the Celtic, Slavonic, and Gothic.

GRAND DIVISIONS OF EUROPE.

THIS grand division of the earth is situated between the 10th degree west, and the 65th degree east longitude from London, and between the 36th and 72d degree of north latitude. It is bounded on the north by the Frozen ocean; on the east, by Asia; on the south, by the Mediterranean sea, which divides it from Africa; and on the west by the Atlantic Ocean, which separates it from America, being 3000 miles long; from Cape St. Vincent in the west, to the mouth of the river Oby in the north east; and 2500 broad from north to south, from the North Cape in Norway, to Cape Caybs or Metapar in the Moræa, the most southern promontory in Europe. It contains the following kingdoms and states:

Kingdoms	Len.	Bth	Chief City.	Dis. & Bearing from London.	Diff. of Time from London.	Religion
				Miles.	H. M.

DENMARK.

I shall, according to my plan, begin this account of his Danish Majesty's dominions with the most northerly situations, and divide them into four parts: 1st, East and West Greenland, Iceland, and the islands in the Atlantic Ocean; 2d, Norway; 3d, Denmark Proper; and 4th, his German territories.

The dimensions of these countries may be seen in the following table.

Denmark.	Square Miles.	Length.	Breadth.	Chief Cities.	
Denmark Proper.	9,600	135	98	Wyburg.	
Islands at the entrance of the Baltic Sea.	North Jutland,	2,115	70	63	Sleswick.

* Minorca was taken from Spain by General Stanhope, 1708, and confirmed to Great Britain by the treaty of Utrecht, 1713, but was besieged and taken by the Spaniards February 15, 1781, and confirmed to them by the definitive treaty of Peace, signed at Paris, September 3, 1783.

The reader may perceive, that in the preceding table no calculation is made of the dimensions of East and West Greenland; because, in fact, they are not yet known, or known very imperfectly: we shall proceed to give the latest accounts of them, and from the best authorities that have come to our hands.

EAST AND WEST GREENLAND, ICELAND, AND THE ISLANDS IN THE ATLANTIC OCEAN.

EAST GREENLAND.

THE most northerly part of his Danish majesty's dominions, or, as others call it, New Greenland, and the country of Spitzbergen, lies between 11 and 25 deg. E. long. and 76 and 80 deg. N. Lat. according to capt. Phipp's observations in his voyage, 1773. Though it is now claimed by Denmark, it certainly was discovered by sir Hugh Willoughby in 1553; and is supposed to be a continuation of Old Greenland. It obtained the name of Spitzbergen from the height and raggedness of its rocks. Few animals or vegetables are to be found here, and the fish and fowl are said to forsake the coast in winter. The Russians of Archangel have formed, within the last 30 years settlements for hunting in several places of the island of Spitzbergen. The Aurora Borealis, or northern lights reflected from the snow, enabled them to pursue the chase during the long winter's night that reigns in these gloomy regions, and they take a great number of sea-lions, which serve them for food. There is a whale fishery, chiefly prosecuted by the Dutch and some British vessels, on its coasts. It likewise contains two harbours; one called South Haven, and the other Maurice Bay; but the inland parts are uninhabited.

WEST GREENLAND.

LIES between the meridian of London, and 53 deg. W. long. and between 60 and 75 deg. N. lat

[INHABITANTS.] By the latest accounts from the missionaries employed for the conversion of the Greenlanders, their whole number does not amount to above 957 stated inhabitants: Mr. Crants, however, thinks the rising southlanders of Greenland may amount to about 7000. There is a great resemblance between the aspect, manners, and dress of those natives, and the Esquimaux Americans, from whom they naturally differ but little, even after all the pains which the Danish and German missionaries have taken to convert and civilize them. They are low of stature, few exceeding five feet in height, and the generality are not so tall. The hair of their heads is long, straight, and of a black colour; but they have seldom any beards, because it is their constant practice to root them out. They have high breasts and broad shoulders, especially the women, who are obliged to carry great burthens from their younger years. They are very light and nimble of foot, and can also use their hands with much skill and dexterity. They are not very lively in their tempers, but they are good humoured, friendly, and unconcerned about futurity. Their most agreeable food is the flesh of reindeer; but that is now scarce among them, and their best provisions are fish, seals, and sea-fowl. Their drink is clear water, which stands in the house in a large copper vessel, or in a wooden tub, which is very neatly made by them, ornamented with fish bones and rings, and provided with a pewter ladle or dipping dish. The men make their hunting and fishing implements, and prepare the wood work of their boats: and the women cover them with skins.

by the Spaniards
Peace, signed at

The men hunt and fish, but when they have towed their booty to land, they trouble themselves no farther about it nay it would be accounted beneath their dignity only to draw the seal up upon the shore. The women are the butchers and cooks, and also the carriers to dress the pelts, and make cloaths, shoes, and boots, out of them; so that they are likewise both shoemakers and tailors. The women also build and repair the houses and tents, so far as relates to the masonry, the men doing only the carpenter's work. They live in huts during their winter, which is incredibly severe; but Mr. Crantz, who has given us the latest and best accounts of this country, says that, in their longest summer days it is so hot, from the long continuance of the sun's rays, that the inhabitants are obliged to throw off their summer garments. They have no trade, though they have a most improvable fishery upon their coasts; but they employ all the year either in fishing or hunting; in which they are very dexterous, particularly in catching and killing seals.

CURIOSITIES.] The taking of whales in the seas of Greenland, among the fields of ice that have been increasing for ages, is one of the greatest curiosities in nature. These fields, or pieces of ice, are frequently more than a mile in length, and upwards of a 100 feet in thickness; and when they are put in motion by a storm, nothing can be more terrible; the Dutch had 13 ships crushed to pieces by them in one season.

There are several kind of whales in Greenland; some white, and others black. The black sort, the grand bay whale, is in most esteem on account of his bulk, and the great quantity of fat or blubber he affords, which turns to oil. His tongue is about 18 feet long, inclosed in long pieces of what we call whalebone, which are covered with a kind of hair, like horse-hair; and on each side of his tongue are 250 pieces of this whalebone. The bones of his body are as hard as an ox's bones, and of no use. There are no teeth in his mouth and he is usually between 60 and 80 feet long; very thick about the head: but grows less from thence to the tail.

When the seamen see a whale spout, the word is immediately given, *fall, fall*, when every one hastens from the ship to his boat: six or eight men being appointed to a boat, and four or five boats usually belong to one ship.

When they come near the whale, the harpooner strikes him with his harpoon (a barbed dart), and the monster, finding himself wounded, runs swiftly down into the deep, and would carry the boat along with him if they did not give him line fast enough; and to prevent the wood of the boat taking fire by the violent rubbing of the rope on the side of it, one wets it constantly with a mop. After the whale has run some hundred fathoms deep, he is forced to come up for air, when he makes such a terrible noise with his spouting, that some have compared it to the firing of cannon. As soon as he appears on the surface of the water, some of the harpooners fix another harpoon in him, whereupon he plunges again into the deep; and when he comes up a second time, they pierce him with spears in the vital parts, till he spouts out streams of blood instead of water, beating the waves with his tail and fins till the sea is all in a foam, the boats continuing to follow him some leagues, till he has lost his strength; and when he is dying he turns himself upon his back, and is drawn on shore or to the ship, if they be at a distance from the land. There they cut him in pieces, and by boiling the blubber, extract the oil, if they have conveniences on shore; otherwise they barrel up the pieces and bring them home: but nothing can smell stronger than these ships do. Every fish is computed to yield between 60 and 100 barrels of oil, of the value of 3l. or 4l. a barrel. Though the Danes claim the country of East and West Greenland, where these whales

are taken, the Dutch have in a manner monopolised this fishery. Of late the English have become formidable rivals in this trade.

ICELAND.

THIS island lies between 63 and 68 deg. N. Latitude, and between 10 and 26 deg. W. Longitude; its greatest length about 700 miles, and its breadth 300.

CLIMATE.] This country lying partly within the frigid zone, and being liable to be surrounded with vast quantities of ice that come from the Polar seas, is on account of the coldness of its climate very inhospitable, but much more so for other reasons. It is exceedingly subject to earthquakes; and is full of volcanoes, that the little part of it which appears fit for the habitation of man, seems almost totally laid waste by them. The climate of Iceland, however, is not unwholesome, or naturally subject to excessive colds, notwithstanding its northerly situation.

POPULATION, INHABITANTS, MANNERS, AND CUSTOMS.] At what time the island of Iceland was first peopled is uncertain. An English colony indeed is said to have been settled there in the beginning of the fifth century; but of this there are not sufficient proofs. There is, however, reason to suppose that the English and Irish were acquainted with this country under another name, long before the arrival of the Norwegians; for the celebrated Bede gives a pretty accurate description of the island. But of these original inhabitants we cannot pretend to say any thing, as the Iceland chronicles go no farther back than the arrival of the Norwegians. Besides the Norwegians, new colonies arrived from different nations, between whom wars soon commenced; and the Icelandic histories are full of the accounts of their battles. Notwithstanding these troubles, however, the Icelanders remained free from a foreign yoke till 1261; when the greatest part of them put themselves under the protection of Hakans king of Norway, promising to pay him tribute upon certain conditions agreed on between them; and the rest followed their example in 1264. Afterwards, Iceland, together with Norway, became subject to Denmark. They were at first governed by an admiral, who was sent there every year to make the necessary regulations; but for these many years, a governor has been appointed who is styled *Sist-santmann*, and who constantly resides in the country.

The number of the inhabitants of Iceland is computed at about 60,000 which is by no means adequate to the extent of the country. It has been much more populous in former times, but great numbers have been destroyed by contagious diseases. The plague carried off many thousands from 1402 to 1404. Many parts of Iceland have also been depopulated by famine; for though the Icelanders cannot in general be said to be in want of necessary food, yet the country has several times been visited by great famines. These have been chiefly occasioned by the Greenland floating ice; which, when it comes in great quantities, prevents the grass from growing, and puts an entire stop to their fishing. The small-pox has likewise been very fatal here; for in the years 1707 and 1708 that disease destroyed 16,000 persons.

The Icelanders in general are middle-sized, and well made, though not very strong. They are an honest, well-intentioned people, moderately industrious, and are very faithful and obliging. Theft is seldom heard of among them. They are much inclined to hospitality, and exercise it as far as their poverty will permit. Their chief employment is attending to fishing

and

and the care of their cattle. On the coasts the men employ their time in fishing both winter and summer; and the women prepare the fish, and sew and spin. The men also prepare leather, work at several mechanic trades, and some few work in gold and silver. They likewise manufacture a coarse kind of cloth, which they call Wadmal. They have an uncommonly strong attachment to their native country, and think themselves no where else so happy. An Icelander, therefore, seldom settles in Copenhagen, though the most advantageous conditions should be offered him. Their dispositions are serious, and they are much inclined to religion. They never pass a river, or any other dangerous place, without previously taking off their hats, and imploring the divine protection; and they are always thankful for their preservation, when they have passed the danger. When they meet together, their chief pastime consists in reading their history. The master of the house begins, and the rest continue in their turns when he is tired. They are famous for playing at chess; and one of their pastimes consists in reciting verses. Sometimes a man and woman take one another by the hand, and by turns sing stanzas, which are a kind of dialogue, and in which the company occasionally join in chorus. The dress of the Icelanders is not elegant or ornamental, but is neat, cleanly, and suited to the climate. On their fingers the women wear several gold, silver, or brass rings. The poorer women dress in the coarse cloth, called Wadmal, and always wear black; those who are in better circumstances wear broad cloth, with silver ornaments, gilt. The houses of the Icelanders are generally bad: in some places they are built of drift wood, and in others they are raised of lava, with moss, stuffed between the lava. Their roofs are covered with sods laid over rafters, or sometimes over ribs of whales. The walls are about three yards high and the entrance somewhat lower. Instead of glass windows, they make use of the membranes which surround the womb of the ewe. These are stretched on a hoop, and laid over a hole in the roof. They have not even a chimney in their kitchens, but only lay their fuel on the earth, between three stones, and the smoke issues from a square hole in the top of the house. Their food principally consists of dried fish, four butter, which they consider as a great dainty, milk mixed with water and whey, and a little meat. Bread is so scarce among them, that there is hardly any peasant who eats it above three or four months in the year.

RELIGION.] The only religion tolerated in Iceland is the Lutheran. The churches on the east, south, and west quarters of the island, are under the jurisdiction of the bishop of Skalholt (the capital of the island) and those of the north quarter are subject to the bishop of Hoolun. The island is divided into 189 parishes, of which 127 belong to the see of Skalholt, and 62 to that of Hoolun. All the ministers are natives of Iceland, and receive a yearly salary of four or five hundred six-dollars from the king, exclusive of what they have from their congregations.

LANGUAGE.] The language in Iceland is the same as that formerly spoken in Sweden, Denmark, and Norway, and has been preserved so pure, that any Icelander understands their most ancient traditional histories.

LEARNING AND LEARNED MEN.] It is said that poetry formerly flourished very much in Iceland; and we are informed that Egil Skallagrímson, Kormáck Ormúndson, Glum Geirson, and Thorliéf Jarlaa were celebrated as great poets. But the art of writing was not much in use till after the year 1000; though the Runic characters were known in that country before that period, and most probably brought thither from Norway. After the reception of the Christian religion, the Latin characters were immediately adopted, as the Runic alphabet, which only consists of sixteen letters was found insufficient. The first Icelandic bishop Illéif, founded a school at Skalholt; and

soon after they founded four other schools, in which the youth were instructed in the Latin tongue, divinity, and some parts of theoretic philosophy. And from the introduction of the Christian religion here till the year 1264, when Iceland became subject to Norway, it was one of the few countries in Europe, and the only one in the North, wherein the sciences were cultivated and held in esteem.

But this period of time seems to have produced more learned men in Iceland than any other period since. It appears from their ancient chronicles, that they had considerable knowledge in morality, philosophy, natural history, and astronomy. Most of their works were written in the 11th, 12th, 13th, and 14th centuries; and some of them have been printed. Mr. Banks, now sir Joseph Banks, presented one hundred and sixty-two Icelandic manuscripts to the British Museum. That gentleman visited Iceland in 1772, accompanied by Dr. Soländer, Dr. Van Troil, and Dr. Line. Dr. Van Troil, who published an account of their voyage, observes, that he found more knowledge among the lower class in Iceland, than is to be met with in most other places; that many of them could repeat the works of some of their poets by heart; and that a peasant was seldom to be found, who besides being well instructed in the principles of religion, was not also acquainted with the history of his own country; which proceeds from the frequent reading of their traditional histories, that being one of their principal amusements.

John Arefon, bishop of Hoolum, employed John Matthiesson, a native of Sweden, in establishing a printing press in Iceland, about the year 1530; and the first book printed by him there was the *Breviarium Nidarosiense*. He also printed an ecclesiastical manual, Luther's catechism, and other books of that kind. The Icelandic code of laws appeared in 1578, and the Icelandic bible in 1584. A new privileged printing office has lately been established at Hrappey in this island, and at which several valuable books have been printed.

MOUNTAINS, VOLCANOES, AND NATURAL CURIOSITIES.] Iceland though situated so far to the North is remarkable for the earthquakes and volcanoes with which it abounds. To enumerate the ravages of so many dreadful volcanoes, which from time immemorial have contributed to render this dreary country less habitable than it is from the climate, would greatly exceed our limits. One of the most dreadful eruptions happened in 1783; its violence seems to be unparalleled in history; the dreadful scene of devastation lasted in Iceland for several days; the whole country was laid waste, and the inhabitants fled every where to the remotest parts of their miserable country, to seek for safety from the fury of this unparalleled tempest. One of these burning mountain, Heckla, is the best known, especially to foreigners. This mountain, is situated in the southern part of the island, about four miles from the sea-coast, and is divided into three points at the top, the highest of which is that in the middle; and which is computed to be above 5000 feet higher than the sea. This mountain has frequently sent forth flames, and a torrent of burning matter. Its eruptions were particularly dreadful, in 1693, when they occasioned terrible devastations, the ashes being thrown all round the island to the distance of 180 English miles. The last eruption of Mount Heckla happened in 1766. It began on the 5th of April, and continued to the 7th of September following. Flames proceeded also from it in December 1771, and 1772; but no eruptions of lava.

But amongst all the curiosities in Iceland, nothing is more worthy of attention than the hot spouting water springs with which this island abounds. The hot springs at Aix-la-Chapelle, Carlsbad, Bath, and Switzerland, and several

several others found in Italy, are considered as very remarkable; but, excepting in the last mentioned country, the water no where becomes so hot as to boil; nor is it any where known to be thrown so high as the hot spouting water-springs in Iceland. All those water-works that have been contrived with so much art, and at so enormous an expence, cannot by any means be compared with these. The water-works at St. Cloud, which are thought to be the greatest among all the French water-works, cast up a thin column eighty feet in the air; while some springs in Iceland spout columns of water, of several feet in thickness, to the height of many fathoms; and, as many affirm, of several hundred feet. These springs are of an unequal degree of heat. From some, the water flows gently as from other springs, and it is then called a bath: from others, it spouts boiling water with great noise, and it is then called a kettle. Though the degree of heat is unequal, yet Dr. Van Troil says, that he does not remember ever to have observed it under 188 of Fahrenheit's thermometer. At Geyser, Røyhunn, and Laugarvatn, he found it at 212; and in the last place, in the ground, at a little hot current of water, 213 degrees. It is very common for some of the spouting-springs to cease, and others to rise up in their stead. Frequent earthquakes, and subterranean noises, heard at the time, caused great terror to the people who live in the neighbourhood. In several of these hot-springs, the inhabitants who live near them boil their victuals, only by hanging a pot, into which the flesh is put in cold water, in the water of the spring. They also bathe in the rivulets that run from them, which, by degrees, become luke warm, or are cooled by their being mixed with rivulets of cold water. The cows that drink of these springs are said to yield an extraordinary quantity of milk, and it is likewise esteemed very wholesome when drank by the human species.

The largest of all the spouting-springs in Iceland is called Geyser. It is about two days journey from Heekla, and not far from Skalholt. In approaching towards it, a loud roaring noise is heard, like the rushing of a torrent, precipitating itself from stupendous rocks. The water here spouts several times a day, but always by starts, and after certain intervals. Some travellers have affirmed that it spouts to the height of sixty fathoms. The water is thrown up much higher at some times than at others; when Dr. Van Troil was there, the utmost height to which it mounted was computed to be 92 feet.

Basaltine pillars are likewise very common in Iceland, which are supposed to have been produced by subterraneous fires. The lower sort of people imagine these pillars to have been piled upon one another by giants, who made use of supernatural force to effect it. They have generally from three to seven sides, and are from four to seven feet in thickness, and from twelve to sixteen yards in length, without any horizontal divisions. In some places they are only seen here and there among the lava in the mountains; but in some other places, they extend two or three miles in length without interruption.

There are immense masses of ice, by which every year great damage is done to this country, and which affect the climate of it; they arrive commonly with a N. W. or N. N. W. wind from Greenland. The field ice is of two or three fathoms thickness, is separated by the winds, and less dreaded than the rock or mountain-ice, which is often seen fifty and more feet above water, and is at least nine times the same depth below water. These prodigious masses of ice are frequently left in shoal water, fixed, as it were, to the ground, and in that state remain many months, nay, it is said, even years, un-

dissolved, chilling all the ambient part of the atmosphere for many miles round. When many such lofty and bulky masses of ice are floating together, the wood that is often drifted along between them, is so much chafed and pressed with violence together, that it takes fire: which circumstance has occasioned fabulous accounts of the ice being in flames. The ice caused so violent a cold in 1753, and 1754, that horses and sheep dropped down dead on account of it, as well as for want of food: horses were observed to feed upon dead cattle, and the sheep to eat of each other's wool. A number of bears arrive yearly with the ice, which commit great ravages, particularly among the sheep. The Icelanders attempt to destroy these intruders as soon as they get sight of them: and sometimes they assemble together, and drive them back to the ice, with which they often float off again. For want of fire arms, they are obliged to make use of spears on these occasions. The government encourages the natives to destroy these animals, by paying a premium of ten dollars for every bear that is killed. Their skins are also purchased for the king, and are not allowed to be sold to any other person.

It is extraordinary that no wood grows successfully in Iceland; nay, there are very few trees to be found on the whole island, though there are certain proofs that wood formerly grew there in great abundance. Nor can corn be cultivated here to any advantage; though cabbages, parley, turnips, and peas, may be met with in five or six gardens, which are said to be all that are in the whole island.

TRADE.] The commerce of this island is monopolised by a Danish company. The soil upon the sea-coast is tolerably good for pasture: and though there is not any considerable town in the whole island, the Icelanders have several frequented ports. Their exports consist of dried fish, salted mutton and lamb, beef, butter, tallow, train-oil, coarse woollen-cloths, stockings, gloves, raw wool, sheep-skins, lamb-skins, fox furs of various colours, eider-down, and feathers. Their imports consist of timber, fishing-lines and hooks, tobacco, bread, horse-shoes, brandy, wine, salt, linen, and a little silk; exclusive of some necessaries and superfluities for the more wealthy.

STRENGTH AND REVENUE.] As Iceland affords no bait for avarice or ambition, the inhabitants depend entirely upon his Danish majesty's protection; and the revenue he draws from the country amounts to about 30,000 crowns a year.

THE FARO or FERRO ISLANDS.

SO called from their lying in a cluster, and the inhabitants ferrying from one island to another. They are about 24 in number, and lie between 61 and 63 deg. N. L. and 6° 10' W. long, from London. The space of this cluster, extends about 60 miles in length and 40 in breadth, 300 miles to the westward of Norway; having Shetland and the Orkneys on the south-east, and Greenland and Iceland upon the north and north-west. The trade and income of the inhabitants, who may be about 3000 or 4000, add little or nothing to the revenues of Denmark.

NORWAY.

N O R W A Y.

Containing 158,400 square miles, with less than 4 inhabitants to each

NAME, BOUNDARIES, } THE natural signification of Norway is the
AND EXTENT. } *Northern-way*. It is bounded on the South
by the entrance into the Baltic called the Scaggerac, or Categate; on the
West and North by the northern ocean; and on the east it is divided from
Sweden by a long ridge of mountains, called at different parts by different
names; as Fillefield, Dofresfield, Runfield, and Dourfield. The reader may
consult the table of dimensions in Denmark for its extent; but it is a country
so little known to the rest of Europe, that it is difficult to fix its dimensions
with precision.

CLIMATE.] The climate of Norway varies according to its extent, and
its position towards the sea. At Bergen the winter is moderate, and the sea
is practicable. The eastern parts of Norway are commonly covered with
snow; and the cold generally sets in about the middle of October, with
intense severity to the middle of April; the waters being all that while frozen
to a considerable thickness. In 1719, 7000 Swedes, who were on their
march to attack Drontheim, perished in the snow, on the mountain which
separates Sweden from Norway; and their bodies were found in different
postures. But even frost and snow have their conveniencies, as they facilitate
the conveyance of goods by land. As to the more northern parts of this
country, called Finnmark, the cold is so intense, that they are but little
known. At Bergen the longest day consists of about 19 hours, and the
shortest of about five. In summer, the inhabitants can read and write at mid-
night by the light of the sky; and in the most northerly parts, about Mid-
summer, the sun is continually in view. In those parts, however, in the
middle of winter, there is only a faint glimmering of light at noon for about
an hour and a half; owing to the reflection of the sun's rays on the moun-
tains. Nature, notwithstanding has been so kind to the Norwegians, that
in the midst of their darkness, the sky is so serene, and the moon and the
aurora borealis so bright, that they can carry on their fishery, and work at
their several trades in the open air.

The air is so pure in some of the inland parts that it has been said the
inhabitants live so long as to be tired of life, and cause themselves to be trans-
ported to a less salubrious air. Sudden thaws, and snow-falls, have, how-
ever, sometimes dreadful effects, and destroy whole villages.

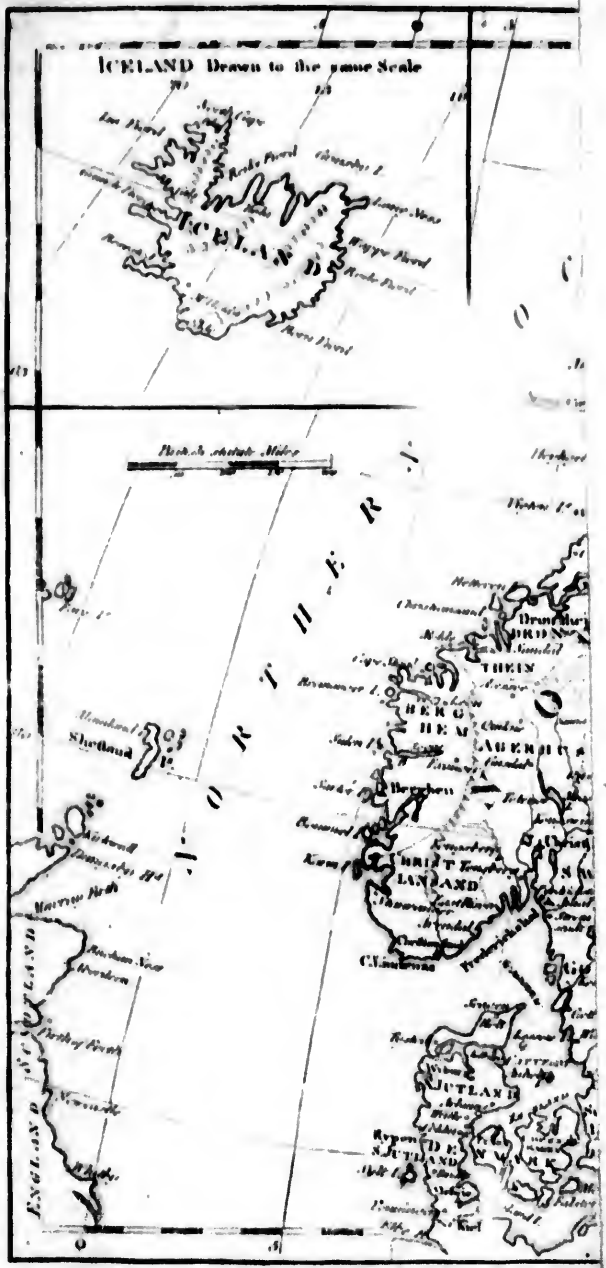

MOUNTAINS.] Norway is reckoned one of the most mountainous coun-
tries in the world; for it contains a chain of unequal mountains running
from south to north: to pass that of Ardanger, a man must travel about
seventy English miles; to pass others upwards of fifty: Dofresfield is count-
ed the highest mountain, perhaps in Europe. The rivers and cataracts
which intersect these dreadful precipices, and that are passable only by
slight tottering wooden bridges, render travelling in this country very terrible
and dangerous; though the government is at the expence of providing at
different stages houses accomodated with fire, light and kitchen furniture.
Detached from this vast chain, other immense mountains present themselves
all over Norway; some of them with reservoirs of water on the top;
and the whole forming a most surprising landscape. The activity of the na-
tives in recovering their sheep and goats, when penned up, through a false
step, in one of those rocks, is wonderful. The owner directs himself to be
lowered down from the top of the mountain, sitting on a cross stick, tied to

the end of a long rope ; and when he arrives at the place where the creature stands, he fastens it to the same cord, and it is drawn up with himself. The caverns that are to be met with in these mountains, are more wonderful than those, perhaps, in any other part of the world, though less liable to observation. One of them called Dolsiteen was, in 1750, visited by two clergymen ; who reported that they proceeded in it till they heard the sea dashing over their heads ; that the passage was as wide and as high as an ordinary church, the sides perpendicular, and the roof vaulted ; that they descended a flight of natural stairs ; but when they arrived at another, they durst not venture to proceed, but returned ; and that they consumed two candles going and returning.

FORESTS.] The chief wealth of Norway lies in its forests, which furnish foreigners with masts, beams, planks, and boards, and serve besides for all domestic uses ; particularly the construction of houses, bridges, ships, and for charcoal to the foundries. The timbers growing here are fir, and pine elm, ash, yew, benreed (a very curious wood), birch, beech, oak, elm or alder, juniper, the aspin-tree, the comel or sloe-tree, hazel, elder, and even ebony (under the mountains of Kolen), lime or linden-tree, and willows. The sums which Norway receives for timber are very considerable ; but the industry of the inhabitants is greatly assisted by the course of their rivers, and the situation of their lakes ; which afford them not only the conveniency already mentioned, of floating down their timber, but that of erecting saw-mills, for dividing their large beams into planks and deals. A tenth of all fawed timber belongs to his Danish majesty, and forms no inconsiderable part of his revenue.

STONES, METALS, AND MINERALS.] Norway contains quarries of excellent marble, as well as many other kinds of stones ; and the magnet is found in the iron mines. The amianthus, or asbestos, which being of an incombustible nature, when its delicate fibre are woven into cloth, is cleaned by burning, is likewise found here ; as are crystals, granates, amethysts, agate, thunder-stones, and eagle-stones. Gold found in Norway has been coined into ducats. His Danish majesty is now working, to great advantage, a silver mine at Coningsburgh ; other silver mines have been found in different parts of the country ; and one of the many silver masses that have been discovered, weighing 560 pounds, is to be seen at the Royal Museum at Copenhagen. Lead, copper, and iron mines, are common in this country : one of the copper mines at Rorana is thought to be the richest in Europe. Norway likewise produces quicksilver, sulphur, salt, and coal-mines : vitriol, alum, and various kinds of loam ; the different manufactures of which bring in a large revenue to the crown.

RIVERS AND LAKES.] The rivers and fresh water lakes in this country are well stocked with fish, and navigable for ships of considerable burden. The most extraordinary circumstance attending the lakes is, that some of them contain floating islands, formed by the cohesion of roots of trees and shrubs ; and, though torn from the main land, bear herbage and trees. So late as the year 1702, the noble family seat of Borge, near Fredericstادت, suddenly sunk, with all its towers and battlements, into an abyss a hundred fathom in depth ; and its scite was instantly filled with a piece of water, which formed a lake 300 ells in length, and about half as broad. This melancholy accident, by which 14 people and 200 head of cattle perished, was occasioned by the foundation being undermined by the waters of a river.

**UNCOMMON ANIMALS, } All the animals that are natives of Denmark
BOWLS, AND FISHES. } are to be found in Norway, with an addition of
many**

many more. The wild beasts peculiar to Norway, are the elk, the rein-deer, the hare, the rabbit, the bear, the wolf, the lynx, the fox, the glutton, the lemming, the ermine, the martin, and the beaver. The elk is a tall, ash-coloured animal, its shape partaking at once of the horse and the stag; it is harmless, and in the winter social; and the flesh of it tastes like venison. The rein-deer is a species of stag; but we shall have occasion to mention him more particularly afterwards. The hares are small; and are said to live upon mice in the winter time, and to change their colour from brown to white. The Norwegian bears are strong and sagacious: they are remarkable for not hurting children; but their other qualities are common with the rest of their species in northern countries; nor can we much credit the very extraordinary specimens of their sagacity, recorded by the natives: they are hunted by little dogs; and some prefer bear hams to those of Westphalia. The Norwegian wolves, though fierce, are shy even of a cow or goat, unless impelled by hunger: the natives are dexterous in digging traps for them; in which they are taken or killed. The lynx, by some called the goupes, is smaller than a wolf, but as dangerous; they are of the cat kind, and have claws like tigers, they dig under ground, and often undermine sheep folds, where they make dreadful havock. The skin of the lynx is beautiful and valuable, as is that of the black fox. White and red foxes are likewise found in Norway, and partake of the nature of that wily animal in other countries; they have a particular way of drawing crabs ashore, by dipping their tails in the water, which the crab lays hold of.

The glutton, otherwise called the *ervan*, or *vielfras*, resembles a turnspit dog; with a long body, thick legs, sharp claws and teeth; his fur, which is variegated, is so precious that he is shot with blunt arrows, to preserve the skin unhurt: he is so bold, and so ravenous, that it is said he will devour a carcase larger than himself, and unburthens his stomach by squeezing himself between two close standing trees: when taken, he has been even known to eat stone and mortar. The ermine is a little creature, remarkable for its shyness and cleanliness; and their fur forms a principal part even of royal magnificence. There is little difference between the martin and a large brown forest cat, only its head and snout are sharper; it is very fierce, and its bite dangerous. We shall have occasion to mention the beaver in treating of North America.

No country produces a greater variety of birds than Norway. The elks build upon rocks; their numbers often darken the air, and the noise of their wings resembles a storm; their size is the bigness of a large duck: they are an aquatic fowl, and their flesh is much esteemed. No fewer than 30 different kinds of thrushes reside in Norway; with various kinds of pigeons, and several sorts of beautiful wild ducks. The Norwegian cock-of-the-wood is of a black or dark grey colour, his eye resembling that of a pheasant; and he is said to be the largest of all eatable birds. Norway produces two kinds of eagles, the land and the sea; the former is so strong, that he has been known to carry off a child of two years old: the sea or *fish-eagle*, is larger than the other; he subsists on aquatic food; and sometimes darts on large fishes with such force, that, being unable to free his talons from their bodies, he is dragged into the water and drowned.

Nature seems to have adapted these aerial inhabitants for the coast of Norway; and industry has produced a species of mankind peculiarly fitted for making them serviceable to the human race; these are the birdmen, or climbers, who are amazingly dexterous in mounting the steepest rocks, and bring

away the birds and their eggs; the latter are nutritive food, and are par-boiled in vinegar; the flesh is sometimes eaten by the peasants, who generally relish it; while the feathers and down form a profitable commodity. Even the dogs of the farmers, in the northern districts, are trained up to be assistants to these birdmen in seizing their prey.

The Scandinavian lakes and seas are astonishingly fruitful in all fish that are found on the sea coasts of Europe, which need not be here enumerated. Stock-fish innumerable, which are dried upon the rocks without salting. Some fishes in those seas, however, have their peculiarities. The haecmoren, is a species of shark, ten fathoms in length, and its liver yields three casks of train oil. The tuella slynder is an excellently large turbot, which has been known to cover a man who has fallen overboard, to keep him from rising. The season for herring fishing is announced to the fishermen by the spouting of water from the whales (of which seven different species are mentioned) in following the herring shoals. The large whale resembles a cod, with small eyes, a dark marbled skin, and white belly; they spout out the water, which they take in by inspiration, through two holes or openings in the head. They copulate like land animals, standing upright in the sea. A young whale when first produced is about nine or ten feet long; and the female sometimes brings forth two at a birth. The whale devours such an incredible number of small fish, that his belly is often ready to burst; in which case he makes a most tremendous noise from pain. The smaller fish have their revenge; some of them fasten on his back, and incessantly beat him; others, with sharp horns, or rather bones, on their beak, swim under his belly, and sometimes rip it up; some are provided with long sharp teeth, and tear his flesh. Even the aquatic birds of prey declare war against him when he comes near the surface of the water; and he has been known to be so tortured, that he has beat himself to death on the rocks. The coast of Norway may be said to be the native country of herrings. Innumerable are the shoals that come from under the ice at the north pole; and about the latitude of Iceland divide themselves into three bodies: one of these supply the western isles and coasts of Scotland, another directs its course round the eastern part of Great Britain down the Channel, and the third enters the Baltic through the sound. They form great part of the food of the common people; and the cod, ling, kabelian, and torsk-fishes follow them, and feed upon their spawn; and are taken in prodigious numbers in 50 or 60 fathoms water: these, especially their roes, and their oil extracted from their livers, are exported and sold to great advantage; and above 150,000 people are maintained by the herring and other fishing on the coast of Norway. The sea-devil is about six feet in length, and is so called from its monitrous appearance and voracity. The sea scorpion is likewise of a hideous form, its head being larger than its whole body, which is about four feet in length, and its bite is said to be poisonous.

The most seemingly fabulous accounts of the ancients, concerning sea-monsters, are rendered credible by the productions of the Norwegian seas; and the sea-snake, or the serpent of the ocean, is no longer counted a chimera. In 1756, one of them was shot by a matter of a ship; its head resembling that of a horse; the mouth was large and black, as were the eyes; a white main hanging from its neck; it floated on the surface of the water, and held its head at least two feet out of the sea: between the head and neck were seven or eight folds, which were very thick; and the length of this snake was more than a hundred yards, some say fathoms. They have a remarkable aversion to the smell of castor; for which reason, ship, boat,

and bark masters provide themselves with quantities of that drug, to prevent being overfet; the serpent's olfactory nerves being remarkably exquisite. The particularities related of this animal would be incredible, were they not attested upon oath. Egede (a very reputable author) says, that on the 6th day of July, 1734, a large and frightful sea-monster raised itself so high out of the water, that its head reached above the main-top-mast of the ship; that it had a long sharp snout, broad paws, and spouted water like a whale; that the body seemed to be covered with scales; the skin was uneven and wrinkled, and the lower part was formed like a snake. The body of this monster is said to be as thick as a hog's head; his skin is variegated like a tortoise-shell; and his excrement, which floats on the surface of the water, is corrosive, and blisters the hands of the seamen if they handle it.

The existence of the kraken, or korken, is strongly asserted; and, as it is said to exist in these seas, we think it proper to mention it in this place, leaving it to the judgment of the readers to give what credit to it he pleases. Its bulk is said to be a mile and a half in circumference; and when part of it appears above the water, it resembles a number of small islands and sand-banks, on which fishes disport themselves, and sea-weeds grow: upon a farther emerging, a number of pellucid antennæ, each about the height, form, and size of a moderate mast, appear; and by their action and re-action he gathers his food, consisting of small fishes. When he sinks, which he does gradually, a dangerous swell of the sea succeeds, and a kind of whirlpool is naturally formed in the water. In 1680, a young kraken perished among the rocks and cliffs of the parish of Alitahong; and his death was attended with such a stench, that the channel where it died was impassable. Without entering into any romantic theories, we may safely say, that the existence of this fish accounts for many of the phenomena of floating islands, and transitory appearances in the sea, that have hitherto been held as fabulous by the learned, who could have no idea of such an animal.

The mer-men and mer-women hold their residence in the Norwegian seas; but I cannot give credit to all that is related concerning them by the natives. The mer-man is about eight spans long, and, undoubtedly, has as much resemblance as an ape has, to the human species; a high forehead, little eyes, a flat nose, and large mouth, without chin or ears, characterize its head; its arms are short, but without joints or elbows, and they terminate in members resembling a human hand, but of the paw kind, and the fingers connected by a membrane; the parts of generation indicate their sexes; though their under parts, which remain in the water, terminate like those of fishes. The females have breasts, at which they suckle their young ones. It would far exceed the bounds allotted to this article, to follow the Norwegian adventurers through all the different descriptions which they have given us of their fishes; but they are so well authenticated, that I make no doubt a new and very surprising theory of aquatic animals may in time be formed.

CURIOSITIES.] Those of Norway are only natural. On the coast, latitude 67, is that dreadful vortex or whirlpool, called by navigators the navel of the sea, and by some Malestrom, or Moskoestrom. The island Moskoe, from whence this stream derives its name, lies between the mountain Hefleggen in Lofoden, and the island Ver, which are about one league distant; and between the island and coast on each side, the stream makes its way. Between Moskoe and Lofoden it is near 400 fathoms deep; but between Moskoe and Ver, it is so shallow as not to afford passage for a small ship. When it is flood, the stream runs up the country between Lofoden and Moskoe with a boisterous rapidity; and when it is ebb, returns to the sea with

a violence and noise unequalled by the loudest cataracts. It is heard at the distance of many leagues, and forms a vortex or whirlpool of great depth or extent; so violent that if a ship comes near it, it is immediately drawn irresistibly into the whirl, and there disappears, being absorbed and carried down to the bottom in a moment, where it is dashed to pieces against the rocks; and just at the turn of ebb and flood, when the water becomes still for about a quarter of an hour, it rises again in scattered fragments, scarcely to be known for the parts of a ship. When it is agitated by a storm, it has reached vessels at the distance of more than a Norway mile, where the crews have thought themselves in perfect security. Perhaps it is hardly in the power of fancy to conceive a situation of more horror than that of being thus driven forward by the sudden violence of an impetuous torrent to the vortex of the whirlpool, of which the noise and turbulence still increasing as it is approached, are an earnest of quick and inevitable destruction; while the wretched victims, in an agony of despair and terror, cry out for that help which they know to be impossible; and see before them the dreadful abyss into which they are to be plunged, and dashed among the rocks at the bottom.

Even animals, which have come too near the vortex, have expressed the utmost terror when they find the stream irresistible. Whales are frequently carried away; and the moment they feel the force of the water, they struggle against it with all their might, howling and bellowing in a frightful manner. The like happens frequently to bears, who attempt to swim to the island to prey upon the sheep.

It was the opinion of Kircher, that the Maelstrom is a sea vortex, which attracts the flood under the shore of Norway, and discharges it again in the gulph of Bothnia; but this opinion is now known to be erroneous, by the return of the shattered fragments of whatever happens to be sucked down by it. The large stems of firs and pines rise again to shivered and splintered that the pieces look as if covered with bristles. The whole phenomena are the effects of the violence of the daily ebb and flow, occasioned by the contraction of the stream in its course between the rocks.

PEOPLE, LANGUAGE, RELIGION, } The Norwegians are a middling
AND CUSTOMS OF NORWAY. } kind of people, between the simplicity
of the Greenlanders and Icelanders, and the more polished manners of the Danes. Their religion is Lutheran; and they have bishops as those of Denmark, without temporal jurisdiction. Their viceroy, like his master, is absolute: but the farmers and common people in Norway are much less oppressed than those in Denmark.

The Norwegians in general are strong, robust, and brave; but quick in resenting real or supposed injuries. The women are handsome and courteous, and the Norwegian forms, both of living, and enjoying property, are mild, and greatly resembling the Saxon ancestors of the present English. Every inhabitant is an artizan, and supplies his family in all its necessaries with his own manufactures; so that in Norway there are few by professions who are hatters, shoe-makers, taylor, tanners, weavers, carpenters, smiths, or joiners. The lowest Norwegian peasant is an artist and a gentleman, and even a poet. They often mix with oat-meal the bark of the fir, made into a kind of flour; and they are reduced to very extraordinary shifts for supplying the place of bread, or farinacious food. The manners of the middling Norwegians form a proper subject for contemplation even to a philosopher, as they lead that kind of life which we may say is furnished with plenty; but they are neither fond of luxury, nor do they dread penury: and this

middle state prolongs their ages surprisngly. Though their dress is in many respects accommodated to their climate, yet, by custom, instead of guarding against the inclemency of the weather, they outbrave it; for they expose themselves to cold, without any cover upon their breasts or necks. A Norwegian of an hundred years of age is not accounted past his labour; and in 1733, four couples were married and danced before his Danish majesty at Frederichshall, whose ages, when joined, exceeded 800 years.

The funeral ceremonies of the Norwegians contain vestiges of their former paganism; they play on the violin at the head of the coffin, and while the corpse is carried to the church, which is often done in a boat. In some places the mourners ask the dead person why he died; whether his wife and neighbours were kind to him, and other such questions frequently kneeling down and asking forgiveness, if ever they had offended the deceased.

[COMMERCE.] We have little to add to this head, different from what will be observed in our account of Denmark. The duties on their exports, most of which have been already recounted, amount to about 100,000 rix-dollars a year.

[STRENGTH AND REVENUE.] By the best calculations, Norway can furnish out 14,000 excellent seamen, and above 30,000 brave soldiers for the use of their king. The royal annual revenue from Norway amounts to near 300,000*l.* and till his present majesty's accession, the army, instead of being expensive, added considerably to his income, by the subsidies it brought him in from foreign princes.

[HISTORY.] We must refer to Denmark likewise for this head. The ancient Norwegians certainly were a very brave and powerful people, and the hardiest seamen in the world. If we are to believe their histories, they were no strangers to America long before it was discovered by Columbus. Many customs of their ancestors are yet discernible in Ireland and the north of Scotland, where they made frequent descents, and some settlements, which are generally confounded with those of the Danes. From their being the most turbulent, they are become now the most loyal subjects in Europe; which we can easily account for, from the barbarity and tyranny of their kings, when a separate people. Since the union of Calmar, which united Norway to Denmark, their history, as well as interests, are the same with that of Denmark.

Breadth 114	
Containing 15,744, square miles with 139 inhabitants to each.	

BOUNDARIES AND DIVISIONS } IT is divided on the North from Norway by the Scaggerac sea, and from Sweden on the East by the Sound; on the South by Germany and the Baltic; and the German sea divides it from Great Britain on the West.

Denmark proper is divided into two parts; the peninsula of Jutland, anciently called *Cimbrica Chersonesus*, and the Islands at the entrance of the Baltic, mentioned in the table. It is remarkable, that though all these together constitute the kingdoms of Denmark, yet not any one of them is separately called by that name. Copenhagen, the metropolis, is in the island of Zealand.

AIR, CLIMATE, SOIL, STATE OF AGRICULTURE, &c.] One of the largest and most fertile of all the provinces of this kingdom is Jutland, which produces abundance of all sorts of grain and pasturage, and is a kind of magazine for Norway on all occasions. A great number of small cattle are bred in this province, and afterwards transported into Holstein, to be fed for the use of Hamburg, Lubec and Amsterdam. Jutland is every where interspersed with hills, and on the east side has fine woods of oak, fir, beech, birch, and other trees; but the west side being less woody, the inhabitants are obliged to use turf and heath for fuel. Zealand is for the most part a sandy soil, but rather fertile in grain and pasturage, and agreeably variegated with woods and lakes of water. The climate is more temperate here, on account of the vapours from the surrounding sea, than it is in many more southerly parts of Europe. Spring and autumn are seasons scarcely known in Denmark, on account of the sudden transitions from cold to heat, and from heat to cold, which distinguish the climate of this kingdom. In all the northern provinces of Denmark the winters are very severe, so that the inhabitants often pass arms of the sea in sledges upon the ice; and during the winter all the harbours are frozen up.

The greatest part of the lands in Denmark and Holstein are fiefs, and the ancient nobility, by grants which they extorted at different times from the crown, gained such a power over the farmers, and those who resided upon their estates, that at length they reduced them to a state of extreme slavery; so that they were bought and sold with their lands, and were esteemed the property of their lords. Many of the noble landholders of Sleswick and Holstein have the power of life and death. The situation of the farmers

* See Mallett's Denmark, p. 1. to 18 vol. v.

† Meaning where longest and broadest, a method which the author has every where observed, and it seems to be the practice of other writers on the subject. Great allowances must therefore be made in most countries, so the reader will perceive by looking on the maps. Jutland for instance, is 114 miles where broadest, though in sundry other parts it is not so.

has, indeed, been made somewhat more agreeable by some modern edicts, but, they are still, if such an expression may be allowed, chained to their farms, and are disposed of at the will of their lords. When a farmer in Denmark or in Holstein, happens to be an industrious man, and is situated upon a poor farm, which by great diligence he has laboured to cultivate advantageously, as soon as he has performed the toilsome task, and expects to reap the profit of what he has sown, his lord, under pretence of taking it into his own hand, removes him from that farm to another of his poor farms, and expects that he should perform the same laborious task there, without any other emolument than what he should think proper to give him. This has been so long the practice in this country, that it necessarily throws the greatest damp upon the efforts of industry, and prevents those improvements in agriculture which would otherwise be introduced: the consequence of which is, that nine parts in ten of the inhabitants are in a state of great poverty. But if the farmers had a security for their property, the lands of Denmark might have been cultivated to much greater advantage than they are at present, and a much greater number of people supported by the produce of agriculture.

ANIMALS.] Denmark produces an excellent breed of horses, both for the saddle and carriage; about 5000 are sold annually out of the country, and of their horned cattle, 30,000. Besides numbers of black cattle, they have sheep, hogs, and game; and the sea coasts are generally well supplied with fish.

POPULATION, MANNERS, AND CUSTOMS.] By an actual numeration made in 1759, of his Danish majesty's subjects, in his dominions of Denmark, Norway, Holstein, the islands in the Baltic, and the counties of Oldenburgh and Delmenhorst in Westphalia, they were said to amount to 2,444,000 souls, exclusive of the Icelanders and Greenlanders. The most accurate account of the population is that made under the direction of the famous Struensee; by which

Jutland numbered	358,136	Iceland	46,201
Denmark, Iceland	283,466	Duchy of Sleswick	283,605
Funen	143,988	Duchy of Holstein	134,665
Norway	723,141	Oldenburgh	62,854
Islands of Ferro	4,754	Delmenhorst	16,217
		Sum Total	2,017,027

Several of the smaller islands included in the district of Fionia are omitted in this computation, which may contain a few thousands.

However disproportioned this number may seem to the extent of his Danish majesty's dominions, yet, every thing considered, it is far greater than could have been expected, from the uncultivated state of his possessions. But the trade of Denmark has been so shackled by the corruption and arbitrary proceedings of her ministers, and her merchants are so terrified by the despotism of her government, that this kingdom, which might be rendered rich and flourishing, is at present one of the most indigent and distressed states in Europe; and these circumstances prevent Denmark from being so populous as it otherwise would be, if the administration of the government were more mild and equitable, and if proper encouragement were given to foreigners, and to those who engage in agriculture and other arts.

The ancient inhabitants of Denmark possessed a degree of courage which

approached even to ferocity ; but by a continued series of tyranny and oppression their national character is much changed, and from a brave, enterprising, and warlike people, they are become indolent, timid, and dull of apprehension. They value themselves extremely upon those titles and privileges which they derive from the crown, and are exceedingly fond of pomp and shew. They endeavour to imitate the French in their manners, dress, and even in their gallantry ; though they are naturally the very contrast of that nation. They fall much into the indolence and timidity which form a considerable part of the characters of the modern Danes ; but in other respects are well-meaning people, and acquit themselves properly in their respective employments. The Danes, like other northern nations, are given to intemperance in drinking, and convivial entertainments ; but their nobility, who now begin to visit the other courts of Europe, are refining from their provincial habits and vices.

[RELIGION.] The religion is Lutheran ; and the kingdom is divided into six dioceses ; one in Zealand, one in Funen, and four in Jutland ; besides four in Norway and two in Iceland. These dioceses are governed by bishops, whose profession is entirely to superintend the other clergy ; nor have they any other mark of pre-eminency than a distinction of their ecclesiastical dress ; for they have neither cathedrals nor ecclesiastical courts, nor the smallest concern with civil affairs : their morals, however, are so good, that they are revered by the people. They are paid by the state, as all the church-lands were wisely appropriated to the government at the reformation.

[LANGUAGE AND LEARNING.] The language of Denmark is a dialect of the Teutonic ; but high Dutch and French are spoken at court ; and the nobility have lately made great advances in the English, which is now publicly taught at Copenhagen as a necessary part of education. A company of English comedians occasionally visit that capital, where they find tolerable encouragement.

The university of Copenhagen has funds for the gratuitous support of 328 students ; these funds are said to amount to 300,000 rix-dollars ; but the Danes in general make no great figure in literature ; though astronomy and medicine are highly indebted to their Tycho Brahe, Borichius, and the Bartholines ; and the round tower and Christian's haven display the mechanical genius of a Longomontanus ; not to mention that the Danes begin now to make some promising attempts in history, poetry, and the drama. It appears, however, that in general, literature receives very little countenance or encouragement in Denmark ; which may be considered as the principal cause of its being so little cultivated by the Danes.

[CITIES AND CHIEF BUILDINGS.] Copenhagen, which is situated on the fine island of Zealand, was originally a settlement of sailors, and first founded by some wandering fishermen in the twelfth century, but is now the metropolis, and makes a magnificent appearance at a distance. It is very strong, and defended by four royal castles or forts. It contains ten parish churches, besides nine others, belonging to the Calvinists and other persuasions, and some hospitals. Copenhagen is adorned by some public and private palaces, as they are called. Its streets are 186 in number ; and its inhabitants amount to 100,000. The houses in the principal streets are built of brick, and those in the lanes chiefly of timber. Its university has been already mentioned. But the chief glory of Copenhagen is its harbour, formed by a large canal flowing through the city, which admits indeed but only one ship to enter at a time, but is capable of containing 500. have canals, and quays for ships to lie close to the houses; and its naval arsenal is said to exceed that of Venice. The road for shipping begins about two miles from the town, and is defended by 90 pieces of cannon, as well as the difficulty of the navigation. But notwithstanding all these advantages, there is little appearance of industry or trade in this city; and Copenhagen, though one of the finest ports in the world, can boast of little commerce. The public places are filled with officers either in the land or sea service; and the number of forces kept up is much too large for this little kingdom. The police of Copenhagen is extremely regular, and people may walk through the whole city at midnight with great safety. Indeed, it is usually almost as quiet here at eleven o'clock at night as in a country village, and, at that time there is scarcely a coach heard to rattle through the streets.

The apartments of the palace at Copenhagen are grand, and the tapestry in many of them beautiful, particularly the story of Esther, and an assortment of wild beasts, after the manner of *Quida*. A colonnade at each extremity forms the stables, which, for their extent and beauty of furniture are equal to any in Europe. But the finest palace belonging to his Danish majesty lies about 20 English miles from Copenhagen, and is called Fredericburgh. It is a very large building, walled round with a triple ditch, and calculated, like most of the ancient residences of princes, for defence against an enemy. It was built by Christian IVth, and, according to the architecture of the times, partakes of the Greek and Gothic styles. In the front of the grand quadrangle appear Tuscan and Doric pillars, and on the summit of the building are spires and turrets. Some of the rooms are very splendid, though furnished in the antique taste. The Knights' hall is of great length. The tapestry represents the wars of Denmark, and the ceiling is a most minute and laboured performance in sculpture. The chimney-piece was once entirely covered with plates of silver, richly ornamented; but the Swedes, who have often landed here, and even besieged the capital, tore them all away, and rifled the palace, notwithstanding its triple moat and formidable appearance. The late unhappy queen Matilda spent much of her time at this palace, during the king's tour through Europe. About two miles from Elsinour is another small royal palace, flat roofed, with twelve windows in front, said to be built on the place formerly occupied by the palace of Hamlet's father. In an adjoining garden is shewn the very spot where, according to that tradition, that prince was poisoned.

Jagersburgh is a park which contains a royal country seat, called the Hermitage; which is remarkable for the disposition of its apartments and the quaintness of its furniture; particularly a machine which conveys the dishes to and from the king's table in the second story. The chief ecclesiastical buildings in Denmark is the cathedral of Roschild, where the kings and queens of Denmark were formerly buried, and their monuments still remain. Joining to this cathedral, by a covered passage, is a royal palace, built in 1733. Elsinour is well-built, contains 5000 inhabitants, and with respect to commerce is only exceeded by Copenhagen. It is strongly fortified on the land side, and towards the sea is defended by a strong fort, containing several batteries of long cannon. Here all vessels pay a toll, and, in passing, lower their top-sails.

COMMERCE.] Denmark is extremely well situated for commerce; her harbours are well calculated for the reception of ships of all burdens, and her mariners are very expert in the navigation of the different parts of the ocean. The dominions of his Danish majesty also supply a great variety

of timber and other materials for ship-building; and some of his provinces afford many natural productions for exportation. Among these, besides fir and other timber, are black cattle, horses, butter, stock-fish, tallow, hides, train-oil, tar, pitch, and iron, which being the natural product of the Danish dominions, are consequently ranked under the head of exports. To these we may add furs; but the exportation of oats is forbidden. The imports are, salt, wine, brandy and silk from France, Portugal, and Italy. Of late the Danes have had great intercourse with England, and from thence they import broad cloths, cloaks, cabinet, lockwork, and all other manufactures carried on in the great trading towns of England, but nothing shews the commercial spirit of the Danes in a more favourable light than their establishments in the East and West Indies.

In 1612, Christian IV. of Denmark, established an East India Company at Copenhagen; and soon after, four ships sailed from thence to the East Indies. The hint of this trade was given to his Danish majesty by James I. of England, who married a princess of Denmark; and in 1617, they built and fortified a castle and town at Tranquebar, on the coast of Coromandel. The security which many of the Indians found under the cannon of this fort invited numbers of them to settle here; so that the Danish East India Company were soon rich enough to pay their king a yearly tribute of 10,000 rix dollars. The company, however, willing to become rich all of a sudden, in 1620 endeavoured to possess themselves of the spice-trade at Ceylon, but were defeated by the Portuguese. The truth is, they soon embroiled themselves with the native Indians on all hands; and had it not been for the generous assistance given them by Mr. Pitt, an English East India governor, the settlement at Tranquebar must have been taken by the Rajah of Tanjour. Upon the close of the wars in Europe, after the death of Charles XII. of Sweden, the Danish east India company found themselves so much in debt, that they published proposals for a new subscription for enlarging their ancient capital stock, and for fitting out ships to Tranquebar, Bengal, and China. Two years after, his Danish majesty granted a new charter to his East India Company, with vast privileges; and for some time its commerce was carried on with great vigour. I shall just mention, that the Danes likewise possess the islands of St. Thomas and St. Croix, and the small island of St. John, in the West Indies, which are free ports, and celebrated for smuggling; also the fort of Christianburg on the coast of Guinea; and carry on a considerable commerce with the Mediterranean.

CURIOSITIES, NATURAL AND ARTIFICIAL.] Denmark proper affords fewer of these than the other parts of his Danish majesty's dominions, if we except the contents of the Royal Museum at Copenhagen, which consists of a numerous collection of both. It contains several good paintings and a fine collection of coins, particularly those of the consuls in the time of the Roman republic, and of the emperors after the seat of empire was divided into the East and West. Besides artificial skeletons, ivory carvings, models, clock-work, and a beautiful cabinet of ivory and ebony, made by a Danish artist who was blind, here are to be seen two famous antique drinking vessels; the one of gold, the other of silver, and both of the form of a haunting horn; that of gold seems to be of Pagan manufacture; and from the raised hieroglyphical figures on its outside, it probably was made use of in religious ceremonies: it is about two feet nine inches long, weighs 102 ounces, contains two English pints and a half, and was found in the diocese of Ripen, in the year 1639. The other, of silver, weighs about four pounds, and is termed *Cornu Oldenburgicum*; which they say was presented to Otho I. duke of Oldenburg, by

a ghost. Some, however, are of opinion, that this vessel was made by order of Christian I. king of Denmark, the first of the Oldenburgh race, who reigned 1448. I shall just mention in this place that several vessels of different metals, and the same form, have been found in the North of England, and are probably of Danish original. This museum is likewise furnished with a prodigious number of astronomical, optical, and mathematical instruments; some Indian curiosities, and a set of medals ancient and modern. Many curious astronomical instruments are likewise placed in the round tower at Copenhagen; which is so contrived that a coach may drive to its top. The village of Anglen, lying between Flensburgh and Sleswick, is also esteemed a curiosity, as giving its name to the Angles, or Anglo-Saxon inhabitants of Great Britain, and the ancestors of the bulk of the modern English.

The greatest rarities in his Danish majesty's dominions are omitted, however, by geographers; I mean those ancient inscriptions upon rocks, that are mentioned by antiquaries and historians; and are generally thought to be the old and original manner of writing, before the use of paper of any kind, and waxen tables was known. These characters are Runic, and so imperfectly understood by the learned themselves, that their meaning is very uncertain; but they are imagined to be historical. Stephanus, in his notes upon Saxo-Græmaticus, has exhibited specimens of several of those inscriptions.

CIVIL CONSTITUTION, GOVERN- } The ancient constitution of Den-
MENT, AND LAWS. } mark was originally much upon the
same plan with other Gothic governments. The king came to the throne by election; and, in conjunction with the senate where he presided, was invested with the executive power. He likewise commanded the army, and decided finally all the disputes which arose between his subjects. The legislative power, together with the right of election of the king, was vested in the states; who are composed, first, of the order of nobility; and secondly, the order of the citizens and farmers; and after the Christian religion had gained ground in the North, the clergy were also admitted, not only to be an order of the states, but to have seats likewise in the senate. These orders had their respective rights and privileges, and were independent of each other; the crown had also its prerogatives, and a certain fixed revenue arising out of lands, which were appropriated to its support. This constitution had many evident advantages; but, unfortunately, the balance of this government was never properly adjusted; so that the nobles very soon assumed a dictatorial power, and greatly oppressed the people, as the national assemblies were not regularly held to redress their grievances. And when the Roman Catholic clergy came to have a share in the civil government, they far surpassed the nobility in pride and ambition. The representatives of the people had neither power, credit, nor talents, to counteract the efforts of the other two orders, who forced the crown to give up its prerogatives, and to oppress and tyrannize over the people. Christian the Second, by endeavouring in an imprudent manner to stem the torrent of their oppression, lost his crown and his liberty; but Christian the Third, by uniting himself with the nobles and the senate, destroyed the power of the clergy, though the oppression of the common people by the nobility still remained. At length, in the reign of Frederick the Third, the people, instead of exerting themselves to remedy the defects of the constitution, and to maintain their common liberties, were so infatuated as to make the king despotic, in hopes thereby of rendering themselves less subject to the tyranny of the nobility. A series of unsuccessful wars had brought the nation in general into so miserable a condition, that the public had not money for paying off the army. The dispute came to a

short question, which was, that the nobles should submit to taxes, from which they pleaded an exemption. The inferior people upon this threw their eyes towards the king, for relief and protection from the oppressions of the intermediate order of nobility: in this they were encouraged by the clergy. In a meeting of the states, it was proposed that the nobles should bear their share in the common burden. Upon this, Otta Craeg put the people in mind that the commons were no more than *slaves* to the lords.

This was the watch-word which had been concerted between the leaders of the commons, the clergy, and even the court itself. Nanson, the speaker of the commons, caught hold of the term *slavery*; the assembly broke up in a ferment; and the commons, with the clergy, withdrew to a house of their own, where they resolved to make the king a solemn tender of their liberties and services, and formally to establish in his family the hereditary succession to their crown. This resolution was executed the next day. The bishop of Copenhagen officiated as speaker for the clergy and commons. The king accepted of their tender, promising them relief and protection. The gates of Copenhagen were shut; and the nobility, finding the nerves of their power thus cut, submitted with the best grace they could to confirm what had been done.

On the 10th of January, 1661, the three orders of nobility, clergy, and people, signed each a separate act; by which they consented that the crown should be hereditary in the royal family, as well in the female as in the male line, and by which they invested the king with absolute power, and gave him the right to regulate the succession and the regency, in case of a minority. This renunciation of their rights, subscribed by the first nobility, is still preserved as a precious relic among the archives of the royal family. A relic, which perpetuates the memory of the humbled insolence of the nobles, and the hypocrisy of the prince, who, to gratify his revenge against them, persuaded the people that his only wishes were to repair a decayed edifice, and then excited them to pull it to the ground, crushing themselves under its ruins.

After this extraordinary revolution in the government, the king of Denmark divested the nobility of many of the privileges which they had before enjoyed; but he took no method to relieve those poor people who had been the instruments of investing him with the sovereign power, but left them in the same state of slavery in which they were before, and in which they have remained to the present age. When the revolution in the reign of Frederick the Third had been effected, the king re-united in his person all the rights of the sovereign power; but as he could not exercise all by himself, he was obliged to intrust some part of the executive power to his subjects; the supreme court of judicature for the kingdoms of Denmark and Norway is holden in the royal palace of Copenhagen, of which the king is the nominal president. What they call the German provinces have likewise their supreme tribunal; which, for the duchy of Holstein is holden at Gluckstadt; and for the duchy of Sleswick, in the town of that name.

As to matters of importance, the king for the most part decides in his council, the members of which are named and displaced at his will. It is in this council that the laws are proposed, discussed, and receive the royal authority, and that any great changes or establishments are proposed, and approved or rejected by the king. It is here likewise, or in the cabinet, that he grants privileges, and decides upon the explication of laws, their extension, or their restriction; and, in fact, it is here that the king expresses his will upon the most important affairs of his kingdom.

In this kingdom, as in many others, the king is supposed to be present to administer

administer justice in the supreme court of his kingdom; and, therefore, the kings of Denmark not only preside nominally in the sovereign court of justice, but they have a throne erected in it, towards which the lawyers always address their discourses in pleading, and the judges the same in giving their opinion. Every year the king is present at the opening of this court, and often gives the judges such instructions as he thinks proper. The decision of these judges is final in all civil actions; but no criminal sentence of a capital nature can be carried into execution till it is signed by the king.

There are many excellent regulations for the administration of justice in Denmark; but notwithstanding this, it is so far from being distributed in an equal and impartial manner, that a poor man can scarcely ever have justice in this country against one of the nobility or against one who is favoured by the court or by the chief minister. If the laws are so clearly in favour of the former, that the judges are ashamed to decide against them, the latter, through the favour of the minister, obtains an order from the king to stop all the law-proceedings, or a dispensation from observing particular laws, and there the matter ends. The code of laws at present established in Denmark was published by Christian V. founded upon the code of Valdemar, and all the other codes which have since been published, and is nearly the same with that published in Norway. These laws are very just and clear; and, if they were impartially carried into execution, would be productive of many beneficial consequences to the people. But as the king can change and alter the laws, and dispense with them as he pleases, and support his ministers and favourites in any acts of violence and injustice, the people of Denmark undergo a great degree of tyranny and oppression, and have abundant reason to regret the tameness and servility with which their liberties have been surrendered into the hands of their monarchs.

The peasants, till 1787, had been in a situation little better than the brute creation; they scarce could be said to possess any loco-motive power, inasmuch that they had no liberty to leave one estate, and to settle on another, without the purchased permission from their masters; and if they chanced to move without their permission, they were claimed as strayed cattle. Such was the state of those wretched beings, who, at best, only might be said to vegetate. These chains of feudal slavery were now broken, through the interest of his royal highness the prince, and heir apparent to the crown; and the prisoners, for such I think they might be called, were declared free. Notwithstanding the remonstrances which were made against this by the landed gentry were very numerous, yet, after the minute examination of the whole, an edict was issued which restores the peasants to their long lost liberty, which once contributed so much to the glory of the state: added to this, a number of grievances, under which the peasantry laboured, were abolished.

[PUNISHMENTS.] The common method of execution in Denmark is beheading and hanging: in some cases, as an aggravation of the punishment, the hand is chopped off before the other part of the sentence is executed. For the most atrocious crimes, such as the murder of a father or mother, husband or wife, and robbery upon the highway, the malefactor is broken upon the wheel. But capital punishments are not common in Denmark; and the other principal modes of punishment are branding in the face, whipping, condemnation to the rasp-house, to houses of correction, and to public labour and imprisonment; all which are varied in duration and rigour, according to the nature of the crime.

POLITICAL AND NATURAL INTERESTS OF DENMARK. } After the accession of his present majesty, his court seemed for some time to have altered its maxims. His father, it is true, observed a most respectable neutrality during the late war; but never could get rid of French influence, notwithstanding his connections with Great Britain. The subsidies he received maintained his army; but his family-disputes with Russia concerning Holstein, and the ascendancy which the French had obtained over the Swedes, not to mention many other matters, did not suffer him to act that decisive part in the affairs of Europe, to which he was invited by his situation; especially about the time when the treaty of Closter-Seven was concluded. His present Danish majesty's plan seemed, soon after his accession, to be that of forming his dominions into a state of independency, by availing himself of their natural advantages. But sundry events which have since happened, and the general feebleness of his administration, have prevented any further expectations being formed, that the real welfare of Denmark will be promoted, at least in any great degree, during the present reign.

With regard to the external interests of Denmark, they are certainly best secured by cultivating a friendship with the maritime powers. The exports of Denmark enable her to carry on a very profitable trade with France, Spain, and the Mediterranean; and she has been particularly courted by the Mahometan states, on account of her ship-building stores.

The present imperial family of Russia has many claims upon Denmark, on account of Holstein; but there is at present small appearance of her being engaged in a war on that account. Were the Swedes to regain their military character, and to be commanded by so enterprising a prince as Charles XII. they probably would endeavour to repossess themselves, by arms, of the fine provinces torn from them by Denmark. But the greatest danger that can arise to Denmark from a foreign power is, when the Baltic sea (as has happened more than once) is so frozen over as to bear not only men but heavy artillery; in which case the Swedes have been known to march over great armies, and to threaten the conquest of the kingdom.

REVENUES.] His Danish majesty's revenues have three sources: the impositions he lays upon his own subjects; the duties paid by foreigners; and his own demesne lands, including confiscations. Wine, salt, tobacco, and provisions of all kinds, are taxed. Marriages, paper, corporations, land, houses, and poll-money, also raise a considerable sum. The expences of fortifications are borne by the people; and when the king's daughter is married, they pay about 100,000 rix-dollars towards her portion. The reader is to observe, that the internal taxes of Denmark are very uncertain, because they may be abated or raised at the king's will. Customs, and tolls upon exports and imports, are more certain. The tolls paid by strangers, arise chiefly from foreign ships that pass through the Sound into the Baltic, through the narrow strait of half a mile between Schonen and the island of Zealand. These tolls are in proportion to the size of the ship and value of the cargo exhibited in the bills of lading. This tax, which forms a capital part of his Danish majesty's revenue, has more than once thrown the northern parts of Europe into a flame. It was often disputed by the English and Dutch, being nothing more originally than a voluntary contribution of the merchants towards the expences of the light-houses on the coast; and the Swedes, who command the opposite side of the pass, for some time refused to pay it; but in the treaty of 1720, between Sweden and Denmark, under the guarantee of his Britannic majesty George I. the Swedes agreed to pay the same rates as are paid by the subjects of Great Britain and the Netherlands.

hands. The first treaty relative to it, was by the emperor Charles V. on behalf of his subjects in the Low Countries. The toll is paid at Elfsneur, a town situated on the Sound, at the entrance of the Baltic Sea, and about 18 miles distant from Copenhagen. The whole revenue of Denmark, including what is received at Elfsneur, amounts at present to above 5,000,000 of six dollars, or 1,002,000. sterling yearly.

The following is a list of the king's revenues, exclusive of his private estates:

	Rix Dollars at 4s. each.
Tribute of hard corn or land-tax,	1,000,000
Small taxes, including poll-tax, pound rents, excise, marriages, &c. }	950,000
Custom-house duties,	154,000
Duties of the Sound,	200,000
Duties of Jutland, from salt-pits,	27,000
Tythes and poll tax of Norway,	770,000
Tolls of Bergen, Drontheim, Christianfand and Christana,	160,000
Other tolls,	552,000
Revenue from mines,	300,000
Revenue from Slefwick, Holstein, Oldenburgh, and Delmenhorst, }	690,000
Taxes on acorns, and masts from beech,	20,000
Tolls on the Weser,	7,500
Post-office,	70,000
Farms of Iceland and Ferro,	35,000
Farms of Bornholm,	14,800
Oyster Fishery,	22,000
Stamp Paper,	40,000

Sum total, 5,042,300

In English money, £. 1,002,460

By a list of the revenue taken in 1730, it then only amounted to English money £. 454,700.

ARMY AND NAVY.] The three last kings of Denmark, notwithstanding the degeneracy of the people in martial affairs, were very respectable princes, by the number and discipline of their troops, which they kept up with vast care. The present military force of Denmark consists of 70,000 men, cavalry and infantry, the greatest part of which consists of a militia who receive no pay, but are registered on the army list, and every Sunday exercised. The regular troops are about 20,000, and mostly foreigners, or most of whom are officered by foreigners; for Frederick III. was too refined a politician to trust his security in the hands of those he had tricked out of their liberty. Though this army is extremely burdensome to the nation, yet it costs little to the crown; great part of the infantry lie in Norway, where they live upon the boors at free quarter: and in Denmark the peasantry are obliged to maintain the cavalry in victuals and lodging, and even to furnish them with money. The present fleet of Denmark is composed of 36 ships of the line, and 18 frigates; but many of the ships being old, and wanting great repairs,

pair, if they can send out 25 ships upon the greatest emergency, this is supposed to be the most they can do. This fleet is generally stationed at Copenhagen, where are the dock-yards, store-houses, and all the materials necessary for the use of the marine. They have 26,000 registered seamen, who cannot quit the kingdom without leave, nor serve on board a merchantman without permission from the admiralty; 4000 of these are kept in constant pay and employed in the dock-yards; their pay, however, scarcely amounts to nine shillings a month, but then they have a sort of uniform, with some provisions and lodgings allowed for themselves and families.

ORDERS OF KNIGHTHOOD IN DENMARK.] These are two; that of the *Elephant*, and that of *Daneburg*; the former was instituted by Christian I. in the year 1478, and is deemed the most honourable; its badge is an elephant surmounted with a castle, set in diamonds, and suspended to a sky-blue watered ribbon; worn like the George in England over the right shoulder: the number of its members, besides the sovereign, are thirty, and the knights of it are addressed by the title of excellency. The badges of the *Daneburg* order, which is said to be of the highest antiquity, instituted in the year 1219, but it became obsolete, and was revived in 1671 by Christian V. consist of a white ribbon with red edges worn scarf-ways over the right shoulder; from which depends a small cross of diamonds, and an embroidered star on the breast of the coat surrounded with the motto, *Pietate & Justitia*. The badge is a cross pattee enamelled white, on the centre the letter C and S crowned with a regal crown, and this motto, *Restitutor*. The number of knights is numerous, and not limited.

HISTORY.] We owe the chief history of Denmark to a very extraordinary phenomenon; the revival of the purity of the Latin language in Scandinavia, in the person of Saxo-Grammaticus, at a time (the 12th century) when it was lost in all other parts of the European continent, Saxo, like the other historians of his age, had adopted, and at the same time ennobled by his style, the most ridiculous absurdities of remote antiquity. We can however collect enough from him to conclude, that the ancient Danes, like the Gauls, the Scots, the Irish, and other northern nations, had their bards, who recounted the military achievements of their heroes; and that their first histories were written in verse. There can be no doubt that the Scandinavians or Cimbri, and the Teutones (the inhabitants of Denmark, Norway, and Sweden) were Scythians by their original; but how far the tracts of land, called either Scythia* or Gaul, formerly reached, is uncertain.

Even the name of the first Christian Danish king is uncertain; and those of the people whom they commanded were so blended together, that it is impossible for the reader to conceive a precise idea of the old Scandinavian history. This, undoubtedly was owing to the remains of their Scythian customs, particularly that of removing from one country to another; and of several nations or septes joining together in expeditions by sea or land; and the adventurers being denominated after their chief leaders. Thus the terms, Danes, Saxons, Jutes or Goths, Germans, and Normans, were promiscuously used long after the time of Charlemagne. Even the short revival of literature,

* By Scythia may be understood all those northern countries of Europe and Asia (now inhabited by the Danes, Norwegians, Swedes, Russians, and Tartars, see the Introduction), whose inhabitants overturned and peopled the Roman empire, and continued so late as the 13th century to issue forth in large bodies, and naval expeditions, ravaging the more southern and fertile kingdoms of Europe; hence by Sir William Temple, and other historians, they are termed the *Northern Elves, the Mother of Nations, the Starbush of Europe.*

under that prince, throws very little light upon the Danish history. All we know is, that the inhabitants of Scandinavia, in their maritime expeditions, went generally under the name of Saxons with foreigners; that they were bold adventurers, rude, fierce, and martial: That so far back as the year of Christ, 500, they insulted all the sea-coasts of Europe; that they settled in Ireland, where they built stone-houses; and that they became masters of England, and some part of Scotland; both which kingdoms still retain proofs of their barbarity. When we read the history of Denmark and that of England, under the Danish princes who reigned over both countries, we meet with but a faint resemblance of events; but the Danes as conquerors, always give themselves the superiority over the English.

In the eleventh century under Canute the Great, Denmark may be said to have been in its zenith of glory, as far as extent of dominion can give sanction to the expression. Few very interesting events in Denmark preceded the year 1387, when Margaret mounted the throne; and partly by her address, and partly by hereditary right, she formed the union of Calmar, anno 1397, by which she was acknowledged sovereign of Sweden, Denmark, and Norway. She held her dignity with such firmness and courage, that she was justly stiled the Semiramis of the north. Her successors being destitute of her great qualifications, the union of Calmar, by which the three kingdoms were in future to be under one sovereign, fell to nothing; but Norway still continued annexed to Denmark. About the year 1448, the crown of Denmark fell to Christian, count of Oldenburgh, from whom the present royal family of Denmark is descended.

In 1513, Christian II. king of Denmark, one of the most complete tyrants that modern times have produced, mounted the throne of Denmark; and having married the sister of the emperor Charles V. he gave a full loose to his innate cruelty. Being driven out of Sweden, for the bloody massacres he committed there, the Danes rebelled against him likewise; and he fled, with his wife and children, into the Netherlands. Frederick, duke of Holstein, was unanimously called to the throne, on the deposition of his cruel nephew, who openly embraced the opinions of Luther, and about the year 1536, the protestant religion was established in Denmark, by that wife and politic prince Christian III.

Christian IV. of Denmark, in 1639, was chosen for the head of the protestant league, formed against the house of Austria; but though brave in his own person, he was in danger of losing his dominions; when he was succeeded in that command by Guiliavus Adolphus king of Sweden. The Dutch having obliged Christian, who died in 1648, to lower the duties of the Sound, his son Frederick III. consented to accept of an annuity of 150,000 florins for the whole. The Dutch, after this, persuaded him to declare war against Charles Gustavus, king of Sweden; which had almost cost him his crown in 1657. Charles stormed the fortrefs of Fredericksstadt; and in the succeeding winter he marched his army over the ice to the island of Funen, where he surpris'd the Danish troops took Odensee and Nyburgh and marched over the great Belt to besiege Copenhagen itself. Cromwell, who then governed England under the title of Protector, interposed; and Frederick defended his capital with great magnanimity till the peace of Roschild; by which Frederic ceded the provinces of Halland, Bleking, and Sconia, the island of Bornholm, and Bahus and Drontheim in Norway, to the Swedes. Frederick sought to elude these severe terms: but Charles took Cronenburgh, and once more besieged Copenhagen by sea and land. The steady intrepid conduct of Frederick under these misfortunes, endeared him

him to his subjects; and the citizens of Copenhagen made an admirable defence till a Dutch fleet arrived in the Baltic and beat the Swedish fleet. The fortune of war was now entirely changed in favour of Frederick, who shewed on every occasion great abilities, both civil and military; and having forced Charles to raise the siege of Copenhagen, might have carried the war into Sweden, had not the English fleet under Montague appeared in the Baltic. This enabled Charles to besiege Copenhagen a third time; but France and England offering their mediation, a peace was concluded in that capital, by which the island of Bornholm returned to the Danes; but the island of Rugen, Bleking, Halland, and Schonen, remained with the Swedes.

Though this peace did not restore to Denmark all she had lost, yet the magnanimous behaviour of Frederic, under the most eminent dangers, and his attention to the safety of his subjects, even preferable to his own, greatly endeared him in their eyes; and he at length became absolute, in the manner already related. Frederick was succeeded in 1670, by his son Christian V. who obliged the duke of Holstein Gottorp to renounce all the advantages he had gained by the treaty of Rosebild. He then recovered a number of places in Schonen; but his army was defeated in the bloody battle of Lunden, by Charles XI. of Sweden. This defeat did not put an end to the war; which Christian obstinately continued, till he was defeated entirely at the battle of Lendseroon: and having almost exhausted his dominions in military operations, and being in a manner abandoned by all his allies, he was forced to sign a treaty, on the terms prescribed by France, in 1679. Christian, however, did not desist from his military attempts; and at last he became the ally and subsidiary of Lewis XIV. who was then threatening Europe with chains. Christian after a vast variety of treating and fighting with the Holsteiners, Hamburgers, and other northern powers, died in 1699. He was succeeded by Frederick IV. who, like his predecessors, maintained his pretensions upon Holstein; and probably must have become master of that duchy, had not the English and Dutch fleets raised the siege of Touningen, while the young king of Sweden, Charles XII. who was then no more than sixteen years of age, landed within eight miles of Copenhagen, to assist his brother in law the duke of Holstein. Charles probably would have made himself master of Copenhagen, had not his Danish majesty agreed to the peace of Travendahl, which was entirely in the duke's favour. By another treaty concluded with the States-General, Charles obliged himself to furnish a body of troops, who were to be paid by the confederates; and afterwards did great execution against the French in the wars of queen Anne.

Notwithstanding this peace, Frederic was perpetually engaged in wars with the Swedes, and while Charles XII. was an exile at Bender, he made a descent upon the Swedish Pomerania; and another in the year 1712, upon Bremen, and took the city of Stade. His troops, however, were totally defeated by the Swedes at Gadesbueh, who laid his favourite city of Altena in ashes. Frederic revenged himself by seizing great part of the Ducal Holstein, and forcing the Swedish general count Steinbock, to surrender himself prisoner, with all his troops. In the year 1716, the success of Frederic were so great, by taking Toningen and Stralfund, by driving the Swedes out of Norway, and reducing Wismar in Pomerania, that his allies began to suspect he was aiming at the sovereignty of all Scandinavia. Upon the return of Charles of Sweden from his exile, he renewed the war against Denmark with a most unwhipped spirit; but on the death of that prince, who was killed at the

sege

siege of Fredericshal, Frederic durst not refuse the offer of his Britannic majesty's mediation between him and the crown of Sweden; in consequence of which a peace was concluded at Stockholm, which left him in possession of the duchy of Sleswick. Frederic died in the year 1730, after having two years before seen his capital reduced to ashes by an accidental fire. His son and successor, Christian-Frederic, or Christian VI. made no other use of his power, and the advantages, with which he mounted the throne, than to cultivate peace with all his neighbours, and to promote the happiness of his subjects, whom he eased of many oppressive taxes.

In 1734, after guaranteeing the Pragmatic Sanction *, Christian sent 6000 men to the assistance of the emperor, during the dispute of the succession to the crown of Poland. Though he was pacific, yet he was jealous of his rights, especially over Hamburg. He obliged the Hamburgers to call in the mediation of Prussia, to abolish their bank, to admit the coin of Denmark as current, and to pay him a million of silver marks. He had, two years after, viz. in 1738, a dispute with his Britannic majesty about the little lordship of Steinhors, which had been mortgaged to the latter by a duke of Holstein Lawenburgh, and which Christian said belonged to him. Some blood was spilt during the contest; in which Christian, it is thought, never was in earnest. It brought on, however a treaty, in which he availed himself of his Britannic majesty's predilection for his German dominions; for he agreed to pay Christian a subsidy of 70,000l. sterling a year, on condition of keeping in readiness 7000 troops for the protection of Hanover: this was a gainful bargain for Denmark. And two years after, he seized some Dutch ships, for trading without his leave to Iceland; but the difference was made up by the mediation of Sweden. Christian had so great a party in that kingdom, that it was generally thought he would revive the union of Calmar, by procuring his son to be declared successor to his then Swedish majesty. Some steps for that purpose were certainly taken; but whatever Christian's views might have been, the design was frustrated by the jealousy of other powers, who could not bear the thoughts of seeing all Scandinavia subject to one family. Christian died in 1746, with the character of being the father of his people.

His son and successor, Frederic V. had, in 1743, married the princess Louisa, daughter to his Britannic majesty George II. He improved upon his father's plan, for the happiness of his people; but took no concern, except that of a mediator, in the German war. For it was by his intervention that the treaty of Closter-Seven was concluded between his royal highness the late duke of Cumberland, and the French general Richlieu. Upon the death of his first queen, who was mother to his present Danish majesty, he married a daughter of the duke of Brunswic-Wolfenbuttle; and died in 1766.

His son, Christian VII. was born the 29th of January, 1749; and married his present Britannic majesty's youngest sister, the princess Carolina-Matilda. This alliance, though it wore at first a very promising appearance, had a very unfortunate termination. This is partly attributed to the intrigues of the queen dowager, mother-in-law to the present king, who has a son named Frederic, and whom she is represented as desirous of raising to the throne. She possesses a great degree of dissimulation, and when the princess Carolina-Matilda came to Copenhagen, she received her with all the appearance

of friendship and affection, acquainting her with all the king's faults, and at the same time telling her, that she would take every opportunity as a mother to assist her in reclaiming him. By this conduct, she became the depository of all the young queen's secrets, whilst at the same time it is said she placed people about the king, to keep him constantly engaged in all kinds of riot or debauchery, to which she knew he was naturally too much inclined; and at length it was so ordered, that a mistress was thrown in the king's way, whom he was persuaded to keep in his palace. When the king was upon his travels, the queen dowager used frequently to visit the young queen Matilda; and under the mask of friendship and affection, told her often of the debaucheries and excesses which the king had fallen into in Holland, England, and France, and often persuaded her not to live with him. But as soon as the king returned, the queen reproaching him with his conduct, though in a gentle manner, his mother-in-law immediately took his part, and endeavoured to persuade the king to give no ear to her counsels, as it was presumption in a queen of Denmark to direct the king. Queen Matilda now began to discover the designs of the queen dowager, and afterwards lived upon very good terms with the king, who for a time was much reclaimed. The young queen also now assumed to herself the part which the queen dowager had been complimented with, the management of public affairs. This stung the old queen to the quick; and her thoughts were now entirely occupied with schemes of revenge. She at length found means to gratify it in a very ample manner. About the end of the year 1770, it was observed that Brandt and Struensee were particularly regarded by the king; the former as a favourite, and the latter as a minister, and that they paid great court to queen Matilda, and were supported by her. This opened a new scene of intrigue at Copenhagen; all the discarded placemen paid their court to the queen-dowager, and she became the head and patroness of the party. Old count Molke, an artful displaced statesman, and others, who were well versed in intrigues of this nature, perceiving that they had unexperienced young persons to contend with, who though they might mean well, had not sufficient knowledge and capacity to conduct the public affairs, very soon predicted their ruin. Struensee and Brandt wanted to make a reform in the administration of public affairs at once, which should have been the work of time: and thereby made a great number of enemies, among those whose interest it was that things should continue upon the same footing that they had been for some time before. After this queen Matilda was delivered of a daughter, but as soon as the queen-dowager saw her, she immediately turned back, and with a malicious smile, declared, that the child had all the features of Struensee: on which her friends published it among the people, that the queen must have had an intrigue with Struensee; which was corroborated by the queen's often speaking with this minister in public. A great variety of evil reports were now propagated against the reigning queen; and another report was also industriously spread, that the governing party had formed a design to supersede the king, as being incapable of governing; that the queen was to be declared regent during the minority of her son; and that Struensee was to be her prime-minister. Whatever Struensee did to reform the abuses of the late ministry, was represented to the people as so many attacks upon, and attempts to destroy, the government of the kingdom. By such means the people began to be greatly incensed against this minister: and as he also wanted to make a reform in the military, he gave great offence to the troops, at the head of which were some of the creatures of the queen dowager, who took every opportunity to make their inferior officers believe, that

it was the design of Struensee to change the whole system of government. It must be admitted, that this minister seems in many respects to have acted very imprudently, and to have been too much under the guidance of his passions; his principles also appear to have been of the libertine kind.

Many councils were held between the queen-dowager and her friends, upon the proper measures to be taken for effectuating their designs: and it was at length resolved to surprize the king in the middle of the night, and force him immediately to sign an order, which was to be prepared in readiness, for committing the persons before mentioned to separate prisons, to accuse them of high treason in general, and in particular of a design to poison, or dethrone the king; and that if that could not be properly supported by torture, or otherwise, to procure witnesses to confirm the report of a criminal commerce between the queen and Struensee. This was an undertaking of so hazardous a nature, that the wary count Moltke, and most of the queen-dowager's friends, who had any thing to lose, drew back, endeavouring to animate others, but excusing themselves from taking any open and active part in this affair. However the queen-dowager at last procured a sufficient number of active instruments for the execution of her designs. On the 16th of January, 1772, a masked ball was given at the court of Denmark. The king had danced at this ball, and afterwards played at quadrille with general Gähler, his lady and counsellor Struensee, brother to the count. The queen, after dancing as usual one country-dance with the king, gave her hand to count Struensee during the remainder of the evening. She retired about two in the morning, and was followed by him and count Brandt. About four the same morning, prince Frederic, who had also been at the ball, got up and dressed himself, and went with the queen-dowager to the king's bed chamber, accompanied by general Eichstedt and count Rantzau. They ordered his majesty's valet-de-chambre to awake him, and in the midst of the surprize and alarm, that this unexpected intrusion excited, they informed him, that queen Matilda and the two Struensees were at that instant busy in drawing up an act of renunciation of the crown, which they would immediately after compel him to sign: and that the only means he could use to prevent so imminent a danger, was to sign those orders without loss of time, which they had brought with them, for arresting the queen and her accomplices. It is said, that the king was not easily prevailed upon to sign these orders; but at length complied, though with reluctance and hesitation. Count Rantzau, and three officers, were dispatched at that untimely hour to the queen's apartments, and immediately arrested her. She was put into one of the king's coaches, in which she was conveyed to the castle of Cronenburgh, together with the infant princefs, attended by lady Brandt, and escorted by a party of dragoons. In the mean time, Struensee, Brandt were also seized in their beds, and imprisoned in the castle. Struensee's brother, some of his adherents, and most of the members of the late administration, were seized the same night, to the number of about eighteen, and thrown into confinement. The government after this seemed to be entirely lodged in the hands of the queen-dowager and her son, supported and assisted by those who had the principal share in the revolution; so that the king appeared to be little more than a pageant, whose person and name it was necessary occasionally to make use of. All the officers who had a hand in the revolution were immediately promoted, and an almost total change took place in all the departments of administration. A new council was appointed, in which prince Frederic presided, and a commission of eight members, to examine the papers of the prisoners, and to com-

mence a process against them. The son of queen Matilda, the prince royal who was entered into the fifth year of his age, was put into the care of a lady of quality, who was appointed governess under the superintendency of the queen-dowager. Struensee and Brandt were put in irons, and very rigorously treated in prison: they both underwent long and frequent examinations, and at length received sentence of death. They were beheaded on the 28th of April, having their right hands previously cut off; but many of their friends and adherents were afterwards set at liberty. Struensee at first had absolutely denied having any criminal intercourse with the queen; but this he afterwards confessed; and though he is said by some to have been induced to do this only by the fear of torture, the proofs of his guilt in this respect were esteemed notorious, and his confessions full and explicit. Besides, no measures were adopted by the court of Great Britain to clear up the queen's character, in this respect. But in May, his Britannic majesty sent a small squadron of ships to convey that princess to Germany, and appointed the city of Zell, in his electoral dominions, for the place of her future residence. She died there, of a malignant fever, on the 10th of May, 1775, aged 23 years and 10 months.

In 1780, his Danish majesty acceded to the armed neutrality proposed by the empress of Russia. He appears at present to have such a debility of understanding, as to disqualify him for the proper management of public affairs; but on the 16th of April, 1784, another court revolution took place. The queen-dowager's friends were removed, a new council formed under the auspices of the prince royal, some of the former old members restored to the cabinet, and no regard is to be paid for the future to any instrument, unless signed by the king, and counter-signed by the prince royal.

The conduct of this prince is stamped with that consistency of behaviour, which enables him to pursue, with unremitting zeal, the prudent and benevolent schemes, which he has planned for the benefit of his grateful country. The restoration of the peasantry to their long-lost liberty, and the abolition of many grievances under which they laboured, have already been distinctly mentioned. To this may be added the exertions he makes for the general diffusion of knowledge; the patronage he affords to societies of learning, arts, and science; the excellent measures he has adopted for the suppression of beggars, with whom the country was over-run, and the encouragement of industry, by the most extensive enquiries into the state of the poor throughout the kingdom; the wise regulations he has introduced into the corn-trade, equally beneficial to the landed interest and to the poor; and the judicious laws, which under his influence have been made to encourage foreigners to settle in Iceland. If any thing is wanting to complete his happiness, his late matrimonial choice crowns it. The princess of Hesse Cassel, whom he has chosen, is said to possess the most amiable disposition and goodness of heart.

Count Schimmelmann, minister of state, finances, and commerce, has the merit of accomplishing the abolition of the slave-trade among the subjects of Denmark. His plan was approved by the king on the 22d of February, 1792, and is to be gradual; and in 1803, all trade in negroes is to cease on the part of Danish subjects. The disinterestedness of this minister, who possesses large estates in the Danish West India islands, recommends his exertions to greater praise. The above ordinance does not seem to have caused any stir in Denmark among the West India merchants, and it is not thought it will cause any in the islands.

A scheme for defraying the national debt has been suggested and followed. One million has already been discharged.

Denmark, has as yet refused to join any confederacy against France. Whether the Danish monarch, will acquiesce in her usurpation and robberies is uncertain.

Christian VII. reigning king of Denmark and Norway, L.L. D. and F. R. S. was born in 1749; in 1756 he was married to the princess Carolina Matilda of England; and has issue, 1. Frederic, prince-royal of Denmark, born January 28, 1768, and married in 1790, to the princess Mary-Anne Frederica, of Hesse. 2. Louisa Augusta, princess-royal, born July 7, 1771, and married May 27, 1786, to Frederic, prince of Sleswick-Holstein, by whom she has issue.

Brothers and sisters to the king. 1. Sophia Magdalene, born July 3, 1746, married to the late king of Sweden, Gustavus III.—2. Wilhelmina, born July 19, 1747; married Sept. 1, 1764, William, the present prince of Hesse-Cassel.—3. Louisa, born Jan. 30, 1750; married Aug. 30, 1766, Charles, brother to the prince of Hesse-Cassel.—4. Frederic, born Oct. 28, 1753.

HIS DANISH MAJESTY'S GERMAN DOMINIONS.

HOLSTEIN, a duchy of Lower Saxony, about 100 miles long and 50 broad, and a fruitful country, was formerly divided between the empress of Russia (termed Ducal Holstein), the king of Denmark, and the imperial cities of Hamburg and Lubeck; but on the 16th of November, 1773, the Ducal Holstein, with all the rights, prerogatives, and territorial sovereignty, was formally transferred to the king of Denmark, by virtue of a treaty between both courts. The duke of Holstein Gottorp is joint sovereign of great part of it now, with the Danish monarch. Kiel is the capital of Ducal Holstein, and is well built, has a harbour, and neat public edifices. The capital of the Danish Holstein is Gluckstadt, a well-built town and fortress, but in a marshy situation on the right of the Elbe, and has some foreign commerce.

Altena, a large populous and handsome town, of great traffic, is commodiously situated on the Elbe, in the neighbourhood of Hamburg. It was built professedly in that situation by the kings of Denmark, that it might share in the commerce of the former. Being declared a free port, and the staple of the Danish East India company, the merchants also enjoying liberty of conscience, great numbers flock to Altena from all parts of the North, and even from Hamburg itself.

The famous city of Hamburg lies, in a geographical sense, in Holstein; but is an imperial, free, and Hanseatic city, lying on the verge of that part of Holstein, called Stormar. It has the sovereignty of a small district round it, of about ten miles circuit: it is one of the most flourishing commercial towns in Europe; and though the kings of Denmark still lay claim to certain privileges within its walls, it may be considered as a well-regulated commonwealth. The number of its inhabitants are said to amount to 180,000; and it is furnished with a vast variety of noble edifices, both public and private: it has two spacious harbours, formed by the river Elbe, which runs through the town, and 84 bridges are thrown over its canals. Hamburg has the good fortune of having been peculiarly favoured in its commerce by Great Britain, with whom it still carries on a great trade. The

Hamburgers maintain twelve companies of foot, and one troop of dragoons, besides an artillery company.

Lubec, an imperial city, with a good harbour, and once the capital of the Hanse towns, and still a rich and populous place, is also in this duchy, and governed by its own magistrates. It has 20 parish churches besides a large cathedral. Lutheranism is the established religion of the whole duchy.

In WESTPHALIA, the king of Denmark has the counties of Oldenburg and Delmenhorst, about 2000 square miles; they lie on the south side of the Weser; their capitals have the same name; the first has the remains of a fortification, and the last is an open place. Oldenburg gave a title to the first royal ancestor of his present Danish majesty. The country abounds with marshes and heaths, but its horses are the best in Germany.

L A P L A N D.

THE northern situation of Lapland, and the division of its property, require, before I proceed farther, that I should treat of it under a distinct head, and in the same method that I observe in other countries.

SITUATION, EXTENT, DIVISION, } The whole country of Lapland ex-
AND NAME. } tends, so far as it is known, from the
North Cape in $71^{\circ} 30'$ N. lat. to the White Sea, under the arctic circle. Part of Lapland belongs to the Danes, and is included in the government of Wardhuys; part to the Swedes, which is by far the most valuable; and some parts in the east, to the Muscovites or Russians. It would be little better than wasting the reader's time, to pretend to point out the supposed dimensions of each. That belonging to the Swedes may be seen in the table of dimensions given in the account of Sweden: but other accounts say, that it is about 100 German miles in length, and 90 in breadth: it comprehends all the country from the Baltic, to the mountains that separate Norway from Sweden. The Muscovite part lies towards the east, between the lake Enarak and the White Sea. Those parts, notwithstanding the rudeness of the country, are divided into smaller districts, generally taking their names from rivers: but, unless in the Swedish part, which is subject to a prefect, the Laplanders can be said to be under no regular government. The Swedish Lapland, therefore, is the object chiefly considered by authors in describing this country. It has been generally thought, that the Laplanders are the descendants of Finlanders driven out of their own country, and that they take their name from *Lapper*, which signifies exiles. The reader, from what has been said in the Introduction, may easily conceive that in Lapland, for some months in the summer, the sun never sets; and during winter, it never rises: but the inhabitants are so well assisted by the twilight and the aurora borealis, that they never discontinue their work through darkness.

CLIMATE.] In winter it is no unusual thing for their lips to be frozen to the cup in attempting to drink; and in some thermometers, spirits of wine are concentered into ice: the limbs of the inhabitants very often mortify with cold: drifts of snow threaten to bury the traveller, and cover the ground four or five feet deep. A thaw sometimes takes place, and then the frost that succeeds, presents the Laplander with a smooth level of ice, over which he travels with a rein-deer in a sledge with inconceivable swiftness. The heats of summer are excessive for a short time; and the cat-
aracts,

tracts, which dash from the mountains, often present to the eye the most picturesque appearances.

MOUNTAINS, RIVERS, LAKES; AND FORESTS. } The reader must form in his mind a vast mass of mountains, irregularly crowded together, to give him an idea of Lapland; they are, however, in some interstices, separated by rivers and lakes, which contain an incredible number of islands, some of which form delightful habitations, and are believed by the natives to be the terrestrial Paradise; even roses and other flowers grow wild on their borders in the summer; though this is but a short gleam of temperature, for the climate in general is excessively severe. Dusky forests, and noisome, unhealthy morasses, and barren plains, cover great part of the flat country, so that nothing can be more uncomfortable than the state of the inhabitants.

METALS AND MINERALS. } Silver and gold mines, as well as those of iron copper and lead, have been discovered and worked in Lapland to great advantage; beautiful crystals are found here, as are some amethysts and topazes; also various sorts of mineral stones, surprisingly polished by the hand of nature; valuable pearls have likewise been sometimes found in these rivers, but never in the seas.

QUADRUPEDS, BIRDS, FISHES, AND INSECTS. } We must refer to our account of Denmark and Norway for great part of this article, as its contents are in common with all the three countries. The *sibelin*, a creature resembling the marten, is a native of Lapland; and its skin, whether black or white, is so much esteemed, that it is frequently given as presents to royal and distinguished personages. The Lapland hares grow white in the winter; and the country produces a large black cat, which attends the natives in hunting. By far the most remarkable, however of the Lapland animals, is the *rein-deer*; which nature seems to have provided to solace the Laplanders for the privations of the other comforts of life. This animal, the most useful perhaps of any in the creation, resembles the stag, only it somewhat droops the head, and the horns project forward. All describers of this animal have taken notice of the cracking noise that they make when they move their legs, which is attributed to their separating and afterwards joining together the divisions of the hoof. The under part is entirely covered with hair, in the same manner that the claw of the *Ptarmigan* is with feathery bristles, which is almost the only bird that can endure the rigour of the same climate. The hoof however is not only thus protected; the same necessity which obliges the Laplanders to use snow shoes, makes the extraordinary width of the rein's hoof to be equally convenient in passing over snow, as it prevents their sinking too deep, which they continually would, did the weight of their body rest only on a small point. This quadruped hath therefore an instinct to use a hoof of such a form in a still more advantageous manner, by separating it when the foot is to touch the ground so as to cover a larger surface of snow. The instant however the leg of the animal is raised, the hoof is immediately contracted, and the collision of the parts occasions the snapping which is heard on every motion of the rein. And probably the cracking which they perpetually make, may serve to keep them together when the weather is remarkably dark. In summer, the rein-deer provide themselves with leaves and grass, and in the winter they live upon moss: they have a wonderful sagacity at finding it out, and when found, they scrape away the snow that covers it with their feet. The scantiness of their fare is inconceivable, as is the length of their journeys which they can perform without any other support. They fix the rein-deer to a kind of sledge, shaped like

like a small boat, in which the traveller well secured from cold, is laced down with the reins in one hand, and a kind of bludgeon in the other, to keep the carriage clear of ice and snow. The deer, whose harnessing is very simple, sets out, and continues the journey with prodigious speed; and is so safe and tractable, that the driver is at little or no trouble in directing him. At night they look out for their own provender; and their milk often helps to support their master. Their instinct in choosing their road, and directing their course, can only be accounted for by their being well acquainted with the country during the summer months, when they live in woods. Their flesh is a well tasted food, whether fresh or dried; their skin forms excellent cloathing both for the bed and body; their milk and cheese are nutritive and pleasant; and their intestines and tendons supply their masters with thread and cordage. When they run about wild in the fields, they may be shot at as other game. But it is said that if one is killed in a flock, the survivors will gore and trample him to pieces; therefore single stragglers are generally pitched upon. Were I to recount every circumstance, related by the credulous, of this animal, the whole would appear fabulous. With all their excellent qualities, however, the rein-deer have their inconveniences.

It is difficult in summer to keep them from straggling; they are sometimes buried in the snow; and they frequently grow restive, to the great danger of the driver and his carriage. Their surprising speed (for they are said to run at the rate of 200 miles a-day) seems to be owing to their impatience to get rid of their incumbrance. None but a Laplander could bear the uneasy posture in which he is placed, when he is confined in one of these carriages or pulkhas; or would believe, that, by whispering the rein-deer in the ear, they know the place of their destination. But after all these abatements, the natives would have difficulty to subsist without the rein-deer, which serve them for so many purposes.

PEOPLE, CUSTOMS, AND MANNERS.] The language of the Laplanders is of Finnish origin, and comprehends so many dialects, that it is with difficulty they understand each other. They have neither writing nor letters among them, but a number of hieroglyphics, which they make use of in their Rounes, a sort of flick that they call Pitave, and which serve them for an almanack. These hieroglyphics are also the marks they use instead of signatures, even in matters of law. Missionaries from the christianized parts of Scandinavia introduced among them the Christian religion; but they cannot be said even yet to be Christians, though they have among them some religious seminaries, instituted by the king of Denmark. Upon the whole the majority of the Laplanders practice as gross superstitions and idolatries as are to be found among the most unimstructed pagans; and so absurd, that they scarcely deserve to be mentioned, were it not that the number and oddities of their superstitions have induced the northern traders to believe that they are skilful in magic and divination. For this purpose their magicians, who are a peculiar set of men, make use of what they call a drum, made of the hollow trunk of a fir, pine, or birch tree, one end of which is covered with a skin; on this they draw with a kind of red colour, the figures of their own gods, as well as of Jesus Christ, the apostles, the sun, moon, stars, birds, and rivers; on these they place one or two brass rings, which, when the drum is beaten with a little hammer, dance over the figures; and according to their progress the forecer prognosticates. These frantic operations are generally performed for gain; and the northern ship-masters are such dupes to the arts of these impostors, that they often buy from them a magic cord, which contains a number of knots, by opening of which, according to the

magician's directions they gain what wind they want. This is also a very common traffic on the banks of the Red Sea, and is managed with great address on the part of the sorcerer, who keeps up the price of his knotted talisman. The Laplanders still retain the worship of many of the Teutonic gods; but have among them great remains of the Druidical institutions. They believe the transmigration of the soul, and have festivals set apart for the worship of certain geni, called Jeuhles, who they think inhabit the air, and have great power over human actions; but being without form or substance, they assign to them neither images nor statues.]

Agriculture is not much attended to in Lapland. The soil of Lapland is generally so chilled and barren, that it produces little or no grain or fruit-trees of any kind. This sterility, however, is not so much owing to the soil, which is in many places of a rich mould, as to want of industry. They are chiefly divided into Lapland fishers, and Lapland mountaineers. The former always make their habitations on the brink, or in the neighbourhood of some lake, from whence they draw their subsistence. The others seek their support upon the mountains, and their environs, possessing herds of rein-deer more or less numerous, which they use according to the season, but go generally on foot. They are excellent and very industrious herdsmen, and are rich in comparison of the Lapland fishers. Some of them possess six hundred or a thousand rein-deer, and have often money and plate besides. They mark every rein-deer on the ears, and divide them into classes; so that they instantly perceive whether any one is strayed, though they cannot count to so great a number as that to which their stock often amounts. Those who possess but a small stock, give to every individual a proper name. The Lapland fishers, who are also called Laplanders of the Woods, because in summer they dwell upon the borders of the lakes, and in winter in the forests, live by fishing and hunting, and choose their situation by its convenience for either. The greatest part of them, however, have some rein-deer. They are active and expert in the chase: and the introduction of fire-arms among them has almost entirely abolished the use of the bow and arrow. Besides looking after the rein-deer, the fishery, and the chase, the men employ themselves in the construction of their canoes, which are small, light, and compact. They also make sledges, to which they give the form of a canoe, harnesses for the rein-deer, cups, bowls, and various other utensils, which are sometimes neatly carved, and sometimes ornamented with bones, brass, or horn. The employment of the women consists in making nets for the fishery, in drying fish and meat, in milking the rein-deer, in making cheese, and tanning hides: but it is understood to be the business of the men to look after the kitchen; in which it is said, the women never interfere.

The Laplanders live in huts in the form of tents. A hut is about twenty-five to thirty feet in diameter, and not much above six in height. They cover them according to the season, and the means of the possessor; some with briars, bark of birch, and linen; others with turf, coarse cloth, or felt, or the old skins of rein-deer. The door is of felt, made like two curtains which open asunder. A little place surrounded with stones is made in the middle of the hut for the fire, over which a chain is suspended to hang the kettle upon. They are scarcely able to stand upright in their huts, but constantly sit upon their heels round the fire. At night they lie down quite naked; and, to separate the apartments, they place upright sticks at small distances. They cover themselves with their clothes, or lie upon them. In winter, they put their naked feet into a fur bag. Their household furniture consists of iron or copper kettles, wooden cups, bowls, spoons, and sometimes tin, or even silver

silver basons; to these may be added, the implements of fishing and hunting. That they may not be obliged to carry such a number of things with them in their excursions, they build in the forests, at certain distances, little huts, made like pigeon-houses, and placed upon a post, which is the trunk of a tree, cut off at the height of about a fathom or six feet from the root. In these elevated huts they keep their goods and provisions; and though they are never shut, yet they are never plundered. The rein-deer supply the Laplanders with the greatest part of their provisions; the chase and the fishery supply the rest. Their principal dishes are the flesh of the rein-deer, and puddings which they make with their blood, by putting it either alone or mixed with wild berries, into the stomach of the animal from whence it was taken, in which they cook it for food. But the flesh of the bear is considered by them as their most delicate meat. They eat every kind of fish, even the sea-dog; as well as all kinds of wild animals, not excepting birds of prey, and carnivorous animals. Their winter provisions consist chiefly of flesh and fish dried in the open air, both of which they eat raw, without any sort of dressing. Their common drink is water, sometimes mixed with milk; they make also broths and fish-soups. Brandy is very scarce with them, but they are extremely fond of it. Whenever they are inclined to eat, the head of the family spreads a carpet on the ground; and then men and women squat round this mat, which is covered with dishes. Every Laplander always carries about him a knife, a spoon, and a little cup for drinking. Each has his portion separately given him, that no person may be injured; for they are great eaters. Before and after the meal they make a short prayer; and, as soon as they have done eating, each gives the other his hand.

The summer garb of the men consists of a long coat of coarse cloth, reaching down the middle of the leg, and girded round the waist with a belt or girdle; from which hang a Norway knife, and a pouch containing flints, matches, tobacco, and other necessaries; the girdle itself being decorated with brass rings and chains. Their caps are made of the skin of the northern diver, with the feathers on; and their shoes of the rein-deer skin, with the hair outwards. They wear no linen; but the garments of the better sort are of a finer cloth, and they delight in a variety of colours, though red, as the most glaring, is the most agreeable. In winter they are totally cased up in coats, caps, boots, and gloves, made of the rein-deer skins.

The women's apparel differs very little from that of the other sex; only their girdles are more ornamented with rings, chains, needle-cases, and toys that sometimes weigh 20 pounds. In winter, both men and women lie in their furs; in summer they cover themselves entirely with coarse blankets to defend them from the gnats which are intolerable. The Laplanders are not only well disposed, but naturally ingenious. They make all their own furniture, their boats, sledges, bows and arrows. They form neat boxes of thin birch boards, and inlay them with the horn of the rein-deer.

The Laplanders make surprising excursions upon the snow in their hunting expeditions. They provide themselves each with a pair of skates, or snow-shoes, which are no other than fir-boards covered with the rough skin of the rein-deer, turned in such a manner that the hair rises against the snow, otherwise they would be too slippery. One of these shoes is usually as long as the person who wears it; the other is about a foot shorter. The feet stand in the middle, and to them the shoes are fastened by thongs or withes. The Laplander thus equipped wields a long pole in his hand, near the end of which there is a round ball of wood to prevent its piercing too deep in the snow; and with this he stops himself occasionally. By means of these

accoutrements he will travel at the rate of 60 miles a-day without being fatigued; ascending steep mountains, and sliding down again with amazing swiftness.

Lapland is but poorly peopled, owing to the general barrenness of its soil. The whole number of its inhabitants may amount to about 60,000. Both men and women are considerably shorter than more southern Europeans. Maupertuis measured a woman who was suckling her child, whose height did not exceed four feet two inches and a half; they make, however, a much more agreeable appearance than the men, who are often ill-shaped and ugly, and their heads too large for their bodies. Their women are complaisant, chaste, often well made, and extremely nervous; which is also observable among the men, although more rarely. It frequently happens, that a Lapland woman will faint away, or even fall into a fit of frenzy, on a spark of fire flying towards her, an unexpected noise, or the sudden light of an unexpected object, though in its own nature not in the least alarming; in short, at the most trifling things imaginable. During these paroxysms of terror, they deal about blows with the first thing that presents itself; and on coming to themselves are utterly ignorant of all that has passed.

When a Laplander intends to marry a female, he, or his friends court her father with brandy, when, with some difficulty, he gains admittance to his fair one, he offers her a beaver's tongue, or some other eatable; which she rejects before company, but accepts of in private. Cohabitation often precedes marriage; but every admittance to the fair one is purchased from her father, by her lover, with a bottle of brandy, and this prolongs the courtship sometimes for three years. The priest of the parish at last celebrates the nuptials; but the bridegroom is obliged to serve his father-in-law for four years after. He then carries his wife and her fortune home.

[COMMERCE.] Little can be said of the commerce of the Laplanders. Their exports consist of fish, rein-deer, furs, baskets, and toys; with some dried pikes, and cheeses made of rein-deer milk. They receive for these six-dollars, woollen cloths, linnen, copper, tin, flour, oil, hides, needles, knives, spirituous liquors, tobacco and other necessaries. Their mines are generally worked by foreigners, and produce no inconsiderable profit. The Laplanders travel in a kind of caravan, with their families, to the Finland and Norway fairs. The reader may make some estimate of the medium of commerce among them, when he is told, that fifty squirrel skins, or one fox skin, and a pair of Lapland shoes, produce one rixdollar; but no computation can be made of the public revenue, the greatest part of which is allotted for the maintenance of the clergy. With regard to the security of their property, few disputes happen; and their judges have no military to enforce their decrees, the people having a remarkable aversion to war; and, so far as we know, are never employed in any army.

Of Gothland, the following are the subdivisions ;

East Gothland,	Dalia
West Gothland,	Schonen,
Smaland,	Bleking,
Wermeland,	Halland.

Of Swedish Lapland, the following are the subdivisions :

Thorne Lapmark,	Pithia Lapmark,
Kimi Lapmark,	Uma Lapmark.
Lula Lapmark.	

The principal places in West Bothnia are Umea, Pitea, and Tornea.

Of Finland, the following are the subdivisions :

East Bothnia,	Nyland,
Cajania,	Travastia,
Savoloxia,	Finland Proper.

The Swedish isles are Gothland, Oeland, Aland, and Rugen.

The face of Sweden is pretty similar to those of its neighbouring countries ; only it has the advantage of navigable rivers.

CLIMATE AND SEASONS, SOIL, } The same may be said with regard to
AND PRODUCTIONS. } this article. Summer bursts from winter ; and vegetation is more speedy than in southern climates ; for the sun is here so hot, as sometimes to set forests on fire. Stoves and warm furs mitigate the cold of winter, which is so intense, that the noses and extremities of the inhabitants are sometimes mortified ; and in such cases, the best remedy that has been found out, is rubbing the affected part with snow. The Swedes, since the days of Charles XII. have been at incredible pains to correct the native barrenness of their country, by erecting colleges of agriculture, and in some places with great success. The soil is much the same with that of Denmark, and some parts of Norway, generally very bad, but in some vallies surprisngly fertile. The Swedes, till of late years, had not industry sufficient to remedy the one, nor improve the other. The peasants now follow the agriculture of France and England ; and some late accounts say, that they raise almost as much grain as maintains the natives. Gothland produces wheat, rye, barley, oats, peas and beans ; and in case of deficiency, the people are supplied from Livonia and the Baltic provinces. In summer, the fields are verdant, and covered with flowers, and produce strawberries, raspberries, currants, and other small fruits. The common people knew, as yet, little of the cultivation of apricots, peaches, nectarines, pine-apples, and the like high flavoured fruits ; but melons are brought to great perfection in dry seasons.

MINERALS AND METALS.] Sweden produces crystals, amethysts, topazes, porphyry, lapis-lazuli, agate, cornelian, marble, and other fossils. The chief wealth of Sweden, however arises from her mines of silver, copper, lead, and iron. The last mentioned metal employs no fewer than 450 forges, hammering mills, and smelting-houses. A kind of a gold mine has likewise been discovered in Sweden, but so inconsiderable, that from the

strong a

year 1741 to 1747, it produced only 2,389 gold ducats, each valued at 9s. 4d. sterling. The first gallery of one silver mine is 100 fathoms below the surface of the earth; the roof is supported by prodigious oaken beams; and from thence the miners descend about 40 fathoms to the low-ell vein. This mine is said to produce 20,000 a year. The product of the copper-mines is uncertain; but the whole is loaded with vast taxes and reductions to the government, which has no other resources for the exigencies of state. These subterraneous mansions are astonishingly spacious, and at the same time commodious for their inhabitants, so that they seem to form a hidden world. The water-falls in Sweden afford excellent conveniency for turning mills for forges; and some years the exports of Sweden for iron brought in 300,000 l. sterling. Dr. Bunting thinks that they constituted two-thirds of the national revenue. It must, however, be observed that the extortions of the Swedish government, and the importation of American bar-iron into Europe, and some other causes, have greatly diminished this manufacture of Sweden; so that the Swedes will be obliged to apply themselves to other branches of trade and improvements, especially in agriculture.

ANTIQUITIES AND CURIOSITIES, } A few leagues from Gottenburgh
NATURAL AND ARTIFICIAL } there is a hideous precipice, down
which a dreadful cataract of water rushes with such impetuosity, from the height into so deep a bed of water, that large masts, and other bodies of timber, that are precipitated down it, disappear, some for half an hour, and others for an hour, before they are recovered; the bottom of this bed has never been found, though sounded by lines of several hundred fathoms. A remarkable slimy lake which sings things put into it, has been found in the southern parts of Gothland: and several parts of Sweden contain a stone, which being of a yellow colour, intermixed with several streaks of white, as if composed of gold and silver, affords sulphur, vitriol, alum, and minium. The Swedes pretend to have a manuscript of a translation of the Gospels into Gothic, done by a bishop 1300 years ago.

SEAS.] Their seas are the Baltic, and the gulfs of Bothnia and Finland, which are arms of the Baltic; and on the west of Sweden are the Categate sea, and the Sound, a strait about four miles over, which divides Sweden from Denmark.

These seas have no tides, and are frozen up usually four months in the year; nor are they so salt as the ocean, never mixing with it, because a current sets always out of the Baltic sea into the ocean.

QUADRUPEDS, BIRDS AND FISHES.] These differ little from those already described in Norway and Denmark, to which I must refer; only the Swedish horses are known to be more serviceable in war than the German. The Swedish hawks, when carried to France, have been known to revisit their native country; as appears from one that was killed in Finland, with an inscription on a small gold plate, signifying that he belonged to the French king. The fishes found in the rivers and lakes of Sweden, are the same with those in other northern countries, and taken in such quantities, that their pickles (particularly) are salted and pickled for exportation. The train-oil of the seals taken in the gulf of Finland, is a considerable article of exportation.

INHABITANTS, MANNERS AND CUSTOMS.] There is a great diversity of characters among the people of Sweden; and what is peculiarly remarkable among them, they are known to have had different characters in different ages. At present, their peasants seem to be a heavy plodding race of men, strong and hardy; but without any other ambition than that of subsisting
themselves

themselves and their families as well as they can : the mercantile classes are much of the same cast ; but great application and perseverance is discovered among them all. One could, however, form no idea that the modern Swedes are descendants of those, who, under Gustavus Adolphus and Charles XII. carried terror in their names, through distant countries, and shook the foundations of the greatest empires. The intrigues of their senators dragged them to take part in the late war against Prussia ; yet their behaviour was spiritless, and their courage contemptible. The principal nobility and gentry of Sweden are naturally brave, polite, and hospitable ; they have high and warm notions of honour, and are jealous of their national interests. The dress, exercises, and diversions of the common people, are almost the same with those of Denmark : the better sort are infatuated with French modes and fashions. The women go to the plough, thresh out the corn, row upon the water, serve the bricklayers, carry burdens, and do all the common drudgeries in husbandry.

RELIGION.] Christianity was introduced here in the 9th century. Their religion is Lutheran, which was propagated amongst them by Gustavus Vasa, about the year 1523. The Swedes are surprisingly uniform and unremittent in religious matters ; and have such aversion to popery, that castration is the fate of every Roman catholic priest discovered in their country. The archbishop of Upsal has a revenue of about 400l. a-year ; and has under him 13 suffragans, besides superintendents, with moderate stipends. No clergyman has the least direction in the affairs of state ; but their morals and the sanctity of their lives endear them so much to the people, that the government would repent making them its enemies. Their churches are neat, and often ornamented. A body of ecclesiastical laws and canons direct their religious œconomy. A conversion to popery, or a long continuance under excommunication, which cannot pass without the king's permission, is punished by imprisonment and exile.

LANGUAGE, LEARNING, AND LEARNED MEN.] The Swedish language is a dialect of the Teutonic, and resembles that of Denmark. The Swedish nobility and gentry are, in general, more conversant in polite literature than those of many other more flourishing states. They have of late exhibited some noble specimens of their munificence for the improvement of literature ; witness their sending, at the expence of private persons, that excellent and candid natural philosopher Hasselquist, into the eastern countries for discoveries, where he died. This noble spirit is eminently encouraged by the royal family ; and her Swedish majesty purchased, at no inconsiderable expence for that country, all Hasselquist's collection of curiosities. That able civilian, statesman, and historian Puffendorf, was a native of Sweden ; and so was the late celebrated Linnæus, who carried natural philosophy, in some branches at least, particularly botany, to the highest pitch. The passion of the famous queen Christina for literature is well known to the public ; and she may be accounted a genius in many branches of knowledge. Even in the midst of the late distractions of Sweden, the fine arts, particularly drawing, sculpture, and architecture, were encouraged and protected. Agricultural learning, both in theory and practice, is now carried to a considerable height in that kingdom ; and the character given by some writers, that the Swedes are a dull heavy people, fitted only for bodily labour, is in a great measure owing to their having no opportunity of exerting their talents.

UNIVERSITIES.] The principal is that of Upsal, instituted near 400 years ago, and patronized by successive monarchs, particularly by the great

Gustavus Adolphus, and his daughter queen Christina. There are near 1500 students in this university; but for the most part they are extremely indigent, and lodge five or six together, in very poor hovels. The professors in different branches of literature are about twenty-two; of whom the principal are those of divinity, eloquence, botany, anatomy, chemistry, natural philosophy, astronomy, and agriculture. Their salaries are from 70*l.* to 100*l.* per annum. This university, justly called by Stillingfleet, "that great and hitherto unrivalled school of natural history," is certainly the first seminary of the North for academical education; and has produced, from the time of its institution, persons eminent in every branch of science. The learned publications, which have lately been given to the world by its members, sufficiently prove the flourishing state of literature in these parts; and the theses, composed by the students on their admission to their degrees would form a very interesting collection. Many of these tracts upon various subjects of polite literature, antiquities, languages, &c. evidence the erudition and taste of the respective authors; among the works of this sort which have widely diffused the fame of this learned society throughout Europe, are the *Amanitates Academica*, or a Collection of Theses upon Natural History, held under the celebrated Linnæus, and chiefly selected by that master.

There is another university at Abo, in Finland, but not so well endowed nor so flourishing; and there was a third at Lunden, in Schonen, which is now fallen into decay. Every diocese is provided with a free school, in which boys are qualified for the university*.

MANUFACTURES, TRADE, COMMERCE, AND CHIEF TOWNS. } The Swedish commonality subsist by agriculture, mining, grazing, hunting, and fishing. Their materials for traffic are bulky and useful commodities of masts, beams, deal-boards, and other sorts of timber for shipping; tar, pitch, bark of trees, pot-ash, woudden utensils, hides, flax, hemp, peltry, furs, copper, lead, iron, cordage, and fish. Even the manufacturing of iron was introduced into Sweden so late as the 16th century; for till that time they sold their own crude ore to the Hanse towns, and brought it back again manufactured into utensils. About the middle of the 17th century, by the assistance of the Dutch and Flemings, they set up some manufactures of glass, starch, tin, woollen, silk, soap, leather-dressing, and saw-mills. Bookselling was at that time a trade unknown in Sweden. They have since had sugar-baking, tobacco-plantations, and manufactures of sail-cloth, cotton, fustian, and other stuffs; of linnen, alum, and brimstone; paper-mills, and gunpowder-mills; vast quantities of copper, brass, steel, and iron, are now wrought in Sweden. They have also foundaries for cannon, forges for fire-arms and anchors, armories, wire and flating mills; mills also for fulling, and for boring and stamping; and of late they have built many ships for sale.

Certain towns in Sweden, 24 in number, are called Staple-towns, where the merchants are allowed to import and export commodities in their own ships. Those towns which have no foreign commerce, though lying near the sea, are called land-towns. A third kind are termed mine-towns, as belonging to the mine districts. The Swedes, about the year 1752, had greatly increased their exports, and diminished their imports, most part of which arrive or are sent off, in Swedish ships; the Swedes having now a kind of navigation act, like that of the English. These promising appear-

* An academy of arts and sciences was some years since established at Stockholm and is now in a flourishing condition. They have published several volumes of memoirs, which have been well received by the public.

ances, were, however, blasted, by the madness and jealousies of the Swedish government.

Stockholm is a staple-town, and the capital of the kingdom: it stands about 760 miles north-east of London, upon seven small rocky islands, besides two peninsulas, and built upon piles. It strikes a stranger with its singular and romantic scenery. A variety of contrasted and enchanting views are formed by numberless rocks of granite, rising boldly from the surface of the water, partly bare and craggy, partly dotted with houses, or feathered with wood. The harbour, which is spacious and convenient, though difficult of access, is an inlet of the Baltic; the water is clear as crystal, and of such depth that ships of the largest burthen can approach the quay, which is of considerable breadth, and lined with spacious buildings and warehouses. At the extremity of the harbour, several streets rise one above another in the form of an amphitheatre; and the palace, a magnificent building, crowns the summit. Towards the sea, about two or three miles from the town, the harbour is contracted into a narrow strait, and, winding among high rocks, disappears from the sight; and the prospect is terminated by distant hills, overpread with forest. It is far beyond the power of words, or of the pencil, to delineate these singular views. The central island, from which the city derives its name, and the Ritterholm, are the handsomest parts of the town.

Excepting in the suburbs, where the houses are of wood, painted red, the generality of the buildings are of stone, or brick, stuccoed white. The royal palace which stands in the centre of Stockholm, and upon the highest spot of ground, was begun by Charles XI.; it is a large quadrangular stone edifice, and the style of architecture is both elegant and magnificent*.

The number of house-keepers who pay taxes are 60,000. This city is furnished with all the exterior marks of magnificence, and erections for manufactures and commerce that are common to other great European cities, particularly a national bank, the capital of which is 466,666*l.* 13*s.* 4*d.* sterling.

GOVERNMENT.] The government of Sweden has undergone many changes. The Swedes, like the Danes, were originally free, and during the course of many centuries the crown was elective; but after various revolutions, which will be hereafter mentioned, Charles XII. who was killed in 1718, became despotic. He was succeeded by his sister Ulrica; who consented to the abolition of despotism, and restored the states to their former liberties; and they, in return associated her husband, the landgrave of Hesse Cassel, with her in the government. A new model of the constitution was then drawn up, by which the royal power was brought, perhaps, too low; for the king of Sweden could scarcely be called by that name, being limited in every exercise of government, and even in the education of his own children. The diet of the states appointed the great officers of the kingdom; and all the employments of any value, ecclesiastical, civil or military, were conferred by the king, only with the approbation of the senate. The estates were formed of deputies from the four orders, nobility, clergy, burghers, and peasants. The representatives of the nobility which included the gentry, amounted to above 1000, those of the clergy to 200, the burghers to about 150, and the peasants to 250. Each order sat in its own house, and had its own speaker; and each chose a secret committee for the dispatch of business. The states were to be convoked once in three years, in the month of

January, and their collective body had greater powers than the parliament of Great Britain; because as it has been observed, the king's prerogative was far more bounded.

When the states were not sitting, the affairs of the public were managed by the king and the senate, which were no other than a committee of the states, but chosen in a particular manner; the nobility, or upper house appointed 24 deputies, the clergy 12, and the burghers 12; these chose three persons, who were to be presented to the king, that he might nominate one out of the three for each vacancy. The peasants had no vote in electing a senator. Almost all the executive power was lodged in the senate, which consisted of 14 members, besides the chief governors of the provinces, the president of the chancery, and the grand-marshal. Those senators, during the recess of the states, formed the king's privy-council; but he had no more than a casting vote in their deliberations. Appeals lay to them from different courts of judicature; but each senator was accountable to the senate for his conduct to the states. Thus, upon the whole, the government of Sweden might be called republican, for the king's power was not so great as that of a stadtholder. The senate had even a power of imposing upon the king a sub-committee of their number, who were to attend upon his person, and to be a check upon all his proceedings, down to the very management of his family. It would be endless to recount the numerous subordinate courts, boards, commissions, and tribunals, which the jealousy of the Swedes had introduced into the civil, military, commercial, and other departments; it is sufficient to say, that though nothing could be more plausible, yet nothing was less practicable, than the whole plan of their distributive powers. Their officers and ministers, under the notion of making them checks upon one another, were multiplied to an inconvenient degree; and the operations of government were greatly retarded, if not rendered ineffectual, by the tedious forms through which they must pass.

But in August, 1772, the whole system of the Swedish government was totally changed by the late king, by force, and in the most unexpected manner. The circumstances which attended this extraordinary revolution, will be found at the close of our review of the history of Sweden. By that event the Swedes, instead of having the particular defects of their constitution rectified, found their king invested with a degree of authority little inferior to that of the most despotic princes of Europe. By the new form of government, the king into a sensible and separate the states whenever he pleases; he is to have the sole disposal of the army, the navy, finances, and all employments, civil and military; and though by this new system the king does not openly claim a power of imposing taxes on all occasions, yet such as already subsist are to be perpetual; and in case of invasion, or pressing necessity, the king may impose some taxes till the states can be assembled. But of this necessity he is to be the judge, and the meeting of the states depends wholly upon his will and pleasure. And when they are assembled, they are to deliberate upon nothing but what the king thinks proper to lay before them. It is easy to discern, that a government thus constituted, can be little removed from one of the most despotic kind. However, the Swedish nation is still amused with some slight appearances of a legal and limited government. For in the new system, which consists of fifty-seven articles, a senate is appointed, consisting of seventeen members, comprehending the great officers of the crown and the governor of Pomerania; and they are required to give their advice in all the affairs of the state, whenever the king shall demand it. In that case, if the questions agitated are of

great importance, and the advice of the senators should be contrary to the opinion of the king, and they unanimous therein, the king, it is said, shall follow their advice. But this, it may be observed, is a circumstance that can hardly ever happen, that all the members of a senate, consisting chiefly of officers of the crown, should give their opinions against the king; and in every other case the king is to hear their opinions, and then to act as he thinks proper. There are some other apparent restraints of the regal power in the new system of government, but they are in reality very inconsiderable. It is said, indeed, that the king cannot establish any new law, nor abolish any old one, without the knowledge and consent of the states; but the king of Sweden, according to the present constitution, is invested with so much authority, power, and influence, that it is hardly to be expected that any person will venture to make an opposition to whatever he shall propose.

PUNISHMENTS.] The common method of execution in Sweden is beheading and hanging; for murder, the hand of the criminal is first chopped off, and he is then beheaded, and quartered; women, after beheading, instead of being quartered are burned. No capital punishment is inflicted without the sentence being confirmed by the king. Every prisoner is at liberty to petition the king, within a month after the trial. The petitioner either complains of unjust condemnation, and in such a case demands a reversal of the sentence; or else prays for pardon, or a mitigation of punishment. Malefactors are never put to death, except for very atrocious crimes, such as murder, housebreaking, robbery upon the highway, or repeated thefts. Other crimes, many of which in some countries are considered as capital, are chiefly punished by whipping, condemnation to live upon bread and water, imprisonment, and hard labour, either for life, or for a stated time, according to the nature of the crime. Criminals were tortured to extort confession till the reign of the present king; but, in 1773, his late Swedish majesty abolished this cruel and absurd practice.

POLITICAL INTERESTS OF SWEDEN.] In the reign of Gustavus Vasa, a treaty of alliance first took place between Sweden and France; and afterwards Sweden also entered into a subsidiary treaty with France, in the reign of Gustavus Adolphus. In consequence of these treaties, France by degrees acquired an ascendancy in Sweden, which was very pernicious to the interests of that kingdom. This crown has generally received a subsidy from France for above 100 years past, and has much suffered by it. During the reign of Charles the XIth and Charles the XIIth, Sweden was sacrificed to the interest of France; and during the last war with the king of Prussia, for the sake of a small subsidy from France, the crown of Sweden was forced to contract a debt of 3,500,000*l.* which has since been considerably augmented, so that this debt now amounts to near five millions. Some of their wise men have perceived the mischievous tendency of their connection with France, and have endeavoured to put an end to it. But the influence of the French court in Sweden, in consequence of their subsidies and intrigues, has occasioned considerable factions in that kingdom. In 1738, a most powerful party appeared in the diet, in favour of French measures. The persons who composed it went under the denomination of *Horn*. The object held out to the nation was, the recovery of some of the dominions yielded to Russia; and consequently the system they were to proceed upon, was to break with that power, and connect themselves with France. The party directly opposed to them was headed by count Horn, and those who had contributed to establish the new form of government, which was settled after the death of Charles XII. Their object was peace, and the promotion

of the domestic welfare of the nation. The system therefore, which they adopted, was to maintain a close correspondence with Russia, and to avoid all farther connection with France. These were styled the *Cops*. There was besides a third party, called the *Hunting Cops*, composed of persons who were as yet undetermined to which of the other two they would join themselves. These parties long continued, but the French party generally prevailed, greatly to the detriment of the real interests of the kingdom. Some efforts were employed by the English court to lessen or destroy the French influence in Sweden, and for some time they were successful; but the Hat party again acquired the ascendancy. These parties, however, are now abolished, in consequence of the late king of Sweden having made such a total change in the constitution of the government.

REVENUE AND COIN.] The revenue of Sweden, by the unfortunate wars of Charles XII. and with the Russians since, has been greatly reduced. Livonia, Bremen, Verdun, and other places that kingdom was stripped of, contained about 78,000 square miles. Her gold and silver specie in the late reign, arose chiefly from the king's German dominions. Formerly, the crown-lands, poll-money, tithes, mines, and other articles, are said to have produced one million sterling. The payments that are made in copper, which is here the chief medium of commerce, is extremely inconvenient; some of those pieces being as large as tiles; and a cart or wheelbarrow is often required to carry home a moderate sum. The Swedes, however, have gold ducats, and eight-mark pieces of silver, valued each at 5s. 2d. but these are very scarce, and the inhabitants of Sweden have now very little specie in circulation: large pieces of copper stamped, and small bank notes, being almost their only circulating money.

STRENGTH AND FORCES.] I have already hinted, that no country in the world has produced greater heroes, or braver troops, than the Swedes; and yet they cannot be said to maintain a standing army, as their forces consist of a regulated militia. The cavalry is clothed, armed, and maintained, by a rate raised upon the nobility and gentry, according to their estates; and the infantry by the peasants. Each province is obliged to find its proportion of soldiers, according to the number of farms it contains; every farm of 60 or 70l. per annum, is charged with a foot-soldier, furnishing him with diet, lodging, and ordinary cloaths, and about 20s. a year in money; or else a little wooden house is built him by the farmer, who allows him hay and pasturage for a cow, and ploughs and sows land enough to supply him with bread. When embodied, they are subject to military law, but otherwise to the civil law of the country. It may therefore literally be said, that every Swedish soldier has a property in the country he defends. This national army is thought to amount to above 40,000 men, but before the loss of Livonia to 60,000; and Sweden formerly could have fitted out 40 ships of the line; but of late years their ships together with their docks, have been suffered greatly to run to decay.

ROYAL-STYLE.] The king's style is king of the Goths and Vandals, great prince of Finland, duke of Schonen, Pomerania, &c.

ORDERS OF KNIGHTHOOD.] These are the order of the *North or Polar Star*, consisting of 24 members; the order of *Vasa*; and the order of the *Sword*; the last created in 1772.

HISTORY OF SWEDEN.] The Goths, the ancient inhabitants of this country, joined by the Normans, Danes, Saxons, Vandals, &c. have had the reputation of subduing the Roman empire, and all the southern nations of Europe. I shall not here follow the wild romances of the Swedish histo-

rians through the early ages, from Magog, the great-grand-son of Noah. It is sufficient to say, that Sweden has as good a claim to be an ancient monarchy, as any we know of. Nor shall I dispute her being the paramount state of Scandinavia (Sweden, Denmark, and Norway,) and that she borrowed her name from one of her princes. The introduction of Christianity by Ansgarius bishop of Bremen, in 829, seems to present the first certain period of the Swedish history.

The history of Sweden, and indeed of all the northern nations, even during the first ages of Christianity, is confused and uninteresting, and often doubtful; but sufficiently replete with murders, massacres, and ravages. That of Sweden is void of consistency till about the middle of the fourteenth century, when it assumes an appearance more regular, and affords wherewith to recompense the attention of those who chuse to make it an object of their studies. At this time, however, the government of the Swedes was far from being clearly ascertained, or uniformly administered. The crown was elective, though in this election the rights of blood were not altogether disregarded. The great lords possessed the most considerable part of the wealth of the kingdom, which consisted chiefly in land; commerce being unknown or neglected, and even agriculture itself in a very rude and imperfect state. The clergy, particularly those of a dignified rank, from the great respect paid to their character among the inhabitants of the North, had acquired an immense influence in all public affairs, and obtained possessions of what lands had been left unoccupied by the nobility. These two ranks of men, enjoying all the property of the state, formed a council called the Senate, which was master of all public deliberations. This system of government was extremely unfavourable to the national prosperity. The Swedes perished in the dissensions between their prelates and lay-barons, or between those and their sovereign; they were drained of the little riches they possessed, to supply the indolent pomp of a few magnificent bishops; and, what was still more fatal, the unlucky situation of their internal affairs exposed them to the incursions and oppression of a foreign enemy. These were the Danes, who by their neighbourhood and power were always able to avail themselves of the dissensions of Sweden, and to subject under a foreign yoke, a country weakened and exhausted by its domestic broils. In this deplorable situation Sweden remained for more than two centuries; sometimes under the nominal subjection of its own princes, sometimes united to the kingdom of Denmark, and in either case equally oppressed and insulted.

Magnus Ladelus, crowned in 1276, seems to have been the first king of Sweden who pursued a regular system to increase his authority; and to succeed in this, he made the augmentation of the revenues of the crown his principal object. He was one of the ablest princes who had ever sat on the Swedish throne; by his art and address he prevailed upon the convention of estates to make very extraordinary grants to him for the support of his royal dignity. The augmentation of the revenues of the crown was naturally followed by a proportionable increase of the regal power; and whilst, by the steady and vigorous exertion of this power, Magnus humbled the haughty spirit of the nobles, and created in the rest of the nation a respect for the royal dignity, with which they appear before to have been but little acquainted; he, at the same time, by employing his authority in many respects for the public good, reconciled his subjects to acts of power, which in former monarchs they would have opposed with the utmost violence. The successors of Magnus did not maintain their authority with equal ability; and several commotions and revolutions followed, which threw the nation into great

disorder and confusion, and the government was for a long time in the most unsettled state.

In the year 1387, Margaret, daughter of Valdemar, king of Denmark, and widow of Huguin, king of Norway, reigned in both these kingdoms. That princess, to the ordinary ambition of her sex, added a penetration and enlargement of mind, which rendered her capable of conducting the greatest and most complicated designs. She has been called the Semiramis of the North, because, like Semiramis, she found means to reduce by arms, or by intrigue, an immense extent of territory; and became queen of Denmark, Norway, and Sweden, being elected to this last in 1394. She projected the union of Calmar, so famous in the North, by which these kingdoms were for the future to remain under one sovereign, elected by each kingdom in its turn, and who should divide his residence between them all. Several revolutions ensued after the death of Margaret; and at length Christian II, the last king of Denmark, who, by virtue of the treaty of Calmar, was also king of Sweden, engaged in a scheme to render himself entirely absolute. The barbarous policy by which he attempted to effect this design no less barbarous, proved the destruction of himself, and afforded an opportunity for changing the face of affairs in Sweden. In order to establish his authority in that kingdom, he laid a plot for massacring the principal nobility. This horrid design was actually carried into execution, Nov. 8, 1520. Of all those who could oppose the despotic purposes of Christian, no one remained in Sweden, but Gustavus Vasa, a young prince, descended of the ancient kings of that country, and who had already signalized his arms against the king of Denmark. An immense price was laid on his head. The Danish soldiers were sent in pursuit of him; but by his dexterity and address he eluded all their attempts, and escaped, under the disguise of a peasant, to the mountains of Dalecarlia. This is not the place to relate his dangers and fatigues, how to prevent his discovery he wrought in the brass-mines, how he was betrayed by those in whom he reposed his confidence, and in fine surmounting a thousand obstacles, engaged the savage, but warlike inhabitants of Dalecarlia, to undertake his cause, to oppose and to conquer his tyrannical oppressor. Sweden by his means, again acquired independence. The ancient nobility were mostly destroyed. Gustavus was at the head of a victorious army who admired his valour, and were attached to his person. He was created therefore first administrator, and afterwards king of Sweden, by the universal consent, and with the shouts of the whole nation. His circumstances were much more favourable than those of any former prince who had possessed this dignity. The massacre of the nobles, had rid him of those proud and haughty enemies, who had so long been the bane of all regular government in Sweden. The clergy, indeed, were no less powerful than dangerous; but the opinions of Luther which began at this time to prevail in the North, the force with which they were supported, and the credit which they had acquired among the Swedes, gave him an opportunity of changing the religious system of that country; and the exercise of the Roman catholic religion was prohibited in the year 1544, under the severest penalties, which have never yet been relaxed. Instead of a Gothic aristocracy, the most turbulent of all governments, and, when enpoisoned by religious tyranny, of all governments the most wretched, Sweden, in this manner, became a regular monarchy. Some favourable effects of this change were soon visible: arts and manufactures were established and improved; navigation and commerce began to flourish; letters and civility were introduced; and a kingdom, known only by name to the rest of Europe, began to be known by its arms, and to have a certain weight in all public treaties or deliberations.

Gusta-

Gustavus was crowned in 1559; while his eldest son Eric, was preparing to embark for England to marry queen Elizabeth.

Under Eric, Gustavus succeeded his father Gustavus Vasa, the titles of count and baron were conferred into Sweden, and made hereditary. Eric's miserable and cauleless reign, of his brothers forced him to take up arms; and the senate siding with them, he was deposed in 1566. His brother John succeeded him, and entered into a ruinous war with Russia. John attempted, by the advice of his queen, to re-establish the catholic religion in Sweden; but, though he made strong efforts for that purpose, and even reconciled himself to the pope, he was opposed by his brother Charles, and the scheme proved ineffectual. John's son Sigismund, was, however, chosen king of Poland in 1587, upon which he endeavoured again to restore the Roman catholic religion in his dominions; but he died in 1592.

Charles brother to king John, was chosen administrator of Sweden; and being a strenuous protestant, his nephew, Sigismund, endeavoured to drive him from the administratorship, but without effect; till at last he and his family was excluded from the succession to the crown, which was conferred upon Charles in 1599. The reign of Charles, through the practices of Sigismund, who was himself a powerful prince, and at the head of a great party both in Sweden and Russia, was turbulent; which gave the Danes encouragement to invade Sweden. Their conduct was checked by the great Gustavus Adolphus, though then a minor, and heir apparent to Sweden. Upon the death of his father, which happened in 1611, he was declared of age by the state, though then only in his eighteenth year. Gustavus, soon after his accession, found himself, through the power and intrigues of the Poles, Russians, and Danes, engaged in a war with all his neighbours, under infinite disadvantages; all which he surmounted. He narrowly missed being master of Russia: but the Russians were so tenacious of their independency, that his scheme was baffled. In 1617 he made a peace, under the mediation of James I. of England, by which he recovered Livonia, and four towns in the prefecture of Novogorod, with a sum of money besides.

The ideas of Gustavus began now to extend. He had seen a vast deal of military service, and he was assisted by the counsels of La Gardie, one of the best generals and wisest statesmen of his age. His troops, by perpetual war, had become the best disciplined and most warlike in Europe; and he carried his ambition farther than historians are willing to acknowledge. The princes of the house of Austria were, it is certain, early jealous of his enterprising spirit, and supported his ancient implacable enemy Sigismund, whom Gustavus defeated. In 1627, he formed the siege of Dantzick, in which he was unsuccessful; but the attempt which was defeated only by the sudden rise of the Viitula, added so much to his military character, that the protestant cause placed him at the head of the confederacy for reducing the house of Austria. His life, from that time, was a continued chain of the most rapid and wonderful successes: even the mention of each would exceed our bounds. It is sufficient to say, that after taking Riga, and over-running Livonia, he entered Poland, where he was victorious; and from thence, in 1630, he landed in Pomerania, drove the Germans out of Mecklenburg, defeated the famous count Tilly the Austrian general, who was till then thought invincible; and over-ran Franconia. Upon the defeat and death of Tilly, Wallenstein, another Austrian general, of equal reputation, was appointed to command against Gustavus, who was killed upon the plain of Lutzen in 1632, after gaining a battle; which, had he survived, would probably have put a period to the Austrian greatness.

The amazing abilities of Gustavus Adolphus, both in the camp and the field, never appeared so fully as after his death. He left behind him a set of generals, trained by himself, who maintained the glory of the Swedish army with most astonishing valour and success. The names of Baner, Torstenson, Wrangel, and others, and their prodigious actions of war, never can be forgotten in the annals of Europe. It is uncertain what course Gustavus would have pursued, had his life been prolonged; but his successes continued; but there is the strongest reason to believe, that he had in his eye somewhat more than the relief of the protestants, and the restoration of the Palatine family. His chancellor Oxenstiern was a consummate a politician as he was a warrior; and during the minority of his daughter Christina, he managed the affairs of Sweden with such success, that he in a manner dictated the peace of Westphalia, 1648, which threw the affairs of Europe into a new system.

Christina was but six years of age when her father was killed. She received a noble education; but her fine genius took an uncommon, and indeed romantic turn. She invited to her court, Descartes, Salmasius, and other learned men; to whom she was not, however, extremely liberal. She expressed a value for Grotius; and she was an excellent judge of the polite arts: but illiberal, and indelicate in the choice of her private favourites. She at the same time discharged all the duties of her high station; and though her generals were safely betrayed by France, she continued to support the honour of her crown. Being resolved not to marry, she resigned her crown to her cousin Charles Gustavus, son to the duke of Deux-Ponts, in 1654.

Charles had great success against the Poles: he drove their king, John Casimir, into Silesia; and received from them an oath of allegiance, which, with their usual inconstancy, they broke. His progress upon the ice against Denmark has been already mentioned; and he died of a fever in 1660. His son and successor, Charles XI. was not five years of age at his father's death; and this rendered it necessary for his guardians to conclude a peace with their neighbours, by which the Swedes gave up the island of Bornholm, and Drontheim, in Norway. All differences were accommodated at the same time with Russia and Holland; and Sweden continued to make a very respectable figure in the affairs of Europe. When Charles came to be of age, he received a subsidy from the French king, Lewis XIV. but perceiving the liberties of Europe to be in danger from that monarch's ambition, he entered into the alliance with England and Holland against him. He afterwards joined with France against the house of Austria; but being beaten in Germany at Felembellin, a powerful confederacy was formed against him. The elector of Brandenburg made himself master of the Swedish Pomerania; the bishop of Munster over-ran Bremen and Verdun, and the Danes took Wismar, and several places in Schonen. They were afterwards beaten; and Charles, by the treaty of St. Germain, which followed that of Nimwegen in 1678, recovered all he had lost, except some places in Germany. He then married Ulrica Leonora, the king of Denmark's sister; but made a very bad use of the tranquillity he had regained: for he enslaved and beggared his people, that he might render his power despotic, and his army formidable. The states lost all their power; and Sweden was now reduced to the condition of Denmark. He ordered the brave Patkul, who was at the head of the Livonian deputies, to lose his head and his right hand, for the boldness of his remonstrance in favour of his countrymen; but he saved himself by flight; and Charles

became so powerful, that the conferences for a general peace at Ryfwick, 1697, were opened under his mediation.

Charles XI. died in 1697, and was succeeded by his minor son, the famous Charles XII. The history of no prince is better known than that of this hero. His father's will had fixed the age of his majority to eighteen, but it was set aside for an earlier date by the management of count Piper, who became thereby his first minister. Soon after his accession, the kings of Denmark and Poland, and the czar of Muscovy, formed a powerful confederacy against him, encouraged by the mean opinion they had of his youth and abilities. He made head against them all; and besieging Copenhagen, he dictated the peace of Travendahl to his Danish majesty, by which the duke of Holstein was re-established in his dominions. The czar Peter was at this time ravaging Ingria, at the head of 80,000 men, and had besieged Narva. The army of Charles did not exceed 20,000 men; but such was his impatience, that he advanced at the head 8000, entirely routed the main body of the Russians, and raised the siege. Such were his successes, and so numerous his prisoners, that the Russians attributed his actions to necromancy. Charles from thence marched into Saxony, where his warlike achievements equalled, if they did not excel, those of Gustavus Adolphus. He dethroned Augustus king of Poland: but stained all his laurels by putting the brave count Patkul to a death equally painful and ignominious. He raised Stanislaus to the crown of Poland in 1705, and his name carried with it such terror, that he was courted by all the powers of Europe; and among others, by the duke of Marlborough, in the name of queen Anne, amidst the full career of her successes against France. His stubbornness and implacable disposition, however, were such, that he cannot be considered in a better light than that of an illustrious madman; for he lost in the battle of Pultowa, 1709, which he fought in his march to dethrone the czar, more than all he had gained by his victories. His brave army was ruined, and he was forced to take refuge among the Turks at Bender. His actions there, in attempting to defend himself with 300 Swedes against 30,000 Turks, prove him to have been worse than frantic. The Turks found it however convenient for their affairs to set him at liberty. But his misfortunes did not cure his military madness; and after his return to his dominions, he prosecuted his revenge against Denmark, till he was killed by a cannon-shot, as it is generally said, at the siege of Fredericshall, in Norway, belonging to the Danes, in 1718, when he was no more than thirty-six years of age. It has been supposed, that Charles was not in reality killed by a shot from the walls of Fredericshall, but that a pistol from some nearer hand, from one of those about him, gave the decisive blow, which put an end to the life of this celebrated monarch. This opinion is said to be very prevalent among the best informed persons in Sweden. And it appears that the Swedes were tired of a prince under whom they had lost their richest provinces, their bravest troops, and their national riches; and who yet, untamed by adversity, pursued an unsuccessful and pernicious war, nor would ever have listened to the voice of peace, or consulted the internal tranquillity of his country.

Charles XII. was succeeded, as had been already mentioned, by his sister, the princess Ulrica Eleonora, wife to the hereditary prince of Hesse. We have also seen in what manner the Swedes recovered their liberties; and given some account of the capitulation signed by the queen and her husband, when they entered upon the exercise of government. Their first care was to make a peace with Great Britain, which the late king intended to have invaded. The Swedes then, to prevent their farther losses by the progress of the Rus-

sian, the Danish, the Saxon, and other arms, made many great sacrifices, to obtain peace from those powers. The French, however, about the year 1738, formed that dangerous party in the kingdom, under the name of the *Haut*, which hath been already spoken of; which not only broke the internal quiet of the kingdom, but led it into a ruinous war with Russia. Their Swedish majesties having no children, it was necessary to settle the succession; especially as the duke of Holstein was descended from the queen's eldest sister, and was at the same time the presumptive heir to the empire of Russia. Four competitors appeared; the duke of Holstein Gottorp, prince Frederic of Hesse Cassel, neph. w. to the king, the prince of Denmark, and the duke of Deux-Ponts. The duke of Holstein would have carried the election, had he not embraced the Greek religion, that he might mount the throne of Russia. The czarina interposed, and offered to restore all the conquests she had made from Sweden, excepting a small district in Finland, if the Swedes would receive the duke of Holstein's uncle, the bishop of Lubeck, as their hereditary prince and successor to their crown. This was agreed to, and a peace was concluded at Abo, under the mediation of his Britannic majesty. This peace was so firmly adhered to by the czarina, that his Danish majesty thought proper to drop all the effects of his resentment, and forget the indignity done to his son. The prince's successor, Adolphus Frederic, married the princess Ulrica, sister to the king of Prussia; and entered into the possession of his new dignity in 1751. He was a prince of a mild and gentle temper, and much harassed by the contending Swedish factions, and found his situation extremely troublesome, in consequence of the restraints and opposition which he met with from the senate. He passed the greatest part of his reign very disagreeably, and was at length, through the intrigues of the queen, brought over to the French party. He died dispirited in February, 1771, after a turbulent reign of twenty years and was succeeded by his son, Gustavus the Third, the late king, a prince both in abilities and intrepidity greatly superior to his father.

He was about five and twenty years of age when he was proclaimed king of Sweden, his understanding had been much cultivated, he had an innumerable address, and a graceful and commanding elocution. He was at Paris at the time of his father's death, from whence he wrote in the most gracious terms to the senate, repeatedly assuring them that he designed to govern according to the laws. In consequence of the death of his predecessor, an extraordinary diet was called to regulate the affairs of the government, and to settle the form of the coronation oath. Some time after his arrival in Sweden, on the 28th of March, 1772, his majesty solemnly signed and swore to observe twenty-four articles, relative to his future administration of government. This was termed a capitulation; and among the articles were the following: "The king promises before God to support the government of the king, as then established; to maintain the rights and liberties of the states, the liberty and security of all his subjects, and to reign with gentleness and equity according to the laws of the kingdom, the form of the regency as it was established in the year 1720, and conformable to the present act of capitulation. The most remarkable transaction of this reign, is the revolution which took place in the government in the year 1772, by which the king from being the most limited, became one of the most despotic monarchs in Europe.

Ever since the death of Charles XII the whole power of the kingdom had been lodged in the states and this power they had on all occasions most grievously abused; it is probable therefore that notwithstanding his having accepted the crown on these conditions, he had soon or soon after determined either

either to seize that power of which they made such a bad use, or perish in the attempt. To pave the way for this hazardous enterprise, he made use of all the dexterity and address he was so fitted to practise. At his first arrival at Stockholm, he adopted every method which could increase his popularity. Three times a week he regularly gave audience to all who presented themselves. Neither rank, fortune, nor interest, were necessary to obtain access to him; it was sufficient to have been injured, and to have a legal cause of complaint to lay before him. He listened to the meanest of his subjects with affability, and entered into the minutest details that concerned them: he informed himself of their private affairs, and seemed to interest himself in their happiness. This conduct made him considered as truly the father of his people, and the Swedes began to idolize him. In the mean time, there happened some contentions between the different orders of the Swedish states; and no methods were left untried to foment these jealousies. Emiffaries were likewise planted in every part of the kingdom, for the purpose of sowing discontent among the inhabitants, of rendering them disaffected to the established government, and of exciting them to an insurrection. At length, when the king found his scheme ripe for execution, on the morning of the 19th of August 1772, a considerable number of officers, as well as soldiers * known to be attached to the royal cause, had been summoned to attend his majesty. Before ten he was on horseback, and visited the regiment of artillery. As he passed through the streets he was more than usually courteous to all he met, bowing familiarly to the lowest of the people. On the king's return to his palace, the detachment which was to mount guard that day being drawn up together with that which was to be relieved, his majesty retired with the officers into the guard-room. He then addressed them with all that eloquence of which he is said to have been a perfect master; and after insinuating to them that his life was in danger, he exposed to them in the strongest colours the wretched state of the kingdom, the shackles in which it was held by means of foreign gold, and the dissensions and troubles arising from the same cause which had distracted the diet during the course of fourteen months. He assured them that his only design was to put an end to these disorders; to banish corruption, restore true liberty, and revive the ancient lustre of the Swedish name, which had been long tarnished by a venality as notorious as it was disgraceful. Then assuring them in the strongest terms that he disclaimed for ever all absolute power, or what the Swedes call sovereignty, he concluded with these words: "I am obliged to defend my own liberty and that of the kingdom, against the aristocracy which reigns. Will you be faithful to me, as your forefathers were to Gustavus Vasa and Gustavus Adolphus? I will then risk my life for your welfare and that of my country."

The officers immediately consented to every thing, and took an oath of fidelity to him; then they received their orders from the king; the first of which was, that the two regiments of guards and of artillery should be immediately assembled, and that a detachment of 36 grenadiers should be posted at the door of the council-chamber to prevent any of the senators from coming out.

* The fidelity which was manifested by a private soldier, on this occasion, deserves to be recorded. The night preceding the revolution, the king being desirous of visiting the arsenal, went thither, and ordered the centinel to admit him. The latter refused. "Do you know who you are speaking to?" said the king. "Yes," replied the soldier, "but I likewise know my duty."—*Vide* a very judicious and well-written account of this extraordinary revolution in Sweden, published by Charles-Francis Sheridan, esq. who was secretary to the British envoy in Sweden at the time of the revolution.

received a
plot that

The senators were now immediately secured. They had from the windows of the council-chamber beheld what was going forward on the parade before the palace; and, at a loss to know the meaning of the shouts they heard, were coming down to inquire into the cause of them, when 30 genadiers, with their bayonets fixed, informed them it was his majesty's pleasure they should continue where they were. They began to talk in a high tone, but were answered only by having the door shut and locked upon them.

The king proceeded in his course, and in less than an hour made himself master of all the military force in Stockholm. In the mean time the heralds by proclamation in the several quarters of the city, summoned an assembly of the States for the ensuing morning, and declared all members traitors to their country who should not appear. Thither his majesty repaired in all the pomp of royalty, surrounded by his guards, and holding in his hand the silver sceptre of Gustavus Adolphus. In a very forcible speech, he lamented the unhappy state to which the country was reduced by the conduct of a party ready to sacrifice every thing to its ambition, and reproached the states with adapting their actions to the views of foreign courts, from whom they received the wages of perfidy. "If any one dare contradict this, let him rise and speak."—Conviction, or fear, kept the assembly silent, and the secretary read the new form of government, which the king submitted to the approbation of the states. It consisted of fifty-seven articles.

When all the articles were gone through, the king demanded if the states approved of them, and was answered by a general acclamation. He then dismissed all the senators from their employments, adding, that in a few days he would appoint others; and concluded this extraordinary scene by drawing out of his pocket a small book of psalms, from which, after taking off the crown, he gave out *Te Deum*. All the members very devoutly added their voices to his, and the hall resounded with thanksgivings, which, it is to be feared, never rose to heaven, if sincerity was necessary to their passport.

The power thus obtained the king employed for the good of his subjects. He took care that the law should be administered with impartiality to the richest noble and to the poorest peasant, making a severe example of such judges as were proved to have made justice venal. He gave particular attention and encouragement to commerce, was a liberal and enlightened patron of learning and science, and laboured strenuously to introduce into his kingdom the most valuable improvements in agriculture that had been made in foreign countries.

The change which was thus introduced into the constitution was very inimical to the intrigues of the court of Petersburg; and the Russian ambassador exerted himself openly to bring about a rupture betwixt the king and the discontented nobles; he was therefore ordered to quit the kingdom in eight days, and war with Russia was immediately resolved on. It is needless to enter into a detail of the particulars of that war, which, as well as the astonishing activity and military skill displayed by the Swedish monarch are fresh in the memory of most readers. It continued from the year 1787 to 1790 when peace was restored between the courts of Petersburg and Stockholm.

The nobles, however, continued discontented, and a conspiracy was planned against Gustavus under his own roof. On the 16th of March 1792 he received an anonymous letter, warning him of his immediate danger from a plot that was laid to take away his life, requesting him to remain at home,

The

and avoid balls for a year; and assuring him that, if he should go to the masquerade for which he was preparing, he would be assassinated that very night. The king read the note with contempt, and at a late hour entered the ball room. Just as he was preparing to retire in company with the Prussian ambassador, he was surrounded by several persons in masks, one of whom fired a pistol at the back of the king, and lodged the contents in his body. He languished in great pain from the 17th to the 29th of March and then expired in the forty fifth year of his age and twentieth of his reign.

During his illness, and particularly after he was made acquainted with the certainty of his approaching dissolution, Gustavus continued to display that unshaken courage which he had manifested on every occasion during his life. A few hours before his decease he made some alterations in the arrangement of public affairs. He had before, by his will, appointed a council of regency; but convinced, by recent experience, how little he could depend on the attachment of his nobles, and being also aware of the necessity of a strong government in difficult times, he appointed his brother, the duke of Sudermania, sole regent, till his son, who was then about fourteen, shall have attained the age of eighteen years. His last words were a declaration of pardon to the conspirators against his life. The actual murderer alone was excepted; and he was excepted only at the strong instance of the regent, and those who surrounded his majesty in his dying moments. Immediately on the death of the king, the young prince was proclaimed by the title of Gustavus IV.

The mild and equal conduct of the regent, has preserved the country from the horrors of internal war, and hitherto he has avoided becoming a party in any coalition formed against the ferocious ambition of France, whether the same policy will prevail on him to keep clear of the combination which is said to be now forming against the present ruling power in that country a little time will shew.

Gustavus Adolphus IV. the present king of Sweden, was born Nov. 1, 1778, and succeeded his father Gustavus III. who was shot the 16th, and died the 29th March, 1792; born Jan. 24, 1746; married Oct. 17, 1766, to the princess royal of Denmark, by whom he had issue Gustavus Adolphus, the present king.

Brothers and sisters to the late king.

1. Charles, duke of Sudermania, born Oct. 7. 1748.
2. Frederic Adolphus, duke of West-Gothland, born July 18, 1750.
3. Sophia Albertina, abbess of Quedlinburgh, born in Oct. 1753.

AND NAMES. } **A** this mighty empire, it consists of fifteen (Mr. Vol.

*Zimmerma
tion of subjects

taire says sixteen) provinces, or governments: which are comprehended again under nineteen general governments *; besides part of Carelia, Esthonia, Ingria, Livonia, and part of Finland, which were conquered from Sweden; the Crimea, or Crim Tartary, anciently the Taurica Chersonesus; a peninsula in the Euxine sea, subject to the Turks formerly, but added in the year 1783 to the Russian Empire, with the isle of Taman, and part of Cuban †; also the duchy of Courland in Poland, of which the empress of Russia has now the entire disposal.

The following table will give some idea of the Russian empire, properly so called, or Russia in Europe, with its acquisitions from Sweden in the present century. And also of the Russian empire in its most extensive sense, for we must also include all the acquisitions in Tartary, now known by the name of Siberia: the whole comprehending the northern parts of Europe and Asia, stretching from the Baltic and Sweden on the West, to Kamtschatka, and the Eastern Ocean; and on the North, from the Frozen Ocean to the forty-seventh degree of latitude, where it is bounded by Poland, Little Tartary, Turkey, Georgia, the Euxine and Caspian seas, Great Tartary, Chinese Tartary, and other unknown regions in Asia.

The country now comprised under the name of Russia or the Russias, is of an extent nearly equal to all the rest of Europe, and greater than the Roman empire in the zenith of its power, or the empire of Darius subdued by Alexander, or both put together, as may be seen by turning to the table, page 27, to which we may add the authority of Voltaire.

R U S S I A.

Russia has been also subdivided into thirty-one provinces, viz.

Northern Provinces.	{	1. Lapland, 2. Samoida, 3. Ballamorenshy, 4. Meseen, 5. Dwina, 6. Syrianes, 7. Permia, 8. Rubeninski, 9. Belafeda.	Eastern Provinces.	{	17. Bulgar, 18. Kafan, 19. Tſcheremiſſi, 20. Little Novogorod, 21. Don Coffacs.
Middle Provinces.	{	10. Rezan, or Pereslaf, 11. Belozero, 12. Wolagda, 13. Jeraslaf, 14. Tweer, 15. Moſcow, 16. Belgorod,	Western Provinces.	{	22. Great Novogorod, 23. Ruſſian Finland, 24. Kexholm, 25. Kalcria, 26. Ingria.
			Southern Provinces.	{	27. Livonia, 28. Smolenko, 29. Zernigof, Seeſſk, Ukraine or country of the old Coffacs.

Mr. Tooke, chaplain to the British factory at Peterburgh, who has lately published an account of Russia, has enumerated the following nations as comprehended in this great empire :

The Monguls, The Kalmucs, The Tartars, The Samoïdes, The Oſtiacs, The Burattians, The Jakutans, The Tunguſians, The Voguls, The Laplanders, The Finns, The Lettonians, The Eſtonians, The Lieſſs, The Ingrians, The Tſcheremiſſes,	The Tſcouwaſches, The Mordvines, The Votiaks, The Terptyaireis, The Tartars of Kafan and Orenburgh, The Tartars of Tobolſk, The Tartars of Tomſk, The Nogayan Tartars, The Tartars of the Ob, The Tſchoulym Tartars, The Kaſchintz Tartars, The Teleutes, The Abinzes, The Biryouſſes, The Coffacs,	The Kourilians, The Kiſtim and Tou- libert Tartars, The Vergo Tomſkoi Tartars, The Sayan Tartars, The Touralizes, The Bougharians, The Baſchkirians, The Meſſceraiks, The Barabinzes, The Kirkgulſians, The Beltirians, The Yakoutes, The Kamtſchadales,
---	--	--

and various others ; but ſome of which muſt be conſidered rather as diſtinct tribes than as diſtinct nations.

As to the names of Ruſſia and Muſcovy, by which this empire is arbitrarily called, they probably are owing to the ancient inhabitants, the Ruſſi, or Boruſſi, and the river Moſca, upon which the ancient capital Moſcow was built : but of this we know nothing certain.

CLIMATE, SOIL, PRODUCTIONS, VEGETABLES, MINES, AND MINERALS. } In the ſouthern parts of Ruſſia, or Muſcovy, the longeſt day does not exceed fifteen hours and a half ; whereas, in the moſt northern, the ſun is ſeen in ſummer two months above the horizon. The reader from this will naturally conclude, that there is in Muſcovy a vaſt diverſity

ity of soil as well as climate, and the extremes of both are seen and felt in this vast empire.

The severity of the climate, however, in Russia properly so called, is very great. Dr. John Elen King, who resided eleven years in Russia, observes, that the cold in St. Petersburg, by Fahrenheit's scale, is, during the months of January, and February, usually from 8 to 15 or 20 degrees below 0; that is, from 40 to 52 degrees below the freezing point; though commonly in the course of the winter, it is for a week or ten days some degrees lower. The same writer remarks that it is very difficult for an inhabitant of our temperate climate to have any idea of a cold so great; but it may help to give some notion of it to inform the reader, that when a person walks out in that severe weather, the cold makes the eyes water, and that water freezing, hangs in little icicles on the eye lashes. As the common peasants usual-ly wear their beards, you may see them hanging at the chin like a solid lump of ice. But even in that state, the beard is found very useful in protecting the glands of the throat: and the soldiers, who do not wear their beards, are obliged to tie a handkerchief under the chin to supply their place. All the parts of the face which are exposed, are very liable to be frozen: though it has often been observed, that the person himself does not know when the freezing begins; but is commonly told of it first by those who meet him; and who call out to him to rub his face with snow, the usual way to thaw it. It is also remarked that the part, which has once been frozen is ever after most liable to be frozen again. In some of our severe winters, sparrows, though a hardy species of birds, have been almost entirely numbed by the intense cold, and unable to fly; and drivers, sitting on their loaded carriages, have sometimes been found frozen to death in that posture. When the thermometer has stood at 25 degrees below 0, boiling water thrown up into the air by an engine, so as to spread, has fallen down perfectly dry, formed into ice. A pint bottle of common water was found by Dr. King frozen into a solid piece of ice in an hour and a quarter. A bottle of strong ale has also been frozen in an hour and a half; but in this substance there was about a tea cup full in the middle unfrozen, which was as strong and inflammable as brandy and spirits of wine. But notwithstanding the severity of the cold in Russia, the inhabitants have such various means and provisions to guard against it, that they suffer much less from it than might be expected. The houses of persons of tolerable circumstances are so well protected, both without doors and within, that they are seldom heard to complain of cold. The method of warming the houses in Russia is by an oven constructed with several flues, and the country abounds with wood, which is the common fuel. These ovens consume a much smaller quantity of wood than might be imagined, and yet they serve at the same time for the ordinary people to dress their food. They put a very moderate faggot into them, and suffer it to burn only till the thickest black smoke is evaporated; they then shut down the chimney to retain all the rest of the heat in the chamber; by this method the chamber keeps its heat 24 hours, and is commonly so warm that they sit with very little covering, especially children, who are usually in their shirts. The windows in the huts of the poor are very small, that as little cold may be admitted as possible: in the houses of persons of condition, the windows are caulked up against winter and commonly have double glass frames. In short, they can regulate the warmth in their apartments by a thermometer with great exactness, opening or shutting the flues to increase or diminish the heat. When the Russians go out, they are clothed so warmly, that they almost bid defiance to frost and snow; and it is observable that the wind is seldom violent in the winter; but when there is much wind, the cold is exceedingly piercing.

One advantage, which the Russians derive from the severity of their climate, is the preserving of provisions by the frost. Good housewives, as soon as the frost sets in for the winter about the end of October, kill their poultry, and keep them in tubs packed up with a layer of snow between them, and then take them out for use as occasion requires; by which means they save the nourishment of the animal for several months. Veal frozen at Archangel, and brought to Petersburg, is esteemed the finest they have, nor can it be distinguished from what is fresh killed, being equally juicy. The markets in Petersburg are by this means supplied in winter with all manner of provisions, at a cheaper rate than would otherwise be possible; and it is not a little curious to see the vast stacks of whole hogs, sheep, fish, and other animals, which are piled up in the markets for sale. The method of preserving frozen provisions in Russia, is by immersing them in cold water; but when the operation of thawing them is effected by heat, it seems to occasion a violent fermentation, and almost a sudden putrefaction; but when produced by cold water, the ice seems to be attracted out of the body, and forms a transparent incrustation round it. If a cabbage, which is thoroughly frozen, be thawed by cold water, it is as fresh as if just gathered out of the garden; but if it be thawed by fire or hot water, it becomes so rancid and strong that it cannot be eaten.

The quickness of vegetation in Russia is pretty much the same as has been described in Scandinavia, or Sweden and Denmark. The snow is the natural manner of Russia, where grain grows in plenty, near Poland, and in the warmer provinces. The bulk of the people, however, are miserably fed; the soil produces a vast number of mushrooms for their subsistence; and in some places, besides oaks and firs, Russia yields rhubarb, flax, hemp, pasture for cattle, wax, honey, rice, and melons. The boors are particularly careful in the cultivation of honey, which yields them plenty of mead, their ordinary drink; they likewise extract a spirit from rye, which they prefer to brandy.

That a great part of Russia was populous in former days, is not to be disputed, though it is equally certain, that the inhabitants, till lately, were but little acquainted with agriculture; and supplied the place of bread, as the inhabitants of Scandinavia do now, with a kind of saw-dust and a preparation of fish-bones. Peter the Great, and his successors down to the present empress, have been at incredible pains to introduce agriculture into their dominions; and though the soil is not every where proper for corn, yet its vast fertility in some provinces, bids fair to make grain as common in Russia as it is in the southern countries of Europe. The vast communication by means of rivers, which the inland parts of that empire have with each other, serve to supply one province with those products of the earth in which another may be deficient. As to mines and minerals, they are as plentiful in Russia as in Scandinavia; and the people are daily improving in working them. Mountains of rich iron ore are found in some places, most of which produce the load-stone, and yield from 50 to 70 per cent. Rich silver and copper mines are found on the confines of Siberia.

MOUNTAINS, RIVERS, FORESTS, } Russia is in general a flat level country, except towards the north, where lie the Zimnopolas mountains, thought to be the famous Montes Rhiphei of the ancients, now called the Girdle of the Earth. On the western side of the Dnieper comes in part of the Carpathian mountains, and between the Black Sea and the Caspian, Mount Caucasus borders a range of plain extending on the sea of Oral. And here we may observe, that from Petersburg

burgh to Peking, one shall hardly meet with a mountain on the road through Independent Tartary; and from Peterburgh to the north part of France, by the road of Dantzic, Hamburg, and Amsterdam, we scarcely can perceive the smallest hill.

The most considerable rivers are the Wolga, or Volga, running east and south, which, after traversing the greatest part of Muscovy, and winding a course of 3000 English miles, discharges itself into the Caspian Sea; it is not only reckoned the largest, but one of the most fertile rivers of Europe; it produces all kinds of fish, and fertilizes all the lands on each side with the richest trees, fruits, and vegetables; and it is remarkable, that in all this long course there is not a single cataract to interrupt the navigation, but the nearer it approaches to its mouth, multiplies its quantities of isles as it divides itself into a greater number of arms than any known river in the world; and all these arms divide themselves into others still less, which join and unite again, so that the Wolga discharges itself into the Caspian Sea by more than 70 mouths. By means of this noble river, the city of Moscow preserves a communication, not only with all the southern parts of Russia, but even with Persia, Georgia, Tartary, and other countries bordering on the Caspian Sea. The Don, or Tanais, which divides the most eastern part of Russia from Asia; and in its course towards the east, comes so near the Wolga, that the late czar had undertaken to have a communication between them by means of a canal: this grand project, however, was defeated by the irruptions of the Tartars. This river, exclusive of its turnings and windings, discharges itself into the F. us Mæotic, or sea of Asoph, about four hundred miles from its rise. The Boristhenes, or Dnieper, which is likewise one of the largest rivers in Europe, runs through Lithuania, the country of the Zapotog Cossacs, and that of the Nagaisch Tartars, and falls into the Euxine, or Black Sea, at Kimburn, near Orzakow; it has thirteen cataracts within a small distance. To these may be added the two Dwina, one of which empties itself at Riga into the Baltic; the other has its source near Ustiage, and dividing itself into two branches near Archangel, there falls into the White Sea.

Forests abound in this extensive country; and the northern and north-eastern provinces are in a manner desert; nor can the few inhabitants they contain be called Christians rather than Pagans.

QUADRUPEDS, BIRDS, FISHES, AND INSECTS. These do not differ greatly from those to which we must refer the reader. The lynx, famous for its piercing eye, is a native of this empire; it makes prey of every creature it can master; and is said to be produced chiefly in the fir-tree forests. The hyaxas, bears, wolves, foxes, and other creatures already described afford their furs for clothing the inhabitants; but the furs of the black-foxes and ermine are more valuable in Russia than elsewhere. The dromedary and camel were formerly almost the only beasts of burden known in many parts of Russia. The czar Peter encouraged a breed of large horses for war and carriages; but those employed in the ordinary purposes of life are but small; as are their cows and sheep.

We know of few or no birds in Russia, that have not been already described. The same may be said of fishes, only the Russians are better provided than their neighbours with sturgeon, cod, salmon, and behuga; the latter resembles a sturgeon, and is often called the large sturgeon; it is from twelve to fifteen feet in length, and weighs from 9 to 16 and 19 hundred weight; its flesh is white and delicious. Of the roe, of the sturgeon, see

the beluga, the Russians make the famous caviar so much esteemed for its richness and flavour, that it is often sent in preserves to crowded heads. In cutting up the belugas they often find what is called the beluga-stone, which is concealed in that mass of glandular flesh which covers the posterior parts of the dorsal spine, supplying the place of a kidney in fish. The instant it is taken from the fish, it is soft and moist, but quickly hardens in the air. Its size is that of a hen's egg, shape sometimes oval and sometimes flattened, and commonly weighs far a rouble. This stone is supposed by professor Pallac to belong to the genitals of the fish: it holds a considerable rank, though with little merit, among the domestic remedies of the Russians, who scrape it, and, mixed with water, give it in difficult labours, in the diseases of children, and other disorders.

[POPULATION, MANNERS AND CUSTOMS.] Nothing can be more injudicious, or remote from truth than the accounts we have from authors, of the population of this vast empire; the whole of which, they think, does not exceed, at most, seven millions. It is surprising that such a mistake should have continued so long, when we consider the immense armies brought into the field by the sovereigns of Russia, and the bloody wars they maintained in Asia and Europe. Mr. Voltaire is, perhaps, the first author who has attempted to undeceive the public in this respect; and has done it upon very authentic grounds, by producing a list, taken in 1747, of all the males who paid the capitation or poll-tax, and which amount to six millions six hundred and forty-six thousand three hundred and ninety. In this number are included boys and old men; but girls and women are not reckoned, or boys born between the making one register of the lands and another. Now if we only reckon triple the number of heads subject to be taxed, including women and girls, we shall find near twenty millions of souls. To this account may be added three hundred and fifty thousand soldiers, and two hundred thousand nobility and clergy; and foreigners of all kinds, who are likewise exempted from the poll-tax; as also (says Mr. Voltaire) the inhabitants of the conquered countries, namely Livonia, Esthonia, Ingria, Carelia, and a part of Finland; the Ukraine, and the Don Cossacs, the Kalmucs, and other Tartars; the Samoides, the Laplanders, the Orsacs, and all the idolatrous people of Siberia, a country of greater extent than China, are not included in this list. The new register in 1764 contains 8,500,000 subject to the poll-tax; and a late ingenious writer, resident some time in Russia, gives the following estimate:

Lower class of people paying capitation tax,	18,000,000
Conquered provinces,	1,200,000
Noble families,	60,000
Clergy,	100,000
Military,	360,000
Civil,	30,000
Ukraine, Siberia, Cossacs, &c.	350,000
	<hr/>
	20,100,000

To these must now be added near a million more by the acquisitions of the Crimea, and part of Cuban Tartary; and, at least, 1,500,000 in the provinces, dismembered from Poland.

Empire issued; there is the strongest reason to believe, that her domesons must have been better peopled formerly than they are at present; twenty-four millions are but a thin population for the immense tract of country she possesses. As the like decrease of inhabitants is observable in many other parts of the globe, we are to look for the reason in natural causes, which we cannot discuss here; Perhaps the introduction of the small pox and the venereal disease may have assisted in the depopulation; and it is likely that the prodigious quantity of strong and spirituous liquours, consumed by the inhabitants of the North, is unfriendly to generation.

The Russians, properly so called, are in general a personable people, hardy, vigorous, and patient of labour, especially in the field, to an incredible degree. Their complexions differ little from those of the English or Scots; but the women think that an addition of red heightens their beauty. Their eyesight seems to be defective, occasioned, probably, by the snow, which for a long time of the year is continually present to their eyes. Their officers and soldiers always possessed a large share of passive valour; but in the late war with the king of Prussia, they proved as active as any troops in Europe; and in the late war with the Turks they greatly distinguished themselves. They are implicitly submissive to discipline, let it be ever so severe; they endure extreme hardships with great patience; and can content themselves with very hard fare.

Before the days of Peter the Great, the Russians were in general barbarous, ignorant, mean, and much addicted to drunkenness; no less than 4000 brandy shops have been reckoned in Moscow. Not only the common people but many of the boyars, or nobles, lived in a continual state of idleness and intoxication; and the most complete objects of misery and barbarity presented themselves upon the streets, while the court of Moscow was by far the most splendid of any upon the globe. The czar and the grandees dressed after the most superb Asiatic manner; and their magnificence exceeded every idea that can be conceived from modern examples. The earl of Carlisle, in the account of his embassy, says, that he could see nothing but gold and precious stones in the robes of the czar and his courtiers. The manufactures, however, of those and all other luxuries, were carried on by Italians, Germans, and other foreigners. Peter saw the bulk of his subjects, at his accession to the throne, little better than beasts of burden, to support the pomp of the court. He forced his great men to lay aside their long robes, and dress in the European manner; and he even obliged the laity to cut off their beards. The other improvements in learning and the arts, which he made shall be mentioned elsewhere. The Russians, before his days, had hardly a ship upon their coasts. They had no convenience for travelling, no pavements in their streets, no places of public diversion; and they entertained a sovereign contempt for all improvements of the mind. At present a French or English gentleman may make a shift to live as comfortably and sociably in Russia as in most part of Europe. Their polite assemblies, since the accession of the present empress, have been put under proper regulations; and few of the ancient usages remain. It is, however, to be observed, that notwithstanding the severities of Peter, and the prudence of succeeding governments, drunkenness still continues among all ranks; nor are even priests or ladies ashamed of it on holidays.

The Russians were formerly noted for so strong an attachment to their native soil, that they seldom visited foreign parts. This, however, was only the consequence of their pride and ignorance; for Russian nobility, besides those who are in a public character, are now found at every court in Europe.

w the Roman
empire

Her imperial majesty even interests herself in the education of young men of quality in the knowledge of the world, and foreign services, particularly that of the British fleet.

It is said that the Russian ladies were formerly as submissive to their husbands in their families as the latter are to their superiors in the field; and that they thought themselves ill-treated if they were not often reminded of their duty by the discipline of a whip, manufactured by themselves, which they presented to their husbands on the day of their marriage. Their nuptial ceremonies are peculiar to themselves; and formerly consisted of some very whimsical rites, many of which are now disused. When the parents are agreed upon a match, though the parties perhaps have never seen each other, the bride is examined stark naked by a certain number of females, who are to correct, if possible, any defects they find in her person. On her wedding-day she is crowned with a garland of wormwood; and after the priest has tied the nuptial knot, his clerk or sexton throws a handful of hops upon the head of the bride, wishing that she may prove as fruitful as that plant. She is then led home, with abundance of coarse and indeed indecent ceremonies, which are now wearing off even amongst the lowest ranks; and the barbarous treatment of wives by their husbands, which extended even to scourging or broiling them to death, is either guarded against by the laws of the country, or by particular stipulations in the marriage-contract.

FUNERALS.] The Russians entertain many fantastic notions with regard to the state of departed souls. After the dead body is dressed, a priest is hired to pray for his soul, to purify it with incense, and to sprinkle it with holy water while it remains above ground, which, among the better sort, it generally does for eight or ten days. When the body is carried to the grave, which is done with many gesticulations of sorrow, the priest produces a ticket, signed by the bishop, and another clergyman, as the deceased's passport to heaven. When this is put into the coffin between the fingers of the corpse, the company return to the deceased's house, where they drown their sorrow in intoxication; which lasts among the better sort, with few intervals, forty days. During that time, a priest every day says prayers over the grave of the deceased; for though the Russians do not believe in purgatory, yet they imagine that their departed friend may be assisted by prayer, in his long journey to the place of his destination after this life.

PUNISHMENTS.] The Russians are remarkable for the severity and variety of their punishments, which are both inflicted and endured with a wonderful insensibility. Peter the Great used to suspend the robbers upon the Wolga, and other parts of his dominion; by iron hooks fixed to their ribs, on gibbets, where they writhed themselves to death, hundreds, nay thousands, at a time. The single and double knout were lately inflicted upon ladies, as well as men of quality. Both of them are excruciating; but in the double knout the hands are bound behind the prisoner's back, and the cord being fixed to a pulley, lifts him from the ground, with the dislocation of both his shoulders; and then his back is in a manner scarified by the executioner, with a hard thong cut from a wild ass's skin. This punishment has been so often used, that a surgeon generally attends the patient, to pronounce the point that it should cease. It is not always the number of the strokes, but the method of applying them, which occasions the death of the criminal; for the executioner can kill him in three or four blows, by striking him upon the ribs; though persons are sometimes recovered, in a few weeks, who have received three hundred strokes moderately inflicted. The boring and cutting out of the tongue are likewise practised in Russia; and even the late

empress Elizabeth, though she prohibited capital punishments, was forced to give way to the supposed necessity of those tortures.

According to the strict letter of the law, there are no capital punishments in Russia; except in the case of high-treason; but when this matter is thoroughly investigated, there is much less humanity in it than has been supposed. For there are many felons who die under the knout; and others die of fatigue in their journeys to Siberia, and from the hardships they suffer in the mines; so that there is reason to believe, that no fewer criminals suffer death in Russia than in those countries where capital punishments are authorized by the laws.

Felons, after receiving the knout, and having their cheeks and forehead marked, are sometimes sentenced for life to the public works at Cronstadt, V.ihnei, Voloshoek, and other places; but the common practice is to send them into Siberia, where they are condemned for life to the mines at Nerzhink. There are upon an average from 1600 to 2000 convicts at these mines. The greatest part are confined in barracks, excepting those who are married; the latter are permitted to build huts, near the mines, for themselves and families. The prohibition of torture does honour to the humanity of the present empress.

TRAVELLING. Among the many conveniencies introduced of late into Russia, that of travelling is extremely remarkable, and the expence very trifling. Nothing strikes either a reader or a stranger more than the facility with which the Russians perform the longest and most uncomfortable journeys. Like their Scandinavian neighbours already described, they travel in sledges made of the bark of the linden-tree, lined with thick felt, drawn by rein-deer, when the snow is frozen hard enough to bear them. In the internal parts of Russia horses draw their sledges, and the sledge-way towards February, becomes so well beaten, that they erect a kind of coach upon the sledges, in which they may lie at full length, and so travel night and day, wrapped up in good furs; thus they often perform a journey of about 400 miles, such as that between Peterburgh and Moscow, in three days and nights. Her imperial majesty, in her journeys, is drawn in a house which contains a bed, a table, chairs, and other conveniencies for four people, by 24 post-horses; and the house itself is fixed on a sledge.

DIFFERENT NATIONS. As the present subjects of the Russian empire, **SUBJECT TO RUSSIA.** in its most extensive sense, are the descendants of many different people, and inhabit prodigious tracts of country, so we find among them a vast variety of character and manners; and the great reformations introduced of late years, as well as the discovery made, render former accounts to be but little depended upon. Many of the Tartars, who inhabit large portions of the Russian dominions, now live in fixed houses and villages cultivate the land, and pay tribute like other subjects. Till lately they were not admitted into the Russian armies; but now they make excellent soldiers. Other Russian Tartars retain their old wandering lives. Both sides of the Wolga are inhabited by Tchermisses and Morduars a peaceable, industrious people. The Baskirs are likewise fixed inhabitants of the tract that reaches from Kasan to the frontiers of Siberia; and have certain privileges of which they are tenacious. The wandering Kalmucs occupy the rest of the tract to Astrachan, and the frontiers of the Usbecs; and in consideration of certain presents they received from her imperial majesty they serve in her armies without pay, but are apt to plunder equally friends or foes.

The *Cossacs* who lately made a figure in the military history of Europe, were originally Polish peasants, and served in the Ukraine, as a militia against the Tar-

Tartars. Being oppressed by their unfeeling lords, a part of them moved to the uncultivated banks of the Don, or Tanais, and there established a colony. They were soon after joined, in 1637, by two other detachments, of their countrymen; and they reduced Asof, which they were obliged to abandon to the Turks, after laying it in ashes. They next put themselves under the protection of the Russians, built Circassia, on an island in the Don; and their possessions which consisted of thirty nine towns on both sides that river, reached from Ribas to Asof. They there lived in a country which they took care to cultivate; and they were so wedded to their original customs, that they were little better than nominal subjects to the czars, till the time of Peter the Great. They professed the Greek religion; their inclinations were warlike, and they occasionally served against the Tartars and Turks on the Palus Meotis.

The mien and character of the Tartars of Kasan, and of those derived from them, are very uniform, and may serve for the characteristic marks of all the Mahometan Tartars in their neighbourhood. Very few of them are tall; but they are generally straight and well made, have small faces, with fresh complexions, and a sprightly and agreeable air. They are haughty and jealous of their honour, but of a very moderate capacity. They are sober and frugal, dexterous at mechanical trades, and fond of neatness. The Tartarian women are of a wholesome complexion rather than handsome, and of a good constitution: from their earliest infancy they are accustomed to labour, retirement, modesty, and submission. The Tartars of Kasan take great care of the education of their children. They habituate their youth to labour, to sobriety, and to a strict observance of the manners of their ancestors. They are taught to read and write, and are instructed in the Arabic tongue, and the principles of their religion. Even the smallest village has its chapel, school, priest and school-master; though some of these priests and school-masters are not much skilled in the Arabic language. The best Tartarian academies in the Russian empire are those of Kasan, Tobolsk, and Astrachan, which are under the direction of the gagouas, or high-priests. It is not uncommon to find small collections of historical anecdotes in manuscript, in the huts of the boors; and their merchants, besides what those little libraries contain, are pretty extensively acquainted with the history of their own people, and that of the circumjacent states, with the antiquities of each. Such as choose to make a progress in theology, enter themselves into the schools of Bougharia, which are more complete than the others.

The Tartar citizens of Kasan, Orenberg, and other governments, carry on commerce, exercise several trades, and have some manufactories. Their manner of dealing is chiefly by way of barter; coin is very rarely seen among them, and bills of exchange never. They are not in general very enterprising; but as they extend their connections by partners and clerks, many of them carry on a great deal of business, which their parsimonious way of life renders very lucrative. At Kasan they make a trade of preparing what is called in England, Morocco-leather. The villages of these people comprehend from ten to one hundred farms. Most of them also contain tanners, shoemakers, taylors, dyers, smiths, and carpenters.

The habitations and manner of living of the Tartar citizens and villagers of Astrachan are perfectly similar with those of the Tartars of Kasan. In the city of Astrachan they have a large magazine for goods, built of bricks, and several shops upon arches. They carry on an important commerce with the Armenians, Persians, Indians, and Bougharians: and their manufac-

manufactory of Morocco leather, cottons, camelots, and silks, are in a very thriving state.

The *Finn*s are of Asiatic origin, and have a close resemblance to the Laplanders, only they are more civilised, and better informed. They live in towns and villages, have schools and academies, and make some progress in the arts and sciences. They profess the Lutheran faith, and use the Christian era in their chronology. They carry on commerce, and exercise most of the common trades. The boors are chiefly employed in agriculture, hunting, and fishing. They are great eaters, making five meals a day, and are immoderately fond of brandy. They enjoy a considerable degree of freedom, as the Russian government has continued to them the enjoyment of the privileges which they formerly had under the crown of Sweden.

The *Votiaks*, who are a Finnish race, chiefly inhabit the provinces of Viatik, in the government of Kasan. Some of the Votiaks are Christians; but great part of them are heathens and idolaters; though even these believe the doctrine of a future state of rewards and punishments.

The *Ofiaks*, who are likewise a Finnish race, are one of the most numerous nations of Siberia. Before they were in subjection to Russia, they were governed by princes of their own nation, and their descendants are still reputed noble. These people divide themselves into different stocks or tribes, they choose their chiefs among the progeny of their ancient rulers. These maintain peace and good order, and superintend the payment of the taxes.

They are entirely unacquainted with the use of letters and are extremely ignorant; they can reckon as far as ten, but no farther, as is the case of other Finnish nations.

The *Vogouls* are rather below the middle stature, have generally black hair, and a scanty beard. Their principal occupation is in the chase, in which they discover much eagerness and address; using indiscriminately fire-arms, the bow, and the spear. They are also skilful in contriving traps, snares, and gins, and all the lures of game.

The *Tschouwasches* dwell along the two sides of the Wolga, in the governments of Nischnei, Novogorod, Kasan, and Orenberg. They never live in towns, but assemble in small villages, and choose the forests for their habitations. They are very fond of hunting, and procure for that purpose screw-barrel muskets, which they prefer to the bow. One of their marriage ceremonies is, that on the wedding night the bride is obliged to pull off her husband's boots. A late writer says, "Among the Tschouwasches the husband is master of the house; he orders every thing himself; and it is the duty of the wife to obey without reply: a custom calculated to prevent domestic broils. Accordingly quarrels are very uncommon in the families of the Tschouwasches."

The *Kirguisians* have a frank and prepossessing air, similar to that which characterises the Tartars of Kasan. They have a sharp but not a fierce look; and smaller eyes than those Tartars. They have good natural sense, and are affable, and high-spirited; but fond of their ease, and voluptuous. They dwell always in portable huts, wandering about their deserts in search of pasture for their flocks and herds, which constitute their principal occupation. The decoration of their horses employs them almost as much as that of their persons; they have generally elegant saddles, handsome housings, and ornamented bridles. They are great eaters; and they also smoke tobacco to excess. Men, women, and children, all smoke, and take snuff; they keep the latter in little horns fastened to their girdles. The great and wealthy live perfectly in the same manner as the rest of the people, and are distinguished

guided only by the numerous trains that accompany them in their cavalcades, and the quantity of huts which surround their quarters, inhabited by their wives, children, and slaves.

The *Tungusians* form one of the most numerous nations of Siberia. They are of a middle stature, well made, and of a good mien. Their sight and hearing are of a degree of acuteness and delicacy that is almost incredible; but their organs of smelling and feeling are considerably more blunt than ours. They are acquainted with almost every tree and stone within the circuit of their usual perambulations; and they can even describe a course of some hundred miles by the configurations of the trees and stones they meet with, and can enable others to take the same route by such descriptions. They also discover the tracts of the game by the compression of the grass or moss. They also learn foreign languages with ease, are alert on horseback, good hunters, and dextrous at the bow.

The *Kalmucs* are a courageous tribe, and numerous; for the most part raw-boned and stout. Their visage is so flat, that the skull of a Kalmuc may be easily known from others. They have thick lips, a small nose, a short chin, the complexion a reddish and yellowish brown. Their clothing is oriental, and their heads are exactly Chinese. Some of their women wear a large golden ring in their nostrils. Their principal food is animals, tame and wild, and even their chiefs will feed upon cattle that have died of distemper or age, and let it stink ever so much; so that in every herd the flesh market hath the appearance of a lay-stall of carrion; they eat likewise the roots and plants of their deserts. They are great eaters; but can endure want for a long time without complaint. Both sexes smoke continually: during the summer they keep to the north, and in the winter to the southern deserts. They sleep upon felt or carpeting, and cover themselves with the same.

The *Kamtschadales* have a lively imagination, a strong memory, and a great genius for imitation. Their chief employments are hunting and fishing. The chase furnishes them with fables, foxes, and other game. They are very expert at fishing, and are well acquainted with the proper seasons for it. They eat and drink great quantities; but as what they eat is always cold, their teeth are very fine. Dogs are their only domestic animals, and they put a high value upon them. Some of them travel in small carriages drawn by dogs; and a complete Kamtschadalian equipage, dog's harness, and all, costs in that country 4l. 10s. or near twenty rubles. The Kamtschadales believed the immortality of the soul, before they were prevailed upon to embrace the Christian religion. They are superstitious to extravagance, and extremely singular and capricious in the different enjoyments of life, particularly their convivial entertainments.

The manners of the *Siberians* were formerly so barbarous, that Peter the Great thought he could not inflict a greater punishment upon his capital enemies, the Swedes, than by banishing them to Siberia. The effect was, that the Swedish officers and soldiers introduced European usages and manufactures into the country, and thereby acquired a comfortable living. In this wide and forlorn region, that was so long unknown to Europe, some new mines have lately been discovered, which, upon their first opening, have yielded 45,000 pounds of fine silver, and which is said to have been obtained with little difficulty or expence. But Kamtschatka is now considered as the most horrid place of exile in the vast empire of Russia, and here some of the greatest criminals are sent.

[RELIGION.] The established religion of Russia is that of the Greek church, the tenets of which are by far too numerous and complicated to

be discussed here. It is sufficient to say, that they deny the pope's supremacy; and though they disclaim image-worship, they retain many idolatrous and superstitious customs. Their churches are full of pictures of saints, whom they consider as mediators. They observe a number of fasts and lent, so that they live half the year very abstemiously: an institution which is extremely convenient for the soil and climate. They have many peculiar notions with regard to the sacraments and Trinity. They oblige their bishops, but not their priests, to celibacy. Peter the Great shewed his profound knowledge in government in nothing more than in the reformation of his church. He broke the dangerous powers of the patriarch, and the great clergy. He declared himself the head of the church; and preserved the subordinations of metropolitans, archbishops, and bishops. Their priests have no fixed income, but depend for subsistence upon the benevolence of their flocks and hearers. Peter, after establishing this great political reformation, left his clergy in full possession of all their idle ceremonies; nor did he cut off the beards of his clergy; that impolitic attempt was reserved for the late emperor, and greatly contributed to his fatal catastrophe. Before his days, an incredible number of both sexes were shut up in convents; nor has it been found prudent entirely to abolish those societies. The abuses of them, however, are in a great measure removed; for no male can become a monk till he is turned of thirty; and no female a nun, till she is fifty; and even then not without permission of their superiors.

The conquered provinces, as already observed, retain the exercise of their own religion; but such is the extent of the Russian empire, that many of its subjects are Mahometans, and more of them no better than Pagans, in Siberia and the uncultivated countries. Many ill-judged attempts have been made to convert them by force, which have only tended to confirm them in their infidelity. On the banks of the river Sarpa, is a flourishing colony of Moravian brethren, to which the founders have given the name of Serepta; the beginning of the settlement was in 1765, with distinguished privileges from the imperial court.

[LANGUAGE.] The common language of Russia is a mixture of the Polish and Sclavonian; their priests, however, and the most learned clergy, make use of what is called modern Greek; and they who know that language in its purity, are at no loss for understanding it in its corrupted state. The Russians have thirty-six letters, the forms of which have a strong resemblance to the old Greek alphabet.

[LEARNING AND LEARNED MEN.] The Russians have hitherto made but an inconsiderable figure in the republic of letters; but the great encouragement given by their sovereigns of late, in the institution of academies, and other literary boards, has produced sufficient proofs, that they are no way deficient as to intellectual abilities. The papers exhibited by them, at their academical meetings, have been favourably received all over Europe; especially those that relate to astronomy, the mathematics, and natural philosophy. The speeches pronounced by the bishop of Turer, the metropolitan of Novogorod, the vice chancellor, and the marshal, at the opening of the commission for a new code of laws, are elegant and classical; and the progress which learning has made in that empire, since the beginning of this century, with the specimens of literature published both at Petersburg and Moscow, is an evidence, that the Russians are not unqualified to shine in the arts and sciences. However, the efforts to civilize them did not begin with Peter the Great, but were much older. A small glimmering, like the first day break, was seen under Czar Iwan, in the middle of the 16th century. This became

more conspicuous under Alexius Michaelowitz; but under Peter it burst forth with the splendor of a rising sun, and hath continued ever since to ascend towards its meridian.

UNIVERSITIES.] Three colleges were founded by Peter the Great at Moscow; one for classical learning and philosophy, the second for mathematics, and the third for navigation and astronomy. To these he added a dispensary, which is a magnificent building, and under the care of some able German chemists and apothecaries; who furnish medicines not only to the army, but all over the kingdom. And within these few years, Mr. de Shorelow, high chamberlain to the empress Elizabeth, daughter to Peter the Great, has founded an university in this city. The present empress has also founded an university at Peterburgh, and invited some of the most learned foreigners in every faculty, who are provided with good salaries; and also a military academy, where the young nobility and officers sons are taught the art of war. It ought also to be mentioned, to the honour of the same royal benefactress, that she is actually employed in founding a number of schools for the education of the lower classes of her subjects, throughout the best inhabited parts of the empire; an institution, which, if rightly executed, will intitle the great Catherine, as much as any of her predecessors, to the gratitude of the Russian nation.

CITIES, TOWNS, PALACES, } Peterburgh naturally takes the lead in this
AND OTHER BUILDINGS. } division. It lies at the junction of the Neva with the lake Ladoga, already mentioned, in latitude 60; but the reader may have a better idea of its situation, by being informed that it stands on both sides the river Neva, between that lake and the bottom of the Finland gulf. In the year 1703, this city consisted of a few small fishing huts, on a spot so waterish and swampy, that the ground was formed into nine islands; by which, according to Voltaire, its principal quarters are still divided. Without entering into too minute a description of this wonderful city, it is sufficient to say, that it extends about six miles every way, and contains every structure for magnificence, the improvement of the arts, revenue, navigation, war, commerce, and the like, that are to be found in the most celebrated cities in Europe. But there is a convent which deserves particular notice, in which 440 young ladies are educated at the expence of the empress; 200 of them of superior rank, and the other, daughters of citizens and tradesmen, who, after a certain time allotted to their education, quit the convent with improvements suitable to their conditions of life, and those of the lower class are presented with a sum of money as a dowry if they marry, or to procure to themselves a proper livelihood. Near to this convent is a Foundling Hospital, assistant to that noble one established at Moscow, and where the mother may come to be delivered privately, and then, after the utmost attention to her, she leaves the child to the state, as a parent more capable of promoting its welfare.

As Peterburgh is the emporium of Russia, the number of foreign ships trading to it in the summer-time is surprising. In winter 3000 one-horse sledges are employed for passengers in the streets. It is supposed, that there are 400,000 inhabitants in this city; and it is ornamented with thirty-five great churches; for in it almost every sect of the Christian religion is tolerated. It also contains palaces, some of which are superb, particularly that which is called the New Summer Palace, near the Triumphant Port, which is an elegant piece of architecture. This magnificent city is defended on that side next the sea by the fortrets of Cronstadt; which, considering the difficulty and danger of navigating a large naval force through the gulf of Fin-

land, is

Moscow, at
adorned it w

land, is sufficient to guard it on that side from the attempts of any enemy. Petersburg is the capital of the province of Ingria, one of Peter the Great's conquests from the Swedes. All the neighbourhood of this city is covered with country houses and gardens.

The city of Moscow was formerly the glory of this great empire, and it still continues considerable enough to figure among the capitals of Europe. It stands, as has been already mentioned, on the river from whence it takes its name, in lat. 55-45, and about 1414 miles north-east of London; and though its streets are not regular, it presents a very picturesque appearance; for it contains such a number of gardens, groves, lawns, and streams, that it seems rather to be a cultivated country, than a city. The ancient magnificence of this city would be incredible, were it not attested by the most unquestionable authors: but we are to make great allowances for the uncultivated state of the adjacent provinces, which might have made it appear with a greater lustre in a traveller's eyes. Neither Voltaire nor Busching give us any satisfactory account of this capital; and little credit is to be given to the authors who divide it into regular quarters, and each quarter inhabited by a different order or profession. Busching speaks of it as the largest city in Europe; but that can be only meant as to the ground it stands on, computed to be 16 miles in circumference. It is generally agreed, that Moscow contains 1600 churches and convents, and forty-three palaces or squares. Busching makes the merchants' exchange to contain about 6000 fine shops, which display a vast parade of commerce, especially, to and from China. No city displays a greater contrast than Moscow, of magnificence and meanness in building. The houses of the inhabitants in general are miserable timber booths: but their palaces, churches, convents, and other public edifices are spacious and lofty. The Krimlin, or grand imperial palace, is mentioned as one of the most superb structures in the world: it stands in the interior circle of the city, and contains the old imperial palace, pleasure house, and stables, a victualling house, the palace which formerly belonged to the patriarch, nine cathedrals, five convents, four parish churches, the arsenal, with the public colleges, and other offices. All the churches, in the Krimlin have beautiful spires, most of them gilt, or covered with silver; the architecture is in the Gothic taste; but the insides of the churches are richly ornamented; and the pictures of the saints are decorated with gold, silver, and precious stones. Mention is made of the cathedral, which has no fewer than nine towers, covered with copper double gilt, and contains a silver branch with 48 lights, said to weigh 2800 pounds. A volume would scarcely suffice to recount the other particulars of the magnificence of this city. Its sumptuous monuments of the great dukes and czars, the magazine, the patriarchal palace, the exchequer, and chancery, are noble structures. The public is not unacquainted with the barbarous anecdote, that the czar, John Basilides, ordered the architect of the church of Jerusalem to be deprived of his eye sight, that he might never contrive its equal. The story is improbable, and might take its rise from the arbitrary disposition of that great prince. I shall have occasion hereafter to mention the great bell of Moscow; where the inhabitants are so distractedly fond of bells, that they are always tinkling in every quarter. The jewels and ornaments of an image of the virgin Mary, in the Krimlin church, and its other furniture, can be only equalled by what is seen at the famous Holy House of Loretto in Italy. Mr. Voltaire says, that Peter, who was attentive to every thing, did not neglect Moscow, at the time he was building Petersburg; for he caused it to be paved, adorned it with noble edifices, and enriched it with manufactures.

The

R U S S I A.

The Foundling Hospital at Moscow is an excellent institution, and appears to be under very judicious regulations. It was founded by the present empress, and is supported by voluntary contributions, legacies, and other charitable endowments. It is an immense pile of building, of a quadrangular shape, and contains 3000 foundlings; when the establishment is completed, it is intended to contain 8000. They are taken great care of; and at the age of fourteen they have the liberty of choosing any particular branch of trade; and for this purpose there are different species of manufactures established in the hospital. When they have gone through a certain apprenticeship, or about the age of twenty, they are allowed the liberty of setting up for themselves: a sum of money is bestowed upon each foundling for that purpose, and they are permitted to carry on trade in any part of the Russian empire. This is a very considerable privilege in Russia, where the peasants are slaves, and cannot leave their villages without the permission of their masters.

Nothing can be said with certainty as to the population of Moscow. When lord Carville was the English ambassador there, in the reign of Charles II. this city was 12 miles in compass, and the number of houses were computed at 40,000. Voltaire says that when he wrote, Moscow was twenty miles in circumference, and that its inhabitants amounted to 500,000. Mr. Coxe confirms the account of the circumference of this city, but thinks the account of its population much exaggerated; according to an account which was given to him by an English gentleman, which he received from the lieutenant of the police, and which he says may be relied on, Moscow contains within the ramparts 250,000, and in the adjacent villages 50,000.

CURIOSITIES.] This article affords no great entertainment, as Russia has but lately been admitted into the rank of civilized nations. She can however, produce many stupendous monuments of the public spirit of her sovereigns; particularly her canals made by Peter the Great, for the benefit of commerce. Siberia is full of old sepulchres of an unknown nation, whose instruments and arms were all made of copper. In the cabinet of natural history at Petersburg, is a rhinoceros, dug up on the banks of the river Valt, with his skin, and the hair upon it, perfect. I have already hinted at the passion the Russians have for bell-ringing; and we are told that the great bell of Moscow, the largest in the world, weighs, according to Mr. Coxe, "432,000 pounds, and which exceeds in bigness every bell in the known world. Its size is so enormous, that I could scarcely have given credit to the account of its magnitude, if I had not examined it myself, and ascertained its dimensions with great exactness. Its height is nineteen feet, its circumference at the bottom twenty-one yards eleven inches, its greatest thickness twenty-three inches." It was cast in the reign of the empress Anne: but the beam on which it hung, being burnt, it fell, and a large piece is broken out of it; so that it lately lay in a manner useless. Mr. Bruce in his late memoirs mentions a bell at Moscow founded in Czar Boris's time, 19 feet high, 23 in diameter, and two in thickness, that weighed 336,000 pounds. The building of Petersburg, and raising it of a sudden from a few fishing huts to be a populous and rich city, is perhaps a curiosity hardly to be paralleled since the erection of the Egyptian pyramids. The same may be said of the fortress of Cronstadt, in the neighbourhood of Petersburg, which is almost impregnable. This fortress and city employed for some years 300,000 men in laying its foundation, and driving piles night and day; a work which no monarch in Europe (Peter excepted) could have executed. The whole plan, with a very little assistance from some German engineers, was drawn by his own hand. Equally wonderful was the navy which he raised to his people at the time

COMMERCE, AND NA- } In treating of the Russian commerce, former
 VITIME FORCE. } accounts are of little service at this time, because of its great improvements and variations. By the best and surest information, the annual exports of Russia at present amount to about £.2,400,000, and her imports do not exceed £.1,600,000; so that the balance of trade is yearly £. 800,000 sterling in her favour*.

Russia's productions and exports, in general, are many, and very valuable, viz. furs and peltry of various kinds, red leather, linen and thread, iron, copper, sail-cloth, hemp and flax, pitch and tar, wax, honey, tallow, isinglass, linseed-oil, pot ash, soap, feathers, train-oil, hog's bristles, muck, rhubarb, and other drugs, timber, and also raw silk from China and Persia.

Her foreign commerce is much increased since her conquests from Sweden, especially of Livonia and Ingria; and since the establishing of her new emporium of Peterburgh, whereby her naval intercourse with Europe is made much more short and easy. The Ukraine may be called the granaries of the empire; the best corn, hemp, flax, honey, and wax, come from this fertile province; and 10,000 head of horned cattle are annually sent from its pastures into Silesia and Saxony.

Russia carries on a commerce over-land, by caravans, to China, chiefly in furs; and they bring back from thence, tea, silk, cotton, gold, &c. To Bocharia, near the river Oxus in Tartary, Russia, sends her own merchandize, in return for Indian silks, curled lamb skins, and ready money; and also for the annual fair at Samarcand; she likewise trades to Persia by Astracan, cross the Caspian sea, for raw and wrought silk. The empress, in 1784, issued an edict, permitting all foreigners to carry on a free trade by sea and land with the several countries bordering on the Euxine, which have been lately annexed to the empire. The same privileges religious and civil, are allowed to them in the ports of Cherson, Sebastopolis, and Theodosia, (formerly Cassa,) in the province of Taurica, as in Peterburgh.

Before the time of Peter the Great, Archangel, which lies upon the White Sea, was the only port of naval communication which Russia had with the rest of Europe; but it was subject to a long and tempestuous voyage. They have now 13 ports, Archangel, Peterburgh, Riga, Revel, Pernau, Narva, Wibourg, Fredericksham, Astracan, and Kola, and the three opened in their new conquests. This town is about three English miles in length, and one in breadth, built all of wood, excepting the exchange, which is of stone. Notwithstanding the decrease of the trade of Archangel, by building Peterburgh, it still exports a considerable quantity of merchandize. Their masts and timber for the dock-yards come chiefly from the forests of Kasan, that border on the province of Astracan.

GOVERNMENT, LAWS, AND } The sovereign of the Russian empire is ab-
 DISTINCTION OF RANK. } solute and despotic in the fullest extent of those terms, and master of the lives and properties of all his subjects; who, though they are of the first nobility, or have been highly instrumental in promoting the welfare of the state, may, notwithstanding, for the most trifling offence, or even for no offence at all, be seized upon and sent to Siberia, or made to drudge for life upon the public works, and have all their goods con-
 fiscated.

* Coxe's Travels, 4to. vol. ii. p. 247.

confiscated, whenever the sovereign or his ministers shall think proper. Persons of any rank may be banished into Siberia for the slightest political intrigue, and their possessions being confiscated, a whole family may at once be ruined by the insinuations of an artful courtier. The secret court of chancery, which was a tribunal composed of a few ministers chosen by the sovereign, had the lives and fortunes of all families at their mercy. But this court was suppressed by Peter III.

The system of civil laws at present established in Russia, is very imperfect, and in many instances barbarous and unjust; being an assemblage of laws and regulations drawn from most of the states of Europe, ill digested, and in many respects not at all adapted to the genius of the Russian nation. But the present empress has made some attempts to reform the laws, and put them upon a better footing. The courts of justice were in general very corrupt, and those by whom it was administered extremely ignorant; but the empress hath lately made some judicious regulations, and fixed a certain salary to the office of judge, which before depended on the contributions of the unhappy clients, and thus the poor were without hope or remedy. It is hoped that the new code of laws for which she hath given instructions, will soon be produced, to increase the people's liberty, security, and felicity.

The distinctions of rank form a considerable part of the Russian constitution. The late empresses took the title of Autocratix; which implies, that they owed their dignity to no earthly power. Their ancient nobility were divided into knezes or knazeys, boyats, and vaivods. The knezes were sovereigns upon their own estates, till they were reduced by the czar; but they still retain the name. The boyats were nobility under the knezes; and the vaivods were governors of provinces; those titles, however, so often revived the ideas of their ancient power, that the present and late empresses have introduced among their subjects, the titles of counts and princes, and the other distinctions of nobility that are common to the rest of Europe.

REVENUE AND EXPENCES.] Nothing certain can be said concerning the revenues of this mighty empire; but they are, undoubtedly, at present, far superior to what they were in former times, even under Peter the Great. The vast exertions for promoting industry, made by his successors, especially her present imperial majesty, must have greatly added to their income, which can scarcely be reckoned at less than 30,000,000 of rubles, or nearly six millions sterling annually; thus computed:

	Rubles.
Capitation tax,	8,500,000
Other taxes and duties,	7,000,000
Her own estates with other domi- nions taken from the clergy }	6,000,000
Produce of the mines,	1,500,000
Monopoly of distilled liquors	4,000,000
Monopoly of salt	1,800,000
	<hr/>
	28,300,000

The deficiency of the sum total may be easily made up by the profit arising from stamp paper, patents, post office, and other articles omitted in the general calculation, besides one per cent, every Russian merchant is obliged to pay out of his yearly capital.

When the reader considers this sum relatively, that is, according to the high value of money, in that empire, compared to its low value in Great Britain, he will find it a very considerable revenue. That it is so, appears from the vast

armies maintained and paid by the late and present emperors, in Germany, Poland, and elsewhere, when no part of the money returned to Russia; nor do we find that they received any considerable subsidy from the houses of Bourbons and Austria, who, indeed, were in no condition to grant them any. Mr. Voltaire says, that in 1725, reckoning the tribute paid by the Tartars, with all taxes and duties in money, the sum total amounted to thirteen millions of rubles (each ruble amounting to 4s. 6d. sterling). This income was at that time sufficient to maintain 330,500 men, employed in the land and sea service. The other expences, besides the payment of the army and navy of her present majesty, the number and discipline of which are at least equal to those of her greatest predecessors, is very considerable. Her court is elegant and magnificent; her guards and attendants splendid; and the encouragement she gives to learning, the improvements of the arts, and useful discoveries, cost her vast sums, exclusive of her ordinary expences of state.

Some of the Russian revenues arise from monopolies; which are often necessary in the infancy of commerce. The most hazardous enterprise undertaken by Peter the Great, was his imitating the conduct of Henry VIII. of England in seizing the revenues of the church. He found perhaps, that policy and necessity required that the greatest part of them should be restored, which was accordingly done; his great aim being to deprive the patriarch of his excessive power. The clergy are taxed in Russia; but the pecuniary revenues of the crown arise from taxes upon estates, baggion, bees, mills, fisheries, and other particulars.

The Russian armies are raised at little or no expence; and, while in their own country, subsist chiefly on provisions furnished them by the country people according to their internal valuation. The pay of a soldier scarcely amounts to 30 shillings yearly: in garrison he receives only five rubles yearly. The pay of a sailor and a gunner is a ruble a-month, and they are found in provisions when a-shore.

ORDERS.] The order of *St. Andrew* instituted by Peter the Great, in 1698, to animate his nobles and officers, in the wars against the Turks. He chose *St. Andrew* for his patron, because by tradition he was the founder of Christianity in the country. The knights are persons of the first rank in the empire. The order of *Sir Alexander Newski*, was also instituted by Peter the Great, and confirmed by the empress Catharine I. in the year 1725. The order of *St. Catharine* was instituted by Peter the Great, in honour of his empress, for her assistance on the banks of the Pruth. The order of *St. George* instituted by the present empress Catharine II. in favour of the military officers in her service. The order of *St. Woldemir* was instituted about October 3d, 1782, by the empress, in favour of those who serve her in a civil capacity. The order of *St. Anne* of Holstein, in memory of Anne, daughter of Peter the Great.

HISTORY.] It is evident both from ancient history and modern discoveries, that some of the most neglected parts of the Russian empire at present were formerly rich and populous. The reader who throws his eyes on a general map of Europe and Asia, may see the advantages of their situation, and their communication by rivers with the Black Sea, and the richest provinces in the Roman and Greek empires. In later times, the Asiatic part of Russia bordered with Samarcand in Tartary, once the capital under Jenghis Khan and Tamerlane, of a far more rich and powerful empire than any mentioned in history; and that nothing is more certain than that the conquest of Russia was among the last attempts made by the former of those princes. The chronicles of this empire reach no higher than the 9th century, but they have vented a tradition;

that Kiow and Novogorod were founded by Kii in the year 430. This Kii is by some considered as an ancient prince, while others mention him as a simple boatman employed to transport goods and passengers across the Neiper. For a long time the chief or ruler had the title of grand duke of Kiow. We cannot with the smallest degree of probability carry our conjectures with regard to the History of Russia higher than the introduction of Christianity, which happened about the tenth century: when the Princes of this country called Olba, is said to have been baptized at Constantinople, and refused the hand of the Greek emperor, John Zimisces, in marriage. This accounts for the Russians adopting the Greek religion, and part of the alphabet. Photus, the famous Greek patriarch, sent priests to baptize the Russians, who were for some time subject to the see of Constantinople; but the Greek patriarch afterwards resigned all their authority over the Russian church; and its bishops erected themselves into patriarchs, who were in a manner independent of the civil power. It is certain, that till the year 1450, the princes of Russia were but very little considered, being chiefly subjected by the Tartars. It was about this time that John or Iwan Basilides conquered the Tartars, and among others, the Duke of Great Novogorod; from whom he is said to have carried 300 cart loads of gold and silver. His prosperous reign of 45 years, gave a new aspect to Russia.

His grandson the famous John Basilowitz II. having cleared his country of the invading Tartars, subdued the kingdoms of Kasan and Astracan Tartary, in Asia, and annexed them to the Russian dominions. By his cruelty, however, he obliged the inhabitants of some of his finest provinces, particularly Livonia and Esthonia, to throw themselves under the protection of the Poles and Swedes. Before the time of this John II. the sovereign of Russia took the title of Welike Knez, "great prince," great lord, or great duke. The title of Tzar, or, as we call it, Czar, (an expression which, in the Sclavonian language, signifies king) was added to that of the Russian sovereigns. Upon the death of John Basilowitz, the Russian succession was filled up by a set of weak, cruel princes; and their territories were torn in pieces by civil wars. In 1597, Boris Godonow, according to Voltaire, whose information I prefer, as it seems to be the most authentic, assassinated Demetrius, the lawful heir, and usurped the throne. A young monk took the name of Demetrius, pretending to be that prince who had escaped from his murderers; and with the assistance of the Poles, and a considerable party (which every tyrant has against him), he drove out the usurper, and seized the crown himself. The imposture was discovered as soon as he came to the sovereignty, because the people were not pleased with him, and he was murdered. Three others pretending to be Demetrius started up one after another.

These impostures prove the despicable state of ignorance in which the Russians were immersed. The country became by turns a prey to the Poles and the Swedes; but was at length delivered by the good sense of the boyars, impelled by their despair, so late as the year 1613. The independency of Russia was then on the point of being extinguished. Uladislaus, son of Sigismund II. of Poland, had been declared czar; but the tyranny of the Poles was such, that it produced a general rebellion of the Russians. They drove the Poles out of Moscow, where they had for some time defended themselves with unexampled courage. Philaretus, archbishop of Moscow, whose wife was descended of the ancient sovereigns of Russia had been sent ambassador to Poland by Demetrius, one of the Russian tyrants; and he was detained prisoner under pretence that his countrymen had rebelled against Uladislaus.

The boyars met in a body; and such was their veneration for Philaretus and his wife, whom the tyrant had shut up in a nunnery, that they elected their son Michael Fædrowitz, of the house of Romanoff, a youth of 15 years of age, to be their sovereign. The father being exchanged for some Polish prisoners, returned to Russia, and being created patriarch by his son, he defeated the attempts of the Poles to replace Uladislaus upon the throne, and likewise the claim of a brother of Gustavus Adolphus. The claims of the Swedes and Poles upon Russia occasioned a war between those two people, which gave Michael a kind of breathing time; and he made use of it for the benefit of his subjects. He reigned thirty-three years; and by his wisdom, and the mildness of his character, he restored ease and tranquillity to his subjects. He encouraged them to industry, and gave them the example of very commendable behaviour in his own person. Before we take leave of Michael, it may be proper to mention the mode of the czar's nuptials, which could not be introduced into the miscellaneous customs of their subjects; and which are as follow. His Czarish majesty's intention to marry being known, the most celebrated beauties of his dominions were sent for to court, and there entertained. They were visited by the czars, and the most magnificent nuptial preparations were made, before the happy lady was declared, by sending her magnificent jewels and a wedding robe. The rest of the candidates were then dismissed to their several homes, with suitable presents. The name of the lady's father who pleased Michael, was Streichen; and he was ploughing his own farm, when it was announced to him, that he was father-in-law to the czar.

Alexius succeeded his father Michael, and was married in the same manner. He appears to have been a prince of great genius. He recovered Smolensko, Kiow, and the Ukraine, but was unfortunate in his wars with the Swedes. When the grand signior, Mahomet IV. haughtily demanded some possessions from him in the Ukraine, his answer was, "that he scorned to submit to a Mahometan dog, and that his scymetar was as good as the grand signior's sabre." He promoted agriculture, introduced into his empire arts and sciences, of which he was himself a lover; published a code of laws, some of which are still used in the administration of justice; and greatly improved his army by mending its discipline. This he effected chiefly by the help of strangers, most of whom were Scotch. He subdued a chief of the Don-Cossacs, named Stenko Rasin, who endeavoured to make himself king of Astracan; and the rebel, with 2,000 of his adherents, was hanged on the high roads. He introduced linen and silk manufactures into his dominions; and instead of putting to death, or enslaving his Lithuanian, Polish, and Tartar prisoners, he sent them to people the banks of the Wolga and the Kama. Theodore succeeded his father Alexius in 1667. He reigned seven years, and having on his death-bed called his boyars round him, in the presence of his brother and sister Iwan and Sophia, and of Peter, who was afterwards so celebrated, and who was his half brother, he said to them, "Hear my last sentiments: they are dictated by my love for the state, and by my affection for my people. The bodily infirmities of Iwan, necessarily must affect his mental faculties; he is incapable of ruling such a dominion as that of Russia; he cannot take it unless I recommend you to set him aside, and let your approbation fall on Peter, who to a robust constitution joins great strength of mind, and marks of a superior understanding." But this wife declaration extremely offended the princess Sophia, who was a woman of great ambition, and who, after the death of Theodore, found means

to excite a horrible sedition among the Strelitzes, who then formed the standing army of Russia. Their excesses surpassed all description; but Sophia by her management, replaced her brother Iwan in his birthright; and exercised the government herself with the greatest severity and inhumanity; for all the Russian grandees who were related to Peter, or whom she supposed to favour him, were put to cruel deaths. The instances given by Voltaire of her barbarous administration, are shocking to humanity. At length, in 1682, the two princes, Iwan and Peter, were declared joint sovereigns, and their sister, their associate co-regent. Her administration was bloody and tumultuous: nor durst she venture to check the fury of the Strelitzes, and other insurgents. Finding this debility in her own person, she intended to have married prince Basil Galitzin, who is said to have been a man of sense and spirit, and some learning. Being placed at the head of the army by Sophia, he marched into Crim Tartary; but Peter now was about seventeen years of age, and asserted his rights to the throne. Sophia and Iwan were then at Moscow, and upon Peter's publishing aloud that a conspiracy had been formed by his sister to murder him, he was joined by the Strelitzes, who defeated or destroyed Sophia's party, and forced herself to retire to a monastery. Galitzin's life was spared, but his great estate was confiscated, and the following curious sentence was pronounced as his punishment, "Thou art commanded by the most clement czar, to repair to Karga, a town under the pole, and there to continue the remainder of thy days. His majesty, out of his extreme goodness, allows thee three pence per day for thy subsistence." This left Peter with no other competitor, in the year 1689, than the mild and easy Iwan, and upon his death, which happened in 1696, Peter reigned alone, and cruelly provided for his own future security, by the execution of above 3000 Strelitzes.

Peter, though he had been but very indifferently educated, through the jealousy of his sister, associated himself with the Germans and Dutch; with the former for the sake of their manufactures, which he early introduced into his dominions; and with the latter for their skill in navigation, which he practised himself. His inclination for the arts was encouraged by his favourite Le Fort, a Piedmontese; and general Gordon, a Scotchman, disciplined the czar's own regiment, consisting of 5000 foreigners; while Le Fort raised a regiment of 12,000, among whom he introduced the French and German exercise of arms, with a view of employing them in curbing the insolence of the Strelitzes. Peter, after this, began his travels; leaving his military affairs in the hands of Gordon. He set out as an attendant upon his own ambassadors; and his adventures in Holland and England, and other courts, are too numerous, and too well known to be inserted here. By working as a common ship-carpenter at Deptford and Saardam, he completed himself in ship-building and navigation; and through the excellent discipline he introduced among his troops by the foreigners, he not only over-awed or crushed all civil insurrections, but all his enemies on this side of Asia; and at last he even exterminated, excepting two feeble regiments, the whole body of the Strelitzes. He rose gradually through every rank and service both by sea and land; and the many defeats which he received, especially that from Charles XII. at Narva, seemed only to enlarge his ambition, and extend his ideas. The battles he lost rendered him a conqueror upon the whole, by adding experience to his courage: and the generous friendship he shewed to Augustus king of Poland, both before and after he was dethroned by the king of Sweden, redounds greatly to his honour. He had no regard for rank distinct from merit; and he at last married Catharine, a young

Lithuanian woman, who had been betrothed to a Swedish soldier; because, after a long cohabitation, he found her possessed of a soul formed to execute his plans, and to assist his councils. Catharine was so much a stranger to her own country, that her husband afterwards discovered her brother, who served as a common soldier in his army. But military and naval triumphs which succeeded one another after the battle of Pultowa in 1709, with Charles XII. were not the chief glory of Peter's reign. He applied himself with equal assiduity, as already mentioned, to the cultivation of commerce, arts, and sciences; and, upon the whole, he made such acquisitions of dominion, even in Europe itself, that he may be said, at the time of his death, which happened in 1725, to have been the most powerful prince of his age, but more feared than beloved by his subjects.

Peter the Great was unfortunate in his eldest son, who was called the czarowitz, and who, marrying without his consent, entered, as his father allowed, into some dangerous practices against his person and government, for which he was tried and condemned to death. Under a sovereign so despotic as Peter was, we can say nothing as to the justice of the charge. It was undoubtedly his will, that the young prince should be found guilty; and the very reading of the sentence appears to have been fatal to him. It is said, that as soon as sentence of death was pronounced upon the prince, wherein were the following words, "The divine, ecclesiastical, civil, and military law condemn to death, without mercy, all those whose attempts against their father and their sovereign are manifest," he fell into the most violent convulsions, from which it was with great difficulty that he regained a little interval of sense, during which he desired his father would come to see him, when he asked his pardon and soon after died. After this event Peter ordered his wife Catharine to be crowned, with the same magnificent ceremonies as if she had been a Greek empress, and to be recognised as his successor; which she accordingly was, and mounted the Russian throne upon the decease of her husband. She died, after a glorious reign, in 1727, and was succeeded by Peter II. a minor, son to the czarowitz. Many domestic revolutions happened in Russia during the short reign of this prince; but none was more remarkable than the disgrace and exile of prince Menzikoff, the favourite general in the two late reigns, and esteemed the richest subject in Europe. Peter died of the small pox, in 1730.

Notwithstanding the despotism of Peter and his wife, the Russian senate and nobility, upon the death of Peter II. ventured to set aside the order of succession which they had established. The male issue of Peter was now extinguished; and the duke of Holstein, son to his eldest daughter, was, by the destination of the late empress, entitled to the crown; but the Russians, for political reasons, filled their throne with Anne, duchess of Courland, second daughter to Iwan, Peter's eldest brother; though her eldest sister the duchess of Mecklenburgh was alive. Her reign was extremely prosperous; and though she accepted the crown under limitations that some thought derogatory to her dignity, yet she broke them all, asserted the prerogative of her ancestors, and punished the aspiring Dologorucki family, who had imposed upon her limitations, with a view, as it is said, that they themselves might govern. She raised her favourite, Biron, to the duchy of Courland; and was obliged to give way to many severe executions on his account. Upon her death in 1740, John, the youngest niece the princess of Mecklenburgh, by Anothony Ulric of Brunswick, Wolfenbuttle, was, by her will, entitled to the succession; but being no more than two years old, Biron was appointed to be admiral, or of the empire during his nonage. This destination was disagreeable to the princess of Mecklenburgh and her husband, and unpopular

among the Russians. Count Munich was employed by the princess of Mecklenburgh to arrest Biron; who was tried, and condemned to die, but was sent in exile to Siberia.

The administration of the princess Anne of Mecklenburgh and her husband was, upon many accounts, but particularly that of her German connections, disagreeable, not only to the Russians, but to other powers of Europe; and notwithstanding a prosperous war they carried on with the Swedes, the princess Elizabeth, daughter, by a former marriage, to Peter the Great, formed such a party, that in one night's time she was declared and proclaimed empress of the Russians; and the princess of Mecklenburgh, her husband, and son, were made prisoners.

Elizabeth's reign may be said to have been more glorious than that of any of her predecessors, her father excepted. She abolished capital punishments; and introduced into all civil and military proceedings a moderation, till her time, unknown in Russia; but at the same time she punished counts Munich and Osterman, who had the chief management of affairs during the late administration, with exile. She made peace with Sweden; and settled, as we have already seen, the succession to that crown, as well as to her own dominions, upon the most equitable foundation. Having gloriously finished a war, which had been stirred up against her, with Sweden, she replaced the natural order of succession in her own family, by declaring the duke of Holstein-Gottorp, who was descended from her eldest sister, to be her heir. She gave him the title of grand-duke of Russia; and soon after her accession to the throne, she called him to her court; where he renounced the succession of the crown of Sweden, which undoubtedly belonged to him, embraced the Greek religion, and married a princess of Anhalt-Zerbst, by whom he had a son, who at her decease, ascended the throne of Russia.

Few princes had a more uninterrupted career of glory than Elizabeth. She was completely victorious over the Swedes. Her alliance was courted by Great Britain, at the expence of a large subsidy; but many political, and some private reasons, it is said, determined her to take part with the house of Austria against the king of Prussia in 1756. Her arms alone gave a turn to the success of the war, which was in disservice of Prussia, notwithstanding that monarch's amazing abilities both in the field and cabinet. Her conquest was such as portended the entire destruction of the Prussian power, which was, perhaps, saved only by her critical death, on January 5, 1767.

Elizabeth was succeeded by Peter III. grand prince of Russia, and duke of Holstein; a prince whose conduct has been variously represented. He mounted the throne possessed of an enthusiastic admiration of his Prussian majesty's virtues; to whom he gave peace, and whose principles and practices he seems to have adopted, as the directories of his future reign. He might have surmounted the effects even of those peculiarities, unpopular as they then were in Russia; but it is said that he aimed at reformation in his dominions, which even Peter the Great durst not attempt; and that he even ventured to cut off the beards of his clergy. It is also alledged, that he had formed a resolution to destroy both his empress and her son, though they had been declared heirs to the imperial throne by the same authority which had placed the crown upon his head: and even the advocates of Peter the Third acknowledge, that he had resolved to shut up his wife and son in a convent, to place his mistress upon the throne, and to change the order of succession. However, the execution of his designs was prevented by an almost general conspiracy being formed against him, in which the empress took a very active part; and this unfortunate prince scarcely knew an interval between the

loss of his crown and his life, of which he was deprived while under an ignominious confinement, in July 1762. That his conduct with regard to Prussia was not the sole cause of his deposition seems pretty evident from the measures of his successor, who was his own wife, and reigned by the title of Catharine II. That princess, with regard to Prussia, trode in her husband's steps, and followed the plan he chalked out. One of the most remarkable domestic occurrences of her reign is the death of prince Iwan, son to the princess of Mecklenburgh.

This young prince, as soon as he came into the world, was designed, though unjustly and illegally, to wear the imperial crown of Russia, after the death of his great aunt, the empress Anna Iwanowna; but by the advancement of the empress Elizabeth, he was condemned to lead an obscure life in the castle of Schlusselfourg, under a strong guard, who had particular orders, that if any person, or any armed force, was employed in attempting to deliver him, they should kill him immediately. He lived quietly in his prison, when the empress Catherine II. mounted the throne; and as the revolution which deposed her husband Peter III. had occasioned a strong ferment in the minds of the people, Catharine was apprehensive that some attempts might be made in favour of Iwan; she therefore doubled the guards of this unhappy prince, and particularly entrusted him to the care of two officers, who were devoted to her interest. However, a lieutenant of infantry, who was born in the Ukraine, undertook, or at least pretended so, to deliver Iwan by force of arms, from the fortress of Schlusselfourg; and under this pretence the prince was put to death. The lieutenant who attempted to deliver him was arrested, and afterwards beheaded: but, notwithstanding this, it has been represented that he was a mere tool of the court, though he suffered for executing the instructions that he had received.

While this event excited the attention of the Russian nation, the flames of civil war broke out with great violence in Poland, which has generally been the case when the throne was vacant. And as the internal tranquillity of Poland is a capital object with Russia, the empress Catharine sent a body of troops into Poland, and by her influence count Poniatowski was raised to the throne. She also interposed, in order to secure the rights which the treaty of Oliva had given to the Greek and protestant subjects of Poland. But the umbrage which her imperial majesty's armies gave to the Roman Catholic Poles, by their residence in Poland, increased the rage of civil war in that country, and produced confederacies against all that had been done during that late election, which rendered Poland a scene of blood and confusion. The conduct of Russia with regard to Poland gave so much offence to the Ottoman court, that the Grand Signior sent Obreskoff, the Russian minister, to the prison of the seven towers, declared war against Russia, and marched a very numerous army to the confines of Russia and Poland. Hostilities soon commenced between these rival and mighty empires. In the months of February and March 1769, Crim Gueray, Khan of the Tartars, at the head of a great body of Tartars, supported by 10,000 spahis, having broken the Russian lines of communication, penetrated into the province of New Servia, where he committed great ravages, burning many towns and villages, and carrying off some thousand families captive. In April following the Grand Vizir, at the head of a great army, began his march from Constantinople, and proceeded towards the Danube. In the mean time prince Gallitzin, who commanded the Russian army on the bank of the Neister, thought this a proper time to attempt something decisive, before the arrival of the great Turkish force in that quarter. Having accord-

ing

dingly crossed the Neister with his whole army, he advanced to Choczim, where he encamped in sight of a body of 30,000 Turks, commanded by Curtin Pacha, and entrenched under the cannon of the town. The prince having made the necessary dispositions, attacked the Turks in their intrenchment early in the morning of the 30th of April, and notwithstanding an obstinate defence, and a dreadful fire from the fortrefs, at length beat them out of their trenches. The Turks endeavoured to cover their retreat, by detaching a large body of cavalry to attack the right wing of the Russian army; but they had such a warm reception from the artillery, that they soon retired in great disorder. General Stoffeln and prince Dolgorucki were then ordered to pursue the fugitives, at the head of eight battalions, which they did so effectually, that they followed them into the suburbs of Choczim, and their pursuit was at length only stopped by the palisades of the fortrefs. On the 13th of July, a very obstinate battle was fought between a considerable Turkish army, and the Russians under prince Gallitzin, in the neighbourhood of Choczim, in which the Turks were defeated. The Russians immediately invested Choczim; but the garrison being numerous, made frequent sallies, and received great reinforcements from the grand vizir's camp, who was now considerably advanced on this side of the Danube. Several actions ensued, and prince Gallitzin was at length obliged to retreat from Choczim, and again to repass the Neister. It was computed that the siege of Choczim, and the actions consequent to it, cost the Russians above 20,000 men.

In the management of this war, the grand vizir had acted with a degree of prudence, which it has been thought would have proved fatal to the designs of the Russians, if the same conduct had been afterwards pursued. But the army of the vizir was extremely licentious, and his caution gave offence to the Janizaries; so that in consequence of their clamours, and the weakness of the councils that prevailed in the seraglio, he at length became a sacrifice, and Moldoyan Ali Pacha, a man of more courage than conduct, was appointed his successor.

During these transactions, general Romantzow committed great devastations upon the Turks in the borders of Bender and Oczakow, where he plundered and burnt several towns and villages, defeated a Turkish detachment, and carried off a great booty of cattle. The Tartars also committed great ravages in Poland, where they almost totally destroyed the palatinate of Braklaw, besides doing much mischief in other places. In the beginning of September, the Russian army was again posted on the banks of the Neister, and effectually defended the passage of that river against the Turks, whose whole army, under the command of the new vizir, was arrived on the opposite shore. Having laid three bridges over the Neister, the Turkish army, without any pretence of stratagem or deception, began to pass the river in the face of the enemy. Prince Gallitzin having perceived this motion early in the morning of the 9th of September, immediately attacked those troops that had crossed the river in the night, who consequently could neither choose their ground, nor have time to extend or form themselves properly where they were. Notwithstanding these extreme disadvantages, the engagement was very severe, and continued from seven in the morning till noon. The Turks fought with great obstinacy; but they were at length totally defeated, and obliged to repass the river with great loss, and in the utmost disorder and confusion. It was computed, that about 60,000 Turks crossed the river before and during the time of the engagement. Prince Gallitzin

charged at the head of five columns of infantry, with fixed bayonets, who destroyed the flower of the Turkish cavalry. It is said, that the loss of the Turks, in this battle, amounted to 7000 men killed upon the spot, besides wounded and prisoners, and a great number who were drowned. Though the ill conduct of the vizir had greatly contributed to this capital misfortune, yet this consideration did not prevent him from engaging in another operation of the same nature. He now laid but one bridge over the river, which he had the precaution to cover with large batteries of cannon, and prepared to pass the whole army over. Accordingly, on the 17th of September, eight thousand Janizaries and four thousand regular cavalry, the flower of the whole Ottoman army, passed over with a large train of artillery, and the rest of the army were in motion to follow, when a sudden and extraordinary swell of the waters of the Neiler carried away and totally destroyed the bridge. The Russians lost no time in making use of this great and unexpected advantage. A most desperate engagement ensued, in which the slaughter of the Turks was prodigious. Not only the field of battle, but the river over which some few hundreds of Turks made their escape by swimming was for several miles covered with dead bodies. The Russians took 64 pieces of cannon, and above 150 colours and horse-tails. The Turks immediately broke up their camp, and abandoned the strong fortress of Choczim, with all its stores and numerous artillery, and retired tumultuously towards the Danube. They were much exasperated at the ill conduct of their commander the vizir; and it was computed that the Turks lost 28,000 of the best and bravest of their troops, within little more than a fortnight; and that 48,000 more abandoned the army, and totally deserted, in the tumultuous retreat to the Danube. Prince Gallitzin placed a garrison of four regiments in the fortress of Choczim, and soon after resigned the command of the army to general count Romanzow, and returned to Peterburgh, covered with laurels.

The Russians continued to carry on the war with success; they over-ran the great province of Moldavia, and general Elmpt took possession of the capital city of Jassy without opposition. And as the Greek natives of this province had always secretly favoured the Russians, they now took this opportunity of their success, and the absence of the Turks, to declare themselves openly. The Greek inhabitants of Moldavia, and afterwards those of Wallachia, acknowledged the empress of Russia their sovereign, and took oaths of fidelity to her. On the 18th of July, 1770, general Romanzow defeated a Turkish army, near the river Larga: the Turks are said to have amounted to 80,000 men, and were commanded by the khan of the Crimea. But on the second of August, the same Russian general obtained a still greater victory over another army of the Turks, commanded by a new grand vizir. This army was very numerous, but was totally defeated. It is said that above 7000 Turks were killed in the field of battle, and that the roads to the Danube were covered with dead bodies; a vast quantity of ammunition, 143 pieces of brass cannon, and some thousand carriages loaded with provisions, fell into the hands of the Russians.

But it was not only by land that the Russians carried on the war successfully against the Turks. The empress sent a considerable fleet of men of war, Russian built, into the Mediterranean, to act against the Turks on that side. And, by means of this fleet, under count Orlop, the Russians spread ruin and desolation through the open islands of the Archipelago, and the neighbouring defenceless coasts of Greece and Asia; the particulars of which will appear in the history of Turkey. It is observable, that in this attempt

of the Russians to act as a maritime power they were greatly assisted by England; but whether in this the English government was influenced by principles of sound policy, may very reasonably be questioned.

The war between the Russians and the Turks still continued to be carried on by land as well as by sea, to the advantage of the former; but at length some attempts were made to negotiate a peace: it was, however, a long time before matters could be accommodated between these great contending powers; hostilities were repeatedly suspended, and afterwards renewed; but at last a peace was concluded, on the 21st of July, 1774, highly honourable and beneficial to the Russians, by which they obtained the liberty of a free navigation over the Black Sea, and a free trade with all the parts of the Ottoman empire.

Before the conclusion of the war with the Turks, a rebellion broke out in Russia, which gave much alarm to the court of Petersburg: A Cossack, whose name was Pugatscheff, assumed the name and character of the late unfortunate emperor Peter the Third. He appeared in the kingdom of Kasan, and pretended that he made his escape through an extraordinary interposition of Providence, from the murderers who were employed to assassinate him; and that the report of his death was only a fiction invented by the court. There is said to have been a striking resemblance in his person to that of the late emperor, which induced him to engage in this enterprize. As he possessed abilities and address, his followers soon became very numerous; and he at length found himself so powerful, his followers being armed and provided with artillery, that he stood several engagements with able Russian generals, at the head of large bodies of troops, and committed great ravages in the country. But being at last totally defeated, and taken prisoner, he was brought to Moscow in an iron cage, and there beheaded, on the 21st of January, 1775.

The peace of 1774 was then indispensably necessary to the immediate preservation of the Turkish empire, but within so small a space of time as 5 years a new war was just upon the point of breaking out between the two empires; and was only prevented by a new treaty of pacification, which took place on the 21st of March, 1779. But the great source of discord was still left open. The pretended independency of the Crimea afforded such an opening to Russia into the very heart of the Turkish empire, and such opportunities of interference, that it was scarcely possible that any lasting tranquillity could subsist between the two empires. A claim made and justified on by Russia, of establishing consuls in the three provinces of Moldavia, Wallachia, and Bessarabia, was exceedingly grievous to the Porte. After long disputes, the Turkish ministers, more from a sense of the disability of the state for war, than from pacific dispositions, found it necessary, towards the close of the year 1781, to give up the point of debate with respect to the consuls. This concession, however mortifying, produced but a short-lived effect. New troubles were continually breaking forth. The emperor of Germany having avowed his determination of supporting all the claims of Russia as well as his own, all sides prepared for the most determined hostility, and the preparations were immense on all. The year 1783 accordingly exhibited the most formidable apparatus of war on the northern and eastern borders of Europe. However, in the midst of all these appearances of war, negotiations for a peace were continually carried on at Constantinople, which was at last signed January 9th, 1784.

By this treaty, the empress retained the sovereignty of the Crimea, of the isle of Taman, and a great part of the Kuban; and the Tsar acknowledged

ledged the right which she pretended incontestibly to have to the dominion of the Euxine, and to the passage of the Dardanelles. Thus Catharine acquired, without the necessity of going to war, a vast territory, and 1,500,000 new subjects.

The empress restored their antient names to the Krimca and to the Kuban. The former of these countries was called Tavrida, and the other Caucasus.

Though Catharine was adding to her vast dominions in every quarter; though she appropriated to herself, in peace or war, all the territory on which she could seize with impunity, she was not the less jealous of every accession of power to her rivals. She had long been particularly uneasy at the increasing fame of Frederic II. and the preponderance he had acquired in Europe. From the first partition of Poland, Frederic had daily been making encroachments on the privileges of the city of Dantzick, and pressed it to such a degree, that it was almost obliged to surrender itself to him, or relinquish its commerce. Catharine was the more exasperated at seeing Dantzick, fall under the power of the Prussians, as the court of Russia had long since itself formed the project of taking possession of that town, and had only been induced to lay it aside by the private remonstrances that were made by the government of France to the chancellor Vorontzoff.

Another corner of Europe was in the mean time disturbed by differences of an opposite nature. Joseph II. had formed the design of opening the Scheldt. To this an opposition was made by the Dutch, who used every effort to engage Frederic to support by force of arms their covetous pretensions. Catharine, on this occasion, declared that she was resolved to support the rights of the emperor of Germany. Upon this, the Dutch, whose cannon had already insulted the austrian flag, dreading an exclusion from the ports of the Baltic, adopted the wisest method, of negotiating instead of fighting.

Frederic II. who regarded the alliance between Austria and Russia as highly dangerous to Prussia, and even to all Germany, invited the electors and the other princes of the empire to unite for the defence of the germanic constitution. The king of Great Britain, as elector of Hanover, was one of the first who entered into the confederacy: a step which caused great displeasure both to the empress and to Potemkin. The treaty was signed at Berlin the 23d of July 1785.

In the year 1785 Cathrine sent several learned persons, some towards Caucasus, others to the frontiers of China. for the purpose of discovering, exploring, and examining, the most remote provinces, and the yet unknown parts of that immense empire. The difficulties and perils to which this expedition by land was supposed liable, through the trackless deserts which were to be explored, the inhospitality of the climates, and the barbarity of the nations that were to be encountered, with the numberless obstacles of various sorts that were to be surmounted, rendered the prospect much more terrible than it had appeared to our circumnavigators in any of their late great voyages of discovery. The boldest and most enterprising persons of all nations were accordingly sought out for this undertaking, and high rewards and promises held out as an encouragement to their zeal and perseverance.

The only fruit of their discoveries which came to the knowledge of the public was that of a small fugitive colony of strangers and christians, whom they found shut up from the world in a most sequestered part of the wilds of Caucasus; and who, in the language of the country, are called Tschetshes. These poor people are said to lead lives of the most exemplary piety, and to

exhibit a primæval simplicity of manners. They are totally ignorant of their origin, any farther than knowing that they are strangers, as they are likewise considered by the scattered neighbouring nations. From an affinity in their language, and some other circumstances, they are supposed to be descended from a colony of Bohemians, who flying from the religious persecutions in their own country towards the close of the fifteenth century, found at length a refuge from oppression, in the distance from the rest of mankind with these remote deserts afforded.

The empress had publicly announced, in the beginning of the year of which we are treating, her intention of making a magnificent progress to Kerfon and the Crimea, in order to her being crowned sovereign of the new conquests. This design was apparently conceived at first in the most splendid ideas of eastern magnificence and grandeur. It was given out, that Catharine was to be crowned queen of Taurida; and to be declared protectress of all the nations of Tartars. That, in order to render the solemnization of this great act the more august, awful, and more extensively striking, she was to be attended by the metropolitan, by six other archbishops, and by a great body of the clergy; which with the court and its attendants, would have formed a prodigious train. Triumphant arches were to be erected, and enriched with sculptures; devices, and inscriptions, on the approaches to Kerfon; and in the town. The empress was to be drawn on the latter part of the way in a triumphal car, with a wreath of laurel on her head; and the concourse of people was expected to be so great, that the multitudes which attend the pilgrimages to Mecca would no longer be regarded as a wonder. She was besides to be escorted by a formidable army, to consist of no less than six regiments of cavalry, and 22 of infantry. The magnificence of the procession, whether by land or water, was to be suited to that of the grand concluding ceremonial. A fleet of galleys was built on the Dnieper; and besides their embellishments and decorations, were to be furnished with all the accommodations necessary for a court, or usually found in a great city. It seemed as if cost was a matter not to be thought of in these preparations; and it is scarcely credible, though positively asserted, that the prodigious sum of 7,000,000 of rubles had been originally dedicated to the purpose only of those presents which were to be distributed at the coronation.

All was in movement for completing the preparations, when the young prince fell sick of the measles, and he was obliged to be left at Petersburg. This circumstance, together with the news of some skirmishes, and even more serious engagements that had happened in the Krim between the Russians and the Tartars, occasioned a great alteration in the scheme of the progress to Kerfon. It was now greatly narrowed in the design, was disincumbered of much of its intended superb magnificence; the great object of the coronation and of the assumption of new titles was entirely given up; the formidable military force that was expected did not attend: the procession did not take place at the time proposed; and the only end obtained, saving the conferences held with the king of Poland and the emperor, was nothing more than the empress's shewing herself to her new subjects, and appearing to take some sort of formal possession of Kerfon and the Crimea.

Soon after the Empress returned to her capital, war was declared against her by the Turks; previous to this step a memorial had been delivered to the Russian minister, stating that the Russian consul in Moldavia had employed all sorts of means to disturb the peace of the two empires. That the troubles which had for two years been raging in Georgia were the effect of the protection granted by the empress to prince Heraclius, to these and other

other causes of complaint that were enumerated the Sublime Port demanded suitable redress. Upon the first meeting of the divan after the delivery of this memorial, war was declared in Constantinople, and the Russian ambassador shut up in the castle of seven towers.

There is little doubt but that the Turks were provoked to this step, by the conduct of Catherine, who never lost sight of her darling object the dismemberment of the Turkish empire, and the placing her Grandson Constantine on the throne of the antient Greek emperors, and who may therefore be considered as the aggressor in this war; she was joined by the emperor of Germany in declaring war against the Porte. The Turks unawed by this formidable combination began to make the most vigorous preparations for war. The operations of the Russian forces were chiefly directed against Oczakow and Ismael the former of these places seemed to be rendered impregnable by fortifications of uncommon strength, an abundant supply of ammunition, a numerous garrison and the severity of the season; it was however taken by assault, and carnage and desolation spread themselves on every side; Ismael after a vigorous resistance shared the same fate; in the assault the Russians were twice repulsed with great loss, but at last they forced their way into the town; what followed was such a scene of horrible cruelty as will be remembered to the everlasting disgrace of the Russian name; the whole garrison and inhabitants amounting to upwards of 30,000 were put to the sword without mercy.

During the progress of these hostilities the empress found herself suddenly involved in a new and unexpected war. Sweden had the greatest causes of resentment against Russia for past injury and loss, at the same time that she had every thing to dread from her present overgrown power and boundless ambition, which was as little qualified in the wanton display, as it was untamable in the actual exertion. Russia has constantly found means to maintain a strong and numerous party in Sweden. All these causes operating together, induced Gustavus the Third to meditate a project of hostilities against Russia, which were commenced in Finland, a few days after the king's arrival in that province. But the principal action of the campaign was the naval battle off Hoogland, in the gulph of Finland. The forces were nearly equal. The Russian fleet, commanded by admiral Greig, consisted of seventeen ships of the line, and the Swedish, under the command of the duke of Sudermazia, the king's brother, consisted of fifteen of an inferior weight of metal, but reinforced by five frigates, one of forty-four, and the rest of forty guns each, which occasionally ranged themselves in order of battle. The Russians possessed upon the whole a superiority of 294 pieces of cannon; while that in the weight of metal was perhaps of greater moment. The action did not commence till five o'clock in the afternoon, and in two hours so many ships were disabled on both sides, that they were mutually obliged to lie by and rest, in order to prepare for a renewal. At eight o'clock the battle was renewed with apparently a fresh accession of rage on both sides. Nothing could exceed its dreadful violence or the fury and determined obstinacy with which it was maintained. The darkness was so great, that the knowledge of each ship was in a great measure confined to her own sphere of action; so that ignorant and heedless of what was passing elsewhere, she fought as if all depended upon herself individually, and as if victory or destruction were the only alternatives. The victory, as is usually the case in actions not apparently and absolutely decisive, was claimed by both fleets, as a flag-ship had been taken on either side.

Another

Another battle at Schwenko-fund between the Russian fleet under the command of the prince of Nassau in which the latter, was completely beaten with the loss of half his fleet and upwards of 10,000 men, accelerated a peace. Gustavus III. by this time saw the imprudence of his conduct, and no longer indulged the expectation, that the war which he had declared against the Russians could be attended with any great success, and on the 14th of August 1790, a convention for a peace was signed between the courts of Russia and Sweden, and was ratified in six days after.

England and Prussia have, after a long and expensive armed negotiation; at length assented to the demand of the empress, which was strengthened by the interference of Spain and Denmark, that Oczakow, and the territory between the rivers Bog and Niester, shall in full sovereignty belong to Russia; that the river Niester shall for the future determine the frontiers of Russia and the Porte; that the two powers may erect on the shores of that river what fortresses they think proper: and Russia engages to grant a free navigation on the river Niester. This was concluded on the 11th of August, 1791. Thus did the Porte enter, into a war, for the purpose of regaining the Crimea, and after reducing the Ottoman empire to extreme weakness and internal symptoms of ruin, irretreivable by a government in a regular progress of deterioration, lost an important territory, and left the existence of the empire at the mercy of another Russian war.

The final treaty with the Turks was concluded at Jassy, the 9th of January, 1792. It has been calculated that in this war Austria lost 130,000 soldiers, and expended three hundred millions of florins.—Russia lost 200,000 men, and expended two hundred millions of rubles.—The Turks lost 330,000 men, and expended two hundred and fifty millions of piastres. Sweden had expended seventy millions of rix-dollars, and lost nine ships of the line, four frigates, and several smaller vessels of war. After the peace the empress adopted such measures as tended to render her conquests of importance to the empire. At the same time she was not negligent of her share in European politics. Catharine not satisfied with what she had acquired by usurpations, by treaties and alliances, and being now enured to conquest turned her arms against Persia; and she still flattered herself with the full accomplishment of her darling project, of driving the Ottomans out of Europe and of reigning in Constantinople.

In that case the vast empire of Catharine would have had for its frontiers, the Thracian Bosphorus to the south, the gulf of Bothnia to the north, the Vistula to the west, and the sea of Japan to the east. But death deceived her hopes. On the morning of the 9th of November, she was in good spirits, and took her coffee as usual. Some time after this she retired to her closet; where, after remaining a full half hour, the women who waited on her, not seeing her return, began to be alarmed; and, on entering the outer room in which it was, they found her stretched on the parquet with her feet against the door, and speechless. Upon this, a messenger was dispatched to Dr. John Rogerfon, her Majesty's chief physician, who, judging it to be a fit of apoplexy, ordered her twice to be let blood, on which the empress at first appeared to be somewhat relieved; but she was unable to utter a single word, and at ten o'clock in the evening of the following day, she expired.

The grand duke was at his country palace of Gatchim, to which place an officer was sent off to apprise him of the danger of his mother. He repaired

ed to Peterburgh, and at the instant when she ceased to breathe, was proclaimed emperor by the name of Paul I.

Catharine II. notwithstanding the very unfavourable circumstances which attended her taking possession of the government of that empire, has, from the commencement of her reign, filled her high station with distinguished reputation and ability. She has encouraged learning and the arts, and endeavoured greatly to extend the commerce of her subjects, though the extreme despotism of the Russian government is a great impediment to the progress of the arts and sciences, and to the real prosperity of the empire. Her imperial majesty has, however, effected many beneficial and important regulations in the interior police of her vast empire, and particularly in the courts of justice. One of these is the abolition of the use of torture; and she has also adopted an excellent plan for the reformation of prisons. The spirit of toleration that animated the whole of Catharine's administration, was a very remarkable and almost singular phenomenon in a despotic government. Notwithstanding all opposition, the empress was true to the resolution she formed at the commencement of her reign; and, from that moment to the day of her death, not one instance occurred of a human being suffering, in any respect whatever, on account of his religious opinions.

Tho' she gave little assistance to the coalition formed against France, other than unavailing promises, she took a great interest in the revolution in that kingdom, apprehensive lest the principles upon which it was effected might find their way into Russia, and there occasion some combustion subversive of the throne. To all the French who signified that they were attached to their old form of government, she gave a welcome reception; while she severely proscribed the rest. But Poland, and the efforts which that kingdom made in the cause of liberty, gave her the greatest apprehensions, which will be briefly narrated in our account of that country. Her bright side of her character the mind is somewhat relieved, from the horrid scenes of barbarity carnage desolation misery occasioned by her cruel and unrelenting ambition.

Paul I. by whom she is succeeded has hitherto evinced in his conduct none of his mother's dispositions but her clemency and magnificence. He has hitherto remained a spectator of the troubles that have afflicted Europe, but of late, especially since the splendid victory of admiral Neilsen over the French fleet at the mouth of the Nile, he seems disposed to join the coalition, which is said to be forming for the purpose of curbing the wild and fanatical ambition of the French and giving peace to Europe.

Paul I. present emperor of Russia has been twice married, and by his present duchess, the princess of Wirtemberg, has issue:

1. Alexander, born Dec. 23, 1777.
2. Constantine, born May 8, 1779.
3. Alexander Powlowna, born in Aug. 1783.
4. Helena, born Dec. 24, 1784.
5. A princess, born in March, 1786.
6. Another princess, born in May, 1788.
7. Another princess, born in 1792.

about 370 square miles, but they have no towns worthy of notice. North Uist contains an excellent harbour, called Lochmaddy, famous for herring-fish-*eg.* I shall omit the mention of many other of the Hebrides islands, which are at present of small importance, either to the public or the proprietors; though, probably, they may in future times be of great consequence to both, by the very improveable fisheries upon their coasts, I cannot, however avoid mentioning the famous isle of Iona, once the seat and sanctuary of western learning, and the burying-place of many kings of Scotland, Ireland and Norway. It is still famous for its reliques of sanctimonious antiquity, as shall be hereafter mentioned. Some authors have been at great pains to describe the island of St. Kilda, or Hirt, for no other reason, that I can discover, but because it is the remotest of all the north-west islands, and difficult of access; for it does not contain above thirty-five families, which are protestant, and know very little of the value of money.

INHABITANTS, CUSTOMS, POPULATION, LANGUAGE, AND RELIGION, } It is not to be imagined, belonging to Scotland can be so minutely described here, as they have been by some authors; not so much on account of their importance, as their curiosity. Those of Shetland and Orkney were formerly subject to the Normans, who conquered them in 1099, a few years after they landed in England under William called the Conqueror. In the year 1263 they were in possession of Magnus of Norway, who sold them to Alexander king of Scots, and he gave them as fiefs to a nobleman of the name of Speire. After this, they were claimed by, and became subject to the crown of Denmark. Christian I. in the reign of James III. conveyed them in property to the crown of Scotland, as a marriage portion with his daughter Margaret, and all future pretensions were entirely ceded on the marriage of James VI. of Scotland with Anne of Denmark. The isles of Shetland and Orkney form a shire, or shire, which sends a member to parliament. At present, the people in general differ little from the Lowlanders of Scotland; only, perhaps they are more honest and religious. Men of fortune there have improved their estates wonderfully of late years: and have introduced into their families many elegancies and luxuries. They build their dwelling and other houses in a modern taste; and are remarkable for the fineness of their linen. As to the common people they live upon butter, cheese, fish, sea and land fowl (of which they have great plenty) particularly geese; and their chief drink is whey, which they have the art to ferment, so as to give it a vinous quality. In some of the northern islands, the Norwegian, which is called the Norse language, is still spoken. Their vast intercourse with the Dutch, during the fishing season, renders that language common in the Shetland and Orkney islands. The people there are as expert as the Norwegians, already described, in seizing the nests of sea fowls, who build in the most frightful precipices and rocks. The people's temperance preserves them from any diseases known to luxury. They cure the scurvy and the jaundice, to which they are subject, with the powder of snail-shells and scurvy-grass, of which they have plenty. Their religion is protestant, and according to the discipline of the church of Scotland; and their civil institutions are much the same with those of the country to which they belong.

Nothing certain can be mentioned, as to the population of these three divisions of islands. We have the most undoubted evidences of history, that about 400 years ago, they were much more populous than they are now; for the Hebrides themselves were known often to send 10,000 fighting men

into the field, without prejudice to their agriculture. At present their numbers are said not to exceed 48,000. The people of the Hebrides are clothed, and live like the Scotch Highlanders, who shall hereafter be described. They are similar in persons, constitution, customs, and prejudices; but with this difference, that the more polished manners of the Lowlanders are every day gaining ground in the Highlands. Perhaps the descendants of the ancient Caledonians, in a few years will be discernible only in the Hebrides.

Those islands alone retain the ancient usages of the Celts, as described by the oldest and best authors; but with a strong tincture of the feudal constitution. Their shamchies or story-tellers supply the place of the ancient bards, so famous in history; and are the historians, or rather genealogists, as well as poets of the nation and family. The chief is likewise attended, when he appears abroad, with his musician, who is generally a Jaggiper, and dressed in the manner, but, as it is said, more sumptuously, than the English minstrels of former times*. Notwithstanding the contempt into which that music is fallen, it is almost incredible with what care and attention it was cultivated among these islanders so late as the beginning of the present century. They had regular colleges and professors, and the students took degrees according to their proficiency. Many of the Celtic rites, some of which were too barbarous to be retained, or even mentioned, are now abolished. The inhabitants, however, still preserve the most profound respect and affection for their several chieftains, notwithstanding all the pains that have been taken by the British legislature to break those connections which experience has shewn to be so dangerous to government. The common people are but little better lodged than the Norwegians and Laplanders already described; though they certainly fare better, for they have oatmeal, plenty of fish and fowl, cheese, butter-milk, and whey; and also mutton, beef, goat, kid, and venison. They indulge themselves, like their forefathers, in a romantic poetical turn, which is an enemy to industry, and indeed to domestic and personal cleanliness. The agility of both sexes in the exercises of the field, and in dancing to their favourite music, is remarkable.

The reader would not pardon an author, who, in treating of this subject, should omit that remarkable mantology, or gift of prophecy, which distinguishes the inhabitants of the Hebrides under the name of second sight. It would be equally absurd to attempt to disprove the reality of the instances of this kind that have been brought by reputable authors, or to admit all that has been said upon the subject. The adepts of the second sight pretend that they have certain revelations, or rather presentations, either really or typically, which swim before their eyes, of certain events that are to happen in the compass of 24 or 48 hours. I do not, however from the best information, observe that any of those adepts agree as to the manner and forms of those revelations, or that they have any fixed method for interpreting their typical appearances. The truth seems to be, that those islanders, by indulging themselves in lazy habits, acquire visionary ideas, and overheat their imaginations, till they are presented with those phantasms, which they mistake for fatidical or prophetic manifestations. They instantly begin to prophesy; and it would be absurd to suppose, that amidst many thousand of predictions, some did not happen to be fulfilled; and these being well attested, gave a sanction to the whole.

Many learned men have been of opinion, that the Hebrides, being the

most westerly islands where the Celts settled, their language must remain there in its greatest purity. This opinion, though very plausible, has failed in experience. Many Celtic words, it is true, as well as customs, are there found; but the vast intercourse which the Hebrides had with the Danes, the Norwegians, and other northern people, whose language is mixed with Scythian and Teutonic, which last has no affinity with the Celtic, has rendered their language a compound; so that it approaches in no degree to the purity of the Celtic, commonly called Erse, which was spoken by their neighbours in Lochaber and the opposite coasts of Scotland, the undoubted descendants of the Celts, among whom their language remains most unmixed.

The religion professed in the Hebrides is chiefly presbyterian, as established in the church of Scotland, but popery and ignorance still prevail among some of the islanders, whilst superstitious practices and customs seem to be almost grafted in their nature.

SOIL, MINES, AND QUARRIES.] Though it is not in the power of natural philosophy to assign the reason, yet it is certain that the soil, both of the northern and western islands belonging to Scotland, has suffered an amazing alteration. It is evident to the eye-sight, that many of these islands have been the habitations of the Druids whose temples are still visible in most of them; and those temples were surrounded by groves, though little or no timber now grows in the neighbourhood. The stumps of former trees however are discernible, as are many vestiges of grandeur, even since the admission of the Christian religion; which prove the decrease of the riches, power and population of the inhabitants. Experience daily shews, that if the soil of the northern or western islands till of late were barren, cold, and uncomfortable, it was owing to their want of culture; for such spots of them as are now cultivated, produce corn, vegetables, and garden-stuff, more than sufficient for the inhabitants; and even fruit-trees are now brought to maturity. Tin, lead, and silver mines; marble, slate, free-stone, and even quarries of marble, have been found upon these islands. They are not destitute of fine fresh water; nor of lakes and rivulets that abound with excellent trout. At the same time it must be owned, that the present face of the soil is bare, and unornamented with trees, excepting a few that are reared in gardens.

TRADE AND MANUFACTURES.] These are all in their infancy in those islands. The reader can easily suppose, that their staple commodities consist of fish, especially herrings, which are the best in the world, and, when properly cured, are equal even to those of the Dutch. They carry on likewise a considerable trade in down and feathers; and their sheep afford them wool, which they manufacture into coarse cloths; and even the linen manufactures make no small progress in these islands. They carry their black cattle alive to the adjacent parts of Scotland, where they are disposed of in sale or barter; as are large quantities of their mutton, which they salt in the hide. Upon the whole, application and industry, with some portion of public encouragement, are only wanting to render these islands at once ornamental and beneficial to the mother country, as well as to their inhabitants.

BESTS, BIRDS, AND FISHES.] Little can be said on this head; that is peculiar to these islands. In the countries already described, mention has been made of most of the birds and fishes that have been discovered here; only it is thought that they contain a species of falcon or hawk, of a more

noble and docile nature than any that are to be found elsewhere. The Shetland isles are famous for a small breed of horses, which are incredibly active, strong, and hardy, and frequently seen in the streets of London, yoked to the splendid carriages of the curious and wealthy. The coasts of those islands, till within these 20 years, seemed, however, to have been created, not for the inhabitants, but for strangers. The latter furnish the former with wines, strong liquors, spice, and luxuries of all kinds, for their native commodities, at the gain of above 100 per cent. But it is to be hoped that this pernicious traffic now draws to an end. Three thousand buffes have been known to be employed in one year by the Dutch in the herring fishery, besides those fitted out by the Hamburgers, Bremeners, and other northerly ports.

RARITIES AND CURIOSITIES. } These islands exhibit many pregnant
ARTIFICIAL AND NATURAL. } proofs, in their churches, the vestiges of
 old forts, and other buildings, both sacred and civil, of what hath been ac-
 cordingly observed, that they were formerly more populous than they are now.
 The use and construction of some of those works are not easily accounted for
 at present. In a gloomy valley belonging to Hoy, one of the western islands,
 is a kind of hermitage, cut out of a stone called a dwarf stone, 36 feet long,
 18 broad, and nine thick; in which is a square hole, about two feet high for
 an entrance, with a stone of the same size for a door. Within this entrance
 is the resemblance of a bed, with a pillow cut out of the stone, big enough
 for two men to lie on; at the other end is a couch, and in the middle a
 hearth, with a hole cut out above for a chimney. It would be endless to re-
 count the various vestiges of the Druidical temples remaining in these islands,
 some of which have required prodigious labour, and are stupendous erections,
 of the same nature as the famous Stonehenge near Salisbury. Others seem
 to be memorials of particular persons, or actions, consisting of one large stone
 standing upright; some of them have been sculptured, and others have served
 as sepulchres, and are composed of stones cemented together. Barrows, as
 they are called in England, are frequent in these islands; and the monu-
 ments of Danish and Norwegian fortifications might long enough an able an-
 tiquary to describe. The gigantic bones found in many places here
 give room to believe, that the former inhabitants were of large size than the
 present. It is likewise probable, from some ancient remains, particularly
 catacombs, and nine silver fibulae or clasps, found at Stennis, one of the
 Orkneys, that the Romans were well acquainted with these parts.

The cathedral of Kirkwall, the capital of the Orkneys, is a fine Gothic
 building, dedicated to St Magnus, but now converted into a parish church.
 Its roof is supported by 14 pillars on each side, and its steeple, in which is
 a good ring of bells, by four large pillars. The three gates of the church
 are chequered with red and white polished stone, embossed and elegantly
 flowered.

The Hebrides are still more distinguished than the Orkney or Shetland isles
 for their remains of antiquity; and it would far exceed the bounds allotted
 to this head, were we even to mention every noted monument found upon
 them, dedicated to civil, religious, or warlike purposes. We cannot, how-
 ever, avoid taking particular notice of the celebrated isle of Iona, called St.
 Columb-kill. Not to enter into the history or origin of the religious erections
 upon this island, it is sufficient to say, that it seems to have served as a sanc-
 tuary for St. Columba, and other holy men of learning, while Ireland, Eng-
 land, and Scotland, were desolated by barbarism. It appears that the nor-

thern pagans often buried here, and paid no regard to the sanctity of the place. The church of St. Mary, which is built in the form of a cathedral, is a beautiful fabric. It contains the bodies of some Scotch, Irish, and Norwegian kings, with some Gaelic inscriptions. The tomb of Columba, who lies buried here, is uninscribed. The steeple is large; the cupola 21 feet square, the doors and windows are curiously carved, and the altar is of the finest marble. Innumerable are the inscriptions of ancient customs and ceremonies that are discernible upon this island; and which give countenance to the well known observation, that when learning was nearly extinct on the continent of Europe, it found a refuge in Scotland, or rather in these islands.

The islands belonging to Seeland contain likewise some natural curiosities peculiar to themselves: the phaeoli, or Mollucca beans, have been found in the Orkneys, driven, as supposed, from the West Indies, by the westerly winds, which often force ashore many curious shells and marine productions, highly esteemed by naturalists. In the parish of Harn, a large piece of King's horn was found very deep in the earth, by the inhabitants who were digging for marble; and certain bituminous effluvia produce surprising phenomena, which the natives believe to be supernatural.

But some of the most astonishing appearances in nature have remained undescribed, and, till lately, unobserved even by the natives of these islands. A discovery reserved for the inquisitive genius of Mr. Banks, now Sir Joseph Banks, who, in relating his voyage through the Hebrides, anno, 1772, says, "We were no sooner arrived, than we were struck with a scene of magnificence which exceeded our expectations, though founded, as we thought, upon the most sanguine foundations, the whole of that end of the island (viz. Staffa, a mile in length, and half a mile in breadth) supported by ranges of natural pillars, mostly above fifty feet high, standing in natural colonnades, according as the bays or points of land formed themselves: upon a firm basis of solid unformed rock, above these, the stratum which reaches to the soil or surface of the island, varied in thickness as the island itself formed into hills or vallies; each hill, which hung over the columns below, forming an ample pediment; some of these, above sixty feet in thickness from the base to the point, formed, by the sloping of the hill on each side, almost in the shape of those used in architecture.

"Compared to this, what are the cathedrals or palaces built by men? mere models or play-things. Imitations as diminutive, as his works will always be, when compared to those of Nature. Where is now the boast of the architect: regularity, the only part in which he fancied himself to exceed his mistress, Nature, is here found in her possession; and here it has been for ages undescribed.—Proceeding farther to the N. W. you meet with the highest ranges of pillars, the magnificent appearance of which is past all description: here they are bare to their very bases, and the stratum below them is also visible." Mr. Banks particularises sundry other appearances in this and a neighbouring island, which is wholly composed of pillars without any stratum. In some parts of Staffa, instead of being placed upright; the pillars were observed to lie on their sides, each forming a segment of a circle; but the most striking object in this field of scenery is Fingal's Cave, which Mr. Banks describes in the following manner:—"With our minds full of such reflections, we proceeded along the shore, treading upon another *Giant's Causeway*, every stone being regularly formed into a certain number of sides and angles; till in a short time, we arrived at the mouth of a cave, the most

magnificent, I suppose, that has ever been described by travellers *. The mind can hardly form an idea more magnificent than such a space, supported on each side by ranges of columns, and roofed by the bottom of those, which have been broken off in order to form it; between the angles of which, a yellow stalagmitic matter has exuded, which serves to define the angles precisely, and at the same time vary the colour, with a great deal of elegance; and to render it still more agreeable, the whole is lighted from without; so that the farthest extremity is very plainly seen from without; and the air within being agitated by the flux and reflux of the tide, is perfectly dry and wholesome, free entirely from the damp of vapours with which natural caverns in general abound.

Mr. Pennant, who also made a voyage to these islands in the same year, had a glance of Staffa, in his passage from Iona to Mull, but was prevented by stormy weather from approaching it. "On the west", says he "appear the beautiful groups of the Treashunish isles. Nearest lies Staffa, a new Giant's Causeway, rising amidst the waves, but with columns of double the height of that in Ireland; glossy and resplendent, from the beams of the eastern sun." And in the isle of Sky, a considerable way northward he resumes the subject; "We had in view a fine series of genuine basaltic columns, resembling the Giant's Causeway; the pillars were above twenty feet high, consisting of four, five, and six angles, but mostly of five. At a small distance from these, on the slope of a hill, is a tract of some roads entirely formed of the tops of several series of columns, even and close set, forming a reticulated surface of amazing beauty and curiosity. This is the most northern basaltic I am acquainted with; the last of four in the British dominions, all running from south to north, nearly in a meridian: the Giant's Causeway appears first; Staffa, &c, succeeds; the rock Humber about twenty leagues farther, and finally, those columns of Sky: the depth of the ocean, in all probability, conceals the vast links of this chain."

SCOTLAND.

EXTENT AND SITUATION.

Miles. } Degrees.
 Length 300 } between { 54 and 59 North latitude.
 Breadth 190 } { 1 and 6 West longitude.

NAME.] THE Celts or Gauls are supposed to have been the original inhabitants of this kingdom. The Scots, a Scythian tribe, invaded it about the beginning of the fourth century, and having conquered the Picts, the territories of both were called Scotland; and that word Scot is no other than a corruption of Scyth, or Scythian, being originally from that immense country, called Scythia by the ancients. It is termed, by the Italians, Scotia; by the Spaniards, Escotia; by the French, Escoffe; and Scotland by the Scots, Germans, and English.

BOUNDARIES.] Scotland, which contains an area of 27,794 square miles, is bounded on the south by England; and on the north, east, and west by the Deucalsonian, German, and Irish seas, or more properly, the Atlantic ocean.

DIVISIONS AND SUBDIVISIONS.] Scotland is divided into the countries south of the Frith of Forth, the capital of which, and of all the kingdom, is Edinburgh; and those to the north of the same river, where the chief town is Aberdeen. This was the ancient national division; but some modern writers, with less geographical accuracy, have divided it into Highlands and Lowlands, on account of the different habits, manners, and customs of the inhabitants of each.

Eighteen counties, or shires, are allotted to the southern division, and fifteen to the northern; and those counties are subdivided into sheriffdoms, stewartries, and bailiwicks, according to the ancient tenures and privileges of the landholders.

CLIMATE, SOIL, AIR, AND WATER.] In the northern parts, day-light, at Midsummer, lasts 18 hours and 5 minutes; and the day and night in winter are in the same proportion. The air of Scotland is more temperate than could be expected in so northerly a climate. This arises partly from the variety of its hills, vallies, rivers, and lakes; but still more, as in England, from the vicinity of the sea, which affords those warm breezes, that not only soften the natural keenness of the air, but by keeping it in perpetual agitation, render it pure and healthful, and prevent those epidemic distempers that prevail in many other countries. In the neighbourhood of some high mountains, however, which are generally covered with snow, the air is keen and piercing for about nine months in the year. The soil in general is not so fertile as that of England; and in many places less fitted for agriculture than for pasture. At the same time, there are particular plains and vallies of the most luxuriant fertility. The finer particles of earth, incessantly washed down from the mountains, and repositied in these vallies, afford them a vegetative nourishment, which is capable of carrying the strongest plants into perfection; though experience has proved, that many vegetables and hortulane productions, do not come so soon to maturity in this country as in England. There is, indeed a great variety of soils in Scotland, the face of which is agreeably diversified by a charming intermixture of natural objects. The vast inequalities of the ground if unfavourable to the labours of the husbandman, are particularly pleasing to a traveller, and afford these delightful situations for country houses, of which many of the Scotch nobility and gentry have so judiciously availed themselves. It is their situation, more than any expensive magnificence, that occasions the seats of the dukes of Argyle and Athol, of lord Hopton, and many others, to fix the attention of the traveller. The water in Scotland, as every where else, depends on the qualities of the soil through which it passes. Water passing through a heavy soil is turbid and noxious; but, filtrating through sand or gravel, it is clear, light, and salutary to the stomach. This last is in general the case in Scotland, where the water is better than that of more southern climates, in proportion as the land is worse.

MOUNTAINS.] The principal mountains in Scotland are the Grampian hills, which run from east to west, from near Aberdeen to Cowal in Argyleshire, almost the whole breadth of the kingdom. Another chain of mountains, called the Pentland-hills, runs through Lothian and joins those of Tweeddale. A third, called Larmer-Muir, rises near the eastern coast, and runs westward through the Merse. Besides those continued chains, among which we may reckon the Cheviot or Tiviot-Hills, on the borders of England, Scotland contains many detached mountains, which, from their conical figure, sometimes go by the celtic word *Laws*. Many of them are stupendously high, and of beautiful forms; but too numerous to be particularised here.

RIVERS, LAKES, AND FORESTS.] The largest river in Scotland is the Forth, which rises in Monteith near Callendar, and passing by Stirling, after a number of beautiful meanders, discharges itself near Edinburgh into that arm of the German sea, to which it gives the name of Frith of Forth. Second to the Forth is the Tay, which issues out of Loch Tay, in Broadalbin, and running south-east, passes the town of Perth, and falls into the sea at Dundee. The Spey, which is called the most rapid river in Scotland, issues from a lake of the same name in Badenoch, and, running from south west to north-east, falls into the sea near Elgin; as do the rivers Dee and Don, which run from west to east, and disembogue themselves at Aberdeen.

excellent in the Highlands, where some woods reach 20 or 30 miles in length, and four or five in breadth; but, through the inconveniency already mentioned, without being of much emolument to the proprietors.

METALS AND MINERALS.] Though Scotland does not at present boast of its gold mines, yet, it is certain that it contains such, or at least that Scotland formerly afforded a considerable quantity of that metal for its coinage. James V. and his father contracted with certain Germans for working the mines of Crawford-Moor: and it is an undoubted fact, that when James V. married the French king's daughter, a number of covered dishes, filled with coins of Scotch gold, were presented to the guests, by way of desert. The civil wars and troubles which followed, under his daughter, in the minority of his grandson, drove those foreigners, the chief of whom was called Cornelius, from their works, which since that time have never been resumed. Some small pieces of gold have been found in those parts washed down by the floods. It likewise appears by the public records, that those beautiful coins, struck by James V. called bonnet-pieces, were fabricated of gold found in Scotland, as were other medals of the same metal.

Several landlords in Scotland derive a large profit from their lead-mines, which are said to be very rich, and to produce large quantities of silver, but we know of no silver mines that are worked at present. Some copper-mines have been found near Edinburgh; and many parts of Scotland, in the east, west, and northern counties, produce excellent coal of various kinds, large quantities of which are exported, to the vast emolument of the public. Lime-stone is here in great plenty, as is free-stone; so that the houses of the better sort are constructed of the most beautiful materials. The indolence of the inhabitants of many places of Scotland, where no coal is found, prevented them from supplying that defect by plantations of wood: and the peat-mosses being in many parts, of the north especially, almost exhausted, the inhabitants are put to great difficulties for fuel: however, the taste for plantations, of all kinds, that now prevails, will soon remedy that inconveniency.

Lapis lazuli is said to be dug up in Lanarkshire; alum-mines have been found in Banffshire; crystal, variegated pebbles, and other transparent stones, which admit of the finest polish for seals, are found in various parts; as are tale, flint, sea-shells, potter's clay, and fuller's earth. The stones which the country people call elk-arrow-heads, and to which they assign a supernatural origin and use, were probably the flint-heads of arrows made use of by the Caledonians and ancient Scots. No country produces greater plenty of iron ore, both in mines and stones, than Scotland; of which the proprietors now begin to taste the sweets, in their founderies, as at Carron, and other metalline manufactures.

VEGETABLE AND ANIMAL PRODUCTIONS, BY SEA AND LAND. } It is certain that the soil of Scotland may be rendered, in many parts, nearly as fruitful as that of England. It is even said, that some tracts of the low countries at present exceed in value English estates of the same extent, because they are so far less exhausted and worn out than those of the southern parts of the island; and agriculture is now perhaps as well understood, both in theory and practice, among many of the Scotch landlords and farmers it is in any part of Europe.

Such is the mutability of things, and the influence of commerce, that a very considerable part of the landed property has lately (perhaps happily for the public) fallen into new hands. The merchants of Glasgow, who are the life and soul of that part of the kingdom, while they are daily introducing

new branches of commerce, are no less attentive to the progress of agriculture, by which they do their country in particular, and the whole island in general, the most essential service. The active genius of these people extends even to moors, rocks, and marshes, which being hitherto reckoned useless, were consequently neglected, but are now brought to produce certain species of grain or timber, for which the soil is best adapted.

But the fruits of skill and industry are chiefly perceivable in the counties lying upon the river Forth, called the Lothians, where agriculture is thoroughly understood, and the farmers, who generally rent from 3 to 500*l*. per annum, are well fed, well clothed, and comfortably lodged. The reverse, however, may be observed of a very considerable part of Scotland, which still remains in a state of nature, and where the landlords, ignorant of their real interest, refuse to grant such leases as would encourage the tenant to improve his own farm. In such places the husbandmen barely exist upon the gleanings of a scanty farm, seldom exceeding 20 or 30*l*. per ann. the cattle are lean and small, the houses mean beyond expression, and the face of the country exhibits the most deplorable marks of poverty and oppression. Indeed, from a mistaken notion of the landed people in general, the greatest part of the kingdom lies naked and exposed, for want of such hedge-rows and plantings as adorn the country of England. They consider hedges as useless and cumbersome, as occupying more room than what they call stone inclosures, which except in the Lothians already mentioned, are generally no other than low paltry walls, huddled up of loose stones, without lime or mortar, which yield a bleak and mean appearance.

The soil in general produces wheat, rye, barley, oats, hemp, flax, hay, and pasture. In the southern counties the finest garden fruits, particularly apricots, nectarines, and peaches, are said to fall little, if at all, short of those in England; and the same may be said of the common fruits. The uncultivated parts of the Highlands abound in various kinds of salubrious and pleasant-tasted berries; though it must be owned that many extensive tracts are covered with a strong heath. The sea coast produces the alga-marina, dulce or dulse, a most wholesome nutritive weed, in great quantities, and other marine plants, which are eaten for nourishment, or pleasure.

The fishes on the coast of Scotland are much the same with those of the islands and countries already described; but the Scots have improved in their fisheries as much as they have in their manufactures and agriculture; for societies have been formed, which have carried that branch of national wealth to a perfection that never was before known in that country, and bids fair to emulate the Dutch themselves in curing, as well as catching, their fish. In former times, the Scots seldom ventured to fish above a league's distance from the land; but they now ply in the deep waters as boldly and successfully as any of their neighbours. Their salmons, which they can send more early, when prepared, to the Levant and southern markets than the English and Irish can, are of great service to the nation, as the returns are generally made in specie, or beneficial commodities.

This country contains few or no kinds, either of wild or domestic animals, that are not common with their neighbours. The red-deer and the roe-buck are found in the Highlands, but their flesh is not comparable to English venison. Hares, and all other animals for game, are here plentiful; as are the grouse and heath-cock, which is a most delicious bird, as likewise are the capparkally, and the ptarmacan, which is of the pheasant kind; but these birds are scarce even in the Highlands, and when discovered are very shy. The numbers of black cattle that cover the hills of Scotland towards the High-

lands, and sheep that are fed upon the beautiful mountains of Tweedale, and other parts of the south, are almost incredible, and formerly brought large sums into the country; the black cattle especially, which, when fattened on the southern pastures, have been reckoned superior to English beef. It is to be hoped, however, that this trade is now on its decline, by the vast increase of manufactures, whose demand for butcher's meat must lessen the importation of cattle into England. Some are of opinion, that a sufficient stock, by proper methods, may be raised to supply both markets, to the great emolument of the nation.

Formerly the kings of Scotland were at infinite pains to mend the breed of the Scotch horses, by importing a larger and more generous kind from the continent; but the truth is, notwithstanding all the care that was taken, it was found that the climate and soil of Scotland was unfavourable to that noble animal, for they diminished both in size and spirit; so that about the time of the Union, few horses, natives of Scotland, were of much value. Great efforts have been made of late to introduce the English and foreign breeds, and much pains have been taken for providing them with proper food and management, but with what success time alone can discover.

POPULATION, INHABITANTS, } The population of Scotland is general-
MANNERS AND CUSTOMS, } ly fixed at about a million and a half of
souls. This calculation rests merely upon vague conjectures, as I know of no attempt that has been made to support even its probability. If we form an estimate upon any known principle, the inhabitants of Scotland are far more numerous. It is to be regretted that some public encouragement has not been given to bring this matter nearer to a certainty, which might be done by the returns of the clergy from their several parishes. The statistical account of Scotland just publishing will tend, when finished, to ascertain this question more exactly, tho' even here it is to be feared the lists returned by the clergy are not always sufficiently accurate. If we consult the most ancient and creditable histories, the population of Scotland, in the thirteenth century, must have been excessive, as it afforded so many thousands to fall by the swords of the English, without any sensible decrease (so far as I can find) of the inhabitants. When we consider the improved system of agriculture now pretty generally diffused over the kingdom, when we consider its extended commerce, its manufactures rapidly increasing, we are warranted to infer a population greatly increased; from all these circumstances we may conclude that the population of this kingdom cannot be much over-rated when it is taken at three millions.

The people of Scotland are generally raw-boned: and a kind of characteristic feature, that of high cheek-bones, reigns in their faces; they are lean, but clean-limbed, and can endure incredible fatigues. Their adventuring spirit was chiefly owing to their laws of succession, which invested the elder brother, as head of the family, with the inheritance, and left but a very scanty portion for the other sons. This obliged the latter to seek their fortunes abroad, though no people have more affection for their native soil than the Scots have in general. It is true, this disparity of fortune among the sons of one family prevails in England likewise; but the resources which younger brothers have in England are numerous, compared to those of a country so narrow, and so little improved, either by commerce or agriculture, as Scotland was formerly.

An intelligent reader may easily perceive, that the ridiculous family-pride, which is perhaps not yet entirely extinguished in Scotland, was owing to the feudal institutions which prevailed there in all the horrors of blood and barbarity. Their family-differences, especially the Highlanders, familiarised them to blood and slaughter; and the death of an enemy, however effected, was

always a matter of triumph. These passions did not live in the breasts of the common people only, for they were authorised and cherished by their chieftains, many of whom were men who had seen the world, were conversant in the courts of Europe; masters of polite literature, and amiable in all the duties of civil and social life. Their kings, excepting some of them who were endued with extraordinary virtues, were considered in little other light than commanders of their army, in time of war; for in time of peace their civil authority was so little felt, that every clan, or family, even in the most civilised parts of Scotland, looked upon its own chieftain as his sovereign. These ideas were confirmed even by the laws, which gave those petty tyrants a power of life and death upon their own estates; and they generally executed in four and twenty hours after the party was apprehended. The pride which those chieftains had of outvying each other in the number of their followers, created perpetual animosities, which seldom or never ended without bloodshed; so that the common people, whose best qualification was a blind devotion to the will of their master, and the aggrandizement of his name, lived in a state of continual hostility.

The late Archibald, duke of Argyle, was the first chieftain we have heard of, who had the patriotism to attempt to reform his dependents, and to banish from them those barbarous ideas. His example has been followed by others; and there can scarcely be a doubt, but that a very few years will reconcile the Highlanders to all the milder habits of society.

From what has been said, it appears that the ancient modes of living among the Scotch nobility and gentry, are as far from being applicable to the present time, as the forms of a Roman senate are to that of a popish conclave; and no nation, perhaps, ever underwent so quick and so sudden a transition of manners.

The peasantry have their peculiarities; their ideas are confined; but no people can form their tempers better than they do to their stations. They are taught from their infancy to bridle their passions, to behave submissively to their superiors, and live within the bounds of the most rigid economy. Hence they save their money and their constitutions, and few instances of murder, perjury, robbery, and other atrocious vices, occur at present in Scotland. They seldom enter singly upon any daring enterprize; but when they act in concert, the secrecy, sagacity, and resolution, with which they carry on any desperate undertaking, is not to be paralleled; and their fidelity to one another, under the strongest temptations arising from their poverty, is still more extraordinary. Their mobs are managed with all the caution of conspiracies; witness that which put Porteus to death in 1736, in open defiance of law and government, and in the midst of 20,000 people; and though the agents were well known, and some of them tried, with a reward of 500l. annexed to their conviction, yet no evidence could be found sufficient to bring them to punishment. The fidelity of the Highlanders of both sexes, under a still greater temptation, to the young pretender, after his defeat at Culloden, could scarcely be believed, were it not well attested.

They affect a fondness for the memory and language of their forefathers beyond perhaps any people in the world; but this attachment is seldom or never carried into any thing that is indecent or disgusting, though they retain it abroad as well as at home. They are fond of ancient Scotch dishes, such as the haggis, the sheep's head singed, the fish in sauce, the chicken broth, and minced collops. These dishes, in their original dressing, were savoury and nutritive for keen appetites; but the modern improvements that

have

have been made in the Scotch cookery have rendered them agreeable to the most delicate palates.

The inhabitants of those parts of Scotland, who live chiefly by pasture, have a natural vein for poetry; and the beautiful simplicity of the Scotch tunes is relished by all true judges of nature. Love is generally the subject, and many of the airs have been brought upon the English stage with variations, under new names, but with this disadvantage, that, though rendered more conformable to the rules of music, they are mostly altered for the worse, being stript of their original simplicity, which, however irregular, is the most essential characteristic, is so agreeable to the ear, and has such powers over the human breast. Those of a more lively and merry strain have had better fortune, being introduced into the army in their native dress, by the sifes, an instrument for which they are remarkably well suited. It has been ridiculously supposed that Rizzio, the unhappy Italian secretary of Mary queen of Scots, reformed the Scotch music. This is a falsehood invented by his country, in envy to the Scots. Their finest tunes existed in their church music, long before Rizzio's arrival; nor does it appear that Rizzio, who was chiefly employed by his mistress in foreign dispatches, ever composed an air during the short time he lived in Scotland; but were there no other evidences to confute this report, the original character of the music itself is sufficient.

The lower people in Scotland are not so much accustomed as the English are to clubs, dinners, and other convivial entertainments; but when they partake of them, for that very reason they seem to enjoy them more completely. One institution there is, at once social and charitable, and that is, the contributions raised for celebrating the weddings of people of an inferior rank. Those festivities partake of the ancient Saturnalia; but though the company consists promiscuously of the high and low, the entertainment is as decent as it is jovial. Each guest pays according to his inclination or ability, but seldom under a shilling a head, for which they have a wedding dinner and dancing. When the parties happen to be servants in respectable families, the contributions are so liberal that they often establish the young couple in the world.

The common people of Scotland retain the solemn and decent manner of their ancestors at burials. When a relation dies in a town, the parish-beadle is sent round with a passing-bell; but he stops at certain places, and with a slow melancholy tone announces the name of the party deceased and the time of his interment, to which he invites all his fellow countrymen. At the hour appointed, if the deceased was beloved in the place, vast numbers attend. The procession is sometimes preceded by the magistrates and their officers, as the deceased is carried in his coffin, covered by a velvet pall with chair poles, to the grave, where it is interred, without any oration or address to the people, or prayers, or farther ceremony, than the nearest relation thanking the company for their attendance. The funerals of the nobility and gentry are performed in much the same manner as in England, but without any funeral service. The Highland funerals were generally preceded by bagpipes, which played certain dirges, called *coronachs*, and were accompanied by the voices of the attendants of both sexes.

Dancing is a favourite amusement in this country, but little regard is paid to art or gracefulness; the whole consists in agility, and in keeping time to their own tunes, which they do with great exactness. One of the peculiar diversions practised by the gentlemen, is the *Golf*, which requires an equal degree of art and strength; it is played by a bat and a ball; the latter is smaller and harder than a cricket ball; the bat is of a taper construction, till it terminates in the part that strikes the ball, which is loaded with lead and faced with horn.

The diversion itself resembles that of the *Ball*, which was common in England in the middle of the last century. An expert player will send the ball an amazing distance at one stroke; each party follows his ball upon an open heath, and he who strikes it in fewest strokes into a hole, wins the game. The diversion of *Cricket* is likewise peculiar to the Scots. It is performed upon ice, with large flat stones, often from twenty to two hundred pounds weight each, which they hurl from a common stand to a mark at a certain distance; and whoever is nearest the mark is the victor. These two may be called the standing winter and summer diversions in Scotland. The natives are expert at all the other diversions common in England, *cricket* excepted, of which they have no notion; the gentlemen considering it as too athletic and mechanical.

LANGUAGE AND DRESS. I place these two articles under the same head, because they had formerly an intimate relation to each other, both of them being evidently Celtic. The Highland plaid is composed of a woollen stuff, sometimes very fine, called *tartan*. This consists of various colours, forming stripes which cross each other at right angles; and the natives value themselves upon the judicious arrangement, or what they call *setts*, of those stripes and colours, which, when skilfully managed, produce a pleasing effect to the eye. Above the shirt the Highlander wears a waistcoat of the same composition with the plaid, which commonly consists of twelve yards in width, and which they throw over the shoulder into very near the form of a Roman toga, as represented in ancient statues; sometimes it is fastened round the middle with a leathern belt, so that part of the plaid hangs down before and behind like a petticoat, and supplies the want of breeches. This they call being dressed in a *phelis*, but which the Lowlanders call a *fil*, and which is probably the same word with Celt. Sometimes they wear a kind of petticoat of the same variegated stuff, buckled round the waist, and this they term the *philibeg*, which seems to be of Milesian extraction. Their stockings are likewise of tartan tied below the knee with tartan garters formed into tassels. The poorer people wear upon their feet brogues made of untanned or undressed leather; for their heads a blue flat cap is used, called a *bonnet*, of a particular woollen manufacture. From the belt of the *philibeg* hang generally their knives and a dagger, which they called a *dirk*, and an iron pistol, sometimes of fine workmanship, and curiously inlaid with silver. The introduction of the broad sword of Andrea Ferrara, a Spaniard (which was always part of the Highland dress), seems to be no earlier than the reign of James III. who invited that excellent workman to Scotland. A large leathern purse, richly adorned with silver, hanging before them, was always part of a Highland chieftain's dress.

The dress of the Highland women consisted of a petticoat and jerkin, with strait sleeves, trimmed or not trimmed, according to the quality of the wearer; over this they wore a plaid, which they either held close under their chins with the hand, or fastened with a buckle of a particular fashion. On the head they wore a kerchief of fine linen of different forms. The women's plaid has been but lately diffused in Scotland by the ladies, who wore it in a graceful manner, the drapery falling towards the feet in large folds. A curious virtuoso may find a strong resemblance between the variegated and simbrated draperies of the ancients, and those of the Tuscans (who were unquestionably of Celtic origin) as they are to be seen in the monuments of antiquity.

The attachment of Highlanders to this dress rendered it a bond of union, which

which often proved dangerous to the government. Many efforts had been made by the legislature, after the rebellion in 1715, to disarm them, and oblige them to conform to the Low-country dresses. The disarming scheme was the most successful; for when the rebellion in 1745 broke out, the common people had scarcely any other arms than those which they took from the king's troops. Their overthrow at Culloden rendered it no difficult matter for the legislature to force them into a total change of their dress. Its conveniency, however, for the purposes of the field, is so great, that some of the Highland regiments still retain it. Even the common people have of late resumed the use of it; and for its lightness and the freedom it gives to the body, many of the Highland gentlemen wear it in the summer time.

The dress of the higher and middle ranks of the Low country differs little or nothing from the English; but many of the peasantry still retain the bonnet, for the cheapness and lightness of the wear. The dress of the women of all ranks is much the same in both kingdoms; but not so as to their neatness, and the cleanliness of the female servants.

I have already mentioned the language of the Highlanders, especially towards Lochaber and Badenoch, to be radically Celtic. The English spoken by the Scots, notwithstanding its provincial articulations, which are as frequent there as in the more southern counties, is written in the same manner in both kingdoms. At present the pronunciation of a Scotchman is greatly improving, and with some does not differ from the pronunciation of a Londoner, more than that of a Londoner does from an inhabitant of Somersetshire, and some parts of Worcestershire.

PUNISHMENTS.] These are pretty much the same in Scotland as in England, beheading used to be performed by an instrument called the Maiden; the model of which, it is well known, was brought from Halifax in England to Scotland, by the regent earl Morton, and it was first used for the execution of himself.

RELIGION.] Ancient Scottish historians, with Bede, and other writers, generally agree that Christianity was first taught in Scotland by some of the disciples of St. John the Apostle, who fled to this northern corner to avoid the persecution of Domitian, the Roman emperor; though it was not publicly professed till the beginning of the third century, when a prince, whom Scotch historians called Donald the First, his queen, and several of his nobles, were solemnly baptised. It was farther confirmed by emigrations from South Britain, during the persecutions of Aurelius and Dioclesian, when it became the established religion of Scotland, under the management of certain learned and pious men, named Culdees, who seem to have been the first regular clergy in Scotland, and were governed by overseers or bishops chosen by themselves, from among their own body, and who had no pre-eminence of rank over the rest of their brethren.

Thus, independent of the church of Rome, Christianity seems to have been taught, planted, and finally confirmed in Scotland as a national church, when it flourished in its native simplicity, till the arrival of Palladius, a priest sent by the bishop of Rome in the fifth century, who found means to introduce the modes and ceremonies of the Romish church, which at length prevailed, and Scotland became involved in that darkness which for ages overspread Europe; though their dependance upon the pope was very slender, when compared to the blind subjection of many other nations.

The Culdees, however, long retained their original manners, and remained a distinct order, notwithstanding the oppression of the Romish clergy, so late as the age of Robert Bruce in the 14th century, when they disappeared.

But it is worthy of observation, that the opposition to popery in this island, though it ceased in Scotland upon the extinction of the Culdees, was in the same age revived in England by John Wickliffe, a man of parts and learning, who was the forerunner in the work of reformation, to John Hus and Jerom of Prague; as the latter were to Martin Luther and John Calvin. But though the doctrines of Wickliffe were nearly the same with those propagated by the reformers in the 16th century, and the age seemed greatly disposed to receive them, affairs were not yet fully ripe for that great revolution; and the finishing blow to popery in England was reserved to the age of Henry VIII.

Soon after that important event took place in England, when learning, arts, and sciences, began to revive in Europe, the absurdities of the church of Rome, as well as the profligate lives of her clergy, did not escape the notice of a free and enquiring people, but gave rise to the Reformation in Scotland. It began in the reign of James V. made great progress under that of his daughter Mary, and was at length completed through the preaching of John Knox, who had adopted the doctrines of Calvin, and in a degree was the apostle of Scotland. It was natural for his brethren to imagine, that upon the abolition of the Roman Catholic Religion, they were to succeed to the revenues of that clergy. The great nobility, who had parcelled out those possessions for themselves, did not at first discourage this notion; but no sooner had Knox succeeded in his designs, which through the fury of the mob destroyed some of the finest ecclesiastical buildings in the world, than the parliament, or rather the nobility, monopolized all the church livings, and most scandalously left the reformed clergy to live almost in a state of beggary; nor could all their efforts produce any great struggle or alteration in their favour.

The nobility and great landholders left the doctrine and discipline of the church to be modelled by the preachers, and they were confirmed by parliament. Succeeding times rendered the presbyterian clergy of vast importance to the state: and their revenues have been so much mended, that though no stipend there exceeds 150l. a year, few fall short of 60l. and none of 50l. If the present expensive mode of living continues in Scotland, the established clergy will have many unanswerable reasons to urge for the increase of their revenues.

The bounds of this work do not admit of entering at large upon the doctrinal and economical part of the church of Scotland. It is sufficient to say, that its first principle is a parity of ecclesiastical authority among all its presbyters; that it agrees in its censures with the reformed churches abroad in the chief heads of opposition to popery; but that it is modelled principally after the Calvinistical plan established at Geneva. This establishment, at various periods, proved so tyrannical over the laity, by having the power of the greater and lesser excommunication, which were attended by a forfeiture of estate, and sometimes life, that the kirk sessions, and other bodies, have been abridged of all their dangerous powers over the laity, who are extremely jealous of their being revived. It is said, that even that relique of popery, the obliging fornicators of both sexes to sit upon what they call a repenting stool, in the church, and in full view of the congregation, begins to wear out; it having been found, that the Scotch women, on account of that penance, were the greatest infanticides in the world. In short, the power of the Scotch clergy is at present very moderate, or at least very moderately exercised; nor are they accountable for the extravagancies of their predecessors.

They have been, ever since the Revolution, firm adherents to civil liberty, and the house of Hanover; and acted with remarkable intrepidity during the rebellion in 1745. They dress without clerical robes; but some of them appear in the pulpit in gowns, after the Geneva form, and bands. They make no use of set forms in worship, but are not prohibited that of the Lord's Prayer. The seats of the bishops, since the abolition of episcopacy, are paid to the king, who commonly appropriates them to pious purposes. A thousand pounds a year is always lent by his majesty for the use of protestant schools erected by act of parliament in North Britain, and the Western isles; and the Scotch clergy, of late, have planned out funds for the support of their widows and orphans. The number of parishes in Scotland are eight hundred and ninety, whereof thirty one are collegiate churches, that is, where the cure is served by more than one minister.

The highest ecclesiastical authority in Scotland is the general assembly, which we may call the ecclesiastical parliament of Scotland. It consists of commissioners, some of which are laymen, under the title of ruling elders, from presbyteries, royal burghs and universities. A presbytery, consisting of under twelve ministers, sends two ministers and one ruling elder; if it contains between twelve and eighteen ministers, it sends three and one ruling elder; if it contains between eighteen and twenty-four ministers, it sends four ministers and two ruling elders; but if the presbytery has twenty-four ministers, it sends five ministers and two ruling elders. Every royal burgh sends one ruling elder, and Edinburgh two; whose election must be attested by the respective kirk sessions of their own burghs. Every university sends one commissioner, usually a minister of their own body. These commissioners are chosen yearly, six weeks before the meeting of the assembly. The ruling elders are often of the first quality of the country.

The king presides by his commissioner (who is always a nobleman) in this assembly, which meets once a year; but he has no voice in their deliberations. The order of their proceedings is regular, though the number of members often creates a confusion; which the moderator who is chosen by them to be as it were speaker of the house, has not sufficient authority to prevent. Appeals are brought from all the other ecclesiastical courts in Scotland to the general assembly; and no appeal lies from its determination in religious matters.

Provincial synods are next in authority to the general assembly. They are composed of a number of the adjacent presbyteries, over whom they have a power; and there are fifteen of them in Scotland; but their acts are reversible by the general assembly.

Subordinate to the synods are presbyteries, sixty-nine of which are in Scotland, each consisting of a number of contiguous parishes. The ministers of these parishes, with one ruling elder, chosen half yearly out of every session, compose a presbytery. These presbyteries meet in the head town of that division; but have no jurisdiction beyond their own bounds, though within these they have cognisance of all ecclesiastical causes and matters. A chief part of their business is the ordination of candidates for livings, in which they are regular and solemn. The patron of a living is bound to nominate or present in six months after a vacancy, otherwise the presbytery fills the place *jure devoluta*; but that privilege does not hold in royal burghs.

A kirk session is the lowest ecclesiastical judicatory in Scotland, and its authority does not extend beyond its own parish. The members consist of the ministers, elders and deacons. The deacons are laymen, and act pretty much as churchwardens do in England, by having the superintendency of the poor, and taking care of other parochial affairs. The elder, or, as he is

called, the ruling elder, is a place of great parochial trust, and he is generally a lay-person of quality or interest in the parish. They are supposed to act in a kind of co-ordinancy with the minister, and to be assisting to him in many of his clerical duties, particularly in catechising, visiting the sick, and at the communion-table.

The office of ministers, or preaching presbyters, includes the offices of deacons and ruling elders; they alone can preach, administer the sacraments, catechise, pronounce church censures, ordain deacons and ruling elders, assist at the imposition of hands upon other ministers, and moderate or preside in all ecclesiastical-judicatories.

It has already been observed that the established religion of Scotland is presbyterian; that it was formerly of a rigid nature, and partook of all the austeries of Calvinism, and of too much of the intolerance of popery, but at present it is mild and gentle, and the sermons and other theological writings of many of the modern Scotch divines, are equally distinguished by good sense and moderation. It is to be wished, however, that this moderation was not too often interrupted by the fanaticism not only of lay seceders, but of regular ministers. These are industrious to fix upon the absurdities of former divines and visionaries, and ecclesiastical ordinances and discipline which were supposed to be incompatible with the nature of government. A vast number of these seceding congregations are to be found in the Lowlands. They maintain their own preachers, though scarcely any two congregations agree either in principle or practice with each other. We do not, however, find that they fly in the face of the civil power, or at least the instances are rare and inconsiderable: and perhaps many of these *secessions* are lawful, or to be justified on account of the great abuses of patronage, by which many parishes have unworthy or incapable ministers imposed upon them, as is the case in many places in England.

A different set of dissenters, in Scotland, consist of the episcopalians; a few quakers, many baptists, and other sectaries, who are denominated from their preachers. Episcopacy, from the time of the Restoration in 1660, to that of the Revolution in 1688, was the established church of Scotland, and would probably have continued so, had not the bishops, who were in general very weak men, and creatures of the duke of York, afterwards James VII. and II. refused to recognise king William's title. The partisans of that unhappy prince retained the episcopal religion; and king William's government was rendered so unpopular in Scotland, that in queen Anne's time, the episcopalians were more numerous in some parts than the presbyterians; and their meetings, which they held under the act of toleration, as well attended. A Scotch episcopalian thus becoming another name for a Jacobite, they received some checks after the rebellion in 1715; but they recovered themselves so well, that at the breaking out of the rebellion in 1745, they became again numerous, after which the government found means to invalidate the acts of their clerical order. Their meetings, however, still subsist, but thinly. In the mean while, the decline of the nonjurors is far from having suppressed episcopacy in Scotland; the English bishops supply them with clergy qualified according to law, whose chapels are chiefly filled by the English; and such Scotch hearers of that persuasion as have places under the government.

The defection of some great families from the cause of popery, and the extinction of others, have rendered its votaries inconsiderable in Scotland. They are chiefly confined to the northern parts, and the islands: and though a violent opposition was lately raised against them, fearing their liberties were about to be enlarged, they appear to be as quiet and inoffensive as protestant subjects.

Scotland, during the time of episcopacy, contained two archbishoprics, St. Andrew's and Glasgow; and twelve bishoprics, Edinburgh, Dunkeld, Aberdeen, Murray, Brechin, Dumblain, Ross, Caithness, Orkney, Galloway, Argyle, and the Isles.

[LEARNING, AND LEARNED MEN.] For this article we may refer to the literary history of Europe for 1400 years past. The western parts and isles of Scotland produced St. Patrick, the celebrated apostle of Ireland; and many others since, whose names would make a long article. The writings of Adamnanus, and other authors, who lived before, and at the time of the Norman invasion, which are come to our hands, are specimens of their learning. Charles the Great, or Charlemagne, most unquestionably held a correspondence by letters with the kings of Scotland, with whom he formed a famous league; and employed Scotchmen in planning, settling and ruling his favourite universities, and other seminaries of learning in France, Italy, and Germany. It is an undoubted truth, though a seeming paradoxical fact, that Barbour, a Scotch poet, philosopher, and historian, though prior in time to Chaucer, having flourished in the year 1368, wrote, according to the modern ideas, as pure English as that bard, and his versification is perhaps more harmonious. The destruction of the Scotch monuments of learning and antiquity have rendered their early annals lame, and often fabulous: but the Latin style of Buchanan's history is to this day the most classical of all modern productions. The letters of the Scotch kings to the neighbouring princes, are incomparably the finest composition of the times in which they were written, and are free from the barbarisms of those sent them in answer. This has been considered as a proof, that classical learning was more cultivated at the court of Scotland than at any other in Europe.

The discovery of the logarithms, a discovery which in point of ingenuity and utility may vie with any that has been made in modern times, is the indisputable right of Napier of Merchiston. And since his time, the mathematical sciences have been cultivated in Scotland with great success. Keil, in his physico-mathematical works, to the clearness of his reasoning has added the colouring of a poet, which is the more remarkable, not only as the subject is little susceptible of ornament, but as he wrote in an ancient language. Of all writers on astronomy, Gregory is allowed to be one of the most perfect and elegant. Maclaurin, the companion and the friend of sir Isaac Newton, was endowed with all that precision and force of mind, which rendered him peculiarly fitted for bringing down the ideas of that great man to the level of ordinary apprehensions, and for diffusing that light through the world, which Newton had confined within the sphere of the learned. His Treatise on Fluxions is regarded by the best judges in Europe, as the clearest account of the most refined and subtle speculations on which the human mind ever exerted itself with success. While Maclaurin pursued this new career, a geometrician no less famous distinguished himself in the sure, but almost deserted, tract of antiquity. This was the late Dr. Simson, so well known over Europe for his illustration of the ancient geometry. His Elements of Euclid, above all his Conic Sections, are sufficient of themselves to establish the scientific reputation of his native country.

This however, does not rest on the character of a few mathematicians and astronomers: the fine arts have been called sisters to denote their affinity. There is the same connection between the sciences, particularly those which depend on observation. Mathematics and physics, properly so called, were in Scotland accompanied by the other branches of study to which they are

allied.

allied. In medicine particularly, the names of Pitcairn, Aibuthnot, Moore, Smelie, Whytt, Cullen, and Gregory, hold a distinguished place.

Nor have the Scots been unsuccessful in cultivating the Belles Lettres. Foreigners who inhabit warmer climates, and conceive the northern nations incapable of tenderness and feeling, are astonished at the poetic genius and delicate sensibility of Thomson.

But of all literary pursuits, that of rendering mankind more virtuous and happy, which is the proper object of what is called *morals*, ought to be regarded with peculiar honour and respect. The philosophy of Dr. Hutcheson, not to mention other works more subtle and elegant, but less convincing and less instructive, deserves to be read by all who would know their duty, or who would wish to practise it. Next to Locke's Essay on the Human Understanding, it is perhaps the best dissection of the human mind that hath appeared in modern times; and it is likewise the most useful supplement to that Essay.

It would be endless to mention all the individuals who have distinguished themselves in the various branches of literature; particularly those who are alive (some of them in high esteem for historical compositions) dispute the palm of merit with the dead, and cover their country with laurels, which neither envy can blast, nor time can destroy.

UNIVERSITIES.] The universities of Scotland are four, viz. St. Andrews*, founded in 1411.—Glasgow †, 1454.—Aberdeen ‡, 1477.—And Edinburgh §, 1582.

It is with pleasure we inform our readers, that a considerable progress has been made in the erection of a new university at Edinburgh, to which our most gracious sovereign has been a very liberal benefactor. This edifice promises to be a noble monument of national taste and spirit.

CITIES,

CITIES, TOWNS, AND OTHER EDIFICES: } Edinburgh, the capital of
PUBLIC AND PRIVATE. } Scotland, naturally takes the

lead in this division, which the bounds of our work oblige us to contract. The castle, before the use of artillery, was deemed impregnable by force. It was probably built by the Saxon king Edwin, whose territory reached to the Frith of Forth, and who gave his name to Edinburgh, as it certainly did not fall into the hands of the Scots till the reign of Indulphus, who lived in the year 953. The town was built for the benefit of protection from the castle, and a more inconvenient situation for a capital can scarcely be conceived; the High-street which is on the ridge of a hill lying east and west; and the lanes running down its sides north and south. In former times, the town was surrounded by water, excepting towards the east; so that when the French landed in Scotland, during the regency of Mary of Guise, they gave it the name of *Lislebourg*. This situation suggested the idea of building very lofty houses divided into stories, each of which contains a suite of rooms, generally large and commodious, for the use of a family; so that the High-street of Edinburgh, which is chiefly of hewn stone, broad, and well paved, makes a most august appearance, especially as it rises a full mile in a direct line and gradual ascent from the palace of Holyrood-house on the east, and is terminated on the west by the rude majesty of its castle, built upon a lofty rock, inaccessible on all sides except where it joins to the city. The castle not only overlooks the city, its environs, gardens, the new town, and a fine rich neighbouring country, but commands a most extensive prospect of the river Forth, the shipping, the opposite coast of Fife, and even some hills at the distance of 40 or 50 miles, which border upon the Highlands. This crowded population, however, was so shockingly inconvenient, that the English who seldom went farther into the country, returned with the deepest impression of Scotch nastiness, which became a proverbial. The castle has some good apartments, a tolerable train of artillery, and has not only a large magazine of arms and ammunition, but contains the regalia, which were deposited here under the most solemn legal instruments of their never being removed from thence. All that is known at present of those regalia, is contained in the instrument which was taken at the time of their being deposited, where they are fully described.

Facing the castle, as I have already observed, at a mile's distance, stands the abbey, or rather palace of Holyrood-house. The inner quadrangle of this palace, begun by James V. and finished by Charles I. is of magnificent modern architecture, built according to the plan, and under the direction of Sir William Bruce, a Scotch gentleman of family, and one of the greatest architects of that age. Round the quadrangle runs an arcade, adorned with pilasters: and the inside contains magnificent apartments for the duke of Hamilton, who is hereditary keeper of the palace, and for other noblemen. Its long gallery contains figures, some of which are from portraits, but all of them painted by modern hands, of the kings of Scotland down to the time of the revolution. James VII. when duke of York, intended to have made great improvements about this palace; for at present nothing can be more uncomfortable than its situation, at the bottom of bleak, unimproved crags and mountains, with scarcely a single tree in its neighbourhood. The chapel belonging to the palace, as it stood when repaired and ornamented by that prince, is thought to have been a most elegant piece of Gothic architecture. It had a very lofty roof, and two rooms of stone galleries, supported by curious pillars. It was the conventual church of the old abbey. Its inside was demolished and rided of all its rich ornaments, by the fury of the mob at the Revolution, which even broke into the repositories

atories of the dead; and discovered a vault till that time unknown, which contained the bodies of James V. his first queen, and Henry Darnley. The walls and roof of this ancient chapel gave way and fell down on the 2d and 3d of December, 1768, occasioned by the enormous weight of a new stone roof, laid over it some years before, which the walls were unable to support.

The hospital, founded by George Herriot, goldsmith to James VI. commonly called Herriot's Work, stands to the south-west of the castle, in a noble situation. It is the finest and most regular specimen which Inigo Jones (who went to Scotland as architect to queen Anne, wife of king James VI.) has left us of his Gothic manner, and far exceeding any thing of that kind to be seen in England. One Balcanguhille, a divine, whom Herriot left his executor, is said to have prevailed upon Jones to admit some barbarous devices into the building, particularly the windows, and to have insisted that the ornaments of each should be somewhat different from those of the others. It is, notwithstanding, upon the whole, a delightful fabric, and adorned with gardens not inelegantly laid out. It was built for the maintenance and education of poor children belonging to the citizens and tradesmen of Edinburgh, and is under the direction of the city magistrates.

Among the other public edifices of Edinburgh, before the Revolution, was the college, which claims the privileges of a university, founded by king James VI. and by him put under the direction of the magistrates, who have the power of chancellor and vice-chancellor. Little can be said of its buildings, which were calculated for the sober literary manners of those days; they are however, improveable, and may be rendered elegant. What is of far more importance, it is supplied with excellent professors in the several branches of learning; and its schools for every part of the medical art are reckoned equal to any in Europe. This college is provided with a library, founded by one Clement Little, which is said to have been of late greatly augmented, and a museum belonging to it was given by Sir Andrew Balfour a physician. It contains several natural, and some literary curiosities, which one would little expect to find at Edinburgh.

The Parliament Square, or, as it is there called, Close, was formerly the most ornamental part of this city: it is formed into a very noble quadrangle, part of which consists in lofty buildings; and in the middle is a fine equestrian statue of Charles II. The room built by Charles I. for the parliament-house, though not so large, is better proportioned than Westminster-hall; and its roof, though executed in the same manner, has been by good judges held to be superior. It is now converted into a court of law, where a single judge, called the lord ordinary, presides by rotation: in a room near it, sit the other judges; and adjoining are the public offices of the law, exchequer, chancery, thrievalty, and magistracy of Edinburgh; and the valuable library of the lawyers. This equals any thing of the kind to be found in England, or perhaps in any part of Europe, and was at first entirely founded and furnished by lawyers. The number of printed books it contains are amazing: and the collection has been made with exquisite taste and judgment. It contains likewise the most valuable manuscript remains of the Scotch history, chartularies, and other papers of antiquity, with a series of medals. Adjoining the library, is the room where the public records are kept; but both it, and that which contains the library, though lofty in the roof, are miserably dark and dismal. It is said that preparations are now carrying on, for lodging both the books and papers in rooms far better suited to their importance and value.

The High Church of Edinburgh, called that of St. Giles, is now divided into four churches, and a room where the general assembly sits. It is a large Gothic building, and its steeple is surmounted by arches, formed into an imperial crown, which has a good effect to the eye. The churches, and other edifices of the city, erected before the Union, contain little but what is common to such buildings; but the excellent pavement of the city, which was begun two centuries ago by one Merlis, a Frenchman, deserves particular attention.

The modern edifices in and near Edinburgh, such as the Exchange, public offices, its hospitals, bridges, and the like, demonstrate the vast improvement of the taste of the Scots in their public works. Parallel to the city of Edinburgh; on the north, the nobility, gentry, and others, have almost completed a new town, upon a plan which does honour to the present age. The streets and Squares are laid out with the utmost regularity, and the houses are built of stone, in an elegant taste, with all the conveniencies that render those of England so delightful and commodious. The fronts of some are superbly finished in all the beauties of architecture displaying at the same time the judgment of the builder, and the public spirit of the proprietor.

Between the old and the new town lies a narrow bottom or vale, which, agreeable to the original plan, was to have been formed into a sheet of water, bordered by a terrace walk, and the ascent towards the new town covered with pleasure gardens, bowberies, &c. But this elegant design fell to nothing, through the narrow ideas of the magistrates, who, finding greater benefits by letting the ground to inferior tradesmen, upon building leases, this spot, formed by nature as an agreeable opening to a crowded city, became a nuisance to those gentlemen who had been so liberal in ornamenting the buildings upon the summit. A decision of the House of Lords (in which a certain great luminary of the law, equally distinguished for his taste and good sense, heartily concurred) put a stop to these mean erections. At the west, or upper end of this vale, the castle, a solid rock not less than twenty stories high, looks down with awful magnificence. The eastern extremity is bounded by a striking object of art, a lofty bridge, the middle arch being ninety feet high, which joins the new buildings to the city, and renders the descent on each side the vale (there being no water in this place) more commodious for carriages. I am the more particular in describing this place, that the reader may form some idea of its pleasant situation; standing on an eminence, with a gentle declivity on each side, in the heart of a rich country; the view southward that of a romantic city, its more romantic castle, and distant hills rising to an amazing height; while the prospect northward gives full scope to the eye, pleases the imagination, and fills the mind with such ideas as the works of nature alone can inspire. One agreeable prospect, however, is still wanting, a handsome clean inn or tavern, with a genteel coffee-room towards the side which overlooks the Forth; and which might easily be accommodated by subscription, and from the great resort of travellers, could not fail to bring a profitable return.

Edinburgh may be considered, notwithstanding its castle, and an open wall which encloses it on the south side of a very modern fabric, but in the Roman manner, as an open town; so that in fact it would have been impracticable for the inhabitants to have defended it against the rebels, who took possession of it in 1745. Edinburgh contains a play-house, which has now the same use as that of parliament; and concerts, assemblies, balls, music-meetings, and other polite amusements, are as frequent and brilliant here, as in any part of his majesty's dominions, London and Bath excepted.

Edinburgh is governed by a lord provost, four bailies, & deans of guild, and a treasurer, annually chosen from the common council. Every company, or incorporated trade, chooses its own deacon, and here are 14; namely, surgeons, goldsmiths, skinners, furriers, hammer-men, wrights or carpenters, masons, taylor, bakers, butchers, cordwainers, weavers, fullers, and bonnet-makers. The lord provost, is colonel of the town-guard, a military institution to be found in no part of his majesty's dominions but at Edinburgh; they serve for the city-watch, and patrolle the streets, are useful in suppressing small commotions, and attend the execution of sentences upon delinquents. They are divided into three companies, and wear an uniform; they are immediately commanded by three officers under the name of captains. Besides this guard, Edinburgh raises sixteen companies of trained bands, which serve as militia. The revenues of the city consist chiefly of that tax which is now common in most of the bodies corporate in Scotland, of two Scotch pennies, amounting in the whole to two thirds of a farthing, laid on every Scotch pint of ale (containing two English quarts) consumed within the precincts of the city. This is a most judicious impost, as it renders the poorest people insensible of the burthen. Its produce, however, has been sufficient to defray the expence of supplying the city with excellent water, brought in leaden pipes at the distance of four miles; of erecting reservoirs, enlarging the harbour of Leith, of completing other public works, of great expence and utility.

Leith, though near two miles distant, may be properly called the harbour of Edinburgh, being under the same jurisdiction. It contains nothing remarkable but the remains of two citadels (if they are not the same), which were fortified and bravely defended by the French, under Mary of Guise, against the English, and afterwards repaired by Cromwell. The neighbourhood of Edinburgh is adorned with noble seats, which are daily increasing; some of them yield to few in England; but they are too numerous to be particularized here. I cannot however avoid mentioning the earl of Abercorn's, a short way from the city, the duke of Buccleugh's house, at Dalkeith, that of the marquis of Lothian at New-bottle, and Hapton-house, so called from the earl its owner. About four miles from Edinburgh is Roslin, noted for a stately Gothic chapel, counted one of the most curious pieces of workmanship in Europe; founded in the year 1440, by William St. Clair, prince of Orkney, and duke of Oldenburgh.

Glasgow, in the shire of Lanerk, situated on a gentle declivity sloping towards the river Clyde, 44 miles west of Edinburgh, is, for population, commerce and riches, the second city of Scotland, and, considering its size, the first in Great Britain, and perhaps in Europe, as to elegance, regularity, and the beautiful materials of its buildings. The streets cross each other at right angles, and are broad, straight, well paved, and consequently clean. The houses make a grand appearance, and are in general four or five stories high, and many of them towards the centre of the city, are supported by arcades, which form piazzas, and give the whole an air of magnificence. Some of the modern built churches are in the finest style of architecture; and the cathedral is a stupendous Gothic building, hardly to be paralleled in that kind of architecture. It contains three churches, one of which stands above another, and is furnished with a very fine spire springing from a tower; the whole being reckoned a masterly and matchless fabric. It was dedicated to St. Mungo, or Kentigern, who was a bishop of Glasgow in the 6th century. The cathedral is upwards of 600 years old, and was preserved from the fury of the rigid Reformers by the resolution of the citizens. The town-house

is a lofty building, and has very noble apartments for the magistrates. The university is esteemed the most spacious and best built of any in Scotland; and is at present in a thriving state. In this city are several well-endowed hospitals; and it is particularly well supplied with large and convenient inns, proper for the accommodation of strangers of any rank. There are two bridges built across the river Clyde; but our bounds do not allow us to particularize these, and the other public-spirited undertakings of this city carrying on by the inhabitants who do honour to the benefits arising from their vast commerce, both foreign and internal; which they carry on with amazing success. In Glasgow are seven churches and eight or ten meeting houses for sectaries of various denominations. The number of its inhabitants have been estimated at 70,000.

Aberdeen is rapidly advancing both in improvement and population. It is the capital of a shire, to which it gives its name, and contains two towns, New and Old Aberdeen. The former is the shire town, and evidently built for the purpose of commerce. It is a large well-built city, and has a good quay, or tide harbour: in it are three churches, and several episcopal meeting-houses, a considerable degree of foreign commerce and much shipping, a well frequented university, and above 20,000 inhabitants. Old Aberdeen, near a mile distant, though almost joined to the New, by means of a long village, has no dependence on the other: it is a moderately large market-town, but has no haven. In each of these two places there is a well-endowed college, both together being termed the university of Aberdeen, although quite independent of each other.

Perth, the capital town of Perthshire, lying on the river Tay, trades to Norway and the Baltic; is finely situated, has an improving linen manufactory, and lies in the neighbourhood of one of the most fertile spots in Great Britain, called the Carle of Gowry. Dundee, by an enumeration in 1788, contains about 24,000 inhabitants: it lies near the mouth of the river Tay; it is a town of considerable trade, exporting much linen, grain, herrings, and peltry, to sundry foreign parts; and has three churches. Montrose, Aberbrothick, and Brechin, lie in the same county of Angus: the first has a great and flourishing trade, and the manufactures of the other two are upon the thriving hand.

It may be necessary again to put the reader in mind, that I write with great uncertainty with regard to the population of Scotland, on account of its improving state. I have rather under than over-rated the number of inhabitants in the towns I have mentioned; for the influx of the people, and the increase of matrimony in proportion to that of property, must create great alterations for the better and few for the worse, because the inhabitants who are disposed to industry may always find employment. This uncertainty is the reason why I omit a particular description of Dumfries, Air, Greenock, Paisley, Stirling, and about 50 other burghs and towns of very considerable trade in Scotland.

The ancient Scots valued themselves upon trusting to their own valour, and not to fortifications, for the defence of their country. This was a maxim more heroic perhaps than prudent, as they have often experienced; and, indeed, at this day, their forts would make but a sorry figure, if regularly attacked. The castles of Edinburgh, Stirling, and Dumbarton, formerly thought places of great strength, could not hold out 48 hours, if besieged by 6000 regular troops, with proper artillery. Fort William which lies in the West highlands, is sufficient to bridle the inhabitants of that neighbourhood;

us are Fort George, and Fort Augustus, in the north and north-west; but none of them can be considered as defences against a foreign enemy.

I shall not pretend to enter upon a description of the noble edifices that, within the course of this and the last century, have been erected for private persons in Scotland because they are so numerous that to particularise them exceeds the bounds of my plan. It is sufficient to say, that many of them are equal to some of the most superb buildings in England and foreign countries, and the reader's surprize at this will cease, when he is informed that the genius of no people in the world is more devoted to architecture than that of the nobility and gentry in Scotland; and that there is no country in Europe, on account of the cheapness of materials, where it can be gratified at so moderate an expence. This may likewise account for the stupendous Gothic cathedrals, and other religious edifices, which anciently abounded in Scotland; but at the time of the Reformation they were mostly demolished, by a furious and most tumultuous mob, who, in these practices, received too much countenance from the reforming clergy, exasperated at the long and sore sufferings they had endured from the popish party.

ANTIQUITIES AND CURIOSITIES, } The Roman and other antiquities
NATURAL AND ARTIFICIAL. } found in Scotland, have of themselves

furnished matter for large volumes. The stations of the Roman legions, their castella, their pretentures or walls reaching across the island, have been traced with great precision by antiquaries and historians; so that, without some fresh discoveries, an account of them could afford no instruction to the learned, and but little amusement to the ignorant; because at present they can be discovered only by critical eyes. Some mention of the chief, however may be proper. The course of the Roman wall (or as it is called by the country people, *Graham's Dyke*, from a tradition that a Scottish warrior of that name first broke over it), between the Clyde and Forth, which was first marked out by Agricola, and completed by Antoninus Pius, is still discernible, as are several Roman camps in the neighbourhood*. Agricola's camp, at the bottom of the Grampian hills, is a striking remain of Roman antiquity. It is situated at Ardoch, in Perthshire, and is generally thought to have been the camp occupied by Agricola, before he fought the bloody battle, so well recorded by Tacitus, with Galgacus, the Caledonian king, who was defeated. Some writers think, that this remain of antiquity at Ardoch, was, on account of the numerous Roman coins and inscriptions found near it, a Roman castellum or fort. Be that as it will, it certainly is the most entire and best preserved of any Roman antiquity of that kind in North Britain, having no less than five rows of ditches, and six ramparts on the south side; and of the four gates which lead

* Near the western extremity of this wall, at Duntocher, in Dumfriesshire, a countryman, in digging a trench on the declivity of a hill, upon which are seen the remains of a Roman fort, turned up several uncommon tiles, which exciting the curiosity of the peasantry in that neighbourhood, it was not long before they broke in upon an entire subterraneous building, from which they dug out a cart-load of these materials. A gentleman, who was then upon a journey through that part of Scotland, found means, upon the second day, to stop all farther proceedings, in hopes that some public spirited persons would, by taking off the surface, explore the whole without demolishing it. The tiles are of seven different sizes; the smallest being seven, and the largest twenty-one inches square. They are from two to three inches in thickness, of a reddish colour, and in a perfectly sound condition. The lesser ones composed several rows of pillars, which form a labyrinth of passages about eighteen inches square; and the larger tiles being laid over the whole, serve as a roof to support the earth above, which is found to be two feet in depth. The building is surrounded by a subterraneous wall of hewn stone. The bones and teeth of animals with a sooty kind of earth, were found in the passages; from which some have conjectured this building to have been occupied as a holed for the use of the neighbouring garrison.

into the area, three are very distinct and plain, viz. the *prætoria*, *decumana*, and *dextra*.

The Roman Temple, or building in the form of the Pantheon at Rome, or of the dome of St. Paul's at London, stood upon the banks of the river Carron, in Stirlingshire, but has been lately barbarously demolished, by a neighbouring Goth, for the purpose of mending a mill-pond. Its height was twenty-two feet, and its external circumference at the base was eighty-eight feet; so that upon the whole it was one of the most complete Roman antiquities in the world. It is thought to have been built by Agricola; or some of his successors, as a temple to the god *Terminus*, as it stood near the pretence which bounded the Roman empire in Britain to the north. Near it are some artificial conical mounds of earth, which still retain the name of *Dunipace*, or *Dunipacis*; which serve to evidence that there was a kind of solemn compromise between the Romans and the Caledonians, that the former should not extend their empire farther to the northwards.

Innumerable are the coins, ural utensils, inscriptions, and other remains of the Romans, that have been found in the different parts of Scotland; some of them to the north of the wall, where, however, it does not appear they made any establishment. By the inscriptions found near the wall, the names of the legions that built it, and how far they carried it on, may be learned. The remains of Roman highways are frequent in the southern parts.

Danish camps and fortifications are easily discernible in several northern countries, and are known by their square figures and difficult situations. Some houses or *rupendinus* fabrics remain in Ross-shire, but whether they are Danish, Pictish, or Scottish, does not appear. The elevations of two of them are to be seen in Gordon's *Itinerarium Septentrionale*. I am of opinion that they are Norwegian or Scandinavian structures, and built about the fifth century, to favour the descents of that people upon those coasts.

Two Pictish monuments, as they are thought to be, of a very extraordinary construction, were lately standing in Scotland; one of them at Abernethy in Perthshire, the other at Brechin in Angus; both of them are columns, hollow in the inside, and without the stair case; that of Brechin is the most entire, being covered at the top with a spiral roof of stone, with three or four windows above the cornice: it consists of sixty regular courses of hewn freestone laid circularly, and regularly tapering towards the top. If these columns are really Pictish, that people must have had among them architects that far exceeded those of any coeval monuments to be found in Europe, as they have all the appearance of an order: and the building is neat, and in the Roman style of architecture. It is, however, difficult to assign them to any but the Picts, as they stand in their dominions; and some sculptures upon that at Brechin, denote it to be of Christian origin. It is not indeed impossible that these sculptures are of a later date. Besides these two pillars, many other Pictish buildings are found in Scotland, but not of the same taste.

The vestiges of erections by the ancient Scots themselves, are not only curious but instructive, as they regard many important events of their history. That people had amongst them a rude notion of sculpture, in which they transmitted the actions of their kings and heroes. At a place called Aberlemno, near Brechin, four or five ancient obelisks are still to be seen, called the Danish stones of Aberlemno. They are erected as commemorations of the Scotch victories over that people; and are adorned with bas-reliefs of men on horseback, and many emblematical figures and hieroglyphics, not intelligible at this day, but minutely described by Mr. Gordon. historical monuments of the Scots may be discovered on the mountains; but it must be acknowledged, that the obscurity of their feelings has encouraged a field of boundless and frivolous conjectures, so that the interpretations of many of them are often fanciful. It would, however, be unparadoxical, if I should neglect to mention the stone near the town of Forroffe, in Murray, which far surpasses all the others in magnificence and grandeur, "and is (says Mr. Gordon) perhaps one of the most stately monuments of that kind in Europe. It rises about 23 feet in height above ground, and is, as I am credibly informed, no less than 12 or 15 feet below; so that the whole height is at least 35 feet, and its breadth near five. It is all one single and entire stone; great variety of figures in relievo are carved thereon, and some of them still distinct and visible; but the injury of the weather has obscured those towards the upper part." Though this monument has been generally looked upon as Danish, yet I have little doubt of its being Scotch, and that it was erected in commemoration of the final expulsion of the Danes out of Murray, where they held their last settlement in Scotland, after the defeat they received from Malcolm, a few years before the Norman invasion.

At Sandwick, in Ross-shire, is a very splendid ancient obelisk, surrounded at the base with large, well-cut flag stones, formed like steps. Both sides of the column are covered with various enrichments, in well finished carved work. The one face presents a sumptuous cross, with a figure of St. Andrew on each hand, and some uncounted animals and flowerings underneath. The central division on the reverse, exhibits a variety of curious figures, birds, and animals.

The ruins of the cathedral of Elgin are very striking; and many parts of that fine building have still the remains of much grandeur and dignity in them. The west door is highly ornamented, there is much elegance in the carvings, and the whole edifice displays very elaborate workmanship.

Among the remains of ancient castles, may be mentioned Kildrumy castle in the north of Scotland, which was formerly a place of great strength and magnificence, and often used as an asylum to noble families in periods of civil war. Inverurie castle, the ancient seat of the earl-marschals of Scotland, is also a large and lofty pile, situated on a steep bank of the river; two very high towers bound the front, and even in their decaying state, give the castle an air of much grandeur and antiquity. Vast rows of venerable trees, inclosing the adjoining garden, add to the effect of the decayed buildings. Near the town of Huntly are the ruins of Huntly castle. On the avenue that leads to it, are two large square towers, which had defended the gateway. The castle seems to be very old, and great part of it is demolished; but there is a massy building of a more modern date, in which some of the apartments, and in particular their curious cielings, are still in tolerable preservation. They are painted with a great variety of subjects, in small divisions, in which are contained many emblematical figures.

Besides these remains of Roman, Pictish, Danish, and Scottish antiquities, many Druidical monuments and temples are discernible in the northern parts of Scotland, as well as in the isles, where we may suppose that paganism took its last refuge. They are easily perceived by their circular forms; but though they are equally regular, yet none of them are so stupendous as the Druidical erections in South Britain. There is in Perthshire a barrow which seems to be a British erection, and the most beautiful of the kind perhaps in the world. It exactly resembles the figure of a ship with the keel uppermoist.

The

The common people call it Ternay, which some interpret to be *terra navis*, the ship of earth. It seems to be of the most remote antiquity, and perhaps was erected to the memory of some British prince, who acted as auxiliary to the Romans; for it lies near Auchterard, not many miles distant from the great scene of Agricola's operations.

The traces of ancient volcanoes are not unfrequent in Scotland. The hill of Finchaven is one instance; and the hill of Bergonium near Dunstaffnage-castle, is another, yielding vast quantities of pumices or *Lava* of different kinds, many of which are of the same species with those of the volcanic Iceland. Among other natural curiosities of this country, mention is made of a heap of white stones, most of them clear like crystal, together with great plenty of oyster and other sea shells; they are found on the top of a mountain called Skorn a Lappich, in Ross-shire, twenty miles distant from the sea. Slains in Aberdeenshire, is said to be remarkable for a petrifying cave, called the Dropping cave, where water oozing through a spongy porous rock at the top, doth quickly consolidate after it drops to the bottom. Other natural curiosities belonging to Scotland have their descriptions and histories; but they generally owe their extraordinary qualities to the credulity of the vulgar, and vanish when they are skilfully examined. Some caverns that are to be found in Fifeshire, and are probably natural, are of extraordinary dimensions, and have been the scenes of inhuman cruelties.

COMMERCE AND MANUFACTURES.] In these respects Scotland has, for some years past, been in a very improving state. Without entering into the disputed point, how far Scotland was benefited by its union with England; it is certain that the expedition of the Scots to take possession of Darien, and to carry on the East and West Indian trade, was founded upon true principles of commerce, and (so far as it went) executed with a noble spirit of enterprise. The miscarriage of that scheme, after receiving the highest and most solemn sanctions, is a disgrace to the annals of that reign in which it happened; as the Scots had then a free, independent; and unconnected parliament. We are to account for the long languour of the Scottish commerce, and many other misfortunes which that country sustained, by the disgust the inhabitants conceived on that account, and some invasions of their rights afterwards, which they thought inconsistent with the articles of union. The entails and narrow settlements of family estates, and some remains of the feudal institutions, might contribute to the same cause.

Mr. Pelham, when at the head of the administration in England, after the extinction of the rebellion in 1745, was the first minister who discovered the true value of Scotland, which then became a more considerable object of governmental inquiry than ever. All the benefits received by that country, for the relief of the people from their feudal tyranny, were effected by that great man. The bounties and encouragements granted to the Scots, for the benefit of trade and manufactures, during his administration, made them sensible of their own importance. Mr. Pitt, a succeeding minister, pursued Mr. Pelham's wise plan; and justly boasted in parliament, that he availed himself of the courage, good sense, and spirit of the Scots, in carrying on the most extensive war that ever Great Britain was engaged in. Let me add, to the honour of the British government, that the Scots, have been suffered to avail themselves of all the benefits of commerce and manufactures they can claim, either in right of their former independency, the treaty of union, or posterior acts of parliament.

This is manifest from the extensive trade they lately carried on with the British settlements in America and the West Indies; and with all the nations

by which the English themselves trade; so that the increase of their shipping within these 30 years past has been very considerable. The exports of those ships are composed chiefly of Scotch manufactures, fabricated from the produce of the soil, and the industry of its inhabitants. In exchange for these, they import tobacco, rice, cotton, sugar, and rum, from the British plantations; and from other countries, their products, to the immense saving of their nation. The prosperity of Glasgow and its neighbourhood hath been greatly owing to the connection and trade with Virginia and the West-Indies.

The fisheries of Scotland are not confined to their own coast, for they have a great concern in the whale-fishery carried on upon the coast of Spitzbergen; and their returns are valuable, as the government allows them a bounty of 40s. for every ton of shipping employed in that article. The late improvement of their fisheries, which I have already mentioned, and which are daily increasing, open inexhaustible funds of wealth; their cured fish being by foreigners, and the English planters in America, preferred to those of Newfoundland.

The busses, or vessels employed in the great herring fishery on the western coasts of Scotland, are fitted out from the north-west parts of England, the north of Ireland, as well as the numerous ports of the Clyde and neighbouring islands. The grand rendezvous is at Campbeltown, a commodious port in Argyshire, facing the north of Ireland, where sometimes 300 vessels have been assembled. They clear out on the 12th of September, and must return to their different ports by the 13th of January. They are also under certain regulations respecting the number of tons, men, nets, &c. the whole being judiciously calculated to promote the best of national purposes, its strength and its commerce. But though the political existence of Great Britain depends upon the number and bravery of our seamen, this noble institution has hitherto proved ruinous to many of those who have embarked in it, and unless vigorously supported, will end in smoke.

To encourage this fishery, a bounty of 50s. per ton was granted by parliament; but whether from the insufficiency of the fund appropriated for this purpose, or any other cause, the bounty was withheld from year to year, while in the mean time the adventurers were not only sinking their fortunes, but also borrowing to the utmost limits of their credit. The bounty has since been reduced from 50 to 30s. with the strongest assurances of its being regularly paid when due. Upon the strength of these promises they have again embarked in the fishery, and it is to be wished, that no consideration whatever may tend to withdraw an inducement so requisite to place this fishery on a permanent footing.

The benefits of these fisheries are perhaps equalled by manufactures carrying on at land; particularly that of iron at Carron, Stirling-shire.

Their linen manufactory, notwithstanding a strong rivalry from Ireland, is in a flourishing state. The thread manufacture of Scotland is equal, if not superior, to any in the world; and the lace fabricated from it has been deemed worthy of royal wear and approbation. It has been said, some years ago, that the exports from Scotland to England, and the British plantations, in linen, cambrics, checks, Osnaburghs, neckerchiefs, and the like commodities, amounted annually to 400,000*l.* exclusive of their home consumption; and there is reason to believe that the sum is considerably larger at present. The Scots are likewise making very promising efforts for establishing woollen manufactures; and their exports of caps, stockings, mittens, and other articles of their own wool, begin to be very considerable. The Scots, it is true, cannot pretend to rival the English in their finer cloths; but they make at

present some broad cloth proper for the wear of people of fashion in an undress, and in quality and fineness equal to what is commonly called Yorkshire cloth. Among the other late improvements of the Scots, we are not to forget the vast progress they have made in working the mines, and smelting the ore of their country. Their coal trade in England is well known; and of late they have turned even their stones to account, by their contracts for paving the streets of London. If the great trade in cattle, which the Scots carried on of late with the English, is now diminished, it is owing to the best of national causes, that of an increase of home consumption.

The trade carried on by the Scots with England, is chiefly from Leith, and the eastern ports of the nation; but Glasgow was the great emporium for the American commerce, before the commencement of the unhappy breach with the colonies. The late junction of the Forth to the Clyde will render the benefits of trade mutual to both parts of Scotland. In short, the more that the seas, the situation, the soil, harbours, and rivers of this country are known, the better adapted it appears for all the purposes of commerce, both foreign and domestic.

With regard to other manufactures, not mentioned, some of them are yet in their infancy. The town of Paisley alone employs an incredible number of hands, in fabricating a particular kind of flowered and striped lawns, which are a reasonable and elegant wear. Sugar-houses, glass-works of every kind, distill-houses, and paper-mills, are erected every where. The Scotch carpeting makes neat and lasting furniture; and some essays have been lately made, with no inconsiderable degree of success, to carry that branch of manufacture to as great perfection as in any part of Europe. After all that has been said, many years will be required before the trade and improvements in Scotland can be brought to maturity. In any event, they never can give umbrage to the English, as the interests of the two people are, or ought to be the same.

Having said thus much, I cannot avoid observing the prodigious disadvantages under which both the commercial and landed interest of Scotland lies, from her nobility and great land-holders having too fond an attachment for England, and foreign countries, where they spend their ready money. This is one of the evils arising to Scotland from the union, which removed the seat of her legislature to London; but it is greatly augmented by the resort of volunteer absentees, to that capital. While this partiality subsists, the Scots will probably continue to be distressed for a currency of specie. How far paper can supply that defect, depends upon an attention to the balance of trade, and the evil may, perhaps be somewhat prevented, by money remitted from England for carrying on the vast manufactures and works now set on foot in Scotland. The gentlemen who reside in Scotland, have wisely abandoned French Claret, and brandy, (though too much is still made use of in that country), for rum produced in the British plantations; and their own malt-liquors are now come nearly to as great perfection as those in England; and it is said, that they have lately exported large quantities of their ale to London, Dublin, and the Plantations.

REVENUES.] See England.

COINS.] In the reign of Edward II. of England, the value and denominations of coins were the same in Scotland as in England. Towards the reign of James II. a Scotch shilling answered to about an English six-pence; and about the reign of queen Mary of Scotland, it was not more than an English groat. It continued diminishing in this manner till after the union of the two crowns under her son James VI. when the vast resort of the Scotch nobility

bility and gentry to the English court, occasioned such a drain of specie from Scotland, that by degrees a Scotch shilling fell to the value of one twelfth of an English shilling, and their pennies in proportion. A Scotch penny is now very rarely to be found; and they were succeeded by bodles, which were double the value of a Scotch penny, and are still current, but are dilly wearing out. A Scotch halfpenny was called a *babie*; some say, because it was first stamped with the head of James III. when he was a babe or baby; put perhaps it is only the corruption of two French words, *bas piece*, signifying a low piece of money. The same observation that we have made of the Scotch shilling, holds of their pounds and merks; which are not coins, but denominations of sums. In all other respects, the currency of money in Scotland and England is the same, as very few people now reckon by the Scotch computation.

ORDER OF THE THISTLE.] This is a military order instituted, as the Scotch writers assert, by their king Achaius, in the ninth century, upon his making an offensive and defensive league with Charlemagne, king of France; or as others say, on account of his victory over Athelstan, king of England, when he vowed in the kirk of St. Andrew, that he and his posterity should ever bear the figure of that cross in their ensigns on which the saint suffered. It has been frequently neglected, and as often resumed. It consists of the sovereign, and 12 companions, who are called Knights of the Thistle, and have on their ensign this significant motto, *Nemo me impune lacesset*, "None shall safely provoke me."

LAWS AND CONSTITUTION.] The ancient constitution and government in Scotland has been highly applauded, as excellently adapted to the preservation of liberty; and it is certain, that the power of the king was greatly limited, and that there were many checks in the constitution upon him, which were well calculated to prevent his assuming or exercising a despotic authority. But the Scottish constitution of government was too much of the aristocratic kind to afford to the common people that equal liberty which they had a right to expect. The king's authority was sufficiently restrained; but the nobles, chieftains, and great landholders, had it too much in their power to tyrannize over and oppress their tenants, and the common people.

The ancient kings of Scotland, at their coronation, took the following oath, containing three promises, viz.

"In the name of Christ, I promise these three things to the Christian people my subjects: First, that I shall give order, and employ my force and assistance that the church of God, and the Christian people, may enjoy true peace during our time, under our government. Secondly, I shall prohibit and hinder all persons, of whatever degree, from violence and injustice. Thirdly, in all judgments I shall follow the prescriptions of justice and mercy, to the end that our clement and merciful God may shew mercy unto me, and to you."

The parliament of Scotland anciently consisted of all who held any portion of land, however small, of the crown, by military service. This parliament appointed the time of its own meetings and adjournments, and committees to superintend the administration during the intervals of parliament; it had a commanding power in all matters of government; it appropriated the public money, ordered the keeping of it, and called for the accounts; it armed the people, and appointed commanders; it named and commissioned ambassadors; it granted and limited pardons; it appointed judges and courts of judicature; it named officers of state and privy-counsellors; it annexed and

alienated the revenues of the crown, and restrained grants by the king. The king of Scotland had no negative voice in parliament; nor could he declare war, make peace, or conclude any other public business of importance without the advice and approbation of parliament. The prerogative of the king was so bounded, that he was not even intrusted with the executive part of the government. And so late as the minority of James IV. who was contemporary with, and son-in-law to, Henry VII. of England, the parliament pointed out to him his duty, as the first servant of his people; as appears by the act still extant. In short, the constitution was rather aristocratical than monarchical. The abuse of these aristocratical powers, by the chieftains and great landholders, gave the king, however, a very considerable interest among the lower ranks; and a prince who had sense and address to retain the affections of his people, was generally able to humble the most overgrown of his subjects; but when, on the other hand, a king of Scotland, like James III. shewed a disrespect to his parliament, the event was commonly fatal to the crown. The kings of Scotland, notwithstanding this paramount power in the parliament, found means to weaken and elude its force; and in this they were assisted by the clergy, whose revenues were immense, and who had very little dependence upon the pope, and were always jealous of the powerful nobility. This was done by establishing a select body of members, who were called *the lords of the articles*. These were chosen out of the clergy, nobility, knights, and burghesses. The bishops, for instance, chose eight peers, and the peers, eight bishops; and these sixteen jointly chose eight barons (or knights, of the shire), and eight commissioners for burghs; and to all those were added eight great officers of state, the chancellor being president of the whole.

Their business was to prepare all questions and bills, and other matters brought into parliament; so that in fact, though the king could give no negative, yet being by his clergy, and the places he had to bestow, always sure of the lords of articles, nothing could come into parliament that could call for his negative. It must be acknowledged, that this institution seems to have prevailed by stealth; nor was it ever brought into any regular system; even its modes varied; and the greatest lawyers are ignorant when it took place. The Scots, however, never lost sight of their original principles; and though Charles I. wanted to form these lords of the articles into regular machines for his own despotic purposes, he found it impracticable; and the melancholy consequences are well known. At the Revolution, the Scots gave a fresh instance how well they understood the principles of liberty, by omitting all pedantic debates about *abdication*, and the like terms, and voting king James at once to have forfeited his crown; which they gave to the prince and princess of Orange.

This spirit of resistance was the more remarkable, as the people had groaned under the most insupportable ministerial tyranny ever since the Restoration. It is asked, Why did they submit to that tyranny? The answer is, In order to preserve that independency upon England, which Cromwell and his parliament endeavoured to destroy, by uniting them with England: they therefore chose to submit to a temporary evil; but they took the first opportunity to get rid of their oppressors.

Scotland, when it was a separate kingdom, cannot be said to have had any peers, in the English sense of the word. The nobility, who were dukes, marquesses, earls, and lords, were by the king made hereditary members of parliament; but they formed no distinct house, for they sat in the same room with the commons, who had the same deliberate and decisive vote with them in all public matters. upon a lord's assize in matters of life and death; nor was it necessary for the assizers, or jury, to be unanimous in their verdict. The feudal customs, even at the time of the Restoration, were so prevalent, and the rescue of a great criminal was commonly so much apprehended, that seldom above two days passed between the sentence and execution.

Great uncertainty occurs in the Scotch history, by confounding parliaments with conventions; the difference was, that a parliament could enact laws as well as lay on taxes; a convention, or meeting of the states, only met for the purposes of taxation. Before the Union, the kings of Scotland had four great and four lesser officers of state; the great, were the lord high chancellor, high treasurer, privy-seal, and secretary: the four lesser were the lords register, advocate, treasurer-depute, and justice clerk. Since the Union none of these continue, excepting the lords privy-seal, register, advocate, and justice-clerk; a third secretary of state has occasionally been nominated by the king for Scottish affairs, but under the same denomination as the other two secretaries. The above officers of state sat in the Scotch parliament by-virtue of their offices.

The officers of the crown were, the high-chamberlain, constable, admiral, and marshal. The offices of constable and marshal were hereditary. A nobleman has still a pension as admiral; and the office of marshal is exercised by a knight-marshal.

The office of chancellor of Scotland differed little from the same in England. The same may be said of the lords treasurer, privy-seal, and secretary. The lord-register was head-clerk to the parliament, convention, treasury, exchequer, and session, and keeper of all public records. Though this office was only during the king's pleasure, yet it was very lucrative, by disposing of his deputation, which lasted during life. He acted as teller to the parliament: and it was dangerous for any member to dispute his report of the numbers upon division. The lord advocate's office resembles that of the attorney-general in England, only his powers are far more extensive; because, by the Scotch laws, he is the prosecutor of all capital crimes before the judiciary, and likewise concurs in all pursuits before sovereign courts, for breaches of the peace, and also in all matters civil, wherein the king or his donator hath interest. Two solicitors are named by his majesty, by way of assistants to the lord-advocate. The office of justice-clerk entitles the possessor to preside in the criminal court of justice, while the justice-general, an office I shall describe hereafter, is absent.

The ancient constitution of Scotland admitted of many other offices both of the crown and state; but they are either now extinct, or too inconsiderable to be described here. That of Lyon king of arms, or the rex facialium, or grand herald of Scotland, is still in being; and it was formerly an office of great splendor and importance, inasmuch that the science of heraldry was preserved there in greater purity than in any other country in Europe. He was even crowned solemnly in parliament with a golden circle; and his authority, which is not the case in England, in all armorial affairs, might be carried into execution by the civil law.

The privy-council of Scotland before the Revolution, had, or assumed inquisitorial powers, even that of torture; but it is now sunk in the parliament and privy-council of Great Britain; and the civil and criminal causes in Scotland are chiefly cognizable by two courts of judicature.

The first is, that of the college of justice, which was instituted by James V. after the model of the French parliament, to supply an ambulatory committee of parliament, who took to themselves the names of the lords of council and session, which the present members of the college of justice still retain.

This

This court consists of a president and fourteen ordinary members, besides extraordinary ones named by the king, who may sit and vote, but have no salaries, and are not bound to attendance. This court may be called a standing jury in all matters of property that lie before them. Their forms of proceeding do not lie within my plan, neither does any inquiry how far such an institution, in so narrow a country as Scotland, is compatible with the security of private property. The civil law is their directory in all matters that come not within the municipal laws of the kingdom. It has been often matter of surprise, that the Scots were so tenacious of the forms of the courts, and the essence of their laws, as to reserve them by the articles of the Union. This, however, can be easily accounted for, because those laws and forms were essential to the possession of estates and lands, which in Scotland are often held by modes incompatible with the laws of England. I shall just add, that the lords of council and session act likewise as a court of equity; but their decrees are (fortunately perhaps for the subject) reversible by the British House of Lords, to which an appeal lies.

The justice-court is the highest criminal tribunal in Scotland; but in its present form it was instituted so late as the year 1672, when a lord-justice-general, removeable at the king's pleasure, was appointed. This lucrative office still exists in the person of one of the chief nobility; but the ordinary members of the court, are the justice-clerk and five other judges, who are always nominated from the lords of session. In this court the verdict of a jury condemns or acquits; but, as I have already hinted, without any necessity of being unanimous.

Besides these two great courts of law, the Scots, by the articles of the Union, have a court of exchequer. This court has the same powers, authority, privilege, jurisdiction, over the revenue of Scotland, as the court of exchequer in England has over the revenues there; and all matters and things competent to the court of exchequer of England relating thereto, are likewise competent to the exchequer of Scotland. The judges of the exchequer in Scotland exercise certain powers which formerly belonged to the treasury, and are still vested in that of England.

The court of admiralty in Scotland, was, in the reign of Charles II. by act of parliament, declared to be a supreme court, in all causes competent to its own jurisdiction; and the lord high admiral is declared to be the king's lieutenant and justice-general upon the seas, and in all ports, harbours, and creeks of the same; and upon fresh waters and navigable rivers, below the first bridge, or within flood mark, so that nothing competent to its jurisdiction can be meddled with, in the first instance, but by the lord high admiral and the judges of his court. Sentences passed in all inferior courts of admiralty may be brought again before his court; but no appeal lies from it to the lords of the session, or any other judicatory, unless in cases not maritime. Causes are tried in this court by the civil law, which in such cases is likewise the common law of Scotland, as well as by the laws of Oleron, Wisby and the Hanse-towns, and other maritime practices and decisions common upon the continent. The place of lord-admiral of Scotland is little more than nominal, but the salary annexed to it is reckoned worth 1000*l.* a year; and the judge of the admiralty is commonly a lawyer of distinction, with considerable perquisites pertaining to his office.

The college or faculty of advocates, which answers to the English inns of court, may be called the seminary of Scotch lawyers. They are within themselves an orderly court, and their forms require great precision and examination to qualify its candidates for admission. Subordinate to them is a

body of inferior lawyers, or, as they may be called, attorneys, who called themselves writers to the signet, because they alone can subscribe the writs that pass the signet; they likewise have a bye government for their own regulation. Such are the different law courts that are held in the capital of Scotland: we shall pass to those that are inferior.

The government of the counties in Scotland was formerly vested in sheriffs and stewards, courts of regality, baron courts, commissaries, justices of the peace, and coroners.

Formerly, sheriffdoms were generally hereditary; but by a late act of parliament, they are now all vested in the crown; it being there enacted, that all high sheriffs, or stewards, shall, for the future, be nominated and appointed annually by his majesty, his heirs, and successors. In regard to the sheriff-deputes, and steward-deputes, it is enacted that there shall only be one in each county, or stewartry, who must be an advocate, of three years standing at least. For the space of seven years, these deputies are to be nominated by the king, with such continuance as his majesty shall think fit; after which they are to enjoy their office *ad vitam aut culpam*, that is, for life, unless guilty of some offence. Some other regulations have been likewise introduced, highly for the credit of the sheriffs courts.

Stewartries were formerly part of the ancient royal domain; and the stewards had much the same power in them as the sheriff had in his county.

Courts of regality of old were held by virtue of a royal jurisdiction vested in the lord, with particular immunities and privileges: but these were so dangerous, and so extravagant, that all the Scotch regalities are now dissolved by an act of parliament.

Baron-courts belong to every person who holds a barony of the king. In civil matters, they extend to matters not exceeding forty shillings sterling; and in criminal cases, to petty actions of assault and battery; but the punishment is not to exceed twenty shillings sterling, or setting the delinquent in the stocks for three hours, in the day time. These courts, however petty, were in former days invested with the power of life and death, which they have now lost.

The courts of commissaries in Scotland answer to those of the English diocesan chancellors, the highest of which is kept at Edinburgh; wherein, before four judges, actions are pleaded concerning matters relating to wills and testaments; the right of patronage to ecclesiastical benefices, tythes, divorces, and causes of that nature; but in almost all other parts of the kingdom, there sits but one judge on these causes.

According to the present institution, justices of the peace in Scotland, exercise pretty much the same powers as those in England. In former times their office, though of very old standing, was insignificant, being cramped by the powers of the great feudal tyrants, who obtained an act of parliament, that they were not to take cognizance of riots till fifteen days after the fact.

The institution of coroners is as old as the reign of Malcolm II. the great legislator of Scotland, who lived before the Norman invasion of England. They took cognizance of all breaches of the king's peace; and they were required to have clerks to register depositions and matters of fact, as well as verdicts of jurors: the office, however, is at present much diffused in Scotland.

From the above short view of the Scotch laws and institutions, it is plain that they were radically the same with those of the English. The latter alledge, indeed, that the Scots borrowed the contents of their *Regiam*

Majestatem, their chief law-book, from the work of Glanville, who was a judge under Henry II. of England. The Scots on the other hand, say, that Glanville's work was copied from their *Regiam Majestatem*, even with the peculiarities of the latter, which do not now, and never did, exist in the laws of England.

The royal burghs in Scotland form, as it were, a commercial parliament, which meets once a year, at Edinburgh, consisting of a representative from each burgh, to consult upon the common good of the whole. Their powers are pretty extensive, and before the Union they made laws relating to shipping, to masters and owners of ships, to mariners, and merchants by whom they were freighted; to manufactures, such as plaiding, liuen, and yarn; to the curing and packing of fish, salmon, and herrings, and to the importing and exporting several commodities. The trade between Scotland and the Netherlands is subject to their regulation: they fix the staple port, which was formerly at Dort, and is now at Campvere. Their conservator is indeed nominated by the crown, but then their convention regulates his power, approves his deputies, and appoints his salary: so that, in truth, the whole staple trade is subjected to their management. Upon the whole, this is a very singular institution, and sufficiently proves the vast attention which the government of Scotland formerly paid to trade. It took its present form in the reign of James III. 1487, and had excellent consequences for the benefit of commerce.

Such are the laws and constitutions of Scotland, as they exist at present, in their general view; but our bounds do not permit us to descend to farther particulars, which are various and complicated. The conformity between the practice of the civil law of Scotland, and that in England, is remarkable. The English law reports are of the same nature with the Scotch practice; and their acts of federunt answer to the English rules of court; the Scottish wadsets and reversions, to the English mortgages and defeasances; their pointing of goods, after letters of horning, is much the same as the English executions upon outlawries; and an appeal against the king's pardon, in cases of murder, by the next of kin to the deceased, is admitted in Scotland as well as in England. Many other usages are the same in both kingdoms. I cannot, however, dismiss this head without one observation, which proves the similarity between the English and Scotch constitutions, which I believe has been mentioned by no author. In old times, all the freeholders in Scotland met together in presence of the king, who was seated on the top of a hillock, which in the old Scottish constitution, is called the Moot, or Moot-hill; all national affairs were here transacted; judgments given, and differences ended. This Moot-hill I apprehend to be of the same nature as the Saxon Folemot, and to signify no more than the hill of meeting.

HISTORY.] Though the writers of ancient Scotch history are too fond of system and fable, yet it is easy to collect, from the Roman authors, and other evidences; that Scotland was formerly inhabited by different people. The Caledonians were, probably, the first inhabitants; the Picts, undoubtedly were the Britons, who were forced northwards by the Belgic Gauls, about fourscore years before the descent of Julius Cæsar; and who settling in Scotland, were joined by great numbers of their countrymen, that were driven northwards by the Romans. The Scots, most probably, were a nation of adventurers from the ancient Scythia, who had served in the armies on the continent, and, as has been already hinted, after conquering the other inhabitants, gave their own name to the country. to have been inhabited by the Saxons, and by the Britons, who formed the kingdom of Alceuth, the capital of which was Dumbarton; but all these people in process of time were subdued by the Scots.

Having premised thus much, it is unnecessary for me to investigate the constitution of Scotland from its fabulous, or even its early ages. It is sufficient to add, to what I have already said upon that head, that they seem to have been as forward as any of their southern neighbours in the arts of war and government.

It does not appear that the Caledonians, the ancient Celtic inhabitants of Scotland, were attacked by any of the Roman generals before Agricola, anno 79. The name of the prince he fought with was Galdus, by Tacitus named Calgacus; and the history of that war is not only transmitted with great precision, but corroborated by the remains of the Roman encampments and forts, raised by Agricola in his march towards Dunheld, the capital of the Caledonians. The brave stand made by Galdus against that great general, does honour to the valour of both people; and the sentiments of the Caledonian, concerning the freedom and independency of this country, appeared to have warmed the noble historian, with the same generous passion. It is plain, however, that Tacitus thought it for the honour of Agricola, to conceal some part of this war; for though he makes his countrymen victorious, yet they certainly retired southward, to the province of the Horesti, which was the county of Fife, without improving their advantage.

Galdus, otherwise called Corbred, was according to the Scotch historians, the 21st in the lineal descent from Fergus I. the founder of their monarchy; and though this genealogy has of late been disputed, yet nothing can be more certain, from the Roman histories, than that the Caledonians, or Scots, were governed by a succession of brave and wise princes, during the abode of the Romans in Britain. Their valiant resistance obliged Agricola himself, and after him the emperors Adrian and Severus, to build the two famous pretences or walls, one between the Frith of Clyde and Forth already mentioned; and the other between Tinnmouth and the Solway Frith, which will be described in our account of England, to defend the Romans from the Caledonians and Scots; and which prove that the independence of the latter was never subdued.

Christianity was introduced into Scotland about the year 201 of the Christian era, by Donald I. The Picts, who, as before mentioned, were the descendents of the ancient Britons, forced northwards by the Romans, had at this time gained a footing in Scotland; and being often defeated by the ancient inhabitants, they joined the Romans against the Scots and Caledonians, who were of the same original, and considered themselves as one people; so that the Scots monarchy suffered a short eclipse; but it broke out with more lustre than ever, under Fergus II. who recovered his crown; and his successors gave many severe overthrows to the Romans and Britons.

When the Romans left Britain in 448, the Scots as appears by Gildas, a British historian, were a powerful nation, and in conjunction with the Picts, invaded the Britons; and having forced the Roman walls, drove them to the very sea; so that the Britons applied to the Romans for relief; and in the famous letter, which they called *their groans*, they tell them, that they had no choice left, but that of being swallowed up by the sea, or perishing by the swords of the barbarians; for so all nations were called who were not Romans, or under the Roman protection.

Dongard was then king of Scotland; and it appears from the oldest histories, and those that are least favourable to monarchy, that the succession to the crown of Scotland still continued in the family of Fergus, but generally

descended collaterally; till the inconveniencies of that mode of succession were so much felt, that by degrees it fell into disuse, and it was at last settled in the descending line.

About the year 769, the Scots were governed by Achaius, a prince so much respected, that his friendship was courted by Charlemagne, and a league was concluded between them, which continued inviolate while the monarchy of Scotland had an existence. No fact of equal antiquity is better attested than this league, together with the great service performed by the learned men of Scotland, in civilizing the vast dominions of that great conqueror, as has been already observed under the article of Learning. The Picts still remained in Scotland as a separate nation, and were powerful enough to make war upon the Scots; who, about the year 843, when Kenneth Mac Alpin was king of Scotland, finally subdued them; but not in the savage manner mentioned by some historians, by extermination. For he obliged them to incorporate themselves with their conquerors, by taking their names, and adopting their laws. The successors of Kenneth Mac Alpin maintained almost perpetual wars with the Saxons on the southward, and the Danes and other barbarous nations towards the east: who being masters of the sea, harassed the Scots by powerful invasions. The latter, however, were more fortunate than the English; for while the Danes were erecting a monarchy in England, they were every where overthrown in Scotland by bloody battles, and at last driven out of the kingdom. The Saxon and Danish monarchs who then governed England were not more successful against the Scots, who maintained their freedom and independency, not only against foreigners, but against their own kings, when they thought them endangered. The feudal law was introduced among them by Malcolm II.

Malcolm III. commonly called Malcolm Cranmore from two Gaelic words which signify a *large head*, but most probably from his great capacity, was the eighty-sixth king of Scotland, from Fergus I. the supposed founder of the monarchy; the forty-seventh from its restorer, Fergus II. and the twenty-second from Kenneth III. who conquered the kingdom of the Picts. Every reader who is acquainted with the tragedy of Macbeth, as written by the inimitable Shakspeare, who keeps close to the facts delivered by historians, can be no stranger to the fate of Malcolm's father, and his own history, previous to his mounting the throne in the year 1057. He was a wise and magnanimous prince, and in no respect inferior to his cotemporary the Norman conqueror, with whom he was often at war. He married Margaret, daughter to Edward, surnamed the Out-law, son to Edmund Ironside, king of England. By the death of her brother Edgar Atheling, the Saxon right to the crown of England devolved upon the posterity of that princess, who was one of the wisest and worthiest women of the age; and her daughter Maud was accordingly married to Henry I. of England. Malcolm, after a glorious reign, was killed, with his son, treacherously, it is said, at the siege of Alnwick, by the besieged.

Malcolm III. was succeeded by his brother Donald VII. and he was dethroned by Duncan II. whose legitimacy was disputed. They were succeeded by Edgar, the son of Malcolm III. who was a wise and valiant prince; he was succeeded by Alexander I. and upon his death David I. mounted the throne.

Notwithstanding the endeavours of some historians to conceal what they cannot deny, I mean the glories of this reign, it yet appears, that David was one of the greatest princes of his age, whether we regard him as a man, a warrior, or a legislator. The noble actions he performed in the service of his niece, the empress Maud, in her competition with king Stephen for the

English crown, give us the highest idea of his virtues, as they could be the result only of duty and principle. To him Henry II. the mightiest prince of his age, owed his crown; and his possessions in England, joined to the kingdom of Scotland, placed David's power nearly on an equality with that of England, when confined to this island. His actions and adventures, and the resources he always found in his own courage, prove him to have been a hero of the first rank. If he appeared to be too lavish to churchmen, and in his religious endowments, we are to consider these were the only means by which he could then civilize his kingdom; and the code of laws I have already mentioned to have been drawn up by him, do his memory immortal honour. They are said to have been compiled under his inspection by learned men, whom he assembled from all parts of Europe in his magnificent abbey of Melros. He was succeeded by his grandson Malcolm IV. and he by William, surnamed from his valour, The Lion. William's son Alexander II. was succeeded in 1249, by Alexander III. who was a good king. He married, first, Margaret daughter to Henry III. of England; by whom he had Alexander, the prince who married the earl of Flanders' daughter; David and Margaret, who married Hangowan, or, as some call him, Eric, son to Magnus IV. king of Norway, who bore to him a daughter named Margaret, commonly called the Maiden of Norway; in whom king William's whole posterity failed, and the crown of Scotland returned to the descendants of David earl of Huntingdon, brother to king Malcolm IV. and king William.

I have been the more particular in this detail, because it was productive of great events. Upon the death of Alexander III. John Baliol, who was great-grandson to David earl of Huntingdon, by his eldest daughter Margaret, and Robert Bruce (grandfather to the great king Robert Bruce) grandson to the same earl of Huntingdon, by his youngest daughter Isabel, became competitors for the crown of Scotland. The laws of succession, which were not then so well established in Europe as they are at present, rendered the case very difficult. Both parties were almost equally matched in interest; but after a confused interregnum of some years, the great nobility agreed in referring the decision to Edward I. of England, the most politic, ambitious prince of his age. He accepted the office of arbiter: but having long had an eye to the crown of Scotland, he revived some obsolete absurd claims of its dependency upon that of England; and finding that Baliol was disposed to hold it by that disgraceful tenure, Edward awarded it to him; but afterwards dethroned him, and treated him as a slave, without Baliol's resenting it.

After this Edward used many endeavours to annex their crown to his own which were often defeated, and though Edward for a short time made himself master of Scotland, yet the Scots were ready to revolt against him on every favourable opportunity. Those of them who were so zealously attached to the independency of their country, as to be resolved to hazard every thing for it, were indeed but few compared to those in the interest of Edward and Baliol, which was the same; and for some time they were obliged to temporize. Edward availed himself of their weakness and his own power. He accepted of a formal surrender of the crown of Baliol, to whom he allowed a pension, but detained him in England and sent every nobleman in Scotland, whom he in the least suspected, to different prisons in or near London. He then forced the Scots to sign instruments of their subjection to him; and most barbarously carried off or destroyed all the monuments of their history, and the evidences of their independency; and

particularly the famous fatical or prophetic stone, which is still to be seen in Westminster-Abbey.

These severe proceedings, while they rendered the Scots sensible of their slavery, revived in them the ideas of their freedom; and Edward finding their spirits were not to be subdued, endeavoured to caress them, and affected to treat them on a footing of equality with his own subjects, by projecting an union, the chief articles of which have since taken place between the two kingdoms. The Scotch patriots treated this project with disdain, and united under the brave William Wallace, the truest hero of his age, to expel the English. Wallace performed actions that entitled him to eternal renown, in executing this scheme. Being however no more than a private gentleman, and his popularity daily encreasing, the Scotch nobility, among whom was Robert Bruce, the son of the first competitor, began to suspect that he had an eye upon the crown, especially after he had defeated the earl of Surry, Edward's viceroy of Scotland, in the battle of Stirling, and had reduced the garrisons of Berwick and Roxburgh, and was declared by the states of Scotland their protector. Their jealousy operated so far, that they formed violent cabals against the brave Wallace. Edward, upon this, once more invaded Scotland, at the head of the most numerous and best disciplined army England had ever seen, for it consisted of 80,000 foot, 3000 horsemen completely armed, and 4000 light armed; and was attended by a fleet to supply it with provisions. These, besides the troops who joined him in Scotland, formed an irresistible body: Edward, however, was obliged to divide it, reserving the command of 40,000 of his best troops to himself. With these he attacked the Scotch army under Wallace at Falkirk, while their disputes ran so high, that the brave regent was deserted by Cumming, the most powerful nobleman in Scotland, and at the head of the best division of his countrymen, Wallace, whose troops did not exceed 30,000, being thus betrayed, was defeated with vast loss, but made an orderly retreat; during which he found means to have a conference with Bruce, and to convince him, of his error in joining with Edward. Wallace still continued in arms, and performed many gallant actions against the English; but was betrayed into the hands of Edward, who most ungenerously put him to death at London, as a traitor; but he died himself as he was preparing to renew his invasion of Scotland with a still more desolating spirit of ambition, after having destroyed 100,000 of her inhabitants.

Bruce died soon after the battle of Falkirk; but not before he had inspired his son, who was a prisoner at large about the English court, with the glorious resolution of vindicating his own rights, and his country's independency. He escaped from London, and with his own hand killed Cumming, for his attachment to Edward; and after collecting a few patriots, among whom were his own four brothers, he assumed the crown, but was defeated by the English, who had a great army in Scotland, at the battle of Methven. After his defeat, he fled with one or two friends to the Western isles, and parts of Scotland, where his fatigues and sufferings were as inexpresible as the courage with which he and his few friends bore them (the lord Douglas especially) was incredible. Though his wife and daughters were sent prisoners to England, where the best of his friends and two of his brothers were put to death, yet such was his persevering spirit that he recovered all Scotland, excepting the castle of Stirling, and improved every advantage that was given him by the dissipated conduct of Edward II. who raised an army more numerous and better appointed still than that of his father, to make total conquest of Scotland. It is said that it consisted of 100,000 men, though this has been supposed to be an exaggerated computation: however it is admitted that the

army of Bruce did not exceed 30,000; but all of them heroes, who had been bred up in a detestation of tyranny.

Edward, who was not deficient in point of courage, led this mighty host towards Stirling, then besieged by Bruce: who had chosen with the greatest judgment, a camp near Bannockburn. The chief officers under Edward were, the earls of Gloucester, Hereford, Pembroke, and Sir Giles Argenton. Those under Bruce were, his own brother Sir Edward, who next to himself, was reckoned to be the best knight in Scotland, his nephew Randolph earl of Murray, and the young lord Walter, high steward of Scotland. Edward's attack of the Scotch army was exceedingly furious, and required all the courage and firmness of Bruce and his friends to resist it, which they did so effectually, that they gained one of the most complete victories that is recorded in history. The great loss of the English fell upon the bravest part of their troops, who were led on by Edward in person against Bruce himself. The Scotch writers make the loss of the English to amount to 50,000 men. As that as it will, there certainly never was a more total defeat, though the conquerors lost 4000. The flower of the English nobility were either killed or taken prisoners. Their camp, which was immensely rich, and calculated for the purpose rather of a triumph than a campaign, fell into the hands of the Scots; and Edward himself with a few followers, favoured by the goodness of their horses, were pursued by Douglas to the gates of Berwick, from whence he escaped in a fishing-boat. This great and decisive battle happened in the year 1314.

The remainder of Robert's reign was a series of the most glorious successes; and so well did his nobility understand the principles of civil liberty, and so unfettered were they by religious considerations, that in a letter they sent to the pope, they acknowledged that they had set aside his holiness for debasing the crown by holding it of England; and that they would do the same by Robert, if he should make the like attempt. Robert having thus delivered Scotland, sent his brother Edward to Ireland, at the head of an army, with which he conquered the greatest part of that kingdom, and was proclaimed its king; but by exposing himself too much, he was killed. Robert, before his death, which happened in 1329, made an advantageous peace with England; and when he died, he was acknowledged to be indisputably the greatest hero of his age.

The glory of the Scots may be said to have been in its zenith under Robert I. who was succeeded by his son David II. He was a virtuous prince, but his abilities, both in war and peace, were eclipsed by his brother-in-law and enemy Edward III. of England, whose sister he married. Edward, who was as keen as any of his predecessors, upon the conquest of Scotland, espoused the cause of Baliol, son to Baliol, the original competitor. His progress was at first amazingly rapid; and he and Edward defeated the royal party in many bloody battles; but Baliol was at last driven out of his usurped kingdom by the Scotch patriots. David had the misfortune to be taken prisoner by the English at the battle of Durham; and after continuing above eleven

years in captivity, he was better acquainted with Mara than the Muse, may be seen from a Scottish ballad, made on this memorable victory, which begins as follows:

Maydens of England fare may ye mourn,
For your semmons now have left at Bannockburn,
With hewe a low.
What hal' weneid the king of England,
Suficoun to have won all Scotland.
With rummy ley.

years in captivity, he paid 100,000 marks for his ransom; and died in peace without issue, in the year 1371.

The crown of Scotland then devolved upon the family of Stuart, by its head having been married to the daughter of Robert I. The first king of that name was Robert II. a wise and brave prince. He was succeeded by his son Robert III. whose age and infirmities disqualified him from reigning; so that he was forced to trust the government to his brother, the duke of Albany, an ambitious prince, who seems to have had an eye to the crown for his own family. Robert, upon this, attempted to send his second son to France; but he was most ungenerously intercepted by Henry IV. of England; and, after suffering a long captivity, he was obliged to pay an exorbitant ransom. During the imprisonment of James, in England, the military glory of the Scots was carried to its greatest height in France, where they supported that tottering monarchy against England, and their generals obtained some of the first titles of the kingdom.

James, the first of that name, upon his return to Scotland, discovered great talents for government, enacted many wise laws, and was beloved by the people. He had received an excellent education in England during the reigns of Henry IV. and V. where he saw the feudal system refined from many of the imperfections which still adhered to it in his own kingdom; he determined therefore to abridge the overgrown power of the nobles; and to recover such lands as had been unjustly wrested from the crown during his minority and the preceding reigns; but the execution of these designs cost him his life; he being murdered in his bed by some of the chief nobility in 1437, and the 44th year of his age.

His long minority succeeded by James II. would probably have equalled the greatest of his ancestors both in warlike and civil virtues, had he not been suddenly killed by the accidental bursting of a cannon, in the thirteenth year of his age, as he was besieging the castle of Roxburgh, which was defended by the English.

Suspicion, indolence, immoderate attachment to females, and many of the errors of a female mind, are visible in the conduct of James III. and his turbulent reign was closed by a rebellion of his subjects, being slain in battle in 1488; aged thirty-five.

His son, James IV. was the most accomplished prince of the age; he was naturally generous and brave: he loved magnificence, he delighted in war, and was eager to obtain fame. He encouraged and protected the commerce of his subjects, so that they greatly increased in riches; and the court of James, at the time of his marriage with Henry VII.'s daughter, was splendid and respectable. Even this alliance could not cure him of his family distemper, a predilection for the French, in whose cause he rashly entered, and was killed, with the flower of his nobility, by the English, in the battle of Flodden, anno 1513; and the fortieth year of his age.

The minority of his son, James V. was long and turbulent; and when he grew up, he married two French ladies; the first being daughter to the king of France, and the latter of the house of Guise. He instituted the court of session, enacted many salutary laws, and greatly promoted the trade of Scotland, particularly the working of the mines. At this time the balance of power was so equally poised between the contending princes of Europe, that James's friendship was courted by the pope, the emperor, the king of France, and his uncle, Henry VIII. of England, from all whom he received magnificent presents. But James took little share in foreign affairs; he seemed rather to imitate his predecessors in their attempts to humble the nobility; and the

doctrines of the Reformation beginning to be propagated in Scotland, he gave way, at the instigation of the clergy, to a religious persecution, though it is generally believed that had he lived longer, he would have seized all the church revenues, in imitation of Henry. However, having rather slighted some friendly overtures made to him by the king of England, and thereby given great umbrage to that prince, a war at length broke out between them. A large army under the command of the duke of Norfolk, entered Scotland and ravaged the country north of the Tweed. After this short expedition, the English army retired to Berwick. Upon this the king of Scotland, sent ten thousand men to the western borders, who entered England, at Solway Frith; and he himself followed them at a small distance ready to join them upon occasion. But he soon after gave great offence to the nobility and the army, by imprudently depriving their general, lord Maxwell, of his commission, and conferring the command on Oliver Sinclair, a private gentleman, who was his favourite. The army were so much disgusted with this alteration, that they were ready to disband, when a small body of English horse appeared, not exceeding five hundred. A panic seized the Scots, who immediately took to flight, supposing themselves to be attacked by the whole body of the English army. The English horse, seeing them flee with such precipitation, closely pursued them, and slew great numbers, taking prisoners seven lords, two hundred gentlemen, and eight hundred soldiers, with twenty-four pieces of ordnance. This disaster so much affected king James, that it threw him into a fit of illness, of which he soon after died on the 14th of December, 1542.

His daughter and successor, Mary, was but a few hours old at the time of her father's death. Her beauty, her imprudence, and her misfortunes are alike famous in history. It is sufficient here to say, that during her minority, and while she was wife to Francis II. of France, the Reformation advanced in Scotland: that being called to the throne of her ancestors while a widow, she married her own cousin-german, the lord Darnley, whose untimely death hath given rise to so much controversy. The consequence of her husband's death, and of her marriage with Bothwell, who was considered as his murderer, was an insurrection of her subjects, from whom she fled into England, where she was ungenerously detained a prisoner for eighteen years; and afterwards, on motives of state policy, beheaded by queen Elizabeth in 1587, in the forty-sixth year of her age.

Mary Mon, James VI. of Scotland, succeeded, in right of his blood from Henry VII. upon the death of queen Elizabeth, to the English crown, after shewing considerable abilities in the government of Scotland. This union of the two crowns, in fact, destroyed the independency, as it impoverished the people of Scotland; for the seat of government being removed to England, their trade was checked, their agriculture neglected, and their gentry obliged to seek for bread in other countries. James, after a splendid, but troublesome reign over his three kingdoms, left them in 1625, to his son, the unfortunate Charles I. That prince, by his despotic principles and conduct, induced both his Scottish and English subjects to take up arms against him; and indeed, it was in Scotland that the sword was first drawn against Charles. But when the royal party was totally defeated in England, the king put himself into the powers of the Scottish army; they at first treated him with respect, but afterwards delivered him up to the English parliament, on condition of their paying 400,000 pounds to the Scots, which was paid to be due to them for arrears. However, the Scots afterwards made several bloody but unsuccessful attempts, to restore his son Charles II. That prince

price was finally defeated by Cromwell, at the battle of Worcester, 1651, after which, to the time of his restoration, the commonwealth of England and the protector gave law to Scotland. I have, in another place, touched on the most material parts of Charles's reign, and that of his deluded brother, James VII. of Scotland, and II. of England, as well as of King William, who was so far from being a friend to Scotland, that, relying on his royal word to her parliament, she was brought to the brink of ruin.

The state of parties in England at the accession of Queen Anne, was such, that the Whigs once more had recourse to the Scots, and offered them their own terms, if they would agree to the incorporate Union as it now stands. It was long before the majority of the Scotch parliament would listen to the proposal; but, at last, partly from conviction, and partly through the force of money distributed among the needy nobility, it was agreed to; since which great the history of Scotland becomes the same with that of England.

ENGLAND.

SITUATION AND EXTENT.

Miles.	Degrees.
Length 320 } between { 50 and 56 North latitude.	
Breadth 200 } { 2 East and 6-20 West longitude.	

Great Britain contains 79,712 square miles, with 19 inhabitants to each.

CLIMATE AND BOUNDARIES. } THE longest day in the northern part contains 17 hours 30 minutes; and the shortest in the southern near eight hours. It is bounded on the north by that part of the island called Scotland; on the East by the German ocean; on the West by St. George's Channel; and on the South by the English Channel, which parts it from France, and contains 49,450 square miles.

The situation, by the sea washing it on three sides, renders England liable to a great uncertainty of weather, so that the inhabitants on part of the sea-coasts are often visited by agues and fevers. On the other hand, it prevents the extremes of heat and cold, to which other places, lying in the same degree of latitude, are subject; and it is, on that account, friendly to the longevity of the inhabitants in general, especially those who live on a dry soil. To this situation likewise we are to ascribe that perpetual verdure for which England is remarkable, occasioned by refreshing showers and the warm vapours of the sea.

NAME AND DIVISIONS. } Antiquaries are divided with regard to the ANCIENT AND MODERN; } etymology of the word *England*; some derive it from a Celtic word, signifying a level country; but I prefer the common etymology of its being derived from Anglen, a province now subject to his Danish majesty, which furnished a great part of the original Saxon adventurers into this island. In the time of the Romans the whole island went by the name of *Britannia*. The word *Brit*, according to Mr. Camden, signified painted or stained; the ancient inhabitants being famous for painting their bodies; other antiquaries, however, do not agree in this etymology. The western tract of England, which is almost separated from the rest of the river Severn

and Dee, is called Wales, or the *land of strangers*, because inhabited by the Belgic Gauls, who were driven thither by the Romans, and were strangers to the old natives.

When the Romans provinciated England, they divided it into,

1. Britannia Prima, which contained the southern parts of the kingdom.
2. Britannia Secunda, containing the western parts, comprehending Wales.
3. Maxima Cæsariensis, which reached from the Trent as far northward as the wall of Severus, between Newcastle and Carlisle, and sometimes as far as that of Adrian in Scotland, between the Forth and Clyde.

To these divisions some add the Flavia Cæsariensis, which they suppose to contain the midland counties.

When the Saxons invaded England about the year 550, and when they were established in the year 582, their chief leaders appropriated to themselves, after the manner of the other northern conquerors, the countries which each had been the most instrumental in conquering; and the whole formed a heptarchy, or political republic, consisting of seven kingdoms: But in time of war, a chief was chosen out of the seven kingdoms; for which reason I call it a political republic, its constitution greatly resembling that of ancient Greece.

Kingdoms erected by the Saxons, usually styled the Saxon Heptarchy.

I have been the more solicitous to preserve these divisions, as they account for different local customs, and many very essential modes of inheritance, which to this day prevail in England, and which took their rise from different institutions under the Saxons. Since the Norman invasion, England has been divided into counties, a certain number of which, excepting Middlesex and Cheshire, are comprehended in six circuits, or annual progresses of the judges, for administering justice to the subjects who are at a distance from the Capital. The circuits are:

Circuits.

Counties.

Chief Towns.

1. Home Circuit	Essex	Chelmsford, Colchester, Harwich, Malden, Saffron-Walden, Bocking, Braintree, and Stratford.
	Hertford	Hertford, St. Albans, Ware, Hitchin, Baldock, Bishop's-Stortford, Berkhamsted, Hemsted, and Barnet.
	Kent	Maidstone, Canterbury, Chatham, Rochester, Greenwich, Woolwich, Dover, Deal, Deptford, Feverham, Dartford, Romney, Sandwich, Sheerness, Tunbridge, Margate, Gravesend, and Milton.
	Surry	Southwark, Kingston, Guildford, Croydon, Epsom, Richmond, Wandsworth, Battersea, Putney, Farnham, Godalmin, Bagshot, Egham, and Dorking.
	Suffex	Chichester, Lewes, Rye, East Grinstead, Hastings, Horsham, Midhurst, Shoreham, Arundel, Winchelsea, Basset, BRIGHTHELMSTONE, and Petworth.

Circuits.	Counties.	Chief Towns.
1. Norfolk Circuit.	Ducks	Aylesbury, Buckingham, High-Wickham, Great-Marlow, Stoney Stratford, and Newport Pagnel.
	Bedford	Bedford, Amptill, Woodburn, Dunstable, Luton, and Biggleswade.
	Huntingdon	Huntingdon, St. Ives, Kimbolton, Godmanchester, St. Neot's Ramsey, and Yaxley.
	Cambridge	Cambridge, Ely, Newmarket, Royston, and Wisbech.
	Suffolk	Bury, Ipswich, Sudbury, Leostoff, part of Newmarket, Aldborough, Bungay, Southwold, Brandon, Halesworth, Mildenhall, Beccles, Framlingham, Stow-market, Wood-Bridge, Lavenham, Hadley, Long-Melford, Stratford, and Easterbergholt.
	Norfolk	Norwich, Thetford, Lynn, Yarmouth.
	Oxon	Oxford; Banbury, Chippin-Norton, Henley, Burford, Whitney, Dorchester, Woodstock, and Thame.
	Berks	Abingdon, Windsor, Reading, Wallingford, Newbury, Hungerford, Maidenhead, Farringdon, Wantage, and Oakingham.
	Gloucester	Gloucester, Tewksbury, Cirencester, part of Bristol, Campden, Stow, Berkley, Dursley, Lechdale, Tetbury, Sudbury, Wotton, & Marshfield.
	Worcester	Worcester, Evesham, Droitwich, Bewdly, Stourbridge, Kidderminster, and Pershore.
2. Oxford Circuit.	Monmouth	Monmouth, Chepstow, Abergavenny, Caerleon, and Newport.
	Hereford	Hereford, Leominster, Weobly, Ledbury, Kyneton, and Ross.
	Salop	Shrewsbury; Ludlow, Bridgnorth, Wenlock, Bishop's Castle, Whit-Church, Oswestry, Wem, and Newport.
	Stafford	Stafford, Litchfield, Newcastle under Line, Wolverhampton, Rugeley, Burton, Uttoxeter, and Stone.
	Warwick	Warwick, Coventry, Birmingham, Stratford upon Avon, Tamworth, Aulcester, Nuneaton, and Ather-ton.
	Leicester	Leicester, Melton-Mowbray, Ashby de-la-Zouch, Bosworth, and Ha-borough

Circuits.	Counties.	Chief Towns.
4. Midland Circuit.	Derby	Derby, Chesterfield, Winkworth, Ashbourne, Bakewell, Balfover, and Buxton.
	Nottingham	Nottingham, Southwell, Newark, East and West Retford, Mansfield, Tuxford, Workop, and Blithe.
	Lincoln	Lincoln, Stamford, Boston, Grantham, Croyland, Spalding, New Sleaford, Great Grimsby, Gainborough, Louth, and Horncastle.
	Rutland	Oakham and Uppingham.
	Northampton	Northampton, Peterborough, Daventry, Higham-Ferrers, Brackley, Oundle, Wellingborough, Thrapston, Towcester, Rockingham, Kettering, and Rothwell.
	Hants	Winchester, Southampton, Portsmouth, Andover, Basingstoke, Christchurch, Petersfield, Lymington, Ringwood, Rumsey, Arleford: and Newport, Yarmouth, and Cowes, in the Isle of Wight.
5 Western Circuit	Wilt	Salisbury, Devizes, Marlborough, Malmesbury, Wilton, Chippenham, Calne, Cricklade, Trowbridge, Bradford, and Warminster.
	Dorset	Dorchester, Lyme, Sherborne, Shaftesbury, Poole, Blandford, Bridport, Weymouth, Melcombe, Wareham, and Winburn.
	Somerset	Bath, Wells, Bristol in part, Taunton, Bridgewater, Ilchester, Minehead, Milbourn-Port, Glastonbury, Wellington, Dulverton, Dunster, Watchet, Yeovil, Somerton, Axbridge, Chard, Bruton, Shepton Mallet, Croscomb, and Froome.
	Devon	Exeter, Plymouth, Barnstable, Bideford, Tiverton, Honiton, Dartmouth, Tavistock, Topsham, Okehampton, Ashburton, Crediton, Moulton, Torrington, Totnes, Axminster, Plympton, and Ilfracomb.
	Cornwall	Launceston, Falmouth, Truro, Saltash Bodmyn, St. Ives, Padstow, Tregony, Fowey, Penryn, Kelington, Leskard, Lestwiell, Helston, Penzance, and Redruth.

Total 558

Besides the 52 counties into which England and Wales are divided, there are counties corporate, consisting of certain districts, to which the liberties and jurisdictions peculiar to a county have been granted by royal charter. Thus the city of London is a county distinct from Middlesex; the cities of York, Chester, Bristol, Exeter, Norwich, Worcester, and the towns of Kingston upon Hull and Newcastle upon Tyne, are counties of themselves, distinct from those in which they lie. The same may be said of Berwick upon Tweed, which lies in Scotland, and hath within its jurisdiction a small territory of two miles on the north side of the river.

Under the name of a town, boroughs and cities are contained: for every

borough or city is a town, though every town is not a borough or city. A borough is so called, because it sends up burgesses to parliament; and this makes the difference between a village or town, and a borough. Some boroughs are corporate, and some not corporate; and though decayed, as Old Sarum, they still send burgesses to parliament. A city is a corporate borough, that hath had, or at present hath, a bishop; for if the bishoprick be dissolved, yet the city remains. To have suburbs prove it to be a city. Some cities are also counties, as before mentioned.

SOIL, AIR SEASONS, AND WATER.] The soil of England and Wales differs in each county, not so much from the nature of the ground, though that must be admitted to occasion a very considerable alteration, as from the progress which the inhabitants of each county have made in the cultivation of lands and gardens, the draining of marshes, and many other local improvements, which are here carried to a much greater degree of perfection than they are perhaps in any other part of the world, if we except China. To enter upon particular specimens and proofs of these improvements, would require a large volume. All that can be said therefore is in general, that if no unkindly season happen, England produces corn, not only sufficient to maintain her own inhabitants, but to bring large sums of ready money for her exports.

The soil of England seems to be particularly adapted for rearing timber; and the plantations of trees round the houses of noblemen and gentlemen, and even of peasants, is delightful and astonishing at the same time. Some have observed a decay of that oak timber which anciently formed the great fleets that England put to sea, but as no public complaints of this kind have been heard, it may be supposed that great stores are still in reserve; unless it may be thought that our ships-yards have lately been partly supplied from America, or the Baltic.

As to air, I can add but little to what I have already said concerning the climate*. In many places it is certainly loaded with vapours wafted from the Atlantic Ocean by westerly winds; but they are ventilated by winds and storms, so that in this respect England is to foreigners, and people of delicate constitutions, more disagreeable than unsalubrious. It cannot, however, be denied that in England the weather is so excessively capricious and unfavourable to certain constitutions, that many of the inhabitants are induced to fly to foreign countries, in hopes of obtaining a renovation of their health.

After what we have observed in the English air, the reader may form some idea of its seasons which are so uncertain, that they admit of no description, Spring, summer, autumn, and winter, succeed each other, but in what month

* The climate of England has more advantages than are generally allowed it, if we admit the opinion of king Charles the Second upon this subject, which is corroborated by that of Sir William Temple; and it may be observed, that they were both travellers. "I must needs add one thing (says Sir William, in his Miscellanea, part ii. p. 11, edit. 8vo. 1690) in favour of our climate, which I heard the king say, and I thought new and right, and truly like a king of England, that loved and esteemed his own country. It was in reply to some company that were reviling our climate, and extolling those of Italy and Spain, or at least of France. He said, He thought that was the best climate where he could be abroad, in the air with pleasure, or at least without trouble or inconvenience, the most days in the year, and the most hours in the day; and this he thought he could be in England, more than in any country he knew in Europe." "And I believe (adds Sir William) it is true, not only of the hot and the cold, but even among our neighbours in France and the Low Countries themselves, where the heats or the colds, and changes of seasons are less treatable (or moderate) than they are with us."

their different appearances take place is very undetermined. The spring begins sometimes in February, and sometimes in April. In May the face of the country is often covered with hoary frost instead of blossoms. The beginning of June is sometimes as cold as in the middle of December, yet at other times the thermometer rises in that month as high as it does in Italy. Even August has its vicissitudes of heat and cold, and upon an average September, and next to it October, are the two most agreeable months in the year. The natives sometimes experience all the four seasons within the compass of one day, cold, temperate, hot, and mild weather. After saying thus much, it would be in vain to attempt any farther description of the English seasons. Their inconstancy, however, is not attended with the effects that might be naturally apprehended. A fortnight, or at most three weeks, generally make up the difference with regard to the maturity of the fruits of the earth: and it is hardly ever observed that the inhabitants suffer by a hot summer. Even the greatest irregularity, and the most unfavourable appearance of the seasons, are not, as in other countries, attended with famine, and very seldom with scarcity. Perhaps this, in a great measure, may be owing to the vast improvements of agriculture, for when scarcity has been complained of, it generally, if not always, proceeded from the excessive exportations of grain on account of the drawback, and the profit of the returns.

In speaking of water, I do not include rivers, brooks, or lakes; I mean waters for the common convenience of life, and those that have mineral qualities. The champaign parts of England are generally supplied with excellent springs and fountains; though a discerning palate may perceive, that they frequently contain some mineral impregnation. In some very high lands, the inhabitants are distressed for water, and supply themselves by trenches, or digging deep wells. The constitutions of the English, and the diseases to which they are liable, have rendered them extremely inquisitive after salubrious waters, for the recovery and preservation of their health; so that England contains as many mineral wells, of known efficacy, as perhaps any country in the world. The most celebrated are the hot-baths of Bath and Bristol in Somersetshire, and of Buxton and Matlock in Derbyshire; the mineral waters of Tunbridge, Epsom, Harrowgate, and Scarborough. Sea-water is used as commonly as any other for medical purposes; and so delicate are the tones of the English fibres, that the patients can perceive, both in drinking and bathing, a difference between the sea-water of one coast and that of another.

FACE OF THE COUNTRY } AND MOUNTAINS: } The industry of the English is such, as to supply the absence of those favours which nature has so lavishly bestowed upon some foreign climates, and in many respects even to exceed them. No nation in the world can equal the cultivated parts of England in beautiful scenes. The variety of high-lands and low lands, the former generally swelling, and both of them forming prospects equal to the most luxuriant imagination, the corn and meadow ground, the intermixtures of enclosures and plantation, the noble seats, comfortable houses, cheerful villages, and well-stocked farms, often rising in the neighbourhood of populous towns and cities, decorated with the most vivid colours of nature, are inexpressible. The most barren spots are not without their verdure; but nothing can give us a higher idea of the English industry than observing that some of the pleasantest counties in the kingdom are naturally the most barren, but rendered fruitful by labour. Upon the whole, it may be safely affirmed, that no country in Europe equals England in the beauty of its prospects, or the opulence of its inhabitants.

Though England is full of delightful rising grounds, and the most enchanting slopes, yet it contains few mountains. The most noted are the Peak in Derbyshire, the Endle in Lancashire, the Wolds in Yorkshire, the Cheviot-hills on the borders of Scotland, the Chiltern in Bucks, Malvern in Worcester-shire, Cotswould in Gloucestershire, the Wrekin in Shropshire; with those of Plinlimonia and Snowdon in Wales. In general however Wales and the northern parts may be termed mountainous.

RIVERS AND LAKES.] The rivers in England add greatly to its beauty as well as its opulence. The Thames, the noblest perhaps in the world, rises on the confines of Gloucestershire, a little S. W. of Cirencester; and after receiving the many tributary streams of other rivers, it passes to Oxford, then by Abingdon, Wallingford, Marlow, and Windsor. From thence to Kingston, where formerly it met the tide, which, since the building of Westminster-bridge, is said to flow no higher than Richmond; from whence it flows to London, and after dividing the counties of Kent and Essex, it widens in its progress, till it falls into the sea at the Nore, from whence it is navigable for large ships to London-bridge: but for a more particular description the reader must consult the map. It was formerly a matter of reproach to England among foreigners, that so capital a river should have so few bridges; those of London and Kingston being the only two it had, from the Nore to the last mentioned place, for many ages. This inconveniency was in some measure owing to the dearness of materials for building stone bridges; but perhaps more to the fondness which the English, in former days, had for water-carriage, and the encouragement of navigation. The great increase of riches, commerce, and inland trade is now multiplying bridges, and the world cannot parallel for commodiousness, architecture, and workmanship, those lately erected at Westminster and Black Friars: Battersea, Putney, Kew, Richmond, Walton, and Hampton-court, have now bridges likewise over the Thames, and others are projecting by public-spirited proprietors of the grounds on both sides.

The river Medway, which rises near Tunbridge, falls into the Thames at Sheerness, and is navigable for the largest ships as far as Chatham. The Severn, reckoned the second river for importance in England, and the first for rapidity, rises at Plinlimmon-hill in North Wales; becomes navigable at Welsh-pool; runs east to Shrewsbury; then turning south, visits Bridgenorth, Worcester, and Tewkesbury, where it receives the Upper Avon; after having passed Gloucester, it takes a south-west direction; is near its mouth increased by the Wye and Ustre, and discharges itself into the Bristol Channel, near King-road; and there lie the great ships which cannot get up to Bristol. The Trent rises in the Moorlands of Staffordshire, and running south-east by Newcastle-under-Line, divides that county into two parts; then turning north-east on the confines of Derbyshire, visits Nottingham, running the whole length of that county to Lincolnshire, and being joined by the Ouse, and several other rivers towards the mouth, obtains the name of the Humber, falling into the sea south-east of Hull.

The other principal rivers in England, are the Ouse (a Gaelic word signifying *water* in general), which falls into the Humber, after receiving the water of many other rivers. Another Ouse rises in Bucks, and falls into the sea near Lynn in Norfolk. The Tyne runs from west to east through Northumberland, and falls into the German sea at Tinmouth, below Newcastle. The Tees runs from west to east, dividing Durham from Yorkshire, and falls into the German sea below Stockton. The Tweed runs from west to east on the borders of Scotland, and falls into the German sea at Ber-

wick. The Eden runs from south to the north through Westmorland and Cumberland, and passing by Carlisle, falls into the Solway Frith below that city. The Lower Avon runs west through Wiltshire to Bath, and then dividing Somersetshire from Gloucestershire, runs to Bristol, falling into the mouth of the Severn below that city. The Derwent, which runs from east to west through Cumberland, and passing by Cockermouth, falls into the Irish sea a little below. The Ribble, which runs from east to west through Lancashire, and passing by Preston, discharges itself into the Irish sea. The Mersey, which turns from the south-east to the north-west through Cheshire, and then dividing Cheshire from Lancashire, passes by Liverpool, and falls into the Irish sea a little below that town; and the Dee rises in Wales, and divides Flintshire from Cheshire, falling into the Irish Channel below Chester.

The lakes of England are few; though it is plain from history and antiquity, and indeed, in some places from the face of the country, that meres and fens have been frequent in England, till drained and converted into arable land. The chief lakes remaining, are Soham mere, Wittlesea mere, and Ramfay mere, in the isle of Ely, in Cambridgehire. All these meres in a rainy season are overflowed, and form a lake of 40 or 50 miles in circumference. Winader mere lies in Westmoreland, and some small lakes in Lancashire go by the name of Derwent waters.

FORESTS.] The first Norman kings of England, partly for political purposes, that they might the more effectually enslave their new subjects, and partly from the wantonness of power, converted immense tracts of grounds into forests for the benefit of hunting, and these were governed by laws peculiar to themselves: so that it was necessary, about the time of passing the Magna Charta, to form a code of the forest-laws; and justices in Eyre, so called from their sitting in the open air, were appointed to see them observed. By degrees those vast tracts were disforested, and the chief forests, properly so called, remaining out of no fewer than 69, are those of Windsor, New Forest, the Forest of Dean, and Sherwood Forest. Those forests produced formerly great quantities of excellent oak, elm, ash, and beech, besides walnut-trees, poplar, maple, and other kinds of wood. In ancient times England contained large woods, if not forests, of chefnut-trees, which exceeded all other kinds of timber, for the purposes of building, as appears from many great houses still standing, in which the chefnut beams and roofs remain still fresh, and undecayed, though some of them above 600 years old.

METALS AND MINERALS.] Among the minerals, the tin mines of Cornwall deservedly take the lead. They were known to the Greeks and Phenicians, the latter especially, some ages before that of the Christian Era; and since the English have found the method of manufacturing their tin into plates, and white iron, they are of immense benefit to the nation. An ore called Mundie is found in the beds of tin, which was very little regarded, till above 70 years ago, Sir Gilbert Clark discovered the art of manufacturing it, and it is said now to bring in 150,000. a year, and to equal in goodness the best Spanish copper, yielding a proportionable quantity of lapis calaminaris for making brals. Those tin-works are under peculiar regulations, by what are called the stannary laws, and the miners have parliaments and privileges of their own, which are in force at this time. The number of Cornish miners alone is said to amount to 100,000. Some gold has likewise been discovered in Cornwall, and the English lead is impregnated with silver. The English coined silver is particularly known by roses, and that of Wales by that prince's cap of feathers. Devonshire, and other counties

of England, produce marble, but the best kind, which resembles Egyptian granite, is excessively hard to work. Quarries of freestone are found in many places. Northumberland and Cheshire yield allum and salt pits. The English fullers earth is of such infinite consequence to the cloathing trade, that its exportation is prohibited under the severest penalties. Pit and sea coal is found in many counties of England, but the city of London, to encourage the nursery of seamen, is chiefly supplied from the pits of Northumberland, and the bishopric of Durham. The cargoes are shipped at Newcastle and Sunderland, and the exportation of coals to other countries, is a valuable article.

VEGETABLE AND ANIMAL PRO- } This is so copious an article, and
DUCTIONS BY SEA AND LAND. } such improvements have been made in
gardening and agriculture, ever since the best printed accounts we have had
of both, that much must be left to the reader's own observation and experi-
ence. I have already touched, in treating on the soil, upon the corn trade of
England, but nothing can be said with any certainty concerning the quan-
tities of wheat, barley, rye, peas, beans, vetches, oats, and other horse grain
growing in the kingdom. Excellent institutions for the improvement of
agriculture, are now common in England, and their members are so public
spirited as to print periodical accounts of their discoveries and experiments,
which serve to shew that both agriculture and gardening can admit to be
carried to a much higher state of perfection, than they are in at present.
Honey and saffron are natives of England. It is almost needless to mention
to the most uninformed reader, in what plenty the most excellent fruits,
apples, pears, plums, cherries, peaches, apricots, nectarines, currants, goose-
berries, raspberries, and other hortulane productions, grow here, and what vast
quantities of cyder, perry, metheglin, and the like liquors, are made in some
counties. The cyder, when kept, and made of proper apples, and in a par-
ticular manner, is often preferred, by judicious palates, to French white wine.
It is not enough to mention those improvements, did we not observe that
the natives of England have made the different fruits of all the world their
own, sometimes by simple culture, but often by hot beds, and other means
of forcing nature. The English pine-apples are delicious, and now plentiful.
The same may be said of other natives of the East and West Indies, Persia
and Turkey. The English grapes are pleasing to the taste, but their flavour
is not exalted enough for making of wine, and indeed wet weather injures the
flavour of all the other fine fruits raised here. Our kitchen gardens abound
with all sorts of greens, roots, and sallads, in perfection, such as artichokes,
asparagus, cauliflowers, cabbages, coleworts, brocoli, peas, beans, kidney
beans, spinage, beets, lettuce, cellary, endive, turnips, carrots, potatoes, mush-
rooms, leeks, onions and shallots.

Woad for dying is cultivated in Bucks and Bedfordshire, as hemp and
flax as in other counties. In nothing, however, have the English been more
successful, than in the cultivation of clover, cinquefoil, trefoil, saintfoin,
lucern, and other meliorating grasses for the soil. It belongs to a botanist to
recount the various kinds of useful and salutary herbs, shrubs, and roots, that
grow in different parts of England. The soil of Kent, Essex, Surry, and
Hampshire, is most favourable to the difficult and tender culture of hops,
which is now become a very considerable article of trade.

With regard to animal productions, I shall begin with the quadrupeds.
The English oxen are large and fat, but some prefer for the table the smal-
ler breed of the Scotch, and the Welch cattle, after grazing in English pas-
tures.

tures. The English horses, upon the whole, are the best of any in the world, whether we regard their spirit, strength, swiftness, or docility. Incredible have been the pains taken by all ranks, from the monarch down to the peasant, for improving the breed of this favourite and noble animal, and the success has been answerable, for they now unite all the qualities and beauties of Indian, Persian, Arabian, Spanish, and other foreign horses. It is no uncommon thing for an English horse, mare, or gelding, though not of the race kind, to run above 20 miles within the hour, and they have been known to do it in a carriage. The irresistible spirit and weight of the English cavalry, renders them the best in the world in war; and an English hunter will perform incredible things in a fox or stag-chace. Those which draw equipages on the streets of London, are particularly beautiful, and a set often costs 1000*l.* a stronger and a heavier breed is employed for other draughts. I must not omit that the exportation of horses to France, and other countries, where they sell for large prices, has of late become a considerable article of commerce. It is hard to say how far this traffic with our natural enemies is allowable, but there is certainly less danger attending it, as the animals are commonly gelded. The breed of asses and mules begin likewise to be improved and encouraged in England.

The English sheep are of two kinds, those that are valuable for their fleeces, and those that are proper for the table. The former are very large, and their fleeces constitute the original staple commodity of England. I have been credibly informed, that in some counties the inhabitants are as curious in their breed of rams, as in their horses and dogs, and that in Lincolnshire, particularly, it is no uncommon thing for one of those animals to sell for 50*l.* It must, however, be owned, that those large fat sheep are very rank eating. It is thought that in England twelve millions of fleeces are shorn annually, which at a medium of 2*s.* a fleece, makes 1,200,000*l.* It is supposed, however, that by the fall of the value of the fleeces, a fourth part of this sum ought to be deducted at present. The other kind of sheep, which are fed upon the downs, such as those of Banstead, Bagshot-heath, and Devonshire, where they have, what the farmers call, a short bite, is little, if at all, inferior in flavour and sweetness, to venison.

The English mastiffs and bulldogs, are the strongest and fiercest of the canine species in the world, but either from the change of soil, or feeding, they degenerate in foreign climates. James I. of England, by way of experiment, turned out two English bulldogs, upon one of the most terrible lions in the Tower, and they laid him on his back. The mastiff, however, has all the courage of the bull-dog, without its ferocity, and is particularly distinguished for his fidelity and docility. All the different species of dogs that abound in other countries, for the field as well as domestic uses, are to be found in England.

What I have observed of the degeneracy of the English dogs in foreign countries is applicable to the English game cocks, which afford much barbarous diversion to our sportsmen. The courage of these birds is astonishing, and one of the true breed never leaves the pit alive without victory. The proprietors and feeders of this generous animal are likewise extremely curious as to his blood and pedigree.

Tame fowls are pretty much the same in England as in other countries; turkeys, peacocks, common poultry, such as cocks, pullets, and capons, geese, swans, ducks, and tame pigeons. The wild sort are bustards, wild geese, wild ducks, teal, widgeon, plover, pheasants, partridges, woodcocks, growls, quail,

quail, landrail, snipe, wood-pigeons, hawks of different kinds, kites, owls, herons, crows, rooks, ravens, magpies, jackdaws and jays, blackbirds, thrushes, nightingales, goldfinches, linnets, larks, and a great variety of small birds; canary birds also breed in England. The wheat-ear is by many preferred to the ortolan, for the delicacy of its flesh and flavour, and is peculiar to England.

Few countries are better supplied than England with river and sea-fish. Her rivers and ponds contain plenty of salmon, trout, eels, pike, perch, smelts, carp, tench, barble, gudgeons, roach, dace, grey mullet, bream, plaice, flounders, and craw-fish, besides a delicate lake-fish called char, which is found in some fresh water lakes of Wales and Cumberland, and as some say no where else. The sea-fish are cod, mackarel, haddock, whiting, herrings, pilchards, skate, soles. The john-dory, found towards the western coast, is reckoned a great delicacy, as is the red mullet. Several other fish are found on the same coasts. As to shell-fish, they are chiefly oysters, the propagation of which, upon their proper banks, requires a peculiar culture. Lobsters, crabs, shrimps, and Escallops, one of the most delicious of shell-fishes, cockles, wilks, periwinkles, and muscles, with many other small shell-fish, abound in the English seas. The whales chiefly visit the northern coast; but great numbers of porpoises and seals appear in the channel.

With regard to reptiles, such as adders, vipers, snakes, and worms; and insects, such as ants, gnats, wasps, and flies, England is pretty much upon a par with the rest of Europe; and the difference, if any, becomes more proper for natural history than geography.

POPULATION, INHABITANTS, MAN- } The exemption of the English
NERS, CUSTOMS, AND DIVERSIONS. } constitution from the despotic pow-
ers exercised in foreign nations, not excepting republics, is one great reason why it is very difficult to ascertain the number of inhabitants in England; and yet it is certain that this might occasionally be done, by parliament, without any violation of public liberty, and probably soon will take place. With regard to political calculations, they must be very fallible, when applied to England. The prodigious influx of foreigners, who settle in the nation, the emigrations of inhabitants to America and the islands, their return from thence and the great number of hands employed in shipping, are all of them matters that render any calculation extremely precarious. Upon the whole, I am apt to think that England is more populous than the estimators of her inhabitants are willing to allow. The war with France and Spain before the last, annually employed about 200,000 Englishmen, exclusive of Scotch and Irish, by sea and land: and its progress carried off, by various means, very near that number. The decay of population was indeed sensibly felt, but not so much as it was during the wars in queen Anne's reign, though not half of the numbers were then employed in the sea and land service.

At the same time, I am not of opinion that England is at present naturally more populous than she was in the reign of Charles I, though she is accidentally so. The English of former ages were strange to the excessive use of spirituous liquors, and other modes of living that are destructive of propagation. On the other hand, the vast quantities of cultivated lands in England, since those times, it might reasonably be presumed, would be favourable to mankind; but this advantage is probably more than counterbalanced by the prevailing practice of engrossing farms, which is certainly unfavourable to population; and, independent of this, upon an average, perhaps a married couple has not such a numerous progeny now as formerly. I will take

the

the liberty to make another observation, which falls within the cognizance of almost every man, and that is the incredible increase of foreign names upon our parish books, and public lists, compared to what they were even in the reign of George I.

After what has been premised, it would be presumptuous to pretend to ascertain the number of inhabitants in England and Wales; but, in my own private opinion, there cannot be fewer than 7,000,000.

Englishmen, in their persons, are generally well-sized, regularly featured, commonly fair rather than otherwise, and florid in their complexions. It is however, to be presumed that the vast number of foreigners that are intermingled and intermarried with the natives, have given a cast to their persons and complexions different from those of their ancestors 150 years ago. The women in their shape, features, and complexion, appear so graceful and lovely, that England may be termed the native country of female beauty. But beside the external graces so peculiar to the women in England, they are still to be more valued for their prudent behaviour, thorough cleanliness, and a tender affection for their husbands and children, and all the engaging duties of domestic life.

Of all the people in the world, the English keep themselves the most cleanly. Their nerves are so delicate, that people of both sexes are sometimes forcibly, nay mortally affected by imagination; insomuch, that before the practice of inoculation for the small pox took place, it was thought improper to mention that loathsome disease by its true name, in any polite company. This oversensibility has been considered as one of the sources of those singularities which so strongly characterize the English nation. They sometimes magnify the slightest appearances into realities, and bring the most distant dangers immediately home to themselves; and yet when real danger approaches, no people face it with greater resolution or constancy of mind. They are fond of clubs and convivial associations; and when these are kept within the bounds of temperance and moderation, they prove the best cure for those mental evils, which are so peculiar to the English, that foreigners have pronounced them to be national.

The same observations hold with regard to the higher orders of life, which must be acknowledged to have undergone a remarkable change since the accession of the House of Hanover, especially of late years. The English nobility and gentry of great fortunes now assimilate their manners to those of foreigners, with whom they cultivate a more frequent intercourse than their forefathers did. They do not now travel only as pupils, to bring home the vices of the countries they visit, under the tuition perhaps of a despicable pedant, or family dependant; but they travel for the purposes of society, and at the more advanced stages of life, while their judgements are mature, and their passions regulated. This has enlarged society in England, which foreigners now visit as commonly as Englishmen visited them, and the effects of the intercourse become daily more visible, especially as it is not now, as formerly confined to one sex.

Such of the English noblemen and gentlemen as do not strike into those high walks of life, affect what we call a sough rather than a splendid way of living. They study and understand better than any people in the world, conveniency in their houses, gardens, equipages, and estates, and they spare no cost to purchase it. It has, however been observed, that this turn renders them less communicative than they ought to be: but, on the other hand, the few connections they form, are sincere, cheerful and indissoluble. The like habits descend pretty far into the lower ranks, and are often discernible among

tradesmen. This love of snugness and conveniency may be called the ruling passion of the English people, and is the ultimate end of all their application, labours, and fatigues, which are incredible. A good economist with a brisk run of trade, is generally, when turned of 50, in a condition to retire from business; that is, either to purchase an estate, or to settle his money in the funds. He then commonly resides in a comfortable house in the country, often his native county, and expects to be treated on the footing of a gentleman; but his style of living is always judiciously suited to his circumstances.

The over-sensibility of the English is discovered in nothing more than in the vast subscriptions for public charities, raised by all degrees of both sexes. An Englishman feels all the pains which a fellow-creature suffers, and poor and miserable objects are relieved in England with a liberality that some time or other may prove injurious to industry; because it takes from the lower ranks the usual motives of labour, that they may save somewhat for themselves and families, against the days of age or sickness. The very people who contribute to those collections are assessed in proportion to their property for their parochial poor, who have a legal demand for their maintenance; and upwards of three millions sterling is said to be collected yearly in this country for charitable purposes. The institutions however of extra-parochial infirmaries, hospitals, and the like, are in some cases reprehensible. The vast sums bestowed in building them, the contracts made by their governors, and even the election of physicians, who thereby, qualified or unqualified, acquire credit, which is the same as profit, very often beget heats and cabals, which are very different from the purposes of disinterested charity; owing to the violent attachments and prepossessions of friends, and too often even to party considerations.

Notwithstanding those noble provisions, which would banish poverty from any other country, the streets of London, and the highways of England, abound with objects of distress, who beg in defiance of the laws, which render the practice severely punishable. This is partly owing to the manner in which the poor people live, who consider the food to be uneatable which in other countries would be thought luxurious.

The English listen to the voice of misfortunes in trade, whether real or pretended, deserved or accidental, and generously contribute to the relief of the parties, sometimes even by placing them in a more creditable condition than ever. The lowest bred of the English are capable of these and the like generous actions; but they often make an ostentatious display of their own merits, which diminishes their value. There is among the generality of the English of all ranks, an unpardonable preference given to wealth, above most other considerations. Riches, both in public and private, are often thought to compensate for the absence of almost every good quality. This offensive failing arises partly from the people being so much addicted to trade and commerce, the great object of which is gain; and partly from the democratical part of their constitution, which makes the possession of property a qualification for the legislature, and for almost every other species of magistracy, government, honours, and distinctions.

An Englishman, of education and reading, is the most accomplished gentleman in the world: he is however shy and reserved in his communications. This unamiable coldness is so far from being affected, that it is a part of their natural constitution. Living learning and genius, often meet not with their suitable regard even from the first-rate Englishmen; and it is not unusual for them to throw aside the best productions of literature, if they are not acquaint-

ed with the author. While the state distinction of Whig and Tory subsisted, the heads of each party affected to patronize men of literary abilities; but the pecuniary encouragements given them were but very moderate, and the very few who met with preferments in the state, might have earned them by a competent knowledge of business, and that pliability which the dependents in office generally possess. We scarcely have an instance, even in the munificent reign of queen Anne, or of her predecessors, who owed so much to the press, of a man of genius, as such, being made easy in his circumstances. Mr. Addison had about 300*l.* a year of the public money to assist him in his travels; and Mr. Pope, though a Roman catholic, was offered, but did not accept of, the like pension from Mr. Craggs, the whig secretary of state; and it was remarked, that his tory friend and companion the earl of Oxford, when sole minister, did nothing for him, but bewail his misfortune in being a papist. Indeed, a few men of distinguished literary abilities, as well as some without, have of late received pensions from the crown; but from the conduct of some of them it should seem, that state and party services have been expected in return.

The unevenness of the English in their conversation is very remarkable; sometimes it is delicate, sprightly, and replete with true wit; sometimes it is solid, ingenious, and argumentative; sometimes it is cold and phlegmatic, and borders upon disgust, and all in the same person. In many of their convivial meetings they are very noisy, and their wit is often offensive, while the loudest are the most applauded. This is particularly apt to be the case in large companies; but in smaller and more select parties, all the pleasures of rational conversation, and agreeable society, are enjoyed in England in a very high degree. Courage is a quality that seems to be congenial to the English nation. Boys, before they can speak, discover that they know the proper guards in boxing with their fists; a quality that perhaps is peculiar to the English, and is seconded by a strength of arm that few other people can exert. This gives the English soldier an infinite superiority in all battles that are to be decided by the bayonet scrowed upon the musket. The English courage has likewise the property, under able commanders, of being equally passive as active. Their soldiers will keep up their fire in the mouth of danger, but when they deliver it, it has a most dreadful effect upon their enemies; and in naval engagements they are unequalled. The English are not remarkable for invention, though they are for their improvements upon the inventions of others, and in the mechanical arts they excel all nations in the world. The intense application which an Englishman gives to a favourite study is incredible, and, as it were, absorbs all his other ideas. This creates the numerous instances of mental absences that are to be found in the nation.

All that I have said concerning the English, is to be understood of them in general, as they are at present; for it is not to be dissembled, that every day produces strong indications of great alterations in their manners. The great fortunes made during the late and the preceding wars, the immense acquisitions of territory by the peace of 1763, and above all, the amazing increase of territorial as well as commercial property in the East Indies, introduced a species of people among the English, who have become rich without industry, and by diminishing the value of gold and silver have created a new system of finances in the nation. Time alone can shew the event; hitherto the consequences seem to have been unfavourable, as it has introduced among the commercial a spirit of luxury and gaming that is attended with the most fatal effects, and an emulation among merchants and traders of all kinds, to equal or surpass the nobility and the courtiers. The plain frugal manners of men of business, which prevailed so lately at the accession of the present family to the crown, are now disregarded for tasteless extravagance of dress and equipage,

and the most expensive amusements and diversions, not only in the capital, but all over the trading towns of the kingdom.

Even the customs of the English have, since the beginning of this century, undergone an almost total alteration. Their ancient hospitality subsists but in few places in the country, or is revived only upon electioneering occasions. Many of their favourite diversions are now disused. Those remaining, are operas, dramatic exhibitions, ridottos, and sometimes masquerades in or near London; but concerts of music, and card and dancing assemblies, are common all over the kingdom. I have already mentioned stag and fox hunting, and horse races, of which many of the English are fond, even to insatiation. Somewhat however may be offered by way of apology for those diversions: the intense application which the English give to business, their sedentary lives, and luxurious diet, require exercise; and some think that their excellent breed of horses is increased and improved by those amusements. The English are remarkably cool, both in losing and winning at play; but the former is sometimes attended with acts of suicide. An Englishman will rather murder himself, than bring a sharper, who he knows has sinned him, to condign punishment, even though warranted by law. Next to horse-racing and hunting, cock-fighting, to the reproach of the nation, is a favourite diversion among the great as well as the vulgar. Multitudes of both classes assemble round the pit at one of those matches, and enjoy the pangs and death of this generous animal, every spectator being concerned in a bet, sometimes of high sums. The athletic diversion of cricket is still kept up in the southern and western parts of England, and is sometimes practised by people of the highest rank. Many other pastimes are common in England, some of them of a very robust nature, such as cudgelling, wrestling, bowls, skittles, quoits, and prison-base; not to mention duck-hunting, foot and ass races, dancing, puppet-shews, May garlands, and, above all, ringing of bells, a species of music which the English boast they have brought into an art. The barbarous diversion of boxing and prize-fighting, which were as frequent in England as the shews of gladiators in Rome, are now prohibited, though often practised; and all places of public diversions, excepting the royal theatres, are under regulations by act of parliament. Other diversions, which are common in other countries, such as tennis, fives, billiards, cards, swimming, angling, fowling, coursing, and the like, are familiar to the English. Two kinds, and those highly laudible, are perhaps peculiar to them, and these are rowing and sailing. The latter, if not introduced, was patronized and encouraged by his present majesty's father, the late prince of Wales, and may be considered as a national improvement. The English are amazingly fond of skating, in which, however, they are not very expert, but they are adventurous in it often to the danger and loss of their lives. The game acts have taken from the common people a great fund of diversion, though without answering the purposes of the rich: for the farmers and country people destroy the game in their nests, which they dare not kill with the gun. This monopoly of game, among so free a people as the English has been considered in various lights.

DRESS.] In the dress of both sexes, before the present reign of George III. they followed the French: but that of the military officers partook of the German, in compliment to his late majesty. The English, at present, bid fair to be the dictators of dress to the French themselves, at least with regard to elegance, neatness, and richness of attire. People of quality and fortune, of both sexes, appear on high occasions, in cloth of gold and silver, the richest brocades, satins, silks, and velvets, both flowered and plain: and

it is to the honour of the court, that the foreign manufactures of all these are discouraged. Some of these rich stuffs are said to be brought to as great perfection in England as they are in France, or any other nation. The quantities of jewels that appear on public occasions are incredible, especially since the vast acquisitions of the English in the East Indies. The same nobility, and persons of distinction, on ordinary occasions, dress like creditable citizens, that is; neat, clean, and plain, in the finest cloth and the best of linen. The full dress of a clergyman consists of his gown, cassock, scarf, beaver hat and rose, all of black; his undress is a dark grey frock, and plain linen. The physicians, the formality of whose dresses, in large tie perukes, and swords, was formerly remarkable if not ridiculous, begin now to dress like other gentlemen, and men of business. Few Englishmen, tradesmen, merchants, and lawyers, as well as men of landed property, are without some passion for the sports of the field, on which occasions they dress with remarkable propriety in a light frock, narrow brimmed hat, &c. The people of England love rather to be neat than fine in their apparel; but since the accession of his present majesty, the dresses at court, on particular occasions, are superb beyond description. Few even of the lowest tradesmen, on Sundays, carry about them less than 10l. in clothing, comprehending hat, wig, stockings, shoes, and linen, and even many beggars in the streets appear decent in their dress. In short, none but the most abandoned of both sexes are otherwise; and the appearance of an artisan or manufacturer in holiday times, is commonly an indication of his industry and morals.

[RELIGION.] Eusebius, and other ancient writers, positively assert, that Christianity was first preached in South Britain by the apostles and their disciples; and it is reasonable to suppose, that the success of the Romans opened a highway for the triumphs of the gospel of peace. It is certain also, that many of the soldiers and officers in the Roman armies were Christians; and as their legions were repeatedly sent over to England to extend as well as preserve their conquests, it is probable that thus Christianity was diffused among the natives. If any of the apostles visited this country, and our heathen ancestors, it was St. Paul, whose zeal, diligence, and fortitude were abundant. But who was the first preacher, or the precise year and period, the want of records leaves us at a loss; and all the traditions about Joseph of Arimathea and St. Peter's preaching the gospel in Britain, and Simon Zelotes suffering martyrdom here, are romantic fables, monkish legends. We have good authority to say, that about the year 150, a great number of persons professed the Christian faith here, and, according to archbishop Usher in the year 182, there was a school of learning to provide the British churches with proper teachers; and from that period it seems as if Christianity advanced its benign and salutary influences among the inhabitants in their several districts. It is unnecessary to repeat what has been said in the introduction respecting the rise and fall of the church of Rome in Europe. I shall only observe in this place, that John Wickliffe, an Englishman, educated at Oxford in the reign of Edward III. has the honour of being the first person in Europe who publicly called in question, and boldly refuted those doctrines which had passed for certain during so many ages. The constitution of the church is episcopal, and it is governed by bishops, whose benefices were converted by the Norman conqueror into temporal baronies, in right of which every bishop has a seat and vote in the house of peers. The benefices of the inferior clergy are now freehold, but in many places their tithes are appropriated in favour of the laity. The oeconomy of the church of England has been accused for the inequality of its livings; some of them extending from three hundred to

fourteen hundred a-year, and many, particularly in Wales, being too small to maintain a clergyman, especially if he has a family, with any tolerable decency; but this seems not easily to be remedied, unless the dignified clergy would adopt and support the reforming scheme. The crown, as well as private persons, has done great things towards the augmentation of poor livings.

The dignitaries of the church of England, such as deans, prebendaries, and the like, have generally large incomes; some of them exceeding in value those of bishoprics, for which reason the revenues of a rich deanry, or other living, is often annexed to a poor bishopric. At present, the clergy of the church of England, as to temporal matters, are in a most flourishing situation, because the value of their tithes increases with the improvements of lands, which of late have been amazing in England. The sovereigns of England, ever since the reign of Henry VIII. have been called in public writs, the supreme heads of the church; but this title conveys no spiritual meaning; as it only denotes the regal power, to prevent any ecclesiastical differences, or in other words, to substitute the king in place of the pope before the Reformation, with regard to temporalities, and the internal œconomy of the church. The kings of England never intermeddle in ecclesiastical disputes, unless by preventing the convocation from sitting to agitate them, and are contented to give a sanction to the legal rights of the clergy.

The church of England, under this description of the monarchical power over it, is governed by two archbishops, and twenty-four bishops besides the bishop of Sodor and Man, who not being possessed of an English barony, does not sit in the house of peers. The archbishops are those of Canterbury and York, who are dignified with the address of Your Grace. The former is the first peer of the realm as well as metropolitan of the English church. He takes precedence, next to the royal family, of all dukes and officers of state. He is enabled to hold ecclesiastical courts upon all affairs that were cognizable in the court of Rome, when not repugnant to the law of God, or the king's prerogative. He has the privilege consequently of granting, in certain cases, licences and dispensations, together with the probate of wills, when the party dying is worth upwards of five pounds. Besides his own diocese, he has under him the bishops of London, Winchester, Ely, Lincoln, Rochester, Litchfield and Coventry, Hereford, Worcester, Bath and Wells, Salisbury, Exeter, Chichester, Norwich, Gloucester, Oxford, Peterborough, Bristol; and, in Wales, St. David's, Landaff, St. Asaph, and Bangor.

The archbishop of Canterbury has, by the constitution and laws of England, such extensive powers, that ever since the death of archbishop Laud (whose character will be hereafter given) the government of England has chiefly thought proper to raise to that dignity men of very moderate principles; but they have generally been men of considerable learning and abilities. This practice has been attended with excellent effects, with regard to the public tranquillity of the church, and consequently of the state.

The archbishop of York takes place of all dukes not of the blood royal, and of all officers of state, the lord chancellor excepted. He has in his province, beside his own diocese, the bishoprics of Durham, Carlisle, Chester, and Sodor and Man. In Northumberland, he has the power of a palatine, and jurisdiction in all criminal proceedings.

The bishops are addressed by the appellation of your Lordships; styled "Right reverend fathers in God," and take the precedence of all temporal barons. They have all the privileges of peers; and the bishoprics of London, Winchester, Durham, Salisbury, Ely, and Lincoln, require no additions

al revenues to support their prelates in the rank of noblemen. English bishops are to examine and ordain priests and deacons, to consecrate churches and burying places, and to administer the rite of confirmation. Their jurisdiction relates to the probation of wills; to grant administration of goods to such as die intestate; to take care of perishable goods when no one will administer; to collate to benefices; to grant institutions to livings; to defend the liberties of the church; and to visit their own dioceses once in three years.

To the following list of Archbishoprics and Bishoprics, I have subjoined the sum each see is charged in the king's books; for though that sum is far from being the real annual value of the see, yet it affords in forming a comparative estimate between the revenues of each see with those of another.

Deans and prebendaries of cathedrals have been already mentioned; but it would perhaps be difficult to assign their utility in the church, farther than to add to the pomp of worship, and to make provision for clergymen of eminence and merit; but interest often prevails over merit in the appointment. England contains about sixty archdeacons, whose office is to visit the churches twice or thrice every year, but their offices are less lucrative than they are honourable. Subordinate to them are the rural deans, formerly styled arch-presbyters, who signify the bishop's pleasure to his clergy, the lower class of which consists of priests and deacons.

The ecclesiastical government of England is, properly speaking, lodged in the convocation, which is a national representative or synod, and answers pretty nearly to the ideas we have of a parliament. They are convoked at the same time with every parliament, and their business is to consider of the state of the church, and to call those to an account who have advanced new opinions, inconsistent with the doctrines of the church of England. Some high-flying clergymen, during the reign of queen Anne, and in the beginning of that of George I. raised the power of the convocation to a height that was inconsistent with the principles of religious toleration, and indeed of civil liberty; so that the crown was obliged to exert its prerogative of calling the members together, and of dissolving them, and ever since, they have not been permitted to sit for any time in which they could do business.

terbury, and all appeals in church matters, from the judgment of the inferior courts, are directed to this. The processes run in the name of the judge, who is called dean of the arches; and the advocates who plead in this court must be doctors of the civil law. The court of audience has the same authority with this, to which the archbishop's chancery was formerly joined. The prerogative court is that wherein wills are proved, and administration taken out. The court of peculiars, relating to certain parishes, have a jurisdiction among themselves, for the probate of wills, and are therefore exempt from the bishop's courts. The see of Canterbury has no less than fifteen of these peculiars. The court of delegates receives its name from its consisting of commissioners delegated or appointed by the royal commission; but it is no standing court. Every bishop has also a court of his own, called the consistory court. Every archdeacon has likewise his court, as well as the dean and chapter of every cathedral.

The church of England is now, beyond any other national church, tolerant in its principles. Moderation is its governing character, and in England no religious sect is prevented from worshipping God in that manner which their consciences approve. Some severe laws, were, indeed, lately in force against those protestant dissenters who did not assent to the doctrinal articles of the church of England; but these laws were not executed; and in 1779, religious liberty received a considerable augmentation, by an act which was then passed for granting a legal toleration to dissenting ministers and school-masters, without their subscribing any of the articles of the church of England. Not to enter upon the motives of the reformation under Henry VIII. it is certain that episcopal government, excepting the few years from the civil wars under Charles I. to the restoration of his son, has ever since prevailed in England. The wisdom of acknowledging the king the head of the church, is conspicuous, in discouraging all religious persecution and intolerance; and if religious sectaries have multiplied in England, it is from the same principle that civil licentiousness has prevailed. I mean a tenderness in matters that can affect either conscience or liberty. The bias which the clergy had towards popery in the reign of Henry VIII. and his son, and even so late as that of Elizabeth, occasioned an interposition of the civil power for a farther reformation. Thence also the *puritans*, so called from their maintaining a singular purity of life and manners. Many of them were worthy pious men, and some of them good patriots. Their descendants are the modern presbyterians, who retain the same character, and have true principles of civil and religious liberty; but their theological sentiments have undergone a considerable change. Their doctrine, like the church of Scotland, was originally derived from the Geneva plan, instituted by Calvin and tended to an abolition of episcopacy, and to vesting the government of the church in a parity of presbyters. But the modern English presbyterians, in their ideas of church government, differ little from the independents, or congregationalists, who are so called from holding the independency of congregational churches, without any respect to doctrine; and in this sense almost all the *dissenters* in England are now become *independents*. As to points of doctrine, the presbyterians are generally Arminians. Many of their ministers have greatly distinguished themselves by their learning and abilities, and some of their writings are held in high estimation by many of the clergy, and other members of the established church. The same may be said of some of the independent and baptist ministers. The independents are generally Calvinists. The baptists do not believe that infants are proper subjects of baptism, and in the baptism of adults they practise immersion into water. They are divid-

ed

ed into two classes, which are styled general baptists, and particular baptists. The general baptists are Arminians, and the particular baptists are Calvinists. The moderate clergy of the church of England treat the protestant dissenters with affection and friendship: and though the hierarchy of their church, and the character of bishops, are capital points in their religion, they consider their differences with the presbyterians, and even with the baptists, as not being very material to salvation; nor indeed do many of the established church think that they are strictly and conscientiously bound to believe the doctrinal parts of the thirty-nine articles, which they are obliged to subscribe before they can enter into holy orders. Several of them have of late contended in their writings, that all subscriptions to religious systems are repugnant to the spirit of Christianity, and to reformation. Some doctrines which were formerly generally considered as too sacred to be opposed, or even examined, are now publicly controverted, particularly the doctrine of the Trinity. Places of worship have been established in which that doctrine has been openly renounced; and several clergymen have thrown up valuable livings in the church, and assigned their disbelief of that doctrine as the motive of their conduct.

The *Methodists* are a sect of a late institution, and their founder is generally looked upon to be Mr. George Whitefield, a divine of the church of England; but it is difficult to describe the tenets of this numerous sect. They pretend to great fervour and devotion, and their founder thought that the form of ecclesiastical worship, and prayers whether taken from a common prayer book, or poured forth extempore, was a matter of indifference, he accordingly made use of both these methods. His followers are rigid observers of the doctrinal articles of the church of England, and profess themselves to be Calvinists. But even the sect of methodists is split among themselves, some of them acknowledging Mr. Whitefield, and others Mr. Wesley, for their leader; not to mention a variety of subordinate sects (some of whom are from Scotland, particularly the *Sandemianians*) who have their separate followers, but very few, at London and other places in England. Mr. Whitefield died a few years since; but the places of worship erected by him near London, are still frequented by persons of the same principles, and they profess a great respect for his memory. Some of the Calvinistic doctrines were opposed by Mr. Wesley, and his followers, particularly that of predestination; but they appear still to retain some of them. He erected a very large place of public worship near Moorfields, and had under him a considerable number of subordinate preachers, who submitted to their leader very implicitly, propagate his opinions, and make proselytes throughout the kingdom with great industry. After a very long life, spent in the most strenuous endeavours to do good, and having been blest in reforming the morals of thousands of the lower ranks of society, he died in 1791.

The *Quakers* are a religious sect, which took its rise about the middle of the last century: a summary account of their tenets having been published by themselves, the following is abstracted from it.

“ They believe in one eternal God, the Creator and preserver of the universe, and in Jesus Christ his Son the Messiah and Mediator of the new covenant

“ When they speak of the miraculous conception, birth, life, miracles, death, resurrection, and ascension of our Saviour, they use scriptural terms, and acknowledge his divinity.

“ To Christ alone they give the title of the word of God, and not to the

scriptures, although they highly esteem these sacred writings, in subordination to the Spirit from which they were given forth.

"They believe (and it is their distinguishing tenet), that every man coming into the world, is endued with a measure of the light, grace, or good spirit of Christ, by which, as it is attended to, he is enabled to distinguish good from evil, and to correct the corrupt propensities of his nature, which mere reason is altogether insufficient to overcome.

"They think the influence of the Spirit especially necessary to the performance of worship; and consider as obstructions to pure worship, all forms which divert the attention of the mind from the secret influence of this unction from the Holy One. They think it incumbent on Christians to meet often together, and to wait in silence to have a true sight of their condition bestowed upon them; believing even a single sigh arising from such a sense to be more acceptable to God than any performances, however specious, which originate in the will of man.

"As they do not encourage any ministry but that which is believed to spring from the influence of the Holy Spirit, so neither do they refrain this influence to persons of any condition in life, or to the male sex alone; but as male and female are one in Christ, they allow such of the female sex as are endued with a right qualification for the ministry, to exercise their gifts for the general edification of the church.

"Respecting baptism, and what is termed the Lord's supper, they believe, that the baptism with water, administered by John, belonged to an inferior and decreasing dispensation.

"With respect to the other rite, they believe that communion between Christ and his church is not maintained by any external performance; but only by a real participation of his divine nature through faith.

"They declare against oaths and war; abiding literally by Christ's positive injunction, "Swear not at all." From the precepts of the gospel, from the example of our Lord, and from his spirit in their hearts, they maintain that wars and fightings are repugnant to the gospel.

"They disuse the names of the months and days, which were given in honour of the heroes or false gods of the heathens; and the custom of speaking to a single person in the plural number, as having arisen also from motives of adulation. Compliments, superfluity of apparel, and furniture, outward shews of rejoicing, and mourning, and observations of days and times, they esteem to be incompatible with the simplicity and sincerity of a Christian life; and public diversions, gaming, and other vain amusements of the world, they condemn as a waste of time, and diverting the attention of the mind from the sober duties of life.

"This society hath a discipline established among them, the purposes of which are the relief of the poor—the maintenance of good order—the support of the testimonies which they believe it is their duty to bear to the world—and the help and recovery of such as are overtaken in faults.

"It is their decided judgment that it is contrary to the gospel to sue each other at law. They enjoin all to end their differences by speedy and impartial arbitration according to rules laid down. If any refuse to adopt this mode, or having adopted it, to submit to the award, it is the rule of the society that such be disowned."

It is well known that William Penn, one of this society, founded the province of Pennsylvania, and introduced therein a plan of civil and religious liberty, particularly of the latter, at that time unexampled. The government of the province was at first, and for many years, chiefly in the hands of the

Quakers

but as persons of other persuasions increased, and became partakers of power, they grew uneasy at the pacific plan of the quakers, and at length succeeding to establish such modes of defence for their country as did not accord with the principles of the latter, these gradually withdrew themselves from active employments in the state. For some time previous to the late revolution, few of them were in any other station than that of private citizens; and during its progress, their refusing to arm exposed them to much suffering, by disburts levied on them, in order to procure their quota in support of the war.

Many families in England still profess the Roman catholic religion, and its exercise is under very mild and gentle restrictions. Though the penal laws against papists in England appear at first to be severe, yet they are either not executed, or with so much lenity, that a Roman catholic feels himself under few hardships. Legal evasions are found out for the double taxes upon their landed property, and as they are subject to none of the expences and troubles (unless voluntary) attending public offices, parliamentary elections, and the like burdens, the English papists are in general in good circumstances as to their private fortunes. Some of the penal laws against them have also lately been repealed, much to the satisfaction of all liberal-minded men, though a vehement outcry was afterwards raised against the measure by ignorance and bigotry. The papists now seem to be convinced, that a change of government instead of bettering would hurt their situation, because it would increase the jealousy of the legislature, which must undoubtedly expose them daily to greater burdens and heavier penalties. This sensible consideration has of late made the Roman catholics to appear as dutiful and zealous subjects as any his majesty has. Scarcely any English papists, excepting those who were bred, or had served abroad, were engaged in the rebellion of the year 1745, and though those at home were most carefully observed, few or none of them were found guilty of disloyal practices.

As England has been famous for the variety of its religious sects, so it has also for its *Free-thinkers*; but that term has been applied in very different senses. It has sometimes been used to denote opposers of religion in general, and in particular of revealed religion; but it has also been applied to those who have been far from disbelieving Christianity, and who have only opposed some of those doctrines which are to be found in public creeds and formularies, but which they conceived to be no part of the original Christian system. As to those who are truly *deists* or *infidels*, there is abundant reason to believe, that this class of men is much more numerous in some popish countries than in England. Christianity is so much obscured and disfigured by the fopperies and superstitions of the Romish church that men who think freely are naturally apt to be prejudiced against it, when they see it in so disadvantageous a form; and this appears to be in fact very much the case abroad. But in England, where men have every opportunity of seeing it exhibited in a more rational manner, they have less cause to be prejudiced against it; and therefore are more ready to enter into an examination of the evidence of its divine origin. Nor does it appear, that the writings of the Unitarians against Christianity have been of any real disservice to it. On the contrary, they have caused the arguments in its favour to be used with greater force and clearness, and have been the means of producing such defenses of it as all the acuteness of modern infidelity has been unable to overthrow.

LANGUAGE. The English language is known to be a compound of almost every other language in Europe, particularly the Saxon, the French, and the Celtic. The Saxon, however, predominates; and the words that are borrowed

fowed from the French, being radically Latin, are common to other nations, particularly the Spaniards and the Italians. To describe it abstractedly, would be superfluous to an English reader; but relatively, it enjoys all the properties, without many of the defects, of other European languages. It is more energetic, manly, and expressive, than either the French or the Italian; more copious than the Spanish, and more eloquent than the German, or the other northern tongues. It is however subject to some considerable provincialities in its accent, there being much difference in the pronunciation of the inhabitants of different counties; but this chiefly affects the lowest of the people; for as to well-educated and well-bred persons there is little difference in their pronunciation all over the kingdom. People of fortune and education in England, of both sexes, also commonly either speak or understand the French, and many of them the Italian and Spanish; but it has been observed, that foreign nations have great difficulty in understanding the few English who talk Latin, which is perhaps the reason why that language is much disused in England, even by the learned professions.

LEARNING AND LEARNED MEN.] England may be looked upon as another word for the seat of learning and the Muses. Her great Alfred cultivated both, in the time of the Saxons, when barbarism and ignorance overspread the rest of Europe: nor has there, since his time, been wanting a continual succession of learned men, who have distinguished themselves by their writings or studies. These are so numerous, that a bare catalogue of their names, down to this day, would form a moderate volume.

The English institutions, for the benefit of study, partake of the character of their learning. They are solid and substantial, and provide for the ease, the disencumbrance, the peace, the plenty, and the conveniency of its professors; witness the two universities of Oxford and Cambridge, institutions that are not to be matched in the world, and which were respected even amidst the barbarous rage of civil war. The industrious Leland, who was himself a moving library, was the first who published a short collection of the lives and characters of those learned persons who preceded the reign of his master Henry VIII. among whom he has inserted several of the blood royal of both sexes, particularly a son and daughter of the great Alfred, Editha, the queen of Edward the Confessor, and other Saxon princes, some of whom were equally devoted to Mars and the Muses.

In speaking of the dark ages, it would be unpardonable if I should omit the mention of that prodigy of learning, and natural philosophy, Roger Bacon, who was the forerunner in science to the great Bacon lord Verulam, as the latter was to Sir Isaac Newton. Among the other curious works written by this illustrious man, we find treatises upon grammar, mathematics, physics, the flux and reflux of the British sea, optics, geography, astronomy, chronology, chemistry, logic, metaphysics, ethics, medicine, theology, philosophy, and upon the impediment of knowledge. He lived under Henry III. and died at Oxford about the year 1294. The honourable Mr. Walpole has preserved the memory of some noble and royal English authors, who have done honour to learning and the Muses, and to this work I must refer. Since the Reformation, England resembles a galaxy of literature; and it is but doing justice, to the memory of cardinal Wolsey, though otherwise a dangerous and profligate minister, to acknowledge, that both his example and encouragement laid the foundation of the polite arts, and greatly contributed to the revival of classical learning in England. As many of the

English clergy had different sentiments in religious matters at the time of the Reformation, encouragement was given to learned foreigners to settle in England. Edward VI. during his short life, did a great deal for the encouragement of these foreigners, and shewed dispositions for cultivating the most useful parts of learning; had he lived. Learning, as well as liberty, suffered an almost total eclipse in England, during the bloody bigotted reign of queen Mary. Elizabeth her sister, was herself a learned princess. She advanced many persons of consummate abilities to high ranks, both in church and state; but she seems to have considered their literary accomplishments to have been only secondary to their civil. In this she shewed herself a great politician, but she would have been a more amiable queen had she raised genius from obscurity: for though she was no stranger to Spenser's muse, she suffered herself to be so much imposed upon by a tasteless minister, that the poet languished to death in obscurity. Though she tasted the beauties of the divine Shakspeare, yet we know not that they were distinguished by any particular acts of her munificence; but her parsimony was nobly supplied by her favourite the earl of Essex, the politest scholar of his age, and his friend the earl of Southampton, who were liberal patrons of genius.

The encouragement of learned foreigners in England continued to the reign of James I. who was very munificent to Casaubon, and other foreign authors of distinction, even of different principles. He was himself no great author, but his example had a considerable effect upon his subjects; for in his reign were formed those great masters of polemic divinity, whose works are almost inexhaustible mines of knowledge. Nor must it be forgotten, that the second Bacon, whom I have already mentioned, was by him created viscount Verulam, and lord high chancellor of England. He was likewise the patron of Camden and other historians, as well as antiquaries, whose works are to this day standards in those studies. Upon the whole, therefore, it cannot be denied, that English learning is under obligations to James I. though, as he had a very pedantic taste himself, he was the means of diffusing a similar taste among his subjects.

His son Charles I. had a taste for the polite arts, especially sculpture, painting, and architecture. He was the patron of Rubens, Vandyke, Amigo Jones, and other eminent artists; so that, had it not been for the civil wars, he would probably have converted his court and capital into a second Athens; and the collections he made for that purpose, considering his pecuniary difficulties, were stupendous. His favourite, the duke of Buckingham, imitated him in that respect, and laid out the amazing sum of 400,000l. upon his cabinet of paintings and curiosities.

The earl of Arundel was however, the great Mæcenas of that age, and by the immense acquisition he made of antiquities, especially his famous marble inscriptions, he may stand upon a footing, as to the encouragement and utility of literature, with the greatest of the Medicæan princes. Charles and his court had little or no relish for poetry; but such was his generosity in encouraging genius and merit of every kind, that he increased the salary of his poet laureat, the famous Ben Jonson, from 100 marks to 200l. per annum, and a tierce of Spanish wine; which salary is continued to this day.

The public encouragement of learning and the arts suffered indeed an eclipse, during the time of the civil wars, and the succeeding interregnum. Many very learned men, however, found their situations under Cromwell, though he was no stranger to their political sentiments, so easy, that they followed their studies; to the vast benefit of every branch of learning; and many works of

vast literary merit appeared even in those times of distraction. Usher, Walton, Wiles, Harrington, Wilkins, and a prodigious number of other great names, were unmolested and even favoured by that usurper; and he would also have filled the universities with literary merit, could he have done it with any degree of safety to his government.

The reign of Charles II. was chiefly distinguished by the great proficiency to which it carried natural knowledge, especially by the institution of the Royal Society. The king was a good judge of those studies, and, though irreligious himself, England never abounded more with learning and able divines than in his reign. He loved painting, and poetry, but was far more munificent to the former than the latter. The incomparable *Paradise Lost*, by Milton, was published in his reign, but was not read or attended to in proportion to its merit; though it was far from being disregarded so much as has been commonly apprehended. The reign of Charles II. notwithstanding the bad taste of his court in several of the polite arts, by some is reckoned the Augustan age in England, and is dignified with the names of Boyle, Halley, Hook, Sydenham, Harvey, Temple, Tillotson, Barrow, Butler, Cowley, Waller, Dryden, Wycherley, and Otway. The pulpit assumed more majesty, a better style, and truer energy than it had ever known before. Classic literature recovered many of its native graces; and although England could not under him boast of a Jones and a Vandyke, yet Sir Christopher Wren introduced a more general regularity than had ever been known before in architecture. Nor was Sir Christopher Wren merely distinguished by his skill as an architect. His knowledge was very extensive, and his discoveries in philosophy, mechanics, &c. contributed much to the reputation of the new established Royal Society. Some excellent English painters (for Lely and Kneller were foreigners) also flourished in this reign.

That of James II. though he likewise had a taste for the fine arts, is chiefly distinguished in the province of literature by those compositions that were published by the English divines against popery, and which, for strength of reasoning, and depth of erudition, never were equalled in any age or country.

The names of Newton and Locke adorned the reign of William III. and he had a particular esteem for the latter, as he had also for Tillotson and Burnet, though he was far from being liberal to men of genius. Learning flourished, however, in his reign, merely by the excellency of the soil in which it had been planted.

The most uninformed readers are not unacquainted with the improvements which learning, and all the polite arts, received under the auspices of Queen Anne, and which put her court at least on a footing with that of Lewis XIV. in its most splendid days. Many of the great men, who had figured in the reigns of the Stuarts and William were still alive, and in the full exercise of their faculties, when a new race sprung up, in the republic of learning and the arts. Addison, Prior, Pope, Swift, lord Bolingbroke, lord Shaftesbury, Arbuthnot, Congreve, Steele, Rowe, and many other excellent writers, both

H h 2

Mr. Horace Walpole says that a variety of knowledge proclaims the universality, a multiplicity of works the abundance, and St. Paul's the greatness of Sir Christopher's genius. So many great architects as were employed on St. Peter's have not left, upon the whole, a more perfect edifice than this work of a single mind. The noblest temple, the largest palace and the most sumptuous hospital, in such a kingdom as Britain are all the works of the same hand. He restored London, and recorded its fall. He built about fifty parish churches, and designed the monument.

in

in verse and prose, need but to be mentioned to be admired; and the English were as triumphant in literature as in war. Natural and moral philosophy kept pace with the polite arts, and even religious and political disputes contributed to the advancement of learning, by the unbounded liberty which the laws of England allow in speculative matters, and which has been found highly advantageous in the promotion of true and valuable knowledge.

The ministers of George I. were the patrons of erudition, and some of them were no mean proficient themselves. George II. was himself no Mæcenas, yet his reign yielded to none of the preceding in the numbers of learned and ingenious men it produced. The bench of bishops was never known to be so well provided with able prelates as it was in the early years of his reign; a full proof that his nobility and ministers were judges of literary qualifications. In other departments of education, the favour of the public generally supplied the coldness of the court. After the rebellion in the year 1745, when Mr. Pelham was considered as being first minister, this screen between government and literature was in a great measure removed, and men of genius began then to taste the royal bounty. Since that period, a great progress has been made in the polite arts in England. The Royal Academy has been instituted, some very able artists have arisen, and the annual public exhibitions of painting and sculpture have been extremely favourable to the arts, by promoting a spirit of emulation, and exciting a greater attention to works of genius of this kind among the public in general. But notwithstanding these favourable circumstances, the fine arts have been far from meeting with that public patronage, to which they have so just a claim. Few of our public edifices are adorned with paintings or with statues. The sculptors meet with little employment, nor is the historical painter much patronized. Though the British artists of the present age have proved that their genius for the fine arts is equal to those of any other nation.

Besides learning, and the fine arts in general, the English excel in what are called the learned professions. Their courts of justice are adorned with greater abilities and virtues, perhaps, than those which any other country can boast of. A remarkable instance of wisdom occurs, in the appointments for the last 200 years of their lord chancellors, who hold the highest and the most uncontrollable judicial seat in the kingdom, and yet it is acknowledged by all parties, that during that time, their bench has remained unpolluted by corruption, or partial affections. The few instances that may be alledged to the contrary, fix no imputation of wilful guilt upon the parties. The great lord chancellor Bacon was censured indeed for corrupt practices, but malevolence itself does not say that he was guilty any farther than in too much indulgence to his servants. The case of one of his successors is still more favourable to his memory, as his censure reflects disgrace only upon his enemies; and his lordship was, in the judgment of every man of candour and conscience, fully acquitted. Even Jeffries, infernal as he was in his politics, never was accused of partiality in the causes that came before him as chancellor.

It must be acknowledged, that neither pulpit nor bar-eloquence have been sufficiently studied in England, but this is owing to the genius of the people, and their laws. The sermons of their divines are often learned, and always sound as to the practical and doctrinal part; for the many religious sects in England require to be opposed rather by reasoning than eloquence. An unaccountable notion has however prevailed even among some of the clergy themselves, that the latter is incompatible with the former, as if the arguments of Cicero and Demosthenes were weakened by those powers of language with which they are adorned. A short time perhaps may remove

this prepossession, and convince the clergy, as well as the laity, that true eloquence is the first and fairest handmaid of argumentation. The reader, however, is not to imagine, that I am insinuating that the preachers of the English church are destitute of the graces of elocution; so far from that, no clergy in the world can equal them in the purity and perspicuity of language, though I think that if they consulted more than they do the powers of elocution, they would preach with more effect. If the semblance of those powers, coming from the mouths of ignorant enthusiasts, are attended with the amazing effects we daily see; what must not be the consequence if they were exerted in reality, and supported with spirit and learning?

The laws of England are of so peculiar a cast, that the several pleadings at the bar do not admit, or but very sparingly, of the flowers of speech; and I am apt to think, that a pleading in the Ciceronian manner would make a ridiculous appearance in Westminster-hall. The English lawyers, however, though they deal little in eloquence, are well versed in rhetoric and reasoning.

Parliamentary speaking, not being bound down to that precedent which is required in the courts of law, no nation in the world can produce so many examples of true eloquence as the English senate in its two houses; witness the fine speeches made by both parties in parliament in the reign of Charles I. and those that have been printed since the accession of the present family.

Medicæ and surgery, botany, anatomy, chemistry, and all the arts or studies for preserving life, have been carried to a great degree of perfection by the English. The same may be said of music, and theatrical exhibitions. Even agriculture and mechanism are now reduced in England to sciences, and that too without any public encouragement but such as is given by private noblemen and gentlemen, who associate themselves for that purpose. In ship-building, clock-work, and the various branches of cutlery, they stand unrivalled.

UNIVERSITIES.] I have already mentioned the two universities of Oxford and Cambridge, which have been the seminaries of more learned men than any in Europe, and some have ventured to say, than all other literary institutions. It is certain that their magnificent buildings, which in splendour and architecture rival the most superb royal edifices, the rich endowments, the liberal ease and tranquillity enjoyed by those who inhabit them, surpass all the ideas which foreigners, who visit them, conceive of literary societies. So respectable are they in their foundations, that each university sends two members to the British parliament, and their chancellors and officers have a civil jurisdiction over their students, the better to secure their independency. Their colleges, in their revenues and buildings, exceed those of many other universities.

In Oxford there are twenty colleges and five halls: the former are very liberally endowed, but in the latter the students chiefly maintain themselves. This university is of great antiquity: it is supposed to have been a considerable place even in the time of the Romans: and Camden says, that "wise antiquity did, even in the British age, consecrate this place to the Muses." It is said to have been styled an university before the time of king Alfred; and the best historians admit, that this most excellent prince was only a restorer of learning here. Alfred built three colleges at Oxford: one for divinity, another for philosophy, and a third for grammar.

The University of Cambridge consists of twelve colleges, and four halls;

but

but though they are distinguished by different names, the privileges of the colleges and halls, are in every respect the same.

The senate-house at Cambridge is a most elegant edifice, executed entirely in the Corinthian order, and is said to have cost sixteen thousand pounds. Trinity college library is also a very magnificent structure, and in Corpus Christi college library is a valuable collection of ancient manuscripts, which were preserved at the dissolution of the monasteries, and given to this college by archbishop Parker.

ANTIQUITIES AND CURIOSITIES, } The antiquities of England are **NATURAL AND ARTIFICIAL.** } either British, Roman, Saxon, Danish, or Anglo-Norman; but these, excepting the Roman, throw no great light upon ancient history. The chief British antiquities are those circles of stones, particularly that called Stonehenge, in Wiltshire, which probably were places of worship in the times of the Druids. Stonehenge is, by Inigo Jones, Dr. Stukely, and others, described as a regular circular structure. The body of the work consists of two circles and ovals, which are thus composed; the upright stones are placed at three feet and a half distance from each other, and joined, at the top by over-thwart stones, with tenons fitted to the mortises in the uprights, for keeping them in their due position. Some of these stones are vastly large, measuring two yards in breadth, one in thickness, and above seven in height; others are less in proportion. The uprights are wrought a little with a chissel, and sometimes tapered; but the transoms, or over-thwart stones, are quite plain. The outside circle is near one hundred and eighty feet in diameter, between which and the next circle there is a walk of three hundred feet in circumference, which has a surprising and awful effect upon the beholders.

Monuments of the same kind as that of Stonehenge are to be met with in Cumberland, Oxfordshire, Cornwall, Devonshire, and many other parts of England, as well as in Scotland, and the isles, which have been already mentioned.

The Roman antiquities in England consist chiefly of altars and monumental inscriptions, which instruct us as to the legionary stations of the Romans in Britain, and the names of some of their commanders. The Roman military ways give us the highest idea of the civil as well as military policy of those conquerors. Their vestiges are numerous; one is mentioned by Leland, as beginning at Dover, and passing through Kent to London, from thence to St. Alban's, Dunstable, Stratford, Tewcester, Littleburn, St. Gilbert's Hill near Shrewsbury, then by Stratton, and so through the middle of Wales to Cardigan. The great Via Militaris called Hermen-Street, passed from London through Lincoln, where a branch of it from Pontefract to Doncaster, strikes out to the westward, passing through Tadcaster to York, and from thence to Aldby, where it again joined Hermen-street. There would, however, be no end of describing the vestiges of the Roman roads in England, many of which serve as foundations to our highways. The great earl of Arundel, the celebrated English antiquary, had formed a noble plan for describing those which pass through Sussex and Surry towards London; but the civil war breaking out, put an end to the undertaking. The remains of many Roman camps are discernible all over England; one particularly very little defaced, near Dorchester in Dorsetshire, where also is a Roman amphitheatre. Their situations are generally so well chosen, and their fortifications appear to have been so complete, that there is some reason to believe that they were the constant habitations of the Roman soldiers in England; though it is certain, from the baths and

testified officers, been four mains of and it is and court gentlemen arms, coins but the n pretentare Northumb Solway F only of st and turrec tion with lun to th The Sa and placee Arthur wi disputed b be not Ba as the bur ted togeth ments of S they are of Museum co Saxon char their names was always every dono England are round, and square. teshelated pavements, that have been found in different parts, that their chief officers, or magistrates lived in towns or villas. Roman walls have likewise been found in England, and perhaps, upon the borders of Wales, many remains of their fortifications and castles are bleaded with those of a latter date; and it is difficult for the most expert architect to pronounce that some halls and courts are not entirely Roman. The private cabinets of noblemen and gentlemen, as well as the public repositories, contain a vast number of Roman arms, coins, shuls, trinkets, and the like, which have been found in England; but the most amazing monument of the Roman power in England, is the pretenture, or wall of Severus commonly called the Picts wall, running through Northumberland and Cumberland; beginning at Tinmouth, and ending at Solway Frith, being about eighty miles in length. The wall at first consisted only of stakes and turf, with a ditch; but Severus built it with stone forts, and turrets at proper distances; so that each might have a speedy communication with the other, and it was attended all along by a deep ditch, or vallum to the north, and a military highway to the south.

The Saxon antiquities in England consist chiefly in ecclesiastical edifices, and places of strength. At Winchester is shewn the round table of king Arthur with the names of his knights. The antiquity of this table has been disputed by Camden; and latter writers, perhaps with reason; but if it be not British, it certainly is Saxon. The cathedral of Winchester served as the burying place of several Saxon kings, whose bones were collected together by bishop Fox, in six large wooden chests. Many monuments of Saxon antiquity present themselves all over the kingdom though they are often not to be discerned from the Normanic; and the British Museum contains several striking original specimens of their learning. Many Saxon charters, signed by the king and his nobles, with a plain cross instead of their names, are still to be met with. The writing is neat and legible, and was always performed by a clergyman, who affixed the name and quality of every donor, or witness, to his respective cross. The Danish erections in England are hardly discernible from the Saxon. The form of their camps is round, and they are generally built upon eminences, but their forts are square.

All England is full of Anglo-Norman monuments, which I chuse to call so, because, though the princes under whom they were raised were of Norman original, yet the expence was defrayed by Englishmen, with English money. York-minster, and Westminster-hall and abbey, are perhaps the finest specimens to be found in Europe, of that Gothic manner which prevailed in building, before the recovery of the Greek and Roman architecture. All the cathedrals and old churches in the kingdom, are more or less in the same taste; if we except St. Paul's in short, those erections are so common, that they scarcely deserve the name of curiosities. It is uncertain, whether the artificial excavations, found in some parts of England, are British, Saxon, or Norman. That, under the old castle of Ryegate in Surry is very remarkable, and seems to have been designed for secreting the cattle and effects of the natives, in times of war and invasion. It contains an oblong square hall, round which runs a bench, cut out of the same rock, for sitting upon; and tradition says; that it was the room in which the barons of England met during the wars with king John. The rock itself is soft and very practicable; but it is hard to say where the excavation, which is continued in a square passage, about six feet high, and four feet wide, terminates, because the work is fallen in, in some places.

The natural curiosities of England are so various, that I can touch upon them

them only in general; as there is no need of describing the several medicinal waters and springs which are to be found in every part of the country.

The Bath waters are famous through all the world, both for drinking and bathing. Spaws of the same kind are found at Scarborough, and other parts of Yorkshire; at Tuabridge in Kent; Epsom and Dulwich in Surrey; and at Acton and Ilington in Middlesex. There also are many remarkable springs, whereof some are impregnated either with salt, as that at Droitwich in Worcestershire; or sulphur, as the famous well of Wigan in Lancashire; or bituminous matter, as that at Pitchford in Shropshire. Others have a petrifying quality, as that near Lutterworth in Leicestershire; and a dropping well in the West-riding of Yorkshire. And finally, some ebb and flow, as those of the Peak in Derbyshire, and Laywell near Torbay, whose waters rise and fall several times in an hour. To these we may add that remarkable fountain near Richard's castle in Herefordshire, commonly called Bonewell, which is generally full of small bones, like those of frogs or fish, though often cleared out. At Ancliff, near Wigan in Lancashire, is the famous burning well; the water is cold, neither has it any smell; yet there is so strong a vapour of sulphur issuing out with the stream, that upon applying a light to it, the top of the water is covered with a flame, like that of burning spirits, which lasts several hours, and emits a heat that meat may be boiled over it. The fluid itself will not burn when taken out of the well*.

Derbyshire is celebrated for many natural curiosities. The Mam Tor, or Mother Tower, is said to be continually mouldering away, but never diminishes. The Elden Hole, about four miles from the same place; and this is a chasm in the side of a mountain, near seven yards wide, and fourteen long, diminishing in extent within the rock, but of what depth is not known. A plummet once drew 884 yards of line after it, whereof the last eighty were wet, without finding a bottom. The entrance of Poole's hole near Buxton, for several paces, is very low, but soon opens into a very lofty vault, like the inside of a Gothic cathedral. The height is certainly very great, yet much short of what some have asserted, who reckon it a quarter of a mile perpendicular, though in length it exceeds that dimension; a current of water, which runs along the middle, adds, by its sounding stream, re-echoed on all sides, very much to the astonishment of all who visit this vast concave. The drops of water which hang from the roof, and on the sides, have an amusing effect; for they not only reflect numberless rays from the candles carried by the guides, but, as they are of a petrifying quality, they harden in several places into various forms, which, with the help of a strong imagination, may pass for lions, founts, organs, and the like. The entrance into that natural wonder at C. Aleton, which is from its hideousness named the Devil's Arse, is wide at first, and upwards of thirty feet perpendicular. Several cottagers dwell under it, who seem in a great measure to subsist by guiding strangers into the cavern, which is crossed by four streams of water, and then is thought impassable. The vault, in several places, makes a noble appearance, and is particularly beautiful by being chequered with various coloured stones.

Some spots of England are said to have a petrifying quality. We are told, that near Whitby in Yorkshire, are found certain stones, resembling the folds and wreaths of a serpent; also other stones of several sizes, and of ex-

actly round, as if artificially made for cannon balls, which being broken, do commonly contain the form and likeness of serpents, wreathed in circles, but generally without heads. In some parts of Gloucestershire, stones are found resembling cockles, oysters, and other testaceous marine animals. Those curiosities, however, are often magnified by ignorance and credulity.

CITIES, TOWNS, PORTS, AND OTHER } This head is so very extensive,
EDIFICES, PUBLIC AND PRIVATE. } that I can only touch upon objects that may assist in giving the reader some idea of its importance, grandeur, or utility.

London *, the metropolis of the British empire, is the first in this division. It appears to have been founded between the reigns of Julius Cæsar and Nero, but by whom is uncertain; for we are told by Tacitus, that it was a place of great trade in Nero's time, and soon after became the capital of the island. It was first walled about with hewn stones, and British bricks, by Constantine the Great, and the walls formed an oblong square, in compass about three miles, with seven principal gates. The same emperor made it a bishop's see, for it appears that the bishops of London and York, and another English bishop, were at the council of Arles, in the year 314: he also settled a mint in it, as is plain from some of his coins.

London, in its large sense, including Westminster, Southwark, and part of Middlesex, is a city of a very surprising extent, of prodigious wealth, and of the most extensive trade. This city, when considered with all its advantages, is now what ancient Rome once was; the seat of liberty, the encourager of arts, and the admiration of the whole world. London is the centre of trade; it has an intimate connection with all the counties in the kingdom; it is the grand mart of the nation, to which all parts send their commodities, from whence they are again sent back into every town of the nation, and to every part of the world. From hence innumerable carriages by land and water are constantly employed; and from hence arises the circulation in the national body, which renders every part healthful, vigorous, and in a prosperous condition; a circulation that is equally beneficial to the head and the most distant members. Merchants are here as rich as noblemen; witness their incredible loans to government; and there is no place in the world where the shops of tradesmen make such a noble and elegant appearance, or are better stocked.

It is situated on the banks of the Thames, a river which though not the largest, is the richest and most commodious for commerce of any in the world. It being continually filled with fleets, sailing to or from the most distant climates; and its banks extend from London-bridge to Blackwall, almost one continued great magazine of naval stores, containing three large wet docks, 32 dry docks, and 33 yards for the building of ships for the use of the merchants, besides the places allotted for the building of boats and lighters; and the king's yards down the river, for the building of men of war. As this city is about sixty miles distant from the sea, it enjoys, by means of this beautiful river, all the benefits of navigation, without the danger of being surpris'd by foreign fleets, or of being annoy'd by the moist

I i

* London is situated in 51° 31 north latitude, 400 miles south of Edinburgh, and 270 south-east of Dublin; 180 miles west of Amsterdam, 210 north-west of Paris, 500 south-west of Copenhagen, 600 miles north-west of Vienna, 790 south-west of Stockholm, 800 north-east of Madrid, 810 north-west of Rome, 850 north-east of Lisbon, 1360 north-west of Constantinople, 1414 south-west of Moscow.

vapours of the sea. It rises regularly from the water side, and extending itself on both sides along its banks, reaches a prodigious length from east to west in a kind of amphitheatre towards the north, and is continued for near 20 miles on all sides, in a succession of magnificent villas, and populous villages, the country seats of gentlemen and tradesmen; whither the latter retire for the benefit of fresh air, and to relax their minds from the hurry of business. The regard paid by the legislature to the property of the subject, has hitherto prevented any bounds being fixed for its extension.

The irregular form of this city makes it difficult to ascertain its extent. However, its length from east to west, is generally allowed to be above seven miles, from Hyde-park corner to Poplar; and its breadth in some places three, in others two, and in others again not much above half mile. Hence the circumference of the whole is almost 18 miles; or, according to a modern measurement, the extent of continued buildings, is 35 miles two furlongs and 39 roods. But it is much easier to form an idea of the large extent of a city so irregularly built, by the number of the people, who are computed to be near a million; and from the number of edifices devoted to the service of religion.

Of these, besides St. Paul's cathedral, and the collegiate church at Westminster, here are 102 parish churches, 69 chapels of the established religion; 21 French protestant chapels; 11 chapels belonging to the Germans, Dutch, Danes, &c. 26 independent meetings; 34 presbyterian meetings; 20 baptist meetings 19 popish chapels, and meeting-houses for the use of foreign ambassadors, and people of various sects; and three Jewish synagogues. So that there are 305 places devoted to religious worship, in the compass of this vast pile of buildings, without reckoning the 21 out-parishes usually included in the bills of mortality, and a great number of methodist tabernacles:

There are also in and near this city 100 alms-houses, about 20 hospitals and infirmaries, 3 colleges, 10 public prisons; 15 flesh-markets; 1 market for live cattle, 2 other markets more particularly for herbs; and 23 other markets for corn, coal, hay, &c. 15 inns of court, 27 public squares besides those within single buildings, as the Temple, &c. 3 bridges, 49 halls for companies, 8 public schools, called free-schools; and 31 charity-schools, which provide education for 5034 poor children; 207 inns, 447 taverns, 551 coffee-houses; 5975 alehouses; 1000 hackney-coaches; 400 ditto chairs; 7000 streets, lanes, courts, and alleys, and 150,000 dwelling houses, containing, as has been already observed, about 1,000,000 inhabitants, who, according to a late estimate, consume annually the following articles of provisions*.

Black cattle	—	—	—	98,244
Sheep and lambs	—	—	—	711,123

London-bridge was first built of stone in the reign of Henry II. about the year 1163, by a tax laid upon wool, which in course of time gave rise to the notion that it was built upon wool-packs; from that time it has undergone many alterations and improvements, particularly since the year 1756, when the houses were taken down, and the whole rendered more convenient and beautiful. The passage for carriages is 31 feet broad, and 7 feet on each side for foot passengers. It crosses the Thames, where it is 915 feet broad, and has at present 19 arches of about 20 feet wide each, but the centre one is considerably larger.

Westminster-bridge is reckoned one of the most complete and elegant structures of the kind known in the world. It is built entirely of stone, and extended over the river at a place where it is 1,223 feet broad; which is above 300 feet broader than at London-bridge. On each side is a fine balustrade of stone, with places of shelter from the rain. The width of the bridge is 44 feet, having on each side a fine foot-way for passengers. It consists of 14 piers, and 13 large, and two small arches, all semicircular, that in the centre being 76 feet wide, and the rest decreasing four feet each from the other; so that the two least arches of the 13 great ones, are each 52 feet. It is computed that the value of 40,000l. in stone, and other materials, is always under water. This magnificent structure was begun in 1738, and finished 1750, at the expence of 389,000l. defrayed by the parliament.

Black-friars bridge falls nothing short of that of Westminster, either in magnificence or workmanship; but the situation of the ground on the two shores, obliged the architect to employ elliptical arches; which, however, have a very fine effect; and many persons even prefer it to Westminster bridge. This bridge was begun in 1760, and finished in 1770, at the expence of 152,840l. to be discharged by a toll upon the passengers. It is situated almost at an equal distance between those of Westminster and London, commands a view of the Thames from the later to Whitehall, and discovers the majesty of St. Paul's in a very striking manner.

The cathedral of St. Paul's is the most capacious, magnificent, and regular protestant church in the world. The length within is 500 feet; and its height, from the marble pavement to the cross, on the top of the cupola, is 340. It is built of Portland stone, according to the Greek and Roman orders, in the form of a cross, after the model of St. Peter's at Rome, to which in some respects it is superior. St. Paul's church is the principal work of Sir Christopher Wren, and undoubtedly the only work of the same magnitude that ever was completed by one man. He lived to a great age, and finished the building 37 years after he himself laid the first stone. It takes up six acres of ground, though the whole length of this church measures no

and extending from east to west for near 10 miles. The latter re- the hurry of the subject,

of Rome, had ever able of furnishing

Small

more than the width of St. Peter's. The expence of rebuilding it after the fire of London, was defrayed by a duty on coals, and is computed at a million sterling.

Westminster-abbey, or the collegiate church of Westminster, is a venerable pile of building, in the Gothic taste. It was first built by Edward the Confessor; king Henry III. rebuilt it from the ground, and Henry VII. added a fine chapel to the east end of it; this is the repository of the deceased British kings and nobility; and here are also monuments erected to the memory of many great and illustrious personages, commanders by sea and land, philosophers, poets, &c. In the reign of queen Anne, 4000*l.* a year out of the coal duty, was granted by parliament for keeping it in repair.

The inside of the church of St. Stephen's, Valbrook, is admired for its lightness and elegance, and does honour to the memory of Sir Christopher Wren. The same may be said of the steeples of St. Mary-le-Bow, and St. Bride's, which are supposed to be the most complete in their kind of any in Europe, though architecture has laid down no rules for such erection. Few churches in and about London are without some beauty. The simplicity of the portico in Covent-Garden is worthy the purest ages of ancient architecture. That of St. Martin's in the Fields would be noble and striking, could it be seen from a proper point of view. Several of the new churches are built in an elegant taste, and even some of the chapels have gracefulness and proportion to recommend them. The Banquetinghouse at Whitehall, is but a very small part of a noble palace designed by Inigo Jones, for the royal residence, and as it now stands, under all its disadvantages, its symmetry, and ornaments, are in the highest style and execution of architecture.

Westminster-hall, though on the outside it makes a mean, and no very advantageous appearance, is a noble Gothic building, and is said to be the largest room in the world, whose roof is not supported with pillars; it being 230 feet long, and 70 broad. The roof is the finest of its kind that can be seen. Here are held the coronation feasts of our kings and queens; also the courts of chancery, king's-bench, and common-pleas, and above stairs, that of the exchequer.

That beautiful column, called the monument, erected at the charge of the city, to perpetuate the memory of its being destroyed by fire, is justly worthy of notice. This column, which is of the Doric order, exceeds all the obelisks and pillars of the ancients, it being 202 feet high, with a stair-case in the middle to ascend to the balcony, which is about 30 feet short of the top, from whence there are other steps, made for persons to look out at the top of all, which is fashioned like an urn, with a flame issuing from it. On the base of the monument, next the street, the destruction of the city, and the relief given to the sufferers by Charles II. and his brother, is emblematically represented in bas relief. The north and south sides of the base have each a Latin inscription, the one describing its dreadful desolation, and the other its splendid resurrection; and on the east side is an inscription, shewing when the pillar was begun and finished. The charge of erecting this monument, which was begun by Sir Christopher Wren in 1671, and finished by him in 1677, amounted to upward of 13,000*l.*

The Royal-Exchange is a large and noble building, and is said to have cost above 80,000*l.*

The terrace in the Adelphi is a very fine piece of architecture, and has laid open one of the finest prospects in the world.

We might here give a description of the Tower, Bank of England, the New Treasury, the Admiralty-office, and the Horse-guards at White-hall,

the Mansion-house, or house, of the Lord-mayor, the Custom-house, Excise-office, India-house, and a vast number of other public buildings; besides the magnificent edifices raised by our nobility; as lord Spencer's house, Marlborough-house, and Buckingham-house in St. James's park; the earl of Chesterfield's house, near Hyde park; the Duke of Devonshire's, and the late earl of Bath's, in Piccadilly; lord Shelburne's in Berkeley square; Northumberland-house in the Strand; the duke of Bedford's, and Montague-house, in Bloomsbury; with a number of others of the nobility and gentry; but these would be sufficient to fill a large volume.

In Montague-house is deposited the British Museum. Sir Hans Sloane, bart (who died in 1753) may not improperly be called the founder of the British Museum; for its being established by parliament, was only in consequence of his leaving by will his noble collection of natural history, his large library, and his numerous curiosities, which cost him 50,000*l.* to the use of the public, on condition that the parliament would pay 20,000*l.* to his executors. To this collection were added the Cottonian library, the Harleian manuscripts, collected by the Oxford family, and purchased likewise by the parliament, and a collection of books given by the late major Edwards. His late majesty, in consideration of its great usefulness, was graciously pleased to add thereto the royal libraries of books and manuscripts collected by the several kings of England.

The Sloanian collection consists of an amazing number of curiosities: among which are, the library, including books of drawings, manuscripts, and prints, amounting to about 50,000 volumes. Medals and coins, ancient and modern, 20,000. Cameos and intaglios, about 700. Seals, 268. Vessels, &c. of agate, jasper, &c. 542. Antiquities, 1,125. Precious stones, agate, jasper, &c. 2,156. Metals, minerals, ores, &c. 2,725. Chrytal, spars, &c. 1,864. Fossils, flints, stones, 1,275. Earth, sands, salts, 1,035. Bitumens, sulphurs, amber, &c. 399. Tales, micæ, &c. 388. Corals, sponges, &c. 2,421. Testacea, or shells, &c. 5,843. Echini, echinits, &c. 659. Asteriæ-trochi, entrochi, &c. 241. Crustaceæ, crabs, lobsters, &c. 363. Stellæ marinæ, star-fishes, &c. 173. Fish, and their parts, &c. 1,555. Birds, and their parts, eggs, and the nests of different species, 1,172. Quadrupeds, &c. 1,886. Vipers, serpents, &c. 521. Insects, &c. 5,439. Vegetables, 12,506. Hortus ficcus, or volumes of dried plants, 334. Humani, as calculi, anatomical preparations, 756. Miscellaneous things, natural, 2,098. Mathematical instruments, 55. A catalogue of all the above is written in a number of large volumes.

This great and populous city is happily supplied with abundance of fresh water, from the Thames and the New River; which is not only of inconceivable service to every family, but by means of fire-plugs every where dispersed, the keys of which are deposited with the parish officers, the city is in a great measure secured from the spreading of fire; for these plugs are no sooner opened than there are vast quantities of water to supply the engines.

This plenty of water has been attended with another advantage, it has given rise to several companies, who insure houses and goods from fire; an advantage that is not to be met with in any other nation on earth: the premium is small, and the recovery in case of loss, is easy and certain. Every one of these offices keeps a set of men in pay, who are ready at all hours to give their assistance in case of fire; and who are on all occasions extremely bold, dexterous, and diligent: but though all their labours should prove unsuccessful, the person who suffers by this devouring element, has the comfort

fort that must arise from a certainty of being paid the value (upon oath) of what he has insured.

Before the conflagration in 1666, London (which, like most other great cities, had arisen from small beginnings) was totally inelegant, inconvenient, and unhealthy, of which latter misfortune many melancholy proofs are authenticated in history, and which, without doubt, proceeded from the narrowness of the streets, and the unaccountable projections of the buildings, that confined the putrid air, and joined with other circumstances, such as the want of water, rendered the city seldom free from pestilential devastation. The fire which consumed the greatest part of the city, dreadful as it was to the inhabitants at that time, was productive of consequences, which made ample amends for the losses sustained by individuals; a new city arose on the ruins of the old; but, though more regular, open, convenient, and healthful than the former, yet it by no means answered to the characters of magnificence or elegance, in many particulars: and it is ever to be lamented (such was the insatiation of those times) that the magnificent, elegant, and useful plan of the great Sir Christopher Wren, was totally disregarded and sacrificed to the mean and selfish views of private property. Views which did irreparable injury to the citizens themselves, and to the nation in general; for had that great architect's plan been followed, what has often been asserted, must have been the result; the metropolis of this kingdom would incontestably have been the most magnificent and elegant city in the universe, and of consequence must, from the prodigious resort of foreigners of distinction and taste who would have visited it, have become an inexhaustible fund of riches to this nation. But as the deplorable blindness of that age has deprived us of so valuable an acquisition, it is become absolutely necessary that some efforts should be made to render the present plan in a greater degree answerable to the character of the richest and most powerful people in the world.

The plan of London, in its present state, will in many instances appear to very moderate judges, to be as injudicious a disposition as can easily be conceived for a city of trade or commerce, on the border of so noble a river as the Thames. The wharfs and quays on its banks are extremely mean and inconvenient. And the want of regularity and uniformity in the streets of the city of London, and the mean avenues to many parts of it, are also circumstances that greatly lessen the grandeur of its appearance. Many of the churches, and other public buildings, are likewise thrust up in corners in such a manner, as might tempt foreigners to believe, that they were designed to be concealed. The improvements of the city of London for some years past, have however been very great: and the new streets, which are numerous, are in general more spacious, and built with greater regularity and elegance.

In the centre of the town, and upon the banks of the noblest river in Europe, was a chain of inelegant, ruinous houses, known by the name of Durham-Yard, the Savoy, and Somerset House. The first, being private property, engaged the notice of the ingenious Adams, who opened the way to a piece of scenery, which no city in Europe can equal. On the site of Durham-Yard was raised upon arches the pile of the Adelphi, celebrated for its enchanting prospect, the utility of its wharfs, and its subterraneous apartments answering a variety of purposes of general benefit. Contiguous to the Adelphi stands the Savoy, the property of government, hitherto a nuisance; and, adjoining to the Savoy towards the Temple, stood Somerset-House, where, being the property of government also, a new pile of buildings for public offices has been erected; and here, in a very magnificent edifice, are elegant apart-

apartments appropriated for the use of the Royal Society, the Royal Academy of painting and sculpture, and the Society of Antiquaries.

Though a variety of circumstances have hitherto been disadvantageous to the embellishment of the metropolis, it must at the same time be acknowledged that a spirit of improvement seems universal among all degrees of people. The very elegant and necessary method of paving and enlightening the streets, is felt in the most sensible manner by all ranks and degrees of people. The roads are continued for several miles around upon the same model; and, exclusive of lamps regularly placed on each side, at short distances, are rendered more secure by watchmen stationed within call of each other. Nothing can appear more brilliant than those lights when viewed at a distance, especially where the roads run across: and even the principal streets, such as Pall Mall, New Bond-street, Oxford street, &c. convey an idea of elegance and magnificence.

Among the list of improvements worthy notice, may be included the Six Clerks Office, in Chancery-lane, and that very substantial building in the Old Bailey, which does honour to a people celebrated for their cleanliness, and for their humanity. Here the unfortunate debtor will no longer be annoyed by the dreadful rattle of chains, or by the more horrid sounds issuing from the lips of those wretched beings, who set defiance to all laws divine and human; and here also the offender, whose crime is not capital, may enjoy all the benefits of a free open air.

Windfor castle is the only fabric that deserves the name of a royal palace in England; and that chiefly through its beautiful and commanding situation; which with the form of its construction, rendered it, before the introduction of artillery, impregnable. Hampton-court was the favourite residence of king William, it is built in the Dutch taste, and has some good apartments, and, like Windfor, lies near the Thames. Both these palaces have some good pictures; but nothing equal to the magnificent collection made by Charles I. and dissipated in the time of the civil wars. The cartoons of Raphael, which for design and expression are reckoned the masterpieces of painting, have by his present majesty been removed from the gallery built for them at Hampton-court, to the queen's-palace, formerly Buckingham-house, in St. James's park. The palace of St. James's is commodious, but has the air of a convent; and that of Kensington, which was purchased from the Finch Family by king William, is remarkable only for its gardens. Other houses, though belonging to the king, are far from deserving the name of royal.

Next to these, if not superior, in magnificence and expensive decorations, are many private seats in the neighbourhood of London, and all over the kingdom, wherein the amazing opulence of the English nation shines forth in its fullest point of view. Herein also the princely fortunes of the nobility are made subservient to the finest classical taste; witness the seats of the marquis of Buckingham and earl Pembroke. At the seat of the latter, more remains of antiquity are to be found than are in the possession of any other subject in the world.

But those capital houses of the English nobility and gentry have an excellency distinct from what is to be met with in any other part of the globe, which is, that all of them are complete without and within, all the apartments and members being suitable to each other, both in construction and furniture, and all kept in the highest preservation. It often happens that the house, however elegant and costly, is not the principal object of the seat which consists in its hortulan and rural decorations. Vistas, opening land-
scapes,

scapes, temples, all of them the result of that enchanting art of imitating nature, and uniting beauty with magnificence.

It cannot be expected that I should here enter into a particular detail of all the cities and towns of England, which would far exceed the limits of this work: I shall, therefore, only touch upon some of the most considerable.

Bristol is reckoned the second city in the British dominions for trade, wealth, and the number of inhabitants. It stands upon the north and south sides of the river Avon, and two parts of the city are connected by a strong bridge. The city is not well built; but it is supposed to contain 15,000 houses, and 95,000 inhabitants. Here is a cathedral and eighteen parish churches, besides seven for eight other places of worship. On the north side of a large square, called Queen's square, which is adorned with rows of trees, and an equestrian statue of William the Third, there is a custom-house, with a quay half a mile in length, said to be one of the most commodious in England, for shipping and landing of merchants goods. The exchange, wherein the merchants and traders meet, is all of freestone, and is one of the best of its kind in Europe.

York is a city of great antiquity, pleasantly situated on the river Ouse; it is very populous, and surrounded with a good wall, through which are four gates, and five posterns. Here are seventeen parishes churches, and a very noble cathedral, or minster it being one of the finest Gothic buildings in England. It extends in length 525 feet, and in breadth 110 feet. The nave, which is the largest of any in the world, excepting that of St. Peter's church at Rome, is four feet and a half wider, and eleven feet higher, than that of St. Paul's cathedral at London. At the west end are two towers, connected and supported by an arch which forms the west entrance, and is reckoned the largest gothic arch in Europe. The windows are finely painted, and the front of the choir is adorned with statues of all the kings in England from William the Norman to Henry VI. and here are thirty-two stalls, all of fine marble with pillars, each consisting of one piece of alabaster. Here is also a very neat Gothic chapter-house. Near the cathedral is the assembly-house, which is a noble structure, and which was designed by the late earl of Burlington. This city has a stone bridge of five arches over the river Ouse.

The city of Exeter was for some time the seat of the West-Saxon kings; and the walls, which at this time enclose it, were built by king Athelstan, who encompassed it also with a ditch. It is one of the first cities in England, as well on account of its buildings and wealth, as its extent, and the number of its inhabitants. It has six gates, and, including its suburbs, is more than two miles in circumference. There are sixteen parish churches, besides chapels, and five large meeting houses within the walls of this city. The trade of Exeter in ferges, perpetuans, long-ells, druggets, kerseys, and other woollen goods, is very great. Ships come up to this city by means of sluices.

The city of Gloucester stands on a pleasant hill, with houses on every descent, and is a clean, well-built town, with the Severn on one side, a branch of which brings ships up to it. The cathedral here is an ancient and magnificent structure, and there are also five parish churches.

Litchfield stands in a valley, three miles south of the Trent, and is divided by a stream which runs into that river. The cathedral was founded in the year 1148: it was much damaged during the civil war, but was so completely repaired soon after the Restoration, that it is now one of the noblest

Gothic structures in England. Litchfield is thought to be the most considerable city in the north-west of England, except Chester.

Chester is a large, populous, and wealthy city, with a noble bridge, that has a gate at each end, and twelve arches over the Dee, which falls into the sea. It has eleven parishes, and nine well-built churches. The streets are generally even and spacious, and crossing one another in straight lines, meet in the centre. The walls were first erected by Edelfleda, a Mercian lady, in the year 908, and join on the south side of the city to the castle, from whence there is a pleasant walk round the city upon the walls, except where it is intercepted by some of the towers over the gates; and from whence there is a prospect of Flintshire, and the mountains of Wales.

Warwick is a town of great antiquity, and appears to have been of eminence even in the time of the Romans. It stands upon a rock of free-stone, on the banks of the Avon; and a way is cut to it through the rocks from each of the four cardinal points. The town is populous, and the streets are spacious and regular, and all meet in the centre of the town.

The city of Coventry is large and populous: it has a handsome town-house, and twelve noble gates. Here is also a spacious market-place, with a cross in the middle, 60 feet high, which is adorned with statues of several kings of England as large as life.

Salisbury is a large, neat, and well-built city, situated in a valley, and watered by the Upper Avon on the west and south, and by the Bourne on the east. The streets are generally spacious, and built at right angles. The cathedral, which was finished in 1358, at the expence of above 26,000 pounds, is, for a Gothic building, the most elegant and regular in the kingdom. It is in the form of a lanthorn, with a beautiful spire of freestone in the middle, which is 410 feet high, being the tallest in England. The length of the church is 478 feet, the breadth is 76 feet, and the height of the vaulting 80 feet. The church has a cloister, which is 150 feet square, and of as fine workmanship as any in England. The chapter-house, which is an octagon, is 150 feet in circumference; and yet the roof bears all upon one small pillar in the centre, so much too weak in appearance for the support of such a prodigious weight, that the construction of this building is thought one of the greatest curiosities in England.

The city of Bath took its name from some natural hot baths; for the medicinal waters of which this place has been long celebrated, and much frequented. The seasons for drinking the Bath-waters are the spring and autumn; the spring season begins with April, and ends with June; the autumn season begins with September and lasts to December, and some patients remain here all the winter. In the spring, this place is most frequented for health, and in the autumn for pleasure, when at least two thirds of the company consisting chiefly of persons of rank and fortune, come to partake of the amusements of the place. In some seasons there have been no less than 8000 persons at Bath, besides its inhabitants. Some of the buildings lately erected here are extremely elegant, particularly Queen's square, the North and South Parade, the Royal Forum, the Circus, and Crescent.

Nottingham is pleasantly situated on the ascent of a rock, overlooking the river Trent, which runs parallel with it about a mile to the south, and has been made navigable. It is one of the neatest places in England; and has a considerable trade.

No nation in the world can shew such dock-yards, and all conveniencies for construction and repairs of the royal navy, as Portsmouth (the most regular fortification in England), Plymouth (by far the best dock-yard) Chatham;

Woolwich, and Deptford. The royal Hospital at Greenwich, for superannuated seamen, is scarcely exceeded by any royal palace, for its magnificence and expence.

[COMMERCE AND MANUFACTURES.] This article is copious, and has been well discussed in former publications, many of which are master-pieces of their kind. It is well known that commerce and manufactures have raised the English to be the first and most powerful people in the world. Historical reviews, on this head, would be tedious. It is sufficient then to say, that it was not till the reign of Elizabeth that England began to feel her true weight in the scale of commerce. She planned some settlements in America, particularly Virginia, but left the expence attending them to be defrayed by her subjects; and indeed she was too parsimonious to carry her own notions of trade into execution. James I. entered upon great and beneficial schemes for the English trade. The East India company owes to him their success and existence, and British America saw her most flourishing colonies rise under him and his family. The spirit of commerce went hand in hand with that of liberty, and though the Stuarts were not friendly to the latter, yet, during the reigns of the princes of that family, the trade of the nation was greatly increased. It is not within our design to follow commerce through all her fluctuations and states. This would be an idle attempt, and it has already taken up large volumes. The nature of a geographical work requires only a representation of the present state of commerce in every country; and, in this light, I flatter myself that I shall be able to treat of it with more precision than former writers upon the same subject.

The present system of English politics may properly be said to have taken rise in the reign of queen Elizabeth. At this time the protestant religion was established, which naturally allied us to the reformed states, and made all the Popish powers our enemies.

We began in the same reign to extend our trade, by which it became necessary for us also to watch the commercial progress of our neighbours, and if not to incommode and obstruct their traffic, to hinder them from impairing ours.

We then likewise settled colonies in America, which was become the great scene of European ambition; for, seeing with what treasures the Spaniards were annually enriched from Mexico and Peru, every nation imagined that an American conquest or plantation would certainly fill the mother-country with gold and silver.

The discoveries of new regions, which were then every day made, the profit of remote traffic, and the necessity of long voyages, produced, in a few years, a great multiplication of shipping. The sea was considered as the wealthy element; and, by degrees, a new kind of sovereignty arose, called *naval dominion*.

As the chief trade of Europe, so the chief maritime power was at first in the hands of the Portuguese and Spaniards, who, by a compact, to which the consent of other princes was not asked, had divided the newly discovered countries between them: but the crown of Portugal having fallen to the king of Spain, or being seized by him, he was master of the shipping of the two nations, with which he kept all the coasts of Europe in alarm, till the Armada, he had raised at a vast expence for the conquest of England, was destroyed; which put a stop, and almost an end to the naval power of the Spaniards.

At this time the Dutch, who were oppressed by the Spaniards, and feared yet greater evils than they felt, resolved no longer to endure the insolence of their

their masters; they therefore revolted, and after a struggle, in which they were assisted by the money and forces of Elizabeth, erected an independent and powerful commonwealth.

When the inhabitants of the Low Countries had formed their system of government, and some remission of the war gave them leisure to form schemes for future prosperity, they easily perceived that as their territories were narrow, and their numbers small, they could preserve themselves only by that power, which is the consequence of wealth; and that by a people whose country produced only the necessaries of life, wealth was not to be acquired but from foreign dominions, and by transportation of the products of one country into another.

From this necessity, thus justly estimated, arose a plan of commerce, which was for many years prosecuted with an industry and success perhaps never seen in the world before; and by which the poor mud-walled villages and impassable bogs erected themselves into high mighty states, who set the greatest monarchs at defiance, whose alliance was courted by the proudest, and whose power was dreaded by the fiercest nations. By the establishment of this state, there arose to England a new ally, and a new rival.

When queen Elizabeth entered upon the government, the customs produced only 36,000*l.* a year; at the Restoration, they were let to farm for 400,000*l.* and produced considerably above double that sum before the Revolution. The people of London, before we had any plantations, and when our trade was inconsiderable, were computed at about 100,000; at the death of queen Elizabeth, they were increased to 150,000, and are now above six times that number. In those days we had not only naval stores, but ships, from our neighbours. Germany furnished us with all things made of metals, even to nails: wine, paper, linen, and a thousand other things, came from France. Portugal furnished us with sugars: all the produce of America was poured upon us from Spain; and the Venetians and Genoese retailed to us the commodities of the East Indies at their own price. In short, the legal interest of money was twelve per cent. and the common price of our land ten or twelve years purchase. We may add, that our manufactures were few, and those but indifferent; the number of English merchants very small, and our shipping much inferior to what lately belonged to the American colonies.

Great Britain is, of all other countries, the most proper for trade; as well from its situation as an island, as from the freedom and excellency of its constitution, and from its natural products, and considerable manufactures. For exportation our country produces many of the most substantial and necessary commodities; as butter, cheese, corn, cattle, wool, iron, lead, tin, copper, leather, copperas, pit-coal, alum, saffron, &c. Our corn sometimes preserves other countries from starving. Our horses are the most serviceable in the world, and highly valued by all nations for their hardiness, beauty, and strength. With beef, mutton, pork, poultry, biscuit, we victual not only our own fleets, but many foreign vessels that come and go. Our iron we export manufactured in great guns, carcasses, bombs, &c. - Prodigious, and almost incredible is the value likewise of other goods from hence exported; viz. hops, flax, hemp, hats, shoes, household-stuff, ale, beer, red-herrings, pilchards, salmon, oysters, liquorice, watches, ribbands, toys, &c.

There is scarcely a manufacture in Europe but what is brought to great perfection in England; and therefore it is perfectly unnecessary to enumerate them all. The woollen manufacture is the most considerable, and exceeds in

goodness and quantity that of any other nation. Hardware is another capital article; locks, edge-tools, guns, swords, and other arms, exceed any thing of the kind; household utensils of brass, iron, and pewter, also are very great articles; and our clocks and watches are in great esteem. There are but few manufactures in which we are defective. In those of lace and paper we do not seem to excel, though they are greatly advancing; we import much more than we should, if the duties on British paper were taken off. As to foreign traffic, the woolen manufacture is the great foundation and support of it.

The American colonies are the objects which would naturally have first presented themselves, before the unhappy contest between them and the mother country commenced; but as a separation hath taken place, the commercial intercourse is regulated by a treaty lately entered into between the two countries.

The principal islands belonging to the English in the West Indies, are Jamaica, Barbadoes, St. Christophers, Grenada, Antigua, St. Vincent, Dominica, Anguilla, Nevis, Montserrat, the Bermudas or Summer Islands, and the Bahama or Lucayan Islands in the Atlantic ocean.

The English trade with their West India Islands consist chiefly in sugars, rum, cotton, logwood, cocos, coffee, pimento, ginger, indigo, materials for dyes, mahogany and manchinel plants, drugs, and preserves; for these the exports from England are osenbuge, a coarse kind of linen, with which the West Indians now clothe their slaves: linen of all sorts, with broad cloth and kerseys, for the planters, their overseers and families: silks and stuffs for their ladies and household servants; hats; red caps for their slaves of both sexes; stockings and shoes of all sorts; gloves and millinery ware, and perukes, laces for linen, woolen, and silks; strong beer, pale beer, pickles, candles, butter, and cheese; iron ware, as saws, files, axes, hatchets, chisels, adzes, hoes, mattocks, gouges, planes, augers, nails; lead, powder, and shot; brass and copper wares; toys, coals, and pantiles; cabinet wares, snuffs, and in general whatever is raised or manufactured in Great Britain; and also negroes from Africa, and all sorts of India goods.

The trade of England to the East Indies constitutes one of the most stupendous, political, as well as commercial machines, that is to be met with in history. The trade itself is exclusive, and lodged in a company, which has a temporary monopoly of it, in consideration of money advanced to the government. Without entering into the history of the East India trade, within these twenty years past, and the company's concerns in that country, it is sufficient to say, that, besides their settlements on the coast of India, which they enjoy under certain restrictions by act of parliament; they have, through the various internal revolutions which have happened at Indostan, and the ambition and avarice of their servants and officers, acquired such territorial possessions, as render them the most formidable commercial republic (for so it may be called in its present situation) that has been known in the world ever since the demolition of Carthage. Their revenues are only known, and that but imperfectly, to the directors of the company, who are chosen by the proprietors of the stock; but it has been publicly affirmed, that they amount annually to above three millions and a half sterling. The expences of the company in fleets, and armies, for maintaining those acquisitions, are certainly very great: but after these are defrayed, the company not only cleared a vast sum, but was able to pay to the government four hundred thousand pounds yearly for a certain time, partly by way of indemnification for the expences of the public in protecting the company, and partly

ly as a tacit tribute for those possessions that are territorial and not commercial. This republic, therefore, cannot be said to be independent; and it is hard to say what form it may take when the term of the bargain with the government is expired. For many years past, the company's servants abroad have enriched and served themselves more than the company or the republic.

This company exports to the East Indies all kinds of woollen manufactures, all sorts of hard-ware, lead, bullion, and quicksilver. Their imports consist of gold, diamonds, raw silks, drugs, tea, pepper, arrack, porcelain or China ware, salt-petre for home consumption; and of wrought silks, muslins, callicoës, cottons, and all the woven manufactures of India, for exportation to foreign countries. I shall now proceed to a concise view of the English trade to foreign countries, according to the latest and most authentic accounts.

To Turkey, England sends in her own bottoms, woollen cloths, tin, lead, and iron; hardware, iron utensils, clocks, watches, verdegris, spices, cochineal, and logwood. She imports from thence raw-silks, carpets, skins, dyeing drugs, cotton, fruits, medicinal drugs, coënes, and some other articles. Formerly, the balance of this trade was about 500,000l. annually in favour of England. The English trade was afterwards diminished through the practices of the French; but the Turkey trade at present is at a very low ebb with the French as well as the English.

England exports to Italy woollen goods of various kinds, peltry, leather, lead, tin, fish, and East India goods; and brings back raw and thrown silk, wines, oil, soap, olives, oranges, lemons, pomegranates, dried fruits, colours, anchovies, and other articles of luxury: the balance of this trade to England is annually about 200,000l.

To Spain, England sends all kinds of woollen goods, leather, tin, lead, fish, corn, iron, and brass manufactures; haberdashery wares, assortments of linen from Germany, and elsewhere, for the American colonies: and receives in return, wines, oils, dried fruits, oranges, lemons, olives, wool, indigo, cochineal, and other dyeing drugs, colours, gold and silver coin.

Portugal formerly was, upon commercial accounts, the favourite ally of England, whose fleets and armies have more than once saved her from destruction. England sends to this country almost the same kind of merchandizes as to Spain, and receives in return vast quantities of wines, with oils, salt, dried and moist fruits, dyeing drugs, and gold coin.

The treaty of commerce between England and France promised to have been advantageous to both countries, but that with every other connection is for the present dissolved.

England sends to Flanders, serges, flannels, tin, lead, sugar, and tobacco; and receives in return, laces, linen, cambrics, and other articles of luxury, by which England loses upon the balance 250,000l. sterling yearly. To Germany England sends cloths and stuffs, tin, pewter, sugars, tobacco, and East India merchandise; and brings thence vast quantities of linen, thread, goatskins, tinned plates, timbers, for all uses, wines, and many other articles. Before the late war, the balance of this trade was thought to be 500,000l. annually, to the prejudice of England, but that sum is now greatly reduced, as most of the German princes find it their interest to clothe their armies in English manufactures. I have already mentioned the trade with Denmark, Norway, Sweden, and Russia, which formerly was against England; but the balance was lately vastly diminished by the great improvements of her American

col.

colonies, in raising hemp, flax, making pot-ashes, iron works, and tallow, all which used to be furnished to her by the northern powers. The goods exported to Poland, chiefly by the way of Dantzick, are many, and the duties upon them low. Many articles are sent there for which there is no longer any demand in other countries. Poland consumes large quantities of our woollen goods, hard-ware, lead, tin, salt, sea-coal, &c. and the export of manufactured tobacco is greater to Poland than to any other country. The balance of trade may be estimated much in our favour.

To Holland, England sends an immense quantity of many sorts of merchandise; such as all kinds of woollen goods, hides, corn, coals, East-India and Turkey commodities, tobacco, tar, sugar, rice; ginger, and other American productions; and makes return in fine linen, lace, cambrics, thread, tapes, mcle, madder, boards, drugs, whalebone, train-oil, toys, and many other things; and the balance is usually supposed to be much in favour of England.

The foregoing account of the trade of England is adapted to the relative situation of the different countries of Europe, as they stood before the commencement of the present war; but the disastrous events which have taken place during this awful struggle, having totally overthrown the fabric of European politics, dissolved and broken all her political as well as commercial relations; before any speculation on this subject can be hazarded, we must wait till tranquillity is restored and some system of connection and intercourse, which promises to be lasting, established. Whatever this system may be, whether one altogether new, or one similar to the old; we cannot entertain a doubt that Great Britain will retain that dignified situation in the scale of nations; to which her magnanimous conduct during the contest, so justly entitles her; and tho' her commerce may be at present diverted from its former channels, it is at this time greater than it has ever been at any former period.

The acquisitions which the English made upon the coast of Guinea, particularly their settlements at Senegal opened new sources of commerce with Africa. The French, when in possession of Senegal, sent there for gold, slaves, hides, ostrich-feathers, bees-wax, millet, amberg; and above-all, for that useful commodity gum Senegal, which was monopolized by them and the Dutch, and probably will again; as Senegal is now delivered up to France by the late treaty of peace. At present, England sends to the coast of Guinea, sundry sorts of coarse woollen and linen, iron, pewter, brass, and hardware manufactures, lead, shot, swords, knives, fire-arms, gunpowder, and glass manufactures. And, besides its drawing no money out of the kingdom, it lately supplied the American colonies with negro slaves, amounting in number to above 100,000 annually. The other returns are in gold-dust, gum, dyeing and other drugs, redwood, Guinea-grains, and ivory.

To Arabia, Persia, China, and other parts of Asia, England sends much foreign silver coin and bullion, and sundry English manufactures of woollen goods, and of lead, iron, and brass; and brings home from those remote regions, muslins and cottons of many various kinds, calicoes, raw and wrought silk, chintz; teas, porcelain, gold dust, coffee, salt-petre, and many other drugs. And so great a quantity of those various merchandises are re-exported to foreign European nations, as more than abundantly compensates for all the silver bullion which England carries out.

During the infancy of commerce with foreign parts, it was judged expedient to grant exclusive charters to particular bodies or corporations of men; hence the East India, South Sea, Hudson's Bay, Turkey, Russia, Royal African

companies; but the trade to Turkey, Russia, and Africa, is now laid open; though the merchant who proposes to trade thither, must become a member of the company, be subject to their laws and regulations, and advance a small sum at admission, for the purpose of supporting consuls, agents, &c.

With regard to the general account of England's foreign balance, the exports, preceeding 1798, according to the accounts of the inspector general of imports and exports, were 31 millions; the imports 23 millions; the imports from China and the East Indies 6 millions; so that, according to this calculation, England gains, annually, eight millions sterling, exclusive of the profits of her East India trade.

Yet our foreign trade does not amount to one-sixth part of the inland; the annual produce of the natural products and manufactures of England amounting to above forty-two millions. The gold and silver of England is received from Portugal, Spain, Jamaica, the American colonies, and Africa, but great part of this gold and silver we again export to Holland, and the East Indies; and it is supposed that two-thirds of all the foreign traffic of England is carried on in the port of London.

Our bounds will not afford room to enter into a particular detail of the places where those English manufactures, which are mentioned in the above account, are fabricated; a few general strictures, however, may be proper.

Cornwall and Devonshire supply tin and lead, and woollen manufactures are common to almost all the western counties. Dorsetshire makes cordage for the navy, feeds an incredible number of sheep, and has large lace-manufactures. Somersetshire, besides furnishing lead, copper, and lapis calaminaria, has large manufactories of bone-lace, stockings, and caps. Bristol is said by some to employ 2000 maritime vessels of all sizes, coasters as well as ships employed in foreign voyages: it has many very important manufactures; its glass-bottle, and drinking glass, one alone occupying fifteen large houses; its brass-wire manufactures are also very considerable. Vast manufactures of all kinds (glass, jewellery, clocks, watches, and cutlery, in particular), are carried on in London and its neighbourhood; the gold and silver manufactures of London, through the encouragement given them by the court and the nobility, already equal, if they do not exceed, those of any country in Europe. Colchester is famous for its manufactures of bays and ferges; and also Exeter for ferges, and long ells; and Norwich for its excellent stuffs, camblets, druggets, and stockings. Birmingham, though no corporation, is one of the largest and most populous towns in England, and carries on an amazing trade in excellent and ingenious hardware manufactures, particularly snuff and tobacco-boxes, buttons, shoe-buckles, etwees, and many other sorts of steel and brass wares; it is here, and in Sheffield, which is famous for cutlery, that the true genius of English art and industry is to be seen; for such are their excellent inventions for fabricating hard wares, that they can afford them for a fourth part of the price at which other nations can furnish the same of an inferior kind: the cheapness of coals, and all necessaries, and the conveniency of situation, no doubt, contribute greatly to this.

The northern counties of England carry on a prodigious trade in the coarse and slighter woollen manufactures; witness those of Halifax, Leeds, Wakefield, and Richmond, and, above all, Manchester; which, by its variety of beautiful cottons, dimities, ticken, checks, and the like stuffs, is become a large and populous place, though only a village, and its highest magistrate a constable. I might mention here many other manufacturing

towns

judged expedient
of men; hence
Royal African
com

towns and places of England, each of which is noted for some particular commodity; but the detail would become too bulky. I must not however dismiss this head, without observing the beautiful porcelain and earthen ware that have of late years been manufactured in different places of England, particularly in Worcestershire and Staffordshire. The English carpets, especially those of Axminster, Wilton, and Kidderminster, though but a late manufacture, greatly excel in beauty any imported from Turkey, and are extremely durable; and consequently are a vast saving to the nation. Paper, which till very lately was imported in vast quantities from France and Holland, is now made in every corner of the kingdom, and is a most necessary as well as beneficial manufacture. The parliament, of late, has given encouragement for reviving the manufacture of salt-petre, which was first attempted in England by Sr Walter Raleigh, but was dropt afterwards in favour of the East-India company; the success of such an undertaking would be an immense benefit, as well as security to the nation.

After all that has been said on this head, the seats of manufactures, and consequently of trade, in England, are fluctuating; they will always follow those places where living is cheap and taxes are easy: for this reason they have been observed of late to remove towards the northern counties, where provisions are in plenty, and the land-tax very low; add to this, that probably, in a few years, the inland navigations, which are opening in many parts of England, will make vast alterations as to its internal state.

A SHORT VIEW of the STOCKS, or PUBLIC FUNDS in ENGLAND with an HISTORICAL ACCOUNT of the EAST INDIA, the BANK, and the SOUTH COMPANIES.

In order to give a clear idea of the money-transactions of the several companies; it is proper we should say something of money in general, and particularly of paper-money, and the difference between that and the current specie. Money is the standard of the value of all the necessaries and accommodations of life, and paper-money is the representative of that standard to such a degree, as to supply its place, and to answer all the purposes of gold and silver coin. Nothing is necessary to make this representative of money supply the place of specie, but the credit of that office or company who delivers it; which credit consists in its always being ready to turn it into specie whenever required. This is exactly the case of the Bank of England; the notes of this company are of the same value as the current coin, as they may be turned into it whenever the possessor pleases. From hence; as notes are a kind of money, the counterfeiting them is punished with death, as well as coining.

The method of depositing money in the Bank, and exchanging it for notes, (though they bear no interest), is attended with many conveniences: as they are not only safer than money in the hands of the owner himself, but as the notes are more portable, and capable of a much more easy conveyance: since a bank-note for a very large sum may be sent by the post, and, to prevent the designs of robbers, may, without damage, be cut in two, and sent at two several times. Or bills, called Bank-post-bills, may be had by application to the Bank, which are particularly calculated to prevent losses by robberies, they being made payable to the order of the person who takes them out, at a certain number of days after sight; which gives an opportunity to stop bills at the Bank, if they should be lost, and prevents their being so easily negotiated by strangers as common bank notes are: and whoever considers the

hazard, the expence, and trouble there would be in sending large sums of gold and silver to and from distant places, must also consider this as a very singular advantage. Besides which, another benefit attends them; for if they are destroyed by time, or other accident, the Bank will, on bath being made of such accident, and security being given, pay the money to the person who was in possession of them.

Bank-notes differ from all kinds of stock in these three particulars, 1. They are always of the same value. 2. They are paid off without being transferred; and, 3. They bear no interest; while *stocks* are a share in a company's fund, bought without any condition of having the principal returned. *India-bonds* indeed (by some persons, though erroneously, denominated stock) are to be excepted, they being made payable at six months notice, either on the side of the company, or of the possessor.

By the word *Stock* was originally meant, a particular sum of money contributed to the establishing a fund to enable a company to carry on a certain trade, by means of which the person became a partner in that trade, and received a share in the profit made thereby, in proportion to the money employed. But this term has been extended farther, though improperly, to signify any sum of money which has been lent to the government, on condition of receiving a certain interest till the money is repaid, and which makes a part of the national debt. As the security both of the government and the public companies is esteemed preferable to that of any private person; as the stocks are negociable and may be sold at any time; and as the interest is always punctually paid when due; so they are thereby enabled to borrow money on a lower interest than what might be obtained from lending it to private persons, where there is often some danger of losing both principal and interest.

But as every capital stock or fund of a company is raised for a particular purpose, and limited by government to a certain sum, it necessarily follows, that when that fund is completed, no stock can be bought of the company; though shares, already purchased, may be transferred from one person to another. This being the case, there is frequently a great disproportion between the original value of the shares, and what is given for them when transferred; for if there are more buyers than sellers, a person who is indifferent about selling, will not part with his share without a considerable profit to himself: and on the contrary, if many are disposed to sell, and few inclined to buy, the value of such shares will naturally fall, in proportion to the impatience of those who want to turn their stock into specie.

These observations may serve to give our readers some idea of the nature of that unjustifiable and dishonest practice called *Stock-jobbing*, the mystery of which consists in nothing more than this: the persons concerned in that practice, who are denominated *Stock-jobbers*, make contracts to buy or sell at a certain distant time, a certain quantity of some particular stock; against which time they endeavour, according as their contract is, either to raise or lower such stock, by spreading rumours, and fictitious stories, in order to induce people either to sell out in a hurry, and consequently cheap, if they are to deliver stock; or to become unwilling to sell it, and consequently to make it dearer, if they are to receive stock.

The persons who make these contracts are not in general possessed of any real stock; and when the time comes that they are to receive or deliver the quantity they have contracted for, they only pay such a sum of money as makes the difference between the price the stock was at, when they made the contract, and the price it happens to be at when the contract is fulfilled; and

it is no uncommon thing for persons not worth 100*l.* to make contracts for the buying or selling 100,000*l.* stock. In the language of Exchange Alley, the buyer is in this case called the Bull, and the seller the Bear; one is for raising or tossing up, and the other for lowering or trampling upon the stock.

Besides these, there is another set of men, who, though of a higher rank, may properly enough come under the same denomination. These are the great moneyed men, who are dealers in stock, and contractors with the government whenever any money is to be borrowed. These, indeed, are not fictitious, but really buyers and sellers of stock; but by raising false hopes, or creating groundless fears, by pretending to buy or sell large quantities of stock on a sudden, by using the forementioned set of men as their instruments, and other like practices, they are enabled to raise or fall stocks one or two per cent. at pleasure.

However, the real value of one stock above another, on account of its being more profitable to the proprietors, or any thing that will really, or only in imagination, affect the credit of a company, or endanger the government, by which that credit is secured, must naturally have a considerable effect on the stocks. Thus, with respect to the interest of the proprietor, a share in the stock of a trading company which produces 5*l.* or 6*l.* per cent. per annum, must be more valuable than an annuity with government security, that produces no more than 3*l.* or 4*l.* per cent. per annum; and consequently such stock must sell at a higher price than such an annuity. Though it must be observed, that a share in the stock of a trading company producing 5*l.* or 6*l.* per cent. per annum, will not fetch so much money at market as a government annuity producing the same sum, because the security of the company is not reckoned equal to that of the government, and the continuance of their paying so much per annum is more precarious, as their dividend is, or ought to be, always in proportion to the profits of their trade.

As the stocks of the East India, the Bank, and the South Sea companies, are distinguished by different denominations, and are of a very different nature, we shall give a short history of each of them, together with an account of the different stocks each is possessed of, beginning with the East India company, as the first established.

EAST INDIA COMPANY.] We have already given some account of this company, as being the capital commercial object in England. The first idea of it was formed in queen Elizabeth's time, but it has since admitted of vast alterations. Its shares, or subscriptions, were originally only 50*l.* sterling, and its capital only 369,891*l.* 5*s.* but the directors having a considerable dividend to make in 1676, it was agreed to join the profits to the capital, by which the shares were doubled, and consequently each became of 100*l.* value, and the capital 739,782*l.* 10*s.* to which capital, if 963,639*l.* the profits of the company to the year 1685, be added, the whole stock will be found to be 1,703,102*l.* Though the establishment of this company was vindicated in the clearest manner by Sir Josiah Child and other able advocates, yet the partiality which the duke of York, afterwards James II. had for his favourite African trade, the losses it sustained in wars with the Dutch, and the Revolutions which had happened in the affairs of Indostan, damped the ardour of the people to support it; so that at the time of the Revolution, when the war broke out with France, it was in a very indifferent situation. This was in a great measure owing to its having no parliamentary sanction, whereby its stock often sold for one half less than it was really worth; and it was resolved that a new company should be erected under the authority of parliament.

in the country

The opposition given to all the public-spirited measures of King William, by faction, rendered this proposal a matter of vast difficulty; but at last, after many parliamentary enquiries, the new subscription prevailed; and the subscribers, upon advancing two millions to the public at 3 per cent. obtained an act of parliament in their favour. The old company, however, retained a vast interest both in the parliament and nation; and the act being found in some respects defective, so violent a struggle between the two companies arose, that in the year 1702, they were united by an indenture tripartite. In the year 1708, the yearly fund of 3 per cent. for two millions, was reduced to 5 per cent. by a loan of 1,200,000l. to the public, without an additional interest for which consideration the company obtained a prolongation of its exclusive privileges; and a new charter was granted to them, under the title of "The United Company of Merchants trading to the East Indies." Its exclusive right of trade was prolonged from time to time; and a farther sum was lent by the company in 1730; by which, though the company's privileges were extended for thirty-three years, yet the interest of their capital, which then amounted to 3,190,000l. was reduced to three per cent. and called the India three per cent. annuities.

These annuities are different from the trading stock of the company, the proprietors of which, instead of receiving a regular annuity, have, according to their different shares, a dividend of the profits arising from the company's trade; and that dividend rises or falls according to the circumstances of the company, either real, or, as is too often the case, pretended. A proprietor of stock to the amount of 500l. formerly had, but now of 1000l. whether man or woman, native or foreigner, has a right to be a manager, and to give a vote in the general council. Two thousand pounds is the qualification for a director: the directors are twenty-four in number, including the chairman, and deputy-chairman, who may be re-elected in turn, six a year, for four years successively. The chairman has a salary of 200l. a year, and each of the directors 150l. The meetings, or court of directors, are to be held at least once a week; but are commonly oftner, being summoned, as occasion requires. Out of the body of directors are chosen several committees, who have the peculiar inspection of certain branches of the company's business; as the committee of correspondence, a committee of treasury, a house committee, a committee of warehouse, a committee of shipping, a committee of accounts, a committee of lawsuits, and a committee to prevent the growth of private trade; who have under them a secretary, cashier, clerks, and warehouse-keepers.

The amazing territorial acquisitions of this company, computed to be 287,000 square miles, and containing thirty millions of people, must be necessarily attended with a proportionable increase of trade; and this joined to the dissensions among its managers both at home and abroad, have of late greatly engaged the attention of the legislature. A restriction has occasionally been laid on their dividends for a certain time. From the report of the committee in 1773, appointed by parliament on Indian affairs, it appears that the India Company, from the year 1708 to 1750, for the space of forty-seven years and a half, divided the sum of 12,000,000l. or above

in the country trade, and from China		6 Packets 310
		34 Galleys 740

180,000. per annum, which, on a capital of 3,100,000. amounted to above eight and a half per-cent. and that at the last mentioned period it appeared, that besides the above dividend, the capital stock of the company had been increased 180,000. Considerable alterations were made in the affairs and constitution of the East India Company by an act passed in 1773, intitled, "An act for establishing certain rules and orders, for the future management of the affairs of the East India Company, as well in India as in Europe." It was thereby enacted, that the court of directors should, in future, be elected for four years; six members annually, but none to hold their seats longer than four years. That no person should vote at the election of the directors, who had not possessed their stock twelve months. That the stock of qualification should, instead of 500. as it had formerly been, be 1000. That the mayor's court of Calcutta should for the future be confined to small mercantile causes, to which only its jurisdiction extended before the territorial acquisition. That in lieu of this court, thus taken away, a new one be established, consisting of a chief justice and three puisne judges; and that these judges be appointed by the crown. That a superiority be given to the presidency of Bengal, over the other presidencies in India. That the right of nominating the governor and council of Bengal should be vested in the crown. The salaries of the judges were also fixed, at 8000. to the chief justice, and 6000. a year to each of the other three. The appointments of the governor-general and council were also fixed, the first at 25,000. and the four others at 10,000. each annually. This was certainly a very extraordinary act, and an immense power and influence were thereby added to the crown. But no proportional benefit has hitherto resulted to the company: on the contrary, the new established court of justice has paid so little attention to the manners of the inhabitants of India, and to the usages of that country, as to occasion the most alarming discontents among the natives, and great dissatisfaction even among the company's own servants.

In the month of November, 1783, Mr. Fox, then secretary of state, brought forward a bill for new regulating the company, under the supposition of the incompetency of the directors, and the present insolvent state of the company.

The bill passed the commons; but, it seems by the secret influence of the crown, an opposition was formed against it in the house of lords, as placing too dangerous a power in the hands of any men, and which would be sure to operate against the necessary power of the crown; and, after long debates, it was thrown out by a majority of nineteen peers. The consequence of this, was the downfall of the ministry, and a general revolution of the cabinet.

By the new bill, which passed at the close of the session 1784, three things were intended.

First, the establishing a power of controul, in this kingdom, by which the executive government in India is to be connected with that over the rest of the empire.

Secondly, the regulating the conduct of the company's servants in India, in order to remedy the evils which have prevailed there.

Thirdly, the providing for the punishment of those persons who shall, nevertheless, continue in the practice of crimes which have brought disgrace upon the country.

Accordingly, six persons are to be nominated by the king as commissioners for the affairs of India, of which one of the secretaries of state and the

chancellor of the Exchequer for the time being, shall be two, and the president is to have the casting vote, if equally divided. New commissioners to be appointed at the pleasure of the crown. This board is to superintend, direct and controul all acts, operations, and concerns which in any wise relate to the civil and military government or revenues of the British territorial possessions in the East Indies. They are sworn to execute the several powers and trusts reposed in them without favour or affectation, prejudice or malice, to any person whatever. The court of directors of the company are to deliver to this board all minutes, orders, and resolutions of themselves, and of the courts of proprietors, and copies of all letters, orders, and instructions proposed to be sent abroad, for their approbation or alteration. None to be sent until after such previous communication on any pretence whatsoever. The directors are still to appoint the servants abroad, but the king has a power by his secretary of state to recal either of the governors or members of the councils, or any person holding any office under the company in their settlements, and make void their appointment. By this bill there is given to the governor and council of Bengal, a controul over the other presidencies in all points which relate to any transactions with the country powers, to peace and war, or to the application of their forces or revenues; but the council of Bengal are subjected to the absolute direction of the company at home, and in all cases, except those of immediate danger and necessity, refrained from acting without orders received from hence.

BANK OF ENGLAND.] The company of the Bank was incorporated by parliament, in the 5th and 6th year of king William and queen Mary, by the name of the Governor and Company of the Bank of England; in consideration of the loan of 1,200,000*l.* granted to the government; for which the subscribers received almost 8 per cent. By this charter, the company are not to borrow under their common seal, unless by act of parliament; they are not to trade, or suffer any person in trust for them to trade in any goods or merchandise; but they may deal in bills of exchange, in buying or selling bullion, and foreign gold and silver coin, &c.

By an act of parliament passed in the 8 and 9th year of William III. they were empowered to enlarge their capital stock to 2,201,171*l.* 10*s.* It was then also enacted, that Bank stock should be a personal and not a real estate; that no contract either in word or writing, for buying or selling Bank stock, should be good in law, unless registered in the books of the Bank within seven days, and the stock transferred in fourteen days, and that it should be felony, without the benefit of clergy, to counterfeit the common seal of the Bank or any sealed Bank bill, or any Bank-note, or to alter or erase such bills or notes.

By another act, passed in the 7th of queen Anne, the company were empowered to augment their capital to 4,402,343*l.* and they then advanced 400,000*l.* more to the government; and in 1714 they advanced another loan of 1,500,000*l.*

In the third year of king George I. the interest of their capital stock was reduced to 5 per cent. when the Bank agreed to deliver up as many Exchequer bills as amounted to 2,000,000*l.* and to accept an annuity of 100,000*l.* and it was declared lawful for the Bank to call from their members, in proportion to their interests in their capital stock, such sums of money as in a general court should be found necessary. If any member should neglect to pay his share of the monies so called for, at the time appointed, by notice in the London Gazette, and fixed upon the Royal Exchange, it should be lawful for the Bank, not only to stop the dividend of such a member, and

to apply it toward payment of the money in question, but also to stop the transfers of the share of such defaulter, and to charge him with the interest of 5 per cent. per annum for the money so omitted to be paid; and if the principal and interest should be three months unpaid, the Bank should then have power to sell so much of the stock belonging to the defaulter as would satisfy the same.

After this the Bank reduced the interest of the 2,000,000l. lent to the government, from 5 to 4 per cent. and purchased several other annuities, which were afterwards redeemed by the government and the national debt due to the Bank, reduced to 1,600,000l. But in 1742, the company engaged to supply the government with 1,600,000l. at three per cent. which is now called the three per cent. annuities; so that the government was now indebted to the company 3,200,000l. the one half carrying 4, and the other 3 per cent.

In the year 1746, the company agreed that the sum of 986,800l. due to them in the Exchequer bills unsatisfied, on the duties for licences to sell spirituous liquors by retail, should be cancelled, and in lieu thereof to accept of an annuity of 39,442l. the interest of that sum at 4 per cent. The company also agreed to advance the farther sum of 1,000,000l. into the Exchequer, upon the credit of the duties arising by the malt and land-tax, at 4 per cent. for Exchequer bills to be issued for that purpose; in consideration of which the company were enabled to augment their capital with 986,800l. the interest of which, as well as that of the other annuities, was reduced to three and a half per cent. till the 25th of December, 1757, and from that time to carry only 3 per cent.

And in order to enable them to circulate the said Exchequer bills, they established what is now called Bank circulation: the nature of which not being well understood, we shall take the liberty to be a little more particular in its explanation than we have been with regard to the other stocks.

The company of the Bank are obliged to keep cash sufficient to answer not only the common, but also any extraordinary demand that may be made upon them; and whatever money they have by them over and above the sum supposed necessary for these purposes, they employ in what may be called the trade of the company; that is to say, in discounting bills of exchange, in buying of gold and silver, and in government securities, &c. But when the Bank entered into the above-mentioned contract; as they did not keep unemployed a larger sum of money than what they deemed necessary to answer their ordinary and extraordinary demands, they could not conveniently take out of their current cash so large a sum as a million, with which they were obliged to furnish the government, without either lessening that sum they employed in discounting, buying gold and silver, &c. (which would have been very disadvantageous to them), or inventing some method that should answer all the purposes of keeping the million in cash. The method which they chose, and which fully answers their end, was as follows:

They opened a subscription, which they renew annually, for a million of money; wherein the subscribers advance 10 per cent. and enter into a contract to pay the remainder, or any part thereof, whenever the Bank shall call upon them, under the penalty of forfeiting the 10 per cent. so advanced; in consideration of which, the Bank pays the subscribers 4 per cent. interest for the money paid in, and one fourth per cent. for the whole sum they agree to furnish; and in case a call should be upon them for the whole, or any part

† The Bank

part thereof, the Bank farther agrees to pay them at the rate of 5 per cent. per annum for such sum till they repay it, which they are under an obligation to do at the end of the year. By this means the Bank obtains all the purposes of keeping a million of money by them; and though the subscribers, if no call is made upon them, (which is in general the case), receive six and a half per cent. for the money they advance, yet the company gains the sum of 23,500l. per annum by the contract; as will appear by the following account:

The Bank receives from the government for the advance of a million	£. 30,000
The Bank pays to the subscribers who advance 100,000l. and engage to pay (when called for) 900,000l. more	6,500
The clear gain to the Bank therefore is	23,500

This is the state of the case, provided the company should make no call on the subscribers, which they will be very unwilling to do, because it would not only lessen their profit, but affect the public credit in general.

Bank stock may not improperly be called a trading stock, since with this they deal very largely in foreign gold and silver, in discounting bills of exchange, &c. Besides which, they are allowed by the government very considerable sums annually for the management of the annuities paid at their office. All which advantages render a share in their stock very valuable; though it is not equal in value to the East India stock. The company make dividends of the profits half yearly, of which notice is publicly given; when those who have occasion for their money, may readily receive it: but private persons, if they judge convenient, are permitted to continue their funds, and to have their interest added to the principal.

This company is under the direction of a governor, deputy-governor, and twenty-four directors, who are annually elected by the general court, in the same manner as in the East India company. Thirteen, or more, compose a court of directors for managing the affairs of the company.

The officers and servants of this company are very numerous.

SOUTH SEA COMPANY.] During the long war with France, in the reign of queen Anne, the payment of the sailors of the royal navy being neglected, and they receiving tickets, instead of money, were frequently obliged, by their necessities, to sell these tickets to avaricious men at a discount of 40 and sometimes 50l. per cent. By this, and other means, the debts of the nation unprovided for by parliament, and which amounted to 9,471,321l. fell into the hands of these usurers. On which Mr Harley, at that time chancellor of the Exchequer, and afterwards earl of Oxford, proposed a scheme to allow the proprietors of these debts and deficiencies 6l. per cent. per annum, and to incorporate them, in order to their carrying on a trade to the South Sea; and they were accordingly incorporated under the title of, "the Governor and Company of Merchants of Great Britain, trading to the South Sea, and other parts of America, and for encouraging the fishery, &c."

Though this company seemed formed for the sake of commerce, it is certain that the ministry never thought seriously, during the course of the war;

* At 4 per cent. in the year 1773, when it was advanced to five.

† The Bank company is supposed now to have twelve millions of circulating paper.

about making any settlement on the coast of South America, which was what flattered the expectations of the people; nor was it indeed ever carried into execution, or any trade ever undertaken by this company, except the Affiento, in pursuance of the treaty of Utrecht, for furnishing the Spaniards with Negroes, of which this company was deprived upon receiving 100,000*l.* in lieu of all claims upon Spain, by a convention between the courts of Great Britain and Spain, soon after the treaty of Aix-la-Chapelle, in 1748.

Some other sums were lent to the government in the reign of queen Anne, at 6 per cent. In the third of George I. the interest of the whole was reduced to 5 per cent. and they advanced two millions more to the government at the same interest. By the statute of the 6th of George I. it was declared, that this company might redeem all or any of the redeemable national debts; in consideration of which, the company were empowered to augment their capital according to the sums they should discharge: and for enabling the company to raise such sums for purchasing annuities, exchanging for ready money new Exchequer bills, carrying on their trade, &c. the company might, by such means as they should think proper, raise such sums of money as in a general court of the company should be judged necessary. The company were also empowered to raise money on the contracts, bonds, or obligations under their common seal, on the credit of their public stock. But if the sub-governor, deputy-governor, or other members of the company, should purchase lands or revenues of the crown, upon account of the corporation, or lend money by loan or anticipation on any branch of the revenue, other than such part only on which a credit of loan was granted by parliament, such sub-governor, or other member of the company, should forfeit treble the value of the money so lent.

The fatal South Sea scheme, transacted in the year 1720, was executed upon the last mentioned statute. The company had at first set out with good success, and the value of their stock, for the first five years, had risen faster than that of any other company; and his majesty, after purchasing 10,000*l.* stock, had condescended to be their governor. Things were in this situation when, taking advantage of the above statute, the South-Sea bubble was projected. The pretended design of which was, to raise a fund for carrying on trade to the South Sea, and purchasing annuities, &c. paid to the other companies: and proposals were printed and distributed, shewing the advantages of the design, and inviting persons into it. The sum necessary for carrying it on, together with the profits that were to arise from it, were divided into a certain number of shares, or subscriptions, to be purchased by persons disposed to adventure therein. And the better to carry on the deception, the directors engaged to make very large dividends; and actually declared, that every 100*l.* original stock would yield 50*l.* per annum: which occasioned so great a rise of their stock, that a share of 100*l.* was sold for 800*l.* This was in the month of July; but before the end of September it fell to 150*l.* by which multitudes were ruined, and such a scene of distress occasioned, as is scarcely to be conceived. But the consequence of this infamous scheme are too well known; most of the directors were severely fined, to the loss of nearly all their property; some of whom had no hand in the deception, nor gained a farthing by it; but it was agreed they ought to have opposed and prevented it.

By a statute of the 6th of George II. it was enacted, that from and after the 24th of June, 1733, the capital stock of this company, which amounted to 14,631,103*l.* 8*sh.* 1*d.* and the shares of the respective proprietors should be divided into four equal parts; three-fourths of which should be converted

into a joint stock, attended with annuities after the rate of 4 per cent. until redemption by parliament, and should be called the New South Sea annuities, and the other fourth part should remain in the company as a trading capital stock attended with the residue of the annuities or funds payable at the Exchequer to the company for their whole capital, till redemption; and attended with the same sums always allowed for the charge of management, with all effects, profits of trade, debts, privileges, and advantages belonging to the South Sea company. That the accountant of the company should, twice every year, at Christmas and midsummer, or within one month after, state an account of the company's affairs, which should be laid before the next general court, in order to their declaring a dividend; and all dividends should be made out of the clear profits, and should not exceed what the company might reasonably divide without incurring any farther debt; provided that the company should not at any time divide more than 4 per cent. per annua until their debts were discharged; and the South Sea company, and their trading stock, should, exclusively from the new joint stock of annuities, be liable to all debts and incumbrances of the company; and that the company should cause to be kept, within the city of London, an office and books, in which all transfers of the new annuities should be entered and signed by the party making such transfer, or his attorney; and the person to whom such transfer should be made, or his attorney, should underwrite his acceptance; and no other method of transferring the annuities should be good in law.

The annuities of this company, as well as the other, are now reduced to 3 per cent.

This company is under the direction of a governor, sub-governor, deputy governor, and twenty-one directors; but no person is qualified to be governor, his majesty excepted, unless such governor has, in his own name and right, 5000*l.* in the trading stock; the sub-governor is to have 4000*l.* the deputy-governor 3000*l.* and a director 2000*l.* in the same stock. In every general court, every member having in his own name and right 500*l.* in trading stock, has one vote; if 2000*l.* two votes; if 3000*l.* three votes, and if 5000*l.* four votes.

The East India company, the Bank of England, and the South Sea company, are the only incorporated bodies to which the government is indebted, except the million Bank, whose capital is only one million, constituted to purchase the reversion of the long Exchequer orders.

The interest of all the debts owing by the government was lately reduced to 3 per cent. excepting only the annuities for the year 1758, the life annuities, and the Exchequer orders; but the South Sea company still continues to divide 4 per cent. on their present capital stock; which they are enabled to do from the profits they make on the sums allowed to them for management of the annuities paid at their office, and from the interest of annuities which are not claimed by the proprietors.

As the prices of the different stocks are continually fluctuating above and below *par*; so when a person, who is not acquainted with transactions of that nature, reads in the papers the prices of stocks, where Bank stock is marked perhaps 127, India ditto, 134 a 134½, South Sea ditto 97½, &c. he is to understand that 100*l.* of those respective stocks sell at such a time for those several sums.

In comparing the prices of the different stocks one with another, it must be remembered, that the interest due on them from the time of the last payment is taken into the current price, and the seller never receives any separate

consideration for it, except in the case of India bonds, where the interest due is calculated to the day of the sale, and paid by the purchaser, over and above the premium agreed for. But as the interest on the different stocks is paid at different times, this, if not rightly understood, would lead a person, not well acquainted with them, into considerable mistakes in his computation of their value; some always having a quarter's interest due to them more than others, which makes an appearance of a considerable difference in the price, when in reality there is none at all; thus for instance, Old South Sea annuities sell for 85*l.* or 85*l.* 10*s.* while New South Sea annuities fetch only 84*l.* or 84*l.* 15*s.* though each of them produce the annual sum of 3 per cent.; but the old annuities have a quarter's interest more due on them than the new annuities, which amounts to 15*s.* the exact difference. There is, however, one or two causes that will always make one species of annuities sell somewhat lower than another, though of the same real value; one of which is, the annuities making but a small capital, and there not being, for that reason, so many people at all times ready to buy into it, as into others, where the quantity is larger; because it is apprehended that whenever the government pays off the national debt, they will begin with that particular species of annuity, the capital of which is the smallest.

While the annuities and interest for money advanced, is regularly paid, and the principal insured by both prince and people (a security not to be had in other nations), foreigners will lend us their property, and all Europe be interested in our welfare; the paper of the companies will be converted into money and merchandise, and Great Britain can never want cash to carry her schemes into execution. In other nations, credit is founded on the word of the prince, if a monarchy; or that of the people, if a republic; but here it is established on the interest of both prince and people, which is the strongest security; for however lovely and engaging honesty may be in other subjects, interest in money matters will always obtain confidence; because many people pay great regard to their interest, who have but little veneration for virtue.

[CONSTITUTION AND LAWS.] Tacitus, in describing such a constitution as that of England, seems to think, that however beautiful it may be in theory, it will be found impracticable in the execution. Experience has proved this mistake; for, by contrivances unknown to antiquity, the English constitution has existed for above 500 years. It must at the same time be admitted, that it has received, during that time, many amendements, and some interruptions; but its principles are the same with those described by the above-mentioned historian, as belonging to the Germans, and the other northern ancestors of the English nation, and which are very improperly blended under the name of Gothic. On the first invasion of England by the Saxons, who came from Germany and the neighbouring countries, their laws and manners were pretty much the same as those mentioned by Tacitus. The people had a leader in time of war. The conquered lands, in proportion to the merits of his followers, and their abilities to serve him, were distributed among them: and the whole was considered as the common property which they were to unite in defending against all invaders. Fresh adventurers coming over, under separate leaders, the old inhabitants were driven into Wales; and those leaders, at last, assumed the titles of kings over the several districts they had conquered. This change of appellation made them more respectable among the Britons, and their neighbours the Scots and Picts, but did not increase their power, the operations of which continued to be confined to military affairs.

* Called by

All civil matters were proposed in a general assembly of the chief officers and the people, till, by degrees, sheriffs and other civil officers were appointed. To Alfred we owe that masterpiece of judicial policy the subdivision of England into wapentakes and hundreds, and the subdivision of hundreds into tithings, names that still subsist in England; and overseers were chosen to direct them for the good of the whole. The sheriff was the judge of all civil and criminal matters within the county, and to him, after the introduction of Christianity, was added the bishop. In process of time, as business multiplied, itinerant and other judges were appointed; but by the earliest records, it appears that all civil matters were decided by 12 or 16 men, living in the neighbourhood of the place where the dispute lay; and here we have the original of English juries. It is certain that they were in use among the earliest Saxon colonies, their institution being ascribed by bishop Nicholson to Woden himself, their great legislator and captain. Hence we find traces of juries in the laws of all those nations which adopted the feudal system, as in Germany, France, and Italy; who had all of them a tribunal composed of 12 good men and true, equals or peers of the party litigant. In England we find actual mention made of them so early as the laws of king Ethelred, and that not as a new invention.

Before the introduction of Christianity, we know not whether the Saxons admitted of juries in criminal matters; but we are certain that there was no action so criminal as not to be compensated for by money*. A mulct was imposed in proportion to the guilt, even if it was the murder of the king, upon the malefactor, and by paying it he purchased his pardon. Those barbarous usages seem to have ceased soon after the Saxons were converted to Christianity; and cases of felony and murder were then tried, even in the king's court, by a jury.

Royalty, among the Saxons, was not, strictly speaking, hereditary, though, in fact, it came to be rendered so through the affection which the people bore for the blood of their kings, and for preserving the regularity of government. Even estates and honours were not strictly hereditary, till they were made so by William the Norman.

In many respects, the first princes of the Norman line afterwards did all they could to efface from the minds of the people the remembrance of the Saxon constitution; but the attempt was to no purpose. The nobility, as well as the people, had their complaint against the crown, and, after much war and bloodshed, the famous charter of English liberties, so well known by the name of Magna Charta, was forcibly, in a manner, obtained from king John, and confirmed by his son Henry III. who succeeded to the crown in 1216. It does not appear, that till this reign, and after a great deal of blood had been spilt, the commons of England were represented in parliament, or the great council of the nation; so entirely had the barons engrossed to themselves the disposal of property.

The precise year when the house of commons was formed, is not known: but we are certain there was one in the reign of Henry III. though we shall not enter into any disputes about their specific powers. We therefore now proceed to describe the CONSTITUTION as it stands at present.

In all states there is an absolute supreme power, to which the right of legislation belongs; and which, by the singular constitution of these kingdoms, is here vested in the king, lords, and commons.

M m 2

Or

* Called by the Saxons *Gwilt*; and thence the word guilty, in criminal trials.

OF THE KING.] The supreme executive power of Great Britain, and Ireland, is vested by our constitution in a single person, king or queen; for it is indifferent to which sex the crown descends; the person intitled to it, whether male or female, is immediately entrusted with all the ensigns, rights, and prerogatives of sovereign power.

The grand fundamental maxim upon which the right of succession to the throne of these kingdoms depends, is, "that the crown, by common law and constitutional custom, is hereditary, and this in a manner peculiar to itself; but that the right of inheritance may, from time to time, be changed, or limited, by act of parliament: under which limitations the crown still continues hereditary."

That the reader may enter more clearly into the deduction of the following royal succession, by its being transferred from the house of Tudor to that of Stuart, it may be proper to inform him, that on the death of queen Elizabeth, without issue, it became necessary to recur to the other issue of her grandfather Henry VII. by Elizabeth of York his queen; whose eldest daughter Margaret, having married James IV. king of Scotland, king James the Sixth of Scotland, and of England the First, was the lineal descendant from that alliance. So that in his person, as clearly as in Henry VIII. centered all the claims of the different competitors, from the Norman invasion downward; he being indisputably the lineal heir of William I. And, what is still more remarkable, in his person also centred the right of the Saxon monarchs, which had been suspended from the Norman invasion till his accession. For Margaret, the sister of Edgar Atheling, the daughter of Edward the Outlaw, and grand-daughter of king Edmund Ironside, was the person in whom the hereditary rights of the Saxon kings, supposing it not abolished by the Conquest, resided. She married Malcolm III. king of Scotland; and Henry II. by a descent from Matilda their daughter, is generally called the restorer of the Saxon line. But it must be remembered, that Malcolm, by his Saxon queen, had sons as well as daughters; and that the royal family of Scotland, from that time downward, were the offspring of Malcolm and Margaret. Of this royal family king James I. was the direct and lineal descendant; and therefore united in his person every possible claim by hereditary right, to the English as well as Scottish throne, being the heir both of Egbert and William the Norman.

At the Revolution in 1688, the convention of estates, or representative body of the nation, declared that the misconduct of king James II. amounted to an abdication of the government, and that the throne was thereby vacant.

In consequence of this vacancy, and from a regard to the ancient line, the convention appointed the next Protestant heirs of the blood royal of king Charles I. to fill the vacant throne, in the old order of succession; with a temporary exception, or preference to the person of king William III.

On the impending failure of the Protestant line of king Charles I. (whereby the throne might again have become vacant) the king and parliament extended the settlement of the crown to the Protestant line of king James I. viz. to the princess Sophia of Hanover, and the heirs of her body, being Protestants; and she is now the common stock, from whom the heirs of the crown must descend.

A chronology of English Kings, since the time that this country became united under one monarchy, in the person of Egbert, who subdued the other princes of the Saxons heptarchy, and gave the name of Angle-land to this part of the island, the Saxons and

The true ground and principle, upon which the Revolution proceeded, was entirely a new case in politics, which had never before happened in our history; the abdication of the reigning monarch, and the vacancy of the throne thereupon. It was not a defeasance of the right of the succession, and a new limitation of the crown by the king and both houses of parliament; it was the act of the nation alone, upon a conviction that there was no king in being. For in a full assembly of the lords and commons, met in convention upon the supposition of this vacancy, both houses came to this resolution: "that king James II. having endeavoured to subvert the constitution of the kingdom, by breaking the original contract between king and people; and by the advice of Jesuits, and other wicked persons, having violated the fundamental laws, and having withdrawn himself out of this kingdom, has abdicated the government, and that the throne is thereby vacant." Thus ended at once, by this sudden and unexpected revolution, the old line of succession: which from the Norman invasion had lasted above 600 years, and from the union of the Saxa heptarchy in king Egbert almost 900.

Though

Though in some points the revolution was not so perfect as might have been wished, yet from thence a new æra commenced, in which the bounds of prerogative and liberty have been better defined, the principles of government more thoroughly examined and understood, and the rights of the subject more explicitly guarded by legal provisions, than in any other period of the English history. In particular, it is worthy of observation, that the convention, in this their judgement, avoided with great wisdom the extremes into which the visionary theories of some zealous republicans would have led them. They held that this misconduct of king James amounted to an endeavour to subvert the constitution, and not to an actual subversion, or total dissolution of the government. They, therefore, very prudently voted it to amount to no more than an abdication of the government, and a consequent vacancy of the throne; whereby the government was allowed to subsist, though the executive magistracy was gone: and the kingly office to remain, though James was no longer king. And thus the constitution was kept entire; which, upon every sound principle of government must otherwise have fallen to pieces, had fo principal and constituent a part as the royal authority been abolished, or even suspended.

Hence it is easy to collect, that the title to the crown is at present hereditary, though not quite so absolutely hereditary as formerly; and the common stock or ancestor, from whom the descent must be derived, is also different. Formerly the common stock was king Egbert; then William the Conqueror; afterward, in James I.'s time, the two common stocks united, and so continued till the vacancy of the throne in 1688: now it is the princess Sophia, in whom the inheritance was vested by the new king and parliament. Formerly the descent was absolute, and the crown went to the next heir without any

restriction; but now, upon the new settlement, the inheritance is conditional; being limited to such heirs only, of the body of the princess Sophia, as are protestant members of the church of England, and are married to, none but Protestants.

And in this due medium consists the true constitutional notion of the right of succession to the imperial crown of these kingdoms. The extremes between which it steers, have been thought each of them to be destructive of those ends for which societies were formed, and are kept on foot. Where the magistrate, upon every succession, is elected by the people, and may by the express provision of the laws be deposed (if not punished) by his subjects, this may sound like the perfection of liberty, and look well enough when delineated on paper; but in practice will be ever found extremely difficult. And, on the other hand divine indefeasible hereditary right as our laws have created and vested in the royal stock, is closely interwoven with those liberties, which are equally the inheritance of the subject, this union will form a constitution in theory the most beautiful of any, in practice the most approved, and, in all probability will prove in duration the most permanent. This constitution it is the duty of every Briton to understand, to revere, and to defend.

The principal duties of the king are expressed in his oath at the coronation, which is administered by one of the archbishops or bishops of the realm, in the presence of all the people; who on their parts, do reciprocally take the oath of allegiance to the crown. This coronation oath is conceived in the following terms:

"The archbishop, or bishop, shall say. Will you solemnly promise and swear, to govern the people of this kingdom of England, and the dominions thereunto belonging, according to the statutes in parliament agreed on, and the laws and customs of the same?—*The king or queen shall say,* I solemnly promise so to do.

"Archbishop or bishop. Will you to your power cause law and justice, in mercy, to be executed in all your judgments?—*King or queen.* I will.

"Archbishop or bishop. Will you to the utmost of your power maintain the laws of God, the true profession of the gospel, and the protestant reformed religion established by the law? and will you preserve unto the bishops and clergy of this realm, and to the churches committed to their charge, all such rights and privileges as by the law, do, or shall appertain unto them, or any of them.—All this I promise to do.

"After this the king or queen, laying his or her hand upon the holy gospels, shall say. The things which I have here before promised. I will perform and keep; So help me God: *And then kiss the book.*"

This is the form of the coronation oath, as it is now prescribed by our laws: and we may observe, that, in the king's part, in this original contract, are expressed all the duties that a monarch can owe to his people; viz. to govern according to law; to execute judgment in mercy; and to maintain the established religion. With respect to the latter of these three branches we may farther remark, that by the act of union, 5 Ann. c. 8. two preceding statutes are recited and confirmed; the one of the parliament of Scotland, the other of the parliament of England, which enact; the former, that every king at his succession shall take and subscribe an oath, to preserve the Protestant religion, and Presbyterian church government in Scotland; the latter, that, at his coronation, he shall take and subscribe a similar oath, to preserve the settlement of the church of England within England, Ireland, Wales, and Berwick, and the territories thereunto belonging.

The

The king of Great Britain, notwithstanding the limitations of the power of the crown, already mentioned, is the greatest monarch reigning over a free people. His person is sacred in the eye of the law, which makes it high treason so much as to imagine or intend his death; neither can he, in himself, be deemed guilty of any crime, the law taking no cognizance of his actions, but only in the persons of his ministers, if they infringe the laws of the land. As to his power, it is very great, though he has no right to extend his prerogative beyond the ancient limits or the boundaries prescribed by the constitution; he can make no new laws, nor raise any new taxes, nor act in opposition to any of the laws; but he can make war or peace; send and receive ambassadors; make treaties of league and commerce; levy armies, and fit out fleets, for the defence of his kingdom, the annoyance of his enemies, or the suppression of rebellions; grant commissions to his officers, both by sea and land, or revoke them at pleasure; dispose of all magazines, castles &c. summon the parliament to meet, and, when met, adjourn, prorogue, or dissolve it at pleasure; refuse his assent to any bill, though it had passed both houses; which, consequently, by such a refusal, has no more force than if it had never been moved; but this is a prerogative that the kings of England have very seldom ventured to exercise. He possesseth the right of choosing his own council; of nominating all the great officers of state, of the household, and the church; and, in fine, is the fountain of honour, from whom all degrees of nobility and knighthood are derived. Such is the dignity and power of a king of Great Britain.

OF THE PARLIAMENT.] Parliaments, or general councils, in some shape, are, as has been before observed, of as high antiquity as the Saxon government in this island, and coeval with the kingdom itself. Blackstone, in his valuable Commentaries, says, "it is generally agreed, that in the main the constitution of parliament as it now stands, was marked out so long ago as the 17th of king John, A. D. 1215, in the Great Charter granted by that prince; wherein he promises to summon all archbishops, bishops, abbots, lords, and greater barons personally; and all other tenants in chief, under the crown, by the sheriff and bailiffs to meet at a certain place, with forty days notice, to assess aids and scutages when necessary. And this constitution had subsisted, in fact, at least from the year 1266, to 49 Henry III. there being still extant writs of that date to summon knights, citizens, and burgesses to parliament."

The parliament is assembled by the king's writs, and its sitting must not be intermitted above three years. Its constituent parts are, the king sitting there in his royal political capacity, and the three estates of the realm; the lords spiritual, the lords temporal (who sit together with the king in one house), and the commons, who sit by themselves in another. The king and these three estates, together, form the great corporation or body politic of the kingdom, of which the king is said to be *caput, principium, et finis*. For upon their coming together the king meets them, either in person, or by representation; without which there can be no beginning of a parliament; and he also has alone the power of dissolving them.

It is highly necessary for preserving the balance of the constitution, that the executive power should be a branch, though not the whole, of the legislature. The crown cannot begin of itself any alterations in the present established law; but it may approve or disapprove of the alterations suggested and consented to by the two houses. The legislative therefore cannot abridge the executive power of any rights which it now has by law, without its own consent; since the law must perpetually stand as it now does, unless all the power

will agree to alter it. And herein indeed consists the true excellency of the English government, were it maintained in its purity, that all the parts of it form a mutual check upon each other. In the legislature, the people are a check upon the nobility, and the nobility a check upon the people; by the mutual privilege of rejecting what the other has resolved: while the king is a check upon both, which preserves the executive power from encroachments.

The lords spiritual consist of two archbishops and twenty-four bishops. The lords temporal consist of all the peers of the realm, the bishops not being in strictness held to be such, but merely lords of parliament. Some of the peers sit by descent, as do all ancient peers; some by creation, as do all the new-made ones: others, since the union with Scotland, by election, which is the case of the sixteen peers, who represent the body of the Scots nobility. The number of peers is indefinite, and may be increased at will by the power of the crown.

A body of nobility is more peculiarly necessary in our mixed and compounded constitution, in order to support the rights of both the crown and the people; by forming a barrier to withstand the encroachments of both. It creates and preserves that gradual scale of dignity, which proceeds from the peasant to the prince; rising like a pyramid from a broad foundation, and diminishing to a point as it rises. The nobility therefore are the pillars, which are reared from among the people, more immediately to support the throne; and if that falls, they must also be buried under its ruins. Accordingly, when in the last century the commons had determined to extirpate monarchy, they also voted the house of lords to be useless and dangerous.

The commons consist of all such men of any property in the kingdom, as have not seats in the house of lords; every one of which has a voice in parliament, either personally, or by his representatives*. In a free state, every man who is supposed a free agent, ought to be in some measure, his own governor; and therefore a branch at least of the legislative power should reside in the whole body of the people. In so large a state as ours, it is very wisely contrived, that the people should do that by their representatives, which it is impracticable to perform in person; representatives chosen by a number of minute and separate districts, wherein all the voters are, or easily may be, distinguished. The counties are therefore represented by knights, elected by the proprietors of lands: the cities and boroughs are represented by citizens and burgesses, chosen by the mercantile part, or supposed trading interest of the nation †. The number of English representatives is 513, and of Scots 45; in all 558. And every member, though chosen by one particular dis-

N N

* This must be understood with some limitation. Those who are possessed of land-estates, though to the value of only 40s per annum, have a right to vote for members of parliament; as have most of the members of corporations, boroughs, &c. But there are very large trading towns, and populous places, which send no members to parliament; and of those towns which do send members, great numbers of the inhabitants have no votes. Many thousand persons of great personal property, have, therefore, no representatives. Indeed the inequality and defectiveness of the representation, has been justly considered as one of the greatest imperfections in the English constitution. The duration of parliaments being extended to seven years, has also been viewed in the same light.

† Copy of the bribery oath, which is administered to every person before they poll.

do swear (or being one of the people called Quakers, do solemnly affirm) I have not received or had, by myself, or any person whatsoever in trust for me, or for my use and benefit, directly or indirectly, any sum or sum of money, office, place or employment, gift or reward or any promise or security for any money, office, or employment, or gift, in order to give my vote at this election; and that I have not before been polled at this election. So help me God."

trick, when elected and returned, serves for the whole realm. For the end of his coming thither is not particular, but general; not merely to serve his constituents, but also the commonwealth, and to advise his majesty, as appears from the writ of summons.

These are the constituent parts of a parliament, the king, the lords spiritual and temporal, and the commons. Parts, of which each is so necessary, that the consent of all three is required to make any new law that should bind the subject. Whatever is enacted for law by one, or by two only, of the three, is no statute; and to it no regard is due, unless in matters relating to their own privileges.

The power and jurisdiction of parliament, says Edward Coke, is so transcendent and absolute, that it cannot be confined, either for causes or persons, within any bounds. It hath sovereign and uncontrollable authority in making, confirming, enlarging, restraining, abrogating, repealing, reviving, and expounding of laws, concerning matters of all possible denominations, ecclesiastical or temporal, civil, military, maritime, or criminal: this being the place where that absolute despotic power, which must in all governments reside somewhere, is entrusted by the constitution of these kingdoms. All mischiefs and grievances, operations and remedies, that transcend the ordinary course of the laws, are within the reach of this extraordinary tribunal. It can regulate or new model the succession to the crown: as was done in the reign of Henry VIII. and William III. It can alter and establish the religion of the land; as was done in a variety of instances in the reign of Henry VIII. and his three children, Edward VI. Mary, and Elizabeth. It can change and create afresh even the constitution of the kingdom, and of parliaments themselves; as was done by the act of union, and the several statutes for triennial and septennial elections. It can, in short, do every thing that is not naturally impossible; and therefore some have not scrupled to call its power by a figure rather too bold, the *omnipotens of parliament*. But then their power, however great, was given them in trust, and therefore ought to be employed, according to the rules of justice, and for the promotion of the general welfare of the people. And it is a matter essential to the liberties of the kingdom, that such members be delegated to this important trust, as are most eminent for their probity, their fortitude, and their knowledge; for it was a known apophthegm of the great lord treasurer Burleigh, "that England could never be ruined but by a parliament;" and, as Sir Mathew Hale observes, this being the highest and greatest court, over which none other can have jurisdiction in the kingdom, if by any means a misgovernment should any way fall upon it, the subjects of this kingdom are left without all manner of legal remedy.

In order to prevent the mischiefs that might arise, by placing this extensive authority in hands that are either incapable, or else improper, to manage it, it is provided, that no one shall sit or vote in either house of parliament, unless he be twenty-one years of age. To prevent innovations in religion and government, it is enacted, that no member shall vote or sit in either house, till he hath, in the presence of the house, taken the oaths of allegiance, supremacy, and abjuration; and subscribed and repeated the declaration against transubstantiation, the invocation of saints, and the sacrifice of the mass. To prevent dangers that may arise to the kingdom from foreign attachments, connexions, or dependencies, it is enacted, that no alien, born out of the dominions of the crown of Great Britain, even though he be naturalized, shall be capable of being a member of either house of parliament.

Some of the most important privileges of the members of either house are

privilege of speech, of person, of their domestics, and their lands and goods. As to the first, privilege of speech, it is declared by the statute of 1. W. & M. II. 2. c. 2. as one of the liberties of the people, "that the freedom of speech, and debates, and proceedings in parliament, ought not to be impeached or questioned in any court or place out of parliament." And this freedom of speech is particularly demanded of the king in person, by the speaker of the house of commons, at the opening of every new parliament. So are the other privileges, of person, servants, lands, and goods. This includes not only privilege from illegal violence, but also from legal arrests, and seizures by process from the courts of law. To assault by violence a member of either house, or his menial servants, is a high contempt of parliament, and there punished with the utmost severity. Neither can any member of either house be arrested and taken into custody, nor served with any process of the courts of law; nor can his menial servants be arrested; nor can any entry be made on his lands; nor can his goods be distrained or seized, without a breach of the privilege of parliament.

The house of lords have a right to be attended, and constantly are, by the judges of the court of king's bench and common pleas, and such of the barons of the exchequer as are of the degree of the coif, or have been made sergeants at law; as likewise by the masters of the court of chancery; for their advice in point of law, and for the greater dignity of their proceedings.

The speaker of the house of lords is generally the lord chancellor, or lord keeper of the great seal, which dignities are commonly vested in the same person.

Each peer has a right, by leave of the house, as being his own representative, when a vote passes contrary to his sentiments, to enter his dissent on the journals of the house, with the reasons of such dissent; which is usually styled his protest. Upon particular occasions, however, these protests have been so bold as to give offence to the majority of the house, and have therefore been expunged from their journals; but this has always been thought a violent measure, and not very consistent with the general right of protesting.

The house of commons may be properly styled the grand inquest of Great Britain, empowered to enquire into all national grievances, in order to see them redressed.

The peculiar laws and customs of the house of commons relate principally to the raising of taxes, and the elections of members to serve in parliament.

With regard to taxes: it is the ancient indisputable privilege and right of the house of commons, that all grants of subsidies, or parliamentary aids, do begin in their house, and are first bestowed by them; although their grants are not effectual to all intents and purposes, until they have the assent of the other two branches of the legislature. The general reason given for this exclusive privilege of the house of commons is, that the supplies are raised upon the body of the people, and therefore it is proper that they alone should have the right of taxing themselves.

The method of making laws is much the same in both houses. In each house the act of the majority binds the whole; and this majority is declared

N 2

* This exemption from arrests for lawful debts, was always considered by the public as a grievance. The lords and commons therefore generously relinquished their privilege by act of parliament in 1700; and members of both houses may now be sued debtors.

by votes publicly and openly given; not as at Venice, and many other senatorial assemblies, privately or by ballot. This latter method may be serviceable, to prevent intrigues and unconstitutional combinations, but it is impossible to be practised with us, at least in the house of commons, where every member's conduct is subject to the future censure of his constituents, and therefore should be openly submitted to their inspection.

To bring a bill into the house of commons, if the relief sought by it is of a private nature, it is first necessary to prefer a petition; which must be presented by a member, and usually sets forth the grievance desired to be remedied. This petition, (when founded on facts that may be in their nature disputed) is referred to a committee of members, who examine the matter alleged, and accordingly report it to the house; and then (or, otherwise upon the mere petition) leave is given to bring in the bill. In public matters, the bill is brought in upon motion made to the house without any petition. (In the house of lords, if the bill begins there, it is, when of a private nature, referred to two of the judges, to examine and report the state of the facts alleged, to see that all necessary parties consent, and to settle all points of technical propriety.) This is read a first time, and, at a convenient distance, a second time; and after each reading, the speaker opens to the house the substance of the bill, and puts the question whether it shall proceed any farther. The introduction of the bill may be originally opposed, as the bill itself may at either of the readings; and if the opposition succeeds, the bill must be dropt for that session; as it must also, if opposed with success in any of the subsequent stages.

After the second reading it is committed, that is referred to a committee: which is either selected by the house in matters of small importance, or else, if the bill is a matter of great, or national consequence, the house resolves itself into a committee of the whole house. A committee of the whole house is composed of every member; and, to form it, the speaker quits the chair (another member being appointed chairman), and may sit and debate as a private member. In these committees, the bill is debated clause by clause, amendments made, the blanks filled up, and sometimes the bill is entirely new modelled. After it has gone through the committee, the chairman reports it to the house, with such amendments as the committee have made; and then the house re-consider the whole bill again, and the question is repeatedly put upon every clause and amendment. When the house have agreed or disagreed to the amendments of the committee, and sometimes added new amendments of their own, the bill is then ordered to be engrossed or written in a strong gross hand, on one or more long rolls of parchment sewed together. When this is finished, it is read a third time, and amendments are sometimes then made to it; and, if a new clause be added, it is done by tacking a separate piece of parchment on the bill, which is called a rider. The speaker then again opens the contents; and holding it up in his hands, puts the question whether the bill shall pass. If this be agreed to, the title to it is then settled. After this it is carried to the lords, for their concurrence, by one of the members; who, attended by several more, presents it to the bar of the house of peers, and there delivers it to their speaker, who comes down from his woolpack to receive it. It there passes through the same forms as in the other house (except engrossing, which is already done), and if rejected, no more notice is taken, but it passes *in* *the* *house*, to prevent unbecoming altercations. But if it be agreed to, the lords send a message by two masters in chancery (or sometimes, in matters of high importance, by two of the judges) that they have agreed to the same; and

the bill remains with the lords, if they have made no amendment to it. But if any amendments are made, such amendments are sent down with the bill to receive the concurrence of the commons. If the commons disagree to the amendments, a conference usually follows between members deputed from each house; who, for the most part, settle and adjust the difference: but if both houses remain inflexible, the bill is dropped. If the commons agree to the amendments, the bill is sent back to the lords by one of the members with a message, to acquaint them therewith. The same forms are observed *mutatis mutandis*, when the bill begins in the house of lords. But when an act of grace or pardon is passed, it is first signed by his majesty, and then read once only in each of the houses, without any new engrossing or amendment. And when both houses have done with any bill, it always is deposited in the house of peers, to wait the royal assent; except in the case of a money-bill, which, after receiving the concurrence of the lords, is sent back to the house of commons. It may be necessary here to acquaint the reader, that both in the houses, and in their committees, the slightest expression, or most minute alteration, does not pass till the speaker, or the chairman, puts the question; which in the house of commons, is answered by *aye* or *no*; and in the house of peers, by *content* or *not content*.

The giving the royal assent to bills is a matter of great form. When the king is to pass bills in person, he appears on his throne in the house of peers, in his royal robes, with the crown on his head, and attended by his great officers of state and heralds. A seat on the right hand of the throne, where the princes of Scotland, when peers of England, formerly sat, is reserved for the prince of Wales. The other princes of the blood sit on the left hand of the king; and the chapoellor on a close bench removed a little backwards. The viscounts and temporal barons, or lords, face the throne, on benches, or wool-packs covered with red cloth or baize. The bench of bishops runs along the house to the bar on the right hand of the throne; as the dukes and earls do on the left. The chancellor and judges, on ordinary days, sit upon wool-packs, between the barons and the throne. The common opinion is, that the house sitting on wool, is symbolical of wool being formerly the staple commodity of the kingdom. Many of the peers, on solemn occasions, appear in their parliamentary robes. None of the commons have any robes, excepting the speaker, who wears a long black silk gown; and when he appears before the king it is trimmed with gold.

The royal assent may be given two ways; 1. In person. When the king sends for the house of commons to the house of peers, the speaker carries up the money-bill or bills in his hand; and, in delivering them, he addresses his majesty in a solemn speech, in which he seldom fails to extol the generosity and loyalty of the commons and to tell his majesty how necessary it is to be frugal of the public money. It is upon this occasion, that the commons of Great Britain appear in their highest lustre. The titles of all bills that have passed both houses are read; and the king's answer is declared by the clerk of the parliament in Norman-French. If the king consents to a public bill, the clerk usually declares, *le roy le veut*, "the king wills it so to be;" if to a private bill, *soit fait come il est desiré*, "be it as it is desired." If the king refuses assent, it is in the gentle language of *le roy s'avisera*, "the king will advise upon it." When a money-bill is passed, it is carried up and presented to the king by the speaker of the house of commons, and the royal assent is thus expressed, *le roy remercie ses loyal subjects, accepte leur benevolence, et aussi le veut*, "the king thanks his loyal subjects, accepts their benevolence, and wills it so to be." In case of an act of grace, which originally proceeds from

from the crown, and has the royal assent in the first stage of it, the clerk of the parliament thus pronounces the gratitude of the subject; *les prelates, seigneurs, et communs, en ce present parlement assemblez, au nom de tous vous autres subjects, remercient tres humblement votre majesté: et prient à Dieu vous donner en santé bonne vie et longue*; "the prelates, lords, and commons, in this present parliament assembled, in the name of all your other subjects, most humbly thank your majesty, and pray to God to grant you in health and wealth long to live." 2. By the statute 33 Hen. VIII. c. 21. the king may give his assent by letters patent under his great seal, signed with his hand, and notified, in his absence, to both houses assembled together in the high house, by commissioners, consisting of certain peers named in the letters. And when the bill has received the royal assent in either of these ways, it is then, and not before, a statute or act of parliament.

This statute or act is placed among the records of the kingdom; there needing no formal promulgation to give it the force of a law, as was necessary by the civil law with regard to the emperor's edicts; because every man in England is, in judgment of law, party to the making of an act of parliament, being present thereat by his representatives. However, copies thereof are usually printed at the king's press, for the information of the whole land.

From the above general view of the English constitution, it appears, that no security for its permanency, which the wit of man can devise, is wanting. If it should be objected, that parliaments may become so corrupted, as to give up or betray the liberties of the people, the answer is, that parliaments, as every other body politic, are supposed to watch over their political existence, as a private person does his natural life. If a parliament was to act in that manner, it must become *felâ de se*, an evil that no human provisions can guard against. But there are great resources of liberty in England; and though the constitution has been even overturned, and sometimes dangerously wounded, yet its own innate powers have recovered and still preserve it. Mons. Mezeray, the famous historian, said to a countryman of ours, in the close of the last century, "We had once in France the same happiness and the same privileges which you have; our laws were then made by representatives of our own choosing, therefore our money was not taken from us, but granted by us. Our kings were then subject to the rules of law and reason—now, alas! we are miserable, and all is lost. Think nothing Sir, too dear to maintain these precious advantages; if ever there should be occasion, venture your life and estate rather than basely and foolishly submit to that abject condition to which you see us reduced."

The king of England, besides his high court of parliament, has subordinate officers and ministers to assist him, and who are responsible for their advice and conduct. They are made by the king's nomination, without either patent or grant; and on taking the necessary oaths, they become immediately privy-counsellors during the life of the king that chuses them, but subject to removal at his direction.

The duty of a privy-counsellor appears from the oath of office, which consists of seven articles; 1. To advise the king according to the best of his cunning and discretion. 2. To advise for the king's honour and good of the public, without partiality through affection, love, need, doubt, or dread. 3. To keep the king's counsel secret. 4. To avoid corruption. 5. To help and strengthen the execution of what shall be there resolved. 6. To withstand all persons who would attempt the contrary. And, lastly, is

general, 7. To observe, keep, and do all that a good and true counsellor ought to do to his sovereign lord.

As no government can be so complete as to be provided with laws that may answer every unforeseen emergency, the privy-council, in such cases, can supply the deficiency. It has been even known, that, upon great and urgent occasions, such as that of a famine, or the dread of one, they can supersede the operation of the law; if the parliament is not sitting; but this is considered as illegal, and an act of parliament must pass for the pardon and indemnification of those concerned.

The office of secretary of state is at present divided into a southern and a northern department. The southern contains France, Spain, Portugal, Italy, the Swiss Cantons, Constantinople, and, in short, all the states in the southern parts. The northern comprehends the different states of Germany, Prussia, Poland, Russia, Sweden, Denmark, Holland, Flanders, and the Hanseatic towns.

With regard to the capital acts of government which were formerly entrusted with the secretaries of state, a committee of the privy-council, commonly called a cabinet-council, are chiefly entrusted. This cabinet generally consists of a select number of ministers and noblemen, according to the king's opinion of their integrity and abilities, or attachment to the views of the court: but though its operations are powerful and extensive, a cabinet council is not essential to the constitution of England.

This observation naturally leads me to mention the person who is so well known by the name of the *first minister*; a term unknown to the English constitution, though the office, in effect, is perhaps necessary. The constitution points out the lord high chancellor as minister, but the affairs of his own court give him sufficient employment. When the office of the first lord of the treasury is united with that of chancellor of the exchequer (offices which I am to explain hereafter) in the same person, he is considered as first minister. The truth is, his majesty may make any of his servants his first minister. But though it is no office, yet there is a responsibility annexed to the name and common repute, that renders it a post of difficulty and danger. I shall now take a short review of the nine great officers of the crown, who, by their posts, take place next to the princes of the royal family and the two primates.

The first is the lord high steward of England. This is an office very ancient, and formerly was hereditary, or at least for life; but now and for centuries past it is exercised only occasionally; that is, at a coronation, or to sit as a judge on a peer or peers, when tried for a capital crime. In coronations, it is held for that day only, by some high nobleman. In cases of trials, it is exercised generally by the lord chancellor, or lord keeper; whose commission as high steward, ends with the trial, by breaking his white rod, the badge of his office.

The lord high chancellor presides in the court of chancery, to moderate the severities of the law, in all cases where the property of the subject is concerned; and he is to determine according to the dictates of equity and reason. He is an officer of the greatest weight and power of any now subsisting in the kingdom, and is superior in precedency to every temporal lord. He is a privy counsellor by his office, and, according to some, prolocutor of the house of lords by prescription. To him belongs the appointment of all justices of the peace; he is visitor, in right of the king, of all hospitals and colleges of the king's foundation, and patron of all the king's livings under the value of 20l. per annum in the king's books. He is the general guardian of all infants, idiots, and lunatics, and hath the superintendance of all chari-

chartered offices in the kingdom, over and above the extensive jurisdiction which he exercises in his judicial capacity in the court of chancery.

The post of lord high treasurer has of late been vested in a commission consisting of five persons, who are called lords of the treasury, but the first commissioner is supposed to possess the power of lord high treasurer. He has the management and charge of all the revenues of the crown kept in the exchequer: as also the letting of the leases of all crown-lands, and the gift of all places belonging to the customs in the several ports of the kingdom.

The lord president of the council was an officer formerly of great power, and hath precedence next after the lord chancellor, and lord treasurer. His duty is to propose all the business transacted at the council-board, and to report to the king, when his majesty is not present, all its debates and proceedings. It is a place of great dignity as well as difficulty, on account of the vast number of American and West India causes, captures, and the like affairs, that come before the board: all which may be abridged to the vast convenience of the subject by an able president.

The office of lord privy seal consists in his putting the king's seal to all charters, grants, and the like, which are signed by the king, in order to their passing the great seal; and he is responsible if he should apply the privy seal to any thing against the law of the land.

The office of lord great chamberlain of England is hereditary in the duke of Ancafter's family. He attends the king's person, on his coronation, to dress him: he has likewise charge of the house of lords during the sitting of parliament; and of fitting up Westminster-hall for coronations, or trials of peers.

The office of lord high constable has been disused since the attainder and execution of Stafford duke of Buckingham, in the year 1521, but is occasionally revived for a coronation.

The duke of Norfolk is hereditary earl marshal of England. Before England became so commercial a country as it has been for a hundred years past, this office required great abilities, learning, and knowledge of the English history for its discharge. In war time he was judge of army causes, and decided according to the principles of the civil law. If the cause did not admit of such a decision, it was left to a personal combat, which was attended with a vast variety of ceremonies; the arrangement of which, even to the smallest trifle, fell within the marshal's province. To this day, he or his deputy regulates all points of precedence according to the archives kept in the herald's office which is entirely within his jurisdiction. He directs all solemn processions, coronations, proclamations, general mournings and the like.

The office of lord high admiral of England is now likewise held by commission, and is equal in its importance to any of the preceding, especially since the growth of the British naval power. The English admiralty is a board of direction as well as execution, and is in its proceedings independent of the crown itself. All trials upon life and death, in maritime affairs are appointed and held under a commission immediately issuing from that board: and the members must sign even the death-warrants for execution; but it may be easily conceived, that, as they are removable at pleasure, they do nothing that can clash with the prerogative of the crown, and conform themselves to the directions they receive from his majesty. The board of admiralty regulates the whole naval force of the realm, and names all their

officers, or confirms them when named; so that its jurisdiction is very extensive. They appoint vice-admirals under them; but an appeal from them lies to the high court of admiralty, which is of a civil nature: London is the place where it is held; and all its processes and proceedings run in the lord high admiral's name, or those of the commissioners, and not in that of the king. The judge of this court is commonly a doctor of the civil law, and its proceedings are according to the method of the civil law; but all criminal matters, relating to piracies, and other capital offences committed at sea, are tried and determined according to the laws of England, by witnesses and a jury, ever since the reign of Henry VIII. It now remains to treat of the courts of law in England.

COURTS OF LAW.] The court of chancery, which is the court of equity, is next in dignity to the high court of parliament, and is designed to relieve the subject against frauds, breaches of trust, and other oppressions, and to mitigate the rigour of the law. The lord high chancellor sits as sole judge, and in his absence, the master of the rolls. The form of proceeding is by bills, answers, and decrees; the witnesses being examined in private; however, the decrees of this court are only binding to the persons of those concerned in them, for they do not affect their lands and goods; and consequently, if a man refuses to comply with the terms, they can do nothing more than send him to the prison of the Fleet. This court is always open; and if a man be sent to prison, the lord chancellor, in any vacation, can, if he sees reason for it grant a *habeas corpus*.

The clerk of the crown likewise belongs to this court, he, or his deputy, being obliged always to attend on the lord chancellor as often as he is for the dispatch of business; through his hands pass all writs for summoning the parliament or choosing of members, commissions of the peace, pardons, &c.

The King's Bench, so called either from the kings of England sometimes, sitting there in person, or because all matters determinable by common law between the king and his subjects are here tried, except such affairs as properly belong to the court of Exchequer. This court is, likewise, a kind of check upon all the inferior courts, their judges and justices of the peace. Here preside four judges, the first of whom is styled lord chief justice of England, to express the great extent of his jurisdiction over the kingdom: for this court can grant prohibitions in any cause depending either in spiritual or temporal courts; and the house of peers does often direct the lord chief justice to issue out his warrant for apprehending persons under suspicion of high crimes. The other three judges are called justices, or judges of the King's Bench.

The court of Common Pleas takes cognizance of all pleas debatable, and civil actions depending between subject and subject and in it, besides all real actions, fines and recoveries are transacted, and prohibitions are likewise issued out of it, as well as from the King's Bench. The first judge of this court is styled lord chief justice of the Common Pleas, or common bench: besides whom there are likewise three other judges, or justices of this court. None but sergeants at law are allowed to plead here.

The court of Exchequer was instituted for managing the revenues of the crown, and has a power of judging both according to law and according to equity. In the proceedings according to law, the lord chief baron of the Exchequer, and three other barons, preside as judges. They are styled barons, because formerly none but barons of the realm were allowed to be judges

judges in the court. Besides there is a fifth, called *curiator baron*, who has not a judicial capacity; but is only employed in administering the oath to sheriffs and other officers, and also to several of the officers of the custom-house. But when this court proceeds according to equity, then the lord treasurer and the chancellor of the Exchequer preside, assisted by the other barons. All matters touching the king's treasury, revenue, customs, and fines, are here tried and determined. Besides the officers already mentioned, there belong to the Exchequer, the king's remembrancer, who takes and states all accounts of the revenue, customs, excise, parliamentary aid and subsidies, &c. except the accounts of the sheriffs and their officers: the lord treasurer's remembrancer, whose business it is to make out processes against sheriffs, receivers of the revenue, and other officers.

For putting the laws effectually in execution, a high-sheriff is annually appointed for every county (except Westmoreland and Middlesex) by the king*; whose office is both ministerial and judicial. He is to execute the king's mandate, and all writs directed to him out of the king's court of justice; to impanel juries, to bring causes and malefactors to trial, to see sentences, both in civil and criminal affairs, executed; and at the assize to attend the judges, and guard them all the time they are in his county. He likewise to decide the elections of knights of the shire, of coroners and verderers; to judge of the qualifications of voters, and to return such as he shall determine to be duly elected. It is also part of his office to collect all public fines, distresses, amerciaments, into the Exchequer, or where the king shall appoint, and so make such payments out of them as his majesty shall think proper.

As his office is judicial, he keeps a court, called the county court, which is held by the sheriff, or his under-sheriffs, to hear and determine all civil causes in the county, under forty shillings: this, however, is no court of record; but the court, formerly called the sheriff's torn, was one; and the king's leet, through all the county: for in this court inquiry was made into all criminal offences against the common law, where by the statute law there was no restraint. This court, however, has been long since abolished. As the keeper of the king's peace, both by common law and special commission, he is the first man in the county, and superior in rank to any nobleman therein, during his office. He may command all the people of his county to attend him, which is called the *posse comitatus*, or power of the county.

Under the sheriff are various officers; as the under-sheriff, clerks, stewards of courts, bailiffs (in London called serjeants), constables, goalers, bea-
dles, &c.

The next officer to the sheriff, is the *justice of peace*, several of whom are commissioned for each county: and to them is intrusted the power of putting great part of the statute law in execution, in relation to the highways, the poor, vagrants, treasons, felonies, riots, the preservation of the game, &c. &c. and they examine and commit to prison all who break or disturb the peace, and disquiet the king's subjects. In order to punish the offenders, they meet every quarter at the county-town, when a jury of twelve men, called the grand inquest of the county, is summoned to appear. This

* Sheriffs were formerly chosen by the inhabitants of the several counties. In some counties the sheriffs were formerly hereditary, and still continue in the county of Westmoreland. The city of London hath also the inheritance of the shrievalty of Middlesex vested in their body by charter.

jury, upon oath, is to inquire into the cases of all delinquents, and to present them by bill, guilty of the indictment, or not guilty: the justices commit the former to gaol for their trial at the next assizes, and the latter are acquitted. This is called the quarter-sessions for the county. The justice of peace ought to be a person of great good sense, sagacity, and integrity, and to be not without some knowledge of the law; for as much power is lodged in his hands, and as nothing is so intoxicating, without these qualifications, he will be apt to make mistakes, and to step beyond his authority, for which he is indeed liable to be called to an account at the court of King's Bench.

Each county contains two *coroners*, who are to enquire by a jury of neighbours, how and by whom any person came by a violent death and to enter it on record as a plea of the crown. Another branch of his office is to enquire concerning shipwreck, and certify whether wreck or not, and who is in possession of the goods. In his ministerial office, he is the sheriff's substitute.

The civil government of cities is a kind of small independent policy of itself; for every city hath, by charter from the king, a jurisdiction within itself, to judge in all matters civil and criminal: with this restraint only, that all civil causes may be removed from their courts to the higher courts at Westminster; and all offences that are capital, are committed to the judge of the assize. The government of cities differs according to their different charters, immunities, and constitutions. They are constituted with a mayor, aldermen, and burghesses, who, together, make the corporation of the city, and hold a court of judicature, where the mayor presides as judge. Some cities are counties, and chuse their own sheriffs; and all of them have a power of making by-laws for their own government. Some have thought the government of cities, by mayor, aldermen, and common council, is an epitome of the English government, by king, lords, and commons.

The government of incorporated boroughs is much after the same manner: in some there is a mayor, and in others two bailiffs; all which, during their mayoralty or magistracy, are justices of the peace within their liberties, and consequently esquires.

The cinque ports are five havens, formerly esteemed most important ones, that lie on the east part of England towards France, as Dover, Sandwich, Romney, Hastings and Hythe, to which Winchelsea and Rye have been since added, with similar franchises in many respects. These cinque-ports were endowed with particular privileges by our ancient kings, upon condition that they should provide a certain number of ships, at their own charge, to serve in the wars for forty days, as often as they were wanted.

For the better government of villages; the lords of the soil, or manor, (who were formerly called barons), have generally a power to hold courts, called courts-leet and courts-baron, where their tenants are obliged to attend and receive justice. The business of courts-leet is chiefly to present and punish nuisances; and at courts-baron the conveyances and alienations of the copyhold tenants are enrolled, and they are admitted to their estates on a descent or purchase.

A *constable* is a very ancient and respectable officer of the peace, under the English constitution. Every hundred hath a high constable, and every parish hath a hundred a constable; and they are to attend the high constable upon proper occasions. They are assisted by another ancient officer, called the *tythingman*, who formerly superintended the tenth part of an hundred, or ten free burghs, as they were called in the time of the Saxons, and each free burgh

consisting of ten families. The business of constable is to keep the peace in all cases of quarrels and riots. He can imprison offenders till they are brought before a justice of peace; and it is his duty to execute, within his district, every warrant that is directed to him from that magistrate, or a bench of justices. The neglect of the Old Saxon courts, both for the preservation of the peace, and the more easy recovery of small debts, has been regretted by many eminent lawyers; and it has of late been found necessary to revive some of them, and to appoint others of a similar nature.

Besides these, there are courts of conscience settled in many parts of England for the relief of the poor, in the recovery of payment of small debts not exceeding forty shillings.

There neither is, nor ever was, any constitution provided with so many fences, as that of England is, for the security of personal liberty. Every man imprisoned has a right to bring a writ before a judge at Westminster-hall, called his Habeas Corpus. If that judge, after considering the cause of commitment, shall find that the offence is bailable, the party is immediately admitted to bail, till he is condemned or acquitted in a proper court of justice.

The rights of individuals are so attentively considered, that the subject may, without the least danger, sue his sovereign, or those who act in his name, and under his authority; he may do this in open court, where the king may be cast, and be obliged to pay damages to his subject. He cannot take away the liberty of the least individual, unless he has, by some illegal act, of which he is accused or suspected upon oath, forfeited his right or liberty; or except when the state is in danger, and the representatives of the people think the public safety makes it necessary, that he should have the power of confining persons on such a suspicion of guilt; such as the case of a rebellion within the kingdom, when the legislature has thought proper to pass a temporary suspension of the Habeas Corpus act; but this seldom has been done but with great difficulty and caution, and when the national safety has absolutely required it. The king has a right to pardon; but neither he nor the judges, to whom he delegates his authority, can condemn a man as a criminal, except he be first found guilty by twelve men, who must be his peers or his equals. That the judges may not be influenced by the king or his ministers, to misrepresent the case to the jury, they have their salaries for life, and not during the pleasure of their sovereign. Neither can the king take away, nor endanger the life of any subject, without trial, and the persons being first chargeable with a capital crime, as treason, murder, felony, or some other act, injurious to society; nor can any subject be deprived of his liberty, for the highest crime, till some proof of his guilt be given upon oath before a magistrate; and he has then a right to insist upon his being brought, the first opportunity, to a fair trial, or to be restored to liberty on giving bail for his appearance. If a man is charged with a capital offence, he must not undergo the ignominy of being tried for his life; till the evidences of his guilt are laid before the grand jury of the town or county in which the fact is alleged to be committed, and not without twelve of them agreeing to a bill of indictment against him. If they do this, he is to stand a second trial before twelve other men, whose opinion is definitive. By the 28 Edward III. it is enacted, that where either party is an alien born, the jury shall be one half aliens, and the other denizens if required, for the more impartial trial. A privilege indulged to strangers in no other country in the world, but which is as ancient with us as the time of king Ethelred.

some cases, the man (who is always supposed innocent till there be sufficient proof of his guilt) is allowed a copy of his indictment, in order to help him to make his defence. He is also furnished with the panel, or list of the jury, who are his true and proper judges, that he may learn their characters, and discover whether they want abilities, or whether they are prejudiced against him. He may in open court peremptorily object to twenty of the number *, and to as many more as he can give reason for their not being admitted as his judges; till at last twelve unexceptionable men, the neighbours of the party accused, or living near the place where the supposed fact was committed, are approved of, who take the following oath, that they *shall well and truly try, and true deliverance make, between the king and the prisoners, whom they shall have in charge, according to the evidence.* By challenging the jury, the prisoner prevents all possibility of bribery, or the influence of any superior power; by their living near the place where the fact was committed, they are supposed to be men who knew the prisoner's course of life, and the credit of the evidence. These only are the judges from whose sentence the prisoner is to expect life or death, and upon their integrity and understanding the lives of all that are brought in danger ultimately depend; and from their judgment there lies no appeal: they are therefore to be all of one mind, and after they have fully heard the evidence, are to be confined without meat, drink, or candle, till they are unanimous in acquitting or condemning the prisoner. Every jurymen is therefore invested with a solemn and awful trust, if he without evidence submits his opinion to that of any other of the jury, or yields in complaisance to the opinion of the judge; if he neglects to examine with the utmost care; if he questions the veracity of the witnesses, who may be of an infamous character; or after the most impartial hearing, has the least doubt upon his mind, and yet joins in condemning the person accused; he will wound his own conscience, and bring upon himself the complicated guilt of perjury and murder. The freedom of Englishmen consists in its being out of the power of the judge on the bench to injure them, for declaring a man innocent whom he wishes to bring in guilty. Were not this the case, juries would be useless; so far from being judges themselves, they would only be the tools of another, whose province is not to guide, but to give a sanction to their determination. Tyranny might triumph over the lives and liberties of the subject, and the judge on the bench be the minister of the prince's vengeance.

Trial by jury is so capital a privilege, and so great a security to the liberty of the subject, it is much to be regretted, that persons of education and property are often too ready to evade serving the office. By this means juries frequently consist of ignorant and illiterate persons, who neither have knowledge enough to understand their rights and the privileges of Englishmen, nor spirit enough to maintain them. No man should be above serving so important an office, when regularly called upon: and those who, from indolence or pride, decline discharging this duty to their country, seem hardly to deserve that security and liberty which the inhabitants of this country derive from this invaluable institution. Juries have, indeed, always been considered as giving the most effectual check to tyranny; for in a nation like this, where a king can do nothing against law, they are a security that he shall never make the laws, by a bad administration, the instruments of cruelty and oppression. Were it not for juries, the advice given by father Paul, in his maxims of the republic at Venice, might take effect in its fullest latitude. "When the offence is committed by a nobleman against a subject, says he,

* The party may challenge thirty-five in case of treason.

let all ways be tried to justify him ; and if that is not possible to be done, let him be chastised with greater noise than damage. If it be a subject that has affronted a nobleman, let him be punished with the utmost severity, that the subjects may not get too great a custom of laying their hands on the patrician order." In short, was it not for juries, a corrupt nobleman might, whenever he pleased, act the tyrant, while the judge would have that power which is now denied to our kings. But by our happy constitution, which breaths nothing but liberty and equity, all imaginary indulgence is allowed to the meanest, as well as the greatest. When a prisoner is brought to take his trial, he is freed from all bonds ; and though the judges are supposed to be counsel for the prisoner, yet, as he may be incapable of vindicating his own cause, other counsel are allowed him ; he may try the validity and legality of the indictment, and may set it aside, if it be contrary to law. Nothing is wanting to clear up the cause of innocence, and to prevent the sufferer from sinking, under the power of corrupt judges, and the oppression of the great. The racks and tortures that are cruelly made use of in other parts of Europe, to make a man accuse himself, are here unknown, and none punished without conviction, but he who refuses to plead in his own defence.

As the trial of malefactors in England is very different from that of other nations, the following account thereof may be useful to foreigners and others, who have not seen those proceedings.

The court being met, and the prisoner called to the bar, the clerk commands him to hold up his hand, then charges him with the crime of which he is accused, and asks him whether he is *guilty* or *not guilty*. If the prisoner answers *guilty*, his trial is at an end ; but if he answers *not guilty*, the court proceeds on the trial, even though he may before have confessed the fact ; for the law of England takes no notice of such confession ; and unless the witnesses, who are upon oath, prove him guilty of the crime, the jury must acquit him ; for they are directed to bring in their verdict according to the evidence given in court. If the prisoner refuses to plead, that is, if he will not say in court whether he is *guilty* or *not guilty*, he might, till lately, by the law of England, be pressed to death, with a load of iron upon his breast.

When the witnesses have given in their evidence, and the prisoner has, by himself or his counsel, cross-examined them, the judge recites to the jury the substance of the evidence given against the prisoner, and bids them discharge their conscience ; when, if the matter be very clear, they commonly give their verdict without going out of the court ; and the foreman, for himself and the rest, declares the prisoner *guilty*, or *not guilty*, as it may happen to be. But if any doubt arises among the jury, and the matter requires debate, they all withdraw into a room with a copy of the indictment, where they are locked up till they are unanimously agreed on the verdict ; and if any one of the jury should die during this their confinement, the prisoner will be acquitted.

When the jury have agreed on the verdict, they inform the court thereof by an officer who waits without, and the prisoner is again set to the bar to hear his verdict. This is unalterable, except in some doubtful cases, when the verdict is brought in *special*, and is therefore to be determined by the twelve judges of England.

If the prisoner be found guilty, he is then asked what reason he can give why sentence of death should not be passed upon him ? There is now properly no benefit of clergy ; it is changed to transportation, or burning in the hand. Upon a capital conviction, the sentence of death, after a summary account of

All the prisoners found *not guilty* by the jury, are immediately acquitted and discharged, and in some cases obtain a copy of their indictment from the court, to proceed at law against their prosecutors.

OF PUNISHMENTS.] The law of England includes all capital crimes under *high treason, petty treason, and felony*. The first consists in plotting, conspiring, or rising up in arms against the sovereign, or in counterfeiting the coin. The traitor is punished by being drawn on a sledge to the place of execution, when, after being hanged upon a gallows for some minutes, the body is cut down alive, the heart taken out and exposed to public view, and the entrails burnt; the head is then cut off, and the body quartered, after which the head is usually fixed on some conspicuous place. All the criminal's lands and goods are forfeited, his wife loses her dowry, and his children both their estates and sobility.

But though coining of money is adjudged high treason, the criminal is only drawn upon a sledge to the place of execution, and there hanged.

Though the sentence passed upon all traitors is the same, yet with respect to persons of quality, the punishment is generally altered to beheading: a scaffold is erected for that purpose, or which the criminal placing his head upon a block, it is struck off with an axe.

The punishment for misprision of high treason, that is, for neglecting or concealing it, is imprisonment for life, the forfeiture of all the offender's goods, and the profits arising from his lands.

Petty treason is when a child kills his father, a wife her husband, a clergyman his bishop, or a servant his master or mistress. This crime is punished by the offender's being drawn on a sledge to the place of execution, and there hanged upon a gallows till dead. Women guilty both of this crime and of high treason, are sentenced to be burnt alive; but instead of suffering the full rigour of the law, they are strangled at the stake before the fire takes hold of them.

Felony includes murders, robberies, forging notes, bonds, deeds, &c. These are all punished by hanging, only * murderers are to be executed soon after sentence is passed, and then delivered to the surgeons in order to be publicly dissected. Persons guilty of robbery, when there were some alleviating circumstances, used sometimes to be transported for a term of years to his majesty's plantations; but since the American war, they are now generally condemned to hard labour in works of public utility, upon the river, &c. for a certain number of years, and lately some have been sent to Africa, Nova Scotia, and Botany Bay.

Other crimes punished by the laws are,

Man slaughter, which is the unlawful killing of a person without premeditated malice, but with a present intent to kill; as when two who formerly meant no harm to each other, quarrel, and the one kills the other: in this case, the crim-

* This is not to be considered as a different punishment, but as a remission of all the parts of the sentence mentioned before, excepting the article of beheading.

* By a late act, murderers are to be executed within twenty-four hours after sentence is pronounced; but as Sunday is not reckoned a day, they are generally tried on a Saturday, so that they obtain a respite till Monday.

criminal is allowed the benefit of his clergy for the first time, and only burnt in the hand.

Chance-medley, is the accidental killing of a man without an evil intent, for which the offender is also to be burnt in the hand, unless the offender was doing an unlawful act; which last circumstance makes the punishment death.

Shop-lifting, and receiving goods known them to be stolen, are punished with hard labour for a number of years, or burning in the hand.

Perjury, or keeping disorderly houses, are punished with the pillory and imprisonment.

Petty-larceny, or small theft, under the value of twelve pence, is punished by whipping.

Libelling, using false weights and measures, and forestalling the market, are commonly punished with standing on the pillory.

For striking, so as to draw blood, in the king's court, the criminal is punished with losing his right hand.

For striking, in Westminster hall, while the courts of justice are sitting the punishment is imprisonment for life, and forfeiture of all the offender's estate.

Drunkards, vagabonds, and loose, idle, disorderly persons, are punished by being set in the stocks, or by paying a fine.

[OF HUSBAND AND WIFE.] The first private relation of persons is that of marriage, which includes the reciprocal rights and duties of husband and wife; or, as most of our elder law books call them, *baron and feme*. The holiness of the matrimonial state is left entirely to the ecclesiastical law; the punishment, therefore, or annulling of incestuous, or other unscriptural marriages, is the province of spiritual courts.

There are two kinds of divorce; the one total, the other partial. The total divorce must be for some of the canonical causes of impediment, and those existing before the marriage; as consanguinity, affinity, or corporeal imbecility. The issue of such marriage, as it is thus entirely dissolved, are bastards.

The other kind of divorce is, when the marriage is just and lawful, and therefore the law is tender of dissolving it; but, for some supervenient cause, it becomes improper, or impossible, for the parties to live together; as in the case of intolerable ill temper, or adultery, in either of the parties. In this case the law allows alimony to the wife (except when for adultery, the parliament grants a total divorce, as has happened frequently of late years), which is that allowance which is made to a woman for her support out of the husband's estate, being settled at the discretion of the ecclesiastical judge, on the consideration of all the circumstances of the case, and the rank and quality of the parties.

In the civil law, the husband and the wife are considered as two distinct persons; and may have separate estates, contracts, debts and injuries; and therefore in our ecclesiastical courts a woman may sue, and be sued, without her husband.

But though our law in general considers man and wife as one person, yet there are some instances in which she is separately considered, as inferior to him, and acting by his compulsion. And therefore all deeds executed, and acts done, by her, during her coverture, are void; except it be a fine, or the like matter of record, in which case she must be solely and secretly examined, to learn if her act be voluntary. She cannot by will devise land to her husband, unless under special circumstances; for at that time of making

is, she is supposed to be under his coercion. And in some felonies, and other inferior crimes committed by her, through constraint of her husband, the law excuses her; but this extends not to treason or murder.

The husband also (by the old, and likewise by the civil law) might give his wife moderate correction. For, as he is to answer for her misbehaviour, the law thought it reasonable to entrust him with this power of restraining her, by domestic chastisement, in the same moderation that a man is allowed to correct his servants or children; for whom the master or parents is also liable in some cases to answer. But in the pious reign of Charles II. this power of correction began to be doubted; and a wife may now have security of the peace against her husband; or, in return, a husband against his wife; yet the lower ranks of people, who were always fond of the old common law, still claim and exert their ancient privilege; and the courts of law will still permit a husband to restrain a wife of her liberty, in case of any gross misbehaviour.

These are the chief legal effects of marriage during the coverture; upon which we may observe that even the disabilities which the wife lies under, are for the most part intended for her protection and benefit. So great a favourite is the female sex with the laws of England.

REVENUES OF THE BRITISH GOVERNMENT. } The king's ecclesiastical revenues consist in, 1. The custody of the temporalities of vacant bishopricks; from which he receives little or no advantage. 2. Corrodies and pensions, formerly arising from allowances of meat, drink, and clothing due to the king from an abbey or monastery, and which he generally bestowed upon favourite servants; and his sending one of his chaplains to be maintained by the bishop, or to have a pension bestowed upon him till the bishop promoted him to a benefice. These corrodies are due of common right; but now I believe, disused. 3. Extra-parochial tithes. 4. The first-fruits and tenths of benefices. At present, such has been the bounty of the crown to the church, that these four branches afford little or no revenue.

The king's ordinary temporal revenue consists in, 1. The demesne lands of the crown, which at present are contracted within a narrow compass. 2. The hereditary excise; being part of the consideration for the purchase of his feudal profits, and the prerogatives of purveyance and pre-emption. 3. An annual sum issuing from the duty on wine licences; being the residue of the same consideration. 4. His forests. 5. His courts of justice, &c.

The extraordinary grants are usually called by the synonymous names of aids, subsidies, and supplies; and are granted, as has been before hinted, by the commons of Great Britain in parliament assembled; who, when they have voted a supply to his majesty, and settled the *quantum* of that supply usually resolve themselves into what is called a committee, or ways and means, to consider the ways and means of raising the supply so voted. And in this condition every member (though it is looked upon as the peculiar province of the chancellor of the exchequer) may propose such scheme of taxation as he thinks will be least detrimental to the public. The resolutions of this committee (when approved by a vote of the house) are in general esteemed to be (as it were) final and conclusive. For, though the supply cannot be actually raised upon the subject till directed by an act of the whole parliament, yet no monied man will scruple to advance to the government any quantity of ready cash, if the proposed terms be advantageous, on the credit of the bare vote of the house of commons, though no law be yet passed to establish it.

The annual taxes are, 1. The land tax, or the ancient subsidy raised up-

on a new assessment. 2. The malt-tax, being an annual excise on malt, mum, cyder, and perry.

The perpetual taxes are. 1. The customs, or tonnage and poundage of all merchandis exported or imported. 2. The excise duty, or inland imposition on a great variety of commodities. 3. The salt duty. 4. The post-office, or duty for the carriage of letters. 5. The stamp duty on paper, parchment, &c. 6. The duty on houses and windows. 7. The duty on licences for hackney coaches and chairs. 8. The duty on offices and pensions; with a variety of new taxes in the sessions of 1784, and since the commencement of the present war.

The clear neat produce of these several branches of the revenue, old and new taxes, after all charges of collecting and management paid, is estimated to amount annually to upwards of 17 millions sterling; with two millions and a quarter raised at an average, by the land and malt tax. How these immense sums are appropriated, is next to be considered. And this is, first and principally, to the payment of the *interest* of the national debt.

In order to take a clear and comprehensive view of the nature of this NATIONAL DEBT, it must first be provided, that after the Revolution, when our new connections with Europe introduced a new system of foreign politics, the expences of the nation, not only in settling the new establishment, but in maintaining long wars, as principals on the continent, for the security of the Dutch barrier, reducing the French monarchy, settling the Spanish successions supporting the house of Austria, maintaining the liberties of the Germanic body, and other purposes, increased to an unusual degree; in-somuch that it was not thought advisable to raise all the expences of any one year by taxes to be levied within that year, least the unaccustomed weight of them should create murmurs among the people. It was therefore the bad policy of the times, to anticipate the revenues of their posterity, by borrowing immense sums for the current service of the state, and to lay no more taxes upon the subject than would suffice to pay the annual interest of the sums so borrowed: by this means converting the principal debt into a new species of property, transferable from one man to another, at any time and in any quantity. A system which seems to have had its original in the state of Florence, A. D. 1344: which government then owed about 60,000l. sterling; and being unable to pay it, formed the principal into an aggregate sum, called, metaphorically a mount or bank; the shares whereof were transferable like our stocks. This laid the foundation of what is called the NATIONAL DEBT: for a few long annuities, created in the reign of Charles II. will hardly deserve that name. And the example then set, has been so closely followed during the long wars in the reign of queen Anne, and since, that the capital of the funded debt, at Midsummer 1775 was 129,860,018l. and the annual charge of it amounted to 4,219,241l. 7s. The unfortunate American war, commencing at this time, and the execrable policy of continuing and alienating the sinking fund, with the extravagancies in every department of government, and the manner of borrowing the money for supplies, have considerably increased it †.

* From the year 1644, to 1744, the annual amount of this revenue gradually increased from 5000l. to 198,326l. but it should be observed, that the gross amount of both inland and foreign offices was that year 225,492l. In 1764, the gross amount of the revenue of the Post office for that year was 432,048l. which by the act passed in the session of 1784, increasing the duty according to the distance, and abridging the franking, was considerably augmented.

† In the course of the late war, from 1776 to 1782, 46,530,000l. was added to the war debt, and 29,750,000l. to the 4 per cent, making together a capital of 73,280,000l. for which the money advanced was only 48 millions.

The

The following was the state of the national debt in the year 1794, extracted from the eleventh report of the commissioners of the public accounts:

£	11,303,254	18 43	Funded debt	£	7,951,390	1 0
	18,856,541	11 43	Unfunded, 1st of October, 1783.			
			Fifteen millions of this bears interest now.		612,841	0 0
	<u>130,219,706</u>	<u>6. 9 3</u>				

Charges at the Bank for managing the business	134,291	13	1
Fees at the auditor's office of interest	19,774	2	7
Some other fees of office	696	12	4
	<u>8,719,534</u>	<u>9</u>	<u>1</u>

Since this report, the funded debt hath increased to	232,280,349	0 0
The unfunded debt meaning all expences, deficiencies, arrears, and outstanding debts, for paying the principal or interest of which no provision was made by parliament, may be moderately reckoned	38,000,000	0 0
The amount of exchequer bills	9,418,564	0 0
	<u>279,698,913</u>	<u>0 0</u>

Thus the whole annual charge brought upon the nation by its debts funded and unfunded, appear to be about	9,500,000	0 0
Peace establishment reckoned at the average annual expence for eleven years preceding the war	3,950,000	0 0
Income of the civil list	900,000	0 0
Whole expenditure	<u>14,350,000</u>	<u>0 0</u>

The supplies demanded for the year 1784 amounted to 14,181,240l. but an eminent political writer, lord Stair, reckons the future annual peace expenditure at sixteen millions and a half, including half a million for a surplus to answer emergencies. Another respectable writer on the subject estimates it at 13,615,609l. including 954000l per annum for the interest and charge of what remained of the unfunded debt after the last loan, and he estimates the peace revenue at near sixteen millions. Time will unfold the future progress of our national debt, and the calamities towards which it is carrying us, if the most effectual measures are not adopted and zealously pursued for a thorough reformation.

It is indisputably certain, that the present magnitude of our national incumbrances very far exceeds all calculations of commercial benefit, and is productive

 The

ductive of the greatest inconveniences. For, first, the enormous taxes that are raised upon the necessaries of life, for the payment of the interest of this debt, are a hurt both to trade and manufactures; by raising the price as well of the artificer's subsistence, as of the raw material; and of course, in a much greater proportion, the price of the commodity itself. Secondly, if part of this debt be owing to foreigners, either they draw out of the kingdom annually a considerable quantity of specie for the interest; or else it is made an argument to grant them unreasonable privileges, in order to induce them to reside here. Thirdly, if the whole be owing to subjects only, it is then charging the active and industrious subject, who pays his share of the taxes, to maintain the indolent and idle creditor who receives them. Lastly, and principally, it weakens the internal strength of a state, by anticipating those resources which should be reserved to defend it in case of necessity. The interest we now pay for our debts would be nearly sufficient to maintain any war, that any national motives could require. And if our ancestors in king William's time had annually paid so long as their exigences lasted, even a less sum than we now annually raise upon their account, they would, in time of war, have borne no greater burdens than they have bequeathed to and settled upon their posterity in the time of peace, and might have been eased the instant the exigence was over.

The produce of the several taxes before mentioned were originally separate and distinct funds; being securities for the sums advanced on each several tax, and for them only. But at last it became necessary, in order to avoid confusion, as they multiplied yearly, to reduce the number of these separate funds, by uniting and blending them together, superadding the faith of parliament for the general security of the whole. So that there are now only three capital funds of any account: the *aggregate fund*, the whole produce of which hath been for some years about 2,600,000*l. per annum*; the *general fund*, so called from such union and addition, which for some years have amounted to rather more than a million *per annum*; and the *South Sea fund*, being the produce of the taxes appropriated to pay the interest of such part of the national debt as was advanced by that company and its annuitants, the produce of which lately hath been about half a million *per annum*. Whereby the separate funds, which were thus united, are become mutual securities for each other; and the whole produce of them, thus aggregated, liable to pay such interest or annuities as were formerly charged upon each distinct fund; the faith of the legislature being moreover engaged to supply any casual deficiencies.

The customs, excises, and other taxes, which are to support these funds, depending on contingencies, upon exports, imports, and consumptions, must necessarily be of a very uncertain amount: but they have always been considerably more than sufficient to answer the charge upon them. The surpluses therefore of the three great national funds, the aggregate, general, and South Sea funds; over and above the interest and annuities charged upon them, are directed by statute 3 Geo. I. c. 7. to be carried together, and to attend the disposition of parliament; and are usually denominated the *sinking fund*, because originally destined to be held sacred, and to be applied inviolably to the redemption of the national debt. To this have been since added many other entire duties, granted in subsequent years; and the annual interest of the sums borrowed on their respective credits, is charged on, and payable out of the produce of the sinking fund. However, the neat surpluses and savings, after all deductions paid, amount annually to a very considerable sum. For, as the interest on the national debt has been at several times reduced (by the consent of the proprietors, who had their option either to lower their interest, or

We paid their principal), the savings from the appropriated revenues must needs be extremely large. This sinking fund is the last resort of the nation, its only domestic resource, on which must chiefly depend all the hopes we can entertain of ever discharging or moderating our incumbrances. And therefore the prudent application of the large sum, now arising from this fund, is a point of the utmost importance, and well worthy the serious attention of parliament.

Between the years 1727 and 1732, several encroachments were made upon the sinking fund; and in the year 1733, half a million was taken from it by Sir Robert Walpole, under pretence of raising the landed interest. The practice of alienating the sinking fund began thus begun, hath continued of course; and in 1736, it was anticipated and mortgaged; and every subsequent administration hath broken in upon it, thus converting the excellent expedient for saving the kingdom, into a supply for extravagance, and a support of corruption and despotism.

In some years, the sinking fund hath produced from two to three millions per annum, and if only 1,212,000l. of it had been inviolably applied to the redemption of the public debts, from the year 1733, instead of only eight millions and a half paid off by it, as is the case at present, one hundred and sixty millions would have been paid, and the nation have been extricated and saved. Different schemes have been formed for paying the public debts, but no method can be so expeditious and effectual as an unalienable sinking fund, as this money is improved at compound interest, and therefore in the most perfect manner, but money procured by a loan, bears only simple interest. "A nation therefore, whenever it applies the income of such a fund to current expenses rather than the redemption of its debts, chuses to lose the benefit of compound interest in order to avoid paying simple interest, and the loss in this case is equal to the difference between the increase of money at compound and simple interest *."

Before any part of the aggregate fund (the surplusses whereof are one of the chief ingredients that form the sinking fund) can be applied to diminish the principal of the public debt, it stands mortgaged by parliament to raise an annual sum for the maintenance of the king's household and the civil list. For this purpose, in the late reigns, the produce of certain branches of the excise and customs, the post-office, the duty on wine-licences, the revenues of the remaining crown lands, the profit arising from courts of

* Dr. Price's calculation plainly shews what this difference is: "One penny put out at our Saviour's birth to 5 per cent. compounded interest, would, in the year 1781, have increased to a greater sum than would be contained in 200,000,000 of earths all sold, gold; but if put out at simple interest, it at the same time would have amounted to no more than seven shillings and six-pence. All governments that alienate funds destined for reimbursements choose to improve money in the last rather than the first of these ways." He adds, "A million borrowed annually for twenty years, will pay off, in this time, 55 millions 3 per cent. stock, if discharged at 60l. in money for every 100l. stock; and in 48 years more, without any farther aid from loans, 333 millions (that is, 388 millions in all) would be paid off.

"The addition of nineteen years to this period would pay off 1000 millions.

"A surplus of half a million per annum, made up to a million by borrowing half a million every year for twenty years, would discharge the same sums in the same periods.

"In short, so necessary is it at present to expedite, by every possible means, the redemption of our debts, that, let the surplus which can be obtained for a sinking fund be what it will, an addition to it by annual loans, will be proper, in order to give it greater efficiency and a better chance for saving the kingdom.—The increase of taxes which such a measure must occasion, would be so inconsiderable and so gradual, as to be scarcely perceptible; and at the same time, it would manifest such a determined resolution in our powers to reduce our debts, as might have the happiest influence on public credit."

quantity

justice (which articles include all the hereditary revenue of the crown), and also a clear annuity of 120,000*l.* in money, were settled on the king for life, for the support of his majesty's household, and the honour and dignity of the crown. And as the amount of these several branches were uncertain, (though in the last reign they were computed to have sometimes raised almost a million), if they did not rise annually to 800,000*l.* the parliament engaged to make up the deficiency. But his present majesty having, soon after his accession, spontaneously signified his consent, that his own hereditary revenues might be so disposed of, as might best conduce to the utility and satisfaction of the public; and having accepted the limited sum of 800,000*l.* *per. annum*, for the support of his civil list (and that also charged with the three life annuities to the princess of Wales, the duke of Cumberland, and princess Amelia, to the amount of 77,000*l.*), the said hereditary, and other revenues, are now carried into, and make, part of the aggregate fund; and the aggregate fund is charged with the payment of the whole annuity to the crown, besides annual payments to the dukes of Gloucester and Cumberland, and the representatives of Arthur Onslow, esq. and the earl of Chatham. Hereby the revenues themselves, being put under the same care and management as the other branches of the public patrimony, will produce more, and be better collected, than heretofore. The civil list, thus liquidated, together with the millions interest of the national debt, and the sums produced from the sinking fund, besides the uncertain sums arising from the annual taxes on land and malt, and others lately imposed, make the clear produce of the taxes, exclusive of the charges of collecting, which are raised yearly on the people of this country, amount to upward of fourteen millions sterling. The amount of the capitals of the respective public funds, may be seen in the following page.

* Releasable: when 25 millions of the 3 or 4 per cent. are paid.

The expences defrayed by the civil list, are those that in any shape relate to civil government; as the expences of the household, all salaries to officers of state, to the judges, and every one of the king's servants; the appointments to foreign ambassadors, the maintenance of the queen and royal family, the king's private expences, for privy purse, and other very numerous outgoings; as secret service money, pensions, and other bounties. These sometimes have so far exceeded the revenues appointed for that purpose, that application has been made to parliament to discharge the debts contracted on the civil list; as particularly in 1724, when one million was granted for that purpose by the statute 11 Geo. I. c. 17. Large sums have also been repeatedly granted for the payment of the king's debts in the present reign; and the considerable augmentation of 100,000l. has likewise been made to his annual income. When the bill for suppressing certain offices, as the board of trade, &c. was debated, by which savings were to be made to the amount of 72,308l. per annum, it appeared that the arrears then due on the civil list at that time, June 1782, amounted to 95,877l. 18s. 4d. notwithstanding so liberal an allowance had been recently made, and the king's debts had been repeatedly liquidated by parliamentary grants; and for the payment of this other debt, provision was made by the bill.

The civil list is indeed properly the whole of the king's revenue in his own distinct capacity; the rest being rather the revenue of the public, or its creditors, though collected and distributed again in the name, and by the officers of the crown; it is now standing in the same place as the hereditary income did formerly; and as that has gradually diminished, the parliamentary appointments have increased.

MILITARY AND MARINE STRENGTH OF GREAT BRITAIN. } The *military state* includes the whole of the soldiery; or such persons as are peculiarly appointed among the rest of the people, for the safeguard and defence of the realm.

In a land of liberty it is extremely dangerous to make a distinct order of the profession of arms. In fact, no man should take up arms but with a view to defend his country and its laws; he puts not off the citizen when he enters the camp; but it is because he is a citizen and would wish to continue so, that he makes himself for a while a soldier. The laws and constitution of these kingdoms know no such state as that of a perpetual standing soldier; bred up to no other profession than that of war; and it was not till the reign of Henry VII. that the kings of England had so much as a guard about their persons.

It seems universally agreed by all historians, that king Alfred first settled a national militia in this kingdom, and by his prudent discipline made all the subjects of his dominions soldiers.

In the mean time we are not to imagine that the kingdom was left wholly without defence, in case of domestic insurrections, or the prospect of foreign invasions. Besides those, who, by their military tenures, were bound to perform forty days service in the field, the statute of Winchester obliged every man, according to his estate and degree, to provide a determinate quantity of such arms as were then in use, in order to keep the peace: and constables were appointed in all hundreds, to see that such arms were provided: These weapons were changed by the statute 4 and 5 Ph. and M. c. 2. into others of more modern service: but both this and the former provisions were repealed in the reign of James I. While these continued in force, it was usually from time to time, for our princes to issue commissions

of array, and send into every county officers in whom they could confide, to muster and array (or set in military order) the inhabitants of every district; and the form of the commission of array was settled in parliament in the 5 Henry IV. But at the same time it was provided, that no man should be compelled to go out of the kingdom at any rate; nor out of his shire, but in cases of urgent necessity; nor should provide soldiers unless by consent of parliament. About the reign of king Henry VIII. lord-lieutenants began to be introduced, as standing representatives of the crown, to keep the counties in military order; for we find them mentioned as known officers in the statute 4 and 5 Ph. and M. c. 3. though they had not been then long in use: for Camden speaks of them in the time of queen Elizabeth as extraordinary magistrates, constituted only in times of difficulty and danger.

Soon after the restoration of king Charles II. when the military tenures were abolished, it was thought proper to ascertain the power of the militia, to recognise the sole right of the crown, to govern and command them, and to put the whole into a more regular method of military subordination: and the order in which the militia now stands by law, is principally built upon the statutes which were then enacted. It is true, the two last of them are apparently repealed; but many of their provisions are re-enacted, with the addition of some new regulations, by the present militia-laws; the general scheme of which is, to discipline a certain number of the inhabitants of every county, chosen by lot for three years; and officered by the lord lieutenant, the deputy lieutenants, and other principal land-holders, under a commission from the crown. They are not compellable to march out of their counties, unless in case of invasion, or actual rebellion, nor in any case to be sent out of the kingdom. They are to be exercised at stated times; and their discipline in general is liberal and easy; but, when drawn out into actual service, they are subject to the rigours of martial law, as necessary to keep them in order. This is the constitutional security which our laws have provided for the public peace, and for protecting the realm against foreign or domestic violence, and which the statutes declare, is essentially necessary to the safety and prosperity of the kingdom; the militia, however, are not called forth and embodied but by an act of the legislature, and at present are laid aside.

But as the fashion of keeping standing armies has universally prevailed over all Europe of late years (though some of its potentates, being unable themselves to maintain them, are obliged to have recourse to richer powers, and receive subsidiary pensions for that purpose), it has also for many years past been annually judged necessary by our legislature, for the safety of the kingdom, the defence of the possessions of the crown of Great Britain, and the preservation of the balance of power in Europe, to maintain, even in time of peace, a standing body of troops, under the command of the crown; who are, however, *ipso facto*, disbanded at the expiration of every year, unless continued by parliament. The land forces of these kingdoms, in time of peace, amount to about 40,000 men, including troops and garrisons in Ireland, Gibraltar, the East Indies, and America; but in time of war, there have formerly been in British pay, natives and foreigners, above 150,000; and there have been in the pay of Great Britain, since the commencement of the America war, 135,000 men, besides 42,000 militia. To keep this body of troops in order, an annual act of parliament passes, "to punish mutiny and desertion, and for the better payment of the army and their quarters." This regulates the manner in which they are to be dispersed among the several inn-keepers and victuallers throughout the kingdom; and establishes a law martial for their government.

The MARITIME state is nearly related to the former, though much more agreeable to the principles of our free constitution. The royal navy of England hath ever been its greatest defence and ornament; it is its ancient and natural strength; the floating bulwark of the island; an army, from which, however strong and powerful, no danger can ever be apprehended to liberty; and accordingly it has been assiduously cultivated, even from the earliest ages. To so much perfection was our naval reputation arrived in the twelfth century, that the code of maritime laws, which are called the laws of Oleron, and are received by all nations in Europe as the ground and substruction of all the marine constitutions, was confessedly compiled by our king Richard I. at the isle of Oleron, on the coast of France, then part of the possessions of the crown of England. And yet, so vastly inferior were our ancestors in this point to the present age, that, even in the maritime reign of queen Elizabeth, Sir Edward Coke thinks it matter of boast that the royal navy of England then consisted of 33 ships. The present condition of our marine is in great measure owing to the salutary provisions of the statute, called the navigation act; whereby the constant increase of English shipping and seamen was not only encouraged, but rendered unavoidably necessary. The most beneficial statute for the trade and commerce of these kingdoms, is that navigation act; the rudiments of which were first framed in 1650, partly with a narrow view; being intended to mortify the sugar islands, which were disaffected to the parliament, and still held out for Charles II. by stopping the gainful trade which they then carried on with the Dutch; and at the same time to clip the wings of those our opulent and aspiring neighbours. This prohibited all ships of foreign nations from trading with any English plantations without licence from the council of state. In 1651, the prohibition was extended also to the mother country; and no goods were suffered to be imported into England, or any of its dependencies, in any other than English bottoms, or in the ships of that European nation, of which the merchandise imported was the genuine growth or manufacture. At the Restoration, the former provisions were continued, by statute 12 Car. II. c. 18. with this very material improvement, that the master, and three-fourths of the mariners, shall also be English subjects.

The complement of seamen, in time of peace, usually hath amounted to 12 or 15,000. The vote of parliament for the service of the year 1784, was for 26,000 seamen, including 4425 marines. In time of war, they have formerly amounted to no less than 80,000 men; and after the commencement of the American war, they amounted to above 100,000 men, including marines, at present they amount to 120,000.

This navy is commonly divided into three squadrons, namely, the red, white, and blue, which are so termed from the differences of their colours. Each squadron has its admiral; but the admiral of the red squadron has the principal command of the whole, and is styled vice-admiral of Great Britain. Subject to each admiral is also a vice and rear-admiral. But the supreme command of our naval force is, next to the king, in the lords commissioners of the admiralty. Notwithstanding our favourable situation for a maritime power, it was not until the vast armament sent to subdue us by Spain, in 1588, that the nation, by a vigorous effort, became fully sensible of its true interest and natural strength, which it has since so happily cultivated.

We may venture to affirm, that the British navy, during the war of 1756, was able to cope with all the other fleets in Europe. In the course of a few years it entirely vanquished the whole naval power of France, disabled Spain, and kept the Dutch and other powers in awe. For the protection

ROYAL TR
AND C
Ireland, King
England, was
put himself o
jesty; but the
Elizabeth's re

of the British empire, and the annoyance of our enemies, it was then divided into several powerful squadrons, so judiciously stationed, as at once to appear in every quarter of the globe; and while some fleets were humbling the pride of Spain in Asia and America, others were employed in frustrating the designs of France, and escorting home the riches of the eastern and western worlds. But, the naval power of Great Britain never appeared in such splendour as during the present war, whether we consider the number of our ships stationed in all quarters of the globe, or the astonishing victories they have gained over the fleets of France, Spain and Holland, which they have almost totally annihilated. The fleet of Great Britain at present consists of about 775 ships of which 196 are of the Line, during the present war she has taken from her enemies about 200 ships of war of which 53 are of the line, of such unexampled success our history affords no example.

I shall close this account of the military and maritime strength of England, or rather of Great Britain, by observing, that though sea-officers and sailors are subject to a perpetual act of parliament, which answers the annual military act, that is passed for the government of the army, yet neither of those bodies are exempted from legal jurisdiction in civil or criminal cases, but in a few instances, of no great moment. The soldiers particularly, may be called upon by a civil magistrate, to enable him to preserve the peace against all attempts to break it. The military officer who commands the soldiers on those occasions, is to take his directions from the magistrate; and both he and they, if their proceedings are regular, are indemnified against all consequences, be they ever so fatal. Those civil magistrates, who understand the principles of the constitution, are however, extremely cautious in calling for the military on these occasions, or upon any commotion whatever; and, indeed, with good reason; for the frequent employment of the military power in a free government is exceedingly dangerous, and cannot be guarded against with too much caution.

COINS.] In Great Britain money is computed by pounds, shillings, and pence, twelve pence making a shilling, and twenty shillings one pound; which pound is only an imaginary coin. The gold pieces consist only of guineas, half guineas, and seven shilling pieces, the silver, of crowns; half crowns, shillings, sixpences, groats, and even down to a silver penny: and the copper money, pennies, half-pence and farthings. In a country like England, where the intrinsic value of silver is nearly equal, and in some coins, crown pieces particularly superior to the nominal, the coinage of silver money is a matter of great consequence; and yet the present state of the national currency seems to demand a new coinage of shillings and six-pences; the intrinsic value of the latter being many of them worn down to half their nominal value. This can only be done by an act of parliament, and by the public losing the difference between the bullion of the new and the old money. Besides the coins already mentioned, five and two guinea pieces are coined at the Tower of London, but these are not generally current; nor is any silver coin that is lower than six-pence. The coins of the famous Simon, in the time of Cromwell, and in the beginning of Charles II.'s reign, are remarkable for their beauty.

ROYAL TITLES, ARMS, } The title of the king of England is, By, the
AND ORDERS. } Grace of God, of Great Britain, France, and
Ireland, King, Defender of the Faith. The designation of the kings of England, was formerly his or her Grace, or Highness, till Henry VIII. to put himself on a footing with the emperor Charles V. assumed that of majesty; but the old designation was not abolished till towards the end of queen Elizabeth's reign.

Since the accession of the present royal family of Great Britain, anno 1714, the royal achievement is marshalled as follows: quarterly, in the first grand quarter, *Mars, three lions passant guardant, in pale Sol;* the imperial ensigns of England, impaled, with the royal arms of Scotland, which are, *Sol, a lion rampant within a double tressure-flowered, and counter-flowered, with fleurs-de-lis, Mars.* The second quarter in the royal arms of France, viz. *Jupiter, three fleurs-de-lis, Sol.* The third, the emblem of Ireland; which is, *Jupiter, an harp, Sol, stringed, Luna.* And the fourth grand quarter is his present majesty's own coat, viz. *Mars, two lions passant guardant, Sol,* for Brunswick, impaled with Lunenburg, which is *Sol, Semée of hearts; proper, a lion rampant, Jupiter;* having ancient Saxony, viz. *Mars, an horse currant, Luna, one (or grafted) in base; and in a shield furtow, Mars, the diadem, or crown of Charlemagne;* the whole, within a garter, as soverign of that most noble order of knight-hood.

The motto of *Dieu et mon Droit*, that is, *God and my Rights*, is as old as the reign of Richard I. who assumed it to shew his independency upon all earthly powers. It was afterwards revived by Edward III. when he laid claim to the crown of France. Almost every king of England had a particular badge or cognisance: sometimes a white hart, sometimes a setcolt with a falcon, by which it is said Edward IV. alluded to the infidelity of one of his mistresses; and sometimes a portcullis, which was that of the house of Lancaster, many of the princes of which were born in the castle of Beaufort. The white rose was the bearing of the house of York; and that of Lancaster, by way of contradistinction, adopted the red. The thistle, which is now part of the royal armorial bearings, belonged to Scotland, and was very significant when joined to its motto, *Nemo me impune lacesset*, "None shall safely provoke me."

The titles of the king's eldest son, are, prince of Wales, duke of Cornwall and Rothsay, earl of Chester, electoral prince of Brunswick and Lunenburg, earl of Carrick, baron of Renfrew, lord of the Isles, great steward of Scotland, and captain-general of the artillery company.

The order of the GARTER, the most honourable of any in the world, was instituted by Edward III. January 19, 1344. It consists of the sovereign, who is always king or queen of England, of 25 companions called Knights of the Garter, who wear a medal of St. George killing the dragon, supposed to be the tutelar saint of England, commonly enamelled on gold, suspended from a blue ribband, which was formerly worn about their necks, but since the latter end of James I. now crosses their bodies from their shoulder. The garter, which is of blue velvet, bordered with gold, buckled under the left knee, and gives the name to the order, was designed as an emblem of unity and combination; on it is embroidered the words, *Honi soit qui mal y pense*, "Evil to him who evil thinks."

Knights of the BATH, so called from their bathing at the time of their creation, are supposed to be instituted by Henry IV. about the year 1399, but the order seems to be more ancient. For many reigns they were created at the coronation of a king or queen, or other solemn occasions, and they wear a scarlet ribband hanging from the left shoulder, with an enamelled medal, the badge of the order, a rose issuing from the dexter side of a sceptre, and a thistle from the sinister, between three imperial crowns placed within the motto, *Tria juncta in uno*, "Three joined in one." This order being discontinued, was revived by king George I. on the 18th of May, 1725, and the month following, eighteen noblemen, and as many commoners of the first rank, were installed knights of the order with great ceremony, at Westminster.

her, where the place of instalment is Henry VII.'s chapel. Their robes are splendid and showy, and the number of knights is undetermined. The bishop of Rochester is perpetual dean of the order, which has likewise a register and other officers.

The order of the **THIAZLE**, as belonging to Scotland, is mentioned in the account of that kingdom; as is also the order of St. Patrick, newly instituted for Ireland, in our account of that kingdom.

The origin of the English peerage, or nobility, has been already mentioned. Their titles, and order of dignity, are dukes, marquesses, earls, viscounts, and lords or barons.

Baronets can scarcely be said to belong to an order, having no other badge than a bloody hand in a field, argent, in their arms. They are the only hereditary honour under the peerage, and would take place even of the knights of the Garter, were it not that the latter are always privy counsellors; there being no intermediate honour between them and the parliamentary barons of England. They were instituted by James I. about the year 1615. Their number was then two hundred, and each paid about 1000*l.* on pretence of reducing and planting the province of Ulster in Ireland: but at present their number amounts to 700.

A knight is a term used almost in every nation in Europe, and in general signifies a soldier serving on horseback; a rank of no mean estimation in ancient armies, and entitling the parties themselves to the appellation of *Sir*. Other knighthoods formerly took place in England; such as those of *bannerets*, bachelors, knights of the carpet, and the like, but they are now disused. Indeed in the year 1773, at a review of the royal navy at Portsmouth, the king conferred the honour of Knights Bannerets on two admirals and three captains. They have no particular badge on their garments, but their arms are painted on a banner placed in the frames of the supporters.

It is somewhat difficult to account for the origin of the word *esquire*, which formerly signified a person bearing the arms of a nobleman or knight, and they were therefore called *armigeri*. This title denoted any person, who, by his birth or property, was entitled to bear arms; but it is at present applied promiscuously to any man who can afford to live in the character of a gentleman without trade; and even a tradesman, if he is a justice of peace, demands the appellation. This degree, so late as in the reign of Henry IV. was an order, and conferred by the king, by putting about the party's neck a collar of SS. and giving him a pair of silver spurs. Gower the poet appears, from his effigies on his tomb in Southwark, to have been an esquire by creation. Serjeants at-law, and other serjeants belonging to the king's household, justices of the peace, doctors in divinity, law, and physic, take place of other esquires; and it is remarkable, that all the sons of dukes, marquesses, earls, viscounts, and barons, are in the eye of the law no more than esquires, though commonly designed by noble titles. The appellation of gentleman, though now confounded with the mean ranks of people, is the root of all English honour; for every nobleman is presumed to be a gentleman, though every gentleman is not a nobleman.

HISTORY.] It is generally agreed that the first inhabitants of Britain were a tribe of the Gauls, or Celtæ, that settled on the opposite shore; a supposition founded upon the evident conformity in their language, manners, government, religion, and complexion.

When Julius Cæsar, about fifty-two years before the birth of Christ, meditated a conquest of Britain, the natives, undoubtedly, had great connections with the Gauls, and other people of the continent, in government, religion, and

and commerce, rude as the latter was. Cæsar wrote the history of his two expeditions, which he pretended were accompanied with vast difficulties, and attended by such advantages over the islanders, that they agreed to pay tribute. It plainly appears, however, from contemporary and other authors, as well as Cæsar's own narrative, that his victories were incomplete and indecisive; nor did the Romans receive the least advantage from his expedition; but a better knowledge of the island than they had before. The Britons, at the time of Cæsar's descent, were governed in the time of war by a political confederacy, of which Cassibelan, whose territories lay in Hertfordshire, and some of the adjacent counties, was the head; and this form of government continued among them for some time.

In their manner of life, as described by Cæsar, and the best authors, they differed little from the rude inhabitants of the northern climates that have been already mentioned; but they certainly sowed corn, though perhaps, they chiefly subsisted upon animal food and milk. Their clothing was skins, and their fortifications beams of wood. They were dexterous in the management of their chariots beyond credibility; and they fought with lances, darts, and swords. Women sometimes led their armies to the field, and were recognised as sovereigns of their particular districts. They favoured a primogeniture or seniority, in their succession to royalty, but set it aside on the smallest inconvenience attending it. They painted their bodies with woad, which gave them a bluish or greenish cast; and they are said to have had figures of animals, and heavenly bodies on their skins. In their marriages they were not very delicate, for they formed themselves into what we may call matrimonial clubs. Twelve or fourteen men married as many wives, and each wife was in common to them all, but her children belonged to the original husband.

The Britons lived, during the long reign of Augustus Cæsar, rather as the allies than the tributaries of the Romans; but the communications between Rome and Great Britain being then extended, the emperor Claudius Cæsar, about forty-two years after the birth of Christ, undertook an expedition in person, in which he seems to have been successful against Britain. His conquests, however, were imperfect; Caractacus, and Boadicia, though a woman, made noble stands against the Romans. The former was taken prisoner after a desperate battle, and carried to Rome, where his undaunted behaviour before Claudius, gained him the admiration of the victors, and is celebrated in the histories of the times. Boadicia being oppressed in a manner that disgraces the Roman name, and defeated, disdain'd to survive the liberties of her country; and Agricola, general to Domitian, after subduing South Britain, carried his arms northwards; as has been already seen in the history of Scotland, where his successors had no reason to boast of their progress, every inch of ground being bravely defended. During the time the Romans remained in this island, they erected those walls I have so often mentioned, to protect the Britons from the invasions of the Caledonians, Scots, and Picts; and we are told, that the Roman language, learning, and customs, became familiar in Britain. There seems to be no great foundation for this assertion; and it is more probable that the Romans considered Britain chiefly as a nursery for their armies abroad, on account of their superior strength of body, and courage of the inhabitants, when disciplined. That this was the case, appears plainly enough from the defenceless state of the Britons, when the government of Rome recalled her forces from that island. I have already taken notice, that during the abode of the Romans in Britain, they introduced into it all the luxuries of Italy; and it is certain, that under them the

South Britons were reduced to a state of great vassalage, and that the genius of liberty retreated northwards, where the natives had made a brave resistance against these tyrants of the world. For though the Britons were unquestionably very brave, when incorporated with the Roman legions abroad, yet we know no struggle they made in latter times, for their independency at home notwithstanding the many favourable opportunities that presented themselves. The Roman emperors and generals while in this island, assisted by the Britons, were entirely employed in repelling the attacks of the Caledonians and Picts (the latter are thought to have been the southern Britons retired northwards), and they appeared to have been in no pain about the southern provinces.

Upon the mighty inundations of those barbarous nations, which, under the names of Goths and Vandals, invaded the Roman empire with infinite numbers, and with danger to Rome itself *, the Roman legions were withdrawn out of Britain, with the flower of the British youth, for the defence of the capital and centre of the empire; and that they might leave the island with a good grace, they assisted the Britons in rebuilding with stone the wall of Severus, between Newcastle and Carlisle, which they lined with forts and watch-towers: and having done this good office, took their last farewell of Britain about the year 448, after having been masters of the most fertile parts of it, if we reckon from the invasion of Julius Cæsar, near 500 years.

The Scots and Picts finding the whole island finally deserted by the Roman legions, now regarded the whole as their prize, and attacked Severus's wall, with redoubled forces, ravaged all before them with a fury peculiar to northern nations in those ages, and which a remembrance of former injuries could not fail to inspire. The poor Britons, like a helpless family, deprived of their parent and protector, already subdued by their own fears, had again recourse to Rome, and sent over their miserable epistle for relief (still upon record), which was addressed in these words: *To Aëtius, thrice consul: The groans of the Britons;* and after other lamentable complaints, said, *That the barbarians drove them to the sea, and the sea back to the barbarians; and they had only the hard choice left of perishing by the sword or by the waves.* But having no hopes given them by the Roman general of any succours from that side, they began to consider what other nation they might call over to their relief; Gildas, who was himself a Briton, describes the degeneracy of his countrymen at this time in mournful strains, and gives some confused hints of their officers, and the names of some of their kings, particularly one Vortigern, chief of the *Danmonii*, by whose advice the Britons struck a bargain with two Saxon chiefs, Hengist and Horfa, to protect them from the Scots and Picts. The Saxons were in those days masters of what is now called the English channel, and their native countries comprehending Scandinavia and the northern parts of Germany, being overstocked with inhabitants, they readily accepted the invitation of the Britons; whom they relieved, by checking the progress of the Scots and Picts, and had the island of Thanet allowed them for their residence. But their own country was so populous and barren, and the fertile lands of Britain so agreeable and alluring, that in a very little time, Hengist and Horfa began to meditate a settlement on themselves; and fresh supplies of their countrymen arriving daily, the Saxons soon became formidable to the Britons, whom, after a violent struggle of near 150 years, they subdued, or drove into Wales, where their language and descendants still remain.

Literature at this time in England was so rude, that we know but little

* See the Introduction.

of its history. The Romans were ignorant of letters, and public transactions among the Britons were recorded only by their bards and poets; a species of men whom they held in great veneration.

It does not fall within my design to relate the separate history of every particular nation that formed the heptarchy. It is sufficient to say, that the pope in Austin's time supplied England with about 400 monks, and that the popish clergy took care to keep their kings and lady under the most deplorable ignorance, but always magnifying the power and sanctity of his holiness. Hence it was that the Anglo Saxons during their heptarchy, where governed by priests and monks; and as they saw convenient, persuaded their kings either to shut themselves up in cloisters, or to undertake pilgrimages to Rome, where they finished their days; no less than thirty Anglo-Saxon kings during the heptarchy, resigned their crowns in that manner, and among them was Ina king of the West-Saxons, though in other respects he was a wife and brave prince. The bounty of those Anglo-Saxon kings to the see of Rome, was therefore unlimited; and Ethelwald, king of Mercia, imposed an annual tax of a penny upon every house; which was afterwards known by the name of Peter's pence, because paid on the holiday of *St. Peter ad vincula*; August 1st *.

Under all those disadvantages of bigotry and barbarity, the Anglo-Saxons were happy in comparison of the nations on the continent; because they were free from the Saracens, or successors of Mahomet, who had erected an empire in the East upon the ruins of the Roman, and began to extend their ravages over Spain and Italy. London was then a place of very considerable trade; and, if we are to believe the Saxon chronicles quoted by Tytel, Withred king of Kent, paid at one time to the king of Wessex, a sum in silver equal to 90,000 sterling, in the year 694. England, therefore, we may suppose to have been about this time a refuge for the people of the continent. The venerable but superstitious Bede, about the year 740, composed his church history of Britain, from the coming in of the Saxons down to the year 731. The Saxon Chronicle is one of the oldest and most authentic monuments of history that any nation can produce. Architecture, such as it was, with stone and glass working, was introduced into England; and we read, in 709, of a Northumbrian prelate who was served in silver plate. It must however be owned, that the Saxon coins, which are generally of copper, are many of them illegible, and all of them mean. Ale and alehouses are mentioned in the laws of Ina, about the year 728; and in this state was the Saxon heptarchy in England, when about the year 800, most of the Anglo-Saxons, tired out with the tyranny of their petty kings, united in calling to the government of the heptarchy, Egbert, who was the eldest remaining branch of the race of Cerdic, one of the Saxon chiefs who first arrived in Britain. On the submission of the Northumbrians in the year 827 he became king of all England.

Charles the Great, otherwise Charlemagne, was then king of France, and emperor of Germany. Egbert had been obliged by state jealousies, to fly to the court of Charles for protection from the persecutions of Eadburga daughter of Offa, wife to Brithric, king of the West-Saxons. Egbert acquired at the court of Charles, the arts both of war and government, and

* This tax was imposed at first for the supports of a college at Rome, for the education of English youth, found by Ina king of Wessex, under the name of *Roma-Scol*, but in process of time the the popes claimed it as a tribute due to St. Peter and his successors.

therefore soon united the Saxon heptarchy in his own person, but without subduing Wales. He changed the name of his kingdom into that of England, or England; but there is reason to believe that some part of England continued still to be governed by independent princes of the blood of Cerdic, though they paid perhaps a small tribute to Egbert, who died in the year 838, at Winchester, his chief residence.

Egbert was succeeded by his son Ethelwolf, who divided his power with his eldest son Athelstan. By this time, England had become a scene of blood and ravages, through the renewal of the Danish invasions; and Ethelwolf after some time bravely opposing them, retired in a fit of devotion to Rome, to which he carried with him his youngest son, afterwards the famous Alfred, the father of the English constitution. The gifts which Ethelwolf made to the clergy on this occasion (copies of which are still remaining) are so prodigious, even the tithes of all his dominions, that they shew his brain to have been touched by his devotion, or guided by the arts of Swithin bishop of Winchester. Upon his death, after his return from Rome, he divided his dominions between two of his sons (Athelstan being then dead), Ethelbald and Ethelbert, but we know of no patrimony that was left to young Alfred. Ethelbert who was the surviving son, left his kingdom in 866, to his brother Ethelred; in whose time, notwithstanding the courage and conduct of Alfred, the Danes became masters of the sea-coast, and the finest countries in England. Ethelred being killed, his brother Alfred mounted the throne in 871. He was one of the greatest princes, both in peace, and war, mentioned in history. He fought seven battles with the Danes with various success, and when defeated, he found resources that rendered him as terrible as before. He was, however, at one time reduced to an uncommon state of distress, being forced to live in the disguise of a cowherd: but still he kept up a secret correspondence with his brave friends, whom he collected together, and by their assistance he gave the Danes many signal overthrows, till at last he recovered the kingdom of England, and obliged the Danes who had been settled in it, to swear obedience to his government: even part of Wales courted his protection; so that he is thought to have been the most powerful monarch that had ever reigned in England.

Among the other glories of Alfred's reign, was that of raising a maritime power in England, by which he secured her coasts from future invasions. He rebuilt the city of London, which had been burnt down by the Danes, and founded the university of Oxford about the year 895: he divided England into counties, hundreds, and tythings; or rather he revived those divisions, and the use of juries, which had fallen into desuetude by the ravages of the Danes. Having been educated at Rome, he was himself not only a scholar, but an author; and he tells us himself, that upon his accession to the throne he had scarcely a lay subject who could read English, or an ecclesiastic who understood Latin. He introduced stone and brick buildings to general use in palaces as well as churches, though it is certain that his subjects for many years after his death, were fond of timber buildings. His encouragement of commerce and navigation may seem incredible to modern times, but he had merchants who traded in East India jewels; and William of Malmesbury says, that some of their gems were repositied in the church of Sherborne in his time. He received from one Osher, about the year 890, a full discovery of the coast of Norway and Lapland, as far as Russia: and he tells the king in his memorial, printed by Hakluyt, "that he sailed along the Norway coast, so far north as commonly the whale hunters use to travel." He invited numbers of learned men into his dominions, and found faithful and

useful allies in the two Scotch kings his contemporaries, Gregory and Donald, against the Danes. He is said to have fought no less than fifty-six pitched battles with those barbarians. He was inexorable against his corrupt judges, whom he used to hang up in the public highways, as a terror to evil doers. He died in the year 901, and his character is so completely amiable and heroic, that he is justly distinguished with the epithet of the Great. I have been the more diffuse on the history of Alfred's reign, as it is the most glorious of any in the English annals, though it did not extend to foreign conquests.

Alfred was succeeded by his son Edward the Elder, under whom though a brave prince, the Danes renewed their barbarities and invasions. He died in the year 925, and was succeeded by his eldest son Athelstan. This prince was such an encourager of commerce as to make a law, that every merchant who made three voyages on his account to the Mediterranean, should be put upon a footing with a *thane*, or *nobleman* of the first rank. He caused the Scriptures to be translated into the Saxon tongue. He encouraged coinage, and we find by his laws, that archbishops, bishops, and even abbots, had then the privilege of minting money. His dominions appear however to have been confined towards the north by the Danes, although his vassals still kept a footing in those counties. - He was engaged in perpetual wars with his neighbours, the Scots in particular, and was generally successful, and died in 941. The reigns of his successors, Edmund, Edred, and Edwy, were weak and inglorious, they being either engaged in wars with the Danes, or disgraced by the influence of priests. Edgar, who mounted the throne about the year 959, revived the naval glory of England, and is said to have been rowed down the river Dee by eight kings his vassals, he sitting at the helm; but, like his predecessors, he was the slave of priests, particularly St. Dunstan. His reign, however, was pacific and glorious, though he was obliged to cede to the Scots all the territory to the north of the Tyne. He was succeeded in 975, by his eldest son Edward, who was barbarously murdered by his step-mother, whose son Ethelred mounted the throne in 978. The English nation at this time, by the help of priests, was over-run with barbarians, and the Danes by degrees became possessed of the finest parts of the country, while their countrymen made sometimes dreadful descents in the western parts. To get rid of them, he agreed to pay them 30,000l.; which was levied by way of tax, and called *Danegeld*, and was the first land tax in England. In the year 1002 they had made such settlements in England, that Ethelred was obliged to give way to a general massacre of them by the English, but it is improbable that it was ever put into execution. Some attempts of that kind were undoubtedly made in particular counties, but they served only to enrage the Danish king Swein, who, in 1013, drove Ethelred, his queen, and two sons out of England into Normandy, a province of France, at that time governed by its own princes, styled the dukes of Normandy. Swein being killed, was succeeded by his son Canute the Great, but Ethelred returning to England, forced Canute to retire to Denmark, from whence he invaded England with a vast army, and obliged Edmund Ironside, (so called for his great bodily strength) Ethelred's son, to divide with him the kingdom. Upon Edmund's being assassinated, Canute succeeded to the undivided kingdom; and dying in 1035, his son Harold Hareford, did nothing memorable, and his successor Hardicanute, was so degenerate a prince, that the Danish royalty ended with him in England.

The family of Ethelred was now called to the throne; and Edward, who is commonly called the Confessor, mounted it, though Edgar Atheling, by

The loss whic

tain. Anglo-Sax

attacked William

by being descended from an elder branch, had the lineal right, and was alive. Upon the death of the Confessor, in the year 1066, Harold, son to Goodwin earl of Kent, mounted the throne of England.

William duke of Normandy, though a bastard, was then in the unrivalled possession of that great duchy, and resolved to assert his right to the crown of England. For that purpose he invited the neighbouring princes, as well as his own vassals, to join him and made liberal promises to his followers, of lands and honours in England, to induce them to assist him effectually. By these means he collected 40,000 of the bravest and most regular troops in Europe, and while Harold was embarrassed with the fresh invasions from the Danes, William landed in England without opposition. Harold returning from the North, encountered William in the place where the town of Battle now stands, which took its name from it, near Hastings in Suffex, and a most bloody battle was fought between the two armies; but Harold being killed, the crown of England devolved upon William, in the year 1066.

We have very particular accounts of the value of provisions and manufactures in those days; a palfrey cost 1s. an acre of land (according to bishop Fleetwood in his Chronicon Pretiosum) 1s. a hide of land containing 120 acres, 100s. but there is great difficulty in forming the proportion of value which those shillings bore to the present standard of money, though many ingenious treatises have been written on that head. A sheep was estimated at 1s. an ox was computed at 6s. a cow at 4s. a man 3l. The board wages of a child the first year, was 8s. The tenants of Shireburn were obliged at their choice to pay either 6d. or four hens. Silk and cotton were quite unknown. Linen was not much used. In the Saxon times, land was divided among all the male children of the deceased. Entails were sometimes practised in those times.

With regard to the manners of the Anglo-Saxons, we can say little, but they were in general a rude uncultivated people, ignorant of letters, unskillful in the mechanical arts, untamed to submission under law and government, addicted to intemperance, riot, and disorder. Even so low as the reign of Canute, they sold their children and kindred into foreign parts. Their best quality was their military courage, which yet was not supported by discipline or conduct. Even the Norman historians, notwithstanding the low state of the arts in their own country, speak of them as barbarians, when they mention the invasion made upon them by the duke of Normandy. Conquest put the people in a situation of receiving slowly from abroad all the rudiments of science and cultivation, and of correcting their rough and licentious manners. Their uncultivated state might be owing to the clergy, who always discouraged manufactures.

We are however to distinguish between the secular clergy, and the regulars or monks. Many of the former, among the Anglo-Saxons, were men of exemplary lives, and excellent magistrates. The latter depended upon the see of Rome, and directed the conscience of the king and the great men, and were generally ignorant, and often a bloody set. A great deal of the Saxon barbarism was likewise owing to the Danish invasions, which left little room for civil or literary improvements. Amidst all these defects, public and personal liberty were well understood and guarded by the Saxon institutions; and we owe to them at this day, the most valuable privileges of the English subjects.

The loss which both sides suffered at the battle of Hastings is uncertain. Anglo-Saxon authors say, that Harold was so impatient to fight, he attacked William with half of his army, so that the advantage of num-

bers was on the side of the Norman; and, indeed, the death of Harold seems to have decided the day; and William, with very little farther difficulty, took possession of the throne, and made a considerable alteration in the constitution of England; by converting lands into knight's fees*, which are said to amount to 62,000, and were held of the Norman and other great persons who had assisted him in his conquest; and who were bound to attend him with their knights and their followers in his wars. He gave for instance to one of his barons, the whole county of Chester, which he erected into a palatinate, and rendered by his grant almost independent of the crown; and here, according to some historians, we have the rise of the feudal law in England. William found it no easy matter to keep possession of his crown. Edgar Atheling, and his sister, the Next Anglo-Saxon heirs, were affectionately received in Scotland, and many of the Saxon lords took arms, and formed conspiracies in England. William got the better of all difficulties, especially after he had made a peace with Malcolm king of Scotland; who married Atheling's sister; but not without exercising horrible cruelties upon the Anglo-Saxons. He introduced the Norman laws and language. He built the stone square tower at London, commonly called the White Tower; bridled the country with forts, and disarmed the old inhabitants; in short, he attempted every thing possible to obliterate every trace of the Anglo-Saxon constitution: though, at his coronation, he took the same oath that used to be taken by the ancient Saxon kings.

He caused a general survey of all the lands in England to be made, or rather to be completed (for it was begun in Edward the Confessor's time), and an account to be taken of the villains, or servile tenants, slaves, and live stock upon each estate; all which were recorded in a book called Domesday-book, which is now kept in the Exchequer. But the repose of this fortunate and victorious king was disturbed in his old age, by the rebellion of his eldest son Robert, who had been appointed governor of Normandy, but now assumed the government as sovereign of that province, in which he was favoured by the king of France. And here we have the rise of the wars between England and France; which have continued longer, drawn more noble blood, and been attended with more memorable achievements, than any other national quarrel we read of in ancient or modern history. William seeing a war inevitable, entered upon it with his usual vigour, and with incredible celerity, transporting a brave English army, invaded France, where he was every where victorious, but died before he had finished the war, in the year 1087, the sixty-first of his age, and twenty-first of his reign in England, and was buried in his own abbey at Caen in Normandy.

The above are the most material transactions of William's reign; and it may be farther observed, that by the Norman conquest, England not only lost the true line of her ancient Saxon kings, but also her principal nobility, who either fell in battle in defence of their country and liberties, or fled to foreign countries, particularly Scotland, where, being kindly received by king Malcolm, they established themselves; and what is very remarkable, introduced the Saxon or English, which has been the prevailing language in the Lowlands of Scotland to this day.

On the other hand, England by virtue of the conquest, became much greater, both in dominion and power, by the accession of so much territory upon

* Four hides of land made one knight's fee; a barony was twelve times greater than that of a knight's fee: and when Domesday-book was framed, the number of great barons amounted to 700.

the continent. For though the Normans by the conquest, gained much of the English land and riches, yet the English gained the large and fertile dukedom of Normandy, which became a province to this crown. England likewise gained much by the great increase of naval power, and multitude of ships, wherein Normandy then abounded. This, with the perpetual intercourse between England and the continent, gave us an increase of trade and commerce, and of treasure to the crown and kingdom, as appeared soon afterwards. England, by the conquest, gained likewise a natural right to the dominion of the Channel, which had been before acquired only by the greater naval power of Edgar, and other Saxon kings. But the dominion of the narrow seas seems naturally to belong, like that of rivers, to those who possess the banks or coasts on both sides; and so to have strengthened the former title, by so long a coast as that of Normandy on one side and of England on the other side of the Channel. This dominion of the Channel, though we have long ago lost all our possessions in France, we have continued to defend and maintain by the bravery of our seamen, and the superior strength of our navy to any other power.

The succession to the crown of England was disputed between the Conqueror's sons Robert and William (commonly called Rufus, from his being red-haired), and was carried in favour of the latter. He was a brave and intrepid prince, but no friend to the clergy, who have therefore been unfavourable to his memory. He was likewise hated by the Normans, who loved his elder brother, and consequently he was engaged in perpetual wars with his brothers, and rebellious subjects. About this time the crusades of the Holy Land began, an enterprise who was among the first to engage, accommodated matters with William for a sum of money, which he levied from the clergy. William behaved with great generosity towards Edgar Atheling and the court of Scotland, notwithstanding all the provocations he had received from that quarter; but was accidentally killed as he was hunting in New Forest in Hampshire, in the year 1100, and the forty-fourth year of his age.

This prince built Westminster-hall as it now stands, and added several works to the tower, which he surrounded with a wall and a ditch. In the year 1100 happened that inundation of the sea, which overflowed great part of Earl Goodwin's estate in Kent, and formed those shallows in the Downs, now called the Goodwin Sands.

He was succeeded by his brother Henry I. surnamed Beauclerc, on account of his learning, though his brother Robert was then returning from the Holy Land. Henry may be said to have purchased the throne, first by his brother's treasures, which he seized at Winchester; secondly, by a charter, in which he restored his subjects to the reigns and privileges they had enjoyed under the Anglo-Saxon kings; and thirdly, by his marriage with Matilda daughter of Malcolm III. King of Scotland, and niece to Edgar Atheling, of the ancient Saxon line. His reign in a great measure restored the clergy to their influence in the state, and they formed, as it were, a separate body dependent upon the pope, which afterwards created great convulsions in England. Henry, partly by force, and partly by stratagem, made himself master of his brother Robert's person, and duchy of Normandy; and, with the most ungenerous meanness, detained him a prisoner for twenty-eight years, till the time of his death; and in the mean while Henry quieted his conscience by founding an abbey. He was afterwards engaged in a bloody but successful war with France; and before his death he settled the succession upon his daughter the empress Matilda, widow to Henry IV. emperor of Germany, and her son Henry, by her second husband Geoffry Plantagenet,

earl

earl of Anjou. Henry died of a surfeit, in the seventy-eight year of his age, in 1135.

Notwithstanding the late settlement of succession, the crown of England was claimed, and seized by Stephen earl of Blois, the son of Adela, fourth daughter to William the Conqueror. Matilda and her son were then abroad; and Stephen was assisted in his usurpation by his brother the bishop of Winchester, and the other great prelates, that he might hold the crown, dependent, as it were, upon them. Matilda, however, found a generous protector in her uncle, David, king of Scotland; and a worthy subject in her natural brother, Robert Earl of Gloucester, who headed her party before her son grew up. A long and bloody war ensued, the clergy having absolved Stephen and all his friends from their guilt of breaking the act of succession; but at length, the barons, who dreaded the power of the clergy, inclined towards Matilda; and Stephen, who depended chiefly on foreign mercenaries, having been abandoned by the clergy, was defeated and taken prisoner in 1141; and being carried before Matilda, she scornfully upbraided him, and ordered him to be put in chains.

Matilda was proud and weak; the clergy were bold and ambitious; and when joined with the nobility, who were factious and turbulent, were an overmatch for the crown. They demanded to be governed by Saxon laws, according to the charter that had been granted by Henry I. upon his accession; and finding Matilda refractory, they drove her out of England in 1142. Stephen having been exchanged for the earl of Gloucester, who had been taken prisoner likewise, upon his obtaining his liberty, found that his clergy and nobility had in fact excluded him from their government, by building 1100 castles, where each owner lived as an independent prince. We do not, however, find that this alleviated the feudal subjection of the inferior ranks. Stephen was ill enough advised to attempt to force them into a compliance with his will, by declaring his son Eustace heir apparent to the kingdom; and this exasperated the clergy so much, that they invited over young Henry of Anjou, who had been acknowledged duke of Normandy, and was son to the empress; and he accordingly landed in England with an army of foreigners.

This measure divided the clergy from the barons, who were apprehensive of a second conquest; and the earl of Arundel, with the heads of the lay aristocracy, proposed an accommodation, to which both parties agreed. Stephen, who about that time lost his son Eustace, was to retain the name and office of king; but Henry, who was in fact invested with the chief executive power, was acknowledged his successor. Though this accommodation was only precarious and imperfect, yet it was received by the English, who had died at every pore during the late civil wars, with great joy; and Stephen dying very opportunely, Henry mounted the throne, without a rival, in 1154.

Henry II. surnamed Plantagenet, was by far the greatest prince of his time. He soon discovered amazing abilities for government, and had performed in the sixteenth year of his age, actions that would have dignified the most experienced warriors. At his accession to the throne, he found the condition of the English boroughs greatly bettered by the privileges granted them in the struggles between their late kings and the nobility. Henry perceived the good policy of this, and brought the boroughs to such a height, that if a bondman or servant remained in a borough a year and a day, he was by such residence made free. He erected Wallingford, Winchester, and Oxford, into free boroughs, for the services the inhabitants had done to his mother and himself; by discharging them from every burthen, excepting the fixed fees

farm rent of each town; and this throughout all England, excepting London. This gave a vast accession of power to the crown, because the crown alone could support the boroughs against their feudal tyrants, and enabled Henry to reduce his overgrown nobility.

Without being very scrupulous in adhering to his former engagements, he resumed the excessive grants of crown lands made by Stephen, which were represented as illegal. He demolished many of the castles that had been built by the barons; but when he came to touch the clergy, he found their usurpations not to be shaken. He perceived that the root of all their enormous disorders lay in Rome, where the popes had exempted churchmen, not only from lay courts, but civil taxes. The bloody cruelties and disorders occasioned by those exemptions, all over the kingdom, would be incredible, were they not attested by the most unexceptionable evidences. Unfortunately for Henry the head of the English church, and chancellor of the kingdom, was the celebrated Thomas Becket. This man, powerful from his office, and still more so by his popularity, arising from a pretended sanctity, was violent, intrepid, and a determined enemy to temporal power of every kind, but without cool and politic. The king assembled his nobility at Clarendon, the name of which place is still famous for the constitutions there enacted, which, in fact, abolished the authority of the Romish see over the English clergy. Becket finding it in vain to resist the stream, signed those constitutions till they could be ratified by the pope; who, as he foresaw, rejected them. Henry, though a prince of the most determined spirit of any of his time, was then embroiled with all his neighbours; and the see of Rome was at the same time in its meridian grandeur. Becket having been arraigned and convicted of robbing the public, while he was chancellor, fled to France, where the pope and the French king espoused his quarrel. The effect was, that all the English clergy, who were on the king's side were excommunicated, and the subjects absolved from their allegiance. This disconcerted Henry so much, that he submitted to treat, and even to be insulted by his rebel prelate, who returned triumphantly through the streets of London in 1170. His return swelled his pride, and increased his insolence, till both became insupportable to Henry, who was then in Normandy. Finding that he was in fact only the first subject of his own dominions, he was heard to say, in the anguish of his heart, "Is there none who would revenge his monarch's cause upon this audacious priest?" These words reached the ears of four knights, Reginald Fitzuric, William de Tracy, Hugh de Moreville, and Richard Brito; and, without acquainting Henry of their intentions, they went over to England, where they beat out Becket's brains before the altar of his own church at Canterbury in the year 1171.

Henry was in no condition to second the blind obedience of his knights; and the public resentment rose so high, on the supposition that he was privy to the murder, that he submitted to be scourged by monks at the tomb of the pretended martyr.

Henry, in consequence of his well known maxim, endeavoured to cancel all the grants which had been made by Stephen to the royal family of Scotland, and actually resumed their most valuable possessions in the north of England. This occasioned a war between the two kingdoms, in which William king of Scotland was taken prisoner; and, to deliver himself from captivity, was obliged to pay liege homage to king Henry for his kingdom of Scotland, and for all his other dominions. It was also agreed, that liege homage should be done, and fealty sworn to Henry, without reserve or exception, by all the earls and barons of the territories of the king of Scotland, from whom

Henry should desire it, in the same manner as by his other vassals. The heirs of the king of Scotland, and the heirs of his earls, barons, and tenants in chief, were likewise obliged to render liege homage to the heirs of the king of England.

Henry likewise distinguished his reign by the conquest of Ireland: and by marrying Eleanor the divorced queen of France, but the heirs of Guienna and Poictou, he became almost as powerful in France as the French king himself, and the greatest prince in Christendom. In his old age, however, he was far from being fortunate. He had a turn for pleasure, and embarrassed himself in intrigues with women, particularly the fair Rosamond, which were resented by his queen Eleanor, to her seducing her sons, Henry, (whom his father had unadvisedly caused to be crowned in his own life time), Richard and John, into repeated rebellions, which affected him so much as to throw him into a fever, and he died at Chinon, in France, in the year 1189, and 57th of his age. The sum he left in ready money at his death, has perhaps been exaggerated, but the most moderate accounts make it amount to 200,000*l.* of our money.

During the reign of Henry, corporation charters were established all over England; by which, as I have already hinted, the power of the barons was greatly reduced. Those corporations encouraged trade; but manufactures, especially those of silk, seem still to have been confined to Spain and Italy; for the silk coronation robes, made use of by young Henry and his queen, cost 87*l.* 10*s.* 4*d.* in the sheriff of London's account, printed by Mr. Maddox: a vast sum in those days. Henry introduced the use of glass in windows into England, and stone arches in building.

In this reign, and in those barbarous ages, it was a custom in London for great numbers, to the amount of a hundred or more of the sons and relations of eminent citizens, to form themselves into a licentious confederacy, to break into rich houses and plunder them, to rob and murder passengers, and to commit with impunity, all sorts of disorders. Henry about the year 1176, divided England into six parts; called *circuits*, appointing judges to go at certain times of the year and hold *assizes*, or administer justice to the people, as is practised at this day.

Henry so far abolished the barbarous and absurd practice of forfeiting ships, which had been wrecked on the coast, that if one man or animal were alive in the ship, the vessel and goods were restored to the owners. This prince was also the first who levied a tax on the moveable and personal estate of his subjects, nobles as well as people. To shew the genius of these ages, it may not be improper to mention the quarrel between Roger archbishop of York, and Richard archbishop of Canterbury. We may judge of the violence of military men and laymen, when ecclesiastics could proceed to such extremities. The pope's legate having summoned an assembly of the clergy at London, and as both the archbishops pretended to sit on his right hand, this question of precedency begot a controversy between them. The monks and retainers of archbishop Richard fell upon Roger, in the presence of the cardinal and of the synod, threw him on the ground, trampled him under foot, and so bruised him with blows, that he was taken up half dead, and his life was with difficulty saved from their violence.

Richard I. surnamed *Cœur de Lion*, from his great courage, was the third, but eldest surviving son of Henry II. The clergy had found means to gain him over, and for their own ends they persuaded him to make a most magnificent ruinous crusade to the Holy Lands, where he took *Acre*, and performed actions of valour, that gave countenance even to the fables

fables of antiquity. After several glorious, but fruitless campaigns, he made a truce of three years with Saladin emperor of the Saracens; and on his return to England he was treacherously surpris'd by the Duke of Normandy, who, in 1193, sent him a prisoner to the emperor Henry VI. His ransom was fixed by the fœdus emperor at 150,000 merks; about 300,000*l.* of our present money.

Whilst the Scottish kings enjoyed their lands in England, they found it their interest, once generally in every king's reign, to perform the same homage; but when they were deprived of their said lands, they paid no more homage*.

Woollen broad cloths were made in England at this time. An ox sold for three shillings, which answers to nine shillings of our money, and a sheep at four pence, or one-shilling. Weights and measures were now ordered to be the same all over the kingdom. Richard was slain in besieging the castle of Chalons in the year 1199, the 42d of his age, and 10th of his reign.

The reign of his brother John, who succeeded him, is infamous in the English history. He is said to have put to death Arthur the eldest son of his brother Geoffrey, who had the hereditary right to the crown. The young prince's mother Constance, complain'd to Phillip, the king of France; who, upon John's non-appearance at his court as a vassal, deprived him of Normandy. John notwithstanding, in his wars with the French, Scotch, and Irish, gave many proofs of personal valour; but became at last so apprehensive of a French invasion, that he rendered himself a tributary to the pope, and laid his crown and regalia at the foot of the legate Pandulph, who kept them for five days. The great barons resent'd his meanness, by taking arms; but he repeated his shameful submissions to the pope, and after experiencing various fortunes of war, John was at last brought so low, that the barons oblig'd him, in 1215, to sign the great deed so well known by the name of *Magna Charta*. Though this charter is deem'd the foundation of English liberty, yet it is in fact no other than a renewal of those immunities which the barons and their followers had possess'd under the Saxon princes, and which they claim'd by the charters of Henry I. and Henry II. As the principles of liberty, however, came to be more enlarg'd, and property to be better secur'd, this charter, by various subsequent acts and explanations, came to be applicable to every English subject, as well as to the barons, knights, and burgeses. John had scarcely sign'd it, but he retract'd, and call'd upon the pope for protection, when the barons withdrew their allegiance from John, and transferr'd it to Lewis, the eldest son of Phillip Augustus, king of France. This gave umbrage to the pope; and the barons being apprehensive of their country becoming a province to France, they return'd to John's allegiance; but he was unable to protect them, till the pope refus'd to confirm the title of Lewis. John died in 1216, in the 18th year of his reign, and 49th of his age, just as he had a glimpse of resuming his authority.

The city of London owes some of her privileges to him. The office of mayor, before his reign, was for life; but he gave them a charter to chuse

* It appears however, that William I. king of Scotland, and his subjects, consented to acknowledge the king of England and his heirs, to all perpetuity, to be their sovereigns and liege lords, and they did homage for the kingdom of Scotland accordingly; but this advantage was given up by Richard I. Vide lord Lyttleton's History of Henry II. Vol. v. p. 220, 223, 235. 8vo. edit.

a mayor out of their own body, annually, and to elect their sheriffs and common-council annually, as at present.

England was in a deplorable situation when her crown devolved upon Henry III. the late king's son, who was but nine years of age. The earl of Pembroke was chosen his guardian; and the pope taking part with the young prince, the French were defeated and driven out of the kingdom, and their king obliged to renounce all claims upon the crown of England. The regent, earl of Pembroke, who had thus retrieved the independency of his country, died 1219, and the regency devolved upon the bishop of Winchester. The king was of a soft, pliable disposition, and had been persuaded to violate the Great Charter. Indeed he seemed always endeavouring to evade the privileges which he had been compelled to grant and confirm. An association of the barons was formed against him and his government, and a civil-war breaking out, Henry seemed to be abandoned by all but his Gascons, and foreign mercenaries. His profusion brought him into inexplicable difficulties; and the famous Stephen Montfort, who had married his sister, and was made earl of Leicester, being chosen general of the association, the king and his two sons were defeated, and taken prisoners at the battle of Lewes. A difference happening between Montfort and the earl of Gloucester, a nobleman of great authority, prince Edward, Henry's eldest son, obtained his liberty, and assembling as many as he could of his father's subjects, who were jealous of Montfort, and weary of the tyranny of the barons, he gave battle to the rebels, whom he defeated at Evesham, August 4th, 1265, and killed Montfort. The representatives of the commons of England, both knights and burgesses, formed now part of the English legislature, in a separate house, and this gave the first blow to feudal tenures in England; but historians are not agreed in what manner the commons before this time formed any part of the English parliaments, or great councils. Prince Edward being afterwards engaged in a crusade, Henry, during his absence, died in 1272, the sixty-fourth year of his age, and fifty-sixth of his reign, which was uncomfortable and inglorious; and yet, to the struggles of this reign, the people in great measure owe the liberties of the present day. Interest had in that age mounted to an enormous height. There are instances of 50l. per cent. being paid for money, which tempted the Jews, to remain in England, notwithstanding the grievous oppressions they laboured under, from the bigotry of the age, and Henry's extortions. In 1255 Henry made a fresh demand of 8000 merks from the Jews, and threatened to hang them if they refused compliance. They now lost all patience, and desired leave to retire with their effects out of the kingdom, but the king replied, "How can I remedy the oppression you complain of? I am myself a beggar; I am despoiled; I am stripped of all my revenues; I owe above 200,000 merks; and if I had said 300,000, I should not exceed the truth; I am obliged to pay my son prince Edward 15,000 merks a year; I have not a farthing, and I must have money from any hand, from any quarter, or by any means." King John, his father, once demanded 10,000 marks from a Jew at Bristol; and on his refusal, ordered one of his teeth to be drawn every day till he should consent. The Jew lost seven teeth, and then paid the sum required of him. Trial by *ordeal* was now entirely disused, and that by *duel* discouraged. Bracton's famous law treatise was published in this reign.

Edward returning to England, on the news of his father's death, invited all who held of his crown *in capite*, to his coronation dinner, which consisted (that the reader may have some idea of the luxury of the times) of 278

bacon hogs, 450 hogs, 440 oxen, 420 sheep, 23,600 hens and capons and thirteen fat goats. (See Rymer's *Fœdera*.) Alexander III. king of Scotland was at the solemnity, and on the occasion 500 horses were let loose, for all that could catch them to keep them.

Edward was a brave and politic prince, and being perfectly well acquainted with the laws, interests, and constitution of his kingdom, his regulations, and reformations of his laws, have justly given him the title of the English Justinian. He passed the famous Mortmain act, whereby all persons "were restrained from giving by will or otherwise, their estates to (those so called) religious purposes, and the societies that never die, without a licence from the crown." He granted certain privileges to the Cinque Ports, which, though now very inconsiderable, were then obliged to attend the king when he went beyond sea, with fifty-seven ships, each having twenty armed soldiers on board, and to maintain them at their own coasts for the space of fifteen days. He reduced the Welch to pay him tribute, and annexed its principality to his crown, and was the first who gave the title of prince of Wales to his eldest son.

His vast connections with the continent were productive of many benefits to his subjects, particularly by the introduction of reading-glasses and spectacles; though they are said to have been invented in the late reign, by the famous friar Bacon. Windmills were erected in England about the same time, and the regulation of gold and silver workmanship was ascertained by an assay, and mark of the goldsmith's company. After all, Edward's continental wars were unfortunate both to himself and the English, by draining them of their wealth; and it is thought that he too much neglected the woollen manufactures of his kingdom. He was often embroiled with the pope, especially upon the affairs of Scotland; and he died in 1307, in the sixty-ninth year of his age, and thirty-fifth of his reign, while he was upon a fresh expedition to exterminate that people. He ordered his heart to be sent to the Holy Land, with 32,000*l.* for the maintenance of what is called the *Holy Sepulchre*.

His son and successor Edward II. shewed early dispositions for encouraging favourites; but Gaveston, his chief minion, a Gascon, being banished by his father Edward, he mounted the throne with vast advantages, both political and personal, all which he soon forfeited by his own imprudence. He recalled Gaveston, and loaded him with honours, and married Isabella, daughter of the French king, who restored to him part of the territories which Edward I. had lost in France. The barons, however, obliged him once more to banish his favourite, and to confirm the Great Charter, while king Robert Bruce recovered all Scotland, excepting the castle of Stirling; near to which, at Bannockburn, Edward in person received the greatest defeat England ever suffered, in 1314. Gaveston being beheaded by the barons, they fixed upon young Hugh Spencer as a spy upon the king, but he soon became his favourite. He, through his pride, avarice, and ambition, was banished, together with his father, whom he had procured to be made earl of Winchester. The queen, a furious ambitious woman, persuaded her husband to recall the Spencers, while the common people, from their hatred to the barons, joined the king's standard, and after defeating them, restored him to the exercise of all his prerogatives. A cruel use was made of those successes, and many noble patriots, with their estates, fell victims to the queen's revenge; but at last she became enamoured with Roger Mortimer, who was her prisoner, and had been one of the most active of the anti-royalists. A breach between her and the Spencers soon followed, and going over to France with her lover, she found means to form such a party in England,

that, returning with some French troops, she put the eldest Spencer to an ignominious death, made her husband prisoner, and forced him to abdicate his crown in favour of his son Edward III. then fifteen years of age. Nothing now but the death of Edward II. was wanting to complete her guilt; and he was most barbarously murdered in Berkley-castle, by ruffians, supposed to be employed by her and her paramour Mortimer, in the year 1327.

Upon an average, the difference of living then and now, seems to be nearly as 5 or 6 is to 1, always remembering that the money contained thrice as much silver as our money or coin of the same denomination does. Thus, for example, if a goose then cost 2d., that is $\frac{2}{3}$ of our money, or according to the proportion of 6 to 1, it would now cost us 3s. 9d. The knights Templars were suppressed in this reign, owing to their enormous vices.

Edward III. mounted the throne in 1327. He was then under the tuition of his mother, who cohabited with Mortimer, and they endeavoured to keep possession of their power by executing many popular measures, and putting an end to all national differences with Scotland, for which Mortimer was created earl of March. Edward, young as he was, was soon sensible of their designs. He surprised them in person at the head of a few chosen friends in the castle of Nottingham. Mortimer was put to a public death, hanged as a traitor at the common gallows at Tyburn, and the queen herself was shut up in confinement twenty-eight years, to her death. It was not long before Edward found means to quarrel with David king of Scotland, though he had married his sister, and he was driven to France by Edward Baliol, who acted as Edward's tributary, king of Scotland, and general, and did the same for Edward for Scotland, as his father had done to Edward I. Soon after the death of Charles the Fair, king of France (without issue), who had succeeded by virtue of the Salic law, which the French pretended cut off all female succession to that crown, Philip of Valois claimed it as being the nearest male by succession; but he was opposed by Edward, as being the son of Isabella, who was sister to the three last-mentioned kings of France, and first in the female succession. The former was preferred, but the case being doubtful, Edward pursued his claim, and invaded France with a powerful army.

On this occasion the vast difference between the feudal constitutions of France, which were then in full force, and the government of England, more favourable to public liberty, appeared. The French officers knew no subordination. They and their men were equally undisciplined and disobedient, though far more numerous than their enemies in the field. The English freemen on the other having now vast property to fight for, which they could call their own, independent of a feudal law, knew its value, and had learnt to defend it by providing themselves with proper armour, and submitting to military exercises, and proper subordination in the field. The war, on the part of Edward was therefore a continued scene of success and victory. In 1340 he took the title of king of France, using it in all public acts, and quartered the arms of king of France with his own, adding this motto, *Dieu & mon droit*, "God and my right." At Cressly, August 26th, 1346, above 100,000 French were defeated, chiefly by the valour of the prince of Wales, who was but sixteen years of age (his father being no more than thirty-four) though the English did not exceed 30,000. The loss of the French far exceeded the number of the English army, whose loss consisted of no more than three knights and one esquire, and about fifty private men. The battle of

of Poitiers was fought in 1356, between the prince of Wales and the French king John, but with greatly superior advantages of numbers on the part of the French, who were totally defeated, and their king and his favourite son Philip taken prisoners. It is thought that the number of French killed in this battle, was double that of all the English army; but the modesty and politeness with which the prince treated his royal prisoners, formed the brightest wreath in his garland.

Edward's glories were not confined to France. Having left his queen Philippa, daughter to the earl of Hainault, regent of England, she had the good fortune to take prisoner David king of Scotland, who had ventured to invade England, about six weeks after the battle of Cressy was fought, and remained a prisoner eleven years. Thus Edward had the glory to see two crowned heads his captives at London. Both kings were afterwards ransomed, David for 100,000 marks, and John for three millions of gold crowns; but John returned to England, and died at the palace of the Savoy. After the treaty of Bretigny, into which Edward III. is said to have been frightened by a dreadful storm, his fortunes declined. He had resigned his French dominions entirely to the prince of Wales, and he sunk in the esteem of his subjects at home, on account of his attachment to his mistress, one Alice Pierce. The prince of Wales, commonly called the Black Prince*, from his wearing that armour, while he was making a glorious campaign in Spain, where he reinstated Peter the Cruel on that throne, was seized with a consumptive disorder, which carried him off in the year 1372. His father did not long survive him; for he died dispirited and obscure, at Shene in Surry, in the year 1377, the 65th of his age, and 51st of his reign.

No prince ever understood the balance and interests of Europe better than Edward did, and he was one of the best and most illustrious kings that sat on the English throne. Having set his heart on the conquest of France, he gratified the more readily his people in their demands, for protection and security to their liberties and properties, but he thereby exhausted his regal dominions; neither was his successor, when he mounted the throne, so powerful a prince as he was in the beginning of his reign. He has the glory of inviting over and protecting fullers, dyers, weavers, and other artificers from Flanders, and of establishing the woollen manufacture among the English, who, till his time generally exported the unwrought commodity. The rate of living in his reign seems to have been much the same as in the preceding reign; and few of the English ships even of war, exceeded forty or fifty tons. But notwithstanding the vast increase of property in England, villanage still continued in the royal, episcopal, and baronial manors. Historians are not agreed whether Edward made use of artillery in his first invasion of France, but it certainly was well known before his death. The magnificent castle of Windsor was built by Edward III. and his method of conducting that work may serve as a specimen of the condition of the people of that age. Instead of alluring workmen by contracts and wages, he assessed every county in England to send him so many masons, tilers, and carpenters, as if he had been levying an army. Soldiers were enlisted only for a short time; they lived idle all the rest of the year, and commonly all the rest of their lives; one successful campaign by pay and plunder, and the ransom of prisoners, was

* He was also the first in England that had the title of *Duke*, being created by his father Duke of Cornwall; and ever since, the eldest son of the king of England is by birth Duke of Cornwall.

supposed to be a small fortune to a man; which was a great allurements to enter into the service. The wages of a master carpenter was limited through the whole year to three pence a day, a common carpenter to two pence, money of that age.

Dr. John Wickliffe a secular priest, educated at Oxford, began in the latter end of this reign to spread the doctrines of reformation by his discourses, sermons, and writings; and he made many disciples of all ranks and stations. He was a man of parts, learning, and piety; and has the honour of being the first person in Europe who publicly called in question those doctrines, which had generally passed for certain and undisputed, during so many ages. The doctrines of Wickliffe being derived from his search into the scripture, and into ecclesiastical antiquity, were nearly the same with those propagated by the reformers in the sixteenth century. But though the age seemed strongly disposed to receive them, affairs were not yet fully ripe for this great revolution, which was reserved for a more free and enquiring period, that gave the finishing blow to Romish superstition in this and many other kingdoms of Europe. He had many friends in the university of Oxford and at court, and was powerfully protected against the evil designs of the pope and bishops, by John of Guant duke of Lancaster one of the kings sons, and other great men. His disciples were distinguished by the name of Wickliffites or Lollards.

Richard II. son of the Black Prince, was no more than eleven years of age when he mounted the throne. The English arms were then unsuccessful both in France and in Scotland; but the doctrines of Wickliffe took root under the influence of the duke of Lancaster, the king's uncle and one of his guardians, and gave enlarged notions of liberty to the villains, and lowest ranks of people. The truth is, agriculture was then in so flourishing a state, that corn, and other vituals, were suffered to be transported, and the English had fallen upon a way of manufacturing, for exportation, their leather, horns, and other native commodities; and with regard to the woollen manufactures, they seem, from records, to have been exceeded by none in Europe. John of Guant's foreign connections with the crowns of Portugal and Spain were of prejudice to England: and so many men were employed in unsuccessful wars, that the commons of England, like powder, receiving a spark of fire, all at once flamed out into a succession, under the conduct of Ball, a priest, Wat Tyler, Jack Straw, and others, the lowest of the people. The conduct of these insurgents was very violent; and in many respects extremely unjustifiable: but it cannot justly be denied, that the common people of England then laboured under many oppressions, particularly a *poll-tax*, and had abundant reason to be discontented with the government.

Richard was not then above sixteen; but he acted with great spirit and wisdom. He faced the storm of the insurgents, at the head of the Londoners, while Walworth the mayor, and Philpot an alderman, had the courage to put Tyler, the leader of the malecontents, to death, in the midst of his adherents. Richard then associated to himself a new set of favourites. His people and great lords again took up arms, and being headed by the duke of Gloucester, the king's uncle, they forced Richard once more into terms; but being insincere in all his compliances, he was upon the point of becoming more despotick than any king in England ever had been, when he lost his crown and life by a sudden catastrophe.

A quarrel happened between the duke of Hereford, son to the duke of Lancaster, and the duke of Norfolk; and Richard banished them both, with particular marks of injustice to the former, who now became duke of Lancaster,

after, by his father's death; and Richard carrying over a great army to quell a rebellion in Ireland, a strong party formed in England, the natural result of Richard's tyranny, who offered the duke of Lancaster the crown. He landed from France at Ravenspur in Yorkshire, and was soon at the head of 60,000 men, all of them English. Richard hurried back to England, where his troops refusing to fight, and his subjects, whom he had affected to despise, generally deserting him, he was made prisoner with no more than twenty attendants; and being carried to London, he was deposed in full parliament, upon a formal charge of tyranny and misconduct; and soon after he is supposed to have been starved to death in prison, in the year 1399 the 34th of his age, and the 23d of his reign. He had no issue by either of his two marriages.

Though the nobility of England, were possessed of great power at the time of this revolution, yet we do not find that it abated the influence of the commons. They had the courage to remonstrate boldly in parliament against the usury, which was but too much practised in England, and other abuses of both clergy and laity: and the destruction of the feudal powers soon followed.

Henry the Fourth*, son of John of Gaunt duke of Lancaster, fourth son of Edward III. being settled on the throne of England, in prejudice to the elder branches of Edward III.'s family, the great nobility were in hopes that this glaring defect in his title would render him dependent upon them. At first some conspiracies were formed against him among his great men, as the dukes of Surry and Exeter, the earls of Gloucester and Salisbury, and the archbishop of York; but he crushed them by his activity and steadiness, and laid a plan for reducing their overgrown power. This was understood by the Percy family the greatest in the north of England, who complained of Henry having deprived them of some Scotch prisoners, whom they had taken in battle; and a dangerous rebellion broke out under the old earl of Northumberland, and his son the famous Henry Percy, surnamed Hotspur, but it ended in the defeat of the rebels, chiefly by the valour of the prince of Wales. With equal good fortune, Henry suppressed the insurrection of the Welch, under Owen Glendower: and by his prudent concessions to his parliament, to the commons particularly, he at last conquered all opposition, while, to save the defect of his title, the parliament entailed the crown upon him, and the heirs male of his body lawfully begotten, thereby shutting out all female succession. The young duke of Rothsay, heir to the crown of Scotland (afterwards James I. of that kingdom), falling a prisoner into Henry's hands about the time, was of infinite service to his government; and before his death, which happened in 1413, in the 46th year of his age, and 13th of his reign, he had the satisfaction to see his son and successor, the prince of Wales, disengage himself from many youthful follies, which then had disgraced his conduct.

The English marine was now so greatly increased, that we find an English vessel

* The throne being now vacant, the duke of Lancaster stepped forth, and having crossed himself on his forehead and on his breast, and called upon the name of Christ, he pronounced these words, which I shall give in the original language, because of their singularity.

In the name of the Father, Son, and Holy Ghost, I Henry of Lancaster, challenge this crown of England, and the crown, with all the members, and the appurtenances; als I shal am descended by right line of the bloode (meaning a claim in right of his mother) coming from the good king Henry therde and throge that God of his grace hath sent me, with helpe of hym, and of my frende, to recover it: the which crowne was in point to be done by default of government, and underyng of the gode lawe.

vessel of 200 tons in the Baltic, and many other ships of equal burden, carrying on an immense trade all over Europe, but with the Hanse towns in particular. With regard to public liberty, Henry IV. as I have already hinted, was the first prince who gave the different orders in parliament, especially that of the commons, their due weight. It is however a little surprising, that learning was at this time in a much lower state in England, and all over Europe, than it had been 200 years before. Bishops, when testifying synodal acts, were often forced to do it by proxy in the following terms, viz. "As I cannot read myself, N. N. hath subscribed for me; or, As my lord bishop cannot write himself, at his request I have subscribed." By the influence of the court and the intrigues of the clergy, an act was obtained in the sessions of parliament 1401 for the burning of heretics, occasioned by the great increase of the Wickliffites or Lollards; and immediately after, one Sawtre, parish-priest of St. Osithe in London, was burnt alive by the king's writ, directed to the mayor and sheriffs of London.

The balance of trade with foreign parts was against England at the accession of Henry V. in 1413, so greatly had luxury increased. The Lollards, or the followers of Wickliffe, were excessively numerous, and sir John Oldcastle and lord Cobham having joined them, it was pretended that he had agreed to put himself at their head, with a design to overturn the government; but this appears to have been a groundless accusation, from a bloody zeal of the clergy, though he was put to death in consequence of it. His only real crime seems to have been the spirit with which he opposed the superstition of the age, and he was the first of the nobility who suffered on account of religion. Henry was about this time engaged in a contest with France, which he had many incitements for invading. He demanded a restitution of Normandy, and other provinces that had been ravished from England in the preceding reigns; also the payment of certain arrears due for king John's ransom since the reign of Edward the III. and availing himself of the distracted state of that kingdom by the Orleans and Burgundy factions, he invaded it, where he first took Harfleur, and then defeated the French in the battle of Agincourt, which equalled those of Cressy and Poitiers in glory to the English, but exceeded them in its consequences, on account of the vast number of French princes of the blood, and other great noblemen, who were there killed. Henry, who was as great a politician as a warrior, made such alliances, and divided the French among themselves so effectually, that he forced the queen of France, whose husband, Charles VI. was a lunatic, to agree to his marrying her daughter, the princess Catharine, to disinherit the dauphin, and to declare Henry regent of France during her husband's life, and him and his issue successors to the French monarchy, which must at this time have been exterminated, had not the Scots (though their king still continued Henry's captive) furnished the dauphin with vast supplies, and preserved the French crown for his head. Henry however made a triumphal entry into Paris, where the dauphin was proscribed; and after receiving the fealty of the French nobility, he returned to England to levy a force that might crush the dauphin and his Scotch auxiliaries. He probably would have been successful, had he not died of a pleuritic disorder, 1442, the 34th year of his age, and the 10th of his reign.

Henry V's vast successes in France revived the trade of England, and at the same time increased and established the privileges and liberties of the English commonalty. As he died when he was only thirty four years of age, it is hard to say, if he had lived, whether he might not have given the law to all the continent of Europe, which was then greatly distracted by the divisions

among its princes; but whether this would have been of service or prejudice to the growing liberties of the English subjects, we cannot determine.

By an authentic and exact account of the ordinary revenues of the crown during this reign, it appears that they amounted only to 55,714*l.* a year, which is nearly the same with the revenues in Henry III's time, and the kings of England had neither become much richer nor poorer in the course of 200 years. The ordinary expences of the government amounted to 52,507*l.* so that the king had of surplus only 3,207*l.* for the support of his household for his wardrobe, for the expence of embassies, and other articles. This sum was not nearly sufficient even in time of peace: and to carry on his wars, this great conqueror was reduced to many miserable shifts; he borrowed from all quarters; he pawned his jewels, and sometimes the crown itself; he ran in arrears to his army; and he was often obliged to stop in the midst of his career of victory, and to grant a truce to the enemy. I mention these particulars, that the reader may judge of the simplicity and temperance of our predecessors three centuries ago, when the expences of the greatest king in Europe were scarcely equal to the pension of a superannuated courtier of the present age.

It required a prince equally able with Henry IV. and V. to confirm the title of the Lancaster house to the throne of England. Henry VI. surnamed of Windsor, was no more than nine months old, when, in consequence of the treaty of Troyes, concluded by his father with the French court, he was proclaimed king of France as well as England. He was under the tuition of his two uncles, the dukes of Bedford and Gloucester, both of them princes of great accomplishments, virtues, and courage, but unable to preserve their brother's conquests. Upon the death of Charles VI. the affections of the French for his family revived in the person of his son and successor Charles VII. The duke of Bedford, who was regent of France, performed many glorious actions, and at last laid siege to Orleans, which, if taken would have completed the conquest of France. The siege was raised by the valour and good conduct of the Maid of Orleans, a phenomenon hardly to be paralleled in history, she being of the lowest extraction, and bred a cow-keeper, and sometimes a helper in stables in public inns. She must notwithstanding have possessed an amazing fund of sagacity as well as valour. After an unparalleled train of heroic actions, and placing the crown upon her sovereign's head, she was taken prisoner by the English in making a sally during the siege of Compeigne, who burnt her alive for a witch at Roan, May 30, 1451.

The death of the duke of Bedford, and the agreement of the duke of Burgundy, the great ally of the English, with Charles VII. contributed to the entire ruin of the English interest in France, and the loss of all their fine provinces in that kingdom, notwithstanding the amazing courage of Talbot the first earl of Shrewsbury, and their other officers. The capital misfortune of England, at this time, was its disunion at home. The duke of Gloucester lost his authority in the government, and the king married Margaret of Anjou, daughter to the needy king of Sicily; a woman of a high spirit, but an implacable disposition; while the cardinal of Winchester, who was the richest subject in England if not in Europe, presided at the head of the treasury, and by his avarice ruined the interest of England, both at home and abroad. Next to the cardinal, the duke of York, who was lord lieutenant of Ireland, was the most powerful subject in England. He was descended by the mother's side from Lionel, an elder son of Edward III. and prior in claim to the reigning king, who was descended from John of Gaunt, Ed-

ward's youngest son ; and he affected to keep up the distinction of a white rose, that of the house of Lancaster being red. It is certain that he paid no regard to the parliamentary entail of the crown upon the reigning family, and he lost no opportunity of forming a party to assert his right but acted at first with a most profound dissimulation. The duke of Suffolk was a favourite of the queen, who was a professed enemy to the duke of York, but being impeached in parliament, he was banished for five years, and had his head struck off on board a ship, by a common sailor. This was followed by an insurrection of 20,000 Kentish-men, headed by one Jack Cade, a man of low condition, who sent to the court a list of grievances ; but he was defeated by the valour of the citizens of London, and the queen seemed to be perfectly secure against the duke of York. The inglorious management of the English affairs in France befriended him, and upon his arrival in England from Ireland, he found a strong party of the nobility his friends ; but being considered as the fomentor of Cade's rebellion, he professed the most profound reverence to Henry.

The persons in high power and reputation in England, next to the duke of York, were the earl of Salisbury, and his son the earl of Warwick. The latter had the greatest land estate of any subject in England, and his vast abilities, joined to some virtues, rendered him equally popular. Both father and son were secretly on the side of York ; and during a fit of illness of the king, that duke was made protector of the realm. Both sides now prepared for arms, and the king recovering, the queen with wonderful activity assembled an army : but the royalists were defeated in the first battle of St. Alban's, and the king himself was taken prisoner. The duke of York was once more declared protector of the kingdom, but it was not long before the queen resumed all her influence in the government, and the king, though his weakness became every day more and more visible, recovered all his authority.

The duke of York upon this threw off the mask, and in 1450, he openly claimed the crown, and the queen was again defeated by the earl of Warwick, who was now called the king-maker. A parliament upon this being assembled, it was enacted, that Henry should possess the throne for life, but that the duke of York should succeed him, to the exclusion of all Henry's issue. All, excepting the magnanimous queen, agreed to this compromise. She retreated northwards, and the king being still a prisoner, she pleaded his cause so well, that, assembling a fresh army, she fought the battle of Wakefield, where the duke of York was defeated and slain in 1460.

It is pretty extraordinary, that though the duke of York and his party openly asserted his claim to the crown, they still professed allegiance to Henry ; but the duke of York's son, afterwards Edward IV. prepared to revenge his father's death, and obtained several victories over the royalists. The queen, however, advanced towards London, and defeating the earl of Warwick, in the second battle of St. Alban's, she delivered her husband ; but the disorders committed by her northern troops disgusted the Londoners so much, that she durst not enter London, where the duke of York was received on the 28th of February, 1461, while the queen and her husband were obliged to retreat northwards. She soon raised another army, and fought the battle of Towton, the most bloody perhaps that ever happened in any civil war. After prodigies of valour had been performed on both sides, the victory remained with young king Edward, and near 40,000 men lay dead on the field of battle. Margaret and her husband were once more obliged to fly to Scotland, where they met with generous protection.

It may be proper to observe, that this civil war was carried on with greater animosity than any perhaps ever known. Margaret was as blood-thirsty

as her opponents, and she was the cause of many deaths, especially of her own children.

Margaret fled to France, where she remained for some time, but she was obliged to return to London.

The duke of York, who was now called Edward IV., demanded the crown, and upon his arrival in England, he was proclaimed king.

The duke of York, who was now called Edward IV., demanded the crown, and upon his arrival in England, he was proclaimed king. He was defeated and taken prisoner, but he was released and fled to France. He was defeated and taken prisoner, but he was released and fled to France.

as her opponents, and when prisoners on either side were made, their deaths, especially if they were of any rank, were deferred only for a few hours.

Margaret by the concessions she made to the Scots, soon raised a fresh army there, and in the north of England, but met with defeat upon defeat, till at last her husband, the unfortunate Henry, was carried prisoner to London.

The duke of York, now Edward IV. being crowned on the 29th of June, fell in love with, and privately married Elizabeth, the widow of Sir John Gray, though he had some time before sent the earl of Warwick to demand the king of France's sister in marriage, in which embassy he was successful, and nothing remained but the bringing over the princess into England. When the secret of Edward's marriage broke out, the haughty earl deeming himself affronted, returned to England inflamed with rage and indignation; and from being Edward's best friend became his most formidable enemy, and gaining over the duke of Clarence, Edward was made prisoner, but escaping from his confinement, the earl of Warwick, and the French king, Lewis XI. declared for the restoration of Henry, who was replaced on the throne, and Edward narrowly escaped to Holland. Returning from thence, he advanced to London under pretence of claiming his dukedom of York; but being received into the capital, he resumed the exercise of royal authority, made king Henry once more his prisoner, and defeated and killed Warwick, in the battle of Barnet. A few days after, he defeated a fresh army of Lancastrians, and made queen Margaret prisoner, together with her son prince Edward, whom Edward's brother, the duke of Gloucester, murdered in cold blood, as he is said (but with no great show of probability) to have done his father Henry VI. then a prisoner in the Tower of London, a few days after, in the year 1471.

Edward, partly to amuse the public, and partly to supply the vast expences of his court, pretended sometimes to quarrel, and sometimes to treat with France, but his irregularities brought him to his death (1483) in the twenty-third year of his reign, and forty-second of his age.

Notwithstanding the turbulence of the times, the trade and manufactures of England, particularly the woollen, increased during the reigns of Henry VI. and Edward IV. So early as 1440, a navigation act was thought of by the English, as the only means to preserve to themselves the benefit of being the sole carriers of their own merchandise; but foreign influence prevented Henry's passing the bill for that purpose. The invention of printing, which is generally supposed to have been imported into England by William Caxton and which received some countenance from Edward, is the chief glory of his reign; but learning in general was then in a poor state in England. The lord Tiptoft was its great patron, and seems to have been the first English nobleman who cultivated what are now called the belles lettres. The books printed by Caxton are mostly re-translations, or compilations from the French or Monkish Latin; but it must be acknowledged, at the same time, that literature, after this period, made a more rapid and general progress among the English, than it did in any other European nation. The famous Littleton, judge of the Common Pleas, and Fortescue, chancellor of England, flourished at this period.

Edward IV. left two sons by his queen, who had exercised her power with no great prudence, by having nobilitated many of her obscure relations. Her eldest son, Edward V. was about thirteen; and his uncle the duke of

Gloucester, taking advantage of the queen's unpopularity among the great men, found means to bastardize her issue, by act of parliament, under the scandalous pretext of a pre-contract between their fathers and another lady. The duke, at the same time, was declared guardian of the kingdom, and at last accepted of the crown, which was offered him by the Londoners; having first put to death all the nobility and great men, whom he thought to be well affected to the late king's family. Whether the king and his brother were murdered in the Tower, by his direction, is doubtful. The most probable opinion is, that they were clandestinely sent abroad by his orders; and that the elder died, but that the younger survived, and was the same who was well known by the name of Perkin Warbeck. Be this as it will, the English were prepossessed so strongly against Richard, as being the murderer of his nephews, that the earl of Richmond who still remained in France, carried on a secret correspondence with the remains of Edward IV.'s friends, and by offering to marry his eldest daughter, he was encouraged to invade England at the head of about 2000 foreign troops; but they were soon joined by 7000 English and Welch. A battle between him and Richard, who was at the head of 15,000 men, ensued at Bosworth-field, in which Richard, after displaying most astonishing acts of personal valour, was killed, having been first abandoned by a main division of his army, under lord Stanley and his brother, in the year 1485.

Though the same act of bastardy affected the daughters, as well as the sons of the late king, yet no disputes were raised upon the legitimacy of the princess Elizabeth, eldest daughter to Edward IV. and who, as had been before concerted, married Henry of Lancaster, earl of Richmond, thereby uniting both houses, which happily put an end to the long and bloody war between the contending houses of York and Lancaster. Henry, however, rested his right upon conquest, and seemed to pay little regard to the advantages of his marriage. He was the first who instituted that guard called Yeomen, which still subsists, and in imitation of his predecessor, he gave an irrecoverable blow to the dangerous privileges assumed by the barons, in abolishing liveries and retainers, by which every malefactor could shelter himself from the law, on assuming a nobleman's livery, and attending his person. The despotic court of star-chamber owed its original to Henry; but at the same time, it must be acknowledged, that he passed many acts, especially for trade and navigation, that were highly for the benefit of his subjects; and, as a finishing stroke to the feudal tenures, an act passed by which the barons and gentlemen of landed interest were at liberty to sell and mortgage their lands, without fines or licences for the alienation.

This, if we regard its consequences, is perhaps the most important act that ever passed in an English parliament, though its tendency seems only to have been known to the politic king. Luxury, by the increase of trade, and the discovery of America, had broken with irresistible force into England, and monied property being chiefly in the hands of the commons, the estates of the barons became theirs, but without any of their dangerous privileges; and thus the baronial powers were soon extinguished in England.

Henry, after encountering and surmounting many difficulties both in France and Ireland, was attacked in the possession of his throne by a young man, one Perkin Warbeck, who pretended to be the duke of York, second son to Edward IV. and was acknowledged as such by the duchess of Burgundy, Edward's sister. We shall not follow the adventures of this young man, which were various and uncommon; but it is certain that many of the

English, with the courts of France and Scotland, believed him to be what he pretended. Henry endeavoured to prove the death of Edward V. and his brother, but never did it to the public satisfaction; and though James IV. of Scotland dismissed Perkin out of his dominions, being engaged in a treaty of marriage with Henry's oldest daughter, yet by the kind manner in which he entertained and dismissed him, it is plain that he believed him to be the real duke of York, especially as he refused to deliver up his person, which he might have done with honour, had he thought him an impostor. Perkin, after various unfortunate adventures, fell into Henry's hands, and was shut up in the Tower of London, from whence he endeavoured to escape along with the innocent earl of Warwick, for which Perkin was hanged, and the earl beheaded. In 1499, Henry's eldest son, Arthur prince of Wales, was married to the princess Catharine of Arragon, daughter to the king and queen of Spain, and he dying soon after, such was Henry's reluctance to refund her great dowry, 200,000 crowns of gold, that he consented to her being married again to his second son, then prince of Wales, on pretence that the first match had not been consummated. Soon after, Henry's eldest daughter, the princess Margaret, was sent with a most magnificent train to Scotland, where she was married to James IV. Henry, at the time of his death, which happened in 1509, the 52d year of his age, and 24th. of his reign, was possessed of 1,800,000l. sterling, which is equivalent to five millions at present; so that he may be supposed to have been master of more ready money than all the kings in Europe besides possessed, the mines of Peru and Mexico being then only beginning to be worked. He was immoderately fond of replenishing his coffers, and often tricked his parliament to grant him subsidies for foreign alliances which he intended not to pursue.

I have already mentioned the vast alteration which happened in the constitution of England during Henry VII.'s reign. His excessive love of money, and his avarice, was the probable reason why he did not become master of the West Indies, he having the first offer of the discovery from Columbus, whose proposals being rejected by Henry, that great man applied to the court of Spain, and he set out upon the discovery of a new world in the year 1492, which he effected after a passage of thirty-three days, and took possession of the country in the name of the king and queen of Spain. Henry, however, made some amends by encouraging Cabot, a Venetian, who discovered the main land of North America in 1498; and we may observe to the praise of this king, that sometimes, in order to promote commerce, he lent to merchants sums of money without interest, when he knew that their stock was not sufficient for those enterprizes which they had in view. From the proportional prices of living, produced by Madox, Fleetwood, and other writers, agriculture and breeding of cattle must have been prodigiously advanced before Henry's death; an instance of this is given in the case of lady Anne, sister to Henry's queen, who had an allowance of 20s. per week for her exhibition, sustentation, and convenient diet of meat and drink; also for two gentlewomen, one woman child, one gentleman, one yeoman, and three grooms (in all eight persons), 51. 11s. 8d. per annum, for their wages, diet, and clothing; and for the maintenance of seven horses, 16l. 9s. 4d. for each horse, 2l. 7s. 6d. yearly, money being still 1. ½ times as weighty as our modern silver coin. Wheat was that year no more than 3s. 4d. a quarter, which answers to 5s. of our money, consequently it was about seven times as cheap as at present; so that had all other necessaries been equally cheap,

The fine arts were as far advanced in England at the accession of Henry VIII. 1509, as in any European country, if we except Italy; and perhaps no prince ever entered with greater advantages than he did on the exercise of royalty. Young, vigorous, and rich, without any rival, he held the balance of power in Europe; but it is certain that he neglected these advantages in commerce, with which his father became too lately acquainted. Imagining he could not stand in need of a supply, he did not improve Cabot's discoveries, and he suffered the East and West Indies to be engrossed by Portugal and Spain. His vanity engaged him too much in the affairs of the continent, and his flatterers encouraged him to make preparations for the conquest of all France. These projects and his establishing what is properly called a *navy royal*, for the permanent defence of the nation (a most excellent measure) led him into incredible expences. He became a candidate for the German empire, during its vacancy; but soon resigned his pretensions to Francis I. of France, and Charles of Austria, king of Spain, who was elected in 1519. Henry's conduct, in the long and bloody wars between those princes, was directed by Wolsey's views upon the papedom, which he hoped to gain by the interest of Charles; but finding himself twice deceived, he persuaded his matter to declare himself for Francis, who had been taken prisoner at the battle of Pavia. Henry, however, continued to be the dupe of all parties, and to pay great part of their expences, till at last he was forced to lay vast burdens upon his subjects.

Henry continued all this time the great enemy of the reformation, and the champion of the popes and the Romish church. He wrote a book against Luther, "of the Seven Sacraments," about the year 1521, for which the pope gave him the title of *Defender of the Faith*; which his successors retain to this day; but about the year 1527, he began to have some scruples with regard to the validity of his marriage with his brother's widow. I shall not say, how far on this occasion he might be influenced by scruples of conscience, or aversion to the queen, or the charms of the famous Anne Boleyn, maid of honour to the queen, whom he married, before he had obtained from Rome the proper bulls of divorce from the pope. The difficulties he met with in this process, ruined Wolsey, who died heart-broken, after being stripped of his immense possessions.

A perplexing, though nice conjuncture of affairs, it is well known, induced Henry at last to throw off all relation to, or dependence upon the church of Rome, and to bring about a reformation; in which, however, many of the Romish errors and superstitions were retained. Henry never could have effected this mighty measure, had it not been for his despotic disposition, which broke out on every occasion. Upon a slight suspicion of his queen's inconstancy, and after a sham trial, he cut off her head in the Tower, and put to death some of her nearest relations; and in many respects he acted in the most arbitrary manner, his wishes, however unreasonable, being too readily complied with, in consequence of the shameful servility of his parliaments. The dissolution of the religious houses, and the immense wealth that came to Henry, by seizing all the ecclesiastical property in his kingdom, enabled him to give full scope to his sanguinary disposition; so that the best and most innocent blood of England was shed on his throne, and seldom any long time passed without being marked with some bloody victim of his tyranny.—Among others, was the aged countess of Salisbury, descended immediately from Edward IV. and mother to cardinal Pole; the marquis of

Exeter, the lord Montague, and others of the blood royal, for holding a correspondence with that cardinal.

His third wife was Jane Seymour, daughter to a gentleman of fortune and family; but she died in bringing Edward VI. into the world. His fourth wife was Anne, sister to the duke of Cleves. He disliked her so much that he scarcely bedded with her; and obtaining a divorce, he suffered her to reside in England on a pension of 30,000*l.* a year. His fifth wife was Catherine Howard, niece to the duke of Norfolk, whose head he cut off for antenuptial incontinency. His last wife was queen Catharine Par, in whose possession he died, after she had narrowly escaped being brought to the stake, for her religious opinions, which favoured the reformation. Henry's cruelty increased with his years, and was now exercised promiscuously on Protestants and Catholics. He put the brave earl of Surry to death without a crime being proved against him; and his father, the duke of Norfolk, must have suffered the next day, had he not been saved by Henry's own death, 1547, in the 56th year of his age, and the 38th of his reign.

The state of England, during the reign of Henry VIII. is, by the help of printing, too well known to be enlarged upon here. His attention to the naval security of England is highly commendable; and it is certain that he employed the unjust and arbitrary power he frequently assumed, in many respects for the glory and interest of his subjects. Without enquiring into his religious motives, it must be candidly confessed, that had the reformation gone through all the forms prescribed by the laws, and the courts of justice, it probably never could have taken place, or at least not for many years; and whatever Henry's personal crimes or failings might have been, the partition he made of the church's property among his courtiers and favourites, and thereby rescuing it from dead hands, undoubtedly promoted the present greatness of England. With regard to learning and the arts, Henry was a generous encourager of both: He gave a pension to Erasmus, which is another name for learning itself. He brought to England, encouraged, and protected Hans Holbein, that excellent painter and architect; and in his reign, noblemen's houses began to have the air of Italian magnificence and regularity. He was a constant and generous friend to Cranmer; and though he was, upon the whole rather whimsical than settled in his own principles of religion, he advanced and encouraged many who became afterwards the instruments of a more pure reformation.

In this reign the Bible was ordered to be printed in English. Wales was united and incorporated with England. Ireland was created into a kingdom, and Henry took the title of king instead of lord of Ireland.

Edward VI. was but nine years of age at the time of his father's death; and after some disputes were over, the regency was settled in the person of his uncle the earl of Hertford, afterwards the protector, and duke of Somerset, a declared friend and patron of the reformation, and a bitter enemy to the see of Rome.

The reader is to observe in general that the reformation was not effected without many public disturbances. The common people, during the reigns of Henry and Edward, being deprived of the vast relief they had from abbeys and religious houses, and being ejected from their small corn-growing farms, had often taken arms, but had been as often suppressed by the government; and several of these insurrections were crushed in this reign.

The reformation, however, went on rapidly, through the zeal of Cranmer, and others, some of them foreign divines. In some cases, particularly with regard

regard to the princess Mary, they lost sight of that moderation, which the reformers had before so strongly recommended; and some cruel sanguinary executions, on account of religion, took place. Edward's youth excuses him from blame, and his charitable endowments, as Bridewell, and St. Thomas's hospitals, and also several schools which still exist and flourish, shew the goodness of his heart. He died of a deep consumption in 1553, in the 16th year of his age, and the 7th of his reign.

Edward, on his death-bed, from his zeal for religion, had made a very unconstitutional will, for he set aside his sister Mary from the succession, which was claimed by lady Jane Grey, daughter to the dutchess of Suffolk, younger sister to Henry VIII. This lady, though she had scarcely reached her 17th year, was a prodigy of learning and virtue; but the bulk of the English nation recognised the claim of the princess Mary, who cut off lady Jane's head, and that of her husband lord Guildford Dudley, son to the duke of Northumberland, who also suffered in the same manner.

Mary being thus settled on the throne, suppressed an insurrection under Wyatt, and proceeded like a female fury to re-establish popery, which she did all over England. She recalled cardinal Pole from banishment, made him instrumental in her cruelties, and lighted up the flames of persecution, in which archbishop Cranmer, the bishops Ridley, Hooper, and Latimer, and many other illustrious confessors of the English reformed church, were consumed; not to mention a vast number of other sacrifices of both sexes, and all ranks, that suffered through every quarter of the kingdom. Bonner bishop of London, and Gardiner bishop of Winchester, were the chief executioners of her bloody mandates; and had she lived, she would have endeavoured to exterminate all her protestant subjects.

Mary now married Philip II. of Spain, who, like herself, was an unfeeling bigot to popery; and the chief praise of her reign is, that by the marriage articles, provision was made for the independency of the English crown. By the assistance of troops, which she furnished to her husband, he gained the important battle of St. Quintin; but that victory was so ill improved, that the French under the duke of Guise, soon after took Calais, the only place then remaining to the English in France, and which had been held ever since the reign of Edward III. This loss, which was chiefly owing to cardinal Pole's secret connections with the French court is said to have broken Mary's heart, who died in 1558, in the 42d year of her life, and 6th of her reign. "In the heat of her persecuting flames (says a contemporary writer of credit), were burnt to ashes, one archbishop, 4 bishops, 21 divines, 8 gentlemen, 84 artificers, 100 husbandmen, servants and labourers, 26 wives, 28 widows, 9 virgins, 2 boys, and 2 infants; one of them whipped to death by Bonner, and the other, springing out of the mother's womb from the stake as she burned, thrown again into the fire." Several also died in prison, and many were otherwise cruelly treated.

Elizabeth, daughter to Henry VIII. by Anne Boleyn, mounted the throne under the most discouraging circumstances both at home and abroad. Popery was the established religion of England; her title to the crown, on account of the circumstances attending her mother's marriage and death, was disputed by Mary queen of Scots, grandchild to Henry VII's eldest daughter, and wife to the dauphin of France; and the only ally she had on the continent was Philip king of Spain, who was the life and soul of the popish cause, both abroad and in England. Elizabeth was no more than 25 years of age at the time of her inauguration; but her sufferings under her bigoted sister,

joined to the superiority of her genius, had taught her caution and policy, and she soon conquered all difficulties.

In matters of religion she succeeded with surprising facility; for in her first parliament, in 1550 the laws establishing popery were repealed; her supremacy was restored, and an act of uniformity passed soon after. And it is observed, that of 9400 beneficed clergymen in England, only about 120 refused to comply with the reformation. With regard to her title, she took advantage of the divided state of Scotland, and formed a party there, by which Mary, now become the widow of Francis II. of France, was obliged to renounce, or rather to suspend her claim. Elizabeth, not contented with this, sent troops and money, which supported the Scotch malecontents; till Mary's unhappy marriage with lord Darnley, and then with Bothwell, the supposed murderer of the former, and her other misconduct and misfortunes, drove her to take refuge in Elizabeth's dominions, where she had often been promised a safe and honourable asylum. It is well known how unfaithful Elizabeth was to this profession of friendship, and that she detained the unhappy prisoner 18 years in England, then brought her to a sham trial, pretending that Mary aimed at the crown, and without sufficient proof of her guilt, cut off her head; an action which greatly tarnished the glories of her reign.

The same Philip, who had been the husband of her late sister, upon Elizabeth's accession to the throne, offered to marry her, but she dextrously avoided his addresses; and by a train of skilful negotiations between her court and that of France, she kept the balance of Europe so undetermined, that she had leisure to unite her people at home, and to establish an excellent internal policy to her dominions. She supported the protestants of France, against their persecuting princes and the papists; and gave the dukes of Anjou and Alençon, brothers of the French king, the strongest assurances that one or other of them should be her husband; by which she kept that court, who dreaded Spain, at the same time in so good humour with her government, that it shewed no resentment when she cut off queen Mary's head.

When Philip was no longer to be imposed upon by Elizabeth's arts, which had amused and baffled him in every quarter, it is well known that he made use of the immense sums he drew from Peru and Mexico, in equipping the most formidable armament that perhaps ever had been put to sea, and a numerous army of veterans, under the prince of Parma, the best captain of that age; and that he procured a papal bull for absolving Elizabeth's subjects from their allegiance. The largeness of the Spanish ships proved disadvantageous to them on the seas where they engaged; the lord admiral Howard, and the brave sea-officers under him, engaged, beat, and chased the Spanish fleet for several days: and the seas and tempests finished the destruction which the English arms had begun, and few of the Spanish ships recovered their ports. Next to the admiral, lord Howard of Effingham, Sir Francis Drake, captain Hawkins, and captain Frobisher, distinguished themselves against this formidable invasion, in which the Spaniards are said to have lost 81 ships of war, large and small, and 13,500 men.

Elizabeth had for some time supported the revolt of the Hollanders from Philip, and had sent them her favourite, the earl of Leicester, who acted as her viceroy, and general in the Low Countries. Though Leicester behaved well, yet her measures were so wise, that the Dutch established their independency upon Spain; and then she sent forth her fleets under Drake, Raleigh, and Cumberland, and other gallant naval officers into the East and West

West Indies, from whence they brought prodigious treasures taken from the Spaniards, into England.

Elizabeth in her old age grew distrustful, peevish, and jealous. Though she undoubtedly loved the earl of Essex, she teased him by her capriciousness into the madness of taking arms, and then cut off his head. She complained that she had been betrayed into this sanguinary measure, and this occasioned a sinking of her spirits, which brought her to her grave in 1603, the seventieth year of her age, and 45th of her reign, having previously named her kinsman James VI. king of Scotland, and son to Mary, for her successor.

The above form the great lines of Elizabeth's reign; and from them may be traced, either immediately or remotely, every act of her government. She supported the protestants in Germany, against the house of Austria, of which Philip, king of Spain, was the head. She crushed the papists in her own dominions for the same reason, and made a farther reformation in the church of England, in which state it has remained ever since. In 1600, the English East-India company received its first formation, that trade being then in the hands of the Portuguese (in consequence of their having first discovered the passage to India by the Cape of Good Hope, by Vasco de Gama, in the reign of Henry VII.), who at that time were subjects to Spain; and factories were established in China, Japan, India, Amboyna, Java, and Sumatra.

As to Elizabeth's internal government, the successes of her reign have disguised it; for she was far from being a friend to personal liberty, and she was guilty of many stretches of power against the most sacred rights of Englishmen. The severe statutes against the puritans, debarring them of liberty of conscience, and by which many suffered death, must be condemned.

We can scarcely require a stronger proof that the English began to be tired of Elizabeth, than the joy testified by all ranks at the accession of her successor, notwithstanding the long, inveterate animosities between the two kingdoms, James was far from being destitute of natural abilities for government; but he had received wrong impressions of the regal office, and too high an opinion of his own dignity, learning, and political talents. It was his misfortune that he mounted the English throne under a full conviction that he was entitled to all the unconstitutional powers that had been occasionally exercised by Elizabeth and the house of Tudor; and which various causes had prevented the people from opposing with proper vigour. The nation had been wearied and exhausted by the long and destructive wars between the houses of Lancaster and York, in the course of which, the ancient nobility were in great part cut off; and the people were inclined to endure much, rather than again involve themselves in the miseries of civil war. Neither did James, make any allowance for the glories of Elizabeth; which as I have observed, disguised her most arbitrary acts; and none for the free, liberal sentiments, which the improvement of knowledge and learning had diffused through England. His needless, perhaps, to point out the vast increase of property through trade and navigation which enabled the English at the same time to defend their liberties. James's first attempt of great consequence was to effect an union between England and Scotland; but though he failed in this through the aversion of the English to that measure, on account of his loading his Scotch courtiers with wealth and honours, he showed no violent resentment at the disappointment. It was an advantage to him at the beginning of his reign, that the courts of Rome and Spain were thought to be his enemies; and this opinion was increased by the discovery and defeat of the gunpowder treason.

lords, and commons, at the meeting of parliament; when it was also expected that the queen and prince of Wales would be present. The manner of enlisting any new conspirator was by oath, and administering the sacrament; and this dreadful secret, after being religiously kept near eight or ten months, was happily discovered in the following manner: about ten days before the long wished-for meeting of parliament, a Roman catholic peer received a letter, which had been delivered to his servant by an unknown hand, earnestly advising him to shift off his attendance on parliament at that time; but which contained no kind of explanation. The nobleman, though he considered the letter as a foolish attempt to frighten and ridicule him, thought proper to lay it before the king, who studying the contents with more attention, began to suspect some dangerous contrivance by gun powder; and it was judged adviseable to inspect all the vaults below the houses of parliament; but the search was purposely delayed till the night immediately preceding the meeting, when a justice of peace was sent with proper attendants, and before the door of the vault, under the upper house, finding one Fawkes, who had just finished all his preparations, he immediately seized him, and at the same time discovered in the vault 36 barrels of powder, which had been carefully concealed under faggots and piles of wood. The match, with every thing proper for setting fire to the train, were found in Fawkes's pocket whose countenance bespoke his savage disposition, and who, after regretting that he had lost the opportunity of destroying so many heretics, made a full discovery; and the conspirators, who never exceeded eighty in number, being seized by the country people, confessed their guilt, and were executed in different parts of England. Notwithstanding this horrid crime, the bigoted catholics were so devoted to Garnet, a Jesuit, one of the conspirators, that they fancied miracles to be wrought by his blood, and in Spain he was considered as a martyr. The above letter to lord Mounteagle had long been supposed to be an artifice of Cecili's, his first minister, and that the king and himself received full intimation of the plot from Henry IV. of France, by the marquis de Sully. So they let the conspirators work on till all was prepared for the stroke, and they might know all their strength.

James and his ministers were continually inventing new ways to raise money, as by monopolies, benevolence, loans, and other illegal methods. Among other expedients, he sold the titles of baron, viscount, and earl, at a certain price, made a number of knights of Nova Scotia, each to pay such a sum, and instituted a new order of knights baronets which was to be hereditary, for which each person paid 1095l.

His pacific reign was a series of theological contests with ecclesiastical casuists, in which he proved himself more a theologian than a prince, and in 1617 he attempted to establish episcopacy in Scotland, but the zeal of the people baffled his design.

James gave his daughter, the princess Elizabeth, in marriage to the Elector Palatine, the most powerful protestant prince in Germany, and he soon after assumed the crown of Bohemia. The memory of James has been much abused for his tame behaviour, after that prince had lost his kingdom and electorate by the imperial arms; but it is to be observed, that he always opposed his son-in-law's assuming the crown of Bohemia; that had he kindled a war to reinstate him in that and his electorate, he probably would have stood single in the same, excepting the feeble and uncertain assistance he might have received from the elector's dependents and friends in Germany. Nothing, however, is more certain, than that James furnished the elector with large sums of money to retrieve them, and that he actually raised a regiment

of 2200 men under Sir Horace Vere, who carried them over to Germany, where the Germans, under the marquis of Anspach, refused to second them against Spinola the Spanish general, and that the elector hurt his own cause by not giving the brave count Mansfield the command of his troops instead of Anspach.

James has been greatly and justly blamed for his partiality to favourites. His first was Robert Carr, a private Scotch gentleman, who was raised to be first minister and earl of Somerset. His next favourite was George Villiers, a private English gentleman, who, upon Somerset's disgrace, was admitted to an unusual share of favour and familiarity with his sovereign. James had at that time formed a system of policy for attaching himself intimately to the court of Spain, that it might assist him in recovering the Palatinate; and to this system he had sacrificed the brave Sir Walter Raleigh, on a charge of having committed hostilities against the Spanish settlements in the West Indies. James having lost his eldest son, Henry prince of Wales, who had an invincible antipathy to a popish match, threw his eyes upon the infant of Spain, as a proper wife for his son Charles, who had succeeded to that principality. Buckingham, who was equally a favourite with the son as with the father, fell in with the prince's romantic humour, and against the king's will, they travelled in disguise to Spain, where a most solemn farce of courtship was played; but the prince returned without his bride, and had it not been for the royal partiality in his favour, the earl of Bristol, who was then ambassador in Spain, would probably have brought Buckingham to the block.

James was all this while perpetually jarring with his parliament, whom he could not persuade to furnish money equal to his demands; and at last he agreed to his son's marrying the princess Henerietta Maria, sister to Lewis XIII. and daughter to Henry the Great of France. James died before the completion of this match; and it is thought that had he lived, he would have discarded Buckingham. His death happened in 1625, in the 59th year of his age, after a reign over England of twenty-two years. As to the progress of the arts and learning under his reign, it has been already described. James encouraged and employed that excellent painter Sir Peter Paul Rubens, as well as Inigo Jones, who restored the pure taste of architecture in England; and in his reign, poetical genius, though not much encouraged, at court, arrived at its vertical point. Mr. Middleton also at this time projected the conveying water into the city from Hertfordshire by means of pipes, which is now called the *New River*.

The death of the duke of Buckingham, the king's favourite, who was assassinated by one Felton, a subaltern officer, in 1628, did not deter Charles from his arbitrary proceedings, which the English patriots in that enlightened age justly considered as so many acts of tyranny. He, without authority of parliament, laid arbitrary impositions upon trade, which were refused to be paid by many of the merchants and members of the house of commons. Some of them were imprisoned, and the judges were checked for admitting them to bail. The house of commons resenting those proceedings by drawing up a protest, and denying admittance to the gentleman usher of the black rod, who came to adjourn them, till it was finished. This served only to widen the breach, and the king dissolved the parliament; after which he exhibited informations against nine of the most eminent members, among whom was the great Mr. Selden, who was as much distinguished by his love of liberty, as by his uncommon erudition. They objected to the jurisdiction of the court, but their plea was over-ruled, and they were sent to prison during the king's pleasure.

Every thing now operated towards the destruction of Charles. The commons would vote no supplies without some redress of the national grievances; upon which Charles, presuming on what had been practised in reigns when the principles of liberty were imperfectly, or not at all understood, levied money upon monopolies of salt, soap, and such necessaries, and other obsolete claims, particularly for knighthood, and raised various taxes without authority of parliament. His government becoming every day more and more unpopular, Burton, a divine, Prynne, a lawyer, and Bastwick, a physician men of no great eminence or abilities, but warm and resolute, published several pieces which gave offence to the court, and which contained some severe strictures against the ruling clergy. They were prosecuted for these pieces in the star-chamber in a very arbitrary and cruel manner; and punished with so much rigour, as excited an almost universal indignation against the authors of their sufferings. Thus was the government rendered still more odious; and unfortunately for Charles, he put his conscience into the hands of Laud, archbishop of Canterbury, who was as great a bigot as himself, both in church and state. Laud advised him to persecute the puritans, and in the year 1637 to introduce episcopacy into Scotland. The Scots upon this formed secret connections with the discontented English, and invaded England, in August, 1640, where Charles was so ill served by his officers and his army, that he was forced to agree to an ignominious peace with the Scots, who made themselves masters of Newcastle and Durham; and being now openly befriended by the house of commons, they obliged the king to comply with their demands.

Charles had made Wentworth, earl of Strafford, a man of great abilities, president of the council of the North, and lord lieutenant of Ireland: and he was generally believed to be the first minister of state. Strafford had been a leading member of the opposition to the court, but he afterwards, in conjunction with Laud, exerted himself so vigorously in carrying the king's despotic schemes into execution, that he became an object of public detestation. As lord president of the North, as lord lieutenant of Ireland, and as a minister and privy-counsellor in England, he behaved in a very arbitrary manner, and was guilty of many actions of great injustice and oppression. He was, in consequence, at length on the 22d of May, 1641, brought to the block, though much against the inclinations of the king, who was in a manner forced by the parliament and people to sign the warrant for his execution. Archbishop Laud was also beheaded; but his execution did not take place till a considerable time after that of Strafford, the 10th of January, 1645.

In the fourth year of his reign, Charles had passed the *petition of right* into a law, which was intended by the parliament as the future security of the liberty of the subject, which established particularly, "That no man hereafter be compelled to make or yield any gift, loan, benevolence, tax or such like charge, without common consent by act of parliament;" but he afterwards violated it in numerous instances, so that an universal discontent at his administration, prevailed throughout the nation. A rebellion also broke out in Ireland, on October 23, 1641; where the Protestants, without distinction of age, sex, or condition, to the amount of many thousands, were massacred by the Papists; and great pains were taken to persuade the public that Charles secretly favoured them out of hatred to the English subjects. The bishops were expelled the house of peers, on account of their constantly opposing the designs and bills of the other house; and the leaders of the English house of commons still kept up a correspondence with the discontent-

ed

ed Scots. Charles was ill enough advised to go in person to the house of commons, January 4, 1642, and there demanded that lord Kimbolton, Mr. Pym, Mr. Hampden, Mr. Hollis, Sir Arthur Hasebrig, and Mr. Stroud, should be apprehended; but they had previously made their escape. This act of Charles was resented as high treason against his people, and the commons rejected all the offers of satisfaction he could make them.

Notwithstanding the many acts of tyranny and oppression, which the king and his ministers had been guilty, yet when the civil war broke out, there were great numbers who repaired to the regal standard. Many of the nobility and gentry were much attached to the crown, and considered their own honours as connected with it; and a great part of the landed interest was joined to the royal party. The parliament, however, took upon themselves the executive power, and were favoured by most of the trading towns and corporations; but its great resource lay in London. The king's general was the earl of Lindsay, a brave, but not an enterprising commander; but he had great dependence on his nephews, the princes Rupert and Maurice, sons to the elector Palatine, by his sister the princess Elizabeth. In the beginning of the war, the royal army had the ascendancy, but in progress of it, affairs took a very different turn. The earl of Essex was made general under the parliament, and the first battle was fought at Edge-hill in Warwickshire, the 13d of October 1642; but both parties claimed the victory, though the advantage lay with Charles, for the parliament was so much distressed, that they invited the Scots to come to their assistance, and they accordingly entered England anew, with about 20,000 horse and foot. Charles attempted to remove the parliament to Oxford, where many members of both houses met; but his enemies were still sitting at Westminster, and continued to carry on the war against him with great animosity. The independent party, which had scarcely before been thought of, began now to increase and to figure at Westminster. They were averse to the Presbyterians, who till then had conducted the war against the king, nearly as much as to the royalists; and such was their management, under the direction of the famous Oliver Cromwell, that a plan was formed for dismissing the earls of Essex and Manchester, and the heads of the Presbyterians, from the parliament's service, supposing that they were not for bringing the war to a speedy end, or not for reducing the king too low, and for introducing Fairfax, who was an excellent officer, but more manageable, though a Presbyterian, and some independent officers. In the mean while, the war went on with resentment and loss on both sides. Two battles were fought at Newbury, one on September 20th 1643, and the other October, 27, 1644, in which the advantage inclined to the king. He had likewise many other successes; and having defeated Sir William Waller, he pursued the earl of Essex, who remained still in command, into Cornwall, from whence he was obliged to escape by sea; but his infantry surrendered themselves prisoners to the royalists, though his cavalry delivered themselves by their valour.

The first fatal blow the king's army received, was at Marston-moor, July 2d, 1644, where, through the imprudence of prince Rupert, the earl of Manchester defeated the royal army, of which 4000 were killed, and 1500 taken prisoners. This victory was owing chiefly to the courage and conduct of Cromwell; and though it might have been retrieved by the successes of Charles in the West, yet his whole conduct was a string of mistakes, till at last his affairs became irretrievable. It is true, many treaties of peace, particularly one at Uxbridge, were set on foot during the war, and the heads of the presbyterian party would have agreed to terms, that very little bounded the king's

prerogative. They were outwitted, and over-ruled by the independents, who were assisted by the stiffness, insincerity, and unamiable behaviour of Charles himself. In short, the independents at last succeeded, in persuading the members at Westminster, that Charles was not to be trusted, whatever his concessions might be. From that moment the affairs of the royalists rushed into ruin; Charles by piece meal lost all his towns and forts, and was defeated by Fairfax and Cromwell, at the decisive battle of Naseby, June 14. 1645, owing partly, as usual, to the misconduct of prince Rupert. This battle was followed with fresh misfortunes to Charles, who retired to Oxford, the only place where he thought he could be safe.

The Scots were then besieging Newark; and no good understanding subsisted between them and the English parliamentarians, but the best and most loyal friends Charles had, thought it prudent to make their peace. In this melancholy situation of his affairs, he escaped in disguise from Oxford and came to the Scotch army before Newark, on May 6, 1646, upon promise of protection. The Scots, however, were so intimidated, by the resolutions of the parliament at Westminster, that in consideration of 400,000 of their arrears being paid, they put the person of Charles into the hands of the parliament's commissioners, probably not suspecting the consequences.

The presbyterians were now more inclined than ever to make peace with the king, but they were no longer masters, being forced to receive laws from the army, and the independents. The army now avowed their intentions. They first by force took Charles out of the hands of the commissioners, June 4. 1647, and then dreading that a treaty might still take place with the king, they imprisoned 41 of the presbyterian members, voted the house of peers to be useless; and that of the commons was reduced to 150, most of them officers of the army. In the mean while, Charles, who unhappily promised himself relief from those dilations, was carried from prison to prison, and sometimes cajoled by the independents with hopes of deliverance, but always narrowly watched. Several treaties were set on foot, but all miscarried; and he had been imprudent enough, after his effecting an escape, to put himself into colonel Hammond's hands, the parliament's governor of the isle of Wight. A fresh negotiation was begun, and almost finished, when the independents, dreading the general disposition of the people for peace, and strongly persuaded of the insincerity of the king, once more seized upon his person, brought him prisoner to London, carried him before a court of justice of their own erecting, and, after an extraordinary trial, his head was cut off, before his own palace at Whitehall, on the 30th of January, 1648-9, being the 49th of his age, and 24th of his reign.

Charles is allowed to have had many virtues, and some have supposed that affliction had taught him so much wisdom and moderation, that had he been restored to his throne he would have become an excellent prince; but there is abundant reason to conclude, from his private letters, that he retained his arbitrary principles to the last, and that he would again have regulated his conduct by them, if he had been reinstated in power. It is however certain, that notwithstanding the tyrannical nature of his government, his death was exceedingly lamented by great numbers; and many in the course of the civil war, who had been his great opponents in parliament, became converts to his cause in which they lost their lives and fortunes. The surviving children of Charles, were Charles and James, who were successively kings of England, Henry duke of Gloucester, who died soon after his brother's restoration, the princess Mary, married to the prince of Orange, and mother to William prince of Orange.

Orange, who was afterwards king of England, and the princess Herietta Maria, who was married to the duke of Orleans, and whose daughter was married to Victor Amadeus, duke of Savoy, and king of Sardinia.

They who brought Charles to the block, were men of different persuasions and principles, but many of them possessed most amazing abilities for government. They omitted no measure that could give a perpetual exclusion to kingly power in England; and it cannot be denied, that after they erected themselves into a commonwealth, they did prodigious things for retrieving the glory of England by sea. They were joined by many of the presbyterians, and both parties hated Cromwell and Ireton; though they were forced to employ them in the reduction of Ireland, and afterwards against the Scots, who had received Charles II. as their king. By cutting down the timber upon the royal domains, they produced, as it were by magic, all at once, a fleet superior to any that had ever been seen in Europe. Their general, Cromwell, invaded Scotland, and though he was there reduced to great difficulties, he totally defeated the Scots at the battles of Dunbar and Worcester. The same commonwealth passed an act of navigation; and declaring war against the Dutch, who were thought till then invincible by sea, they effectually humbled those republicans in repeated engagements.

By this time Cromwell, who hated subordination to a republic, had the address to get himself declared commander in chief of the English army. Admiral Blake, and the other English admirals, carried the terror of the English name by sea to all quarters of the globe; and Cromwell, having now but little employment, began to be afraid that his services would be forgotten, for which reason he went, April 20, 1653, without any ceremony, with about 300 musqueteers, and dissolved the parliament, opprobriously driving all the members, about a hundred out of their house. He next annihilated the counsel of state, with whom the executive power was lodged, and transferred the administration of government to about 140 persons, whom he summoned to Whitehall, on the 4th of July, 1653.

The war with Holland, in which the English were again victorious, still continued. Seven bloody engagements by sea were fought in little more than the compass of one year; and in the last, which was decisive in favour of England, the Dutch lost their brave admiral Van Tromp. Cromwell all this while wanted to be declared king, but he perceived that he must encounter unsurmountable difficulties from Fleetwood and his other friends, if he should persist in his resolution. He was, however, declared *lord protector* of the commonwealth of England; a title under which he exercised all the power that had been formerly annexed to the regal dignity. No king ever acted, either in England or Scotland, more despotically in some respects than he did; yet no tyrant ever had fewer real friends, and even those few threatened to oppose him, if he should take upon him the title of king. Historians, in drawing a character of Cromwell, have been imposed upon by his amazing success, and dazzled by the lustre of his fortune; but when we consult his secretary Thurloe's, and other state papers, the imposition in a great measure vanishes. After a most uncomfortable usurpation of four years, eight months, and thirteen days, he died on the 3d of September, 1658, in the 60th year of his age.

It is not to be denied that England acquired much more respect from foreign powers, between the death of Charles I. and that of Cromwell, than she had been treated with since the death of Elizabeth. This was owing to the great men who formed the republic, which Cromwell abolished; and who, as it were, intantaneously called forth the naval strength of the kingdom. In the

year 1656, the charge of the public amounted to one million three hundred thousand pounds; of which a million went to the support of the navy and army, and the remainder to that of the civil government. In the same year, Cromwell abolished all tenures *in capite*, by knight's service, and the socage in chief, and likewise the courts of wards and liveries. Several other grievances that had been complained of, during the late reigns, were likewise removed. Next year the total charge, or public expence of England, amounted to two millions three hundred twenty-six thousand nine hundred and eighty nine pounds. The collections by assessments, excise, and customs, paid into the Exchequer, amounted to two millions three hundred and sixty-two thousand pounds, four shillings.

Upon the whole it appears, that England, from the year 1648, to the year 1658, was improved equally in riches and in power. The legal interest of money was reduced from 8 to 6 per cent. a sure symptom of increasing commerce. The famous and beneficial navigation act, that palladium of the English trade, was now planned and established, and afterwards confirmed under Charles II. Monopolies of all kinds were abolished, and liberty of conscience to all sects was granted; to the vast advantage of population and manufactures, which had suffered greatly by Laud's intolerant schemes, having driven numbers of handicrafts to America, and foreign countries. To the above national meliorations we may add the modesty and frugality introduced among the common people, and the citizens in particular, by which they were enabled to increase their capitals. It appears, however, that Cromwell, had he lived, and been firmly settled in the government, would have broken through the sober maxims of the republicans; for some time before his death, he affected great magnificence in his person, court, and attendants. He maintained the honour of the nation much, and in many instances interposed effectually in favour of the the protestants abroad. Arts and sciences were not much patronized, and yet he had the good fortune to meet in the person of Cooper, an excellent miniature painter, and his coins done by Simon exceed in beauty and workmanship any of that age. He certainly did many things worthy of praise, and as his genius and capacity led him to the choice of fit persons for the several parts of administration; so he paid some regard to men of learning, and particularly to those entrusted with the care of youth at the universities.

The fate of Richard Cromwell, who succeeded his father Oliver as protector, sufficiently proves the great difference there was betwixt them, as to spirit and parts in the affairs of government. Richard was placed in his dignity by those who wanted to make him the tool of their own government: and he was soon after driven, without the least struggle or opposition, into obscurity. It is in vain for historians of any party to ascribe the restoration of Charles II. (who with his mother and brothers, during the usurpation, had lived abroad on a very precarious subsistence) to the merits of any particular persons. The presbyterians were very zealous in promoting it, but it was effected by the general concurrence of the people, who seemed to have thought that neither peace nor protection were to be obtained, but by the restoring the antient constitution of monarchy. General Monk, a man of military abilities, but of no principles excepting such as served his ambition or interest, had the sagacity to observe this; and after temporizing in various shapes, being at the head of the army, he made the principal figure in restoring Charles II. For this he was created duke of Albemarle, confirmed in the command of the army, and loaded with honours and riches.

Charles II. being restored in 1660, in the first year of his reign seemed

to have a real desire to promote his people's happiness. Upon his confirming the abolition of all the feudal tenures, he received from the parliament a gift of the excise for life; and in this act, coffee and tea are first mentioned. By his long residence and that of his friends abroad, he imported into England the culture of many elegant vegetables; such as that of asparagus, artichokes, cauliflowers, and several kinds of beans, peas, and fallads. Under him, Jamaica, which had been conquered by the English under the auspices of Cromwell, was greatly improved, and made a sugar colony. The Royal Society was instituted, and many popular acts respecting trade and colonization were passed. In short, Charles knew and cultivated the true interests of his kingdom, till he was warped by pleasure, and sunk in indolence; failings that had the same consequences as despotism itself. He appeared to interest himself in the sufferings of his citizens, when London was burnt down in 1666; and it being rebuilt with greater lustre and conveniences, is a proof of the increase of her trade; but there were no bounds to Charles's love of pleasure, which led him into the most extravagant expences. He has been severely censured for selling Dunkirk to the French king to supply his necessities, after he had squandered the immense sums granted him by parliament. The price was about 250,000. sterling. But even in this, his conduct was more defensible than in his secret connections with France, which were of the most scandalous nature, utterly repugnant to the welfare of the kingdom, and such as must ever reflect infamy on his memory.

Among the evidences of his degeneracy as a king, may be mentioned his giving way to the popular clamour against the lord Clarendon, as the chief adviser of the sale of Dunkirk; a man of extensive knowledge, and great abilities, and more honest in his intentions than most of his other ministers, but whom he sacrificed to the sycophants of his pleasurable hours. The first Dutch war, which began in 1665, was carried on with great resolution and spirit under the duke of York; but through Charles's misapplication of the public money which had been granted for the war, the Dutch, while a treaty of peace was depending at Breda, found means to insult the royal navy of England, by sailing up the Medway as far as Chatham, and destroyed several capital ships of war. Soon after this, a peace was concluded at Breda between Great Britain and the States-general, for the preservation of the Spanish Netherlands; and Sweden having acceded to the treaty, 1668, it was called the *triple alliance*.

In 1671, Charles was so ill advised as to seize upon the money of the bankers, which had been lent him at 8l. per cent. and to shut up the Exchequer. This was an indefensible step; and Charles pretended to justify it by the necessity of his affairs, being then on the eve of a fresh war with Holland. This was declared in 1672, and had almost proved fatal to that republic, for in this war, the English fleet and army acted in conjunction with those of France. The duke of York commanded the English fleet, and displayed great gallantry in that station. The duke of Monmouth, the eldest and favourite natural son of Charles, commanded 6000 English forces, who joined the French, in the Low Countries; and all Holland must have fallen into the hands of the French, had it not been for the vanity of their monarch Lewis XIV. who was in a hurry to enjoy his triumph in his capital, and some very unforeseen circumstances. All confidence was now lost between Charles and his parliament, notwithstanding the glory which the English fleet obtained by sea against the Dutch. The popular clamour at

last obliged Charles to give peace to that republic, in consideration of 200,000*l.* which was paid him.

In some things Charles acted very despotically. He complained of the freedom taken with his prerogative in coffee-houses, and ordered them to be shut up, but in a few days afterwards they were opened again. Great rigour and severity were exercised against the Presbyterians, and all other nonconformists to episcopacy, which was again established with a high hand in Scotland as well as in England. His parliament addressed him, but in vain, to make war with France in the year 1677, for he was entirely devoted to that crown, and regularly received its money as a pensioner, and hoped through its influence and power to be absolute. It is not however to be denied, that the trade of England was now incredibly increased, and Charles entered into many vigorous measures for its protection and support.

Charles's connections in France gave him no merit in the eyes of his parliament, which grew every day more and more exasperated against the French and the Papists; at the head of whom was the king's eldest brother, and presumptive heir of the crown, the duke of York. Charles dreaded the prospect of a civil war, and offered many concessions to avoid it. But many of the members of parliament were bent upon such a revolution as afterwards took place, and were secretly determined that the duke of York never should reign. In 1678, the famous Titus Oates, and some others, opened a plot, charging the papists with a design to murder the king, and to introduce popery by means of Jesuits in England, and from St. Omer's. Though nothing could be more ridiculous, and more self-contradictory, than some parts of their narrative, yet it was supported with the utmost zeal on the part of the parliament. The aged lord Stafford, Coleman secretary to the duke of York, with many Jesuits, and other papists, were publicly executed on evidences, supposed now to have been perjured, by those who will have the whole plot to have been a fiction. The queen herself escaped with difficulty; the duke of York was obliged to retire into foreign parts, and Charles, though convinced, as it is said, that the whole was an imposture, yielded to the torrent. At last it spent its force. The earl of Shaftesbury, who was at the head of the opposition, pushed on the total exclusion of the duke of York from the throne. He was seconded by the ill-advised duke of Monmouth, and the bill, after passing the commons, miscarried in the house of peers. All England was again in a flame; but the king, by a well-timed adjournment of the parliament to Oxford, seemed to recover the affections of his people to a very great degree.

The Duke of York and his party made a scandalous use of their victory. They trumped up on their side a plot of the protestants for seizing and killing the king, and altering the government. This plot was as false as that which had been laid against the papists. The excellent lord Russel, who had been remarkable in his opposition to the popish succession, Algerton Sidney, and several other distinguished protestants, were tried, condemned, and suffered death, and the king set his foot on the neck of opposition. Even the city of London was intimidated into the measures of the court, as were almost all the corporations in the kingdom. The duke of Monmouth and the earl of Shaftesbury were obliged to fly, and the duke of York returned in triumph to Whitehall. It was thought, however, that Charles repented of some of his arbitrary steps, and intended to have recalled the duke of Monmouth, and have executed some measures for the future quiet of his reign; when he died February 6th, 1684-5, in the 55th year of age, and 25th of his reign.

He had married Catharine, infant of Portugal, by whom he received a large fortune in ready money, besides the crown and fortrefs of Tangier in Africa; but he left behind him no lawful issue. The descendants of his natural sons and daughters, are now amongst the most distinguished of the British nobility.

The reign of Charles has been celebrated for wit and gallantry, but both were coarse and indelicate. The court was the nursery of vice, and the stage exhibited scenes of impurity. Some readers were found, who could admire Milton as well as Dryden, and never perhaps were the pulpits of England so well supplied with preachers as in this reign. Our language was harmonized, refined, and rendered natural, witness the style of their sermons; and the days of Charles may be called the Augustan age of mathematics and natural philosophy. Charles loved and understood the arts more than he encouraged, or rewarded them, especially those of English growth; but this neglect proceeded not from narrow-mindedness, but indolence and want of reflection. If the memory of Charles II. has been traduced for being the first English prince, who formed a body of standing force, as guards to his person; it ought to be remembered, at the same time, that he carried the art of ship-building to the highest perfection; and that the royal navy of England, at this day, owes its finest improvements to his and his brother's knowledge of naval affairs and architecture. As to his religion, James, soon after his death, published to the world, that his brother, notwithstanding his repeated professions of regard to the protestant faith, was a papist and died such, of which there are now incontestable proofs.

All the opposition which, during the late reign, had shaken the throne, seems to have vanished at the accession of James II. The popular affection towards him was increased by the early declaration he made in favour of the church of England, which, during the late reign, had formally pronounced all resistance to the reigning king to be unlawful. This doctrine proved fatal to James, and almost ruined protestantism. The army and people supported him in crushing an ill-concerted rebellion of the duke of Monmouth, who pretended to be the lawful son of Charles II. and as such had assumed the title of king. That duke's head being cut off, July 15, 1685, and some hundreds of his followers hanged, drawn and quartered, in the West of England, exhibiting a scene of barbarity scarcely ever known in this country; by the instrumentality of Jefferies and colonel Kitke, James desperately resolved to try how far the practice of the church of England would agree with her doctrine of non-resistance. The experiment failed him. He made the most provoking steps to render popery the established religion of his dominions. He pretended to a power of dispensing with the known laws; he instituted an illegal ecclesiastical court, he openly received and admitted into his privy council the pope's emissaries, and gave them more respect than was due to the ministers of a sovereign prince. He sent an embassy to Rome, and received at his court the pope's nuncio. The encroachments he made upon both the civil and religious liberties of his people, are almost beyond description, and were disapproved of by the pope himself, and all sober Roman catholics. His tending to prison, and prosecuting for a libel, seven bishops, for presenting a petition against reading his declaration for liberty of conscience, and their acquittal upon a legal trial, alarmed his best protestant friends.

In this extremity, many great men in England and Scotland, though they wished well to James, applied for relief to William prince of Orange in Holland, a prince of great abilities, and the inveterate enemy of Lewis

erate enemy of Lew

XIV. who then threatened Europe with chains. The prince of Orange was the nephew and son-in-law of James, having married the princess Mary, that king's eldest daughter; and he at last embarked with a fleet of 500 sail for England, avowing it to be his design to restore the church and state to their true rights. Upon his arrival in England, he was joined not only by the Whigs, but by many whom James had considered as his best friends, and even his daughter the princess Anne, and her husband, George prince of Denmark, left him and joined the prince of Orange, who soon discovered that he expected the crown. James might still have reigned; but he was surrounded with French emissaries, and ignorant Jesuits, who wished him not to reign rather than not restore popery. They secretly persuaded him to send his queen, and son, real or pretended, then but six months old, to France, and to follow them in person, which he did; and thus, in 1688, ended his reign in England, which event in English history is termed the *Revolution*.

It is well known that king William's chief object was to humble the power of France, and his reign was spent in an almost uninterrupted course of hostilities with that power, which were supported by England at an expence she had never known before. The nation had grown cautious, through the experience of the two last reigns, and he gave his consent to the *bill of rights*, by which the liberties of the people were confirmed and secured; though the friends of liberty in general complained, that the bill of rights was very inadequate to what ought to have been insisted on, in a period so favourable to the enlargement and security of liberty, as a crown bestowed by the free voice of the people. The two last kings had made a very bad use of the whole national revenue, which was put into their hands, and which was found to be insufficient to raise and maintain a standing army. The revenue was therefore now divided, part was allotted for the current national service of the year, and was to be accounted for to parliament; and part, which is still called the civil list money, was given to the king, for the support of his house and dignity.

It was the just sense the people of England had of their civil and religious rights alone, that could provoke them to agree to the late revolution; for they never in other respects had been at so high a pitch of wealth and prosperity as in the year 1688. The tonnage of their merchant ships, as appears from Dr. Davenant, was that year near double to what it had been in 1666; and the tonnage of the royal navy, which in 1660, was only 62594 tons, was in 1688 increased to 101,032 tons. The increase of the customs, and the annual rental of England, was in the same proportion. The war with France which, on the king's part, was far from being successful required an enormous expence, and the Irish continued, in general, faithful to king James. But many English, who wished well to the Stuart family, dreaded their being restored by conquest; and the parliament enabled the king to reduce Ireland, and to gain the battle of the Boyne against James, who there lost all the military honours he had acquired before. The marine of France proved superior to that of England, in the beginning of the war; but in the year 1692, that of France received an irrecoverable blow in the defeat at La Hogue.

Invasions were threatened, and conspiracies discovered every day against the government; and the supply of the continental war forced the parliament to open new resources for money. A land-tax was imposed, and every subject's land was taxed, according to their valuations given in by the several countries. Those who were the most loyal gave the highest valuations, and

were

the heaviest taxed and this preposterous burthen still continued, but the greatest and boldest operation in finances that ever took place, was established in that reign, which was the carrying on the war by borrowing money upon the parliamentary securities, and which form what are now called the public funds. The chief projector of this scheme is said to have been Charles Mordaunt, afterwards lord Halifax. His chief argument for such a project was, that it would oblige the monied part of the nation to befriend the Revolution interest, because, after lending their money, they could have no hopes of being repaid but by supporting that interest, and the weight of taxes would be upon the commercial people to be more industrious. How well those views have been answered is needless here to observe, being already mentioned in the present state of public credit.

William, notwithstanding the vast service he had done to the nation, and the public benefits which took place under his auspices, particularly in the establishment of the bank of England, and the reclaiming the silver money, met with so many mortifications from his parliament, that he actually resolved upon an abdication, and had drawn up a speech for that purpose, which he was prevailed upon to suppress. He long bore the affronts he met with in hopes of being supported in his war with France, but at last, in 1697, he was forced to conclude the peace of Ryswick with the French king, who acknowledged his title to the crown of England. By this time William had lost his queen*, but the government was continued in his person. After peace was restored, the commons obliged him to disband his army, all but an inconsiderable number, and to dismiss his favourite Dutch guards. Towards the end of his reign, his fears of seeing the whole Spanish monarchy in possession of France at the death of the catholic king Charles II, which was every day expected, led him into a very impolitic measure, which was the partition treaty with France, by which that monarchy was to be divided between the houses of Bourbon and Austria. This treaty was highly resented by the parliament, and some of his ministry were impeached for advising it. It is thought that William saw his error when it was too late. His ministers were acquitted from their impeachments, and the death of king James discovered the insincerity of the French court, which immediately proclaimed his son king of Great Britain.

This perfidy rendered William again popular in England. The two houses passed the bill of abjuration, and an address for a war with France. The last and most glorious act of William's reign was his passing the bill for settling the succession to the crown in the house of Hanover, on the 12th of June 1701. His death was hastened by a fall he had from his horse, soon after he had renewed the grand alliance against France, on the 8th of March, 1702, the 52d year of his age, and the 14th of his reign in England. This prince was not made by nature for popularity. His manners were cold and forbidding, he seemed also sometimes almost to lose sight of those principles of liberty, for the support of which he had been raised to the throne; and though he owed his royalty to the Whigs, yet he often favoured the Tories. The former had the mortification of seeing those who had acted the most inimical to their party, and the free principles of the constitution, as the marquis of Halifax, the earl of Danby, and lord Nottingham, taken into favour and resume their places in the cabinet; and the whole influence of government extended, to silence all enquiries into the guilt of those who had been the chief instruments in the cruel persecutions of the past reign, and to the

the obtaining such an act of indemnity as effectually screened every delinquent from the just retaliation of injured patriotism. The rescue and preservation of religion and public liberty were the chief glory of William's reign; for England under him suffered severely both by sea and land, and the public debt at the time of his death amounted to the unheard-of sum of 14,000,000.

Annes princess of Denmark, by virtue of the act of settlement, and being the next protestant heir to her father James II, succeeded king William in the throne. As she had been ill treated by the late king, it was thought she would have deviated from his measures; but the behaviour of the French in acknowledging the title of her brother, who has since been well known by the name of the Pretender, left her no choice, and she resolved to fulfil all William's engagements with his allies, and to employ the earl of Marlborough, who had been imprisoned in the late reign on a suspicion of Jacobitism, and whose wife was her favourite, as her general. She could not have made a better choice of a general and statesman, for that earl excelled in both capacities. No sooner was he placed at the head of the English army abroad than his genius and activity gave a new turn to the war, and he became as much the favourite of the Dutch as his wife was of the queen.

Charles II. of Spain, in consequence of the intrigues of France, at the same time resenting the partition treaty, to which his consent had not been asked, left his whole dominions by will to Philip, duke of Anjou, grandson of Lewis XIV. and Philip was immediately proclaimed king of Spain, which laid the foundation of the family alliance, between France and that nation. Philip's succession was disputed by the second son of the emperor of Germany, who took upon himself the title of Charles III. and his cause was favoured by the empire, England, Holland, and other powers, who joined in a confederacy against the house of Bourbon now become more dangerous than ever by the acquisition of the whole Spanish dominions.

The capital measure of continuing the war against France being fixed, the queen found no great difficulty in forming her ministry, who were for the most part Tories: and the earl of Godolphin, who (though afterwards a leading Whig) was thought all his life to have a predilection for the late king James and his queen, was placed at the head of the treasury. His son had married the earl of Marlborough's eldest daughter, and the earl could trust no other with that important department.

In the course of the war, several glorious victories were obtained by the earl, who was soon made duke of Marlborough. Those of Blenheim and Ramillies gave the first effectual checks to the French power. By that of Blenheim in 1704, the empire of Germany was saved from immediate destruction. Though prince Eugene was that day joined in command with the duke, yet the glory of the day was confessedly owing to the latter. The French general Tallard was taken prisoner, and sent to England; and 20,000 French and Bavarians were killed, wounded, or drowned in the Danube, besides about 13,000 who were taken, and a proportionable number of cannon, artillery, and trophies of war. About the same time, the English admiral, Sir George Rooke, reduced Gibraltar, which still remains in our possession. The battle of Ramillies in 1706, was fought and gained under the duke of Marlborough alone. The loss of the enemy there has been variously reported: it is generally supposed to have been 8000 killed or wounded, and 6000 taken prisoners; but the consequences shewed its importance.

After the battle of Ramillies, the states of Flanders assembled at Ghent,

and

and recognized Charles for their sovereign, while the confederates took possession of Louvain, Brussels, Mechlin, Ghent, Oudenarde, Bruges, and Antwerp; and several other considerable places in Flanders and Brabant acknowledged the title of king Charles. The next great battle gained over the French was Oudenarde, 1708, where they lost 3000 of the field, and about 7000 taken prisoners; and the year after, September 11, 1709, the allies forced the French lines at Malplaquet near Mons; after a bloody action in which the French lost 15,000 men. Thus far I have recounted the flattering successes of the English; but they were attended with many portions of bitter alloy.

The queen had sent a very fine army to assist Charles III. in Spain, under the command of lord Galway; but in 1707, after he had been joined by the Portuguese, the English were defeated in the plains of Almanza, chiefly through the cowardice of their allies. Though some advantages were obtained at sea, yet that war in general was carried on to the detriment, if not the disgrace of England. Prince George of Denmark, husband to the queen, was then lord high admiral. At the same time England felt severely the scarcity of hands in carrying on her trade and manufactures.

As Lewis XIV. professed a readiness for peace, and sued earnestly for it, the Whigs at last gave way to a treaty, and the conferences were held at Gertruydenburgh, 1710. They were managed on the part of England by the duke of Marlborough and the lord Townshend, and by the marquis de Torcy for the French. All his offers were rejected by the duke and his associates, as only designed to amuse and divide the allies, and the war was continued.

The unreasonable haughtiness of the English plenipotentiaries at Gertruydenburgh (as some term it) and the then expected change of the ministry in England, saved France, and affairs from that day took a turn in its favour. Means were found to convince the queen, who was faithfully attached to the church of England, that the war in the end, if continued, must prove ruinous to her and her people, and that the Whigs were no friends to the national religion. The general cry of the deluded people was, that "the church was in danger," which, though groundless, had great effects. One Sacheverel, an ignorant, worthless preacher, had espoused this clamour in one of his sermons, with the ridiculous, impracticable doctrines of passive obedience and non-resistance. It was, as it were, agreed by both parties to try their strength in this man's case. He was impeached by the commons, and found guilty by the lords, who ventured to pass upon him only a very small censure. After this trial, the queen's affections were entirely alienated from the duchess of Marlborough, and the Whig administration. Her friends lost their places, which were supplied by Tories, and even the command of the army was taken from the duke of Marlborough, in 1712, and given to the duke of Ormond, who produced orders for a cessation of arms; but they were disregarded by the queen's allies in the British pay. And, indeed, the removal of the duke of Marlborough from the command of the army, while the war continued, was an act of the greatest imprudence, and excited the astonishment of all Europe. So numerous had been his successes, and so great his reputation, that his very name was almost equivalent to an army. But the honour and interest of the nation were sacrificed to private court intrigues, managed by Mrs. Masham, a relation of the duchess of Marlborough, who had supplanted her benefactress, and by Mr. Harley.

Conferences were opened for peace at Utrecht, in January 1712, to which the queen and the French king sent plenipotentiaries, and the allies being de-

seated at Denain, they grew sensible they were no match for the French, now that they were abandoned by the English. In short, the terms were agreed upon between France and England. The reader needs not be informed of the particular cessions made by the French, especially that of Dunkirk; but after all, the peace would have been still more indefensible and shameful than it was, had it not been for the death of the emperor Joseph, by which his brother Charles III. for whom the war was chiefly undertaken, became emperor of Germany, as well as king of Spain: and the dilatoriness, if not bad faith of the English allies, in not fulfilling their engagements, and throwing upon the British parliament almost the whole burthen of the war, not to mention the exhausted state of the kingdom. Such was the state of affairs at this critical period; and I am apt to think, from the complexion that the queen had by some secret influence, which had not been discovered, and was even concealed from some of her ministers, to call her brother to the succession. The rest of the queen's life was rendered uneasy by the jarring of parties, and the contentions among her ministers. The Whigs demanded a writ for the electoral prince of Hanover, as duke of Cambridge, to come to England; and she was obliged hastily to dismiss her lord-treasurer, when she fell into a lethargic disorder, which carried her off the first of August 1714, in the fiftieth year of her age, and the thirtieth of her reign. And with her ended the line of the Stuarts, which, from the accession of James I. anno 1603, had swayed the sceptre of England 111 years, and that of Scotland 343 years, from the accession of Robert II anno 1371. James, the late pretender, son of James the II. and brother to queen Anne, upon his father's decease, anno 1701, was proclaimed king of England, by Lewis XIV. at St Germain's, and for some time treated as such by the courts of Rome, France, Spain and Turin. He resided at Rome, where he kept up the appearance of a court, and continued firm in the Romish faith till his death, which happened in 1765. He left two sons, viz. Charles Edward, born in 1720, who was defeated at Culloden in 1746, and upon his father's death repaired to Rome, where he continued for some time, and afterwards resided at Florence, under the title of count Albany, but died lately. Henry, his second son, who enjoys a dignified place in the church of Rome, and is known by the name of cardinal York. March 28th, 1772, Charles married Louisa Maximilienne, born September 21st, 1752, daughter to a prince of the family of Stolberg Grudern, in the Circle of Upper Saxony, and grand-daughter, by the mother, of Thomas Bruce, late earl of Aylesbury. Notwithstanding the exhausted state of England before the peace of Utrecht was concluded, yet the public credit was little or nothing affected by her death, though the national debt then amounted to about fifty millions; so firm was the dependence of the people upon the security of parliament.

Anne had no strength of mind, by herself, to carry any important resolve into execution; and she left public measures in so indecisive a state, that, upon her death, the succession took place in terms of the act of settlement, and George I. elector of Hanover, son of the princess Sophia, grand-daughter of James I. was proclaimed king of Great Britain; his mother, who would have been next in succession, having died but a few days before. He came over to England with strong prepossessions against the Tory ministry, most of whom he displaced. This did not make any great alteration in his prejudice in England; but many of the Scots, by the influence of the earl of Mar, and other chiefs, were driven into rebellion in 1715, which was happily suppressed the beginning of the next year.

formed by Sir William Wyndham and Mr. Pultney, the parliament continued to be more and more lavish in granting money, and subsidies for the protection of Hanover to the kings of Denmark and Sweden, and the bad-governance of Hesse-Cassel. Such was the state of affairs in Europe, when George I. suddenly died on the 11th of June 1727, at Osnaburgh, in the sixty-eight year of his age, and the thirteenth of his reign. The reign of George I. is remarkable for the incredible number of bubbles and cheating projects to which it gave rise, of which it was reckoned that almost a million and a half was won and lost; and for the great alteration of the system of Europe, by the concern which the English took in the affairs of the continent. The institution of the sinking fund for diminishing the national debt, is likewise owing to this period. The value of the northern parts of the kingdom began now to be better understood than formerly, and the state of manufactures began to shift. This was chiefly owing to the unequal distribution of the land-tax, which rendered it difficult for the poor to subsist in certain counties, which had been forward in giving in the true value of their estates when that tax took place.

Sir Robert Walpole was considered as first minister of England when George I. died, and some differences having happened between him and the prince of Wales, it was generally thought, upon the accession of the latter to the crown, that Sir Robert would be displaced. That might have been the case, could another person have been found equally capable, as he was to manage the house of commons, and to gratify that predilection for Hanover which George II. inherited from his father. No minister ever understood better the temper of the people of England, and none, perhaps, ever tried it more. He filled all places of power, trust, and profit, and almost the house of commons itself, with his own creatures: but peace was his darling object, because he thought that war must be fatal to his power. During his long administration he never lost a question that he was in earnest to carry. The excise scheme was the first measure that gave a shock to his power, and even that he could have carried, had he not been afraid of the spirit of the people without doors, which might have either produced an insurrection, or endangered his interest in the next general election.

His pacific system brought him, however, into inconveniences both at home and abroad. It encouraged the Spaniards to continue their depredations upon the British shipping in the American seas, and the French to treat the English court with insolence and neglect. At home, many of the great peers thought themselves slighted, and they interested themselves more than ever they had done in elections. This, together with the disgust of the people at the proposed excise scheme, and passing the *Gen. Act*, in the year 1730, increased the minority in the house of commons to 130, some of whom were as able men and as good speakers as ever had sat in a parliament, and taking advantage of the increasing complaints against the Spaniards, they attacked the minister with great strength of argument and with great eloquence. In justice to Walpole, it should be observed, that he filled the courts of justice with able and upright judges, nor was he ever known to attempt any perversion of the known law of the kingdom. He was so far from checking the freedom of debate, that he bore with equanimity the most scurrilous declamations that was thrown out to his face. He gave way to one or two prosecutions for libels, in compliance to his friends, who thought themselves affected by them; but it is certain, that the press of England never was more open or free than during his administration. And as to his pacific system, it undoubtedly more than repaid to the nation

that was required to support it, by the increase of her trade and the improvements of her manufactures.

Queen Caroline, consort to George II. had been always a firm friend to the minister; but she died November 20th, 1737, when a variance subsisted between the king and his son, the prince of Wales. The latter complained, that through Walpole's influence he was deprived not only of the power but the provision to which his birth entitl'd him; and he put himself at the head of the opposition with so much firmness, that it was generally foreseen Walpole's power was drawing to a crisis. Admiral Vernon, who hated the minister, was sent, in 1739, with a squadron of six ships to the West Indies, where he took and demolished Porto Bello; but being a hot impracticable man, he miscarried in his other attempts, especially that upon Carthage, in which some thousands of British lives were wantonly thrown away. The opposition exulted in Vernon's success, and afterwards imputed his miscarriages to the minister's starving the war, by withholding the means for carrying it on. The general election approaching, so prevalent was the interest of the prince of Wales in England, and that of the duke of Argyle in Scotland, that a majority was returned to parliament who were no friends to the minister, and after a few trying divisions, he retired from the house, on the 9th of February, 1742, was created earl of Oxford, and on the 11th resigned all his employments.

George II. bore the loss of his minister with the greatest equanimity, and even conferred titles of honour, and posts of distinction, upon the heads of the opposition. By this time, the death of the emperor Charles VI. the danger of the pragmatic sanction (which meant the succession of his daughter to all the Austrian dominions), through the ambition of France, who had filled all Germany with her armies, and many other concurrent causes, induced George to take the leading part in a continental war. He was encouraged to this by lord Carteret, afterwards earl of Granville, an able, but headstrong minister, whom George had made his secretary of state, and indeed by the voice of the nation in general. George accordingly put himself at the head of his army, fought and gained the battle of Dettinger June 16, 1743, and his not suffering his general, the earl of Stair, to improve the blow, was thought to proceed from tenderness for his electoral dominions.

Great Britain was then engaged in a very expensive war both against the French and Spaniards, and her enemies thought to avail themselves of the general discontent that had prevailed in England on account of Hanover, and which, even in parliamentary debates, were thought by some to exceed the bounds of decency. This naturally suggested to them the idea of applying to the Pretender, who resided at Rome; and he agreed that his son Charles, who was a sprightly young man, should repair to France, from whence he set sail, and narrowly escaped with a few followers, in a frigate, to the western coasts of Scotland, between the islands of Mull and Sky, where he discovered himself, assembled his followers, and published a manifesto exciting the nation to rebellion. It is necessary, before we relate the true cause of this enterprize, to make a short retrospect to foreign parts.

The war of 1741 proved unfortunate in the West Indies, through the fatal divisions between admiral Vernon and general Wentworth, who commanded the land troops: and it was thought that above 20,000 British soldiers and seamen perished in the impracticable attempt of Carthage, and the inclemency of the air and climate during other idle expeditions. The year 1742 had been spent in negotiations with the courts of Peterburgh and

Berlin, which, though expensive, proved of little or no service to Great Britain; so that the victory of Dettingen left the French troops in much the same situation as before. A difference between the admirals Mathews and Lestock had suffered the Spanish and French fleets to escape out of Toulon with but little loss; and soon after, the French, who had before only acted as allies to the Spaniards, declared war against Great Britain, who, in her turn, declared war against the French. The Dutch, the natural allies of England, during this war, carried on a most lucrative trade; nor could they be brought to act against the French till the people entered into associations and insurrections against the government. Their marine was in a miserable condition, and when they at last sent a body of troops to join the British and Austrian armies, which had been wretchedly commanded for one or two campaigns, they did it with so bad a grace, that it was plain they did not intend to act in earnest. When the duke of Cumberland took upon himself the command of the army, the French, to the great reproach of the allies, were almost masters of the barrier of the Netherlands, and were besieging Tournay. The duke attempted to raise the siege, but by the coldness of the Austrians, the cowardice of the Dutch, whose government all along held a secret correspondence with France, and misconduct somewhere else, he lost the battle of Fontenoy, and 7000 of his best men; though it is generally allowed that his dispositions were excellent, and both he and his troops behaved with unexampled intrepidity. To counterbalance such a train of misfortunes, admiral Anson returned this year to England, with an immense treasure (about a million sterling), which he had taken from the Spaniards in his voyage round the world; and commodore Warren, with colonel Pepperel, took from the French the important town and fortrefs of Louisburgh, in the island of Cape Breton.

Such was the state of affairs abroad in August 1745, when the Pretender's eldest son, at the head of some Highland followers, surpris'd and disarm'd a party of the king's troops in the western Highlands, and advanced with great rapidity to Perth. The government never so thoroughly experienced, as it did that time, the benefit of the public debt for the support of the Revolution. The French and the Jacobite party (for such there was at that time in England), had laid a deep scheme of distressing the Bank; but common danger abolished all distinctions, and united them in defence of one interest, which was private property. The merchants undertook, in their address to the king, to support it by receiving bank notes in payment. This reasonable measure sav'd public credit; but the defeat of the rebels by the duke of Cumberland at Culloden, in the year 1746, did not restore tranquillity to Europe. Though the prince of Orange, son-in-law to his majesty George II. was, by the credit of his majesty, and the spirit of the people of the United Provinces, rais'd to be their stadtholder, the Dutch never could be brought to act heartily in the war. The allies were defeated at Val, near Maestricht, and the duke of Cumberland was in danger of being made prisoner. Bergen-op-zoom was taken in a manner that has never yet been accounted for. The allies suffer'd other disgraces on the continent; and it now became the general opinion in England, that peace was necessary to save the duke and his army from total destruction. By this time, however, the French marine and commerce were in danger of being annihilated by the English at sea, under the command of the admirals Anson, Warren, Hawke, and other gallant officers; but the English arms were not so successful as could have been wish'd, under rear admiral Boscawen in the East Indies. In this state of affairs, the successes of the French and English, during the

war

war, may be said to have been balanced, and both ministries turned their thoughts to peace.

However this might be, preliminaries for peace were signed in April, 1748, and a definitive treaty was concluded at Aix-la-Chapelle in October, the basis of which was the restitution on both sides of all places taken during the war. The next year the interest of the national debt was reduced from four to three and a half per cent. for seven years, after which the whole was to stand reduced to three per cent.

This was the boldest stroke of financing that ever was attempted perhaps in any country, consistently with public faith; for the creditors of the government, after a small ineffectual opposition, continued their money in the funds, and a few who sold out even made interest to have it replaced on the same security, or were paid off their principal sums out of the sinking fund.

A new treaty of commerce was signed at Madrid, between Great Britain and Spain, by which, in consideration of 100,000*l.* the South Sea company gave up all their future claims to the assiento contract, by virtue of which, that company had supplied the Spanish West Indies with negroes. In March, 1750, died, universally lamented, his royal highness Frederic, prince of Wales. In May, 1751, an act passed for regulating the commencement of the year, by which the old style was abolished, and the new style established, to the vast conveniency of the subjects. This was done by sinking eleven days in September, 1752, and from that time beginning the year on the first of January. In 1753, the famous act passed for preventing clandestine marriages; but whether it is for the benefit of the subject, is a point that is still very questionable.

The barefaced encroachments of the French, who had built forts on our back settlements in America, and the dispositions they made for sending over vast bodies of veteran troops, to support those encroachments, produced a wonderful spirit in England, especially after admiral Boscawen was ordered, with eleven ships of the line, besides a frigate and two regiments, to sail to the banks of Newfoundland, where he came up with, and took two French men of war, the rest of their fleet escaping up the river St. Lawrence, by the straits of Belleisle. No sooner was it known that hostilities were begun, than the people of England poured their money into the government's loan, and orders were issued for making general reprisals in Europe as well as in America; and that all the French ships, whether outward or homeward bound, should be stopped and brought into British ports. These orders were so effectual, that before the end of the year 1765, above 500 of the richest French merchant ships, and above 8,000 of their best sailors were brought into the kingdom. This well-timed measure had such an effect, that the French had neither hands to navigate their merchantmen, nor to man their ships of war; for about two years after, near 30,000 French seamen were found to be prisoners in England.

In July, 1755, General Braddock, who had been injudiciously sent from England to attack the French, and reduce the forts on the Ohio, was defeated and killed, by falling into an ambuscade of the French and Indians near Fort de Quefne; but major-general Johnson defeated a body of French near Crown Point, of whom he killed about 1000.

In proportion as the spirits of the public were elevated by the formidable armaments, which were prepared for carrying on the war, they were sunk with an account that the French had landed 11,000 men in Minorca, to attack Fort St. Philip there; that admiral Byng, who had been sent

out with a squadron, at least equal to that of the French, had been baffled, if not defeated, by their admiral Gallifionere, and that at last Minorca was surrendered by General Blakeney. The English were far more alarmed than they ought to have been at those events. The loss of Minorca was more shameful than detrimental to the kingdom, but the public outcry was such, that the king gave up Byng to public justice, and he was shot at Portsmouth for not doing all that was in his power against the enemy.

It was about this time, that Mr. Pitt was placed, as secretary of state, at the head of administration. He had long been known to be a bold, eloquent, and energetic speaker, and he soon proved himself to be as spirited a minister. The misadventures in the Mediterranean had no consequence but the loss of Fort St. Philip, which was more than repaired by the vast success of the English privateers, both in Europe and America. The successes of the English in the East Indies, under Colonel Clive, are almost incredible. He defeated Suraja Dowla, Nabob of Bengal, Bahar, and Orissa, and placed Jaffier Ally Cawn in the ancient seat of the nabobs of those provinces. Suraja Dowla, who was in the French interest, a few days after his being defeated, was taken by the new nabob Jaffier Ally Cawn's son, and put to death. This event laid the foundation of the present amazing extent of riches and territory, which the English now possess in the East Indies.

Mr. Pitt introduced into the cabinet a new system of operations against France, than which nothing could be better calculated to restore the spirits of his countrymen, and to alarm their enemies. Far from dreading an invasion, he planned an expedition for carrying the arms of England into France itself; and the descent was to be made at Rochefort, under general Sir John Mordaunt, who was to command the land troops. Nothing could be more promising than the dispositions for this expedition. It failed on the 8th of September, 1757; and admiral Hawke brought both the sea and land forces back on the 6th of October, to St. Helen's without the general making any attempt to land on the coast of France. He was tried and acquitted, without the public murmuring, so great an opinion had the people of the minister; who, to do him justice, did not suffer a man or a ship belonging to the English army or navy to lie idle.

The French having attacked the electorate of Hanover with a most powerful army, merely because his Britannic majesty refused to wink at their encroachments in America, the English parliament, in gratitude, voted large supplies of men and money in defence of the electoral dominions. The duke of Cumberland had been sent thither to command an army of observation, but was so powerfully pressed by a superior army, that he found himself obliged to lay down his arms; and the French, under the duke of Richlieu took possession of that electorate and its capital. At this time, a scarcity next to a famine, raged in England; and the Hessian troops, who, with the Hanoverians, had been sent to defend the kingdom from an invasion intended from the French, remained still in England. So many difficulties concurring in 1758, a treaty of mutual defence was agreed to between his majesty and the king of Prussia: in consequence of which, the parliament voted 670,000*l.* to his Prussian majesty; and also voted large sums, amounting in the whole to two millions a year, for the payment of 50,000 of the troops of Hanover, Hesse Cassel, Saxe-gotha, Wolfenbuttel, and Buckeberg. This treaty, which proved afterwards so burdensome to England, was intended to unite the protestant interest in Germany.

George

George II. with the consent of his Prussian majesty, declaring that the French had violated the convention concluded between them and the duke of Cumberland at Closterseven, ordered his Hanoverian subjects to resume their arms under prince Ferdinand of Brunswick, a Prussian general, who instantly drove the French out of Hanover, and the duke of Marlborough, after the English had repeatedly insulted the French coasts by destroying their stores and shipping at St. Malo's and Cherbourg, marched into Germany, and joined prince Ferdinand with 12,000 British troops, which were afterwards increased to 25,000. A war ensued, in the course of which the English every where performed wonders, and were every where victorious, but nothing decisive followed, and the enemy opened every campaign with advantage. Even the battle of Minden, the most glorious, perhaps, in the English annals, in which 7000 English defeated 180,000 of the French regular troops in fair battle, contributed nothing to the conclusion of the war, or towards weakening the French in Germany.

The English bore the expences of the war with cheerfulness, and applauded Mr. Pitt's administration, because their glorious successes in every other part of the globe demonstrated that he was in earnest. Admiral Boscawen and general Amherst, in August 1758, reduced and demolished Louisburgh in North America, which had been restored to the French by the treaty of Aix-la-Chapelle, and was become the scourge of the British trade, and took five or six French ships of the line; Frontenac and Fort du Quebec, in the same quarter, fell also into the hands of the English: acquisitions that far overbalanced a check which the English received at Ticonderago, and the loss of above 300 of the English guards, as they were returning under general Blyth from the coast of France.

The English affairs in the East Indies this year proved equally fortunate; and the lords of the admiralty received letters from thence, with an account that admiral Pococke had engaged the French fleet near Fort St. David's on the 29th of March, in which engagement a French man of war, called the *Bien Aime*, of 74 guns, was so much damaged that they ran her on shore. That on the 3d of August following, he engaged the French fleet a second time, near Pondicherry; when, after a brisk firing of ten minutes, the French bore away with all the sail they could make, and got safe into the road of Pondicherry. And that, on the 14th of December following, general Lally, commander of the French army in those parts, marched to besiege Madras, which was defended by the English colonels Lawrence and Draper; and, after a brisk cannonade, which lasted till the 16th of February following, the English having received a reinforcement of 600 men, general Lally thought proper to raise the siege, and retire with precipitation, leaving behind him forty pieces of cannon.

The year 1759 was introduced by the taking of the island of Groëe, on the coast of Africa, by commodore Keppel. Three capital expeditions had been planned for this year in America; and all of them proved successful. One of them was against the French islands in the West Indies, where Guadaloupe was reduced. The second expedition was against Quebec, the capital of Canada. The command was given, by the minister's advice, to general Wolfe, a young officer of a truly military genius. Wolfe was opposed, with far superior force, by Montcalm, the best and most successful general the French had. Though the situation of the country which Wolfe was to attack, and the works the French threw up to prevent a descent of the English, were deemed impregnable, yet Montcalm never relaxed in his vigilance. Wolfe's courage and perseverance, however, surmounting incredible difficulties; he

gained the heights of Abraham, near Quebec, where he fought and defeated the French army, but was himself killed, as was Montcalm; general Monkton, who was next in command, being wounded, the completion of the French defeat, and the glory of reducing Quebec, was reserved for brigadier-general (now lord vilcount) Townshend.

General Amherst, who was the first English general in command in America, conducted the third expedition. His orders were to reduce all Canada, and to join the army under general Wolfe on the banks of the river St. Lawrence. It is to the honour of the minister, that Mr. Amherst in this expedition was so well provided with every thing that could make it successful, that there scarcely appeared any chance for its miscarriage; and thus the French empire in North America became subject to Great Britain.

The affairs of the French being now desperate, and their credit exhausted, they resolved upon an attempt to retrieve all by an invasion of Great Britain: but on the 8th of August, 1759, admiral Boscawen attacked the French squadron, commanded by M. de la Clue, near the straits of Gibraltar, took *Le Centaure* of 74, *Le Teneiraire* of 74, and *Le Modeste* of 74 guns; and burnt *L'Océan* of 80, and *Le Redoubtable* of 74 guns. The rest of the fleet, consisting of seven ships of the line, and three frigates, made their escape in the night; and on November 20, Sir Edward Hawke defeated the French fleet, commanded by admiral Conflans, off the island of Dumet, in the Bay of Biscay. The *Formidable*, a French man of war of 80 guns was taken; the *Thésée* of 74, and the *Superbe* of 70 guns, were sunk; and the *Soleil Royal* of 80, and the *Héros* of 74 guns, were burnt, and afterwards the *Juste* of 74 perished in the mouth of the Loire. Seven or eight French men of war of the line got up the river Villaine, by throwing their guns overboard; and the rest of the fleet, consisting of five ships of the line, and three frigates, escaped in the night. The English lost on this occasion, the *Essex* of 64, and the *Resolution* of 74 guns, which ran ashore in the chase. After this engagement, the French gave over all thoughts of their invasion of Great Britain.

In February 1760, captain Thurot, a French marine adventurer, who had, with three sloops of war, alarmed the coasts of Scotland, and actually made a descent at Carrickfergus in Ireland, was, on his return from thence, met, defeated, and killed by captain Elliot, the commodore of three ships, inferior in force to the Frenchman's squadron. In short, Great Britain now reigned as sole mistress of the main, and succeeded in every measure that had been projected for her own safety and advantage.

The war in Germany, however, continued still as undecided as it was expensive, and many in England began to consider it now as foreign to the internal interests of Great Britain. The French again and again shewed dispositions for treating, and the charges of the war, which began now to amount to little less than eighteen millions sterling, yearly, inclined the British ministry to listen to their proposals. A negotiation was accordingly entered upon, which proved abortive, as did many other projects for accommodation; but on the 25th of October 1760, George II. died suddenly (from a rupture in the right ventricle of the heart), full of years and glory, in the 77th year of his age, and 34th of his reign, and was succeeded by his grandson, now George III. eldest son to the late prince of Wales.

The memory of George II. is reprehensible on no head but his predilection for his electoral dominions. He never could separate an idea that there was any difference between them and his regal dominions; and he was sometimes ill enough advised to declare so much in his speeches to parliament.

We are, however, to remember, that his people gratified him in this partiality, and that he never acted by power or prerogative. He was not very accessible to conversation, and therefore it was no wonder that having left Germany after he had attained to man's estate, he still retained foreign notions both of men and things. In government he had no favourite, for he parted with Sir Robert Walpole's administration with great indifference; and showed very little concern at the subsequent revolutions among his servants. In his personal disposition he was passionate, but placable, fearless of danger, fond of military parade, and enjoyed the memory of the campaigns in which he served when young. His affections, either public or private, were never known to interfere with the ordinary course of justice; and though his reign was distracted by party, the courts of justice were never better filled than under him: this was a point in which all factions were agreed.

King George III. ascended the throne with great advantages. His being a native of England prejudiced the people in his favour; he was in the bloom of youth, in his person tall and comely, and at the time of his accession Great Britain was in the highest degree of reputation and prosperity, and the most salutary unanimity and harmony prevailed among the people. The first acts of his reign seemed also calculated to convince the public that the death of his predecessors should not relax the operations of the war. Accordingly, in 1761, the island of Belleisle, on the coast of France, surrendered to his majesty's ships and forces under commodore Keppel and general Hodgson; as did the important fortrefs of Pondicherry, in the East Indies, to colonel Coote and admiral Stevens. The operations against the French West Indies still continued under general Monkton, lord Rollo, and Sir James Douglas; and in 1762, the island of Martinico, hitherto deemed impregnable, with the islands of Grenada, St. Lucia, Grenadillas, St. Vincent, and others of less note, were subdued by the British arms with inconceivable rapidity.

In the mean time, Mr. Pitt, who had conducted the war against France with such eminent ability, and who had received the best information of the hostile intentions, and private intrigues of the court of Spain, proposed in council an immediate declaration of war against that kingdom. But he was over-ruled in the council, all the members of which declared themselves of a contrary opinion, excepting his brother-in-law earl Temple. Mr. Pitt now found the decline of his influence; and it was supposed that the earl of Bute, who had a considerable share in directing the education of the king, had acquired an ascendancy in the royal favour*. Mr. Pitt, however, said that "as he was called to the ministry by the voice of the people, to whom he considered himself as accountable for his conduct, he would no longer remain in a situation which made him responsible for measures that he was no longer allowed to guide." He, therefore, resigned the seals, and lord Temple also gave up the post which he held in the administration. But the next day, the king settled a pension of three thousand pounds a year upon Mr. Pitt, and at the same time a title was conferred upon his lady and her issue; and the pension was to be continued for three lives.

The war still continued to be carried on with vigour after the resignation of Mr. Pitt, and the plans were pursued that he had previously concerted. Lord Egremont was appointed to succeed him, as secretary for the south-

* It was on the 25th of March 1761, that the earl of Bute was appointed one of the principal secretaries of state; and on the 5th of October following, Mr. Pitt resigned the seals.

ern department. It was at length also found indispensably necessary to engage in a war with Spain, the famous family compact among all the different branches of the Bourbon family being generally known; and accordingly war was declared against that kingdom, on the 4th of January 1762. A respectable armament was fitted out under admiral Pococke, having the earl of Albemarle on board to command the land forces; and the vitals of the Spanish monarchy were struck at, by the reduction of the Havannah, the strongest and most important fort which his catholic majesty held in the West Indies, after a siege of two months and eight days. The capture of the Hermione, a large Spanish register ship, bound from Lima to Cadiz, the cargo of which was valued at a million sterling, preceded the birth of the prince of Wales, and the treasure passed in triumph through Westminster to the Bank, the very hour he was born. The loss of the Havannah, with the ships and treasures there taken from the Spaniards, was succeeded by the reduction of Manilla and the Philippine islands in the East Indies, under general Draper and admiral Cornish, with the capture of the Trinidad, reckoned worth three millions of dollars. To counteract those dreadful blows given to the family compact, the French and Spaniards opened their last resource, which was to quarrel with and invade Portugal, which had been always under the peculiar protection of the British arms. Whether this quarrel was real or pretended, is not for me decide. It certainly embarrassed his Britannic Majesty, who was obliged to send thither armaments both by sea and land.

The negotiations for peace were now resumed; and the enemy at last offered such terms as the British ministry thought admissible and adequate to the occasion. The defection of the Russians from the confederacy against the king of Prussia, and his consequent successes, produced a cessation of arms in Germany, and in all other quarters; and on the 10th of February 1763, the definitive treaty of peace between his Britannic majesty, the king of France, and the king of Spain, was concluded at Paris, and acceded to by the king of Portugal; March 10, the ratifications were exchanged at Paris. The 22d, the peace was solemnly proclaimed at Westminster and London; and the treaty having on the 18th been laid before the parliament, it met the approbation of a majority of both houses.

By this treaty the extensive province of Canada, with the islands of Newfoundland, Cape Breton, and St. John, were confirmed to Great Britain; also the two Floridas, containing the whole of the continent of North America, on this side the Mississippi, (except the town of New Orleans, with a small district round it), was surrendered to us by France and Spain, in consideration of restoring to Spain the island of Cuba; and to France the islands of Martinico, Guadaloupe, Mariegalante, and Desada; and in consideration of our granting to the French the two small islands of St. Pierre and Miquelon, on the coast of Newfoundland; and quitting our pretensions to the neutral island of St. Lucia, they yielded to us the islands of Grenada and the Grenadilles, and quitted their pretensions to the neutral islands of St. Vincent, Dominica, and Tobago. In Africa we retained the settlement of Senegal, by which we nearly engrossed the whole gum trade of that country, but we returned Goree, a small island of little value. The article that relates to the East Indies, was dictated by the directors of the English company; which restores to the French all the places they had at the beginning of the war, on condition that they shall maintain neither forts nor forces in the province of Bengal;

and the city of Manilla was restored by the Spaniards; but they confirmed to us the liberty of cutting logwood in the Bay of Honduras in America. In Europe, likewise, the French restored to us the island of Minorca, and we restored to them the island of Belleisle. In Germany, after six years spent in marches and counter-marches, numerous skirmishes and bloody battles, Great Britain acquired much military fame, but at the expence of thirty millions sterling! As to the objects of that war, it was agreed that a mutual restitution and oblivion should take place, and each party sit down at the end of the war in the same situation in which they began it. And peace was restored between Portugal and Spain, both sides to be upon the same footing as before the war.

The war, to which a period was now put, was the most brilliant, and distinguished with the most glorious events in the British annals. No national prejudices, nor party disputes then existed. The same truly British spirit by which the minister was animated, fired the breast of the soldier and seaman. The nation had then arrived at a pitch of wealth unknown to former ages; and the monied man, pleased with the aspect of the times, confiding in the abilities of the minister, and courage of the people, cheerfully opened his purse. The incredible sums of 18, 19, and 22 millions, raised by a few citizens of London, upon a short notice, for the service of the years 1759, 1760, and 1761, was no less astonishing to Europe than the success which attended the British fleets and armies in every quarter of the globe.

But the peace, though it received the sanction of a majority of both houses of parliament, was far from giving universal satisfaction to the people. And from this period various causes contributed to occasion a great discontent to prevail throughout the nation.

On the 30th of April, 1763, three of the king's messengers entered the house of John Wilkes, esq. member of parliament for Aylesbury, and seized his person, by virtue of a warrant from the secretary of state, which directed them to seize 'the authors, printers, and publishers, of a seditious and treasonable paper, intitled the North Briton, No. 45.' The papers published under this title severely arraigned the conduct of the administration, and represented the earl of Bute as the favourite of the king, and the person from whom measures of government of a very pernicious tendency originated. The 45th number contained strictures on the king's speech. Mr. Wilkes was suspected to be the author but his name was not mentioned in the warrant, by which he was apprehended. He objected to being taken into custody by such a warrant, alleging that it was illegal. However he was forcibly carried before the secretaries of state for examination, and they committed him close prisoner to the Tower, his papers being also seized. He was likewise deprived of his commission as colonel of the Buckinghamshire militia. A writ of habeas corpus being procured by his friends, he was brought to the court of Common Pleas, and the matter being there argued, he was ordered to be discharged. This affair made a great noise; people of all ranks interested themselves in it, and Westminster-hall resounded with acclamations when he was set at liberty. An information, however, was filed against him in the court of King's Bench, at his majesty's suit, as author of the North Briton, No. 45. On the first day of the meeting of parliament, after these transactions Mr. Wilkes stood up in his place, and made a speech, in which he complained to the house, that in his person the rights of all the commons of England, and the privileges of parliament, had been violated by his imprisonment, the plundering of his house, and the seizure of his papers. The same day a message was sent to acquaint the house of commons, with

the information his majesty had received, that John Wilkes, esq. a member of that house, was the author of a most seditious and dangerous libel, and the measures that had been taken thereupon. The next day a duel was fought in Hyde Park between Mr. Wilkes and Mr. Martin, another member of parliament, and secretary of the treasury, in which Mr. Wilkes received a dangerous wound in the belly with a pistol-bullet. Both houses of parliament soon concurred in voting the North Briton, No. 45. to be a false, scandalous, and seditious libel, and ordered it to be burnt by the common hangman. This order was accordingly executed, though not without great opposition from the populace: and Mr. Harley, one of the sheriffs who attended, was wounded and obliged to take shelter in the Mansion house. Another prosecution was commenced against Mr. Wilkes, for having caused an obscene and profane poem to be printed, intitled, "An Essay on Woman." Of this, only twelve copies had been privately printed: and it did not appear to have been intended for publication. Finding, however, that he should continue to be prosecuted with the utmost rigour, when his wound was in some degree healed, he thought proper to quit the kingdom. He was soon after expelled the house of commons; verdicts were also given against him, both on account of the North Briton and the Essay on Woman, and towards the end of the year 1764 he was outlawed. Sundry other persons had been taken up for being concerned in printing and publishing the North Briton; but some of them obtained verdicts against the king's messengers for false imprisonment.

In the mean while, the earl of Bute, who had been made first lord of the treasury, resigned that office, and was succeeded by Mr. George Grenville. And under this gentleman's administration, an act was passed, said to have been framed by him, which was productive of the most pernicious consequences to Great Britain; "An Act for laying a *stamp-duty* in the British colonies of North America," which received the royal assent on the 22d of March 1765. Some other injudicious previous regulations had also been made, under pretence of preventing smuggling in America; but which in effect cramped the trade of the colonies, as to be prejudicial both to them and the mother country. As soon as it was known in North America that the *stamp-act* was passed, the whole continent was kindled into a flame. As the Americans had hitherto been taxed by their own representatives in their provincial assemblies; they loudly asserted, that the British parliament, in which they were not represented, had no right to tax them. Indeed, the same doctrine had been maintained in the British parliament, when the stamp-act was under consideration: on which occasion it was said, that it was the birth-right of the inhabitants of the colonies, even as the descendants of Englishmen, not to be taxed by any but their own representatives; that, so far from being actually represented, they were not even virtually represented there, as the meanest inhabitants of Great Britain are, in consequence of their intimate connection with those who are actually represented; and that therefore the attempt to tax the colonies in the British parliament was oppressive and unconstitutional. On the other hand it was contended, that the colonies, who had been protected by Great Britain, ought, in reason and justice, to contribute towards the expence of the mother-country. "Those children, of our own planting," said Mr. George Grenville, speaking of the Americans, "nourished by our indulgence, until they are grown to a good degree of strength and opulence, and protected by our arms, will they grudge to contribute their mite to relieve us from the heavy load of national expence which we lie under?"

When

When the stamp act, printed by royal authority, reached the colonies, it was treated with every mark of indignation and contempt. Several acts of violence were likewise committed, with a view of preventing the operations of the stamp-act; and associations were also formed in the different colonies, whereby the people bound themselves not to import or purchase any British manufactures, till that act should be repealed. The inhabitants of the different colonies also established committees from every colony to correspond with each other, concerning the general affairs of the whole, and even appointed deputies from these committees to meet in CONGRESS at New York. They assembled together in that city, in October 1765, and this was the first congress held on the American continent.

These commotions in America occasioned so great an alarm in England, that the king thought proper to dismiss his ministers. The marquis of Rockingham was appointed first lord of the treasury; and some of his lordship's friends succeeded to the vacant places. In March 1766, an act was passed for repealing the American stamp-act. This was countenanced and supported by the new ministry; and Mr. Pitt, though not connected with them, yet spoke with great force in favour of the repeal. He also asserted, that the profits to Great Britain from the trade of the colonies, through all its branches, was two millions a year.

At the time that the stamp-act was repealed, an act was also passed for securing the dependence of the American colonies on Great Britain.

The marquis of Rockingham and his friends continued in administration but a short time; though during their continuance in power several public measures were adopted, tending to relieve the burdens of the people, and to the security of their liberties. But on the 30th of July, 1766, the duke of Grafton was appointed first lord of the treasury, in the room of the marquis of Rockingham; the earl of Shelburne, secretary of state, in the room of the duke of Richmond; Charles Townshend, chancellor of the exchequer; and Mr. Pitt, now created earl of Chatham, was appointed lord privy-seal; but that eminent statesman's acceptance of a peerage, as it removed him from the house of commons, greatly lessened his weight and influence. Indeed, this political arrangement was not of any long continuance, and sundry changes followed. Mr. Charles Townshend, who was a gentleman of great abilities and eloquence, made for some time a considerable figure both in the cabinet and in parliament; but, on his death, the place of chancellor of the exchequer was supplied by lord North, who afterwards became first lord of the treasury, and obtained a great ascendancy in the administration.

In the year 1768, Mr. Wilkes, who had for a considerable time resided in France, came over to England, and again became an object of public attention. The limits of our work will not permit us to enter into all the particulars respecting the prosecution of this gentleman, and the subsequent transactions concerning him: for these we must refer to our quarto edition. It is well known, that verdicts were found against him on account of the North Briton, and for the indecent poem, "Essay on Woman." That he suffered a long imprisonment of two years, and paid two fines of 500l. each. That he displayed great abilities during his contests with the ministry, and was chosen member for the county of Middlesex, on the 28th of March, 1768. He was also again expelled for being the author of some prefatory remarks on a letter which he published, written by one of the secretaries of state to the chairman of the quarter-sessions at Lambeth, in which the secretary had recommended to the magistrates, previous to the unhappy affair of St. George's Fields, their calling in the assistance of the military, and employing them *effectually*, if there should

should be occasion. In the vote for his expulsion, his former offences, for which he was now suffering imprisonment, were complicated with this charge, and a new writ was ordered to be issued for the election of a member for the county of Middlesex.

The rigour with which Mr. Wilkes was prosecuted, only increased his popularity, which was also much augmented by the spirit and firmness which on every occasion he displayed. Before his expulsion he had been chosen an alderman of London: and on the 16th of February, 1769, he was re-elected at Brentford, member for the county of Middlesex without opposition. The return having been made to the house, it was resolved, that Mr. Wilkes having been expelled that session, was incapable of being elected a member of that parliament. The late election, therefore was again declared void, and a new writ issued for another. He was once more unanimously re-elected by the freeholders, and the election was again declared void by the house of commons. After this, a new election being ordered, colonel Luttrell, in order to recommend himself to the court, vacated the seat which he already had in parliament, by the acceptance of a nominal place, and declared himself a candidate for the county of Middlesex. Though the whole weight of court interest was thrown into the scale in this gentleman's favour, yet a majority of near four to one appeared against him on the day of election: the numbers for Wilkes being 1143, and for Luttrell only 236. Notwithstanding this, two days after the election it was resolved in the house of commons, that Mr. Luttrell ought to have been returned a knight of the shire for the county of Middlesex; and the deputy clerk of the crown was ordered to amend the return, by erasing the name of Mr. Wilkes, and inserting that of colonel Luttrell in its place. The latter accordingly took his seat in parliament; but this was thought so gross a violation of the rights of the electors, that it excited a very general discontent, and loud complaints were made against it in every part of the kingdom.

After the term of Mr. Wilkes's imprisonment was expired in the year 1771, he was chosen one of the sheriffs for London and Middlesex; and was afterwards again chosen member for the county of Middlesex in the subsequent parliament, and permitted quietly to take his seat there; in the year 1775, he executed the office of lord mayor of the city of London; and was afterwards elected to the lucrative office of chamberlain of that city. In the year 1783, after the change of lord North's administration, at Mr. Wilkes's motion, all the declarations, orders, and resolutions of the house of commons respecting his election for the county of Middlesex, were ordered to be expunged from the journals of that house, "as being subversive of the rights of the whole body of this kingdom." And it should be remembered, that in consequence of his manly and spirited contests with the government, general warrants were declared to be illegal, and an end was put to such warrants, and to the unlawful seizure of an Englishman's papers by state messengers.

After the repeal of the stamp-act, which was received with great joy in America, all things became quiet there; but unhappily new attempts were made to tax them in the British parliament, though, besides the experience of the ill success of the stamp-act, governor Pownall, a gentleman well acquainted with the disposition of the colonists, said in the house of commons, in 1767, "It is a fact which this house ought to be apprized of in all its extent, that the people of America, universally, unitedly, and unalterably, are resolved not to submit to any internal tax imposed upon them by any legislature, in which they have not a share by representatives of their own
elec.

election." He added, "this claim must not be understood as though it were only the pretences of party leaders and demagogues; as though it were only the visions of speculative enthusiasts; as though it were the mere ebullition of a faction which must subside; as though it were only temporary or partial—it is the cool, deliberate, principled maxim of every man of business in the country." The event verified the justice of these observations; yet the same year, an act was passed laying certain duties on paper, glass, tea, &c. imported into America, to be paid by the colonies, for the purpose of raising a revenue to the government. About two years after, it was thought proper to repeal these duties, excepting that on tea; but it was not the amount of the duties, but the *right* of the parliament of Great Britain to impose taxes in America, which was the subject of dispute, the repealing the other duties answered no purpose, while that on tea remained; which accordingly became a fresh subject of contest between the mother-country and the colonies.

In order to induce the East India company to become instrumental in enforcing the tea-duty in America, an act was passed, by which they were enabled to export their teas, duty free, to all places whatsoever. Several ships were accordingly freighted with teas for the different colonies by the company, who also appointed agents there for the disposal of that commodity. This was considered by the Americans as a scheme calculated merely to circumvent them into a compliance with the revenue law, and thereby pave the way to an unlimited taxation. For it was easily comprehended, that if the tea was once landed, and in the custody of the consignees, no associations, nor other measures, would be sufficient to prevent its sale and consumption: and it was not to be supposed, that when taxation was established in one instance, it would restrain itself in others. These ideas being generally prevalent in America, it was resolved by the colonists to prevent the landing of the tea-cargoes amongst them, at whatever hazard. Accordingly, three ships laden with tea having arrived in the port of Boston in December, 1773, a number of armed men, under the disguise of Mohawk Indians, boarded these ships, and in a few hours discharged their whole cargoes of tea into the sea, without doing any other damage, or offering any injury to the captains or crews. Some smaller quantities of tea met afterwards with a similar fate at Boston, and a few other places; but in general, the commissioners for the sale of that commodity were obliged to relinquish their employments, and the masters of the tea vessels from an apprehension of danger, returned again to England with their cargoes. At New York, indeed, the tea was landed under the cannon of a man of war. But the persons in the service of government there were obliged to consent to its being locked up from use. And in South Carolina some was thrown into the river, as at Boston, and the rest put into damp warehouses, where it perished.

These proceedings in America excited so much indignation in the government of England, that on the 31st of March, 1774, an act was passed for removing the custom-house officers from the town of Boston, and shutting up the port. Another act was soon after passed for better regulating the government of the province of Massachusetts Bay. The design of this act was to alter the constitution of that province as it stood upon the charter of king William; to take the whole executive power out of the hands of the people, and to vest the nomination of the counsellors, judges and magistrates of all kinds, including sheriffs, in the crown, and in some cases in the king's governor, and all to be removeable at the pleasure of the crown. Another act was also passed, which was considered as highly injurious, cruel and un-

constitutional, empowering the governor of Massachusetts Bay to send persons accused of crimes there, to be tried in England for such offences. Some time after, an act was likewise passed, "for making more effectual provision for the government of the province of Quebec," which excited a great alarm both in England and America. By this act, a legislative council was to be established for all the affairs of the province of Quebec, except taxation, which council was to be appointed by the crown, the office to be held during pleasure; and his majesty's Canadian Roman Catholic subjects were intitled to a place in it. The French laws, and a trial without jury, were also established in civil cases, and the English laws, with a trial by jury, in criminal; and the popish clergy were invested with a legal right to their tithes from all who were of their own religion. No assembly of the people, as in other British colonies, was appointed, it being said in the act, that it was then inexpedient; but the king was to erect such courts of criminal, civil, and ecclesiastical jurisdiction, as he would think proper. The boundaries of the province of Quebec were likewise extended, by the act, thousands of miles at the back of the other colonies, whereby, it was said, a government little better than despotic was established throughout an extensive country.

The measures of government respecting America had so universally exasperated the colonists, that provincial or town meetings were held in every part of the continent, wherein they avowed their intentions of opposing, in the most vigorous manner, the measures of administration. Agreements were entered into in the different colonies, whereby the subscribers bound themselves in the most solemn manner, and in the presence of God, to suspend all commercial intercourse with Great Britain, from the last day of the month of August 1774, until the Boston port bill, and the other late obnoxious laws, were repealed, and the colony of Massachusetts Bay fully restored to its chartered rights. Other transactions succeeded; and the flame continued to increase and extend in America, till at length, twelve of the colonies, including that whole extent of country which stretches from Nova Scotia to Georgia, had appointed deputies to attend a General Congress, which was to be held at Philadelphia, and opened the 5th of September, 1774. They met accordingly, and the number of delegates amounted to fifty-one; who represented the several English colonies of New Hampshire (2 delegates), Massachusetts Bay (4), Rhode Island and Providence plantations (2), Connecticut (3), New York (7), New Jersey (4), Pennsylvania (7), the lower counties on Delaware (3), Maryland (4), Virginia (7), North Carolina (3), and South Carolina (5 delegates); Georgia afterwards acceded to the confederacy and sent deputies to the Congress.

They drew up a petition to the king in which they enumerated their several grievances, and solicited his majesty to grant them peace, liberty, and safety. They likewise published an address to the people of Great Britain, another to the colonies in general, and another to the inhabitants of the province of Quebec. The congress broke up on the 26th of October, having resolved, that another congress should be held in the same place on the 10th of May following, unless the grievances of which they complained should be redressed before that time; and they recommended to all the colonies to choose deputies, as soon as possible, for that purpose.

Shortly after these events, some measures were proposed in the parliament of Great Britain, for putting a stop to the commotions which unhappily subsisted in America. The earl of Chatham, who had been long in an infirm state of health, appeared in the house of lords, and expressed in the

strongest terms his disapprobation of the whole system of the American measures. He also made a motion, for immediately recalling the troops from Boston, as a measure which should be instantly adopted; urging, that an hour then lost, in allaying the ferment in America, might produce years of calamity. He pledged that this conciliatory measure would be well-timed; and as a mark of affection and good will on our side, would remove all jealousy and apprehension on the other, and instantaneously produce the happiest effects to both. His lordship's motion was rejected by a large majority, 68 against 18; as was also a bill which he brought in soon after for settling the American troubles, by 61 to 32. The methods proposed in the house of commons for promoting an accommodation, met also with a similar fate. The number of his majesty's troops was ordered to be augmented; and an act was passed for restraining the commerce of the New England colonies, and to prohibit their fishery on the Banks of Newfoundland. A motion was, indeed afterwards made in the house of commons, by lord North, first lord of the treasury, for suspending the exercise of the right of taxation in America, claimed by the British parliament, in such of the colonies as should, in their general assemblies, raise such contributions as were approved of by the king in parliament. This motion was carried, and afterwards communicated to some provincial assemblies; but it was rejected by them as delusive and unsatisfactory, and only calculated to disunite them. The petition from the congress to the king was ordered by his majesty to be laid before the parliament; whereupon Dr. Franklin, and two other American agents, solicited to be heard at the bar of the house of commons, on behalf of the colonies, in support of that petition; but their application was rejected; it being said, that the American congress was no legal assembly, and that therefore no petition could be received from it by the parliament with propriety.

It was on the 19th of April, 1775, that the first blood was drawn in this unhappy civil war, at Lexington and Concord in New England. This was occasioned by general Gage sending a body of troops to destroy some military stores that were at Concord. They succeeded in their design, but were extremely harassed and forced to a quick retreat; 65 of them were killed 170 wounded, and about 20 made prisoners. The Americans were computed not to have lost more than 60, including killed and wounded. Immediately after, numerous bodies of the American militia invested the town of Boston, in which general Gage and his troops were. In all the colonies they prepared for war with the utmost dispatch; and a stop was almost every where put to the exportation of provisions. The continental congress met at Philadelphia on the 10th of May 1775, as proposed, and soon adopted such measures as confirmed the people in their resolutions to oppose the British government to the utmost. Among their first acts, were resolutions for the raising of an army, and the establishment of a large paper currency for its payment. They assumed the appellation of "The United Colonies of America," who were securities for realizing the nominal value of this currency. They also strictly prohibited the supplying of the British fisheries with any kind of provisions; and to render this order the more effectual, stopt all exportation to those colonies, islands, and places, which still retained their obedience.

In the mean time, a body of provincial adventurers, amounting to about 240 men, surprised the garrisons of Ticonderago and Crown Point. These fortresses were taken without the loss of a man on either side; and the provincials found in the forts a considerable number of pieces of cannon, besides mortars, and sundry kinds of military stores. However, the force of Great Britain in America was now augmented, by the arrival at Boston from Eng-

land of the generals Howe, Burgoyne, and Clinton, with considerable reinforcements. But the continental congress were so little intimidated by this, that they voted, a few days after, that the compact between the crown and the people of Massachusetts Bay was dissolved, by the violation of the charter of William and Mary; and therefore recommended to the people of that province, to proceed to the establishment of a new government, by electing a governor, assistants, and house of assembly, according to the powers contained in their original charter.

Our limits will not permit us here to relate, as in the quarto edition, all the particulars of this fatal war. We can only mention some of the most important transactions. On the 17th of June, 1775, a bloody action took place at Bunkers Hill, near Boston; in which the king's troops had the advantage, but with the loss of 226 killed, and more than 800 wounded, including many officers. But after this action, the Americans immediately threw up works upon another hill, opposite to it, on their side of Charlestown neck; so that the troops were as closely invested in that peninsula as they had been in Boston. About this time the congress appointed George Washington, esq. a gentleman of large fortune in Virginia, of great military talents, and who had acquired considerable experience in the command of different bodies of provincials during the last war, to be general and commander in chief of all the American forces. They also published a declaration, in which they styled themselves "The representatives of the United Colonies of North America," and assigned their reasons for taking up arms. It was written in a very animated strain, and contained the following passage: "In our own native land, in defence of the freedom that is our birth-right, and which we ever enjoyed till the late violation of it; for the protection of our property, acquired solely by the honest industry of our forefathers and ourselves; against violence actually offered, we have taken up arms. We shall lay them down when hostilities shall cease on the part of the aggressors, and all danger of their being renewed shall be removed, and not before." A second petition to the king was voted by the congress, in which they earnestly solicited his majesty to adopt some method of putting a stop to the unhappy contest between Great Britain and the colonies. This petition was presented by Mr. Penn, late governor, and one of the proprietors of Pennsylvania, through the hands of lord Dartmouth, secretary of state for the American department; but Mr. Penn was soon after informed, that no answer would be given to it. The refusal of the king to give answer to this petition, from near three millions of people, by their representatives, contributed exceedingly towards farther exasperating the minds of the Americans. It was a rash and unhappy determination of the cabinet-council, and their advice to the king on this point was fatal, if not highly criminal. An address now also was published by the congress to the inhabitants of Great Britain, and to the people of Ireland.

But as no conciliatory measures were adopted, hostilities still continued; and an expedition was set on foot by the Americans against Canada, to which they were induced by an extraordinary commission given to general Carleton, the governor of Canada: by which he was empowered to embody and arm the Canadians, to march out of the country for the subjugation of the other colonies, and to proceed even to capital punishments against all those whom he should deem rebels and opposers of the laws. The American expedition against Canada was chiefly conducted by Richard Montgomery, a gentleman of an amiable character, and of considerable military skill, on

whom the congress conferred the rank of brigadier-general. On the 31st of December, Montgomery attempted to gain possession of Quebec by storm but was killed in the first fire from a battery, as advancing in the front of his men: Arnold was also dangerously wounded, about 60 of their men were killed and wounded, and 300 taken prisoners. The besiegers immediately quitted their camp, and retired about three miles from the city, and the siege was for some months converted into a blockade. On general Carleton's receiving considerable reinforcements and supplies of provisions from England, May 1776, Arnold was obliged to make a precipitate retreat; Montreal, Chamblee, and St. John's were retaken, and all Canada recovered by the king's troops.

During these transactions, the royal army at Boston was reduced to great distress for want of provisions; the town was bombarded by the Americans, and general Howe, who now commanded the king's troops, which amounted to upwards of seven thousand men, was obliged to quit Boston, and embark for Halifax, leaving a considerable quantity of artillery and some stores behind. The town was evacuated on the 17th of March, 1776, and general Washington immediately took possession of it. On the 4th of July following, the congress published a solemn declaration, in which they assigned their reasons for withdrawing their allegiance from the king of Great Britain. In the name, and by the authority of the inhabitants of the united colonies, they declared that they then were, and of right ought to be, "Free and Independent States;" that they were absolved from all allegiance to the British crown, and that all political connection between them and the kingdom of Great Britain was totally dissolved; and also that, as free and independent states, they had full power to levy war, conclude peace, contract alliances, establish commerce, and do all other acts and things, which independent states may of right do. They likewise published articles of confederation and perpetual union between the united colonies, in which they assumed the title of "The United States of America."

In July 1776, an attempt was made by commodore Sir Peter Parker, and lieutenant-general Clinton, upon Charles-town in South Carolina. But this place was so ably defended by the Americans under general Lee, that the British commodore and general were obliged to retire, the king's ships having sustained considerable loss, and a twenty-eight gun ship, which run aground, was obliged to be burnt by the officers and seamen. However, a much more important and successful attack against the Americans was soon after made under the command of general Howe, then joined with a large body of Hessians, and a considerable number of Highlanders, so that his whole force was now extremely formidable. The fleet was commanded by his brother vice-admiral lord How; and both the general and the admiral were invested with a power, under the title of "Commissioners for granting Peace to the Colonies," of granting pardon to those who would lay down their arms. But their offers of this kind were treated by the Americans with contempt. An attack upon the town of New York seems to have been expected by the provincials, and therefore they had fortified it in the best manner they were able. On Long Island, near New York, the Americans had also a large body of troops encamped, and several works thrown up. General Howe first landed on Staten Island, where he met with no opposition; but early in the morning of the 22d of August, a descent was made by the British troops upon Long Island, and towards noon about fifteen thousand were landed. They had greatly the advantage of the Americans, by their superior skill and discipline, and being better provided with artillery,

and every kind of military accommodation; and the American passes were far from being properly secured. Some actions and skirmishes happened between them during several successive days; in which the British troops engaged their enemies with great ardour, and the Americans suffered exceedingly. Finding themselves so much overpowered, they at length resolved to quit the island, and general Washington came over from New York to conduct their retreat, in which he displayed great ability. In the night of the 29th of July, the American troops were withdrawn from the camp, and their different works, and with their baggage, stores, and part of their artillery, were conveyed to the water-side, embarked, and passed over a long ferry to New York, with such extraordinary silence and order, that the British army did not perceive the least motion, and were surprised in the morning at finding the American lines abandoned, and seeing the last of their rear-guard in their boats, and out of danger. The provincials had been so surrounded by the British troops, and the latter had displayed such superior military skill, it was a subject of wonder that the greatest part of the American army should be able to effectuate their retreat. In the different actions previous to this, the loss of the Americans had been very considerable. Upwards of a thousand of them were taken prisoners, including three generals, three colonels, and many inferior officers; their number killed and wounded was computed to be still greater; they lost also five field-pieces, and a quantity of ordnance was found in their different redoubts and forts on the island; whilst the whole loss of the British troops, if faithfully published, did not amount to more than three hundred killed and wounded.

New York was now soon abandoned, and the royal army obtained some other considerable advantage over the Americans: at the White Plains, taking fort Washington, with a garrison of 2500 men, and fort Lee with a great quantity of stores, which losses obliged the American general to retreat through the Jerseys to the river Delaware, a distance of ninety miles. Also on the 8th of December, general Clinton and Sir Peter Parker obtained possession of Rhode-island; and the British troops covered the Jerseys. This was the crisis of American danger. All their forts taken, and the time of the greatest part of their army to serve, was expired, and the few that remained with their officers were in a destitute state, with a well clothed and disciplined army pursuing. Had general Howe pushed on at that time to Philadelphia, after Washington, it hath been maintained there would have been an end of the contest; but Providence directed otherwise; and the general's orders from home are said to have prevented him. This delay gave way for volunteer reinforcements of gentleman, merchant, farmer, tradesman, and labourer, to join general Washington, who, in the night of the 25th of December, amidst snow, storms, and ice, with a small detachment, crossed the Delaware, and surprised a brigade of the Hessian troops at Trenton. He took upwards of 900 of them prisoners, with whom he repassed the river; having also taken three standards, six pieces of brass cannon, and near one thousand stand of arms. Immediately after this surprize of the Hessians, and depositing them in safety, Washington recrossed the river to resume his former post at Trenton. The British troops collected in force to attack him, and only waited for the morning to execute it; but the Americans, by a happy stroke of generalship, defeated the plan. Washington, to disguise his retreat in the night, ordered a line of fires in front of his camp, as an indication of their going to rest, and to conceal what was acting behind them. Then he moved completely from the ground with his baggage and artillery, and by a circuitous march of eighteen miles reached Prince-town early in the morning.

carried

carried the British post at that place, and set off with near 300 prisoners on his return to the Delaware, just as the British troops at Trenton were under arms and proceeding to attack him, supposing him in his former position.

In the month of September 1777, two actions of some importance happened between the armies of general Howe and general Washington, in both of which the former had the advantage; and soon after, the city of Philadelphia surrendered to the king's troops. But an expedition, that had for some time been concerted, of invading the northern colonies by way of Canada, proved extremely unsuccessful. The command of this expedition had been given to lieutenant-general Burgoyne, a very experienced officer. He set out from Quebec with an army of near 10,000 men, and an extraordinary fine train of artillery, and was joined by a considerable body of the Indians. For some time he drove the Americans before him, and made himself master of Ticonderago; but at length he encountered such difficulties, and was so vigorously opposed by the Americans under Gates and Arnold, that after two severe actions, in which great numbers fell, general Burgoyne and his army of 5,600 men were obliged to lay down their arms, October 17, 1777.

About the same time, Sir Henry Clinton and general Vaughan made a successful expedition against the Americans up the North River; they made themselves masters of several forts; but the Americans complained, that in this expedition, and some others, the British troops had wantonly set fire to houses and towns, particularly Esopus, and carried on the war in a manner not usual among civilized nations. These devastations greatly increased the aversion of the Americans to the British government, which had already taken a deep root. General Howe soon after returned to England, and the command of the British army in America devolved upon general Clinton; but it was now found necessary to evacuate Philadelphia; and accordingly Clinton retreated with the army to New York, in June 1778. The British troops were attacked on their march by the Americans, but the retreat was so ably conducted, or the American general Lee behaved so ill, that their loss did not amount to 300, killed and wounded.

During part of this unhappy war between Great Britain and the colonies, the latter received considerable supplies of arms and ammunition from France; and the French court seems to have thought this a favourable opportunity for lessening the power of Great Britain. Some French officers also entered into the American service; and on the 6th of February, 1778, a treaty of alliance was concluded at Paris, between the French king and the Thirteen United Colonies; and in this treaty it was declared, that the essential and direct end of it was "to maintain effectually the liberty, sovereignty, and independence, absolute and unlimited, of the United States of North America, as well in matters of government as of commerce."

The parliament and people of Great Britain now began to be in general alarmed at the fatal tendency of the American war: and in June, 1778, the earl of Carlisle, William Eden, and George Johnstone, esqrs. arrived at Philadelphia, as commissioners from his majesty, to settle the disputes between the mother country and the colonies. But it was now too late; the terms, which, at an earlier period of the contest, would have been accepted with gratitude, were now rejected with disdain. The congress refused to enter into any treaty with the British commissioners, if the independency of the United States of America was not previously acknowledged, or the British fleets and armies withdrawn from America. being complied with, the war continued to be carried on with mutual animosity.

The conduct of France towards Great Britain, in taking part with the revolted colonies, occasioned hostilities to be commenced between the two nations, though without any formal declaration of war on either side. On the 27th of June, 1778, the *Licorne* and *La Belle Poule*, two French frigates, were taken by admiral Keppel. Orders were immediately issued by the French court for making reprisals on the ships of Great Britain; and on the 27th of July, a battle was fought off Brest between the English fleet, under the command of admiral Keppel, and French fleet, under the command of the court d'Orvilliers. The English fleet consisted of 30 ships of the line, and the French 32, besides frigates: they engaged for about three hours; but the action was not decisive, no ship being taken on either side, and the french fleet at length retreated into the harbour of Brest. Of the English 133 were killed in the action, and 373 wounded; and the loss of the French is supposed to have been very great. After the engagement, there was much murmuring throughout the English fleet, because a decisive victory had not been obtained over the French; at last the blame was thrown upon Sir Hugh Palliser, vice admiral of the blue, who was charged in a news paper with misconduct, and disobedience of orders. Though no regular accusation was brought against him, he required of admiral Keppel publicly to vindicate his conduct from the unfavourable reports that were propagated against him. This the admiral declined, which gave rise to some altercation between them; and Sir Hugh Palliser afterwards thought proper to exhibit to the board of admiralty (of which he was himself a member) articles of accusation against admiral Keppel, though for many months after the action he had continued to act under him, and professed the greatest respect to him. A mode of conduct so extraordinary, was very generally and severely censured, but the lords of the admiralty ordered a court-martial to be held for the trial of admiral Keppel. When the court-martial was held, admiral Keppel was acquitted in the most honourable manner; and Sir Hugh Palliser's charge against him was declared by the court to be "malicious and ill-founded." But Sir Hugh Palliser being afterwards tried by another court martial, partly composed from some of the captains of his own division, he likewise was acquitted; his disobedience to the admiral's orders was considered as being occasioned by the disabled state of his ship; a slight censure only was passed on him for not making the state of his ship known to the admiral; and his conduct in other respects was declared to have been meritorious.

In the East Indies also an engagement happened between some English ships of war under the command of Sir Edward Vernon, and some French ships under the command of Mons. de Tronjolly, on the 10th of August, in which the former obliged the latter to retire; and on the 17th of October following, Pondicherry surrendered to the arms of Great Britain. In the course of the same year, the island of St. Lucia, in the West Indies, was taken from the French; but the latter made themselves masters of Dominica, and the following year they obtained possession of the islands of St. Vincent's and Grenada. In September, 1779, the count D'Estaing arrived at the mouth of the river Savannah, with a large fleet, and a considerable body of French troops, to the assistance of the Americans. After dallying a month, the French and Americans made an united attack upon the British troops at Savannah, under the command of general Prevost. But the latter defended themselves so well, that the French and Americans were driven off with great

loss, and D'Estaing soon after totally abandoned the coast of America. And at the close of the year 1779, several French ships of war, and merchant-ships, were taken in the West-Indies, by a fleet under the command of Sir Hyde Parker.

By the Intrigues of the French court, Spain was at length brought to engage with France in the war against England; one of the first enterprises in which the Spaniards engaged was the siege of Gibraltar, which was defended by the garrison with great vigour. The naval force of Spain was also added to that of France, now become extremely formidable, and their combined fleets seemed for a time to ride almost triumphant in the British channel. So great were their armaments, that the nation was, under no inconsiderable apprehensions of an invasion; but they did not venture to make an experiment of that kind; and after parading for some time in the channel, thought proper to retire to their own ports without effecting any thing. On the 8th of January 1780, Sir George Brydges Rodney, who had a large fleet under his command, captured seven Spanish ships and vessels of war belonging to the royal company of Carraccas, with a number of trading vessels under their convoy; and in a few days after, the same admiral engaged near Cape St. Vincent, a Spanish fleet, consisting of eleven ships of the line, and two frigates, under Don Juan de Langara. Four of the largest Spanish ships were taken, and carried into Gibraltar, and two others driven on shore, one of which was afterwards recovered by the English. A Spanish 70 gun-ship, with 600 men was also blown up in the action. In April and May three actions likewise happened in the West Indies, between the English fleet under admiral Rodney, who was now arrived in that part of the world, (having previously thrown supplies into Gibraltar), and the French fleet under the count de Guichen; but none of these actions were decisive, nor was any ship taken on either side. In July following, admiral Geary took twelve valuable French merchant ships from Port au Prince; but on the 8th of August, the combined fleets of France and Spain took five English East-Indiamen, and fifty English merchant ships, bound for the West Indies, which was one of the most complete naval captures ever made, and a very severe stroke to the commerce of Great Britain. Such a prize never before entered the harbour of Cadiz.

On the 4th of May, 1780, Sir Henry Clinton made himself master of Charles-town, South Carolina; and on the 16th of August, earl Cornwallis obtained a very signal victory over general Gates in that province, in which about a thousand American prisoners were taken.

Soon after, major general Arnold deserted the service of the congress, made his escape to New York, and was made a brigadier-general in the royal service. Major André, who negotiated this desertion, and was concerting measures with him for betraying the important post of West Point into the hands of the English, was taken in the American lines, in his return to New York, and being considered as a spy, suffered death accordingly, much regretted for his amiable qualities.

The great expences of the American war, and the burthens which were thereby laid upon the people naturally occasioned much discontent in the nation, and seemed to convince persons of all ranks of the necessity of public economy. Meetings were therefore held in various counties of the kingdom at the close of the year 1779, and the beginning of the year 1780, at which great numbers of freeholders were present, who agreed to present petitions to the house of commons, stating the evils which the profuse expenture of the public money occasioned, &c.

Some trivial attempts were made in parliament to remedy the grievances stated in the petitions, but nothing important was effected; the ministry soon found means to maintain their influence in parliament; a diversity of sentiments occasioned some dissension among the popular leaders; the spirit which had appeared among the people by degrees subsided; and various causes at length conspired to bring the great part of the nation to a patient acquiescence in the measures of administration.

The middle of the year 1780 was distinguished by one of the most disgraceful exhibitions of religious bigotry that had ever appeared in this country; especially if it be considered as happening in an age, in which the principles of toleration were well understood, and very prevalent. An act of parliament had been lately passed "for relieving his majesty's subjects, professing the Romish religion, from certain penalties and disabilities imposed upon them in the 11th and 12th years of the reign of king William III." This act was generally approved by men of taste, and of liberal sentiments, by whom the laws against Papists were justly deemed too severe. The act at first seemed to give little offence to persons of any class in England, but in Scotland it excited much indignation, though it did not extend to that kingdom. Resolutions were formed to oppose any law for granting indulgences to Papists in Scotland; and a Romish chapel was burned, and the houses of several Papists demolished, in the city of Edinburgh. The contagion of bigotry at length reached England: a number of persons assembled themselves together, with a view of promoting a petition to parliament, for a repeal of the late act in favour of the Papists, and they assumed the title of the Protestant Association. It was then resolved, in order to give the more weight to their petition, that it should be attended by great numbers of petitioners in person; and a public advertisement was issued for that purpose, signed by lord George Gordon.

Fifty thousand persons are supposed to have assembled with this view, on Friday the 2d of June, in St. George's Fields; from whence they proceeded, with blue cockades in their hats, to the house of commons, where their petition was presented by their president. On the same day several members of both houses of parliament were grossly insulted and ill-treated by the populace; and a mob assembled the same evening, by which the St. Martin's chapel in Lincoln's-in Fields, and another Romish chapel in Warwick street, Golden-square, were entirely demolished. A party of the guards were then sent for, to put a stop to the farther progress of these violences, and thirteen of the rioters were taken, five of whom were afterwards committed to Newgate, deserted by the military. On the Sunday following, another mob assembled, and destroyed a Popish chapel in Rope-maker's Alley, Moorfields. On Monday they demolished a school house, and three dwelling-houses, in the same place, belonging to the Romish priests, with a valuable library of books, and a man-house in Virginia-street, Ratcliff-highway. They also destroyed all the household furniture of Sir George Saville, one of the most respectable men in the Kingdom, because he had brought in the bill in favour of the Papists. On Tuesday great numbers again assembled about the parliament house, and behaved so tumultuously, that both houses thought proper to adjourn. In the evening, a most daring and violent attempt was made to force open the gates of Newgate, in order to release the rioters who were confined there; and the keeper having refused to deliver them, his house was set on fire, the prison was soon in flames, and great part of it consumed, though a new stone edifice of uncommon strength; and more than three hundred prisoners made their escape, many of whom joined

the mob. Now, a committee of the Protestant Association circulated hand bills, requesting all true protestants to shew their attachment to their best interests, by a legal and peaceable deportment: but none of them slept forth, notwithstanding their boasted numbers, to extinguish the flames they had occasioned; violence, tumult, and devastation still continued. The Protestant Association, as they thought proper to style themselves, had been chiefly actuated by ignorance and bigotry; and their new confederates were animated by the love of mischief, and the hope of plunder. Two other prisons, the houses of lord Mansfield, and Sir John Fielding, and several other private houses, were destroyed the same evening. The following day, the King's Bench prison, the New Bridewell, in St. George's Fields, some popish chapels several private houses of the Papists, and other buildings, were destroyed by the rioters; some were pulled down, and others set on fire; and every part of the metropolis exhibited violence and disorder, tumults and conflagrations.

During these extraordinary scenes, there was a shameful inactivity in the lord mayor of London, and in most of the other magistrates of the metropolis, and its neighbourhood; and even the ministry appeared to be panic-struck, and to be only attentive to the preservation of their own houses, and of the royal palace. The magistrates, at the beginning of the riots, declined giving any orders to the military to fire upon the insurgents: but at length, as all property began to be insecure, men of all classes began to see the necessity of vigorous opposition to the rioters; large bodies of troops were brought to the metropolis from many miles round it; and an order was issued, by the authority of the king in council, "for the military to act without waiting for directions from the civil magistrates, and to use force for dispersing the illegal and tumultuous assemblies of the people." The troops exerted themselves with diligence in the suppression of these alarming tumults, great numbers of the rioters were killed, many were apprehended, who were afterwards tried and executed for felony*, and the metropolis was at length restored to order and tranquillity. The manner in which these tumults were suppressed by the operations of the military, without any authority from the civil magistrate, however necessary from the peculiar circumstances of the case, was thought to be a very dangerous precedent: and that an act of indemnity ought to have been passed, not only with regard to inferior persons who had acted in the suppression of these riots, but also with respect to the ministry themselves, for the part they had taken in this transaction, in order to prevent its being established as a precedent.

While the internal peace of the kingdom was disturbed by these commotions, there appeared reason to apprehend an increase of its foreign enemies, by a rupture with Holland; loud remonstrances were made by the British minister to the States-general, complaining that a clandestine commerce was carried on between their subjects and the Americans; that this was particularly the case at St. Eustatia; and that the enemies of Great Britain were supplied with naval and military stores by the Dutch.

The war with Holland was commenced with great vigour: and that republic soon suffered a very severe stroke, in the loss of the island of St. Eustatia, which was taken by the English on the 2d of February, 1781.

On the 5th of August the same year, a very bloody engagement was fought between an English squadron of ships of war, under the command of admiral Hyde Parker, and a Dutch squadron under the command of admiral

Zoutman, off the Dogger Bank. On both sides they fought with great gallantry, and by both of the contending squadrons the victory was claimed.

The war continued to be prosecuted with various success; the French made themselves masters of the island of Tobago; and the Spaniards of Pensacola; and the whole province of West Florida, with little effectual resistance. Earl Cornwallis obtained a victory over the Americans under general Green, at Guildford, in North Carolina, March 15, 1781, but it was a hard fought battle, and the loss on both sides considerable. Indeed the victory was productive of all the consequences of a defeat; for three days after, lord Cornwallis was obliged to leave part of his sick and wounded behind him to the care of his enemy, and to make a circuitous retreat of 200 miles to Wilmington before they could find shelter, and so left South Carolina entirely exposed to the American general. The generals Philips and Arnold committed some ravages in Virginia, destroyed much shipping, and about 8000 hogheads of tobacco; but none of these events at that time promised any speedy termination of the war, they rather contributed to draw the attention of the Americans and the French at Rhode island to that quarter, where the next year the decisive blow was struck which firmly established American independence. Lord Cornwallis's situation at Wilmington was very disagreeable, and his force reduced so low that he could not think of marching to Charles-Town by land; he turned his thoughts then to a co-operation in Virginia with Philips and Arnold, and began his march, April 25, 1781. In this central province, all the scattered operations of active hostility began at length to converge into a point, and the grand catastrophe of the American war opened to the world. By different reinforcements, lord Cornwallis's force amounted to above 7000 excellent troops, but such was their plundering and devastations on their route, and the order of the Americans, his situation became at length very critical. Sir Henry Clinton, the commander in chief, was prevented from sending those succours to him which he otherwise would have done, by his fears for New York, against which he apprehended Washington meditated a formidable attack. This American general played a game of great address; as many of their posts and dispatches had been intercepted, and the letters published with great parade and triumph in the New York papers, to expose the poverty, weakness and disunion of the Americans; Washington soon turned the tables on the British commanders, and derived public advantage from this source of vexation and prejudice. He wrote letters to the Southern officers and others, informing them of his total inability to relieve Virginia, unless by a direct attack with the French troops on New York. He asserted it was absolutely determined on, and would soon be executed. These letters were intercepted (as was intended they should) with others of the like kind from the French, and the project was successful, Sir Henry Clinton was thus amused and deceived, and kept from forming any suspicion of the real designs of the enemy.

By a variety of judicious military manœuvres, Washington kept New York, and its dependencies in a continual state of alarm for about six weeks, and then suddenly marched across the Jerseys and through Pennsylvania to the head of the Elk, at the bottom of the Chesapeak, from which the light troops were conveyed by shipping down the bay, and the bulk of the army, after reaching Maryland by forced marches, were also there embarked, and soon joined the other body under the marquis de la Fayette, Sir Henry Clinton receiving information that the count de Grasse was expected every moment in the Chesapeak, with a large French fleet to co-operate

rate with Washington, now seriously attempted to reinforce lord Cornwallis, but without success; for on the 5th of September, after a partial action of a few hours between the British fleet under admiral Graves, and that of the French under de Grasse, Graves returned to New York to rest, and left the French masters of the navigation of the Chesapeake. Presently the most effectual measures were adopted by general Washington for surrounding lord Cornwallis's army, and on the last of September it was closely invested in York Town, and at Gloucester on the opposite side of the river, with a considerable body of troops on one side, and a large naval force on the other. The trenches were opened in the night between the 5th and 7th of October, with a large train of artillery. The works which had been raised by the British, sunk under the weight of the enemies' batteries; the troops were much diminished by the sword and sickness, and worn down by constant watching and fatigue, and all hope of relief failing, the 19th of October lord Cornwallis surrendered himself and his whole army by capitulation to general Washington, as prisoners of war*. Fifteen hundred seamen underwent the fate of the garrison, but these, with the Guadalupe frigate of 24 guns and a number of transports, were assigned to M. de Grasse, as a return for the French naval power and assistance.

Such was the issue of the Virginian war. The capture of this army, under lord Cornwallis, was too heavy a blow to be soon or easily recovered; it threw a gloom over the whole court and cabinet at home, and put a total period to the hopes of those who had flattered themselves with the subjugation of the colonies by arms. The surrender of this second British army may be considered as the closing scene of the continental war in America; for the immense expence of carrying it on so distant from the seat of preparations and power; the great accumulation of public debt it had brought upon the nation; the plentiful effusion of human blood it had occasioned; the diminution of trade, and the vast increase of taxes—these were evils of such a magnitude, arising from this ever to be lamented contest, as could scarcely be overlooked even by the most insensible and stupid. Accordingly, on the first of March, 1782, after repeated struggles in the house of commons, the house addressed the king, requesting him to put a stop to any farther prosecution of so offensive a war against the American colonies. This was a most important event; it rendered a change of measures, and of councils absolutely necessary, and diffused universal joy throughout the kingdom. Those country gentlemen who had generally voted with the ministry, saw the dangers to which the nation was exposed in an expensive war with France, Spain, and Holland, without a single ally and feeling the pressure of the public burdens, they at length deserted the standard of administration, and a complete revolution in the cabinet was effected, March 27th, 1782, under the auspices of the marquis of Rockingham, who was appointed first lord of the treasury.

The first business of the new ministry, was the taking measures for effectuating a general peace; Mr. Grenville was invested with full powers to treat at Paris with all the parties at war, and was also directed to propose the independency of the Thirteen United Provinces of America in the first instance, instead of making it a condition of a general treaty. The commanders in chief in America were also directed to acquaint the congress with the pacific views of the British court, and with the offer to acknowledge the independency of the United States.

Peace every day became more desirable to the nation. A series of losses agitated the minds of the people. January 14th 1782, the French took Nevis.

* The American return made the number of prisoners 7,447, land and marine.

1755. The

On the 5th of February, the island of Minorca surrendered to the Spaniards; and on the 13th of the same month, the island of St. Christopher was given up to the French. The valuable island of Jamaica would soon probably have shared the same fate, had not the British fleet, under admiral Rodney, fallen in with that of the French under the Count de Grasse, in their way to join the Spanish fleet at St. Domingo. The van of the French was too far advanced to support the centre, and a signal victory was obtained over them. The French admiral, in the Ville de Paris of 110 guns (a present from the city of Paris to the French king), was taken, with two seventy-fours, and one of 64 guns; a 74 gun ship blew up by accident soon after she was in our possession, and another 74 sunk during the engagement. A few days after, two more of the same fleet, of 64 guns each, were captured. By this victory of the 12th of April, the design against Jamaica was frustrated, and admiral Rodney's reputation and interest were greatly promoted.

May 8th, the Bahama islands surrendered to the Spaniards: but the credit of the British arms was well sustained at Gibraltar, under general Elliot, the governor, and their formidable attack on the 13th of September with floating batteries of 212 brass cannon, &c. in ships from 1400 to 600 tons burthen, ended in disappointment, and the destruction of all the ships and most of the assailants in them. The garrison was relieved by lord Howe, in the month of October, who offered battle to the combined force of France and Spain, though twelve sail of the line inferior. The military operations after this, were few, and of little consequence. Negapatnam, a settlement in the East Indies, and Trincomale on the island of Ceylon, were taken from the Dutch by the British forces; but the French soon receiving considerable succours from Europe, took Cuddalore, retook Trincomale forced the British fleet into several actions, but none decisive, and enabled Hyder Ally to withstand, with various success, all the efforts of Sir Eyre Coote, and his troops.

The death of the marquis of Rockingham, on the 1st of July, occasioned a violent commotion in the cabinet, and lessened the hopes which had been formed of important national benefits from the new administration. Lord Shelburne succeeded the marquis as first lord of the treasury, and it is said, without the knowledge of his colleagues.

By the treaty of peace between Great Britain and France; * Great Britain ceded to France, of her possessions before the war, the island of Tobago, in the West Indies, and the river of Senegal in Africa, with its dependencies and the forts on the river; and gave up a few districts in the East Indies, as dependencies on Pondicherry, and Karical; it agreed also to restore the islands St. Lucia, St. Pierre, and Miquelon, and the island of Goree; with Pondicherry, Karical; Mahe, Chandernagore, and the comptoire of Surat, in the East Indies, which had been conquered from the French during the war. To prevent disputes about boundaries in the Newfoundland fishery, it was agreed, that the French line for fishing should begin from St. John on the eastern side, and going round by the North, should have for its boundary Cape Ray on the Western side; and Great Britain renounced every claim by former treaties with respect to the demolition of Dunkirk. France on the other hand was to restore to Great Britain the islands of Granada, and the Grenadines, St. Christopher's, St. Vincent, Dominica, Nevis, and Montserrat; and guaranteed Fort James, and the river Gambia, agreeing that the gum trade should remain in the same condition as before the war, 1755. The allies of each state in the East Indies were to be invited to accede

* Preliminary articles, settled January 20, 1763.

to the pacification, but if they were averse to peace, no assistance on either side was to be given to them.

By the treaty with Spain, Great Britain gave up to that power East Florida, and also ceded West Florida and Minorca, which Spain had taken during the war. To prevent all causes of complaint and misunderstanding for the future, it was agreed that British subjects should have the right of cutting and carrying away logwood in the district lying between the rivers Wallis or Bellize, and Rio Hondo, taking the course of the said rivers for unalterable boundaries. Spain agreed to restore the islands of Providence and the Bahamas, to Great Britain, but they had been retaken before the peace was signed.

In the treaty with the United States of America, the king of Great Britain acknowledges New Hampshire, Massachusetts Bay, Rhode Island and Providence plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia, to be free, sovereign, and independent states, and for himself, his heirs and successors, relinquished all claims to the government, propriety, and territorial rights of the same, and every part thereof. To prevent all disputes in future on the subject of boundaries between these states and the remaining provinces to Great Britain, lines were very minutely drawn, which will be noticed in the proper place, and some favourable clauses were obtained for the loyalists. The navigation of the Mississippi to remain open to both parties, as also the Newfoundland fisheries.

In the treaty with the Dutch, great difficulties arose; but at length it was stipulated that Great Britain should restore Trincomale in the island of Ceylon, but the French had already taken it; and that the Dutch should yield to us the town of Negapatnam, with its dependencies in the East Indies, with liberty to treat for its restitution on the point of an equivalent.

Thus a period was put to a most calamitous war, in which Great Britain lost the best part of her American colonies, and many thousand valuable lives, and expended or squandered nearly 150 millions of money. The terms of the peace were, to many, a subject of great regret; but had the war continued, it would have been necessary to have borrowed annually 17 millions and a half, by which a million *per annum* would have been added to the taxes, and 25 millions at least to the capital of the public debt, according to the usual modes of funding. The address of thanks for the peace was carried in the house of lords, by a majority of 72 to 59, but lost in the house of commons by a majority of 224 to 208.

The majority of the commons, thus enlisting under the banners of the famous coalition leaders, Mr. Fox and lord North plainly indicated a ministerial revolution to be near at hand, unless the cabinet would call a new parliament.

As they did not, the peace makers were obliged to withdraw from power. The two gentlemen just mentioned were made secretaries of state, and the duke of Portland first lord of the treasury, on April the 2d, 1783. All plans of reformation in public offices, and for preserving the nation, which lord Shelburne proposed, seemed now to be dropt. Every thing went on just as the coalition administration pleased, till Mr. Fox brought into parliament his famous bill for new regulating the government of the East India company, and their commercial affairs and territories; a plan of which bill, its progress and fate, we have already given in our account of that trading company. This bill being rejected in the house of lords, on December 17, by a majority of 19, occasioned a great ferment in the cabinet, and in both houses of parliament.

A royal message was sent between 12 and 1 of the morning of the 10th of December, to desire the two secretaries to send the seals of their offices immediately; and Mr. Pitt succeeded the duke of Portland as first lord of the treasury, bringing in his friends into the respective departments, which formed the tenth administration since his majesty's accession.

Some leading independent gentlemen (as they styled themselves) interposed to unite the contending parties, which had filled parliament and the country with distractions, and tended to the ruin of all; but their endeavours to form what they called a firm, efficient, extended, and united administration, proved unsuccessful.

Persons of the most distinguished and independent character in the house of commons, and in the kingdom, now wished that a dissolution had taken place weeks before, even at the first forming of the coalition.

At last, after strong and repeated contests between the two parties, on the 25th of March, 1784, a proclamation was issued for dissolving the present parliament, and calling a new one, agreeable to the desires and addresses of a great part of the kingdom. Just at that critical period, the great seal was stolen from the house of the lord chancellor, which occasioned many suspicions, as if done by more than ordinary felons; but nothing farther appeared, and a new seal was presently made. On the 19th of May the new parliament assembled, and the commons chose Mr. Cornwall, the speaker of the late house, for their present speaker. The next day, his majesty addressed them from the throne. A very feeble opposition was made to the address of thanks in the house of lords, and it soon appeared that the appeal to the people had turned out greatly in Mr. Pitt's favour; for on May 24th, on a division of the house for an address to the king's speech, the numbers for it without any alteration or amendment, were 282 against 114.

Mr. Pitt brought in his famous East India bill the 5th of July, the leading particulars of which we have given in our account of that company, with a few observations upon it.

The business of parliamentary reform having been taken up by Mr. Pitt, he accordingly introduced a specific plan for that purpose on the 18th of April, 1785. The plan was to give one hundred members to the popular interest of the kingdom; and to extend the right of election to above one hundred thousand persons, who, by the existing provisions of law, were excluded from it. This accession to the popular interest was to be principally obtained by the suppression of decayed boroughs, and the transfer of their representatives to the counties; so that the number of the house of commons would remain the same.—After a debate of considerable length, it was rejected by a majority of 74; the noes being 248, and the ayes 174.

Amongst the various measures agitated by parliament in 1786, the plan for establishing a sinking fund, and employing a million annually for reducing the national debt, engaged their most immediate attention. The heads of this plan as stated by Mr. Pitt, in his speech on this subject are—First, That the yearly income of the state exceeded the permanent level of its expenditure, by a sum of 900,000. Next that this sum would be increased to a million by means in no wise burthensome to the people.—Thirdly, That altho' the present establishment exceeded in certain instances the same establishments as stated in the report of the select committee, yet there were ample resources, and contingent and outstanding receipts, sufficient to overbalance such excesses; without having recourse to any fresh taxes.—And lastly, that the ways and means for the present year would be sufficient

to furnish the supplies, together with the sum of 250,000*l.* to be applied quarterly towards the establishment of the new fund; and, after all, would leave a considerable balance to be carried to the next year. Mr. Pitt concluded by moving, "That the sum of one million be annually granted to certain commissioners, to be by them applied to the purchase of stocks, towards discharging the public debt of this country; which money shall arise out of the surplusses, excesses, and overplus monies composing the fund, commonly called the sinking fund."

In the month of August 1786, an attempt was made by one Margaret Nicholson on the life of his majesty, as he was alighting from his carriage at the gate of St. James's palace. This woman had been observed to wait the king's arrival for some time, and previous to the appearance of the carriage, had taken her station between two women that were unknown to her. On the sight of the carriage, she begged with some earnestness that she might not be hindered from delivering a memorial to his majesty. As the king was alighting, she pushed forward, and presented a paper, which his majesty received with great condescension. At that instant she struck a concealed knife at the king's breast, which his majesty happily avoided; by bowing as he received the paper. As she was making a second thrust, one of the yeoman caught her arm; and at the same instant, one of the king's footmen wrenched the knife out of her hand. His majesty, with amazing temper and fortitude exclaimed, "I have received no injury! Do not hurt the woman, the poor creature appears to be insane."—She was immediately taken into custody; and upon examination was found to be insane. In consequence thereof, she was afterwards sent to Bethlehem hospital, to be taken proper care of.

A plan was this year set on foot for establishing a colony in New Holland, for the convenience of transporting convicts thither; and with a future view of improving the soil, and cultivating the manners of the natives.

Both houses of parliament having met on the 23d of January 1787, his majesty then delivered a speech from the throne, in which he informed them, that he had concluded a treaty of navigation and commerce with his most Christian Majesty.

In the house of commons, Mr. Sheridan brought forward an important charge against Warren Hastings, Esq; late governor general of Bengal, for high crimes and misdemeanors in the East Indies.

He was accused of various acts of tyranny, extortion, and cruelty, during his government of India. The house of commons resolved to impeach him, and prosecute his trial before the house of peers. The impeachment was conducted by a number of its most distinguished members, and enforced with all their eloquence. But he was believed to have performed those acts, for which he was impeached, upon the most urgent necessity, and for the salvation of the British empire in India. All the influence of the East India Company, and its most distinguished servants, was employed to save him; ministry wavered between his friends and his enemies, till the energy of the latter languished by the lengthening out of his trial. He was acquitted, and the East India Company repayed to him the expences of his trial, and settled upon him an annuity of 5000*l.* a year.

The consolidation of the customs and excise was the most important circumstance deserving of attention in the year 1787. This was a measure of incredible labour and detail, as well as of infinite advantage to commerce, by facilitating and simplifying the intricacies attendant on mercantile trans-

factions, and the payment of duties, a regulation which was duly and permanently effected.

The ministry soon after the recess of parliament were engaged in attending to disputes which subsisted in the Republic of the United Provinces of Holland. The malcontents there were become highly refractory and turbulent, and had treated the royal consort of his serene highness the Stadtholder, sister to the king of Prussia with the greatest indignity. Every method was taken on the part of his Britannic Majesty, to effect the restoration of tranquillity, and the maintenance of lawful government among them. To this end a memorial was presented by Sir James Harris to the States General, representing the extreme inquietude with which the king his master beheld the continuance of their dissentions; expressing his ardent desire of seeing peace re-established; and assuring them, that if it should be found necessary to recur to a foreign mediation, and to invite his majesty, every effort should be exerted on his part to bring the negotiations to a happy, solid, and permanent issue. His Majesty also thought it necessary to explain his intention of counteracting all forcible interference on the part of France in the internal affairs of the Republic.

As the king of Prussia had taken measures to enforce his demand of satisfaction for the insult offered to the Princess of Orange, and the party which then usurped the government of Holland had applied to the French king, and received assurance of assistance, which was notified to his Britannic majesty, orders were given for augmenting the British forces both by sea and land, to cooperate with the king of Prussia, which orders were executed with the greatest alacrity.

In the mean time, the rapid success of the Prussian troops under the conduct of the duke of Brunswick at once obtained the reparation demanded by their sovereign, and enabled the provinces to deliver themselves from the oppression under which they laboured, as well as to re-establish their lawful government; inasmuch that all subjects of contest being thus removed, an explanation took place between the courts of London and Versailles, and declarations were exchanged by their respective ministers, by which it was mutually agreed to disarm, and to place their naval establishment on the same footing as in the beginning of this year. Thus by the united efforts of the kings of England and Prussia, the king of France was prevented from openly assisting the malcontents in Holland, and the Stadholder established in the government of the United Provinces.

In the beginning of this year 1788, died at Rome prince Charles Lewis Caffimir Stuart, who headed the rebellion in 1745. Since the death of his father in 1765, he had assumed to himself the title of King of England; but was commonly known on the continent by the name of Chevalier de St. George, and in England by that of the young Pretender. He was just 67 years and two months old on the day of his death. This person was grandson to James II. whose son was recognized by several courts of Europe as king of England, immediately after the death of his father. As such he received kingly honours, had his palace and his guards, and enjoyed the privilege allowed by the Pope to catholic kings, of bestowing a certain number of cardinal hats. But his son prince Charles, who lately died, did not enjoy these honours. He was indeed called prince of Wales during the life of his father; but after that event, he no longer bore that title; nor would the catholic courts style him king.

A provisional treaty of defensive alliance was signed on the 18th of June

between the ministers plenipotentiary of their majesties the kings of Great Britain and Prussia; and afterwards with the States General of Holland.

The centenary of the revolution in 1688 was this year observed, on the 5th of November, by many societies in the metropolis, and other parts of the kingdom, not only with festivity, but devotion and thanksgiving.

His majesty was in the month of November afflicted by a severe indisposition which prevented him from meeting his parliament. Several physicians were examined as to the state of his majesty's health. In consequence of this, a grand question was started in the house of commons, between the right honourable William Pitt and Charles James Fox, concerning the right of supplying the deficiency of the royal authority during the incapacity of his majesty. In 1789, after very considerable debates the following resolutions were at length agreed to; viz. 1. "That it is the opinion of this committee, that for the purpose of providing for the exercise of the king's royal authority during the continuance of his majesty's illness, in such manner, and to such extent, as the present circumstances of the urgent concerns of the nation may require: it is expedient that his royal highness the prince of Wales, being resident within the realm, shall be empowered to exercise and administer the royal authority according to the laws and constitution of Great Britain, in the name, and on the behalf of his majesty, under the style and title of REGENT of the kingdom; and to use, execute and perform, in the name, and on the behalf of his majesty, all authorities, prerogatives, acts of government, and administration of the same, which belong to the king of this realm to use, execute, and perform, according to the law thereof, subject to such limitations and exceptions as shall be provided.— 2. That the prince regent should not confer peerages but on persons of the royal issue, and those of full age.— 3. That he should not grant offices, or pensions, nor salaries for life, or in reversion.— 4. That the real and personal property of his majesty should be secured, and not be considered as appertaining to, or under the controul of the prince regent.— 5. That it is the opinion of this committee, that the care and custody of the king's person should be committed to the queen's most excellent majesty; that her majesty shall have power to remove and appoint, from time to time, all persons belonging to the different departments of his majesty's household during the continuance of his majesty's illness, and no longer; and that for the better enabling her majesty to perform this duty, it is expedient that a council should be appointed to advise with her majesty on all matters relative to the said trust, who shall be empowered to examine upon oath, at such times as they shall think proper, the physicians who have attended, or may in future attend his majesty touching the state of his majesty's health."

All these resolutions were agreed to after much altercation; and before the lords could communicate their concurrence to the commons, a protest by upwards of fifty peers was entered on their journals. The resolutions were afterwards agreed to, and a committee appointed to communicate them to her majesty, and his royal highness the prince of Wales. The prince replied to the committee in terms that did honour to his humanity, liberality, and patriotism; and her majesty expressed her satisfaction and pleasure at the measures they had adopted in the present situation of affairs.

The consideration of the regency bill was resumed from time to time in both houses of parliament, till the 10th of March, when the lords commissioners sent a message to the commons, desiring their attendance in the house of peers: and announced to them, by his majesty's command, his happy recovery

recovery from his late indisposition, and consequent capacity of now attending to the public affairs of his kingdom, together with his warmest acknowledgements for their late proofs of their attachment to his person and government. On this occasion a general joy was manifested by all ranks of people, and illuminations and other marks of public rejoicings were made over all the kingdom. By his majesty's proclamation, the 23d of April was observed as a day of public thanksgiving to Almighty God for the removal of his late illness. The king, attended by the whole royal family, went to St. Paul's church in state, amidst the joyful acclamations of the populace, who demonstrated their loyalty and affection by every possible token of respect and applause; and particularly on the following evening, by the most universal and splendid illuminations ever known.

In the month of May 1790, a message was sent from his majesty to both houses of parliament, relative to two vessels taken by the Spaniards in Nootka Sound, on the south west coast of America. In consequence of which, both houses unanimously agreed to assist his majesty in obtaining full satisfaction for the insult done to our trade. The greatest preparations, therefore, were made both by land and sea. Fifty ships of the line and a proportionable number of frigates were put in commission, and the greatest exertions made in the different dock-yards in repairing and equipping several more. The Spaniards, on the other hand, appeared to be equally diligent. They had a large fleet at sea, and used their utmost endeavours to put their marine on a respectable footing. And the nation had the melancholy prospect of being involved in a Spanish war. In this state of things Mr. Herbert was sent to Madrid with plenipotentiary powers to adjust the dispute. The treaty was first protracted to the latter end of July, and then to the 28th of October, when all differences were finally settled, and peace thus happily re-established. It was agreed, that the buildings and vessels should be restored, that the right of navigation and fishery should be equally conceded to both nations; that illicit commerce with the Spanish settlements should be prohibited, and that the British fishing vessels or others should be restricted to ten leagues distance from the Spanish coast; that those parts of the North West parts of America, which are to the north of those now occupied by Spain, should be left free; and those to the south of the present Spanish settlements should be declared the exclusive property of that state.

But though Great Britain was thus happily rescued from the horrors of war in this quarter of the globe, accident and ambition involved our Indian possessions in blood.

Of all the native princes of India, Tippoo was the most formidable to the British government, and the most hostile to its authority. The dispute which finally involved the English arose betwixt the Dutch and Tippoo. The Dutch were possessed of two forts situated between Mysore and Cochin, to these forts Tippoo laid claim, in right of his father who had conquered them. The Dutch, unable to defend themselves entered into a negotiation with the Rajah of Travancore for the purchase of them. That politic people easily saw that by placing them in the hands of the Rajah of Travancore who was the ally of Great Britain, they erected a powerful barrier against the ambitious encroachments of their neighbour, no less than the whole power of Britain. The bargain was concluded with the Rajah in July 1789, though it was not till the 4th of August that the Rajah informed the Madras government that he was on the point of making the purchase.

It was not probable that Tippoo would remain an indifferent spectator of these transactions. He insisted on the claims which he retained over these
forts

forts, in consequence of their being conquered by his father, and in consequence of the subsequent compromise. He asserted, that in virtue of the feudal laws no transfer of them could be made without his consent as sovereign of Mysore; and alledging as a further cause of complaint against the Rajah that he had given protection to a number of his rebel subjects, he assembled a considerable force and on the 29th of December made a direct attack on the lines of Travancore. On a remonstrance however, from the British government, he desisted and even apologized for his conduct. From the 29th of March to the first of December Tippoo remained perfectly quiet, still asserting his claim to the sovereignty of these forts; but, it is confidently affirmed offered to submit the dispute to any impartial arbitration.

On the first of March 1790 the Rajah's troops made an attack upon Tippoo, who had continued quiet within his lines from the 29th of December. An engagement took place, and war being thus commenced, the British government conceived themselves bound to take an active part. Such was the state of affairs previous to the meeting of parliament, and such were the facts which induced the ministry to take part in an Indian war.

In pursuance of his majesty's intimation of the close of the session, the parliament was dissolved on the 11th of June. On the 25th of November 1790 the new parliament was assembled, and on the following day his majesty opened the session by a speech from the throne. He began with testifying his approbation that the difference with the court of Spain had been brought to an amicable termination. He informed parliament, that since the late negotiation a foundation had been laid for a pacification between Austria and the Porte, and for putting an end to the dissensions in the Netherlands. He remarked that a separate peace had taken place between Russia and Sweden; but as the war still continued between Russia and the Porte, he intimated an intention of employing the weight and influence of Great Britain in restoring the general tranquillity. In the conclusion of his speech, his majesty remarked the hostilities which had commenced in India; and called the attention of both houses to the state of the province of Quebec. The address after a few words from Mr. Pitt and Mr. Fox was voted without a division.

On the third of December the chancellor of the exchequer presented to the house of commons a copy of the declaration and counter-declaration as exchanged at Madrid on the 25th of July 1790, and a copy of the convention with the expences of the armament. But these not appearing satisfactory to the members in opposition, Mr. Grey on the 13th moved for the production of several other papers relative to the negotiation, and particularly the requisitions made by his majesty's ministers to the court of Spain. The motion was supported by Mr. Pelham and Mr. Fox; it was opposed by Mr. Wilberforce, and Mr. Pitt, and negatived by a majority of 124. Immediately connected with the armament are the ways and means of defraying it. This business was opened by the chancellor of the exchequer who stated the whole expences of the armament including stores at £.3,133,000. That this debt might not be left a permanent burden, Mr. Pitt produced a plan of ways and means which would in a short period, extinguish the whole of the debt. The first resource for this purpose was the balance of issues of public money, which had accumulated from unpaid dividends in the hands of the bank of England. By the yearly accounts of the bank it appeared that this balance had been increasing from the year 1727, and on the 5th of July 1789 amounted to £.547,000. On the 12th of October there was a floating balance of £.660,000. Mr. Pitt intended to avail himself of this dead balance to the amount

amount of £.500,000, which he should take for the public use, and £.160,000 would then be left for the discharge the whole of arrears. In order to discharge the whole of the remainder in four years, Mr. Pitt proposed an additional tax of 2s. 8d. per cent. on Sugar; one fifth additional tax on Spirits; a tax of 3d. per bushel on malt to continue for two years only; ten per cent. on all assessed taxes, the commutation and land tax excepted; and lastly a double tax on game keepers, and one third additional on game licences. To these he proposed to add one permanent tax, which consisted in a further regulation of the tax already existing upon bills of exchange. After much contest, however, the minister thought proper to relinquish that part of his plan, which related to the appropriation of the £.500,000, instead of which he accepted of a loan of that sum without interest, as long as a floating balance should remain in the hands of their cashier. The other arrangements were carried into effect.

A subject of considerable constitutional importance came under the consideration of parliament in the beginning of this session; the question was whether prosecutions upon impeachments of the commons before the peers of great Britain, do or do not abate by the dissolution of parliament; on the 17th of December Mr. Burke moved for a committee to consider of the state of the impeachment of Warren Hastings Esq. This motion being carried, Mr. Burke opened the main question and moved that it appeared to the house that a prosecution against Warren Hastings is now pending. After Mr. Burke Mr. Erskine rose and moved that the house should search for precedents, which was carried against him by a majority of 13. Mr. Burke's original motion was then put and carried without a division.

The next important business that engaged the attention of the British legislature was the Indian War, the causes and circumstances of which have been already noticed.

On the 22d of December Mr. Cox Hippesley rose to propose a preliminary motion, the object of which was merely to desire that copies of the correspondence relative to the attack of Tippoo Sultan on the lines of Travancore should be laid before the house, Mr. Hippesley disapproved of the war in India both for its injustice and impolicy; the motion was supported by Mr. Francis who reprobated the destructive policy of increasing our territories in India: he was followed on the same side by Mr. Fox; the motion was opposed by Mr. Pitt, who represented Tippoo as a merciless tyrant. The question was carried however in favour of the production of the papers.

On the 28th of February Mr. Hippesley followed up his motion on the Indian war: but his ill state of health only permitted him to read the acts of parliament and resolutions of the house of commons which prohibit the British government of India from entering into offensive war. After the reading of these papers, Mr. Francis rose at the request of Mr. Hippesley, and in a very able speech explained the causes of the war, which he entirely attributed to the Dutch and the ambition of the Rajah of Travancore, Mr. Francis concluded with several motions, the object of which was to continue the origin and prevent the prosecution of the war.

Mr. Dundas, Mr. V ilberforce, and the solicitor-general supported the conduct of government and Mr. Francis's motions were negated. A bill for the relief of protesting catholics brought in by Mr. Mitford, passed the house of commons without opposition. The rights of juries with regard to libels had formerly been indeterminate; it had been maintained that juries had no right to judge of the matter contained in the libels; that their sole objects was to judge of the fact whether the pannel had published the alleged libel or not. To ascertain and settle the law in this point, and

in another which appeared equally defective, Mr. Fox moved for a grand committee of justice to consider of two important law questions, this motion Mr. Fox afterwards withdrew and substituted in its place a motion for leave to bring in two bills, one "to remove all doubts respecting the right and functions of juries in criminal cases," and the other to explain and amend the act of the ninth year of queen Anne, relative to quo warrantos. On the 25th of May Mr. Fox introduced his bill and with a slight opposition from the legal profession, it completed its progress through the house of commons with the loss of its preamble. In the house of lords, however, it experienced a different reception. On the 8th of June the second reading of the bill was moved for in that house, when it met with a warm opposition from the lord chancellor, who moved for the second reading of the bill on that day month. The lord chancellor's motion was carried and the bill consequently postponed to a future session.

The important question relative to the abolition of the slave trade had been agitated in a former session. Early in the session of 1791, Mr. Wilberforce gave notice of an intended motion for appointing a committee for receiving and examining evidence on that subject; and on the 4th of February he submitted a motion to that effect; which after a short debate was put and carried.

It was not however till the 18th of April that the business was in such a degree of forwardness as to enable Mr. Wilberforce to press for the abolition. On that day he opened the display of the leading arguments in favour of that measure, his reasoning convinced all those whose minds were not blinded by prejudice or the more sordid consideration of interest. The motion was supported by Mr. Francis, W. Smith, the chancellor of the exchequer, and by Mr. Fox, who assured the house that "if they did not by their vote of that night mark their abhorrence of a practice so enormous, so repugnant to all laws human and divine, it would be more scandalous and more degrading in the eyes of the world than any vote that house had ever given. It would in fact give a parliamentary sanction to rapine, robbery and murder."—The motion was opposed by Sir William Young and Lord Sheffield, and was at last negatived by a majority of seventy five.

One of the main objects recommended in his Majesty's speech, was, that the house would consider of such regulations for the government of Quebec as the present circumstances of the province seemed to require. On the 4th of March his majesty sent a message to the house importing, that it appeared to his majesty, that it would be for the benefit of the inhabitants of that province that the same should be divided into two separate provinces, to be called the Upper and Lower Canada. He further recommended to the house to consider of such provisions as might enable his majesty to make a permanent appropriation of lands within the said provinces for the maintenance of a protestant clergy within the same. In consequence of this message the chancellor of the exchequer moved for leave to bring in a bill to repeal certain provisions of the fourteenth of his majesty respecting the government of Canada, and to make such farther provisions, &c. The bill was warmly opposed by Mr. Fox, Mr. Hussey, and Lord Sheffield. During the discussion of this bill, a very warm dispute took place between the two most distinguished characters in opposition, Mr. Burke and Mr. Fox. The seeds of disunion had been already sown between these great men, but had never broke forth into any public difference till the debate on the army estimates for 1791, when a dispute took place concerning the French revolution. A more violent difference now took place on the same subject in the

debate upon the Quebec-bill, in which Mr. Burke said, he knew the price of his conduct, and their friendship was at an end. This alteration produced a schism in the politics of the opposition, which ended in a final separation.

While several of the topics we have just mentioned, remained in agitation before the British senate, the attention of that body was called to another object, not less important to the interests of the nation. On the 28th of March a message was delivered from his majesty, importing, that the endeavours which he had used, in conjunction with his allies, to effect a pacification, not having proved successful, his majesty judged it requisite, in order to add weight to his representations, to make some further augmentation to his naval force.

On the 30th Mr. Pitt, moved an address, to thank his majesty for the communication of his message, which was carried by a majority of 93. This subject was afterwards agitated at three different times in the house of commons; it was likewise brought forward in the house of peers, by a motion of Earl Fitzwilliam, which was negatived by a majority of 67.

As in the course of the preceding session a considerable difference of opinion had existed relative to the supposed state of the national finances a committee of nine were chosen to enquire into the state of the public expenditure. With a great deal of diligence and attention they produced a very accurate report sufficiently early in the session to meet the opening of the minister's budget on the 18th of May.

In stating the articles of expenditure and of the ways and means for the current year, Mr. Pitt desired to keep them entirely separate from the expences of the armament on the dispute with Spain, which had been already provided for. This being the case the sum total of the supplies amounted to 5,728,000*l.* The sum total of ways and means amounted to 5,734,471*l.*

This session of parliament was concluded on the 10th of June by a speech from the throne in which his majesty expressed his satisfaction at the circumstance, that a mode had been attempted for defraying the expences of last year without any permanent addition to the public burthens, and also at the provision which had been made for the government of Canada. He intimated his regret at not being able to acquaint them with the result of the negociation for peace between Russia and the Porte, thanked the commons for the supplies and prorogued the parliament to the 16th of August.

Soon after the rising of parliament, a series of shameful outrages and violentes, took place in the town of Birmingham, and for the space of four days spread terror and alarm through the town and adjacent country. A festive meeting previously announced to the public, in commemoration of the French revolution seems to have provoked these tumults. Without attempting to palliate much less excuse the excesses of a frantick mob, it may be observed that the purpose of the meeting was at least very idle, and when we consider the scenes of wickedness that had taken place in France, and the detestable principles, propagated by the leaders of the French Revolution, it may seem to deserve a harsher appellation.

The transactions of the parliament of 1792 were even less important than those of the sessions immediately preceding. The session was opened on the 31st of January by a speech from the throne, in which his Majesty expressed his satisfaction in announcing to parliament the marriage which had been celebrated between his son, the duke of York, with the daughter of his good brother and ally the king of Prussia. He acquainted them that a definitive treaty had been concluded between the emperor and the Ottoman Porte;

and

and also that preliminaries had been agreed upon by the latter of these powers and the empress of Russia. He regretted that he was not able to acquaint them with the issue of the Indian war, but expressed his hopes that it would soon be brought to an honourable conclusion. The friendly assurances he had received from foreign powers, and the general state of affairs in Europe, appeared to promise to his subjects the continuance of tranquillity; in consequence of this he was induced to hope that some reduction might be made in the naval and military establishments. These were the principal subjects of the speech delivered from the throne.

The address after an amendment proposed by Mr. Grey, which was rejected, passed as usual. The subject which appears to have first engaged attention was the Indian war.

After several motions by opposition for the production of papers, had been rejected; it was moved by Col. Phipps on the part of ministry that the agreement entered into with the Nizam by lord Cornwallis, in his letter of the 7th of July 1789 is consonant to the wise and politic views established by the parliament of Great Britain as the rule of conduct to be observed in the British government of India. The motion was carried without a division.

The next business of importance that occupied the attention of parliament, was the armament against Russia. On the 13th of February Mr. Grey made a motion for the production of papers, which was opposed by Mr. Pitt, on the ground that some of the papers which Mr. Grey thought were omitted never existed.

While the Russian armament was in agitation, Mr. Pitt, on the 17th of February presented a copy of the treaty between his Majesty and the king of Prussia on the marriage of his royal highness the duke of York with the princess Frederica of Prussia; the substance of which is as follows.—1st. That the king of Prussia gives to the princess his daughter 100,000 crowns.—2d. That their royal highnesses and the king of Great Britain renounce for ever all right of inheritance to the crown of Prussia.—3d. That the duke of York make a present to her royal highness for pin-money the sum of 4,000l. per annum.—4th. That the king of Great Britain pay a counter portion of 100,000 crowns, and that he engage in case of the death of his royal highness, to provide for the princess, the annual sum of 8,000l. with a suitable residence and suitable establishment.

On the 7th of March the house resolved itself into a committee to take into consideration an establishment for their royal highnesses the duke and duchess of York. The subject was opened by Mr. Pitt, who after observing that the satisfaction which the house and the public had expressed on the marriage of their royal highnesses, rendered it unnecessary to trouble them with any observation on that topic, proposed that 18,000l. a year should be allowed them from the consolidated fund; to which he proposed to add a further sum of 7000l. a year out of the Irish revenue, and that in the event of her royal highness surviving the duke, the jointure of 8,000l. a year should be payable out of the consolidated fund. Mr. Pitt concluded with a motion to that effect. After much desultory conversation the resolutions passed the house by which these kingdoms were pledged to an allowance of 37,000 pounds per annum to their royal highnesses.

The last object to which his Majesty's speech at the opening of the session directed the attention of the parliament was the state of the public revenue and expenditure; on the 17th of February, the house of commons resolved itself into a committee to take into consideration this important subject.

Adverting to the paragraph in his majesty's speech which related to the finances of the country, Mr. Pitt stated the actual produce of permanent taxes from 5th of January 1791 to 5th of January 1792 at 14,132,000*l*. The actual produce of the land and malt-tax at 2,558,000*l*. The regulation in stamp duties intended to be permanent at 40,000*l*. These three sums taken together make 16,730,000*l*. The permanent expence by the estimate of the committee was 15,969,000*l*. To this was to be added an additional charge on the sinking fund for the duke of Clarence, which amounted to 12,000*l*; for the establishment of Upper Canada, 12,000*l*. Proposed establishment of the duke of York, 18,000*l*. Total of permanent expence was 16,011,000*l*. From which by the reduction of several articles of expenditure was to be taken 200,000*l*. Deducting the amount of the above savings from the estimate of the committee, the future permanent expenditure would be 15,811,000*l*. Thus the future permanent income, estimated on an average of four years exceeded the permanent expence, including the million appropriated to the gradual reduction of the debt, by 401,000*l*. The total of the estimate for 1793 amounted to 5,654,000*l*. The total of ways and means amounted to 5,691,000*l*, exceeding the supply by 37,000*l*.

The slave trade which had been so ably discussed the former session, was again brought before the house, by Mr. Wilberforce who severely reprobated this abominable traffic. The question was adjourned to Wednesday the 25th, when Mr. Dundas moved his first resolution, viz. That the importation of negroes should cease 1st of January 1800. Lord Mornington moved that "1800" should be altered for 1793, Lord Mornington's amendment was negatived.

On the 18th of April Mr. Sheridan made his long expected motion concerning the grievances complained of by petition from the royal burghs of Scotland. The motion was negatived by a majority of 42. On the 5th of June Mr. Dundas made his statement of the revenues of India, which was controverted by Mr. Francis. A great deal of the debate consisted in desultory conversation concerning the Indian war. But as we are now in possession of sufficient information we hasten to detail the principal events of that war from its commencement to the peace concluded in March 1792.

The actual commencement of hostilities may be dated from the engagement between the troops of the Rajah of Travancore with those of Tippoo Sultan, on the 1st of May 1790. Immediately after this the grand Carnatic army assembled in the southern provinces. The general plan of the campaign was to reduce the Coimbatore and all the adjacent country, which lay below the narrow passes between the mountains, and to advance by the Guejlihetty pass to the siege of Seringapatam the capital of Mysore. While such were to be the operations of the grand army under General Meadows, the Bombay army under General Abercrombie was to undertake the reduction of the country lying to the west of the Ghauts or passes between the mountains, and afterwards to co-operate with the main army as circumstances might direct.

It would be needless to detail the history of the grand army, during this period; which is no more than a journal of its marches in pursuit of an enemy. On the 29th of January the grand army was joined by earl Cornwallis; who after repeated successes, arrived on the 5th of March, within sight of the walls of Seringapatam. The British commander did not suffer his troops to enjoy a long repose in this station. At 7 o'clock that evening he commenced an attack upon the enemy's camp and lines. After a de-

perate conflict which continued in different quarters, with some intermission the two succeeding days, the enemy were finally dislodged from their camp and lines. Thus pressed on all hands, Tippoo began anxiously to wish for peace. As a preliminary article he released lieutenants Chalmers and Nash, whom he had made prisoners at Coimbatore. On being introduced into the Sultan's presence, these officers found him in a small tent on the south glacis of the fort, very plainly dressed and with but few attendants. After acquainting them with their release, he asked Mr. Chalmers, if on going to the camp, he was likely to see lord Cornwallis; and on being answered in the affirmative, he requested that he would take charge of a letter to his lordship on the subject of peace. He expressed a wish that Mr. Chalmers would return with the answer, and concluded by presenting him with two shawls and 500 rupees.

The Sultan's desire of peace did not, however, divert him from the prosecution of the war. He had a plan in view for making himself master of the person of lord Cornwallis. For this purpose he dispatched a considerable body of cavalry who got round the left wing undiscovered, and on their asking some of the camp-followers for the commander, they, supposing they wished to communicate some intelligence to colonel Duff, pointed to his tent. The horsemen, then drawing their sabres galloped to the tent; but being perceived by the seapoy drafts and recruits, they were soon dispersed, and the attempt proved abortive. Having been joined on the 16th by general Abercrombie, lord Cornwallis made vigorous preparations for the attack of the fort on the quarter he deemed most assailable; on the night of the 19th a parallel and redoubt were completed within a small distance of the walls of the fort. The Sultan made every possible exertion to deliver himself from this difficult situation; but his vigilant enemies by their bravery and prudence baffled every exertion; every enterprise that was undertaken by the British succeeded; they were well supplied with every necessary, while the army of the Sultan was reduced to the greatest distress.

In this hopeless situation the Sultan was compelled to accept of whatever terms were offered by the British commander. The substance of the treaty was. 1st. That Tippoo was to cede one half of his dominions to the allied powers. 2d. That he was to pay three crores and thirty lacks of rupees. 3d. That all prisoners were to be restored. 4th. That two of the Sultan's three eldest sons were to become hostages for the due performance of the treaty.

On the 26th the two princes, each mounted on an elephant, richly caparisoned, proceeded from the fort to lord Cornwallis's camp. The kindness with which they were received by the British commander appeared to afford them visible satisfaction. The scene is described as highly interesting.

It was the 19th of March before the definitive treaty was finally adjusted. Tippoo however gave his reluctant consent, as it is said, to a treaty which despoiled him of half his dominions. Thus was concluded by the prudence and activity of lord Cornwallis, a war, judged rash and impolitic by several of those, who by their abilities, and the attention they had given to Indian affairs, must be allowed to be competent judges of that important question.

We now come to treat of a most eventful period in the British history; a period in which our invaluable constitution was threatened with dangers the most alarming and unprecedented. It was not difficult to foresee that the French revolution must produce consequences of the utmost importance to Europe in general; particularly to England, both on account of its vicinity and the connection which subsisted betwixt the two countries.

Mr. Burk
great man,
memorable v
"crable phi
"here, and

We have already taken notice of a difference betwixt two of the most distinguished members of opposition concerning the French revolution. This difference as it was fundamental produced afterwards a final separation in politics between Mr. Burke and Mr. Fox. Mr. Fox extolled the French constitution as a "stupendous monument of human wisdom;" Mr. Burke reprobated it as a "cruel, bloody, and ferocious democracy." As to the sentiments of ministry with respect to the French revolution, they seemed to coincide with those of Mr. Burke. In 1790 the celebrated reflections on the French revolution were published; in this work with equal truth and eloquence the illustrious author shewed its true spirit, and the direct tendency of those principles which were professed by its authors. It would be difficult to give any idea of the ferment and commotion that was occasioned by the French revolution at that time in Great Britain. The proselytes to French principles spoke and acted as if a sudden blaze of light had illuminated the darkened world; as if mankind had awakened from a dream, and just opened their eyes hitherto obscured by prejudice and superstition. Congratulatory addresses were sent from different societies to the national convention, extolling their new constitution with the highest praises; the press teemed with publications of the most seditious tendency: the wholesome principles of our ancestors were derided as the prejudices of narrow minds; and nothing was heard but the vain sounds of liberty, equality, and the rights of man. A book was at this time published by one Paine, foolishly called an answer to Mr. Burke, which contributed very much to poison the minds of the ignorant and profligate, and to spread the infection of French principles among the lower classes of the people. The book contained a great deal of extravagant ideas expressed in coarse and inelegant language well suited to ensnare those to whom it was addressed. The author had evidently meddled with a subject of which he was ignorant, and in which he shewed the narrowness of his understanding, and the wickedness of his heart. The astonishing rapidity however with which the book circulated, together with the successes of the French in the Netherlands, inspired the favourers of French anarchy with unusual boldness, and under the specious pretext of reform, they entered into designs for the subversion of the British government.

The first measure that was adopted in this difficult crisis was the Alien-bill. In consequence of the disorders which at that time prevailed in France, and the tyrannical government which was established in that country, great numbers of the French nobility and clergy had been obliged to emigrate, and to seek for safety in poverty and in exile. Together with them, another description of men had emigrated from France, some for the worst of purposes. It was to thwart the designs of these men, that a bill, establishing regulations respecting aliens arriving in this kingdom, was presented to the house of peers. It passed the house of lords without any thing remarkable; but met with more violent opposition in the house of commons. The principal opposers of the bill were, Mr. Fox, Mr. Sheridan, and Mr. Grey.

Mr. Burke eminently distinguished himself in favour of the bill; that great man, concluded a most eloquent oration, with this solemn and ever memorable warning. "I now warn my country, to beware of those execrable philosophers, whose only object is to destroy every thing that is good here, and to establish murder by precept and example."

"Hic niger est, hunc tu, Romane, caveto."

The Alien Bill, was followed by another bill brought in by the Attorney-general, to prevent the circulation of assignats, bonds, promissory notes, &c. issued under the authority of France; another bill was passed about the same period, for restraining the exportation of naval stores, ammunition, &c. and an order of council was issued, for preventing the exportation of corn to France. These were strong measures; but rendered absolutely necessary, by the threatening aspect of the times.

While these affairs were transacting in parliament, lord Loughborough was honoured with the great seal of England, and was called to succeed lord Thurlow on the woolfack.

The French having now filled up the measure of their crimes, by imbruing their hands in the blood of their sovereign, having by repeated decrees held out encouragement and protection to traitors in every country, and endeavoured to kindle the flames of rebellion in the world, the situation of Great Britain was rendered to the last degree critical and alarming.

Having by their last outrage, the opening of the Scheldt, manifested their contempt of all the existing treaties of Europe, Great Britain determined to remain no longer an unconcerned spectator of what was transacting on the continent of Europe. On the 28th of January 1793, a message was delivered to the house of commons, informing them that his majesty thinks it indispensibly necessary, to make a further augmentation of his forces by sea, for opposing views of aggrandisement and ambition on the part of France, which would be at all times dangerous to the general interests of Europe, but were peculiarly so, when connected with the propagation of principles which lead to the violation of the most sacred duties, and are utterly subversive of the peace and order of all civil society. The question in favour of the address was carried both in the house of lords and commons without a division. The French however, anticipated our intentions, whatever they might have been, by a decree of the convention formally declaring war against his Britannic majesty, and the Stadtholder.

War being thus declared on the part of France, it became necessary to provide for the expences, which would necessarily be incurred in a state of war. Mr. Pitt therefore took the earliest opportunity of stating to the house the total amount of the supplies and of the ways and means. The total of the supply amounted to 8,734,043*l.* To defray this expence, Mr. Pitt stated the total of ways at 8,299,696*l.* He further observed, that after every other resource, there would be wanting a loan of 2,900,000*l.* To pay the interest of this loan, he meant to devote the temporary taxes imposed upon occasion of the Spanish armament, which amounted to 287,000*l.* Such was the statement Mr. Pitt submitted to the committee of the house of commons. After an eloquent defence of the principles of the war he concluded with moving the several resolutions which were agreed to.

About this period from different causes a general paralysis appeared to seize the country, and the number of bankruptcies exceeded all that had ever happened in the most calamitous times; such was the general distress, that each man looked upon his neighbour with suspicion. Those who were possessed of property, appeared at a loss where to deposit it, and those who experienced pecuniary distress, appeared at a loss where to look for relief. To apply a remedy to this alarming evil, Mr. Pitt moved that 5,000,000*l.* should be issued by exchequer bills, under certain restrictions; for the assistance of such persons, who can give proper security to the commissioners, for the sum

that may be advanced. The bill passed the house of lords and commons without a division.

In the mean time events on the continent became every day more critical and alarming. Instead of delivering France from the tyranny by which she was oppressed, the combined armies had been obliged to retreat with loss, and the arms of France were unfortunately victorious in every quarter. General Montesquieu had over-run Savoy and Nice, and the whole of the Austrian Netherlands were subjected by Dumourier to her dominion before the conclusion of the year. The next campaign was begun with the same successes. General Dumourier assembled his army in the vicinity of Antwerp. Previous to his unprovoked aggression of Holland, he published a manifesto inviting the Dutch to rebel against their lawful government. Breda surrendered after a very feeble resistance. General Dumourier dispatched general Berneron to the attack of Williamstadt, and general d'Arcon to Gertruydenberg. On the 4th of March Gertruydenberg surrendered, and at this place Dumourier's successes ended. On the 1st of March, general Clairfait, having passed the Roer; attacked the French posts, and compelled them to retreat with the loss of 2000 men. The following day the archduke attacked them anew with considerable success. On the 3d the French were driven from Aix la Chapelle, with the loss of 4000 men killed and 1600 taken prisoners. But the battle of Neerwinden was most fatal to the enemy. Besides their loss of men in the field, 6000 immediately deserted, and proceeded to Brussels and France. Dumourier continuing to retreat, at last came to an agreement with the Imperialists that he should not be seriously interrupted. It was fully agreed between him and the Austrians, that while the latter took possession of Condé and Valenciennes, he should march to Paris, dissolve the convention, and deliver France from her tyrannical oppressors. Several circumstances, however, contributed to render the conduct of Dumourier suspected by the National Convention. Commissioners were therefore sent in order to discover his designs; the consequence of which was that he was obliged to make his escape with all possible expedition.

By the defection of Dumourier, the whole army of the north, was left exposed to the attacks of a numerous and victorious enemy. The command of this army was provisionally given to general Dampierre by the commissioners.

The war had hitherto been carried on with various success, when an action of a very serious nature took place on the 8th of May. General Dampierre on that day advanced to dislodge the allied forces who were posted in the wood of Rheime and Vicoigne. In this action the French general received a wound of which he died next day, leaving the command in the hands of general La Marche. The English distinguished themselves in this action, and suffered greatly. The loss of the enemy was estimated at 4000 men. Little of importance occurred till the 23. On that day the British and Hanoverians assembled, together, with the Austrians and German auxiliaries, with a design to dislodge the French from their fortified camp on the heights of Famars.

They experienced a tremendous fire from the enemy, whom they defeated, notwithstanding, in the field; the duke of York advanced within a small distance of the works, but on account of the strong position of the French, thought proper to defer the attack till next day. The French, however, apprehensive of the consequences, abandoned their camp, and retreated. This success enabled the allies to lay siege to Valenciennes, which surrendered on the 26th of July. During the whole of the siege General Custine was not able to make any attempt of moment for the relief of the place. The king of Prussia had been employed from the beginning of April in preparations for the siege of Mentz. The garrison made several sorties with various success.

On the 18th the French army of the Rhine made a grand attempt for the relief of Mentz. They attempted to force their way not far from Landau, and made an attack in three places at once. They were, however, repulsed in every part by General Wurmsler. This last effort proving unsuccessful, the garrison capitulated on the 22d, on condition that they should not serve for the space of one year against the allies.

With these achievements terminated the success of the allies. After the reduction of Valenciennes a grand council of war was held in which, it was resolved, contrary, it is said, to the opinion of the Austrian commanders, that the British, Hanoverians, and Dutch, should separate from the main army, and attack West Flanders. In consequence of this determination, the British, Hanoverians and the Dutch, with some Austrians and Hessians commenced their march to Dunkirk. On the 24 of August the duke of York attacked and drove in the French outposts, after an action in which the Austrian general Dalton was killed. General Freytag, who commanded the covering army of the allies was soon after attacked and totally routed. The British lost their heavy cannon and baggage, with 2000 men. The consequence of this disaster was, that the siege was soon after raised. Several engagements took place at this time between Prince Cobourg and the French general Jourdan. The attacks were repeated and terrible on both sides and the enemy were but too successful in driving back the allied forces. They now threatened the whole of maritime Flanders. A detachment of British troops ready to sail to the West Indies, were hastily sent to Ostend and prevented for the present the farther progress of the French.

But while the enemy were successful in their military operations on the frontiers, internal discord began to make its appearance in the interior of France. The people exasperated at the cruelty of the tyrants who governed them, and impatient to deliver themselves from the bloody democracy by which they were oppressed, had taken up arms in several departments. Marseilles, Lyons, and Toulon rose up against their oppressors. Lyons was attacked on the 8th of August, and after repeated assaults surrendered to general Doppet. Then followed a scene of cruelty, the like of which, "no eye had seen, no heart can conceive, no tongue can adequately tell." Unmoved by the "tears of affliction, the yells of murder, or the cries of despair," those merciless barbarians wrecked their vengeance on the helpless inhabitants; no refinement of barbarity which could embitter their misery, was forgotten; neither the natural weakness of the female sex, nor the tenderness of infancy could soften their cruel hearts; they proceeded in their work of slaughter and destruction till they had laid desolate one of the noblest and most ancient cities of France. The Marseillois shortly after submitted, but the leading people of Toulon entered into a negotiation with the British, admiral lord Hood and surrendered to him, on condition that he should preserve to them as a deposit the town and shipping for Louis XVII. The siege of Toulon was commenced by general Cartaux in the beginning of September. After several sallies the place was judged not tenable and in the course of the day they embarked their troops after having set fire to the arsenal. Crowds of people of every rank, age, and sex, hurried on board the ships to avoid the vengeance of their countrymen. Thirty-one ships of the line were found by the British at Toulon, thirteen were left; ten were burnt; four had been previously sent to Brest and Rochfort with 5000 republicans, who could not be trusted; and Great Britain finally obtained by the expedition three ships of the line and five frigates.

months of August and September, 1793. General Wurmser formed the lines of Weissenbourg, and penetrated to Hagenau, from whence he was driven back by the French, and after several dreadful conflicts he was finally obliged to retreat across the Rhine. The blockade of Landau was raised; Fort Louis was evacuated, and Kaiserslautern, Germerheim and Spires submitted to the French. The decree that had passed the convention for placing France in a state of requisition had already given the enemy a superiority in point of numbers which neither bravery nor superior discipline could withstand. In this manner ended the campaign of 1793.

Thus far we have attended to the military transactions of Great Britain and her allies on the continent. We must now look back to her internal affairs, which are by no means less important. No event occurs of great importance till the meeting of parliament, which took place on the 21st of January 1794. His majesty, opened the session with the usual formalities. The address was voted by a majority of 118. Our narrow limits render it impossible for us to take notice of the important questions that were agitated in parliament this session. No less than three motions were made by different members; of opposition for altering the criminal law of Scotland; the landing of Hessian troops, the conduct of the war, were all reprobated by opposition. The treaty concluded by the king of Sardinia likewise underwent a severe investigation. The resolution, however allowing his majesty to make good the treaty passed without a division. The chancellor of the exchequer then moved two resolutions to allow his majesty 4,500,000. for the present year by a loan on exchequer bills, which were put and carried.

On the 5th of February, the minister proceeded to open the budget, and stated the whole amount to be provided for, at 19,939,000. The ways and means he stated 19,947,000. After stating several other expences, and repealing the tax on births and burials the sum of 908,000. remained to be provided for. The surplus of the taxes in 1791 produced 385,000 and the new arrangement adopted with respect to the duty on spirits in Scotland amounted to 43,000. which taken collectively amounted to 428,000. To these Mr. Pitt proposed an additional tax on British spirits, of one penny per gallon, ten pence per gallon on brandy, nine-pence on rum; 1s. 6d. per thousand additional on bricks and tile; slate carried coast-ways 10s. per ton; stone 2s. 6d. an additional tax on crown and plate glass, paper, and attornies, all which amounted to 911,000. Mr Pitt concluded by moving his first resolution; after some remarks from Mr. Fox, the resolutions were all passed.

On the 11th of February, the chancellor of the exchequer, read to the house the decree of an extraordinary commission instituted in France, in consequence of a resolution of the joint committees of finance, of public and general safety, and subsistence, directing the use of every possible expedient, to ascertain the property of French subjects, in foreign funds; in order that it might be delivered up to the state, and become public property; and that when the transfer was made, it should be paid for in assignats estimated at par. The motion on this occasion was brought forward by the solicitor-general, and was in substance for leave to bring in a bill, "to prevent the application of debts in the hands of any of the subjects of his majesty, to or for the disposal of persons resident in France, under the power of persons who exercise the present government of France." The bill passed without any opposition.

The success which attended the French revolution assisted greatly the propagation of the principles professed by the Jacobins. And notwith-

standing

during the
months

standing the excellence of the British constitution, there were found, men profligate enough to conspire its destruction. A plan had been digested and acted upon, the object of which was to assemble a convention of the people for the purpose of assuming the character of a general representation of the nation, superseding the representative capacity of the house of commons, and arrogating the legislative power of the country at large. In consequence of the information they had received on this subject, the ministry issued warrants for apprehending, Mr. Horne Tooke, Mr. Hardy, and Mr. Thelwall, and several other persons on a charge of high treason. On the same day (May 12) Mr. Dundas brought down a message from the king recommending to the house to consider the books and papers, of the London Corresponding Society which his majesty had given orders to seize, and to pursue such measures as were necessary to prevent their pernicious tendency.

The papers were referred to a committee of secrecy, who brought up their report on the 16th of May, when Mr Pitt after an eloquent speech moved for a bill "empowering his majesty to secure and detain all persons suspected of designs against his crown and government. The bill met with a strong opposition; it passed however by a great majority. Little else of very great importance occurred, during the present session. There happened some differences with America, concerning which several motions were made. They were afterwards, however happily adjusted. On the 11th of July his majesty terminated the session by a speech to both houses of parliament. Immediately on the rising of parliament several changes took place in administration. The Duke of Portland was made one of his Majesty's principal secretaries of state, and Mr. Windham secretary at war. Shortly after Earl Fitzwilliam was appointed viceroy of Ireland.

We have already taken notice of the apprehension of several persons on a charge of high treason. Their trials shortly after commenced; Mr. Erskine and Mr. Gibbs appeared, as advocates for the prisoners who were all acquitted. Without presuming to decide upon the actual guilt of the prisoners who were tried, we may safely say that evidence appeared to convince the greater part of men that a dangerous conspiracy had been actually formed for the subversion of the British government.

The campaign of 1793 had terminated very unfavourably for the allies. By various negotiations the campaign of 1794 was delayed till a late period. On the 5th of March the duke of York arrived on the continent to take the command of the British army, and on the 17th he proceeded with general Clairfait to Valenciennes where a council of war was held with the prince of Saxe Cobourg. Towards the latter end of March the French made their appearance in West Flanders, and on the 29th. of that month, they attacked the Austrian outposts at Cateau, Beauvais, and Solemes, in the vicinity of Landrecy. They were however obliged to retreat with the loss of 900 men.

On the 9th of April the emperor arrived at Brussels, from whence he proceeded to Valenciennes, where his presence diffused universal joy through the allied army. The emperor having reviewed the combined forces on the heights above Cateau, proceeded in eight columns to invest Landrecy, a small but well fortified town. The objects of these columns were the redoubts and village of Vaux and the strong entrenchments of the French in the wood called Bois de Bouchain. The fire of the republicans was at first severe, but finding their position no longer tenable against the superior force of the British; they retreated as soon as the latter approached to a close engagement

engagement. The siege of Landrecy was shortly after commenced, and this important fortress surrendered in about ten days. In consequence of these successes, a grand attack was resolved upon, which was to oblige the enemy to evacuate the whole of Flanders. By some unaccountable treachery on the part of the allies, the enemy were acquainted with the whole plan. The issue was such as might be expected; the allies were obliged to retreat in the most disorderly manner, and were pursued with great loss by the enemy. They collected as soon as the desperate state of their affairs would admit, and resumed their former position. The enemy encouraged by this victory, determined to give the allies no respite, and next day attacked them with a force of 100,000 men. They at first succeeded in driving in the out-posts, but a reinforcement arriving under the command of major-general Fox, the skill and intrepidity of that officer enabled the allies to maintain their position, who in their turn made a general attack upon the French posts, in which they were defeated with immense loss, and obliged to retreat thirty miles.

Instead of joining with one heart and one soul in opposing an enterprising enemy, mutual jealousies, disunion, and even treachery, seem to have crippled the operations of the combined armies, and to have rendered ineffectual the skill and abilities of the most gallant generals in the world. Mournful is the task, to those who love their country, to be the unwilling recorders of her calamities and misfortunes; ungrateful the employment, to the last degree, and grievous to be obliged to relate the victories of her inveterate foes. This, however, is the task of the historian, to whose lot it falls to relate the events of the following campaign, which, is little else than "a long unbroken, funereal train of misfortunes."

It may be the opinion of some, that the success of the republic on the continent of Europe was in some degree counterbalanced by the dismemberment of their foreign possessions; the whole of their West India islands being subjected by the navy of Great Britain. But when we consider how many of our gallant troops were lost in those unhealthy climates, not cut off by the fury of war, but by the afflicting hand of heaven, we cannot but think that it was, in an evil hour the ministry planned the subjection of the West India islands; where so many brave men have been sacrificed for what was infinitely below their value.

Amidst all our misfortunes on the continent, we had still the consoling reflection of triumphing completely over the enemy at sea. In the month of May, the French were induced to depart from the system of naval hostilities which they had hitherto pursued, and anxious for the fate of a large convoy expected from America, the Breft fleet to the amount of 26 sail ventured out to sea. On the 1st of June, the British commander, having obtained the weather-gage of the enemy, determined to improve the opportunity for bringing them to a close action. A desperate engagement accordingly commenced, which the enemy's fleet supported with amazing obstinacy and courage. But nothing could withstand the skill, discipline, and valour of the British fleet. In less than an hour after close action commenced, the French admiral, who had been engaged by the Queen Charlotte, crowded off and was followed by most of the ships in his van in condition to carry sail, leaving ten or twelve of his crippled or dismasted ships behind. Such, however, was the disabled state of the British fleet, that several of these escaped. Six ships of the line remained in possession of the British admiral, and were brought safe into Plymouth, and one

In the course of the preceding year, a treaty of marriage had been negotiated between his royal highness, the prince of Wales, and the princess, Caroline of Brunwick, daughter to the duke of Brunwick. On the 27th of April, a message from his majesty was delivered to both houses of parliament, relative to the debts of the prince of Wales; it stated the reliance of his majesty on their generosity for enabling him to settle an establishment upon the prince, and his august bride, suited to their rank and dignity; that the benefit of any settlement now to be made, could not be effectually secured to the prince till he was relieved from his present incumbrances to a large amount; but that his majesty did not propose to his parliament any other means of providing for this object, than the application of a part of the income which may be settled on the prince, and the appropriation for a certain time of the revenue of the duchy of Cornwall, &c. After a considerable difference of opinion upon this subject the annual sum of 125,000*l.* was finally voted by the commons as a suitable establishment for the heir apparent to the throne. Of this 65,000*l.* with the income of the duchy of Cornwall was set apart for the liquidation of his debts.

We are now to resume our unfinished narration of last campaign. In addition to their other calamities, the British army was afflicted with disease to such a degree that great part of it was rendered wholly incapable of any exertion. On the 10th of January, the French having crossed the Waal in immense force, to the amount of 70,000 men, made a general attack upon Walmoden's position, between Nimeguen and Arnheim, and were successful in every quarter. All thoughts of resistance were now given up by the allies. They continued retreating before the enemy, and were obliged in this severe season to pass the night under the canopy of the inclement sky. By their retreat they left the most important places in the United Provinces open to the conquerors. Utrecht, Rotterdam, and Dort successively surrendered to the enemy, and on the 20th Pichegru entered Amsterdam, at the head of 5000 men. Leyden, Haerlem, Breda, Williamstadt, and Bergen-op-Zoom shortly after capitulated, and were followed by the whole province of Zealand.

While these events were taking place in the Low Countries, the campaign seemed rather to languish on the Rhine, and was at last concluded by common consent of the hostile generals, who agreed to a suspension of arms for three months which was ratified by the respective powers.

As his majesty was proceeding this session at the usual hour to open the parliament, the most daring insults were offered him as he passed along, by the crowd in St. James's park which was much greater than usual; in the streets adjoining Westminster-hall, stones and other things were thrown, several of which struck the state-coach. As his majesty returned from the house, the outrages were renewed: and after he alighted, the state-coach was attacked and almost totally destroyed.

Immediately after the speech from the throne an address to his majesty relative to the outrages committed against his person was proposed and agreed to. On the 4th of November copies of his majesty's proclamations relative to the outrages committed against his person were submitted to the house and ordered to lie upon the table. Lord Grenville on the 6th in pursuance of the notice he had given on a former day, presented a bill, "for the safety and preservation of his majesty's government against treasonable and seditious practices and attempts." On the same day, the chancellor of the exchequer after an eloquent speech moved that "Leave be given to bring in a bill for the

more effectually preventing seditious meetings and assemblies." These bills after a violent opposition passed both houses of parliament.

On the continent the French proceeded with their usual success, till being weakened by the vast track of country they had overrun, they became less able to resist the attacks of the Austrians, who had received considerable reinforcements. They were compelled to retire with precipitation before the Austrian forces, who hung closely on their rear and allowed them no respite. The peasantry encouraged by their distressed situation took the opportunity of revenging the oppressions they had suffered from them. Prince Charles in consequence of his successes commenced the siege of Kehl, which after a desperate resistance was obliged to capitulate.

Dismayed by the successes of the French, several states had sent ambassadors to Paris to open a negotiation for peace. A treaty was concluded with Spain and several of the German princes. But of all these the negotiation opened by the English government engaged most deeply the attention of Europe. The necessary passports which had been demanded for an envoy from the English court were sent and the minister plenipotentiary arrived in Paris. The commencement of this negotiation clearly foreboded what would be the event. The grossest calumnies, concerning the insincerity and even perfidy of the English court were circulated under the apparent sanction of the Directory. After a good deal of discussion concerning the principle of restitution, the two governments at last agreed on that point, and lord Malmesbury delivered two memorials on the principal objects of restitution, compensation, and reciprocal arrangements. The directory having read the memorials sent an extract from the registers of their deliberations requiring his signature to the memorials, and also the ultimatum of his demands in 24 hours. Lord Malmesbury complied with the forms required by the directory, but observed that the peremptory demand which they made of an ultimatum, shut the door at once to all negotiation; and represented that if the conditions submitted to their consideration were not approved, or were not to be the subject of discussion, if they would propose their own conditions, he would submit them to the consideration of his court.

At this point the negotiation ended, for on reading the memorials received on the 17th of December the directory ordered the minister to write to lord Malmesbury on the 18th, that they could hear of no propositions contrary to the constitution, and the laws and treaties by which the republic was engaged; and likewise enjoining him to leave Paris in 24 hours. Such was the event of this negotiation; on the part of the French, commenced with reluctance, conducted with insincerity, and concluded with insult.

Among other projects of hostility which the French government had meditated against Britain the invasion of Ireland at this period engaged their attention; and though it proved abortive, yet it excited a considerable degree of alarm. The squadron under vice admiral Bouchard sailed from Brest the 10th of December, and anchored in Bantry-bay, on the coast of Ireland; here they remained for some days, waiting the arrival of the frigate which conveyed the commander in chief, who had been separated from the fleet in a strong gale of wind, the day after its departure from Brest; but finding it impossible to remain any longer in that situation, on account of the tempestuous weather, they set sail for Brest, and were followed at different periods by the rest of the fleet, except two ships of the line and three frigates, which were either taken or sunk.

In one part of his speech, his Majesty had taken notice of the invasion which the enemy had projected against England, which although it

excited no serious apprehensions, was not to be completely despised. Mr. Pitt brought forward the business in the house of commons and pointed out the means by which he proposed to raise 15,000 men, to be divided between the land and sea service, to raise a supplemental levy of 60,000 for the militia; and 200,000 cavalry, which with a few alterations and amendments were agreed to.

The total of the supplies for the year amounted to 27,647,000. In explaining the different articles of expenditure Mr. Pitt alluded to an expence of a particular nature which had been incurred during the interval of parliament. As it would have been a matter of extreme delicacy to have brought forward a public discussion on the propriety of advancing a sum to a foreign court in the critical situation of the country, the ministers had granted to the emperor without a public discussion the sum of 1,200,000l. This measure came shortly after to be discussed, and the opposition took this opportunity of reproaching it with the utmost acrimony; the ministry were loaded with every expression of abuse and obloquy which the English language could produce; a vote of censure on their conduct was moved and supported by the most violent declamations on the part of opposition, but was negatived by a great majority.

Meanwhile amidst this scene of faction, of mutual asperity and reproach, a most alarming mutiny broke out in the navy, formerly the pride and glory of the British nation. The professed object of these disturbances was the redress of certain grievances respecting the quantum and distribution of their pay. Several letters were addressed on this subject to Earl Howe, which, as they were anonymous could not be attended to. This imagined neglect produced a general correspondence by letter through the whole fleet, and on the 14th. of April, when the signal was made to prepare for sea, a general disobedience was obvious, and instead of weighing anchor, the seamen of the admiral's ship gave three cheers, and these cheers were answered in the same manner from the other ships. Delegates were then appointed for each ship to represent the whole fleet, and the cabin of the admiral's ship was fixed upon as the place of their deliberation. In short the whole of their conduct was totally different from the honest, unreflecting character of British seamen; the unanimity with which they acted manifested a complete combination; and evidently shewed that they acted upon a deliberate and premeditated plan of mutiny. Petitions were drawn up and presented to the admirals then upon the spot, stating their demand of an increase of wages, and also some regulations for their benefit with respect to the ratio of provisions. On the 18th. a committee of the admiralty arrived at Portsmouth, who made several propositions to reduce the men to obedience; the lords of the admiralty next conferred with the delegates who assured their lordships that no arrangement would be considered as final until it should be sanctioned by king and parliament and guaranteed by a proclamation for a general pardon.

Matters remained in this situation till the 23d. when Earl Howe returned to his ship, hoisted his flag, and after a short address to the crew he informed them that he had brought with him a redress of all their grievances, and his majesty's pardon for the offenders; after some deliberation these offers were accepted, and every man returned with cheerfulness to his duty. It was now generally believed that all disputes were settled; but either by some misunderstanding, or by design, the sailors were betrayed into a belief that the government deluded them with vain hopes, and never intended to accede to their requests. This rekindled the flame of mutiny, and on the 7th of

May when lord Bridport made the signal to weigh anchor every ship at St. Helens refused to obey. A meeting of the delegates was ordered on board the London. Vice-admiral Colpoys opposed their coming on board and gave orders to the marines to level their pieces at them; a slight skirmish ensued in which 5 of the seamen were killed. The whole crew of the London now turned their guns towards the stern and threatened to blow all aft into the water unless the commanders surrendered; to this imperious menace they reluctantly submitted, and admiral Colpoys and captain Griffiths were confined for several hours in separate cabins.

In this mutinous state did they continue till the 14th. of May, when lord Howe at length arrived from the admiralty with plenary powers to enquire into and settle the matters in dispute; he was also the welcome bearer of an act of parliament, which had been passed on the 9th granting an additional allowance and also with his majesty's proclamation of pardon for all who should immediately return to their duty. Affairs being thus adjusted, the sailors appeared perfectly satisfied; the officers were generally reinstated in their commands, the flag of disaffection was struck, and the fleet prepared to put to sea to encounter the enemy.

Thus was Britain, awed by this dreadful and alarming mutiny, forced to accede to every request demanded by its authors, and to grant his majesty's pardon to those who had violated all discipline and subordination, and who had insulted and even confined officers of the highest rank, whom by their duty they were bound to treat with the greatest deference and respect. We shall make no farther observation upon this subject; the mutiny which followed soon after in another quarter is a sufficient comment; a mutiny which spread terror and alarm through the whole country, and which for boldness and extent was without a parallel in the history of Great Britain; by some, indeed, it has been considered rather as a fortunate circumstance, that by the unreasonable demands of the sailors, which were incompatible with all discipline and subordination, their country was roused to a just sense of her wrongs, and at last raised her indignant arm against those who relinquishing their own natural character of her gallant defenders, were the most forward to overwhelm her with ruin.

This alarming mutiny broke out at the Nore. The mutineers in imitation of what had been done at Portsmouth chose delegates from every ship, of whom a man of the name of Richard Parker was appointed president. After having either confined or sent ashore their principal officers, they transmitted to the lords of the admiralty a series of articles or conditions, to which they peremptorily demanded compliance, as the only terms on which they would return to obedience. On the 23d. of May they struck the flag of admiral Buckner, and hoisted the red flag, the symbol of mutiny in its stead. At the commencement of the mutiny, the delegates and committee-men went on shore every day to Sheerness, where they paraded the streets and ramparts of the garrison. These processions were accompanied with music and flags, and had a triumphant appearance calculated to make new converts to their unlawful proceedings.

The mutiny having now risen to a most alarming height a deputation of the lords of the admiralty, at the head of whom was earl Spencer, proceeded to Sheerness; but finding the sailors rather rising in insolence and disobedience, than inclining to submission, they departed, after having signified to the seamen, that they were to expect no concessions whatever, further than what had been already made by the legislature, the benefit of which they might yet enjoy on returning to their duty.

The

The seamen now perceived the delicate situation and with a view of exacting a compliance with their demands they proceeded to block up the Thames, by refusing a free passage up and down the river to the London trade. The ships of neutral nations, however, colliers, and a few small craft were suffered to pass having first received a passport, signed Richard Parker, president of the delegates.

All hopes of an accommodation being now given up, every necessary measure was taken to compel the seamen to return to their duty. An act of parliament was speedily passed for preventing all intercourse with the ships in a state of mutiny; all the buoys were removed from the river Thames, and the neighbouring coast by order of government, great preparations were also made at Sheerness against an attack from the mutinous ships, which had manifested some strong dispositions to bombard that place; and after the rejection of the last attempt at a reconciliation through the medium of Lord Northesk, measures were taken by lord Keith, and Sir C. Grey, to attack the fleet from the works at Sheerness, with gun boats and every thing else necessary for that purpose. Happily however the defection of several of the ships, with other strong symptoms of disunion, rendered the application of force unnecessary. On the 10th. of June several more of them pulled down the red flag. The rest of the fleet in a few days followed their example, and went under the guns of the fort at Sheerness. Immediately upon this admiral Buckner's boat went to the Sandwich with a picket-guard of soldiers to arrest Parker, who was very peaceably surrendered to them with about thirty other delegates. Their trials shortly after commenced; many of them were executed, a considerable number remained under sentence till the signal victory of admiral Duncan when they were pardoned. The seamen returned very peaceably to their duty and great Britain was by the blessing of providence delivered from a situation of the most extreme peril, and where one accident or mistake might have been the cause of unspeakable distress if not utter ruin.

While the tranquillity of the nation was disturbed, and its existence endangered by the mutinous disposition of its most collective defenders, an evil which appeared at first of scarcely inferior magnitude threatened to overwhelm in ruin the pecuniary resources and even commerce of the country. The year 1797 among other wonders, which it produced, likewise added this to the number, that the Bank of England suspended its payments in specie and yet public credit remained unshaken.

Various conjectures have been formed with respect to this event. One powerful cause seems to have been the terror of an invasion, which induced the farmers and other persons at a distance from the metropolis to withdraw their money from the hands of those bankers with whom it was deposited. The run, therefore, commenced upon the country banks and the demand for specie soon reached the metropolis. In this alarming state the ministry found themselves compelled to interfere, and an order of the privy council was issued on the 26 of February prohibiting the directors from issuing any cash in payment till the sense of parliament can be taken on that subject, and the proper measures adopted thereupon for maintaining the means of circulation and supporting the public and commercial spirit of the kingdom at this important conjuncture.

The business was immediately laid before the parliament, which was fortunately sitting at this critical moment; the most violent debates ensued, the opposition, as usual, imputing every evil to the incapacity and wickedness of the

the ministry, and declaiming with great violence that the bank had failed, and that the nation was ruined.

The Statement of the committee, being laid before parliament, the fidelity and exactness of which was never questioned, completely refuted all the vague assertions of opposition. By this statement it appeared, that the bank had found far above any demands that could possibly be made upon them; this soon allayed all the ferment and alarm, which had been raised by this unexpected event; and that confidence which had tottered a little now stands on a firm and solid basis, supported by legislative sanction and a development of the affairs of that great monied corporation.

On the 9th of June this year died at his seat at Beaconsfield after a painful illness the Rt. Hon. Edmund Burke. He did not live to see the unravelling of the intricate plot, which saddened and perplexed the awful drama of providence. but soon followed his beloved and lamented son from a world of strife and discord to more inviting regions of undisturbed repose.

In this extraordinary man was united every quality which could form an accomplished orator, and as long as genius, erudition, eloquence, integrity and wisdom are valued among men so long will his character be revered. As an orator and a writer he shone with the same unrivalled splendour. The same sublime and magnificent conceptions adorned with the most elegant language; the same dazzling brilliancy of wit and humour; the same luxuriance of imagination; the same fertility of allusion and illustration; the same depth of judgment, and extensive knowledge distinguished both his writings and speeches as the productions of a superior genius, and reflected the lively image of their illustrious author. The words which the Roman historian makes use of in drawing a great character may be applied with propriety to him; *neq; is tantum, cujus lingua, vivo eo, vigerit, monumentum eloquentie nullum extet; vivit in eo, vigetque eloquentia ejus sacra scriptis omnis generis.* He was the first man in Britain; we may say in the world, who, foreseeing the pernicious and destructive tendency of those principles which gave rise to the French Revolution, lifted up his warning voice, and with a certainty almost approaching to prescience proclaimed aloud to Europe the woes which would arise from this most astonishing and awful event.

Were our powers equal to the task, our narrow limits would not permit us to attempt a delineation of the character of Mr. Burke; yet we could not pass over the loss of so excellent a man without withdrawing for a few moments from the noise of faction, mutiny, and war, to shed a tear to his memory, and jult in passing by to breathe a farewell sigh over his grave.

The war on the part of Great Britain was during this year, almost exclusively confined to naval operations, in which the skill and activity of the British seamen was eminently conspicuous, and invariably crowned with victory. The Spaniards and Dutch were grievous sufferers in two great naval engagements, which were both equally glorious to the British arms.

The first of these memorable actions took place on the 14th of February off cape St. Vincent. The British squadron under the command of Sir John Jervis, amounted to no more than fifteen sail of the line, while that of the Spanish consisted of twenty-seven, one of which was a four-decker, and carried 136 guns. The action commenced about half past 11 o'clock, the van ship the Culloden, Captain Trowbridge, firing against the enemy's headmost ships to windward. The action in a short time after became general, and it was soon apparent that the British admiral had accomplished his design of breaking through the enemy's line, and had effectually separated their fleet. Attention

tention was therefore directed to the main body, which was reduced by this separation to 18 sail of the line; and after an engagement of some hours which was but feebly supported by the enemy, the British remained in possession of four ships of the line. This splendid victory was achieved with little loss on the part of the British, the killed and wounded amounting to 300 men.

The Dutch were still more unfortunate in their naval operations, but not equally inglorious; they supported a long and bloody engagement with amazing obstinacy and courage, and every man continued faithful to the last to their gallant admiral. The action commenced at about 40 minutes past 12 o'clock, at which time every ship of the British had broken the enemy's line, and cut them off from getting into the Texel, the land being then distant about seven miles. While the rear was attacked by the larboard division under vice-admiral Onslow, the commander in chief directed all his attention to the enemy's van, and his own ship, the *Venerable*, was in close action for near two hours and a half, when he observed all the masts of the Dutch admiral's ship go by the board, she was, however, defended for some time after in a most gallant manner; but was at last obliged to strike to the *Venerable*; admiral De Winter himself being the only man left on the quarter-deck, who was not either killed or wounded. The great importance of this victory was not fully known at the time it was gained. It did not appear till afterwards that this fleet was designed to assist the French in their intended invasion of this country.

While Britain triumphed so completely at sea, a negotiation was entered into at Lisle for the purpose of restoring peace between the Regicide directory and England. Lord Malmesbury arrived at Lisle in the beginning of July, and on the 8th delivered in his *projet* as the basis of the negotiation. As this *projet* contained some particulars concerning which the French commissioners professed themselves unable to determine, they sent them, with their observations, to the directory. On the 16th of July, Lord Malmesbury received a note from the French plenipotentiaries, informing him that the French government required as a preliminary to negotiation the restitution of all his Britannic majesty's conquests. To this insolent demand lord Malmesbury replied, that he was sure peace on such terms would not be thought of. While the negotiation remained in this state, from some commotion in the internal administration of France, the plenipotentiaries were recalled, and others appointed in their room. After a long discussion, and the strongest professions of a sincere desire to conclude a peace, they sent a note on the 15th peremptorily asking whether lord Malmesbury's powers were sufficient to restore all the possessions taken from France or her allies, and on his answering in the negative, he received another note requiring him to return in 24 hours to obtain the necessary qualifications from his own court. The strange demand urged in the note of the 15th demonstrated beyond a doubt that the professions they made concerning their sincere desire of friendship, however strongly, however solemnly urged, were false and perfidious, and that all prospect of an accommodation must be for the present abandoned.

Having rejected our offers of peace, the enemy resumed the project of an invasion of Britain and it was generally believed that they seriously intended to make the attempt. Vast preparations were made in all the different sea-ports of France; a great number of flat-bottomed boats and transports were fitted out; and a formidable force was assembled near the sea-coast to which they gave the absurd appellation of *The Army of England*. Idle stories were likewise propagated about rafts of an immense size, in which they

were to float over to England; and to carry terror and dismay to her shores. This visionary scheme, does not, however seem to have been seriously adopted by the enemy; perhaps the story was propagated to ridicule their frothy declamations against England. The conduct adopted by the ministry was prudent and judicious. By some the invasion had been treated as so completely ridiculous that no preparation was necessary. Instead of sleeping in this false security, the ministry took every necessary precaution to repel their attacks, unterrified by their threats, but not despising them.

A bill was passed for enabling the king to provide more effectually for the defence of the country and to indemnify such persons as might sustain loss or injury, in consequence of the measures which it might be necessary to take for the general defence of the country &c. likewise to ascertain those who were willing near their own homes to cooperate with the existing force of the country, whether as soldiers, pioneers, drivers of waggons or in any other situation; circular letters were addressed to the Lord Lieutenants of the counties, informing them that any corps of respectable householders would be accepted; in short every measure was taken by ministry which could ensure internal tranquillity, or defeat the attempts of our enemies.

At no period of our history was so much zeal and courage displayed by the British Nation. Instead of that narrow policy which actuated several of the continental powers, they united as one man in defence of their invaluable constitution; indignant at the menaces of the enemy this high-spirited nation with firmness and magnanimity rallied round the standard of freedom; undismayed by the preparations of France they joined with one soul in defence of their most gracious sovereign Lord the King, in defence of their liberties handed down to them by their ancestors as their invaluable birthright; resolved either to preserve these blessings or to perish in the attempt. Such indeed was the spirit, zeal, and loyalty of the British nation, that the enemy after having solemnly promised (if indeed their ludicrous jargon can be solemn) that they would be in England before the spring, finally abandoned the attempt, and instead of the invasion of Britain their fleet set sail for Egypt, accompanied by a great number of transports. It was their intention forcibly to effect a settlement in that country, and by degrees to penetrate to the British settlements in the East Indies; a design for absurdity, for wickedness, for perfidy, and for injustice unequalled in the history of mankind; fit only to be attempted by the bloody oppressors of France who are not to be startled by the most determined villainy. But while the ministry watched with a jealous and vigilant eye the preparations of the enemy abroad, their attention was not diverted from the wicked and treasonable attempts of their adherents at home. By their vigilance a conspiracy of a very dangerous nature was discovered. Mr. O'Connor, a young man of family, leagued with several obscure persons, had given just grounds for suspecting his designs. In consequence of these suspicions he, together with his accomplices were watched, and traced to Margate, from whence they intended to embark for France, and there apprehended. After several examinations they were finally committed to stand their trial, for high treason, which took place at Maidstone. Their defence consisted in a simple denial of the facts with which they were charged. Mr. O'Connor brought forward in his defence the most respectable members of opposition who gave him an excellent character. One only of the prisoners, a Mr. O'Coigley was found guilty, who was shortly after executed. Mr. O'Connor was apprehended immediately on his acquittal by authority of a warrant from the Duke of Portland, and sent under a

guard to Dublin. Affairs in Ireland wore a still more alarming aspect. An extensive and dangerous conspiracy was there formed for erecting Ireland into an independent republic. As the transactions of these conspirators with their subsequent rebellion belong to the history of Ireland, it is unnecessary here to repeat the relation of that calamitous period.

We turn with pleasure from these afflicting scenes to one of the most brilliant naval victories, which adorn the history of Great Britain, achieved off the mouth of the Nile by the illustrious admiral Nelson. The French fleet having escaped the British in their voyage to Egypt and safely landed their forces at Alexandria, were on their return home, when admiral Nelson having reconnoitred the harbour of Alexandria perceived that it was full of vessels of various kinds, and that the French flag was flying on board several of the ships. The enemy's fleet was first discovered by the Zealous, captain Hood, who immediately communicated, by signal, the number of ships, 16, lying at anchor in line of battle, in a bay upon the larboard bow, which he afterwards found to be Aboukir Bay. The admiral made the signal to prepare for battle, and that it was his intention to attack the enemy's van and centre as they lay at anchor, and according to the plan before developed. His idea, in this disposition of his force, was, first to secure the victory, and then to make the most of it, as circumstances might permit. A bower cable of each ship was immediately got out abaft, and bent forward. The British continued carrying sail and standing in for the enemy's fleet in a close line of battle. As all the officers of the squadron were totally unacquainted with Aboukir Bay, each ship kept sounding as she stood in. The enemy appeared to be moored in a strong and compact line of battle, close in with the shore, their line describing an obtuse angle in its form, flanked by numerous gun-boats, 4 frigates, and a battery of guns and mortars on an island in their van. This situation of the enemy seemed to secure to them the most decided advantages, as they had nothing to attend to but their artillery, in their superior skill in the use of which the French so much pride themselves, and to which indeed their splendid series of land victories was in general chiefly to be imputed. The position of the enemy presented the most formidable obstacles; but the Admiral viewed these with the eye of a seaman determined on attack; and it instantly struck his eager and penetrating mind, that where there was room for an enemy's ship to swing, there was room for one of ours to anchor. No further signal was necessary than those which had already been made. The Admiral's designs were as fully known to his own squadron, as was his determination to conquer, or perish in the attempt. The Goliath and Zealous had the honour to lead inside, and to receive the first fire from the van ships of the enemy, as well as from the batteries and gun-boats with which their van was strengthened. These two ships, with the Orion, Audacious, and Theseus, took their stations inside the enemy's line, and were immediately in close action. The Vanguard anchored the first on the outer-side of the enemy, and was opposed within half pistol shot to Le Spartiate, the third in the enemy's line. In standing in, our leading ships were unavoidably obliged to receive into their bows the whole fire of the broad-sides of the French line, until they could take their respective stations; and it is but justness to observe, that the enemy received us with great firmness and deliberation, no colours having been hoisted on either side, nor a gun fired, till our van ships were within half gun shot. At this time the necessary number of our men were employed aloft in furling sails, and on deck, in hauling the braces, &c. preparatory to our casting anchor. As soon as this took place, a most animated fire was opened from

the Vanguard, which ship covered the approach of those in the rear, which were following in a close line. The Minotaur, Defence, Bellerophon, Majestic, Swiftsure, and Alexander, came up in succession, and, passing within hail of the Vanguard, took their respective stations opposite to the enemy's line. All our ships anchored by the stern, by which means the British line became inverted from van to rear. Captain Thomson, of the Leander, of 50 guns, with a degree of judgement highly honourable to his professional character, advanced towards the enemy's line on the outside, and most judiciously dropped his anchor athwart hauls of Le Franklin, raking her with great success, the shot from the Leander's broadside which passed that ship all striking L'Orient, the flag ship of the French Commander in Chief. The action commenced at sunset with an ardour and vigour which it is impossible to describe. At about 7 o'clock total darkness had come on but the whole hemisphere was at intervals illuminated with the fire of the hostile fleets. Our ships, when darkness came on, had all hoisted their distinguishing lights, by a signal from the Admiral. The van ship of the enemy, le Guerrier, was dismasted in less than 12 minutes; and in 10 minutes after the second ship, le Conquerant, and the third le Spartiate, very nearly at the same moment, were also dismasted. L'Aquilon and Le Souverain Peuple, the fourth and fifth ships of the enemy's line, were taken possession of by the British at half past eight in the evening. Captain Berry, at that hour, sent Lieutenant Galwey, of the Vanguard; with a party of marines, to take possession of Le Spartiate, and that officer returned with the boat the French captain's sword, which Captain Berry immediately delivered to the Admiral, who was then below, in consequence of the severe wound which he had received in the head during the heat of the attack. At this time it appeared that victory had already declared itself in our favour; for, although L'Orient, L'Heureux, and Tonnant, were not taken possession of, they were considered as completely in our power, which pleasing intelligence captain Berry communicated in person to the Admiral. At 10 minutes after nine a fire was observed on board L'Orient, which increased with great rapidity presently involving the whole of the after part in flames. The only boats that could swim were instantly dispatched from the Vanguard and the lives of about 70 men were saved. The light thrown by the fire of L'Orient upon the surrounding objects, enabled the British to perceive with more certainty, the situation of the two fleets the colours of both being clearly distinguishable. The cannonading was partially kept up to the leeward of the centre till about 10 o'clock, when the L'Orient blew up with a most tremendous explosion. An awful pause, and silence for about three minutes succeeded, when the wreck of the masts and yards, which had been carried to a vast height fell down into the water and on board the surrounding ships. After this awful scene, the firing recommenced with the ships to the leeward of the centre, till 20 minutes past 10; when there was a total cessation of firing for about 10 minutes, after which it was revived till about 3 in the morning, when it again ceased, and the whole fleet except two ships remained in possession of the British. Thus was achieved by the skill, valour and discipline of the British sailors and officers of every description the glorious and ever memorable victory of the 1st August, which excited the most lively demonstrations of joy not only in Britain but through all Europe. It has not only rendered us sovereign in the Mediterranean; but has aroused the powers on the continent to another vigorous effort for their deliverance from the disgraceful tyranny of France; this spirit has already produced the happiest and most important effects; the French have been repeatedly defeated by the Austrians and pursued across the Rhine, General Suharrow has

been

been equally successful in Italy and has almost entirely driven them out of that country; we may therefore now hope to see an end to the calamities of Europe at no very distant period.

The enemy were likewise about this time disappointed in another expedition, which they fitted out for the invasion of Ireland. Their force consisted of a ship of 80 guns, eight frigates, a schooner and a brig. They were discovered by the squadron under Sir John Borlase Warren, who immediately gave the signal for a general chase, which was continued in very boisterous weather till the night of the 11th, when they were seen at a little distance to windward, the line of battle ship having lost her main top mast. The action commenced at 20 minutes past 7 o'clock in the morning and at 11 the Hoche struck and was followed by three others, full of men and every thing necessary for the establishment of their views in Ireland.

It must surely afford the most heartfelt satisfaction to every one who truly loves his country, who rejoices in her joys, and sorrows in her sorrows, that by the valour of our Seamen we may now laugh at the impotent malignity of our enemies, that Britain still reigns as the sovereign of the ocean, and by the splendor of her late victories emulates and even eclipses the glories of her former days.

GENEALOGICAL LIST OF THE ROYAL FAMILY OF GREAT BRITAIN.

George William Frederic III. born June 4, 1738; proclaimed king of Great Britain, France, and Ireland, and elector of Hanover, October 26, 1760; and married, Sept. 8, 1761, to the princess Sophia Charlotte, of Mecklenburgh Strelitz, born May 16, 1744, crowned September 22, 1761, and now have issue:

1. George Augustus Frederic, prince of Wales, born August 12, 1762. Married April 8, 1795, to her highness the princess Caroline of Brunswick; has issue 7, Jan. 1796 a princess.

2. Prince Frederic, born August 16, 1763, elected bishop of Osnaburg, February 27, 1764; created duke of York and Albany, November 7, 1784. K. G. and K. B. married Sept. 29, 1791, Frederica Charlotta-Ulrica-Catherina, Princess Royal of Prussia.

3. Prince William Henry, born August 21, 1765, created duke of Clarence, K. G. and K. T.

4. Charlotte-Augusta-Matilda, Princess Royal of England, born September 29, 1766. Married 18 April 1797, to his serene highness Frederic Charles William hereditary prince of Wirtemberg.

5. Prince Edward, born November 2, 1767.

6. Princess Augusta Sophia, born November 8, 1768.

7. Princess Elizabeth, born May 22, 1770.

8. Prince Ernest Augustus, born June 5, 1771.

9. Prince Frederic Augustus, born January 27, 1773.

10. Prince Adolphus Frederic, born February 24, 1774.

11. Princess Mary, born April 25, 1776.

12. Princess Sophia, born November 3, 1777.

13. Princess Amelia, born August 7, 1783.

Issue of the late prince of Wales by the princess Augusta of Saxe Gotha, now living:

1. Her royal highness Augusta, born August 12, 1737; married the hereditary prince (now duke) of Brunswick Lunenburgh, January 16, 1764.

2. His present majesty.

3. Prince William Henry, duke of Gloucester, born November 25, 1753.

THOUGH this principality is politically included in England, yet as it has distinction in language and manners, I have, in conformity with common custom, assigned it a separate article.

EXTENT AND SITUATION.

Miles.

Degrees.

Length 130 } between { 51 and 54 North latitude.
Breadth 96 } { 2,41 and 4,56 West longitude.

Area in square miles 7011.

NAME AND LANGUAGE.] The Welch, according to the best antiquaries, are descendants of the Belgic Gauls, who made a settlement in England about fourscore years before the first descent of Julius Cæsar, and thereby obtained the name of Galles or Wallæ. (the G and W being promiscuously used by the ancient Britons.) that is, Strangers. Their language has a strong affinity with the Celtic or Phœnician, and is highly commended for its pathetic and descriptive powers by those who understand it.

BOUNDARIES.] Wales was formerly of greater extent than it is at present, being bounded only by the Severn and the Dee; but after the Saxons had made themselves masters of all the plain country, the Welch, or ancient Britons, were shut up within more narrow bounds, and obliged gradually to retreat westward. It does not however appear that the Saxons ever made any farther conquests in their country than Monmouthshire and Herefordshire, which are now reckoned part of England. This country is divided into four circuits. See ENGLAND.

CLIMATE, SOIL, AND WATER.] The seasons are pretty much the same as in the Northern parts of England, and the air is sharp, but wholesome. The soil of Wales, especially towards the North, is mountainous, but contains rich vallies, which produce crops of wheat, rye, and other corn. Wales contains many quarries of free-stone and slate, several mines of lead, and abundance of coal-pits. This country is well supplied with wholesome springs; and its chief rivers are the Clywd, the Wheeler, the Dee, the Severn, the Elwy, and the Alen, which furnish Flintshire with great quantities of fish.

MOUNTAINS.] It would be endless to particularize the mountains of this country. Snowdon, in Caernarvonshire, and Plinlimmon, which lies partly in Montgomery and partly in Cardiganshire, are the most famous; and their mountainous situation greatly assisted the natives in making so noble and long a struggle against the Roman, Anglo-Saxon, and Norman powers.

VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.] In these particulars Wales differs little from England. Their horses are smaller, but can endure vast fatigue, and their black cattle are small likewise, but excellent beef, and their cows are remarkable for yielding large quantities of milk. Great numbers of goats feed on the mountains. As for the other

other productions of Wales, for England and Scotland. Some very promising mines of silver, copper, lead, and iron, have been discovered in Wales. The Welch silver may be known by its being stamped with the ostrich feathers, the badge of the princes of Wales.

POPULATION, INHABITANTS, MANNERS, AND CUSTOMS. } The inhabitants of Wales are supposed to amount to about 200,000, and though not in general wealthy, they are provided with all the necessaries, and many of the conveniencies of life. The land-tax of Wales brought in some years ago about forty-three thousand seven hundred and fifty-two pounds a year. The Welch are, if possible, more jealous of their liberties than the English, and far more irascible, but their anger soon abates; and they are remarkable for their sincerity and fidelity. They are very fond of carrying back their pedigrees to the most remote antiquity; but we have no criterion for the authenticity of their manuscripts, some of which they pretend to be coeval with the incarnation. It is however certain, that great part of their history, especially the ecclesiastical, is more ancient, and better attested, than that of the Anglo-Saxons. Wales was formerly famous for its bards and poets, particularly Thaliessin, who lived about the year 450, and whose works were certainly extant at the time of the Reformation, and clearly evince, that Geoffrey of Monmouth was not the inventor of the history which makes the present Welch the descendants of the ancient Trojans. This poetical genius seems to have influenced the ancient Welch with an enthusiasm for independency, for which reason Edward I. is said to have made a general massacre of the bards; an inhumanity which was characteristic of that ambitious prince. The Welch may be called an unmixed people, as may be proved by their keeping up the ancient hospitality, and their strict adherence to ancient customs and manners. This appears even among gentlemen of fortune, who in other countries commonly follow the stream of fashion. We are not however to imagine, that many of the nobility and gentry of Wales do not comply with the modes and manner of living in England and France. All the better sort of the Welch speak the English language, though numbers of them understand the Welch,

RELIGION.] I have already mentioned the massacre of the Welch clergy by Augustine, the popish apostle of England, because they would not conform to the Romish ritual. Wales, after that, fell under the dominion of petty princes, who were often weak and credulous. The Romish clergy insinuated themselves into their favour, by their pretended power of absolving them from crimes; and the Welch, when their ancient clergy were extinct, conformed themselves to the religion of Rome. The Welch clergy, in general, are but poorly provided for; and in many of the country congregations they preach both in Welch and English. Their poverty was formerly a vast discouragement to religion and learning, but the measures taken by the society for propagating christian knowledge has in a great degree removed the reproach of ignorance from the poorer sort of the Welch. In the year 1749, a hundred and forty-two schoolmasters were employed to remove from place to place for the instruction of the inhabitants; and their scholars amounted to 72,264. No people have distinguished themselves more, perhaps, in proportion to their abilities, than the Welch have done by acts of national munificence. They print at a vast expence, Bibles, Common prayers, and other religious books, and distribute them gratis to the poorer sort. Few of their towns are unprovided with a free school.

either for po

The established religion in Wales, is that of the church of England, but the common people in many places are so tenacious of their ancient customs, that they retain several of the Romish superstitions, and some ancient families among them are still Roman Catholics. It is likewise said, that Wales abounds with Romish priests in disguise. And it is certain, that the principality contains great numbers of protestant dissenters.

FOR BISHOPRICS (See England). We are to observe that in the former times, Wales contained more bishoprics than it does now; and about the time of the Norman invasion, the religious foundations there far exceeded the wealth of all the other parts of the principality.

LEARNING AND LEARNED MEN.] Wales was a seat of learning, at a very early period; but it suffered an eclipse by the repeated massacres of the bards and clergy. Wickliffism took shelter in Wales, when it was persecuted in England. The Welch and Scotch dispute about the nativity of certain learned men, particularly four of the name of Gildas. Giraldus Cambrensis, whose history was published by Camden, was certainly a Welchman; and Leland mentions several learned men of the same country, who flourished before the Reformation. The discovery of the famous king Arthur's and his wife's burying place was owing to some lines of Thelwall, which were repeated before Henry II. of England, by a Welch bard. Since the Reformation, Wales has produced several excellent antiquaries and divines. Among the latter were Hugh Broughton, and Hugh Holland, who was a Roman Catholic, and is mentioned by Fuller in his Worthies. Among the former were several gentlemen of the name of Lluyd, particularly the author of that invaluable work the Archaeologia Rowland, the learned author of the Mona Antiqua, was likewise a Welchman; as was that great statesman and prelate, the lord-keeper Williams, archbishop of York in the time of king Charles I. After all, we must be of opinion, that the great merit of the Welch learning, in former times, lay in the knowledge of the antiquity, language, and history of their own country. Wales, notwithstanding all that Dr. Hicks, and other antiquaries, have said to the contrary, furnished the Anglo Saxons with an alphabet. This is clearly demonstrated by Mr. Lluyd, in his Welch preface to his Archaeologia, and is confirmed by various monumental inscriptions of undoubted authority. (See Rowland's Mona Antiqua). I must not, however, omit the excellent history of Henry VIII. written by lord Herbert of Cheshire.

With regard to the present state of literature among the Welch, it is sufficient to say, that some of them make a considerable figure in the republic of letters, and that many of their clergy are excellent scholars. The Welch Pater-noster is as follows;

Ein Tad, yr bwn wyt yn y nefoedd, sanctiddier dy mw; dewd dy deyrnas; bydded dy newyllus ar y adaeor, meys y mae yn y nefod: dyro i ny beddys ein bara beynyddiol; a madden i ni ein dyledion, fel y maddewen ni i'n dyledwyr; ac nac arwain ni i brofedigaeth, eithr gwared ni rhag drwg: canys eiddot ti yw'r deyrnas, a'r gallu, a'r gogoniant yn eos o'fsoedd. Amen.

CITIES, TOWNS, FORTS, AND OTHER } . Wales contains no cities or
EDIFICES, PUBLIC AND PRIVATE. } towns that are remarkable
either for populousness or magnificence. Beaumaris is the chief town of

Anglesey has a harbour for ships. Brecknock trades in clothing, Cardigan is a large populous town, and lies in the neighbourhood of lead and silver mines. Caerwathen has a large bridge, and is governed by a mayor, two sheriffs, and aldermen, who wear scarlet gowns, and other ensigns of state. Pembroke is well inhabited by gentlemen and tradesmen; and part of the country is so fertile and pleasant, that it is called Little England. The other towns of Wales have nothing particular. I am however to observe that Wales, in ancient times, was a far more populous and wealthy country than it is at present; and though it contains no regular fortifications, yet many of its old castles are so strongly built, and so well situated, that they might be turned into strong forts by a little expence; witness the vigorous defence which many of them made in the civil wars, between Charles I. and his parliament.

ANTIQUITIES AND CURIOSITIES, } Wales abounds in remains of an-
NATURAL AND ARTIFICIAL. } tiquity. Several of its castles
are stupendously large; and in some, the remains of Roman architecture are plainly discernible. The architecture of others is doubtful; and some appear to be partly British, and partly Roman. In Brecknockshire are some rude sculptures, upon a stone six feet high, called the Maiden-stone; but the remains of the Druidical institutions, and places of worship, are chiefly discernible in the isle of Anglesey, the ancient Mona, mentioned by Tacitus, who describes it as being the chief seminary of the Druidical rites and religion. Cherpilly-castle in Glamorganshire is said to have been the largest in Great Britain, excepting Windsor; and the remains of it shew it to have been a most beautiful fabric. One half of a round tower has fallen quite down; but the other overhangs its basis more than nine feet, and is as great a curiosity as the leaning tower of Pisa in Italy.

Among the natural curiosities of this country are the following. At a small village called Newton, in Glamorganshire, is a remarkable spring nigh the sea, which ebbs and flows contrary to the sea. In Merionethshire is Kader Idris, a mountain remarkable for its height which affords variety of Alpine plants. In Flintshire is a famous well, known by the name of St. Wenefred's well, at which, according to the legendary tales of the common people, miraculous cures have been performed. The spring boils with vast impetuosity out of a rock, and is formed into a beautiful polygonal well, covered with a rich arch, supported by pillars, and the roof is most exquisitely carved in stone. Over the spring is also a chapel, a neat piece of Gothic architecture, but in a very ruinous state. King James II. paid a visit to the well of St. Wenefred in 1686, and was rewarded for his piety by a present which was made him of the very shift in which his great grandmother, Mary Stuart, lost her head. The spring is supposed to be one of the finest in the British dominions; and by two different trials and calculations lately made, is found to sling out about twenty-one tons of water in a minute. It never freezes, or scarcely varies in the quantity of water in droughts, or after the greatest rains. After a violent fall of wet, it becomes discoloured by a wheyish tinge. The small town adjoining to the well, is known by the name of Holywell. In Caernarvonshire is a high mountain of Penmanmawr, across the edge of which the public road occasions no small terror to many travellers; from one hand the im-

* The isle of Anglesea, which is the most western county of North Wales, is surrounded on all sides by the Irish sea, except on the south-east, where it is divided from Britain by a narrow strait, called Menai, which in some places may be passed on foot at low water, the island is about 24 miles long, and 18 broad, and contains 74 parishes. It was the ancient seat of the British Druids.

pending precipices when a vessel was 1240 yards high. There is a vessel for travellers.

pendig rock seems ready every minute to crush them to pieces; and the great precipice below, which hangs over the sea, is so hideous, and till very lately, when a wall was raised on the side of the rock, full of danger, that one false step was of dismal consequence. Snowdon hill is by triangular measurement 1240 yards perpendicular height.

There are a great number of pleasing prospects and picturesque views in Wales; and this country is highly worthy the attention of the curious traveller.

COMMERCE AND MANUFACTURES. The Welch are on a footing as to their commerce and manufactures, with many of the northern counties of England. There trade is mostly inland, or with England, into which they import numbers of black cattle. Milfordhaven, which is reckoned the finest in Europe, lies in Pembrokeshire; but the Welch have hitherto reap no great benefit from it, though of late considerable sums have been granted by parliament for its fortification. It lies under two capital disadvantages, the first, that by making it the rendezvous of all the English marine, a bold attempt of an enemy might totally destroy the shipping, however strongly they may be defended by walls and forts. The same objection however lies to every harbour that contains ships of war and merchantmen. The second, and perhaps the chief disadvantage it lies under, is the strong opposition to rendering it the capital harbour of the kingdom, that it must meet with in parliament from the numerous Cornish and West country members, the benefit of whose estates must be greatly lessened by the disuse of Plymouth and Portsmouth, and other harbours. The town of Pembroke employs near 200 merchant ships, and its inhabitants carry on an extensive trade. In Brecknockshire are several woollen manufactures; and Wales in general carries on a great coal trade with England, and even Ireland.

CONSTITUTION AND GOVERNMENT.] Wales was united, and incorporated with England, in the 27th of Henry VIII. when, by act of parliament, the government of it was modelled according to the English form; all laws, customs, and tenures, contrary to those of England, being abrogated, and the inhabitants admitted to a participation of all the English liberties, and privileges, particularly that of sending members to parliament, viz. a knight for every shire, and a burgess for every shire-town, except Merioneth. By the 34th and 35th of the same reign, there were ordained four several circuits for the administration of justice in the said shires, each of which was to include three shires; so that the chief justice of Chester has under his jurisdiction the three several shires of Flint, Denbigh, and Montgomery. The shires of Caernarvon, Merioneth, and Anglesey, are under the justices of North Wales. Those of Caermarthen, Pembrokeshire, and Cardigan, have also their justices; as have likewise those of Radnor, Brecknock, and Glamorgan. By the 18th of queen Elizabeth, one other justice assistant was ordained to the former justices; so that now every one of the said four circuits has two justices, viz. one chief-justice, and a second justice-assistant.

REVENUES.] As to the revenues, the crown has a certain, though small property, in the product of the silver or lead mines; but it is said that the revenue accruing to the prince of Wales from his principality, does not exceed 7 or 8,000l; a-year.

ARMS. The arms of the prince of Wales differ from those of England, only by the addition of a label of three points. His cap, or badge of ostrich feathers, was occasioned by a trophy of that kind, which Edward the Black Prince took from the king of Bohemia, when he was killed at the battle of Poitiers, and the motto is *Ich dien*, I serve. St. David, commonly called

St. Taffy, is the tutelar saint of the Welch, and his badge is a sock, which is worn on his day, the 1st of March, and for which various reasons have been alleged.

HISTORY. The ancient history of Wales is uncertain, on account of the number of petty princes who governed it. That they were sovereign and independent, appears from the English history. It was formerly inhabited by three different tribes of Britons, the Silures, the Demetæ, and the Ordovices. These people cut out so much work for the Romans, that they do not appear ever to have been entirely subdued; yet part of their country, as appears from the ruins of castles, was bridled by garrisons. Though the Saxons, as hath been already observed, conquered the counties of Monmouth and Hereford, yet they never penetrated farther, and the Welch remained an independent people, governed by their own princes and their own laws. About the year 870, Roderic, king of Wales, divided his dominions among his three sons; and the names of these divisions were, Demetia, or South Wales; Powys, or Powis-land; and Venedotia, or North Wales. This division gave a mortal blow to the independency of Wales. About the year 1112, Henry I. of England planted a colony of Flemings on the frontiers of Wales, to serve as a barrier to England, none of the Welch princes being powerful enough to oppose them. They made, however, many vigorous and brave attempts against the Norman kings of England, to maintain their liberties; and even the English historians admit the injustice of their claims. In 1257, the crown of England was first supplied with a handle for the future conquest of Wales; their old and infirm prince Llewella, in order to be safe from the persecutions of his unwholesome son Griffyn, having put himself under subjection and homage to king Henry III.

But no capitulation could satisfy the ambition of Edward I. who resolved to annex Wales to the crown of England; and Llewella, prince of Wales, disdaining the subjection to which old Llewella had submitted, Edward raised an irresistible army at a prodigious expence, with which he penetrated as far as Flint, and taking possession of the isle of Anglesey, he drove the Welch to the mountains of Snowdon, and obliged them to submit to pay a tribute. The Welch, however, made several efforts under young Llewella; but at last, in 1285, he was killed in battle. He was succeeded by his brother David, the last independent prince of Wales, who, falling into Edward's hands through treachery, was by him most barbarously and unjustly hanged; and Edward, from that time pretended that Wales was annexed to his crown of England. It was about this time, probably, that Edward perpetrated the inhuman massacre of the Welch bards. Perceiving that his cruelty was not sufficient to complete his conquest, he sent his queen in the year 1282, to be delivered in Caernarvon castle, that the Welch having a prince born among themselves, might the more readily recognize his authority. This prince was the unhappy Edward II. and from him the title of prince of Wales has always since descended to the eldest sons of the English Kings. The history of Wales and England becomes now the same. It is proper, however to observe, that the kings of England have always found it their interest to soothe the Welch with articular marks of their regard. Their eldest sons not only held the titular dignity, but actually kept a court at Ludlow; and a regular council, with a president, was named by the crown, for the administration of the principality. This was thought so necessary a piece of policy that when Henry VIII. had no son, his daughter Mary was created princess of Wales.

ISLE OF MAN.

THE *Manna* mentioned by Tacitus was the *isle of Anglesæa*, not this island.

Some think it takes its name from the Saxon word *Mann* (or among) because lying in St. George's Channel, it is almost at an equal distance from the kingdoms of England, Scotland and Ireland; but *Manna* seems to have been a general name with the ancients for any detached island. Its length from north to south is rather more than thirty miles, its breadth from eight to fifteen; and the latitude of the middle of the island is fifty-four degrees fifteen minutes north. It is said that on a clear day the three British kingdoms may be seen from this island. The air is wholesome, and the climate, only making an allowance for the situation, pretty much the same as that in the north of England, from which it does not differ much in other respects. The hilly parts are barren, and the champaign fruitful in wheat, barley, oats, rye, flax, hemp, roots, and pulse. The ridge of mountains, which, as it were, divide the island, both protects and fertilises the valleys, where there is good pasturage. The better sort of inhabitants have good sensible horses, and a small kind, which is swift and hardy; nor are they troubled with any noxious animals. The coasts abound with sea-fowl; and the pussins which breed in rabbit holes, are almost a lump of fat, and esteemed very delicious. It is said that this island abounds with iron, lead, and copper mines, though unwrought; as are the quarries of marble, slate, and stone.

The Isle of Man contains seventeen parishes, and four towns on the sea coast. *Calle-town* is the metropolis of the island, and the seat of its government; *Poole* of late years begins to flourish; *Douglas* has the best market and best trade in the island, and is the richest and most populous town, on account of its excellent harbour, and its fine mole, extending into the sea; *Ramsley* has likewise a considerable commerce, on account of its spacious bay, in which ships may ride safe from all winds excepting the north-east. The reader, by throwing his eyes on the map, may see how conveniently this island is situated for being the warehouse of smugglers, which it was till within these few years, to the inexplicable prejudice of his majesty's revenue; and this necessarily leads us to touch upon the history of the island.

During the time of the Scandinavian rovers on the seas, whom I have before mentioned, this island was their rendezvous, and their chief force was here collected; from whence they annoyed the Hebrides, Great Britain, and Ireland. The kings of Man are often mentioned in history; and though we have no regular account of their succession, and know but a few of their names, yet they undoubtedly were for some ages masters of those seas. About the year 1263, Alexander II. king of Scotland, a spirited prince, having defeated the Danes, laid claim to the superiority of Man, and obliged Owen or John, its king, to acknowledge him as lord paramount. It seems to have continued, either tributary or in property of the kings of Scotland, till it was reduced by Edward I. and the kings of England, from that time, exercised the superiority over the islands; though we find it still possessed by the posterity of its Danish princes, in the reign of Edward III. who dispossessed the last queen of the island, and bestowed it on his favourite.

favourite, Montagu, earl of Salisbury. His family honours and estate being forfeited, Henry IV. bestowed Man, and the patronage of the bishoprick, first upon the Northumberland family, and that being forfeited, upon Sir John Stanley, whose posterity, the earls of Derby, enjoyed it, till by failure of heirs male; it devolved upon the duke of Athol, who married the sister of the last lord Derby. Reasons of state rendered it necessary for the crown of Great Britain to purchase the customs and the island from the Athol family; and the bargain was completed by 70,000*l.* being paid to the duke in 1764. The duke, however, retains his territorial property in the island, though the form of its government is altered; and the king has now the same rights, powers, and prerogatives, as the duke formerly enjoyed. The inhabitants, also, retain many of their ancient constitutions and customs.

The established religion in Man is that of the church of England. The bishop of Sodor and Man enjoys all the spiritual rights and pre-eminences of the other bishops, but does not sit in the British house of peers; his see never having been erected into an English barony. One of the most excellent prelates who ever adorned the episcopal character, was Dr. Thomas Wilson, bishop of Man, who presided over that diocese upwards of fifty-seven years, and died in the year 1755, aged ninety-three. He was eminently distinguished for the piety and the exemplariness of his life, his benevolence and hospitality, and his unremitting attention to the happiness of the people entrusted to his care. He encouraged agriculture, established schools for the instruction of the children of the inhabitants of the island; translated some of his devotional pieces into the Manks language, to render them more generally useful to them, and founded parochial libraries in every parish in his diocese. Some of his notions respecting government and church discipline were not of the most liberal kind; but his failings were so few, and his virtues so numerous and conspicuous, that he was a great blessing to the Isle of Man, and an ornament to human nature. Cardinal Fleury had so much veneration for his character, that, out of regard to him, he obtained an order from the court of France, that no privateer of that nation should ravage the Isle of Man.

The ecclesiastical government is well kept up in this island, and the livings are comfortable. The language, which is called the Manks, and is spoken by the common people, is radically Erse, or Irish, but with a mixture of other languages. The New Testament and the Common Prayer Book have been translated into the Manks language. The natives, who amount to above 20,000, are inoffensive, charitable, and hospitable. The better sort live in stone houses, and the poorer in thatched; and their ordinary bread is made of oatmeal. Their products for exportation consist of wool, hides, and tallow; which they exchange with foreign shipping for commodities they may have occasion for from other parts. Before the South promontory of Man, is a little island called the Calf of Man: it is about three miles in circuit, and separated from Man by a channel about two furlongs broad.

This island affords some curiosities which may amuse an antiquary. They consist chiefly of Runic sepulchral inscriptions and monuments, of ancient brass daggers, and other weapons of that metal, and partly of pure gold, which are sometimes dug up, and seem to indicate the splendor of its ancient possessors.

ISLE OF WIGHT.

THIS island is situated opposite the coast of Hampshire, from which it is separated by a channel, varying in breadth from two to seven miles; it is considered as part of the county of Southampton, and is within the diocese of Winchester. Its greatest length, extending from east to west, measures nearly twenty-three miles; its breadth from north to south above thirteen. The air is in general healthy, particularly the southern parts; the soil is various, but so great is its fertility, it was many years ago computed, that more wheat was grown here in one year, than could be consumed by the inhabitants in eight; and it is supposed that its present produce, under the great improvements of agriculture, and the additional quantity of land lately brought into tillage, has more than kept pace with the increase of population. A range of hills, which affords fine pasture for sheep, extends from east to west, through the middle of the island. The interior parts of the island, as well as its extremities, afford a great number of beautiful and picturesque prospects, not only in the pastoral, but also in the great and romantic style. Of these beauties the gentlemen of the island have availed themselves; as well in the choice of the situation of their houses, as in their other improvements. Domestic fowls and poultry are bred here in great numbers; the outward-bound ships and vessels at Spithead, the Mother-bank, and Cowes, commonly furnishing themselves from this island.

Such is the purity of the air, the fertility of the soil, and the beauty and variety of the landscapes of this island, that it has been called the garden of England; it has some very fine gentlemen's seats; and it is often visited by parties of pleasure on account of its delightful scenes.

The island is divided into thirty parishes; and, according to a very accurate calculation made in the year 1777, the inhabitants then amounted to eighteen thousand and twenty-four, exclusive of the troops quartered there. Most of the farm houses are built with stone, and even the cottages appear neat and comfortable, having each its little garden.

The town of Newport stands nearly in the centre of the island, of which it may be considered as the capital. The river Medina empties itself into the channel at Cowes harbour, distant about five miles, and being navigable up to the quay, renders it commodious for trade. The three principal streets of Newport extend from east to west, and are crossed at right angles by three others, all which are spacious, clean, and well paved.

Carisbrook castle, in the Isle of Wight, has been rendered remarkable by the confinement of king Charles I. who, taking refuge here, was detained a prisoner, from November 1647, to September 1648. After the execution of the king, this castle was converted into a place of confinement for his children; and his daughter, the princess Elizabeth, died in it. There are several other forts in this island, which were all erected about the 36th year of the reign of Henry VIII. when many other forts and blockhouses were built in different parts of the coast of England.

The SCILLY ISLES, anciently the SILURES, are a cluster of dangerous rocks, to the number of 140, lying about 30 miles from the Land's End in Cornwall, of which county they were reckoned a part. By their situation between the English Channel and St. George's Channel, they have been the destruction of many ships and lives. Some of the islands are well inhabited, and have large and secure harbours.

In the English Channel are four islands subject to England; these are Jersey, Guernsey, Alderney, and Sark; which, though they lie much nearer to the coast of Normandy than to that of England, are within the diocese of Winchester. They lie in a cluster in Mount St. Michael's bay, between Cape la Hague in Normandy, and Cape Frebelle in Brittany. The computed distance between Jersey and Sark is four leagues; and between that and Guernsey, seven leagues; and between the same and Alderney, nine leagues.

JERSEY, anciently CÆSAREA, was known to the Romans; and lies farthest within the bay, in forty-nine degrees seven minutes north latitude, and in the second degree twenty-six minutes west longitude, 18 miles west of Normandy, and 84 miles south of Portland. The north side is inaccessible through lofty cliffs, the south is almost level with the water; the higher land, the midland part, is well planned, and abounds with orchards, from which is made an incredible quantity of excellent cyder. The vallies are fruitful and well cultivated, and contain plenty of cattle and sheep. The inhabitants neglect tillage too much, being intent upon the culture of cyder, the improvement of commerce, and particularly the manufacture of stockings. The honey in Jersey is remarkably fine; and the island is well supplied with fish and wild fowl almost of every kind, some of both being peculiar to the island, and very delicious.

The island is not above twelve miles in length; but the air is so salubrious, that, in Camden's time, it was said there was here no business for a physician. The inhabitants in number are about 20,000, and are divided into twelve parishes. The capital town is St. Helier, or Hilary, which contains above 400 houses, has a good harbour and castle, and makes a handsome appearance. The property of this island belonged formerly to the Carterets, a Norman family, who have been always attached to the royal interest, and gave protection to Charles II. both when king and prince of Wales, at a time when no part of the British dominions durst recognise him. The language of the inhabitants is French, with which most of them intermingle English words. Knit stockings and caps form their staple commodity, but they carry on a considerable trade in fish with Newfoundland, and dispose of their cargoes in the Mediterranean. The governor is appointed by the crown of England, but the civil administration rests with a bailiff, assisted by twelve jurats. As this island is the principal remains of the duchy of Normandy depending on the kings of England, it preserves the old feudal forms, and particularly the assembly of states, which is as it were a miniature of the British parliament, as settled in the time of Edward I.

GUERNSEY is thirteen miles and a half from south-west to north-east, and twelve and half where broadest, east and west; has only ten parishes, to which there are but eight ministers, four of the parishes being united, and Alderney and Sark, which are appendages of Guernsey, having one apiece. Though this is a much finer island than that of Jersey, yet it is far less valuable because it is not so well cultivated, nor is it so populous. It abounds in cyder; and the inhabitants speak French: but want of firing is the greatest inconveniency that both islands labour under. The only harbour here is at St. Peter le Port, which is guarded by two forts; one called the Old-Castle, and the other Castle-Cornet. Guernsey is likewise part of the ancient Norman patrimony.

ALDERNEY is about eight miles in compass, and is by much the nearest of all these islands to Normandy, from which it is separated by a narrow strait, called the Race of Alderney, which is a dangerous passage in stormy

stormy weather, when the two currents meet; otherwise it is safe, and has depth of water for the largest ships. This island is healthy, and the soil is remarkable for a fine breed of cows.

SARK is a small island depending upon Guernsey; the inhabitants are long lived, and enjoy from nature all the conveniences of life; their number is about 300. The inhabitants of the three last-mentioned islands together, are thought to be about 20,000. The religion of all the four islands is that of the church of England.

I R E L A N D.

SITUATION, BOUNDARIES, AND EXTENT.

THE island of Ireland is situated on the west side of England, between 6 and 10 degrees west longitude, and between 51 and 55 degrees 30 minutes north latitude, or between the middle parallel of the eighth clime, where the longest day is 16½ hours, and the 24th parallel, or the end of the 10th clime, where the longest day is 17½ hours.

The extent or superficial content of this kingdom, is, from the nearest computation and survey, found to be in length 285 miles from Fairhead north, to Millenhead south; and from the east part of Down, to the west part of Mayo, its greatest breadth 160 miles, and to contain 11,067,712 Irish plantation acres, which makes 17,027,864 acres of English statute measure, and is held to bear proportion to England and Wales as 18 to 30. Mr. Templeman, who makes the length 275, and the breadth 150 miles, gives it an area of 27,457 square miles, with 127 inhabitants to each. From the east part of Wexford to St. David's in Wales, it is reckoned 45 miles, but the passage between Donaghadee and Portpatrick in Scotland is little more than 20 miles, and the passage from Holyhead in North Wales about 33 miles.

Names and Divisions. Many conjectures have been formed as to ANCIENT AND MODERN: the Latin (Hibernia), the Irish, (Eriu) as well as the English name of this island. It probably takes its rise from a Phœnician or Gaelic term, signifying the farthest habitation westward.

It is pretty extraordinary, that even modern authors are not agreed as to the divisions of Ireland; some dividing it into five circuits, and some into four provinces, those of Leinster, Ulster, Connaught, and Munster. I shall follow the last division, as being the most common, and likewise the most ancient.

CLIMATE, SEASONS, AND SOIL.] The climate of Ireland differs not much from that of England, excepting that it is more moist, the seasons in general being much wetter. From the reports of various registers it appears, that the number of days on which rain had fallen in Ireland was much greater than in the same years in England. But without the evidence of registers, it is certain, that moisture (even without rain), is not only more characteristic of the climate of this island than that of England, but is also one of the worst and most inconvenient circumstances. This is accounted for in observing, that "the westerly winds, so favourable to other regions, and so benign even in this, by qualifying the rigour of the northern air, are yet hurtful in the extreme. Meeting with no lands on this side of America to break their force, and proving in the general too powerful for the counteraction of the shifting winds from the eastern and African continents, they waft hither the vapours of an immense ocean. By this cause, the sky in Ireland is much obscured; and, from the nature of rest and condensation, these vapours descend in such constant rains, as threaten destruction to the fruits of the earth in some seasons. This unavoidable evil from natural causes is aggravated by the increase of it from others, which are either moral or political. The hand of industry hath been long idle in a country where almost every advantage must be obtained from its labour, and where discouragements on the labourer must necessarily produce a state of languor. Ever since the neglect of agriculture in the ninth century, the zaus of so many ages subsiding on the lower grounds, have converted most of the extensive plains into mossy morasses, and near a tenth part of the beautiful ile is become a repository for stagnated waters, which, in the course of evaporation, impregnate the air with noxious exhalations *.

But in many respects the climate of Ireland is more agreeable than that of England; the

summers being cooler and the winters less severe. The piercing frosts, the deep snows, and the dreadful effects of thunder and lightning, which are so frequently observed in the latter kingdom, are never experienced here.

The dampness above alluded to, being peculiarly favourable to the growth of grass, has been used as an argument why the inhabitants should confine their attention to the rearing of cattle, to the total desertion of tillage, and injurious to the consequent growth of population; but the soil is so infinitely various, as to be capable of almost every species of cultivation, suitable to such latitudes, with a fertility equal to its variety. This is so conspicuous, that it has been observed by a respectable English traveller, that "natural fertility, acre for acre, over the two kingdoms, is certainly in favour of Ireland; of this there can scarcely be a doubt entertained, when it is considered that some of the more beautiful, and even best cultivated counties in England, owe almost every thing to the capital, art and industry of its inhabitants."

We shall conclude this article with the further sentiments of the same author (Mr. Young), whose knowledge of the subject, acquaintance with the kingdom, and candour, are unimpeachable.

"The circumstance which strikes me as the greatest singularity of Ireland, is the rockiness of the soil, which should seem at first sight against that degree of fertility; but the contrary is the fact. Stone is so general that I have good reason to believe the whole island is one vast rock of different strata and kinds rising out of the sea. I have rarely heard of any great depths being sunk without meeting with it. In general it appears on the surface in every part of the kingdom; the flattest and most fertile parts, as Limerick, Tipperary, and Meath, have it at no great depth, almost as much as the more barren ones. May we not recognize in this the hand of bounteous providence, which has given, perhaps, the most stoney soil in Europe to the moister climate in it? If as much rain fell upon the clays in England, (a soil very rarely met with in Ireland, and never without much stone) as falls upon the rocks of her sister island, those lands could not be cultivated. But the rocks here are clothed with verdure; those of lime-stone, with only a thin covering of mould, have the softest and most beautiful turf imaginable.

"The rockiness of the soil in Ireland is so universal, that it predominates in every sort. One cannot use with propriety the terms clay, loam, sand, &c. it must be a stoney clay, a stoney loam, a gravelly sand. Clay, especially the yellow, is much used in Ireland, but it is for want of proper discrimination. I have once or twice seen almost a pure clay upon the surface, but it is extremely rare. The true yellow clay is usually found in a thin stratum, under the surface mould, and over a rock; harsh, tenacious, stoney, strong loams, difficult to work, are not uncommon, but they are quite different from English clays.

"Friable sandy loams, dry, but fertile, are very common, and they form the best soils in the kingdom for tillage and sheep. Tipperary and Roscommon abound particularly in them. The most fertile of all are the bullock-pastures of Limerick, and the banks of the Shannon in Clare, called the Corcaffes. These are a mellow, putrid, friable loam.

"Sand, which is so common in England, and yet more common through France, Germany and Poland, quite from Gibraltar to Petersburg, is nowhere met with in Ireland, except in narrow slips of hillocks, upon the sea-coast. Nor did I ever meet with or hear of a chalky soil.

Be-

" Besides the great fertility of the soil, there are other circumstances, which come within my sphere to mention. Few countries can be better watered by large and beautiful rivers; and it is remarkable that by much the finest parts of the kingdom are on the banks of these rivers. Witness the Suir, Blackwater, the Liffey, the Boyne, the Nore, the Barrow, and part of the Shannon; they wash a scenery that can hardly be exceeded. From the rockiness of the country, however, there are few of them that have not obstructions, which are great impediments to inland navigation.

" The mountains of Ireland give to travelling that interesting variety, which a flat country can never abound with. And, at the same time, they are not in such number as to confer the usual character of poverty, which usually attend them. I was either upon or very near the most considerable in the kingdom. Mangerton, and the Reeks in Kerry; the Galties in Cork; those of Mourne in Down; Crow Patrick and Nephin, in Mayo; these are the principal in Ireland, and they are of a character in height and sublimity which should render them the object of every traveller's attention." The soil, though rocky, is extremely fertile, perhaps beyond that of England itself, when properly cultivated. Pasturage, tillage, and meadow ground abound in this kingdom; but of late tillage was too much discountenanced, though the ground is excellent for the culture of all grains; and in some of the northern parts of the kingdom abundance of hemp and flax are raised, a cultivation of infinite advantage to the linen manufacture. Ireland rears vast numbers of black cattle and sheep, and the Irish wool is excellent. The prodigious supplies of butter and salt provisions (fish excepted) shipped at Cork, and carried to all parts of the world, afford the strongest proofs of the natural fertility of the Irish soil.

The bogs of Ireland are very extensive; that of Allen extends 80 miles, and is computed to contain 300,000 acres. There are others also which are very extensive, and smaller ones scattered over the whole kingdom; but it has been observed, that these are not in general more than are wanted for fuel.

RIVERS, BAYS, HARBOURS, } AND LAKES. } The numerous rivers, enchanting lakes, and creeks, with which Ireland abounds, greatly enrich and beautify this country. The Shannon issues from Lough Allen, in the county of Leitrim, serves as a boundary between Connaught and the three other provinces, and, after a course of 150 miles, forming in its progress many beautiful lakes, it falls into the Atlantic ocean, between Kerry-Point and Loop-head, where it is nine miles broad. The navigation of this river is interrupted by a ridge of rocks spreading quite across it, south of Kilalloe; but this might be remedied by a short canal, at the expence of 10 or 12,000*l.* and communication might also be made with other rivers to the great benefit of the nation. The Ban falls into the ocean near Coleraine: the Boyne falls into St. George's channel at Drogheda, as does the Liffey at the bay of Dublin, and is only remarkable for watering that capital, where it forms a spacious harbour. The Barrow, the Nore, and the Suir water the south part of the kingdom, and; after uniting their streams below Ross, they fall into the Channel, at Waterford haven.

But the bays, havens, harbours, and creeks, which every where indent the coast, form the chief glory of Ireland, and render that country beyond any country in Europe best fitted for foreign commerce. The most considerable are those of Carrickfergus, Strangford, Dundrum, Carlingford, Dundal

Ireland contains a vast number of lakes, or, as they were formerly called, boughs, particularly in the provinces of Ulster and Connaught. Many of them produce large quantities of fine fish: and the great lake Neagh, between the counties of Antrim, Down, and Armagh, is remarkable for its petrifying quality. Some of the Irish lakes afford the most beautiful and romantic prospects, particularly that of Killarney, which takes its name from a small town in the county of Kerry. This lake, which may be divided into three, is entirely surrounded with mountains, rocks and precipices, the immense declivities of which are covered with woods, intermixed with evergreens, from near their tops to the lakes themselves; among which are a number of rivulets trembling over the precipices, some from heights of little less than 300 feet. On the top of one of the surrounding mountains is a small round lake of about a quarter of a mile in diameter, called the Devil's Punch Bowl; From the surface of the lake to the top of the cavity, or brim of the bowl, may be about 300 yards, and when viewed from the circular top has a most astonishing appearance. The depth of it is vastly great, but not unfathomable, as the natives pretend. The discharge of the superfluous waters of this bowl, through a chasm into the middle lake, forms one of the finest cascades in the world, visible for 150 yards. The echoes among the hills surrounding the southern parts of the lake, which is mostly inclosed, are equally delightful and astonishing. The proprietor, the earl of Kenmare, has placed some cannon in the most proper places for the amusement of travellers; and the discharge of these pieces is tremendous, resembling most the rolling of a violent peal of thunder, which seems to travel the surrounding scenery, and die away among the distant mountains. Here also musical instruments, especially the horn and trumpet, afford the most delightful entertainment, and raise a concert superior to that of a hundred performers. Among the vast and craggy heights that surround the lake, is one stupendous and frightful rock, the front of which towards the water is a most horrid precipice, called the *eagle's nest*, from the number of those birds which have their nests in that place.

[INLAND NAVIGATION.] The inland navigation of Ireland is very improvable as appears from the canals that have lately been cut through different parts of the kingdom; one in particular, reaching an extent of 60 miles, between the Shannon and the Liffey at Dublin, which opens a communication from the Channel to the Atlantic ocean. In surveying the grounds for this canal, it was found necessary to carry it through a bog 24 miles over, which from the spongy nature of that soil, became a work of incredible labour and expence, in strengthening the sides, and other works, to prevent falling in.

[MOUNTAINS.] The Irish language has been more happy in distinguishing the size of mountains than perhaps any other. A *knock* signifies a low hill, unconnected with any other eminence; *sierr* marks a craggy high mountain, gradually ascending and continued in several ridges; a *bienn* or *binn* signifies a pinnacle, or mountain of the first magnitude, ending in a sharp or abrupt precipice. The two last are often seen and compounded together in one and the same range. Ireland, however, when compared with some other countries, is far from being mountainous. The mountains of Mourne and Iveagh, in the county of Downe, are reckoned among some of the highest in the Kingdom; of which Sliou Denard has been calculated at a perpendicular height of 1056 yards. Many other mountains

are found in Ireland, but they contain little or nothing particular, if we except the fabulous histories that are annexed to some of them. Some of these mountains contain in their bowels, beds of minerals, coals, stone, slate, and marble, with veins of iron, lead, and copper.

FORESTS.] The chief forests in Ireland are in Leinster, the King's and Queen's counties, and those of Wick and Carlow. In Ulster there are great forests, and in the county of Donegal, and in the north part of Tyrone; also in the country of Fermanagh, along Lough Erne, and in the north part of the county of Down, wherein is some good timber; and the oak is esteemed as good as any of the English growth, and as fit for ship-building.

METALS AND MINERALS.] The mines of Ireland are late discoveries. Several contain silver and lead, and it is said that thirty pounds of their lead-ore produce a pound of silver; but the richest silver mine is at Wicklow. A copper and lead mine have been discovered at Tipperary: as likewise iron-ore, and excellent free-stone for building. In one part of the kingdom is a stream of water, very much impregnated with copper, which yields great quantities of that metal. The method taken to obtain it, is by putting broad plates of iron into a place where the water falls from some height, so that they may receive the whole power of the falling water. The acid, which holds the copper in solution, lets it fall in order to dissolve the iron, to which it has a stronger affinity. On the iron the other metal appears in its proper form, incrusting the plate, and gradually penetrating it; so that at last a plate of copper is left instead of iron. Hence, it is said by the vulgar, that this water has a power of changing iron into copper; but this is a mistake, for the iron is all dissolved and carried down the stream by the acid, which formerly held the copper in solution; while the latter deprived of its solvent, which then rendered it invisible, only makes its appearance when the water lets it fall. Some of the Irish marble quarries contain a kind of porphyry, being red striped with white. Quarries of fine slate are found in most of the counties. The coals that are dug at Kilkenny emit very little smoke; and it contains a crystalline stream which has no sediment. Those peculiarities, with the serenity of the air in that place, have given rise to the well-known proverb that Kilkenny contains fire without smoke, water without mud, and air without fog.

VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.} There is little that falls under this head that is peculiar to Ireland, her productions being much the same as those of England and Scotland. Ireland affords excellent turf and moss, which are of vast service for firing, where wood and coals are scarce. A few wolves were formerly found in Ireland; but they have been long since exterminated by their wolf-dogs, which are much larger than mastiffs, shaped like grey-hounds, yet as gentle and governable as spaniels. What I have already observed about the Irish exportation of salt provisions, sufficiently evinces the prodigious number of hogs and sheep, as well as black cattle, bred in that kingdom. Rabbits are said to be more plentiful there than in England. The fish that are caught upon the coasts of Ireland are likewise in greater plenty than on those of England, and some of them larger and more excellent in their kind.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.} Ireland is said to contain two millions and a half of inhabitants; but I suspect that the calculation is overcharged by near half a million. As it is of great consequence to ascertain as near as possible the

number of inhabitants of Ireland of both religions, we shall give them according to the best accounts, as they stood in the four provinces in 1733 :

	Protestant Families.	Popish Families.
In Ulster	62,620	38,459
Leinster	25,238	92,424
Munster	13,337	106,407
Connaught	4,299	44,133
Total	105,494	281,423

which, at five to each family in the country, and ten for Dublin, and seven for Cork city, makes in all 2,015,229 souls. I am apt to think, when we consider the waste of war by sea and land, and the vast emigrations of the Irish to England, the British colonies, and other nations, that the above calculation may nearly serve for the present times, though the balance of number is certainly greatly risen on the side of Protestantism; and in some late debates in the Irish parliament, it has been asserted, that the number of inhabitants of Ireland amount to three millions; it is probable they are now considerably above this number.

As to the manners of the ancient Irish, Dr. Leland observes, that if we make our enquires on this subject in English writers, we find their representations odious and disgusting: if from writers of their own race, they frequently break out into the most animated encomiums of their great ancestors. The one can scarcely allow them any virtue: the other, in their enthusiastic ardour, can scarcely discover the least imperfection in their laws, government, or manners. The historian of England sometimes regards them as the most detestable and contemptible of the human race. The antiquary of Ireland raises them to an illustrious eminence, above all other European countries. Yet, when we examine their records, without regard to legendary tales or poetic fictions, we find them, even in their most brilliant periods, advanced only to an imperfect civilization; a state which exhibits the most striking instances both of the virtues and the vices of humanity.

With respect to the present descendants of the old Irish, or as they are termed by the Protestants, the *mere Irish*, they are generally represented as an ignorant, uncivilized, and blundering sort of people. Impatient of abuse and injury, they are implacable and violent in all their affections; but quick of apprehension, courteous to strangers, and patient of hardships. Though in these respects there is, perhaps, little difference between them and the more uninformed part of their neighbours, yet their barbarisms are more easy to be accounted for, from accidental than natural causes. By far the greater number of them are Papists, and it is the interest of their priests, who govern them with absolute sway, to keep them in the most profound ignorance. They have also laboured under many discouragements, which in their own country have prevented the exertion both of their mental and bodily faculties; but when employed in the service of foreign princes; they have been distinguished for intrepidity, courage, and fidelity. Many of their surnames have an *O*, or *Mac*, placed before them, which signify grandson and son; formerly the *O* was used by their chiefs only, or such as piqued themselves on the antiquity of their families. Their music is the bagpipe, but their tunes are generally of a melancholy strain; though some of their latest airs are lively; and when sung by an Irishman are extremely diverting. The old Irish is generally spoken in the interior parts of the kingdom, where some of the old uncouth customs still

prevail, particularly their funeral howlings; but this custom may be traced in many countries of the continent. Their custom of placing a dead corpse before their doors, laid out upon tables, having a plate upon their body to excite the charity of passengers, is practised even in the skirts of Dublin, though one would wish to see it abolished. Their convivial meeting on Sunday afternoon, with dancing to the bagpipe, and more often quarrelling among themselves, is offensive to every stranger. But, as we have already observed, these customs are chiefly confined to the more unpolished provinces of the kingdom, particularly Connaught; the common people there having the least sense of law and government of any in Ireland, excepting their tyrannical landlords or leaseholders, who squeeze the poor without mercy. The common Irish, in their manner of living, seem to resemble the ancient Britons, as described by Roman authors, or the present Indian inhabitants of America. Mean huts or cabins built of clay and straw, partitioned in the middle by a wall of the same materials, serve the double purposes of accommodating the family, who live and sleep promiscuously, having their fires of turf in the middle of the floor, with an opening through the roof for a chimney; the other being occupied by a cow, or such pieces of furniture as are not in immediate use.

Their wealth consists of a cow, sometimes a horse, some poultry, and a spot for potatoes. Coarse bread, potatoes, eggs, milk, and sometimes fish, constitute their food; for however plentifully the fields may be stocked with cattle, these poor natives seldom taste butchers meat of any kind. Their children, plump, robust, and hearty scarcely known the use of cloaths, and are not ashamed to gaze upon strangers, or make their appearance upon the roads, in that primitive manner.

In this idle and deplorable state, many thousands have been lost to the community and to themselves, who, if they had but an equal chance with their neighbours, of being instructed in the real principles of Christianity, and been enured and encouraged to industry and labour, would have added considerable strength to government. The Spaniards and French, particularly the latter, have not failed to avail themselves of the uncomfortable situation in which the Irish were at home, by alluring them to enter their service and in this they have hitherto been assisted by priests and jesuits, whose interest it was to infuse into the minds of their credulous disciples an aversion to the British government: but we have now the pleasing prospect of a happy reformation among these people, in consequence of the late laws passed by the parliament of Great Britain in favour of Ireland, as well as from the numerous English protestant working schools lately established over the kingdom; which institution will undoubtedly strike deeper at the root of popery, than all the endeavours of the British monarchs to reduce them.

The descendants of the English and Scots, since the conquest of Ireland by Henry II. though not the most numerous, form the wealthiest part of the nation. Of these are most of the nobility, gentry, and principal traders, who inhabit the eastern and northern coasts, where most of the trade of Ireland is carried on; especially Belfast, Londonderry, and other parts of the province of Ulster, which, though the poorest soil, is, next to Dublin and its neighbourhood, by far the best cultivated and most flourishing part of the kingdom. Here a colony of Scots in the reign of James I. and other Presbyterians, who fled from persecution in that country in the succeeding reigns, planted themselves and established that great staple of Irish wealth, the linen manufactory, which they have since carried on and brought to the utmost perfection. From this short review, it appears, that the present

Inhabitants are composed of three distinct classes of people; the old Irish, poor, ignorant, and depressed, who inhabit, or rather exist, upon the interior and western parts; the descendants of the English, who inhabit Dublin, Waterford, and Cork, and who gave a new appearance to whole coast facing England, by the introduction of arts, commerce, science, and more liberal and cultivated ideas of the true God and primitive Christianity; thirdly, emigrants from Scotland in the northern provinces, who, like the others, are so zealously attached to their own religion and manner of living, that it will require some ages before the inhabitants of Ireland are so thoroughly consolidated and blended as to become one people. The gentry, and better sort of the Irish nation, in general differ little in language, dress, manners, and customs, from those of the same rank in Great Britain, whom they imitate. Their hospitality is well known; but in this they are sometimes suspected of more ostentation than real friendship.

[RELIGION.] The established religion and ecclesiastical discipline of Ireland is the same with that of England. Among the bulk of the people in the most uncultivated parts, popery, and that too of the most absurd, illiberal kind, is prevalent. The Irish papists still retain their nominal bishops and dignitaries, who subsist on the voluntary contributions of their votaries. But even the blind submission of the latter to their clergy, does not prevent Protestantism from making a very rapid progress in the towns and communities. How far it may be the interest of England, that some kind of balance between the two religions should be kept up, I shall not here enquire.

Ireland contains at least as many sectaries as England, particularly Presbyterians, Baptists, Quakers, and Methodists, who are all of them connived at or tolerated. Great efforts have been made, ever since the days of James I. in erecting free-schools for civilizing and converting the Irish Papists to Protestantism. The institution of the incorporated society for promoting English Protestant working-schools, though of no older date than 1717, has been amazingly successful, as have many institutions of the same kind, in introducing industry and knowledge among the Irish; and no country in the world can shew greater public spirited efforts than have been made by the government of Ireland, since that time, for these purposes; but many of the parliamentary grants of this kind have been trifled with and perverted.

[ARCHBISHOPRICS AND BISHOPRICS.] The archbishoprics are four; Armagh, Dublin, Cashel, and Tuam.

The bishoprics are eighteen, viz. Clogher, Clonfert, Cloyne, Cork, Derry, Down, Dromore, Elphin, Kildare, Killala, Kilmore, Killaloe, Leighlin, Limerick, Meath, Ossory, Raphoe, and Waterford.

[LANGUAGE.] The language of the Irish is fundamentally the same with the British and Welch, and a dialect of the Celtic, which is made use of by the Scotch Highlanders, opposite the Irish coasts. It is, however, in a great measure defaced by provincial alterations, but not so altered as to render the Irish, Welch, and Highlanders, unintelligible to each other. The usage of the Irish language, occasions among the common people, who speak both that and the English, a disagreeable tone in speaking, which diffuses itself among the vulgar in general, and even among the better sort, who do not understand Irish. It is probable, however, that a few ages hence the latter will be accounted among the dead languages.

[LEARNING AND LEARNED MEN.] Learning seems to have been culti-

vated in Ireland at a very early period. Mr. O'Halloran says, that the Irish 'appear to have been, from the most remote antiquity, a polished people, and that with propriety they may be called, the Fathers of Letters.' We are even told, that Egypt received arts and letters from Niulus the Phœnician, who is represented as the great ancestor of the Irish nation. But these accounts are considered by many as fabulous: and it has been observed that no literary monuments have yet been discovered in Ireland earlier than the introduction of Christianity into this country; and that the evidence of any transaction previous to this period, rests entirely on the credit of Christian writers, and their collections from old poets, or their transcripts of records deemed to have been made in the times of Paganism.

It is said, that when St. Patrick * landed in Ireland, he found many holy and learned Christian preachers there, whose votaries were pious and obedient. Camden observes, that, 'the Irish scholars of St. Patrick profited so notably in Christianity, that, in the succeeding age, Ireland was termed *Sanctorum Patria*. Their monks so greatly excelled in learning and piety, that they sent whole flocks of most learned men into all parts of Europe, who were the first founders of Lieuxeu abbey, in Burgundy; of the abbey Bobie, in Italy; of Wirtzburgh, in Franconia; St. Gall, in Switzerland; and of Malmbsury, Lindisfarran, and many other monasteries, in Britain.' We have also the testimony of venerable Bede, that about the middle of the seventh century, many nobles, and other orders of the Anglo-Saxons, retired from their own country into Ireland, either for instruction, or for an opportunity of living in monasteries of stricter discipline; and that the Scots (as he styles the Irish) maintained them, taught them, and furnished them with books, without fee or reward: 'a most honourable testimony,' says lord Lyttleton, 'not only to the learning, but likewise to the hospitality and bounty of that nation.' Dr. Leland remarks, that a conflux of foreigners to a retired island, at a time when Europe was in ignorance and confusion, gave peculiar lustre to this seat of learning: nor is it improbable or surprising, that seven thousand students studied at Armagh, agreeable to the accounts of Irish writers, though the seminary of Armagh was but one of those numerous colleges erected in Ireland.

In modern times, the Irish have also distinguished themselves in the republic of letters. Archbishop Usher does honour to literature itself. Dean Swift, who was a native of Ireland, has perhaps never been equalled in the walks of wit, humour, and satire. The sprightliness of Farquhar's wit is well known to all lovers of the drama. And among the men of distinguished talents whom Ireland has lately produced, may also be particularly mentioned Sir Richard Steele, bishop Berkely, Parnel, Sterne, and Goldsmith.

UNIVERSITY.] Ire: l contains but one university, which is denominated Trinity college. It consists of two squares, in the whole of which are thirty-three buildings, of eight rooms each. Three sides of one of the squares are of brick, and the fourth is a very superb library, but being built of bad stone, it is unfortunately mouldering away. The inside is beautiful and commodious, and embellished with the busts of several ancient and modern worthies. A great part of the books on one side were collected by archbishop Usher, who was one of the original members of this body, and the most learned man it ever produced. The new square, three sides of which have been built

* It has been affirmed, that St. Patrick was a Scotchman; but Mr. O'Halloran denies this, and says, that it appears from the most authentic records, that Patrick was from Wales.

within about twenty years, by parliamentary bounty, and from thence called Parliament Square, is of hewn stone; and the front of it next the city of Dublin, is ornamented with pilasters, festoons, &c. The provost's house has an elegant little front, entirely of Portland stone. The chapel is a very mean structure, as is also the old hall, wherein college exercises are performed; but the new hall in which the members of the college dine, is a fair and large room. In their museum, is a set of figures in wax, representing females in every state of pregnancy. They are done upon real skeletons, and are the labours of almost a whole life of a French artist.

This seminary was founded and endowed by queen Elizabeth; but the original foundation consisted only of a provost, three fellows, and three scholars which has from time to time been augmented to twenty-two fellows, seventy scholars, and thirty sizers. However, the whole number of students is at present about four hundred; who are of three classes, fellow-commoners, pensioners, and sizers or servitors. Of the fellows, seven are called seniors; and the annual income of each of these is about seven hundred pounds. The provostship is supposed to be worth three thousand pounds a year. Trinity college has a power of conferring degrees of bachelors, masters, and doctors, in all the arts and faculties. The visitors are, the chancellor or vice-chancellor, and the archbishop of Dublin.

ANTIQUITIES AND CURIOSITIES. } I have already mentioned the wolf-

NATURAL AND ARTIFICIAL. } dogs in Ireland. The Irish goshaws and gerfalcons are celebrated for their shape and beauty. The moose-deer is thought to have been formerly a native of this island, their horns being sometimes dug up of so great a size, that one part has been found near eleven feet from the tip of the right horn to the tip of the left; but the greatest natural curiosity in Ireland is the Giant's Causeway in the county of Antrim, about eight miles from Colerain, which is thus described by Dr. Pococke, late bishop of Ossory, a celebrated traveller and antiquary. He says, "that he measured the most westerly point at high water, to the distance of 360 feet from the cliff; but was told, that at low water it extended 60 feet farther upon a descent, till it was lost in the sea. Upon measuring the eastern point, he found it 540 feet from the cliff; and saw as much more of it as of the other, where it winds to the east, and is, like that, lost in the water.

The causeway is composed of pillars all of angular shapes, from three sides to eight. The eastern point, where it joins the rock, terminates in a perpendicular cliff, formed by the upright sides of the pillars, some of which are thirty-three feet four inches high. Each pillar consists of several joints or stones, lying one upon another, from six inches to about one foot in thickness; and what is very surprising, some of these joints are so convex, that their prominences are nearly quarters of spheres, round each of which is a ledge, which holds them together with the greatest firmness, every stone being concave on the other side, and sitting in the exactest manner the convexity of the upper part of that beneath it. The pillars are from one to two feet in diameter, and generally consist of about forty joints, most of which separate very easily and one may walk along upon the tops of the pillars as far as to the edge of the water.

"But this is not the most singular part of this extraordinary curiosity, the cliffs themselves being still more surprising. From the bottom, which is of black stone, to the height of about sixty feet, they are divided at equal distances by stripes of a reddish stone, that resembles a cement, about four inches in thickness; upon this there is another stratum of the same black stone, with a stratum of five inches thick of the red. Over this is another stratum

stratum ten feet thick, divided in the same manner; then a stratum of the red stone twenty-feet deep, and above that a stratum of upright pillars; above these pillars lies another stratum of black stone, twenty feet high; and, above this again, another stratum of upright pillars, rising in some places to the tops of the cliffs, in others not so high, and in others again above it, where they are called the chimneys. The face of these cliffs extends about three English miles.

The cavities, the romantic prospects, cataracts, and other pleasing and uncommon natural objects to be met with in Ireland, are too numerous to be called rarities, and several pamphlets have been employed in describing them.

As to the artificial rarities in Ireland, the chief are the round Pharos, or stone-towers, found upon the coasts, and supposed to be built by the Danes and Norwegians in their piratical incursions, who made use of them as spy-towers or barbacans, light houses or beacons.

CITIES, TOWNS, FORTS, AND OTHER EDIFICES, PUBLIC AND PRIVATE. } Dublin, the capital of Ireland, is in magnitude and the number of inhabitants, the second city in the British dominions; much about the size of Stockholm, Copenhagen, Berlin, and Marseilles, and is supposed to contain near 200,000 inhabitants. It is situated 270 miles northwest of London, and near sixty miles west from Holyhead in North Wales, the usual station of the passage vessels between Great Britain and Ireland. Dublin stands about seven miles from the sea, at the bottom of a large and spacious bay, to which it gives name, upon the river Liffey, which divides it almost into two equal parts, and is banked in through the whole length of the city, on both sides, which form spacious and noble quays, where vessels below the first bridge load and unload before the merchants' doors and warehouses. A stranger upon entering the bay of Dublin, which is about seven miles broad, and in stormy weather extremely dangerous, is agreeably surprised with the beautiful prospect on each side, and the distant view of Wicklow mountains; but Dublin, from its low situation, makes no great appearance. The increase of Dublin, within these last twenty years, is incredible, and it is generally supposed that 7000 houses have been added to the city and suburbs since the reign of queen Anne. The number of houses in the year 1777, was 17,151, and there have been many new buildings erected since. This city, in its appearance, bears a near resemblance to London. The houses are of brick; the old streets are narrow and mean, but the new streets are as elegant as those of the metropolis of Great Britain. Sackville-street, which is sometimes called the Mall, is particularly noble. The houses are elegant, lofty, and uniformly built, and a gravel walk runs through the whole, at an equal distance from the sides.

The river Liffey, though navigable for the sea vessels, as far as the custom-house, or centre of the city, is but small when compared with the Thames of London. Over it are two handsome bridges, lately built of stone, in imitation of that at Westminster, and there are three others that have little to recommend them. Formerly the centre of Dublin, towards the customhouse was crowded and inconvenient for commercial purposes; but of late, a new street has been opened, leading from Essex-bridge to the castle, where the lieutenant resides. A new Exchange has been lately erected, an elegant structure of white stone, richly embellished with semi-columns of the Corinthian order, a cupola, and other ornaments.

The barracks are pleasantly situated on an eminence near the river. They consist of four large courts, in which are generally quartered four battalions of foot, and one regiment of horse; from hence the castle and city garrisons are

are relieved daily. They are said to be the largest and completest building of the kind in Europe, being capable of containing 3000 foot and 100 horse.

The linen hall was erected at the public expence, and opened in the year 1728, for the reception of such linen cloths as were brought to Dublin for sale, for which there are convenient apartments. It is entirely under the direction of the trustees for the encouragement of the linen manufactory of Ireland, who are composed of the lord chancellor, the primate, the archbishop of Dublin, and the principal part of the nobility and gentry. This national institution is productive of great advantages, by preventing many frauds which otherwise would be committed in a capital branch of trade, by which many thousands are employed, and the kingdom greatly enriched.

Stephen's Green is a most extensive square, round which is a gravel walk of near a mile. Here genteel company walk in the evenings, and on Sundays after two o'clock, and in fine weather make a very gay appearance. Many of the houses round the Green are very stately, but a want of uniformity is observable throughout the whole. Ample amends will be made for this defect by another spacious square near Stephen's Green, now laid out and partly built. The houses being lofty, uniform, and carried on with stone as far as the first floor, will give the whole an air of magnificence, not exceeded by any thing of the kind in Britain, if we except Bath. The front of Trinity-college, extending above 3000 feet, is built of Portland stone in the finest taste.

The parliament house was begun in 1729, and finished in 1739, at the expence of 40,000l. This superb pile was in general of the Ionic order, and was justly accounted one of the foremost architectural beauties. The portico in particular was, perhaps, without parallel; the internal parts had also many beauties, and the manner in which the building was lighted, has been much admired. This superb building, on the 27th of February 1792 was observed to be in flames, about 5 o'clock in the afternoon, when the house of Lords, as well as the Commons was sitting, and in full debate. When the alarm was given, one of the members made his way to the roof, and looking down into the house from one of the ventilators, confirmed the apprehensions of those within, by saying the dome was surrounded by fire, and would tumble into the house in five minutes. The volume of fire, by which the dome was surrounded, soon made apertures on all sides, by melting the copper from the wood-work, and thus exhibiting the cavity of the dome filled with flames like a large furnace, which at about half past six tumbled into the house with one great crash. The valuable library, and all the papers of importance, were saved.

But one of the greatest and most laudable undertakings that this age can boast of, is the building a stone wall about the breadth of a moderate street, and of a proportionable height, and three miles in length, to confine the channel of the bay, and to shelter vessels in stormy weather.

The civil government of Dublin is by a lord-mayor, &c. the same as in London. Every third year, the lord mayor, and the twenty-four companies, by virtue of an old charter, are obliged to perambulate the city, and its liberties, which they call riding the Franchises. Upon this occasion the citizens vie with each other, in shew and ostentation, which is sometimes productive of disagreeable consequences to many of their families. In Dublin there are two large theatres, that are generally well filled, and which serve as a kind of nursery to those in London. In this city are 18 parish churches,

8 chapels, 3 churches for French, and 1 for Dutch protestantes, 7 presbyterian meeting houses, 1 for methodists, 2 for quakers, and 16 Roman catholic chapels. A royal hospital, like that at Chelsea, for invalids; a lying-in-hospital, with gardens, built and laid out in the finest taste; an hospital for lunatics, founded by the famous Dean Swift, who himself died a lunatic; and sundry other hospitals for patients of every kind. Some of the churches have been lately rebuilt, and others are rebuilding in a more elegant manner. And, indeed, whatever way a stranger turns himself in this city, he will perceive a spirit of elegance and magnificence; and if he extends his view over the whole kingdom, he will conclude that works of ornament and public utility in Ireland, almost keep pace with those erecting, great as they are, over the different parts of Great Britain. For it must be acknowledged that no nation in Europe, comparatively speaking, has expended such sums as the grants of the Irish parliament, which has been, and continues to be, the life and soul of whatever is carried on; witness the many noble erections, churches, hospitals, bridges; the forming of harbours, public roads, canals, and other public and private undertakings.

It has, however, been matter of surprize, that with all this spirit of national improvement, few or no good inns are to be met with in Ireland. In the capital, which may be classed among the second order of cities of Europe, there is not one inn which deserves that name. This may, in some measure, be accounted for, by the long, and sometimes dangerous passage from Cheller and Hollyhead to Ireland, which prevents the gentry of England, with their families, from visiting that island; but as it is now proposed to make turnpike roads to Portpatrick in Scotland, from whence the passage is short and safe, the roads of Ireland; may by this means, become more frequented, especially when the rural beauties of that kingdom are more generally known. For though in England, France, and Italy, a traveller meets with views the most luxuriant and rich, he is sometimes cloyed with a sameness that runs through the whole: but in those countries of North Britain and Ireland, the rugged mountains, whose tops look down upon the clouds, and extensive lakes, enriched with bushy islands, the cavities, glens, cataracts, the numerous feathered creation, hopping from cliff to cliff, and other pleasing and uncommon natural objects, that frequently present themselves in various forms and shapes, have a wonderful effect upon the imagination, and are pleasing to the fancy of every admirer of nature, however rough and unadorned with artificial beauties.

Cork is deservedly reckoned the second city in Ireland; in magnitude, riches, and commerce. It lies 129 miles south-west of Dublin, and contains above 8500 houses. Its haven is deep, and well sheltered from all winds; but small vessels only can come up to the city, which stands about seven miles up the river Lee. This is the chief port of merchants in the kingdom; and there is, perhaps, more beef, tallow, and butter shipped off here, than in all the other ports of Ireland put together. Hence there is a great resort of ships to this port, particularly of those bound from Great Britain to Jamaica, Barbadoes, and all the Caribbee islands, which put in here to victual and complete their lading. It appears, that in the reign of Edward IV. there were 11 churches in Cork; though there are now only seven, and yet it has ever since that time been esteemed a thriving city; but it must be observed, that besides the churches, there are at this time six mass-houses, two dissenting meeting-houses, another for quakers, and a chapel for French protestants. Kinsale is a populous and strong town, with an excellent harbour, and considerable commerce and shipping; and it is, moreover, occasionally a station for the navy royal; for which end this port is furnished with proper naval officers

and storekeepers. Waterford is reckoned next to Cork for riches and shipping, and contains 2561 houses. It is commanded by Duncannon Fort, and on the west side of the town is a citadel. Limerick is a handsome, populous, commercial, strong city; it lies on both sides the Shannon, and contains 5257 houses.

Belfast is a large sea-port and trading town at the mouth of the Lagen water, where it falls into Carrickfergus Bay. Downpatrick has a flourishing linen manufacture, Carrickfergus (or Knoekfergus) by some deemed the capital town of the province, has a good harbour and castle, but little commerce. Derry (or Londonderry, as it is most usually called) stands on Lough-Foyl, is a strong little city, having linen manufactures, with some shipping. All this extreme north part of Ireland is situated so near to Scotland, that they are in sight of each others coasts. Donegal, the county-town of the same name (otherwise called the county of Tyrconnel); is a place of some trade; as is likewise Enniskilling. All which last mentioned places, and many more (though less considerable ones), are chiefly and most industriously employed in the manufacturing of linen and linen thread, to the benefit of the whole kingdom, which, by its vast annual exportations of linen into England, is enabled to pay for the great annual importations from England into Ireland; and likewise to render the money constantly drawn from Ireland into England, by her absentees, less grievous to her.

Though Ireland contains no strong places, according to the modern improvements in fortification, yet it has several forts and garrisons, that serve as comfortable sinecures to military officers. The chief are Londonderry and Culmore Fort, Cork, Limerick, Kinsale, Duncannon, Ross-Castle, Dublin, Charlemont, Galway, Carrickfergus, Maryborough, and Athlone. Each of these forts are furnished with deputy governors, under various denominations, who have pecuniary provisions from the government.

It cannot be pretended, that Ireland is as yet furnished with any public edifices, to compare with those to be found in countries where sovereigns and their courts reside; but it has some elegant public buildings, which do honour to the taste and public spirit of the inhabitants. The castle, Essex-bridge, and several edifices about Dublin, already mentioned, are magnificent; and elegant pieces of architecture, and many noble Gothic churches and other buildings, are to be seen in Ireland.

The Irish nobility, and gentry of fortune, now vie with those of England in the magnificent structure of their houses, and the elegance of their ornaments; but it would be unjust, where there are so many equal in taste and magnificence, to particularize any. In speaking of the public buildings of this kingdom, I must not forget the numerous barracks where the soldiers are lodged, equally to the ease and convenience of the inhabitants.

COMMERCE AND MANUFACTURES.] What I have said of England under this head, is in a great measure applicable to Ireland. Her exports are linen-cloth, yarn, lavns, and cambrics, horses, and black cattle, beef, pork, green hides; tanned leather, calf skins dried, tallow, butter, candles, cheese, ox and cow-horns, ox-hair, horse-hair, lead, copper-ore, herrings, dried fish, rabbit-skins, and fur, otter-skins, goat-skins, salmon, and some other particulars; but it is probable that the exports of Ireland will be greatly increased by the late laws passed in favour of the trade of that kingdom. It is certain that the Irish have carried their inland manufactures, even those of luxury, to a considerable height, and that their lord lieutenants, and their courts have of late encouraged them by their examples, and, while they are in that government, make use of no other.

PUBLIC TRADING COMPANIES.] Of these I know none in Ireland, as the bankers cannot be admitted as such: neither can the Dublin Society for the encouragement of manufactures and commerce, which was incorporated in 1750. The linen-hall, however, that is erected at Dublin, is under as just and nice regulations, as any commercial house in Europe.

CONSTITUTION AND GOVERNMENT.] Ireland formerly was only entitled, the dominion or lordship of Ireland, and the king's style was no other than Dominus Hiberniæ, lord of Ireland, till the 33d. year of king Henry VIII. when he assumed the title of king, which is recognised by act of parliament in the same reign. But as England and Scotland are now one and the same kingdom, and yet differ in their municipal laws; so England and Ireland are distinct kingdoms, and yet in general agree in their laws. For after the conquest of Ireland by king Henry II. the laws of England were received and sworn to by the Irish nation, assembled at the council of Lismore. And as Ireland, thus conquered, planted, and governed, continued in a state of dependence, it was thought necessary that it should conform to, and be obliged by, such laws as the superior state thought proper to prescribe.

But this state of dependence being almost forgotten, and ready to be dissolved by the Irish nation, it was thought necessary, some years ago, to declare how that matter stood; and therefore, by statute 6th of George I. it is declared, "that the kingdom of Ireland ought to be subordinate to, and dependent upon the imperial crown of Great Britain, as being inseparably united thereto; and that the king's majesty, with the consent of the lords and commons of Great Britain, in parliament, hath power to make laws to bind the people of Ireland." This determination of the British parliament, was, however, far from giving general satisfaction to the Irish nation, many of whom disputed the dependency of Ireland upon the parliament of Great Britain more than ever. After many struggles, feeling their own strength by means of their volunteer associations, and encouraged and favoured by the several parties contending for the administration in England; the Irish obtained, in the year 1782, a formal repeal of the above galling statute, which was considered as a renunciation on the part of the parliament of Great Britain of every claim of legislation over Ireland.

The constitution of the Irish government, as it stands at present, with regard to distributive justice, is nearly the same with that of England. A chief governor, who generally goes by the name of lord lieutenant, is sent over from England by the king, whom he represents; but his power is in some measure restrained, and in others enlarged, according to the king's pleasure, or the exigency of the times. On his entering upon this honourable office, his letters patent are publicly read in the council-chamber; and having taken the usual oaths before the lord chancellor, the sword, which is to be carried before him, is delivered into his hands, and he is seated in the chair of state, attended by the lord chancellor, the members of the privy council, the peers and nobles, the king at arms, a serjeant at mace, and other officers of state; and he never appears publicly without being attended by a body of horse-guards. Hence, with respect to his authority, his train and splendor, there is no viceroy in Christendom that comes nearer to the grandeur and majesty of a king. He has a council composed of the great officers of the crown; namely, the chancellor, treasurer, and such of the archbishops, bishops, earls, barons, judges, and gentlemen, as his majesty is pleased to appoint. The parliament here, as well as in England, is the

supreme court, which is convened by the king's writ, and generally sits once every year. It consists, as in England, of a house of lords and commons. Of the former, many are English or British peers, or commons of Great Britain; a few are papists, who cannot sit without being properly qualified; and the number of commons amount to about three hundred. Since the accession of his present majesty, Irish parliaments have been rendered octennial. The representation of the people in the senate of Ireland, is in many instances like that of England, partial and inadequate. As long as a majority of the commons is composed of members for insignificant boroughs, and where a few individuals are devoted to the selfish or imperious will of a still smaller number of lords or absolute grandees, a spirit of venality must pervade the political system through all the departments of state, corrupt the representatives, and destroy the freedom of the legislative body. If parliaments were still more limited in their duration, it would be better for the public, and greatly promote national prosperity. The laws are made by the house of lords and commons, after which they are sent to England for the royal approbation; when, if approved of by his majesty and council, they pass the great seal of England, and are returned.

For the regular distribution of justice, there are also in Ireland four terms held annually for the decision of causes; and four courts of justice, the chancery, king's bench, common-pleas, and exchequer. The high sheriffs of the several counties were formerly chosen by the people, but are now nominated by the lord lieutenant. From this general view it appears, that the civil and ecclesiastical institutions are almost the same in Ireland as in England.

REVENUES.] In Ireland the public revenue arises from hereditary and temporary duties, of which the king is the trustee, for applying it to particular purposes; but there is besides this, a private revenue arising from the ancient demesne lands, from forfeitures for treason and felony, prisage of wines, light-house duties, and a small part of the casual revenue, not granted by parliament; and in this the crown has the same unlimited property that a subject has in his own freehold. The extent of that revenue is perhaps a secret to the public.

The revenue of Ireland is supposed at present to exceed half a million sterling, of which the Irish complain greatly and justly, that about 70,000*l.* is granted in pensions, and a great part to absentees. Very large sums are also granted by their own parliament for more valuable purposes, the improvement of their country and civilizing the people; such as the inland navigation, bridges, highways, churches, premiums, protestant schools, and other particulars, which do honour to the wisdom and patriotism of that parliament.

COINS.] The coins of Ireland are at present of the same denominations and the like fabric with those of England, only an English shilling passes in Ireland for thirteen pence. What the ancient coins of the Irish were, is at present a matter of mere curiosity and great uncertainty.

MILITARY STRENGTH.] Ireland now maintains and pays a considerable body of troops who have been often of singular service to England; and the military force of Ireland has been greatly increased by the many volunteer associated companies of yeomanry, which have been lately formed in that kingdom; these have been highly beneficial in quelling the late rebellion which was raised there. Those parts of Ireland that are most uncultivated, contain numbers of inhabitants that have very little sense either of divine or human laws, and regular forces are absolutely necessary for keeping them in order;

witness the insurrections of the Whiteboys, and other banditti, who were instigated by their priests; and the late atrocious rebellion, marked with such circumstances of unprincipled and diabolical cruelty, as are a disgrace to humanity; though it must be confessed that many of the common people in Ireland have laboured under such oppressions as afforded them just grounds for discontent. It does not however, appear, that the bulk of the Irish Catholics are fond of a revolution in government.

ORDER OF ST. PATRICK. This order was instituted February 5, and the installation of the first knights was performed on the 17th of March, 1783. It consists of the sovereign and fifteen other knights companions. The lord lieutenants of Ireland for the time being officiate as grand masters of the order, and the archbishop of Armagh is the prelate, the archbishop of Dublin the chancellor, and the dean of St. Patrick the register of the order. The knights are installed in the cathedral of St. Patrick, Dublin. Their robes are splendid, and the badge is three crowns united together on a cross, with the motto round *Quis separabit*, 1783, fastened by an Irish harp, to the crown imperial. A star of eight points encircles it on the coat.

HISTORY.] The history of Ireland has been carried to a very remote antiquity, and may, with greater justice than that of any other country, be distinguished into the legendary and authentic. In the reign of Edward II. an Ulster prince boasted to the pope of an uninterrupted succession of one hundred and ninety seven kings of Ireland, to the year 1170. Even the more moderate Irish antiquaries carry their history up to 500 years before the Christian era, at which time they assert, that a colony of Scythians, immediately from Spain, settled in Ireland, and introduced the Phœnician language and letters into this country; and that however it might have been peopled still earlier from Gaul or Britain, yet Heber, Heremon, and Ith, the sons of Milefius, gave a race of kings to the Irish, distinguished from their days by the name of Gadelians and Scuits, or Scots. But as our limits will not permit us to enlarge on the dark and contested parts of the Irish history, we shall only observe, that it was about the middle of the fifth century that the great apostle of Ireland, St. Patrick, was employed in the propagation of Christianity in this country, though there had been Christian missionaries here long before, by whose means it had made a considerable progress among the inhabitants of Ireland. After this period, Ireland was occasionally invaded by the Saxon Kings of England; but in the year 795 and 798 the Danes and Norwegians, or, as they were called Easterlings, invaded the coasts of Ireland, and were the first who erected stone edifices in that kingdom. The common habitations of the Irish till that time, were hurdles covered with straw and rushes, and but very few of solid timber. The natives defended themselves bravely against the Easterlings, who built Dublin, Waterford, Limerick, Wexford, and Cork: but they resided chiefly at Dublin, or in its neighbourhood, which, by the old Irish was called Fingal, or the Land of Strangers. The natives, about the year 962, seemed to have called to their assistance the Anglo-Saxon king Edgar, who had then a considerable maritime power; and this might have given occasion for his clergy to call him king of great part of Ireland. It is certain that Dublin was about that time a flourishing city, and that the native Irish gave the Easterlings several defeats, though supported by their countrymen from the continent, the Isle of Man, and the Hebrides.

In the twelfth century, Henry the Second of England formed a design of annexing Ireland to his dominions. He is said to have been induced to this by the provocation he had received from some of the Irish chieftains, who had

afforded considerable assistance to his enemies. His design was patronized by the pope, and a fair pretext of attacking Ireland offered about the year 1168. Dermot Mac Murrough, king of Leinster, and an oppressive tyrant, quarrelled with all his neighbours, and carried off the wife of a petty prince O'Roirk. A confederacy being formed against him, under Roderick O'Connor (who it seems was the paramount king of Ireland) he was driven from his country, and took refuge in the court of king Henry II. who promised to restore him, upon taking an oath of fidelity to the crown of England, for himself, and all the petty kings depending on him, who were very numerous. Henry, who was then in France, recommended Mac Dermot's cause to the English barons, and particularly to Strongbow, earl of Pembroke, Robert Fitz-Stephen, and Maurice Fitzgerald. Those noblemen undertook the expedition upon much the same principles as the Norman and Breton lords did the conquest of England under William I. and Strongbow was to marry Mac Dermot's daughter Eva. In 1169, the adventurers reduced the towns of Wexford and Waterford; and the next year Strongbow arriving with a strong reinforcement, his marriage was celebrated.

The descendants of the Danes continued still possessed of Dublin, which after some ineffectual opposition made by king O'Connor, was taken and plundered by the English soldiers; but Mac Turkil the Danish king, escaped to his shipping. Upon the death of Dermot Henry II. became jealous of earl Strongbow, seized upon his estate in England and Wales, and recalled his subjects from Ireland. The Irish about the same time, to the amount of above 60,000, besieged Dublin, under king O'Connor; but though all Strongbow's Irish friends and allies had now left him, and the city was reduced to great extremity, he forced the Irish to raise the siege with great loss; and going over to England, he appealed Henry by swearing fealty to him and his heirs, and resigning into his hands all the Irish cities and forts he held. During Strongbow's absence, Mac Turkil returned with a great fleet, attempted to retake the city of Dublin, but was killed at the siege; and in him ended the race of the Easterling princes in Ireland.

In 1172, Henry II. attended by 400 knights, 4000 veteran soldiers, and the flower of his English nobility, landed near Waterford; and not only all the petty princes of Ireland, excepting the king of Ulster, but the great king Roderick O'Connor, submitted to Henry, who pretended that O'Connor's submission included that of Ulster, and that consequently he was the paramount sovereign of Ireland. Be that as it will, he affected to keep a magnificent court, and held a parliament at Dublin, where he parcelled out the estates of Ireland, as William the Conqueror had done in England, to his English nobility. He then settled a civil administration at Dublin, as nearly as possible to that of England, to which he returned in 1173, having first settled an English colony from Bristol in Dublin, with all the liberties and free customs, say their charters, which the citizens of Bristol enjoyed. From that time Dublin began to flourish—Thus the conquest of Ireland was effected by the English, almost with as much ease as that of Mexico was by the Spaniards; and for much the same reasons, the rude and unarmed state of the natives, and the differences that prevailed among their princes or leaders.

Henry gave the title of lord of Ireland to his son John, who, in 1185, went over in person to Ireland; but John and his giddy Norman courtiers made a very ill use of their power, and rendered themselves hateful to the Irish, who were otherwise very well disposed towards the English. Edward I.

was too much taken up with the crusades to pay any great regard to the affairs of Ireland; but king John, after his accession, made amends for his former behaviour towards the Irish. He enlarged his father's plan of introducing into Ireland English laws and officers, and he erected that part of the provinces of Leinster and Munster, which was within the English pale, into twelve counties. I find, however, that the descendants of the ancient princes in other places paid him no more than a nominal subjection. They governed by their old Brehon laws, and exercised all acts of sovereignty within their own states; and indeed this was pretty much the case so late as the reign of James I. The unsettled reign of Henry III. his wars and captivity gave the Irish a very mean opinion of the English government during his reign; but they seem to have continued quiet under his son Edward I. Gaveston, the famous favourite of Edward II. acquired great credit while he acted as lieutenant of Ireland; but the successes of the Scotch king, Robert Bruce, had almost proved fatal to the English interest in Ireland, and suggested to the Irish the idea of transferring their allegiance from the kings of England to Edward Bruce, king Robert's brother. That prince accordingly invaded Ireland, where he gave repeated defeats to the English governors and armies; and being supported by his brother in person, he was actually crowned king at Dundalk, and narrowly missed being master of Dublin. The younger Bruce seems to have been violent in the exercise of his sovereignty, and he was at last defeated and killed by Bermingham, the English general. After this Edward II. ruled Ireland with great moderation, and passed several excellent acts with regard to that country.

But during the minority of Edward III. the commotions were again renewed in Ireland, and not suppressed without great loss and disgrace on the side of the English. In 1333 a rebellion broke out, in which the English inhabitants had no inconsiderable share. A succession of vigorous, brave governors, at last quieted the insurgents; and about the year 1361, prince Lionel, son to Edward III. having married the heiress of Ulster, was sent over to govern Ireland, and, if possible, to reduce its inhabitants to an entire conformity with the laws of England. In this he made a great progress but did not entirely accomplish it. It appears, at this time, that the Irish were in a very flourishing condition, and that one of the greatest grievances they complained of, was, that the English sent over men of mean birth to govern them. In 1394, Richard II. finding that the execution of his despotic schemes in England must be abortive without farther support, passed over to Ireland with an army of 34,000 men, well armed and appointed. As he made no use of force, the Irish looked upon his presence to be a high compliment to their nation, and admired the magnificence of his court. Richard, on the other hand, courted them by all the arts he could employ, and bestowed the honour of knighthood on their chiefs. In short, he behaved, so as entirely to win their affections. But in 1399, after having acted in a very despotic manner in England, he undertook a fresh expedition to Ireland, to revenge the death of his lord lieutenant, the earl of March, who had been killed by the wild Irish. His army again struck the natives with consternation, and they threw themselves upon his mercy. It was during this expedition, that the duke of Lancaster landed in England; and Richard upon his return, finding himself deserted by his English subjects on account of his tyranny, and that he could not depend upon the Irish, surrendered his crown to his rival.

The Irish, after Richard's death, still retained a warm affection for the house of York; and upon the revival of that family's claim to the crown, embraced

braced its cause. Edward IV. made the earl of Desmond lord lieutenant of Ireland for his services against the Ormond party and other adherents of the house of Lancaster; and he was the *first Irish chieftain* that obtained this honour. Even the accession of Henry VII. to the crown of England did not reconcile the Irish to his title as duke of Lancaster; they therefore readily joined Lambert Simnel, who pretended to be the eldest son of Edward IV. but for this they paid dear, being defeated in, their attempt to invade England. This made them somewhat cautious at first of joining Perkin Warbeck, notwithstanding his plausible pretences to be the duke of York, second son of Edward IV. He was, however, at last recognized as such by the Irish; and in the preceding pages, under the history of England, the reader may learn the event of his pretensions. Henry behaved with lenity towards his favourers, and was contented with requiring the Irish to take a fresh oath of allegiance to his government. This lenity produced good effects during the administration of the two earls of Kildare, the earl of Surry, and the earl of Ormond. Henry VIII. governed Ireland by supporting its chiefs against each other, but they were tampered with by the emperor Charles V. upon which Henry made his natural son, the duke of Richmond, his lord lieutenant. This did not prevent the Irish from breaking out into rebellion in the year 1540, under Fitz Gerald, who had been lord deputy, and was won over by the emperor, but was at last hanged at Tyburn. After this the house of Austria found their account in their quarrels with England, to form a strong party among the Irish.

About the year 1542, James V. king of Scotland, formed some pretensions to the crown of Ireland, and was favoured by a strong party among the Irish themselves. It is hard to say, had he lived, what the consequence of his claim might have been. Henry understood that the Irish had a mean opinion of his dignity, as the kings of England had hitherto assumed no higher title than that of lords of Ireland. He therefore took that of king of Ireland, which had a great effect with the native Irish, who thought that allegiance was not due to a lord; and, to speak the truth, it was somewhat surprising that this expedient was not thought of before. It produced a more perfect submission of the native Irish to Henry's government than ever had been known; and even O'Neil, who pretended to be successor to the last paramount king of Ireland, swore allegiance to Henry who created him earl of Tyrone.

The pope, however, and the princes of the house of Austria, by remitting money, and sometimes sending over troops to the Irish, still kept up their interest in that kingdom, and drew from them vast numbers of men to their armies, where they proved as good soldiers as any in Europe. This created inexpressible difficulties to the English government, even in the reign of Edward VI. but it is remarkable, that the Reformation took place in the English part of Ireland with little or no opposition. The Irish seem to have been very quiet during the reign of queen Mary; but they proved thorns in the side of queen Elizabeth. The perpetual disputes she had with the Roman catholicicks, both at home and abroad, gave her great uneasiness; and the pope and the house of Austria always found new resources against her in Ireland. The Spaniards possessed themselves of Kinfales; and the rebellions of Tyrone, who baffled and outwitted her favourite general the earl of Essex, are well known in English history.

The lord deputy Mountjoy, who succeeded Essex, was the first Englishman who gave a moral blow to the practices of the Spaniards in Ireland, by defeating them and the Irish before Kinfales, and bringing Tyrone prisoner

to England; where he was pardoned by queen Elizabeth in 1602. This lenity, shewn to such an offender, is a proof of the dreadful apprehensions Elizabeth had from the popish interest in Ireland. James I. confirmed the possessions of the Irish; but such was the influence of the pope and the Spaniards that the earls of Tyrone and Tyrconnel, and their party, planned a new rebellion, and attempted to seize the castle of Dublin; but their plot being discovered, their chiefs fled beyond seas. They were not idle abroad; for in 1608 they instigated Sir Calim O'Dogharty to a fresh rebellion, by promising him speedy supplies of men and money from Spain. Sir Calim was killed in the dispute, and his adherents were taken and executed. The attainders of the Irish rebels, which passed in the reigns of James and Elizabeth, vested in the crown 511,465 acres, in the several counties of Donegal, Tyrone, Colerain, Fermanagh, Cavan, and Armagh; and enabled the king to make that protestant plantation in the North of Ireland, which now, from the most rebellious province of the kingdom, is the most quiet and reformed.

Those prodigious attainders, however just and necessary they might be, operated fatally for the English in the reign of Charles I. The Irish Roman Catholics in general, were influenced by their priests to hope not only to repossess the lands of their forefathers, but to restore the popish religion in Ireland. They therefore entered into a deep and detestable conspiracy for massacring all the English protestants in that kingdom. In this they were encouraged by the unhappy dissensions that broke out between the king and his parliaments in England and Scotland. Their bloody plan being discovered by the English government at Dublin, prevented that city from falling into their hands. They, however, partly executed in 1641 their horrid scheme of massacre; but authors have not agreed as to the numbers who were murdered; perhaps they have been exaggerated by warm protestant writers, for some of whom have mounted the number of the sufferers to 40,000; other accounts speak of 10,000 or 12,000, and some have even diminished that number. What followed in consequence of this rebellion, and the reduction of Ireland by Cromwell, who retaliated the cruelties of the Irish Papists upon themselves, belongs to the History of England. It is certain that they smarted so severely, that they were quiet during the reign of Charles II. His popish successor and brother James II. even after the Revolution took place, found an asylum in Ireland; and was encouraged to hope, that, by the assistance of the natives there, he might remount his throne: but he was deceived, and his own pusillanimity co-operated with his disappointment. He was driven out of Ireland by his son-in-law, after the battle of the Boyne, the only victory that king William ever gained in person; a victory, however, on which depended the safety of the protestant religion, and the liberties of the British empire. Had James been victorious, he probably would have been reinstated on the throne, and nothing else could have been expected than that being irritated by opposition, victorious over his enemies, and free from every restraint, he would have trampled upon all rights, civil and religious, and pursued more arbitrary designs than before. The army of William consisted of 36,000 men, that of James of 33,000, but advantageously situated. James, it is true, fought at the head of an undisciplined rabble; but his French auxiliaries were far from

* Mr. Guthrie's account of the numbers killed in the Irish massacre is much below that generally given. Mr. Hume, after enumerating the various barbarities practised by the Papists upon the Protestants, says, "by some computations, those who perished by all those cruelties, are made to amount to an hundred and fifty, or two hundred thousand; by the most moderate, and probably the most reasonable account, they must have been near 40,000." Hist. of England, vol. vi. p. 377, edit. 8vo. 1763.

behaving as heroes. It must be acknowledged, however, that he left both the field and the kingdom too soon for a brave man.

Many political reasons occurred for not driving the Irish to despair. The friends of the Revolution and the protestant religion were sufficiently gratified out of the forfeited estates. It was therefore thought prudent to relax the reins of government, and not to put the forfeitures too rigorously into execution. The experience of half a century has confirmed the wisdom of the above considerations. The spirit of industry has enabled the Irish to know their own strength and importance; to which some accidental circumstances have concurred. All her ports were opened for the exportation of wool and woollen yarn to any part of Great Britain; and of late years acts of parliament have been made for permitting the importation of salt, beef, pork, butter, cattle, and tallow, from Ireland to Great Britain. But though some laws and regulations had occasionally taken place favourable to Ireland, it must be acknowledged, that the inhabitants of that country laboured under considerable grievances, in consequence of sundry unjust and injudicious restraints of the parliament of England respecting their trade.

The war between Great Britain and her American colonies was attended with very important consequences in Ireland. By this contest, her attention was excited to the restrictions on her own manufactures and commerce. In 1779, therefore, the parliament of Ireland, in their address to the throne, demanded in strong language, the restoration of their commercial freedom; hopes were repeatedly held out to them of some partial compliance with their requisition; but when the people of Ireland saw that nothing effectual was likely to be done, and that an opposition to any relaxation of the commercial laws was pretty general in England, resolutions were entered into by the inhabitants of the trading towns to prevent the importation of British manufactures, and associations were entered into of a more effective, but more dangerous nature. The dread of an invasion from France, added to the circumstance of the military force of Ireland being continually drained for the support of the American war, furnished a plausible plea for forming military associations, avowedly for the defence of the country against foreign enemies; this spirit soon became universal throughout the kingdom; the numbers thus associated and armed are said at last to have amounted to upwards of 60,000 men.

Government saw these proceedings with astonishment and alarm; to offer the least resistance was vain, and a proposal to bring them to act under the authority of the government, was rejected with scorn. Having provided for the defence of the country, they soon began to extend their views. A free and unlimited commerce with all the world was the first and great object for which no compensation could be admitted. This state of things joined to the alarming and perilous situation of Great Britain, left to her ministers no alternative; they were under the necessity of yielding to that spirit, which they were unable to repress: accordingly on the 13th of Decr. the minister laid before the house, three propositions for granting relief to Ireland; they were unanimously agreed to, and bills founded upon them, immediately brought in and passed.

These conciliatory measures produced but a momentary quiet among the people; they soon began to proceed farther, and to declare all authority assumed by the British parliament over them in any case whatsoever to be a gross usurpation. The parliament of Ireland not being so forward in attending to these views, as they had expected, a meeting of the volunteers

corps took place on the 15th of February 1784, when the most violent resolutions were adopted, and they declared that in every situation, they would maintain with their lives and fortunes the constitutional right of the kingdom to be governed only by the king and parliament of Ireland. The same sentiments soon became universally avowed throughout the kingdom; the plan of concession was again resorted to. A change having taken place in the British ministry in the spring of 1782, the duke of Portland came over as lieutenant, and in April of that year, the declaratory act asserting and securing the sovereignty of the parliament of Great Britain over Ireland, was repealed; and that all doubts and jealousies might be effectually removed, a bill was passed in the following year by the British legislature, containing in the fullest and most express terms, a relinquishment, on the part of Great Britain, of all right to interfere with the judgment of the Irish courts, or to make laws to bind Ireland in time to come.

These concessions great and important as they were to Ireland, dishonourable and dangerous to Great Britain as striking at the root of the connection between the two countries, did not produce either general or lasting tranquillity. When the government of a country, either through weakness or imprudence, is reduced to the necessity of yielding to the demands of popular clamour, its concessions only prove sources of new and perhaps more unresistible demands; such was the case at present in Ireland. Agitated by the spirit of political innovation, and inflamed by their late success, the minds of the people were not easily tranquillized; during their apparent insensibility, they seem only to have been in search of an object suited to their perturbed and restless imaginations; and such was the subject of parliamentary reform. The advocates prevailing, on the part of government, some indications of a design to regard them altogether, eagerly fixed upon this popular topic as a centre of union. A grand national convention of delegates from the whole volunteer army was assembled at Dublin on the tenth of November 1783; the earl of Charlemont was elected president, and on the following day, a committee was appointed to prepare a specific plan of parliamentary reform; by their a number of resolutions were digested, which were submitted to the convention at large on the twenty eighth of November.

Mr. Flood on the following day, in the house of commons, moved for leave to bring in a bill for the more equal representation of the people in parliament. The motion was received by a great majority of the house, with the strongest marks of disapprobation. Mr. Yeiverton the attorney general insisted, that the house could not, without yielding to a disgraceful pusillanimity, consent to receive propositions tendered to them at the point of the bayonet, by a body of armed men; the motion was rejected by a great majority. The house then came to a resolution, that they will support the rights and privileges of parliament against all encroachments. An address was also ordered to be presented to the king, expressing the happiness they enjoyed under the established government, and assuring him of their determination to support the present constitution with their lives and fortunes. This address being sent up to the Lords received their concurrence.

Thus by the firmness of the legislature, the farther pursuit of an object, which had very much agitated the minds of the people, and which in its farther progress threatened the most serious mischief to the country, was for the present repressed. The subject of parliamentary reform made some noise in Great Britain about this period and for sometime before, but in Ireland

Ireland the speeches and resolutions of the reformers were distinguished by the particular indecency of their expression and the virulence of their reflections against the laws and constitution of their country. In these violent proceedings the eye may now trace the latent fermentation of that mighty mischief, which hath lately burst forth in all the horrors of treason and rebellion, transforming the ignorant and misguided populace into demons, and rendering the country a dreadful scene of affluatation and murder.

About this period the minds of the people in that country were in a state of extreme agitation; their passions had been so long stimulated by these objects, which are of all others most calculated to inflame, that they seem to have acquired a morbid degree of irritability; those grievances whether real or imaginary, which in other nations would scarcely have ruffled the calm of domestic tranquillity, threatened, in that country, to produce all the horrors of the most violent temper.

During the course of their proceedings, relative to parliamentary reform, interests of a more pressing nature frequently divided the attention of the people, and were pursued with a most intemperate degree of zeal and violence. They seem to have expected, that by the restitution of commercial freedom, they were immediately to arrive at the possession of that prosperity and opulence, which can only be obtained by slow progress, and is the reward of patient and persevering industry. Disappointed in these visionary hopes, their situation was rendered more calamitous by the idleness of the lower class of people, and the neglect of their proper occupations by the better sort, both of which were to be attributed to the general disposition to political speculations. In order to relieve the distresses of their own manufacturers, it was proposed to lay heavy duties on the manufactures of other countries, imported into Ireland; a measure dictated by a narrow and short-sighted policy, but for which the people had become extremely clamorous. The legislature, however, with no less wisdom than firmness, rejected the motion. In consequence of this disappointment of their hopes, the people were thrown into the most violent fermentation, and as there was reason to believe that these commotions were either excited or continued by the seditious and inflammatory libels, which were daily circulated in the public papers, prosecutions were commenced against several of the printers, and a bill was brought into parliament by Mr. Foster for securing the liberty of the press, by preventing the publication of libels, which after a considerable opposition, and receiving several modifications, passed with a general concurrence.

Soon after this a plan for regulating and finally adjusting the commercial intercourse between the two nations, excited a very general interest, both in Great Britain and Ireland, but after having exercised the attention of the legislatures of both kingdoms for upwards of seven months, was frustrated by the violence of that misguided zeal which then pervaded the whole nation. Indeed so infatigable had the people of that country now become, in consequence of the conceit extorted from Great Britain, their minds so agitated with groundless doubts and jealousies; so distracted with political speculations, that a calm and temperate discussion of a subject of such magnitude was no; to be hoped for. The unfortunate indisposition of his majesty happened soon after their rejection of the commercial propositions. This event was no sooner known in Ireland, than the rage of theoretical innovation and all the angry passions which had agitated the minds of parties were re-kindled; as if on the watch for an object of sufficient force to set them in motion, they eagerly laid hold of the opportunity afforded them by the question of the regency to exhibit a practical proof of their newly acquired inde-

pendence, and perhaps indirectly to point at other aims, which at that period were not ripe for development.

Our limits do not permit us to enter into a detail of the measures adopted on this occasion; but we may shortly observe, that the conduct of the Irish parliament in the whole of this business is strongly marked by precipitation and violence, and that the arguments by which the leaders in both houses supported their views were such as in their ultimate application evidently tended to break the connection betwixt the two kingdoms; that this project had been already conceived in by no means improbable. Mr. Fitzgibbon the attorney general firmly and strenuously opposed the measures of the majority in parliament, contending for the constitutional connection betwixt the two kingdoms, and concluded his speech by this solemn and almost prophetic warning, that if the two houses of parliament should in a moment of phrenzy, sacrifice in connection with the crown in pursuit of paradoxical phantoms, they might perhaps live to see Ireland once more indebted for the restoration of her civil and religious liberties, to a British army. But while these matters were drawing to a conclusion their necessity was superseded by the sudden and unexpected recovery of the King, and thus the immediate cause of the discontents and divisions being removed, a temporary calm was produced.

But the discontented and turbulent spirits of the people of Ireland were now and had been for some time past in such a state of continual agitation and ferment, that no tranquillity was lasting; the fire of political discord sometimes ceased to blaze, but the smoking embers were ever ready to burst forth into a flame, upon the smallest communication with any inflammable matter. Such was the state of the Irish nation at the breaking out of the French revolution. It is not therefore surprising that the dreadful explosion which nearly set Europe on fire, should have almost destroyed that country. The principles of those who overturned the old government of France, have been justly considered as the signal for revolt to the discontented, to the unprincipled, and to the profligate of all nations. In Britain they spread with rapidity, and their progress at one time was so considerable, and the evident intentions of the faction so alarming, as to excite no small degree of apprehension and terror; but the firmness of the executive government, supported by the good sense and energy of the British nation, carried us nobly thro' the storm. In Ireland these principles took an immediate and firm hold of the minds of the people; enflamed by political speculation and irritated by groundless jealousies and discontents, they were urged into the very last stage of crime with a precipitation which has no parallel.

It appears that soon after the French revolution a conspiracy was formed in Ireland, whose aim was to overthrow the constitution and government of the country, to separate Ireland from Great Britain, and to establish a republic after the example of France on the destruction of all religious establishments, the abolition of ranks, and the confiscation of property. The most efficient engine of this unreasonable combination was the society of united Irishmen. This society was established in the year 1791; for sometime their attention was entirely directed to the engaging into their society persons of activity and talents; and the subject of parliamentary reform, either as a step to the attainment of their ultimate object, or as a cover to their real designs, was again revived and prosecuted, with redoubled energy and vigour; affiliated clubs and societies were spread over the whole country, writings of the most flagitious and unreasonable tendency were circulated with indefatigable perseverance, and the lower classes, who in that country are sunk in the most de-

plorable ignorance, were in this manner trained to be instruments of the most diabolical barbarity. No efforts were left untired for bringing their designs to maturity, and for giving to the societies the strength and consistency of a revolutionary army; every mean was employed, which malignity cunning could devise, for eradicating from the minds of the people all the principles either of public or private duty; they incited the soldier to betray his king, they armed the tenant against his landlord, and they taught the serfs to conspire with the assassin of his master, thus blasting the repose and security of private life in its very sanctuary, and effacing every law of truth, justice, and gratitude. Nor was any artifice omitted, which could either weaken or embarrass the government; the well affected were intimidated from joining the yeomanry corps; magistrates, witnesses, jurors, in a word every class and description of people, who ventured to support the laws, were immediately marked for destruction, and the barbarous assassinations perpetrated by murderers, who issued from their dens during the darkness of midnight, sparing neither sex nor age, spread terror and dismay over the whole face of this miserable and distracted country.

In the summer 1796 great numbers had enrolled themselves; and about this period a direct communication with the enemy was opened by the heads of the party, and French assistance was solicited and promised to be speedily sent to aid the disaffected in that kingdom; directions were in consequence issued by the leaders of the societies, to form themselves into military bodies, and to be provided with arms and ammunition; these directions were speedily obeyed; the societies assumed a military form, and it appears by the original papers seized at Belfast on April 1797, that their numbers at that period, in the province of Ulster alone, amounted to nearly 100,000.

An agent was soon after sent to the French directory, acquainting them with their preparations; this agent from various channels of information appears to have been the late Lord Fitzgerald, who, accompanied by Mr. O'Connor, proceeded to Switzerland, and had an interview near the French frontier with general Hoche, on which occasion every thing was settled with a view to the invasion.

About October 1796 an accredited messenger arrived from the French republic, who came to communicate to the leaders of the Irish union the intention of the French, speedily to invade Ireland with fifteen thousand men and a great quantity of arms and ammunition; this attempt was accordingly made in December following, when the French fleet took the advantage of a thick fog and escaped from Brest unobserved by admiral Colpoys, who had been blocking them up for several months; meeting with violent storms in their passage, the fleet was dispersed, and on the 24th part of them consisting of eight two deckers and nine of different classes, anchored in Bantry bay, the fury of the tempest rendering any attempt to land impossible; they quitted their station on the 27th in the evening; an officer and seven men were driven on shore in a boat belonging to one of the French ships; this gentleman upon examination stated that the fleet upon leaving Brest consisted of about fifty sail, having on board 25,000 men commanded by general Hoche, and that it was destined to attack Ireland. The appearance of this armament excited a considerable degree of alarm in Ireland, but the greatest loyalty manifested itself throughout this part of the kingdom, and every demonstration was given of their zeal and ardour to oppose the enemy, wherever it could be supposed a descent would be attempted. The effects of the union had not so fully extended themselves at that time to this part of the kingdom, a defect which the leaders afterwards took care to supply. During the summer of 1797 very extensive preparations were made

made both at the Texel and at Brest for a second attempt; and in the augmented intelligence was received by the executive of the union, that the troops were actually embarked in the Texel and only waited the wind; their designs were again frustrated by the glorious and ever memorable victory of Lord Duplein over the Dutch fleet on the 11th October 1797. The communication betwixt the directory of France and the Irish executive was still kept up, and assurances were still given that succours might be expected. In the mean time the most active and vigorous measures were pursued against the conspirators; a bill was passed prohibiting seditious meetings; another commonly called the infirmary act, by which the Lord Lieutenant and council were enabled upon the requisition of seven magistrates of any county, to proclaim the whole or any part thereof to be in a state of disturbance, and within these limits this law was to operate; and by another the habeas corpus act was suspended and the summary established.

But such was the boldness of the conspirators that in defiance of the additional energy of the executive government, the same system of outrage and opposition to the laws which had been so successfully made use of the former year in Ulster, was now very generally extended over all the southern and midland counties, and every exertion was made to give strength to the conspiracy, and by an active system of terror to compel the people to look for protection to the union rather than to the law. Our limits do not permit us to enter into a detail of the enormities committed on the peaceable and well affected inhabitants, nor could we shock the feelings of the humane reader by a recital of barbarities attended with such circumstances of unrelenting cruelty as must entail everlasting disgrace upon the Irish name and nation. It will be sufficient to say that in the months of February and March, many parts of the provinces of Leinster and Munster were actually in possession of a murderous banditti, and no night passed without the commission of numerous murders, several districts in these provinces had been proclaimed, but this measure proved ineffectual, and great numbers of the loyal inhabitants of the counties of Cork, Limerick, Tipperary, Kilkenny, Carlow, King's county, Queen's county, Kildare, and Wicklow were in the course of one month stripped of their arms, and obliged to fly for shelter into the garrison towns. Under those alarming circumstances, on the 30th March the Lord Lieutenant issued a proclamation, stating that the traitorous conspiracy, which had long existed with this kingdom had broken out into acts of open rebellion, and giving notice that the most direct and positive orders were given to the officers commanding his majesty's forces, to employ them with the utmost vigour and decision for its suppression, and for disarming the rebels, and all persons disaffected to his majesty's government by the most summary and effectual methods; the promptitude and energy with which these orders was executed, were attended with such effects in dissolving the union and disconcerting the views of the conspiracy, that it became evident to the generality of the leaders, they had now no other alternative than to rise at once or abandon their designs. The arrest of the Leinster committee on the 12 March with several other leading members of the union on the same day, had likewise so much exposed the traitors in all their unhalloved hypocrisies of iniquity, and tended so much to weaken their organization, that they were precipitated into a desperate effort before their designs were fully ripe for execution. A plan was accordingly digested by the military committee for a general rising, which was to take place on the 23 of May. Government were perfectly informed of the intentions of the conspirators, and caused several of the leaders to be apprehended on the 20th and 21st, and late in the evening of that day the approaching insurrection was announced to the Lord Mayor, and on the follow-

diabolical

ing day a message to the same effect was sent by the Lord Lieutenant to both houses of parliament.

Notwithstanding the military precautions that were adopted to counteract the insurrection, it took place in the neighbourhood of Dublin on the spot appointed; the measures taken in the metropolis prevented any disturbance there. They attacked the town of Nass in considerable force, but were repulsed by the Anagh militia and ancient British light dragoons with great slaughter; several other engagements took place in that part of the country, in all of which the rebels were defeated and put to flight, and great numbers killed. On the 28 intelligence was received that the insurrection was spreading southward, and had broke out in great force in the county of Wexford; these numbers were then stated to amount to 4000 at least, and a great number of them mounted. Here their principal strength seemed to be collected, where they were broken and dispersed in every other quarter; their numbers so lost amounting by the best accounts to near 15,000.

Our limits do not permit us to enter into a detail of the military operations against this formidable force; it is sufficient for us to say, that the rebels after having been defeated at Emisforth by general Lake, and in the neighbourhood of Wexford by brigadier General Mory, evacuated their camp, which was immediately entered by the king's troops without opposition. The rebels who escaped from Wexford, in different places, attempted to make a stand, and collect the scattered remains of their adherents, but failed in the activity and energy of the officers and soldiers, that all their enterprises were frustrated; they were attacked, defeated, and dispersed in all quarters, and tranquillity began gradually to be restored.

About the end of August, some frigates and transports from France, appeared in Killish bay, and landed about 1000 men, with a considerable quantity of arms and ammunition. At the strength of the rebellion was now broken, the numbers who joined them were not considerable, and on the eighth of Sept. being attacked by general Lake, they surrendered at discretion; the rebels who had joined them were dispersed, and a great proportion of them killed or taken. Another effort was made by the French to support, or rather to rekindle the flames of rebellion in Ireland. On the 17th of September, a fleet sailed from France, destined for that country, consisting of a ship of eighty guns, eight heavy frigates, a schooner, and a long single masted ships were all entirely new, full of troops and stores, with every thing necessary for the establishment of their views; on the 17th of October, this fleet was discovered by the squadron under Sir J. B. Warren, who immediately gave chase; next morning he came up with them, attacked and defeated them; the whole fleet except one or two frigates, was captured. This blow, it is to be presumed, had put a period to all the hopes entertained by the French directory, of making themselves masters of Ireland, by a co-operation with the traitors of that kingdom. Bands of banditti continued for some time after this, to infest the country, particularly the county of Wexford; property to a great amount was in a short time destroyed, in the plunder of houses and houghing of cattle; scarce a night passed in which groups of 50 or 60 of these miscreants did not assemble to the horrible occupations of burning, murdering, and plundering the industrious and well affected inhabitants; but by the vigilance and activity of the troops, they were pursued to their lurking holes, and either dispersed, taken or destroyed.

Such has been the termination, we sincerely hope it will turn out to be, of a conspiracy no less atrocious than alarming; whether we consider the diabolical designs of the traitors, the secrecy with which they conducted their

 ... duced sufferings, put to an ignominious death; the clergy and nobility, with
 ... almost every gentleman of landed property, either massacred, robbed, or
 ... banished; the citizens of her most flourishing and prosperous cities fallen
 ... victims to the unfeeling and diabolical barbarity of systematic assassins; their
 ... wives and daughters sacrificed to the brutal lust of their destroyers; them-
 ... selves either perishing by the hand of the executioner or collected in the pub-
 ... lic hospitals without distinction of sex or age; and slaughtered by thousands,
 ... or doomed to languish in hopeless slavery; in noisome and pestilential dun-
 ... geons; in short, after such a long, unbroken, melancholy train of woes
 ... flowing one upon another in France; we cannot too strongly execute
 ... the sentence of those wretches who had conspired to reduce their principles to
 ... practice in this happy country, and to pollute these sacred shades of peace,
 ... and of generosity, with blood and massacre; our warmest gratitude is due to
 ... the fortunate disorder of all things, whose protecting care hath defended us
 ... from the machinations of our enemies, and averted the dreadful calamity
 ... which was impending over us; and after him to the vigilance of the executive
 ... power, to the activity of the army, and to the zealous co-operation
 ... of the loyal and affectionate subjects.

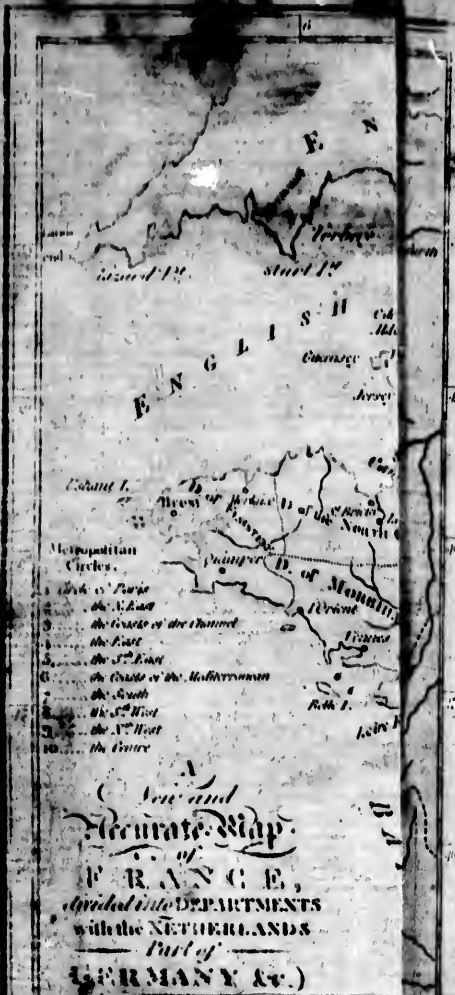

... the consolidation of the empire by the union of Ireland with Great
 ... Britain now to be the only thing still wanting to complete our security.
 ... was laid before the British house of commons by Mr. Pitt; his
 ... on this occasion was eloquent, perspicuous and argumentative; with his
 ... and accuracy he completely refuted all the calumnies, the mis-
 ... and false assertions of its opponents, both as to the principle
 ... the terms to be proposed for adoption, and the means of car-
 ... into execution; by the opposition it was combated with their usual
 ... but after undergoing an ample discussion it received the approbation
 ... majority in both houses. When the subject came to be considered
 ... its reception was such as was unworthy of a deliberat-
 ... assembly, it appeared, had not yet warmed their illustrious spirits, and
 ... they distinguished themselves by a renewal of the same in-
 ... violence, which had characterized their debates on former occasions;
 ... by the heat of the contest they were incapable of truly perceiving
 ... a subject of such magnitude, in all its bearings and relations;
 ... shall have subsided and sound judgement resumed the reins,
 ... we may hope that they will cheerfully agree to a measure so
 ... conducive to their true interest. England, Scotland and Ireland
 ... form a triple cord which no man can break, the firm guarantees of
 ... each being and each others right.

FRANCE.

FRANCE.

HAVING gone over the British Isles, we shall now return to the continent, beginning with the extensive and mighty kingdom of France, being the nearest to England though part of Germany, and Poland lies to the northward of France.

SITUATION AND EXTENT.

Miles Degrees.

Length 600 } between 5 West and 8 East longitude.
 Breadth 500 } between 43 and 51 North latitude.

Containing 160,374 square miles, with 155 inhabitants to each.

BOUNDARIES.] It is bounded by the English Channel and the Netherlands, on the North; by Germany, Switzerland, and Italy, East; by the Mediterranean and the Pyrenean mountains, which divide it from Spain, South; and by the Bay of Biscay, West.

DIVISIONS.] The ancient provinces of this kingdom have been divided by the national assembly into 83 departments, as follows.

Departments.	Chief Towns.	Inland Departments.	Chief Towns.
Paris	Paris N. Lat. 48° 30'	Moselle	Moselle

France, nearly a square, is divided into 83 DEPARTMENTS, including Corsica. Every department is subdivided into DISTRICTS, in all 347; and each district into CANTONS. The above are the chief towns of each department, and also the districts. The new department of Savoy, which forms the 84th, is not added it being at present undecided what part of the conquest of France will remain in her possession.

NAME AND CLIMATE.] France took its name from the Franks, or *Freemen*, a German nation, restless and enterprising, who conquered the Gauls, the ancient inhabitants: and the Roman force not being able to repress them, they were permitted to settle in the country by treaty. By its situation, it is the most compact kingdom perhaps in the world, and well fitted for every purpose both of power and commerce; and since the beginning of the 12th century the inhabitants have availed themselves of many of their natural advantages. The air, particularly that of the interior parts of the kingdom, is in general mild and wholesome; but some late authors think it is not nearly so salubrious as is pretended; and it must be acknowledged, that the French have been but too successful in giving the inhabitants of Great Britain false prepossessions in favour of their own country. It must indeed be owned, that their weather is more clear and settled than in England. In the northern provinces, however, the winters are more intensely cold, and the inhabitants not so well supplied with firing, which in France is chiefly of wood.

SOIL AND WATER.] France is happy in an excellent soil, which produces corn, wine, oil, and almost every luxury of life. Some of their fruits have a higher flavour than those of England; but neither the pasturage nor tillage are comparable to ours. The heats in many parts burn up the ground, so that it has no verdure, and the soil barely produces as much rye and chestnuts as serve to subsist the poor inhabitants; but the chief misfortune attending the French soil is, that the inhabitants having but a precarious security in their own property, do not apply themselves sufficiently to cultivation and agriculture. But nature has done wonders for them, and both animal and vegetable productions are found there in vast plenty.

Notwithstanding great efforts made in agriculture, much of the land remains uncultivated; and though some provinces, as Alsace and Languedoc, yield an exuberance of corn, it is frequently imported. Indeed all Europe, one year with another, does not produce sufficient corn for its own consumption, and it is necessary to have supplies from the luxuriant harvest of America.

The French have of late endeavoured to supply the loss arising from their precarious title to their lands, by instituting academies of agriculture, and proposing premiums for its improvement, as in England; but those expedients, however successful they may be in particular instances, can never become of national utility in any but a free country, where the husbandman is sure of enjoying the fruit of his labour, which is far from being the case in the pre-

sent distracted state of the country. No nation is better supplied than France is with wholesome springs and water; of which the inhabitants make excellent use by the help of art and engines, for all the conveniences of life. Of their canals and mineral waters, distinct notice will be hereafter taken.

MOUNTAINS.] The chief mountains in France, or its borders, are the Alps, which divide France from Italy; the Pyrenees, which divide France from Spain; Vauze, which divides Lorrain from Burgundy and Alsace; Mount Jura, which divides Franche Comté from Switzerland; the Cévennes, in the province of Languedoc; and Mount Dor in the province of Auvergne.

RIVERS AND LAKES.] The principal rivers in France are the Loire, the Rhone, the Garonne, and the Seine. The Loire takes its course north and north west, being, with all its windings, from its source to the sea, computed to run about 500 miles. The Rhone flows on the south-west to Lyons, and then runs on due south till it falls into the Mediterranean. The Garonne rises in the Pyrenean mountains, takes its course, first north-east, and has a communication with the Mediterranean by means of a canal, the work of Lewis XIV. The Seine, soon after its rise, runs to the north-west, visiting Troyes, Paris, and Rouen, in its way, and falls into the English Channel at Havre. To these we may add the Soanne which falls into the Rhone at Lyons; the Charente, which rises near Havre de Grace, and discharges itself into the Bay of Biscay at Rochfort. The Rhine, which rises in Switzerland, is the eastern boundary between France and Germany, and receives the Moselle and the Sarre in its passage. The Somme, which runs north-west through Picardy, and falls into the English channel below Abbeville. The Var, which rises in the Alps, and runs south, dividing France from Italy, and falling into the Mediterranean, west of Nice. The Adour runs from east to west, through Gascoigne, and falls into the Bay of Biscay, below the Bayonne.

The vast advantage, both in commerce and conveniency, which arises to France from those rivers, is wonderfully improved by the artificial rivers and canals which form the chief glory of the reign of Lewis XIV. That of Languedoc was begun in the year 1666, and compleated in 1680; it was intended for a communication between the ocean and the Mediterranean, for the speedier passage of the French fleet: but though it was carried on at an immense expence, for 100 miles, over hills and vallies, and even through a mountain in one place, it has not answered that purpose. By the canal of Calais, travellers easily pass by water from thence to St. Omer, Graveline, Dunkirk, Ypres, and other places. The canal of Orleans is another noble work, and runs a course of eighteen leagues, to the immense benefit of the public and the royal revenue. France abounds with other canals of the like kind, which render her inland navigation inexpressibly commodious and beneficial.

Few lakes are found in this country. There is one at the top of a hill near Alegre, which the vulgar report to be bottomless. There is another at Issoire, in Auvergne; and one at La Besse, in which if you throw a stone, it causes a noise like thunder.

MINERAL WATERS, AND } REMARKABLE SPRINGS. The waters of Bareges which lie near the borders of Spain, under the Pyrenean mountains, have of late been preferred to all the others of France, for the recovery of health. The best judges think, however, that the cures performed by them are more owing to their accidental success, with some great persons,

and the fecundity of the air and soil, than to the virtues of the waters. The waters of Sultzbach in Allace are said to cure the palsy, weak nerves, and the stone. At Bagueuis, not far from Bareges, are several wholesome minerals and baths, to which people resort as to the English baths, at spring and autumn. Forges in Normandy is celebrated for its mineral waters; and those of St. Amand cure the gravel and obstructions. It would be endless to enumerate all the other real or pretended mineral wells in France, as well as many remarkable springs; but there is one near Aigne, in Auvergne, which boils violently, and makes a noise like water thrown upon lime; it has little or no taste, but has a poisonous quality, and the birds that drink of it die instantly.

[METALS AND MINERALS.] France has many unworked *mines*, which would be very productive, if duly attended to, but at present do not yield minerals sufficient for consumption; steel alone is imported, to the annual value of 125,000*l.* Languedoc is said to contain veins of gold and silver. Allace has mines of silver and copper, but they are too expensive to be wrought. Alabaster, black marble, jasper, and coal, are found in many parts of the kingdom. Bretagne abounds in mines of iron, copper, tin, and lead. Salt-petre is made in every part of the kingdom, and *sea-salt* is now procured free from oppressive duty, but not remarkable for its purity. At Laverdau, in Cominges, there is a mine of chalk. At Berry there is a mine of oker, which serves for melting of metals, and for dying, particularly the best drab cloth; and in the provinces of Anjou are several quarries of fine white stone. Some excellent turquoises (the only gem that France produces) are found in Languedoc; and great care is taken to keep the mines of marble and freestone open all over the kingdom.

[VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.] France abounds in excellent roots, which are more proper for soups than those of England. As to all kinds of seasoning and salads they are more plentiful, and in some places better than in England; they being next to their vines, the chief object of their culture.

France produces excellent *fruits* of all kinds, particularly grapes, figs, prunes, chestnuts, cyder in the northern provinces, and capers in the southern. It produces annually, though not enough for consumption, above twelve million pounds of tobacco, besides hemp, flax, manna, saffron, and many drugs. Allace, Burgundy, Lorraine, and especially the Pyrene mountains, supply it plentifully with timber and other wood. Silk is so plentifully produced, besides what is imported, as to afford a considerable trade. The cattle and horses are neither very numerous nor very good, but it has many flocks of fine *sheep*; yet so great is the consumption, that both sheep and wool are imported. The province of Gastinois produces great quantities of saffron. The wines of Champagne, Burgundy, Bourdeaux, Gascony, and other provinces of France, are so well known, that they need only be mentioned. It is sufficient to observe, that though they differ very sensibly in their taste and properties, yet all of them are excellent, particularly those of Champagne, Burgundy, Bourdeaux, Pontacke, Hermitage, and Frontiniac: and there are few constitutions, be they ever so valetudinary, to which some one or other of them is not adapted.

Wine, the staple, is made to the value of 15,000,000*l.* annually, more than an eighth part of which, besides brandy and vinegar, is exported. Olive oil is made in large quantities, particularly in the provinces next the Mediterranean; but the consumption is so great, that much of it is imported from Italy: the

inferior sort supplies the soap manufactories, of which, there are thirty six at
Marseilles.

Oak, elm, ash, and other timber, common in England, is found in France ;
but it is said, that the internal parts of the kingdom begin to feel the want of
fuel. A great deal of salt is made at Rhée, and about Rochfort on the coast
of Saintoign. Languedoc produces an herb called kali, which when burnt,
makes excellent barilla, or pot-ashes. The French formerly were famous for
horticulture, but they are at present far inferior to the English both in the
management and dispositions of their gardens. Prunes and capers are pro-
duced at Bourdeaux and near Toulon.

France contains few animals, either wild or tame, that are not to be found
in England, excepting wolves. Their horses, black cattle, and sheep, are far
inferior to the English ; nor is the wool of their sheep so fine. The hair and
skin of the chamois, or mountain goats, are more valuable than those of Eng-
land. We know of no difference between the marine productions of France
and those of England, but that the former is not so well served, even on the sea
coasts, with salt-water fish. There is a considerable herring fishery and one
for anchovies to the annual amount of 83,000l. besides more important fisheries
upon the coast of America and Newfoundland.

FORESTS.] The chief forests of France are those of Orleans, which con-
tains 14,000 acres of wood of various kinds, oak, elm, ash, &c. and the forest of
Fontainbleau near as large ; and near Morchismoir is a forest of tall, straight
timber, of 4000 trees. Besides these, large numbers of woods, some of them
deserving the name of forests, lie in different provinces ; but too remote from
sea-carriage to be of much national utility.

POPULATION, INHABITANTS, MANNERS, } According to the most
CUSTOMS, AND DIVERSIONS. } authentic calculations, it is
not probable that France before the revolution contained above 24,000,000
of inhabitants ; at present, its population must be reduced greatly below
that number. It was formerly supposed, by some speculative men, that
the population of France had for many years been upon the decline ; but,
upon an accurate investigation, the reverse appeared to be fact ; though this
country certainly lost a great number of valuable inhabitants, by the revoca-
tion of the edict of Nantes*.

The French, in their persons, are rather lower than their neighbours : but
they are well proportioned and active, and more free than other nations, in
general, from bodily deformities. The ladies are celebrated more for their
sprightly wit than personal beauty ; the peasantry in general, are remark-
ably ordinary, and are best described by being contrasted with women of the
same ranks in England. The nobility and gentry accomplish themselves in
the academical exercises of dancing, fencing, and riding ; in the practice of
which they excel all their neighbours in skill and gracefulness. They are
fond of hunting ; and the gentry have now left off their heavy jack boots,
their hinge war-saddle, and monstrous curb bridle in that exercise, and ac-
commodate themselves to the English manners.

The genius and manners of the French are well known, and have been
the subject of many able pens. A national vanity is their predominant cha-
racter ; and they are perhaps the only people ever heard of, who have de-

* in the year 1398, Henry IV. who was a protestant, and justly styled the Great after
fighting his way to the crown of France, passed the famous edict of Nantes, which secured
the Protestants the free exercise of their religion ; but his edict was revoked by Lewis
XIV. which, with the succeeding persecutions, drove the people to England, Holland,
and other Protestant countries, where they established the silk manufacture, to the great
prejudice of the country that persecuted them.

rived great utility from a national weakness. It supports them under misfortunes, and impels them to actions to which true courage inspires other nations. This character, however, is conspicuous only in the higher and middling ranks, where it produces excellent officers; for the common soldiers of France have few or no ideas of heroism. Hence it has been observed, with great justice, of the French and English, that the French officers will lead, if their soldiers will follow, and the English soldiers will follow, if their officers will lead.

The French affect freedom and wit; but fashionable dresses and diversions engross too much of their conversation. Their diversions are much the same with those of the English, but their gallantry is of a very different complexion. Their attention to the fair degenerates into gross foppery in the men, and in the ladies it is kept up by admitting of indecent freedoms; but the seeming levities of both sexes are seldom attended with that criminality which, to people not used to their manners, they seem to indicate; nor are the husbands so indifferent; as we are apt to imagine, about the conduct of their wives. The French are excessively credulous and litigious; but of all people in the world they bear adversity and reduction of circumstances with the best grace; though in prosperity many of them are apt to be insolent, vain, arbitrary, and imperious. An old French officer is an entertaining and instructive companion, and indeed the most rational species of all the French gentry.

The French have been much censured for insincerity; but this charge has been carried too far, and the imputation is generally owing to their excess of civility, which throws a suspicious light upon their candour. The French, in private life, have certainly many amiable characters, and a great number of instances of generosity and disinterestedness may be found amongst them.

It is doing the French no more than justice to acknowledge, that, as they are themselves polite, so they have given a polish to the ferocious manners, and even virtues of other nations. They have long possessed the lead in taste, fashion, and dress; but it seems now to be in the wane, and they themselves think very favourably of the English. This alteration of opinion has not, however, entirely taken its rise from their wits and learned men, and still less from their courtiers, or the middle ranks of life. The superior orders of men in France are of a very different cast from those below them. Independent by their rank and fortunes, they think and act for themselves. They are open to conviction, and examine things to the bottom. They saw during the war before the last, the management of their armies, their finances, and fleets, with silent indignation, and their researches were favourable to the English. The conclusion of the peace of Fontainbleau, and the visits which they have since paid to England, have improved that good opinion; the courtiers themselves have fallen in with it; and, what some years ago would have been thought incredible, people of fashion in France now study the English language, and imitate them in their customs, amusements, dress, and buildings. They both imitate and admire our writers; the names of Bacon, Locke, Newton, Milton, Pope, Addison, Hume, Robertson, Richardson, and many others of the last and present century, are sacred among the French of any education; and, to say the truth, the writings of such men have equally contributed, with our military reputation, to raise the name of Great Britain to that degree in which it has been held of late by foreign nations, and to render our language more universal, and even a necessary study among foreign nobility. But we cannot quit this article of the

the manners and customs of the French, without giving a more minute view of some peculiarities observable among that whimsical people in private life, and this from the remarks of a late ingenious traveller, Smollet, who was also distinguished by various other productions in polite literature.

“The natural levity of the French, says he, is reinforced by the most preposterous education, and the example of a giddy people, engaged in the most frivolous pursuits. A Frenchman is by some priest or monk taught to read his mother tongue, and to say his prayers in a language he does not understand. He learns to dance and to fence by the masters of those sciences. He becomes a complete connoisseur in dressing hair, and in adorning his own person, under the hands and instructions of his valet-de-chambre. If he learns to play upon the flute or fiddle, he is altogether irresistible. But he piques himself upon being polished above the natives of any other country, by his conversation with the fair sex. In the course of this communication, with which he is indulged from his tender years, he learns like a parrot, by rote, the whole circle of French compliments, which are a set of phrases, ridiculous even to a proverb; and those he throws out indiscriminately to all women without distinction, in the exercise of that kind of address which is here distinguished by the name of gallantry. It is an exercise, by the repetition of which he becomes very pert, very familiar, and very impertinent. A Frenchman, in consequence of his mingling with the females from his infancy, not only becomes acquainted with all their customs and humours, but grows wonderfully alert in performing a thousand little offices, which are overlooked by other men, whose time hath been spent in making more valuable acquisitions. He enters, without ceremony, a lady's bed-chamber, while she is in bed, reaches her whatever she wants, airs, her shift, and helps to put it on. He attends at her toilette, regulates the distribution of her patches, and advises where to lay on the paint. If he visits her when she is dressed, and perceives the least impropriety in her coiffure, he insists upon adjusting it with his own hands. If he sees a curl, or even a single hair amiss, he produces his comb, his scissors, and pomatum, and sets it to rights with the dexterity of a professed friseur. He squires her to every place she visits, either on business or pleasure; and, by dedicating his whole time to her renders himself necessary to her occasions. In short, of all the coxcombs on the face of the earth, a French *petit-maitre* is the most impertinent; and they are all *petits maitres*, from the marquis, who glitters in lace and embroidery, to the *garçon bar bierre* (barber's boy) covered with meal, who struts with his hair in a long queue, and his hat under his arm.

“A Frenchman will sooner part with his religion than his hair. Even the soldiers in France wear a long queue, and this ridiculous foppery has descended to the lowest class of people. The boy who cleans shoes at the corner of a street, has a tail of this kind hanging down to his rump: and the beggar who drives an ass, wears his hair *en queue*, though, perhaps, he has neither shirt nor breeches.

“I shall only mention one custom more, which seems to carry human affectation to the very farthest verge of folly and extravagance; that is the manner in which the faces of the ladies are primed and painted. It is generally supposed, that part of the fair sex in other countries, make use of *sard* and *vermillion* for very different purposes; namely, to help a bad or faded complexion, to heighten the graces, or conceal the defects of nature, as well as the ravages of time. I shall not enquire whether it is just and honest to

impose

impose in this manner on mankind; if it is not, honest, it may be allowed to be artful and politic, and shews, at least, a desire of being agreeable. But to lay it on, as the fashion in France prescribes to all the ladies of condition, who cannot appear without this badge of distinction, is to disguise themselves in such a manner, as to render them odious and detestable to every spectator, who has the least relish left for nature and propriety. As for the *yard* or *wook*, with which their necks and shoulders are plaited, it may be in some measure excusable, as their skins are naturally brown, or fallow but the *rays*, which is daubed on their faces, from the chin up to the eyes, without the least art or dexterity; not only destroys all distinction of features, but renders the aspect really frightful, or at least conveys nothing but ideas of disgust and aversion. Without this horrible mask, no married lady is admitted at court, or in any polite assembly; and it is a mark of distinction which none of the lower classes dare assume."

The above picture of the manners of the French nation is drawn with wit and spirit; and is in some respects highly characteristic; but it is certainly not a flattering portrait; and the faults and failings of this vivacious people are, perhaps, by the author whom we have transcribed, too much magnified. With all their defects the French have many good qualities, and are undoubtedly a very agreeable people to reside among, at least for a time; on account of the politeness of their manners, the great attention they pay to strangers, and the general taste for literature which prevails among those in the better ranks of life. The French literati have great influence even in the gay and dissipated city of Paris. Their opinions not only determine the merit of works of taste and science, but they have considerable weight with respect to the manners and sentiments of people of rank, and of the public in general, and consequently are not without effect in the measures of government.

Dress.] The French dress of both sexes is so well known, that it is needless to expatiate upon them here; but, indeed, their dress in cities and towns is so variable, that it is next to impossible to describe it. They certainly have more invention in that particular than any of their neighbours, and their constantly changing their fashions is of infinite service to their manufactures. With regard to the English, they possess one capital superiority, which is, that the clothes of both sexes, and their ornaments, are at least one third cheaper.

When a stranger arrives in Paris, he finds it necessary to send for the tailor, perruquier, hatter, shoe-maker, and every other tradesman concerned in the equipment of the human body. He must even change his buckles, and the form of his ruffles; and, though at the risk of his life, suit his clothes to the mode of the season. For example, though the weather should be ever so cold, he must wear his *habit d'été*, or *demi-saison*, without presuming to put on a warm dress before the day which fashion has fixed for that purpose; and neither old age nor infirmity will excuse a man for wearing his hat upon his head, either at home or abroad. Females are, if possible, still more subject to the caprices of fashion. All their saks and negligees must be altered and new trimmed. They must have new caps, new laces, new shoes, and their hair new cut. They must have their tassettes for the summer, their flowered silks for the spring and autumn, their sattins and damasks for winter. The men too must provide themselves with a camblet suit, trimmed with silver for spring and autumn, with silk clothes for summer, and cloth laced with gold, or velvet for winter; and he must wear his *bagwig à la pigeon*. This variety of dress is absolutely indispensable for all

those who pretend to any rank above the mere vulgar; all ranks, from the highest downwards, use powder; and even the rabble, according to their abilities, imitate their superiors in the fopperies of fashion. The common people of the country, however, still retain, without any material deviation, the old-fashioned modes of dress, the large hat, and most enormous jack-boots, with suitable spurs; and this contrast is even perceivable a few miles from Paris. In large cities, the clergy, lawyers, physicians, and merchants, generally dress in black; and it has been observed, that the French nation, in their modes of dress, are in some measure governed by commercial circumstances.

The first national assembly in their new constitution retained the Roman Catholic religion in France, allowing religious liberty to all other sects. By the laws of that constitution, no man was to be molested for his opinions, nor interrupted in the exercise of his religion. The territorial possessions of the Gallican church were claimed as national property, and disposed of through the medium of a paper money called assignats, for the creditors of the state; and the clergy made dependent upon pensionary establishments paid out of the national treasury; out of which, also were paid the expences of worship, the religious, and the poor. All monastic establishments were suppressed; but the friars and nuns were allowed to observe their vows, and nuns optionally to remain in their convents, or retire upon pensions.

The clergy were elective by the people, and took an oath to observe the laws of the new constitution*. They notified to the bishop of Rome their union in doctrine, paid him no fees, nor acknowledged any subordination to his authority. They were supplied with lodgings upon their livings, whereon they were obliged to reside and perform the duties of their office. They voted as active citizens, and were eligible to some lay-offices in the districts, but to no principal ones.

The whole country was divided into nine metropolitan circles, had a Metropolitan Bishop with a synod in each, besides one for Paris. The metropolitan bishop was confirmed by the eldest bishop in his circle. Appeals were made from the bishops to these synods.

A bishop was appointed to each of the eighty-three *departements*, which formed so many dioceses. They were appointed by the electoral assembly of the department, and confirmed by the metropolitan bishop, but must have held an ecclesiastical office fifteen years. The salaries was from 500l. to 840l. per annum. Each diocese had also a *seminary*, with three vicars, and a vicar general to prepare students for holy orders, and these vicars formed a council for the bishop.

But this new constitution of the church was of short duration, it seems to have been only a preparatory step to what soon after followed, the absolute proscription of the Christian religion. There is no doubt but the party which has been ultimately victorious in France, had this in view from the beginning of the revolution, as well as the destruction of the monarchy; at present therefore there is no established religion in that country. In their public shows and festivals the people have been accustomed to witness the most shocking indignities committed both against natural and revealed religion; and if the success of their rulers is proportionate to the ardour of their zeal, all regard to either will be banished from the minds of that people.

3 M

France

* Many of the clergy, called *refractory* priests, from a conscientious refusal of this oath, have been ejected from their benefices, and many of the popular curates made bishops.

France contains more than two millions of non-catholics; and the *protestants*, who are greatly increasing, are in proportion to the catholics, as one to twelve. There are already many regular congregations; viz. German Lutherans, French and Swiss Calvinists, Bohemian Anabaptists, and Walloon or Flemish Dissidents, besides many chapels for the ambassadors. It also contains many Jews.

[LANGUAGE.] One of the wisest measures of Lewis XIV. was his encouragement of every proposal that tended to the purity and perfection of the French language. He succeeded so far as to render it the most universal of all the living tongues; a circumstance that tended equally to his greatness and his glory, for his court and nation thereby became the school of arts, sciences, and politeness. The French language, at present, is chiefly composed of words radically derived from the Latin, with many German derivatives introduced by the Franks. It is now rather on the decay: its corner stones, fixed under Lewis XIV. are as it were loosened; and in the present mode of writing and expressing themselves, the modern French abandon that grammatical standard, which alone can render a language classical and permanent.

As to the properties of the language, they are undoubtedly greatly inferior to the English: but they are well adapted to subjects void of elevation or passion. It is well accommodated to dalliance, compliments, and common conversation.

The Lord's Prayer in French is as follows: *Nôtre Père qui es aux cieux, ton nom soit sanctifié. Ton regne vienne. Ta volonté soit faite en la terre comme au ciel. Donne nous aujourd'hui notre pain quotidien. Pardonne nous nos offenses, comme nous pardonnons à ceux qui nous ont offensés. Et ne nous induis point en tentation; mais nous délivre du mal: car à toi est le regne, la puissance, & la gloire aux siècles des siècles. Amen.*

[LEARNING AND LEARNED MEN.] The French, like the other nations of Europe, were for many centuries immersed in barbarity. The first learning they began to acquire, was not of that kind which improves the understanding, corrects the taste, or regulates the affections. It consisted in a subtle and quibbling logic which was more adapted to prevent than improve the faculties. But the study of the Greek and Roman writers, which first arose in Italy, diffused itself among the French, and gave a new turn to their literary pursuits. This, together with the encouragement which the polite and learned Francis I. gave to all men of merit, was extremely beneficial to French literature. During this reign, many learned men appeared in France, who greatly distinguished themselves by their writings; among whom were Budeus, Clement Marot, Peter du Chatel, Rabelais, and Peter Ramus. The names of Henry and Robert Stephens, are also mentioned by every real scholar with respect. It was not, however, till the seventeenth century, that the French began to write with elegance in their own language. The Académie Française was formed for this purpose: and though their labours, considered as a body, were not so successful as might have been expected, some particular academicians have done great service to letters. In fact, literary copartnerships are seldom very successful. Of this we have a remarkable example in the present case. The Academy published a dictionary for improving the French language: it was universally despised. Furetières, a single academician, publishes another: it meets with universal approbation.

letters, and the pensions he bestowed on learned men, both at home and abroad, which, by calculation, did not amount to above 12,000*l.* per annum, have gained him more glory than all the military enterprises, upon which he expended so many millions. The learned men who appeared in France during this reign, are too numerous to be mentioned. Their tragic poets, Racine and Corneille, have deservedly obtained a very high reputation; the first was distinguished for skill in moving the passions; the second for majesty; and both, for the strength and justness of their painting, the elegance of their taste, and their strict adherence to the rules of the drama. Moliere would have exhausted the subjects of comedy, were they not every where inexhaustible, and particularly in France. In the works of satire and criticism, Boileau, who was a close imitator of the ancients, possessed uncommon merit. But France has not yet produced an epic poem that can be mentioned with Milton's; nor a genius of the same extensive and universal kind with Shakespeare, equally fitted for the gay and the serious, the humorous and the sublime. In the eloquence of the pulpit and of the bar, the French are greatly our superiors: Bossuet, Bourdaloue, Flechier, and Massillon, have carried pulpit eloquence to a degree of perfection which we may approach to, but can hardly be expected ever to surpass. The genius, however, of their religion and government is extremely unfavourable to all improvements in the most useful branches of philosophy. All the establishments of Lewis XIV. for the advancement of science, were not able to counterbalance the influence of the clergy, whose interest is to keep mankind ignorant in matters of religion and morality; and the influence of the court and ministry, who have an equal interest in concealing the natural rights of Mankind, and every sound principle of government. The French have not therefore so many good writers on moral, religious, or political subjects, as have appeared in Great Britain. But France has produced some great men who do honour to humanity; whose career no obstacle could stop, whose freedom no government however despotic, no religion however superstitious, could curb or restrain. As an historian, De Thou is entitled to the highest praise; and who is ignorant of Pascal, or of the archbishop of Cambray? Few men have done more service to religion, either by their writings or their lives. As for Montequieu, he is an honour to human nature; he is the legislator of nations; his works are read in every country and language, and wherever they go they enlighten and invigorate the human mind. And, indeed, several writers have lately appeared in France, whose writings breathe such sentiments of liberty, as did but ill accord with an arbitrary government; sentiments which have made rapid progress among men of letters, and persons in the higher ranks of life, and which there can be no doubt, have been one considerable cause in producing the late important revolution.

In the Belles Lettres and miscellaneous way, no nation ever produced more agreeable writers: among whom we may place Montaigne, D'Argens, and Voltaire, as the most considerable.

Before the immortal Newton appeared in England, Descartes was the greatest philosopher in modern times. He was the first who applied algebra to the solution of geometrical problems, which naturally paved the way to the analytical discoveries of Newton. Many eminent mathematicians have flourished in the present age, particularly Clairaut, Bezout, and D'Alembert, the latter of whom, to the precision of a geometer, has united the talents of a fine writer.

Since the beginning of the present century, the French have almost vied

with the English in natural philosophy. Buffon would deserve to be reckoned among men of science, were he still not more remarkable for his eloquence than for his philosophy. He is to be regarded as a philosophical painter of nature; and, under this view, his Natural History is the first work of its kind.

Their painters, Pouffin, Le Brun, and above all Le Sueur, did honour to the age of Lewis XIV. They have none at present to compare with them in the more noble kinds of painting; but Mr. Greuse, for portraits and conversation pieces, never perhaps was excelled.

Sculpture is in general better understood in France than in most other countries of Europe. Their engravings on copper plates have been universally and justly celebrated; but such a liberal patronage has been afforded to English artists, that they are now thought to excel their ingenious neighbours, and have rivalled them also in the manufacture of paper proper for such impressions. Their treatises on ship-building and engineering stand unrivalled; but in the practice of both they are outdone by the English. No genius has hitherto equalled Vauban in the theory or practice of fortification. The French were long our superiors in architecture; though we now bid fair for surpassing them in this art.

We shall conclude this head with observing, that the French have now finished the Encyclopedie, or general dictionary of arts and sciences, which was drawn up by the most able masters in each branch of literature, in 28 volumes in folio (six of which are copper plates) under the direction of Messieurs D'Alembert and Diderot, and is the most complete collection of human knowledge we are acquainted with.

[UNIVERSITIES AND PUBLIC COLLEGES.] These literary institutions have received a loss for the present by the expulsion of the Jesuits, who made the languages, arts, and sciences, their particular study, and taught them all over France; but as the extinction of this body of men will probably lessen the influence of superstition in France, there is reason to believe that the interests of real learning and science will, upon the whole, be promoted by that event. It is not within my plan to describe the different governments and constitutions of every university or public college in France; but they are in number twenty-eight, as follow: Aix, Angiers, Arles, Avignon, Besancon, Bourdeaux, Bourges, Caen, Cahors, Dol, Douay, Fleche, Montauban, Montpellier, Nantes, Orange, Orleans, Paris, Perpignan, Poitiers, Point Mouson, Richlieu, Rheims, Soissons, Straßbourg, Toulouse, Tournoise, and Valence. Among these, the Sorbonne at Paris is most celebrated.

[ACADEMIES.] The following literary establishments are supported out of the national treasury: the French Academy, Academy of Belles Letters, Academy of Sciences, Royal Society of Medicine, King's Library, Observatory, and the Free School of Design.

[ANTIQUITIES AND CURIOSITIES,] Few countries, if we except Italy, can boast of more valuable remains of antiquity than France. Some of the French antiquities belong to the time of the Celts, and consequently, compared to them, those of Rome are modern. Father Mabillon has given us a most curious account of the sepulchres of their kings, which have been discovered so far back as Pharamond; and some of them, when broken open, were found to contain ornaments and jewels of value. At Rheims, and other parts of France, are to be seen triumphal arches; but the most entire is at Orange, erected on account of the victory obtained over the Cimbræ and Teutones, by Caius Marius and Lucatius Catulus. After Gaul was reduced to a Roman province, the Romans took vast

delight in adorning it with magnificent edifices, both civil and sacred; some of which are more entire than any to be met with in Italy itself. The ruins of an amphitheatre are to be found in Chalons, and likewise at Vienne. Nîmes, however, exhibits the most valuable remains of ancient architecture of any place in France. The famous Pont du Garde was raised in the Augustan age by the Roman colony of Nîmes, to convey a stream of water between two mountains for the use of that city, and is as fresh to this day as Westminster bridge: it consists of three bridges, or tiers of arches one above another; the height is 174 feet, and the length extends to 723. The moderns are indebted for this, and many other stupendous aqueducts, to the ignorance of the ancients; that all streams will rise as high as their heads. Many other ruins of antiquity are found at Nîmes; but the chief, are the temple of Diana, whose vestiges are still remaining; the amphitheatre, which is thought to be the finest and most entire of the kind of any in Europe; but above all, the house erected by the emperor Adrian, called the Maison Carrée. The architecture and sculpture of this building are so exquisitely beautiful, that it enchants even the most ignorant; and it is still entire, being very little affected either by the ravages of time, or the havoc of war. At Paris, in La Rue de la Harpe, may be seen the remains of a palace, or Thermæ, supposed to have been built by the emperor Julian, surnamed the Apostate, about the year 356, after the same model as the baths of Dioclesian. The remains of this ancient edifice are many arches, and within them a large saloon. It is fabricated of a kind of mastic, the composition of which is not now known, intermixed with small square pieces of free stone and bricks. But the most extraordinary of all artificial curiosities, is the subterraneous cavern at Paris: For the first building of that city, it was necessary to get the stone in the environs; as Paris was enlarged, the streets and suburbs extended to and were built on the ancient quarries from which the stone had been taken, and thence proceed the caverns or frightful cavities which are found under the houses in several quarters of the city. Eight persons lately perished in one of them, a gulf of 150 feet deep, which excited the police and government to cause the buildings of several quarters to be privately propped up. All the suburbs of St. James's, Harp-street, and even the street of Tournon, stand upon the ancient quarries; and pillars have been erected to support the weight of the houses; but as the lofty buildings, towers, and steeples, now tell the eye what is seen in the air, it wanting under the feet, so it would not require a very violent shock to throw back the stones to the places from whence they have been raised.

At Ayles in Provence is to be seen an obelisk of oriental granite, which is 52 feet high; and seven feet diameter at the base, and all but one stone. Roman temples are frequent in France. The most particular are in Burgundy and Guienne; and other places, besides the neighbourhood of Nîmes, contains magnificent ruins of aqueducts. The passage cut through the middle of a rock near Briançon in Dauphiney, is thought to be a Roman work, if not of greater antiquity. The round buckler of massy silver, taken out of the Rhone in 1665, being twenty inches in diameter, and weighing twenty-one pounds, containing the story of Scipio's continence, is thought to be coeval with that great general. It would be endless to recount the different monuments of antiquity to be found in France, particularly in the cabinets of the curious.

I have already mentioned several remarkable springs and mountains, which may be considered as natural curiosities. Some of the modern works of art, particularly the canals, have been also before noticed. There are some sub-

terraneous passages and holes, especially at St. Aubin in Brittany, and Nient in Dauphiny, really stupendous.

CITIES AND TOWNS.] These are numerous in France; of which we shall mention only Paris, Lisle, and their principal sea-ports, Bréſt and Toulon.

Lisle, in French Flanders, is thought to be the most regular and strongest fortification in Europe, and was the master-piece of the famous Vauban. It is generally garrisoned with above ten thousand regulars; and for its magnificence and elegance, it is called Little Paris. Its manufactures of silk, cambric, and camblets, are very considerable; and its inhabitants amount to about one hundred thousand. Every reader is acquainted with the history of Dunkirk, which the French were obliged by the treaty of Utrecht to demolish, but it is still a thorn in the side of the English, by being a harbour for their smugglers, and may now, by an article in the last treaty of peace, be put into what condition the French ministry may please. The rest of French Flanders, and its Netherlands, abound with fortified towns, which carry on very gainful manufactures.

Moving southward, we come to the Isle of France; the capital of which and of the whole kingdom, is Paris. This city has been so often described, it may appear superfluous to mention it more particularly, were it not that the vanity of the French has given it a preference, which it by no means deserves, to all the capitals in the world, in every respect, not excepting even population. Many of the English have been imposed upon in this point; particularly by the computing from the births and burials within the bills of morality, which exclude the most populous parishes about London. Another mistake lies in computing from births and marriages. The number of dissenters of all kinds in and about London, who do not register the births of their children, is amazing; the registers of others are not known by the public; and many of the poorer sort will not afford the small expence of such registering. Another peculiarity existing in London, is that most of the Londoners, who will afford the expence, when they find themselves consumptive, or otherwise indisposed, retire into the country, where they are buried, and thereby excluded from the bills of mortality. The population of Paris, therefore, where the registers are more exact and accessible to the poor, and where the religion and the police are more uniform and strict, is far more easily ascertained than that of London; and by the best accounts, it does not exceed seven or eight hundred thousand, which is far short of the inhabitants of London and the contiguous parishes.

Paris is divided into three parts; the city, the university and that which was formerly called the Town. The city is old Paris; the university and the town are the new. Paris contains more works of public munificence than utility. Its palaces are shewy, and some of its streets, squares, hotels, hospitals, and churches, superbly decorated with a profusion of paintings, tapestry, images, and statues; but Paris, notwithstanding its boasted police, is greatly inferior to London in many of the conveniences of life, and the solid enjoyments of society. Without entering into more minute disquisitions, Paris, it must be owned, is the paradise of splendor and dissipation. The tapestry of the Gobelines* is unequalled for beauty and riches. The Louvre is a building that does honour to architecture itself; and the institution of the French academy far exceeds any thing of the kind in England, or else-

* One *Goblet*, a noted dyer at Rheims, was the first who settled in this place, in the reign of Francis I. and the house has retained his name ever since; and here the great *Golbert*, about the year 1667, established that valuable manufactory.

where. The Thuilleries, the palace of Orleans, or as it is called Luxembourg, where a valuable collection of paintings are shewn, the royal palace, the king's library, the guild hall, and the hospital for the invalids, are superb to the highest degree. The city of Paris is said to be fifteen miles in circumference. The hotels of the French noblesse at Paris take up a great deal of room with their court-yards and gardens; and so do their convents and churches. The streets are very narrow, and the houses very high, many of them seven stories. The houses are built of stone, and are generally mean, even to wretchedness, owing partly to their containing a different family on every floor. The river Seine, which runs through the centre of the city, is not half so large as the Thames at London; it is too far distant from the sea for the purposes of navigation, and is not furnished, as the Thames, with vessels or boats of any sort; over it are many stone and wooden bridges, which have nothing to recommend them. The streets of Paris are generally crowded, particularly with coaches, which gives that capital the appearance of wealth and grandeur; though in reality, there is more shew than substance. The glittering carriages that dazzle the eyes of strangers are mostly common hacks, hired by the day or week to the numerous foreigners who visit that city; and in truth, the greatest part of the trade of Paris arises from the constant succession of strangers that arrive daily, from every nation and quarter of the globe. This ascendancy is undoubtedly owing to the reputation of their language, their public buildings the Gobelines, or manufacture of tapestry, their libraries, and collections of paintings, that are open to the public; the cheapness of provisions, excellency of the French wines, and above all the purity of the air and climate in France. With all these advantages, Paris, in general, will not bear a comparison with London, in the more essential circumstances of a thriving foreign and domestic trade, the cleanness of their streets, elegance of their houses, especially within; the plenty of water, and that of a better quality than the Seine, which it is said disagrees with strangers, as do likewise their small wines. In the houses of Paris most of the floors are of brick, and have no other kind of cleaning than that of being sprinkled with water, and swept once a day. These brick floors, the stone stairs, the want of wainscoting in the rooms, and the thick party walls of stone, are however, good preservatives against fire, which seldom does any damage in this city. Instead of wainscoting, the walls are covered with tapestry or damask. The beds in general are very good, and well ornamented with tester and curtains; but bugs are here a most intolerable nuisance, which frequently oblige strangers to sleep on the floor during the excessive heat in the summer. Their shops are but poorly stored with goods; and the shopkeepers and tradesmen, an indolent, loitering people, seldom, make their appearance before dinner in any other than a morning dress, of velvet cap, silk night gown, and Morocco slippers; but when they intend a visit, or going abroad, all the punctilios of a courtier are attended to, and hardly the resemblance of a man remains. There is a remarkable contrast between this class of people and those of the same rank in London. In Paris, the women pack up parcels, enter the orders, and do most of the drudgery business of the shop, while the husband loiters about, talks of the great, of fashions and diversions, and the invincible force of their armies. The splendour of the grand Monarque used to be also with them a favourite topic of conversation, previous to the change in their political system. The Parisians however, as well as the natives of France in general, are remarkably temperate in their living; and to be intoxicated with liquor is considered as infamous.

Bread,

Bread, and all manner of butcher's meat and poultry, are extremely good in Paris; the beef is excellent; the wine they generally drink, is a very thin kind of Burgundy. The common people, in the summer season, live chiefly on bread, butter, grapes and small wine. The Parisians scarcely know the use of tea, but they have coffee in plenty. The police of Paris used to be so well attended to, that quarrels, accidents, or felonies, seldom happened, and strangers from all quarters of the globe, let their appearance be ever so uncommon, met with the most polite treatment. The streets are patrolled at night by horse and foot; so judiciously stationed, that no offender can escape their vigilance. They likewise visit the publicans precisely at the hour of twelve at night, to see that the company are gone; for in Paris no liquor can be had after that time. The public roads in France are under the same excellent regulation, which, with the torture of the rack, prevents robberies in that kingdom; but for the same reason, when robberies do happen, they are always attended with the death of the unfortunate traveller; and indeed this is the general practice in every country of Europe, Great Britain excepted.

The environs of Paris are very pleasant, and contain a number of fine seats, small towns, and villages; some of them, being scattered on the edges of lofty mountains rising from the Seine, are remarkably delightful.

The palace of Versailles, which stands twelve miles from Paris, though magnificent and expensive beyond conception, and adorned with all that art can furnish, is properly a connection of buildings, each of exquisite architecture, but not forming a whole, agreeable to the grand and sublime of that art. The gardens, and water works, (which are supplied by means of prodigious engines, across the Seine at Marli, about three miles distance), are astonishing proofs of the fertile genius of man, and highly worthy of a stranger's attention. Trianon, Marli, St. Germain en Laye, Meudon, and other royal palaces, are laid out with taste and judgment; each has its peculiar beauties for the entertainment and amusement of that luxurious court which lately occupied them: but some of them are in a shameful condition, both as to repairs and cleanliness.

Brest is a small, but very strong town, upon the English channel, with a most spacious and finely fortified road and harbour, the best and safest in all the kingdom: yet its entrance is difficult, by reason of many rocks lying under water. At Brest is a court of admiralty, and academy for sea affairs, docks and magazines for all kinds of naval stores, rope-yards, store-houses, &c. in somuch that it may now be termed the capital receptacle for the navy of France and is admirably well adapted for that end.

Lewis XIV. rendered Toulon, from a pitiful village, a sea-port of great importance. He fortified both the town and harbour for the reception and protection of the navy. Its old and its new harbour lie contiguous; and by means of a canal, ships pass from the one to the other, both of them having an outlet into the spacious outer harbour. Its arsenal, established also by that king has a particular store-house for each ship of war, its guns cordage, &c. being separately laid up. Here are spacious workshops, for blacksmiths, joiners, carpenters, locksmiths, carvers, &c. Its rope-walk, of stone, is 320 toises or fathoms in length, with three arched walks. Its general magazine supplies whatever may be wanting in the particular store-houses, and contains an immense quantity of all kinds of stores, disposed in the greatest order.

COMMERCE AND MANUFACTURES.] Next to Henry IV. justly styled the Great, the famous Colbert, minister to Lewis XIV. may be called the

ocean,

ther of the French commerce and manufactures. Under him there was a great appearance that France would make as illustrious a figure as a trading people as she did then as a warlike people; but the truth is, the French do not naturally possess that undaunted perseverance which is necessary for commerce and colonization, though no people, in theory, understood them better. It is to be considered at the same time, that France, by her situation, by the turn of her inhabitants for certain manufactures, and the happiness of her soil, must be always possessed of great inland and neighbouring trade.

The silk manufacture was introduced into France so late as the reign of Henry IV. and in the age of his grandson Lewis XIV. the city of Tours alone employed 8000 looms, and 800 mills. The city of Lyons then employed 18,000 looms; but after the impolitic and unjust revocation of the edict of Nantes, the expulsion of the Protestants, and the ruinous wars maintained by France, they decreased to 4000; and their silk manufacture is now rivalled by that of England, where the French Protestants took refuge, and were happily encouraged. Next to Tours and Lyons, Pairs, Chatillion, and Nismes, are most celebrated for silk manufactures. France contains 1,500 silk mills, 21,000 looms for stuffs, 12,000 for ribbons and lace, 20,000 for silk stockings, all of which employ two millions of people. They also manufacture gloves and stockings from spider-silk. On the other hand, the French woollen cloths and stuffs, more especially at Abbeville, Amiens, and Paris are said to be now little inferior to those of England, and have greatly injured them, particularly in the Turkish market, assisted by the clandestine importation of English and Irish wool; and workmen from this country.

In manufactures the French have always been distinguished for their invention, and the English for their superior improvement. Abbeville is famous for cloth, linen, sail-cloth, and soap; Auvergue for fine thread, lace, stuffs; and paper; Nismes for fine serges; Cambray for cambrics; St Quentin for lawns; and Picardy for plate glass.

The districts adjoining the British channel, contain many sheep of the English breed, which are said to degenerate by removal from their native soil.

Besides the infinite advantage arising to her inland commerce, from her rivers, navigable canals; and a connexion with two seas, her foreign trade may be said to extend itself all over the globe. It is a doubtful point whether France was a loser by its cession of Canada and part of Louisiana at the late peace. But the most valuable part of Hispaniola in the West Indies, which she possesses by the partiality and indolence of Spain, is a most improveable acquisition, and the most valuable of all her foreign colonies. In the West Indies, she likewise possesses the most important sugar islands of Martinico, Guadaloupe, St. Lucia, St. Bartholomow, Desada, and Margalante. Her possessions in North America are only a small tract upon the Mississippi.

The French possessions in the East Indies are not very considerable; though had their genius been more turned for commerce than war, they might have engrossed more territory and revenues than are now in possession of the English; but they over-rated both their own power and their courage, and their East India company never did much. At present (says Mr. Anderson,) her land trade to Switzerland and Italy is by way of Lyons—To Germany, though Metz and Strasburg—To the Netherlands, through Lille—To Spain (a most profitable one), though Bayonne and Perpignan. As for her naval commerce, her ports in the channel, and on the western ocean, are frequented by all the trading nations in Europe, to the great

advantage of France, more especially respecting what is carried on with England, Holland, and Italy. The trade from her Mediterranean ports (more particularly from Marseilles) with Turkey and Africa has long been very considerable. The negro trade from Guinea supplies her sugar colonies, besides the gold, ivory, and drugs got from thence.

The commercial treaty between France and England appears to have served both countries, by opening an extensive market for English woollens, cottons, pottery, and hardware, and for French wines, linens, and cambrics, besides having nearly destroyed the great smuggling trade on their coasts, and promoted a friendly intercourse between the two nations; but it has also been the means of glutting the French market with English goods, and affording the French an opportunity to rival the English in their manufactures, as appears from new ones, particularly one in imitation of W^{al}wood's ware, already established at Paris.

The exports are wine, vinegar, brandy, oil, silks, satins, linens, Indian cloth, tapestries, laces, gold and silver embroideries, toys, trinkets, penumery, paper, prints, books, drugs, dyes, &c. The imports are hardware, earthenware, cottons, metals, hemp, flax, silk, wool, horses, East and West Indian goods, &c. It employs one million tons of shipping; with near 50,000 seamen; and before the revolution, the imports were valued at 9,583,333*l.* the exports at 12,500,000*l.* and it had a *balance* of trade of more than two millions in its favour; but its trade and manufactures have since declined.

One great disadvantage to the commerce of France is, that the profession of a merchant is not so honourable as in England and some other countries. A great number of the cities of France have the privilege of coinage, and each of them a particular mark to distinguish their respective pieces; which must be very embarrassing, especially to strangers.

PUBLIC TRADING COMPANIES.] It has no trading companies (having abolished all monopoly) but a bank or *caisse d'escompte*, and a bank of extraordinary.

CONSTITUTION AND GOVERNMENT.] France, by the revolution in 1789, founded a *new constitution*, upon the principles that all men are free, and equal in their rights, and that sovereignty resides in the nation. It would be trifling with our readers to give them any detail of this constitution, as it has been virtually overthrown, by the abolition of the monarchical part of it, and by the subsequent condemnation, and execution of the king; a deed of most singular atrocity, by which the national convention have stamped eternal infamy upon their characters.—A committee was appointed by the convention to draw up a new constitution, which was approved of by the representatives of the people, but this was soon overthrown to make way for another; how long this may continue, or upon what order of things France may ultimately settle, it is impossible at present even to form a conjecture and to attempt in a work of this kind, a description of a state of things, which at the very moment may be hastening to its fall, would answer no useful purpose.

After the reader has been told of the excellency of the climate, and fertility of the soil in France; her numerous manufactures and extensive commerce; her great cities, her numerous towns, sea-ports, rivers and canals; the cheapness of provisions, wines and liquors; the formidable armies, and fleets she has sent forth, to the terror of Europe; and the natural character of her inhabitants, their sprightliness and gaiety; he will undoubtedly conclude, that France is the most powerful nation, and her people the most opulent and happy in Europe. The reverse, however, appears to be the state of

that nation at present; and we do not find that in any former period they were more rich or more happy.

The most obvious causes of this national poverty took their rise from the ambition and vanity of their kings and courtiers, which led them into schemes of universal dominion, the aggrandizement of their name, and the enslaving of Christendom. Their wars, which they sometimes carried on against one half of Europe, and in which they were generally unfortunate, led them into difficulties to which the ordinary revenues were inadequate; and hence proceeded the arbitrary demands upon the subject, under various pretences, in the name of loans, free-gifts, &c. When these failed, other methods, more despotic and unwarrantable, such as raising and reducing the value of money as it suited their own purposes, national bankruptcies, and other grievous oppressions, were adopted, which gave the finishing blow to public credit, and shook the foundations of trade, commerce, and industry, the fruits of which no man could call his own.

When we consider the motives of these wars, a desire to enslave and render miserable the nations around them, that man must be devoid of humanity whose breast is not raised with indignation upon the bare mention of the blood that has been spilt, the miseries and desolations that have happened, and the numerous places that have fallen a sacrifice to their ambition. It appears too plain, that while they thus grasp after foreign conquest, their country exhibits a picture of misery and beggary. Their towns, a very few excepted, make a most dismal and solitary appearance. The shops are mean beyond description; and the passengers, who saunter through a labyrinth of narrow dirty streets, appear to be chiefly composed of priests and devotees passing to or from mass, hair dressers, and beggars. That this is the appearance of their towns, and many of their cities; we may appeal to the observation of any one who has been in that kingdom. Were it possible to mention a people more indigent than these citizens, we might describe the farmers and peasantry. We have in another place, mentioned the natural advantages of France, where the hills are covered with grapes, and most extensive plains produce excellent crops of corn, rye, and barley. Amidst this profusion of plenty, the farmer and his family barely exist upon the gleanings, and his cattle, which are seldom numerous, pick a subsistence, in the summer months, from the skirts of his fields. Here the farmer, meagre, dispirited, and depressed, exhibits a spectacle of indigence hardly credible; and to see him ploughing the ground with a lean cow, ass, and a goat yoked together, excites in an English traveller that pity to which human nature is entitled. He forgets the country while he feels for the man.

REVENUES.] Mr. Lafond presented to the assembly, December 30, 1791, the following general estimate from the particular estimate of the ministers for the year 1792 :

			Livres.
Appanage of princes	_____	_____	5,000,000
Foreign affairs	_____	_____	6,000,000
Marine and colonies	_____	_____	43,000,000
General administration	_____	_____	5,000,000
Public worship	_____	_____	81,000,000
Pensions to ecclesiastics	_____	_____	68,000,000
National assembly	_____	_____	5,000,000
Civil list	_____	_____	25,000,000
Bridges and roads	_____	_____	45,000,000
		3 N 2	High

	Livres.
High national court and court of appeal	450,000
Schools and academies	1,000,000
Interest of debts	20,000,000
Life annuities	100,000,000
Perpetual annuities	300,000,000

Besides the expences of the army.

The WAYS and MEANS.

By land tax, a tax on personal property, patents, stamps, &c. valued at 530,000,000 livres; the remaining sum to be provided for from the fund of extraordinaries.

The extraordinary expences of the army, colonies and public works would soon cease, and bring the expenditure on a level with the revenue.

Some authors make the amount of the assessed taxes for the years 1792, only 300,000,000 livres equal to 12,500,000l. sterling, and with the incidental taxes in all 15,500,000l. sterling; near nine million less than before the revolution, when the noblese and clergy were exempted.

All excises and excisemen, tythes, and game laws, are now abolished; and the roads maintained at public expence.

The Revenue in the year 1788, before the revolution, was 20 millions and a half sterling; and its ordinary expenditure exceeded the revenue five millions and a half.

The public debt, 1784, was £. 141,666,000

MILITARY AND MARINE STRENGTH.] There is no nation in Europe where the art of war, particularly that part of it relating to gunnery and fortification, is better understood than in France. Besides other methods for cultivating it, there is a royal military academy established purposely for training up 500 young gentlemen at a time, in the several branches of this great art.

ARMY. The peace establishment of the army, for the year 1792, was

Infantry	111,000
Cavalry	30,000
Artillery	11,000

Total 152,000

These are called *troops of the line*, and, along with the volunteer national guards, form an army, at present on the frontiers, of 224,000 men.

The *municipal army* or national guards, are a kind of embodied militia for the interior defence of the kingdom, and amount to between 3 and 4 million.

The *gens d'armes* are an auxiliary body of troops, for the protection of laws and police.

NAVY. The report of the minister towards the close of the year 1791, states the ships in good condition to be 86 of the line, and, including those building, as follows:

Large first rates	8
100 guns	5
80 guns	10
	24 guns

Livres.
450,000
1,000,000
20,000,000
100,000,000
300,000,000

74 guns	67
64 guns	1

Total	91
Frigates	78

besides fireships, corvettes, galleys, and cutters.

There are 28 of the line and 5 frigates in commission, and 80,000 seamen, with officers registered to man the fleet; But the signal victories obtained by the fleets of Great Britain over those of France during the present war have almost totally annihilated its naval power.

ROYAL TITLES, ARMS, NOBILITY, } THE NATIONAL ASSEMBLY, de-
AND ORDERS. } siring of establishing the French

constitution on the principles it has declared, abolished, irrevocably, those institutions which are injurious to liberty and equality of rights.

There is no longer any nobility, nor peerage, nor hereditary distinctions, nor difference of orders, nor feudal government, nor patrimonial jurisdiction nor any of the titles, denominations and prerogatives, which are derived from them; or any of the orders of chivalry, corporations or decorations, for which proofs of nobility were required: nor any kind of superiority but that of public functioners in the exercise of their functions.

Royalty, which was one branch of the first constitution, is now abolished, the unfortunate monarch decapitated, and five tyrants have usurped his throne who are called the directory.

HISTORY.] The history of no country is better authenticated than that of France, and it is particularly interesting to an English reader. This kingdom, which was by the Romans called Transalpine Gaul, or Gaul beyond the Alps, to distinguish it from Cisalpine Gaul, on the Italian side of the Alps, was probably peopled from Italy, to which it lies contiguous. Like other European nations, it soon became a desirable object to the ambitious Romans; and, after a brave resistance, was annexed to their empire by the invincible arms of Julius Cæsar, about forty-eight years before Christ. Gaul continued in the possession of the Romans till the downfall of that empire in the fifth century, when it became a prey to the Goths, the Burgundians, and the Franks, who subdued but did not extirpate the ancient natives. The Franks themselves, who gave it the name of France, or Frankenland, were a collection of several people inhabiting Germany, and particularly the Salii, who lived on the banks of the river Sale, and who cultivated the principles of jurisprudence better than their neighbours. These Salii had a rule, which the rest of the Franks are said to have adopted, and has been by the modern Franks applied to the succession of the throne, excluding all females from the inheritance of sovereignty, and is well known by the name of the *Salic law*.

The Franks and Burgundians, after establishing their power, and reducing the original natives to a state of slavery, parcelled out the lands among their principal leaders; and succeeding kings found it necessary to confirm their privileges, allowing them to exercise sovereign authority in their respective governments, until they at length assumed an independency, only acknowledging the king as their head. This gave rise to those numerous principalities that were formerly in France, and to the several parliaments; for every province became, in its policy and government, an epitome of the whole kingdom; and no laws were made, or taxes raised, without the concurrence of the grand council, consisting of the clergy and of the nobility.

Thus, as in other European nations, immediately after the dissolution of the Roman empire, the first government in France seems to have been a kind of

of mixed monarchy, and the power of their kings extremely circumscribed and limited by the feudal barons.

The first christian monarch of the Franks (according to Daniel, one of the best French historians) was Clovis, who began his reign anno 481, and was baptized, and introduced Christianity in the year 496: The mind of Clovis had been affected by the pathetic tale of the passion and the death of Christ; and insensible of the beneficial consequences of the mysterious sacrifice, he exclaimed with religious fervour, "Had I been present with my valiant Franks, "I would have revenged his injuries." But though he publicly professed to acknowledge the truth of the gospel, its divine precepts were but little respected. From this period the French history exhibits a series of great events; and we find them generally engaged in domestic broils or in foreign wars. The first race of their kings prior to Charlemagne, found a cruel enemy in the Saracens, who then over-ran Europe, and retaliated the barbarities of the Goths and Vandals upon their posterity. In the year 800, Charlemagne, king of France, whom we have often mentioned as the glory of those dark ages, became master of Germany, Spain, and part of Italy, and was crowned king of the Romans by the pope; he divided his empire by will, among his sons, which proved fatal to his family and posterity. Soon after this, the Normans, a fierce warlike people from Norway, Denmark, and other parts of Scandinavia, ravaged the kingdom of France, and about the year 900 obliged the French to yield Bretagne to Rollo their leader, who married the king's daughter, and was persuaded to profess himself a Christian. This laid the foundation of the Norman power in France; which afterwards gave a king to England, in the person of William duke of Normandy, who subdued Harold, the last Saxon king, in the year 1066. This event proved unfortunate and ruinous to France; as it engaged that nation in almost perpetual wars with England, for whom they were not an equal match, notwithstanding their numbers, and the assistance they received from Scotland.

The rage of crusading, which broke out at this time, was of infinite service to the French crown in two respects: in the first place, it carried off hundreds of thousands of its turbulent subjects, and their leaders, who were almost independent of the king: in the next, the king succeeded to the estates of numbers of the nobility, who died abroad without heirs.

But passing over the dark ages of the crusades, their expedition to the Holy Land, and wars with England, which have already been mentioned, we shall proceed to that period when the French began to extend their influence over Europe; and this brings us to the reign of Francis I. contemporary with Henry VIII. of England. This prince, though he was brave to excess in his own person, and had defeated the Swiss, who till then were deemed invincible, was an unfortunate warrior. He had great abilities and great defects. He was a candidate for the empire of Germany, but lost the imperial crown: Charles V. of the house of Austria, and king of Spain being chosen. In the year 1520, Francis having invited Henry VIII. of England to an interview, the two kings met in an open plain near Calais, where they and their attendants displayed their magnificence with such emulation and profuse expence as produced it the name of the *Field of the Cloth of Gold*. Feats of chivalry, parties of gallantry, together with such exercises and pastimes as were in that age reckoned manly or elegant, rather than serious business, occupied both courts during eighteen days that they continued together*. Francis made

some dazzling expeditions against Spain, but suffered his mother, of whom he was very fond, to abuse his power: by which he disoblged the constable of Bourbon, the greatest of his subjects, who joined in a confederacy against him with the emperor and Henry VIII. of England. In a capital expedition he undertook into Italy, he was taken prisoner at the battle of Pavia, in the year 1524, and obliged to agree to dishonourable terms, which he never meant to perform, to regain his liberty. His non-performance of those conditions was afterwards the source of many wars between him and the emperor; and he died in 1547.

France, at the time of his death, notwithstanding the variety of disagreeable events during the late reign, was in a flourishing condition. Francis I. was succeeded by his son Henry II. who upon the whole was an excellent and fortunate prince. He continued the war with the emperor of Germany to great advantage for his own dominions; and was so well served by the duke of Guise, that though he lost the battle of St. Quintin, against the Spaniards and the English, he retook Calais from the latter, who never since had any footing in France. He married his son, the Dauphin, to Mary queen of Scots, in hopes of uniting that kingdom to his crown; but in this scheme, he, or rather his country, was unfortunate, as may be seen in the history of Scotland. He was killed in the year 1559, at an unhappy tilting-match, by the count of Montgomeri.

He was succeeded by his son Francis II. a weak, sickly, inactive prince, and only thirteen years of age, whose power was entirely engrossed by a prince of the house of Guise, uncle to his wife, the beautiful queen of Scotland. This engrossment of power encouraged the Bourbon, the Montmorenci, and other great families, to form a strong opposition against the government. Anthony, king of Navarre, was at the head of the Bourbon family; but the queen-mother, the famous Catherine of Medicis, being obliged to take part with the Guises, the confederacy, who had adopted the cause of Hugonotism, was broken in pieces, when the sudden death of Francis happened, in the year 1560.

This event took place while the prince of Condé, brother to the king of Navarre, was under sentence of death for a conspiracy against the court; but the queen-mother saved him, to balance the interest of the Guises; so that the sole direction of affairs fell into her hands, during the minority of her second son, Charles IX. Her regency was a continued series of dissimulation, treachery and murder. The duke of Guise, who was the scourge of the Protestants, was assassinated by one Poltro, at the siege of Orleans; and the murderer was unjustly thought to have been instigated by the famous Coligni, admiral of France, who was then at the head of the Protestant party. Three civil wars succeeded each other. At last the court pretended to grant the Hugonots a very advantageous peace, and a match was concluded between Henry, the young king of Navarre, a Protestant, and

Fleuranges, who was present, and which appears singular in the present age, is commonly omitted. "After the tournament," says he "the French and English wrestlers made their appearance, and wrestled in presence of the kings and the ladies; and as there were many stout wrestlers there, it afforded excellent pastime; but as the king of France had neglected to bring any wrestlers out of Bretagne, the English gained the prize.—After this, the kings of France and England retired to a tent, where they drank together, and the king of England seizing the king of France by the collar, said, "My brother, I must wrestle with you," and endeavoured once or twice to trip up his heels; but the king of France, who was a dextrous wrestler, twisted him round, and threw him on the earth with prodigious violence. The king of England wanted to renew the combat, but was prevented."

Memoires de Fleuranges, 2amo. Paris, 1753, p. 329.

the French king's sister. The heads of the Protestants were invited to celebrate the nuptials at Paris, with the infernal view of butchering them all if possible in one night. This project proved but too successful, though it was not completely executed, on St. Bartholomew's day, 1572. The king himself assisted in the massacre, in which the admiral Coligni fell. The signal for the inhuman slaughter of so many thousands, was to be made by striking the great bell of the palace. At that dreadful knell, the work of death was begun, and humanity recoils from the horrors of the fatal night of St. Bartholomew; yet the reader may expect amidst the general carnage that some few moments should be devoted to the fate of Coligni. He had long retired to rest, when he was aroused by the noise of the assassins, who had surrounded his house. A German, named Besme, entered his chamber, and the admiral, apprehending his intentions, prepared to meet death with that fortitude which had ever distinguished him. Incapable of resistance from the wounds he had received by two balls in a late attempt to assassinate him, with an undismayed countenance, he had scarce uttered the words, "young man, respect these grey hairs, nor stain them with blood," when Besme plunged his sword into his bosom, and with his barbarous associates threw the body into the court. The young duke of Guise, contemplated it in silence, but Henry count d'Angouleme, natural brother to Charles, spurned it with his foot, exclaiming, "Courage, my friends, we have begun well, let us finish in the same manner." It is said that about 30,000 Protestants were murdered at Paris, and in other parts of France, and this brought on a fourth civil war. Though a fresh peace was concluded in 1573 with the Protestants, yet a fifth civil war broke out the next year, when the bloody Charles IX. died without heirs.

His third brother, the duke of Anjou, had some time before been chosen king of Poland; and hearing of his brother's death, he with some difficulty escaped to France, where he took quiet possession of that crown, by the name of Henry III.

Religion at that time supplied to the reformed nobility of France, the feudal powers they had lost. The heads of the Protestants could raise armies of Hugonots. The governors of provinces behaved in them as if they had been independent of the crown; and the parties were so equally balanced, that the name of the king alone turned the scale. A *holy league* was formed for the defence of the catholic religion, at the head of which was the duke of Guise. The protestants under the prince of Condé, and the duke of Alençon, the king's brother, called the German princes to their assistance, and a sixth civil war broke out in 1577, in which the king of Spain took the part of the league, in revenge of the duke Alençon declaring himself lord of the Netherlands. The civil war was finished within the year, by another sham peace. The king, ever since his accession to the crown, had plunged himself into a course of infamous debauchery and religious extravagancies. He was entirely governed by his profligate favourites, but he possessed natural good sense. He began to suspect that the proscriptions of the protestants, and the setting aside from the succession the king of Navarre, on account of his religion, which was aimed at by the holy league, was with a view to place the duke of Guise, the idol of the Roman Catholics, on the throne, to which that duke had some distant pretensions. To secure himself on the throne, a seventh civil war broke out in 1579, and another in the year 1585, both of them to the disadvantage of the Protestants, through the abilities of the duke of Guise. The king thought him now so dangerous, that after inviting him in a friendly manner to court, both

* A f
Upper M
of Spain

he and his brother the cardinal, were, by his majesty's orders, and in a manner under his eyes, safely assassinated in 1588. The leaguers, upon this, declared that Henry had forfeited his crown, and was an enemy to religion. This obliged him to throw himself into the arms of the Protestants; but while he was besieging Paris, where the leaguers had their greatest force, he was in his turn assassinated by the Clement, a young enthusiastic monk, in 1590. In Henry III. ended the line of Valois.

The readers of history are well acquainted with the difficulties, on account of his religion, which Henry IV. king of Navarre *, head of the house of Bourbon, and the next heir by the Salic law, had to encounter before he mounted the throne. The leaguers were headed by the duke of Main, brother to the late duke of Guise; and they drew from his cell the decrepit popish cardinal of Bourbon, uncle to the king of Navarre, to proclaim him king of France. Being strongly supported by the power of Spain and Rome, all the glorious actions performed by Henry, his courage and magnanimity, seemed only to make him more illustriously unfortunate; for he and his little court were sometimes without common necessities. He was, however, personally beloved; and no objection lay against him but that of religion. The leaguers, on the other hand, split among themselves; and the French nation in general, being jealous of the Spaniards, who availed themselves of the public distractions, Henry, after experiencing a variety of good and bad fortune, came secretly to a resolution of declaring himself a Roman Catholic. This was called a measure of prudence, if not of necessity, as the king of Spain had offered his daughter Isabella Clara Eugenia to be queen of France and would have married her to the young duke of Guise.

In 1593, Henry went publicly to mass, as a mark of his conversion. This complaisance wrought wonders in his favour; and having with great difficulty obtained absolution from the pope, all France submitted to his authority, and he had only the crown of Spain to contend with, which he did for several years with various fortune. In 1598 he published the famous edict of Nantes, which secured to his old friends the Protestants the free exercise of their religion; and next year the treaty of Vervins was concluded with Spain. Henry next chastised the duke of Savoy who had taken advantage of the late troubles in his kingdom; and applied himself with wonderful attention and success (assisted in all his undertakings by his minister, the great Sully), to cultivate the happiness of his people, by encouraging manufactures, particularly that of silk, the benefit of which France feels at this day. Having re-established the tranquillity, and in a great measure, secured the happiness of his people, he formed connexions with the neighbouring powers for reducing the ambition of the house of Austria; for which purpose, it is said, he had formed great schemes, and collected a formidable army; others say (for his intention does not clearly appear), that he designed to have formed Christendom into a great republic, of which France was to be the head, and to drive the Turks out of Europe; while others attribute his preparations to more ignoble motives, that of a criminal passion for a favourite princess, whose husband had carried her for protection into the Austrian dominions. Whatever may be in these conjectures, it is certain, that while he was making preparations for the coronation of his queen, Mary of Medicis, and

3 O

* A small kingdom lying upon the Pyrenean mountains, of the greatest part of which, Upper Navarre, Henry's predecessors had been unjustly dispossessed, by Ferdinand, king of Spain, about the year 1512.

was ready to enter upon his grand expedition, he was assassinated in his coach in the streets of Paris, by one Ravillac, like Clement, another young enthusiast, in 1610.

Lewis XIII. son to Henry IV. deservedly named the Great, was but nine years of age at the time of his father's death. As he grew up, he discarded his mother and her favourites, and chose for his minister the famous cardinal Richlieu, who put a period, by his resolute and bloody measures, to the remaining liberties of France and to the religious establishment of the protestants there, by taking from them Rochelle, though Charles I. of England, who had married the French king's sister, made some weak efforts by his fleet and arms, to prevent it. This put an end to the civil wars, on account of religion in France. Historians say, that in these wars above a million of men lost their lives; that 150,000,000 livres was spent in carrying them on; and that nine cities, four hundred villages, two thousand churches, two thousand monasteries, and ten thousand houses, were burnt, or otherwise destroyed, during their continuance.

Richlieu, by a masterly train of politics, though himself was next to an enthusiast for popery, supported the protestants of Germany, and Gustavus Adolphus, against the house of Austria: and after quelling all the rebellions and conspiracies which had been formed against him in France, he died some months before Lewis XIII. who in 1643, left his son, afterwards the famous Lewis XIV. to inherit his kingdom.

During that prince's non-age, the kingdom was torn in pieces under the administration of his mother Anne of Austria, by the factions of the great, and the divisions between the court and parliament, for the most trifling causes, and upon the most despicable principles. The prince of Condé flamed like a blazing star; sometimes a patriot, sometimes a courtier, and sometimes a rebel. He was opposed by the celebrated Turenne, who from a protestant, had turned papist. The nation of France was involved at once in civil and domestic wars; but the queen mother having made choice of cardinal Mazarine for her first minister, he found means to turn the arms even of Cromwell against the Spaniards, and to divide the domestic enemies of the court so effectually among themselves, that when Lewis assumed the reins of government in his own hands, he found himself the most absolute monarch that ever sat upon the throne of France. He had the good fortune, on the death of Mazarine, to put the domestic administration of his affairs into the hands of Colbert, whom I have more than once mentioned, who formed new systems for the glory, commerce, and manufactures of France, all which he carried to a surprising height.

To write the history of this reign, would be to write that of all Europe. Ignorance and ambition were the only enemies of Lewis: through the former, he was blind to every patriotic duty of a king, and promoted the interests of his subjects only that they might the better answer the purposes of his greatness; by the latter he embroiled himself with all his neighbours, and wantonly rendered Germany a dismal scene of devastation. By his impolitic and unjust revocation of the edict of Nantes, in the year 1685, with the dragging the protestants that followed it, he obliged them to take shelter in England, Holland, and different parts of Germany, where they established the silk manufactures, to the great prejudice of their own country. He was so blind by flattery, that he arrogated to himself the divine honours paid to the pagan emperors of Rome. He made and broke treaties for his convenience, and at last raised against himself a confederacy of almost all the other princes of Europe; at the head of which was king William III. of England. He

was

was so well served, that he made head for some years against this alliance; but having provoked the English by his repeated infidelities, their arms, under the duke of Marlborough, and the Austrians, under the prince Eugene, rendered the latter part of his life as miserable as the beginning of it was splendid. His reign, from the year 1702 to 1711, was one continued series of defeats and calamities; and he had the mortification of seeing those places taken from him, which in the former part of his reign, were acquired at the expence of many thousand lives. Just as he was reduced, old as he was, to the desperate resolution of collecting his people, and dying at their head, he was saved by the English Tory ministry deserting the cause, withdrawing from their allies, and concluding the peace of Utrecht, in 1713. He survived his deliverance but two years; and in his last hours displayed a greatness of mind worthy of his elevated situation, "Why do you weep," said he to his domestics, "Did you think me immortal?" He died on the first of September, 1715, and was succeeded by his great grandson Lewis XV.

The partiality of Lewis XIV. to his natural children might have involved France in a civil war, had not the regency been seized upon by the duke of Orleans, a man of sense and spirit, and the next legitimate prince of the blood, who having embroiled himself with Spain, the king was declared of age in 1722, and the regent on the fifth of December 1723, was carried off by an apoplexy.

The reader is not to imagine that I am to follow the affairs of France through all the inconsistent scenes of fighting and treating with the several powers of Europe, which are to be found in their respective histories. Among the first acts of the late king's government, was his nominating his preceptor, afterwards cardinal Fleury, to be his first minister. Though his system was intirely pacific, yet the situation of affairs in Europe, upon the death of the king of Poland, in 1734, more than once embroiled him with the house of Austria. The intention of the French king was to replace his father-in-law, Stainlaus, on the throne of Poland. In this he failed through the interposition of the Russians and Austrians; but Stainlaus enjoyed the title of king, and the revenues of Lorraine, during the remainder of his life. The connection between France and Spain forced the former to become principals in a war with Great Britain; in the management of which the latter was so ill seconded by her allies, that it was finished by the peace of Aix la Chapelle in 1748.

In the year 1757, Francis Damien, an unhappy wretch, whose sullen mind, naturally unsettled, was inflamed by the disputes between the king and his parliament relative to religion, embraced the desperate resolution of attempting the life of his sovereign. In the dusk of the evening, as the king prepared to enter his coach, he was suddenly wounded, though slightly with a pen-knife, between the fourth and fifth ribs, in the presence of his son, and in the midst of his guards. The daring assassin had mingled with the croud of courtiers, and was instantly betrayed by his distracted countenance. He declared it was never his intention to kill the king, but that he only meant to wound him, that God might touch his heart, and incline him to restore the tranquillity of his dominions by re-establishing the parliament, and banishing the arch-bishop of Paris whom he regarded as the source of the present commotions. In these frantic and incoherent declarations he persisted amidst the most exquisite tortures; and after human ingenuity had been exhausted in devising new modes of torment, his judges, tired out with his obstinacy, consigned him to a death, the inhumanity of which is increased by the evident madness that stimulated to the fatal attempt; and which might fill the

heart of savages with horror. He was conducted to the common place of execution, amidst a vast concourse of the populace; stripped naked and fastened to the scaffold by iron gyves. One of his hands was then burnt in eiquid flaming sulphur. His thighs, legs, and arms, were torn with red hot pincers; boiling oil, melted lead, rosin, and sulphur were poured into the wounds; and to complete the awful catastrophe, tight ligatures being tied round his limbs, he was torn to pieces by young and vigorous horses.

The Jesuits having rendered themselves universally odious by their share in the conspiracy against the late king of Portugal, fell in France under the lash of the civil power, for certain fraudulent mercantile transactions. They refused to discharge the debts of one of their body, who had become bankrupt for a large sum, and who was supposed to act for the benefit of the whole society. As a monk, indeed, he must necessarily do so. The parliaments eagerly seized an opportunity of humbling their spiritual enemies. The Jesuits were every where cited before those high tribunals in 1761, and ordered to do justice to their creditors. They seemed to acquiesce in the decision, but delayed payment under various pretences. New suits were commenced against them, in 1762, on account of the pernicious tendency of their writings. In the course of these proceedings which the king endeavoured in vain to prevent, they were compelled to produce their INSTITUTE, or the rules of their order, hitherto studiously concealed. That mysterious volume, which was found to contain maxims subversive of all civil government, and even of the fundamental principles of morals, completed their ruin. All their colleges were seized, all their effects confiscated, and the king, ashamed or afraid to protect them, not only resigned them to their fate, but finally expelled them the kingdom, by a solemn edict, and utterly abolished the order of Jesus in France.

Elated with this victory over ecclesiastical tyranny, the French parliaments attempted to set bounds to the absolute power of the crown, and seemed determined to confine it within the limits of law. Not satisfied with refusing, as usual, to register certain oppressive edicts, or with remonstrating against them, they ordered criminal prosecutions to be commenced against the governors of several provinces, acting in the king's name, who had enforced the registration of those edicts. The magnanimity of these assemblies had awakened new ideas in the bosoms of the French; they were taught by the late remonstrances to consider their inherent rights; and this flame, in the succeeding reign, burst forth with accumulated force, and overwhelmed the throne.

As to the war with Great Britain, which was ended by the peace of Fontenbleau, in 1763, the chief events attending it, so humiliating to France, have been already mentioned in the history of England, and therefore need not be recapitulated here.

Corsica, a small island in the Mediterranean, had long resisted with manly firmness the oppressive councils of the Genoese, who claimed the sovereignty over it, by right of conquest. But, unable to support those pretensions, Genoa transferred them to France, on condition that Lewis should put her in full possession of the adjacent island of Capraria, which the Corsicans had lately invaded and reduced. To execute his engagements, powerful armaments were fitted out by Lewis, at Antibes and Toulon; twenty battalions of French were landed in Corsica; and the natives, whose free suffrages had summoned Paoli, one of their principal chiefs, to the supreme government of the island, determined to defend their liberties to the utmost.

A sharp and bloody war, such as suited the inferior numbers of the inhabitants

ants and the nature of the country, was carried on in all the fastnesses and mountainous parts of the island; and it was not till after the French had fatally experienced, in two successive campaigns, the enthusiastic courage which animates the champions of freedom, that they overwhelmed by their superior numbers this unfortunate people; nor had Lewis much reason to triumph in an acquisition, to attain which he had sacrificed several thousand of his bravest troops, and only extended his dominion over a rugged and unproductive island.

The late unfortunate king, Lewis the XVI. succeeded his grandfather, Lewis the XV. on the 10th of May, 1774. Several regulations were made after his accession, highly favourable to the general interests of the nation, particularly the suppression of the Mufquetaries, and some other corps, which being adapted more to the parade of guarding the royal person than any real military service, were supported at a great expence, without an adequate return of benefit to the state. One remarkable circumstance which attended this reign, was the placing of Mr. Necker, a protestant, and a native of Switzerland, at the head of the French finances, in 1776. Possessed of distinguished and acknowledged abilities, his appointment would have excited no surprize, had it not been contrary to the constant policy of France, which had carefully excluded the aliens of her country and faith from the controul of the revenue. It now stood forward as a new instance of enlargement of mind and liberality of sentiment; and will to posterity mark the prominent features of the reign of Lewis the sixteenth. Under the direction of this gentleman, a general reform took place in France, through every department in the revenue. When hostilities commenced in 1777, between France and Great Britain, in consequence of the assistance afforded by the former to the revolted British colonies, in America, the people of France were not burthened with new taxes for carrying on the war; but the public revenue was augmented by his œconomy, improvements, and reformation that were introduced into the management of the finances. In consequence of this national œconomy, the navy of France was also raised to so great a height, as to become truly formidable to Great Britain.

With a most laudable zeal to extend the dominion of science, Lewis fitted out several vessels on astronomical discoveries. The chevalier de Borda was intrusted to ascertain the exact position of the Canary islands and Cape de Verd; and the different degrees of the coast of Africa from Cape Sparte to the island of Goree. The chevalier Grenier, who had traversed the Indian seas to improve the charts and correct the errors of former navigators, was liberally rewarded by a monarch who aspired to immortalize the æra of his power by expeditions beneficial to mankind.

The visit of the emperor of Germany to the court of Paris, was another occurrence that excited the attention of Europe. Averse to pomp, he chose to travel under the humble title of count Falkenstein; he was received by Lewis with that respect which was due to the imperial dignity, and the regard that he was impatient to testify to the brother of his royal consort. During six weeks that the emperor remained at Paris, his hours were incessantly devoted to examine the various establishments of that capital, and in viewing the manufactures. With the same spirit of enquiry, he made a tour through the different provinces of the kingdom, and in his journey endeavoured to glean whatever might be advantageous to his own dominions.

Amidst the fury of war, Lewis displayed that regard for science which

had early formed a striking characteristic of his reign. Previous to the commencement of hostilities, the English had sent two vessels into the South seas, commanded by captains Cook and Clerke, to explore the coasts and islands of Japan and California; the return of those vessels was hourly expected in Europe; and Lewis, with a considerate humanity which reflects the brightest lustre on his character, by a circular letter to all his naval officers, commanded them to abstain from all hostilities against these ships, and to treat them as neutral vessels. The letters mentioned also in terms of the highest respect Captain Cook, who had long distinguished himself in successive voyages of discovery. But death allowed not that celebrated navigator to enjoy this grateful testimony to his merit; for in one of the newly discovered islands he had already fallen a victim to the blind fury of the savage inhabitants.

At the beginning of the year 1780, in consequence of the representations of Mr. Necker, a variety of unnecessary offices in the household of the queen were abolished; and sundry other important regulations adopted, for the ease of the subject, and the general benefit of the kingdom. Could we implicitly credit his memorial, he changed the excess of the disbursements at least one million sterling, of the year 1776, into an excess of revenue in the year 1780, to the amount of 445,000*l.* But the measures of Mr Necker were not calculated to procure him friends at court; the vain, the interested, and the ambitious, naturally became his enemies; and the king appears not to have possessed sufficient firmness of mind to support an upright and able minister. He was therefore displaced, and is said to have been particularly opposed by the queen's party.

The independence of America had been the grand object of France, and that having been acknowledged in the fullest and most express terms by Great Britain, the preliminary articles of peace were signed at Paris on the 20th of January, 1783: but the immense expences incurred were found at last to be much more than the revenues of the kingdom could by any means support; and the miserable exigencies to which government was reduced, contributed no doubt to bring about the present revolution.

In the various wars of France with England, particularly in the last and present centuries, no object appears of more consequence to her naval operations than the obtaining a port in the Channel. With a view of obviating this want, the ablest engineers in that kingdom have proceeded, by the most astonishing and stupendous works, to render the port of Cherburgh capable of receiving and protecting a royal navy. Since the last peace, they have prosecuted this work at an annual expence of upwards of 200,000*l.* and expectation was so sanguine, that it was thought a year or two more would effect this arduous and important undertaking, but they have been disappointed.

In the year 1786 a treaty of navigation and commerce was concluded between the two courts of London and Versailles, and this having concluded the transactions between the two kingdoms, we have now only to give an account of the late revolution.

The ambition of the French government, which made it acquainted with liberty, in assisting the insurgents in America and Holland, excited a spirit amongst the people, which could not well admit of the continuance of arbitrary power at home. The dismissal of Monsieur Necker from the direction of public affairs, and succeeding ministers being endowed neither with his integrity or abilities, the finances of the nation were on the point of being intirely ruined. hundred and thirty thousand pounds, was presented to the parliament of Paris, the murmurs of the people, and the remonstrances of that assembly, assumed a more legal and formidable form. The king, however, signified to the select deputations that were commissioned to convey to him their remonstrances, that he expected to be obeyed without farther delay. The ceremony of the registering took place on the next day, but was accompanied with a resolution, importing, that public economy was the only genuine source of abundant revenue, the only means of providing for the necessity of the state, and restoring that credit, which borrowing had reduced to the brink of ruin.

This proceeding was no sooner known than the king required the attendance of the grand deputation of parliament: he erased from their records the resolution that had been adopted; and declared himself satisfied with the conduct of Monsieur de Calonne, his comptroller-general.

However gratified by the support of his sovereign, Monsieur de Calonne could not fail of feeling himself deeply mortified by the opposition of the parliament. An anxious enquiry into the state of the public finances had convinced him that the expenditure had far exceeded the revenues; in the present situation, to impose new taxes was impossible, to continue the method of borrowing was ruinous, and to have recourse only to economical reforms, would be found wholly inadequate; and he hesitated not to declare that it would be impossible to place the finances on a solid basis, but by the reformation of whatever was vicious in the constitution of the state. To give weight to this reform, the minister was sensible that something more was necessary than royal authority; he perceived that the parliament was neither a fit instrument for introducing a new order into public affairs, nor would submit to be a passive machine for sanctioning the plans of a minister, even if these plans were the emanations of perfect wisdom.

Under these circumstances, the only alternative that seemed to remain was to have recourse to some other assembly, more dignified and solemn in its character, and that should consist in a greater degree of members from the various orders of the state, and the different provinces of the kingdom; but the true and legitimate assembly of the nation, the states-general, had not met since the year 1614. Another assembly had occasionally been substituted in the room of the states-general; this was distinguished by the title of the *notables* or men of note, and consisted of a number of persons from all parts of the kingdom, chiefly selected from the higher orders of the state, and nominated by the king himself. This assembly had been convened by Henry the fourth, and again by Lewis the thirteenth; and was now once more summoned by the authority of the present monarch, and the 29th of January, 1787, was the period appointed for their opening.

It was under great difficulties that monsieur Calonne first met the assembly of the notables, and opened his long expected plan. He began, by stating that the public expenditure had for centuries past exceeded the revenues; that a very considerable deficiency had of course existed; and that at his own accession to office it was three millions three hundred and thirty thousand pounds.

To remedy this evil the comptroller general recommended a territorial impost, in the nature of the English land-taxes, from which no rank or order of men were to be exempted; an enquiry into the possessions of the clergy, which hitherto had been deemed sacred, from their proportion of the public burthens; the various branches of internal taxation were also to undergo a

strict examination; and a considerable resource was presented in mortgaging the demefne lands of the crown.

Before monsieur Necker retired from the management of the finances, he had published his *Compte rendu au Roi*, in which France was represented as possessing a clear surplus of four hundred and twenty-five thousand pounds sterling. This performance had been read with avidity, and had been considered as an era in the history of France. The credit of this statement was ably vindicated by monsieur de Brienne, archbishop of Thoulouse, and by the count de Mirabeau, a still more formidable enemy to Calonne. His eloquence, however, might have successfully vindicated his system and reputation against the calculations of Brienne, and investives of Mirabeau; but the genius of the comptroller-general sunk under the influence of the three great bodies of the nation. The grand and essential object of reform was to equalize the public burthens, and, by rendering the taxes general, to diminish the load of the lower and most useful classes of the people. The ancient nobility and the clergy had ever been free from all public assessment; the crowds of new noblesse, who had purchased their patents, were by that shameful custom exempted, both themselves and their posterity, from contributing proportionably to the expences of the state; the magistracies likewise throughout the kingdom enjoyed their share of exemptions; so that the whole weight of the taxes fell on those who are least able to bear them. Thus the nobility, the clergy, and the magistracy, were united against the minister, and the event was such as might be expected. The intrigues of those three bodies raised against him so loud a clamour, that finding it impossible to stem the torrent, monsieur de Calonne not only resigned his place on the 12th of April, but soon after retired to England from the storm of persecution.

The notables proceeded in their inquiries, and it was now suggested that an assembly of the state should be called, as the notables were not competent to impose a new tax. As the deliberations of the notables were not carried on in secret, this proposal was instantly circulated through the capital, and supposed to be a new discovery. The notables were soon after dissolved, without having accomplished any thing except the justification of M. Necker.

The stamp act, however, was established, and a bed of justice was held by the king on the 5th of August, 1787, at which the parliament of Paris was obliged to attend, and the edict was registered, notwithstanding their protest to the contrary. But the parliament, though defeated, were far from subdued: on the day after the king had held his bed of justice, they entered a formal protest against the concession that had been extorted from them.

Painful as every appearance of violence must have proved to the mild disposition of Lewis, he could not consent to surrender, without a struggle, that authority which had been so long exercised by his predecessors. Since the commencement of the present discontents, the capital had been gradually filled with considerable bodies of troops; and about a week after the parliament had entered the protest, an officer of the French guards, with a party of soldiers, went at break of day to the house of each individual member, to signify to him the king's command, that he should immediately get into his carriage, and proceed to Troyes, a city of Champagne, about seventy miles from Paris, without writing or speaking to any person out of his own house before his departure. These orders were served at the same instant, and before the citizens of Paris were acquainted with the transaction, the parliament were already on the road to the scene of their banishment.

mortgaging

finances, he represented several millions of pounds sterling as considered was ably vindicated by the count's eloquence, and the station against the genius of the bodies of the people to increase the load of the public debt, and the ability and the crowds of new and useful customs, and proportioned throughout the whole weight of the nation. Thus the minister, by the figures of those things it imposed on his place, and the storm of

suggested that not competent were not carried the capital, and after dissolved, the dissolution of M.

was held by the court of Paris was against their protest, and far from submitting they entered a demand in them.

led to the mildness of a struggle, and efforts. Since they had been gradually after the parades, with a individual memorial immediately to get about seventy out of his own same instant, and satisfaction, the present.

So

But such was the weakness and imbecility of government at the present conjuncture, and such the discontent excited by this measure that they found it necessary to recall the parliament after a month's exile. As they had declared their incapacity to register a tax, the only expedient that offered itself to the Archbishop was that of a loan. In order to give this edict the authority of a law without the voluntary participation of parliament he devised the mode of a *séance royale*, where the edicts were at last registered. The duke of Orleans in presence of the king protested against the legality of the proceeding, for which he with four others were banished. The king at the same time sent for the journals of the parliament and by his direction the resolution of the evening of the *séance royale* was erased. The banishment of the duke of Orleans and the other four members excited great clamours, and a memorial was presented to the king by the peers demanding their recall, which was agreed to, and the prohibition of their attendance was in a short time taken off.

Meanwhile the opposition of the provincial parliaments continued without the smallest interruption. That of Bourdeaux, which as a punishment for its refractory dispositions had been exiled to Libourne discovered no inclination to retract, and one of their earliest concerns after their translation was to vote a remonstrance; the object of which was to justify their proceedings. The parliaments of Grenoble and Rennes adopted the sentiments of their brethren of Bourdeaux. In short a daring spirit of innovation roused and kept alive by writings of every description which issued in great numbers from the press, had diffused itself through all ranks, and rendered them impatient of the necessary restraint of legal government; many of the officers in the army who had recently served in America were deeply tainted with the theoretical and destructive principles, which afterwards involved their country in anarchy, bloodshed, and ruin.

Under these impressions an arret was issued in August fixing the meeting of the States-general to the first of May the ensuing year; and every step was taken to secure the favourable opinion of the public during the interval. New arrangements took place in the administration; and Mr Necker, who had long been the idol of the people, was again introduced into the management of the finances; the torture, which by a former edict had been restricted in part was now entirely abolished; every person accused was allowed the assistance of counsel, and permitted to avail himself of any point of law; and it was decreed, that in future sentence of death should not be passed on any person, unless the party accused should be pronounced guilty by a majority at least of three judges.

The eyes of all Europe were now turned on the States-general; but the moment of that assembly's meeting was far from auspicious; the minds of the French had long been agitated by various rumours; the unanimity that had been expected from the different orders of the states, was extinguished by the jarring pretensions of each; and their mutual jealousies were attributed by the suspicions of the people to the intrigues of the court, who were supposed already to repent of the hasty assent which had been extorted from them. A dearth that pervaded the kingdom increased the general discontent and the people pressed by hunger, and inflamed by resentment, were ripe for a revolt. The sovereign, also, equally impatient of the obstacles he continually encountered, could not conceal his chagrin; while the influence of the queen in the cabinet was again established, and was attended with the immediate dismissal of Mr. Necker, who received a letter from the king requiring

him to quit the kingdom in 24 hours. That minister took the route of Brussels on the following day, when his departure was made public.

The city of Paris was thrown into deep consternation by Mr Neckar's retreat. His bust and that of the duke of Orleans were dressed in mourning and carried through the streets. The Royal Allemand, a German regiment, broke in pieces the busts and dispersed the populace. The mob being joined by the French guards assaulted the military on all sides, and compelled the Germans, overpowered by numbers, and unsupported by the rest of the army to retire.

All order was now at an end, and as night approached, an universal terror diffused itself through the city. Bands of robbers were collecting; and from them or from the foreign soldiery a general pillage was expected.

The celebrated fortress of the Bastille was an object of much jealousy to the Parisians. At 11 o'clock in the morning, M. de la Rosiere at the head of a numerous deputation, waited upon M. de Launay the governor, who promised, along with the officers of his garrison, that they would not fire upon the city unless they should be attacked. But a report was spread through Paris, that M. de Launay had in a short thereafter, admitted into the fortress a multitude of persons unarmed and then treacherously massacred them. This report propagated for the purpose of inflaming the multitude, was not only in itself highly improbable, but has been since proved utterly false and unfounded.

Its effect however was such as might naturally be expected; a sudden resolution was adopted of attacking the Bastille; an immense and furious multitude rushed into its outer, and soon forced their way into its inner courts, where they received and returned a severe fire for the space of an hour. After many proofs of the most daring intrepidity by those who headed the assault, the fortress was carried. Those who had the merit of the exploit saved M. de Launay from being immediately torn in pieces by the multitude who poured in from all quarters, and conducted him with danger and difficulty to the Hotel de Ville, but were unable to prevent his being massacred by the cowardly rabble which surrounded it, and who had no part in the taking of the Bastille. M. de Lofme, his Major, a person distinguished for his humanity to the prisoners, was at the same time a victim to the undistinguishing fury of those wretches. Their thirst of blood was so great, that although the marquis de Billeport, who had been confined five years in the Bastille, rushed among them and proclaimed the humanity of M. de Lofme to himself and other prisoners, he was not listened to, but insulted and wounded, and escaped not without difficulty with his life. M. de Fleffelles, the Prevot de Marchands, of a character less popular, but who seems to have been guilty of nothing, which candour could have thought a proof of guilt, incurred the same fate, and the heads of all three being fixed upon pikes were carried by those savages in triumph through the streets.

Meanwhile the king was kept ignorant of these tumults, until at midnight the duke de Liancourt forced his way into his apartment, and told him of the revolt of his capital, of his army, and of the surrender of the Bastille. Early the next morning he went to the assembly, where he was received with the most profound silence; some of the deputies were no doubt affected with sentiments of humanity and compassion at the sight of fallen majesty, when their king appeared among them in a style so different from that in which they had been accustomed to view him; when without pomp, almost without attendants, and in the plainest dress, standing and uncovered, he addressed them in the most conciliatory terms, professing his sorrow for the

disorders in Paris, his regard for the assembly, and assured them that the reports of any design on their personal liberty were calumnious. He ended by declaring that he had ordered the troops, which had given so much offence to remove from the neighbourhood of the capital.

This discourse was not heard to an end without interruption. The emotion it produced was too powerful for the stern maxims of the cold philosophy the French politicians had adopted, and the hall resounded with shouts of applause. When the king withdrew, all the deputies followed, and forming a respectful ring around his person, attended him to the palace, in the balcony of which the queen appeared with the Dauphin in her arms, while the music played the pathetic air of *Ou peut-on être mieux qu'au sein de sa famille.*

On the following day the king declared his resolution to visit the city of Paris in person. Accordingly that monarch, who never wanted personal courage, however he might want that commanding firmness which perilous times require, left Versailles on the morning of the 17th of July, with only one carriage, besides that in which he was himself. He was attended by the Dukes of Villeroy and Vilquier, the Marshal Beauveau, the Count d'Estaing, and one or two other persons of the court. The militia of Versailles accompanied the carriages to Sevé, where they were met by M. de la Fayette, at the head of a large body of national guards; a party of cavalry headed the procession from Sevé, followed by the French guards with their cannon; a deputation of the National assembly in their robes also attended, and were followed by the Parisian National Guards. The procession was slow and to the king would be more gloomy that he no more heard the ancient cry of *Vive le Roi!* whereas that of *Vive la Nation!* was incessantly screamed from all sides. That this did not happen by accident was evident; for men were heard admonishing the people not to cry *Vive le Roi!* There are many reasons for believing that the king's journey to Paris and his reception there were planned by a few, who had influence in the committee at Paris as well as in the assembly, with a view to strike him with terror, and bend his spirit to an acquiescence in their future projects. It is not therefore surprising that he looked pale, melancholy, and with disquietude. He was met at the barrier by the Mayor, who presenting him with the keys of the city informed him that they were the identical keys which had been presented to Henry IV. observing at the same time, in language more quaint than flattering, that Henry had *re-conquered* his people, whereas in the present instance the people had *re-conquered* their king. He told the king also, what he might otherwise not have believed, that this was a very glorious day for the French monarchy, and added, what might have occurred to him without being told; that it was a day, which it was not likely his majesty would forget. Whatever the king's thoughts were, he said nothing. Finding himself equally embarrassed to answer all the fine speeches which were addressed to him on his arrival at the Hotel de Ville, his majesty observed nearly the same silence there. M. Bailly, the mayor, having presented the national cockade to him, he appeared at the window with it attached to his hat; the populace in the square shouted; the cry of *Vive le Roi!* was then heard for the first time that day, and resounded through the streets as the king returned from the town-house to Versailles, where he was expected with fearful inquietude by the queen and all his family.

The members of the new administration which had been so suddenly and imprudently formed, sensible of the quick transitions to which the French populace are liable, and by no means certain that they would be satisfied with

their resignation, resolved to withdraw from the kingdom. The count d'Artois with his family, the princes of Condé and Conti, with many of the nobility did the same. M. Foulon, who in the formation of the late ministry had been placed in the war-department as an assistant to M. de Bröglie, was not so fortunate as to escape out of France. Sensible of the people's prejudice against him, he kept himself concealed, and caused the report of his death to be spread abroad. He was discovered by the peasants, while he was under hiding at a country-house near Patis. Some of the enemies of this unhappy man had circulated the incredible story, that he had often declared, that if he should ever be minister, he would make the people live on hay. The surest way of gaining the belief of the populace is, to speak to their passions. This absurd expression was repeated by every mouth, and it kindled the more resentment in the breasts of the rabble at this period, because many of them actually experienced hunger at the same time.

The cruelties which these peasants, and some of the populace at Paris, committed on M. Foulon and his son in law M. Berthier, in spite of all the efforts of the mayor of Paris and the commander of the national guards to prevent them, are shocking to humanity, and disgusting to narrate. They were hanged at a lamp iron by the enraged multitude and their heads were carried round on poles. The populace were thus habituated to blood and murder; they were even taught by popular songs to glory in such actions, and particularly by the well-known song of *Ca ira*.

The vindictive disposition and excesses of the Parisian populace were to be regretted not only on account of their effects at Paris, but also on account of the example thereby given to the lower orders, and particularly the tenants of land, and the peasantry, all over France, among whom great disorders continued after some appearance of regularity had taken place in the capital. Accounts came from all quarters, that the spirit of revolt seemed to increase instead of diminishing in the provinces; that to a refusal of paying taxes and rents many instances of pillaging, robbery, and housebreaking, were added; that the nobility in particular were exposed to these depredations; that many of their families had been plundered and demolished, and in some cases their wives abused and insulted in the grossest manner. The measures which were taken in consequence of these disorders and tumults were very extraordinary, and opened a very important scene in the French Revolution. On the afternoon sitting of the 4th of August, the Viscount de Noailles after stating that the true cause of the commotions which convulsed the kingdom, existed in the misery of the people, who were driven to those excesses by the accumulation and weight of the burdens under which they laboured; and were become desperate by the exaction of taxes which they could not pay; after enlarging on the glory which the nobility would derive from sacrificing private interest and importance to the public good, he concluded by moving that those sources of tyranny and injustice should be abolished; that all public charges should be equally supported by the whole community, and all taxes levied in proportion to the income of each individual; that all feudal claims should be redeemable at a fair valuation; that corvées, and all rights of the lords to the services of the peasantry should be entirely abolished, and other grievances, under which the people suffered, alleviated.

The viscount de Noailles' motion was seconded by the duke d'Anguillon, who made another tending to the same purpose, which created more surprise than the former on account of the duke's ample estate and extensive royalties. These bright examples, joined to the thundering applause, with which

their proposals were heard, excited great emulation. The virtues of self-denial and patriotism became so precious in the eyes of some who had never before seemed to put any great value on them, that hardly any sacrifice was thought too dear for the purchase of even the reputation of possessing them. Some of the nobles, however, were provoked at certain sacrifices which affected themselves more than the proposers, and in revenge they moved for different sacrifices which affected the others more than themselves; and it is said, to the heat raised by this collision of emulation, patriotism and revenge, the heat and expansion produced by wine were added; so that on the whole more was obtained for the republicans at this one sitting after dinner, than the most sanguine of the party could have expected in many days.

The clergy had hitherto remained astonished and silent spectators of a scene so awful and unexpected; and a motion having been made to put an end to the meeting, the president was proceeding accordingly, when suddenly he made a pause, and reproached himself for want of attention in being about "prematurely to close the meeting before any of the venerable body of the clergy, ever sympathising with the distresses of the people, had declared their sentiments on so interesting a subject."

There was no evading this apostrophe. The bishops of Nancy and Chartres spoke in the name of their brethren. The first not only approved of a motion which had been made, that the feudal rights, and all other jurisdictions of lords of manors established in the same manner should be abolished; but he proposed besides, that the price of the ransom of ecclesiastical feudalities should be applied to the relief of the poorer part of the ecclesiastical body, and not to the profit of the actual incumbent. The bishop of Chartres after insisting on the injustice of the game laws, moved the abolition of them and all the pretended rights of the chace. To close the whole the duke de Liancourt proposed that a solemn *Te Deum* should be performed, that a medal should be struck in commemoration of the events of that night; and that the title of RESTORER OF GALIC LIBERTY should be bestowed upon the reigning monarch.

Thus did the French nobility with the most unexampled levity and folly, without reflection, without hearing and weighing the arguments which might have been advanced on the opposite side, by acclamation abolish privileges established by ancient usage, and handed down to them by a long line of ancestors. That they were not oppressive we do not mean to affirm; but surely the conduct of the national assembly in that important night resembled rather a conventicle of furious zealots than a legislative assembly of sober and rational men met together for the purpose of deliberating on the affairs of a great nation; moreover all these laws voted in this romantic manner, were not so likely to do real good, or to promote lasting concord between the rich and the poor, as one bill to remove one grievance, voted according to the slow forms of our acts of parliament, after a full discussion and a fair hearing of the arguments on both sides.

Meanwhile that delicate and important question, "whether the king should possess an absolute negative or *veto*, a suspensive *veto*, or no *veto* at all," which was shortly after agitated, operated like a touchstone for trying the sentiments of every person, and the assembly, consisting of 1200, was now seen to arrange itself into two violent contending factions. The one party accused the other of a design to excite insurrections; and the charge was retorted, by circulating a report that a plot for conveying the king to Metz was already ripe for execution. Upon the circulation of this report, the French guards began to wish to be referred to their ancient employment of attend-

ing

ing his person, for the purpose of preventing any attempt of this nature. The popular party saw the advantages they would derive from placing the assembly and the king in the midst of that turbulent metropolis, upon the attachment of which they could most securely depend. Every encouragement was therefore given by the leaders of the democratic party to the project of establishing the court at Paris. An incident soon occurred, which served them for a pretence to accomplish their wicked views, and which others attempted to turn to more heinous purposes.

The count d'Estaing, who had the command of the national guards at Versailles, having previously consulted the municipality, and represented the necessity of protecting the national assembly, and the person of the king from any attempt against them, required that a thousand troops of the line should be quartered at Versailles for that purpose. The regiment of Flanders, consisting of a thousand men, were in consequence ordered to Versailles. When they arrived, the officers together with those of the national guards, were invited to an entertainment by the Gardes du Corps. The entertainment was given in the opera-house belonging to the palace. The guests amounted to 240 and all the boxes were full of spectators. Towards the end of the entertainment, the queen having seen from a window the gaiety which prevailed among the military, requested the king who was just returned from hunting, to visit them along with herself and the dauphin, and several ladies and gentlemen of the court. This unexpected visit to a company, whose hearts were already elated with gaiety and warmed with wine, could not fail to kindle in their minds the most enthusiastic spirit of loyalty. The health of their beloved and amiable prince, with those of all the royal family, was drank with exclamations of joy and with drawn swords. After walking through the hall, the royal party bowed with politeness to the company and retired; the music struck up the favourite air of *O Richard, O mon roi, Puisse-t-on l'abandonner*, "O Richard, O my king, the world abandons thee." Surely they who could have beheld with indifference this tender and affecting scene, must have been strangely hardened by the cold and blood-thirsty philosophy of the French politicians; in the breasts of the present generous and loyal company, it excited the most lively sensations of attachment to their sovereign, and of sympathy for his sufferings. They threw open the gates of the hall for the grenadiers of the two corps, who having drank the healths of the Royal Family, hurried with jovial enthusiasm to pass the night in dancing beneath the windows of the palace.

These events were next day reported at Paris, exaggerated and misrepresented for the worst purposes, by the leaders of the democratic party, who resolved to spirit up the people to an insurrection. By means of these misrepresentations, together with considerable sums distributed among the agents of insurrection, of whom there were at this time abundance in Paris, a numerous band of women, and men disguised in women's cloths, armed with pikes and other weapons, assembled on the morning of the 5th of October, in the square of the Hotel de Ville, and were calling aloud for arms and bread. They resolved to proceed instantly to demand bread from the king and from the National assembly*. A depu-

* La Fayette opposed them in vain; for his soldiers refused to assist them. Upon this, one Stanislaus Maillard, who had distinguished himself at the taking of the Bastille, offered himself as a leader of the insurgents; he set out for Versailles about noon with as much order as could be expected from such an assembly. When he approached Versailles, with his tumultuous troop, he arranged them in three divisions, and persuaded them to behave with some appearance of order.

tation had just been decreed to wait upon the king and to request him to give a pure and simple sanction to the articles of the declaration of rights and the constitution which had been already presented to him; but before the members were appointed, the first tumultuous band that had left Paris, conducted by Maillard, arrived at Versailles. A detachment of the most furious of the Poissardes belonging to it marched directly to the National Assembly, and were on the point of forcing the guards at the gate, when the Assembly prudently decreed, that they should be admitted.

As they began their remonstrances altogether, it was a considerable time before it could be distinguished that the grievance they chiefly insisted on was want of bread. The president declared, that the Assembly was just going to deliberate on the speediest means of procuring it, and added, that the ladies might withdraw. Instead of taking this hint, the ladies seated themselves without ceremony on the benches with the deputies. Nor did they listen to the debates with silence; but took a degree of interest in them which must have been embarrassing to all, and peculiarly so to the orators, whose discourse they disapproved. "Speak, Deputy!" they called to one; "hold your tongue, Deputy!" to another. Sometimes, instead of Deputy, they addressed the speakers whom they did not relish by appellations too vile to be mentioned.

In consequence of the decree which had passed before the arrival of the Poissardes M. Mounier and fifteen deputies went out of the hall. They were again to address the king to give a simple assent to the articles presented to him. As soon as the Poissardes understood this, a number of them insisted on accompanying the president to the king. M. Mounier, with some difficulty prevailed on them to limit their number to six. The deputation of the National Assembly with their new associates, walked under a heavy shower of rain between two rows of an intermingled multitude of armed men and women, from the hall of the assembly to the palace. When they arrived at the gate, a band of Poissardes who followed, instead of adhering to the treaty, insisted that twelve of their number should enter the king's apartment with the president. This new requisition was complied with, as it must have been had they insisted upon a hundred. The president being introduced, with the deputation from the Assembly, and the twelve representatives of the Poissarde army, addressed the king on the deplorable scarcity of provisions, and the confusion resulting from it in the capital. His majesty replied in the same style, lamenting the distresses of the poor in such pathetic terms as charmed the Poissardes, and they withdrew in full confidence that his majesty would do all in his power to remedy the evil of which they complained.

Meanwhile Fayette arrived with his army about 10 o'clock at night, and found the Assembly in a very unpleasant situation. Their hall and galleries were crowded by the Parisian poissardes and others of the mob, who at that very instant interrupted their debates. La Fayette having waited upon the king, and informed him of the proceedings of the day, planted guards where he judged necessary; and after a scanty banquet had been prepared, he prevailed with the Assembly to close their sitting for that night. In this last part of his conduct La Fayette has been much censured, and probably not without reason; for it could scarcely be expected that the night would be spent in peace by the immense assemblage of turbulent characters, that were now brought together.

All was quiet till about six in the morning of the 6th. of October 1789; when different groups of the rabble of both sexes, who had left Paris the pre-

preceding day, and had been spending the night in drinking, met near the palace. It was proposed by some of this united band of ruffians to attack the Gardes du Corps, who were few in number. This was no sooner proposed than executed. Without meeting with any resistance from the national militia of Versailles, those wretches rushed furiously across the courts, crying "Tuez les Gardes du Corps; point de quartier*." Two of those gallant men were murdered, others wounded and driven within the palace. One party of these demons, with horrid threats and imprecations, attempted to force their way into the apartments of the queen, who had lain down to indulge nature in a few hours of respite, and troubled melancholy repose. She was startled from her sleep by the voice of M. de Miomandre the sentinel at her door, who cried to her to save herself by flight, that this was the last proof of fidelity he could give. He opposed however the entrance of the assassins with heroic gallantry until he fell covered with honourable wounds. A band of cruel ruffians and assassins, reeking with his blood, rushed into the chamber of the queen, and pierced with a hundred strokes of bayonets and poniards the bed, from whence this persecuted woman had but just time to fly almost naked, and through ways unknown to her murderers had escaped to seek refuge at the feet of a king and husband, not secure of his own life for a moment. He on his part had at the first alarm hastened to the Queen's chamber by another passage; and some of the attendants, anxious for the life of the Dauphin, had run and fetched him from the children's apartment; and when the king returned to his own chamber, he found the young prince in the arms of his mother.

As soon as M. Mounier heard of these transactions, he hastened to the National Assembly, and made a proposal which was supported by other deputies, that the National Assembly should be immediately transferred to the grand saloon of the palace, that they might at once assist his Majesty with their advice, and contribute to his protection at such an alarming crisis. But Mirabeau opposed it as "unbecoming their dignity, as even unwise to desert their post, when real or imaginary dangers seem to threaten the public." M. Mounier asserts that the joy of some members of the National Assembly was indecently apparent, M. Bailly calling this an "auspicious day."

The king's mind was greatly affected with the death of the guards who had fallen in his defence, and notwithstanding all the assurances of M. La Fayette, was making continual enquiries respecting the body-guards; and his anxiety carried him so far at last, that he appeared at the balcony, assuring the crowd below, that they had been unjustly accused, and even interceding in their favour. Some of the populace calling out for the Queen, she appeared at the balcony with the Dauphin and the Princess Royal at her side.

No tyrant giddy with the plenitude of power, ever pushed the wantonness of despotism to a more disgusting length than the wretches who filled the courts below. Instead of being moved at this mark of condescension, some of the barbarians called out "No children." No construction could be put upon such an exclamation, at such a moment, but that it was thought that the Queen had brought the children as a protection to herself, and that the wretches intended to fire at her, when they were removed. It was most natural for the Queen to think so, because she had been frequently told that their curses and threats had been particularly directed against her. Unmoved

by this reflection, she made the children withdraw, and instantly turning to the multitude she stood alone upright and undaunted. Struck with admiration of her majestic appearance and intrepid behaviour, the most barbarous for a moment forgot their rancour, and joined in the repeated shouts of applause that burst from all quarters, in the midst of which the queen retired. Some time after she had disappeared, those who had directed the movements of the multitude, resumed the great object of this expedition. Voices were heard exclaiming the "king to Paris." The voices multiplied every moment, and at last the cries of "'To Paris! To Paris," were universal. After the fatigues and agonies of such a night, the Royal Family were much in need of an interval of repose; but they were destined to undergo some very painful hours before they obtained it. They had, however, no choice left. It would not have been, perhaps, possible to save their lives had the king refused.

They left Versailles after one o'clock, which was announced by a volley from the troops. The company of the hundred Swiss surrounded the king's coach; a troop of dragoons preceded, and another immediately followed it. The Parisian national guards had begun their march a short time before. Various bands of the Poissards were intermingled with all the different corps of this strange army; some seated on waggons ornamented with green boughs, and white, red, and blue ribbons; some astride upon the cannon, many on horseback; generally two on the same horse, with the hats of the body guards on their heads, the belts across their shoulders, and armed with sabres; rending the air every instant with their savage shouts, and the choruses of their vile songs. In the middle of one band of those sanguinary hags, two men carried long pikes, on the points of which were the heads of the murdered Gardes-du-Corps. At certain distances the whole procession was made to halt, for the purpose of firing fresh volleys, and that the soldiers might be refreshed with wine and a little rest. On these occasions the Poissards on the carriages and on horseback descended and joined hands in horrid dances around the bloody heads that were fixed on the pikes. What rendered the scene completely shocking was the presence of the Gardes du Corps, who had been saved by the grenadiers, and were now marched in triumph, disarmed, in sight of the heads of their murdered companions. These scenes were repeated at intervals during a slow journey of twelve miles, which lasted from a little after one till seven in the evening, about which time the Royal Family arrived at Paris. The town was illuminated, and the evening spent in triumph by the vile populace of Paris.

Such were the transactions of the 6th of October, 1789, a day which "seemed to blot the sun out of heaven." Such were the horrors which surrounded the Royal Family, such the alarm, terror, and dismay, which they suffered from bands of midnight ruffians thirsting for their blood, such were the dangers which the execrable Mirabeau could call imaginary; such was this procession and triumph which some in Britain could compare to the entrance into the world of the Prince of Peace.

The national assembly immediately after their removal to Paris, proceeded in the arduous attempt of forming a free constitution for a great empire. The abbé Sieyès presented a plan for dividing the kingdom into 83 departments, of about 324 square leagues, and of each department into several districts, and each district was subdivided into cantons of four square leagues in extent. Thus the whole of the ancient divisions of the kingdom into governments, generalities and bailiwicks, was in an instant obliterated. At the same time another measure was brought forward, for wickedness and bar-

barity worthy of the instigators of the French Revolution. This was the confiscation of the whole of the lands belonging to the church for supplying the exigencies of the state. When the terrors of this tremendous proscription hung over the clergy, they made an offer of a contribution through the archbishop of Aix, which for its extravagance ought not to have been accepted. "Why was it not accepted" (says an elegant writer.) "The reason is plain—There was no desire that the church should be brought to serve the state. The service of the state was made a pretext to destroy the church. In their way to the destruction of the church, they would not scruple to destroy their country: and they have destroyed it." This nefarious and extensive plan of robbery was proposed by the bishop of Autun (the infamous Talleyrand) who had been promoted to the bench in a most irregular manner to serve this very purpose. The mode in which this property was to be expended was by issuing assignments (*assignats*) upon it, which assignments were to be received by the state for the payment of taxes, or for the purchase of church-lands, when set up for sale. On the day following that on which this plan of robbery was adopted, a decree was passed, suspending the parliaments from the exercise of their functions. On the 13th of February, monastic establishments were suppressed and their lands confiscated. All these decrees were at once cruel, unjust and tyrannical; they reduced a great number of men from the height of opulence to the depths of poverty, and turned out those, accustomed to a life of retirement and seclusion, naked and destitute to the wide world.

Meanwhile the system of the rights of man had begun to operate in the West India islands. There the whites contended with those called *people of colour*. These again sometimes stood in opposition to the free negroes, or to the slaves; and hence it sometimes happened that no less than three hostile assemblies were held at the same time in the same colony and raged with inveterate fury. Each party found protectors in the national assembly of the parent state. Those who favoured or opposed the existence of distinctions at home, in general followed out the same principle with regard to the colonies.

At this time there was some appearance of a rupture between Great Britain and Spain, and the minister laid before the national assembly, the preparations which the king thought expedient, and the precautions he had taken on that occasion. This information gave rise to various discussions, and at last brought on a debate on the important question, into whose hands the nation ought to entrust the power of making war or peace. One party was for placing it in the hands of the king and the other in the hands of the national assembly. They were obliged, however, to acquiesce in a kind of middle plan, proposed by Alexander Lameth, which was decreed in the following words, "The right of declaring war and concluding peace belongs to the nation: war cannot be decided on but by a decree of the legislative body, in consequence of a formal and necessary proposition made to them by the king, which must be afterwards sanctioned by him."

On the 19th of June a very singular farce was acted in the assembly. A Prussian refugee, who called himself Anacharis Clouts, on an evening sitting, introduced to the assembly a number of persons dressed in the habits of all the different countries that could be thought of. In a formal harangue he told the assembly, that he was come as the *Orator of the Human race*, at the head of the representatives of all nations, to congratulate them upon their new constitution. He was answered by the president with abundance of solemnity, and retired with his motley group. This fantastical piece of

folly, which by rational beings would have been treated as perfectly ridiculous and absurd, was treated by the assembly in a very serious light. Shortly afterwards Alexander Lameth proposed, that the figures of the different nations exhibited at the feet of Louis XIV. should be destroyed as an insult upon mankind. Little good can be expected from men, who, forgetting the important station which they fill, spend their time in such empty and futile declamations. Happy had it been for mankind if they had never been more insulted or injured by the French Revolution than they were by this harmless "monument of tyranny."

With a view to impress the revolution on the minds of the people, a great public ceremony had been in preparation for some time. On this occasion the king, the national assembly and the people, were to take an oath to maintain the cause of liberty and the constitution of which the chief articles were already known. The 14th of July, 1790, on account of its being the anniversary of the taking of the Bastille was fixed upon for the day of this ceremony, and the extensive plain of the Champ de Mars for the place in which it was to be celebrated. It was thought expedient to shape the ground into an amphitheatre of such prodigious extent, as should admit the multitude who were to be spectators of, or according to the French phrase, to assist at the ceremony. The Parisians, however, fearing lest the plan might not be completed, offered their gratuitous labour to accelerate the work; and all ranks of persons, the nobles, clergy, and even ladies, with the eagerness for novelty so peculiar to that people, united their efforts.

The day of such vast expectation at length arrived; the amphitheatre was formed with the altar in the middle, the throne of the king, a magnificent pavilion and commodious seats for the queen and Royal Family, and the triumphal arches through which the processions were to pass, were finished only two hours before the processions began. At day break, the citizens began to flock to the amphitheatre, which, it was said, was of sufficient extent to contain above three hundred thousand.

The great procession consisted of a band of music, a body of the national guards, led by M. la Fayette, and followed by the electors of the city of Paris, the principal members of the Municipality, the deputies to the national assembly, the deputies from one half of the departments into which France had been divided, a deputation from the army and fleet, headed by two Marshals of France, the deputies from the other half of the departments, and a body of horse and foot belonging to the national Guards, with a band of music, closed the procession.

Two hundred priests, dressed in garments of white linen bound with the national-coloured ribbons, stood on the steps, which had been raised for the purpose of administering the oath, for which purpose the committee of the commune appointed the bishop of Autun, a man whose real character with that of others, has been developed by the progress of the French revolution. When he was about to celebrate the mass, which preceded the pronouncement of the oath, the sky became obscure with clouds; a storm of wind took place and was followed by a deluge of rain. The bishop proceeded to the celebration of the mass without any regard to the storm; after which he pronounced a benediction on the royal standard of France.

M. La Fayette as a representative of the National Guards took the oath first. When he left the bottom of the throne, where he had hitherto stood, and moved towards the altar for that purpose, the trumpets began to sound; a vast band of martial music continued to play, while he ascended the steps of the altar. In the view of the multitude who filled this immense circus around,

he laid the point of his sword upon the bible, which was on the table of the altar, and raising his other hand towards the sky, the music ceased; an universal stillness ensued, while he pronounced the oath. The trumpets, beginning to sound as soon as he had finished, were drowned in the acclamation of *Vive la Nation!* All the members of the National Assembly then standing up; the President pronounced the oath in his own name and that of his brethren; and was in like manner followed by music and acclamation. When the king himself arose, a great body of the National Guards pressed near the throne, which they surrounded with raised arms, while he repeated the oath. A signal being given that the king had taken the oath, the air resounded with alternate peals of artillery and shouts of the people; and thus ended a ceremony, which has been justly considered as the grandest and most extensive act of perjury that heaven and earth has ever witness to.

Among those who were the most dreadful sufferers by this revolution, were the clergy, who have been persecuted with the most sanguinary fury by the republicans. It had been enacted that every beneficed clergyman should take a solemn oath to be faithful to the nation, the law, the king, and to maintain the new constitution, particularly those decrees which regarded the ecclesiastics. This regulation, however, had not been strongly enforced; but in order to have some pretence for their injustice and cruelty towards the clergy, they were universally accused of counter-revolutionary practices. It was therefore resolved that this decree should be executed with rigour all over the kingdom; and that those who refused or neglected to take the oath should be ejected from their benefices, and suffer other penalties.

This persecuting decree is evidently dictated by that spirit of impiety, that furious and fanatical malignity to the Christian Religion, which has been a leading principle in the French revolution. Their hatred to the clergy is evident by this and by many other acts of odious tyranny. Not content with despoiling them of what lawfully belonged to them they now prepare to persecute those whom they had already oppressed, and whom they had reduced from opulence to poverty.

Lewis XVI. had always been of a pious turn of mind; the constant apprehension, the troubles and dangers with which he and his family were surrounded, would naturally tend to strengthen those impressions, and make him turn his eyes to that future life where wretched man is at last freed from woe, to that land of peace where grief and trouble shall never more annoy. In this disposition of mind the persecution of the clergy would be very disagreeable to the king. It was even said that those who had refused to take the oaths decreed by the national assembly were received with greater signs of cordiality than the others. This conduct was exceedingly natural in the king. Besides those sentiments of compassion which generous minds feel for the unfortunate, he would esteem them as men who had given up all that they possessed rather than forsake their religion.

The king had formed the design of passing the Easter holidays at St. Cloud. He wished to be somewhat removed from the noise and tumult of the capital, while he was engaged in the duties of religion. The monarch's intentions were no sooner known, than rumours were spread with great assiduity, that he wished to go to St. Cloud that he might have the sacrament administered by unconstitutional priests, and that he might arrange matters for withdrawing to a greater distance from the capital, and raising a civil war; or perhaps in the view of leaving the kingdom, and stirring up his brother kings to make war against France. Particular pains were taken to infuse these notions into the national guards. Great numbers of the populace crowded to the Carouel

and Tuilleries. The king's carriages, however, were ordered; the national guards on duty there were under arms, and the King, the Queen and the Princess Elizabeth went into the coach at 11 o'clock; which they had no sooner done than the surrounding populace began to exclaim and make an outcry in the most insulting and threatening manner: but as they were surrounded with numerous detachments of the national guards, disregarding the insolence of the multitude, the king ordered the postillions to drive on; on which, instead of keeping off the crowd, the guards closed before the horses, threatened the postillions if they should dare to proceed, and swore they would not permit the royal family to leave Paris. The king's domestics, and those immediately attached to his person, were in the mean time abused, maltreated, and dragged from the carriages, about which they had pressed to cover the Royal Family from the insults of the rabble. The gross abuses ad to the female part of the Royal Family were not confined to the lowest populace. Some citizens of superior rank joined in them. M. Bailly, the mayor, hastened to the Tuilleries to suppress the disorder; but he was not listened to. M. La Fayette ordered the national guards to open to the right and left, to clear away the multitude, and allow the king's coach to pass; he was not obeyed. After having been more than three hours in the coach, exposed to the insults and derision of the multitude and of the mutinous soldiery, the Royal Family were under the necessity of getting out of the carriage, and walking to the palace amidst the groans, hootings and hissings of the multitude. The king complained with much spirit of this insult to the assembly. He was received respectfully by the president, but instead of taking measures to punish the seditious, they immediately passed to the order of the day; and the king was obliged to give up his journey to St. Cloud.

Thus did the national assembly most shamefully sanction the outrage and insult offered by the soldiery and populace to their king; and there seems to be good reason to believe that on this as well as on former occasions the feeble efforts of the popular leaders in his defence were not intended to protect him either from disgrace or danger; in short the situation of the Royal Family was at this time truly deplorable, surrounded with avowed enemies and treacherous friends.

Meanwhile the most violent and treasonable language was spoken in the groups of the garden of the Palais Royal. Besides the emissaries, who were dispersed to all places of public resort, to circulate calumnies against the court, there was a society at this time called Societé Fraternelle, which met in the church of the Jacobins, near the famous club of Jacobins; of which this "Fraternal Society" was an emanation of the most violent and inflammable portion; and from it there daily issued libels and satires without number, all calculated to irritate the people against the king's family, and ministers. The club of Cordeliers was of the same nature, and held their meetings in the church of that order. In this Pandemonium of wickedness that fiend Danton bore chief sway.

Wearied and harassed with the insults he received from these wretches the King and Royal Family were at last induced to adopt a plan for their escape. They escaped from Paris, and arrived at St. Menchould, about 170 miles from that city. Here the king not seeing the persons whom he expected to find there ready to expedite their departure, looked out of the carriage with the utmost uneasiness, and made many enquiries concerning the road. He was recognized by a postillion, who immediately ran and informed the postmaster. The king's journey was not however stopped; he went on to Clermont,

mont, while the post-master of St. Menchould dispatched his son to Varennes to give notice of his majesty's approach, that measures might be taken to stop him. The son of the post-master got the start of the king by some hours. His departure from that town had been observed by one of the quarter-masters of the *regiment royal*, who was in the secret, and who, suspecting the young man's intentions, found means to escape the watchful observations of the populace, and of his own companions, and pursued the fellow in order to prevent his fatal design. He followed him for about a league; but being afraid to push his horse which had a great way to go, he did not overtake him, and the fellow, perceiving himself pursued, suddenly quitted the high road, escaped into the woods, and through unbeaten tracks, known to himself, proceeded to Varennes. He arrived betwixt 10 and 11 o'clock at night, and with as little noise as possible, he awaked every person he thought necessary for his project, and barricaded with carts and waggon, the bridge of Varennes, which separated the *ville haute* from the *ville basse*.

In the midst of these preparations their majesties arrived at the *ville haute*, and stopped at the first house, in hopes of finding fresh horses ready for them. They were very uneasy on being informed, on their arrival, that there were no horses in readiness, and saw no appearance of troops they expected for their protection. To add to their vexation, their postillions threatened to leave them. The queen alighted, and called at several houses to obtain information respecting the horses. Nobody knew her. She walked for some time in the *ville basse*, with the king, in expectation that some person would appear, who would give them the information they stood so much in need of; but all in vain. They were obliged to return to their carriage without the expected satisfaction; and all they could do, was to intreat the postillions to proceed with the same horses. As they passed under an arch-way near the bridge, a band of ruffians, who lay in wait, stopped the carriages, seized upon the king, and forced him and his family to alight, and they were conducted prisoners to the house of the *Procureur de la commune*. The king expostulated against this violence with equal firmness and dignity, but to no purpose. In a moment the streets were barricaded, the stables of the hussars surrounded, the national guards drawn up under arms, and the tocsin sounded to alarm the country.* The Procureur not being as yet absolutely certain that his guests were actually the Royal Family, went to the house of M. de Lon a judge, who had seen the king, and begged that he would accompany him back to ascertain the point, which the judge agreed to. The Procureur then ascended with M. de Lon into the chamber, where the Royal Family were; the instant de Lon threw his eyes on the king, he signified by an expressive look to the magistrate that it was unquestionably he. The unfortunate monarch, having observed this, thought that all farther dissimulation would be vain; turning then with great emotion to the Procureur, he said "Yes, I am your king. Surrounded in the capital with the bayonets and poinards of assassins, I come to this province wishing only in the midst of my faithful subjects for that liberty and quiet which you all enjoy. In Paris I cannot remain, without being murdered together with my family." He concluded this affecting address by conjuring the magistrate and those around to assist him in making his escape. The queen shocked with the idea of being dragged back to Paris, taking the Dauphin in her arms, in the most pathetic terms, conjured the magistrate,

and all who heard her, to save the lives of their king and his children by assisting them to escape for that misery and ruin awaited them at the capital.

They were inflexible; their hearts were hardened against all the intreaties of this unfortunate princess; and the royal family were obliged to set out, guarded by a numerous band of national guards, and accompanied by the municipal officers of Varennes. As the sad procession moved through Paris to the Tuilleries, the streets were crowded with the populace; some of whom taking off their hats as the royal Family approached, the insulting order, that no person should uncover himself, was heard and obeyed. On the seat of the king's carriage, the three *gardes du Corps*, who had acted as couriers, were seated with their arms bound; and the carriage was followed by an open cabriolet, in which Drouet was placed, crowned with laurel. When the unfortunate family of France arrived at the Tuilleries, the gardens were full. Some were present who had the feelings of men. Turning with sudden emotion from the sight of the king and queen, their eyes fell on the duke of Orleans; who in a circle of deputies, at a small distance seemed to be a gay spectator of the melancholy scene. As the faithful *gardes-du-corps* were untied from the coach-box, they were threatened with being instantly torn in pieces by the savage fury of the populace. The royal family were again lodged in the Tuilleries under the responsibility of M. de Fayette. Several tents were pitched in the garden, and all the avenues were occupied by national guards under his command.

Meanwhile, the question whether the king was subject to trial or punishment, was under discussion all over France, but particularly in the capital. The squares and public gardens were filled with groupes of people, to whom certain well known orators harangued against the conduct of the National Assembly, who had decreed that the king should not be farther questioned, respecting what was passed, and that the constitution should be accomplished as was at first intended. Roberfpierre coming out of the hall found the street filled with those groups; who spreading around the patriot as soon as they observed him. "Alas! my friends," he was heard to say, "all is ruined; the king is to be restored." This was repeated all over Paris, as an unanswerable proof that the Assembly were traitors, and the country undone. The multitude afterwards resorted to the Champ de Mars, with a seditious declaration or petition, of which many copies were made, and the people invited to sign it on the altar of confederation, which still stood in that field. When the National Assembly heard of those proceedings, they ordered the municipal officers of Paris to their bar, and directed them to take measures for dispersing these tumultuous assemblies, and punishing their promoters.

The first measure which the municipality adopted was to issue a proclamation, importing, "that as it was discovered that strangers paid by the enemies of France to sow sedition and to promote insurrection had drawn numbers to assemble under the pretence of signing a petition, but with the real intention of overawing the legislature, and ruining the nation, orders had been given to the commander of the National guards to disperse all groups in the streets, or assemblies in the fields and to seize the disobedient and carry them to prison." As to strangers paid by the enemies of France in order to excite disturbances it was an idle and ridiculous tale. Such accusations are often proclaimed by those who know their falsehood, in order to render the measures against which the proclamation is issued the more unpopular.

popular. The proclamation had little effect. Vast numbers crowded to the Champ de Mars to sign the declaration. Two persons were murdered upon an unfounded report that they had contrived to blow up all the patriots male and female who were upon the altar. When the municipality heard of those murders, they gave orders that M. La Fayette should directly march at the head of a sufficient number of national guards, and use effectual means to seize the murderers and disperse the insurgents. Martial law at the same time was formally proclaimed; and a red flag was displayed from a window of the town-house. When these troops arrived at the Champ de Mars, they found it crowded by a furious multitude, who, instead of dispersing, insulted the troops with repeated exclamations; "Down with the red flag; away with the bayonets," and even by throwing stones. M. Bailly, the mayor desired the troops to halt; and after the formalities which the law required, M. La Fayette ordered part of them to fire over the heads of the mob. When they perceived that none were wounded, it confirmed them in an opinion which their instigators had inspired them with, that neither the general nor the mayor durst fire with ball. From this idea they became more outrageous; the soldiers and some of the national guards were wounded. The troops fired upon their aggressors, of whom between 60 and 70 were killed or wounded. The multitude then fled to the city, exclaiming against the general and the mayor for having ordered innocent persons to be massacred. The open and avowed excitors of this insurrection immediately disappeared. Danton, hearing that an order was issued for arresting him, fled to Marseilles. Camille Desmoulins followed his example. Others of less eminence lurked in Paris. Marat betook himself to a subterranean habitation which had been prepared for him by Le Gendre the butcher, which had served to secret him from justice on various occasions, both before and since the period we are now treating of. It is much to be regretted that he was not dug out and executed on this occasion. It would have prevented a great deal of mischief of which he was afterwards the cause; and he would have died with more propriety by the hand of the hangman, than by that of the extraordinary and most interesting woman who gave him the mortal blow. Her name was Marie Charlotte Cordé. She was a beautiful young woman of an unblemished character, distinguished for dignity of sentiment and benevolence of heart, but who had never given cause of suspicion of a disturbed understanding, nor until she struck a poignard in the heart of Marat, any indication of a violent temper. This insurrection was likewise promoted by Brissot, a man of the most profligate principles and fully equal to any sort of determined villany.

The committee which had been employed for a considerable time in digesting and arranging the constitutional decrees, had now concluded its labour. The whole was read to the assembly on the 4th of August 1791. It was then debated article by article, and on the third of September presented to the king, who was at the same time restricted by the assembly to accept or reject the whole without exception or observation. On the 13th of the same month, being attended by a deputaion of sixty members, the king went to the assembly, and sanctioned the assent he had the day before sent in writing, by an oath to be faithful to the nation, and to employ the powers vested in him for the maintenance of the constitution; and on the 30th of September the assembly was terminated by its own spontaneous dissolution.

Thus concluded the labours of the Constituent Assembly, the first and principal epoch in the French Revolution. Their merits have been variously appraised, as men were disposed either to praise or condemn the system

system upon that there, not be done who had, only the praise may the horrors considered upon their their own promoting all Europe ment, while laws of the people, and and all the able fury of disasters w country a people into with such a adequately previous p directed all

The decision satisfied the influence and the emigration which not of the constitution king's ministry the king had opinion, that that it might be prudent to give the refusal of royal message system

system upon which they acted has either been condemned or approved; that there were some men of rank, talents and integrity, among them cannot be doubted, but that they were overborne by a strong and active party who had planned the destruction of every existing establishment, and became only the instruments of their absurd projects, is as certain; and whatever praise may be bestowed on this first assembly by some, who affect to separate the horrors of the revolution from the revolution itself, they ought to be considered in no other light than the destroyers of their country. Acting upon their visionary and wretched theories, they not only overwhelmed their own country with ruin, but by their avowed intention of aiding and promoting insurrection in every nation, they spread terror and alarm through all Europe. By one mad decree they entirely abolished the ancient government, while they had nothing to substitute in its place, and thus they deprived the laws of that reverence and awe with which they ought to be viewed by the people, and at once opened a door for the introduction of universal anarchy, and all the excesses which naturally result from the licentious and ungovernable fury of the passions, when every restraint is withdrawn. Finally, all the disasters which have plunged France into an abyss of misery, rendered the country a field of blood, converted an elegant, a polished and a civilized people into a horde of robbers and murderers, and furnished the historian with such a tale of woe, as exceeds all the power of language or conception adequately to display: all has sprung from the powerful energy of these mischievous principles which gave rise to the revolution and have ever since directed all its movements.

The second assembly met on the 1st. of October 1791, composed mostly of men with no pretension to knowledge, atheistical fanatics, who were determined, if possible, to effect the total abolition of monarchy and to eradicate every trace of religion from the minds of the people of France. The promoters of the late insurrection, instead of being pursued with vigour, and brought to trial, were allowed to appear again in the capital, and some of them were chosen members of the assembly; particularly Brissot, who in a short time became the centre of that circle, so well known under the name of *Gironde*. By their emissaries rumours of new plots and conspiracies, of an Austrian committee within the palace, and other tales equally false, were propagated and insinuated in the journals supposed to be under the direction of leading men of the party. The king's character was grossly misrepresented, and new sources of calumny were opened against the queen. To that species of slander to which female beauty is most exposed, others were added of a more important nature, in which the independence and freedom of the nation were deeply concerned.

The decrees pronounced against the king's brothers had not entirely satisfied the Jacobins, who governed the majority of the assembly, by their influence and threats; their rancour required another violent decree against the emigrants, and the assembly satisfied them in this point by issuing one, which not only exceeded its powers, but was even contrary to the spirit of the constitution. This was so evident, that after a minute discussion, the king's ministers unanimously advised him to refuse his sanction. But as the king had never yet employed this prerogative, the ministers were of opinion, that to prevent its having a bad effect on the public, and likewise that it might strike the assembly with some degree of awe, it would be prudent to give to this measure an unusual degree of solemnity, by ordering the refusal of the sanction, to be carried to the assembly in the form of a royal message, by all the ministers; whose presence would mark their unanimity.

most agreement. The 12th. of November being the day fixed for the message of the king all the ministers met at the house of the *Garde des Sceaux*, that they might go together to the assembly, before they set out. The *Garde des Sceaux* called for and drank two large glasses of water, M. Bertrand minister of the marine asked him if he was ill. "No, answered he, it is only a precaution I take every time I go to the assembly. The blood boils in my veins when I hear these fellows speak; and if I did not take something to cool myself, I should get into a passion, and be apt to tell them disagreeable truths."

"I hope" replied Bertrand, "all this water will only moderate the passions, without weakening those truths you have to tell them be they agreeable or not."

"Fear not," replied he.

The appearance of all the ministers with a message from the king, the first the assembly had ever received and of which the object was entirely unknown, excited a general and profound silence in the hall and in the tribunes. That of the tribunes could only be imputed to curiosity; but in the silence of the assembly there was at least as much uneasiness as surprize. The *Garde des Sceaux* began by laying upon the table the different decrees which the king had sanctioned, among which there were two or three which the assembly had expected with a good deal of impatience. He terminated the first part of his mission by informing the assembly, that with respect to the decree against the emigrants the king would examine it; which signified, in constitutional language, that the decree was refused. He then drew from his pocket the paper which contained the discourse. Unluckily the water operated, at that moment, with so much violence that his colour forsook him, his hands trembled, and his voice failed him so much that he could hardly read. And what was still more unlucky, the first phrase, instead of relating to the subject of the message, mentioned the refusal of the sanction. He was not permitted to proceed farther. A general murmur arose. All the deputies spoke at once. Every one insisted upon being heard, but no silence was to be obtained. They all vociferously exclaimed, "M. Le President, we can not listen to this message." "This message is unconstitutional." "It is the motives for refusing the sanction." "Call the minister of justice to order." "M. Le President, the constitution—" "M. Le President allow me to make a motion of order." This tumult lasted seven or eight minutes. The minister waited the issue of it standing. At length the president put it to the vote, whether they should hear the message or pass to the order of the day. The *Garde des Sceaux*, entirely disconcerted by this tumultuous scene, sat down with the other ministers, giving up all hopes of being heard. To prevent such an unexpected and unfortunate termination to the business, M. Bertrand asked leave to speak. He rose, and said that he now had nothing to say; but had he been heard before the last motion was carried, he should have informed the assembly, that the object of the king's message was to acquaint them with the new measures adopted by his majesty for stopping the emigration. This renewed the tumult; one party insisting on hearing the message, and recalling the decree just pronounced; the other exclaiming for its execution. But the ministers remaining passive, and the *Garde des Sceaux*, who ought to have represented to the assembly, that they had no right, by the constitution, to refuse to hear any message from the king, being silent, the order of the day was adopted.

The legislative assembly manifested so great a disposition to put an unfavourable

avourable contraction on the king's measures, that he was constantly on his guard, had the constitution always before his eyes; and seldom proposed any plan to his ministers or adopted any one proposed by them, without previously examining whether or not it was strictly conformable to it, and if there were doubts on that head, he generally rejected the measure. This attention rendered it difficult for the king's enemies to find what they looked for, any matter of accusation founded on his having infringed the constitution. An attempt was made to put that construction on his having made use of the veto. It was peculiarly unfortunate that at this period there should exist a misunderstanding among some of the ministry, which terminated in the entire dissolution of this administration.

When this event took place, the king was advised by M. Cahier de Ger-ville to form an administration of a popular nature, as the consequence of acquiring the confidence of the nation. Dumourier was appointed minister for foreign affairs, Roland was named minister for the interior, and Claviere minister of contribution. This has been generally called the Jacobin administration.

In the disordered state of the country it is natural to imagine that war would have been an additional evil, and avoided with the utmost care. It was not, however, viewed in that light by the Jacobins, but rather as forwarding their favourite object; on the 20th of April, therefore, the king, compelled by this Jacobin administration, went to the assembly and proposed that war should be declared against the king of Hungary and Bohemia. The proposal was heard with universal applause, and decreed by the assembly with unanimity. The popularity which the king acquired by this declaration of war alarmed the Jacobins so much, that they thought it necessary to revive a tale which had formerly been circulated, and had afterwards been discredited, namely that a society of persons chosen by the queen frequently met in the apartments of Madame de Lamballe, on purpose to concert measures to assist the emperor in his invasion of France, and to send occasional instructions how to proceed. This was called the Austrian committee; and it was imagined that it would raise a greater indignation, and on that very account be more eagerly believed, now when the emperor was at war with France, than formerly. The journals therefore began again to be filled with the accounts of this dreadful committee; harangues against it were made nightly in the Jacobin club, and it became the chief theme of the orators in the Palais Royal.

In the mean time an occurrence happened, which produced an extraordinary fermentation in the minds of the people and even of the deputies; of which advantage being taken by the king's enemies, it had an effect with which it might naturally have been thought to have no connection. A large edition of the memoirs of Madame de la Motte had been bought long before by the direction of government, and was locked up in a room of M. la Port's house in the Louvre. He was at that time intendant of the civil list, and from the hurry of affairs had neglected to destroy this work until the 30th of May 1792, when he made them be carefully packed up in a couple of waggons, and carried to the manufactory of Seves, where they were burned; during the execution of this, as the spectators were prevented from satisfying the curiosity which they expressed to examine what the piles of paper were, which they beheld in this mysterious manner committed to the flames, some of them concluded that they could be no other than the registers of the famous Austrian committee of which they had heard so much, but of whose existence no trace had ever been discovered before.

This sagacious inference was no sooner made, than the news was spread, that the records of the horrid Austrian committee had been burned at Seves; and within a few hours the street orators of Paris repeated, to the groups assembled in the public places the contents of some of those bloody records, which they pretended to have learned from persons who had read them, in spite of the care taken to prevent it. Those who had ever expressed a doubt of the existence of an Austrian committee were treated as miscreants. The news was brought to the national assembly, where it excited the most violent agitation and heat; in the midst of which a member who watched an opportunity for obtaining a decree against the constitutional troops thought the present rage against the court would answer the purpose as well as any accusation against the troops themselves. He therefore proposed that they should be immediately reduced, and that the duke de Brissac their commander, who in all probability was a member of the Austrian committee, and possibly was privy to the burning of the records, should be sent prisoner to Orleans. The next day the most convincing evidence was given, that the papers burned at Seves were the memoirs of Madame de la Motte, and that no other paper or record of any kind had been destroyed on that occasion. But these rumours had produced the effects their fabricators wished, and the effects continued after the falsehood and infamy of the authors were made manifest. The constitutional household troops were not re-established; and new sources of calumny against the king and queen were opened, with more efficacy than ever.

The assembly, whose usurpations increased as the king's powers of resistance were weakened, passed two most atrocious decrees in the beginning of June 1793. The first was for the banishment of the priests who had refused to take the oath; and the second was for the formation of a camp of 20,000 men in the environs of Paris, to consist of volunteers from every department of the kingdom. It was very well known, that those volunteers would every where be chosen by the Jacobins, whose power was universally felt, and had impressed such general terror as gave them complete sway in every election; so that this army must of course have been made up of their creatures; the most seditious and desperate villains in the kingdom. The king shewed the utmost repugnance to sanction either of their decrees, in spite of the threatening intimations he daily received from his ministers Rolland, Claviere and Servan. At that time a quarrel subsisted betwixt these ministers and their colleagues, who, Jacobins as they were, seemed touched with the king's misfortunes, and always behaved to him with respect. They were shocked with the conduct of Rolland, Claviere, and Servan, and determined to take this opportunity to get them dismissed. Dumourier, with the approbation of his colleagues Duranthon and la Cotte undertook to propose three new ministers to the king. His majesty accepted the proposal with the joy of a person who feels himself suddenly relieved from a heavy load under which he is ready to sink.

On the rejection of their decrees, the Jacobins hastened to bring forward an insurrection which they had previously planned. On the 20th of June an immense multitude collected round the palace and garden of the Tuilleries. At four o'clock in the afternoon the mob amounted to about 40,000, and the gates of the Tuilleries were thrown open to them. At the moment of their entrance the royal family were at dinner, and on their attempting to break open the door of the apartment where the king was, he rose to prevent the guards from making resistance, and said calmly, "I will go to them; I will prevent them from breaking the door." On the instant that it opened, a pike which had been thrust against it to force it open, would have killed the

king, but a chasseur turned the weapon aside with his hand. The cry of *Vive la Nation* resounded from all sides, and was evidently addressed to the king, upon which he loudly said that the nation had not a better friend than himself. A fellow of a sanguinary aspect, with a pike in his hand and evidently drunk then forced his way to the king and said rudely enough, "If you are telling the truth, prove it by putting on the bonnet rouge." "I consent," replied the king, and directly the fellow with one of his companions advanced and put the cap upon his head. It would be an unpleasing task to detail the indignities which were offered to the unfortunate monarch, and which he submitted patiently to hear. During the whole of the tumult the princess Elizabeth continued close by the side of her brother, as if she was born to be the victim of her generous affection, and to partake in all his unmerited disgraces and misfortunes. On the first breaking out of the rabble the queen fainted and was accidentally separated from his majesty, and conveyed to the apartments of the king's physician. As soon as she recovered, in her distraction she attempted to penetrate to the king; but was stopped in her way thither by the mob breaking into the council chamber. The minister at war had fortunately retired to the same spot, who formed a kind of rampart of the great council table, which he placed against the door with a double row of national guards before it. Behind the table stood the queen and her children, the princess de Lamballe and some other ladies. In this situation she remained the whole time, condemned to hear the most indecent reproaches, and the foulest imprecations, from the meanest and most depraved of her sex.

While the king was in this manner surrounded with bands of ruffians, and not sure of his life for a moment, the duke of Brunswick on the 25th of July issued his celebrated manifesto, which was attended with very bad consequences. It irritated the minds even of the more moderate patriots, and the reproaches cast on the king by the Jacobins gained universal belief. Regardless of the menaces contained in that manifesto, the republican party resolved upon the deposition of the king. The chiefs of this party were Vergniaud, Guadet, and Gensoué. To accomplish their purpose, they resolved upon a second insurrection. A letter signed by these three deputies was delivered to the king, in which it was declared that "the discontents of the people were ready to break out in a very terrible manner; that an insurrection, much more considerable and violent than the 20th of June was already planned and ready to burst forth at the first signal; that it would take place in a fortnight and that the dethroning of his majesty was the mildest consequence it would have; that his only means of avoiding this catastrophe was to recall Roland, Servan, and Claviere to the ministry at farthest; that if the king would consent, and give them his word, they would pledge their heads to prevent the insurrection from taking place."

To avert the dreadful consequences of this conspiracy every preparation was made for the defence of the palace. Those battalions of national guards, who were on duty there were extremely well disposed to the king. Their commanders and officers were entirely devoted to him. The Swiss guards were also of approved bravery and fidelity. Those troops were reinforced by gentlemen and royalists of every rank, whom the danger of the royal family drew in crowds to the palace. On this eventful night no person in the palace went to bed. About six o'clock in the morning of the 10th the king descended into the gardens to review the troops. He then returned to the palace, and the multitude continued to collect. Had the king remained in the palace he might have repelled the insurrection of that fatal day;

but giving way to solicitations, perhaps perfidious, unquestionably unfortunate, he sought an asylum in the hall of the national assembly, among those who were preparing a prison, chains, and death for him and his family.

The insurgents amounted to about 20,000 men. They were drawn up in tolerable order by Westerman a Prussian, and had about 30 pieces of cannon along with them. The gentlemen within the king's palace were now dispirited and knew not what part to act. The commander of the Swiss, M. Affry was absent and the captains knew not what to do. About nine o'clock the outer gates were forced open; and the insurgents formed their line in front of the palace. A bloody combat commenced between the Marseillois and the Swiss. All of them that could be found in the palace were massacred by these brutal ruffians, even while imploring quarter on their knees. Others escaped into the city and were protected by individuals. Of this brave regiment only 200 survived; but every human being even the lowest servants in the palace were put to death. The Swiss taken prisoners in various quarters were conducted to the door of the assembly, and taken by a decree under the protection of the state. The suspension of the royal authority was now decreed, and the nation was invited to elect a *Convention* to determine the nature of its future government.

Meanwhile the combined armies of Austria and Prussia had entered France. The duke of Brunswick's army was above 50,000 strong. General Clairfait had joined him with 15,000 Austrians, and a considerable body of Hessians, along with 20,000 French emigrants; amounting in all to 90,000 men. At first their progress into France was very rapid. Longwy surrendered after a siege of fifteen hours, although strongly fortified. Verdun was next summoned; and the governor being compelled by the municipality to surrender, shot himself dead with a pistol in presence of the council, and on 2d. of September the Prussians entered the town.

The news of this second capture, and of the approach of the Prussians spread an instant alarm through Paris. The common council, which was now led by Roberfpierre, Danton, Marat and other sanguinary monsters, ordered the alarm guns to be fired and the populace to be summoned to meet in the champ de Mars to enroll themselves to march against the enemy. The people assembled, and a number of the emissaries of the Jacobins, exclaimed that the domestic foes of the nation ought to be destroyed before its foreign enemies were attacked.

Parties of those bloody ruffians proceeded immediately to the prisons where the Swiss officers, nonjuring clergy, and those confined since the 10th of August on account of practices against the state, were detained in custody. They took out the prisoners one by one, gave them a kind of mock-trial by a jury of themselves, acquitted some few and murdered by far the greater number. These massacres lasted for two days, and upwards of 1000 persons were put to death. Such scenes of bloodshed took place in Paris as must for ever render the tyrants of France execrable and odious. In the dungeon of la Force was confined the beautiful and accomplished Princess de Lamballe, the friend and confidant of the queen. This unfortunate lady was in bed, when she was summoned to appear before a kind of tribunal in the court of the prison. The person who carried the message, however, told her that it was intended to carry her to the Abbaye. She said, since she must be kept in prison, she was as well pleased with that she was in as another; and being a little indisposed, wished to remain in bed. She was then told that she must get up directly to appear before the tribunal. She begged of those who brought this second message, who were two men in the uniform

of national guards to retire till she was dressed, and she would attend them. They did so; and within a few minutes she was conducted before those pretended judges; it is said they wished to draw from her some matter of accusation against the queen. In this they were disappointed; but as there was no positive charge against herself, she was ordered to be removed. As she was conducted out of the prison, stupefied with horror at the mangled bodies that lay around her, she received from behind a blow on the head with a bludgeon which produced instantly a violent effusion of blood; her head was then severed from her body by a sabre. The lifeless corpse was dragged, by some of the wretches who stood around, into an adjoining court, where after a series of indignities not to be related, it was trailed by the mob through the streets. The head being fixed on a pike, was carried to the Temple for the express purpose of shocking the queen. The degree of rancour which those wretches displayed against the queen was as violent as it was unaccountable. After murdering her friend merely because she was her friend, they are not satisfied with letting her know that the afflicting event had taken place but must wring her heart with the most cruel of all spectacles.

The advances of the combined armies were in the mean time rapid and formidable; it was not till the 20th of September that the French were enabled to stop the progress of their victorious adversaries. On that day general Kellerman sustained an attack from the duke of Brunswick for fourteen hours, and retained his post till 10 o'clock at night, and then took another position to the right of the Prussians, who suffered him quietly to make this movement, though it was not completed till the next morning. The pass of Biesme which general Dillon had seized proved an insurmountable obstacle to the Duke of Brunswick's penetrating by the nearest route to Paris; and finding it impossible to dislodge the French, he determined to make the circuit of the forest by Varennes and Grand Pré, a circuit of about fifty miles. The length of this march with the great inclemency of the season laid the foundation of that fatal disease, which afterwards proved more destructive than the swords of the French. To complete this misfortune the rivers were so swollen that their supplies were almost entirely stopped and the combined army was actually without bread for four days, the want of which the soldiers endeavoured to supply by the unripe grapes of Champagne. Such were the distresses which induced the duke of Brunswick to propose an armistice to the French general. Various conjectures have been formed as to the motives of this convention. One thing is certain that the duke of Brunswick shortly afterwards began to retreat, and gave up every fortress he had taken. Verdun surrendered on the 12th. of Octr. and was followed by Longwy which capitulated on the 22d. The Prussian army immediately evacuated the territories of France and the country was solemnly proclaimed to be no longer in danger.

The Republican arms were at present victorious in every quarter. War had been declared against the king of Sardinia on the 16th. of September, and about the 20th. Montefquieu entered the territories of Savoy; he was received with open arms by the inhabitants, who had not yet tasted the fruits of French liberty, and in a short time he subdued the whole country. They were no less successful in the circle of the Upper Rhine, where their operations were directed by general Custine. Spire, Worms, Mentz, and Frankfort successively surrendered to them. By the union of the Prussians with the Hessians and Austrians, however, a check was put upon his career before the end of the campaign. On the 2d. of December the Prussians appeared before Frankfort, the gates of which were opened to them by some of

the populace and the French were expelled. After the surrender of the city a smart action took place between the two armies; the French maintained their ground from one o'clock till three, when they retired to a wood, whence they were able to annoy their adversaries and keep them in check.

We must now turn to the civil transactions of France which at this period are peculiarly interesting. One of the last acts of the legislative assembly shows a most abominable profligacy of mind. This act was to legalize adultery or authorize a community of women. The ordinary tribunals were enabled by a law to pronounce a sentence of divorce between any married couple, not only on mutual agreement, but on the application of either party, alleging simply as a cause incompatibility of humour or character. The female children were directed by this decree, to be entirely confided to the care of the mother, as well as the males to the age of seven years, when they were again to be recommitted to the superintendance of the father.

On the 20th of September the convention met; it was composed of the representatives of the constituent assembly, Robespierre and Petion and other blood-thirsty ruffians being re-chosen on this occasion. The infamous Paine was invited from England to represent one department; and a Prussian of the name of Cloots, a wretched maniac, whom the humanity of this country would have charitably provided with a cell in Bethlem, was chosen to represent another. The department of Paris was first in infamy upon this as on every other occasion. There the prostituted duke of Orleans was united with the infamous incendiary and assassin Marat, with the painter David, and with Legendre, the butcher. Actors, news-writers, and men from almost the lowest ranks and stations, were mingled with the degraded remnants of the ci-devant noblesse, and with such of the clergy as had sufficient laxity of principle to disavow their engagements with the head of their church. On the first day of their meeting Collot d'Herbois, who had formerly been on the stage, ascended the tribune and proposed the eternal abolition of royalty in France. It was in vain that M. Bazire and other members intreated the convention to proceed with more dignity and deliberation on so important a question. The abolition of royalty was voted by acclamation and the house adjourned. Messengers were sent to all parts of France intimating the decree, and by the influence of the Jacobins they were every where received with applause. It was next day decreed that all public acts should be dated by the year of the French Republic, and all citizens were declared eligible to the vacant offices and places. In the course of the succeeding sittings, the convention resolved, "that the French Republic no longer acknowledges princes." The rage of republicanism was carried at this period to an unexampled excess of folly. With a most contemptible puerility the innocent titles of Monsieur and Madame were abolished and the awkward phraseology of citizen was substituted in their stead. The sudden dissolution of the judicial boards was a most atrocious measure and perfectly conformable to the principles upon which these anarchists acted. The convention passed new decrees against the emigrants more cruel and sanguinary than what had been formerly passed. On the 9th of October it was decreed that all emigrants taken in arms should be put to death twenty-four hours after they had been declared guilty by a military committee; and that all foreigners who had quitted the service of France, and entered into that of the enemy should be considered as armed emigrants. Another decree still more bloody was passed on the 27th. by which those unfortunate exiles, who had returned to their native country, were ordered to depart in 24 hours and the penalty of death awarded against those who should fail instantly to obey. There was a double motive for this

decrees; the persecution and oppression of those who by their misfortunes, are not in a situation to resist, gratified the malignity of their sanguinary enemies, and the property of the emigrants, murdered or driven into exile, was an irresistible incentive to those needy adventurers of which the convention was composed. Another decree was passed about this time, called in their vile jargon the decree of *fraternity*, inviting all those who wished for liberty to rise in rebellion against their lawful governors, and ordering their generals to assist them; it was passed by acclamation in the following terms, "The national convention declare, in the name of the French nation, that they will grant fraternity to all those people, who wish to procure liberty, and they charge the executive power to send orders to the generals, to give assistance to such people as have suffered, and are now suffering in the cause of liberty." What sort of liberty they meant may be easily conjectured from what had already happened in France.

The allied armies, meanwhile, had continued to retire before their victorious enemies ever since they had raised the siege of Lille. The first resistance which Dumourier experienced, was at the village of Bossu. Here the Austrians had taken an excellent position but were unable to withstand the impetuosity of the enemy. They lost about 150 men, and 200 were taken prisoners. From Bossu Dumourier proceeded early next morning towards Mons, and soon came in sight of the Austrians, strongly posted on the heights of Gemappe. The French passed the night within sight of their adversaries. At seven in the morning of the sixth of November, a very heavy cannonade commenced on both sides, and continued till ten without much effect on the part of the French; at noon, therefore, the general determined on a close attack. The number of the French who formed for this purpose amounted to about 30,000, and the Austrians are computed to have been upwards of 20,000. The redoubts were carried in a very short time. The cavalry of the Austrians, however advancing at this crisis, with a view of flanking the French, the general dispatched a son of the duke of Orleans to repel this attack and supported him with a detachment of chasseurs and hussars. At the same time some disorder appearing in Bournonville's cavalry, general Dumourier rallied them himself, and in the mean time the left wing, which consisted chiefly of the Belgian volunteers, had obtained possession of Gemappe, and the centre carried the second line of redoubts. After a short resistance on the heights, the Austrians, at about two o'clock retreated with the utmost precipitation and disorder to Mons. The loss of both parties in this engagement must have been great. That of the Austrians has been estimated at nearly 4000 men, while that of the enemy amounted only to 1000. The victory of Gemappe was decisive as to the fate of the Netherlands. Mons immediately surrendered, from whence Dumourier proceeded to Brussels, which he entered on the 14th of November.

While these affairs were transacting, Tournay, Malines, Ghent, and Antwerp, opened their gates to general Labourdonnaye. Louvain and Namur, after a faint resistance by the Austrian general Beaulieu, were taken by general Valence; Ostend was entered by the French fleet on the 15th of November; the Stadels of Antwerp and Namur resisted for a short time, but the former capitulated on the 28th of November to general Miranda, and the latter on the 2d of December to general Valence; in a word the whole of the Austrian Netherlands, Luxemburgh only excepted, were subjected to the victorious arms of France before the conclusion of the year.

We now return to consider the state, condition and transactions of France; and the first event that presents itself to our attention, is among the most

atrocious

atrocious and disgraceful acts that have stained the annals of the world. Before we conduct the reader to the prison of the temple, the bar of the Convention, and the fatal scaffold, it may be necessary to offer some preliminary remarks to his attention.

It was an undoubted principle with the most active party of the convention, that while Louis lived, there would be no permanent security for them; the object, therefore of all their counsels and designs, was to bring the unhappy monarch to that fate which he so soon suffered. Legendre proposed that all who had consigned their opinions on the king's conduct to writing should lay them on the table of the assembly and that after the intervention of one day, they should pronounce sentence on the culprit, without suffering him to utter a word in his defence. Robespierre thought the whole business might be completed in 24 hours, and that the assembly should not separate till it was concluded. St. André declared that Louis had been judged and condemned by the people on the 10th. of August, and nothing was left for them to do but to proceed to execution. Those who desired the death of the king were alarmed at the effects which might be produced by such an awful and affecting spectacle, as would be presented on such an occasion, and they employed the most abominable and profligate means to counteract the influence which these circumstances might produce in favour of the king. Inflammatory papers were dispersed among the people, inciting them to insist on his immediate execution, or to execute him themselves; and to impress an opinion that the death of the royal sufferer was necessary to the existence of the French nation.

But while they endeavoured to dispose the public mind to co-operate with them, they contrived that the object of their diabolical enmity and injustice should be placed in a situation the most disadvantageous to himself, as it might tend to unsettle and trouble his mind, at a moment when he required all his powers to support him; and when his understanding: to do him service must be clear and unclouded. To effect this base and infamous purpose, the whole of the intended proceedings were carefully concealed from the king, and it was merely from the zealous curiosity of Clery, his faithful valet de chambre, that he barely knew the intentions of the convention to call him to their bar, a few days before it happened.

A commission of twenty-four deputies, selected from various committees, having been for some weeks employed in ransacking every suspected place for criminating papers, and in collecting evidence against the deposed monarch, produced on the sixth of November a report full of vague and unsupported accusations; and on the following day the committee of legislation presented a plan for his trial.

But while those execrable ruffians were preparing this mock-trial for their degraded and insulted monarch, the sad and adverse state of his fortune did not deprive him of every friend. Several of his former adherents offered to stand forth in support of his innocence at the hazard of their lives. M. Cazalés, so distinguished in the first assembly for his opposition to the Revolution, and who was then in England, solicited a passport that he might appear as counsel for the king. The same request was made by M. Narbonne, ex-minister of war, and M. Lally Tollandal. The marquis de Bouillé transmitted an attestation in his favour, respecting the flight to Montmedil, and an exculpatory letter to M. Choiseul, respecting the money paid by the marquis to the king's brothers. M. Bertrand also ex-minister of marine, manifested the most zealous solicitude to appear as an evidence for his de-

posed sovereign. But when the proposal made by Manuel, for assuring to all those who should speak for the impeached Louis, the protection of the laws, was suppressed by murmurings and hootings, the spirit by which the assembly was actuated was too manifest to expect honour or justice from its conduct or decisions. They decreed the arraignment of Louis. But though he was reduced to a simple and accused citizen, he seemed still to inspire the convention with apprehension. They feared that the sad spectacle of degraded majesty, and the notorious injustice of the proceedings against him, would, in spite of all their cunning and horrid manoeuvres, awaken the loyalty that slumbered, or stimulate what was still awake, to unite in saving the royal object of its former duty, affection, and veneration from the fate that appeared to await him.

On the 11th. of December, at so early an hour as five in the morning the generale was beat throughout Paris, and a considerable body of cavalry, with several pieces of artillery, were introduced into the garden of the Temple. At 11 o'clock while the king was endeavouring to calm his spirits by giving the usual instructions to the Dauphin, or amusing the young prince by some agreeable recreation, two persons of the municipality entered to inform him that they must, by order of the Convention, conduct the young Louis to his mother. Of this cruel and unexpected separation, the king in vain demanded the reason; and, in a short time, one of the commissioners returned to inform him, that Chambon, the mayor of Paris, was preparing to make him an official visit. At one the mayor appeared. He was accompanied by Chaumette, solicitor of the Commune, and several other municipal officers, and Santerre, commander of the national guard, with his aid de camp. The mayor informed the king that he came to conduct him to the convention, in consequence of a decree, which the secretary should read to him. When that office was performed, the king concluded some observations on the cruelty of depriving him of the society of his son, by saying, I am ready to follow you; not indeed because I am disposed to obey the convention; but because my enemies possess the power to enforce obedience. A large military escort attended him from the gate of the Temple. At length, accompanied by the mayor, two generals, one of whom was Santerre, commander of the Parisian guards, and several municipal officers; Louis XVI. in an ordinary dress, with neglected hair, and a face long unshaven, was presented at the bar of the national convention. Such was the form and appearance of the fallen monarch, that he seemed to subdue, for a moment, the horrid malignity of his enemies, and to awe the uproar of inveterate Jacobinism into something like a respectful silence. The tumult of those who occupied the seats and galleries ceased at once, and sunk into a solemn stillness, when the extraordinary spectacle of their former king was presented to them in such a state of humility and degradation. Barrere the president immediately addressed him as he stood at the bar. "Louis, the French nation accuses you. The national convention decreed, on the 3d. December, that you should be tried by it. On the 6th. of December it was decreed that you should be brought to the bar; and while the charges against you are read, you are permitted to seat yourself." The king who well knew that it would be as vain to disclaim the authority as to resist the power of the convention, submitted in silence to the proceeding against him; and having availed himself of the permission to sit, heard with profound attention the several papers read, in which he was accused of crimes, which may be arranged in two distinct classes, such as were prior, and such as were subsequent to the constitution. The facility and injustice of the charges in the first class, were so manifest, that

some

Some eyes of the vilest ruffians in the convention, demanded that they should be expunged in law, and nullified by the amnesty implied in the proffer and acceptance of the constitution. But the convention, with its usual disregard to every thing but its own will, rejected both these remonstrances with a contemptuous silence. When the articles of impeachment had been read, a long list of frivolous and insidious questions, previously revised by the convention was put to the king by the president; but all their arts to ensnare this unhappy monarch were unsuccessful; for though the questions proposed to him, were prepared by a committee for that purpose, and afterwards reconsidered by the convention; and though he was suddenly led away amidst insult and indignity, and without preparation to answer them on the instant; yet such was his conduct on this trying occasion, such the calm and majestic character of his deportment, such the readiness and sagacity of his replies, and such the predominating proofs of his innocence, that several of his most virulent enemies were filled with alarm, lest such a combination of affecting circumstances, should have at once recalled the spirit of ancient loyalty into the bosoms of his former subjects who heard and beheld him. After the examination was closed, the president addressing the king, said, "I have no other questions to propose—have you any thing more to add in your defence." "I desire to have a copy of the accusation," replied the king, "and of the papers on which it is founded.—I also desire to have a counsel of my own nomination." Barrere informed him, that his two first requests were already decreed, and that the determination respecting the other would be made known to him in due time. The king immediately withdrew.

A very violent debate now ensued in the convention; wherein, to use the expression of their president, the assembly assumed the appearance of gladiators rather than of lawgivers; it was however, decreed, after a most tumultuous sitting, that Louis should be indulged with a counsel for his defence. When he was informed of this decree, the king named Targot and Tronchet, the former of whom declined the office, while several persons of distinguished talents and character, eagerly pressed forward to be employed in the service of their degraded sovereign, on the trying and dangerous occasion. Of these he chose M. de Lamignon Maleherbes, who at the age of seventy two had the courage to plead his cause. In the letter to the president of the convention, expressing this humane and noble desire, he says, "I was once called to the councils of him, who was then my master, and at a time when such a function was an universal object of ambition; I now owe him the same service, when it is an office that in the opinion of many, is attended with risque and peril." Such was the multiplicity of papers to be examined in order to frame the king's defence, that his counsel found it impossible to proceed with that dispatch which the convention expected of them; they accordingly applied for permission to demand the assistance of M. de Seze; and a third counsel was accordingly granted.

On the 26th. of December the king was conducted a second time to the bar of the convention, where he appeared with the same unembarrassed air as he manifested on his first examination; and when the president informed him that the convention had appointed this day for hearing his defence, he replied, with a firm voice and undaunted aspect. "My counsel (pointing to M. de Seze) is to speak for me.—The king then sat down. M. Maleherbes and M. Tronchet took their seats on each side of their august client; and M. de Seze began a most masterly and argumentative speech, which had been prepared by the united skill, labour, and talents of these able advocates.

All ho the king that he n might be sified to af worth d privilege rained t sion to him: S

But eloquence was lost upon those sanguinary wretches, who were determined above all things to effect the murder of this amiable prince.

From the report of the commissioners, who were appointed to do duty at the Temple we learn the following particulars, which, though minute, serve to illustrate the character of the king. The commissioners having according to custom drawn lots for their different posts, that of the king's apartment fell to a M. Cubieres, who with another commissioner, was introduced, the king being then asleep. He rose as usual at seven, and took a book, which they afterwards found was a breviary; breakfast was brought at nine, but the king refused to eat, because it was the fast of *Le Quatre Temps*. He spent some time in prayer and afterwards asked Cubieres about the health of his queen and sister. He walked musing through the room, and then raising his eyes to heaven, "This day (said he) my daughter is fourteen years of age." The unhappy prince repeated the same expression after a pause, during which the tears flowed from his eyes and he was greatly agitated.

The convention, after having adjudged the king guilty, and voted against the appel nominal, thereby constituting themselves accusers and judges, met on the 16th. to determine the punishment. The fatal ceremony employed the whole day and ended in a sentence of death. The sentence after subtracting those who voted for death with certain restrictions, does not appear to have been carried by more than five votes. When the president had declared the state of the scrutiny, and that Louis XVI. was sentenced to suffer death, his council were admitted to the bar, and M. de Seze immediately spoke as follows:

"Citizens representatives. The law and your own decree have entrusted to us the sacred office of defending Louis; and we now approach you with sorrow, to perform the last duty of our function. Louis has expressly charged us to read a letter signed by his own hand, and these are the contents of it."—"I owe to my honour, I owe to my family, not to subscribe to a sentence, which declares me guilty of a crime which my conscience disdains. I therefore appeal to the nation at large, from the sentence of its representatives; and, by these presents, I empower my counsel, and charge them on their fidelity, to make this appeal known to the national convention, by all means in their power, and to demand that mention be made of it in the minutes of their sittings."

"Signed, Louis."

M. de Seze then implored the national convention to consider by what a small majority the punishment of death was pronounced against Louis. "Do not afflict France, said he, by a judgment that will appear to her to be terrible, when it was carried by no more than five votes." By the previous question, however, the convention rejected the appeal to the people; after a sitting of thirty six hours; 310 voices were then declared to be for a respite of the sentence and 380 against it.

All hopes being now over, and this atrocious murder being determined on, the king, requested that the sentence might be delayed for three days, in order that he might be better prepared to appear in presence of his God, and that he might be freely visited by a person, whom he should name, who would be qualified to assist him in that solemn act of preparation. He then named M. Edgeworth de Fermont, as the ecclesiastic whom he would wish to see, if that privilege should be granted to him. At six in the afternoon, Garot returned to inform the king that the convention had decreed him the permission to receive the person whom he named, and who now accompanied him. Six or seven of that court, called *conseil de la commune, s'assembla au Temple* had

had accompanied the minister to the king's chamber. They behaved to M. Edgeworth, not only without compassion, but they even shewed a ferocious joy. They rudely searched all his pockets, opened his snuff-box to see whether it did not contain poison, examined his pencil case on pretence that it might contain a filetto. They then made him ascend to the king's apartment by a little narrow stair, where sentinels were placed at small intervals, some of them drunk, swearing and singing as if it had been an ale-house. The minister of justice was still in the king's apartment with those members of the council who had accompanied him to his majesty; the serene dignity of whose countenance formed a striking contrast with the haggard and villainous looks of the wretches who surrounded him. As soon as the king perceived the abbé Edgeworth, he made a movement expressive of his desire to be left alone with him. The others immediately withdrew. The king shut the door, and turned towards the Abbé, who sunk on his knees, kissed his majesty's hand, and bawled it with his tears. The king equally affected raised M. Edgeworth, saying, "None but the most unrelenting of men have been allowed to approach me of late, my eyes are accustomed to them; but the sight of a man of humanity, a faithful subject, afflicts my whole soul, and melts me as you see." It is impossible to do justice to the devout, sublime, and heroic sentiments expressed by the king in this interesting conference, particularly when he spoke of his own situation and that of his family; but above all when he dwelt on the misfortunes of his country. After their conversation, he rose, saying "I must now go and see my family for the last time. This will be the severest trial of all. When that is over I shall fix my mind solely on what concerns my salvation."

Leaving the abbé Edgeworth in his closet, the unhappy prince went to the room where his family were already assembled, and which was separated only by a door, from that in which were two commissaries constantly on duty; this door was formed of panes of glass from top to bottom like a window; so that those two men could see and hear all that passed. In such horrible circumstances, and in this dismal room did the king of France meet his deploring family, now rendered more dear to him than ever by his own approaching fate, and their unexampled misfortunes. "At half past eight o'clock (says M. Clery the king's valet de chambre) the door was opened; the queen appeared first, holding her son in her hand; the princess royal and madame Elizabeth followed; they all threw themselves into the arms of the king. A mournful silence reigned for some minutes, which was only interrupted by loud sobs. The queen made a motion to draw the king towards her room; "No, said the king, let us go into this hall; I am not permitted to see you in any other place." They went in and M. Clery shut the door, which was made in part of glass. The king sat down, the queen at his left hand, madame Elizabeth at his right, the princess royal faced him, and the young prince stood between his legs. All leaned towards him and frequently embraced him. This afflicting scene lasted one hour and three quarters, during which time it was impossible to hear any thing; we saw, only, that after every expression of the king, the sobs of the princesses redoubled for some minutes, and then the king began again to speak. It was easy to know by his motions that he had himself told them of his condemnation. At a quarter past ten o'clock, the king rose, and they all followed him. I opened the door. The queen held the king by his right arm. Their majesties gave each a hand to the dauphin. The princesses royal,

royal, at the left, had her arms round the body of the king. Madame Elizabeth, on the same side but a little farther back, had seized the left arm of her brother. They moved a few paces towards the door, at which they uttered the most terrible groans. I assure you, said the king to them, that I shall see you to-morrow morning at eight o'clock. You promise us that you will, replied they all together. Yes, I promise you it. Why not at seven o'clock, said the queen. Very good, well at seven o'clock said the king—adieu! He pronounced this adieu in a manner so expressive, that the sobs redoubled. The princess royal swooned away, and fell at the king's feet, which she embraced; I raised her, and assisted madame Elizabeth to support her. The king wishing to put an end to this heart-rending scene, tenderly embraced them and tore himself from their arms. Adieu! adieu! he said, and hurried into his room." He was in a state of emotion that cannot be described. "Why," said he, addressing himself to the abbé Edgeworth, after he had somewhat recovered himself, "why do I love with such tenderness and wherefore am I so tenderly beloved? but now the painful sacrifice is over. Let me now turn my thoughts to the care of my salvation alone." Nothing now remained for the consolation of the king but to perform the rites and receive the communion of his church; and M. Edgeworth after some opposition from the commissaries, obtained the solicited indulgence. The king was no sooner informed of this than he immediately entered upon his confession. When that solemn duty was performed, M. Edgeworth perceiving his royal penitent to be almost exhausted with the fatigue and anguish he had suffered during the day, entreated him to go to bed and endeavour to obtain a little rest. The king complied with this request, and enjoyed a calm, undisturbed repose till five the next morning, when he was awakened according to his order.

All Paris had been under arms since five o'clock, while the sound of drums, the noise of arms, the clatter of horses, the passage of cannon, were distinctly heard in the tower. At nine the bustle increased, when the doors were thrown open with violence, and Santerre appeared, attended by ten *gend'armes*. On his informing the king who came from his closet, that he was come to conduct him to the scaffold, his majesty asked only a few minutes, when he re-entered, and falling on his knees before his confessor, received his last benediction. He then threw open the door, and with a firm voice said to Santerre, let us be gone. M. Edgeworth followed him, and entered with him into the carriage provided for the occasion. When the carriage stopped at the scaffold, the king immediately descended from it; and having thrown off his coat, was about to ascend the scaffold, when the executioner seized his hands, in order to tie them behind him. As he was not prepared for this last insult, he appeared disposed to repel it; but M. Edgeworth, sensible that resistance would be in vain, said to him, "Sir, this new humiliation is another circumstance in which your majesty's sufferings resemble those of that saviour, who will soon be your reward." This observation instantly removed all repugnance.

It was while he was mounting the scaffold, supported by the abbé Edgeworth, that this servant of God, as if by inspiration, addressed the king in this sublime expression, "Offspring of St. Louis, ascend to heaven." As soon as he came upon the scaffold, advancing with a firm step to the part which faced the palace, he desired the drums to cease, and was immediately obeyed, in spite of the orders they had received. He then in strong terms asserted his innocence of the crimes laid to his charge, and was continuing, when that most atrocious of villains, Santerre pushed furiously towards

wards the drummers, and forced them to beat without interruption. The executioners at the same time laid hold of their victim and the horrid deed was completed. This cruel, unprovoked, and atrocious murder excited among foreign nations the strongest emotions of astonishment, horror and execration. They saw with regret that a band of robbers and murderers had usurped the government of France, and had not only overwhelmed their own country with bloodshed and anarchy, but with the most unexampled zeal laboured to reduce every other country in the world to the same dreadful situation. This dangerous disposition which broke forth upon every occasion, the violent decrees which had been passed by the convention, holding out encouragement to traitors in every country, the ungovernable ambition and spirit of aggrandizement which they manifested, at all times dangerous, but particularly so, when connected with the propagation of their vile principles, determined the British government to remain no longer unconcerned spectators of what was transacting on the continent. M. Chauvelin was commanded to leave Britain, and another minister to whom the French executive council gave powers was not suffered to land. The French, whatever the intention of Britain might have been, on the 1st of February 1793 on the motion of Brissot declared war against England. As the transactions of this war have been related in the history of England we will not tire the reader by an unnecessary detail of the conflicts of the hostile armies in the history of France, as the internal history of that country cannot fail to be more interesting; we shall only observe that, notwithstanding the partial successes of the allies, the French were completely successful, and overrun the whole of Holland together with the Low Countries.

The convention of France had now become one continued scene of re-creation and commotion. In the month of March they established that bloody Revolutionary tribunal for trying offences against the state; another decree was passed on the 29th of March by which it was declared, that all persons convicted of composing or printing writings for the restoration of monarchy in France, or the dissolution of the national representation, should be punished with death. The proposal of the financier Cambon, for a compulsory loan of 1,000,000,000 of livres from all those who were indifferent to the cause of French liberty, and who were suspected of taking an interest in the success of their enemies, produced a most disgraceful scene of tumult and uproar. Brissot, and his party exclaimed against the tyranny of a forced loan, and represented in the most violent terms, its counter-revolutionary operation. The adherents of the different parties, who occupied the galleries took a part in the debates; such indeed was the clamour and outrage, that the president, unable to controul the proceedings, resigned his office. Barrere endeavoured to divert their attention from these contests, to objects of public utility. But the people were too much inflamed and agitated by political discussion to be turned aside from these contests by any scheme of internal regulation. Though the constituted authorities had been invited to assemble and concert measures for the salvation of their country; and though repeated proclamations had exhorted the citizens to tranquillity, nevertheless the city of Paris was, on the morning of the 31st. in such a state of confusion, that the tocsin was sounded, the alarm gun fired, and every other signal of extreme danger was heard. The convention assembled to inquire into the extraordinary and alarming situation of the city. The mayor of Paris appeared at the bar, and declared that the public uneasiness arose from the conduct of the commission of twelve, and that the constituted authorities were employed in restoring public tranquillity.

In the evening of the first of June the tocin again proclaimed a state of public commotion. On the following day the hall of the convention was surrounded by a very large and tumultuous assembly of people, who vociferated the demand for a decree of accusation. The hall of the convention itself was in a state of extreme disorder; that its deliberations were no longer free seemed to be the general sense of the convention; but it was forced to submit. The insurgents maintained their purpose, and the assembly was compelled to pass a decree, which ordered the following deputies to be put in arrest, viz. Genfouoné, Vergniaud, Brissot, Guadet, Coiffas, Petion, Selles, Cambon, Barbaroux, Rabaut, Laforce, Lesage, Louvet, Valacé, Lanthenas, Dussaux, with several others, and all the members of the committee of twelve, except Fonfiede and Salut Martin, and the ministers Claviere and Le Brun. The assembly, with the president at their head had quitted the hall with an intention to separate; but Henriot the commander of the Parisian guards, arranged his troops in military array, and threatened them with a discharge of musquetry, if they did not return. Robespierre, Marat, and the Jacobin party, were now triumphant, and the first object of their power was to complete the constitution. The national convention, therefore, on the 23d of June, issued a declaration of the rights of man, as introductory of their new constitution, a very hasty ill-digested work, but in some respects calculated to seduce the populace. It was impracticable as a system to guide, correct and controul the life of man; but whatever it had been, it would not, we believe, have avoided the fate of being lost in that tremendous and sanguinary chaos, in which all the elements of justice, and of mercy, of truth and of religion, of public honour and private virtue were dissolved.

The convention now proceeded to frame various decrees, for civil, military, and naval regulations, for the dispatch of criminal causes, a branch of the executive government with which they appear to have been well acquainted. Among others the following decree was adopted. "Marie Antoinette shall be delivered over to the revolutionary tribunal, and shall be immediately conducted to the prison la Conciergerie, Louise Elizabeth shall remain in the temple till after the judgment of Marie Antoinette." From framing sanguinary decrees these legislators proceeded to settle and arrange such public diversions and amusements, as they deemed proper to fill up the interval of cruelty, or rather to incite the people to the commission of fresh massacres. A very extraordinary and daring scheme was about this time, on the proposal of Barrere, adopted by the convention; it was proposed that the people of France should declare by the mouth of their representatives, that they will rise in one body, in defence of their liberty and equality. This proposition being received with loud bursts of applause, Barrere presented a plan for carrying his design into effect; and it was shortly introduced in its matured state by the committee of public welfare. That such a decree should be proposed cannot produce the least astonishment in the minds of those who are familiar with the history of the convention, which has every hour produced something strange and monstrous; but that it should in any degree, be received by the people, might not be altogether expected, on the avowed principles even of the French Revolution. Jacobins, and the friends of Jacobins, will, without doubt, consider the consent to rise in a mass, as a proof of that ardent love of liberty, which is boasted at this time, to have inspired every patriot heart in France. It must indeed be confessed, that a very active enthusiasm prevailed among the French people; but it was not founded on a knowledge or sense of genuine freedom; it was violent, cruel, and precipitate; it was easily called forth, and set in motion;

but not operating on any principle, however it might be employed, its course must be licentious, and its tendency was rather to evil than to good.

To encrease the military force of the country seems to have interested the Jacobins above every other consideration. The measures that were employed on this occasion, were at once bold and tyrannical. Revolutionary committees, domiciliary visits, the seizure of all gold and silver discoverable in the republic; the coinage of all plate sacred or profane; the fusion of church bells into cannon; the requisition of all property for the use of the state, and the decree ordering the people to rise in a mass were adopted, to render their schemes effective. Oppressed by these plundering decrees, some of the great maritime and commercial cities were driven into insurrection. The inhabitants of Poitou and Brittany had been long in motion, and had frequently defeated the republican troops which had been sent against them. The formidable union, likewise, which had taken place between the cities of Marseilles, Lyons, and Toulon, still continued and alarmed the ruling powers. General Cartaux was accordingly dispatched against them with a considerable force; and having taken the town of Aix, the populace of Marseilles opened their gates to him, and received the plunder of the wealthy inhabitants for their reward. At the same time the inhabitants of Toulon, proposed a negotiation to the English admiral lord Hood, who then commanded a fleet in the Mediterranean, and he was suffered to take possession of the town and shipping in the name of Louis XVII. The Lyonnese did not follow the example of the Marseillois, but sustained with great bravery an active siege of two months. General Kellerman, who commanded the army of the Alps, was ordered to besiege the city, but not answering the impatience of the convention, he was removed and general Doppet appointed to succeed him, to whom the inhabitants, who were not only unused to arms, but very ill provided with the means of defence, as well as the necessaries of life, were on the 8th. of September obliged to surrender. A great part of the city had been reduced to ashes by the incessant bombardment; and the victors satiated their rage by barbarities for which language has no name. The miserable victims, who were too numerous for the individual operations of the guillotine, were driven in great numbers, with the most savage and blasphemous ceremonies, into the Rhine, or hurried in crowds to the squares, to be massacred by the more painful operation of fire arms and artillery. By a decree of the convention, it was ordered, that the walls and public buildings of this city, polluted with massacre, should be demolished, and that it should lose its former name in that of * *La Ville Affranchie*. What language can furnish expressions of abhorrence sufficiently strong to characterise these brutal savages? After having desolated one of the noblest and most ancient cities of France, after having robbed and massacred the wretched inhabitants by thousands, || they insult them in their sufferings by telling them they are restored to liberty. Such indeed is the nature of that liberty, to which the French have erected altars; from her, social order, religion, and all those virtues which assimilate man to the divinity, fly away affrighted, and in their stead start up from hell, covered with blood, those grim fiends, Atheism, Anarchy, and

The lawless association of thieves, murderers and robbers who enslaved France, ruling now with despotic sway, proceeded to gratify their malignity by the trial and public murder of the queen. She had already been separated from her family in the temple. In the night of the first of August, she

was suddenly and in the most cruel and insulting manner, removed to the prison of the Conciergerie, a prison destined for the reception of the vilest malefactors. There she was treated with a degree of savage barbarity, of which we know not how to conceive the motive; unless it was hoped that its severity might save her persecutors the forms of a trial. The cell in which she was immured was only eight feet square; her bed was only an hard mattress of straw, and her food of the meanest kind; while she was never suffered the privilege of being alone, two soldiers being appointed to watch her night and day, without the intermission of a moment. After a confinement of ten weeks in this loathsome dungeon, while preparations were making for her trial, she at length appeared before the revolutionary tribunal. The act of accusation was of great length, heavily charged with the most calumniating expressions, and in which the royal object of its horrid criminations, was represented as having been the cause of every real or supposed public calamity, which had happened in France, from the time of her arrival there to that moment. Of the various charges which were brought against her, not one was proved, which must appear to be somewhat extraordinary, when it is considered how easy it was to procure evidence to any charge. The trial was conducted with some appearance of formality, but the sentence was already prepared; and Marie Antoinette may be said to have been condemned to die, at the moment when she appeared before her judges. On being informed, by the president of the tribunal, that she must prepare to submit to the same fate which her august husband had already suffered, she did not discover the least emotion; and her aspect lost nothing of that dignity, which it displayed in every circumstance of her misfortunes. She had probably anticipated her fate, and therefore met it with calmness and resignation. It is natural to suppose that she might consider it as the end of her troubles; and what could there be in life for her, which would not make her sigh to change for that state, where the wicked cease from troubling and the weary are at rest. During her trial amidst the most aggravated mortification, and wanton insult, under accusation for crimes of which she was altogether innocent, or could not commit; she submitted with a patience that became her sad condition, and answered with a spirit that marked her elevated nature. She retired from the hall without uttering a word to the court or the people, and at four o'clock in the morning was reconducted to her dungeon. At five the drums beat to arms in every part of the city; its whole military force was soon in a state of preparation; cannon were planted in the squares, and at the extremities of the bridges; and at ten, numerous patrols passed through the streets. At half past eleven, the queen was brought out of prison, and like an ordinary malefactor, was conducted, in a common cart, to the place of execution. Her hair was entirely cut off from the back of her head, which was covered with a small white cap; she wore a white undress; her hands were tied behind her, and she sat with her back to the horses. The executioner was seated on her right; and, on the left was a constitutional priest. The cart was escorted by numerous detachments of horse and foot. An immense mob of people, in which the women appeared to predominate, crowded the streets, insulted the queen, and vociferated, "Long live the republic." She seldom cast her eyes upon the populace, and regarded with indifference, if she at all regarded, the great armed force of 30,000 men, which lined the streets in double ranks. They, who had seen her in the former part of her life, could not but observe the altered state of her countenance, and what a sad change sorrow had made in that seat of animation and beauty. Her spirit appeared to be calm, and she conversed

with the priest, who was seated with her, with an air of decent submission, but without the least appearance of anguish and dejection. She ascended the scaffold with much haste and seeming impatience; and then turned her eyes with apparent emotion towards the gardens of the Tuilleries, one of the many scenes of her former greatness.

At half past twelve the guillotine severed her head from her body, which the executioner exhibited all streaming with blood to an inveterate and insatiable multitude. Thus perished in the 38th year of her age, Marie Antoinette, queen of France, who had enjoyed all the good the world could give, and endured all the evil it could inflict. Of Imperial origin, she was destined to share one of the most splendid thrones on the earth: there she continued till she attained her meridian height, when she was plunged to the lowest depth of human misery, to the dungeon and death of the meanest criminal.

On a first view it might appear to be a curious and strange circumstance, that amid such scenes of blood and murder, the government of France should employ itself in such a trifling and unnecessary measure as the alteration of the calendar. But the design was of a more serious nature than superficial observers might imagine. It was intended to abolish, and if possible to eradicate every trace of christianity from their country. According to the new calendar the year retains its division into twelve months; consisting each of thirty days, and distinguished by names expressive of their usual produce, temperature, or appearance; while to complete the year, five supplementary days are added, and denominated *jura callosides*.

A principal object of this machinery was to introduce a division of each month into three decades, and to fix the day of rest on the tenth, and not on the seventh, that all reverence for the institutions contained in the sacred volume might gradually decay. After this prelude the authorities of Paris came in a few days to the convention, attended by the bishop and clergy, decorated with caps of liberty, who, to complete the ceremonial, renounced the office of christian priests, and their appointments as christian pastors, and their character as christian men. They declared, that the necessity of complying with the prejudices of the people, in order to teach them the moral virtues and social duties, had alone caused their acceptance of their sacerdotal functions; that now, abjuring the trade of superstition, they were resolved, instead of christians, to become men, to own no temple but the sanctuary of the law, no divinity but liberty, no object of worship but their country, no gospel but the constitution. These and various other declarations of a similar nature sent from different parts, were dispatched to all the departments, and municipalities, to perfect the work of the revolution; and the day of this event was mentioned in the calendar, as the day of reason. The *Jansculotes* who, in consequence of these proceedings, considered themselves as authorized to plunder every place of worship, public and private, divided with the convention large heaps of shrines, figures, and vessels hitherto used in the offices of religion, while commissioners from the convention aided the sacrilegious pillage. At Abbeville, and other places, the churches were shut; and many of the priests who still attempted to officiate at their altars were arrested and thrown into dungeons. Nor can the bishop of Moulins be passed by without receiving the execration he merits. This furious and atheistical fanatic trampling on the cross and the mitre, assumed the pike and cap of liberty, and preached the doctrine, big with horror to reflecting minds but full of encouragement to diabolical natures, "That death is an eternal sleep."

Roberpierre, however, with all his impiety, could not but perceive that amidst all their enormities the people still retained an attachment to their ancient faith; and that while they were infringing the laws of religion every moment of their lives they saw with disgust the violation of its altars. The various allegorical idols, such as liberty, equality, &c. which had been established amid the applauses of the frantic atheists of the convention; the horrid act of placing a prostitute on the altar of the cathedral church of Paris, to receive adoration as a substitute for the favour of the world, gave great offence to the people at large, while the decree of the first of December, ordaining the churches to be shut up, was received with such public and universal marks of abhorrence and detestation, that it was immediately reversed, and the freedom of religious worship restored.

The death of the queen was soon followed by that of the accused deputies. They were convicted of having conspired against the unity and indivisibility of the republic, by exciting a rebellion in the departments of the south. On the 30th of October, twenty one of these deputies suffered the stroke of the guillotine. And shortly after, the duke of Orleans received the punishment which his conduct deserved. He was in the beginning of November, brought to Paris to appear as a criminal before the revolutionary tribunal, and what was a necessary consequence, was condemned to die. In the evening of the 6th of November, he was conveyed in a cart, to the place of execution, where the public detestation and abhorrence accompanied the close of his infamous career.

On the 3d of February, three deputies from the island of St. Domingo were received into the convention, as representatives of that place; one of the deputies was a negro, and the other two of that description of persons who are called men of colour; on the succeeding day, the black deputies having given an account of the troubles in that island, the abolition of slavery was proposed, and agreed to, the deputies were then decreed French citizens.

Roberpierre having now attained nearly to the summit of his power, exercised it with despotic sway. On the 25th of March, Herbert, with twenty two others, was arrested, and ordered before the revolutionary tribunal. The charges brought against them were many and various. The principal evidences were Louis Legendre, deputy to the national convention, and Louis Pierre Dufourni an architect; although the charges were very ill supported, the evidence being none of the best, one of them only was acquitted. The wretched Anacharis Clootz was among the condemned, and was the only man who attempted to speak; and he appealed but in vain to the *human race*, whose *orator* and ambassador he had declared himself. Herbert and his colleagues, passed their time when together, like the fallen spirits in Milton, in mutual accusation, till they were reconciled by Clootz, who fearing, lest any of them should die in religious belief, preached atheism to them till their last sigh. They were executed amid the applauses of a vile multitude, who, at the falling of the guillotine, rent the air with their savage shouts.

The success and popularity of Roberpierre encouraged him to bring forward a new group of traitors, and to the astonishment of every one, Fabre d'Eglantine and others of the deputies for the reviling of whom, Herbert had been condemned, were among the principal culprits. Danton took part in the convention against the accused deputies, and in a few days after, pleaded strongly for confidence in the committees of public and general safety; uncon-

unconscious that he was soon to be implicated in the fate of the persons whom he censured, and to accompany them to the scaffold, there to receive the reward which his manifold villainies so richly deserved. A secret rivalry and deep-rooted enmity had subsisted between him and Roberfpierre. Of the progress of the quarrel betwixt them we are destitute of information; but a very short time before the arrest of Danton, an interview was brought about between them by the influence of a common friend, in the hope of effecting a reconciliation. Danton after a long conversation, finding it impossible to make an impression on his implacable rival, who heard him with a look of insult and malignity, is said to have burst into tears, and to have left the room with the prophetic exclamation, "I see that my fate is decided, but my death will be your ruin."
